Glossary

Barreau(x). (French) Short sticks or staves inserted between framing members to provide support for bousillage infill between timbers.

Bousillage. (French) A mixture composed of mud or clay with straw, hair, or Spanish moss, for infill between the posts in the construction of heavy timber buildings.

Collar Tie. The horizontal member of a roof truss located at the approximate midpoint of the diagonal top chord members.

Rafter. A diagonal roof framing member that meets at the ridge. "Primary rafters" are those of the main roof structure, and "secondary rafters" are those of the gallery roof structures.

Shutter Dog. A bracket or tieback that secures a swinging shutter in the open position.

Trenail. A tapered wood pin used in traditional heavy timber construction.

A Note on Dates

The dates as presented in this report are drawn from the information available at the time of writing. In a few cases, the dates are supported by direct historical documentation, but in the majority of cases, the dates proposed are based on the project team's best determination based on factors such as physical evidence, circumstantial documentation, research by others, professional experience, or those dates adopted by general consensus. Further research, investigation, and analysis may refine or refute the dates proposed herein.

No notation Direct attribution of the date or date range given is supported by historical documentation or physical evidence; ex: 1826 or 1938–1940.

Circa (c.) Attribution to within one or two years of the date or date range given is supported by historical documentation or physical evidence, but the precise dates are not known; ex: c. 1785 or c. 1955 – c. 1958.

Dash (–) Indicates that the range given is inclusive of the years between the start and end dates, such as an ongoing event or period of ownership, ex: 1937 – 1955.

Slash (/) Indicates that two or more specific dates are referenced without being inclusive of the years between; ex: c. 1785 /c. 1955 or 1940/1972.

Decade Span Indicates a ten-year span, but the date or date range given are approximate and may be refuted by further study; ex: 1920s or 1880s – 1900s.

MANAGEMENT SUMMARY

Resource Information

Mount Locust is administered by the Natchez Trace Parkway, a unit of NPS. The Natchez Trace Parkway is a 444-mile recreational road and scenic drive starting in Natchez, Mississippi, passing through parts of Alabama, and ending in Nashville, Tennessee. The Natchez Trace Parkway generally follows the path of the "Old Natchez Trace," a historic travel corridor that has been in use by the humans for millennia.[1] Mount Locust is currently operated by NPS as an open-air house museum. Visitors are allowed limited access to the house interior and surrounding grounds.

Building Name:	Mount Locust (also called Mount Locust Inn and Plantation). Former names include Mound Plantation, Mound House, Mound Plantation House, Chamberlain House, Ferguson House, and Waterloo.
Administrative Unit:	Natchez Trace Parkway (NATR).
Location:	Natchez, MS 39120, at Milepost 15.5 on the Natchez Trace Parkway, south of the intersection of Canonsburg Road and the Natchez Trace Parkway.
National Register Status:	Not listed, but eligible for listing under Criterion A for national and statewide significance in the areas of Exploration/Settlement, Transportation, Commemoration, and Entertainment/Recreation.[2]
***Current Use*:**	Historic house museum.
Periods of Significance:	1779 – 1820 for its association with the historic Natchez Trace 1937 – 1960 for its association with the Natchez Trace Parkway[3]

Project Scope and Methodology

In 2021, NPS engaged a consultant team to prepare a *Historic Structure Condition Assessment and Treatment and Work Recommendations Report* for Mount Locust. The purpose of the report is to document the existing conditions of the physical structure and prepare recommendations for preservation, repairs, and maintenance by NPS. The report builds on the information contained in the existing Historic Structure Report (HSR), prepared in 1998. The report was prepared in general compliance with Preservation Brief 43: *The Preparation and Use of Historic Structure Reports*,[4]

---

1 "Natchez Trace Parkway," National Park Service, https://www.nps.gov/natr/index.htm.
2 *Mount Locust Cultural Landscapes Inventory* (CLI). National Park Service (2022): 11.
3 CLI, 11.
4 Slaton, Deborah. Preservation Brief 43: *The Preparation and Use of Historic Structure Reports*. Washington, D.C.: National Park Service, Technical Preservation Services (2005).

amended to reflect the limited nature of a condition assessment report compared to a comprehensive HSR.

In November 2021, the project team performed a physical investigation over two days to assess the condition of Mount Locust, including structural systems, enclosure systems, windows and doors, and interior finishes. Several maintenance issues and areas of concern were conveyed to the project team in advance of the physical investigation, as was documentation related to the structure's history of development, previous alterations, and recent studies of the house and grounds performed by NPS. The physical investigation was non-destructive and observation-based, limited to those features readily available without removal of existing materials or finishes.

Based on the condition assessment, a Building Feature Master List (BFML) was prepared using the Uniformat II classification system to organize building features and assist with identifying patterns of conditions and prioritizing repairs. This report is structured around the BFML.

Summary of Findings

Mount Locust has an overall condition rating of Fair[5] and requires short-term and medium-term repairs, along with on-going maintenance activities, to maintain the condition of the structure for its current use. Select repairs, rated with a repair priority of "High" are recommended to be performed within 1 to 2 years to prevent component failures or arrest active distress or deterioration; these repairs primarily encompass items affecting structural stability, bulk water intrusion, and health-safety-welfare concerns.

ABBREVIATED HISTORY OF DEVELOPMENT

A Note on Sources

The narrative below is summarized primarily from the 2022 CLI, which includes a well-researched chapter on the history and development of the building and site on pages 62 through 80, as well as a longer narrative on its context in relation to the historic Natchez Trace. Multiple additional sources were also referenced, including the 2009 CLR, 1998 HSR, and multiple documents produced in the early years of NPS's ownership of the property through the restoration (1937 – 1960). Additional research into primary and secondary sources was outside the scope of this report.

[5] See section "Condition Assessment" for definition.

Abbreviated Historical Background

Mount Locust was likely originally constructed by William Ferguson sometime between 1782 when he acquired the property and 1785.[6] In 1785, the house was included in the survey performed by William Vousdan, who was acting as Deputy Surveyor for the Spanish government in Natchez.[7] The original construction was likely a one room structure of approximately 16-feet by 20-feet, which has been identified as Room 1 (101) of the current building.

William Ferguson married Paulina Burch in 1783, and the couple is believed to have taken up residence on the property around 1784. Ferguson/Chamberlain family tradition holds that the house was used as an inn, or "stand," starting in 1785 to provide respite for travelers along the Old Natchez Trace. The first additions may have been by 1799, based on an invoice for a significant amount of building materials found in Ferguson's estate papers. The c. 1799 addition likely included Rooms 2 (102) and 7 (107) of the current building, the two front rooms on either side of the original house.[8]

Ferguson died in 1801, and his estate entered a lengthy probate. In 1821, the property was divided among his heirs, with his widow Paulina eventually taking legal possession of the part of the property that included Mount Locust. Paulina married James Chamberlain in 1806, but the couple divorced in 1816. The couple had four children, and this seems a likely time for the addition of the rear rooms, which may have enclosed part of the north gallery or porch. Studies performed by Stuart Barnette, Dawson Phelps, and Charles E. Peterson, writing about Mount Locust in the 1940s and 1950s, concluded that Rooms 3 and 6 were likely constructed after Rooms 2 (102) and 7 (107) and were in place c.1820, leaving only the central area of the north gallery open.

After the divorce, Paulina returned to using the surname Ferguson and operated Mount Locust as a stand until 1846. An 1838 map identified Mount Locust as "Mrs. Ferguson's," verifying its use as a stopping point for travelers. In the 1830s and 1840s, Paulina Ferguson significantly expanded the property, purchasing additional acreage and expanding the agricultural use of the land, particularly the production of cotton. No surveys or descriptions exist from this era to describe what buildings were present on the property besides the main house, but the property likely included barns, a summer kitchen, housing for the enslaved workers, and other agricultural structures, in addition to a sleeping house for travelers (the "Sleepy Hollow"), an overseer's house, and a nursery.[9] The presence of sixteen enslaved quarters was confirmed in the 1860 census, and

[6] For the purposes of this report, c. 1785 will be used as the date for the original construction of Mount Locust, with acknowledgement that this date is not definitive, and the structure has undergone multiple generations of expansion and alteration.

[7] Documentary evidence may support a slightly earlier construction date of c. 1779 when the property was under ownership by Thomas Harmon or John Blommart, but this has not been fully resolved as a topic of research.

the location of other outbuildings, such as the overseer's house, the guest house, and the brick kiln, were confirmed through archeological investigations performed by NPS in 1940.[10]
At the time of Paulina's death in 1849, her son Thomas Jefferson Chamberlain lived at Mount Locust and had been managing the plantation since at least 1834. He lived there with his wife Maybella Jane Duncan and their children until his death 1854, at which time the house was described as having a parlor and five bedrooms, suggesting that the house had possibly been expanded again in the 1840s. Indeed, the footprint of the house at the time it was acquired by NPS in 1937 was 60'-2" long,[11] compared to the current footprint of approximately 46'-8" which was determined based on investigation of the structure during the 1955 restoration.[12]

Thomas Jefferson Chamberlain II inherited one-third of his father's estate and eventually took over the deed from his sister after her hospitalization. Thomas Jefferson II, his wife Johnnie Chamberlain, and their children resided at Mount Locust. After his death in 1929, Johnnie Chamberlain resided in the home until it was acquired by NPS in 1937. Her son Bill Chamberlain then resided in the home as the caretaker until 1944.

The house was in disrepair during this era, and temporary measures were undertaken to weatherproof and stabilize the structure, including wrapping the exterior walls in "tar paper."[13] Planning for a restoration project began in the late 1940s to restore Mount Locust to the c. 1820 appearance. During the restoration, the house was allegedly nearly completely disassembled to understand the construction chronology; this is supported by physical evidence at the house of significant replacement of structural and architectural fabric with material branded "1955." The restoration involved removing approximately 12-feet from the west end of the house, reworking Rooms 2 (102), 3 (103), and 6 (104), and removing Rooms 4 (104) and 5 (105) to reopen the central part of the north porch.

Mount Locust has since been operated by NPS as a house museum. In the latter half of the twentieth century, changes and improvements have been made to the site surrounding the house, including landscape features, visitor facilities, parking, and walk paths, but few changes had been made to Mount Locust itself since the 1955 restoration. The house suffered damage from Hurricane Katrina in 2005, after which the roofing and windows were replaced.

PHYSICAL DESCRIPTION

In its current form, Mount Locust exhibits several traits common to vernacular Creole construction, including the broken-pitch (double pitch) roof and open galleries or porches.[14] The footprint of the structure is currently divided into five rooms. Room 1 (101) is believed to be the original c. 1782 structure, with Rooms 2 (102) through 7 (107) being later additions of various construction dates. The south side of the structure is the primary elevation and has an open gallery that runs east to west. The rear gallery on the north is partially enclosed by Room 3 (103) on the west and Room 6 (106) on the east. The stairs to the front and rear galleries are slightly offset to the west of the center of the structure. Two brick chimneys are present: one located between Rooms 1 (101) and 7 (107), and the second on the west wall of Room 2 (102). There is no basement; the crawlspace under the main level is open. The attic is accessed by a wood ladder from the rear gallery and is not occupied.

The building is oriented with the primary façade to the southeast. For the purposes of this report, the northwest façade will be referred to as "north," the southeast as "south," the northeast as "east," and the southwest as "west."

[14] Edwards, Jay D. "Louisiana's French Creole Architecture," National Register of Historic Places Nomination Form. Washington, D.C.: U.S. Department of the Interior, National Park Service, 1991. https://catalog.archives.gov/id/73972785. 35.

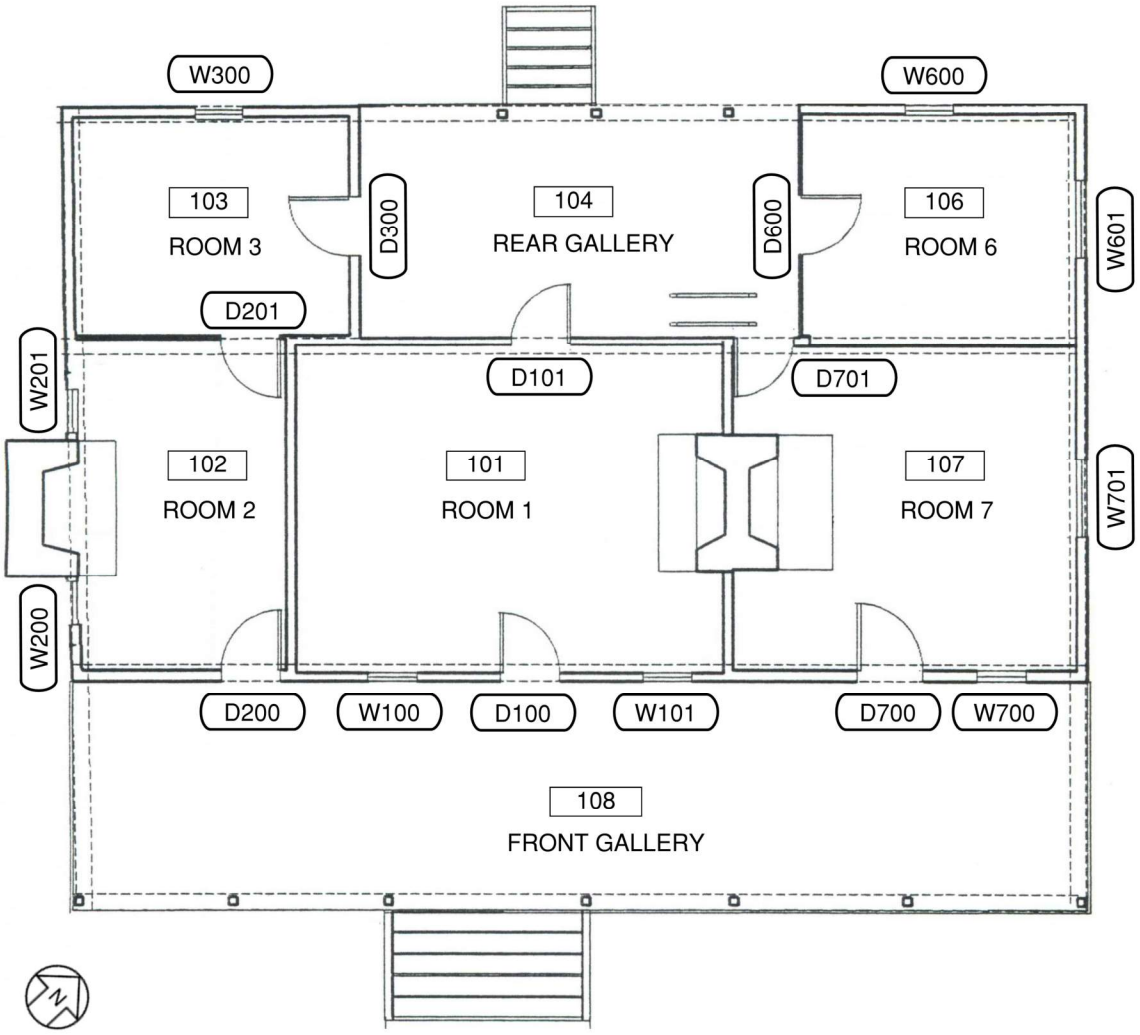

Figure 1. Floor plan of main level, showing room, window, and door designations as used in this report.

Site and Context

The site is rural, located approximately fifteen miles northeast of the city of Natchez, Mississippi (Figure 2). Surrounding properties are residential and spread apart; no adjacent properties are visible from the site. The main house is set approximately 1,300 feet to the northwest of the Natchez Trace Parkway and is not readily visible from the parkway. The entrance to the park site is indicated by NPS signage at the mouth of the public access road.

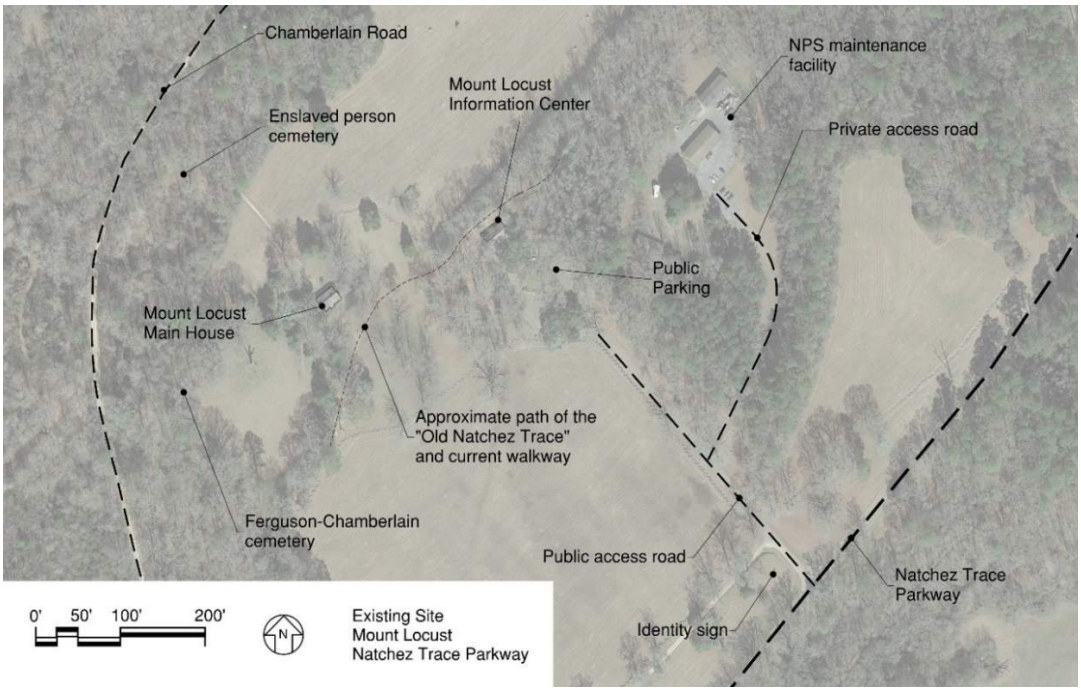

Figure 2. Site plan of Mount Locust.

The main house at Mount Locust is located on a rise or mound that is currently believed to be a natural feature, although historically it was believed to be of Native American construction (Photo 1).[15] From the front (south) gallery, the topography drops steeply to the elevation of the current walkway, which is located on the approximate path of the Old Natchez Trace. From the walkway, the topography continues to drop but with a less severe grade to the south and east as the site approaches the current Natchez Trace Parkway. Mature trees are located around the main house and Information Center, and to the east and west, the land is heavily forested. Lum Bayou (not shown in Figure 2), passes the site on the north and west.

The site is accessed from the Natchez Trace Parkway via Ranger Road that provides public access to the Information Center and surface parking for Mount Locust and also access to NPS's maintenance facility to the northeast. Public parking and the Information Center are located to the east of the historic site. A paved walkway that follows approximate path of the Old Natchez Trace provides pedestrian access from the Information Center to the historic site.

Photo 1. View of Mount Locust from the southeast (south), showing the natural mound or rise.

Photo 2. Main (south) elevation from the south.

Photo 3. West elevation.

Photo 4. East and rear (north) elevations, from the northeast.

Photo 5. Rear (north) elevation, from slightly northwest.

Exterior

Mount Locust is a one-story structure elevated on short log piers. The building massing, with the gable end walls, open galleries, and broken-pitch roof, is consistent with Creole vernacular forms. The roof is steep-sloped and broken-pitch (double pitch), with a steeper slope in the roof framing over the main structure than that over the galleries. The roof is covered with tapersawn cedar shakes; there are no gutters. The south elevation is covered with horizontal board siding painted white to the wall top plate and left unpainted above. The north, east, and west walls are covered with unpainted weatherboard siding.

Doors and windows are generally in their historic locations, with some alterations to Rooms 2 (102), 3 (103), and 6 (106) from the 1955 restoration. There are eight wood doors, seven of which swing to the interior and one door at the north side of Room 1 that swings to the exterior. There are nine wood windows with double-hung sashes throughout the building.

There are two brick chimneys: one located within the body of the main structure and one at the west end wall.

Structure

The main house is timber framed, reportedly in a mix of oak and walnut for larger members and sassafras or poplar for smaller members such as studs and rafters, with other woods randomly included.[16] Cross bracing or lateral braces in the walls are present at the corners of the original structure and the west additions. Much of the wall structure is concealed by finishes and was unable to be fully assessed. Currently, the timber framing is "open," meaning that no infill is present between the members. Evidence of holes for *barreaux* or staves were documented in framing members, indicating that the walls may have originally been filled with *bousillage* in the older portions of the house.[17]

The roof is framed with primary rafters supporting the steeply pitched roof over the main structure and secondary rafters supporting the lower-pitched gallery roofs. Collar ties are located at the midpoint of the primary rafters. The majority of the roof framing members appeared to have been replaced during the 1955 restoration. The roof is sheathed with skip or spaced sheathing to which the cedar shakes are nailed.

