Preface

The goal of this study is to provide a comprehensive historical overview of the Harpers Ferry National Historical Park’s Short Hill tract. When the National Park Service first acquired the Short Hill property in 1981, it was considered significant primarily because federal ownership ensured the preservation of the view from Harpers Ferry. Knowledge of the cultural resources that existed at Short Hill was incomplete and only a basic understanding of their significance existed. Hopefully, this report will contribute to a better understanding of the cultural resources and further the Park’s mission to manage and protect them.

Part One of this report consists of seven essays, each covering a different aspect of Short Hill’s history. Topics addressed are the Native American past, colonial settlement, George Washington, transportation, industry and agriculture, the Civil War, and the National Park Service acquisition and stewardship. Naturally, there are some points of overlap among the topics, but these themes were selected because they best represent the broad forces, times, and events that shaped the Short Hill landscape. Developments that occurred within the boundaries of the current NPS tract are the primary focus of Part One, but since no history can be understood in a vacuum, there is some attempt to place that history into a broader, regional context.

Part Two presents the chain of title for the Short Hill tract. It follows the ownership of the 370 acres over time, from the early 1800s to its ultimate inclusion as part of Harpers Ferry National Historical Park in the 1980s.

The NPS Short Hill tract is best viewed as the combination of two tracts, each having evolved separately from the other. The larger of the two is herein designated the "Stubblefield Tract" and is made up of 320 acres on the west side of Short Hill. The other is the "Mill Tract" and it encompasses 50 acres along Falls Branch and the northern tip of Short Hill. It is important to note that these names are artificial constructions; they are not found in the historical record.

This history of land ownership presented in Part Two contains the real "nuts and bolts" of this resource study. It contains the names of all owners and known tenants and is supplemented by biographical information gathered from census records, will books, and other sources. It also includes details of the transactions that are found in deeds, land tax records, newspapers, and court orders. The amount of information available on each owner and property varies. The goal of this section is to convey all the details that were found regardless of whether or not they fit neatly into a structured story. Future, more tightly focused research can be conducted to fill in any gaps. Even the smallest bit of information presented here may lead to a more productive avenue of research in the future.
Acknowledgements

No project of this kind can be successfully completed by a single person without the support, assistance, and previous hard work of many others. I would like to extend my sincere thanks to the following people: Gary Scott, Chief Historian (National Capital Area); Superintendent Donald W. Campbell (Harpers Ferry National Historical Park); Matt Graves, Chief of Interpretation & Cultural Resource Management, (HFNHP); Mia Parsons, Supervisory Archeologist (HFNHP); Bill Hebb, Natural Resources Manager (HFNHP); Nancy Hatcher, Museum Specialist (HFNHP); and the staff in the file room of the Clerk's Office at the Loudoun County Courthouse, Leesburg Virginia.

I would also like to acknowledge the special contributions of two individuals: Rob Brzostowski, for volunteering his time and skills to produce many of the excellent photographs that appear herein; and John Ravenhorst for the fine job he did formatting the drafts and final version of the report.

Finally, I owe a debt of gratitude to the many local and regional historians whose work I have drawn upon, particularly Eugene M. Scheel, Craig H. Trout, and all the indexers and abstracters who have paved the way for all researchers of Loudoun County history.
Part One: Historical Background

Introduction

The Short Hill portion of Harpers Ferry National Historical Park consists of slightly more than 370 acres in the northwest corner of Loudoun County, Virginia (Figure 1). It is located about two miles downriver from the confluence of the Shenandoah and Potomac Rivers and the town of Harpers Ferry, West Virginia. The tract is mostly made up of the steep and rugged western slope of Short Hill Mountain, but it also includes some bottomland as well as lands straddling the mouth of Falls Branch, a small tributary of the Potomac at the northern tip of the mountain. The Short Hill tract contains the ruins of several historical structures including at least four dwellings, a mill, a millrace and dam, a limekiln, several stone fences, and road traces (Figure 2).

Figure 1. Map of Harpers Ferry National Historical Park showing the Short Hill portion, consisting of slightly more than 370 acres in the northwest corner of Loudoun County, Virginia. (NPS)

The history of these resources has many parallels and connections to the better-known story of Harpers Ferry. In fact, several prominent men from Harpers Ferry speculated in ownership of this land and its resources. Water powered industry was present here also. Likewise, transportation developments such as ferries, turnpike roads, canals, and railroads affected the history of the Short Hill tract much as they did at Harpers Ferry.

There are significant differences, however, that give the Short Hill tract its own unique history. For example, while the town of Harpers Ferry was, in its day, both a regional industrial center and strategic military location, Short Hill was decidedly not. At best, these lands were viewed
by most as valuable for their potential. The timber and water rights were as valuable to its owners and occupants as the land itself.

Acquired by the United States government from The Nature Conservancy in 1981, the tract was added to Harpers Ferry National Historical Park to protect the view from Harpers Ferry made famous by the writings of Thomas Jefferson. The view from Harpers Ferry, Jefferson wrote, was worthy of a journey across the Atlantic. Though Jefferson may have overlooked Short Hill Mountain as he gazed eastward upon the Virginia piedmont, its history is there for all who take the time to discover it.

Figure 2. Short Hill tract landmarks. Showing from right to left: Falls Branch and features associated with the Peacher’s Mill complex (1825); limekiln (ca.1870); River Road (ca.1832-1936); the northern tip of Short Hill Mountain and the rocky point known as Devil’s Elbow; the low land area known generally as Dixie Bottom; and structures associated with the Still House Farm. The series of rapids located near Devil’s Elbow was known as Payne’s Falls and was also the site of the Everhart brothers’ colonial fish dam. Payne’s Ferry of 1760 was located near present day Knoxville, Maryland. “Between the Hills,” an early name for the valley between Short Hill and the Blue Ridge is to the west. The Town of Lovettsville, Virginia is approximately three miles east of Short Hill Mountain. (NPS graphic by John Ravenhorst)
Short Hill as Native American Territory

When Europeans colonized Virginia in the early 17th century, what is now Loudoun County was on the northern fringes of the Manahoac territory. The Manahoacs, with an estimated population of around 1,500, inhabited the portion of northern Virginia from the mountains to the fall line, and from the Potomac to the North Anna River. Their primary villages were on the falls of the Rappahannock River. They were friends of the Monocans to the south and enemies of the Powhatans to the east and the Iroquois to the north. A century later, when significant numbers of European Americans first entered the areas around Short Hill during the first quarter of the 18th century, what they found was a virtual "no-man's land." There were no resident Native Americans, only occasional groups travelling through in small-sized parties.

What happened to the Manahoacs is not known. It is theorized that competition for resources and inter-group hostilities among Native Americans led to their abandonment of these rich lands. Iroquois raids, contacts with colonists, and disease may have pushed the remaining Manahoacs south to join the Monocans.1 Archeological evidence in the form of stockaded villages found throughout much of the Middle Atlantic region indicates that by 1500 AD intertribal warfare was widespread. This was particularly true in the upper Potomac and northern Shenandoah Valley. One of the chief sources of friction between the neighboring Native American groups was the fur trade that was quickly developing with the European colonists. By various circumstances, certain groups of Native Americans occupied favorable positions in this trade and came to dominate it.

The earliest group to achieve preeminence and assume control of the region containing Short Hill was the Susquehannocks. Sometime before their meeting with explorer Captain John Smith in 1608, these Iroquoian-related peoples were living in the lower Susquehanna River valley of Pennsylvania. They achieved dominance over a large area that included much of the Potomac. Other Iroquois tribes, seeking to enhance their own economic and political influence, formed a confederacy and waged war on their neighbors, including the Susquehannocks. After the defeat of the Susquehannocks in the mid-17th century, the League of the Iroquois became the dominant force. The result was total Iroquois domination of a vast area, encompassing territory east of the Ohio and north of the Potomac.

As the supply of beaver and other fur-bearing animals dwindled in the Northeast, the Iroquois sought to extend their influence. They renewed hostilities against their southern neighbors and by 1680 the Manahoacs and remnant Susquehannocks were no longer a factor in the region along the Potomac. One of the policies of the League of the Iroquois was the depopulation of large areas with the reversion of the land to hunting territories. Periodically burning the wooded hills and valleys helped sustain areas of grassy meadows that supported white-tailed deer, wild turkey, black bear, and other game. These highly valued hunting territories also supplied the Iroquois with furs and hides to trade to both the English and French. One of the areas that was

depopulated was the northern Shenandoah Valley, thus explaining why, after 1700, Europeans entered an empty landscape there.

The final episode in Short Hill's Native American story was concluded in 1722. In 1720 Governor Spotswood of Virginia initiated peace talks with the League of the Iroquois, hoping to end their hostilities with the southern tribes and bring stability to the region (Figure 3). It was also apparent that an alliance with the Iroquois would prove beneficial to the English as they tried to gain an advantage over their other colonial rivals, the French. With these factors in mind, Spotswood arranged the Treaty of Albany. The treaty stated that neither the Iroquois nor their allies were to cross the Potomac River or the Blue Ridge Mountains without the consent of the proper political authorities. Ratified in 1722, the Treaty of Albany greatly enhanced the safety of the Virginia frontier and within a decade the first permanent German and Quaker settlements were established in the area.

The Everhart Fish Trap and other Native American Vestiges

While there was no resident population of Native Americans in the Short Hill area, early settlers found unmistakable signs of their past habitations. One aspect of Native American occupation that settlers encountered was the numerous fish traps located along the upper Potomac River. The traps were V-shaped piles of boulders stacked to a height of about three to four feet, with the "wings" extending from the shore and the apex of the "V" facing downriver. Fish were swept into the "V" and wound up at the apex where they were easily scooped out with baskets or forced into an enclosed collection point such as a weir.

In 1969, archeologists Carl Strandberg and Ray Tomlinson identified thirty-six such fish traps between Harpers Ferry and Point of Rocks, four of which are very near to Short Hill. In 1999 archeologist Dan Guzy counted fifty-four such fish traps along the shores of Loudoun County. Some of the remains of traps that are seen today were Native American traps that were repaired and built up by colonial settlers. The settlers, finding the practice still an easy way to catch fish, also constructed traps of their own.

One of these fish traps was located at "Payne's Falls," a naturally rocky ledge extending from the tip of Short Hill across the river to Weverton (Figure 4).

---

The rock outcropping there supported a fish trap operated by the brothers Jacob, Joseph, and John Everhart during the early 1800s. When the Everharts sold ten acres of their Short Hill land to the miller John Peacher, they granted "the privilege of erecting a Mill or any other kind of Machinery" Peacher thought proper, but they stipulated that his mill was "not to interfere with said Everharts fish dam."³ Strandberg and Tomlinson's analysis, which involves studying the shape of the trap's wings, suggests that the Everhart brothers' fish trap had prehistoric origins.

Colonial sentiments concerning these fish dams were mixed. While the Everharts clearly valued the fish traps, to others they were seen as obstacles. The openings in the dams were not wide enough to accommodate flatboats on their way down the river. In June 1768, the Maryland colonial authorities declared "all fish Dams and other Devises for catching of fish already made or hereafter to be made in the River Patowmack...are hereby deemed and declared Nusances and may be by any Person or Persons pulled down prostrated and abated."⁴

Many of the Potomac fish dams were still present in 1789 when George Washington's Patowmack Company began navigational improvements on the river. Washington viewed the fish dams as a hindrance and noted in his diary: "The Fish pots, of which there are many in the

---

³ Loudoun County Deed Book (LC DB) 3W:230, dated March 20, 1824.

---
River, serve to clog the Navigation, and to render the passage more difficult upon the whole." He ordered work crews to remove as many from the river as possible. George Pointer, foreman of the company's wrecking crew, oversaw the removal of forty-four of the dams. Pointer remarked that the settlers who opposed the destruction appeared dangerous, and that he did the job "at the Risk of losing my life by the inhabitants." The fish dams are remarkably resistant to flood damage and during periods of low water are easy to see. Though the Everharts' fish dam was condemned in 1847 to make way for the Weverton dam, others continued to be used until 1924, the year their use was outlawed by the Maryland legislature.

