1.0 INTRODUCTION/PURPOSE AND NEED

1.1 Introduction

The Sonoran Desert National Monument (SDNM) was designated by Presidential Proclamation 7397 on January 17, 2001 (Proclamation), and stated that “[l]aws, regulations, and polices followed by the Bureau of Land Management in issuing and administering grazing permits or leases on all lands under its jurisdiction shall continue to apply with regard to the lands in the monument; provided, however, that grazing permits on Federal lands within the monument south of Interstate 8 shall not be renewed at the end of their current term; and provided further, that grazing on Federal lands north of Interstate 8 shall be allowed to continue only to the extent that the Bureau of Land Management determines that grazing is compatible with the paramount purpose of protecting the objects identified in this proclamation.”

In 2016, the U.S. District Court – District of Arizona issued a ruling concluding that the Bureau of Land Management (BLM) did not provide adequate explanations for determining livestock grazing compatibility on the SDNM for the 2012 SDNM, Resource Management Plan/Record of Decision (RMP/ROD) (BLM 2012a). The court found the administrative record did not support the analysis that led to the decisions in the ROD to make grazing available on five allotments north of Interstate-8 (I-8) and ordered the BLM to complete a new Land Health Evaluation (LHE) and grazing compatibility analysis (GCA) to be incorporated into the SDNM RMP by September 30, 2020.

Since the ruling, the BLM developed a new LHE and GCA (Appendix 1). The BLM determined that an RMP Amendment/Environmental Assessment (RMPA/EA) is warranted to address the Court remand and evaluate whether any allotments on the SDNM north of I-8 would be “available” or “unavailable” for livestock grazing, and whether any changes are needed to the available Animal Unit Months (AUMs). The LHE and GCA, along with public scoping comments, assisted the BLM in the development of the alternatives being considered in this Draft RMPA/EA.

1.2 Planning Area

The Planning Area for this Draft RMPA/EA is defined as approximately 252,460 acres of public land managed by the BLM within the SDNM north of I-8 (Figure 1).

1.3 Purpose and Need

The purpose of this action is to consider the compatibility of livestock grazing with monument objects for which the SDNM was established and to amend the 2012 SDNM RMP/ROD. ‘Objects’ identified in the Proclamation were the following:

- Functioning desert ecosystems;
- Diversity of plant and animal species;
- Saguaro cactus forest;
- Scientific analysis of plant species and climates in past eras;
- Vegetation communities;
- Wildlife; and
- Archeological and historic sites.

The need for this action is established in the Proclamation, Taylor Grazing Act of 1934, the Federal Land Policy and Management Act of 1976, Fundamentals of Rangeland Health (43 Code of Federal Regulation (CFR) 4180), the SDNM RMP and the March 31, 2016 ruling by the U.S. District Court – District of Arizona concluding that the BLM did not provide adequate explanations for determining livestock grazing compatibility on the SDNM in the 2012 SDNM RMP/ROD.

1.4 Scoping and Issue Identification

On January 12, 2020 the BLM sent Cooperating Agency invitations to 16 potential government organizations and tribal governments to participate in this RMPA/EA. Under the National Environmental Policy Act (NEPA), State agencies, local governments, and tribal governments may serve as a Cooperating Agency for a planning effort. Criteria for being a Cooperating Agency is: a) jurisdiction by law or b) special expertise. Listed below in the Table 1 is their status.

Table 1. Cooperating Agencies.

Government/Organization	Invited	Participating
Arizona Game and Fish Department, Region 4	✓	✓
Arizona Game and Fish Department, Region 6	✓	
U.S. Fish and Wildlife Service, Arizona Ecological Services	✓	
Arizona State Land Department	✓	
Arizona Department of Transportation	✓	
Arizona Department of Agriculture	✓	
Ak-Chin Indian Community	✓	
Hopi Tribe	✓	
Tohono O’odham Nation	✓	
Pascua Yaqui Tribe	✓	
Salt River Pima-Maricopa Indian Community	✓	
Gila River Indian Community	✓	
Maricopa Department of Transportation	✓	
Maricopa County	✓	
Pinal County	✓	

The BLM will continue to reach out to the entities that did not accept Cooperating Agency status during public participation and consider their input on this RMPA/EA. On March 6, 2020 tribal governments with an affiliation with the Planning Area were notified and provided early information on this RMPA/EA under the provisions of Section 106 of the National Historic Preservation Act.

Public scoping for this RMPA/EA was initiated with the publication of a Notice of Intent in the *Federal Register* on March 26, 2020 (Vol. 89, No. 59, 17095). The BLM notified 57 individuals, organizations and agencies by email and postcard of the scoping period on March 25, 2020. The BLM published an updated LHE and draft GCA for public input. The 30-day public scoping period ended on April 27, 2020. Approximately 55 comment emails were of similar nature- opposed to livestock grazing within the SDNM. There were requests that the BLM complete an environmental impact statement, and suggestion the review period for this Draft RMPA/EA be 90-days in length. The BLM received approximately 62 comment letters and emails to consider (Appendix 2).

1.4.1 Issues to be Addressed in this Draft RMPA/EA

The BLM through internal scoping and in consideration of public comments, has identified the following issues to be considered in this RMPA/EA:

- Direct, indirect, and cumulative impacts from livestock grazing on monument objects and other resources; and
- Impacts to local economies and livestock operators if allotment(s) made available or unavailable for livestock grazing.

1.4.2 Issues Outside the Scope of this Draft RMPA/EA

The BLM also received comments on issues that are beyond or outside the scope of this Draft RMPA/EA. These comments included the following:

- Commenters stated opposition to livestock grazing on public lands, in national monuments, in deserts;
- Commenters stated opposition to industry/commercial uses of public lands;
- Commenters expressed concern about BLM funding and staffing to effectively manage public lands;
- Commenters stated opposition to sheep grazing;
- Commenters stated concern about the low fees for livestock grazing on public lands;
- Commenter stated that impacts to livestock operators are not relevant to this RMPA/EA as they are not ‘objects’ described in the Proclamation;
- Commenter expressed support for voluntary relinquishment of grazing permits;
- Commenter expressed support to turn management of national monuments to the National Park Service.

1.5 Planning Criteria

The BLM planning regulations (43 CFR 1610.4-2) require the development of planning criteria to guide the preparation of an RMP Amendment. Planning criteria are the standards, rules, and other guidelines developed by BLM staff, with public input, for use in forming judgements about plan-level decision-making, analysis, and data collection. These criteria are used to establish the parameters for making planning decisions and simplifying RMP Amendment actions.

The BLM has identified the following planning criteria:

- The RMPA/EA will cover BLM-administered public lands within the SDNM north of I-8;
- The RMPA/EA will consider a range of reasonable alternatives;
- The BLM will consider current scientific information, research, new technologies, monitoring, and coordination; and
- The RMPA/EA will comply as appropriate with all applicable law, regulations, policy and guidance.

This Draft RMPA/EA is limited in focus, as it is intended to make planning-level decisions for grazing availability and management in response to the U.S. District Court’s Order. No planning-level changes to non-grazing programs (e.g. recreation, travel management, etc.) are proposed in this Draft RMPA/EA. Valid existing rights will not be affected by any alternative analyzed in this

Draft RMPA/EA. No proposed decision would have any effect on private, county, State, or other federal lands within the Planning Area.

1.6 Legislative Constraints

The multiple-use mandates of the Federal Land Policy and Management Act (FLPMA), the Taylor Grazing Act of 1934 and other applicable laws, regulations and policies will be followed. This Draft RMPA/EA also recognizes the mandates in the Proclamation (Appendix 1).

1.7 Planning Process

Below is the planning process being followed:

- As described in Section 1.4, the BLM provided a 30-day public scoping period after publication of a Notice of Intent in the *Federal Register*. The BLM provided notification to approximately 57 individuals, organizations and agencies in addition to publication of a news release. The BLM received 60 comment letters or emails to consider;
- The BLM released this Draft RMPA/EA and unsigned Finding of No Significant Impact (FONSI) on May 08, 2020 for a 30-day public review and comment. The BLM provided notification individuals, organizations and agencies in addition to publication of a news release, The BLM also published a news release and legal notice announcing the comment period;
- Upon the conclusion of the comment period, the BLM would consider substantive and relevant comments received, revise the alternatives and/or impacts analysis as needed, and then publish a Proposed RMPA/EA. If appropriate, the BLM would also publish an approved FONSI;
- A 30-day protest period and concurrent 60-day Governor’s Consistency Review will follow the release of the Proposed RMPA/EA and approved FONSI; and
- After resolution of any protests and conclusion of the Governor’s Consistency Review, the BLM will issue a Decision Record and RMP Amendment.

1.8 Relationships to Statutes, Regulations, Manuals and Other Plans

Actions considered under this Draft RMPA/EA are consistent with all federal, State, and local laws, regulations, and policies deemed relevant to the Draft RMPA/EA. The following statutes, regulations, or plans apply to BLM-managed lands within the Planning Area:

- Maricopa County 2020, Eye to the Future Comprehensive Plan (2008).
- Pinal County Comprehensive Plan (2009).
- Presidential Proclamation 7397
- Taylor Grazing Act of 1934.
- Federal Land Policy and Management Act of 1976 (43 U.S.C. 1701 et seq.).
- Public Rangelands Improvement Act of 1978.
- 43 CFR 4100 Grazing Administration - Exclusive of Alaska.
- Section 106 of the National Historic Preservation Act of 1966, as amended.

- National Environmental Policy Act of 1969.
- Migratory Bird Treaty Act of 1917, and Executive Order 13186 – *Responsibilities of Federal Agencies to Protect Migratory Birds*.
- Secretarial Order 3362: Improving Quality in Western Big-Game Winter Range and Migration Corridors.
- SDNM RMP/ROD (2012).

1.9 Decision to be Made

The Arizona State Director is the Authorized Officer responsible for planning-level decisions within the SDNM. This RMPA/EA will provide information for the Authorized Officer to make an informed decision whether livestock grazing is compatible with the SDNM objects in the SDNM north of I-8.

Decisions to be made include:

- Allotments available/unavailable for livestock grazing; and
- Range of AUM's available for livestock grazing across all SDNM allotments north of I-8.

In Arizona, allotments are classified as perennial, ephemeral, or perennial-ephemeral. The determination of each individual allotments classification and AUMs would be made at the implementation-level and not in this planning effort.

2.0 ALTERNATIVES

2.1 Description of Alternatives

2.1.2 Alternative A: No Action Alternative

Alternative A, the No Action Alternative, “provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives” (CEQ 1981: question 3). This alternative provides the baseline environmental condition against which the other alternatives are compared. For RMP actions, the No Action Alternative is to continue to implement the management direction in the RMP. Under this alternative, the BLM would continue the current livestock management on portions of five allotments (Arnold, Beloat, Big Horn, Hazen, and Lower Vekol), north of I-8 in the SDNM (Figure 2). This alternative allows 3,318 AUMs across the Planning Area (ROD decision GR-2.1.4) (Table 2). The current management actions, best management practices (BMPs) and mitigation as approved in the 2012 ROD would continue to apply to the No Action Alternative.

Under the No Action Alternative, range improvements such as allotment fencing and water developments, would continue to be maintained in allotments available for livestock grazing.

Alternative A was analyzed in the Lower Sonoran/SDNM Final Environmental Impact Statement (FEIS) as Alternative E (BLM 2012b).

2.1.3 Alternative B: Proposed Action

Under Alternative B, the Proposed Action, grazing would be available on all six allotments in the SDNM north of I-8 (Table 3) (Figure 3). Livestock grazing use would range from ephemeral use only to 4,232¹ perennially authorized AUMs across the Planning Area (Appendix 1) (Table 2).

The results of the new LHE and GCA (Appendix 1) suggest that livestock grazing, within this range of potential use, could remain available on the SDNM north of I-8. However, implementation-level adjustments in livestock grazing management, including the number of authorized AUMs by allotment, would be required to maintain and achieve Standards for Rangeland Health (Standards) and be compatible with monument objects.

This alternative would allow grazing on 77,710 acres of the Conley Allotment, a portion of the Big Horn Allotment (16,970 acres), and a portion of the Lower Vekol Allotment (610 acres), that were previously unavailable for grazing (Table 3). The current management actions, best management practices (BMPs) and mitigation as approved in the 2012 ROD would continue to apply to the Proposed Action.

However, no livestock grazing will be permitted on four of the six allotments (Big Horn, Conley, Hazen, and Lower Vekol) until the BLM first completes implementation-level NEPA analysis, on an allotment-by-allotment, or group of allotments, basis.

¹ Based on the average perennially authorized or documented actual use AUMs, prorated by acres, between 2007 and 2018 excluding AUMs authorized for ephemeral use and AUMs previously authorized on allotments and portions of allotments closed under the Proclamation within the SDNM south of I-8.

Table 2. Comparison of Potential AUMs Between the Alternatives.

Planning Area	Alternative A	Alternative B	Alternative C	Alternative D
All SDNM allotments north of I-8	3,318 AUMs*	Ephemeral only to 4,232 AUMs**	0 AUMs	Ephemeral only to 3,293***

* Across five allotments (excluding the Conley and portions of the Big Horn and Lower Vekol Allotments).

** Across all six allotments (including the Conley Allotment).

*** Across all six allotments (excluding portions of the Big Horn and Conley allotments)

Allotments would be classified as perennial, ephemeral, or perennial-ephemeral at the implementation-level.

Table 3. Comparison of Grazing Availability Between the Alternatives.