The main floor is framed with heavy timber joists and beams. Most joists and beams appeared to have been replaced during the 1955 restoration, with some salvaged members reused under Rooms 1 (101), 2 (102), and 3 (103). The floor beams are supported by unshaped log piers that were reportedly replaced in 1992. The log piers sit on buried concrete foundations.

Interior

The interiors of Mount Locust have been finished and furnished to interpret the structure as a family residence c. 1820. The current floorplan is divided into five rooms. The center room is interpreted as the kitchen and main living space, with bedrooms on either side and in the northeast corner. The northwest corner room is interpreted as a storage space. All five rooms are finished with wood flooring, wood plank walls, and wood plank ceilings. Rooms 1 (101), 6 (106), and 7 (107) are painted, while Rooms 2 (102) and 3 (103) have unfinished walls and ceilings. Rooms 4 (105) and 5 (105) are no longer extant, having been removed during the 1955 restoration; this space is now the open north porch.

Visitors are allowed partial access to the interior. The public walk path begins at the south gallery, with views into Rooms 1 (101) and 2 (102) through open doors. Room 7 (107) provides limited access as a barricaded through-path to the north gallery, where visitors can view Rooms 1 (101), 3 (103), and 6 (106) through open doors.

[16] HABS 1955.
[17] HABS 1955, Sheet 3.

Building Systems

The building has no plumbing or natural gas service that extends to the house. Limited electrical service is present in the house which includes lights and receptacles in the attic and one receptacle in the floor of Room 1 (101). An abandoned HVAC system is present in the attic. Ceiling-mounted smoke detectors are present in each room.

CONDITION ASSESSMENT

Assessment Methodology

In the execution of this scope, the project team performed the following:

- Reviewed readily available documentation on Mount Locust provided by NPS and from other sources, as well as available documentation on similar structures along the Natchez Trace and at other locations.
- Field verified select dimensions and measurements to confirm conditions as documented by others.
- Performed a physical investigation of the building from the interior and exterior to observe and document the conditions of the structure, architecture, finishes, building systems, and other components. The investigation was performed over two days in October 2021.
- Assessed the condition and construction methodology of the timber roof framing, floor framing, rooms and interior finishes, and site features.
- Surveyed visible structural members to gain an understanding of the extent of historic structural fabric and members replaced during the 1950s restoration.
- Performed a limited moisture content survey of the log piers and floor framing members.
- Performed a limited level survey on the main floor to aid in understanding differential settlement of the structure.

Definitions

The following terms define subjective ratings used in this part to apply a sliding scale of condition rating, deficiency of the component and priority of the repair, as developed from Sections 7.2 and 7.4 of the “Field Operations Manual, Volume 1”, United States National Park Service, Washington, D.C., 1985.

Condition Rating

Good The element is intact, structurally sound, and performing its intended purpose. There are few or no cosmetic imperfections, and the elements need no repair and only minor or routine maintenance.

Fair There are early signs of wear, failure, or deterioration, though the element is generally structurally sound and performing its intended purpose. There is failure of a sub-component of the element. Up to 25 % of the element or replacement of a sub-component is required.

Poor The element is no longer performing its intended purpose. The element is missing. Deterioration or damage affects more than 25% of the element and cannot be adjusted or rebuilt. The element shows signs of imminent failure or breakdown. The element requires major repair or replacement.

Failed The element is no longer performing its intended purpose and has deteriorated to a point where it presents a life-safety hazard or is contributing to damage to other elements. Full replacement of the component may be required to restore function and service.

Repair Priority

High There is advanced deterioration which has resulted in the failure of the building element or will result in the failure of the building element if not corrected within two years; and/or there is accelerated deterioration of adjacent or related building materials as a result of the element's deficiency; and/or there is a threat to the health and/or safety of the user; and/or there is failure to meet a legislative requirement.

Moderate There is deterioration which, if not corrected within two to five years, will result in the failure of the building element, and/or; a threat to the health and/or safety of the user may occur within two to five years if the deterioration is not corrected, and/or; there is deterioration of adjacent or related building materials and/or systems as a result of the element's deficiency.

Low Standard preventative maintenance practices and building conservation methods have not been followed, and/or; there is a reduced life expectancy of affected or related building materials and/or systems, and/or; there is a condition with long-term impact beyond five years.

CONDITIONS

Date: 2003 **Contributing**: Non-Contributing

Paved Walkway from Information Center to House

To reach Mount Locust from the Information Center, visitors walk along an asphalt-paved pedestrian walkway to the exterior stairs at the base of the mound (Photo 6). This walkway was repaved in 2003 and followed the path of the walkway constructed as part of the 1958 circulation plan. The paving was generally in serviceable condition without cracks or displaced paving that might present tripping hazards. The slope of the walkway was steady and gradual and appeared to generally be in compliance with accessibility standards for slope and cross-slope; the 2022 CLI indicated that this walkway was constructed to comply with accessibility standards.

Paved Walkway from House to the Cemetery

From the north (rear) side of Mount Locust, a paved asphalt walkway extended to the north and west (Photo 7) toward the Ferguson-Chamberlain family cemetery. Portions of this walkway were in poor condition, with cracks, displaced paving, and uneven grade that may present tripping hazards to visitors. The current condition of the paving would not perform as an accessible path through the site; full replacement is recommended.

Paved Walkway Through Grape Arbor

There did not appear to be a clear accessible path from the main walkway to the main house. Remnants of a paved, asphalt walkway were present to the west of the house, that connects the main walkway to the cemetery walkway by passing through the grape arbor (Photo 8). The CLI reported that this walkway was part of the 1958 circulation plan and was repaved in 2003. The paving of this walkway had failed and would require full replacement. With proper design and minor site grading, this walkway could be developed as an accessible path to the top of the mound.

Photo 6. Paved walkway from the Information Center to the house, looking northeast towards the Information Center.

Photo 7. Paved walkway on north side of house, showing cracked and uneven paving.

Photo 8. Paved walkway from main walk to the grape arbor, showing deteriorated and uneven paving.

Main Stairs					
G	BUILDING SITEWORK				
G20	SITE IMPROVEMENTS				
	G2033	EXTERIOR STEPS			
				Condition	Priority
		G203301	Main Exterior Stairs	Good to Fair	Moderate

Date: 1978 **Contributing**: Non-Contributing

The south exterior stairs were installed in 1978 as part of the restoration of the historic approach to Mount Locust (Photo 9). The existing stairs replaced a 1950s stair made from bricks salvaged from a demolished retaining wall.[18]

The exterior stairs provided the primary access to the main house. There did not appear to be an alternate accessible path to the top of the mound. The stairs ascended in three sets of risers with intermediate landings. Tread and riser dimensions appeared to be fairly consistent between each step. The exterior stairs are in generally fair to good maintenance and repair.

Each step was constructed of stack bond brick pavers set in mortar. Mortar between the bricks was heavily weathered in some locations, but no locations of loose pavers were identified. For long term durability and to prevent hazards to pedestrians, the pavers should be repointed.

Photo 9. Main stairs, looking north to house.

Photo 10. Localized deterioration of mortar joints between paving bricks.

[18] CLI, 98.

Main Stair Handrails					
G	BUILDING SITEWORK				
G20	SITE IMPROVEMENTS				
	G2033	EXTERIOR STEPS			
				Condition	Priority
		G203302	Main Stair Handrails	Fair	High

Date: Undetermined (likely 1978 or later) **Contributing**: Non-Contributing

The main exterior stairs have wood handrails on either side of each stair run; the handrails are discontinuous at the landings (Photo 11). The handrails were wood top rails on wood posts. The top rail was approximately thirty-five inches above the walking surface and had a notch on the rear face for grasping (Photo 12). Numerous handrails were loose, and the wood posts may have deteriorated below grade.

In their current form, the handrails do not comply with multiple requirements of the Architectural Barriers Act Accessibility Standard (ABAAS) for dimensions, continuity, gripping surface, and end extensions beyond the top and bottom treads. Given the condition of the handrails and the lack of compliance with ABAAS requirements, replacement is recommended. Compliant wood railings with supplemental metal grips can be designed that will have a minimal aesthetic impact on the property.

Photo 11. End of handrail at an intermediate landing, showing lack of extension and the "notch" for gripping.

Photo 12. Typical top rail showing dimensions of notch for gripping.

Brick Walkway					
G	BUILDING SITEWORK				
G20	SITE IMPROVEMENTS				
	G2030	PEDESTRIAN PAVING			
				Condition	Priority
		G203004	Brick Walkway	Fair to Poor	Moderate

Date: 1955 **Contributing**: Contributing

A brick paver walkway was present around all sides of the main house. The pavers are sand-set in a herringbone pattern with soldier edging (Photo 13). The walkway was installed during the 1955 restoration, modelled after remnants of a brick walkway found on the site. The walkway appeared to be slightly cambered, although it was unclear if this was part of the original installation or due to uneven settlement of the pavers. The brick walkway appeared to be of a consistent age and construction and may largely date to 1955, although individual modern replacement bricks were observed.

The surface of the walkway was uneven. Sand had washed out from paver joints, resulting in gaps and voids between pavers. Localized deterioration of brick pavers was observed. Displacement and heaving of the walkway presented tripping hazards in multiple places (Photo 14). In its current condition, the brick walkway does not provide an accessible path around the house. With repairs potentially to include resetting the pavers, the brick walkway can be retained.

Photo 13. Brick paver walkway at the south side of the house.

Photo 14. Displacement and deterioration of brick pavers.

		G204404	"Slave Cemetery"	Good	N/A

Date: Undetermined (modern alteration) **Contributing**: Non-Contributing

At least two generations of interpretive signage were present in the immediate vicinity of the main house, along with larger interpretive displays near the Information Center (Photo 15 through Photo 17). The signage was in serviceable condition, although beginning to show some weather-related aging. Directional signage to the enslaved person cemetery on the north side of the property was out of date with current NPS Harpers Ferry Center Editorial Style Guide and should be considered for replacement (Photo 18).[19]

Photo 15. "Inns Along the Trace" interpretive signage.

		G204903	Grape Arbor	Good	N/A

Date: c. 1958 **Contributing**: Contributing

A wood grape arbor supporting a mature grapevine was located approximately fifty feet southwest of the main house as part of the 1958 Garden and Residence Plan (Photo 23)[20]. The grape arbor appeared to have been constructed of treated wood timbers as posts and partially dressed logs as cross beams. The grape arbor was generally in serviceable condition with some minor age-related deterioration of the wood.

Photo 23. Grapevine grape arbor to the southwest of the main house.

Cisterns					
G	BUILDING SITEWORK				
G20	SITE IMPROVEMENTS				
	G2049	MISCELLANEOUS STRUCTURES			
				Condition	Priority
		G204905	Northwest Cistern	Failed	Moderate
		G204906	Northeast Cistern	Poor	Moderate

Date: Undetermined **Contributing**: Contributing

Two cisterns are located on the north side of the main house. It was unclear if either cistern had been previously filled. Both cisterns were surrounded by a chain-and-wood-post barricade. Both cisterns require maintenance to stabilize the structures and prevent the upper shaft from collapsing. Stabilization may include reconstruction of the cistern shaft with salvaged and new materials or stabilization in-situ measures to fill cracks and prevent further displacement of the brick walls.

The northwest cistern was constructed of brick with a wood cap (Photo 25 and Photo 26 (). The bricks had been parged with a cementitious mortar. The bricks were heavily distressed, and the cistern wall had failed in two locations and was listing severely to one side. The northeast cistern was also constructed of brick with cementitious parging and a wood lid (Photo 27 and Photo 28). The cistern exhibited some deterioration but was not as distressed as the northwest cistern. A rise constructed of bricks surrounded the cistern shaft. An animal burrow was observed near one of the barrier posts.

Photo 25. Cistern #1 to the northwest of the main house has failed.

Photo 26. Cistern #1 to the northwest of the main house has failed.

				Condition	**Priority**
		G204101	Split Rail Fences	Good to Poor	Low
		G204102	Post and Rail Fence	Good	N/A

Date: 1950s and Undetermined **Contributing**: Contributing and Not Assessed

Wood fences were present at multiple locations around the site. Wood fences were typically stacked, split rail fences set in a zig-zag pattern (Photo 29); these fences were added to the site in the 1950s and are contributing. Split rail fences were typically in serviceable condition, although an area of damaged fencing was present to the west of the main house. Split rail fences can be rebuilt in kind.

A short run of post and rail fence was located along the walkway near the main exterior stairs (Photo 30); this fence was generally in serviceable condition. The function of the post and rail fence was unclear, and removal might be considered if it is determined to be non-contributing.

Photo 29. Split rail site fences.

Exterior

Galleries

South Gallery Stairs and Handrails					
B	**SHELL**				
B10	**SUPERSTRUCTURE**				
	B1015	**EXTERIOR STAIRS**			
				Condition	**Priority**
		B101501	South Gallery Stairs and Handrails	Poor	High

Date: c. 1955 and Later **Contributing**: Contributing

The main stairs to the south gallery were wood framed (Photo 31). Stairs in this style but without handrails were constructed as part of the 1955 restoration.[22] A handrail in this style was added c. 1957 – 1568, as seen in a Mirro-Krome colored postcard from 1958 that showed a simple handrail on the west side of the stair,[23] but the 1974 HABS photographs showed no railings. The stairs may also have been repaired or replaced in 1984.[24]

The wood treads were supported on three wood stringers, one on either side and one at the approximate centerline of the stair. The stringers appeared to be supported on small concrete footings level with grade. At the top of the stairs, the stringers were attached to the gallery rim joist with a metal bracket and lag screws.

Deterioration of multiple tread connections was observed, particularly where treads were pinned through the perimeter stringers (Photo 32). Deterioration of these pins may destabilize the bearing end of the tread. The center stringer was rotated out of place, and the lag screws to the rim joists were distressed (Photo 33 and Photo 34).

The stair handrails were constructed with nominal 2x wood members. The handrails did do not comply with multiple requirements of ABAAS, including those for dimensions, continuity, gripping surface, and end extensions beyond the top and bottom treads. The handrails were loose and likely insufficient to withstand code-required loads for railings. Wood railings with supplemental metal grips can be designed that will have a minimal aesthetic impact on the property.

Overall, the stairs were in poor condition, with active deflection of the treads under use by a single visitor, with uneven slope of some the treads. The stairs should be replaced in kind.

---

North Gallery Stairs and Handrails					
B	**SHELL**				
B10	**SUPERSTRUCTURE**				
	B1015	**EXTERIOR STAIRS**			
				Condition	**Priority**
		B101502	North Gallery Stairs and Handrails	Poor	High

Date: c. 1955 and Later **Contributing**: Not Assessed

The stairs to the north gallery were wood framed and appeared similar to those at the south (Photo 35). Like the south stairs, the stairs may have been repaired or replaced in 1984; the existing stairs do not appear to be the same materials as seen in the 1974 HABS photographs but are constructed of a similar style. The handrail was added sometime after 1974.

The wood treads were supported on wood stringers. The stringers appeared to be supported on small concrete footings level with grade. At the top of the stairs, the stringers were attached to the gallery rim joist with a metal bracket and lag screws.

The entire stair was displaced with significant backslope toward the gallery decking (Photo 36); this may be related to differential settlement at the northeast corner of the structure. The connection between the stairs and the gallery rim joist had failed (Photo 37).

The stair handrails were constructed with nominal 2x wood members. The handrails did do not comply with multiple requirements of ABAAS, including those for dimensions, continuity, gripping surface, and end extensions beyond the top and bottom treads. The handrails were loose and likely insufficient to withstand code-required loads for railings. Wood railings with supplemental metal grips can be designed that will have a minimal aesthetic impact on the property.

Overall, the stairs were in poor condition, with uneven slope between treads and excessive slope which represents a tripping hazard for visitors; to shed water, treads should be set with maximum 2% slope, which should be consistently applied to all treads. The stairs should be replaced in kind.

Photo 35. Exterior stairs to north gallery.

Photo 36. Excessive and uneven backwards slope of treads.

Photo 37. Distress to stair support at gallery rim joist.

South Gallery					
B	**SHELL**				
B10	**SUPERSTRUCTURE**				
	B1013	**BALCONY CONSTRUCTION**			
				Condition	**Priority**
		B101301	South Gallery Floor Framing	Fair	Low
		B101302	South Gallery Roof Framing	Good	N/A
		B101303	South Gallery Railing	Fair	Moderate
		B101304	South Gallery Decking	Poor	High

Date: 1955 and Later **Contributing**: Contributing

The south gallery was an open porch extending the full length of the south elevation (Photo 38). The deck of the gallery was approximately level with the interior finished floor. Based on the HABS photographs, the south gallery appeared to have been reconstructed and few historic structural members appeared to be extant; repairs or replacement of the south gallery were also performed in 1992.[25]

South Gallery Floor Framing

The joists ran east-west; member dimensions varied widely but averaged approximately 8x6.5, spaced approximately two feet on center. Localized and minor carpenter bee damage was observed on a few joists, and one joist had minor deterioration on the top face near the bearing end. The gallery perimeter beams, or rim joists, varied as 8x10 and 8x6.5 members and were supported by the log foundation piers.

South Gallery Roof Framing

The gallery roof was supported by seven wood posts, nominally four-inches square. The posts were finished with a chamfer detail. Checking and splitting was observed at all posts to varying degrees of severity (Photo 39); at two posts, large checks extended through the mortise for the railing connection (Photo 40). The gallery ceiling was open to the underside of roof, exposing the ceiling beams and rafters. The ceiling beams were in serviceable condition.

South Gallery Railing

The railing was a single nominal 4x4 member, set into the posts with a mortise and tenon connection. There is no mid-rail or intermediate vertical members to supplement the top rail. Several of the railings were loose and were likely insufficient to withstand code-required loads for safety railings. The single railing is likely historically appropriate but does not comply with the International Building Code provisions for safety railings for changes in heigh above thirty inches regarding railing height above the walking surface, height and placement of midrails, and maximum allowable spacing between railings, pickets, or posts. Consideration should be made whether a sympathetic modern safety railing should be installed at the south gallery. At a minimum, the rails should be repaired or replaced as required to withstand code-required loading

[25] CLI, 183.

of safety rails, which the 2018 IBC is a minimum of 50 pounds per linear foot for uniform loading, 200 pounds for a concentrated load on the top rail, and 50 pounds for concentrated loads on intermediate members or infill panels.[26]

South Gallery Decking

The gallery decking was replaced in 1995.[27] was constructed of nominal one-inch boards of varying widths spanning north-south. The boards were nailed to the joists. Near the east end, there is visible deflection in the south decking (Photo 41). A differential fall of approximately two inches was measured in the center of the gallery compared to the perimeters (Photo 42). This deflection appeared to be caused by deterioration of the decking boards (Photo 43). Several decking boards in this area exhibited significant rot and loss of section, as well as decking boards immediately east of the stairs. Replacement of deteriorated decking board is required.

North Gallery					
B	**SHELL**				
B10	**SUPERSTRUCTURE**				
	B1013	**BALCONY CONSTRUCTION**			
				Condition	**Priority**
		B101305	North Gallery Floor Framing	Fair	Low
		B101306	North Gallery Roof Framing	Fair to Poor	Moderate
		B101307	North Gallery Handrails	Fair	High
		B101308	North Gallery Decking	Fair	High

Date: 1955 and Later **Contributing**: Contributing

The north gallery was formerly an open porch extending the full length of the north elevation but has previously been enclosed by Room 3 (103) at the west and Room 6 (106) at the east (Photo Photo 44). The decking of the gallery was approximately level with the interior finished floor and was pitched slightly to the north. In its current form, the north gallery appeared to have been reconstructed with just a few potentially historic structural members located at the west end under Room 3 (103).

North Gallery Floor Framing

The joists ran north-south; member dimensions varied widely but averaged approximately as 8x6.5, spaced approximately two feet on center. The gallery perimeter beams, or rim joists, were 8x9 members and were supported by the foundation piers. Deterioration of the north bearing end was observed at several joists; further investigation to include qualitative resistance drilling is recommended to determine if concealed deterioration is present at other joists (see description of "Floor Framing" below for further information). The gallery perimeter beams, or rim joists, varied as 8x10 and 8x6.5 members and were supported by the log foundation piers.

Near the east end, there is visible deflection in the gallery framing. The floor slope increases from one degree to the north at the threshold of Door D701 to a four percent cross slope to the east at Door D600. (Photo 41). This deflection appeared to be caused by deterioration and differential settlement of the log foundation piers at this corner of the structure (Photo 43).