In addition to the Potomac River fish traps, landowners on Short Hill have found other evidence of the Native American past. On a property adjacent to the National Park known as the "Old Distillery House," Mr. William Painter reported there was a ledge of hard rock around which he had recovered numerous "arrowheads and uncounted stone chips." While some of the projectile points were said to be perfect specimens, many others were half made or had other imperfections. Painter's description suggests the site functioned as a Native American quarry and stone tool manufacturing site.

According to the late Charles Painter (William Painter's father), there was a certain place on the same property that he believed to be a Native American burying ground. The site is distinguished by piles of stone all lying contiguous to each other, each about the length and width of a grave. Though there is potential for the presence of prehistoric cultural resources within the boundaries of the Short Hill portion of Harpers Ferry National Historical Park, until a comprehensive archeological survey is undertaken, the full extent and nature of those resources will remain unknown.

---

7 *Farmer's Advocate*, January 24, 1925, p1c2.

Early Exploration, Settlement, and Land Ownership

The land comprising the Short Hill portion of Harpers Ferry National Historical Park was long ago part of an immense colonial land grant of about 6 million acres. In 1661, the King of England, Charles II, issued the grant to seven of his loyal noblemen. All the territory lying between the Rappahannock and Potomac Rivers to their still unknown headwaters was included in this grant (Figure 5). Known as the "Northern Neck Proprietary," the grant encompassed the land now covered by Northumberland, Lancaster, Westmoreland, Richmond, Stafford, King George, Prince William, Fairfax, Loudoun, Fauquier, Rappahannock, Culpeper, Madison, Clarke, Warren, Page, Shenandoah, and Frederick Counties in Virginia and Hardy, Hampshire, Morgan, Berkeley, and Jefferson Counties in West Virginia. Though the King's patent issued land rights to the noblemen, it was an unexplored and unsettled territory.

Figure 5. 1736 survey map of the Northern Neck of Virginia. In 1661, King Charles II granted all the territory between the Rappahannock and Potomac Rivers to their headwaters to seven of his loyal noblemen. (Library of Congress)
European exploration of the area around Short Hill began shortly after 1700. By 1707 the Swiss prospector, Louis Michel established a small outpost on the "forks of the Potomac" in the vicinity of present day Harpers Ferry, scouting land and exploring its mineral resources. Michel produced a crude yet unmistakable map of the Potomac-Shenandoah area, venturing along the Shenandoah possibly as far south as present day Edinburg, Virginia.\(^\text{10}\) Everywhere he went, Michel inquired about the most suitable locations where Swiss emigrants might establish a colony. Though nothing ever came of this colonizing attempt, Michel's reports about the abundant and largely empty lands did not go wholly unnoticed and other permanent settlers soon followed.

Beginning in the mid-1720s, after the Treaty of Albany had ensured the safety of the frontier, the first great land boom on northern Virginia's piedmont occurred. A large number of German, Quaker, and Scotch-Irish settlers flowed into the area in search of new agricultural and commercial opportunities. Within the next few decades, these pioneers made permanent settlements in the areas immediately around Short Hill.

By far the greatest number of migrants to the area were Germans from Pennsylvania. In the late 17th century, thousands upon thousands of Germans emigrated to Pennsylvania and occupied the fertile agricultural lands around Philadelphia. As choice lands were taken up, they settled on the far western frontier of Pennsylvania. There they formed a buffer between the increasingly restless Native-American population and the colony's Quaker settlements. As their numbers grew, settlement proceeded in a southwesterly direction until by 1720 it reached the Susquehanna River. When land prices rose, they pressed further southward, spreading through western Maryland and down to the Potomac River.\(^\text{11}\) This continuous movement of German settlers tended to follow the natural valleys that were long used by Native Americans in their north-south movements.

The main group of Pennsylvania Germans crossed the Potomac into Virginia at Pack Horse Ford just above present day Harpers Ferry. Near there some established the town of Mecklenburg (now Shepherdstown) in 1728. Others filtered into the valleys of the South Branch of the Potomac and its tributaries. Although the main thrust of settlement was southward into the Shenandoah Valley, a small group of Germans had followed the Monocacy trail through Maryland, crossed over the Potomac and settled between Catoctin Creek and the Blue Ridge in present day Loudoun County. About sixty farming families made a settlement near the Potomac at present day Lovettsville, just east of Short Hill Mountain.\(^\text{12}\) For many years their village was known simply as "The German Settlement."

Across the river from The German Settlement, a trader named Abraham Pennington operated a trading post and ferry on a portion of land called "Coxon Rest.\(^\text{13}\) Pennington's trading post,

\(^{11}\) Wust, *The Virginia Germans*, 28-29.

\(^{13}\) Mary McMurry Margrabe, *Brunswick: 100 Years of Memories*, (Brunswick History Commission, Brunswick, Maryland, 1990), 12.
operating during the 1720s, was in the vicinity of present day Brunswick, Maryland, about two miles downriver from Short Hill. To the west of Short Hill, at the confluence of the Shenandoah and Potomac rivers, a simple canoe ferry was established by trader Peter Stephens in 1733. Stephens' operation was later taken over by Robert Harper and the site grew into the town known as Harpers Ferry.

Following close upon the heels of the Germans, Quaker settlers arrived in the area. The Quakers settled west of the Catoctin mountains and formed the communities of Waterford, Goose Creek (now Lincoln), Harmony (now Hamilton), and Union (now Unison). Like the German settlers, the Quakers came from Pennsylvania to northern and western portions of Loudoun County to take up small farms.

During the same period, English settlers from tidewater Virginia moved into eastern and southern Loudoun County. These planters established large tobacco plantations like the ones they had known back east. A number of Irish settlers could also be found among the communities west of Catoctin Mountain. Due to the diversity of the county's colonial stock – German, Quaker, English, Irish – and the geographic distribution of their settlement, Loudoun County had a distinctive cultural heritage.

Whatever their cultural origins, all of the settlers desired land. Cheap and abundant, land was the primary form of wealth in 18th-century Virginia. As soon as it became known that lands were being settled at and beyond the Blue Ridge, wealthy planters in eastern Virginia became aware of the tremendous opportunities that awaited them in the West. Speculators made land their principal vehicle of investment and they eagerly applied for grants from the land's owner, Thomas 6th Lord Fairfax (Figure 6).

By 1720, through a complex series of marriage and inheritance, Thomas 6th Lord Fairfax became the sole proprietor of the entire "Northern Neck," or as it soon came to be called, the "Fairfax Proprietary." As has been noted, by the time Lord Fairfax arrived to take possession of the vast domain he had come to own, settlement had already been firmly established. The early German and Quaker settlers came into the area around Short Hill caring little for colonial boundaries or the alleged owners of wilderness land titles.

For those wishing to take legal possession of the land, however, a visit to Fairfax's Proprietary Office was necessary. There, after agreeing to terms, Fairfax's appointed agent would issue a grant. Among the early speculators of land around Short Hill were Robert Booth and George Atwood. In 1731, Robert Booth was granted an 840-acre estate at the base of the eastern slope of Short Hill, lying between Falls Branch and Dutchman Creek. Some of Booth's original property lines are still evident today.
George Atwood received a grant in 1732 for 2,340 acres that included land to the south and west of the Short Hill tract (Figure 7). Portions of Atwood's grant later became known as the "William Dudley Diggs Short Hill Tract." (The island just off the shore of the Dixie Bottom portion of the NPS tract is known locally as "Digg's Island"). The Booth and Atwood grants were both large tracts. As time went by, the average size of the Fairfax grants decreased. By 1765, only one in five landowners in Loudoun County had more than 500 acres; two-thirds of all land holdings were smaller than 200 acres.\footnote{John T. Phillips, II, \textit{The Historian's Guide to Loudoun County, Virginia: Colonial Laws of Virginia and County Court Orders 1757-1766}. Volume I. (Goose Creek Productions, Leesburg and Middleburg, Virginia, 1996), 246.}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure7.png}
\caption{George Atwood and Robert Booth received grants to land near the current NPS Short Hill tract. (Netti Schreiner Yantis)}
\end{figure}
Lord Fairfax became dissatisfied with the management of his Proprietary and recruited his cousin, Colonel William Fairfax, to be his new agent. Among the first things Colonel Fairfax did as agent was to form a partnership with John Colville, a prominent merchant from Prince William County. Colville was an active land speculator in both Virginia and Maryland. Among his holdings was a 6,300-acre tract called "Merryland Manor" that included lands around the southern end of South Mountain, just across the Potomac River from the Short Hill tract. Together Fairfax and Colville bought out many of the smaller landholders in the Potomac River area between Catoctin Ridge and the Shenandoah Valley.

By buying the claims to many small tracts, Fairfax and Colville were able to consolidate their holdings into large manors, some of which included between 15,000 to 20,000 acres. Upon dissolution of the Fairfax-Colville partnership in 1740, Colonel Fairfax took as his share 44,446 acres on the Potomac River between Catoctin Creek and the Shenandoah River, an area encompassing much of the northern portion of present day Loudoun County. This tract included, among other tracts, the 19,170-acre "Shannondale Manor" tract and the 17,296-acre "Piedmont Manor" tract.

Shannondale Manor straddled the summit of the Blue Ridge and lay along the Shenandoah and Potomac Rivers in the valleys south of present day Harpers Ferry. Piedmont Manor was situated on the Potomac and Catoctin Creek. The crest of Short Hill Mountain served generally as the dividing line between the two manors. Ownership of the tracts can be traced down through the Fairfax family. Colonel Fairfax conveyed both manors to his eldest son, George William Fairfax, in 1753. George William Fairfax in turn bequeathed the land in 1780 to his nephew Ferdinando Fairfax. Ferdinando Fairfax and his wife, Elizabeth Blair Fairfax, were the last owners of the Piedmont and Shannondale Manors before its outsale and subsequent divisions and recombinations.¹⁵ The current NPS Short Hill tract has its origins in the Piedmont Manor.

Not all of the Fairfax land was put up for sale. Some of the lands in Piedmont and Shannondale were leased and it was Colonel Fairfax's intent that the profits generated from the development of these manors would support "Belvoir," the Fairfax family seat. The most common instrument by which one could rent a property was called a "three-life lease." The three-life lease was a quasi-feudal practice of land management and development that was continued on the western Virginia frontier. The lease agreement remained in effect for the duration of the lives of three named people, usually a man, his wife, and their oldest son.

The leasing system as practiced in the Piedmont and Shannondale Manors helped stimulate development of the Short Hill area because provisions in a typical three-life lease required the renter to make substantial improvements to the property. The lease included specific instructions, for example, on the types and sizes of structures. It also frequently required the

planting of orchards. Other covenants might prohibit the extraction of valuable minerals and ores or restrict hunting privileges.

Another factor encouraging development was affordability. Annual rents, payable either in commodities or British currency, were modest, but increased steadily during colonial times. To illustrate the contrast between the costs of Short Hill lands versus "urban" areas in 1760, the rent on a 50-acre Piedmont Manor farm was £1 per year, whereas it cost anywhere from £45 to £60 to rent a house in Williamsburg.\(^\text{16}\)

The earliest documented settlement within the current NPS tract was the result of a three-life lease agreement. On March 20, 1785, Jacob Sullifrank (spelled variously Sullyfrank, Sunnifrank, Sunnefrank, and Sunnafrank) rented 85 acres from George William Fairfax.\(^\text{17}\) The precise location of the acreage is not given; it is recorded only as "situate...in the parish of Shelburne in the County of Loudoun Supposed to be on the Short Hills..." Subsequent deeds, however, indicate its place is on the western side of Short Hill in the Dixie Bottom floodplain.