Allotment Name	Alternative A	Alternative B	Alternative C	Alternative D
Arnold	Available	Available	Unavailable	Available
Beloat	Available	Available	Unavailable	Available
Big Horn	Available	Available	Unavailable	Available ²
Conley	Unavailable	Available	Unavailable	Available
Hazen	Available	Available	Unavailable	Available
Lower Vekol	Available	Available	Unavailable	Available

Table 4. Comparison of Acres Available for Grazing Between Alternatives.

Allotment Name	Alternative A	Alternative B	Alternative C	Alternative D
Arnold	1,610	1,610	0	1,610
Beloat	33,600	33,600	0	33,600
Big Horn	75,230 ³	92,200	0	61,590
Conley	0	77,710	0	36,230
Hazen	31,930	31,930	0	31,930
Lower Vekol	14,800	15,410	0	15,410
Total	157,170	252,460	0	180,370

Under the Proposed Action, range improvements such as allotment fencing and water developments, would continue to be maintained in allotments available for livestock grazing.

2.1.4 Alternative C: No Grazing Alternative

Under Alternative C, the No Grazing Alternative, livestock grazing would be unavailable on all six allotments in the SDNM north of I-8 (Table 3) (Figure 4). The management actions in the 2012 SDNM ROD that specifically address grazing management would no longer apply if this alternative were approved. All other decisions in the 2012 SDNM ROD would continue be implemented in the management of the SDNM.

Under the No Grazing Alternative, permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. These range improvements would then be removed, maintained, or modified in order to achieve resource goals, such as wildlife and recreation, on a case by case basis. Range improvements on allotments outside the SDNM would continue to be maintained for livestock and wildlife use by permittees in accordance with 43 CFR 4120.

² Although the Big Horn and Conley allotments under this alternative would be allocated as available, portions of these allotments would be unavailable for livestock grazing.

³ Although the Big Horn Allotment was allocated as ‘available,’ portions of the allotment, including where livestock waters occur, were made ‘unavailable’ in the 2012 ROD, thus making the majority of the acres unusable (Figure 2).

Alternative C had been analyzed in the Lower Sonoran/SDNM FEIS as Alternative D (BLM 2012b).

2.1.5 Alternative D: Reduced Grazing Alternative

Under Alternative D, the Reduced Grazing Alternative, grazing would be allocated available on portions of all six allotments in the SDNM north of I-8. The portions of the Big Horn and Conley allotments north of State Route 238 (SR-238) (Table 3) (Figure 5) would be unavailable to livestock grazing. Livestock grazing use would range from ephemeral use only to 3,293⁴ perennially authorized AUMs across the Analysis Area (Appendix 1) (Table 2).

The results of the new LHE and new GCA (Appendix 1) suggest that livestock grazing within this range of potential use, could remain available on portions of the SDNM north of I-8. However, implementation-level adjustments in livestock grazing management, including the number of authorized AUMs by allotment, would be required to maintain and achieve Standards and be compatible with monument objects.

This alternative would allow grazing on all allotments except for 30,610 acres of the Big Horn Allotment and 41,480 acres of the Conley Allotment north of SR-238. The proposed unavailable areas on the Big Horn and Conley allotments contain high densities of recreational use and areas with cultural significance, such as the Juan Bautista de Anza Recreational Management Zone (RMZ) and the Anza National Historic Trail and Management Area. The current management actions, best management practices (BMPs) and mitigation as approved in the 2012 ROD would continue to apply to the Reduced Grazing Alternative.

However, no livestock grazing will be permitted on four of the six allotments (Big Horn, Conley, Hazen, and Lower Vekol) until the BLM first completes implementation-level NEPA analysis, on an allotment-by-allotment, or group of allotments, basis.

2.2 Alternatives Considered but Eliminated from Detailed Analysis

This section describes alternatives considered but not further analyzed in this Draft RMPA/EA. These alternatives were recommended by resource specialists or members of the public during scoping. The alternatives along with the rationale for excluding them from further consideration are described below.

Make Portions of Allotments not Meeting Standards for Rangeland Health due to Grazing, Unavailable to Grazing.

Allocating portions of allotments not meeting Standards due to livestock grazing unavailable to grazing would be impractical to implement in lieu of other management options. Areas currently not achieving Standards due to grazing have the potential to achieve Standards given proper grazing management. The implementation of this alternative would segregate pastures and require intensive management of livestock to prevent cattle from drifting into areas not currently meeting Standards. Potential management actions that would be required include fencing around dirt

⁴ Based on the average perennially authorized or documented actual use AUMs, prorated by available acres (excluding proposed unavailable acres), between 2007 and 2018 excluding AUMs authorized for ephemeral use and AUMs previously authorized on allotments and portions of allotments closed under the Proclamation within the SDNM south of I-8.

reservoirs, the removal of livestock troughs fed by pipelines and wells, and additional pasture fencing. Other options such as deferred/rotational grazing, reduction in AUMs, or ephemeral grazing only can improve progress towards achieving Standards and require less additional infrastructure and labor intensive grazing management practices.

Create a Forage Reserve on the Lower Vekol Grazing Allotment.

A forage reserve is an area or allotment without a current permittee where temporary grazing may be authorized for permittees requiring forage for cattle due to extenuating circumstances such as fire, drought, public land sales/exchanges or other variables causing temporary or permanent loss of forage within their grazing allotments. The Lower Vekol Allotment would be impractical to manage as a forage reserve due to its limited livestock carrying capacity, remoteness from other parts of the SDNM, and the mixed land status consisting of private and State lands.

Allowing Other Classes of Livestock to Graze (i.e. Sheep, Goats, and Horses).

The 2012 RMP/ROD does not allow sheep or goat grazing on the SDNM (ROD decision GR-2.1.2). Allowing other classes of livestock to graze would have adverse impacts to wildlife. Sheep, goat, and horse grazing/browsing preferences can have more overlap than cattle with wildlife forage preferences. Domesticated sheep and goats can also transmit diseases to native bighorn sheep that occupy the SDNM.

Making Sensitive Areas such as Cultural Sites and Saguaro Forests Unavailable to Livestock Grazing.

The known cultural sites and the majority of the saguaro forest sites are shielded by natural barriers such as slope and rough terrain and are unlikely to receive substantial livestock grazing due to being far (often greater than two miles) from livestock waters. The new GCA shows that livestock grazing is unlikely to adversely impact cultural monument objects. The sensitive areas that are not protected by natural barriers can be protected through implementation-level adjustments in livestock management such as short duration grazing and/or limiting the number of authorized AUMs. Excluding these areas through fencing would require extensive amounts of fencing materials which would conflict with other uses are resources within the SDNM such as recreation, visual resources, wilderness characteristics, and wildlife movement.

Authorize AUMs at Historical Use

Under this alternative, all allotments would have been allocated as available for livestock grazing and the maximum AUMs would be 8,703. This number is based on the 1985 Lower Gila South Resource Management Plan (BLM 1985), prorated by acres, and deduction of AUMs for unavailable allotments under the Proclamation within the SDNM south of I-8 (BLM 2012b). According to the GCA (Table 4 in Appendix 1), livestock grazing at 8,703 AUMs is incompatible with monument objects. There would be no practical means at the implementation-level for livestock grazing, at this level, to be authorized and be compatible with monument objects. This alternative which authorized 8,703 AUMs was previously analyzed in detail as No Action Alternative in the 2012 FEIS (see Table 2-24).

3.0 AFFECTED ENVIRONMENT & ENVIRONMENTAL CONSEQUENCES

This chapter identifies and describes the current condition and trend of elements or resources in the human environment which may be affected by the Proposed Action or alternatives. The Affected Environment is the same for all alternatives.

3.1 General Setting

The Planning Area is the Analysis Area, encompassing the entire SDNM north of I-8 which includes portions of six grazing allotments (Arnold, Beloat, Big Horn, Conley, Hazen, and Lower Vekol allotments) and is south of the City of Goodyear, northeast of Gila Bend, and north of Mobile, Arizona (Figure 1). The Analysis Area is approximately 252,460 acres of public land. Both the North Maricopa Mountain and South Maricopa Mountain wilderness areas are within the Analysis Area. The predominant vegetation communities in the Analysis Area include creosote-bursage scrub, palo verde mixed cactus, and ephemeral washes. The Analysis Area for socioeconomics is Maricopa County, Arizona covering approximately 9,199 square miles (not shown). Maricopa County is the fourth most populous county in the U.S.

Resources Considered for Analysis

The BLM's interdisciplinary team met on October 21, 2019 and December 16, 2019 to discuss the RMPA/EA, and the presence or absence of resources or issues within the Planning Area. Based on those discussions, and in consideration of relevant comments received during public scoping, the BLM determined which resource or issues are present and warrant detailed analysis in this Draft RMPA/EA. See Appendix 3 for a list and description of those resources or issues not present in the Planning Area, and those resources or issues that are present in the Planning Area that do not warrant detailed analysis.

3.2 Types of Effects

In this document, the terms “effect” and “impact” are used synonymously. Effects fall into two categories:

- **Direct:** caused by the action and occur at the same time and place.
- **Indirect:** caused by the action, but later in time or further in distance, but are still reasonably foreseeable.

For the purpose of this analysis, direct or indirect impacts are referred to as “impacts.”

For the purpose of this analysis, the duration of the impacts are defined as follows:

- **Long-term:** impacts that would over the life of this RMPA/EA. Typically, land use plans remain in effect at least 10-years.
- **Short-term:** impacts of limited duration from implementation-level actions such as modifications to range improvements.

For the purpose of this analysis, intensity of the impact is defined as follows:

- **Negligible:** effects are undetectable and immeasurable. See Appendix 3 for those resources or issues present but not affected to a degree beyond negligible.
- **Minor:** effects are apparent, measurable, small, localized, and contained within the footprint of the action.
- **Moderate:** effects are readily apparent and measurable over a larger area, but are still mainly within the footprint of the action.

For the purpose of this analysis, the type of impact is defined as follows:

- **Adverse:** impacts that would have a detrimental effect to a resource.
- **Beneficial:** impacts that would have a positive effect to a resource.

The Proclamation identified monument ‘objects.’ Table 5 lists the object and applicable section(s) in this Draft RMPA/EA that considered the potential effects from the alternatives.

Table 5. Monument Objects Analyzed in this Draft RMPA/EA.

Object Name	Applicable Resources	RMPA/EA Section(s)
Functioning desert ecosystems	Vegetation, General Wildlife, BLM Sensitive Species (Animals), Migratory Birds, Soil Resources	3.5.1/3.5.2 3.5.3/3.5.4
Diversity of plant and animal species	Vegetation, General Wildlife, BLM Sensitive Species (Animals), Migratory Birds	3.5.1/3.5.2
Saguaro cactus forest	Vegetation	3.5.1/3.5.2
Scientific analysis of plant species and climates in past eras	Vegetation	3.5.1/3.5.2
Vegetation communities	Vegetation	3.5.1/3.5.2
Wildlife	General Wildlife, BLM Sensitive Species (Animals), Migratory Birds	3.5.1/3.5.2
Archeological and historic sites	Cultural and Heritage Resources	3.5.5/3.5.6

Within all or portions of the Analysis Area, there are also the following additional Special Designations:

- Sonoran Desert National Monument – portions of the six allotments fall within the SDNM, unit of the National Conservation System;
- Juan Bautista de Anza National Historic Trail Corridor and Sonoran Desert Trails Special Cultural Resource Management Area – for a discussion, see Sections 3.5.5 and 3.5.6; and
- North and South Maricopa Mountains Wilderness Areas – for a discussion, see Appendix 3.

3.3 Resource Uses

3.3.1 Affected Environment - Livestock Grazing

The Analysis Area includes the SDNM north of I-8 where “...grazing on federal lands north of Interstate 8 shall be allowed to continue only to the extent that the BLM determines that grazing is compatible with the paramount purpose of protecting the objects identified in this proclamation.” This area consists of only those portions of six grazing allotments that are within the SDNM

(Arnold, Beloat, Big Horn, Conley, Hazen, and Lower Vekol) (Figure 1). Grazing on these allotments outside the SDNM are not considered in this analysis.

Compatibility of livestock grazing with monument objects was assessed through a LHE and GCA (Appendix 1). In the LHE, each allotment was evaluated to determine if Standards are achieved and whether livestock grazing is the causal factor for any non-achievement. Many Standards are tied to monument objects which were assessed in the GCA (Table 1 in the GCA). The results of these studies showed some areas with and without expected historical livestock use are meeting Standards and compatible with monument objects. This suggests that livestock grazing could continue on the SDNM north of Interstate 8 with adjustments in grazing management.

These six allotments currently within the SDNM contain a variety of range improvements including wells, pipelines, earthen reservoirs, fence lines, and corrals. As of 2015, four of the six grazing allotment permits (Big Horn, Conley, Hazen, and Lower Vekol) within the Analysis Area are expired and have not been renewed due to pending litigation of the livestock grazing decisions in the 2012 SDNM ROD. Livestock last grazed the Conley Allotment portion of the SDNM up until the permit expired in 2015. The Arnold and Beloat allotments have current permits which both expire in February 2025. However, livestock grazing has not occurred on the SDNM portions of these allotments since 2015, ephemeral use of the Arnold, due to lack of available ephemeral forage in recent years and/or permittees voluntarily choosing to use other non-SDNM portions of the grazing allotments. Under the 2012 ROD across the five livestock grazing allotments available for use, up to 3,318 AUMs are allowed.