North Gallery Roof Framing

The gallery roof was supported by seven wood posts, nominally four-inches square (Photo 45). The posts were finished with a chamfer detail. The gallery ceiling was open to the underside of roof, exposing the ceiling beams and rafters. Five of the nine ceiling beams may be historic fabric. Moderate to severe carpenter bee damage was observed on multiple beams (Photo 46); the holes had been filled with clear sealant.

The gallery top plate had a splice joint to the east of the stairs that appeared to be a historic construction detail (Photo 47). The connection between the beams was a butt joint with an iron staple or cramp. Differential settlement of the northeast corner of the structure had caused distress to this connection detail with displacement of the iron staple. In addition to arresting the differential settlement, this detail may require stabilization in situ.

North Gallery Railing

Similar to the south gallery, the railing was a single nominal 4x4 member, set into the posts with a mortise and tenon connection. There is no mid-rail or intermediate vertical members to supplement the top rail. The railings were loose and were likely insufficient to withstand code-required loads for safety railings. Consideration should be made whether a sympathetic modern safety railing should be installed at the north gallery. At a minimum, the rails should be repaired or replaced as required to withstand code-required loading of safety rails.

North Gallery Decking

The gallery decking was constructed of nominal one-inch boards of varying widths, spanning east-west. The boards were nailed to the joists. Several decking boards along the exterior edge exhibited minor to moderate rot and loss of section (Photo 48). Replacement of deteriorated decking board is required.

Photo 44. North gallery, looking west.

Roofing

Roofing					
B	**SHELL**				
B30	**ROOFING**				
	B3010	**ROOF COVERINGS**			
				Condition	**Priority**
		B301001	Wood Shake Roofing	Good	Low
		B301002	Spaced Sheathing	Good	N/A
		B301003	Metal Flashing at Chimney	Good	Low
		B301004	Metal Flashing at Broken Pitch	Good	N/A

Date: 2007 **Contributing**: Contributing

Wood Shake Roofing

The existing wood shakes were installed in 2007, following damage to the house by Hurricane Katrina (Photo 49).[28] The shakes were installed in the same style as the roofing from the 1955 restoration. The existing shakes are cedar "Certi-Split® Handsplit and Resawn Shakes," approximately 18 inches long by widths ranging from 3 to 8 inches with an approximately 5-inch exposure. The shakes are installed with triple head lap and nailed to the skip sheathing. A white, polymer roofing interlayment appeared to be interlaced between courses (Photo 50). The ridge detail is a project comb ridge extending from the south. The existing shakes appeared to be in good condition with two loose shakes observed on the north gallery slope (Photo 51). Minor repairs are recommended to maintain the weather resistance of the roofing.

Metal Flashing

Metal flashing is present at the brick masonry chimneys (Photo 52); the flashing is sealed to the brick with an elastomeric sealant. Concealed metal flashing is also present at the ridge and the change in pitch at the gallery roofs (Photo 53).

Spaced Sheathing

Open or spaced sheathing was applied over the primary and secondary rafters to support the wood shake roofing (Photo 54). The boards appeared to be nominal 1x2s and 1x4s and were typically set with 3 to 6-inch gaps between boards. Many of the sheathing boards were recent replacement members; few appeared to be older or potentially historic fabric. The attachment of the sheathing boards to the rafters could not be observed from the underside of the roof. The sheathing boards generally appeared to be in serviceable condition.

[28] CLI, 183.

Siding

Horizontal Board Siding					
B	**SHELL**				
B20	**EXTERIOR ENCLOSURE**				
	B2010	**EXTERIOR WALLS**			
				Condition	**Priority**
		B201001	Horizonal Board Siding	Good	Low
		B201002	Base Trim	Good	N/A
		B201003	Corner Trim	Poor	Low

Date: c. 1785 – 1820s, 1955, and Later **Contributing**: Contributing

Horizontal board siding was present on the south wall (Photo 55). The existing siding has a 9.5-inch exposed faces and a small, beaded detail along the bottom edge. The existing siding and trim were unfinished. Exposed fasteners were a combination of cut and forged nails. Many of the siding boards to the east of Window W100 are visible in the 1938 HABS photographs and may be original, with select boards and the siding west of Window W100 having been replaced during the 1955 restoration, potentially with salvaged historic material. The unfinished boards are 1955 replacements with identifying brands on the attic side.

Horizonal Board Siding

The siding was generally in serviceable condition. Minor weather-related deterioration was observed around the cutouts for the railing ends (Photo 56). Five boards exhibited minor checking that did not affect the stability or performance of the siding. Three boards were somewhat loose and may need to be resecured to the backup. The surface had multiple coats of white paint (Photo 57 and Photo 58); minor areas of paint failure were observed. Repainting should be considered within the next three to five years.

Base Trim

The existing base trim appears to postdate the 1972 HABS photographs. The base trim was generally in serviceable condition (Photo 59), which minor weather-related deterioration at the east and west ends of the gallery. The board to the west of Door D200 may be loose and should be resecured to the backup.

Corner Trim

The vertical trim boards at the east and west corners appeared to be the same boards in the 1972 HABS photographs. The trim exhibited moderate to severe deterioration, particularly along the outside faces (Photo 60). These boards should be replaced with the weatherboard siding and painted on exposed faces with back-priming on concealed and cut faces.

Weatherboard Siding					
B	**SHELL**				
B20	**EXTERIOR ENCLOSURE**				
	B2010	**EXTERIOR WALLS**			
				Condition	**Priority**
		B201004	Weatherboard Siding	Poor to Failed	High

Date: 1955 **Contributing**: Contributing

Weatherboard (lapped) siding was installed on the east, west, and south elevations as part of the 1955 restoration. The existing weatherboard siding appeared to be the same siding as seen in the 1972 HABS photographs, with replacement of select boards.

Weatherboard siding was present on the east and west end walls and north walls around the gallery (Photo 61). The existing siding has a 9.5-inch exposed faces and a small, beaded detail along the bottom edge. The existing siding and trim were unfinished. Exposed fasteners were typically modern wire nails. In some locations, asphaltic underlayment or building paper appeared to be in place behind the siding, but it was not confirmed if underlayment was present at all walls. Sheet metal flashing was present at window heads.

The siding generally exhibited moderate weather-related aging and deterioration, with severe deterioration at the northeast corner due to outward displacement of the exterior walls which allows water to sheet down the siding (Photo 62 through Photo 64). Numerous locations of warped, split, loose siding boards, and missing nails were documented (Photo 65). At the west chimney loose boards were observed that exposed the chimney flashing (Photo 66). At the east elevation, evidence of bast roosting under loose siding boards was observed.

Significant deterioration of the weatherboard siding was observed at the east elevation and northeast corner, where the siding has failed and is no longer providing weatherproofing for the building. Displaced boards and localized deterioration were observed at the northwest corner and west elevations. Overall, the siding is aged and has limited remaining performance. Targeted replacement of deteriorated boards can be performed, which may account for 30 to 40 percent of the existing siding. Repairs or full replacement should be planned within the next three to five years.

Chimneys

Central Chimney					
B	SHELL				
B10	SUPERSTRUCTURE				
	B1030	OTHER STRUCTURAL MEMBERS			
				Condition	Priority
		B103001	Central Chimney	Fair	Moderate

Date: c. 1785 **Contributing**: Contributing

A brick masonry chimney was located in the dividing wall between Room 1 (101) and Room 7 (107) that was likely original to the c. 1785 house. The central chimney was red clay brick set in lime and lime-cement mortars. The chimney served back-to-back fireplaces, one open to each room but separated with a solid brick wall at the back of the fireboxes. Water staining along the back of the fire box in Room 7 (107) indicated that rainwater may be flowing down the flue, causing deterioration of the mortar joints of the hearth (Photo 67).

A steel lintel had been installed at both fireplaces and were visible in the 1938 HABS photographs, indicating that the lintels were in place prior to the 1955 restoration. Steel lintels would not have been original to the c. 1785 fireplaces and represent an alteration of undetermined date. Analysis of the metal may be able to determine if the lintel is steel or wrought iron, which may help date the alteration.

The lintels exhibited corrosion and slight deflection (Photo 68 and Photo 69). Cracks and spalls of the bricks on either side of the lintels are due to corrosion expansion (rust jacking). The existing lintels can be exposed and coated to protect them from further corrosion or replaced with new steel with a high-performance coating.

The interiors had several coats of white paint (Photo 70). Localized paint failure was observed, where the outermost application as debonding from the underlying paint layers.

In the crawlspace, the brick foundation was exposed (Photo 71 and Photo 72). Some cracking and mortar deterioration was present, but no evidence of settlement or distress to the chimney foundation was observed. An animal burrow, reportedly to likely be caused by an armadillo, was observed next to the east side of the foundation. Localized repointing of mortar joints with a compatible mortar and filling cracks with lime-based grout is recommended. Petrographic analysis of the existing mortar may be needed to develop a compatible pointing mortar.

Above the roof line, minor weathering and deterioration of mortar joints were observed (Photo 73). Lichen growth on the north face may indicate that the stack remains wet due to water intrusion (Photo 74). The chimney stack did not appear to be displaced or distressed. Localized repointing of the stack is recommended. If uncapped, installing a low-profile cap to minimize rainwater intrusion into the stack and flue can also be considered.

West Chimney					
B	**SHELL**				
B10	**SUPERSTRUCTURE**				
	B1030	**OTHER STRUCTURAL MEMBERS**			
				Condition	**Priority**
		B103002	West Chimney	Fair	Moderate

Date: 1955 **Contributing**: Contributing

A brick masonry chimney was located on the west wall of Room 2 (102) (
Photo 75). This chimney was constructed as part of the 1955 restoration. The west chimney was red clay brick set in lime and lime-cement mortars. Several bricks around the perimeter of the hearth were loose.

A steel lintel had been installed at the fireplaces, likely during the 1950s restoration. The steel lintel exhibited minor corrosion and no deflection (Photo 76). The steel lintel can be exposed and coated to protect it from further corrosion or replaced with new steel with a high-performance coating.

The main body of the chimney and stack were located outside the west wall. A gap was present between the stack and the structure. Where the body of the chimney intersected with the west wall, lead step flashing was present behind the weatherboard siding (Photo 77). The brick was generally in serviceable condition, with isolated units exhibiting surface erosion (Photo 78).

In the crawlspace, the brick foundation was exposed (Photo 79). Some mortar deterioration was present, but no evidence of settlement or distress to the chimney foundation was observed. Localized repointing of mortar joints with a compatible mortar is recommended. Petrographic analysis of the existing mortar may be needed to develop a compatible pointing mortar.

Above the roof line, moderate weathering and deterioration of mortar joints were observed (Photo 80). The chimney stack was not displaced or distressed. Localized repointing of the stack is recommended. If uncapped, installing a low-profile cap to minimize rainwater intrusion into the stack and flue can also be considered.

Date: 1955 / 2006 **Contributing**: Contributing

Window W100 was located on the south wall of Room 1 (101) to the west of Door D100 (
Photo 81). The window and shutter were of a style similar to those seen in the 1938 HABS photographs prior to restoration and again in the 1972 HABS photographs after restoration. Documentation for the colors of the window and shutters has not been uncovered, but the 1958 Mirro-Krome postcard depicted the house with the windows painted white and the shutters painted a brilliant blue, similar to the existing colors. This color scheme is generally consistent with the blue and white palette typically prescribed in the 1956 Furnishings Plan.

The window was nine-over-six double-hung wood sashes. The window had a single four-paneled shutter, attached to the left jamb. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Fair condition with minor repairs required to maintain the weather resistance of the window.

- Shutter: The shutter was generally in good condition. The shutter had multiple layers of blue paint, with localized, minor paint failure. Repainting the shutter should be considered in the next five years.

Shutter Hardware: The shutter hinges appeared to be modern replacements with three screws into the shutter stile and jamb trim (

- Photo 82). The shutter dog was missing (Photo 83). The shutter dog should be replaced in kind.
- Sill: The sill was in good condition without distress or deterioration.
- Jamb Trim: The left jamb was split through the shutter hinge screws. The jamb trim can be replaced or stabilized in place with through-face nails, patching, and repainting.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested.

- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Glazing: The glazing putty was failed and debonded easily from the glass and muntin (Photo 84). The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sash should be coordinated with the putty replacement.
- Pest Control: Bats were actively roosting behind the shutter, so operability of the shutter was not tested during the investigation. Biological staining and guano were observed on the shutter and siding.

Window W101 was located on the south wall of Room 1 (101) to the east of Door D100 (
Photo 85). The window and shutter were of a style similar to those seen in the 1938 HABS photographs prior to restoration and again in the 1972 HABS photographs after restoration. The window was nine-over-six double-hung wood sashes. The window had a single four-paneled shutter, attached to the right jamb. The window sashes and frame were painted white, and the shutter was painted blue (Photo 86). The window was generally in Fair condition with minor repairs required to maintain the weather resistance of the window.

- Shutter: The shutter was generally in Good to Fair condition, with localized, minor paint failure and slight separation of stile-to-rail joints. Repainting the shutter should be considered in the next five years.
- Shutter Hardware: The shutter hinges appeared to be modern replacements and were loose. Shutter hinges should be resecured to the jamb. The shutter dog was missing and should be replaced in kind.
- Sill: The sill was in good condition without distress or deterioration.
- Jamb Trim: The jambs were in good condition without distress or deterioration.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Glazing: One small crack was observed in a lite in the lower sash (Photo 87). The glazing putty was failed and debonded easily from the glass and muntin (Photo 88). The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sash should be coordinated with the putty replacement.
- Pest Control: Minor biological staining likely from bats was observed behind the shutter. See Window W100 for recommendations regarding bat control.

Window W200 was located on the west wall of Room 2 (102) to the south of the brick masonry chimney (Photo 89). This window was recreated during the 1955 restoration when Room 2 (102) was reconfigured. The window was nine-over-six double-hung wood sashes. The window had a single four-paneled shutter, attached to the right jamb. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Fair to Poor condition with serious repairs required to maintain the weather resistance of the window.

- Shutter: The shutter was generally in Fair to Poor condition, with paint failure and localized deterioration, particularly at the top rail (Photo 90). Repainting the shutter should be considered in the next one to three years.
- Shutter Hardware: The shutter hinges appeared to be serviceable, and the shutter dog was present and secured the shutter in the open position.
- Sill: The sill was severely deteriorated and had failed (Photo 91 and Photo 92). The sill should be replaced in kind, and the new sill should be slightly pitched to the west to shed water.
- Jamb Trim: The lower ends of the jambs at the sill were deteriorated. Additionally, the jamb trim was split at the shutter hinges. The jambs should be replaced in kind.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Lower Sash: The lower sash was in poor condition with severe deterioration of the lower rail. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Glazing: The glazing putty was failed and debonded easily from the glass and muntin (Photo 93). The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sashes should be coordinated with the putty replacement.
- Pest Control: Heavy biological staining and deep guano accumulation from bats was observed behind the shutter (Photo 94). See Window W100 for recommendations regarding bat control.

Window W300 was located on the north wall of Room 3 (103) (Photo 99). This window was recreated during the 1955 restoration when Room 3 (103) was reconfigured. The existing shutter has been replaced since the 1972 HABS photographs, which depicted a board-and-batten style shutter.

The window was nine-over-six double-hung wood sashes. The window had a single four-paneled shutter, attached to the right jamb. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Fair condition with moderate repairs required to maintain the weather resistance of the window.

- Shutter: The shutter was generally in Fair condition, with minor weather-related deterioration of the paint. Repainting the shutter should be considered in the next one to three years.
- Shutter Hardware: The shutter dog was present but did not engage the shutter. The shutter dog should be removed and reinstalled.
- Sill: The sill had moderate deterioration of the wood. The sill should be replaced in kind in the next 1 to 2 years, and the new sill should be slightly pitched to shed water.
- Jamb Trim: The jamb trim was in good condition without distress or deterioration.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Glazing: The glazing putty was failed and debonded easily from the glass and muntin. The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sashes should be coordinated with the putty replacement.
- Pest Control: Minor biological staining and guano accumulation from bats was observed behind the shutter. See Window W100 for recommendations regarding bat control.

Date: 1955, Post-1972, 2006 **Contributing**: Contributing

Window W600 was located on the north wall of Room 6 (106) (Photo 100). This window was recreated during the 1955 restoration when Room 6 (102) was reconfigured, and the north chimney was removed; the window may have been set in the rough opening of the door visible in the 1938 HABS photographs. The existing shutter has been replaced since the 1972 HABS photographs, which depicted a board-and-batten style shutter.

The window was nine-over-six double-hung wood sashes. The window had a single four-paneled shutter, attached to the left jamb. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Fair condition with moderate repairs required to maintain the weather resistance of the window. The shutter was fixed in place to protect the window from water sheeting down the displaced exterior wall. Direct observation of the window was limited.

- Shutter: The shutter was generally in Fair condition, with minor weather-related deterioration of the paint. Repainting the shutter should be considered in the next one to three years.
- Shutter Hardware: The shutter dog was missing. Shutter hinges appeared to be replacement hardware.
- Sill: The sill had moderate deterioration of the wood. The sill should be replaced in kind in the next 1 to 2 years, and the new sill should be slightly pitched to shed water.
- Jamb Trim: The jamb trim was in fair condition, with minor deterioration (Photo 101).
- Head Trim: The head trim was in good condition without distress or deterioration.

Date: 1955 / 2006 **Contributing**: Contributing

Window W601 was located on the east wall of Room 6 (106) (Photo 102). The window style was unclear in the 1938 HABS photographs; the existing window and shutters are of the same style as seen in the 1972 HABS photographs. The window was twelve-over-eight double-hung wood sashes. The window had two four-paneled shutters. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Poor condition with serious repairs required to maintain the weather resistance of the window.

- Shutters: The shutters were generally in Fair condition, with paint failure and localized deterioration, particularly at the upper rails. Heavy biological growth was present on the paint. Cleaning and repainting the shutters should be considered in the next one to three years.
- Shutter Hardware: One shutter dog was present, and one was missing. The missing shutter dog should be replaced in kind. The shutter hinges appeared to be replacement hardware.
- Sill: The sill was severely deteriorated and had failed (Photo 103). The sill should be replaced in kind, and the new sill should be slightly pitched to the west to shed water.
- Jamb Trim: The lower ends of the jambs at the sill were deteriorated (Photo 105). Additionally, the jamb trim was split at the shutter hinges (Photo 105). The jambs should be replaced in kind.
- Head Trim: The head trim was in fair condition with minor deterioration of the wood (Photo 106).
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Glazing: The glazing putty was failed and debonded easily from the glass and muntin (Photo 107). The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sashes should be coordinated with the putty replacement.

- Pest Control: No biological staining or guano accumulation from bats was observed behind the shutter. However, see Window W100 for recommendations regarding bat control.

Date: 1955 / 2006 **Contributing**: Contributing

Window W700 was located on the south wall of Room 7 (107) to the east of Door D700. The window was nine-over-six double-hung wood sashes. The window and shutter were of a style similar to those seen in the 1938 HABS photographs prior to restoration and again in the 1972 HABS photographs after restoration.

The window had a single four-paneled shutter, attached to the right jamb. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Fair condition with moderate repairs required to maintain the weather resistance of the window.

- Shutters: The shutters were generally in Good to Fair condition, with minor weather-related deterioration of the paint (Photo 109).
- Shutter Hardware: The shutter dog was present and operable (Photo 110). The interior shutter hook was also present (Photo 111). Shutter hinges appeared to be replacement hardware with corrosion of the hinges and fasteners (Photo 112). Replacement of the hinges and screws should be considered; alternately, the hinges can be cleaned and painted and only the fasteners replaced.
- Sill: The sill was in good condition without distress or deterioration.
- Jamb Trim: The jamb trim was in good condition; one minor split was observed at the base of the left jamb (Photo 113). This split did not affect the serviceability of the jamb.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Glazing: The glazing putty was failed and debonded easily from the glass and muntin (Photo 107). The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sashes should be coordinated with the putty replacement.

- Pest Control: Bats were actively roosting behind the shutter, but operability of the shutter was tested later during the investigation. Biological staining from bats was observed on the shutter and siding. See Window W100 for recommendations regarding bat control.

Window W701 was located on the east wall of Room 7 (107) (Photo 114). The window was twelve-over-eight double-hung wood sashes. The window was of a style similar to that seen in the 1938 HABS photographs prior to restoration and again in the 1972 HABS photographs after restoration. The shutters are missing in the 1938 photographs, but the existing shutters are of the same style as seen in the 1972 photographs. The window had two four-paneled shutters. The window sashes and frame were painted white, and the shutter was painted blue. The window was generally in Poor condition with serious repairs required to maintain the weather resistance of the window.