The term of the lease was for three lives: those of Jacob Sullifrank and his two sons, John and Abraham. The name Jacob Sunnafrank appears on a list of tithables for Shelburne Parish in 1774, 1779, and again in 1782.\(^\text{18}\) Each entry shows he was only responsible for one tithe, indicating his children were under the age of 16 and that he did not own slaves. By the terms of the lease, Sullifrank was to Fairfax pay £2, 2 shillings on the first day of May each year. However, on October 17, 1786, the Virginia General Assembly officially did away with the colonial leasing system and the lands the Sullifranks had leased were now theirs to own. How long the Sullifranks remained on Short Hill is not known, but later deeds refer to the Abraham Sullifrank's tenancy, indicating that at least one son remained on after Jacob Sullifrank's death.

George Washington and Short Hill

Perhaps the best known historical figure with connections to Short Hill and the Potomac River region is George Washington. Numerous scholars have studied the various aspects of his life and career as they relate to this area – as a surveyor and land speculator, a military man, and champion of industrial development. As a result of his many first-hand experiences, Washington became enamored with the region's potential and he dedicated himself to its improvement. Even though Washington's history of involvement with the area is well documented, there are some local legends associated with him that are not as widely known.

As a young man in the good graces of the powerful Fairfax family, George Washington first traveled to Virginia's Blue Ridge frontier as a land surveyor. In a country where land was the commodity most sought after, the services of a surveyor were essential and highly valued. As a boy, Washington learned the rudiments of surveying from tutors and he practiced with his father's surveying instruments. At the age of fifteen, he sharpened his skills by surveying his stepbrother Lawrence's turnip field. The following year, Washington was hired by Thomas 6th Lord Fairfax to assist in making land surveys in the Northern Neck Proprietary (Figure 8). In particular, Washington accompanied the survey team to the lower Shenandoah Valley around Harpers Ferry in March 1748. The first stop for the surveying party, at "Captain Ashby's on the Shenandoah," marked the beginning of Washington's long involvement with the area around Harpers Ferry.19

Washington's work as a surveyor not only provided him a good income, but it also served to familiarize him with the geography of the region and its abundant resources. He was evidently impressed by what he saw in the area. In 1750, with money he saved from surveying fees, Washington purchased his "Bullskin Plantation" in present day Jefferson County, West Virginia. He continued to add to his land holdings so that by 1752, he (along with stepbrother Lawrence) owned about 4,000 acres. This included the land later given to younger brother, Charles, the founder of Charles Town.20

According to widespread local legend, it was also during George Washington's early association with the region that he presided over the first meeting (1754) of Free Masons to assemble west of the Blue Ridge Mountains. The meeting place is said to have been a limestone cave situated

---

19 Brown, Virginia Baron..., 110.

about two miles south of Charles Town. Tradition says that George Washington's initials are inscribed among Masonic symbols upon the walls of the cave.

Later in life, Washington played an active role in the affairs of the Patowmack Company – founded in 1785 to improve navigation on the Potomac and its major tributaries (Figure 9). Washington was keenly interested in the commercial use of the Potomac River and the creation of a canal to join the port of Georgetown with the Ohio Valley and western frontier. He was elected the company's first president and, by all accounts, the canal became his pet project.

Washington traveled to Harpers Ferry in August of 1785 and for two days his party carefully inspected the river and its tributaries. Narrow passages, obstructions, rapids, and falls were all studied in detail. An entry in his diary records Washington's observations of the river near Short Hill Mountain:

> Here we breakfasted [at Harpers Ferry]; after which we set out to explore the Falls below; & having but one Canoe, Colo. Gilpin, Mr. Rumsey...and myself, embarked in it, with intention to pass thro' what is called the Spout (less than half a Mile below the ferry). But when we came to it, the Company on the Shore, on acct. of the smallness, and low sides of the Vessel, dissuaded us from the attempt, lest the roughness of the Water, occasioned by the Rocky bottom, should fill and involve us in danger.

Continuing on, the party encountered smooth and even water for about one mile, until they reached:

> a ridge of rocks which cross the river with Intervals, thro' which the Water passes in crooked directions...From hence to what are called Pain's falls [sic Payne's Falls, site of Everhart's fish dam] the Water is tolerably smooth, with Rocks here and there. These are best passed on the Maryland side. They are pretty swift, shallow, and foul at bottom, but the difficulties may be removed. From the bottom of these Falls, leaving an Island on the right...the easy and good Navigation below is entered.

---

23 Fitzpatrick, 401.
Despite the menacing appearance of the Spout and rocky nature of Payne's Falls, it was decided that no special improvements were needed to bypass them.

According to Loudoun County historian Eugene M. Scheel, George Washington returned in June 1788 to re-inspect the Short Hill area that he had boated through in 1785. During this later visit, Washington is said to have scaled the 1,183'-high Buzzard Rock portion of Short Hill Mountain and inscribed the initials "GW" on a rock face.\(^{24}\) As of this writing the initials have not been discovered. Though it is not known for certain, it may be that the initials were erroneously attributed to Washington. Instead, they may actually be a combination of the initials of George Atwood and William Fairfax, both early owners of Short Hill land. A deed dated 1740 states that the initials "GA" and "WFx" were carved on a sycamore tree and that "WFx" was carved on a "large cliff or Mountain of White Rocks of Stone" by surveyors. These marks indicated property boundaries and corners. Was it later, perhaps, after the widespread hero-worship of the first president blossomed, that the surveyor's marks were misinterpreted and became associated with George Washington?

Helen Hirst Marsh reports another local legend that connects George Washington to Short Hill in her study of historic mills of Loudoun County. In March 1816, John Conard, Jr. entered into an agreement with Canrad Neer whereby Conard purchased all the rock suitable for making millstones on Neer's Short Hill property. Conard operated a mill on a bend of Piney Run about six-tenths of a mile from the Potomac and Neer's property lay at the foot of the western slope of Short Hill. Conard also secured the right to finish the millstones on Neer's lot and to cross property lines with his stone-hauling wagons.\(^{25}\) Historian Marsh states that George Washington once purchased millstones from this quarry operation for a mill he was building. This is reportedly supported by an entry in Washington's diary that notes the purchase of some Short Hill millstones.\(^{26}\) If the tradition is true, the Short Hill millstone quarry must have been in operation well before the recorded agreements of 1816, as Washington died in 1799.

Though the journal entry has not been located, there is indirect evidence that at least supports the possibility of Washington's millstone purchase. John Conard, Jr.'s father (John Conard, Sr.) was a noted stonemason employed by the Patowmack Company. John Conard, Sr. arrived in the Short Hill area from Pennsylvania in 1762 and leased land from George William Fairfax. As an employee of the Patowmack Company in the 1790s, Conard cut stone and supervised its laying for many of the company's improvements in and around Harpers Ferry. During that time Conard must have met George Washington, for John Conard, Jr. remembered his father's description of Washington: "A good-looking man in a general way, of grave countenance and of courtly social manners, rode a splendid horse and sat as erect and straight as an arrow in his saddle, and impressed one with admiration for his friendly ways, as well as awe of his majestic bearing."\(^{27}\) It is possible that Washington purchased millstones from the elder Conard, a man whose quality stonework was already known to him.

\(^{24}\) Eugene M. Scheel, "Irish Corner Where Loudoun's First Irishmen Settled," HFD-396.

\(^{25}\) LC DB 2U:161, 163.

\(^{26}\) Helen Hirst Marsh, "Mills of Loudoun County," 26-27.

\(^{27}\) Scheel, Loudoun Discovered..., 189-190.
Regardless of whether the local legends surrounding the Masonic cave, the initials on Buzzard Rock, and the millstones prove true or not, it is undeniable that Washington's influence on the Harpers Ferry area was enormous. His familiarity with the land and waterways and his vision of their potential convinced him that Harpers Ferry should be the site for a new federal armory and arsenal.

Long after his death, Washington's presence at Harpers Ferry remained almost tangible, a fact attested to by local resident and chronicler Joseph Barry. In his book, *The Strange Story of Harper's Ferry*, Barry gives a description of "Profile Rock," a rock formation on Maryland Heights:

"One rock, on the Maryland side, is a tolerably well defined face with an expression of gravity, with some other points of resemblance, will remind one of George Washington, and, at almost any hour of the day, may be seen strangers gazing intently on the mountain in search of his likeness. Frequently, the Bald Eagle wheels in majestic circles immediately above this rock and, then, indeed, the illusion is too agreeable to be rejected by the most prosaic spectator. George Washington, chiseled by the hand of Nature in living rock, on the summit of the Blue Ridge, with the Bird of Victory fanning his brow, is too much poetry to be thrown away and common sense matter of fact is out of the question."  

---

Short Hill and Transportation

In January 1837, the first B&O Railroad train rumbled over a new bridge and into Harpers Ferry, ushering in an era of rapid growth and industrial expansion. The local economy boomed as manufacturers could now get tools and machinery from their suppliers in the east. Merchants benefited, too, as they were able to offer a wider variety of goods at their establishments. Likewise, finished products and agricultural goods flowed in the other direction, reaching new and distant markets. Already a significant community because of its strategic location in the Potomac water gap, Harpers Ferry was now firmly cemented as the region's primary shipping center. Now more than ever, Loudoun County farmers from "Between the Hills" and those across Short Hill in Lovettsville looked to Harpers Ferry as the destination for their produce and goods.

While the arrival of the railroad certainly facilitated the movement of people and goods from one place to another, in fact, this development was just one in a series of gradual developments of a regional transportation infrastructure. River ferries and fords, roads and turnpikes, canals, and even footpaths all played a part in shaping the history of the Short Hill tract. An important aspect of the Short Hill tract is its many connections to this transportation network.

River Crossings

Ferries and fords played important roles in colonial Loudoun's transportation network. Fords, the shallow parts of a river that can be crossed by wading, allowed people to overcome the obstacles to migration and travel that large rivers presented. Important transportation routes incorporated the easy crossing places. Survey descriptions included in old land records often mention the location of major Potomac River crossings. For example, George Atwood's 1732 grant to land between Short Hill and the Blue Ridge identifies the floodplain area now known as Dixie Bottom as a place "where people cross over the River" (Figure 10). Accordingly, this site is one of the earliest identifiable fording places on the Potomac above Point of Rocks.29

Where the river could not be safely forded, ferry operations sprung up. The earliest known ferry in the vicinity of Short Hill was Abraham Pennington's ferry at Eel Pot Ford (now Brunswick, Maryland). Pennington's ferry, established sometime prior to 1728 and heavily used by the area's first settlers, was taken over by John Hawkins, Sr. around 1741. This ferry connected the village of Potomac Crossing, also known as German Crossing (other early names for Brunswick), to the Loudoun County shore. By 1822 this important river crossing was manned by Jacob Waltman, Jr., who operated a "heavy ferry." It was called a heavy ferry because it was capable of carrying a wagon, two horses, and several people.30

30 Margrabe, Brunswick..., 12-13.
Likewise, Peter Stephens' ferry at "The Hole" (Harpers Ferry) was an essential part of the area's transportation network. Stephens, a squatter on Fairfax's land, operated a canoe ferry at the confluence of the Shenandoah and Potomac Rivers as early as 1733. Robert Harper, intrigued by the area's economic and commercial potential, took over and expanded the operation in 1747. Harper's ferry was not officially licensed until 1761, but he nevertheless provided a critical service for travelers and farmers. Hoping to attract neighboring farmers to his mill, Harper posted notices stating that "farmers...over the Blue Ridge in Loudoun County...bringing grist to my mill...will be ferried over the...Shenandoah river...free of expense."\(^{31}\)

Sometime prior to 1810, another ferry was established at Harpers Ferry, this one near the mouth of the Shenandoah (Figure 11). A November 9, 1810 notice in the *Farmers-Repository* newspaper states that Ferdinando Fairfax wishes to rent his ferry operations, as well as his store and warehouse on the southern shore.\(^{32}\) By about 1814, the informal lane connecting the ferry landing to Shenandoah Street in Harpers Ferry was known as Loudoun Street, attesting to the ferry's importance to the Virginia county on the opposite shore. The federal government purchased the Shenandoah ferry rights in 1818 and maintained it for twenty-five years, until a toll bridge was finally erected there.