No livestock grazing will occur on four of the six allotments (Big Horn, Conley, Hazen, and Lower Vekol) until the BLM first completes implementation-level NEPA analysis, on an allotment-by-allotment, or group of allotments, basis. Upon conclusion of implementation-level analysis, the BLM would proceed to issue grazing permit(s).

At the implementation-level, adjustments to grazing management could include the following:

- Exclusion of sensitive areas and/or areas failing to achieve Standards in proximity to livestock waters by restricting livestock access to waters (fencing) and/or redistributing livestock around additional (new) livestock water sources in less sensitive areas;
- Adjustments in number of authorized AUMs; and/or
- Adjustments in season of use.

For more information on Livestock Grazing within the Analysis Area, see Section 3.3.2 of the Lower Sonoran/SDNM PRMP/FEIS.

3.3.2 Environmental Consequences - Livestock Grazing

No Action Alternative (Current Management)

Under the No Action Alternative, the current livestock management would continue on portions of five of the six allotments available for grazing on the SDNM north of I-8. Livestock grazing would be unavailable within the SDNM on 16,970 acres of the Big Horn Allotment, 610 acres of the Lower Vekol, and the entire (77,710 acres) Conley Allotment, and 3,318 AUMs would remain available across the five allotments available for grazing.

Livestock grazing on the Big Horn Allotment would be moderately impacted due to the areas surrounding livestock waters being unavailable for grazing. By making these areas unavailable for grazing, livestock would not have access to waters that could potentially service other available portions of the Big Horn Allotment. Livestock grazing on the Conley Allotment would be moderately impacted by decreasing the preference inside the SDNM portion of the allotment to zero AUMs and proportionally decreasing the remaining AUMs allocated for portions outside the SDNM boundary. Livestock grazing on the Lower Vekol Allotment would be minorly impacted due to the area around one livestock water being made unavailable for grazing.

Impacts to livestock grazing would be beneficial, minor, and long-term for the Arnold, Beloit, and Hazen allotments and would be adverse, moderate, and long-term for the Big Horn, Conley, and Lower Vekol allotments. Impacts could be mitigated through implementation-level management actions, such as the addition of range improvements to increase the service areas of livestock waters and fencing to prevent livestock from drifting into unavailable areas yet allowing available areas to be grazed.

Proposed Action

Under the Proposed Action, all six allotments (252,460 acres) within the SDNM would be available for livestock grazing, including 77,710 acres of the Conley Allotment, 16,970 acres of the Big Horn Allotment and 610 acres of the Lower Vekol Allotment which were formerly unavailable to grazing would become available for grazing. The level of use would change from 3,318 AUMs across five allotments (Conley Allotment excluded), to a range from ephemeral use only to 4,232 AUMs across all six allotments. Fencing would no longer be required to prevent livestock from accessing unavailable areas which would lower operational costs of maintenance and labor hours. However, the overall impacts to livestock grazing would largely depend on the level and management of grazing authorized under implementation-level decisions. When compared to the No Action Alternative, impacts to livestock grazing would be beneficial, negligible to moderate, and long-term.

The level of authorized grazing use within each allotment will be subject to separate environmental review and authorized under implementation-level decisions. This level could range from ephemeral use only to 4,232 AUMs and require adjustments in grazing management such as the modification of range improvements, adjustments in number of authorized AUMs by allotment, adjustments in season of use, and the exclusion of sensitive areas.

No Grazing Alternative

Under the No Grazing Alternative, livestock grazing would be unavailable on all six allotments in the SDNM north of I-8. Livestock grazing would be eliminated as permits expire on the Arnold and Beloit allotments. The impacts to livestock grazing would be adverse, moderate, and long-term. There would be moderate impacts to grazing permittees as permits expire requiring the permittees to find other means to sustain their herds or leave the livestock industry entirely. Livestock grazing could continue on those portions of the existing allotments outside the SDNM. These authorizations would be subject to separate environmental review. The permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. These range improvements

could then be removed, maintained, or modified in order to achieve resource goals, such as wildlife and recreation, on a case by case basis. The towns and communities that are dependent on the ranching industry could see minor economic impacts. Implementation-level decisions could include additional boundary fencing and/or range improvements, and adjustments in the level of use for the portions of allotments outside the SDNM.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments within the SDNM would be allocated available for livestock grazing, except for 30,610 acres of the Big Horn Allotment and 41,480 acres of the Conley Allotment north of SR-238. The level of use would change from 3,318 AUMs across five allotments (Conley Allotment excluded), to a range from ephemeral use only to 3,293 AUMs across portions of six allotments. The permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable portions of the Big Horn and Conley allotments. These range improvements could then be removed, maintained, or modified in order to achieve resource goals, such as wildlife and recreation, on a case by case basis. The towns and communities that are dependent on the ranching industry could see minor economic impacts. Implementation-level decisions could include additional boundary fencing and/or range improvements, and adjustments in the level of use for the portions of allotments outside the SDNM. Additional fencing would be required to prevent livestock from entering the unavailable portions of the Big Horn and Conley allotments from other portions of the allotments allocated available for grazing. However, the overall impacts to livestock grazing would largely depend on the level and management of grazing authorized under implementation-level decisions. When compared to the No Action Alternative, impacts to livestock grazing would be beneficial, negligible to moderate, and long-term.

The level of authorized grazing use within each allotment will be subject to separate environmental review and authorized under implementation-level decisions. This level could range from ephemeral use only to 3,293 AUMs and require adjustments in grazing management such as the addition or removal of range improvements, adjustments in number of authorized AUMs by allotment, adjustments in season of use, and the exclusion of sensitive areas.

3.4 Social and Economic

3.4.1 Affected Environment - Socioeconomics

Grazing land makes up approximately 75 percent of Arizona's total land area. According to a 2014 University of Arizona study, many Arizona ranches rely on a combination of private, Arizona State Land Department, and BLM-administered lands for their operations (UofA 2014).

The Analysis Area for socioeconomics is Maricopa County, Arizona which includes the six allotments. Maricopa County covers approximately 9,199 square miles and had an estimated population of 4,410,824 people in 2018 (the fourth most populous county in the U.S.). Maricopa County covers approximately eight percent of Arizona, and BLM-administered lands make up approximately 2,688 square miles (29 percent) of Maricopa County. According to the 2010 U.S. Census, the median income for a household was \$55,054 and median income for a family was \$65,438. In 2018 agriculture, including farming and ranching, represented approximately 0.2 percent of all employment in Maricopa County (Headwaters 2020). There are portions of 75 BLM-

administered grazing allotments within Maricopa County, six of which are partially within the SDNM.

The BLM collects annual grazing fees from permittees based on the number of permitted AUMs. An AUM represents the amount of forage required to sustain one cow and one calf for one month. The 2012 ROD provided for 3,318 AUMs on five allotments within the SDNM. At the current rate of \$1.35 per AUM, the allotments can generate as much as \$4,479 per year from active use AUMs. The BLM distributes 50 percent of the grazing revenues to range betterment projects, 37.5 percent to the U.S. Treasury, and 12.5 percent is returned to the State the allotment is located within (43 U.S.C. Chapter 8A 1934).

Permittees also add money to the local economy. Supplies, materials and services are often purchased for the following activities on public lands: fence/corral construction and maintenance, salt and supplements, shoeing, wages for hired herder/rider(s), veterinary expenses, vehicle purchases, repair and fuel. Open space associated with grazing promotes other activities such as recreation, hunting, and wildlife watching. For more information on Social and Economic Conditions within the Analysis Area, see Section 3.5.3 of the Lower Sonoran/SDNM FEIS.

3.4.2 Environmental Consequences - Socioeconomics

No Action Alternative (Current Management)

Under the No Action Alternative, five allotments would continue to be available for livestock grazing in the SDNM, in addition to 69 other allotments in the Analysis Area. Authorized grazing would continue at existing levels (3,318 AUMs). Livestock grazing in the Analysis Area would result in a corresponding benefits to the regional economic activity from the permittee's spending in the local economy. Livestock grazing would benefit the permittee, any employees, the businesses where the permittee purchases supplies from, and the communities that are supported by livestock operations. Grazing would benefit tax revenues for the local economy. One allotment would continue to be unavailable, and the portions of two other allotments would not be available for livestock grazing. These impacts could be partially mitigated if grazing is allowed on the non-SDNM portions of the one unavailable allotments. Overall, impacts to socioeconomics under the No Action Alternative would be beneficial, negligible to minor, and long-term.

Proposed Action

Under the Proposed Action, six allotments would be available for grazing within the Analysis Area in the SDNM, in addition to 69 other allotments in the Analysis Area. The level of authorized use would range from ephemeral use only to 4,232 AUMs. Based on the current rate of \$1.35 per AUM, the allotments would generate as much as \$5,701 per year from active use AUMs. Compared to the No Action Alternative, this would potentially represent an increase of 905 AUMs (\$1,121). Overall availability of BLM-administered lands for livestock grazing would decrease or increase depending on the level of grazing authorized under implementation-level decisions. Regardless of the level of livestock grazing authorized, the availability of a larger area for livestock grazing compared to the No Action Alternative would result in increased benefits to the regional economic activity from the permittee's spending in the local economy. Livestock grazing would benefit the permittee, any employees, the businesses where the permittee purchases supplies from, and the communities that are supported by livestock operations. Grazing would benefit tax revenues for the local economy. permittees would be reimbursed, in accordance with 43 CFR 4120,

for their interest in the fair market value of the documented range improvements within the unavailable allotments. Overall, impacts to socioeconomics under the Proposed Action would be beneficial, negligible to minor, and long-term.

No Grazing Alternative

Under the No Grazing Alternative, no allotments would be available for livestock grazing in the SDNM, however 69 other allotments in the Analysis Area would continue to be available for livestock grazing. The social and economic benefits associated with grazing operations would be lost in the SDNM. The elimination of AUMs could have a multiplier effect on aspects of the local economy that are associated with the ranching community. Elimination of grazing could result in corresponding reduction in regional economic activity and would adversely impact the permittees, any employees, the businesses where the permittees purchase supplies, and the communities that are supported by livestock operations. The permittees may have to relocate their livestock to private land or a different allotment available for use on public land. If the permittee's use of BLM-administered land is critical to their operation, the permittee could be forced to sell livestock and/or close their grazing operation entirely. This could result in decreased tax revenues for the local economy. These impacts could be partially mitigated if grazing is authorized on the non-SDNM portions of the six unavailable allotments. Permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. Overall, impacts to socioeconomics under the No Grazing Alternative would be adverse, negligible to minor, and long-term.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, five allotments would continue to be allocated available for livestock grazing in the SDNM, in addition to 69 other allotments in the Analysis Area. The Conley Allotment would be changed to allocated available, however, portions of the Big Horn and Conley allotments north of SR-238 would be unavailable to livestock grazing. Grazing could be authorized up to 3,293 AUMs within the available portions of the SDNM. Livestock grazing in the Analysis Area would result in a corresponding benefits to the regional economic activity from the permittee's spending in the local economy. Livestock grazing would benefit the permittee, any employees, the businesses where the permittee purchases supplies from, and the communities that are supported by livestock operations. Grazing would benefit tax revenues for the local economy. Overall, impacts to socioeconomics under the Reduced Grazing Alternative would be beneficial, negligible, and long-term.

3.5 Resources

3.5.1 Affected Environment - Biological Resources

Vegetation, Noxious and Invasive Weed Species

The vegetation of the Analysis Area is considered Sonoran desertscrub and includes three predominant vegetation communities (Figure 6). The creosote bush-bursage community is the most prevalent and most arid consisting primarily of creosote bush (*Larrea tridentata*) and white (*Ambrosia dumosa*) or triangle leaf bursage (*Ambrosia deltoidea*). This community exists primarily on broad alluvial valleys and terraces. The palo verde-mixed cacti is the second most prevalent community and is found in areas with different soil types, higher rainfall, and higher elevation gradients and contains a greater diversity of plant and wildlife species. This community

consists of extensive stands of saguaro cactus (*Carnegie gigantea*) interspersed with cholla (*Cylindropuntia* spp.), barrel cacti (*Ferocactus* spp.), palo verde (*Parkinsonia* spp.), brittlebush (*Encelia farinosa*), creosote bush, ocotillo (*Fouquieria splendens*), mesquite (*Prosopis* spp.), cat claw acacia (*Senegalia greggii*), and ironwood (*Olneya tesota*). The desert wash community occurs as small inclusions in large areas of upland sites and is considered to be valuable habitat for a variety of wildlife species. The vegetation of desert washes is quite variable, ranging from sparse to patchy to modernly dense, and usually occurs along the banks but may occur within the channel. The woody layer typically is intermittent to open and may be dominated by shrubs and small trees. Common species of the desert wash community include mesquite, catclaw acacia, blue palo verde (*Parkinsonia florida*), and desert ironwood. No BLM sensitive plant species exist within the Analysis Area.

Natural fire frequency in the Sonoran Desert is known to be a rare event and all vegetation communities present within the Analysis Area are considered to be fire-intolerant. However, some fire-tolerant noxious and invasive weed species have the potential to exist in the Analysis Area including buffelgrass (*Cenchrus ciliaris*), Sahara mustard (*Brassica tournefortii*), and Mediterranean grass (*Schismus barbatus*). For more information on vegetation communities within the Analysis Area, see Section 3.2.7 of the Lower Sonoran/SDNM FEIS.