- Shutters: The shutters were generally in Fair condition, with paint failure and localized deterioration, particularly at the upper rails (Photo 115 and Photo 116). Heavy biological growth was present on the paint. Cleaning and repainting the shutters should be considered in the next one to three years.
- Shutter Hardware: One shutter dog was present, and one was missing with the shutter secured open by a wire and nail. The missing shutter dog should be replaced in kind. The shutter hinges appeared to be replacement hardware.
- Sill: The sill was severely deteriorated and had failed (Photo 117). The sill should be replaced in kind, and the new sill should be slightly pitched to the west to shed water.
- Jamb Trim: The lower ends of the jambs at the sill had minor deterioration. Additionally, the jamb trim was split at the shutter hinges (Photo 118). The jambs should be replaced in kind.
- Head Trim: The head trim was in good condition without distress or deterioration (Photo 119).
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested. The sashes should be repainted in 1 to 2 years.

- Glazing: The glazing putty was failed and debonded easily from the glass and muntin. The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the sashes should be coordinated with the putty replacement.
- Pest Control: Minor biological staining likely from bats was observed behind the shutter. See Window W100 for recommendations regarding bat control.

		B203001.02	D100 Exterior Hardware	Fair	Moderate
		B203001.03	D100 Jamb Trim	Good	Low
		B203001.04	D100 Head Trim	Good	Low
		B203001.05	D100 Transom	Failed	High
		B203001.06	D100 Threshold	N/A	N/A

Date: Undetermined, relocated in 1955 **Contributing**: Contributing

Door D100 was located on the south wall of Room 1 (101), between Windows W100 and W101 (Photo 120). Many of the existing doors, including Door D100, may be historic material of undetermined date that was salvaged and relocated during the 1955 restoration. Documentation for the colors of the doors and trim has not been uncovered, but the 1958 Mirro-Krome postcard depicted the house with the trim painted white and the doors painted a brilliant blue, similar to the existing colors. This color scheme is generally consistent with the blue and white palette typically prescribed in the 1956 Furnishings Plan. The existing door and transom appears to be the same as those seen in the 1972 HABS photographs.

The door was inward-swinging and hinged on the lefthand side. The door was a six-panel, rail-and-stile solid wood door with raised panels. Above the door was a four-lite transom. The exterior surface of the door was painted blue, and the transom and exterior trim were painted white. The door was generally in Fair condition with minor repairs required to maintain the weather resistance of the transom. At the time of the site visit, the door appeared to be fully operable but scraped and abraded the floorboards when opened.

- Door: The door was generally in Fair condition. The door had multiple layers of blue paint, with localized, minor paint failure and minor separation of joints between the rails and stiles (Photo 121). Repainting the door and trim should be considered in the next five years.

Door Hardware: The exterior handle appeared to be a painted iron or steel thumb-latch and was secured to the lock stile with hammered nails (

- Photo 122). The keyhole escutcheon was brass and appeared to take a rounded shaft or "skeleton" key. The exterior hardware generally appeared to be in fair condition. The door appeared to latch when closed.
- Jamb Trim: Minor deterioration of the wood was observed at the bottom edges of both jambs (Photo 123). The stop appeared to be in good condition. Localized paint failure was observed in multiple locations.

- Head Trim: The head trim formed the rail between the transom and the door opening. The trim was in good condition without distress or deterioration.
- Transom: The glazing putty was failed and debonded easily from the glass and muntins, and localized paint failure was observed. The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the transom should be coordinated with the putty replacement.
- Threshold: No threshold was present. The south porch decking boards met the flooring boards of Room 1 (101) just outboard of the exterior face of the closed door.

		B203002.04	D101 Head Trim	Good	Low
		B203002.06	D101 Threshold	N/A	N/A

Date: Undetermined, relocated in 1955 **Contributing**: Contributing

Door D101 was located on the north wall of Room 1 (101), leading to the north porch (
Photo 124,
Photo 125). The door was inward-swinging and hinged on the lefthand side. The door was a ledged or board-and-batten door constructed of vertical wood panels with three interior "ledges" or horizontal battens. The exterior surface of the door and the trim were painted blue. The door was generally in Fair condition with repairs required to maintain the condition and operation of the door. At the time of the site visit, the door dragged on the floorboards and was difficult to open and the locking mechanism was not functional.

- Door: The door was generally in good condition. The door had multiple layers of blue paint, with localized, minor paint failure. Repainting the door and trim should be considered in the next five years.
- Door Hardware: The exterior handle appeared to be an iron thumb-latch and was secured to the lock stile with hammered nails, similar to the handle of Door 100 (Photo 126). The thumb-latch was loose. The lock appeared to be a modern-style cylinder lock with a spring latch, and the cylinder was stamped with the word "BEST". The exterior hardware was generally in poor condition.
- Jamb Trim: The jamb trim was in fair condition; however, separation of the stop from the jamb was observed on the latch side (Photo 127). Localized paint failure was observed in multiple locations. Wood trim had been added to the door jambs to support a plexiglass pedestrian barrier; the trim was loose and should be replaced.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Threshold: No threshold was present. The north porch decking boards ran parallel with the flooring boards of Room 1 (101). The floorboards were noticeably displaced at the door entry, causing the door to drag on the floor, damaging the surface of the boards (Photo 128). The door was difficult to operate and could not be fully opened.

Door D200 was located on the south wall of Room 2 (102), leading to the north porch (
Photo 129). The door was inward-swinging and hinged on the righthand side. The door was a ledged or board-and-batten door constructed of vertical wood panels with three interior "ledges" or horizontal battens. The exterior surface of the door and the trim were painted blue. The door was generally in Fair condition with minor repairs required to maintain the condition and operation of the door. At the time of the site visit, the door appeared to latch when closed.

- Door: The door was generally in good condition. The door had multiple layers of blue paint, with localized, minor paint failure. Repainting the door and trim should be considered in the next five years.
- Door Hardware: The exterior handle appeared to be an iron thumb-latch and was secured to the lock stile with hammered nails, similar to the handle of Door 100 (Photo 130). No exterior locking mechanism was present. The exterior hardware was generally in fair condition. Door hinges were painted steel butt hinges with minor surface corrosion (Photo 131).
- Jamb Trim: The jamb trim was in fair condition with localized paint failure (Photo 132, Photo 133).
- Head Trim: The head trim was in good condition without distress or deterioration (Photo 134).
- Threshold: No threshold was present. The south porch decking boards meet the flooring boards of Room 2 (102) outboard of the exterior face of the door when closed. The floorboards were slightly elevated from the exterior decking, but the door did not appear to catch or drag on the flooring.

Door D201 was located on the north wall of Room 2 (102), leading to Room 3 (103) (Photo 135, Photo 136). The door was inward swinging into Room 2 (102) and hinged on the lefthand side. The door was a ledged or board-and-batten door constructed of vertical wood panels with three interior "ledges" or horizontal battens. The surfaces of the door and the trim were painted blue. The door was generally in Good condition with minor repairs required to maintain the condition and operation of the door.

- Door: The door was generally in good condition. The door had multiple layers of blue paint, with localized, very minor paint failure.
- Door Hardware: The handle was a wood lift-latch attached to the north side of the door. The thumb press was broken and missing. The lift latch could not be operated from the Room 3 (103) side of the door.
- Jamb Trim: The jamb trim was in good condition with minor separation of the jamb from the head trim (Photo 137, Photo 138).
- Head Trim: The head trim was in good condition without distress or deterioration.
- Threshold: No threshold was present, and the door did not appear to catch or drag on the flooring.

Door D300 was located on the east wall of Room 3 (103), leading to the north porch (Photo 139, Photo 140). The door was inward swinging and hinged on the righthand side. The door was a ledged or board-and-batten door constructed of vertical wood panels with three interior "ledges" or horizontal battens. The exterior surface of the door and the trim were painted blue. The door was generally in Fair condition with repairs required to maintain the condition and operation of the door. At the time of the site visit, the door appeared to latch when closed but did not swing freely and dragged on the floorboards of Room 3 (103).

- Door: The door was generally in good condition. The door had multiple layers of blue paint, with localized, minor paint failure. Repainting the door and trim should be considered in the next five years.
- Door Hardware: The exterior handle was a wood lift-latch handle attached to the north side of the door (Photo 141); the handle was damaged, and the thumb press was missing. The lock appeared to be a modern-style cylinder lock with a spring latch, and the cylinder was stamped with the word "BEST". The exterior hardware was generally in fair condition.
- Jamb Trim: The jamb trim was in fair condition with localized paint failure. Some separation of the jambs from the head trim was observed (Photo 142). Gaps between the jambs and the porch decking were also observed due to the slope of the porch (Photo 143).
- Head Trim: The head trim was in good condition without distress or deterioration.
- Threshold: No threshold was present. The north porch decking boards were continuous with the floorboards of Room 3 (103). The floorboards were slightly elevated from the exterior decking, and scrape marks and abrasion to the floorboards were observed where the door drags on the floor when opened (Photo 144).

Door D600 was located on the west wall of Room 6 (106) (Photo 145). The door was inward-swinging and hinged on the lefthand side. The door was a six-panel, rail-and-stile solid wood door with slightly raised panels, of a slightly different style from Door 100. The exterior surface of the door and the trim were painted blue. The door was generally in Fair condition with repairs required to function and operation of the door. At the time of the site visit, the door was extremely difficult to unlock and dragged on the floor when opened.

- Door: The door was generally in good condition (Photo 146). The door had multiple layers of blue paint, with localized, minor paint failure. Repainting the door and trim should be considered in the next five years.
- Door Hardware: The exterior handle appeared to be a painted iron or steel thumb-latch and was secured to the lock stile with hammered nails (Photo 147). The lock appeared to be a modern-style brass cylinder lock with a spring latch, and the cylinder was stamped with the word "BEST". Door hinges were painted steel butt hinges with minor surface corrosion (Photo 148). The exterior hardware was generally in fair to poor condition.
- Jamb Trim: The jamb trim was in fair condition with localized paint failure. Some separation of the jambs from the head trim was observed (Photo 149). The stops appeared to be in good condition. Large gaps between the jambs and the porch decking were observed due to the slope of the porch. Wood trim had been added to the door jambs to support a plexiglass pedestrian barrier.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Threshold: No threshold was present. The north porch decking boards abutted the flooring boards of Room 6 (106) just outboard of the exterior face of the closed door. Scrape marks and abrasions to the floorboards were observed where the door drags on the floor when opened (Photo 150).

Door D700 was located on the south wall of Room 7 (107), between Windows W101 and W700 (Photo 151). The door was inward-swinging and hinged on the lefthand side. The door was a six-panel, rail-and-stile solid wood door with raised panels, similar in style to Door 100. Above the door was a four-lite transom. The exterior surface of the door was painted blue, and the transom and exterior trim were painted white. The door was generally in Fair condition with minor repairs required to maintain the weather resistance of the transom. At the time of the site visit, the door appeared to be operable without dragging on the floor.

- Door: The door was generally in fair condition. The door had multiple layers of blue paint, with localized, minor paint failure and minor separation of joints between the rails and stiles (Photo 153, Photo 154). Repainting the door and trim should be considered in the next five years.
- Door Hardware: The exterior handle appeared to be a painted iron or steel thumb-latch and was secured to the lock stile with hammered nails (Photo 152). The keyhole escutcheon was brass and appeared to take a rounded shaft or "skeleton" key. The exterior hardware generally appeared to be in fair condition with surface corrosion of the handle. The door appeared to latch when closed.
- Jamb Trim: Minor deterioration of the wood was observed at the bottom edges of the jambs. The stops appeared to be in good condition. Localized paint failure was observed in multiple locations.
- Head Trim: The head trim formed the rail between the transom and the door opening. The trim was in good condition without distress or deterioration.
- Transom: The glazing putty was failed and was debonded from the glass and muntins, and localized paint failure was observed. The glazing putty should be fully replaced in the next 1 to 2 years; repainting of the transom should be coordinated with the putty replacement.
- Threshold: No threshold was present. The south porch decking boards met the flooring boards of Room 1 (101) just outboard of the exterior face of the closed door.

Door D701 was located on the north wall of Room 7 (107), leading to the north porch (Photo 155). The door was inward-swinging and hinged on the righthand side. The door was a six-panel, rail-and-stile solid wood door with raised panels, similar in style to Door 100. The exterior surface of the door and trim were painted blue. The door was generally in Fair condition with minor repairs required to maintain the operation of the door. At the time of the site visit, the door appeared to be operable without dragging on the floor.

- Door: The door was generally in fair condition. The door had multiple layers of blue paint, with localized, minor paint failure (Photo 156). Repainting the door and trim should be considered in the next five years.
- Door Hardware: The exterior handle appeared to be a painted iron or steel thumb-latch and was secured to the lock stile with hammered nails (Photo 157). The lock appeared to be a modern-style brass cylinder lock with a spring latch, and the cylinder was stamped with the word "BEST". Door hinges were painted steel butt hinges with minor surface corrosion (Photo 158). The exterior hardware was generally in fair condition.
- Jamb Trim: The jamb trim was in good condition without distress or deterioration except for minor areas of paint failure. The stops appeared to be in good condition.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Threshold: No threshold was present. The north porch decking boards ran parallel with the flooring boards of Room 7 (107). Small abrasions to the flooring were observed near the hinge jamb, but the door swung without dragging on the flooring at the time of the site visit; during summer months, the door may catch on the flooring.

Date: Replaced in 1992 **Contributing**: Contributing

Pier Description, General

The structure is supported on a series of twenty-eight short log piers. The piers bear on buried concrete footings and support the primary floor beams. A short crawl space is present under the full length of the house, and each pier was able to be assessed. The piers were visually assessed for condition, including evidence of deterioration or displacement, and three interior moisture content readings were taken at each pier at the top of the log, at mid-height, and at grade.

The piers are undressed logs with the bark still attached. The piers were reported in the 1998 HSR as sassafras (*Sassafras albidum*). The piers may have been replaced in part or entirely in 1992 due to deterioration of the logs. The piers are gravity-set without mechanical anchorage to the concrete footing or the building structure. Each pier was capped with a sheet of copper flashing to provide a capillary and insect break between the log and the timber floor beam.

A summary of the conditions observed at each pier are described in the table below and graphically shown in Figure 3.

Moisture Content Readings

Electric resistance meters indicate moisture content (MC) as a percentage of the oven-dry weight of the wood by measuring electrical conductivity between two probes inserted into the wood. This method works well because moisture is an excellent conductor of electricity, while dry wood is an effective insulator. High conductivity generally indicates high moisture levels in the wood. Measurements above 20% MC are widely accepted to indicate a level of moisture that supports fungal decay.

The MC readings of the log piers were taken with a Delmhorst RDM-2 meter with a 4.5 to 60% range and contact pins with 1-inch penetration. The meter allows the operator to input the temperature and the wood species. The wood species presets for the Delmhorst RDM-2 did not include a setting for "sassafras," so the setting for "red oak" was selected as the most comparable ring-porous hardwood. The meter also provides a hammer-like probe handle to fully seat the probes in the substrate. The MC reading at a 1-inch depth is considered representative of the MC through the full depth of the member.

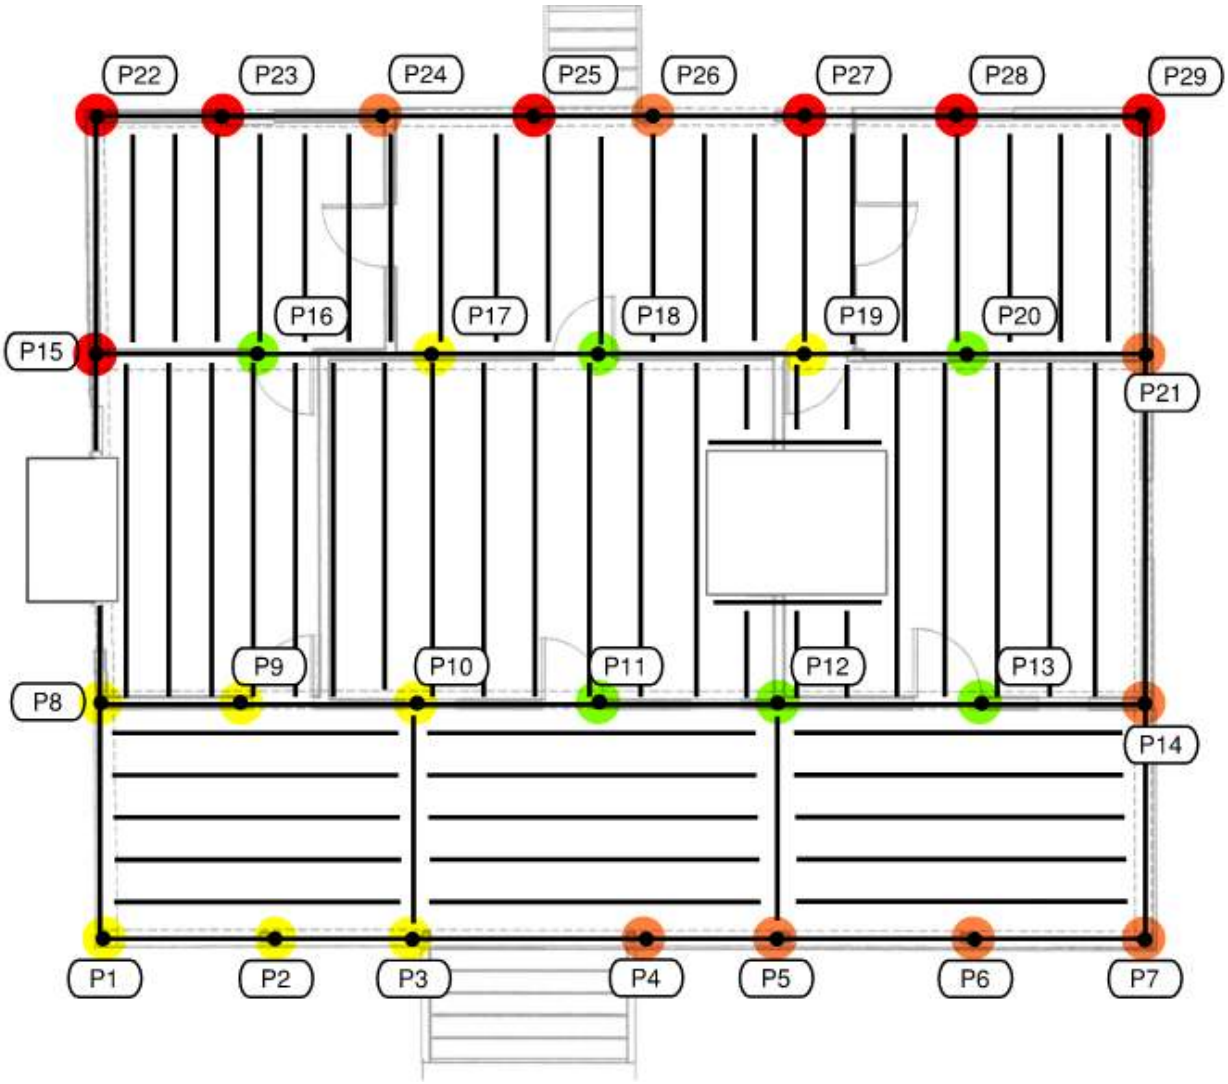

Figure 3. Schematic floor framing plan graphically showing condition ratings for foundation piers: Good (green), Fair (yellow), Poor (orange), and Failed (red).