Even closer to Short Hill was "Frail Pain's [sic] Ferry." This early ferry, just downriver from the cluster of fish dams, was put into operation in 1760, when "Frail Pain" – actually Flayle Payne, Jr. – and brother John Payne provided a crossing from their "Pain's Delight" estate in Maryland to Stump's Landing on the Virginia side. The Payne's estate included the land upon which the town of Knoxville, Maryland was eventually founded. Many of the area's natural landmarks, such as Pain’s Branch (a creek through Knoxville), Pain's Rock (a rocky point on South Mountain), and Pain's Falls (in the Potomac River), derive their names from Flayle Payne and his descendents.

On the Loudoun shore, Stump's Landing was named after Thomas Stump, the first known ferryman at Payne's Ferry. Stump was married to Jane Booth, daughter of Robert Booth. Robert Booth was among the early (1732) land speculators around Short Hill. Stump, through his wife Jane, inherited and lived with his family on a 200-acre parcel of the Booth estate. Stump apparently had assistants for the ferry operation; a tithable list of September 1760 records one Patrick McKenzie as working with Thomas Stump at his landing above Dutchman Creek. In terms of the precise location of Stump's Landing, Craig H. Trout, who has researched the nearby Peacher's Mill site in detail, places it approximately one-half mile downriver of the mouth of Falls Branch. Flooding, however, has scoured away all physical evidence of the ferry landing.

On account of its location near the base of the eastern slope of Short Hill, Payne's Ferry was an important crossing for residents of the German Settlement (Lovettsville), The Gap in the Short Hill (now Hillsboro), and others scattered throughout the Piedmont Manor. Ferry operations continued there through the French and Indian War and the decade preceding the American Revolution.

References to Payne's Landing continue to appear in documents as late as 1830 and some Civil War-era maps show roads leading to the landings, but omit the word "ferry." On one of these maps, the road leading up Falls Branch is designated "Boonesboro Road," implying a ferry connection with roads running north through Maryland. Another circa 1926 manuscript map in the papers of George W. Kernodle, a one-time owner of the land in question, labels the location "Hickory Landing." Certainly Payne's Ferry was most active in the 18th century and probably received only intermittent usage, if any, after the mid-19th century.

Roads, too, were essential to connect settlements and provide access to mills and other commercial establishments. The quality of the roads in colonial times, even the primary routes, was usually not good. Overland travel was difficult and slow. Secondary roads, especially in remote areas such as northwest Loudoun, were often little more than unimproved pathways. In some cases, the location of the earliest roads was dependent on even earlier Native American paths, which, in turn, usually followed game trails.

By the 1730s, the various Indian paths traveled by pioneer families had been given English names. For example, the Carolina Road (forerunner of modern US Rt. 15), and further west, the Philadelphia Wagon Road (modern US Rt. 11), were significant regional north-south arteries developed from pre-existing Native American pathways. Of course, natural features such as mountains, gaps, valleys, rivers, and streams also were determining factors in the development of road networks.

Vestal's Gap Road (forerunner of modern VA Rt. 9), an east-west route over the Blue Ridge, appears on maps of the Northern Neck as early as 1754, but was almost certainly used by explorers, hunters, and settlers alike, long before this date. Another important road went from below Robert Harper's ferry on the Potomac River for several miles southward before intersecting the Vestal's Gap Road. This "Between the Hills" route was surveyed in August 1761, when Robert Yeldell and Nicholas Osborn "looked over and marked out a way for a Road leading from Potomack River to ye Mountain Road betwixt ye Blue Ridge and Short Hill to the best of our skill and knowledge both for good ground and convenience of ye inhabiters." Though Yeldell and Osborn's survey took place in 1761, again, it is likely that some type of road already existed in the valley between the Blue Ridge and Short Hill.

Nearly 100 years later, the Hillsborough & Harpers Ferry Turnpike Company constructed a road in this same vicinity. Completed in 1852, the Hillsborough and Harpers Ferry Turnpike was a 30' wide, 15-mile toll road from Hillsboro in Loudoun to a point on the Shenandoah River across from Harpers Ferry in Jefferson County (Figure 12). Influential businessmen from Harpers Ferry backed the project, including the Shenandoah Street merchant, Philip Coons, and the Virginius Island miller, Abraham Herr. Coons, who at the time also owned a large farm and distillery on Short Hill, served as the company's first president. With a few modifications, today's Virginia Route 671 follows the way of the old turnpike and remains a principal means of travel between the two counties.

Closer to Short Hill, a flurry of road building and improvement activities began in the 1760s. Court records suggest that roads leading to Stump's Landing/Payne's Ferry were built between 1760 and 1763. On March 11, 1760, the Loudoun County Court ordered John McIlhaney, Joseph Jones, and William Smith "to view the most convenient way for a new Road from John Hough's Mill [in Hillsboro] to the mouth of Dutchman's Run" on the Potomac River, east of Short Hill. The three men acting as road viewers reported back to the court, stating that the route

---

38 Road Case file No. 38, 1758 – 1763, Loudoun County Circuit Court, Leesburg, Virginia, as quoted in Costantino, 11.
to the mouth of Dutchman Creek would "not answer for a Road neither can any Ferry be here kept." Instead they proposed a road "running...under the short Hill to the River opposite John Payne's about a Mile above the mouth of the Dutchman..." Though no action was taken on this particular road order, this record indicates that road building activities to Payne's Ferry were at least being actively considered.

In 1763, the same Hillsboro miller, John Hough, petitioned the Court "for a Road, from his Grist Mill on the North Fork of Kittockton Creek at the Gap of the Short Hills, to Potomack River opposite or near Frail Pain's." Another report to the County Court in 1768 states "The Great Road some time ago laid out from Frail Pains Ferry to Mahlon Janney's Mill" is "very much hurt." The petitioner, whose farm the road passed through, asked if he could relocate a portion of the road "which will be no disadvantage to the inhabitants using the same, as it will run through more firmer ground." A good road to Payne's ferry from nearby mills was obviously considered important.

39 LC Road Order Book A:301, 329.
40 LC Road Order Book B:169, 227.
41 LC Road Case file No. 40, 1768, as quoted in Costantino, 45.
The Short Hill road down Falls Branch, located partially on Park property, was built in 1825 (Figure 13). Though the legal rights for a road to be kept open and accessible to and from this mill lot had been conveyed since 1818, there is no clear evidence a road existed there until after John Peacher purchased the property. In order to provide easy access to his new flour mill, Peacher made a motion on May 9, 1825, to have a road approved from Georges Mill down Falls Branch to his mill site. The road case was finalized in September 1825 and construction likely soon began. In a motion filed on June 13, 1827, adjacent property owner John Booth requested a minor change in the route of the Falls Branch road to Peacher's Mill. Booth's comments indicate that within two years of Peacher's original motion, the route down Falls Branch was already heavily traveled.42

![Figure 13. Falls Branch road trace, looking south. John Peacher had the road constructed in 1825 to provide easy access to his grist mill. (Photo by Rob Brzostowski)](image)

For reasons not clearly understood, on September 30, 1830, John Peacher filed another road-related motion. This time he requested the Court to approve a road across private lands and down a deep ravine to "Payne's Landing where there is at present a road marked and sometimes used."43 Trout speculates that Peacher petitioned for this alternate route for use during times of minor flooding damage to the Falls Branch road.

42 Trout, "Peacher's Mill...," 33. See also LC Road Case file No. 299.

43 LC Road Case file No. 308.
At about the same time the Falls Branch road was being constructed, another important Short Hill road was in the planning stages. This road, commonly called "River Road" or sometimes just "Around the Points," led from Harpers Ferry at the site of the Shenandoah rope ferry eastward to Conard's Mill on Piney Run. After crossing Piney Run, the road looped northeast through Dixie Bottom, passed around Devil's Elbow and the rocky northern tip of Short Hill Mountain, and proceeded on to Peacher's Mill (Figure 14). At Peacher's Mill, the River Road intersected the earlier Falls Branch road, as well as a short spur road that led to Stump's Landing and Lovettsville beyond.

Figure 14. When completed ca. 1832, River Road became the fastest and most convenient way from Harpers Ferry to Lovettsville. (NPS graphic by John Ravenhorst)

The impetus for constructing River Road came from a number of private citizens who stood to gain most from its completion, chiefly the property owners along the proposed route. Among these men were James Stubblefield (superintendent of the federal armory at Harpers Ferry), John George, various members of the Everhart family (of the fish dam), and John Booth. On October 10, 1825, Stubblefield filed a motion in the Loudoun County Court and, as a result, road viewers were assigned to assess the most practical route from Peacher's Mill to Harpers Ferry. The men submitted a detailed report to the Court. The report contains estimates of how much black powder would be required to blast the rocks at the constricted northern point of Short Hill, and also lists the location, height, and length of several proposed retaining walls needed so as not to interfere with Peacher's millrace and headgate (Figure 15).
The effort to open River Road progressed slowly, as is evidenced by the number of petitions and additional surveys that were filed with the Court over a four-year period. Later documents reveal that the private citizens partially financed construction of River Road at their own expense. These private funds were eventually supplemented with public funding. In January 1832, the *Virginia Free Press* reported that a bill was pending in the Virginia General Assembly authorizing a lottery to raise the necessary money "for removing obstructions" at Short Hill and completing the road. The bill passed a month later and commissioners were appointed to oversee the work. Among the commissioners from Loudoun County were local property owners John Conard, George W. Shover, John Wenner, and John Everhart.

With the necessary funds now in hand, the laborious process of clearing the rocky obstacles at Devil's Elbow began. The technology for blasting rock using black powder had been pioneered by the Patowmack Company in the construction of its locks and gates at Great Falls and was used at Harpers Ferry in association with the early canal construction along the Shenandoah River. The technique was also used to modify the landscape of Lower Town area of Harpers

---

44 LC Road Case file No. 369 (1839).

45 For details see *Virginia Free Press*, January 5, 1832, p2c5 and February 23, 1832, p2c5.
Ferry, especially the rocky areas around the Harper House. By this process, drill holes were made in the rock that were then filled with the powder and ignited. Along River Road, quarrying and blasting cleared the way for the roadbed, and probably also generated the raw materials used to build the road's retaining walls (Figure 17).

When construction of the road was completed, River Road became the fastest and most convenient way to travel and trade goods between Harpers Ferry and Lovettsville. The road was soon heavily traveled and needed maintenance. In 1839, John Everhart petitioned for $1,000 in improvements for the existing road. During the Civil War, River Road was a primary route for troop movements below Harpers Ferry. Finally, in March 1936, after a century of service, a devastating flood badly damaged River Road and it was closed for good. Nature has since reclaimed much of River Road, but the roadbed is still apparent in many places. In some places of exposed bedrock, wagon ruts purportedly have been worn into the rock and are visible yet.

Figure 16. Quarrying and black powder blasting was necessary to open parts of River Road. Drill marks such as this are evidence of the techniques used. (NPS photo by Andrew S. Lee)

The Canal and Railroad

The C&O Canal Company and the B&O Railroad Company both initiated their respective internal improvement projects on the same day – July 4, 1828. But the date of the ribbon cutting ceremonies was not the only thing the two companies had in common. Both companies, in their earliest planning, had proposed to follow the north bank of the Potomac to a point as far west as Cumberland, Maryland. This led to a bitter legal dispute in 1832 and progress beyond Point of Rocks was delayed for both projects. The problem was one of space. From Point of Rocks to Harpers Ferry, the shoreline is at several places reduced to a very narrow strip of land by the sheer cliffs of the Catoctin Mountains. Along this narrow shelf, the projected routes for the works overlapped. Both companies claimed prior rights to the contested right-of-way.

After the legal conflict was finally settled in 1833 (by a compromise agreement quite favorable to the canal), the two competing companies resumed their race towards Harpers Ferry. At the same time the improvements were being made to open River Road around the northern tip of Short Hill, on the other side of the river the B&O and C&O were both securing right-of-ways and starting construction around Knoxville and the future sites of Weverton and Sandy Hook. Slowed by a deadly outbreak of Asiatic cholera that affected the available labor pool, the canal did not reach Harpers Ferry until November 1833. The railroad was completed to Harpers Ferry in December 1834.