General Wildlife, BLM Sensitive Species (Animals), Migratory Birds

The Analysis Area contains many species of animals that are commonly associated with a Sonoran desertscrub community. Typical wildlife species include the following: desert mule deer (*Odocoileus hemionus*), javelina (*Pecari tajacu*), mountain lion (*Puma concolor*) and bighorn sheep (*Ovis canadensis*). For more information on General Wildlife within the Analysis Area, see Section 3.2.13 of the Lower Sonoran/SDNM FEIS.

There are several BLM sensitive species that potentially occur within the Analysis Area including the Sonoran desert tortoise (*Gopherus morafkai*) and the lesser long-nosed bat (*Leptonycteris curasoae yerbabuena*). The Analysis Area contains habitat that the BLM characterizes as tortoise habitat. There are approximately 154,200 acres of Category I tortoise habitat, 22,340 acres of Category II tortoise habitat and 3,450 acres of Category III tortoise habitat within the Analysis Area (Figure 7). For more information on BLM Sensitive Species within the Analysis Area, see Section 3.2.13 of the Lower Sonoran/SDNM FEIS.

Sonoran pronghorn (*Antilocapra americana sonoriensis*) are not known to occur within the Analysis Area. The entire Analysis Area has been designated as a 'Non-Essential Experimental Population' under section 10(j) of the Endangered Species Act for Sonoran pronghorn (Vol. 76, No. 87, 25593) (see Figure 3-15 of the Lower Sonoran/SDNM FEIS).

The Analysis Area contains suitable habitat for many migratory birds. Typical migratory bird species including the following: mourning dove (*Zenaida macroura*), phainopepla (*Phainopepla nitens*) and cactus wren (*Campylorhynchus brunneicapillus*). For more information on Migratory Birds within the Analysis Area, see Section 3.2.13 of the Lower Sonoran/SDNM FEIS.

3.5.2 Environmental Consequences - Biological Resources

No Action Alternative (Current Management)

Vegetation, Noxious and Invasive Weed Species

Under the No Action Alternative, the current livestock management would continue on portions of five of the six allotments available for grazing on the SDNM north of I-8. Portions of the Big Horn Allotment, the Lower Vekol Allotment, and the entire Conley Allotment would remain unavailable inside the SDNM and 3,318 AUMs would remain available across the five allotments available for grazing. Impacts to vegetation from sustained heavy livestock use can result in reduced plant vigor, alteration of vegetation community composition or structure, reduction of vegetation cover, reduction of individual plants, and introduction or spread of invasive weeds. However, light to moderate use of most forage species can promote growth and vigor and can aerate soils for increased infiltration of moisture. Areas of livestock concentration such as around permanent water sources could experience prolonged use by livestock and wildlife. These impacts from livestock on vegetation in the immediate vicinity of water sources (1/4 mile) would continue to be adverse but would decrease with distance from the water source.

Livestock grazing has the potential to reduce fire frequency through the thinning of dense annual forbs and grasses (fine fuels) but also has the potential to increase the fire frequency through the introduction of fire adapted non-native annual species. These consequences would be expected in areas available for grazing. However, vegetation resources would be beneficially impacted in the areas unavailable for grazing where there would be an expected increase in vegetative cover, vigor, diversity, and reproductive capability of native plants and a reduction in the potential spread of noxious and invasive species. Overall, the impacts to vegetation and noxious and invasive weed species would be beneficial, negligible, and long term on the Big Horn, Conley, and Lower Vekol allotments and would be adverse, moderate, and long-term on the Arnold, Beloit, and Hazen allotments. Impacts can be mitigated through implementation-level adjustments in livestock grazing management such as alteration of authorized AUMs, changes in season of use, and modifications to range improvements.

General Wildlife, BLM Sensitive Species (Animals), Migratory Birds

Both livestock and wildlife utilize vegetation. Various wildlife species (e.g., bighorn sheep, mule deer, some migratory birds) depend on forbs and shrubs for forage and concealment. Insectivore species such as bats or some migratory birds are indirectly dependent on herbaceous vegetation to support their insect population diet or to provide a substrate for nesting, roosting, or concealment. Larger predator species are also indirectly dependent on herbaceous vegetation to provide forage and cover for prey species such as small mammals and birds. The presence and movement of livestock between areas can result in the direct disturbance or displacement of individual wildlife species from areas providing cover and forage. Competition between livestock and a variety of wildlife species can occur in areas with low perennial grass composition where livestock and wildlife are more likely to utilize the same browse forage species. According to the 2020 LHE, there are areas that are not achieving Standards as a result of historical livestock grazing. One of the three ecological sites on the Arnold Allotment, two of the seven ecological sites on the Beloit Allotment, one of the four ecological sites on the Big Horn Allotment, two of the six ecological sites on the Conley Allotment, and two of the five ecological sites on the Lower Vekol Allotment are not achieving Standards as a result of livestock grazing.

Under the No Action Alternative, range improvements such as water developments, would continue to be maintained in allotments available for livestock grazing. The water developments could benefit wildlife, especially during the hot and dry periods prior to summer monsoons.

Under the No Action Alternative, impacts to general wildlife, BLM sensitive animal species and migratory birds would be adverse, moderate, and long-term on the Arnold, Beloat, Big Horn, Hazen, and Lower Vekol allotments and would be beneficial, minor, and long-term on the Conley, Allotment.

Proposed Action

Vegetation, Noxious and Invasive Weed Species

Under the Proposed Action, all six allotments within the SDNM would be available for livestock grazing; 77,710 acres of the Conley Allotment, 16,970 acres of the Big Horn Allotment and 610 acres of the Lower Vekol Allotment which were formerly unavailable for grazing would become available for grazing. The level of use would range from ephemeral use only to a maximum of 4,232 AUMs. Impacts to vegetation would be similar to the areas available for grazing under the No Action Alternative, but expanded across the entirety of the six allotments available for grazing. The likelihood of vegetation disturbance and spread of noxious and invasive weed species around watering facilities and congregation areas, as described in the No Action Alternative, would increase on the Big Horn, Conley, and Lower Vekol allotments. However, the overall impacts to vegetative resources would largely depend on the level and management of grazing authorized under implementation-level decisions.

The GCA (Table 4, Appendix 1) shows livestock grazing at historic levels to be incompatible with vegetation communities and diversity of plant and animal species on the Beloat, Big Horn, Conley, and Lower Vekol allotments. The GCA also shows livestock grazing at historic levels to be incompatible with saguaro cactus forests on the Beloat, portions of the Big Horn, and Conley allotments. At the implementation-level, compatibility of livestock grazing with vegetation communities would be achieved through adjustments to grazing management through the modification of range improvements, adjustments in number of authorized AUMs, adjustments in season of use, and/or exclusion of sensitive areas.

Adjustments to grazing management, as described above, have been shown to maintain and improve the monument objects tied to vegetation. Conservatively managed grazing can improve vegetation diversity, productivity, and reduce mortality (Holechek 2004). The Proposed Action includes a reduction in the potential maximum perennial AUMs, from historically authorized 8,703 AUMs under the 1985 Lower Gila South RMP to 4,232 AUMs, across the Analysis Area. Adjustments in season of use, such as authorizing ephemeral grazing only, can allow forage plants to withstand grazing during certain times of the year as compared to others (Caldwell 1984). Ephemeral grazing allows for flexible stocking rates, based on annual forage availability, and the ability to remove livestock quickly in response to changing conditions (Hall 2005). The flexibility and criteria required to authorize ephemeral grazing would prevent potential impacts to vegetation.

The maximum potential of 4,232 AUMs would be compatible with monument objects tied to vegetation following the modification of range improvements, such as restricting use of water sources. Compatibility of saguaro cactus forests can be achieved through restricting access by

fencing of livestock waters within two miles of saguaro forest areas. The restriction of access by fencing of livestock waters would also be implemented in areas failing to achieve Standards due to livestock grazing. These actions together would result in the overall compatibility of grazing with monument objects tied to vegetation.

The installation of new fencing around livestock waters to restrict livestock use can cause short-term localized adverse impacts to soils and vegetation. New fencing would be constructed in a wildlife friendly manner and is unlikely to cause adverse impacts to wildlife. The addition of new livestock water infrastructure may be needed to redistribute livestock to less sensitive areas which can cause adverse impacts to vegetation, wildlife, and soils. The degree of impacts from these implementation-level actions would depend on the extent of the developments and would be evaluated under separate environmental review.

Overall, under the Proposed Action, impacts to vegetation resources would be adverse, negligible to moderate, and long-term.

General Wildlife, BLM Sensitive Species (Animals), Migratory Birds

Under the Proposed Action, livestock grazing would be available on all allotments including an additional 77,170 acres of the Conley Allotment, 16,970 acres of the Big Horn Allotment, and 610 acres of the Lower Vekol Allotment. The level of grazing authorized across the SDNM would range from ephemeral use only to a maximum of 4,232 AUMs. Depending on the number of authorized AUMs under implementation level decisions, the Proposed Action could have similar or fewer impacts than the No Action Alternative.

The GCA (Table 4, Appendix 1) shows livestock grazing at historic levels to be incompatible with wildlife and diversity of plant and animal species on the Beloat, Big Horn, Conley, and Lower Vekol allotments. At the implementation-level, compatibility of livestock grazing with wildlife and species diversity would be achieved through adjustments to grazing management through the modification of range improvements, adjustments in number of authorized AUMs, adjustments in season of use, and/or exclusion of sensitive areas.

Adjustments to grazing management, as described above, have been shown to maintain and improve the monument objects tied to wildlife, including wildlife habitat. Conservatively managed grazing can improve vegetation diversity, productivity, and reduce mortality (Holechek 2004). This in turn would improve habitat and forage availability for wildlife. The Proposed Action includes a reduction in the potential maximum perennial AUMs, from historically authorized 8,703 AUMs under the 1985 Lower Gila South RMP to 4,232 AUMs, across the Analysis Area. Adjustments in season of use, such as authorizing ephemeral grazing only, can allow forage plants to withstand grazing during certain times of the year as compared to others (Caldwell 1984). Ephemeral grazing limits the frequency of livestock/wildlife interactions, especially in wash communities that serve as forage areas and movement corridors, and competition for perennial browse. The flexibility and criteria required to authorize ephemeral grazing would prevent potential impacts to wildlife and wildlife habitat.

The maximum potential of 4,232 AUMs would be compatible with monument objects tied to wildlife following the modification of range improvements, such as restricting livestock use of

water sources. Restricting livestock access by fencing livestock waters within two miles of saguaro forest areas would allow additional recruitment of saguaro and increase foraging opportunities for saguaro dependent wildlife species. The restriction of access by fencing livestock waters would also be implemented in areas failing to achieve Standards due to livestock grazing which would improve wildlife habitat in these areas. These actions together would result in the overall compatibility of grazing with monument objects tied to wildlife.

Under the Proposed Action, water developments, would continue to be maintained on allotments available for livestock grazing. Water developments could benefit wildlife, especially during hot and dry periods prior to summer monsoons.

The installation of new fencing around livestock waters to restrict livestock use can cause short-term localized adverse impacts to soils and vegetation. New fencing would be constructed in a wildlife friendly manner and is unlikely to cause adverse impacts to wildlife. The addition of new livestock water infrastructure may be needed to redistribute livestock to less sensitive areas which can cause adverse impacts to vegetation, wildlife, and soils. The degree of impacts from these implementation-level actions would depend on the extent of the developments and would be evaluated under separate environmental review.

Overall, under the Proposed Action, impacts to general wildlife, BLM sensitive animal species and migratory birds would be adverse, negligible to moderate, and long-term.

No Grazing Alternative

Vegetation, Noxious and Invasive Weed Species

Under the No Grazing Alternative, livestock grazing would be unavailable on all six allotments in the SDNM north of I-8. Livestock grazing would be eliminated as permits expire (in the case of the Arnold and Beloit allotments). There would likely be an increase in vegetative cover, vigor, and diversity, and reproductive capability as well as a reduction in the potential spread of noxious and invasive weed species. Overall impacts to vegetative resources would be beneficial, negligible, and long-term.

General Wildlife, BLM Sensitive Species (Animals), Migratory Birds

In the absence of livestock grazing, competition for wildlife forage vegetation would be reduced, providing more forage for wildlife and insect populations. The absence of livestock grazing could result in cover canopy increasing over time, benefiting cover-dependent species. Livestock disturbance/displacement effects would not occur, benefiting nesting migratory birds and other wildlife. With the absence of grazing, improvements in vegetative cover conditions would be expected to occur more rapidly. This would result in a potential benefit for wildlife. An increase of herbaceous species frequency, cover, and composition would be expected to be greater under this alternative.

Under the No Grazing Alternative, permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. These range improvements could then be removed, maintained, or modified in order to achieve resource goals, such as wildlife, on a case by case basis. Allotment fencing and water developments outside the SDNM would continue to be maintained by

permittees. However, the number of maintained water sources within the SDNM is likely to decrease due to the removal of permittee maintenance contributions. Fewer water developments could have adverse impacts on wildlife. Fencing hinders the movement of some wildlife species and it is possible for wildlife to get injured on fencing. Unmaintained fencing is potentially a greater hazard to wildlife. When fence materials break, and are on the ground, there is a greater potential for wildlife to become entangled in it. Unmaintained range improvements could result in adverse impacts to wildlife.

Under the No Grazing Alternative, impacts to general wildlife, BLM sensitive animal species and migratory birds would be beneficial, minor, and long-term.