Table 1. Summary of Foundation Pier Conditions

Pier No.	Condition	MC%[1]	Nom. Diameter[2]	Observations	Photos
P1	Fair	19.0 (t) 26.2 (m) 45.0 (b)	1'-4.1"	Deterioration of the pier was observed at grade that appeared to extend approximately 1-inch into the sapwood.	Photo 159
P2	Fair	17.4 22.1 30.5	1'-8.2"	Deterioration of the pier was observed at grade that appeared to extend approximately 1-inch into the sapwood.	Photo 160
P3	Fair	23.3 24.3	1'-1.4"	Minor deterioration of the sapwood was observed at grade.	Photo 161

Table 1. Summary of Foundation Pier Conditions					
		29.8			
P4	Poor	17.7 19.9 30.5		The pier appeared to be displaced to the north and was not fully engaged with the beam above. Deterioration of the pier was observed at grade that extended 1 to 2-inches into the sapwood.	Photo 162
P5	Poor	16.5 23.0 27.3	1'-2.3"	Deterioration of the pier was observed at grade that appeared to extend approximately 1 to 2-inches into the sapwood.	Photo 163 Photo 164
P6	Poor	15.5 15.6 23.9	1'-3.3"	Deterioration of the pier was observed at grade that appeared to extend approximately 2 to 3-inches into the sapwood.	Photo 165 Photo 166
P7	Poor	19.6 24.6 27.7	1'-5.2"	Deterioration of the pier was observed at grade that appeared to extend approximately 1-inch into the sapwood.	Photo 167 Photo 168
P8	Fair	16.0 16.0 20.0	1'-3.9"	Minor deterioration of the sapwood was observed at grade.	Photo 169
P9	Fair	18.5 18.8 22.8	1'-0.6"	Pier 9 appeared to be slightly displaced to the north and east but was fully engaged with the beam above.	Photo 170
P10	Fair	19.1 19.8 22.3	1'-4.1"	Pier 10 appeared to be slightly displaced to the north but was fully engaged with the beam above.	Photo 171
P11	Good	19.3 19.4 20.2	1'-3.6"		Photo 172
P12	Good	17.5 18.9 19.4	1'-2.5"		Photo 173
P13	Good	17.8 18.9 19.7	1'-1.8"		Photo 175
P14	Poor	16.8 23.1 25.2	1'-7.1"	Minor deterioration of the pier was observed at grade. The pier also exhibited multiple vertical splits and checks.	Photo 176
P15	Failed	15.2 23.6 20.7	1'-3.9"	Deterioration was observed at grade at Pier 16 that extended approximately 4 to 5-inches into the sapwood and heartwood of the pier.	Photo 177 Photo 178
P16	Good	18.0	1'-6.5"		Photo 179

Table 1. Summary of Foundation Pier Conditions					
		18.6 20.0			
P17	Fair	17.7 18.2 20.7	1'-1.0"	No distress or deterioration were observed at Pier 17. The vertical split in the pier appeared to be shallow and did not affect the ability of the pier to support the structure.	Photo 180
P18	Good	18.7 20.1 22.5	1'-3.3"		Photo 181
P19	Fair	17.7 15.4 18.9	1'-2.6"	Pier 19 was slightly displaced to the south but appeared to be fully engaged with the beam above. Minor deterioration of exterior surface of the sapwood was observed at grade that did not appear to impact the performance of the pier.	Photo 182
P20	Good	18.4 18.7 20.7	1'-3.9"		Photo 183
P21	Poor	20.0 20.5 24.2	1'-3.3"	Deterioration was observed at grade of the sapwood at Pier 21. Per the 1998 HSR, this pier extends 12-inches below ground and bears on a concrete footing.	Photo 184
P22	Failed	17.1 20.0 26.0	1'-3.9"	Per the 1998 HSR, this pier extends 14-inches below ground, were it bears on a concrete footing. A vertical split approximately ½-inches wide on the east face of the pier was fairly shallow and did not compromise the pier's ability to support the structure. At grade, deterioration of the sapwood was observed, as well as an undetermined amount of deterioration of the heartwood core. The pier was not fully engaged with the perimeter beam above.	Photo 185 Photo 186
P23	Failed	18.8 17.3 19.6	1'-2.0"	Pier 23 was leaning out of plumb to the northwest and no longer provided support for the perimeter beam; a gap of approximately 1 to 2 inches was present between the top of the copper flashing and the bottom of the beam. Significant deterioration was observed at grade of both the sapwood and the inner	Photo 187 Photo 188

Table 1. Summary of Foundation Pier Conditions					
				heartwood. Section loss of the wood was approximately 4 to 5-inches deep.	
P24	Poor	19.8 20.0 22.7	1'-0.1"	Deterioration of the sapwood was observed at grade, and the deterioration appeared to extend approximately 3-inches into the sapwood and potentially into the heartwood of the pier.	Photo 189
P25	Failed	15.8 17.8 17.2	1'-0.1"	Pier 25 had significant deterioration through the entire thickness of the pier at grade, resulting in full loss of section of the member. Pier 25 has failed and can no longer support the structure above.	Photo 190 Photo 191
P26	Poor	18.7 22.4 26.6	1'-2.5"	Pier 26 appeared to be plumb. Deterioration at grade was observed at Pier 26 that extended approximately 3-inch into the sapwood. Frass from a wood-boring insect was also observed.	Photo 192 Photo 193
P27	Failed	15.0 16.4 25.0	1'-2.6"	Per the HSR, this pier extends 10-inches into the ground where it bears on a concrete footing. Pier 27 was significantly out of plumb, leaning to the north. The perimeter beam was no longer bearing on the pier; a gap of approximately 1 to 2-inches was present between the top of the copper flashing and the underside of the beam. Vertical splits in the pier were shallow. Significant deterioration of the pier at grade appeared to extend the full depth of the core.	Photo 194 Photo 195 Photo 196
P28	Failed	15.8 16.3 23.0	1'-2.6"	Pier 28 was also displaced to the north. Significant deterioration and loss of section was observed at grade that extended into the sapwood and heartwood of the pier approximately 3 to 4-inches.	Photo 197 Photo 198
P29	Failed	18.2 18.5 28.8	1'-7.6"	Pier 29 appeared to generally be plumb, with possible some displacement to the north and east. Deterioration was observed at grade that appeared to extend nearly the full thickness of the pier's core.	Photo 199 Photo 200

Notes:

1. Weather conditions on November 16, 2021: 65°F and 90% RH (Relative Humidity). The MC readings are reported in the column below, as taken from the top (t), midpoint (m), and bottom (b) of each pier.
2. Nominal diameter of piers in feet and inches, as reported by the 1998 HSR update.

Crawlspace					
G	SUBSTRUCTURE				
G20	FOUNDATIONS				
	G2040	SITE DEVELOPMENT			
				Condition	Priority
		G204002	Crawlspace	Fair	Moderate

Date: N/A **Contributing**: N/A

The crawlspace under the first floor is a low space open to the exterior, approximately two to three feet above grade. The elevation of the soil in the crawlspace varies (Photo 201), being lowest at the northeast corner of the building under Room 6 (106) and highest at the west end of the building under Room 3 (103) (Photo 202). This does not appear an intention grade change but more related to natural settlement or erosion and soil disturbance by animals. Much of the crawlspace was protected from direct weather by the footprint of the house, but low areas at the northwest corner of the building appeared to allow surface water to collect around the foundation piers at this area, which is contributing to the differential settlement and distress to the foundation piers.

Clean fill can be used to level out low areas of soil in the crawlspace to encourage positive drainage of surface water away from the building footprint. This is especially important at areas of soil backslope near the perimeters of the crawlspace and the at the northeast corner where the soil is low. Ground-disturbing improvements will need to be coordinated with administrative and compliance requirement, potentially including an archeological survey and/or monitoring during the work.

Photo 201. Uneven grade of soil in crawlspace, looking east.

Photo 202. High point of crawlspace under Room 3 (103), looking west.

Floor Framing					
B	**SHELL**				
B10	**SUPERSTRUCTURE**				
	B1010	**FLOOR CONSTRUCTION**			
				Condition	**Priority**
		B101001	Floor Joists	Good to Fair	Low
		B101002	Floor Beams	Good to Fair	Low

Date: 1955 and Undetermined **Contributing**: Contributing

The floor structure of the main level was constructed of heavy timber beams and joists (Figure 4). The members appeared to be oak, but this was not confirmed by formal wood species identification. The beams were supported by the log piers, and the joists were supported by the beams. A continuous beam formed the perimeter of the structure, and two intermediate beams running east-west divided the structure into three longitudinal bays: North Porch and Rooms 3 (103) and 6 (106); Main House consisting of Rooms 1 (101), 2 (102), and 7 (107); and South Porch. At the north porch and main house bays, the joists run north-south, while under the south porch, the joists run east-west.

All beams and all except seven joists appeared to be replacement members from the 1955 restoration; the timbers were circular sawn wood, and numerous members were visibly branded with "1955." The seven joists that may be repurposed older or historic members were clustered in two groups under Rooms 2 (102) and 3 (103).

The timbers were generally in good condition without widespread distress or deterioration. Localized deterioration of joists typically included either deterioration of the bearing ends due to water exposure or deep checks in the timber which should be monitored. Checks are "splits" or "shrinkage cracks" in wood from the natural expansion and contraction of the wood member in the presence of moisture. Checks do not typically impact the capacity of a structural member. Where the checks extend halfway or more through a member, they should be periodically monitored for any signs of change.

MC readings were also taken of select floor framing members with a Delmhorst RDM-2 meter with a 4.5 to 60% range and contact pins with 1-inch penetration (See "Foundation Piers" for additional information on MC readings). High conductivity generally indicates high moisture levels in the wood. Measurements above 20% MC are widely accepted to indicate a level of moisture that supports fungal decay; these conditions should be periodically monitored.

A summary of the conditions observed at each pier are described in Table 2 below and graphically shown in Figure 4.

Figure 4. Schematic floor framing plan graphically showing condition ratings for the joists and beams: Good (green - not shown for clarity), Fair (yellow), Poor (orange), and Failed (red - none). Joists which may be repurposed historic members are indicated as red lines and with an asterisk (*).

				Condition	**Priority**
		B102001	Rafters Bays	Good to Failed	Low to High
		B102002	Gable End Wall Framing	Good to Fair	Low

Date: Undetermined and 1955 **Contributing**: Contributing

The roof of Mount Locust is double-pitch, gable roof structure constructed of paired primary and secondary rafters, with the primary rafters forming the steeper-sloped main house roof and the secondary rafters forming the lower-sloped roofs for the galleries (Photo 221 and Photo 222).

The primary rafters met at the roof ridge with a half-lap scarf joint pinned with a wood trenail. A horizontal collar tie was located approximately mid-height of the primary rafters with a notch joint also pinned with a wood trenail. The secondary rafters were toenailed to the outside face of the primary rafters at the same elevation as the collar tie and secured in place with nails. Vertical posts rising from the top plate of the wall supported the secondary rafters.

The roof framing appeared to have been majorly altered during the 1955 restoration, with most members dating to 1955 and only a handful of members appearing to be historic or repurposed from another location or building. Many of the members branded with "1955" were roughly vertically sawn, appeared to have hewn surfaces, and used traditional timber framing joinery; this is supported by the 1958 "Narrative to Accompany Project Completion Report" which described engaging craftspeople and special ordering materials to perform the restoration with traditional materials and techniques:

> Mr. Judd was fortune in securing the services of Gordon Whittington, a Natchez carpenter, who had had considerable experience in restoration work…The most difficult aspect of the job was the acquisition of materials…Much of the lumber had to be produced by special order to duplicate that used in the original building…modern nails were remade to duplicate old nails.[29]

As such, estimating the age of a roof framing member by the saw marks, nails, or connection details can be misleading in this structure. Eight members were identified that were hewn or vertically sawn with Roman numeral carpentry marks; none of these members appeared to be in their original or historic locations. Another twenty members appeared to have been repurposed during the 1955 restoration, either from other locations from the structure or from other buildings entirely. A few of the framing members appeared to be more modern than 1955 and were circular sawn dimensional lumber.

[29] Phelps, "Narrative to Accompany…," 3.

The roof framing generally appeared to be in good condition with only isolated locations of deterioration or distress. Several conditions were noted for minor repairs or monitoring. A summary of the conditions observed at each rafter pair are described in Table 2 below and graphically shown in Figure 4.

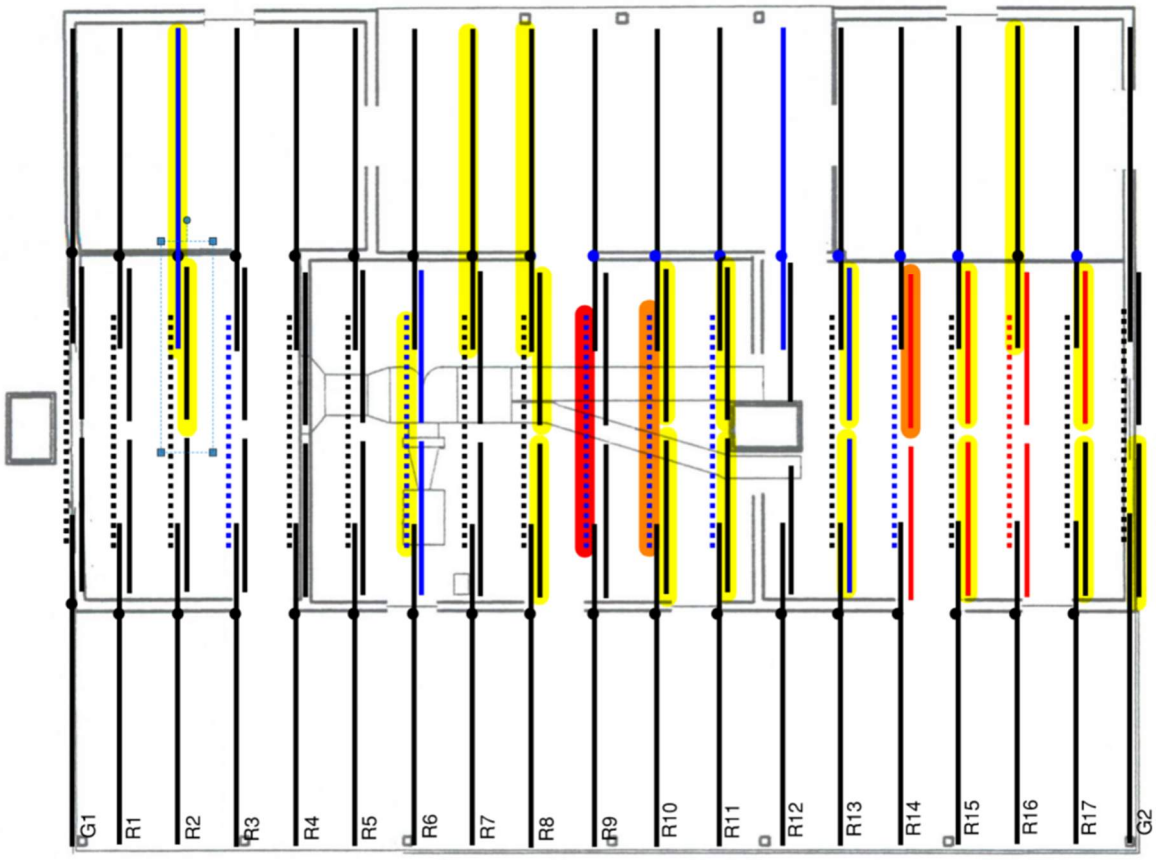

Figure 5. Schematic roof framing plan graphically showing condition ratings for the roof framing members.

Note that primary and secondary rafters are depicted as slightly offset for clarity. Member conditions are indicated as Good (green - not shown for clarity), Fair (yellow), Poor (orange), and Failed (red).

Framing members which are repurposed historic members with carpentry marks are in red; framing members that appeared to be repurposed from other locations or other structures are in blue; all other members appeared to be 1955 or later based on identity marks on the lumber.

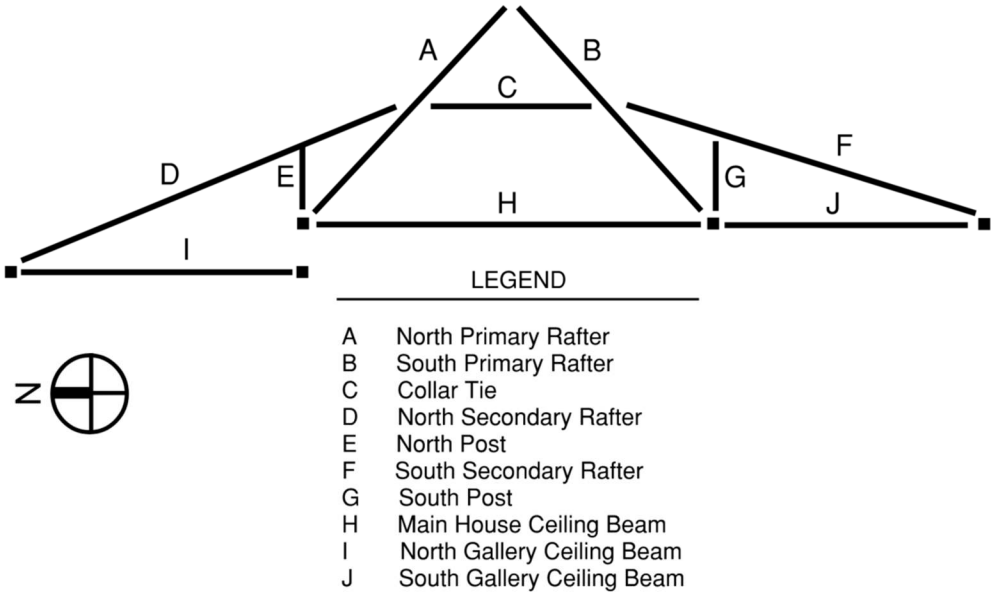

Figure 6. Roof framing diagram, identifying each structural member within a paired rafter bay, for reference in Table 3 narratives below.

Table 3. Summary of Roof Framing Conditions

Rafter Bay No.	Condition	Observations[1]	Photos
R1	Good		
R2	Fair	The north primary rafter (A) was a repurposed, semi-dressed member with abandoned framing notches. The rafter (A) exhibited damage from wood-boring insects, such as woodworm or powder-post beetles. Distress was observed at the ridge connection between the primary rafters (A and B). The half-lap scarf joint was cracked, and a piece of dimensional lumber had been attached to the west face of the ridge joint. The collar joint (C) appeared to be a replacement member and had been nailed to the primary rafters (A and B).	Photo 223 Photo 224
R3	Good		
R4	Good		
R5	Good		
R6	Fair	Both the north and south primary rafters (A and B) appeared to be hewn. Some water staining was observed at the ridge connection, but no damage or distress were observed.	

Table 3. Summary of Roof Framing Conditions			
		The collar tie (C) appeared to be a repurposed ceiling beam with evidence of nail holes from previous lath. The member exhibited some displacement or rotation at the connection to the north primary rafter (A).	
R7	Fair	The north secondary rafter (D) exhibited some displacement or rotation where it connected with the north primary rafter (A).	Photo 225 Photo 226
R8	Fair	Distress was observed at the ridge connection between the primary rafters (A and B), and the trenail was missing. The scarf joint did not appear to be displaced. The north secondary rafter (D) exhibited some displacement or rotation where it connected with the north primary rafter (A).	Photo 227
R9	Failed	Terminate damage was observed at the bearing end of the south rafter (B). The collar tie (C) had failed and was loose.	Photo 228 Photo 229 Photo 230
R10	Fair	Both the north and south primary rafters (A and B) appeared to be hewn. Water damage was present at the ridge connection, and the half-lap scarf joint between the rafters was displaced. Terminate damage was observed at the bearing end of the south rafter (B). The connection of the collar joint (C) to the south primary rafter (B) was distressed. The collar tie exhibited damage from wood-boring insects, such as woodworm or powder-post beetles.	Photo 231
R11	Fair	The north primary rafter (A) appeared to be hewn, while the south primary rafter (B) was vertically sawn. The trenail at the ridge connection of the primary rafters (A and B) was missing; minor displacement of the ridge connection was observed. The collar tie (C) had notches that indicated it was a repurposed member from another location or structure.	Photo 232
R12	Good	Both north and south primary rafters (A and B) are set into pockets in the brick masonry chimney. The rafters (A and B) had notches to indicate that a collar tie (C) may have once been present. The collar tie (C) is missing, and the rafters are supported with vertical posts from the ceiling beam. It was unclear why these members had notches	Photo 233 Photo 234

Table 3. Summary of Roof Framing Conditions			
		for a collar tie unless it was removed when the chimney was previously altered.	
R13	Fair	The north and south primary rafters (A and B) appeared to be hewn members. Water damage was observed at the ridge connection. The south rafter (B) had moderate termite damage at the bearing end and some wood-boring insect, such as woodworm or powder-post beetle, damage. The north post (E) appeared to be part of a repurposed ceiling beam with beaded edge detailing.	
R14	Poor	The north primary rafter (A) was vertically sawn and marked with a "II" on the west face, while the south primary rafter (B) was vertically sawn and marked with "I" on the east face. The north rafter (A) had full length checks and a split in the member; this rafter was slightly displaced to the west. The south rafter (B) had marks on the underside of the member that resembled spaced sheathing marks, suggesting the member had been relocated or repurposed from another structure. The collar tie (C) appeared to be a repurposed ceiling beam with evidence of nail holes from previous lath. The north post (E) appeared to be part of a repurposed ceiling beam with beaded edge detailing.	Photo 235
R15	Fair	The north and south primary rafters (A and B) were vertically sawn and marked with "III" on the west faces; both rafters had diagonal splits and checks down the full length of the members. The north post (E) appeared to be part of a repurposed ceiling beam with beaded edge detailing.	
R16	Fair	The north primary rafter (A) was vertically sawn and marked with a "II" on the east face, while the south primary rafter (B) was vertically sawn and marked with "I" on the west face. The collar tie (C) was vertically sawn and marked with a "II" on the underside of the member. The north secondary rafter (D) had significant fungal growth, indicating the member was exposed to water, likely from a previous roof leak.	Photo 236 Photo 238

Table 3. Summary of Roof Framing Conditions			
		The north bearing end of the ceiling beam (H) had significant deterioration caused by an animal, likely a squirrel.	
R17	Fair	The north primary rafter (A) was vertically sawn and marked with a "V" on the east and west faces; both rafters (A and B) had diagonal splits and checks down the full length of the members. Minor displacement was observed at the ridge connection of the primary rafters (A to B); the trenail appeared to be undamaged. The north secondary rafter (D) had significant fungal growth, indicating the member was exposed to water, likely from a previous roof leak; the rafter had been reinforced with a dimensional lumber sister. The collar tie (C) had been replaced and connected to the primary rafters (A and B) with nails. The north post (E) appeared to be part of a repurposed ceiling beam with beaded edge detailing.	Photo 237 Photo 238
G1	Good	The west gable end wall was framed similarly to a typical rafter bay with additional vertical members to support the wall and wood siding. The gable framing was typically in good condition and was constructed of a combination of repurposed timbers, timbers branded with "1955," and dimensional lumber.	Photo 239
G2	Fair	The east gable end wall was framed similarly but not identically to the west gable. The gable framing was typically in good condition and was constructed of a combination of repurposed timbers, timbers branded with "1955," and dimensional lumber. Damage was observed to multiple members in the southwest corner, likely due to squirrels. The holes allowed wasps to enter the attic.	Photo 240

Notes:

1. Except where noted otherwise, structural members appeared to date to 1955 or later.

Window W100 had been painted white on the interior (Photo 241). The window and trim were painted white on the interior, which is consistent with the 1956 Furnishing Plan. The window was generally in Fair condition with minor repairs required to maintain the weather resistance of the window. Minor areas of mildew or biological soiling were present on the painted surfaces of the window and trim.