The coming of the C&O Canal and B&O Railroad transformed Harpers Ferry from a small village to a major crossroads of 19th-century industry and transportation. Farmers and millers from the surrounding areas also reaped the benefits of these new modes of transportation as their corn, wheat, and flour could now be shipped to market faster and cheaper than ever before. The nearly simultaneous completion of the River Road in the Short Hill area and the arrival of canal and railroad in Harpers Ferry did much to strengthen the ties that already existed between the two places.

During the years prior to the Civil War, two other railroad companies were interested in using the Loudoun County shoreline around Short Hill to make a direct connection with Harpers Ferry, but neither of these proposed routes ever came to fruition. The Alexandria, Loudoun & Hampshire Railroad Company, incorporated in 1847 by the Virginia Assembly, wanted to run its railway "around the points." The plan continued to be discussed by interested businessmen in Harpers Ferry, a number of whom were also backers of the contemporary Hillsborough and Harpers Ferry turnpike, as late as 1853.  

Just as interest seemed to be flagging in a railroad alignment around Short Hill, the Virginia Assembly briefly revived the idea. In 1854 the Assembly proposed funding for a Loudoun Branch of the Manassas Gap Railroad. The proposed branch line would run north from Purcellville in Loudoun County along the east side of Short Hill and follow the alignment of River Road towards Harpers Ferry (Figure 18). Discussions were held the following year and in 1856 the act was approved. This was a renewal of an earlier effort that had gone bankrupt.

several times before. Construction of the roadbed reached Purcellville in 1853, but no tracks were ever laid and the idea was soon abandoned.

The Egg Path

Another local transportation route that deserves mention is the Egg Path, a narrow east-west trail across the steep slopes of Short Hill. Situated just south of National Park Service property, on the east side of the crest the trail begins at the end of present-day Long Lane. On the west side the trail descends to meet the road currently known as Snider Lane. In the past, a spur of the Egg Path extended north from Snider Lane to Conard's Mill on Piney Branch.

---

According to Loudoun County historian Eugene Scheel, Mr. Abner Riley, a farmer who lived adjacent to the northern spur of the trail during the postbellum period, coined the name "Egg Path." Riley was a fixture on the trail; on horseback he often used it to cross over to the Lovettsville-area where he gathered eggs and butter. He would then put the produce into two baskets that hung from his horse, Patch Stripes, and bring it back to sell at stores and hotels in Harpers Ferry. 49

Another local resident, Miss Catherine Stevens, remembered the Egg Path and its importance to the local economy. In a 1975 letter she wrote:

...some went across this mountain...either riding a horse, in a buggy or in a wagon. Those making the trip often visited relatives on their ways to or from taking eggs, butter, chickens etc. to market over at the stores in Harpers Ferry. Prices for such items were higher in Harpers Ferry than at the local stores...There was another way to go, and that was the Egg Path, wide enough to ride horseback or for a person to walk over the mountain. Someone told me a short time ago that Mr. and Mrs. Calvin Everhart, Charlie Everhart's mother and father, as well as Walter Frye's father were a few of the local people who used to take eggs, etc. across the mountain to sell in Harpers Ferry a number of years ago.50

In addition to providing a short cut to the Harpers Ferry stores, the Egg Path was also used by attendees of the Ebenezer Church. The church was located on the west side of Short Hill Mountain on present day Snider Lane. By the 1880s, only a few church members were from the east side of Short Hill and the congregation began looking for a more convenient site along the main road. By this time the trail over the mountain was becoming less and less passable, and when the church was relocated in 1895, regular usage of the Egg Path seems to have ended.51

Industrial and Agricultural Use of Short Hill

By the early 1800s, much of the Short Hill area's agricultural and industrial potential was beginning to be realized. Land transportation and ferry services had improved during the last half century and most of the natural resources that attracted early settlers were still abundant. Roads – particularly the "Between the Hills" Road and the routes leading to Payne's Ferry – led to active development of the Short Hill tract. Milling, which had long played an important role in the region's local economy, was the earliest industry to appear on the Short Hill tract. Peacher's Mill, constructed in 1825 at the mouth of Falls Branch, was the most significant local industrial development. Hand in hand with industrial development came small-scale agricultural-related activities such as the establishment of farms and orchards, distilleries, and timbering operations.

The presence of the Potomac River and its swiftly flowing tributaries contributed enormously to the proliferation of mills around Short Hill during the 1700s. The rushing water not only provided abundant power for machinery, it also served as a ready avenue for boating finished flour to the waiting markets of Georgetown and Alexandria. When one considers the readily available building supplies and local scope of community living, it seems practically inevitable that these mills should have appeared.

Of particular interest to the Short Hill tract prior to the construction of Peacher's Mill are Dodd's Mill (early 1760s) on Dutchman Creek and Conard's Mill (1806) on Piney Run. Dodd's grist mill was purchased by Jacob Everhart, Sr. in 1765. Everhart's descendants were among the early owners of the Short Hill river mill lot and eventually sold a portion of it to John Peacher. Conard's Mill, lying just west of the present park boundary, was the Dixie Bottom area's first known business. Situated on a westerly bend of Piney Run, John Conard, Jr. operated the successful grist mill until his death in 1841. His son Joseph Conard inherited the business, but soon the mill faced growing competition from the grist mills over in Harpers Ferry. A toll bridge built across the Shenandoah in 1844 provided local farmers a choice in where to take their business. Local tradition indicates Conard's Mill operated up until the mid-1870s. It could not compete with the Harpers Ferry mills that used more modern "roller mill" technology.\(^{52}\)

Within the boundaries of the current NPS Short Hill tract, other properties were recognized as being suitable for mills. In a deed dated June 1, 1812, from Ferdinando Fairfax to Elijah Chamberlain's trustee, Chamberlain's purchase is described as including lands "comprehending a range of Mill seats with a command of Water at & below a Considerable Fall on the River Potomack."\(^{53}\) Whether or not he intended to develop the property is not known, but Chamberlain was among a group of citizens involved in "The Jefferson Company of Farmers, Mechanics, and Merchants." This company was founded in 1814 "to encourage the spirit of improvement and enterprise in agriculture, commerce, manufactures, and the mechanic arts."\(^{54}\)

\(^{53}\) LC DB 2P:315, dated June 1, 1812.

\(^{54}\) *Farmers-Repository*, June 9, 1814, p3c1-3.
No improvements were made, however, and in 1818 Chamberlain sold his lot to Jacob Waltman, Sr.

In the deed from Chamberlain's trustee to Waltman, Waltman acknowledges the receipt of the above "river mill lots" and the "right for a road to be kept open to & from the mill seats on said mill lots." The land, encompassing about sixty acres where Falls Branch meets the Potomac, was commonly referred to as "Waltman's river mill lot."

Waltman's lot was not the only area within the NPS Short Hill tract that was deemed potentially suitable for a mill. In 1819, Frederick Handshy sold all of his certain tract of land on the west side of Short Hill, "reserving and excepting one acre in the upper bottom together with the use of the water if the sd [said] Hensha shall want the same for a mill." Though a mill was never established on the property, Handshy's reservation reveals that it was valued for its industrial potential. Jacob Waltman's lot was much better situated for the seating of a mill and John Peacher was the man who would develop it.

**Peacher's Mill**

In 1816, John Peacher, a boatman working the Potomac River landings near the old Keep Tryst Furnace, advertised in the *Farmers-Repository* newspaper: "To gentlemen millers and farmers. Am in boating this season. Warehouse on the Potomac ½ mile above old Furnace. Will deliver flour to Alexandria and Georgetown. John Peacher." The following year Peacher purchased an island in the Shenandoah and relocated his boating stand there. The island, the lowermost one in the Shenandoah, soon was called "Peacher's Island" (later "Stubblefield's" and eventually "Virginius Island"). Sometime between 1820 and 1823, Peacher expanded his boating operations and went into the milling business. Not only did he build a "chopping mill" (grist mill) on Peacher's Island, he also assumed control of another mill back on the Keep Tryst Furnace tract.

In 1823, in one of several business dealings with armory superintendent James Stubblefield, John Peacher sold Stubblefield a portion of Peacher's Island for $15,000. Using the money realized from the sale, Peacher bought a 10-acre portion of "Waltman's river mill lot," the Short Hill tract that straddled the mouth of Falls Branch. He purchased the land from Jacob Waltman's in-laws, the Everhart brothers, who operated fish traps out in the river (Figure 19). The Everharts may have been reluctant to sell to Peacher for two reasons: first, Peacher's new grist mill would be in competition with their own family's mill on nearby Dutchman Creek; and Peacher's millrace

---

56 LC DB 2Y:29, dated April 1, 1819.
57 *Farmers-Repository*, February 1, 1816.
58 For details of Peacher's career prior to establishing his Loudoun County mill, see Trout, "Peacher's Mill..." 19-28.
might also interfere with their fish dam operation. After inserting a clause in the deed to protect the fish dam, the sale was made in 1824.

Peacher's shoreline property included a strip of land on the west side of Falls Branch long enough to accommodate a millrace and head gate. Work is believed to have begun on the mill, millrace, and head gate almost immediately. Peacher's millrace was unique; it was the only one in Loudoun County to draw water directly from the Potomac (Figure 20). Judging from the available fall of the river and estimated level of the mill’s first floor, Trout suggests the millrace powered a wheel (or wheels) of the "undershot" design. Because of the source of its waterpower, the mill was sometimes called "River Mill."

Construction of the mill complex was completed in 1825. The 2½-story mill building, possibly constructed of locally quarried stone, was approximately 55' long by 30' wide. The walls were substantial, built 30" thick so they would be capable of resisting the periodic floods that were sure to come (Figure 21). A warehouse or perhaps a frame elevator was attached to the mill’s west wall; this would be a necessary feature to meet the storage needs associated with processing grain and selling finished flour. The structure had a basement, or "meal floor," that is currently exposed to a depth of only about 2'. The basement would have included the cog pit as well as bins for receiving the finished meal and flour from above. The first floor ("stones floor") housed

---

60 Trout, "Peacher's Mill...," 31.
the millstones and was supported by three heavy timbers that were inserted into the wall (Figure 22). A corner fireplace suggests the mill office was located on the first floor as well (Figure 23). The second floor typically would have housed grain bins that fed unprocessed grain down to the millstones below, grist cooling apparatus, tools, cooperage supplies, and other lightweight items such as empty barrels and sacks. The second story loft or attic would have been where the gear shafts, pulleys, and conveyor belt systems terminated.

Approximately 200' southeast of the mill on a small rise are additional ruins associated with John Peacher's milling operation at Short Hill. The stone foundation of what is generally considered the miller's house is 27' by 28' with an exposed half basement present on the northeast side (Figure 24). Adjacent to the miller's house are the stone foundations of two additional buildings, set end to end, the whole measuring 35' by 12'. Also nearby are the remains of a small outbuilding, possibly a springhouse, and numerous stone walls of varying heights. While the function of these various structures is nowhere indicated in the historic record, Trout points out that an operation the size of Peacher's might have supported a warehouse, a blacksmith shop, a cooper's shop, stables, or even a small saw mill. Archeological research is needed to determine the use of the buildings. Fortunately, given their elevation above the river, it is possible that the miller's house and its outbuildings have avoided much of the damaging effects of flooding.

Figure 23. A fireplace in the southeast corner of the first floor suggests the mill office was located there. (Photo by Rob Brzostowski)
About 450' up Falls Branch on the east side of the road trace is a dam of dry-laid stone (Figure 25). Though no documentation has been found on this feature, the dam almost certainly dates to 1825, the original period of construction of the Peacher's Mill complex. Based on the dam's distance from the mill complex below and its relative elevation, it may have provided water for an additional sluiceway that led either to the miller's house or the mill itself. The dam currently ranges from 5' to 8' tall and spans Falls Branch at 32' wide.