Reduced Grazing Alternative

Vegetation, Noxious and Invasive Weed Species

Under the Reduced Grazing Alternative, all six allotments within the SDNM would be allocated available for livestock grazing, except for 30,610 acres of the Big Horn Allotment and 41,480 acres of the Conley Allotment north of SR-238. The level of use would change from 3,318 AUMs across five allotments (Conley Allotment excluded), to a range from ephemeral use only to 3,293 AUMs across portions of six allotments. Impacts to vegetation would be similar to the areas available for grazing under the No Action Alternative but expanded across the entirety of the four allotments and portions of two allotments available for grazing. The likelihood of vegetation disturbance and spread of noxious and invasive weed species around watering facilities and congregation areas, as described in the No Action Alternative, would increase on some portions of the Big Horn, Conley, and Lower Vekol allotments. However, the overall impacts to vegetative resources would largely depend on the level and management of grazing authorized under implementation-level decisions.

The GCA (Table 4, Appendix 1) shows livestock grazing at historic levels to be incompatible with vegetation communities and diversity of plant and animal species on the Beloat, Big Horn, Conley, and Lower Vekol allotments. The GCA also shows livestock grazing at historic levels to be incompatible with saguaro cactus forests on the Beloat, portions of the Big Horn, and Conley allotments. At the implementation-level, compatibility of livestock grazing with vegetation communities would be achieved through adjustments to grazing management through the modification of range improvements, adjustments in number of authorized AUMs, adjustments in season of use, and/or exclusion of sensitive areas.

Adjustments to grazing management, as described above, have been shown to maintain and improve the monument objects tied to vegetation. Conservatively managed grazing can improve vegetation diversity, productivity, and reduce mortality (Holechek 2004). The Reduced Grazing Alternative includes a reduction in the potential maximum perennial AUMs, from historically authorized 8,703 AUMs under the 1985 Lower Gila South RMP to 3,293 AUMs, across the Analysis Area and the unavailability of grazing on portions of the Big Horn and Conley allotments north of SR-238. Adjustments in season of use, such as authorizing ephemeral grazing only, can allow forage plants to withstand grazing during certain times of the year as compared to others (Caldwell 1984). Ephemeral grazing allows for flexible stocking rates, based on annual forage availability, and the ability to remove livestock quickly in response to changing conditions (Hall

2005). The flexibility and criteria required to authorize ephemeral grazing would prevent potential impacts to vegetation.

The maximum potential of 3,293 AUMs would be compatible with monument objects tied to vegetation following the modification of range improvements, such as restricting use of water sources. Compatibility of saguaro cactus forests can be achieved through restricting access by fencing of livestock waters within two miles of saguaro forest areas. The restriction of access by fencing of livestock waters would also be implemented in areas failing to achieve Standards due to livestock grazing. These actions together would result in the overall compatibility of grazing with monument objects tied to vegetation.

The installation of new fencing around livestock waters to restrict livestock use can cause short-term localized adverse impacts to soils and vegetation. New fencing would be constructed in a wildlife friendly manner and is unlikely to cause adverse impacts to wildlife. The addition of new livestock water infrastructure may be needed to redistribute livestock to less sensitive areas which can cause adverse impacts to vegetation, wildlife, and soils. The degree of impacts from these implementation-level actions would depend on the extent of the developments and would be evaluated under separate environmental review.

Overall, under the Reduced Grazing Alternative, impacts to vegetation resources would be adverse, negligible to moderate, and long-term.

General Wildlife, BLM Sensitive Species (Animals), Migratory Birds

Under the Reduced Grazing Alternative, livestock grazing would be available on all allotments. Under this alternative the northern portions of the Big Horn and Conley allotments would be unavailable for grazing. When compared to the No Action Alternative there would be an additional 46,556 acres of the Conley Allotment, 5,645 acres of the Big Horn Allotment south of SR-238 and 610 acres of the Lower Vekol allotment that would become available to grazing. There are 30,614 acres of the Big Horn Allotment north of SR-238 that would become unavailable for grazing. The level of grazing authorized across the SDNM would range from ephemeral use only to a maximum of 3,293 AUMs. Depending on the number of authorized AUMs under implementation-level decisions, the Reduced Grazing Alternative could have similar or fewer impacts than the No Action Alternative.

The GCA (Table 4, Appendix 1) shows livestock grazing at historic levels to be incompatible with wildlife and diversity of plant and animal species on the Beloat, Big Horn, Conley, and Lower Vekol allotments. At the implementation-level, compatibility of livestock grazing with wildlife and species diversity would be achieved through adjustments to grazing management through the modification of range improvements, adjustments in number of authorized AUMs, adjustments in season of use, and/or exclusion of sensitive areas.

Adjustments to grazing management, as described above, have been shown to maintain and improve the monument objects tied to wildlife, including wildlife habitat. Conservatively managed grazing can improve vegetation diversity, productivity, and reduce mortality (Holechek 2004). This in turn would improve habitat and forage availability for wildlife. The Proposed Action includes a reduction in the potential maximum perennial AUMs, from historically authorized 8,703

AUMs under the 1985 Lower Gila South RMP to 3,293 AUMs, across the Analysis Area. Adjustments in season of use, such as authorizing ephemeral grazing only, can allow forage plants to withstand grazing during certain times of the year as compared to others (Caldwell 1984). Ephemeral grazing limits the frequency of livestock/wildlife interactions, especially in wash communities that serve as forage areas and movement corridors, and competition for perennial browse. The flexibility and criteria required to authorize ephemeral grazing would prevent potential impacts to wildlife and wildlife habitat.

The maximum potential of 3,293 AUMs would be compatible with monument objects tied to wildlife following the modification of range improvements, such as restricting livestock use of water sources. Restricting livestock access by fencing livestock waters within two miles of saguaro forest areas would allow additional recruitment of saguaro and increase foraging opportunities for saguaro dependent wildlife species. The restriction of access by fencing livestock waters would also be implemented in areas failing to achieve Standards due to livestock grazing which would improve wildlife habitat in these areas. These actions together would result in the overall compatibility of grazing with monument objects tied to wildlife.

Under the Reduced Grazing Alternative, range improvements such as water developments, would continue to be maintained in areas available for livestock grazing. The range improvements north of SR-238 would potentially be unmaintained including two livestock waters on the Big Horn Allotment. Water developments could benefit wildlife, especially during hot and dry periods prior to summer monsoons.

The installation of new fencing around livestock waters to restrict livestock use can cause short-term localized adverse impacts to soils and vegetation. New fencing would be constructed in a wildlife friendly manner and is unlikely to cause adverse impacts to wildlife. The addition of new livestock water infrastructure may be needed to redistribute livestock to less sensitive areas which can cause adverse impacts to vegetation, wildlife, and soils. The degree of impacts from these implementation-level actions would depend on the extent of the developments and would be evaluated under separate environmental review.

Under the Reduced Grazing Alternative, impacts to general wildlife, BLM sensitive animal species and migratory birds would be adverse, negligible to moderate, and long-term on the Arnold, Beloit, Hazen, Lower Vekol, 36,231 acres of the Conley and 61,586 acres of the Big Horn allotments, and there would be beneficial, minor, and long-term impacts on 19,289 acres of the Big Horn allotment north of SR-238.

3.5.3 Affected Environment - Soil Resources

Landforms in the Analysis Area consist of broad, alluvial basin floors separated by basaltic or granitic mountains, hills, and rock outcrops, dissected by several major drainages and numerous ephemeral ones. The soils range from shallow to deep, usually calcareous, sandy loams. Upland parts of the basins are carved by desert washes with soils that are coarse- to medium-textured and cobbly to gravelly on the surface. Soils located higher on broad alluvial fans often derive directly from upslope bedrock and are underlain by a caliche layer. Farther down, alluvial fans often occur with loamier texture in the upper horizons and often contain a less distinct carbonate layer. Biotic crusts and desert pavement are common in the Analysis Area and provide protection against wind

and surface-sheet erosion. Qualitative and quantitative soil-resource data is available from the National Resource Conservation Service soils surveys (NRCS 1997). For additional information on Soils Resources in the Analysis Area, see Section 3.2.6 of the Lower Sonoran/SDNM FEIS.

3.5.4 Environmental Consequences - Soil Resources

No Action Alternative (Current Management)

Under the No Action Alternative, the current livestock management would continue on portions of five of the six allotments available for grazing on the SDNM north of I-8. Portions of the Big Horn and Lower Vekol allotments, and the entire Conley Allotment would remain unavailable inside the SDNM and 3,318 AUMs would remain available across the five allotments available for grazing. The impacts to soil resources would include soil compaction around water sources and fence-lines, a reduction in protective vegetation cover, litter, and biological crusts leading to an increased potential for soil loss through erosion. When compared to the No Grazing alternative, impacts to soil resources would be adverse, minor, and long-term.

Proposed Action

Under the Proposed Action, all six allotments within the SDNM would be available for livestock grazing; 77,710 acres of the Conley Allotment, 16,970 acres of the Big Horn Allotment and 610 acres of the Lower Vekol Allotment which were formerly unavailable to grazing, would become available for grazing. The level of use across all six allotments would range from ephemeral use only to 4,232 AUMs. Soil compaction in areas of heavier use and the potential for increased erosion would be similar to the No Action Alternative and would be expected to occur on the additional areas available for grazing under this alternative. The likelihood of disturbance around watering facilities and congregation areas on the Big Horn, Conley and Lower Vekol allotments would increase. However, the impacts to soil resources would largely depend on the level of grazing authorized under implementation-level decisions.

At the implementation-level, achievement of Standards related to soils would be made through adjustments to grazing management through the modification of range improvements, adjustments in number of authorized AUMs, adjustments in season of use, and/or exclusion of sensitive areas.

Adjustments to grazing management, as described above, have been shown to maintain and improve soil resources. Conservatively managed grazing can improve vegetation diversity, productivity, and reduce mortality (Holechek 2004). The Proposed Action includes a reduction in the potential maximum perennial AUMs, from historically authorized 8,703 AUMs under the 1985 Lower Gila South RMP to 4,232 AUMs, across the Analysis Area. Adjustments in season of use, such as authorizing ephemeral grazing only, can allow forage plants to withstand grazing during certain times of the year as compared to others (Caldwell 1984). Ephemeral grazing allows for flexible stocking rates, based on annual forage availability, and the ability to remove livestock quickly in response to changing conditions (Hall 2005). Ephemeral grazing may only occur during wet seasons when biological crusts are less vulnerable to damage by livestock grazing activities (Belnap 1995, Belnap 2001). The flexibility and criteria required to authorize ephemeral grazing would improve vegetative and biological crust cover and prevent potential impacts to soils.

The maximum potential of 4,232 AUMs would achieve Standards related to soils following the modification of range improvements, such as restricting use of water sources. The restriction of

access by fencing of livestock waters would also be implemented in areas failing to achieve Standards due to livestock grazing. These actions would result in the achievement of Standards tied to soils.

The installation of new fencing around livestock waters to restrict livestock use can cause short-term localized adverse impacts to soils and vegetation. New fencing would be constructed in a wildlife friendly manner and is unlikely to cause adverse impacts to wildlife. The addition of new livestock water infrastructure may be needed to redistribute livestock to less sensitive areas which can cause adverse impacts to vegetation, wildlife, and soils. The degree of impacts from these implementation-level actions would depend on the extent of the developments and would be evaluated under separate environmental review.

Overall, under the Proposed Action, impacts to soil resources would be adverse, negligible to moderate, and long-term.

No Grazing Alternative

Under the No Grazing Alternative, livestock grazing would be unavailable on all six allotments in the SDNM north of I-8. Livestock grazing would be eliminated in the SDNM as permits expire (in the case of the Arnold and Belloat allotments). Eliminating grazing would reduce impacts on soil resources by decreasing ground disturbance and allowing additional vegetation and biological crust cover to develop over time. The impacts to soil resources would be beneficial, minor, and long-term.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments within the SDNM would be allocated available for livestock grazing, except for 30,610 acres of the Big Horn Allotment and 41,480 acres of the Conley Allotment north of SR-238. The level of use would change from 3,318 AUMs across five allotments (Conley Allotment excluded), to a range from ephemeral use only to 3,293 AUMs across portions of six allotments. Impacts to vegetation would be similar to the areas available for grazing under the No Action Alternative but expanded across the entirety of the four allotments and portions of two allotments available for grazing. The likelihood of soil disturbance around watering facilities and congregation areas, as described in the No Action Alternative, would increase on some portions of the Big Horn, Conley, and Lower Vekol allotments. However, the overall impacts to soil resources would largely depend on the level and management of grazing authorized under implementation-level decisions.

At the implementation-level, achievement of Standards related to soils would be made through adjustments to grazing management through the modification of range improvements, adjustments in number of authorized AUMs, adjustments in season of use, and/or exclusion of sensitive areas.

Adjustments to grazing management, as described above, have been shown to maintain and improve soil resources. Conservatively managed grazing can improve vegetation diversity, productivity, and reduce mortality (Holechek 2004). The Proposed Action includes a reduction in the potential maximum perennial AUMs, from historically authorized 8,703 AUMs under the 1985 Lower Gila South RMP to 3,293 AUMs, across the Analysis Area. Adjustments in season of use, such as authorizing ephemeral grazing only, can allow forage plants to withstand grazing during

certain times of the year as compared to others (Caldwell 1984). Ephemeral grazing allows for flexible stocking rates, based on annual forage availability, and the ability to remove livestock quickly in response to changing conditions (Hall 2005). Ephemeral grazing may only occur during wet seasons when biological crusts are less vulnerable to damage by livestock grazing activities (Belnap 1995, Belnap 2001). The flexibility and criteria required to authorize ephemeral grazing would improve vegetative and biological crust cover and prevent potential impacts to soils.