- Jamb Trim: The jamb trim and stops were in good condition without distress or deterioration.
- Head Trim: The head trim was distressed (Photo 242). The trim fascia was separated from the return with a significant gap between the trim pieces. Wood deterioration may be present (Photo 243).
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Stool and Apron: The sill and apron were in good condition without distress or deterioration.

Window W101 had been painted white on the interior (
Photo 244); multiple coats of paint were present. The window and trim were painted white on the interior, which is consistent with the 1956 Furnishing Plan. The window was generally in Fair condition with minor repairs required to maintain the weather resistance of the window. Minor areas of mildew or biological soiling were present on the painted surfaces of the window and trim.

- Jamb Trim: The jamb trim and stops were in good condition without distress or deterioration.
- Head Trim: The head trim was in good condition without distress or deterioration (Photo 245).
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Lower Sash: The lower sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Stool and Apron: The sill had failed (Photo 246, Photo 247). Multiple cracks and splits were present, and water staining and areas of soft wood were observed.

Window W300 was painted blue on the interior (Photo 252), which is consistent with the description in the 1956 Furnishing Plan; multiple coats of paint were present. The window was generally in Fair condition and required minor repairs to maintain the performance of the window.

- Jamb Trim: The jamb trim and stops were in good condition without distress or deterioration.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Lower Sash: Small areas of deterioration of the interior muntins and lower rail were observed (Photo 253), likely due to failure of the exterior glazing putty which allows water penetration. Operability of the sash was not tested. Repairs should be coordinated with replacement of the glazing putty.
- Stool and Apron: The interior sill and apron were in good condition without distress or deterioration, despite the poor condition of the exterior sill.

Date: 1995 / 2006 **Contributing**: Contributing

Window W600 was painted red on the interior (Photo 254). The 1956 Furnishing Plan called for the trim in Room 6 (106) to be painted red to reflect a more feminine interpretation of the room as the bedroom of Philadelphia Ferguson, the only daughter of William Ferguson and Paulina Chamberlain. Multiple coats of paint were present on all surfaces. The window was generally in Fair condition and required minor repairs to maintain the performance of the window. Minor areas of mildew or biological soiling were present on the painted surfaces of the window and trim.

- Jamb Trim: The jamb trim and stops were in good condition without distress or deterioration (Photo 255).
- Head Trim: The head trim was in good condition without distress or deterioration.
- Upper Sash: The upper sash was in good condition without distress or deterioration. Operability of the sash was not tested.
- Lower Sash: The lower sash was in good condition without distress or deterioration (Photo 256). Operability of the sash was not tested.
- Stool and Apron: The interior sill was in good condition, but water damage was present at the lower right corner of the apron (Photo 257). The window may be leaking around the frame. This is likely attributable to the displacement of the north exterior wall at this corner of the structure, which allows water to sheet down the wall from the roof. The shutter at this window has been permanently closed to protect the window.

Photo 254. Window W600 from the interior.

Window W700 was painted light blue on the interior (Photo 261), which is consistent with the 1956 Furnishing Plan; multiple coats of paint were present. The window was generally in Fair condition and required minor repairs to maintain the performance of the window. Mildew or biological soiling were present on the painted surfaces of the window and trim.

- Jamb Trim: The jamb trim and stops were in good condition with minor separation of the wood at joints (Photo 262).
- Head Trim: The head trim was in good condition without distress or deterioration (Photo 263).
- Upper Sash: The upper sash was in good condition without distress or deterioration but was slightly racked in the frame. Operability of the sash was not tested.
- Lower Sash: The lower sash was in fair condition. Operability of the sash was not tested. Damage to the lower rail and muntins had been filled with a composite patch. The composite patch had not been tooled or painted. The damage to the lower sash may have been caused by squirrels.
- Stool and Apron: The interior sill and apron were continuous with the chair rail. They were in good condition.

		B203001.09	D100 Interior Head Trim	Good	N/A
		B203001.10	D100 Interior Transom	Good	N/A

Date: Undetermined / Relocated in 1955 **Contributing**: Contributing

The interior of Door D100 was painted blue, and the trim and transom were painted white (Photo 269). This is consistent with the 1956 Furnishing Plan. All surfaces appeared to have multiple coats of paint. Minor mildew or biological soiling were present on the painted surfaces of the door and trim.

- Interior Door Surfaces: The interior of Door D100 was generally in good condition with minor separation of wood-to-wood joints at the rails and stiles.
- Hardware: The interior door hardware consisted of an iron lift-latch controlled by the exterior handle and a rim lock controlled by a key. The hardware of Door D100 is the only door that is visible in the 1972 HABS photographs. The existing hardware appears similar but is likely not the same hardware as seen in the photos; both the rim lock and lift-latch appear to have been replaced. The lift-latch appeared to generally be functional but was "sticky" to operate, meaning the thumb press did not smoothly engage and operate the interior lift. Damage to the door frame finishes were observed around the interior lift (Photo 270). It was unclear if the rim lock was functional.
- Jamb Trim: The jamb trim was generally in good condition with signs of wear and tear from operation of the door.
- Head Trim: The head trim formed the rail between the door opening and the transom and was in good condition without distress or deterioration
- Transom: The interior transom appeared to be in good condition without distress or deterioration (Photo 271).

Photo 269. Door D100 from the interior.

Date: Undetermined / Relocated in 1955 **Contributing**: Contributing

The interior of Door D101 was painted blue, and the trim was painted white (Photo 272). This is consistent with the 1956 Furnishing Plan. All surfaces appeared to have multiple coats of paint. Minor mildew or biological soiling were present on the painted surfaces of the door and trim.

- Interior Door Surfaces: The interior of Door D101 was generally in good condition with minor separation of wood-to-wood joints and minor areas of paint failure. The three interior ledges appeared to be in good condition and were securely fastened to the door.
- Hardware: The interior door hardware consisted of an iron lift-latch controlled by the exterior handle and a lacquered rim lock controlled by an interior thumb turn (Photo 273). The lift-latch appeared to generally be functional but was "sticky" to operate, meaning the thumb press did not smoothly engage and operate the interior lift. The rim lock appeared to be a Yale lacquered metal rim lock from the mid-twentieth century; further research may be able to identify the model and year of manufacturer. It was disengaged from the lock cylinder and did not appear to be functional (Photo 274).
- Jamb Trim: The jamb trim was generally in good condition with signs of wear and tear from operation of the door.
- Head Trim: The head trim formed the rail between the door opening and the transom and was in good condition without distress or deterioration

		B203004.07	D300 Interior Hardware	Poor	High
		B203004.08	D300 Interior Jamb Trim	Good	N/A
		B203004.09	D300 Interior Head Trim	Good	N/A

Date: Undetermined / Relocated in 1955 **Contributing**: Contributing

The interior of Door D300 and the trim were painted blue (Photo 282), which is consistent with the 1956 Furnishing Plan. All surfaces appeared to have multiple coats of paint. Minor mildew or biological soiling were present on the painted surfaces of the door and trim.

- Interior Door Surfaces: The interior of Door D300 was generally in good to fair condition. The three interior ledges appeared to be securely fastened to the door.
- Hardware: The interior door hardware consisted of a wood lift-latch controlled by the exterior handle, which was damaged and the thumb press missing. The interior components of the latch were still in place (Photo 283) along with the wood latch catch on the interior jamb. A painted, lacquered metal rim lock was present that was controlled by an exterior key or interior thumb turn (Photo 284). The rim lock appeared to be mid-twentieth century Yale lock. It was partially disengaged from door but did appear to be functional. Damage to the edge of the door was present at the strike plate, indicating that the strike plate may be too proud of the jamb or that the door may swell seasonally. The strike plate appeared to have been adjusted, likely to accommodate sagging of the door in the opening (Photo 285).
- Jamb Trim: The jamb trim was in good condition without distress or deterioration.
- Head Trim: The head trim was in good condition without distress or deterioration

Photo 282. Door D300 from the interior.

Date: Undetermined / Relocated in 1955 **Contributing**: Contributing

The interior of Door D600 and the trim were painted red (Photo 286). All surfaces appeared to have multiple coats of paint. Minor mildew or biological soiling were present on the painted surfaces of the door and trim.

- Interior Door Surfaces: The interior of Door D600 was generally in fair condition. Some damage to the jamb stile was observed, likely due to now-missing door hardware.
- Hardware: Several of the interior components of the lift-latch were missing. A lacquered metal rim lock was present that was controlled by an exterior key or interior thumb turn (Photo 287). The rim lock appeared to be mid-twentieth century. The rim lock was functional, but it was extremely difficult to operate.
- Jamb Trim: The jamb trim was in fair condition with minor deterioration at the base of the jambs, likely due to moisture (Photo 288).
- Head Trim: The head trim was in good condition without distress or deterioration

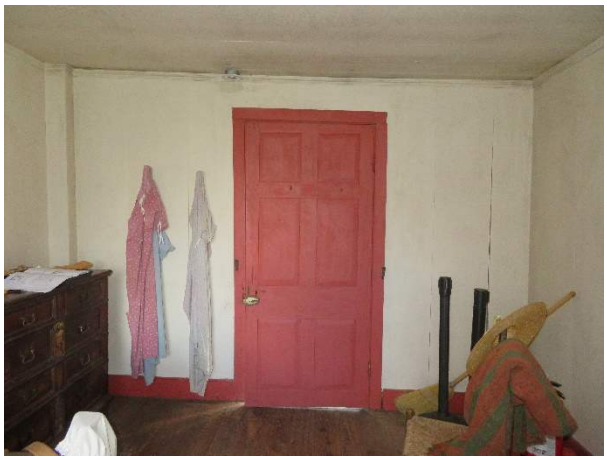

Photo 286. Door D600 from the interior.

Photo 287. Lacquered metal rim lock, missing interior lift-latch components, and damage to the door stile.

Photo 288. Minor deterioration of the bottom of the jamb trim, where the floor slope creates a gap at the base of the wall.

The interior rails and stiles of Door D700 were painted light blue, and the panels were painted white. The transom and trim were painted light blue (Photo 289). All surfaces appeared to have multiple coats of paint. Mildew or biological soiling were present on the painted surfaces of the door and trim.

- Interior Door Surfaces: The interior of Door D700 was generally in fair condition. Some damage to the painted surfaces was observed around the lift latch. Minor areas of paint failure were also observed.
- Hardware: The interior components of the lift latch were present and appeared to generally be functional. A wood rim lock was present that was controlled by a key on both the interior and exterior (Photo 290). It was unclear if the rim lock was functional.
- Jamb Trim: The jamb trim was in good condition without distress or deterioration.
- Head Trim: The head trim was in good condition without distress or deterioration.
- Transom: The interior transom appeared to be in good condition without distress or deterioration (Photo 291).

		B203007.07	D701 Interior Hardware	Fair	High
		B203007.08	D701 Interior Jamb Trim	Fair	High
		B203007.09	D701 Interior Head Trim	Good	N/A

Date: Undetermined / Relocated in 1955 **Contributing**: Contributing

The interior rails and stiles of Door D701 were painted light blue, and the panels were painted white. The transom and trim were painted light blue (Photo 292). All surfaces appeared to have multiple coats of paint. Mildew or biological soiling were present on the painted surfaces of the door and trim.

- Interior Door Surfaces: The interior of Door D701 was generally in good condition. Some damage to the painted surfaces was observed around the lift latch. Minor areas of paint failure were also observed.
- Hardware: The interior components of the lift latch were present and appeared to generally be functional. A lacquered metal rim lock was present that was controlled by an exterior key or interior thumb turn (Photo 293). The rim lock appeared to be mid-twentieth century. The rim lock was functional, but the spring latch and strike plate did not align well.
- Jamb Trim: The jamb trim was in fair condition. Minor areas of damage to the painted surfaces were observed around the lift latch.
- Head Trim: The head trim was in good condition without distress or deterioration.

		C303301	101 Exposed Ceiling Beams	Fair	Moderate

Date: Undetermined / 1955 **Contributing**: Contributing

Room 1 (101) is believed be the footprint of the original house, constructed sometime between 1782 and 1785.[30] The current interior dimensions of the room were approximately 15'-3" deep (north-south) by 19'-10" wide (east-west). The main entry to the room (Door D100) was centered on the south wall (Photo 294), and a secondary entry was centered on the north wall (Door D101). A brick masonry fireplace was located on the east wall (Photo 295). On the 1955 HABS drawings, a door was depicted on the west wall, leading to Room 2 (102); this door is no longer extant and has been infilled.

Where dates for room features or information about relocated or salvaged historic fabric are given below, it references information included in the 1998 HSR and the 1991 HSAR. The decorative scheme followed the 1956 Furnishing Plan[31], which called for "Doors, baseboard, ceiling, beams and cornice dark blue. Sidewalks, including chair rail, cream" and for the floor to be poplar.

Flooring

The existing flooring was tongue-and-groove wood planks of varying widths, running east-west. The 1998 HSR indicated that the existing flooring was installed in the 1950s. The wood planks spanned across floor joists without subflooring. The flooring shows some wear, particularly at the thresholds of the two doors from foot traffic and the doors abrading the floor. Wear was also present around the dining table, likely from furniture being moved or relocated (Photo 296). No areas of rot or deterioration were observed.

The flooring generally slopes to the north and east by 1 to 2 degrees. At the threshold of Door D101, the first floor plank is heaved, visibly bowing upward (Photo 297). This floor plank is directly above Joists J49 and J50 (Figure 4). The displacement and differential movement of the northwest corner of the structure may be causing Joists J49, J50, and other joists along this line to deflect upwards at their south bearing end on Beams B16 and B17, causing this high point. The

[30] CLI, 64.
[31] Furnishing Plan, 51.

downward slope to the north and east, in combination with the heaved floor plank, prevent Door D101 from free operation.

A small hole had been cut in the floorboard immediately to the east of Door D101 to provide an access point for electrical service from the crawl space (Photo 298).

Wall Finishes

All four walls of Room 1 (101) were finished with a combination of vertical and horizontal boards with a beaded detail along one edge. At the north and south walls, the 1998 HSR indicated that the boards on these two walls were believed to be historic fabric (Photo 299). The east and west walls were finished in vertical boards reported to dated to the 1955 restoration. The boards were secured with face nails and were painted white. The wall boards were generally in good condition without areas of deterioration. Some separation between boards was present but did not appear to indicate that the wall finishes were loose or distressed (Photo 300); likely this was normal cyclical expansion and contraction of the wood with temperature and humidity.

Both doors are typically open during visitor hours, although visitors are not allowed into the room. When both doors were open, there was good airflow through the space. However, some mildew or biological soiling were present on the painted surfaces of the walls and wall mouldings.

Ceiling Finishes

The ceiling was wide wood planks installed above the ceiling beams, running east-west (Photo 301). The ceiling boards had a beaded detail along one edge, similar to the wall boards, and were painted blue. Areas of distress and failure to the paint were observed, and mildew or biological soiling were present on the painted surfaces of the ceiling. Minor areas of damage to ceiling boards were observed, but no locations of significant decay or deterioration were present.

Wall Mouldings

The room had a simple baseboard, chair rail (Photo 302), and ceiling moulding. The baseboard and ceiling moulding were painted blue. The chair rail was painted white. The moulding was generally in good condition with only minor areas of paint failure.

Exposed Ceiling Beams

The ceiling also had eight exposed beams, running north-south. The 1998 HSR indicated that the two westernmost beams may have been original or historic members, while the others were believed to have been replaced during the 1955 restoration. The two westernmost beams were identified as poplar in the 1940 HABS drawings. The ceiling beams had a mix of square and beaded edges. Similar to the ceiling boards, mildew or biological soiling were present on the painted surfaces of the ceiling beams.

The third beam from the west was spliced at the south bearing end; the splice exhibited some displacement (Photo 303). The first beam from the west had been partially replaced with a splice in the midpoint of the span. The splice was not plumb with the beam on either end but did not exhibited displacement at the connections (Photo 304, Photo 305). This spliced member appeared in the 1940 HABS drawings; it is likely stable but should be monitored for signs of movement.

Date: Undetermined / 1955 **Contributing**: Contributing

Room 2 (102) is believed to have been added to the house shortly after the original construction, possibly around the same time as Room 7 (107) (Photo 306, Photo 307). The current interior dimensions of the room were approximately 15'-3" deep (north-south) by 9'-8" wide (east-west). The main entry to the room (Door D200) was located on the south wall in the east corner, and a secondary entry was centered on the north wall in the east corner (Door D101), leading into Room 3 (103). A brick masonry fireplace was located on the west wall. On the 1955 HABS drawings, a door was depicted on the east wall, leading to Room 1 (101); this door is no longer extant and has been infilled.

Where dates for room features or information about relocated or salvaged historic fabric are given below, it references information included in the 1998 HSR and the 1991 HSAR. The decorative scheme followed the 1956 Furnishing Plan, which called for "Woodwork natural finish, except for window and door frames and doors painted dark blue" and for the floor to be salvaged pine. This restrained decorative scheme was intended to preserve the "early pioneer character" of the room.[32]

Flooring

The existing flooring was tongue-and-groove wood board, running east-west. The 1998 HSR indicated that the existing flooring was historic material that had been salvaged and reinstalled in this room during the 1955 restoration. The floorboards spanned across floor joists without subflooring. The flooring shows minor areas of wear, particularly at the thresholds of the two doors from foot traffic and the doors abrading the floor (Photo 308). No areas of rot or deterioration were observed.

Wall Finishes

All four walls of Room 2 (102) were finished with unfinished, horizontal, tongue-and-groove boards with a beaded detail along one edge (Photo 309). The 1998 HSR believed all the wall boards and mouldings dated to the 1955 restoration. The boards were secured with face nails. The

[32] Furnishing Plan, 51.

wall boards were generally in good condition without areas of deterioration. Evidence of mildew or biological soiling was not observed in this room.

Ceiling Finishes

The ceiling was wide wood planks installed above the ceiling beams, running north-south (Photo 310). The ceiling boards had a beaded detail along one edge, similar to the wall boards, and were also unfinished. No areas of distress or deterioration were present.

One small area of dark staining appeared to be related to a previous roof leak. The area did not appear to be deteriorated.

Wall Mouldings

The room had a simple baseboard (Photo 311) and ceiling moulding. The baseboard was painted blue, and ceiling moulding was unfinished. The mouldings were generally in good condition. A small area of pest damage, likely mice, to the baseboard and floorboard was present in the southwest corner behind the bureau.

Exposed Ceiling Beams

The ceiling also had five exposed beams, running east-west. The 1998 HSR believed all five beams were replaced during the 1955 restoration, which is likely given that Rooms 2 (102) and 3 (103) were reduced in width and reconfigured at that time. The ceiling beams were unfinished and had a beaded edge detail (Photo 312). Similar to the ceiling boards and walls, no mildew or biological soiling were present.

Fireplace Mantle

The brick masonry fireplace on the west wall had a decorative wood mantel and surround (Photo 313). The mantel shelf was a compound cornice profile with a paneled header supported by paneled pilasters. The mantel was painted blue, and multiple coats of blue paint of varying shades were present and could be observed at small, overpainted areas around the edges. The mantel was in good condition.