Further up Falls Branch, near the current NPS gate about ¼ mile south of Peacher's Mill, is the site of Shover's distillery. According to a Leesburg newspaper report in 1827, "four copper stills have been installed by George Shover near Peacher's Mill." Operating a distillery near a mill had certain advantages, especially in the form of a ready supply of corn mash. The closeness of Shover's Distillery and Peacher's Mill is depicted on Civil War-period map (Figure 26).

---

Figure 25. Dam on Falls Branch. (Photo by Rob Brzostowski)

Figure 26. This detail of a Civil War-period map shows the location of Shover's Distillery in relation to Peacher's Mill. (O.R. Atlas, Plate XIII)
During the early years of its operation, Peacher's Mill served primarily the needs of the local farming community, grinding wheat, corn, and rye for the nearby farmers of Short Hill and Lovettsville. With the completion of River Road in 1832, the mill came to occupy the key intersection of the Falls Branch road and the main route to the Neersville area and Harpers Ferry. The proximity of Peacher's Mill to Stump's Landing and Waltman's heavy ferry at Berlin also provided a connection (after 1833) to the newly built C&O Canal and B&O Railroad systems. This connection allowed Peacher to do business with those outside of the local area. According to some reports, large shipments of imported grain received from C&O canal boats were transported by wagon to Peacher's Mill.\(^{63}\)

Despite the advantageous location of Peacher's Mill, and perhaps due to personal financial stress caused by a nationwide economic depression in the mid-1830s, John Peacher decided to sell his Loudoun County mill. On February 25, 1836, an item in the *Virginia Free Press* informed its readers: "John Peacher, Sr. selling mill on Potomac 4 miles below Harpers Ferry..."\(^{64}\) When the mill finally sold almost three years later, the sale price was only $4,250. The low sales price and evidence from property tax records indicates the mill building and/or its machinery was in poor condition. Through 1838, the mill was consistently valued at $1,500, but then dropped in value in 1839 to $800.

Robert Y. Wilson of Baltimore purchased Peacher's Mill in 1839. Wilson was a key financial backer of Caspar Wever and the Wever Manufacturing Company. Wilson's purchase was one in name only; the guiding force behind the acquisition was Caspar Wever. Inspired by the factory town of Lowell, Massachusetts, and the rapid developments taking place over at Harpers Ferry, Wever formulated a plan to develop his own industrial community at a site across the Potomac from Peacher's Mill. A voracious reader and informed businessman, Wever surely understood that his Maryland land along the falls of the Potomac, or "Weverton" as it was aptly named, held the same industrial potential (Figure 27). Wever had strong money-making ambitions as well and this led him to acquire much real estate, speculating on a big return in the future.\(^{65}\)

Over on the Loudoun shore, Wever's plans included expanding the production of the Peacher's Mill complex. Deeds indicate he had the mill refurbished shortly after it was purchased and census records suggest a miller and two assistants were hired to oversee the day-to-day operations. Then, in 1847, the Wever Manufacturing Company initiated condemnation hearings against the lands of John Everhart, Sarah (Everhart) Wenner, and Samuel E. Washington, in order to widen the Peacher's Mill millrace. The company's stated reason for the improvement was to "build other machines and engines...and to supply the same with water by enlarging the present race or canal."\(^{66}\) During this time Peacher's Mill was known variously as "Wever's Merchant Mill," "Weverton Flour Mill," and "Canal Mill."

\(^{64}\) *Virginia Free Press*, February 25, 1836, p2c4.

\(^{66}\) LC Order Book 10 (1847), 354-356, 374, 386, 394.
At the same time as improvements were made to the millrace, Caspar Wever was negotiating with the C&O Canal Company to have a dam built across the Potomac. Needed to divert water to power the mills on both shores, the dam was to occupy the same rocky ledge that had supported the Everharts' fish dam since prehistoric times (Figure 28). The fish dam was removed and C&O personnel began work on the new dam. Completed in 1849, the Weverton dam consisted of wood-covered rock cribbing secured with iron bolts to the bedrock in the river.

The Wever Manufacturing Company, despite its name, was not directly involved in manufacturing. Instead, it was devoted to the development and management of waterpower and to the sale and lease of adjacent real estate. Weverton Manufacturing's own insufficient capital and their excessive lease rates discouraged other companies from investing in Weverton. As a result, Wever's dream of establishing an industrial village never fully materialized. A flood of unprecedented proportions struck in 1852 from which Weverton never fully recovered. A number of liens were placed on company assets to ensure the payment of company debts. Liens were attached to Peacher's Mill, and when the debts were settled to the satisfaction of the courts in 1860, the property was sold by the Sheriff of Loudoun for a mere five dollars.\textsuperscript{67} The mill seems to have remained in production, although at a reduced capacity, until sometime shortly after the Civil War.

\textsuperscript{67} LC DB 5T:209, dated December 16, 1860.
Quarrying

Though stone quarrying was never pursued on a large commercial scale on Short Hill, it nevertheless fulfilled local needs. Documentary evidence for quarrying on Short Hill is found in a deed agreement between two Dixie Bottom property owners, construction reports for the River Road, and advertisements in local newspapers. Other indications of quarrying are the actual physical remains indicative of this limited industry. There are what appear to be at least two abandoned quarries on the NPS Short Hill tract.

The earliest mention of stone-cutting activities comes in the form of an 1816 agreement between miller John Conard, Jr. and his brother-in-law/neighbor Canrad Neer. Neer agreed to allow Conard to buy rock on Neer's lots so that the miller could fashion millstones. This arrangement was significant as it illustrates a growing self-reliance by area millers that was absent in earlier colonial days. Up to this time, the most popular millstones were French burr-stones, which had

---

68 LC DB 2U:161, 163; both dated March 15, 1816. There is anecdotal evidence of earlier quarrying (see section on George Washington).
to be imported and often at great costs. The Short Hill millstone quarry may have been utilized sporadically into the mid-19th century, when merchant Philip Coons became owner of the property. Newspaper advertisements indicate Coons was selling grindstones at his store in Harpers Ferry.

Significant quarrying appears to have occurred along River Road near Peacher's millrace and the Weverton dam site (Figure 29). Records associated with the construction of River Road indicate quarrying and blasting occurred there to make room for the road along the narrow shoreline. The quarry may also have been the principal source of building stone for the nearby Peacher's Mill and its attendant miller's house and outbuildings. Furthermore, the quarry would have been a convenient source for materials necessary for the frequent repairs made to the mill, the Weverton dam, as well as the structures across the river at the Weverton town site. A smaller quarry is located several hundred feet east of the rock walls found at the Peacher's Mill complex.

Figure 29. The bare spot on the side of Short Hill Mountain indicates the location of past quarrying activities. (Photo by Rob Brzostowski)

70 Virginia Free Press, December 19, 1844, p4c3.
Plentiful quantities of timber on Short Hill awaited the first settlers. Just how valuable a commodity the wood was can be gleaned from a 1785 lease agreement between farmer Jacob Sullifrank and owner George William Fairfax. In the lease, Fairfax included some very specific conditions regarding the woods and its management during Sullifrank's tenancy. In fact, Sullifrank could not use or dispose of any timber or wood without Fairfax's consent. Neither was Sullifrank to allow any "waste or spoil to be made of the woods, underwoods, trees or timber and if at any time any timber fit for carpenters or coopers use, or rails should be cut down in clearing ground or otherwise, the same shall all be worked up and not suffered to rot or perish under the penalty of five pounds over and above the value of such timber...for every such offense." A final stipulation required Sullifrank to leave standing in one body at least seventeen acres (20%) of his eighty-five acre farm. The wood from these acres would have been utilized to support and maintain the farm, providing materials to construct and repair the dwelling, outbuildings, and fences, as well as serving as fuel for heat.

The Fairfax woodlands situated on the south side of Shenandoah River, across the river from the armory, were early recognized as a valuable source of wood. A constant supply of wood and charcoal was needed to heat the armory workshops and fire the iron smelting furnaces. In 1809 a contract was made with Ferdinando Fairfax whereby Fairfax allowed the armory to cut 1,400 cords of wood on his Shannondale Manor land "from the mouth of the Shenandoah to Nicewanger's place...," a property adjacent to the Piedmont Manor containing the Short Hill tract. Two years later, in 1811, Ferdinando Fairfax offered to sell to the United States (also for the use of the armory) the right to cut wood from the Loudoun Heights portion of Shannondale Manor for ten dollars per acre.

About the same time Fairfax was completing these deals with the U.S. government, he began dividing up his Piedmont Manor tract and selling off parcels specifically as wood lots. John Matthias, the official Loudoun County surveyor, was employed to mark off several contiguous lots on the east side of Short Hill Mountain. The western boundary line of these woodlots was the crest of Short Hill Mountain and it remains a boundary for the current NPS Short Hill tract. Elsewhere on Short Hill, an 1812 deed to Jacob Waltman, Sr.'s "wood lott" describes the land as "...Chiefly in wood and timber some of it large and fine..." A portion of this tract apparently remained wooded at least through the late 1870s, as subsequent deeds refer to the property as the "Washington Wood lot."

By 1829 the armory obtained all of its firewood and charcoal from Loudoun Heights and an estimated 2,000 wagonloads per year was brought over to Harpers Ferry. Starting in 1835, the work was contracted out to individuals who furnished woodchoppers and also hauled the wood.

---

73 LC DB  2P:313, dated June 1, 1812 and LC DB  6L:374, dated November 2, 1877.
to the armory.\textsuperscript{74} Among those contractors was the prominent Harpers Ferry merchant, Philip Coons. Coons owned several large farms, one of which, known as the Still House Farm, consisted of 309 acres on the west side of Short Hill in the Dixie Bottom area. Armory documents show that Coons entered into contracts with the U.S. for delivery of charcoal and wood from as early as 1829 to at least until 1843.

Both the U.S. Armory and private landholders were continually bothered by trespassers on their wood lots. Pilfering of wood supplies on Loudoun Heights had become a problem as early as 1818 and overseers and rangers were eventually hired to patrol the woodlands.\textsuperscript{75} In 1829 the armory superintendent issued warnings in the local newspaper against trespassing on government wood lots. Philip Coons placed similar public notices forbidding trespassing and the pilfering of wood "on his land in Loudoun two miles below Harpers Ferry."\textsuperscript{76}

Coons was involved in other entrepreneurial activities that he hoped would increase the value of his Still House Farm. As president of the Shenandoah Bridge Company he spearheaded the effort to replace the Shenandoah ferry with a toll bridge. The bridge became a reality in 1844 and was soon returning a handsome profit on initial investments. An account in the \textit{Spirit of Jefferson} states, "It is acknowledged by all who are acquainted with the subject that [the bridge project] would have failed, but for the great energy and untiring zeal with which Mr. Philip Coons exerted himself."\textsuperscript{77} Then, in 1851, now president of the newly formed Hillsborough & Harpers Ferry Turnpike Company, Coons granted free passage for armory employees and waived tolls for wood and coal shipments to the armory. Both of these efforts, the bridge and turnpike, occurred as the wood supply on Loudoun Heights was nearly exhausted and the armory was actively seeking other sources of timber. Had he not been forced to sell his Loudoun farm a few years later, it is likely Coons' Short Hill land would have been valuable indeed (Figure 30).

Logging on Short Hill never seems to have reached a large scale. With the destruction and closure of the armory during the Civil War, the primary consumer of the area's woodlands was gone. It was not until the early 20\textsuperscript{th} century that some clearing of timber on the Short Hill tract occurred.

In 1903, Charles E. Roach purchased the old Coons Still House Farm tract. The following year he sold a fifty-acre portion of the property. The deed for that transaction specifies that Roach retains the timber rights for one year and that he reserves a right-of-way "until the balance of the tract is cleared of wood and timber and that fences are to be kept closed during wood hauling."\textsuperscript{78} It is unknown whether Roach was associated with the Roach Lumber Company that appears

in local advertisements beginning in 1909. Road traces located throughout the NPS Short Hill tract were probably associated with the logging of this period.