The maximum potential of 3,293 AUMs would achieve Standards related to soils following the modification of range improvements, such as restricting use of water sources. The restriction of access by fencing of livestock waters would also be implemented in areas failing to achieve Standards due to livestock grazing. These actions would result in the achievement of Standards tied to soils.

The installation of new fencing around livestock waters to restrict livestock use can cause short-term localized adverse impacts to soils and vegetation. New fencing would be constructed in a wildlife friendly manner and is unlikely to cause adverse impacts to wildlife. The addition of new livestock water infrastructure may be needed to redistribute livestock to less sensitive areas which can cause adverse impacts to vegetation, wildlife, and soils. The degree of impacts from these implementation-level actions would depend on the extent of the developments and would be evaluated under separate environmental review.

Under the Reduced Grazing Alternative, impacts to vegetation resources would be adverse, negligible to moderate, and long-term.

3.5.5 Affected Environment – Cultural and Heritage Resources

Cultural and heritage resources are the physical and traditional remnants of thousands of years of human occupation and use of the land and its resources. Cultural resource sites date to both prehistoric and historic time periods up to the mid-20th century. Cultural resources also include places of traditional importance to Native Americans and are recognized as fragile and irreplaceable resources.

The types of sites present on the SDNM include prehistoric sites with artifact scatters, prehistoric trails, petroglyphs, and rock alignments. In the Analysis Area, the sites most often found there tend to be associated with short-term resource procurement and occupation. This translates to light-density, temporary use cultural sites, probably related to hunting and gathering camps, trails, some light processing of resources.

Roughly 80 percent of the cultural sites found on public lands in the SDNM reflect aboriginal occupation. About 13 percent of the total can be attributed to Euro-American occupation, leaving some number of sites of unknown age or cultural affiliation. Also, an unknown number of sites have not been identified or documented.

Historic era sites found in the Analysis Area include ranching sites with corrals and water troughs; railroad sites with foundations and graves; historic artifact scatters; historic structures; and historic trail sites. A great many of these historic era sites are associated with the settling of the West by Euro-American people beginning in the mid to late 19th century. Structures and longer-term

settlements typically date to the mid-20th century. An example of this later use is the presence of homesteads.

The objects of the SDNM include not only prehistoric and historic cultural sites, but also the natural historic landscape settings of a segment of the Juan Bautista de Anza National Historic Trail (Anza NHT) corridor (Figure 8)⁵, and the 19th century era trails that have been documented along the same corridor. The Juan Bautista de Anza NHT, designated by Congress in 1990, is a 1,200-mile historic trail corridor extending from what was to become Mexico to northern California. The NHT commemorates the 1775–1776 land route that Spanish commander Juan Bautista de Anza took in an effort to establish a self-sustaining settlement and presidio near San Francisco Bay. It has been documented only through diaries and journal entries made by the people who followed the trail for the first time, making it a historic corridor. A segment of this historic trail corridor is located north of State Route 238 and runs east-west for approximately 17 miles through the width of both the Big Horn and Conley allotments. Although the Anza NHT has no known surviving trail signature on the ground, certain segments of the trail that traverse the SDNM are considered to be among the best-preserved corridor segments and most representative of the historic trail corridor landscape and conditions.

In addition to the Anza Trail corridor, remnants of 19th century historic trails can be seen. The Mormon Battalion and the Butterfield Overland Stage Route are two of these later trails that were constructed for the use of wheeled vehicles. These 19th century trails are an example of the types of routes that crossed through this part of the Sonoran Desert from east to west in this period. These 19th century trails have archaeological evidence associated with them.

Ongoing consultation with the Gila River Indian Community and the other O’odham-speaking indigenous groups, has resulted in some new understanding about a historic, traditional trail route called the Komatke Trail. This trail is a route connecting the historical Piman villages of Oxibahibuiss and Comac/Komatke (Darling and Eiselt 2009). The Gila River Indian Community has been performing in-depth research and field investigation to document any physical traces of this trail. The route is described in the Oriole Song, a traditional Akimel O’odham song series known by many in the Gila River Indian Community (Darling 2009). The Oriole song creates a song-scape by describing the traveler’s movement along this route from east to west as the sun moves in the daytime and then back from west to east as it moves through the underworld at night or through fire (Darling 2009). This type of song has geographical information in it as well as traditional knowledge that the traveler must learn to follow (Darling and Lewis 2007). There are more than 100 songs that chart a journey over at least 280 miles from their villages along the upper Gila River all the way to particular salt flats in Sonora (Darling and Lewis 2007).

No physical traces of the Komatke traditional trail corridor have been observed within the SDNM. Recent archaeological inventory has identified some possible trail segments that appear to cut through the northern end of the SDNM. Physical traces have been documented on the western slope of the Sierra Estrella Mountains and in some areas near State Route 85. For additional information on Cultural and Heritage Resources in the Analysis Area, see Section 3.2.4 of the Lower Sonoran/SDNM FEIS.

⁵ The SDNM ROD also allocated two overlapping areas that include the Anza NHT Corridor, the Sonoran Desert Historic Trails Special Cultural Resource Management Area (Map 2) and Management Area (Map 10).

For the purposes of this Draft RMPA/EA, the Analysis Area is also known as the Area of Potential Effect for compliance with Section 106 of the National Historic Preservation Act. In 2018 the BLM completed a Class I literature search for the entire SDNM. Table 6 lists the known cultural resource sites within the Analysis Area based on previously completed Class III cultural resource surveys.

Table 6. Cultural Resource Sites Documented within the Analysis Area.

Allotment	Known cultural sites	Status	Observed impacts from grazing
Arnold	0 sites	N/A	N/A
Beloat	2 sites	Eligible*	No indication of grazing impacts.
Bighorn	22 sites	Eligible	Seven sites show evidence of some level of impact from grazing.
Conley	10 sites	Eligible	Four sites show some impact from grazing.
Hazen	5 sites	Eligible	One site shows signs of impact from grazing.
Lower Vekol	2 sites	Eligible	No indication of impact from grazing.

* Eligible for listing on the National Register of Historic Places.

On March 17, 2020 the BLM initiated consultation with the State Historic Preservation Office and government-to-government consultation with the tribes (Table 1) for this RMPA/EA.

3.5.6 Environmental Consequences – Cultural and Heritage Resources

No Action Alternative (Current Management)

Under the No Action Alternative, five of the six allotments would be available for livestock grazing. The impacts would be similar to the Proposed Action, except that the Conley Allotment and portions of the Big Horn and Lower Vekol allotments would be unavailable for livestock grazing. The No Action Alternative would benefit the Butterfield Trail segment in the vicinity of the North Tank (in the Conley Allotment) by eliminating the potential for livestock to congregate there. According to the GCA (Appendix 1) concentrated livestock use at watering facilities and trailing along fencing can be incompatible with cultural monument objects. At the implementation-level, any new range improvements would be subject to a Class III cultural resources survey. If eligible-cultural sites are present, the range improvement(s) such as livestock waters would be excluded from livestock by fencing to avoid adverse⁶ effects to the site(s) and maintain compatibility with monument objects. Allowing livestock grazing in the other five allotments would result in negligible to minor, and long-term impacts to cultural and heritage resources.

Proposed Action

Under the Proposed Action, livestock grazing would be available on all six allotments. The cultural sites documented in the Analysis Area are scattered lightly across the landscape. Soils and slope play a strong role in how precipitation affects the area, which influences the distribution of cultural sites. Lower precipitation, a lack of permanent water sources, and limited areas having thick stands of vegetation results in very light density of cultural sites. Areas of scattered and light density vegetation patterns offer few areas where livestock would congregate. Other areas with soft soils and dense vegetation providing shade occur along major washes and in proximity to livestock

⁶ In this Section the term “adverse” is used consistent with 36 CFR 800.5(a)(1) defined as the “alteration to the characteristics of a historic property that qualify it for inclusion in the National Register of Historic Places in a manner that would diminish its integrity.”

waters provide areas where livestock are most likely to concentrate. Roughly 12 of the documented cultural sites (Table 6) within the six allotments show some level of impact from livestock grazing.

The historic Butterfield Overland State Route, the Mormon Battalion Trail, and several other 19th Century trails all occupy the same set of trail-tread on the ground. The Butterfield and other trails cross east to west through the Conley and Big Horn allotments. Gap Tank, Gap Well, Conley Tank, and North Tank Well are all livestock water developments that provide water, shade and soft soils where livestock tend to congregate. Livestock use of these water developments in proximity to these trails and their associated sites, have resulted in some level of impacts. Livestock trailing has resulted in vegetation loss and compaction of soils, leading to erosion of some sites. According to the GCA (Appendix 1) concentrated livestock use at watering facilities and trailing along fencing can be incompatible with cultural monument objects.

At the implementation-level, any new range improvements would be subject to a Class III cultural resources survey. If eligible-cultural sites are present, the range improvement(s) such as livestock waters would be excluded from livestock by fencing to avoid adverse effects to the site(s) and maintain compatibility with monument objects. Allowing livestock grazing in these areas would result in negligible to minor, and long-term impacts to cultural and heritage resources.

No Grazing Alternative

Under the No Grazing Alternative, livestock grazing would be unavailable for all six allotments. With the elimination of livestock grazing in the SDNM, there would be no potential impacts from livestock grazing on cultural sites. Vegetative cover around existing livestock water developments may increase over time and have a beneficial impact on nearby cultural sites by reducing the potential for erosion. The No Grazing Alternative would eliminate livestock grazing within the de Anza NHT Corridor and Management Area. Excluding livestock grazing from Conley and Big Horn allotments north of SR-238 would result in beneficial, negligible to minor, and long-term impacts to historic trails, and overall negligible to minor, and long-term impacts to cultural and heritage resources in the SDNM north of I-8.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments would be available for livestock grazing, except portions of the Conley and Big Horn allotments would be unavailable. The Reduced Grazing Alternative would benefit the Butterfield Trail segment in the vicinity of the North Tank (in the Conley Allotment) by eliminating the potential for livestock to congregate there (Map 2 in the GCA). The Reduced Grazing Alternative would eliminate livestock grazing within the Anza NHT Corridor and Management Area. According to the GCA (Appendix 1) concentrated livestock use at watering facilities and trailing along fencing can be incompatible with cultural monument objects.

At the implementation-level, any new range improvements would be subject to a Class III cultural resources survey. If eligible-cultural sites are present, the range improvement(s) such as livestock waters would be excluded from livestock by fencing to avoid adverse effects to the site(s) and maintain compatibility with monument objects. Allowing livestock grazing in the six allotments, except for portions of the Conley and Big Horn allotments north of SR-238 would result in

beneficial, negligible to minor, and long-term impacts to historic trails, and overall negligible to minor, and long-term impacts to cultural and heritage resources in the SDNM north of I-8.

3.7 Residual Effects

Residual effects are those effects that remain after mitigation measures have been applied to the Proposed Action or alternatives, and had not been previously incorporated into the Proposed Action or alternatives (BLM 2008). No mitigation has been identified for the alternatives, therefore no residual impacts are discussed.

4.0 CUMULATIVE EFFECTS

A cumulative effect is defined under NEPA as “the change in the environment which results from the incremental impact of the action, decision, or project when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other action.” “Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time” (40 CFR Part 1508.7). Past, present, and reasonably foreseeable future actions are analyzed to the extent that they are relevant and useful in analyzing whether the reasonably foreseeable effects of the Proposed Action and/or alternatives may have an additive and significant relationship to those effects.

4.1 Geographic Scope

The Cumulative Effects Study Area (CESA) for all resources, except socioeconomics, is approximately 733,973 acres on BLM-administered, Arizona State Land Department and privately-owned lands (Figures 9 and 10). This CESA consists of the six livestock grazing allotments including those portions outside the SDNM, plus the Kirian, Palo Verde Mountains, and Powers Butte allotments. The Gila River serves as the northern and western boundary of this CESA. Rainbow Valley and the Sierra-Estrella Mountains are located in the northeastern portion of this CESA. I-8 serves as the southern boundary of this CESA. The CESA for socioeconomics is Maricopa County, Arizona (not shown).

4.2 Timeframe of Effects

The timeframe for effects is 10-years, which is the minimum lifetime of a planning action, and the duration of a term livestock grazing permit/lease.

4.3 Past and Present Actions

The CESA includes BLM, Arizona State Land Department, other federal agencies including tribal lands, and privately-owned lands. BLM-administered lands make up approximately 407,937 acres (56 percent) of the CESA.

On non-BLM administered lands within the CESA, past and present actions include agriculture, low-density residential development, and small communities on private lands such as Gila Bend (population 1,922), Bosque, Shawmut, and Estrella, Enid and Heaton along Maricopa Road/State Route 238 which runs west to east through the SDNM. I-8 crosses west to east through the SDNM and serves as the southern boundary of this CESA with Gila Bend on the west, and small communities of Big Horn and Freeman occur I-8 along the corridor on private lands within the SDNM. Interstate, state highways (State Route 85), county roads, overhead transmission lines, and underground natural gas pipelines are examples of transportation and energy infrastructures within the CESA. A portion of the Gila River Indian Reservation is located within the northeastern portion of this CESA. Maricopa County Department of Parks and Recreation operates the Estrella Mountains Regional Park in the northern portion of this CESA and the Buckeye Hills Recreation Area in the northwestern corner of this CESA.