		C302603	103 Mouldings	Fair	Low
		C303303	103 Exposed Ceiling Beams	Fair	Low

Date: Undetermined / 1955 **Contributing**: Contributing

Room 3 (103) is believed to have been added to the house by about 1820, possibly around the same time as Room 6 (106) (Photo 314, Photo 315). The current interior dimensions of the room were approximately 10'-5" deep (north-south) by 12'-11" wide (east-west). The main entry to the room (Door D300) was centered on the east wall, and a secondary entry was located on the south wall in the east corner (Door D201), leading into Room 2 (102).

Where dates for room features or information about relocated or salvaged historic fabric are given below, it references information included in the 1998 HSR and the 1991 HSAR. The decorative scheme followed the 1956 Furnishing Plan, which called for "Woodwork natural, dark blue trim" and for the floor to be poplar.[33]

Flooring

The existing flooring was tongue-and-groove wood planks of varying widths, running east-west. The 1998 HSR indicated that the existing flooring was installed in the 1950s. The wood planks spanned across floor joists without subflooring. The flooring shows some wear (Photo 316), particularly at the thresholds of the two doors from foot traffic and the doors abrading the floor (Photo 317). No areas of rot or deterioration were observed.

Wall Finishes

All four walls of Room 3 (103) were finished with unfinished, horizontal, tongue-and-groove boards with a beaded detail along one edge, similar to those in Room 2 (102). The 1998 HSR believed all the wall boards, ceiling boards, and mouldings dated to the 1955 restoration. The boards were secured with face nails. The wall boards were generally in good condition without areas of deterioration. Evidence of mildew or biological soiling was not observed in this room.

Ceiling Finishes

The ceiling was wide wood planks installed above the ceiling beams, running east-west (Photo 318). The ceiling boards had a beaded detail along one edge, similar to the wall boards, and were also unfinished. No areas of distress or deterioration were present.

[33] Furnishing Plan, 51.

Wall Mouldings

The room had a simple baseboard and ceiling moulding (Photo 319). The baseboard was painted blue, and ceiling moulding was unfinished. The mouldings were generally in good condition.

Exposed Ceiling Beams

The ceiling also had five exposed beams, running north-south (Photo 318). The beams appeared to be historic. Abandoned nail holes from a previous ceiling were present; similar nail holes were observed on multiple collar ties in the roof framing, which may have been repurposed ceiling beams from other locations in the structure or from Room 3 (103) which it was reduced and reconfigured during the 1955 restoration. The ceiling beams were unfinished and had a beaded edge detail. Similar to the ceiling boards and walls, no mildew or biological soiling were present.

		C302004	106 Flooring	Poor	Moderate
		C301004	106 Wall Finishes	Poor	Moderate
		C303004	106 Ceiling Finishes	Poor	Moderate
		C302604	106 Mouldings	Fair	Moderate

Date: Undetermined / 1955 **Contributing**: Contributing

Room 6 (106) is believed to have been added to the house by about 1820 (Photo 320, Photo 321), possibly around the same time as Room 3 (103). The current interior dimensions of the room were approximately 10'-5" deep (north-south) by 12'-8" wide (east-west). The entry to the room (Door D600) was centered on the west wall.

Where dates for room features or information about relocated or salvaged historic fabric are given below, it references information included in the 1998 HSR and the 1991 HSAR. The decorative scheme followed the 1956 Furnishing Plan, which called for "Walls and ceiling, cream; door, baseboard and other trim, red" and for the floor to be poplar.[34]

Flooring

The existing flooring was tongue-and-groove wood board, running east-west. The 1998 HSR indicated that the existing flooring was installed in the 1950s; in the crawlspace, multiple floorboards had been branded with "1955" (Photo 323). The wood boards spanned across floor joists without subflooring. The flooring shows hear wear at the thresholds from foot traffic and the door abrading the floor. Water staining of flooring was also observed under Window W600 (Photo 323). No areas of rot or deterioration were observed.

The flooring slopes 3 to 4 degrees to the north and east, with the greatest slope approximately near the door.

Wall Finishes

All four walls of Room 6 (106) were finished with vertical boards (Photo 324); the boards were square-edged, without a beaded edge detail. The 1998 HSR believed that the boards on the north, east, and west walls dated to 1955, while the south wall was constructed of reused historic boards without studs. The boards were secured with face nails and were painted white. The wall boards were generally in fair condition.

Deterioration of boards was observed in small areas on the north wall, including spots of sap seepage (Photo 325). Separation between boards was also present and appeared related to the differential movement of the structure to the north and east.

[34] Furnishing Plan, 62.

The north wall appeared to have significant displacement outward at the base of the wall compared to the top of the wall. This displacement could be measured at both the east (5-inch displacement) and west (3-inch displacement) walls. Racking of wall boards, particularly at the east and west wall, was observed. The west wall had a large gap between the base of the wall and the flooring and was slightly loose when pushed.

The door is typically open during visitor hours, although visitors are not allowed into the room. However, the door was extremely difficult to open, and even when open, there was not good airflow in the room. Mildew or biological soiling were present on the painted surfaces of the walls, ceiling, and wall mouldings (Photo 326).

Ceiling Finishes

The ceiling was square-edged wood boards, painted white and running north-south; the ceiling beams were not exposed. Areas of distress and failure to the paint were observed, and mildew or biological soiling were present on the painted surfaces of the ceiling. Areas of damage and potentially deterioration to ceiling boards were observed due to water intrusion, particularly at the north wall (Photo 327).

Wall Mouldings

The room had a simple baseboard and a compound-profile ceiling moulding. The baseboard was painted red, and the ceiling moulding was painted white. The moulding was generally in fair condition with limited areas of paint failure. At the west wall, the ceiling moulding and base boards were detached from the wall (Photo 328, Photo 329).

Photo 320. Room 6 (106), looking east.

		C301005	107 Wall Finishes	Poor	Moderate
		C303005	107 Ceiling Finishes	Poor	Moderate
		C302605	107 Mouldings	Poor	Moderate

Date: Undetermined / 1955 **Contributing**: Contributing

Room 7 (107) is believed to have been added to the house shortly after the original construction (Photo 330, Photo 331), possibly around the same time as Room 2 (102). The current interior dimensions of the room were approximately 15'-3" deep (north-south) by 16'-0" wide (east-west). The main entry to the room (Door D700) located centered on the south wall in the west corner, and a secondary entry was centered on the north wall in the west corner (Door D701). A brick masonry fireplace was located on the west wall. The lower walls were finished with flat panel wainscotting.

Where dates for room features or information about relocated or salvaged historic fabric are given below, it references information included in the 1998 HSR and the 1991 HSAR. The existing finishes with the blue and white color scheme generally follow the description of the 1956 Furnishing Plan: "Walls cream,; ceiling, ceiling mould, rails and stiles of wainscot and of doors painted light blue (panels cream); window and door trim light blue."[35] However, blue and white may not have been the original colors, as the room may have been painted in shades of tan at an earlier date: "Of special interest is the original paint to be found on the dado, chair rail, and base within this cupboard. A very successful relationship of shades of tan has been obtained here."[36] The 1956 Furnishing Plan did not provide a basis for the blue and white color scheme.

Flooring

The existing flooring was tongue-and-groove wood planks, running east-west. The 1998 HSR indicated that the existing flooring was installed in the 1950s. The wood planks spanned across floor joists without subflooring. The flooring shows wear, particularly at the thresholds of the two doors from foot traffic and the doors abrading the floor (Photo 332, Photo 333). No areas of rot or deterioration were observed.

The flooring generally slopes to the east by 1 to 2 degrees.

[35] Furnishing Plan, 66.
[36] Barnette, Stuart. M. "Architectural Survey of the Chamberlain House or Mound Plantation" (1937): 3.

Wall Finishes

The east, west, and south walls of Room 7 (107) were finished with horizontal boards with a beaded detail along one edge (Photo 334), which the 1998 HSR indicated dated to the 1950s restoration. The north wall was constructed of historic square-edged boards with no studs. The boards were painted white. The wall boards were generally in good condition without areas of deterioration. Some separation between boards was present but did not appear to indicate that the wall finishes were loose or distressed. At the north wall, the boards were racked to the east about 2 degrees.

Both doors are typically open during visitor hours, and visitors are allowed into pass through the room. When both doors were open, there was good airflow through the space. However, heavy mildew or biological soiling were present on the painted surfaces of the walls, ceiling, and wall mouldings.

Ceiling Finishes

The ceiling was wide wood planks, running east-west; the ceiling beams were not exposed. The ceiling boards were square-edged and painted blue. Areas of distress and failure to the paint were observed, and mildew or biological soiling were present on the painted surfaces of the ceiling. Areas of damage to ceiling boards were also observed, including split boards, deflected boards (Photo 335), and evidence of water intrusion at the southeast corner (Photo 336, Photo 337). In the immediate southeast corner of the ceiling, a large hole had been gnawed by pests, likely squirrels (Photo 338).

Wall Mouldings

The room had a simple baseboard, chair rail, and ceiling moulding. The lower walls also had a recessed panel wainscot. The baseboard, ceiling moulding, and rails and stiles of the wainscot were painted blue. The moulding was generally in good to fair condition with areas of paint failure and heavy mildew or biological soiling on the painted surfaces (Photo 339, Photo 340, Photo 341).

	G3010	WATER SUPPLY			
				Condition	Priority
		G301001	Service Hydrant	Unknown	High

Date: Undetermined (modern alteration) **Contributing**: Non-Contributing

There is no water supply at the house. A service hydrant was located approximately 50-feet north of the structure and was concealed by a small wood shed (Photo 351).

Photo 351. Hydrant, located approximately 50 feet north of the main house.

Fire Detection					
D	**SERVICES**				
D50	**ELECTRICAL**				
	D5037	**FIRE ALARM SYSTEMS**			
				Condition	**Priority**
		D503701	Fire/Smoke Detectors	Unknown	High

Date: Undetermined (modern alteration) **Contributing**: Non-Contributing

Each room had a ceiling-mounted fire/smoke detector (Photo 352 through Photo 355). The detectors were in various stages of damage or disrepair, and some may not be functioning properly.

Photo 352. Damaged ceiling-mounted detector in Room 6 (106).

Photo 353. Damaged ceiling-mounted detector in Room 1 (101).

Photo 354. Ceiling-mounted detector in Room 3 (103).

Photo 355. Damaged ceiling-mounted detector in Room 2 (102).

TREATMENT RECOMMENDATIONS

Requirements for Treatment

Laws, Regulations, And Functional Requirements

Key laws, regulations, and functional requirements that apply to the recommended work include the following:

- National Park Service Cultural Resources Management Guideline (Director's Order 28), which requires planning for the protection of cultural resources on park property.
- Section 106 of the National Historic Preservation Act, which mandates that federal agencies, including the National Park Service, take into account the effects of their actions on properties listed or eligible for listing in the National Register of Historic Places and give the Advisory Council on Historic Preservation a reasonable opportunity to comment.

Treatment of the building and site are also to be guided by the following, listed as of the date of preparation of this report and subject to future amendment, revision, and adoption of updated editions:

- Secretary of Interior's Standards for the Treatment of Historic Properties
- National Park Service Management Policies, 2006 Edition
- National Park Service Guiding Principles of Sustainable Design
- Architectural Barriers Act Accessibility Standards (ABAAS)
- Current State and Local Building Codes, including:
    - 2018 International Building Code (IBC)
    - 2018 International Energy Conservation Code (IECC)
    - 2018 International Existing Building Code (IEBC)

With historic structures, attempts to achieve strict conformance with model building code standards that are intended for new construction can lead to damage or destruction of historic fabric and negative impacts to the character or integrity of the building. IEBC Section 507, "Historic Buildings" allows flexibility in the repair and alteration of historic structures where such changes do not "constitute a distinct life safety hazard" as determined by the building official. This flexibility provides opportunities for compliance alternatives that protect the fabric and character of historic buildings where strict compliance with the model code would be detrimental to the building.

The NPS is self-regulating in terms of enacting and enforcing building code standards. Mount Locust is therefore not legally subject to local or state building code requirements. When undertaking repairs to buildings and structures, NPS endeavors to have the work comply with model building code standards.

NPS currently recognizes the following as the model building codes for design and construction projects:

- International Building Code (IBC), 2021 Edition
- International Energy Conservation Code (IECC), 2021 Edition
- International Existing Building Code (IEBC), 2021 Edition
- NFPA 101 Life Safety Code (where IBC is silent)

Where conflicts exist between the 2021 ICC Codes and the codes currently adopted by the state of Mississippi, compliance with the more stringent of the two, as determined by a licensed design professional or code official, should be followed.

Treatment Standards

The recommendations presented within this report have been developed in accordance with *The Secretary of the Interior's Standards for the Treatment of Historic Properties* and NPS-28: *Cultural Resource Management Guideline*. Per NPS-28, "Continuing preservation maintenance is the stewardship key to protecting the integrity of cultural resources and the investments made to bring them to maintenance condition."[37]

Preservation Maintenance[38]

Action to mitigate wear and deterioration of a historic property without altering its historic character by protecting its condition, repairing when its condition warrants with the least degree of intervention including limited replacement in-kind, replacing an entire feature in-kind when the level of deterioration or damage of materials precludes repair, and stabilization to protect damaged materials or features from additional damage.

Types of preservation maintenance are:

- Housekeeping: The removal of undesirable deposits of soil in ways that minimize harm to the surfaces treated, repeated at short intervals so that the gentlest and least radical methods can be used.
- Routine Maintenance: Service activities such as tightening, adjusting, oiling, pruning, etc.
- Cyclic Maintenance: Maintenance performed less frequently than annually; usually involves replacement or at least mending of material.

[37] NPS-28: Cultural Resource Management Guideline. National Park Service. June 11, 1998. https://www.nps.gov/parkhistory/online_books/nps28/28contents.htm: Chapter 4

[38] NPS-28, Appendix A

- Stabilization: Action to render an unsafe, damaged, or deteriorated property stable while retaining its present form.

Recommended Preservation Maintenance Treatments

- Fire Alarms, Fire Protection, and Water Service to the Building: Currently the existing fire/smoke alarms are damaged and may not be fully functional. Additionally, there is no fire protection or fire suppression system installed at Mount Locust. The nearest water supply is the hydrant located to the north of the structure. Given the slow response time of emergency services to such a remote location, even a small fire could be devastating. While the project team was on site, a survey was in progress by other parties, reportedly regarding a water service improvement project.

Immediate (Year 1)	Fire/Smoke Alarms • Inspect the existing fire/smoke alarms and replace all damaged or non-functioning units. • Test each unit to ensure that the alarms are properly alerting the central building system (if present). • Install two fire/smoke alarms in the attic space.
Long Term (5+ Years)	Fire Suppression System • Consider installing a fire-suppression system. Coordination with the available water supply and pressure will be needed with the preferred fire suppression system. A fire pump may be required.
Regular Maintenance	Inspections • On a monthly basis, test the fire/smoke alarms. • Inspect fire-suppression system (heads and other exposed components) for signs of leaks, corrosion, or other issues.

- Electrical Service: The existing electrical service is aged and has undergone multiple modifications since the initial installation in 1955. Damaged and exposed electrical components were present, as well as a damaged electrical panel that may be live.

Immediate (Year 1)	Electrical Inspection • Have a licensed electrician inspect the panel and electrical service for damaged components. Perform urgent repairs as required by this inspection.
Short Term (1 to 2 Years)	Electrical System Repairs • Replace the existing electrical lines. Remove the exposed wires and Romex cables. • Install a new service panel and "whole house" disconnect. New electrical system should be installed within metal conduit (EMT) in compliance with the National Electrical Code (NFPA 70). • Install new light fixtures, switches, and receptacles.

	• Low voltage lines may be unprotected if allowed by local code. • Provide capacity for any future plans for HVAC systems.
Long Term (5+ Years)	Security • Consider if a security system or security lighting may be desired for the house or site.
Regular Maintenance	Inspections • On a monthly basis, inspect receptacles and switches for operation. Immediately repair any components that are not properly functioning.

- Foundation Piers: Below-grade deterioration has caused distress and displacement of multiple foundation piers, particularly at the northeast corner of the structure. The displacement does not appear to have increased in severity since the 1998 HSR assessment; however, the deterioration levels of the piers has significantly worsened since the conditions reported in the 1998 HSR. Several of the piers have failed and require replacement; others exhibit deterioration and should be replaced at the same time.

Short Term (1 to 2 Years)	Pier Replacement • Replace all piers with condition ratings of Poor to Failed. Consider if replacement of all piers is desired. New piers should match the size, shape, and character of the existing piers. • Consultation with a wood scientist is recommended to determine the full extent of deterioration at the piers. This assessment may include resistance drilling to determine density and identify concealed decay conditions, interior moisture content measurements, and to assist with determination of remaining structural capacity of piers with significant section loss or interior deterioration. • New piers should be fabricated from rot-resistant wood: sassafras, western red cedar, cypress, or similar. Cut ends of piers should be thoroughly saturated with an end-grain sealer. • Provide new concrete footings for the piers so that wood is in minimal contact with the ground. New footings should come to within 1-inch of grade so as not to impact the historic character. • Reinstall the copper cap flashing at each pier. • If performed carefully, it should be possible to raise the northeast corner of the structure closer to level. Due to the extent of displacement, the north wall will likely not be able to be returned closer to plumb without deconstructing and rebuilding the wall. Care should be taken during leveling not to further distress the historic iron staple connection at the north gallery.

- An archeological survey and site monitoring will be required for pier replacement.

Pier Treatment

- Piers of Moderate condition can be evaluated for stabilization treatment in situ, potentially to include consolidation of the wood to stabilize areas of section loss.
- All piers should be treated with a water-diffusible, borate-based product, such as Impel Rods®. The pilot holes for the rods can be sealed with an elastomeric sealant or a small wood plug.

Medium Term (2 to 5 Years)

Crawlspace Regrading

- Provide clean topsoil fill to level low areas within the crawlspace and to slightly raise the crawlspace grade at the northeast corner to prevent surface water from running under the house. The new fill should be compacted by hand.
- Ground-disturbing improvements will need to be coordinated with requirements for an archeological survey and/or monitoring during the work.

- South and North Galleries: Both galleries require maintenance and in-kind replacement to address life-safety issues. The stairs are loose and represent a trip hazard, and the deteriorated decking also represents a trip hazard for visitors.

Immediate (Year 1)

Replace Steps

- Replace the steps at the south and north galleries to match existing. The new steps should comply with accessibility standards for treads/risers and handrails.
- Replace the ledger boards in-kind where deteriorated to provide support for the stingers.
- Replacement woods should be of a rot-resistant wood such as white oak, red cedar, or cypress.

Replace Decking

- Replace deteriorated deck boards in kind. If desired, the boards near the entrance of Room 7 (107) can be raised and shimmed level after the deteriorated boards are replaced.

Replace Railing

- Replace deteriorated or damaged railings in-kind.

Medium Term (2 to 5 Years)	Railing Improvements • The existing railings were constructed in 1955 in a compatible style common in the nineteenth century. The railings are in fair condition but are not incompliance with IBC railing requirements. Additionally, the existing railings likely cannot withstand code-required loads for a top rail for pedestrian fall protection purposes. Replacing the railings with modern, code-compliant railings would not be in keeping with the historic character of the property; however, consider if retrofitting the existing railing is desired.

- South Exterior Stairs: The brick stairs extending from the main walkway to the south gallery are in fair condition and require minor maintenance to the brick joints, but the handrails are loose and do not comply with accessibility standards for handrails or with IBC requirements for railings. This represents an issue for visitors to the site who are mobility limited and rely on handrails to safely navigate stairs.

Short Term (1 to 2 Years)	Replace Handrails • Remove the existing railings and install new wood railings in kind. • On the inside face of the new wood rails, provide a modern, aluminum handrail that meets the graspability profile and other requirements of ABAAS for accessible design.
Medium Term (2 to 5 Years)	Brick Pavers • Perform general maintenance to the brick pavers, including replacing failed mortar joints. The current brick stairs date to 1978. The replacement mortar should match the existing in properties, appearance, and tooling; the 1978 renovation plans may include the material or property specification for the paver mortar. Otherwise, petrographic analysis may be required to develop a compatible replacement mortar.
Regular Maintenance	Inspections • On an annual basis, inspect the handrails for any signs of movement or conditions which may negatively affect their performance.

- Roofing, Roof Framing, and Attic: The existing roof framing did not appear to exhibit any structural distress; however, select repairs are recommended to prevent displacement of framing members.

Immediate (Year 1)	Remove Debris • Remove the debris from the attic. Removal all old insulation, trash, broken glass, dirt, and abandoned building materials. Pest Management • Install heavy-gauge stainless steel wire mesh or sheet metal over the squirrel hole in northeast corner. Seal the hole against insect infiltration. Roofing Repairs • Repair isolated locations of damaged or missing shakes.
Medium Term (2 to 5 Years)	Roof Framing Repairs • Reinstall the failed collar tie in R9. • Reinforce the bearing end of the termite-damaged rafter in R9 with a wood sister or similar support. • Install new trenails at ridge connections where missing: R8, R11, and inspect other locations. • Install sister rafters adjacent to R14 to provide supplemental support to the distressed historic members.
Long Term (5+ Years)	Remove Abandoned Equipment • Remove the abandoned HVAC equipment and infill any holes in the attic flooring. Water Management • Consider installing a gutter on the north eave that discharges to a downspout at the west to control water runoff from the roof. • A gutter on the north eave will protect the displaced northeast corner (including the siding and Window W600), will reduce exposure to water and opportunities for settlement of the foundation piers in this area, and will reduce the ground saturation issues observed during the physical investigation. A study of local historic gutter practices should explore whether a metal half-round gutter may be appropriate to the interpretation period and region.
Regular Maintenance	Inspections • On a monthly basis, inspect the attic for signs of pest infiltration or water leakage. These inspections will be easier to perform if the attic is clean.

- Floor Framing: The floor structure was generally in good to fair condition, without areas of significant deterioration. A small number of repairs are recommended at specific framing members.

Short Term (1 to 2 Years)

Framing Repairs

- Reinforce the deteriorated bearing end of Joist J41 with a sister joist or partial splice.
- After replacement of the foundation piers, the distressed scarf joint between Beams B20 and B21 may be able to be partially reset. Shim as needed to reestablish bearing across the scarf joints.

- Weatherboard Siding Replacement: The siding has failed and is no longer providing weatherproofing for the building, particularly at areas of significant moisture-related deterioration at the north and east elevations. Overall, the siding is aged and has limited remaining performance; however, select boards may be able to be retained if in sound condition without warping, checking, fungal attack, or other deleterious conditions.

Medium Term (2 to 5 Years)

Siding Replacement

- Perform a board-by-board assessment of the existing siding and determine what boards are suitable to remain in place and which require replacement due to deterioration.
- Remove the deteriorated boards and building paper/underlayment.
- Inspect the wall framing for signs of distress or deterioration and perform any required repairs.
- Install new siding boards to match existing or as determined to be historically appropriate for the interpretation period.
- Provide new metal cap flashing at window heads.
- Exposed nails should follow the existing fastener patterns.
- Provide new metal flashing at the west chimney.
- Consider if a modern sealant or a traditional surface protection treatment like linseed oil or whitewash may be appropriate to extend the service life of the new siding.
- Replace the deteriorated vertical trim boards on either end of the south elevation and paint to match existing.

- Windows: Deterioration and conditions affecting the weather-resistance of the windows were observed at multiple locations. While these conditions do not represent critical structural or life-safety issues, maintaining the performance of the windows is important to prevent moisture and pest-related damage to other building components.

Medium Term (2 to 5 Years)

Finishes Analysis

- Prior to performing repairs on painted substrates, engage a qualifies finishes conservator to perform an analysis on the existing paint layers to determine a compatible material for new paint layers and to determine what color most closely approximates the original paint layer, likely from the 1955 Furnishing Plan.

Shutter Repairs

- Replace the shutters on Windows W200 and W201 in kind.
- Scrape and repaint the remaining existing shutters. Minor wood repairs can be performed with a wood filler prior to painting. Replace any hinges in-kind that are damaged or missing.
- Replace shutter dogs and hooks where missing. Resecure loose shutter dogs.
- When reinstalling shutters, install bat-exclusion mesh between the shutter and siding.

Trim and Sill Repairs

- Replace the jamb trim on Windows W200 and W201 in kind.
- Scrape and paint the wood trim for all other windows. Fill any holes with wood filler, including holes from shutter hingers, prior to repainting.
- Replace failed exterior sills at Windows W200, W201, W300, W600, and W601.
- Replace failed interior sills at Window W101, W600, and W601.

Glazing and Sash Repairs

- Replace the failed glazing putty at all exterior windows and door transoms. Coordinate repainting of sashes with putty replacement.
- Replace the broken pane in Window W101.
- Perform repairs to the lower sashes of Windows W300 and W700.

Surface Cleaning

- On the interior, painted surfaces with mildew or biological soiling should be cleaned using the gentlest means possible. A dilute solution of an unscented surfactant in warm water, such as Dawn Dish Soap or Ivory Liquid Dish Soap (discontinued), with light abrasion using a natural sponge. This should be

sufficient to remove most bulk soiling. Spot treatment with dilute vinegar in warm water, dilute citrus-based cleaner, or proprietary chemical cleaners specifically manufactured for this purpose can be tested on areas of heavier soiling.

Regular Maintenance

Inspections

- On an annual basis, inspect the exterior windows for signs of deterioration, paint failure, broken glass, failed glazing putty, and other conditions which may allow water penetration through the window system.

- Doors: Deterioration and conditions affecting the weather-resistance and operation of the doors were observed at multiple locations. While these conditions do not represent critical structural or life-safety issues, maintaining the performance of the doors is important to prevent moisture and pest-related damage to other building components. Additionally, issues with operation of locks and handles and where doors catch on the flooring affect the daily operations of the park, and short-term measures have not been successful at resolving these issues.
  The existing door hardware, including handles, locks, and hinges, were all replaced during the 1955 restoration.[39] Based on the pre-restoration HABS photographs taken in 1938, several of the existing doors were relocated to their current placement from other locations on the house; other doors may be 1950s reproductions.

Immediate (Year 1)

Lock Repair and Replacement

- The twentieth-century lacquered metal rim locks are worn or damaged and several did not appear to be functional. The locks may be able to be repaired and will likely require replacement of the inner mechanisms and locking cylinders.
- For rim locks that are damaged beyond repair, since these are not reproduction or historically accurate locks, they can be replaced with either modern rim locks in a simple style and left unfinished or painted to match the door, with reproduction hardware suitable for an 1820s interpretive period, or replaced with salvaged rim locks of the same style. The lock will be concealed behind the open doors and will not be visible to visitors.
- Repairs to the jamb catch or strike plates will also be required.
- The failed existing hardware should be removed and fastener holes in the door and jamb filled with wood putty prior to installation of the new locks and repainting of the door and trim.

[39] Phelps, "Narrative to Accompany…," 3-4.

- At least one entry in each room or series of connected rooms should have a door capable of being locked from the exterior with a key. Consider locating the keyed locks on the north porch (Doors D101, D300, D600, and D701). Other doors (Doors D100 and D700) can be secured from the interior with slide bolts, similar the lock on Door D200.

Short Term (1 to 2 Years)

<u>Re-Level Doors</u>

- After stabilization of the piers has been performed and the floors releveled as much as possible, the doors will need to be reset. To fix the issue of doors dragging on the flooring.
- The doors should be removed from the jambs, fastener holes in the jambs filled with wood putting, and reinstalled level within the jamb opening.
- Inspect and replace hinges as required. Hinges can be replaced in-kind to match the 1955 hardware. Consider if reproduction hinges suitable for an 1820s interpretive period are preferred. In the 1938 HABS photos, several doors had strap rather than butt hinges.
- Doors should be hung with approximately 3/8-inch clearance between the bottom of the door and the highest point of the flooring within the swing radius to allow free movement even during periods of normal swelling of the wood.
- To minimize pest, air, and water infiltration under the doors, brushseal sweeps should be considered. A black brushseal sweep applied to the interior face of the door and painted would have minimal visual impact and would be mostly concealed behind the open doors during visitor hours. Adhesive sweeps are not recommended.
- This work should be coordinated with repairing deteriorated stops, installing new supports for the plexiglass barricades, and repainting doors and jambs.
- For certain doors, particularly D101 and D600, releveling the rough opening may be required to allow the door to be rehung. This will require removing the interior and exterior trim, leveling the rough opening sub-framing or installing shims and reinstalling the trim. Ideally, relevelling doors should be performed after the foundation repairs are complete.

Medium Term (2 to 5 Years)

Finishes Analysis

- Prior to performing repairs on painted substrates, engage a qualifies finishes conservator to perform an analysis on the existing paint layers to determine a compatible material for new paint layers and to determine what color most closely approximates the original paint layer, likely from the 1955 Furnishing Plan.

Hardware Repairs

- Where exterior door hardware is significantly damaged or broken (such as Doors D201 and D300), the thumb-latch handle should be replaced in kind.
- Where exterior door hardware is intact but not operating smoothly (such as Doors D100 and D101), and experienced locksmith should be able to disassemble the lath mechanism and perform repairs, which may be as simple as replacing failed springs. If securing the door will not rely on the performance of the lift-latch handle, the existing hardware can be left in place as is.

Surface Cleaning

- On the interior, painted surfaces with mildew or biological soiling should be cleaned using the gentlest means possible, this primarily affects doors in Rooms 1, 6, and 7. A dilute solution of an unscented surfactant in warm water, such as Dawn Dish Soap or Ivory Liquid Dish Soap (discontinued), can be used with light abrasion using a natural sponge. This should be sufficient to remove most bulk soiling. Spot treatment with dilute vinegar in warm water, dilute citrus-based cleaner, or proprietary chemical cleaners specifically manufactured for this purpose can be tested on areas of heavier soiling but should be used with care.

Regular Maintenance

Maximize Ventilation

- Air movement is critical to reducing biological growth on interior surfaces, particularly during hot, humid weather. Whenever possible, doors should be opened to allow natural ventilation through the house. Consider restoring operation to one of the windows in Room 6 (106) to allow cross ventilation.

Inspections

- On a monthly basis, inspect the doors for operation of the hardware and to ensure the doors are operating properly.

- Interiors: Interiors were generally in good to fair condition. Specific conditions were identified for repair to address component stability or the long-term performance of finishes. The existing flooring is currently serviceable; replacement of flooring boards where abraded by door swings or foot traffic is not recommended at this time. Minor areas of wear or failure of painted surfaces were observed but did not rise to the level where full repainting is required if surfaces are able to be cleaned without damaging the existing paint.

Medium Term (2 to 5 Years)	Finishes Analysis • Prior to performing repairs on painted substrates, engage a qualifies finishes conservator to perform an analysis on the existing paint layers to determine a compatible material for new paint layers and to determine what color most closely approximates the original paint layer, likely from the 1955 Furnishing Plan. Surface Cleaning • Multiple rooms, particularly Rooms 1, 6, and 7, exhibited varying severities of mildew or biological soiling on painted surfaces. The mildew or biological soiling should be cleaned using the gentlest means possible. A dilute solution of an unscented surfactant in warm water, such as Dawn Dish Soap or Ivory Liquid Dish Soap (discontinued), with light abrasion using a natural sponge. This should be sufficient to remove most bulk soiling. Spot treatment with dilute vinegar in warm water, dilute citrus-based cleaner, or proprietary chemical cleaners specifically manufactured for this purpose can be tested on areas of heavier soiling. • If repainting is planned, surfaces must still be cleaned before new paint is applied.
Long Term (5+ Years)	Moisture Control • Past evidence of water intrusion was observed in Rooms 6 and 7, which were the rooms with the heaviest mildew growth on the painted surfaces. Replacement of deteriorated siding and installation of a gutter on the north are recommended to address the water intrusion issues, which will reduce the relative humidity in the rooms, particularly when closed. Ventilation • Improving ventilation in the structure should also be considered. In a humid climate, movement of air is critical to maintaining humidity levels and preventing moisture accumulation on surfaces, which will promote mildew growth. The house can be mechanically ventilated. Existing chases for ductwork can be reused, and small diameter ducts can be added to ceilings of other spaces. A small air handling unit in the attic will provide air movement. This could be particularly effective

	to take advantage of "night flushing" that brings in cooler, dryer air during the night to control interior humidity.
Regular Maintenance	Inspection • On a monthly basis, inspect interiors for signs of pest infiltration, moisture intrusion issues, and mildew growth. • On an annual basis, inspect the displaced ceiling beam splice for signs of movement or distress. Installing a static movement gauge across the splice will assist with determining if the splice is stable.

- Chimneys: Deterioration of brick mortar joints was observed at the foundations of both chimneys and at isolated joints in upper areas.

Immediate (Year 1)	Pest Management • Flood the animal burrow under the central chimney or otherwise confirm that the burrow is unoccupied. Backfill the burrow with gravel and cover with soil. • If burrowing under the chimney foundation is a persistent problem, stainless steel mesh can be set in the soil around the affected area or concrete pavers can be placed around the base of the foundation to discourage digging.
Medium Term (2 to 5 Years)	Brick Maintenance • Petrographic analysis should be performed of the existing brick and mortar to determine compatible pointing mortar mixes. The replacement mortar should match the existing in properties, appearance, and tooling. • Repoint open and weathered joints in the brick masonry chimneys, particularly in the crawlspace. • At the central chimney: the existing brick appeared to be soft, low-fired clay, and the mortar appears to be a soft, lime-based mortar. • The west chimney dates to the 1955 restoration. The bricks appear to be fairly soft, low-fired clay, and the mortar appears to have a cement matrix. Steel Lintels • The interior steel plate lintels exhibited deflection and surface corrosion. The level of deflection did not appear substantially worse than conditions in the 1938 HABS photographs. • Repair brick or spalled bricks at lintel corners and repaint.

Regular Maintenance

Inspections

- After heavy rains, inspect the fireboxes for signs of water intrusion through the flue.
- On an annual basis, inspect the portions of the chimney stack with rise above the roof line for signs of mortar deterioration.
- On an annual basis, inspect the steel lintels for signs of continued deflection or worsening corrosion.

- Cisterns: The two cisterns to the north and east of the house are in a partially ruined condition and are in danger of failure of the brick walls. The wood cap could not be lifted during the physical investigation to determine if the cisterns had been previously backfilled.

Medium Term (2 to 5 Years)

Brick Repairs

- Petrographic analysis should be performed of the existing brick and mortar to determine compatible pointing mortar mixes. The replacement mortar should match the existing in properties, appearance, and tooling.
- Perform repairs to the exposed brick walls of the cisterns. If the desire is to maintain the cisterns in a distressed condition, voids between bricks and open mortar joints should be filled with a lime putty mortar at a minimum.
- Backfill the cisterns with sand to the level of the existing grade to provide support to below-grade walls.

Other Repairs

- Reset loose barricade posts or replace deteriorated posts in kind.
- Flood the open animal burrow near the east cistern or otherwise confirm that the burrow is unoccupied. Backfill the burrow with gravel and cover with soil.

Regular Maintenance

Inspections

- On an annual basis, inspect the cisterns for signs of masonry distress.

- Walkways and Visitor Circulation: Multiple walking surfaces around the historic site are in poor to failed condition, with cracks, heaves, and other deterioration conditions that create tripping hazards for visitors and negatively impact the ability of mobility limited visitors to access the site.

Medium Term (2 to 5 Years)	Brick Walkway • Remove the existing bricks and sand setting bed. Salvage and clean the existing bricks for reinstallation. • Individually damaged bricks should be replaced in kind. • Install new gravel base and sand bed, either flat or slightly cambered to encourage water shedding. • Reinstall the salvaged bricks to provide a level walking surface, with care to avoid lippage between units, in compliance with accessibility requirements for walking surfaces.
Long Term (5+ Years)	Accessible Path to Mound • The asphalt or chip-seal walkway through the grape arbor is significantly deteriorated. This path may be suitable for rehabilitation as an accessible path to the top of the mound. A new, wider paved walkway can be installed to meet accessibility requirements. Accessible Access to House • Currently, the house is not accessible except via stairs at the north and south elevations. Consider if there is desire to provide a ramp or a motorized lift. The west elevation was heavily reconstructed in 1955, and this may be a rehabilitation zone to explore future accessibility needs.
Regular Maintenance	Inspection • On a quarterly basis, inspect the brick walkway for evidence of sand loss, paver displacement, paver deterioration, or other conditions which may represent tripping hazards or present walking difficulties for visitors.

- Site Features: Miscellaneous repairs to landscape features, small-scale site features, and fences.

Long Term (5+ Years)	Miscellaneous Items • Replace deteriorated post for the bell stand in kind. • Some of the interpretive signage is outdated. Consider updating the signage with current terminology, particularly those features which interpret the African-American experience at the site (enslaved persons vs. slave, etc). This should be coordinated with the park's interpretive plan and other management requirements.
Regular Maintenance	Fence Repairs • Repair damaged or deteriorated split-rail fences as required.

Pest Exclusion and Treatment

Big Brown Bats

Bats are beneficial species and are experiencing stresses on healthy populations nationwide, including loss of habitat, poisoning by insecticides, and disease. Mississippi is home to 15 native species of bats, several of which are threatened or endangered. The most common species of bat is the Big Brown Bat (*Eptesicus fuscus*), which is known for its preference for roosting in structures.

Exclusion

Exclusion is the simpler and more effective method of controlling unwanted bat populations. If the shutters will be permanently secured in the open position, a nylon or polypropylene mesh, such as a wall cavity drainage mesh, can be fixed between the shutter and the wall to prevent bats from entering the gap. This mesh will not stain or deteriorate the shutter or siding, and the high porosity of the mesh will allow free flow of water and air while excluding pests. The mesh can be friction fit or secured with nails with plastic washers.

Deterrents

Seasonal application of camphor (moth balls) or a product specifically designed to repel bats with a strong odor can also be applied behind the shutters and at other roosting locations in the late winter and early spring, when female bats are roosting for the breeding season.

Additional Bat Control Measures

In addition to exclusion and deterrents, alternate roosting opportunities should be provided, including dedicated "bat houses" to encourage relocation and support of local bat populations. The construction and placement of bat houses are species-specific. The Mississippi Department of Natural Resources and local bat conservation groups may be able to suggest the most appropriate type and placement of bat houses for this region. Big

Brown Bats, one of the most common species, prefers roosting in structures and bat houses mounted to structures. Alternate housing for Big Brown Bats could be provided on the upper gables of the east and west walls and could provide an interpretive or educational opportunity for visitors to the site. Other bat species may prefer houses mounted along the tree lines to the west and north of the house.

Armadillos

The nine-banded armadillo (*Dasypus novemcinctus*) is an invasive, burrowing mammal. Armadillo burrows can attract other pests including snakes, rats, and skunks. Burrows should be filled as soon as they are observed. Armadillos are known to carry Hanson's Disease, which on very rare occasions has been transmitted to humans. Gloves, masks, and other protection are recommended when filling armadillo burrows and handling soil disturbed by armadillos.

Deterrents

Home or folk remedies for repelling armadillos typically include applying strong smelling products like camphor or ammonia, cayenne pepper, or capsaicin to areas potentially attractive for roosting. Home remedies may have limited effectiveness. Since armadillos are nocturnal, light may also be an effective deterrent.

Exclusion

Exclusion methods are likely to be more successful than deterrents, particularly when addressing reoccurring burrowing issues at a specific location. Stainless steel mesh can be embedded vertically in the soil to a depth of 12 to 16-inches to form a "fence" around the affected area, and concrete pavers can be placed on the surface to discourage digging.

Carpenter Bees

Carpenter bees are large bees that resemble bumblebees but with fully black, hairless abdomens. The Eastern Carpenter Bee (*Xylocopa virginica*) is the most common species in Mississippi. They are typically not aggressive, but the females are able to deliver a painful sting. Carpenter bees are beneficial pollinators.

Carpenter bees are particularly attracted to pine and cedar but will infest other woods. The damage is usually aesthetic, but heavy infestations can cause structural damage. Carpenter bees bore "brood tunnels" into wood for breeding purposes, creating easily recognizable damage in the form of perfectly circular and ovoid holes in wood.

Treating New Holes

The best management for carpenter bees is to prevent infestation by treating brood tunnels promptly. Holes with bright edges or where frass (sawdust) is present are new. If treated, the bee will likely abandon the hole. Localized treatment of the hole with insecticide is usually sufficient. After treatment, the hole should be filled with elastomeric sealant or a small wood plug.

Squirrels

Squirrels are small, clever, and adaptable mammals that are agile climbers. Squirrel damage presents as rounded holes where squirrels have gnawed through wood members. Squirrels can be unexpectedly destructive, causing damage to electrical lines and wood members. Attics are attractive nesting locations for squirrels; this is especially true for a structure that is not permanently occupied. Eastern gray squirrels (*Sciurus carolinensis*) and fox squirrels (*Sciurus niger*) are two common, native species in Mississippi that both are known for invading attics.

Deterrents

Home or folk remedies for repelling squirrels also typically include applying strong smelling products like camphor or ammonia, cayenne pepper, or capsaicin. Home remedies have limited effectiveness with squirrels.

Exclusion

Controlling squirrel damage is best performed through discouraging access to the roof by keeping tree limbs and other climbing paths trimmed and by closing off entry paths into the attic. Sheet metal or stainless steel mesh/hardware cloth can be used to seal openings. Regular inspection and maintenance are needed to repair damage caused by squirrels and to seal any entry points into the structure that may be created. Controlling entry points for squirrels will also prevent entry of birds and bats.