**Orchards And Distilleries**

The growing of orchards began in Dixie Bottom at an early date. The above mentioned Sullifrank-Fairfax lease agreement of 1785 contained, among other things, a provision that compelled Sullifrank to establish an orchard and keep it in "*good and sufficient repair.*" Fairfax's requirement for his tenant to plant an orchard was actually a fairly standard clause in many leases of the period. Fairfax wanted his lands to be developed and he early recognized the value of orchards as a means to do it. He correctly estimated the soil and climate of the area to be especially favorable for orchards. Indeed, since colonial times the orchard industry has prospered and to this day features prominently among the agricultural pursuits of the region.

Sullifrank's lease stated that within two years he was to plant an orchard of 100 winter apple trees and 150 peach trees. The apple trees were to be placed at a minimum of 30' away from each other and the peach trees at least 16' apart. The entire orchard, Fairfax insisted, should then be "*well inclosed with a good, sufficient and lawful fence*" to protect the fruit from horses and
other livestock. The trees were to be kept well pruned and if any should die, Sullifrank was to replace them in kind.\textsuperscript{79}

Sullifrank's orchard seems to have prospered. Later deeds to the same property suggest the orchard was maintained by subsequent owners or tenants. For example, James Stubblefield's 1827 deed is careful to state that his purchase includes all houses, buildings, and orchards.\textsuperscript{80} At some point (if it was not actually part of Sullifrank's original farm) a distillery was added to complement the existing orchard. Proof for the distillery is found in an advertisement of sale placed by Philip Coons in 1834. After having purchased the property from Stubblefield only one week before, Coons advertised: "As I have determined to remove to the West, I will offer for sale my Property...I will also sell my FARM and DISTILLERY, situated in Loudoun county, Virginia, within two miles of Harpers-Ferry, on the Potomac River."\textsuperscript{81} Coons, in fact, did not sell the orchard and distillery at this time. He owned the property until 1856.

During Coons' tenure as owner, the orchard and distillery came to be known as the Still House Farm and the surrounding land was commonly called Still House Flats. Under Coons' management from 1834 to 1856, improvements were made at the Still House Farm, so that by 1855 it contained three dwelling houses, a stable, barn, spring house, still house, and about 500 apple trees. The 309-acre tract contained approximately sixteen acres of orchard land while the remainder was largely in timber. Several stone foundations and one abandoned and dilapidated frame dwelling are found on the property today (Figure 31). The various structures are of undetermined age, but some potentially date back to Sullifrank's tenancy beginning in 1785.

Coons, in one of his many commercial enterprises, sold groceries in Harpers Ferry and the apples from Still House Farm may well have been sold at his store on Shenandoah Street. A testimonial in the \textit{Virginia Free Press} newspaper, remarking on a rather large piece of fruit, states: "Have been presented with an apple by Mr. P. Coons. Measures 14 inches in circumference. Comes from his Still House Farm 2 miles from Harpers Ferry in Loudoun County."\textsuperscript{82} When Coons' personal property was put up for sale to cover some debts, the inventory included items related to his distillery at Still House Farm, including: "2 Stills, cups, and [illegible]; 20 Hogshead for Distilling; 20 Cider, Molasses, liquor & fish barrels; 6 Barrels of Cider & Vinegar; 2 Empty half barrels; 1 Cider Mill cast iron nuts; 1 Cast iron Screw Cider Press; [and] 1 Grindstone & Crank."\textsuperscript{83}

Figure 31. Ruins of the Still House Farm property. The stone foundation is the still house; the frame structure is of undetermined age. (NPS photos by David Tucker)
After Still House Farm passed out of the possession of Philip Coons, references to the orchard and distillery largely disappear from the historical record. However, descriptions of the acreage still characterize some of it as "orchard or hill land" as opposed to the more general "wood lot."

Other distillers are known to have manufactured "moonshine" in the Dixie Bottom area in more modern times (Figure 32). Historian Eugene Scheel reports that Mr. Johnny Nick and his father operated a legal still at the mouth of Piney Branch (site of the NPS Potomac Wayside). The still continued in operation (illegally after Prohibition was ratified in 1920) until 1941, when the Rt. 340 bridge was constructed and the site was no longer as remote as it once had been. Illegal stills were occasionally raided by the law. In 1927, the *Farmer's Advocate* reported that five Prohibition officers raided a moonshine camp in Loudoun County one mile southeast of Harpers Ferry. The raid netted two stills and an unspecified quantity of mash and liquor.84

Another local man, Harry "Shorty" Ashbaugh, chose an un-named stream in the Dixie Bottom floodplain for the site of his intermittent moonshining operation. Ashbaugh, who also ferried passengers across the Shenandoah River after the 1936 flood destroyed the old bridge there, lived in a "close by cabin at the head of the stream." A humorous anecdote says that, while he tended his illegal still, his family was instructed to tell anyone who asked, "He's hunting squirrels up on Short Hill." Scheel states that Ashbaugh continued to "hunt" into the early 1950s.85

**Limekiln on Falls Branch**

By the year 1780, much of the soil in Loudoun County had become seriously depleted and unproductive. To many farmers the idea of rotating crops was not considered important and their insistent growing of corn or wheat exhausted the soil almost as quickly as tobacco had in the rest of the state. In contrast to the general poor husbandry of their neighbors, the farmers of the Quaker and German settlements of northern Loudoun practiced crop rotation and manuring. In addition to these practices, many German farmers also applied crushed limestone to their fields. Adding lime to the fields balanced the soil conditions and noticeably increased a farmer's yield. The custom was not widely practiced until after 1803 when Loudoun agronomist John Alexander Binns published a popular book on the subject. Binns had first seen the effectiveness of the method during his Revolutionary War service near Philadelphia. The "Pennsylvania Dutch" had brought the tradition with them from Germany and subsequently carried it with them to Virginia.

Testimonials to the effectiveness of Binn's "Loudoun system" soon filled the newspapers. Here and there mills sprang up where limestone could be ground into powder. So great were the increases in yield in Loudoun's wheat country, that farmers wholeheartedly embraced the practice. As a result of this balanced agriculture, harvested grain flooded the mills and was "king" of the region throughout the rest of the 19th century.

In addition to grinding by waterpower, limestone could be burned in a kiln to produce lime. Alternating layers of wood and limestone were laid down inside the kiln. The wood was then burned and the resulting burnt lime was removed through a small opening at the base. One such limekiln is located on the east side of the Falls Branch road, just south of Peacher's Mill (Figure 33). Scheel attributes the construction of this limekiln to the Leesburg firm of Manning and Orr. He states it was built in the 1870s, run by local farmers as a cooperative, and was last fired in the late 1890s. A lack of local limestone may account for the brief period of operation.

Though operation of Peacher's Mill had long before left his family's control, it is possible that John Peacher's grandson was affiliated with the Falls Branch limekiln. The 1910 census lists William H. Peacher's occupation as foreman of a limekiln. Born in 1871, William Peacher would have been a young man during the kiln's brief period of operation. Though it is only speculation, he may have acquired the necessary skills there to become foreman at another later limekiln.

---

88 1910 U.S. Census, 166. William H. Peacher's son (William L. Peacher) and two in-laws (Nute Manuel and Edward Manuel) are also listed as limekiln laborers.
Springs and Water

It was the availability of water and waterpower that fostered the industrial developments and nurtured the agricultural pursuits around Short Hill. The Potomac River was the obvious source for water to power mills and their machinery, but springs and streams provided the water for household use and for use in the local distilleries. Fresh water springs can be found scattered across Short Hill, but one in particular – Painter's Spring – deserves special mention. Painter's Spring, so-called because of its location on the old Painter family property just south of Peacher's Mill, was well known for its great capacity.

So great was the output of Painter's Spring, that for many years it provided water for the entire town of Brunswick. In 1919, town officials sought to replace their old pump system that drew water directly from the river with a gravity-based system. The new system called for a collector pipeline to run down Short Hill from Painter's Spring, across the Potomac River to Knoxville, where it would then turn and proceed to a reservoir in Brunswick – for a total distance of about two miles (Figure 34). Acting on behalf of the citizens of the town, the mayor negotiated the purchase of the necessary right-of-way and obtained an easement across George W. Kernodle's

Figure 33. Limekiln on Falls Branch. It was in operation from ca. 1870 to ca. 1900. (Photo by Rob Brzostowski)
Kernodle had his own plans for the Short Hill tract. In 1925, he began a sustained but unsuccessful campaign to generate hydroelectricity at his Short Hill property. Kernodle envisioned a dam on the Potomac at the northern tip of Short Hill.

Construction of Brunswick's water pipeline started in 1922. Painter's Spring was capped and a 6" cedar pipe wrapped with wires was attached. About fifteen years later, with funding obtained from the Public Works Administration, the cedar pipe was replaced with a 6" steel pipe. The steel pipe is still visible as it approaches the Potomac River, poking through the ground about 12' east of the ruins of Peacher's Mill. This use of the future NPS tract is the last documented development to occur on Short Hill.

90 LC DB 10E:299, dated April 18, 1919.
Short Hill and the Civil War

On the eve of the Civil War in 1861, residents of Loudoun County, Virginia were divided in sentiment over the issue of secession. The difference of opinion was largely a result of the nature of the county's early settlement. Germans and Quakers had come down from Pennsylvania to take up small farms in the northern and western portions of the county, while planters of English heritage had settled the eastern and southern portions of the county where they established larger plantation-like holdings. Thus, when faced with the decision to remain with the Union or join the Confederacy, the northern and western sections were predominately pro-Union, while to the south and east the people were equally strong in their Southern views.

On April 17, 1861, five days after the attack on Fort Sumter and the beginning of the war, the Virginia convention met and passed an Ordinance of Secession by a vote of 85 to 55. The ordinance could not become official, however, until ratified by the people in a special referendum. The two delegates from Loudoun had voted against secession in Richmond, but popular opinion had shifted by May 23, 1861 when Loudouners, by a more than 2 to 1 margin, endorsed ratification of the Ordinance.

The results of the referendum in Loudoun show how deeply the county remained divided. The precincts in the northwestern section voted more than 7 to 1 against the ratification, while the eastern and southern precincts voted strongly to support it. Several precincts in southern Loudoun voted unanimously for its adoption. The residents living "Between the Hills," including the populations of Neersville, Turneysville, and the areas on the west side Short Hill, voted in the Waters Precinct. When the results were tallied there, thirty-nine votes were cast against secession and twenty-six in favor. Even though the Waters Precinct neighbored other overwhelmingly unionist precincts, people living in the Short Hill area were still clearly divided.\footnote{Fitzhugh Turner, (editor), \textit{Loudoun County and the Civil War: A History and Guide}, (Potomac Press, Leesburg, Virginia, 1961), 12; Scheel, \textit{Loudoun Discovered...}, 203.}

Virginia's decision to secede had dire consequences for the residents of northwestern Loudoun County. When Maryland failed to join the Confederacy, Loudoun found itself in the dangerous and unenviable position of being a border county. The physical geography of the region left it no protection from invasion. Under average conditions, the Potomac River had multiple fording places that allowed troops to advance through Loudoun during offenses and likewise retreat through it after defeat. Strategic mountain passes in the Blue Ridge also attracted armies and served as critical routes of supply and communication.

The richness of Loudoun's agriculture and quality of its horses and livestock frequently attracted armies of both sides in need of supplies. The presence of the B&O Railroad and nearby Harpers Ferry placed further emphasis on Loudoun as a border county. The strategic importance of the B&O Railroad, and the South's nearly constant attempts to disrupt it, ensured a military presence throughout the war. Though no major engagements occurred in Loudoun, with the exception of the battle of Ball's Bluff, the citizens endured many hardships.
Within the boundaries of the NPS Short Hill tract, wartime activities were on a limited scale. Because of its inferior elevation to Maryland Heights and South Mountain, Short Hill Mountain was not considered a critical position to hold (Figure 35). Picket forces and scouting parties probably entered the area from time to time, but there is no documentation supporting any sustained occupation. Trout suggests the possibility that some of the rock "walls" near Peacher's Mill may have served some military purpose, as the site commands the Loudoun shoreline approaches to and from Harpers Ferry.  

Certainly the River Road from Harpers Ferry to Lovettsville was an important east-west route of travel for both sides. On February 24, 1862, five companies of the 28th Pennsylvania Infantry and a four gun battery under the command of Colonel John W. Geary crossed the Shenandoah River from Harpers Ferry and occupied Loudoun Heights. By February 27, they were joined by the remaining companies of the regiment supported by another four guns of the battery plus a squadron of the First Michigan Cavalry. On the following morning they marched towards Lovettsville along the River Road. In his report of the movement, Geary wrote "...along the route [we] were greeted with enthusiastic demonstrations of joy and manifestations of Union feeling."  

---

92 Trout, "Peacher's Mill...," 33.
Geary's forces occupied Lovettsville where he established his headquarters. He obviously received a similar welcome to the one given him as he rounded Short Hill. Regarding Lovettsville, he wrote: "The majority of the inhabitants and many from the surrounding country hailed our presence with gladness, and willingly took the oath of allegiance and claimed the protection of our government." But there were hostile elements as well. Finding that the enemy intended to harass his forces, Geary dispatched a detachment of infantry with one gun to the crest of "Short Mountain" to protect his flank. Though their position on Short Hill is not specifically stated, it may be assumed the detachment was near Mr. Christian Nicewarner's farm, for Nicewarner's diary entry for March 1, 1862 states: "Federal troops came to our house. Taken prisoner by Col. Geary."

Christian Nicewarner, in his early forties when the war began, lived on a farm on the east side of Short Hill Mountain a few miles west of Lovettsville. Other Nicewarners, including his father, lived on the west side of Short Hill and Loudoun Heights. Christian Nicewarner kept a diary from 1861 to 1877, recording nearby events as he saw or experienced them. His wartime entries are short and mostly devoid of commentary or opinion, but they nevertheless provide a unique local perspective on the events of the Civil War.

Naturally, most often Nicewarner's diary entries record the things that effected him personally: the several occasions his horses were stolen; the torching of his father's barn and his own barn during the disastrous "Burning Raid" of 1864; and the capture or death of soldiers from local families. Other entries concern the goings-on in nearby communities. For instance, Nicewarner notes the destruction of bridges and buildings at Harpers Ferry in June 1861 and the movements of troops associated with the Federal occupation of Lovettsville in February 1862. He makes note of the burning of the bridge and canal boats at Berlin and the frequent episodes of guerilla warfare that occurred all around him.

Another class of Nicewarner's diary entries documents happenings that, without the benefit of today's hindsight, might seem mundane. For example, he observes Confederate cavalry massing in Lovettsville for two straight days, September 4 – 5, 1862, followed by "Stonewall" Jackson's army, unaware that they will soon take part in the siege and capture of Harpers Ferry and the horrific battle of Antietam. His entry for July 8, 1863: "Fight at Gettysburg" (the battle took place July 1-3) gives some indication how slow news could be to reach more rural areas. Taken as a whole, Christian Nicewarner's diary reflects how the Short Hill population experienced the Civil War.

Guerilla Warfare and the "Burning Raid"

In common with other border areas during the conflict, Loudoun County was the scene of much partisan activity on both sides. It has been claimed by some that the activities of Confederate partisan troops in northern and western Virginia, especially those of Colonel John S. Mosby, may have prevented a Union victory in the summer or fall of 1864. While there is no doubt that the disruptions of communications and supply lines was effective, there were many Southerners

who were critical of the partisan tactics. Some saw them as the cause of much unnecessary suffering and loss.

Mosby was the best known of the partisan commanders that operated in northwestern Loudoun, an area that came to be known as "Mosby's Confederacy." Originally an enlisted man and officer in the 1st Virginia Cavalry, he eventually joined Colonel J.E.B. Stuart's staff as a scout. After paving the way for Stuart's famous ride around McClellan during the Peninsula Campaign of 1862, Mosby was rewarded with the authority to raise a band of partisans for service in northern Virginia. Mosby's "Rangers," along with Major Elijah White's "Comanches," were a great nuisance to the Northern field commanders.

On the Union side, Captain Samuel C. Means commanded the Independent Loudoun Rangers. In conjunction with Major Henry Cole's Maryland Cavalry Battalion, the Loudoun Rangers engaged in scouting and patrolling in Loudoun County and along the Potomac and Shenandoah Rivers. In this duty they frequently clashed with the commands of Mosby and White. Skirmishes occurred between the forces around Harpers Ferry, Lovettsville, Waterford, Brunswick, and Hillsboro.

Of all the personalities of the Civil War period, none is more central to the history (and folklore) of Short Hill than Confederate cavalryman John W. Mobberly. It is an understatement to say that Mobberly was a legendary figure (Figure 36). According to his tombstone in the cemetery of Salem Methodist Church, Mobberly was twenty-years old at the time of his "assassination" in 1865. His story, much romanticized and exaggerated, touches on the Short Hill country around Harpers Ferry, Lovettsville, Hillsboro, and the nearby villages of Maryland and West Virginia.

Most of what is known about the Neersville native comes from reports written after the Civil War and there is little consistency to these accounts. In them, Mobberly is said to be either a private, a lieutenant, or a captain. He is variously reported to be a member of White's Comanches, Mosby's Rangers, or else operating independently with no allegiance whatsoever. Depending on the account, he was either a bushwacker and ruthless murderer or he was a fearless cavalier, aiding people in need, and idolized by area women. No doubt the truth lies somewhere in between the sharply contrasting claims.

Figure 36. Confederate cavalryman, John W. Mobberly. Stories of Mobberly's wartime activities in the Short Hill area have been exaggerated and romanticized. (NPS, courtesy of Helen Cooke, Leesburg)

94 Turner, Loudoun County and the Civil War..., 47.

Loudoun historian Eugene Scheel places the Mobberly homeplace at the junction of the northern spur of the Egg Path trail and the current Branch River Road. Mobberly and his mother Polly were neighbors of the Rileys, and James H. Riley (father of Abner Riley, the entrepreneur of the Egg Path in later days) was one of Mobberly's marauders. Mobberly and his men supposedly had a hideout somewhere on Short Hill Mountain, for that was the direction from which they always swept down and attacked.

Years after the war, an anonymous local resident confessed that he and other members of Mobberly's gang had abducted a prominent Unionist from his home and staked him out to die of exposure on Short Hill Mountain. John W. Forsythe, a veteran of the Independent Loudoun Rangers, recorded in his 1892 memoirs that "a number of skeletons" were found on Short Hill at the end of the war. And though sources disagree, the Still House Farm may be the site of the capture of "French Bill," a notorious Union deserter who joined Mobberly's ranks. Mobberly himself was killed in an ambush on April 5, 1865, at the Potterfield farm on the east side of Short Hill. Christian Nicewarner's diary notes the event, "Mobley [sic] killed at S. Potterfield's" as well as Confederate retribution two days later: "S. Potterfield's barn burned by Rebels."

If the legends of Mobberly's cruelty are even remotely accurate, it is no wonder that Union leaders desperately wanted to capture or kill the Confederate partisan forces. The aggressiveness of Mobberly, Mosby, and White's men caused much annoyance to Union troops. Unfortunately for the non-combatant element of Loudoun's population, the retaliatory acts of the frustrated Union commanders led to the systematic destruction of much of the area surrounding Short Hill.

When General Philip Sheridan opened his Shenandoah Valley Campaign in 1864, Mosby immediately began harassing his supply lines. On August 16, 1864, General Grant telegraphed instructions to Sheridan: "If you can possibly spare a division of cavalry, send them into Loudoun County to destroy and carry off the crops, animals, negroes, and all men under fifty years of age capable of bearing arms...In this way you will get many of Mosby's men." Sheridan, busy with his operations in the Shenandoah Valley, did not act immediately on Grant's instructions, but on November 26, 1864, he sent the following ominous communication to his superiors: "...I will soon commence on Loudoun County, and let them know there is a God in Israel."

One day later, Sheridan issued orders to Brevet Major General Wesley Merritt to begin an operation against the guerrillas in the large area bounded on the west by the Shenandoah River, on the south by the Manassas Gap Railroad, on the east by the Bull Run mountain range, and on the north by the Potomac River. To capture the partisans and deprive the rest of forage, Sheridan ordered Merritt to burn all barns and mills and their contents, and drive off all livestock. He was, however, to ensure that no harm was done to the citizens and that no dwellings were burned.

---

96 Scheel, *Loudoun Discovered...*, 189; Scheel, "Irish Corner....," B-1, B-3.
98 as quoted in Turner, *Loudoun County and the Civil War...,* 54.
Merritt was given five days to complete the task.  The order led to great destruction of property in Loudoun County and the episode became known as the "Burning Raid."

As part of this raid, on November 30, 1864, two regiments of the Reserve Brigade commanded by Lieutenant Colonel Caspar Crowninshield moved north "between the hills" to the Dixie Bottom area, passed along River Road to Peacher's Mill, and then joined up with other Union forces at Lovettsville (Figure 37). In a detailed report of the Reserve Brigade's operations, Crowninshield listed as destroyed 230 barns, 8 mills, 1 distillery, 10,000 tons of hay, and 25,000 bushels of grain. Listed as captured were 87 horses, 474 beef-cattle, and 100 sheep. Farmer/diarist Christian Nicewarner lost all his livestock and his entire crop when his barn was set afire.

Though Crowninshield states that the order to burn all mills and barns was literally carried out, documentation suggests that Peacher's Mill was spared. Loudoun County personal property taxes for 1865 routinely list "damage by burning," yet no such entry is made for the mill and its assessed value remains constant. Peacher's Mill may have been spared because its owner, Samuel B. Preston of Knoxville, Maryland, was a loyal Unionist. It is believed that Shover's Distillery, located about ¼ mile south of Peacher's Mill, may have been the one distillery listed as destroyed by Crowninshield's Reserve Brigade during the raid.

Aside from bringing much misery to the local citizens, many of whom had Union sympathies anyway, it appears the raid was ineffective in curtailing the activities of the Confederate partisans. In his official report, Brevet Major General Merritt explained that the guerrillas were very cautious to avoid his men while they carried out their incendiary duty. Furthermore, the rebels were able to avoid capture because: "the sides of the mountain bordering Loudoun Valley are practicable throughout their extent for horsemen, and the guerrillas, being few in numbers, mounted on fleet horses and thoroughly conversant with the country, had every advantage of my men." Short Hill Mountain, it would seem, was a good place to hide out as only about a dozen of Mosby's men were captured in the entire operation.

---

100 War Department, *Official Records*..., Series I, Volume XLIII, Part I, 671.

101 Ibid, 673.

Official estimates of the damages inflicted during the five-day Burning Raid exceeded $1 million dollars. After the war, at least 208 Union-sympathizing residents of Loudoun County filed claims against the government for payment of damages caused by Union soldiers. John and Christian Nicewarner were among the claimants. In his last will and testament, John Nicewarner bequeathed $100 to his grandson "in consideration of his services rendered me during the late Rebellion and for assisting me in getting up my account against the United States for property taken by the United States troops." The $100 gift was conditional on whether the government accepted the claim. This fact and other items of the will suggest that John Nicewarner had very few assets to pass on to his family.\(^{104}\) Christian Nicewarner's diary entry for January 27, 1865 simply states: "Sent claim to Washington for barns burned."

Such claims, when the government made payment on them, helped Loudouners rebuild after the war. The transition back to "normalcy" actually came easier to Loudoun County than it did in other parts of the South. One reason for this quicker recovery was the nature of Loudoun's population. Before the war began, Loudoun enjoyed a booming agricultural economy. The main products – wheat and corn – did not require the large number of slaves that the tobacco and cotton-growing areas did. In a trend going back to the mid-18\(^{th}\) century, slaves made up less than 5% of the total population in northwestern Loudoun (compared to 30-40% in the eastern reaches of the county).\(^{105}\) Thus when the Emancipation Proclamation freed their slaves, the individual slave owners here did not suffer the economic loss felt in some other places. Small-sized farms were able to resume levels of previous production more quickly during the Reconstruction period.