On BLM-administered lands outside the SDNM and north of I-8, past and present actions include: rights-of-ways for overhead transmission lines and underground natural gas pipelines; exploration and mining on unpatented mining claims; county maintained roads; BLM travel routes ranging from single-track trails to bladed dirt and gravel roads; and permitted livestock grazing on nine

allotments. There are approximately 270 miles of allotment fencing for BLM-administered allotments outside the SDNM. Uses outside of the SDNM and north of I-8 on BLM-administered lands include non-motorized trails for hiking and equestrian use, travel routes for motorcycles and motor vehicles, dispersed camping, hunting, recreational target shooting. There are two special recreation permits for recreational activities within the CESA. In 2018 the BLM approved a 250-foot right-of-way for the Sonoran Valley Parkway. This corridor resides outside and along the northeastern corner of the SDNM, connecting the communities of Goodyear and Maricopa with a 15- to 18-mile long, two- to six-lane parkway. Construction of the Sonoran Valley Parkway would impact approximately 472 acres of BLM- and non-BLM lands. Construction of the initial two-lane highway by the City of Maricopa is not anticipated to start until 2021 or later.

On BLM-administered lands within the SDNM and north of I-8, past and present actions include: rights-of-ways for I-8 and overhead transmission lines along the I-8 corridor; and rights-of-ways on Maricopa Road/State Route 238 through the SDNM. In 2012 the BLM completed a travel management plan for the SDNM which designated travel routes as open, limited or closed within the SDNM. Uses inside the SDNM and north of I-8 include non-motorized trails for hiking and equestrian use, travel routes for motorcycles and motor vehicles, dispersed camping, hunting, recreational target shooting. Five grazing allotments are available for livestock grazing. There are approximately 115 miles of allotment fencing for BLM-administered allotments within the SDNM. There are two special recreation permits for recreational activities within the CESA. In January 2017 the BLM approved the Juan Bautista de Anza RMZ Project, which authorized the construction of three recreation developments within the SDNM: Butterfield Recreation Area, Sierra-Estrella Wayside Recreation Area, and Christmas Group Camp Recreation Area. Construction of these recreation areas would impact approximately 15 acres of BLM-administered lands and is not anticipated to start until 2020 or later.

4.4 Reasonably Foreseeable Future Actions

Reasonably foreseeable future actions (RFFAs) are actions that are known or could reasonably be anticipated to occur within the CESA (Figures 9 and 10). They include actions that have existing decisions, funding, formal proposals, or that are highly probable.

On non-BLM administered lands within the CESA, RFFAs include continued population growth, housing and commercial development, agricultural use, additional energy and transportation infrastructure especially along the urban fringe adjacent to BLM-administered lands is anticipated to continue into the foreseeable future. Areas of growth within the CESA include Rainbow Valley in the northeast, and Gila Bend in the southwest. Livestock grazing and maintenance of range improvements would be expected to occur in the future.

On BLM-administered lands outside the SDNM and north of I-8, RFFAs include renewal of existing authorizations for utility rights-of-ways, livestock grazing (including maintenance of range improvements), exploration on unpatented mining claims, dispersed recreational activities, and construction of the Sonoran Valley Parkway.

The I-11 corridor study area stretches 280 miles from Nogales to Wickenburg, Arizona and may affect BLM and non-BLM lands in the Rainbow Valley area, northeast of the SDNM in the CESA. The study area varies in width from approximately 10 to 25 miles. The Arizona Department of

Transportation/Federal Highway Administration prepared Draft Environmental Impact Statement had been made available for public input in mid-2019. The timeframe for the selected corridor and implementation is unknown. Construction of I-11 and the Sonoran Valley Parkway are reasonably certain to occur although the timeframes are unknown. There is also potential these two highway projects may be combined.

On BLM-administered lands within the SDNM and north of I-8, RFFAs include renewal of existing authorizations for utility rights-of-ways, dispersed camping, hunting, hiking, and recreational target shooting. Construction of recreation developments in the Juan Bautista de Anza Recreation Management Zone is anticipated to start in 2020 and be completed in multiple phases.

4.5 Analysis by Resource

Only those resources or issues indirectly affected by the alternatives in Chapter 3 and analyzed in detail are considered for cumulative effects.

4.5.1 Resource Uses

Livestock Grazing

Cumulative Impacts Common to All Alternatives

Livestock grazing in the CESA is currently impacted by activities such as urban sprawl, recreational activities, utility and road right-of-ways, and mining operations. Urban sprawl, primarily in the northeast and southeast portions of the CESA is likely to increase in the foreseeable future. This may lead to increased recreational activity, human/livestock interactions, and damage to livestock grazing infrastructure in the form of cut fences, damage and tampering with water facilities, and gates left open. Utility and road right-of-ways and mining operations can fragment allotments and create challenges with moving livestock between pastures. Developed recreational facilities will be constructed within the Juan Bautista de Anza RMZ of the SDNM which would increase recreational opportunities in or near areas where livestock would be present if the Big Horn and Conley allotments are available for livestock grazing. The Sonoran Valley Parkway is also planned for construction in Rainbow Valley in the foreseeable future and would fragment the Beloit Allotment and portions of the Conley Allotment outside the SDNM.

No Action Alternative (Current Management)

Under the No Action Alternative, five of the six allotments associated with the SDNM would be available for livestock grazing, in addition to three other allotments outside the SDNM. Portions of the Big Horn Allotment (16,960 acres), the Lower Vekol Allotment (610 acres), and the entire Conley Allotment (77,170 acres) within the SDNM would be unavailable to grazing within the SDNM. The permittees of the Big Horn, Conley, and Lower Vekol allotments would have less flexibility in their management of livestock. The level of and management of grazing on allotments within the CESA would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. Existing allotment fencing and water developments for livestock would continue to be maintained in those allotments available for livestock grazing. Urban sprawl and the development of recreational facilities would likely have a minor impact to livestock grazing on these allotments more so than the Proposed Action. The cumulative effects of the No Action Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, beneficial, and long-term impacts to livestock grazing.

Proposed Action

Under the Proposed Action, all six allotments associated with the SDNM would be available for livestock grazing, in addition to three other allotments outside the SDNM. Existing allotment fencing and water developments for livestock would continue to be maintained in those allotments available for livestock grazing. The level of and management of grazing on allotments within the CESA would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. The availability of livestock grazing on all six allotments associated with the SDNM would benefit livestock producers as they would have a larger area to manage their herds allowing flexibility in grazing management. The cumulative effects of the Proposed Action, in combination with other past, present, and RFFAs, would result in negligible to minor, beneficial, and long-term impacts to livestock grazing.

No Grazing Alternative

Under the No Grazing Alternative, the SDNM portions of six allotments would be unavailable for livestock grazing. However, the non-SDNM portions of these allotments and three other allotments outside the SDNM would be available for livestock grazing. These allotments are in the urban/rural interface and could be impacted by other uses or activities in the CESA. There would be fewer human/livestock interactions on the SDNM where recreational facilities will be developed in the Big Horn and Conley allotments. Under the No Grazing Alternative, allotment fencing within the SDNM would likely not be maintained, in addition to water developments solely for the purpose of livestock. The cumulative effects of the No Grazing Alternative, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to livestock grazing.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments associated with the SDNM would be allocated available for livestock grazing, except for 30,610 acres of the Big Horn Allotment and 41,480 acres of the Conley Allotment north of SR-238, in addition to three other allotments outside the SDNM. Existing allotment fencing and water developments for livestock would continue to be maintained in the allotments and portions of allotments available for grazing. The level and management of grazing on allotments within the CESA would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. The availability of livestock grazing on the entirety of four and portions of two allotments associated with the SDNM would benefit livestock producers as they would have a larger area to manage their herds allowing flexibility in grazing management. Permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable portions of two allotments. The cumulative effects of the Reduced Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, beneficial, and long-term impacts to livestock grazing.

4.5.2 Social and Economic

Socioeconomics

Cumulative Impacts Common to All Alternatives

The CESA for socioeconomics is Maricopa County (not shown). BLM-administered lands make up approximately 29 percent of Maricopa County. There are portions of 75 BLM-administered grazing allotments within Maricopa County. The Phoenix metropolitan area currently has more than four million people and is projected to increase to more than seven million people by 2050 (MAG 2017). On non-BLM lands, population growth will continue to result in the conversion of Arizona State Land Department and privately-owned lands currently available for grazing into residential and commercial developments. This trend would result in increased pressure on BLM-lands to maintain availability for livestock grazing. Overall agriculture employment in Maricopa County would be expected to decline as lands are converted from agricultural into residential and commercial uses. Open space associated with grazing would also be expected to decline in Maricopa County.

No Action Alternative (Current Management)

Under the No Action Alternative, five allotments associated with the SDNM and portions of 69 other allotments outside the SDNM would be available for livestock grazing. Portions of the Big Horn and Lower Vekol allotments, and the entire Conley Allotment within the SDNM would be unavailable for grazing within the SDNM. The No Action Alternative would provide for less economic contributions from livestock grazing than the Proposed Action, and more than the No Grazing Alternative. Permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. The cumulative effects of the No Action Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, beneficial, and long-term impacts to socioeconomics.

Proposed Action

Under the Proposed Action, all six allotments associated with the SDNM and portions of 69 allotments outside the SDNM would be available for livestock grazing. Compared to the other alternatives, the Proposed Action would provide for the greatest economic contributions from livestock grazing. The cumulative effects of the Proposed Action, in combination with other past, present, and RFFAs, would result in minor, beneficial, and long-term impacts to socioeconomics.

No Grazing Alternative

Under the No Grazing Alternative, the SDNM portions of six allotments would be unavailable for livestock grazing. However, the non-SDNM portions of these allotments would be available for grazing which includes the areas with urban/rural interface and other uses, in addition to portions of 69 other allotments outside the SDNM. The No Grazing Alternative would provide no economic contributions from livestock grazing on six allotments in the SDNM. Permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. The cumulative effects of the No Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, adverse, and long-term impacts to socioeconomics.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, six allotments associated with the SDNM and portions of 69 other allotments outside the SDNM would be allocated available for livestock grazing. Portions of the Big Horn and Conley allotments north of SR-238 would be unavailable to livestock grazing.

The Reduced Grazing Alternative would provide for less economic contributions from livestock grazing than the Proposed Action, and more than the No Grazing Alternative. Permittees would be reimbursed, in accordance with 43 CFR 4120, for their interest in the fair market value of the documented range improvements within the unavailable allotments. The cumulative effects of the Reduced Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible, beneficial, and long-term impacts to socioeconomics.

4.5.3 Resources

Biological Resources

Vegetation, Noxious and Invasive Weed Species

Cumulative Impacts Common to All Alternatives

The vegetation in the CESA (Figure 9) is currently impacted by activities such as urban sprawl, recreational activities, livestock grazing, agricultural developments, utility and road right-of-ways, and mining operations. Urban sprawl, primarily in the northeast and southeast portions of the CESA is likely to increase in the foreseeable future. This may lead to the removal of vegetation and spread of invasive species on private lands and also increased recreational activity which can lead to damage of vegetation and spread of noxious and invasive species by off-road vehicular travel. Utility and road right-of-ways and mining operations damage and remove vegetation through clearing and maintenance of right-of-ways. The Sonoran Valley Parkway is an approved right-of-way and is planned for construction in Rainbow Valley in the foreseeable future and would impact approximately 472 acres. Developed recreational facilities will be constructed within the Juan Bautista de Anza RMZ of the SDNM which would increase recreational opportunities and would increase the potential for damage of vegetation and spread of invasive species from motor vehicle use and camping.

No Action Alternative (Current Management)

Under the No Action Alternative, five of the six allotments associated with the SDNM would be available for livestock grazing. Portions of the Big Horn Allotment, the Lower Vekol Allotment, and the entire Conley Allotment within the SDNM would be unavailable to grazing within the SDNM. The level and management of grazing on allotments within the CESA (Figure 9) would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. The areas unavailable to grazing within the Big Horn, Lower Vekol and Conley allotments would benefit vegetation and reduce the likelihood of the spread of noxious and invasive species. Urban sprawl and the development of recreational facilities within the SDNM would impact vegetation less in the No Action Alternative, than under the Proposed Action. The cumulative effects of the No Action Alternative, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to vegetation.

Proposed Action

Under the Proposed Action, all six allotments associated with the SDNM would be available for livestock grazing. The level and management of grazing on allotments within the CESA (Figure 9) would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. The impacts to vegetation would depend on the level of grazing authorized under implementation-level decisions. However, under the Proposed Action

vegetation is more likely to be utilized and damaged by livestock and invasive species are more likely to be spread by livestock when compared to other alternatives. Vegetation on the non-SDNM portion of the CESA has the potential to be grazed by livestock on the other allotments available for grazing. The cumulative effects of the Proposed Action, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to vegetation.

No Grazing Alternative

Under the No Grazing Alternative, the SDNM portions of six allotments would be unavailable for livestock grazing. However, the non-SDNM portions of these allotments could potentially be remain available for grazing. These allotments include areas with urban/rural interface and could potentially be impacted by other uses listed in the RFFAs. The cumulative effects of the No Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, beneficial, and long-term impacts to vegetation.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments associated with the SDNM would be allocated available for livestock grazing, except for portions of the Big Horn and Conley allotments north of SR-238, in addition to three other allotments outside the SDNM. The level and management of grazing on allotments within the CESA (Figure 9) would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. The impacts to vegetation would depend on the level of grazing authorized under implementation-level decisions. However, under the Reduced Grazing Alternative vegetation is less likely to be utilized and damaged by livestock and invasive species are less likely to be spread by livestock when compared to the Proposed Action. Vegetation on the non-SDNM portion of the CESA has the potential to be grazed by livestock on the other allotments available for grazing. The cumulative effects of the Reduced Grazing Alternative, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to vegetation.

General Wildlife, BLM Sensitive Species (Animals), Migratory Birds

Cumulative Impacts Common to All Alternatives

Other activities such as recreation and continued population growth in and around the CESA (Figure 10) could result in a variety of impacts to wildlife and wildlife habitat. Roads and other infrastructure projects in the CESA could displace wildlife, fragment and remove habitat, and could contribute to direct mortality. The Sonoran Valley Parkway is an approved right-of-way and is planned for construction in Rainbow Valley in the foreseeable future and would impact approximately 472 acres.

No Action Alternative (Current Management)

Livestock grazing would continue within the CESA (Figure 10) outside of the SDNM on BLM-administered, State and private lands. Under the No Action Alternative, five allotments within the SDNM would continue to be available for livestock grazing. Competition for forage between wildlife and livestock would continue. Range improvements such as water developments for livestock would be maintained and would also benefit wildlife. Grazing, infrastructure projects including highways, conversion of open space into residential and commercial developments outside of the SDNM and within the CESA would add additional impacts to wildlife. The

cumulative effects of the No Action Alternative, in combination with other past, present, and RFFAs, would result in long-term, minor to moderate, adverse impacts to general wildlife, BLM sensitive animal species and migratory birds.

Proposed Action

Under the Proposed Action, livestock grazing would be available on all allotments within the SDNM, in addition to three other allotments outside the SDNM. There would be competition for forage and space between wildlife and livestock. Range improvements such as water developments for livestock would be maintained and would also benefit wildlife. Grazing, infrastructure projects including highways, conversion of open space into residential and commercial developments outside of the SDNM and within the CESA (Figure 10) would add additional impacts to wildlife. The cumulative effects of the Proposed Action, in combination with other past, present, and RFFAs, would result in long-term, negligible to moderate, adverse impacts to general wildlife, BLM sensitive animal species and migratory birds.

No Grazing Alternative

Livestock grazing would continue within the CESA (Figure 10) outside of the SDNM on BLM-administered, State and private lands. Under the No Grazing Alternative, livestock grazing would not be authorized within the SDNM. In the absence of livestock grazing, competition for forage between wildlife and livestock would be eliminated, which would result in more forage for wildlife and insect populations. The absence of livestock grazing could result in cover canopy increasing over time, a benefit for cover-dependent species. Livestock disturbance/displacement effects would not occur, benefiting nesting migratory birds and other wildlife individuals. The absence of grazing within the SDNM would result in a benefit to wildlife within the SDNM, although as population growth continues in the CESA it is highly likely that recreation on the SDNM would increase, which would contribute to many new stressors on wildlife. Grazing, infrastructure projects including highways, conversion of open space into residential and commercial developments outside of the SDNM and within the CESA would add additional impacts to wildlife. Range improvements such as water developments within the SDNM would no longer be maintained by permittees, resulting in a potential loss for use by wildlife. The cumulative effects of the No Grazing Alternative, in combination with other past, present, and RFFAs, would result in long-term impacts that could range from negligible beneficial to minor adverse, to general wildlife, BLM sensitive animal species and migratory birds.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, livestock grazing would be available on all allotments within the SDNM with portions of the Big Horn and Conley allotments unavailable, in addition to three other allotments outside the SDNM. There would be competition for forage and space between wildlife and livestock. Except for on the Big Horn Allotment north of SR 238, range improvements such as water developments for livestock would be maintained and would also benefit wildlife. Grazing, infrastructure projects including highways, conversion of open space into residential and commercial developments outside of the SDNM and within the CESA (Figure 10) would add additional impacts to wildlife. The cumulative effects of the Reduced Grazing Alternative, in combination with other past, present, and RFFAs, would result in long-term, negligible to moderate, adverse impacts to general wildlife, BLM sensitive animal species and migratory birds.

Soil Resources

Cumulative Impacts Common to All Alternatives

Soils in the CESA (Figure 9) are currently impacted by activities such as urban sprawl, recreational activities, livestock grazing, agricultural developments, utility and road right-of-ways, and mining operations. Urban sprawl, primarily in the northeast and southeast portions of the CESA is likely to increase in the foreseeable future. Residential and commercial development, and off-road vehicular travel would result in impacts to soils and potential for increased erosion by wind and water. Utility and road right-of-ways and mining operations damage and remove soil through clearing of vegetation and maintenance of right-of-ways. The Sonoran Valley Parkway is an approved right-of-way and is planned for construction in Rainbow Valley in the foreseeable future and would cause soil disturbance to approximately 472 acres. Developed recreational facilities will be constructed within the Juan Bautista de Anza RMZ of the SDNM, which would increase recreational opportunities and would increase the potential for soil damage from motor vehicle use and camping.

No Action Alternative (Current Management)

Under the No Action Alternative, five of the six allotments associated with the SDNM would be available for livestock grazing. Portions of the Big Horn Allotment, the Lower Vekol Allotment, and the entire Conley Allotment within the SDNM would be unavailable to grazing within the SDNM. The level and management of grazing on allotments within the SDNM would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA (Figure 9). The areas unavailable to livestock grazing within the Big Horn, Lower Vekol and Conley allotments would benefit soils as the areas would not be subject to compaction, disturbance, and potential erosion caused by livestock grazing where intensive use occurs. Urban sprawl and the development of recreational facilities within the SDNM would contribute to less impacts under the No Action Alternative, than under the Proposed Action. The cumulative effects of the No Action Alternative, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to soils.

Proposed Action

Under the Proposed Action, all six allotments associated with the SDNM would be available for livestock grazing. The level and management of grazing on allotments within the SDNM would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA (Figure 9). Under the Proposed Action, soils are more likely to be damaged by livestock through trampling and removal of vegetation when compared to the other alternatives. Soils on the non-SDNM portion of the CESA have the potential to be disturbed by livestock on all allotments available for grazing, in addition to impacts from other activities such as conversion of open space to residential and commercial developments. The cumulative effects of the Proposed Action, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to soils.

No Grazing Alternative

Under the No Grazing Alternative, the SDNM portions of six allotments would be unavailable for livestock grazing. Within the SDNM no soil disturbance associated with livestock grazing would occur. However, the non-SDNM portions of these allotments could potentially remain available

for grazing. These allotments include an urban/interface outside the SDNM and soils could be impacted by other uses listed in the RFFAs. The cumulative effects of the No Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible, beneficial, and long-term impacts to soils.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments associated with the SDNM would be allocated available for livestock grazing, except for portions of the Big Horn and Conley allotments north of SR-238, in addition to three other allotments outside the SDNM. The level and management of grazing on allotments within the CESA (Figure 9) would be determined at the implementation-level and could vary in order to meet Standards and adapt to other uses within the CESA. The impacts to soils would depend on the level of grazing authorized under implementation-level decisions. However, under the Reduced Grazing Alternative soils are less likely to be damaged by livestock, when compared to the Proposed Action. Soils on the non-SDNM portion of the CESA has the potential to be damaged by livestock on the other allotments available for grazing. The cumulative effects of the Reduced Grazing Alternative, in combination with other past, present, and RFFAs, would result in minor to moderate, adverse, and long-term impacts to soils.

Cultural and Heritage Resources

Cumulative Impacts Common to All Alternatives

Forty-four percent of the CESA (Figure 10) is non-BLM administered land, where the greatest impacts to cultural sites is from the conversion of lands from open space to residential and commercial uses associated with population growth. Cultural sites may also be impacted from other authorized uses on BLM-administered lands outside the SDNM including right-of-ways, mining and exploration on unpatented mining claims. The Sonoran Valley Parkway is an approved right-of-way and is planned for construction in Rainbow Valley in the foreseeable future and mitigation for impacts to cultural sites has been addressed through an approved Programmatic Agreement.

No Action Alternative (Current Management)

Under the No Action Alternative, five of the six allotments within the SDNM would be available for livestock grazing, in addition to three other allotments outside the SDNM (Figure 10). No livestock grazing would occur in portions of the Big Horn Allotment, the Lower Vekol Allotment, and the entire Conley Allotment. The level of potential impacts to cultural sites would depend on the grazing management system set at the implementation-level. The potential for trampling and accelerated erosion due to loss of vegetation and topsoil would be eliminated in areas unavailable to livestock grazing. Impacts from livestock grazing to cultural sites within five allotments would continue, with the greatest potential for impacts to areas near concentrated livestock use near water developments which can lead to loss of vegetative cover and increase in potential for soil erosion. Impacts from livestock would be less where use is generally dispersed across the allotments. Other activities would be expected to continue such as recreation and motor vehicle use, which can lead to the loss of vegetative cover and potential for increase in soil erosion, which could impact cultural sites. Outside the SDNM, the conversion of open space into residential and commercial developments would also be expected to impact cultural sites. The cumulative effects of the No

Action Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, and long-term impacts cultural and heritage resources.

Proposed Action

Under the Proposed Action, all six allotments would be available for livestock grazing, in addition to three other allotments outside the SDNM (Figure 10). The level of potential impacts to cultural sites would depend on the level of grazing and adjustments of grazing management set at the implementation-level. Dispersed livestock grazing has low potential to impact cultural sites. Cultural sites adjacent to areas of concentrated use around water developments have the greatest potential to be impacted by livestock grazing. Concentrated use can lead to loss of vegetative cover and increase in potential for soil erosion, which could impact cultural sites. Other activities would be expected to continue such as recreation and motor vehicle use, which can lead to the loss of vegetative cover and potential for increase in soil erosion, which could impact cultural sites. Outside the SDNM, the conversion of open space into residential and commercial developments would also be expected to impact cultural sites. The cumulative effects of the Proposed Action, in combination with other past, present, and RFFAs, would result in negligible to minor, and long-term impacts cultural and heritage resources.

No Grazing Alternative

Under the No Grazing Alternative, all six allotments would be unavailable for livestock grazing within the SDNM. Three other allotments outside the SDNM would continue to be available for livestock grazing (Figure 10). The potential for trampling and accelerated erosion due to loss of vegetation and topsoil from livestock grazing would be eliminated in the SDNM. Under the No Grazing Alternative, there would be no livestock grazing within the de Anza NHT Corridor and Management Area, eliminating potential impacts to historic trails. Other activities would be expected to continue such as recreation and motor vehicle use, which can lead to the loss of vegetative cover and potential for increase in soil erosion, which could impact cultural sites. Outside the SDNM, the conversion of open space into residential and commercial developments would also be expected to impact cultural sites. The cumulative effects of the No Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, and long-term impacts cultural and heritage resources.

Reduced Grazing Alternative

Under the Reduced Grazing Alternative, all six allotments within the SDNM would be available for livestock grazing, except for portions of the Conley and Big Horn allotments north of SR-238, in addition to three other allotments outside the SDNM (Figure 10). The level of potential impacts to cultural sites would depend on the grazing management system set at the implementation-level. The potential for trampling and accelerated erosion due to loss of vegetation and topsoil would be eliminated in areas unavailable to livestock grazing. Impacts from livestock grazing to cultural sites within the allotments would continue, with the greatest potential for impacts to areas near concentrated livestock use near water developments which can lead to loss of vegetative cover and increase in potential for soil erosion. Impacts from livestock would be less where use is generally dispersed across the allotments. Under the Reduced Grazing Alternative, there would be no livestock grazing within the Anza NHT Corridor and Management Area, eliminating potential impacts to historic trails. Other activities would be expected to continue such as recreation and motor vehicle use, which can lead to the loss of vegetative cover and potential for increase in soil

erosion, which could impact cultural sites. Outside the SDNM, the conversion of open space into residential and commercial developments would also be expected to impact cultural sites. The cumulative effects of the Reduced Grazing Alternative, in combination with other past, present, and RFFAs, would result in negligible to minor, and long-term impacts cultural and heritage resources.

5.0 PERSONS, GROUPS, AND AGENCIES CONSULTED

5.1 List of Preparers

The following individuals were involved in the preparation of this Draft RMPA/EA:

Bureau of Land Management

Name	Title	Project Expertise
Brian Buttazoni	Planning and Environmental Specialist	National Environmental Policy Act, Socioeconomics, Cumulative Effects
Michael Daehler	Biologist	Biological Resources
Doug Whitbeck	Rangeland Management Specialist	Livestock Grazing, Vegetation, Noxious and Invasive Weeds, Soils
Cheryl Blanchard	Archeologist	Cultural and Heritage Resources

5.2 Public Review

This Draft RMPA/EA has been made available to the public for review and comment for 30-days. Comments must be received by the close of business on June 6, 2020. All comments would be reviewed and categorized by the BLM. Although not required for an EA by regulation, an agency may respond to and summarize substantive and timely comments received as a part of the Proposed RMPA/EA in a new appendix (BLM 2008).

Substantive comments would:

- 1) Question, with reasonable basis, the accuracy of the information in the Draft RMPA/EA;
- 2) Question, with reasonable basis, the adequacy of, methodology for, or assumptions used for the Draft RMPA/EA;
- 3) Present new information relevant to the Draft RMPA/EA;
- 4) Present reasonable alternatives other than those analyzed in the Draft RMPA/EA; and/or
- 5) Cause changes or revisions in one or more of the alternatives.

5.3 Tribes, Individuals, Organizations or Agencies Consulted

The following tribes, individuals, organizations or agencies were consulted during public scoping and/or public review of this Draft RMPA/EA:
