		process known as repowering is extremely challenging. What guarantees are provided that the old blades from Lava Ridge will not end up being stored on site or placed in Idaho landfills versus being recycled?	

Human Health and Safety

Table A-3m. Human Health and Safety

Comment ID	Commenter	Public Comment	Response to Comment
1042-18	WildLands Defense	The EIS greatly downplays the serious human health risks of exposure and people, pets and wildlife to gargantuan turbines, transmission lines and other project elements.	EIS Chapter 3 (Affected Environment and Impacts) discloses the potential for human health impacts in Sections 3.2 (Air Quality), 3.4 (Climate and Greenhouse Gases), 3.6.1 (Environmental Justice Communities), 3.14 (Transportation), 3.16 (Visual Resources), and 3.17 (Water and Wetland Resources). Numerous human health issues are also addressed in EIS Appendix 3 (Issues Analyzed in Brief), such as AIB-12: How would the project contribute to EMFs and corona exposures to workers and the public? Noise information is provided in the project noise technical report (SWCA 2022) on the BLM project website. The report clarifies that turbines would be audible within 2.2 miles, and 500-kV transmission lines would be audible within 0.5 mile. The 500-kV transmission line corridors would be 1.6 miles from the closest residence. MVE would implement appropriate industry best-practice setback distances to surrounding residences and occupied buildings (typically defined by a fixed distance [e.g., 2 miles] or a function of the dimension of the selected wind turbine [e.g., 1.1 times the maximum turbine tip height]), as stipulated in applicant-committed measure 25.
10426-4	Casey Stevenson	[These are my concerns which have not been addressed by the EIS which will impact thousands of people, and need to be reevaluated. Here are my concerns:] Wind turbines can also produce electromagnetic interference that can affect certain farming equipment such as weather radars and communication systems (our GPS for our tractors and our radio pivot controls).	Interference with communication systems is discussed in Section 3.8 (Land Use and Realty). The EIS provides information about communication system interference: “Comsearch (2020) recommended not locating any turbines within 254 feet of land mobile fixed-base stations to avoid potential impacts to the communications services provided by these stations. This setback distance is based on FCC interference emissions from electrical devices in the land mobile frequency bands.” Additionally, applicant-committed measures 27 and 28 state that MVE would design the project to minimize interference and work with system users to resolve issues: “Measures to reduce interference may include the use of Comsearch’s recommended setbacks from land mobile fixed-base stations (254 feet) or other design modifications such as attaching communications equipment to project infrastructure or to existing communications structures in the analysis area. Signal studies were provided in April 2021 to all communication site authorization holders who had submitted responses to the BLM following notification provided in July 2020. Prior to final design and siting of project infrastructure, MVE would complete a line-of-sight interference study to further identify communication pathways potentially blocked by the project’s proposed infrastructure and to determine where potential impacts to existing communication towers can either be avoided through micro-siting of infrastructure or mitigated. Coordination with local communication providers and operators is considered ongoing.” Also see response to comment 11978-67 (see in. Table A-3cc, Mitigation – EIS Appendix 4).
10427-1	Jess Bartlett	What about the detrimental health effects they've been shown to have on humans?	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
10477-1	Brenda Ford	once the windmills are up and running there are people who live around there and they will have to deal with the noise, oil leaks, and potential fires caused by the windmills.	Fire and fuels management is discussed in EIS Section 3.7 (Fire and Fuels Management). Noise information is provided in the project noise technical report (SWCA 2022) on the BLM project website. The report clarifies that turbines would be audible within 2.2 miles, and 500-kV transmission lines would be audible within 0.5 mile. Noise impacts are discussed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) and cover both the construction and operation phases of the project. Section 3.6.1.2.2 (Alternative B [Proposed Action]) provides details on noise impacts to people and communities. Noise issues are also discussed in Section 3.9.2 (Physiological Effects to Livestock). Applicant-committed measures to address noise impacts can be found in Table App4-2i in EIS Appendix 4 (Mitigation). Section 3.12 (Recreation) discusses noise impacts on recreational uses. Finally, Section 3.18 (Wildlife) addresses noise impacts, including operational noise, on wildlife. See also response to comment 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
1054-2	Jeff Juker	What are the plans both environmental and electrical concerning public safety?	See responses to comments 1042-18 (see in Table A-3m, Human Health and Safety) and 10426-4 (see in Table A-3m, Human Health and Safety). The EIS also addresses public safety in Section 3.8 (Land Use and Realty). Applicant-committed measures 42 and 43 would reduce the duration of public access restrictions to the extent practicable during construction while also ensuring public safety (see Table App4-2e in EIS Appendix 4 [Mitigation]). During operation, the project would not physically preclude any other permitted uses (e.g., grazing and recreation) from the siting corridors, except where permanent infrastructure is sited (2,374 acres).

Comment ID	Commenter	Public Comment	Response to Comment
			During operation, the ROW would be non-exclusive, and any new applications for ROWs in the siting corridors would be analyzed for compatibility with the project infrastructure on a case-by-case basis. The safety of project structures is discussed in Section 4.1 (Operation and Facility Maintenance Needs) of MVE (2023).
1074-1	Sue Page	I am opposed to Lava Ridge Wind Project because Of the health Hazards the Hidden Human Tragedy Caused by Incessant Wind Turbine Noise wind-turbines-near-house Helen Schwiesow Parker, PhD, is a Licensed Clinical Psychologist and a Past Clinical Supervisory Faculty member at the University of Virginia Medical School. Her career includes practical experience in the fields of autism, sensory perception, memory and learning, attention deficit and anxiety disorders, including panic disorder and PTSD. In this well-crafted piece, Helen details the misery and suffering which is caused by incessant turbine generated low-frequency noise and infrasound and maliciously covered up by the wind industry and its political enablers. [text of article included below in comment]	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety). Also, see AIB-32 in EIS Appendix 3 (Issues Analyzed in Brief): How would vibrations from project wind turbines affect nearby structures? The calculated amplitude of vibrations from the turbines at the nearest residential structure is less than the threshold for human perception per guidelines based on international standards for allowable vibration levels.
11204-24	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Separate-and-apart from the foregoing, while reviewing information relating to previously expressed concerns about the potential physiological effects of the proposed Project to their livestock, Permittees discovered additional information that created new concerns that the proposed Project has the potential to cause physiological distress to the Permittees, their families, and their employees. Concerns regarding potential impacts of the proposed Project to human health are particularly relevant to the Permittees and their families and employees because they will be required to spend significant periods of time managing and moving their livestock within and adjacent to the proposed siting corridors within the Star Lake Allotment particularly during the construction phase and during the operational phase (30-year period) of the Project. Wind-energy projects have been reported to create negative impacts on human health and well-being, mainly by noise, shadow flicker, and visual impacts. The health implications of visual impacts are often underestimated. The World Health Organization reported that a “bad view” out of a window can increase the risk for depression by 40%.11 The same study also reported that noise disturbance when awake can increase depression by 40% while sleep disturbance from noise can increase depression risk by 100%. Other scientific studies indicate a strong correlation between sunlight deficiency and depression, or the risk thereof. Therefore, those who are exposed to the sound and visual disturbances experienced when living close to wind turbines seem to be at an elevated risk of suffering from depression no matter what they do. If they allow the shadow flicker caused by the wind turbines to encroach through windows, the “bad view” and 11 World Health Organization, Large analysis and review of European housing and health status (LARES) Preliminary overview, 2007. disorienting flickers coupled with the sound pollution raises their risk of depression. On the other hand, if they frequently draw light-darkening curtains to keep the shadow flicker under control, they are also at higher risk for depression than they otherwise would be in normal living situations. Wind turbines create visual burdens along with noise pollution12 which can cause annoyance, stress, and disturbance to sleep.13 14 15 16 17 Thus, the visual and noise impacts of wind turbines, particularly when combined, can result in adverse human health effects. See Visual Health Effects and Wind Turbines at www.aboutgenerators.com/visual-health-effects-and-wind-turbines (last checked 4/11/2023 @ 9:57 A.M). When wind turbine blades rotate, they cause an effect commonly known as shadow flicker, particularly when backlit by the sun when it is low on the horizon. Shadow flicker has been reported to be bright enough to pass through closed eyelids,18 and has the potential to induce photosensitive epileptic seizures, although this risk is low with proper planning and mitigation.19 Planning to mitigate epilepsy triggers should ensure that shadow flicker from individual turbines or from multiple adjacent turbines does not exceed a flash frequency of three per second18. See Visual Health Effects and Wind Turbines at www.aboutgenerators.com/visual-health-effects-and-wind-turbines (last checked 4/11/2023 @ 9:58 A.M). Annoyance and/or stress have consistently been found to be the most common adverse human health effects correlated with shadow flicker from wind turbines.20 21 22 Wind turbine noise is easily heard, and turbines are visually prominent objects whose spinning motion attracts the eye. The combined auditory and visual effects and negative aesthetic response can multiply the experience of annoyance and lead to stress- related symptoms due to prolonged physiological stimulation which is resistant to psycho-physiological recovery.23 See Visual Health Effects and Wind Turbines at www.aboutgenerators.com/visual-health-effects- and-wind-turbines (last checked 4/11/2023 @ 10:00 A.M.). Shadow flicker can be an issue both indoors and outdoors, particularly when the sun is low on the horizon, and must be modeled for human exposure risks in locations other than nearby homes. Shadow flicker is also a travel safety concern because it can be a distraction while driving vehicles. In the northern hemisphere, locations East-NE or West-NW from wind turbines are most vulnerable to adverse effects from shadow flicker.24 See Visual Health Effects and Wind Turbines at www.aboutgenerators.com/visual-health-effects-and- wind-turbines (last checked 4/11/2023 @ 10:03 A.M.). The DEIS appears to have confined its shadow flicker modeling to residences and other “receptor” building sites that are located close to the proposed Project’s siting corridors. The DEIS needs to consider and assess shadow flicker modeling in other outdoor locations, particularly along improved roads subject to moderate to high vehicle speeds which may experience Project-related shadow flicker that can distract drivers. Recommended setbacks to avoid shadow flicker conflicts are 10 rotational diameters which would translate to approximately 4,590 feet for the 3-MW turbines and 5,600 feet for the 6-MW wind turbines analyzed for the proposed Project. Protection from excessive shadow flicker exposure to avoid adverse human health effects must be engineered into the project-design during the planning stages of any wind turbine facility. Shadow flicker modeling in the planning stage should include: calculations based on the actual location of the wind turbines; exposure calculations on the entire neighboring properties and not just “receptor” locations; calculations for both sun and moon induced flicker using conservative assumptions to ensure maximum	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety). Also see AIB-32 in EIS Appendix 3 (Issues Analyzed in Brief): How would vibrations from project wind turbines affect nearby structures? The calculated amplitude of vibrations from the turbines at the nearest residential structure is less than the threshold for human perception per guidelines based on international standards for allowable vibration levels. Noise information is provided in the project noise technical report (SWCA 2022) on the BLM project website. The report clarifies that turbines would be audible within 2.2 miles, and 500-kV transmission lines would be audible within 0.5 mile. Noise impacts are discussed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) and cover both construction periods and operation of the project. Section 3.6.1.2.2 (Alternative B [Proposed Action]) provides details on noise impacts to people and communities. Noise issues are also discussed in Section 3.9.2 (Physiological Effects to Livestock). Applicant-committed measures to address noise impacts can be found in Table App4-2i in EIS Appendix 4 (Mitigation). Impacts from shadow flicker and potential mitigation are described in Section 3.16.3 (Shadow Flicker).

Comment ID	Commenter	Public Comment	Response to Comment
		protection against adverse human health effects and safety risks; and, protection against photosensitive epilepsy by ensuring the flash frequency of shadows cast by individual turbines or a combination of multiple turbines does not exceed three flashes per second. See Visual Health Effects and Wind Turbines at www.aboutgenerators.com/visual-health-effects-and-wind-turbines (last checked 4/11/2023 @ 10:07 A.M.). The DEIS and its associated Appendices fail to comply with the shadow flicker modeling recommendations disclosed above because: they do not base the modeling calculations on actual wind turbine locations (which will not be determined until the plan is finalized); they appear to base the calculations primarily or exclusively on “receptor” locations which are residences or other buildings that would be located near the Project siting corridors and fail to model impacts on all neighboring properties including outdoor locations; they do not appear to include any modeling of shadow flicker induced by the moon; and, they do not even mention epilepsy whatsoever. The DEIS needs to be amended to correct these deficiencies. A 2008 article published in Epilepsia (49(6), pgs. 1095-1098) titled “Wind turbines, flicker, and photosensitive epilepsy: characterizing the flashing that may precipitate seizures and optimizing guidelines to prevent them” reported that “seizure risk does not decrease significantly until the distance exceeds 100 times the hub height” and concluded that “flash frequency is therefore the critical factor and should be kept to a 23 Pedersen Eja, Human Response To Wind Turbine Noise: Perception, Annoyance And Moderating Factors , May 23, 2007. 24 Verkuijlen E, Westra CA. (1984) Shadow hindrance by wind turbines. Proceedings of the European wind Energy Conference. October 1984, Hamburg, Germany. maximum of three per second, i.e., sixty revolutions per minute for a three-bladed turbine.” The article also concluded “the shadows cast by one turbine on another should not be viewable by the public if the cumulative flash rate exceeds three per second” and that to reduce epilepsy-related health concerns wind turbine blades “should not be reflective.” While articles regarding potential health effects from the shadow flicker and noise (both audible and infrasound) created by wind turbines have generally concluded that annoyance, stress, and sleep disruption are the most significant health effects to humans, the trend in concern levels reported within these articles is not reassuring. Older articles tended to downplay the severity of these human health concerns more than do the most recent articles. Thus, it seems that the more we study the issue, the more the scientific community finds that there is merit behind the health concerns regarding annoyance and sleep disturbance. For example, conclusions from synthesis articles regarding scientific investigation of the issue taken in chronological order are summarized below: March 5, 2013; Environmental Impacts of Wind Power by the Union of Concerned Scientists. “Public health and community – Some people living close to wind facilities have complained about sound and vibration issues, but industry and government-sponsored studies in Canada and Australia have found that these issues do not adversely impact public health.” June 19, 2014; Wind turbines and human health a review article in Frontiers in Human Health. “The available scientific evidence suggests that EMF, shadow flicker, low-frequency noise, and infrasound from wind turbines are not likely to affect human health; some studies have found that audible noise from wind turbines can be annoying to some. Annoyance may be associated with some self-reported health effects (e.g., sleep disturbance) especially at sound pressure levels >40 dB(A). … Based on the findings and scientific merit of the available studies, the weight of evidence suggests that when sited properly, wind turbines are not related to adverse health.” December 4, 2014; Health effects related to wind turbine noise exposure: a systematic review in PLoS One - doi: 10.1371/journal.pone.0114183. “Exposure to wind turbines does seem to increase the risk of annoyance and self-reported sleep disturbance in a dose-response relationship. There appears, though, to be a tolerable level of around LAeq of 35 dB. Of the many other claimed health effects of wind turbine noise exposure reported in the literature, however, no conclusive evidence could be found. January 23, 2019; The influence of wind turbine visibility on the health of local residents: a systematic review by Alice Freiberg, Christiane Schefter, Janice Hegewald, and Andreas Seidler. “Results: The pooled prevalence of high annoyance due to altered views and shadow flicker was 6% each. The results of other health effects were inconsistent, with some indications showing that direct wind turbine visibility increases sleep disturbance. Annoyance by direct visibility, shadow flicker, and blinking lights was significantly associated with an increased risk for sleep disorders. One study indicated reactions to visual wind turbine features may be influenced by acoustical exposures. Conclusions: Direct and indirect wind turbine visibility may affect residents' health, and reactions may differ in combination with noise.” Note that in 2013 it was flatly concluded that “these issues do not adversely impact public health.” In mid-2014 it was reported that “scientific evidence suggests” that phenomena generated by wind turbines “are not likely to affect human health” while “audible noise from wind turbines can be annoying to some” which can induce certain “self-reported health effects (e.g., sleep disturbance) especially at sound pressure levels >40 dB(A).” In late-2014 it was concluded that wind turbine exposure “does seem to increase the risk of annoyance and self-reported sleep disturbance in a dose-response relationship” with a toleration “level of around” 35 dB. In contrast, by 2019 it was concluded that there was a “prevalence of high annoyance due to altered views and shadow flicker” (6% each) “with some indications showing that direct wind turbine visibility increases sleep disturbance” while visual annoyance paired with “shadow flicker, and blinking lights was significantly associated with an increased risk for sleep disorders25.” As seen above, the more recent synthesis articles conclude that there are negative health effects with an increasing degree of certainty, and report that the thresholds of toleration are progressively lower. In other words, as time goes on the scientific viewpoint is increasingly recognizing the legitimacy of health concerns regarding long-term annoyance and sleep disruption impacts and is finding that what were initially considered to be tolerable impact levels may have been set too high. The DEIS needs to consider and assess that the science regarding long-term annoyance and sleep disruption impacts associated with wind turbines is growing and that the more we study these phenomena, the more we discover regarding their prevalence and the more we understand about how they can be mitigated. While reviewing information relating to previously expressed concerns about the potential physiological effects of the proposed Project to their livestock, the Permittees discovered additional information	

Comment ID	Commenter	Public Comment	Response to Comment
		that created new concerns that the proposed Project has the potential to cause health and safety risks due to the danger of falling ice. Given the extremely high tip-speed of wind turbine blades, there is the potential for ice to be hurled across an impact zone which may extend far beyond the vertical footprint of the wind turbine rotor itself. The DEIS fails to disclose or analyze this potential risk whatsoever. The DEIS needs to consider and assess the risks to health and safety that would be created by the proposed Project due to the danger of falling / hurling ice, including: associated risks to the Permittees' livestock during their annual scheduled grazing seasons within the Star Lake Allotment (4/16 – 12/31); associated risks to wildlife (sage-grouse and other birds, big game, small game, other mammals, amphibians, and reptiles); and, humans (particularly within the wind turbine siting corridors and associated roadways).	
11238-1	Angela Mooney	30 years of the vibrations from these towers, taller and larger than anything every built for this purpose, known to vibrate and sicken people and livestock (crushing them from the inside out), for 30 years, will certainly send shocks through the ground and whatever firmament remains after the construction period will surely compress and collapse over the decades. This project is creating a hellscape that will affect the food chain for years to come. And it will be irreversible. The vibrations from wind mills are known to change the brains and blood flow in humans. There are published studies. There are lawsuits. These are easily researched, public knowledge, which makes this whole project a known danger. That is why there is a hold harmless clause in the EIS. If you don't stop this, the litigation may go on for decades, but we'll still be ruined in this valley, from the inside of our bodies to the backbone of the economy that FEEDS MILLIONS.	See AIB-32 in EIS Appendix 3 (Issues Analyzed in Brief): How would vibrations from project wind turbines affect nearby structures? The calculated amplitude of vibrations from the turbines at the nearest residential structure is less than the threshold for human perception per guidelines based on international standards for allowable vibration levels.
11360-3	Sergio Arroyo Jr.	" Additionally, blasting during construction would generally be limited to Monday through Friday during daytime hours (7:00 a.m.-7:00 p.m.) within 3,000 feet of sensitive receptors." DEIS V 1, 3-199 Have they taken into consideration that agricultural work demands day and night shifts? The plan to blast 5 days a week, 7 am to 7 pm, will interrupt the day sleepers for 525 days. This interruption will devastate the health of day sleepers who can't sleep soundly enough to prepare for the night shift, and may cause a dearth of workers willing to tolerate the situation. In turn this could harm farming and dairy operations in the area surrounding the blasting projects.	The EIS describes the applicant-committed measures regarding blasting in Table App4-2i in EIS Appendix 4 (Mitigation). Measures are intended to minimize impacts during evening hours when the majority of the community would be sleeping.
11372-4	Jamie Kohtz	Lastly, there are details on the effects to wildlife. One species not mentioned is the rattlesnake. Every farmer in Hunt, and every homeowner has had rattlesnakes. Whenever a home is built, a domestic well drilled, bulldozer work, or a fire, rattlesnakes move close to our home for that summer. These rattlesnakes have killed livestock and dogs, and we've had close calls with rattlesnakes and people. Blasting of this magnitude will disturb the rattlesnakes, and they will move closer to the populated areas.	As stated in EIS Section 3.18.1.2.2 (Alternative B [Proposed Action]), "Blasting would also occur approximately twice per day during the 2-year construction period. Although individual blasts may disturb or displace wildlife, they would be unlikely to lead to long-term effects on wildlife movement because blasting would not occur repeatedly in the same area over a long period of time."
11491-22	Dean Dimond, Jennie Bateman	- In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: [...] 30. Full disclosure of data on human health impacts from wind projects across the USA, [...]	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
11491-29	Dean Dimond, Jennie Bateman	3. no human safety analysis,	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
11535-98	Steven Andersen	Ice Shedding There DEIS fails to address the known phenomenon of "ice shedding" caused when ice is thrown vertically and horizontally from blades to the ground below. An in-depth study into ice shedding and ice throw was conducted by GE Energy and noted that rotating turbine blades may propel ice fragments several hundred meters, causing damage to structures, vehicles, personnel and the general public unless adequate measures are put in place for protection.309 A risk assessment should have been conducted that accounted for the projected the hub height and rotor diameter, turbine dimensions, rotational speed and site locations (which are unknown).	AIB-14 was added to EIS Appendix 3 (Issues Analyzed in Brief): Would ice throw or ice shed from turbine blades pose risk of injury to workers and the public?
11554-7	Raul Labrador; Idaho Attorney General's Office	[The draft EIS Ignores Idaho's Sovereign Interest in its People.] Fifth, a growing body of scientific literature shows that living close to large wind turbines can damage people's mental and physical health.7 The agency pays this important environmental factor no heed.	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
11554-10	Raul Labrador; Idaho Attorney General's Office	Eighth, the Project will have a generation capacity of 1,000 megawatts or more. DEIS, Introduction. This could tax the energy grid and threaten the stability and predictability of Idaho's energy supply, but the draft EIS doesn't consider this, or even mention it.	EIS Section 2.4 (Alternative B [Proposed Action]) describes the substations and transmission lines for the project. These are also discussed in Section 1.3.6 (Substations and Transmission Lines) in MVE (2023).
11566-1	Clare Josaitis	It does not appear that the DEIS analyzes any of the well-documented adverse health effects that are known to occur to the human population from wind turbines. Given the unprecedented height of the proposed turbines and the proximity of the wind turbines to nearby communities and field workers, farmers, ranchers, etc., this concern needs to be analyzed. There are global reports of adverse effects from wind turbines on people. Complaints include annoyance, reduced quality of life, sleeplessness, and headaches. (Minnesota Department of Health [website] Public health impacts of wind turbines. St Paul, MN: Minnesota Department of Health; 2009. www.health.state.mn.us/divs/eh/hazardous/topics/windturbines.pdf.) Noise-induced annoyance is acknowledged to be an adverse health effect. (Pedersen E, Persson Waye K. Wind turbine noise, annoyance and self-reported health and well-being in different living environments. Occup Environ Med. 2007;64(7):480-6). The Canadian Family Physician which is a peer-reviewed medical journal states that, "Canadian family physicians can expect to see increasing numbers of rural patients reporting adverse effects from exposure to industrial wind turbines (IWTs). People who live or work in close proximity to IWTs have experienced symptoms that include decreased quality of life, annoyance, stress, sleep disturbance, headache, anxiety, depression, and cognitive dysfunction.	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety). Also, see AIB-32 in EIS Appendix 3 (Issues Analyzed in Brief): How would vibrations from project wind turbines affect nearby structures? The calculated amplitude of vibrations from the turbines at the nearest residential structure is less than the threshold for human perception per guidelines based on international standards for allowable vibration levels. Noise information is provided in the project noise technical report (SWCA 2022) on the BLM project website. The report clarifies that turbines would be audible within 2.2 miles, and 500-kV transmission lines would be audible within 0.5 mile. Noise impacts are discussed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) and cover both construction periods and operation of the project. Section 3.6.1.2.2 (Alternative B [Proposed Action]) provides details on noise impacts to people and communities. Noise issues are also discussed in Section 3.9.2 (Physiological Effects to Livestock). Applicant-committed measures to address noise impacts can be found in Table App4-2i in EIS Appendix 4 (Mitigation). Impacts from shadow flicker and potential mitigation are described in Section 3.16.3 (Shadow Flicker).

Comment ID	Commenter	Public Comment	Response to Comment
		Some have also felt anger, grief, or a sense of injustice. Suggested causes of symptoms include a combination of wind turbine noise, infrasound, dirty electricity, ground current, and shadow flicker.1 Family physicians should be aware that patients reporting adverse effects from IWTs might experience symptoms that are intense and pervasive and might feel further victimized by a lack of caregiver understanding." (https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3653647/#b30-0590473). Researchers found "people that live near wind turbines have reported adverse health effects such as (but not limited to) ringing in ears, headaches, lack of concentration, vertigo, and sleep disruption that they attribute to the wind turbines." https://www.frontiersin.org/articles/10.3389/fpubh.2014.00063/full NEPA requires that federal agencies must analyze the direct and indirect effects on the human environment, including effects on health. (SS 1508.1(g)(1)-(4). A decision has not yet been made, and folks in the Magic Valley has been expressing their disdain, anxiety, opposition, and depression about this proposed project. I respectfully request that the BLM thoroughly consider and explore the potential effects of the proposed wind turbines on the residents of the communities surrounding the project area.	
11608-2	Alison Yasuoka	There are many research-based articles about the negative impacts of wind turbines. Here is one article from the NIH: Jeffery RD, Krogh C, Horner B. Adverse health effects of industrial wind turbines. Can Fam Physician. 2013 May;59(5):473-5. PMID: 23673580; PMCID: PMC3653647. LINK: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3653647/ (At the end of the article, additional references are cited in support of its claims.)	See response to comment 11566-1 (see in Table A-3m, Human Health and Safety).
11640-1	Amber Madsen	Please examine (From the Lava Ridge EIS) Pg 82 3.2 Air Quality “Blasting emissions were estimated assuming two blasts per day for 525 days assuming 120 pounds of ammonium nitrate-fuel oil per blast using AP-42 Explosive Detonation factors.” (1050 days x 120 lbs. = 126,000 lbs. of explosives). This is not acceptable! I have worked with many people who have lived with long term health issues, and ultimately died from these issues, that could have been prevented if such facts were not ignored. There would be no way to contain the particulate matter in the air that would cause irreversible damage to the health of many.	The EIS discusses air quality in Section 3.2 (Air Quality) of Chapter 3 (Affected Environment and Impacts). A detailed summary of emissions analysis is available in the project air quality technical report (SWCA 2022). Project-specific measures for air quality are shown in Table App4-4, a through i.
11747-2	Eric Hess	1. We have personal experience in both an urban as well as a rural setting, with the introduction of “smart” electrical meters, that the electromagnetic and radio frequencies were so painfully disruptive, that we were forced to move from one of the locations. (We moved from the other location for different reasons.) We understand that EMF’s and radio frequencies are generated by the infrastructure of the turbines. 2. We noticed that insects in the urban location and various groups of insects, birds, deer etc. in the rural setting, not to mention people, were affected when the “smart” meters were turned on. 3. We have encountered other people who have similar painful experiences with EMF’s and radio frequencies.	See AIB-12 in EIS Appendix 3 (Issues Analyzed in Brief): How would the project contribute to EMFs and corona exposures to workers and the public?
11855-5	Mark Doerr	The published DEIS only lightly touched on the issues surrounding aviation; lighting of the towers and communication. There needs to be far more study on the effects of the project on the following issues: [...] Impact to aircraft and people on the ground by the shedding of ice from spinning blades on the towers. How far can ice be expected to be thrown vertically and horizontally from a 220 foot blade moving near 600 miles per hour at the tip.	AIB-14 was added to EIS Appendix 3 (Issues Analyzed in Brief): Would ice throw or ice shed from turbine blades pose risk of injury to workers and the public?
11869-10	Raul Labrador, Josh Turner; Idaho Attorney General’s Office	Most importantly, Idaho has a critical sovereign interest in protecting “the health and well-being—both physical and economic—of its residents.” Alfred L. Snapp & Son, Inc. v. Puerto Rico, 458 U.S. 592, 607 (1982). The Project harms the physical and economic well-being of Idahoans in several ways. [...] Second, the Project will rapidly increase the number of roads and traffic in the Magic Valley Region. The Project will require the construction of more than 500 new roads. This influx in traffic will raise the risk of traffic-related injuries and fatalities and place more strain on existing roads and bridges.	See AIB-13 in EIS Appendix 3 (Issues Analyzed in Brief): Would project activities change the potential for risks of accidents or injuries to public health and safety? Although the project would construct up to 486 miles of new roads, most of the roads would be in the siting corridors where fewer people would be driving and roads would be designed to be driven at slower speeds. As per applicant-committed measure 33, project personnel during all project phases would be required to drive 25 mph or less on non-[posted] public project roads. Also, BLM-required mitigation measure N would require that MVE establish speed limits on BLM roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.
11871-118	WildLands Defense	Wind turbines also emit a low frequency noise that is out of most people's hearing range, including very low frequency noise (<20 Hz) that some refer to as “infrasound” or “infrasound and low frequency noise” (IFLN). It is still unclear whether IFLN has any influence on human health or wellbeing in situations where turbines are too distant for audible noise to be detected”.	Noise information is provided in the project noise technical report (SWCA 2022) on the BLM project website. The report clarifies that turbines would be audible within 2.2 miles, and 500-kV transmission lines would be audible within 0.5 mile. Noise impacts are discussed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) and cover both construction periods and operation of the project. Section 3.6.1.2.2 (Alternative B [Proposed Action]) provides details on noise impacts to people and communities. Noise issues are also discussed in Section 3.9.2 (Physiological Effects to Livestock). Applicant-committed measures to address noise impacts can be found in Table App4-2i in EIS Appendix 4.
11873-10	Mary Schwartz, Frank Schwartz	10. The DEIS, Appendix 3, item AIB-12 provides a very limited acknowledgement of potential environmental impacts from the electromagnetic fields (emf) associated with the power lines. As with humans, the electromagnetic radiation has a detrimental effect on wildlife, insects (like pollinators) and plants that are resident (with continuous exposure) near these power lines and that impact has not been acknowledged or analyzed in this DEIS. The density of these power lines in the project area creates a condition unlike that of a single power line in an area. If these effects have not been studied, why does the project assume it is acceptable? The DEIS is incomplete without addressing the potential significance of this impact.	See AIB-12 in EIS Appendix 3 (Issues Analyzed in Brief): How would the project contribute to EMFs and corona exposures to workers and the public?
11899-2	Diana Nielson>	The Magic Valley doesn’t have a burn or trauma center. Life Flight and other air emergency response will have limited access to the areas. To travel over the dirt roads will be very time consuming for ground ambulance	The Health and Safety Plan (Appendix F in MVE [2023]) establishes MVE’s commitment to preparing an Emergency Action Plan that will be a term and condition of the ROW grant if an authorization is granted. OSHA

Comment ID	Commenter	Public Comment	Response to Comment
		emergency response. If there is a catastrophic accident how many people will be able to respond with emergency medical techniques? Who will be in charge of making sure each employee has a form of accident or health insurance so Lava Ridge will not be economical burden to health services that are already in short supply ? Many states have HMO healthcare and will not pay unless the patient goes to a preferred provider. Will Magic Valley Energy/ LS Power have contracts with local hospitals? Subcontractors will not always be covered by workers comp.	establishes and enforces requirements related to employee medical coverage, which is outside the scope of the draft EIS and the BLM's delegate authority. See the following AIBs in EIS Appendix 3 (Issues Analyzed in Brief): AIB-10: Would project activities change the potential for risks of accidents or injuries to worker health and safety? AIB-11: How would the project impact emergency responders that serve the project vicinity? AIB-13: Would project activities change the potential for risks of accidents or injuries to public health and safety?
11915-3	Kim Peyman	I would be remiss if I did not mention the obliteration of the sky caused by the almost constant brown cloud of smog (air pollution), traffic noise and the light pollution at night! You can actually taste the pollution in the air over Denver. Here I am free of the city's oppressive pollution; the sky is actually blue and I am grateful! Regretfully, the deck on the front of my home faces directly toward this proposed wind farm site. If this project gets approved, my southeast view will turn into a strange, new cityscape complete with 700-foot-tall skyscraper windmills, and their light and noise pollution. I left Denver because of the pollution. I think about the extreme toxicity of the lithium-ion batteries used for these wind turbines. What are the potential consequences if someone uses them for target practice? We see objects all over in the desert that have been used for this purpose. These batteries contain toxic metals such as cobalt, nickel and manganese that can contaminate water supplies and ecosystems if not handled properly.	The EIS discusses air quality in Section 3.2 (Air Quality) of Chapter 3 (Affected Environment and Impacts). A detailed summary of emissions analysis is available in the project air quality technical report (SWCA 2022). Project-specific measures for air quality are shown in Table App4-4, a through i. See AIB-45 in EIS Appendix 3 (Issues Analyzed in Brief): How would hazardous materials and wastes generated by the project be managed? Would they exceed capacities of approved disposal facilities? See AIB-46 in EIS Appendix 3 (Issues Analyzed in Brief): How would solid wastes generated by the project (packaging materials and employee-generated wastes) be managed? Would they exceed capacities of approved disposal facilities?
11962-3	Cassie Christensen, Tyler Christensen	Stray Voltage If there is one topic here, I have personal experience with, it is this one. I watched my parents give up everything they had to fight a battle against a giant. Years of toiling just dwindled away as cows would drop dead or stop producing for what was an unknown reason at that time. Unfortunately, my 5 siblings and I also lost precious time with our parents as they were away fighting for everything they had worked for their entire lives. When the term stray voltage appears, people just look the other way because it's not a topic that has had a lot of light spread on it. Stray voltage is a prominent issue in the area and it mainly affects dairies and farming operations that draw in the stray electricity with their stations and other grounding objects. Every time a cow goes to eat, drink or get milk they are getting shocked. This is a huge stressor and it causes an array of issues. Cattle die for no reason, milk production decreases, cancer develops, birth rates and pregnancy rates decrease, practically everything you can think of to make a dairyman broke. However, 20 years after Vierstra vs Idaho Power, few things have been done to improve this and they are not the only ones affected. If it is happening to cattle in the area, what is it doing to the people? How will we be affected by transporting more energy through power lines? The substation has to be grounded, so there is no way to stop some power from leaking. The term "stray voltage" or "stray electricity" doesn't even show up when you search the DEIS. What research has been done in other areas where operations this large have been put in place? 7Or even operations half this size, since this will be the largest operation in the United States according to NS Energy?	See EIS Section 3.9.2 (Physiological Effects to Livestock).
11962-9	Cassie Christensen, Tyler Christensen	Our property is 1 mile from the proposed site and if I was unfamiliar with my area, I would consider driving with such a large load, in the condition of our roads extremely hazardous. There are times while approaching HWY 25 I feel unable to stop a truck and trailer going at a low speed because of the pot holes and damage to the road and how the road slopes down to the HWY.	The EIS discusses road impacts and traffic in Section 3.14 (Transportation). Applicant-committed measures 31–43 (see EIS Appendix 4 [Mitigation], Table App4-2e) would be implemented and would reduce potential impacts to traffic patterns in the analysis area during construction and operation by limiting use of roads outside work areas, through the use of traffic control measures, by repairing and restoring roads postconstruction, and by coordinating any changes to traffic patterns with local authorities and rightsholders within the siting corridors. See also the following AIBs in EIS Appendix 3 (Issues Analyzed in Brief): AIB-37: How would the project's operation traffic impact the condition and maintenance of major public roads? AIB-38: How would the weight/load characteristics of project truck traffic impact the existing major public roads? AIB-39: How would project road use on BLM lands affect maintenance of the roads, including winter maintenance?
12232-4	Juli Miller	First, as a healthcare consultant, I am aware of the serious detrimental effects on the health and wellbeing of people who are exposed to the energy wavelengths and emissions which will be emitted from the project.	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
12275-1	Jerry Holton	I was told that being around the windmills can affect the heart. I did research on this and found articles I will be attaching to this. I have spent 44 years in the area of the proposed project, and it really bothers me that I will not be able to share this area with my family due to the affects it has on me. It is a feeling I do not like and don't understand. This is just what happened to me and my own personal experience in 3 areas I have been. Quite disturbing what these windmills can do to someone physically. I have never had those chest problems and I have hiked, climbed, packed weight on a pack frame, I do construction for a living, climb up and down ladders and have never had my heart/chest feel like this. It was quite frightening. But here are the links to the articles I am sharing. They all state there are issues from windmills and to each person is different in what happens. Not every persons body is the same.	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
12307-13	Dean Dimond	no human safety analysis,	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
12307-32	Dean Dimond	Need detailed county law enforcement, search and rescue personnel review and analysis of viability	See AIB-11 in EIS Appendix 3 (Issues Analyzed in Brief): How would the project impact emergency responders that serve the project vicinity? The EIS also discusses public use and safety in Section 3.8 (Land Use and Realty), Section 3.6 (Environmental Justice and Socioeconomics), and Section 3.12 (Recreation). Additionally, emergency services are discussed in Section 3.7 (Fire and Fuels Management).

Comment ID	Commenter	Public Comment	Response to Comment
12443-2	Diana Nielson	I am having difficulty finding in the draft EIS who will be liable for the compensation ofrom loss of life from electrical faults or the stray electrical current resulting in Step Potential or Touch Potential electrocution. This Step Touch Potential of electrical accidents will be increased when the soils are very dry because the grounding rods don't work effectively or when the weather increases the soil moisture in excess with or without water pooling. The grounding of the wind turbines and the transmission towers is vital to all life forms. The groundings need to maintain less than 1 ohm of resistance with enough paths to the earth to dissipate faults. Who and how will these grounds be tested? How will the wind turbine generators be monitored for faults to prevent stray electricity from charging the ground? Wind Turbine generators have no fuse to break the energy current or its production. The loss of life for humans, reptiles, big game and livestock could be disastrous.	MVE would conduct an electrical grounding study to determine turbine step-and-touch potentials during fault conditions. Factors such as the grounding system design, soil resistivity, and ground fault current are used in the computation and then compared to permissible touch-and-step voltages for the design (permissible levels defined by IEEE Std. 80-2013). The maximum touch-and-step voltages would be designed to be less than the permissible touch-and-step voltages. The grounding study would also calculate a ground grid resistance for the turbines. After the ground grid is installed, the resistance would be measured by a qualified contractor via an industry standard method (e.g., fall of potential), which uses a ground resistance tester). Wind turbines are controlled by management systems that monitor a variety of performance characteristics in real time, including electrical fault conditions. Wind turbines are equipped to safely trip off-line if needed during a detected fault. MVE (2023) Section 2.10 (Electrical) states that "Counterpoise Installation: Part of standard construction practices prior to wire installation will involve measuring the resistance of tower footings. If the resistance to remote earth for each transmission tower is greater than 10 ohms, counterpoise (grounds) would be installed to lower the resistance to 10 ohms or less." See AIB-12 and EIS Section 3.9.2 (Physiological Effects to Livestock) regarding the potential for impacts from electromagnetic exposure to humans and animals, including livestock.
12474-1	Joan Hurlock	Wind turbine blades are composed of balsa wood, fiberglass, and epoxy, with Bisphenol-A (BPA) comprising approximately 40% of the epoxy. BPAs are frequently banned substances due to their link to almost 80 diseases, including testicular cancer, and reproductive disorders. BPAs are also known as endocrine disrupters and neurotoxins. Studies have shown that wind turbine blades experience "leading edge erosion", which is the shedding of the epoxy coating, due to wind, rain and hail. One turbine will shed about 136 pounds of BPAs annually. It has been estimated that a 400 turbine project will shed almost 25 TONS of these toxic chemicals per year. Here is a link to the article where information about microplastic shedding can be found: https://breakingviewsnz.blogspot.com/2023/02/ian-bradford-more-problems-with-wind.html <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fbreakingviewsnz.blogspot.com%2F2023%2F02%2Fian-bradford-more- problems-with-wind.html&data=05%7C01%7Cblm_id_lavaridge%40blm.gov%7C79b09c991b4a4fa8490b08db3f7fa951%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638173589762469241%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=7jFeZI07Tqr3KbqITdg4aFk%2BqxaNrPfAfETYG9htEXE%3D&reserved=0> Noticeably absent from the DEIS is any study related to the shedding of microplastics from wind turbine blades. How far are the epoxy resins distributed across the land? What effects will tons of BPAs strewn across the desert have on water quality, especially with the Snake River Plains Aquifer below the surface of the Lava Ridge project? Will these BPAs leach in to the groundwater? The mission of the BLM is "to sustain the health, diversity, and productivity of public lands…". How will the shed BPAs impact the health of wildlife, livestock, humans and agricultural crops in the surrounding area? Will the milk produced from the nearby organic dairies be contaminated with BPAs? How does blade shedding facilitate the BLM's mission of sustaining health? Will LS Power/Magic Valley Energy be held liable in the ensuing years if there is an increase in cancer rates, infertility, or other health problems? Until more studies are conducted to determine the possible detrimental impacts shed BPAs will have on public lands, it is far too great a risk to allow the Lava Ridge project to proceed.	See response to comment 11686-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
12532-2	Jon McGregor	I have been studying the blade erosion on the propeller blades.The blades are constructed from epoxy consisting of 33% Bisphenol resin which is on the " Norwegian priority list of dangerous substances". Very little study has been on the blade deterioration. These chemicals are considered to pose a serious threat to human health and the environment and are placed on the Norwegian priority list. These blades are constantly giving off microplastic emissions. There is no mention of this in the Dies. "Bard-Einar Rimereit ,Weatherford Internatioal, Jan-Erik Weinbach Vestland county, Asbjorn Solberg. These turbines are sending toxic emissions in the air whenever they are turning.	As described in EIS Section 3.2.2 (Operation Air Quality and Air Quality–Related Values), project emissions, when added to background pollutant concentrations, are unlikely to violate the NAAQS, and the project area would remain in attainment for all criteria pollutants. It is outside the BLM's scope and authority to analyze specific industry wide manufacturing practices.
12871-2	Michelle Pabarcuis	Wind Farms are not a clean energy source. You have not asked more members of different wind-turbine groups who have technical and health expertise to be part of the group that either writes or reviews the final document. It is incomplete in it assessment so it is by no means a way for you to make any final decisions off of.	As described in the Cooperating Agencies section in EIS Appendix 10, the BLM and seven cooperating agencies participated in drafting the EIS. In addition, the BLM sought input from the National Renewable Energy Laboratory. Cooperating agencies are federal, state, Tribal, or local agencies that have jurisdiction by law or have special expertise regarding issues addressed in the EIS (40 CFR 1501.8).
12965-1	Mark Southwick	The Dietrich Quick Response Unit, Inc. is a totally volunteer non-transport medical rescue unit. We partner with Lincoln County Emergency Medical Services as our medical transport agency. Our response area is large, incorporating the Dietrich and Hidden Valley communities. Most, if not all of the proposed Lava Ridge Windmill (LRWP) turbines in Lincoln County are within our established response borders. Where the elevation of all the 740' windmill towers is above the surrounding buttes and existing radio towers, the project stands to disrupt and impact our emergency communications and response. The majority of our calls in the proposed LRWP use air ambulance services. Access to residences and our patients in and around wind turbines present a danger and liability to the medical personnel, the pilots and aircraft being used, eliminating a timely intervention. The project will add significantly to the number and severity of our emergency medical, accident and rescue responsibilities. Funding for, obtaining properly trained personnel and rescue equipment to prepare for such a project is extremely limited and difficult to obtain. There has not been any consideration or support for the upgrade	See AIB-11 in EIS Appendix 3 (Issues Analyzed in Brief): How would the project impact emergency responders that serve the project vicinity? Potential impacts to local aerial fire responders are addressed in EIS Section 3.7 (Fire and Fuels Management). Effects to first responder communication pathways are addressed in EIS Section 3.8 (Land Use and Realty).

Comment ID	Commenter	Public Comment	Response to Comment
		necessary for the Emergency Medical and First Responder units in Lincoln County. The Environmental Impact Statement has left out these issues.	
13011-3	Ron Yates	The EIS does not include and assessment or a means of mitigation or a means to protect all people and their property from physical or surreptitious attacks upon Homo sapiens, (humans) by groups and or individuals that are opposed to the Lava Ridge project. When the BLM does approve the Lava Ridge Wind Project how will this threat to Homo sa,Piens be addressed?	Vandalism and terrorism are illegal; it would be speculative to assume if, and to what extent, the law would be broken by any member of the public. The BLM is not aware of such types of vandalism at other wind energy projects. As needed, MVE would scale up project security in response to vandalism.
1622-1	Dawn Leiske	I am concerned by the lack of consideration in the Lava Ridge Wind Turbine EIS Draft document regarding our personal safety, as well as the protection of our Idaho public lands and private properties. Idaho, as well as the rest of the country, is suffering from the lack of qualified applicants and resignations in law enforcement. How will this safety issue be alleviated in Jerome, Lincoln, and Minidoka Counties as well as the neighboring counties affected by the Lava Ridge Wind Turbine project during construction and after completion? There will be financial and operational issues arising within law enforcement management due to this project. As it is, the Idaho Fraternal Order of Police claims applications for law enforcement and public safety jobs began dropping off years before the COVID-19 pandemic. How will we be able to guarantee our safety during and after the Lava Ridge Wind Turbine project is completed? The general population is aware that the reality of hiring law enforcement during this period of time is bleak at best, regardless of the project-related increases in local tax revenues. Page 3-222 3.6.3.2.2 ALTERNATIVE B (PROPOSED ACTION) / Operation The long-term addition of 486 miles of new roads that are open to the public could increase demands on local law enforcement; however, many of the new roads built for the project would be gravel roads mostly used for project access and are expected to have low use. Project-related increases in local tax revenues would help mitigate any increased demands placed on local law enforcement. MVE's applicant[1]committed measure 38 (see Table App4-2e, EIS Appendix 4) would minimize the amount of new roads to the extent practicable, which in turn would minimize the potential for increased demand on local law enforcement. Page 3-220 3-221 3.6.3.2.2 ALTERNATIVE B (PROPOSED ACTION) Construction During construction, the estimated 0.8% to 1.7% increase in total population of the tri-county area could increase the demand for community services in the local area (e.g., public schools and law enforcement); however, the increased demand is not expected to overwhelm the service providers' existing operational capacities or require a need for additional resources. Some public schools in the tri-county area could see an increase in enrollment due to non-local workers bringing their families with them; however, not all construction workers would have children or relocate their children with them (trade workers are expected to work for a subset of the construction period when their trade is needed). For the purpose of analysis, if it is conservatively assumed that 50% of all construction workers brought one child under the age of 18 with them, then the number of children in the analysis area would increase by up to 425, which is 2.8% above the existing population (14,921 children as of 2020) (University of Idaho Extension 2022a). Given that the average student-to-teacher ratio for the analysis area is 14.2 (University of Idaho Extension 2022b), the increase in the under age 18 population would increase the student-to-teacher ratio slightly to approximately 14.6. The increase in the tri-county area's population during construction could also increase demands on local law enforcement. An increase of 400 to 850 people in the tri-county area Lava Ridge Wind Project Draft Environmental Impact Statement 3.6 Environmental Justice and Socioeconomics 3-221 during construction would slightly reduce the number of police officers per 1,000 people to approximately 1.9 (compared to 2.1 in 2019) (University of Idaho Extension 2022c). Resources: Police And Other Public Safety Organizations Have Also Seen A Decline In Applications. Https://www.ktvb.com/article/money/economy/idaho-police-applicants-decline/277-8a339a4b-de7d-449b-9ffe-a2b86d936bb7 Survey on Police Workforce Trends WorkforceSurveyJune2021 (policeforum.org) Police officers in Los Angeles, Calif. in July 2022. From March 2020 to August 2022, the number of law enforcement workers decreased by 4%, according to data from the U.S. Bureau of Labor Statistics https://www.themarshallproject.org/2023/01/21/police-hiring-government-jobs-decline Please consider stopping this project altogether or addressing this critical issue of public safety, and the protection of our public land and private properties.	Effects to law enforcement are address in EIS Section 3.6.2 (Community Services, Employment, and Housing Availability). In addition, see AIB-11 in EIS Appendix 3 (Issues Analyzed in Brief): How would the project impact emergency responders that serve the project vicinity?
2898-1	Adrian Arp	There are negative health effects from the turbines. Research from the Washington University School of Medicine reveals problems including nausea, vertigo, tinnitus, ear pressure and sleep disturbance in areas where turbines are installed.	See response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
3340-6	Sue Page	How will the EMFs, turbine vibrations, and noise, impact their livestock? Their health?	See EIS Section 3.9.2 (Physiological Effects to Livestock). Also see response to comment 1042-18 (see in Table A-3m, Human Health and Safety).
6075-3	Lorinda Grant, Douglas Grant	Studies show that under certain circumstances the wind turbines can be heard for approximately nine miles. These would cause noise pollution to all the houses that are within that area. The homeowners would be negatively impacted by loss of sleep and stress resulting from the infra-sound created by the turbines.	Noise information is provided in the project noise technical report (SWCA 2022) on the BLM project website. The report clarifies that turbines would be audible within 2.2 miles, and 500-kV transmission lines would be audible within 0.5 mile. Noise impacts are discussed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) and cover both construction periods and operation of the project. Section 3.6.1.2.2 (Alternative B [Proposed Action]) provides details on noise impacts to people and communities. Noise issues are also discussed in Section 3.9.2 (Physiological Effects to Livestock). Applicant-committed measures to address noise impacts can be found in Table App4-2i in EIS Appendix 4 (Mitigation).
7320-5	Lora Ohlensehlen	I am a Jerome County resident. I grew up on a farm within 5 miles of this proposed wind project. Several of my siblings continue to farm, and raise animals in this same area. There are an additional two generations of family members that live on these farms. That is 3 generations of my family, that currently live within 5 miles of this proposed project. My family has lived in this same area for 6 generations. I have concerns about how the wind	See response to comment 11566-1 (see in Table A-3m, Human Health and Safety).

Comment ID	Commenter	Public Comment	Response to Comment
		and vibrational energy created by these massive wind mills will affect the health and well being of the 3 generations of my family members.	
7336-1	Matt F.	Please accept my comment regarding the Lava Ridge Wind Project EIS as it relates to potential ice throw from the turbine blades that will be produced during the operations phase of the project. The concept of "ice throw" is a well known hazard created by wind turbines. It occurs when ice builds up on the blades, and then dislodges. This can cause large and heavy fragments of ice to be thrown into the air, landing hundreds of feet away. They can be deadly to life and severely destructive to property. Despite being a well known hazard for wind projects in areas with cold, snowy winters, the draft EIS volumes 1, 2a, 2b and 3 do not make any mention of ice throw, or ice shards. This represents a severe environmental threat to life and property with no mitigation plan. Before approving any alternative other than A, a comprehensive plan must be developed to address the deadly threat of ice throw. Further, said plan must include some type of bond or insurance which can be used to pay out affected parties, should they or their property be harmed by an ice shard.	AIB-14 was added to EIS Appendix 3 (Issues Analyzed in Brief): Would ice throw or ice shed from turbine blades pose risk of injury to workers and the public?
7359-3	Name Not Provided	Farmers are also concerned about their own safety and the safety of those that work for them when it comes to possible fires, blades throwing ice, and blades breaking off or turbines collapsing. https://slate.com/technology/2017/08/why-farmers-in-iowa-hope-wind-energy-will-blow-over.html Shadow flicker and noise are annoying at best. There has been little evidence about how turbines affect people's health, but there is a lot of anecdotal evidence about how turbines can make people feel sick. "Wind turbine syndrome" is a term to describe adverse effects related to wind turbine proximity. Health effects include rapid heart rate due to a panic response, tinnitus, vertigo, panic attacks, migraines, ear pressure, nausea, problems concentrating and memory, and sleep deprivation. https://www.windturbinesyndrome.com/img/WTSguide.pdf	See response to comment 11566-1 (see in Table A-3m, Human Health and Safety) regarding noise and shadow flicker. AIB-14 was added to EIS Appendix 3 (Issues Analyzed in Brief): Would ice throw or ice shed from turbine blades pose risk of injury to workers and the public? Fire safety is addressed in Section 3.7 (Fire and Fuels Management). Human health impacts are addressed in Sections 3.2 (Air Quality), 3.4 (Climate and Greenhouse Gases), 3.6.1 (Environmental Justice Communities), and 3.17 (Water and Wetland Resources).
7409-1	Sue Page	I come again to you with additional information that should cause everyone concern for the health and well being of humans and animals exposed to the vibrations caused by these machines. There doesn't seem to be any mention in the EIS of exposure to humans or animals and the damage to organs and tissues. These machines will be running around the clock. The continuous vibrations will resonate into the ground and can be heard through concrete. In the attached study, it says long term exposure can cause lesions in the vascular, osteoarticular and nervous systems.	See response to comment 11566-1 (see in Table A-3m, Human Health and Safety).
8206-2	Sheryl May	We are concerned about health effects due to the noise	See response to comment 11566-1 (see in Table A-3m, Human Health and Safety).
8421-4	Brian Olmstead	Another issue with water is the proximity of all the blasting to domestic wells, and to the Milner Gooding Canal. I was working for TFCC in 2007-2008 when we built the Midway Power Plant South of Kimberly Idaho. We blasted about 1/3 mile of Lava Rock about 20 feet deep for the tailrace of the plant. We almost immediately started getting reports of wells being contaminated with coliform bacteria. Before long all 7 of the residential wells within ¾ mile of the project were contaminated. It was pretty obvious to TFCC that the blasting had caused the contamination so we drilled new deeper wells, cased farther down, and eventually got pure water back to the homeowners. Blasting absolutely does open up new cracks in lava rock, and it most certainly can lead to contamination, and sickness to domestic well users!	Two new issues were added to the EIS to address well and canal integrity and water quality: Section 3.17.2 (Existing Groundwater Wells and Canals) and Section 3.17.3 (Groundwater Quality).
8632-3	Charles Van Vooren	If this is approved BLM will have to prove why. It's all on you and remember; a majority of Idaho residents do not want this! And also; who here in Idaho is getting paid, or receiving ANYTHING from anyone to approve this project? I want to know and I also want to see a study and research on electrical pollution from power lines and wind generators.	Pollutants are described in EIS Section 3.2 (Air Quality).

Issues Analyzed in Brief – EIS Appendix 3

Table A-3n. Issues Analyzed in Brief – EIS Appendix 3

Comment ID	Commenter	Public Comment	Response to Comment
11272-1	Clare Josaitis	Much of the 'Supporting Rationale' for exempting further analysis of the issues is very nebulous and generalized. Such as "The project would be designed to minimize electromagnetic interference where practical...". First of all, how is it going to be specifically designed to minimize EMFs? Why isn't this explained and layed out for the reader? "Where practical' is essentially meaningless and just a feel-good, catch-all-angles phrase.	See response to comment 10426-4 (see in Table A-3m, Human Health and Safety).
11491-37	Dean Dimond; Jennie Bateman	26. Seasonal access including snow/ ice load on wind turbines including breakdowns and access for snow and grass fire fuel load removal,	In response to public comments, additional discussion of ice throw from turbines has been added to Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-14. As described in MVE (2023), “Snow removal will be performed as required to ensure safe access for personnel. Snow removal will occur to accommodate daily traffic from public roads to the O&M facilities. Other project roads will be plowed if O&M staff needs to gain access to a particular Project component to perform O&M activities.” Impacts to fire and fuels management are described in EIS Section 3.7 (Fire and Fuels Management).

Comment ID	Commenter	Public Comment	Response to Comment
11505-1	Kristy Churchman	Southern Idaho Regional Communications Center (SIRCOMM) remains deeply concerned that the proposals by MVA may interfere with the integrity of SIRCOMM's operations in the region. While it is impossible at this early stage to completely identify all possible risks or problems the Project may cause for SIRCOMM, we once again identify and reiterate the following concerns: • Interference with the radio transmission and reception pathways near Dietrich Butte. • Interference with the transmission and reception pathways between the Dietrich, Hansen, and Gooding Tower Sites. • Interference with the transmission and reception pathways between Dietrich Butte and Skeleton Butte. • Interference with the transmission and reception pathways caused by the large equipment that will likely be utilized to construct the windmills proposed in the project. SIRCOMM recently completed a significant comprehensive project, at great expense, to improve the coverage of its telecommunication system based on the current conditions in the region. A project of the magnitude being proposed by MVE may place the future efficacy of this overhaul at risk. The statement below from the Commsearch report (Section 4-Recomendations, pg.8) cause us additional concern: 4. "Recommendations- In the event that a public safety entity believes its coverage has been compromised by the presence of the wind energy facility, it has many options to improve its signal coverage to the area through optimization of a nearby base station or even adding a repeater site. Utility towers, meteorological towers or even the turbine towers within the wind project area can serve as the platform for a base station or repeater site." The realization that "coverage has been compromised" would likely occur in the construction phase of the Project. Once compromise has been realized, efforts to repair the compromise may not be swift enough to avoid the disruption of emergency services to that region, which could impact human life and safety. The time and cost associated with "optimizing a nearby base station", "adding a repeater site" to a "utility tower, meteorological tower or turbine tower", can be lengthy, complex, and expensive. There also remains uncertainty as to the efficacy of these alternatives. And, if these things were required by the Project, SIRCOMM may not have the financial means to carry them out. It may therefore be appropriate to begin consideration and discussion about whether these potential costs should be part of overall Project expense. Included as an attachment with this letter, is a simple diagram showing the microwave pathways SIRCOMM is primarily concerned about. The Dietrich site serves as a "back-up" microwave system to our Jerome tower site. Should our microwave system in Jerome malfunction, the Dietrich site would then serve as our primary microwave simulcast system. Interference from any wind turbine structures at that point could prove disastrous.	See response to comment 10426-4 (see in Table A-3m, Human Health and Safety). Potential impacts to local aerial fire responders are addressed in EIS Section 3.7 (Fire and Fuels Management). Effects to first responder communication pathways are addressed in EIS Section 3.8 (Land Use and Realty).
11620-4	Simone Griffin; BlueRibbon Coalition	We would like the BLM to acknowledge that when public land is analyzed, studied or even used for solar or wind projects then there has been human impact. This impact from analyzing parcels of land for proposed renewable energy projects disqualifies the land from being designated or managed as Wilderness. Any future planning process needs to reflect the consideration of evaluated land for renewable energy and exclude these areas from restrictive management designations. This area is not the best suitable location for wind turbines according to recent studies. BLM MUST use best available science and in this case the no action alternative is the only alternative that uses such data.	In EIS Appendix 3 (Issues Analyzed in Brief), AIB-53 provides information on the impact of the action alternatives to wilderness ("How would project construction and operation affect wilderness areas?"). The EIS finds that wilderness areas are not present in the project area; the nearest is 28 miles northeast of the siting corridor (Craters of the Moon). AIB-53 provides more detail on related analysis contained within EIS Section 3.16 (Visual Resources), the air quality technical report (SWCA 2022a), and the noise technical report (SWCA 2022b) and found that "given the distance of Craters of the Moon Wilderness Area, the project would not be visually perceptible from within the wilderness area." In compliance with FLPMA, the BLM is required to manage public lands for multiple uses and authorizes the BLM to issue ROW grants on public land for projects in the public interest. The BLM is required to make three decisions based on a review of all components of the project (see Section 1.3 [Decision to be Made]).
11822-3	Bob & Linda Sojka	Unfortunately Americans have already seen attacks on power infrastructure elsewhere in the U.S. So, to ignore this aspect in today's world would be irresponsible. What will be the impacts of the necessary security measures of this project on range use and/or public access to Lava Ridge in the future? Has that cost to the project and to the state and local communities been included in your assessments?	All proposed security fences have been disclosed (EIS Appendix 11 [Project Elements Common to All Action Alternatives]) and the effects on livestock analyzed in the EIS (Section 3.9.1 [Grazing Allotments and Range Socioeconomics]).
11871-32	WildLands Defense	Weather Impacts – A Hard look Must Be Taken Regarding Air Velocity, Temperature, Moisture and Precipitation – i.e. weather – wind turbines also impact that: "The fluid-dynamic effects of wind turbines on the flow field in the turbulent atmospheric boundary layer are, in principle, well known. Wind turbines extract kinetic energy from the atmospheric flow. The influence of individual rotors and wind farms on the flow field pertains both to the mean flow and the turbulent fluctuations. Wind farms increase the effective surface roughness of the ground and redistribute the mean flow. In particular, they create upward flow (so-called convergence zones) upstream and downward flow (so-called divergence zones) downstream of the wind farms [49]. Moreover, the rotor blades create additional turbulent fluctuations that propagate downstream and intensify the turbulent kinetic energy per unit volume'. They also reference that "impacts are likely to affect agricultural practices" but did not attempt to quantify them. Zhou [52] analyzed satellite data of wind farms from a moderate-resolution image spectrometer (MODIS) in west-central Texas between 2003 and 2011. A warming of up to 0.72 K per decade, particularly at night, was demonstrated".	AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief) examines how vegetation would be affected by changes to ground-level temperature from turbine operation. Based on previous studies and ground disturbance caused by the project and already analyzed, it was found that any ground-level temperature-related impacts would not be further impacted in a significant way.
11873-12	Mary Schwartz, Frank Schwartz	12. The DEIS, Appendix 3, AIB-43 discusses the air mixing phenomenon which occurs in the vicinity of the operating turbines, the associated ground temperature changes in those locations, and the potential response of vegetation. More mixing will occur with larger diameter turbine circles. The discussion concludes that effects are likely to be variable and site specific for the Lava Ridge project. How can a project such as this wind project be approved if the environmental impacts are not known and not addressed specific to this site? The DEIS is incomplete without addressing the potential significance of this impact.	Issues may be eliminated from detailed analysis when the impact context is so low that a detailed analysis is not needed to determine significance. Some issues eliminated from detailed analysis may involve resources that may be affected by the project, but effects would be relatively minor in comparison with the issues analyzed in detail. In compliance with 40 CFR 1502.2(b), this EIS has "only brief discussion of other than significant issues." AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief) examines how vegetation would be affected by changes to ground-level temperature from turbine operation. Based on previous studies and ground disturbance caused by the project and already analyzed, it was found that any ground-level temperature-related impacts would not be further impacted in a significant way.

Comment ID	Commenter	Public Comment	Response to Comment
11873-13	Mary Schwartz, Frank Schwartz	13. The operation of wind turbines is accomplished by removing energy from the wind through contact with the turbine blades. The towers and other above-ground infrastructure also slow the wind speed as well as locally modifying flow direction. The resulting effect is slower wind speed downstream of each turbine and structure and localized changes in wind direction and temperature. With a wind farm such as this, with a large array of turbines, the overall wind speed downstream of this array will be reduced and will likely influence the adjacent wind direction and pattern downstream as well. The larger diameter turbines with taller towers have a greater influence on the wind changes than smaller turbines. With the continued addition of wind farms, both locally and nationally, this effect will result in changed wind patterns and temperature and an impact on the ecosystem of the area. These localized and broader differences must be understood and analyzed for its affect on the overall ecosystem and environment. This DEIS does not address this matter and is incomplete without addressing the potential significant environmental impacts of this phenomenon.	Issues may be eliminated from detailed analysis when the impact context is so low that a detailed analysis is not needed to determine significance. Some issues eliminated from detailed analysis may involve resources that may be affected by the project, but effects would be relatively minor in comparison with the issues analyzed in detail. In compliance with 40 CFR 1502.2(b), this EIS has “only brief discussion of other than significant issues.” AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief) examines how vegetation would be affected by changes to ground-level temperature from turbine operation. Based on previous studies and ground disturbance caused by the project and already analyzed, it was found that any ground-level temperature-related impacts would not be further impacted in a significant way.
12221-1	Ken Kostka	Idaho is ag country. We have no idea how these monster turbines will affect the communication with GPS signals needed by todays ag operations.	See response to comment 10426-4 (see in Table A-3m, Human Health and Safety).
12685-3	Philip Gossi; Gooding-Lincoln County Farm Bureau	There is a need to better understand wind power and its effect on agricultural products. There is not enough evidence presented currently indicating that changing air stream flows will not impact weather and its relationship with established moisture patterns needed for plant growth that wildlife habitat depends on and agriculture relies on for a variety of crop and animal production.	See response to comment 11873-12 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3).
12934-5	Rob Thornberry; Theodore Roosevelt Conservation Partnership	Address shooting-related vandalism. Since this is the first public land wind project proposed in Idaho, the BLM and the applicant would be well served in spelling out the conditions necessary for the project area to be closed in the face of vandalism. It is conceivable, albeit unlikely, that vandalism could damage infrastructure in a way that would necessitate the applicant to push to close the area to shooting sports to stop vandalism. That is a potential outcome that should be studied by BLM, and the applicant and solutions should be spelled out. Fencing the area to preclude recreation can’t be a potential solution. This issue needs the appropriate clarity. There is too great of a chance to lose access to 312 square miles of public ground to the careless actions of one public land user.	Vandalism is illegal; it would be speculative to assume if, and to what extent, the law would be broken by any member of the public. The BLM is not aware of such types of vandalism at other wind energy projects that have shut down shooting sports in the area. As needed, MVE would scale up project security in response to vandalism.
1455-1	Dean Dimond	In reviewing the DEIS I can't find anything that address how the Proposed Windmills will interfere with the GPS signal for my farm equipment. The RTK GPS system we use requires a fixed base station. While these station can be miles away it requires a line of sight. These windmills could easily obstruct that line of sight. And since this turbines will also be producing power that power generation will most likely infer with the communication signal. In addition the grid work of power lines will also most likely infer as well. I currently have a large power line going through my farm. This power line interferes with my radio signal, It shortens the life of my electrical components on my pivots, and it causes a lot of problems with the static electricity. Please require LS power to address these concern before approval of such a damaging project.	See response to comment 10426-4 (see in Table A-3m, Human Health and Safety).
3043-1	Cameron Stauffer	What the EIS is lacking is an understanding of this environment. Evaluating individual effects turbines and construction will have on certain species is a recipe for disaster. There needs to be a comprehensive approach to evaluating a large-scale change, like what is proposed for Lava Ridge. For example, if weather patterns are changed slightly that could have cascading effects on the local environment. More fires, less birds and more pests could take over quickly. I am writing to request, and urge BLM before it is too late, that more research NEEDS to be done on current and established wind energy in brittle environments, before we take on bigger projects in these very sensitive environments.	See response to comment 11873-12 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3).
3997-8	Angelee Eames	6.These turbines will be visible for miles and will disrupt airflow patterns in our skies. The EIS does not state how the power of these turbines can and will change weather patterns. The SCience is clearly not available to answer this critical question. Why not wait until there is science that evaluates weather pattern changes. No research has been done on a project of this size. How do you "mitigate" Lava Ridge being the "first failure" due to lack of science. Wind energy has been tried and failed in many countries. Areas in the U.S. have huge piles of turbine cemeteries because you cannot recycle the fiberglass components or tower structures. Look in the Texas department of lands study.	See response to comment 11873-12 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3).
3997-9	Angelee Eames	7. If the majority of the power is transmitted across the lines 487 miles south-what is the ground and air impact from 1,000 megawatts inside these transmission lines-how will they be protected from fire, vandals, and terror threats? MVE says they are "pursuing technology" that will turn the red airplane lights on and off-so they DO NOT have the science currently? Once again Lava Ridge will be a "first failure" without science.	The SWIP-North transmission line and Section 368 Energy Corridors was previously authorized via different processes and are not part of the BLM’s decision for the project. As described in EIS Appendix 11 (Project Elements Common to All Action Alternatives), if approved by the FAA, MVE would deploy ADLS to mitigate the need for continuous operation of the flashing red lights during nighttime hours. ADLS is existing and proven technology used in other areas. See Section 3.7 (Fire and Fuels Management) and Section 3.8.1.1 (Land Use Authorizations, Affected Environment). Vandalism and terrorism are illegal; it would be speculative to assume if, and to what extent, the law would be broken by any member of the public. The BLM is not aware of such types of vandalism at other wind energy projects. As needed, MVE would scale up project security in response to vandalism.

Comment ID	Commenter	Public Comment	Response to Comment
4018-2	Dave Jakovac	The proposed wind turbine farm will have adverse effects on wildlife in the area, may even eliminate some endangered game birds, migratory animals and multiple preditors from the ecosystem. These proposed wind turbines will adversely affect our skyline and create issues with increased ground and air temperatures due to the increase in hard and reflective surfaces. These concerns need to be addressed and found inert to degradation of land, air, and wildlife before consideration for permit by law.	See response to comment 11873-12 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3). EIS Chapter 3 (Issues Analyzed in Brief) provides detailed information about the analysis of the action alternatives on the affected environment, including visual resources, avian species, and wildlife.
6868-8	Barbara Martien	Idaho values its land and the natural environment. We hold a precious resource. The reality is wind power stations are no parks. They are industrial and commercial installations and do NOT belong in wilderness areas.	See response to comment 11620-4 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3).

Land Use and Realty, including Aviation

Table A-3o. Land Use and Realty, including Aviation

Comment ID	Commenter	Public Comment	Response to Comment
1054-1	Jeff Juker	Is there a proposed rental agreement for the project?	If approved by the BLM, the project would be authorized to use BLM public lands for the life of the project under a ROW grant, with terms and conditions. See EIS Section 1.3 (Decision to be Made) for a detailed description of the BLM's decision to be made. Also see response to comment 11216-1 (see in Table A-3o, Land Use and Realty, including Aviation).
11212-3	Ruth Muir, Ira Muir, Sherri Roche	New transmission lines will need to be installed which will cut through prime farm ground.	The EIS analyses potential impacts to prime farmlands in AIB-34.
11213-1	Tim Neilson	Yes, its Federal land but its IN THE STATE OF IDAHO and there is a States Rights issue involved.	As discussed in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), the BLM conducted consultation and coordination with cooperating federal, state, and local agencies. Coordinated by the Idaho Governor's Office of Energy and Mineral Resources, various Idaho state agencies have provided input on the project (see Table App10-2 of EIS Appendix 10). Comments from the State of Idaho have been incorporated into the EIS analysis and coordination with the State of Idaho is ongoing.
11216-1	Eric Campbell	After brief searches, I have been unable to find anything about lease agreements. Unless the land is being sold to, or leased at a fair market value, the BLM, as well as the State of Idaho land involved, should not be just "given" to a private business regardless of the reasoning. Tax payers should not be forced to subsidize the profits of a cooperation. If a company won't pay a market price for leasing or buying property, don't allow the company to get rich using tax payers public lands.	Portions of the project that occur on public BLM lands would be authorized through the issuance of a ROW grant, which requires payments be made to the BLM in the form of rental fees. As stated on the BLM's ROW program website (https://www.blm.gov/programs/lands-and-realty/ROWs), rental fees are calculated on a per-acre basis, according to schedules that reflect local real estate values, and in the case of renewable energy projects, the value of the electric power generated. Fee schedules vary according to the type of ROW, and for larger sites, rental fees are determined after an appraisal. In addition to rental fees associated with the ROW grant, the project would be required to pay property taxes to the state and local counties in which the facilities are located. EIS Section 3.6.3 (Local and Regional Economy) analyzes the project effects on the local and regional economy and provides an estimate of property tax payments during construction and operation.
11491-9	Dean Dimond, Jennie Bateman	Further, there is not a transparent plan for a power transmission ROW that must be part of this project EIS.	The EIS analysis of the Proposed Action does account for ancillary facilities and their associated ROW needs, including 34.5-kV collector lines, collector substations, 230-kV and 500-kV transmission lines, and a single 230/500-kV substation. As stated in MVE (2023), the project's proposed 500-kV transmission line would interconnect with the existing Midpoint Substation or an alternative new substation located along the SWIP alignment. Once the project's proposed facilities reach their point of interconnection (POI), any ROW needs that extend past the POI would be managed by Idaho Power Company (IPC) per the terms of the project's interconnection agreement with IPC. The existing Midpoint Substation and proposed SWIP-North transmission line that the project proposes to interconnect to are both analyzed in the EIS within the context of cumulative effects (see EIS Section 3.1 [Introduction and Methodology]).
11535-100	Steven Andersen	Electromagnetic interference, which is the potential blockade, scattering, and modulation of signals emanating from the communication (television or radio), radar (surveillance), and navigation systems by the rotating turbine's blades, has been an ongoing problem with massive wind farms.311 There is a demonstrable link between large wind farms and and interference or degradation of communication signals for existing and necessary means of communications on land, air or water.312 Interference with emergency communication by emergency medical personnel, fire fighters, EMS and other first responders who rely on accurate communication signals in order to perform their emergency services is a serious issue for the surrounding communities. None of this was studied and it should have been. The safety of the local communities is at risk if these systems are jeopardized. Owing to their huge dimension and continuous motion, wind turbines can interfere with radio-electric signals, such as those emitted by television broadcasting. Distorted television signals are usually the result of two independent mechanisms: the shadowing effect and time dependent multi-path due to signal scattering by wind turbines. The scattered broadcasting signals are mostly attenuated, time-delayed, and phase shifted copies of the actual signal, which differs based on the blade rotation and orientation of the rotors. The reflected signals on the metallic parts of the wind turbine caused static ghosts in transmission of analogue television service. More often than not, the rotating blades resulted in variations in brightness. A number of software simulation tools can be used to analyze models and predictions of the impacts of wind turbines on digital television signals. 314 In	Potential effects of the project on communication services are analyzed in Section 3.8.1 (Land Use Authorizations) of the EIS. EIS Section 3.8.1 identifies communication services (i.e., registered frequencies) associated with emergency first responders; industrial or commercial operators; and other state, county, and local municipal agencies. Additional communication uses in the area (e.g., telephone and broadband) were identified during scoping and incorporated into the EIS analysis. The impacts of wind turbines on communication services identified are analyzed in the EIS, and design features and other mitigation measures to reduce signal interference are discussed. These include MVE completing a line-of-sight interference study, incorporating setbacks, and coordinating with local communication providers and operators to resolve issues identified. Also see response to comment 11978-67 (see in. Table A-3cc, Mitigation – EIS Appendix 4). Potential effects of EMFs are further analyzed in EIS Appendix 3 (Issues Analyzed in Brief) (see AIB-12), which explains that the project would comply with applicable FCC regulations. The National Telecommunications and Information Administration (NTIA) is predominantly a policy and political advisory agency who works at the national level. Consultation with NTIA is not warranted for the project at this time.

Comment ID	Commenter	Public Comment	Response to Comment
		this area, networks operate on a line-of-site basis; and therefore, large physical obstructions can impede the transmission line-of-sight signals – and yet, this is not addressed at all in the DEIS. Further, the National Telecommunications and Information Administration was never consulted to assess potential impacts on technical communications for both the government and private citizens.	
11535-101	Steven Andersen	Modern agriculture is a precision data-driven industry. Farmers rely on GPS with terrestrial-based correction signals to operate much of their large machinery to sub-inch accuracy. Additionally, irrigation systems utilize telemetry and supervisory control and data acquisition (SCADA) systems providing intelligent use of scarce water resources and alarming of time sensitive critical system failures which could be the difference between a successful season and crop failure in the hot Idaho sun. Data, and access to data, in their homes, vehicles, and cell phones is critical for running their farm operations. There is a complete disregard of this issue, or fundamental misunderstanding of it, in the DEIS. As noted above in the aviation section of comments, an inadequate evaluation of GPS interference, terrestrial based correction signals, and heavy use of the unlicensed industrial scientific and medical (ISM) band, was conducted and that failed to account for 500 wind turbines and their impact on these mission critical radio communication systems.	Section 3.8 (Land Use and Realty) of the EIS has been revised to discuss farming-related communication uses in the analysis area (see Section 3.8.1.1.4 [Communication Sites]) and to analyze how they might be affected by the project (see Section 3.8.1.2 [Impacts]).
11535-102	Steven Andersen	Further, the DEIS only evaluates licensed frequencies. For example, there are GPS correction signals for heavy machinery utilizing real-time kinematic positioning (RTK) from multiple equipment vendors (John Deere and Tremble), which operate in the ISM Band off of Kimama Butte, which are not addressed in the draft EIS. 315 Additionally, most broadband Internet access is provided to end users by technologies utilizing frequencies in these same ISM Bands, funded in part thru Federal programs such as the Rural Digital Opportunity Fund, the Connect America Fund, and the USDA ReConnect program. The DEIS relies solely on an evaluation of Licensed frequencies, which is inadequate and based off false assumptions. In rural areas, licensed microwave paths are frequently used for backhaul of data to other locations with better access to primary data centers.317 These technologies broadcast in very specific directions on very narrow beams, and any occlusion into the path will render the link unusable. Authorization for amendments to these licensed links requires extensive coordination with the FCC, and in many heavily congested microwave areas new licenses are very difficult, if not impossible, to obtain.318 In the DEIS (on 3.264), it is stated: “MVE’s coordination with communication providers and operators is ongoing to identify specific sites and pathways of concern in the analysis area.” It is not clear what efforts exactly have been undertaken and what specific sites or pathways of concern were identified, and therefore this vague statement provides little value for the reader. Mr. McCarthy was not contacted by anyone from MVE, and he is a key communications provider in the analysis area.319 Local Internet Service Providers, Cellular telephone providers, State of Idaho internal Emergency Management, and other land mobile radio providers all heavily utilize microwave for backhaul on Kimama Butte.	EIS Section 3.8.1.1.4 (Communication Sites) analysis has been revised to include additional details regarding the types and names of licensees that occur in the analysis area based on the database query of registered frequencies completed for the EIS. This list includes key communications providers (e.g., Verizon, Sprint, and AT&T) and other regional emergency management providers. The EIS has also been revised to discuss farming-related communication uses in the analysis area, which are not reflected in the list registered licensees but could potentially be affected by the project.
11535-103	Steven Andersen	The DEIS notes that the siting for the turbines has not yet been determined, and therefore, it is impossible to thoroughly analyze potential interference; however, based on the form MVE submitted to the FAA, there are at least 9 wind turbines that would impact the first frezenal zone of links, impacting anthem broadband.320 Loss of these critical back haul links would render much of these communications systems inoperable.321 The DEIS failed to accurately analyze potential impacts. Due to the nature of the links being unlicensed, Comsearch and MVE would have no way of knowing what is in use. On page 3-267 of the draft EIS, it states: Comsearch (2020) assessed the impact of wind turbines on communication sites. Results of this assessment indicate that the impact of wind turbines on communication services is consistently low, despite variations amongst different services in terms of frequency ranges and the type of services provided (including voice, video, and data applications). Each network is designed to operate reliably in a non-line-of sight environment, and many land mobile systems are designed with multiple base transmitter stations that cover a large geographic area with overlap between adjacent transmitter sites to provide handoff between calls. Therefore, any signal block that may be caused by wind turbines would not materially degrade the reception because the end user would likely receive signals from multiple transmitter locations. In addition, the frequency of the operation for these services would allow the signal to propagate through the wind turbines. The DEIS cuts and pastes this language from the same Comsearch report that is provided in many other wind power cases (including cases in MN, NY, KS, etc.). Note that in one report with identical language, Comsearch concludes its report by stating: “For this location, turbine locations were not provided; thus we could not determine if any potential obstructions exist between the planned wind turbines and the incumbent microwave paths.”322 That is exactly the scenario in this case. Comsearch didn’t conduct a tailored analysis to this project. They didn’t look at all used bands. Rather, they did the quickest and cheapest analysis and solely referred to those reflected in FCC licenses – but this is inadequate and fails to capture unlicensed frequencies, which are used in this particular region.	As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction), the project’s final design and engineering would be completed after the BLM has issued a ROD and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. This approach provides flexibility for the project design to be adjusted in response to resource constraints through site-specific engineering for the final layout. As described in Section 3.8.1.2.2 (Alternative B [Proposed Action]), resource constraints related to communication uses would be identified prior to final design and siting of project infrastructure, through completion of a line-of-sight interference study. This study would further identify communication pathways potentially blocked by the project’s proposed infrastructure to determine where potential impacts to existing communication towers can either be avoided through micrositing of infrastructure or mitigated. In addition, per MVE’s applicant-committed measures 27 and 28 (see EIS Appendix 4 [Mitigation]), the project would be designed to minimize electromagnetic interference [e.g., impacts to radar, microwave, television, and radio transmissions] where practical and would comply with applicable FCC regulations. In the event the project results in electromagnetic interference, MVE would work with the owner of the impacted communications system(s) to resolve the problem.
11535-105	Steven Andersen	In summary, there was an inadequate electromagnetic analysis to demonstrate that interference will not impact national security, emergency responders, farmers, AM, cellular, and TV. There was no analysis of critical zones compared to siting under the alternatives and potential compromises or obstructions to be avoided. In fact, the exact location of the towers is unknown, making an analysis and meaningful participation in the analysis of this issue inherently problematic, as key information is missing. What we do know is the foot print of the project and size of the 600+ proposed towers will be massive – taller than any ever constructed. Based on what we know, there is a high likelihood of interference with LMR for public safety and commercial use; blocking of microwave paths used for back haul; interference with GPS correction signals (RTK); interference with SCADA and Telemetry used on irrigation control systems; and interference with internet connectivity through cellular or other fixed wireless systems. All of this was inadequately addressed in the DEIS.	As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction), the project’s final design and engineering would be completed after the BLM has issued a ROD and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. This approach provides flexibility for the project design to be adjusted in response to resource constraints through site-specific engineering for the final layout. As described in Section 3.8.1.2.2 (Alternative B [Proposed Action]), resource constraints related to communication uses would be identified prior to final design and siting of project infrastructure, through completion a line-of-sight interference study. This study would further identify communication pathways potentially blocked by the project’s proposed infrastructure to determine where potential impacts to existing communication towers can either be avoided through micrositing of infrastructure or mitigated. In addition, per MVE's applicant-committed measures 27 and 28 (see EIS Appendix 4 [Mitigation]), the

Comment ID	Commenter	Public Comment	Response to Comment
			project would be designed to minimize electromagnetic interference [e.g., impacts to radar, microwave, television, and radio transmissions] where practical and would comply with applicable FCC regulations. In the event the project results in electromagnetic interference, MVE would work with the owner of the impacted communications system(s) to resolve the problem.
11962-5	Cassie Christensen, Tyler Christensen	How long is Magic Valley Energy going to be allowed to use our public lands? Is there a lease agreement that will be made? Is it possible to look at other sources of energy that leaves a smaller footprint to our precious lands? What happens when Idaho needs more power but all of our lands have been used up to ship it out of state?	As described in EIS Section 2.3.3 (Project Phases and Duration), the project duration would be up to 34 years total, which includes 2 years of construction, up to 30 years of operation and maintenance, and 2 years of decommissioning. If approved by the BLM, the project would be authorized to use BLM public lands for the life of the project under a ROW grant, with terms and conditions. As discussed in EIS Section 2.1 (Alternatives Development Process), the BLM analyzed a range of alternatives to address issues identified during internal and external scoping. This included, but was not limited to alternatives with a smaller footprint compared to the Proposed Action. A total of four alternatives were carried forward for detailed analysis in the EIS, including three alternatives that have smaller siting corridors and disturbance acreages compared to the Proposed Action. As described in EIS Section 1.3 (Decision to be Made), The BLM's decision space for this EIS is limited to the ROW grant, the location of the proposed facilities, and terms and conditions attached to the ROW grant. Decisions related to the state of Idaho's long term energy security are outside the scope of this EIS.
11981-1	Ron Stradiotto	I was brought up with the idea that BLM land was public land for the public's use. My family fought in WW II and access to public land was a patriotic right. It was also our duty to look after and care for these lands. I now feel largely the same. However, I feel the balance has turned towards private corporations and profits instead of the public(ie people). Please consider your fiduciary role in managing these lands of the "American People" in your considerations to grant access to these same lands and consider "multi purpose" in your decision.	The BLM has considered and developed the EIS to be consistent with all applicable federal, state, and local statutes, regulations, and permit requirements that are described in EIS Chapter 1 (Introduction) and Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies). In addition, the EIS was developed in accordance with applicable BLM plans and policies described in EIS Section 3.1.2.2 (Tiering to the 2005 Programmatic Wind Environmental Impact Statement) and EIS Appendix 2. As stated in EIS Section 1.2 (Purpose and Need), the BLM's need for the EIS arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V). Therefore, preparation of this EIS is consistent with FLPMA's multiple use mandate, and the BLM's purpose and need statement reflects this.
12307-36	Dean Dimond	Need new information on project scale effects on other aspects of human use of public lands in addition to grazing,	EIS Section 3.8.1 (Land Use Authorizations) analyzes potential effects of the project on authorized land uses and ROWs, communication sites, or FAA/aviation uses. As described in Section 3.8.1.1.2 (Authorized Land Uses), grazing land uses cover approximately 91.7% of the analysis area; therefore, the level of analysis devoted to grazing land uses in the EIS is commensurate with the scale and importance of grazing in the analysis area. Potential effects on other types of land uses, such as agriculture, rural residential, and recreational uses, are analyzed not only in the land use chapter (see Section 3.8.1.2 [Impacts]) but also within the context of other resource analyses, including but not limited to recreation, visual, and environmental justice and socioeconomics. Section 3.8.1 of the EIS has also been revised to discuss farming-related communication uses in the analysis area (see Section 3.8.1.1.4 [Communication Sites]) and how they might be affected by the project (see Section 3.8.1.2).
6913-4	Public Comments Canyon Crest Events Center	My big concern is on our RTKs on our tractor's GPSs. Our towers are only a little over 200 feet tall and -- around Jerome Butte, Kimama Butte and Eden Butte and all that. And all the dealerships work together to get us this RTK, which is just an inch minus variance on our guess rows. But what it does is all the farmers that plant with it, cultivate with it, everything else. I've had White Cloud tell us that the blades will interrupt the signals and everything, because they tried getting signals down into Bennett Hills, Glenns Ferry area off of Rattlesnake Hill out of Mountain Home and they had to divert their signals clear around them towers out there at Bennett Hills because they couldn't get the signals to them. They would interfere. It would drop out and then it has to loop back in. And I don't know what will happen where they enclose all of Hidden Valley with all these towers, and I can't seem to find out where the environmental studies every studies that. That's how we run it. That's how we farm. And I don't know what it impacts on the environmentalists, I don't know where it goes in, what section or anything like that, because that's what they comment -- we had to comment, we had to find what section -- I just don't know where it is on the environmental impact statement. I couldn't find it, and my sister-in-law couldn't find it, so -- and I talked to Casey and he says he didn't know where it is, either. It has not been brought up.	Section 3.8.1 (Land Use and Realty) of the EIS has been revised to discuss farming-related communication uses in the analysis area (see Section 3.8.1.1.4 [Communication Sites]) and to analyze how they might be affected by the project (see Section 3.8.1.2 [Impacts]).
7377-1	Louis Zamora; Twin Falls Canal Company	Communication Issues In section 3.8.1.1.4 of the EIS it talks about communication sites and lists some of them. Microwave signals need a clear line of site without interference that could scatter the signal. One major site that is not listed is Jerome Butte. Just go to Jerome Butte (east of Jerome and east of Highway 93) and look at all the towers and which way the microwave heads are pointing. They are pointed to Gooding, Dietrich, Kimama, Skeleton, Hansen, Hazelton, Burley and many other Buttes and sites that are not listed in the EIS. All of these sites point to each other to provide a network that connects the valley together. Skeleton Butte actually has a microwave link going straight to the Dietrich school, which is in the path of the proposed project. If you start drawing lines between all the sites listed and unlisted, I don't know how you could place windmills in a pattern that would not cause interference. The EIS only listed two companies, SIRCOMM and Project Mutual Telephone. What about Verizon, AT&T, CenturyLink, Idaho Power, television stations, radio stations and canal companies that use these sites. Then you have broadband companies that supply internet, like Anthem, White Cloud, Sparklight, and Tekfinity. The list of companies that use these sites is long and I only listed a few. Then there are GPS stations on these site that the farmers use for their equipment. How would that be impacted. An unknowing person would be astonished how many signals and paths are crisscrossing this valley to provide us the communications that we enjoy. The Section listed above is a very inadequate and does not represent the impacts to the communication network in this valley. There definitely needs more research and a full plan done,	Section 3.8.1.1.4 (Communication Sites) of the EIS characterizes the affected environment for communication-related uses by identifying registered frequencies that intersect the analysis area rather than identifying specific communication facilities (e.g., tower locations) that occur within the analysis area. Therefore, the towers located on Jerome Butte and Skeleton Butte may be accounted for in the EIS analysis, so long as their registered frequencies are area-based/regional in nature and intersect the analysis area. Section 3.8.1.1.4 of the EIS analysis has been revised to include additional details regarding the types and names of licensees that occur in the analysis area based on the database query of registered frequencies completed for the EIS. Many of the companies mentioned by the commenter (e.g., Verizon, AT&T, and Idaho Power) were identified in the database query performed for the EIS and are now listed in the EIS analysis to provide additional detail. The EIS has also been revised to discuss farming-related communication sues in the analysis area and to analyze how they might be affected by the project.

Comment ID	Commenter	Public Comment	Response to Comment
		and reviewed just for this subject alone. I don't believe people would be very happy if you start messing with the communications of our first responders, internet, cell phones, etc. There is just too much left out of this section to make any educated decision.	
9213-1	Richard Dinges	In chapter 2.3.1 Project Location, Siting, Landownership, and Jurisdiction and on page 2-2, there is the following paragraph: "Most project components would be located on BLM public lands. Several State of Idaho-owned parcels are also present in the siting corridors and would provide opportunities to locate additional wind turbines, collector and transmission lines, and potentially other ancillary components. Tracts of privately .....". I am very surprised to see that State of Idaho-owned land is being included in the Lava Ridge project. I was under the impression that this project was being sited only on BLM public land. I am not aware of any comment by the State of Idaho that they are partners in this project. I do not believe that the BLM EIS would apply to state owned land. Yet, when I look at the siting map, I see Idaho state lands under the hashed area shown for the turbine corridors. It appears that the phrase "would provide opportunities" is now a fact. Is Idaho receiving compensation? Are these state owned lands being used for grazing and the leases being pulled from the ranchers?	As described in EIS Section 3.8.1.1.1 (Land Use Designations), most of the siting corridors for Alternative B are on BLM public lands (75,760 acres), with smaller portions on state (2,910 acres), BOR (288 acres), and private land (5,417 acres). As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and jurisdiction) the EIS evaluated the entirety of the siting corridors for potential impacts because the exact location of infrastructure and activities within the siting corridors is unknown at this time. Therefore, although the siting corridors intersect state-owned lands, it is unknown which, if any, project facilities would be sited on state lands, or where they would be located. As discussed in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), the State of Idaho is a cooperating agency for the EIS and has been involved in the planning, scoping, and EIS analysis phases of the project. Coordinated by the Idaho Governor's Office of Energy and Mineral Resources, various Idaho state agencies have provided input on the project (see Table App10-2 of EIS Appendix 10). Comments from the State of Idaho have been incorporated Into the EIS analysis and coordination with the State of Idaho is ongoing. EIS Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies) lists all permits and approvals that would be required from the State of Idaho, should any project facilities end up being sited on state owned lands. Of the state permits listed in EIS Appendix 2, many of them would involve payments from MVE to the State in the form of permit fees or property taxes. The analyses presented in EIS Sections 3.9 (Livestock Grazing) and 3.9.1 (Grazing Allotments and Range Socioeconomics) address potential project effects on grazing uses throughout the entirety of the siting corridors, including allotments that intersect both BLM and state-owned lands.
9473-4	Jeffrey Warren	What about the damage from the 400 to 500 miles of roads that will have to be constructed to install and maintain these turbines?	The EIS includes an analysis of the potential effects of proposed access roads on each of environmental resources analyzed in Chapter 3 (Affected Environment and Impacts). Access roads are included in the description of the Proposed Action (see Section 2.3 [Project Elements Common to All Action Alternatives]) and are defined as a type of ancillary facility that is included in the siting corridors. In addition, the estimated disturbance acreages presented in Section 2.3 (Table 2.4-2) account for the siting corridors and disturbance acreages associated with proposed access roads. The siting corridors and estimated disturbance acreages presented in Chapter 2.3 were then used to inform the resource analyses presented in Chapter 3. EIS Appendix 4 (Mitigation) includes applicant-committed measures regarding roads and traffic. Tables App4-2e and App4-2m provide details about mitigating the impacts to roads and of road use. The BLM requires certain mitigation measures that include road usage and are shown in Table App4-3.
9595-1	Sandra Machado	I have been deeply troubled by the proposed Lava Ridge Wind Project and how it will affect all the things I love about our state of Idaho. Prior to living in Idaho, we lived in the San Joaquin Valley, California. There were many fruit & nut orchards spread throughout the valley, because of the climate there to grow produce. Not often, but I remember a few times there was a risk of unusual freezing temps in the valley. The farmers would construct wind mills or fans over the orchards, which would change the air pressure and raise temperatures 5-8 degrees, preventing their crop from frost damage. If these relatively small fans can change the air pressure and temperature in these orchards, how might these large wind mills that are proposed to come to our Magic Valley effect our air pressure and temperatures across our valley? How might these changes affect agricultural in the Magic Valley. Being Dairy Farmers ourselves, we are greatly concerned about this proposed project and how it will affect the crops that we rely on to feed our dairy herd.	AIB-44 (Vegetation) in EIS Appendix 3 (Affected Environment and Impacts) analyzes how turbine operation would affect ground-level temperatures and vegetation phenology. As stated in AIB-44, studies have shown that turbines can affect surrounding vegetation (within 295 feet of the turbines, according to one study) by changing ground-level air temperatures and humidity levels. Another study is cited that points to the potential for vegetation to be affected up to 1.9 miles from turbines due to changes in soil moisture downwind of turbines. However, data regarding the response of vegetation to wind facilities show varied outcomes (increased growth in one study and decreased growth in another). This is because vegetative responses to win facilities are influenced by several factors such as vegetation type, wind speed, photoperiod, humidity, dormancy requirements, the time of day or year, precipitation regimes, and the relative concentrations of atmospheric gases. Therefore, the effects of turbine operations on ground-level temperatures and vegetation phenology or productivity are difficult to predict with any certainty but would likely be variable and site-specific. AIB-44 concludes that the project could impact the phenology of vegetation within 295 feet of each turbine location, likely in the form of warmer temperatures in the winter and potentially a longer growing season; however, these impacts would occur in a small proportion of the analysis area (3%) and would occur within the footprint of construction and decommissioning disturbance at each turbine, which is already accounted for in calculations of impacts to native upland plant communities (see EIS Section 3.15.1 [Native Upland Vegetation Communities]).
9919-2	Kenneth Vaughn	In a recent article in Journal Science Direct, Chinese researchers stated that wind farms on premium farm/agricultural lands causes drying of surrounding soil, which may increase the damage caused by drought. "The long-term operation of wind turbines can affect local climates. Soil moisture affects ecosystem balance, so determining the impact of wind farms on soil moisture is important..." Their research shows that the operation of wind turbines will cause "significant drying of the soil", with a measured decrease of 4.4%. Wind farms aggravate the soil drying in grassland areas, which may negatively impact grassland ecosystems. In a state like Idaho which has a dry climate to begin with in the areas wind farms are p resently located, as well as being prone to drought conditions, a 4.4% decrease in soil moisture could be catastrophic to agriculture.	AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief) analyzes how turbine operation would affect ground-level temperatures and vegetation phenology. As stated in AIB-44, studies have shown that turbines can affect surrounding vegetation (within 295 feet of the turbines, according to one study) by changing ground-level air temperatures and humidity levels. Another study is cited that points to the potential for vegetation to be affected up to 1.9 miles from turbines due to changes in soil moisture downwind of turbines. However, data regarding the response of vegetation to wind facilities show varied outcomes (increased growth in one study and decreased growth in another). This is because vegetative responses to wind facilities are influenced by several factors such as vegetation type, wind speed, photoperiod, humidity, dormancy requirements, the time of day or year, precipitation regimes, and the relative concentrations of atmospheric gases. Therefore, the effects of turbine operations on ground-level temperatures and vegetation phenology or productivity are difficult to predict with any certainty but would likely be variable and site-specific. AIB-44 concludes that the project could impact the phenology of vegetation within 295 feet of each turbine location, likely in the form of warmer temperatures in the winter and potentially a longer growing season; however, these impacts would occur in a small proportion of the analysis area (3%) and would occur within the footprint of construction and decommissioning disturbance at each

			turbine, which is already accounted for in calculations of impacts to native upland plant communities (see EIS Section 3.15.1 [Native Upland Vegetation Communities]).
10430-1	Name Not Provided	The effects on the local Jerome Airport will be very damaging and raise many safety concerns. This airport is used for private use and for our local farmers to have their fields sprayed. With the growth of our community our little Jerome airport will also expand.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome Airport.
10512-4	S. (No Last Name Provided)	I also have sizable concerns about Lava Ridge project's impact on aviation for our area. Crop dusting is critical to the success of crops that many in our area rely on for their living and others rely on to get food in the grocery store. Hidden Valley will be almost inaccessible to crop dusters if the project goes through.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). With regard to the Hidden Valley, the Preferred Alternative was identified, in part, to address concerns with access to the Hidden Valley for aerial applications.
1053-3	Sue Page	My next area of concern is the wind wakes caused by turbines. Specifically, the significant roll hazard to general aviation aircraft, crop dusters, helicopters - Life Flight and the light aircraft and helicopters used by Fish and Game to track herds of animals. A study needs to be compiled to determine the effects of the wind created	An issue analyzed in brief was added to EIS Appendix 3 (Issues Analyzed in Brief) to address concerns regarding turbine wake. According to data from the National Transportation Safety Board's (NTSB's) Aviation Database Query and Case Analysis and Reporting Online (CAROL) databases, the independent federal agency charged by Congress with investigating every civil aviation accident in the United States, there are no aircraft mishaps attributed to wake turbulence from wind turbines. While various studies have documented the potential for wake turbulence from wind turbines, it is well within the ability of pilots to avoid this potential hazard. Because of the passive generation of this type of turbulence from wind turbine blades (as opposed to the similar type of turbulence that is generated by the wing of a powered aircraft) the effects from wind turbines turbulence are limited in distance and very predictable. Pilots are instructed about the effects of turbulence and wake and are trained how to recognize situations that might create the turbulence, avoidance, and/or how to handle it. Pilots operating light aircraft downwind of the proposed wind turbines would need to exercise the same due diligence and awareness of possible turbulence and wake as they would normally be expected to in those situations.
1053-4	Sue Page	A study needs to be compiled to determine the effects of the wind created on fertilizers spread by crop dusting. As we know crops are not dusted in winding conditions so how will a constant wind affect the farms in the surrounding areas? Will the fertilizers be blown out over sage brush areas and the wildlife causing environmental damages?	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation).
1075-1	Sue Page	I am opposed to the windfarm proposal at Lava Ridge and wish the BLM to consider this study of the affect the wind generated on aircraft. Wind Energ. Sci., 3, 833-843, 2018 https://doi.org/10.5194/wes-3-833-2018 (c) Author(s) 2018. This work is distributed under the Creative Commons Attribution 4.0 License. The report indicates the adverse effect the turbines have on aircraft and the hazard of rolling to light wing and helicopters. Fixed wing cropdusters and helicopters are at risk from downwind effects. Any chemicals they might try to spread could be defused and spread over other wild life rather than the intended targets. I submit a review and study must be conducted to determine the effect these turbines have on aviation within and around the Lava Ridge Project. Article: Do wind turbines pose roll hazards to light aircraft? Jessica M. Tomaszewski1 , Julie K. Lundquist1,2 , Matthew J. Churchfield2 , and Patrick J. Moriarty2 1Department of Atmospheric and Oceanic Sciences, University of Colorado, Boulder, CO 80309-0311, USA 2National Wind Technology Center, National Renewable Energy Laboratory, Golden, CO 80401-3305, USA Correspondence: Jessica M. Tomaszewski (jessica.tomaszewski@colorado.edu) Received: 20 May 2018 - Discussion started: 19 June 2018 Revised: 13 September 2018 - Accepted: 16 October 2018 - Published: 2 November 2018	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11204-33	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The 2021 Comments expressed concerns about how the proposed Project would impact future wildfire suppression efforts, particularly with respect to reduced air tanker use in the vicinity of 545 foot or taller wind turbines and opined that reduced air tanker effectiveness implicates the likelihood of larger wildfires in the future within the Star Lake Allotment due to inefficient or ineffective wildfire suppression (2021 Comments, pg. 18). The 2021 Comments asked if the applicant (MVE) is going to pay for the temporary loss of AUMs due to future wildfire impacts related to the proposed Project (2021 Comments, pg. 18). The DEIS addressed this issue in some detail. However, after briefly discussing the potential for the proposed Project to impact the use of air tankers in future fire suppression efforts, the DEIS appears to trivialize or brush aside this concern and does not even mention the concern in its summary of Alternative B impacts related to wildfire. The DEIS summarizes its analysis of Fire and Fuels management under Alternative B as follows: Project infrastructure in the analysis area would result in increased fragmentation of the landscape and break up fuel continuity, potentially reducing the potential for large fire spread; however, it could also result in increased ignitions. This could lead to a higher number of small fires and could increase fire resource response regardless of the size the ignitions grow to. The additional road development could, however, increase access for responders, reducing initial response times by fire agencies and increasing potential for fires to be contained at a smaller size. Increased anthropogenic activity that leads to ignitions sometimes occurs outside peak fire season in a geographic area. Project ground disturbance could increase the likelihood of introduction and spread of nonnative plants, which are a fuel source; however, mitigation measures would reduce this possibility. DEIS, pg. 3-252. The DEIS then reports in Table 3.7-1 (Summary of Impacts to Fire and Fuels Management by Action Alternative) anticipated differences regarding wildfire impacts for each action alternative by ranking the alternatives from those that would be most impacted to those that would be least impacted (DEIS, pgs. 3-252 & 3-253). Only the "Acres of changes to vegetation types, fuel types, or fuel loading" indicator reported in Table 3.7-1 quantifies the potential wildfire impacts in any way. With respect to the "Changes to navigable airspace" indicator, DEIS Table 3.7-1 merely reports that Alternative B	Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). See response to comment 1042-30 (Table A-3i, Fire and Fuels Management) for additional analysis added to EIS Section 3.7.

Comment ID	Commenter	Public Comment	Response to Comment
		would be “Most impacted due to the largest project footprint” and that the other action alternatives would be somewhat less impacted due to their associated smaller project footprints (DEIS, pg. 3-253). Earlier, the DEIS admits that “navigation in the area would change for fire responders, and aerial resources could be more limited in their ability to respond due to the presence of turbines and associated infrastructure in the airspace around the siting corridors” (DEIS, pg. 3-251). The DEIS also reports that “FAA regulations do not limit the proximity of aircraft to turbines for fire suppression” and concludes that fire suppression from the air “could occur near project infrastructure at the pilot’s discretion” based upon assessment of “situation-specific risk when flying fire suppression aircraft” (DEIS, pg. 3-251). The DEIS analysis “assumes there would be some reduction in aerial suppression in the analysis area, and aerial suppression that does occur may take longer because flight paths may need to be broken up or require more turns” (DEIS, pg. 3-251). However, the assumed reduction in aerial suppression is not considered important enough to even be mentioned in the DEIS summary statement related to potential wildfire impacts from the proposed Project quoted above and is not quantified in any way in Table 3.7-1 (Summary of Impacts to Fire and Fuels Management by Action Alternative).27 The DEIS admits that the proposed Project “would complicate fire resource allocation decisions because there would be new infrastructure at risk, and decision-makers would need to consider this when prioritizing active fire events which require response resources” (DEIS, pg. 3-251). However, as was the case for potential impacts with respect to the use of air tankers in future fire suppression efforts, the DEIS appears to trivialize or brush aside the concern regarding the potential for the proposed Project to “complicate fire resource allocation decisions” and does not even mention the concern in its summary of Alternative B impacts related to wildfire. On balance, the DEIS appears to emphasize those factors for which the proposed Project would potentially improve or enhance wildfire suppression efforts and appears to trivialize or brush aside those factors for which the proposed Project would potentially hinder or reduce wildfire suppression efforts.	
11226-3	Clare Josaitis	Much of the 'Supporting Rationale' for exempting further analysis of the issues is very nebulous and generalized. Such as "The project would be designed to minimize electromagnetic interference where practical...". First of all, how is it going to be specifically designed to minimize EMFs? Why isn't this explained and layed out for the reader. "Where practical' is essentially meaningless and just a feel-good, catch-all-angles phrase. "Crop dusting operations would not be precluded in the project vicinity...". According to whom? Have you actually talked to Jerome Airport officials? Have you actually asked any local crop duster pilots how the turbines would specifically effect their operations? The rationale states assumptions about reductions in aerial crop dusting, that there could be delays in critical timing of applications, and effects to crop productivity. Given all the tens of thousands of agricultural acres surrounding this project, this should be an issue carried through the EIS. Furthermore, there is absolutely no discussion on how these proposed wind turbines would effect management and operations for the nearby Jerome Airport. This needs to be analyzed in the EIS.	Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1 [Affected Environment]) and to analyze how they might be affected by the project (see Section 3.8.2.2 [Impacts]). Effects to communication pathways (including electromagnetic interference) are addressed in EIS Section 3.8 (Land Use and Realty). Also see responses to comments 10426-4 (see in Table A-3m, Human Health and Safety) and 11535-105 (see in Table A-3o, Land Use and Realty, including Aviation) regarding interference with communication systems. The project would not significantly impact or reduce the usefulness of the existing overlying FAA airspace, except for within 500 feet of obstructions, and there would be no significant impact to the use of the identified and registered airports in the analysis area. Tall structures, as defined by aviation industry standards, are considered obstructions, and may pose a potential hazard to aircraft conducting aerial operations in their vicinity. The obstructions would not significantly impact or reduce aerial operations in the analysis area, except for the immediate airspace within 500 feet of the obstructions. There are no known agricultural fields or crops that would not be able to be serviced by aerial applicators as a direct result of obstructions being near the fields themselves; however, it is possible that some routes or flight patterns used by aerial applicators while transitioning to and from specific fields may have to be altered to better allow pilots to “see and avoid” obstruction hazards. Aerial applicator flight patterns often vary by type of aircraft, specific crops, and wind direction; therefore, it is not always possible to predict the specific areas that may be impacted.
11273-1	Clare Josaitis	Crop dusting operations would not be precluded in the project vicinity...". According to whom? Have you actually talked to Jerome Airport officials? Have you actually asked any local crop duster pilots how the turbines would specifically effect their operations? The rationale states assumptions about reductions in aerial crop dusting, that there could be delays in critical timing of applications, and effects to crop productivity. Given all the tens of thousands of agricultural acres surrounding this project, this should be an issue carried through the EIS. Furthermore, there is absolutely no discussion on how these proposed wind turbines would effect operations for the nearby Jerome Airport. This needs to be analyzed in the EIS.	See response to comment 11226-3 (see in Table A-o, Land Use and Realty, including Aviation).
11346-4	George Parker, John Arkoosh	The DEIS does not adequately address aviation concerns. Magic Valley airports will be seriously affected by this project according to FAA findings of two 6410 applications filed by Magic Valley Energy. I know that your office is in receipt of these documents so I will not submit them here. Aerial agricultural application, firefighting and predator control will be negatively impacted by this project. Turbines will cause hazards to private pilots as well as local charters services. IFR approaches to local airports will be raised and communications equipment may be affected according to preliminary FAA reports.	See responses to comments 11226-3, 11535-96, and 11481-3 (all in Table A-3o, Land Use and Realty, including Aviation).
11396-5	Gina Jerke	Has the BLM considered the impact to the Jerome County Airport? Is it safe and feasible to have so many turbines that close in proximity to the airport?	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
11481-3	Idaho Wool Growers Association	With height restrictions around the wind turbines, it would make utilizing aircraft nearly impossible for predator control or fire suppression. Sheep producers utilize aircraft to remove harmful predators such as coyotes who prey on young lambs. This option has helped prevent death loss. If this option were to be removed,	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
		compensation should be reviewed for the producers as they would likely assume more death loss. Finally, if aerial movement in the area is removed or severely hampered, it would limit fire suppression as a tool fight fires in the area, therefore creating more fire risk.	Tall structures, as defined by aviation industry standards, are considered obstructions and may pose a potential hazard to aircraft conducting aerial operations in their vicinity. The obstructions would not significantly impact or reduce aerial operations in the analysis area, except for the immediate airspace within 500 feet of the obstructions. The use of small aircraft for livestock predator control was added to new Aviation section (3.8.2) and the Grazing Allotments and Range Socioeconomic section (3.9.1) refers back to this aviation analysis. Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management) for additional analysis added to EIS Section 3.7 (Fire and Fuels Management).
11535-90	Steven Andersen	Airspace Interference The DEIS simply concludes that because the development would have to meet FAA criteria, no adverse impacts to aviation would be expected. It similarly concludes that because the distance between the siting corridors and county and municipal airspace is between 6 and 16 miles, no impacts are expected. In reality, no decisions have been made with reference to siting, making the agency's analysis of this issue (like nearly every issue addressed in the DEIS impacted by the location of the turbines) arbitrary and inadequate.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11535-91	Steven Andersen	In fact, the 7460-2 Form the developer submitted to the FAA in 2021 was later withdrawn when the FAA released unfavorable findings. Even on the current FAA website under the new aeronautical study resubmitted by the developer, in response to "Description of Proposal", it reads, "Filing new locations on wind array. In addition to termination of prior studies, please terminate 2021-WTW-2128-OE." The FAA is directed to issue a Determination of No Hazard to Air Navigation "when the aeronautical study concludes that the proposed construction ... will exceed an obstruction standard but would not have a substantial aeronautical impact to air navigation,"279 or when "a proposed structure does not exceed any of the obstruction standards and would not be a hazard to air navigation." Here, the FAA has determined that the proposal – to construct 509 Wind Turbines to a height of 660 feet above ground level and into Class E airspace – clearly exceeds obstruction standard Part 77. 281 Specifically, the FAA concluded the proposed wind farm would extend into airspace used for flight and have an adverse effect upon air navigation.282 In addition to violating federal aviation standards, the proposed project proposes aviation hazards in violation of I.C. 21-502. As articulated in the Idaho Transportation Department's (ITD) letter to Mr. Prestwich on March 23, 2023, the Idaho Division of Aeronautics "determined the windmills to be an aviation hazard contrary to public interest."283 Specifically, the ITD Aeronautics division found "the installation of the proposed structures will be a hazard to both VFR air navigation and all air traffic operations in the area." The FAA's related aeronautical study (No. 2022-WTW-4666-OE) is still in process.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 9216-2 (see in Table A-3o, Land Use and Realty, including Aviation).
11535-92	Steven Andersen	The DEIS provides no evaluation of the impacts to climb gradients for proposed departure routes. Summer months are times of high flight traffic when weather conditions can change rapidly, from clear skies and unlimited visibility to total obscuration and little visibility, requiring aircrafts to descend. Requiring VFR traffic to circumnavigate the massive high volume of turbines would pose significant problems to pilots already facing conflicting obligations to descend to avoid clouds. It is not only an issue of maintaining the correct altitude but a fundamental issue of safety. The impact of the height of 500+ massive structures protruding into Class E airspace will negatively impact the safety of instrument approaches, transitions and enroute segments for all ways into airports in the Magic Valley including Jerome, Gooding, Burley, Twin Falls, and Sun Valley.288 Pilots must account for the time and distance to climb to altitude after takeoff or descend for a landing, and it is critical for an approach and departure corridor to be clear of obstructions to accommodate flight procedures.289 By modifying VFR traffic, the Project would indirectly impact use of regional airways by forcing lower altitude VFR traffic into, or below those airways. This compression would force the rerouting of aircrafts into narrow, concentrated flight corridors, reducing air traffic dispersion and reducing altitude separation for opposite direction traffic.290 This would overload an already overburdened IFR system.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation), 9216-2 (see in Table A-3o, Land Use and Realty, including Aviation), and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation). Impacts to airports in the analysis area is discussed in Section 3.8.2 (Aviation). The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport and Sun Valley are located outside of the aviation analysis area.
11535-93	Steven Andersen	There is also no indication that MVE made any effort to reach out to the impacted counties regarding aviation impacts or to seek compliance with county aviation plans. It should be noted that in 2007 a comprehensive plan was implemented for Jerome and Hazelton airports that required any proposed development within a 20-mile radius from Jerome and 16 miles from Hazelton to go through Jerome County for approval. This never occurred.	The system of public lands managed by the BLM are not under the jurisdiction of County Planning and Zoning laws and regulations. The BLM considers State and local plans in the preparation of land use plans to ensure there is consistency to the maximum extent as allowable under other laws and fulfilling the purpose of FLPMA. This, however, does not mean that an applicant requesting the use of public lands is required to obtain a permit from the county as there is not development proposed on private property within the jurisdiction of the local government. The County Commissioners from Lincoln, Jerome, and Minidoka Counties have been coordinated with as cooperating agencies throughout preparation of the EIS. As a local agency with jurisdiction by law over adjacent private lands a memorandum of understanding was entered into outlining the counties responsibilities for adjudicating the proposed action and alternatives with local planning and zoning ordinances. During administrative internal reviews of the EIS, the counties did not provide information regarding non-conformance with local planning and zoning ordinances. MVE has submitted project information to the FAA and has coordinated with them on the evaluation of the project. The FAA provided an initial review and a Notice of Preliminary Findings. The FAA will review public feedback and will make a final determination. The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 of the EIS for the detailed aviation analysis.

Comment ID	Commenter	Public Comment	Response to Comment
11535-95	Steven Andersen	Proposed mitigation of lighting up the turbines is inadequate and poses additional visual disturbance to wildlife and individuals nearby and importantly, pilots trying to fly. It is known that such lights create a strobe light effect. Pilots are cautioned of the extreme risk of vertigo and associated disorientation caused by these lights.292 As a result, the FAA cautions pilots that strobe lights installed on aircrafts should be turned off in reduced visibility conditions (exactly when the DEIS proposes that such mitigating lights be turned on) as the strobe lights light up the entire area surrounding the plane, like lightning in a cloud, and are disorienting for a pilot.293 One or more lights – let alone hundreds of flashing lights from wind turbines in the airspace – would certainly pose a serious danger to pilots, and yet, none of this has been evaluated or even mentioned in the DEIS.	See response to comment 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation). The FAA is the federal agency charged with approving the ADLS system.
11535-96	Steven Andersen	Adverse Impacts on Radar In addition to serving as an obstruction in air space, the wind turbines also have the high potential to interfere with communication, navigation and wind patterns for all aircrafts. Here, aviation over the proposed project area and alternatives has not been adequately studied in the DEIS. There is no radar guidance available the Jerome, Gooding, Burley and Twin Falls airports so all pilots are reliant on GPS to guide them safely into the airport.306 A single wind turbine could cause electromagnetic interference, impacting the accuracy of that GPS, and this project is proposing over 500. It is arbitrary and reckless for the DEIS to evaluate a single tower in Dietrich (with a yet to be determined generator) and conclude based on that, that there won't be significant interference caused by a project of around 500 massive turbines in locations that have not even been determined. The DEIS simply defers to the FAA, and the FAA has confirmed they cannot ensure the Project would not interfere with radar communications or other forms of communications.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Effects to communication pathways (including electromagnetic interference) are addressed in EIS Section 3.8 (Land Use and Realty). Further, the FAA study will consider potential effects to radar and electromagnetic interference. Also see responses to comment 10426-4 (see in Table A-3m, Human Health and Safety) and comment 11535-105 (see in Table A-3o, Land Use and Realty, including Aviation) regarding Interference with communication systems.
11535-97	Steven Andersen	A long-term study taking into account aviation patterns, including congested periods, particularly given farming patterns and crop dusting, and weather patterns – all of which impact the altitude of flight paths, ascension and descension of an aircraft – should be conducted. If regularly-occurring flights would be forced to change course and/or altitude if the Project proceeds, there will be significant impacts to local pilots and farmers who need crop dusting for their crops to survive, and in turn, to sustain their livelihoods.308 If airways are restricted due to the structures, how does this rerouting impact air traffic flow? What is the impact to efficiency and cost? The DEIS provides no analysis of the safety risks posed by the turbines, of how the turbines would affect VFR flights in periods of low visibility and poor weather, or how the route and altitude diversion caused by the Turbines would affect other traffic in the area. Although the DEIS defers to the FAA on these critical issues that impact several other factors in the NEPA evaluation process (including socioeconomics, health and safety, wildfires, wildlife, etc.), ultimately, the FAA does not have the authority to halt the construction of the wind turbines – it only has authority over the air space. Therefore, if after construction, the FAA cannot ensure safety, it will halt impacted air traffic. The relevant airspace and airports are important regional assets contributing to area economic stability and growth. Due to the flight restrictions in this area, including arrivals and departures, local airports would effectively be put out of business, and businesses that rely on local aviation would suffer economic consequences. Farmers rely on crop sprayers to maintain the health of their fields and communities rely on planes fighting fires to protect their land. Mitigation efforts such as blinking lights to warn aircrafts pose safety risks to pilots, as outlined above, and have not been adequately explored given the magnitude of the project. There should be in depth studies as to the effects of the project on the operation of navigation facilities and the safe and efficient use of the airspace with specific hazard determinations as to the impact of the turbines on air navigation and the effect on local radar facilities.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation).
11547-4	Lowell Ihler, Carol Ihler	4. The aviation in the area will be affected especially the crop dusting and fire fighting planes in the area near the wind turbines. Also, the Jerome airport was not mentioned in the DEIS and this was a huge oversight in DEIS. This would affect the landing of planes at Jerome especially in bad weather. It also would affect other smaller airports in communities surrounding the wind turbine area.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11554-11	Raul Labrador; Idaho Attorney General's Office	Beyond this, the Project would create a significantly greater risk for aviation safety.8 A 2014 Special Investigation Report by the National Transportation Safety Board concluded that windfarm towers pose a critical hazard to agricultural planes and other low-flying aircraft.9 And MVE's own planning documents note that there are at least eight small Idaho airports within the Project's vicinity.10 Aviation disasters will inevitably increase, and that increase implicates Idaho's resources and harms the environment. Idaho will have to send first responders to address crashes. Any crashes will fall on Idaho soil, endangering Idaho's animals and people. And the fire, fuel, and debris damage caused by aviation crashes will irreversibly harm the environment. For similar reasons, the Project would harmfully impact local economies dependent on the aviation industry. According to the 2020 Idaho Airport Economic Impact Analysis Update, the nearby Jerome County airport alone was responsible for 51 jobs, $2.33 million in earnings, $4.16 million in gross domestic product, and $9.1 million in economic output.11 If Lava Ridge reduces navigable airspace, local airports like this will suffer, causing job loss and economic harm. The economic harm to Jerome is just one example of the draft EIS's failure to consider direct economic and social harms caused by the Project. See DEIS at 3-264–71.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The aviation analysis in the final EIS Section 3.8.2.2 discloses the potential for economic impacts related to aviation resources in the analysis area. Based on the analysis of the preliminary FAA study results, aviation uses in the analysis area, and the probable effects to airspace and airports, no quantifiable or significant economic impacts to aviation are anticipated.
11615-5	Spencer Dixon	The EIS does not adequately address aviation and crop dusting either	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation), 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation), and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation). Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1) and to analyze how they might be affected by the project (see Section 3.8.2.2).

Comment ID	Commenter	Public Comment	Response to Comment
11667-6	Alisa Bowman	Concern: Impact Firefighting Efforts Southern Idaho is known for summer brush fires. The ability to use aerial fire suppression is instrumental in being able to control the path of the fire. With 740 towers dotted all over the landscape, there would no longer be an option to use aerial application of fire retardant to the wildfires. It would take longer to fight these fires and the damage and area impacted would be higher.	Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management) for additional analysis added to EIS Section 3.7 (Fire and Fuels Management).
11785-1	Jake Arkoosh	My name is Jake Arkoosh. I am a private pilot and I run cattle on the star lake allotment. I fly my personal aircraft every year to locate and check on my cattle in and around the star lake allotment every year. The construction of the proposed project will make general aviation for the purpose of locating and identifying animals in the star lake area impossible. This has not been adequately addressed in the DEIS. Furthermore, general aviation in and around the area and in the area of the Jerome airport will we substantially more hazardous, especially at the lower altitudes general aviation, ag, and firefighting pilots typically fly. 740 foot tall windmills will be only 260 feet below airport pattern altitude. These obstacles will erode my ability to exercise my right to fly and take away aviation as a crucial tool I use to manage my cattle. These issues have not been adequately addressed in the DEIS.	Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1) and to analyze how they might be affected by the project (see Section 3.8.2.2). As described in Section 3.8.2.2 (Aviation) the project would not significantly impact or reduce the usefulness of the existing overlying FAA airspace, except for within 500 feet of obstructions, and there would be no significant impact to the use of the identified and registered airports in the analysis area. Pilot operations would be similar to other navigation hazards occurring within the analysis area from existing tall infrastructure, including transmission towers, communication towers, and met towers. Pilots operating under VFR in the associated Class E and Class G airspace in the analysis area would still be required to navigate using the “see and avoid” concept around the turbines or other obstructions (transmission towers or met towers). Regarding commenters stated flights in the Star Lake allotment, the project would not preclude flights in the Star Lake allotment, except for within 500 feet of obstructions as stated above. Specific low-altitude flight paths may need to be altered to avoid obstructions, but flights within the Star Lake allotment would still be feasible. Refer to the analysis area figure in Section 3.9 (Livestock Grazing) for a map showing the siting corridor overlap with the Star Lake allotment for each action alternative. Of the action alternatives, Alternative E and the Preferred Alternative would have the least siting corridor overlap with the Star Lake allotment (approximately 1/3 of the allotment).
11836-1	Red Baron Ag Service Inc.	To aerially apply crop protect products as low as 10 feet, safety becomes of upmost concern. With the proposed windmill heights of up to 740 feet, our safety is put into jeopardy. We provide crop care on farm land right beside the proposed project. Some of the fields we protect would have these windmills right in front of the aircraft. To start a field, the aircraft are heavy and require some room to be able to turn around. This may take over 2 miles to accomplish. Another thing to keep in mind, if the aircraft has to fly above the windmills to enter a field, some distance is needed. For example; at 250 feet above a 740 foot windmill the aircraft would need to drop almost 1000 feet to begin applying. Imagine trying to do that fully loaded or not within just 1 mile of distance. As stated before, the aircraft need some room to be able to do our job safely. Another safety concern is being able to fly safely to many of the fields from various airports. In an emergency situation, currently flying over the desert isn’t nearly as concerning as fly over these very tall obstacles. Turbulence created by the huge size and massive amount of windmills in this proposed project will not only bring safety in concern, but also cause problems in application timing and effectiveness. Flying in the dark over tall windmills with the lights only at the generator level and not at the blade height is a safety hazard too. Red Baron operates out of public and private airports. Two of the private airports are very close to the proposed project. One is only ½ mile away, and the other is about 2 miles away. This presents yet another safety concern. Included is a map and GPS coordinates of our 2 private agricultural airports near the proposed wind project. The proposed Lava Ridge EIS does not include any Aerial Application comments. As an aviation business, Red Baron Ag Service, Inc. would like to see Aerial Application operating hazards be part of the decision making process.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation), 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation), and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation).
11855-2	Mark Doerr	In particular, I oppose the project due to the potential impact it will have on our business at the Jerome County Airport and aviation safety in the airport area in general. Based on the 2020 Idaho Airport Economic Impact Analysis, the Jerome County Airport was responsible for over 50 jobs, $2.33 Million in earnings, $4.16 million in gross domestic product and $9.1million economic output. The published DEIS only lightly touched on the issues surrounding aviation; lighting of the towers and communication. There needs to be far more study on the effects of the project on the following issues: • Effect of electromagnetic interference on the accuracy of GPS signals used for instrument approaches into the Jerome, Gooding, Burley and Twin Falls airports. This should reflect not only single tower effect but also a cluster of 500 towers. • Impact of electromagnetic interference of 500 clustered wind turbines on GPS signals used by agricultural aircraft and agricultural equipment.	See responses to comments 11226-3 and 11535-96 (see both in Table A-3o, Land Use and Realty, including Aviation).
11855-3	Mark Doerr	The published DEIS only lightly touched on the issues surrounding aviation; lighting of the towers and communication. There needs to be far more study on the effects of the project on the following issues: [...] Impact of tower height on all instrument approaches, transitions and enroute segments of airways for all airports in the Magic Valley.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11855-4	Mark Doerr	The published DEIS only lightly touched on the issues surrounding aviation; lighting of the towers and communication. There needs to be far more study on the effects of the project on the following issues: [...] Impact of electromagnetic interference of 500 turbines on aviation, emergency and law enforcement communications in the Magic Valley.	See responses to comments 11226-3 and 11535-96 (see both in Table A-3o, Land Use and Realty, including Aviation).
11855-6	Mark Doerr	The published DEIS only lightly touched on the issues surrounding aviation; lighting of the towers and communication. There needs to be far more study on the effects of the project on the following issues: [...] Impact of the strobe light effect of 500 blinking towers on vertigo for pilots flying at night or in obscured, reduced	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 7337-1 (in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
		visibility conditions. The FAA requires strobe lights installed on aircraft to be turned off in these types of conditions because it will cause vertigo. Will the turbines have the same effect.	
11855-7	Mark Doerr	The published DEIS only lightly touched on the issues surrounding aviation; lighting of the towers and communication. There needs to be far more study on the effects of the project on the following issues: [...] Impact of the height of the towers protruding into the Class E airspace surrounding the Jerome, Gooding, Burley, and Twin Falls Airspace in addition to the Class E airspace on the transitions into and out of the Sun Valley Airports. If the airspace is violated by tower height, will this impact the safety of the instrument approaches into all of the listed airports. [...] Federal Class E airspace, which is the type of airspace surrounding the Magic Valley area, starts at 700 feet above the ground. The FAA will always oppose any tower taller than 700 feet because those towers are in controlled airspace. That 700 floor of the airspace is designed to protect aircraft that are flying in the clouds and flying instrument approaches into, in this case, Jerome. Additionally, the airspace within 2 to 4 miles either side of the centerline of an instrument approach or transition to the instrument approach is considered protected airspace and no towers can protrude into that airspace. If it does, then the FAA has to change the minimum altitudes on those approaches and transitions because TERPS, which is the regulation that controls the designing of these transitions and approaches, does not allow the aircraft to be any closer than 1000 feet above and obstructions around that protected airspace.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation), 9216-2 (see in Table A-3o, Land Use and Realty, including Aviation), and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation). Impacts to airports in the analysis area is discussed in Section 3.8.2 (Aviation). The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport and Sun Valley are located outside of the aviation analysis area.
11855-8	Mark Doerr	It is an issue to build towers in these areas. What is proposed for towers east of the Jerome airport will affect and ultimately change the instrument approaches into these airports. That is why the FAA recommended not building the towers. NEPA requires the BLM to consider the economic impact to airports, counties and businesses. No construction should be allowed to start until all of these issues are vetted by the FAA. Further, there was no inclusion of the FAA findings in the DEIS. This information must be addressed in the final EIS.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
11869-16	Raul Labrador, Josh Turner; Idaho Attorney General's Office	[The draft EIS Ignores Idaho's Sovereign Interest in its People.] Beyond this, the Project would create a significantly greater risk for aviation safety.8 A 2014 Special Investigation Report by the National Transportation Safety Board concluded that windfarm towers pose a critical hazard to agricultural planes and other low-flying aircraft.9 And MVE's own planning documents note that there are at least eight small Idaho airports within the Project's vicinity.10 Aviation disasters will inevitably increase, and that increase implicates Idaho's resources and harms the environment. Idaho will have to send first responders to address crashes. Any crashes will fall on Idaho soil, endangering Idaho's animals and people. And the fire, fuel, and debris damage caused by aviation crashes will irreversibly harm the environment. For similar reasons, the Project would harmfully impact local economies dependent on the aviation industry. According to the 2020 Idaho Airport Economic Impact Analysis Update, the nearby Jerome County airport alone was responsible for 51 jobs, $2.33 million in earnings, $4.16 million in gross domestic product, and $9.1 million in economic output.11 If Lava Ridge reduces navigable airspace, local airports like this will suffer, causing job loss and economic harm. The economic harm to Jerome is just one example of the draft EIS's failure to consider direct economic and social harms caused by the Project. See DEIS at 3-264–71.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11901-1	Bucky Whittier	We are writing to strongly object to the Lava Ridge Wind Turbine project. My wife and I are pilots, located at the Twin Falls, Magic Valley Airport. We used to keep our plane at the Jerome Airport. Flying anywhere near the wind turbines that are already located near Hagerman or Pocatello, is dangerous. Hearing that the issues regarding flying Instrument will be adversely affected with no solution given is just insane. If it might impact General Aviation pilots how in the world are Life Support, Fire Suppression, Rescue or other area safety flight planes supposed to operate? If thought has been given to these issues it appears that no care has been given to deal with these issues. Also, the night lights on the existing turbines are obnoxious already. Flashing red lights all synchronized, all night long--what a lovely sight! How will any pilots, General Aviation or otherwise, be able to fly at night safely? it appears no one cares. This is such a safety issue. We surely hope that a decision is made that no, zero, turbines will be approved, ever, forever in perpetuity for the beautiful State of Idaho.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation).
11909-3	Kevin Trainor	I guess my biggest reason for objecting is the SIZE and its hazard to flight operations. It will be like having a SERIES of 70 story buildings running generally north/south over almost 200,000 acres off the approach end of the most utilized runway at the Jerome airport. The prevailing winds in the area are out of the west, so Runway 27 is the most used runway. The corridors will be PERPENDICULAR to the direction of flight. There is already an antenna farm less than 1.5 mile west and less than 1/2 mile north of the touchdown area of R27. Right hand downwind approaches to R27 are dangerous and strongly discouraged by the Idaho Dept of Aeronautics and the FAA. From the EIS maps the majority of the structures will be south of the R 27 extended centerline.The height of the blades will over 700 ft AGL at the top of their arc. The height of the tower is over 500 ft. AGL This means that hazard to navigation lights on the towers will necessarily be about 250ft BELOW the hazard. All of this steel/aluminum/fiberglass will be in corridors that run perpendicular to R 27.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
11943-2	Mary Kevan	They are hazardous to air traffic because of their height and turbulence. They will alter flight patterns for local airports.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11968-5	Cheryl Sandy	Small aircraft would be difficult to maneuver through these towers.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
12057-2	A. Ben Crouch	1. The Jerome County Airport board is gravely concerned about how it would affect the airport. The 400 75-story windmills would greatly affect the approach and departures from the airport, not to mention the surrounding	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in

Comment ID	Commenter	Public Comment	Response to Comment
		airports as well. Concern has been expressed about instrument interference from the electromagnetic pulses from the wind turbines. Blinking red lights from the 400 plus windmills and low cloud coverage have been cited as just a few ways of causing flight accidents or tragedies, and The FAA has expressed that they should not be built, and that it will not only affect our airport but will also greatly affect all of the other surrounding airports as well. The potential harm and effects of these windmills will have economic and financial consequences for our airport, as a whole, and to the individual stakeholders and owners that operate there as well. It will be detrimental to business at the Jerome County Airport – and no studies have been done to assess all of the potential issues.	general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
12232-2	Juli Miller	Finally, as a pilot, the impacts on the small rural and back country airports for which Idaho is known will change the character of this part of Idaho and create harmful economic impacts for Idaho.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
12233-3	Elizabeth Lampert	The Project will impede air traffic at the Jerome Airport. Crop dusters may have to move operations to a different location. Planes needed to combat forest fires may not be able to fly safely around these wind turbine towers.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1042-30 (in Table A-3i, Fire and Fuels Management). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
12307-18	Dean Dimond	Need new information regarding height of towers and effects on maintenance drones and other aircraft,	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
12351-3	Julie C. Lynn	The wind turbines would hamper fighting wildfires and ot er aircraft flying in the area.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). See response to comment 1042-30 (in Table A-3i, Fire and Fuels Management) for additional analysis added to EIS Section 3.7 (Fire and Fuels Management).
12798-1	Florian Ghighina, Jennifer Schildgen; Idaho Transportation Department	We have received your email and information request regarding the Lava Ridge Wind Project. Based on all the information presented and with the authority of the Idaho Code 21-513 through 21-520 and Idaho Transportation Rule No. 39.04.08, the Division of Aeronautics has performed an obstruction evaluation for the proposed project identified above, and has determined that the wind turbines development will be a hazard to air navigation and air traffic operations in the area. The 660' tall wind turbines will negatively affect and degrade the safe and efficient use of airspace by aircraft. The proposed height of the windmills would extend into the Visual Flight Rules (VFR) airspace, which would have an adverse effect on VFR navigation and a tremendous negative impact on the safety of air operations for the airports located in and around the same region. The Division of Aeronautics strongly opposes the construction of the proposed wind turbines out of concern for the safety of air operations for ag sprayers, fire fighting aircraft and the general aviation pilots that use, need to use, or would want to use the airports within that region.	Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1 [Affected Environment]) and to analyze how they might be affected by the project (see Section 3.8.2.2 [Impacts]). MVE filed a Form 7460-1, Notice of Proposed Construction or Alteration, with the FAA for Alternative B with a maximum turbine height of 660 feet above ground level (AGL) (approximately 4,933 feet amsl). The FAA issued a Notice of Presumed Hazard (NPH) on February 2, 2023, which initiated an FAA public comment period and aeronautical study (FAA 2023a [Aeronautical Study No. 2022-WTW-4666-OE]). The comment period closed on March 11, 2023. As part of the NPH, the FAA public notice contained a preliminary list of detailed impacts that would result in exceeding current federal obstruction standards (as per 14 CFR 77.17 (a)(1) and (3)) and the other effects on aeronautical operations (as per 14 CFR 77.29 (a)(1)). The FAA aeronautical study is underway, and results of the final study were not available at the time of EIS publication. The analysis contained in the EIS references the preliminary analysis that was disclosed in the FAA public notice. The commenter did not provide any supplemental information or studies to include in the analysis.
12901-1	Cheryl Savello	They also say that the turbines light up when aircraft are landing and taking off at the Jerome air field. So what if the sensors fail. Crop dusters are just one of the concerns. Do the sensors light up during the day? Are the people maintaining the systems outside contractors of local people?	See response to comment 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation).
12916-4	Gina Jerke	Has the BLM considered the impact to the Jerome County Airport? Is it safe and feasible to have so many turbines that close in proximity to the airport?	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
12927-5	John Arkoosh	The DEIS does not adequately address aviation concerns. Magic Valley airports will be seriously affected by this project according to FAA findings of two 6410 applications filed by Magic Valley Energy. I know that your office is in receipt of these documents so I will not submit them here. Aerial agricultural application, firefighting and predator control will be negatively impacted by this project. Turbines will cause hazards to private pilots as well as local charters services. IFR approaches to local airports will be raised and communications equipment may be affected according to preliminary FAA reports.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 11481-3 (see in Table A-3o, Land Use and Realty, including Aviation). Effects to communication pathways (including electromagnetic interference) are addressed in EIS Section 3.8 (Land Use and Realty). Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). See responses to comments 10426-4 (see in Table A-3m, Human Health and Safety) and 11535-105 (see in Table A-3o, Land Use and Realty, including Aviation) regarding interference with communication systems.
12949-3	Ralph Kincheloe, Connie Kincheloe	Aviation has not been addressed in the DEIS. ... These wind turbines would have an effect on our ability to fly safely because of the known adverse effects recognized by the FAA. It is a given that these turbines would affect both class G and E airspace, which is used for separation between and IFR and VFR traffic to conduct safe approaches and departures. We could lose our controlled airspace due to the protrusion of wind turbines In a recent meeting between the Bureau of Land Management and the Jerome County Airport Advisory Board, a discussion arose about the cluster of wind turbines proposed in the Lava Ridge area. We have researched, and while there may be areas around the country that contain anywhere from 100 to as many as 350, these turbines are not nearly as tall as these proposed by Magic Valley Energy; they also do not appear to be close to any airport. While Magic Valley Energy has proposed turbines as tall as 740', we do not know the size of these yet-to-be-determined wind turbines and therefore it is impossible to know what the cumulative effect will be. According to the USGS wind mapping program, the tallest wind turbines in service now do not exceed 615'. https://eerscmap.usgs.gov/uswtdb/viewer/#5.74/36.902/-94.235/0/1 Navigation, communication, and gps are an	See responses to comments 11226-3 and 11535-96 (see both in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
		integral part of aviation. In the aviation world, it is of utmost importance to be heard and seen. While flying, we can hear of aircraft in the vicinity before we ever see them. Radio communications are a large part of avoidance of mid-air collisions along with gps transponders. It is a known fact that wind turbines produce electromagnetic interference. What is not known is what effect a cluster of 300-400 wind turbines will have on all avionics. The worst scenario would be flying IFR and losing gps navigation that could lead to loss of life and property for both those in the air and those on the ground. https://www.researchgate.net/figure/3D-representation-of-the-RCS-of-the-wind-turbine-at-1300MHz-applying MoM_fig15_258390079 The alternative lighting solution proposed by Magic Valley Energy only has a 95% efficacy. We don't want to risk our lives, our property or anyone else's life on a failure, even if it is 5%.	
12956-1	Ralph Kincheloe, John Higley, John Toolson, Albert Lockwood, Gary Oliver; Darrell Fairbanks, Tom Peters	We write to you of our concerns that the Lava Ridge Project may potentially harm the aviation communities of Jerome and Hazelton and other airports located in the Magic Valley. The DEIS does not thoroughly address the impacts this project will have on aviation. The Jerome County Airport Advisory Board (Board) oversees both the Jerome County Airport and the Hazelton Municipal Airport. The aviation industry has had a boon as of late due to the central location of our Jerome airport. In 2011, the Board and the Airport Manager at the time, received special recognition by the Federal Aviation Administration for its foresight as a premier airport. (Please see a copy of The Transporter article attached.) In 2019, the Board began revisions to the Jerome Master Plan (a copy which has already been submitted via a RAC subcommittee meeting) to address the needs and demands for the present and future airport operations. Through this analysis, our airport operations have justified the lengthening of our existing 5000' runway to 6500' to accommodate the larger jet traffic that is currently using our facility as well as to draw in new businesses that are waiting for the expansion. The Jerome Master Plan was developed with the Federal Aviation Administration (FAA)'s guidance. Jerome County Airport lies in controlled airspace. This controlled airspace is used for instrument approaches to both runways 09/27. This controlled airspace provides separation for safe operation. (Please see aeronautical maps) According to the FAA's 'Airspace 101', there is no unregulated airspace. Drones can operate in airspace up to 400'. There is 100' of separation between drones and Class G. Aircraft can fly 500' above uncongested (rural) areas and must be 1000' above the surface of congested (city) areas. Class G is the only form of uncontrolled airspace. It is not charted and exists wherever class A, B, C, D or E does not. It starts at the surface and extends up until it hits Class E. For Jerome County Airport, Class G starts at the surface and goes up to 700'. Class E (controlled) airspace starts at 700' at Jerome Airport and extends up to 18,000'. The reason for Class E airspace at 700' is to protect all aircraft on instrument (IFR) approaches and departures. For larger and faster planes, larger and more protective Class E transition areas are necessary. All airspace is navigable airspace. In speaking with the Idaho Division of Aeronautics, they explained the two studies on the turbines by the FAA. Both studies were lumped into a square and a turbine from each study was used to determine that all turbines in the entire project, based on those two, would be hazardous to all navigable airspace. Magic Valley Energy has submitted two sets of 7460-1, Notice of Proposed Construction or Alteration, forms to the FAA. The first set of 7460-1 ASN's were submitted for 740' tall wind turbines. Magic Valley Energy withdrew those studies after the FAA determined that "the structure exceeded obstruction standards and/or would have an adverse physical or electromagnetic interference effect upon navigable airspace or air navigation facilities". In 2022, Magic Valley Energy submitted new 7460-1 forms with revised tower heights of 660' tall wind turbines. A circularization published by the FAA again noted the turbines as penetrating into controlled navigable airspace. While the FAA has yet to release a final determination, a FOIA submitted by a concerned citizen, and submitted herein, shows two responses to the latest 7460-1 forms for wind turbines as still being obstructions and hazards to flight. (Please see FAA OE Study comment submitted letter and FOIA information attached). The Lava Ridge Wind Turbine project encompasses all of the training area for which student pilots learn to fly due to proximity to the Jerome and Hazelton airports as well as being over an uncongested area. This area was set by the FAA. Larger, faster aircraft start transitioning to lower altitudes 120 miles away from their final destination. If the project is constructed, the FAA must readdress our class E airspace. There is grave concern that this will eliminate IFR approaches and departures for both runways for all air traffic. We have worked hard to grow this airport and have spent nearly $4 million in the past four years in preparation for the runway expansion. The Jerome County Airport is now considered a B-11 facility with a 20-year master plan. Ag Tractors use both the Jerome and Hazelton airports. While the Hazelton Municipal Airport is smaller it is no less important and will also be adversely impacted. The runway has been resurfaced and plans for constructing a new paved taxiway are in the works to serve the ag tractors that use the airport. The close proximity of wind turbines to this airport is especially concerning due to the unknown effects of turbulence and/or vortices that are known to be a hazard to flight. We ask that before any decision is made, a thorough investigation also be made regarding the following issues in addition to the concerns we have addressed above: *Effect of electromagnetic interference on the accuracy of GPS for intersections and instrument approaches. The FAA's response to the 7460-1 mentioned electromagnetic interference. What would be the cumulative effect of combining 200 to 400 wind turbines in one geographical area? *Impact of tower height on airspace E for instrument approaches (IFR). The tower height could have an effect upon IFR approaches and possibly eliminate them *Impact of tower height on airspace G for visual flight rules (VFR) *Ice shedding *Strobe effect upon instrument flight (which can cause vertigo). These wind turbines will be required to have 6 red flashing lights per turbine for night time visibility and white flashing lights for daytime visibility *Vortices (AOPA.org) *While the towers require lighting, the blades, which project a minimum of another 240' into the airspace, are unlit, presenting a danger	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation), 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation), and 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
12956-2	Ralph Kincheloe; John Higley; John Toolson; Albert Lockwood; Gary Oliver; Darrell Fairbanks; Tom Peters	The Jerome County Airport is uniquely positioned to capitalize on growth due to its location at two major highway intersections. Based upon a 2020 Idaho Airport Economic Impact Analysis Update, the Jerome County Airport was responsible for 51 jobs, $2.33 million in earnings; $4.16 million in gross domestic product; and $9.1 million in economic output. These numbers have only continued to grow in the nearly three years since the study was performed. The Lava Ridge Project, while it may employ more during the construction phase, is only touted to employ 20 people. If we lose navigable airspace at either Jerome or Hazelton airports, our airports, our pilots and businesses all lose as well. The airport is much more conducive to employment and an economic impact than the wind turbines will ever be. Chapter 12, Airport Zone, in the Jerome County Comprehensive Plan addresses protection of the Jerome County and Hazelton Airports. Coordination with the Jerome County Government is required through NEPA. The DEIS does not address our county airports adequately. (Attached is a copy the ordinance.)	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The aviation analysis in the final EIS Section 3.8.2.2 (Impacts) discloses the potential for economic impacts related to aviation resources in the analysis area. Based on the analysis of the preliminary FAA study results, aviation uses in the analysis area, and the probable effects to airspace and airports, no quantifiable or significant economic impacts to aviation are anticipated.
13006-36	Leon Smith	Recommend updating the DEIS to include newest FAA ceiling requirement that affects Jerome airport and pilots, acknowledging risk to flights in and out of the airport.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport.
13012-12	Heather Saunders	Speaking of warming, we can't forget to discuss the impact that wind turbines can have on local atmospheric conditions. That impact is unpredictable although the production of wake turbulence is a known quantity. Some of the installations shown on the map are awfully close to private land and ranchers frequently hire crop dusting aircraft to apply fertilizers and other substances to their fields. In order to ensure a complete application the aircraft need to cross the boundaries of the fields. How will the developers ensure that such aircraft are not subjected to wake turbulence from these turbines? Is BLM prepared to control the airspace and ensure accidents don't happen? Is the company prepared to compensate ranchers who may have to find more expensive and labor intensive alternatives to crop dusting? Ranchers are also turning to drone technology to keep eyes on their herds and properties. Wake turbulence from wind turbines can have a devastating effect on a flying drone; it's an invisible phenomena that can destroy the expensive tools used to save time and money by monitoring assets from the air.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation).
1538-1	Stephanie	I am writing to adamantly oppose the Lava Ridge wind project. LS Power has neglected to obtain FAA approval for the 740' towers they plan to build. They state "following construction of the towers, they will address the concerns issued by the FAA." How would this constitute the project meeting FAA regulations? I sincerely doubt LS Power will dismantle their towers that are deemed "unsafe for aeronautics" near airports in the entire Magic Valley. This includes Jerome, Hazelton, Gooding, Burley, Shoshone and Twin Falls. What is laughable is that LS Power listed on the FAA form Dietrich as the location for this monstrosity of a turbine; the furthest location from the Jerome County airport.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Impacts to airports in the analysis area is discussed in Section 3.8.2 (Aviation). The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport is located outside of the aviation analysis area.
2314-2	Mike Tylka	Air Space. We have several airports in the area; Jerome, Hazelton, Burley and Hailey. What effect will this have on local airports? How about crop dusters, that generally fly at altitudes lower than these towers? Private pilots in the area? Life Flight helicopters? Fire suppression aircraft?	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
2852-2	Mike Telford	3. Aviation - & GPS signal concerns have not been considered.	See responses to comments 11226-3 and 11535-96 (see both in Table A-3o, Land Use and Realty, including Aviation).
2878-1	Scott Prow	Site elevations of each turbine5 (and thus the terrain) from the lowest to the highest indicates that Class E Airspace would begin anywhere from 4,653' to 5,709' MSL at any point over the Lava Ridge Project. Any aircraft operating under Visual Flight Rules (VFR)6 flying over the top of the project would be operating within Class E Airspace and will have further operational restrictions as an aircraft is required to remain 500' below any cloud7/ceiling.8 This would mean that the ceiling could be no lower than 5,500' to 6,600' MSL (ceiling of 1,600' AGL±) for daytime operations and 5,700' to 6,800' MSL (ceiling of 1,800' AGL±) at night. All the weather data cited within the EIS appears to focus either solely on wind and temperature data or on wildlife habitat. I was interested in finding tactical weather trends needed in performing my job. I first went to the two weather sources cited in the document.9 Neither of these resources had anything of value for the information I needed. Next, I went to various .gov websites for information and was further unable to find historical cloud ceiling data. Eventually I evaluated the Automated Surface Observing System (ASOS) hourly weather data from the Jerome County Airport (KJER) as it is the closest legal aviation weather reporting station to The Lava Ridge Project. I evaluated the period between 15 December and 31 March,10 starting in 2013 to present. Any visibility less than 3 miles I discounted (as this is the minimum required visibility for VFR flight). I discounted ceilings of more than 1,800' (as I have shown this would be our minimum ceiling to fly at night over the project). For each year evaluated I looked at how many periods were below the 1,800' minimum ceiling which is required to fly. Some of these periods within the calendar day were short (one hour) but some were quite lengthy (half the calendar day).11 My conclusion is that there will be an additional 28.7 periods-of-time, some short and some long, within the calendar day that will further preclude flying during the winter months inside the project's area.12 The following are two very realistic scenarios and are something that HAA crews perform regularly. Firstly, I examine an interfacility transfer. A crew may need to fly a patient from one of the hospitals in Burley or Rupert to a higher level of care in the Boise area. I have already discussed that in the event of "low" weather a HAA crew will be unable to fly a direct course over the top of the wind project. In this event one would most likely divert their flight	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1 [Affected Environment]) and to analyze how they might be affected by the project (see Section 3.8.2.2 [Impacts]). As described in Section 3.8.2.2, the project would not significantly impact or reduce the usefulness of the existing overlying FAA airspace, except for within 500 feet of obstructions, and there would be no significant impact to the use of the identified and registered airports in the analysis area. Pilot operations would be similar to other navigation hazards occurring within the analysis area from existing tall infrastructure, including transmission towers, communication towers, and met towers. Pilots operating under VFR in the associated Class E and Class G airspace in the analysis area would still be required to navigate using the “see and avoid” concept around the turbines or other obstructions (transmission towers or met towers).

Comment ID	Commenter	Public Comment	Response to Comment
		path to the south, vicinity Eden. Realistically this would not add more than two minutes to the enroute time depending on the winds. But considering some of the patients that are transferred and the reason, even a minute can count. For a stroke, time is brain. For the heart, time is heart muscle. And there obviously can be various other reasons when time really matters. Secondly, I examine a scene call. Interstate 84 is on the south side of the project. U.S. 93 is on the east side and State Highway 24 on the north. People live, work, travel, and recreate in and around every side of the wind project. There will be injuries and illnesses from all points. Again, if a pilot is operating with low ceilings, they will be forced to circumnavigate the wind turbines. Depending on where the patient is picked up and where the receiving facility is located a pilot may be required to add an additional 6 to 7 minutes of flight time to the time enroute depending on winds and the speed of the aircraft. I have already discussed how minutes can sometimes truly determine the outcome of the patient. This facet of the aviation sector was not discussed in the EIS. I hope that I was able to clearly articulate how weather and terrain/obstacles all must be evaluated before accepting and continuing a flight particularly in the Helicopter Air Ambulance setting. Not to sound cliche, but over the years I have seen how minutes can really affect the outcome of a patient-either negatively or positively.	
3224-1	Scott Prow	I have been a Helicopter Air Ambulance (HAA) Pilot in the Magic Valley since 2007. I am employed by Intermountain Health flying from the Cassia Regional Hospital in Burley, and I Previously flew for Air St Luke's from the Magic Valley facility. There are three HAA operators in the Magic Valley: Intermountain Health/Classic Air Medical at the Burley facility, Lifeflight Network at the Burley Airport (KBYI), and Air St Luke's at the St. Luke's Magic Valley facility in Twin Falls. As proposed, virtually the entire area of the Lava Ridge Wind Project, both vertically and horizontally, (Alternatives B through E) lie within a Class E Airspace Area down to 700' Above Ground Level (AGL). Utilizing the 740' structure/blade height that is cited in the Lava Ridge Wind Project Draft Environmental Impact Statement (EIS) a HAA operator would be required to fly at an altitude of 1,040' AGL during the day and 1,240' at night. This would place a helicopter anywhere from 4,993' to 6,049' Mean Sea Level (MSL) during the day or 5,193' to 6,249' MSL at night. Site elevations of each turbine (and thus the terrain) from the lowest to the highest indicates that Class E Airspace would begin anywhere from 4,653' to 5,709' MSL at any point over the Lava Ridge Project. Any aircraft operating under Visual Flight Rules (VFR) flying over the top of the project would be operating within Class E Airspace and will have further operational restrictions as an aircraft is required to remain 500' below any cloud /ceiling. This would mean that the ceiling could be no lower than 5,500' to 6,600' MSL (ceiling of 1,600' AGL +-) for daytime operations and 5,700' to 6,800' MSL (ceiling of 1,800' AGL +-) at night. All the weather data cited within the EIS appears to focus either solely on wind and temperature data or on wildlife habitat. I was interested in finding tactical weather trends needed in performing my job. I first went to the two weather sources cited in the document. Neither of these resources had anything of value for the information I needed. Next, I went to various .gov websites for information and was further unable to find historical cloud ceiling data. Eventually I evaluated the Automated Surface Observing System (ASOS) hourly weather data from the Jerome County Airport (KJER) as it is the closest legal aviation weather reporting station to The Lava Ridge Project. I evaluated the period between 15 December and 31 March, starting in 2013 to present. Any visibility less than 3 miles I discounted (as this is the minimum required visibility for VFR flight). I discounted ceilings of more than 1,800' (as I have shown this would be our minimum ceiling to fly at night over the project). For each year evaluated I looked at how many periods were below the 1,800' minimum ceiling which is required to fly. Some of these periods within the calendar day were short (one hour) but some were quite lengthy (half the calendar day). My conclusion is that there will be an additional 28.7 periods-of-time, some short and some long, within the calendar day that will further preclude flying during the winter months inside the project's area. The following are two very realistic scenarios and are something that HAA crews perform regularly. Firstly, I examine an interfacility transfer. A crew may need to fly a patient from one of the hospitals in Burley or Rupert to a higher level of care in the Boise area. I have already discussed that in the event of "low" weather a HAA crew will be unable to fly a direct course over the top of the wind project. In this event one would most likely divert their flight path to the south, vicinity Eden. Realistically this would not add more than two minutes to the enroute time depending on the winds. But considering some of the patients that are transferred and the reason, even a minute can count. For a stroke, time is brain. For the heart, time is heart muscle. And there obviously can be various other reasons when time really matters. Secondly, I examine a scene call. Interstate 84 is on the south side of the project. U.S. 93 is on the east side and State Highway 24 on the north. People live, work, travel, and recreate in and around every side of the wind project. There will be injuries and illnesses from all points. Again, if a pilot is operating with low ceilings, they will be forced to circumnavigate the wind turbines. Depending on where the patient is picked up and where the receiving facility is located a pilot may be required to add an additional 6 to 7 minutes of flight time to the time enroute depending on winds and the speed of the aircraft. I have already discussed how minutes can sometimes truly determine the outcome of the patient. This facet of the aviation sector was not discussed in the EIS. I hope that I was able to clearly articulate how weather and terrain/obstacles all must be evaluated before accepting and continuing a flight particularly in the Helicopter Air Ambulance setting. Not to sound cliché, but over the years I have seen how minutes can really affect the outcome of a patient—either negatively or positively. I had thought of offering the following opinions for taking into consideration options of how to mitigate the impact to HAA operations: Use only the shorter towers (maximum height of 390') or proceed only with Alternative "A"—No Action. But after rereading the EIS I found an apparent disparity in quoted wind turbine heights. 390' appears to be the height for a 2-MW turbine. The size and height of the turbines proposed for this project are for 3-MW to 6-MW structures. A 3-MW turbine would likely be larger and taller than a 2-MW turbine. Nowhere in the EIS does it speak to the size of a 3-MW turbine. In light of this oversight I cannot know for sure the actual height of a shorter 3-MW turbine and this inconsistency (between	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1 [Affected Environment]) and to analyze how they might be affected by the project (see Section 3.8.2.2 [Impacts]). As described in Section 3.8.2.2, the project would not significantly impact or reduce the usefulness of the existing overlying FAA airspace, except for within 500 feet of obstructions, and there would be no significant impact to the use of the identified and registered airports in the analysis area. Pilot operations would be similar to other navigation hazards occurring within the analysis area from existing tall infrastructure, including transmission towers, communication towers, and met towers. Pilots operating under VFR in the associated Class E and Class G airspace in the analysis area would still be required to navigate using the "see and avoid" concept around the turbines or other obstructions (transmission towers or met towers).

Comment ID	Commenter	Public Comment	Response to Comment
		the 2-MW and 3-MW turbines) gives me pause and I question what else in this EIS may be wanting or disingenuous. Because of this I cannot support this project and would propose Alternative “A”—No Action.	
3256-3	Regina Smith	In volume three appendix 3. Issues analyzed in brief. AIB -14. Pg. App3-6. Several topics are touched on but only briefly. Issues analyzed in brief include aerial farm crop application. One paragraph. Yes, it says pilots can fly at their own risk around these hazards. "Pilots would assess situation - specific risk when flying crop-dusting or other small aircraft." MVE assumes there will be some reduction in aerial crop dusting and may affect timely application. This is the pilots' livelihood as well as the farmers depending on this treatment in a timely fashion. MVE mentions that the towers will be lit at night. Crop-dusting doesn't occur at night.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
3340-7	Sue Page	The LRWP will alter the way aerial fire suppression and agricultural applicators perform their duties. The imposition of up to 740 foot tall structures on the landscape will dramatically increase the already inherent danger to the pilots. Who will be liable for the loss of life or limb, should one of these pilots collide with these Godzillas? Will LS Power have to pay for the losses? LS Power plans to install lighting atop the turbines that will only come on when the aircraft sensors detect an oncoming plane. These sensors are a mechanical device that can, and will fail (that’s firearms safety 101 – don’t rely upon the safety to operate 100% of the time-it is a mechanical device that can and will fail, so don’t point your gun at anything you don’t intend to destroy). If the sensors and/or lights fail, who or what will be destroyed? Does the BLM care about Mark or Randy – men that make their living with their aircraft?	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1 [Affected Environment]) and to analyze how they might be affected by the project (see Section 3.8.2.2 [Impacts]). Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). Regarding turbine marking and lighting, see the response to comment 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation).
4220-4	Sue Page	Also, there isn't any study of the affect on aviation. The effects on the radar system, the wake rolling of light aircraft, the effects of crop dusting down wind and even if it can be done safely or at all. Will the wake turbulence affect the fertilizer sprayed?	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation).
4724-1	Harold Dimond, Carolyn Dimond	Seriously……we are finding more missing information from this DEIS every day. Things that we have already addressed plus now we find out why aviation is not on the study. Somehow initial findings from the FAA form 6740 have disappeared. Strange, isn’t it? Too bad for them that all copies were not destroyed, even though it has been removed from FAA’s database. That must have cost LS Power/MVE a bit, don’t you think?? The initial findings which you probably already know about stated the project should not be built due to the impact on aviation safety and the instrument approaches to the airports in the Magic Valley. Then a new form 6740 was filed but with a lot of information missing and listing only lighting and communications. Now they are saying they will build the towers and then address and work with the FAA knowing full well the FAA cannot do anything about it after the mess is built. Also, in the initial filing the Jerome airport which of course is closest to their “Wind Project” was not even mentioned. Making it so there was no study made on the most important airport. HMMMMM Solution: BLM must have the project’s impacts on area airports and instrument approaches evaluated before ANY permits for construction are issued.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation), 11535-96 (see in Table A-3o, Land Use and Realty, including Aviation), 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation), and 9216-2 (see in Table A-3o, Land Use and Realty, including Aviation).
5313-1	Richard Dinges	I am commenting on the Project Lighting in Appendix 11.3, and to the following paragraphs: "Because the turbines and met towers would exceed heights of 200 feet above ground level, the turbines would be marked or lighted per Federal Aviation Administration (FAA) guidelines and an approved lighting plan to adequately warn aircraft pilots of the obstruction at night. FAA nighttime lighting requirements include the use of red, simultaneously flashing lights positioned on the outer perimeter of the wind energy facility, each spaced no more 0.5 mile from each other(FAA2020). the FAA determines which turbines would require nighttime lights, but it is anticipated that approximately half of the turbines would be marked by red lights, particularly the turbines on the outer perimeter of the project or on high terrain." Next paragraph is skipped " If approved by the FAA, MVE would deploy an ADLS to mitigate the need for continuous operation of the flashing red lights during nighttime hours. An ADLS has one or more elevated radars that scan the region near the project for aircraft and activate the red flashing lights on turbines only when an aircraft is detected within a specified distance. For the project ....." "When ADLS is used, the frequency of "lights on" time is driven by the geographic location of a project and its proximity to low-altitude, nighttime air traffic operations. The area surrounding....." The wording in these paragraphs imply that aircraft will only be approaching the project area from the outer perimeter and at low-altitude. No consideration is being given to an aircraft approaching from a high-altitude in a spiral decent over the project area. Also, no mention is made of what type of radar will be deployed and what its range of detection would be, both vertically and horizontal. A case can be made for an aircraft descending into the project area from above, being detected by the radar, but if all the towers are not lit, collision with a non lit tower could result. With only half of the towers being lit, I believe the probability of a worse case scenario is very high, even if the interior towers on high terrain within the project are lit. Also, emergency landings in the project area have not been considered. Another case that I do not see addressed is daytime flight operations in non-clear-sky weather. Will the airspace above the project area be a no fly zone, or will there be altitude restrictions for both IFR and non-IFR conditions? I look forward to your response. Thank you.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation).
5437-1	Richard Dinges	I previously submitted a response to the Lava Ridge Environmental Impact Statement (EIS) regarding lighting of the wind turbines for aircraft avoidance. However there is another issue with the wind turbines that has not been addressed, and that is their radar signature or their electromagnetic reflectivity. This concern has been brought to my attention by a congressional hearing on Thursday, 16 March 2023, in Wildwood, New Jersey called by US Congressman Jefferson Van Drew (R-NJ-02). The press release regarding this hearing is attached to this email. The results of this hearing were reported by Breitbart News on 18 March 2023, and partially appears below:	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
		START A panel of experts testifying to members of Congress at an in-district hearing in Wildwood, New Jersey, on Thursday warned that offshore wind projects actively promoted and subsidized by state and national Democrats could greatly interfere with radar and navigation in the Atlantic Ocean, creating a national security threat. The panel included environmentalists, fishing industry experts, and advocates with working experience at the Department of Energy. Several noted concerns with maritime territory designated for wind farms apparently getting in the way of Pentagon and NASA operations. Another noted that the farms' potential interference with ship radar could damage U.S. Coast Guard activities, including rescue missions. Another concern raised was the possibility of cargo ships, particularly those carrying oil or chemicals, being unable to navigate the seas and colliding, causing an environmental catastrophe. NASA has said that these areas interfere with all their missions out of Wallops Island; the Navy has said there is not an area in that whole lease block that does not interfere with DOD [Department of Defense] missions, but BOEM [the Bureau of Ocean Energy Management] is continuing ahead," Meghan Lapp, the fisheries liaison for the Rhode Island commercial fishing company Seafreeze, told the panel of lawmakers. "When I've asked them on webinars, like – the Navy said that this is a problem how can you still be leasing it?" she noted, "'Well, we're just going to be continuing the discussions.'" Lapp recounted that she attempted to discuss the issue of potential radar interference with the U.S. Coast Guard in 2018 and found officials there "completely unaware of the issue." "Coast Guard personnel told us, 'we don't know what to tell you, this is literally the first we heard of this.'" The hearing was chaired by Rep. Jeff Van Drew (R-NJ), who represents the district the hearing occurred in, and attended by fellow Jersey Shore lawmaker Rep. Chris Smith (R-NJ), Rep. Andy Harris (R-MD), and Rep. Scott Perry (R-PA). Rep. Smith has introduced legislation in Congress to demand further scientific research into the impact on ocean ecosystems that offshore wind farms may have. In his opening remarks, Rep. Smith, condemning the wind farm project approval process as "shoddy at best," highlighted studies that suggest wind farms could significantly impair the use of radar to navigate the ocean. "Vessel navigation including U.S. Navy ships, merchant ships, and search and rescue operations … their radars will be compromised," he noted, citing a study published last year by the National Academies of Sciences, Engineering, and Medicine. "The report concludes wind turbine generators have significant electromagnetic reflectivity, and therefore can interfere with radar systems operating nearby," the Academies explained in a press release on the results of the investigation into offshore wind farms last year. "The rotating blades can also create reflections in Doppler radar systems. In particular, these forms of interference could obfuscate smaller vessels and stationary objects such as buoys on radar, complicating navigation decisions and increasing the risk of collision with larger vessels." Rep. Smith highlighted that the study found "that wind turbine generators obfuscate the marine vessel radar for both magnetron-based and solid-state radar." END Although the hearing focused on an off-shore wind project and its effect on marine radar navigation, the question that must be addressed with the Lava Wind Project is: what effect will the electromagnetic reflectivity have on area aircraft radar and navigational systems? There are airports in Jerome, Gooding and Burley servicing private and commercial operations, airports in Twin Falls and Sun Valley servicing private, commercial, and scheduled airline service, and a military air base in Mountain Home. A straight-in approach for landing to the Jerome airport from the east will pass over the Lava Ridge Project. There are aircraft from the Mountain Home airbase frequently operating over the Twin Falls area. The Mountain Home airbase commander must be consulted to determine what effect the electromagnetic reflectivity of the wind turbines might have on their activities. Likewise, the FAA must be consulted to determine what effect the electromagnetic reflectivity of the wind turbines might have on private and commercial radar and navigational systems. An unaligned array of 400 wind turbines would generate a confusing signature to operating radar systems, especially with considerable mountainous terrain nearby. IFR operations could be quite hazardous. Also, consideration must be given to both firefighting aircraft and air life-flight operations that could occur in the area. Since the project area will be open to hunting and livestock grazing, there will be considerable human activity in the area. Since there has been no consideration for the effect of the electromagnetic reflectivity of wind turbines on aircraft radar and navigational systems, the NO BUILD OPTION should be selected.	
5501-1	Diana Nielson	Form 7460-1, Notice of Proposed Construction or Alteration, for ASN 2022-WTW-4666-OE. This application states Burley, Joslin Field and the Jerome airports will be negatively affected. Also the small landing strips will be affected like in Dietrich, Laidlaw and other private strips. This project will affect Gooding Airport to indirectly by loss of crop dusting services. These airports are critical for Air Support Emergency services. If Hailey Airport needs an airport for an emergency landing this project will increase the risks and possibly loss of an instrument landing. [...] The transmission line towers will congest this area even more. They also will need an FAA permit application.	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Impacts to airspace, airports, and aerial operations in the analysis area are discussed in Section 3.8.2 (Aviation). The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport is located outside of the aviation analysis area.
5896-2	Mike Tylka	Air Space. We have several airports in the area; Jerome, Hazelton, Burley and Hailey. What effect will this have on local airports? How about crop dusters, that generally fly at altitudes lower than these towers? Private pilots in the area? Life Flight helicopters? Fire suppression aircraft?	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
6338-1	Chris Austin	This is in response to your request for informal comments. I'm wondering why MVE doesn't seem to be addressing the FAA's concerns about aviation safety with the 740' tall turbines. The FAA submitted a report in 2021, and that report was scrapped at the request of MVE. Then they were asked to resubmit in 2022, which they have, and they still seem to be ignoring their concerns regarding the turbine heights and their request for the no-build option due to their concerns for aviation safety. According to Mark Doerr "Several years ago MVE requested a survey of the Lava Ridge project and the FAA recommended a do not build due to the impact of the towers to aviation safety, airports and instrument approaches." And "This issue has NOT been addressed even though Ben Crouch, a Jerome County Commissioner and a RAC committee member, has brought it to their	See responses to comments 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
		attention multiple times." Mr Doerr also posted "MVE stated in the DEIS that they just need to build the project and then they will work with the FAA. The only problem with that statement is that the FAA has no authority to demand a tower be taken down after it is built and is found to have an impact on airports and instrument approaches. The FAA has no enforcement authority over construction of towers.	
6387-7	AJ Whitecotton	We have several airports in the area; Jerome, Hazelton, Burley and Hailey. What effect will this have on local airports? How about crop dusters, that generally fly at altitudes lower than these towers? Private pilots in the area? Life Flight helicopters? Fire suppression aircraft?	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
6451-1	Kerry Requa	this project will impact flight safety and compromise the ability to navigate and fly in times of bad weather. In good weather this project will cause unsafe conditions when winds are blowing creating turbulent conditions far downstream from the windmills. The location of the project will have impacts on several landing sites including the airstrips in the desert and in particular the Jerome airport. I want to be assured that all aspects of this proposed project include studies of how our airports and flying activities may be impacted. Please show me how you have included aviation and all possible landing sites in this proposal. We, the Idaho Aviation Association and our members demand you study how aviation safety will be addressed and if any landing sites within the area have been studied.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation).
6865-1	Amber Cnossen	My husband is a pilot and we fly into Jerome Idaho. We are concerned that the current EIS for the Lava Ridge project does not contain any data for pilots regarding instrument landing and takeoff at Jerome and Gooding airports. Considering the instrument landing plane accident a few months ago at the Burley airport we request this be addressed in the EIS.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information on the potential impacts to the Jerome County Airport and aviation in general during the public scoping period has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport. The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport is located outside of the aviation analysis area.
6871-1	Name Not Provided	I am aware of at least 2 landing areas near the project that are used by aerial applicators. They are located at 42.735076deg, -113.842667deg and 42.764002deg, -113.828460deg. These are located within 1-3 miles of the siting corridors of Alternatives B, C, & E. Many of the farms in the area depend on the aerial applicators for timely applications of fertilizer, and crop protection products. The installation of the turbines would limit farm's access to affordable application methods as some pilots will simply not fly near a turbine. There is also concern that there might be air disturbance from the turbines that would limit the safe and effective operation of helicopter applications.	See comment 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation) regarding turbine wake. Also see response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). These agricultural landing areas were added to the final EIS and are addressed in Section 3.8.2 (Aviation).
6871-3	Name Not Provided	Living near the BLM land I have witnessed many wildfires. Many of those fires have been fought with the help of airplanes. The retardant drops have been used to help control the spread of the fire and to protect homes and fields that are near BLM land. They have been instrumental in getting a large fire under control that is burning too hot and too fast for a firebreak to be established.	See responses to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 11535-60 (see in Table A-3i, Fire and Fuels Management).
7337-1	Matt F.	lease accept my comment regarding the Lava Ridge Wind Project EIS as it relates to determining the reliability of the lighting system on the turbines. The draft EIS, page 3-424 states that lights on turbines will only illuminate when aircraft are within 25 miles. However, these lights, like all electrical and mechanical systems, will eventually fail. The EIS doesn't lay out a process for who pays for the loss of life and property when an aircraft inevitably collides with a turbine. Further, it doesn't call out the details of a system that would monitor whether the lights are always working. Such a system would need to continually monitor for false positives: a light activating when an aircraft is not within 25 miles. It would also need to monitor for false negatives: a light not activating when an aircraft is within 25 miles. If any alternative other than A is approved, Magic Valley Energy should be required to implement and staff a 24 hour system which monitors whether the lights are working for the life of the project. MVE should also be required to fund and implement a dispute resolution mechanism or restitution process whereby MVE would compensate victims for the loss of life and property when an aircraft inevitably collides with a turbine. Approving the project without explicitly calling out the details of such a process is gross negligence.	It is anticipated that the FAA will require turbines and other tall structures exceeding a height of 200 feet above the ground to be marked or lighted per FAA guidelines. MVE would be required to operate the project in compliance with the FAA's requirements for marking and lighting. Through consultation with the FAA, MVE is investigating deployment of an ADLS to mitigate the need for continuous operation of the red flashing lights during nighttime hours. An ADLS comprises one or more elevated radars that scan the region proximate to the siting corridors for aircraft, and only activates the red flashing lights on the turbines when an aircraft is detected within a specified distance. The ADLS systems being installed in the United States are certified by the FAA and must contain a fail-safe system ensuring that, in the event that the radar or any component of the system becomes inoperable, the lights are illuminated permanently. In the event of a lighting outage, wind turbine operators are obligated to notify the FAA so that a Notice to Air Mission can be issued alerting pilots of the outage, regardless of the presence of an ADLS system.
7359-2	Name Not Provided	A turbine makes it much more of a hazard for crop dusters to fly over fields and spray to protect crops.	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
7412-1	Diana Nielson	This map from the FAA application: the Longitude's and Latitudes of 509 Wind Turbines 660 ft tall. Does not include the transmission line towers. (The few extra points in the far upper left corner are errors I don't know how to delete, please disregard.)	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 9216-2 (see in Table A-3o, Land Use and Realty, including Aviation). The analysis in EIS Section 3.8.2 (Aviation) considers the potential for tall structures (greater than 200 feet AGL) to pose hazards to air navigation.
7413-1	Diana Nielson	Magic Valley Energy/ LS Power does not have an approval from the FAA. Form 7460-1, Notice of Proposed Construction or Alteration, for ASN 2022-WTW-4666-OE. This application states Burley, Joslin Field and the Jerome airports will be negatively affected. Also the small landing strips will be affected like in Dietrich, Laidlaw and other private strips. This project will affect Gooding Airport to indirectly by loss of crop dusting services. These airports are critical for Air Support Emergency services. If Hailey Airport needs an airport for an emergency landing this project will increase the risks and possibly loss of an instrument landing.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). The received comments and additional information during the public scoping period on the potential impacts to the Jerome County Airport and aviation in general has provided additional review and detail concerning the potential impacts in the final EIS. See Section 3.8.2 (Aviation) of the EIS for the detailed aviation analysis. Additionally, the Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Jerome airport. The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport is located outside of the aviation analysis area.

Comment ID	Commenter	Public Comment	Response to Comment
7532-2	Daniel Olmstead	The main reason for my opposition is that I am an Independent General Aviation Flight Instructor, and aircraft owner, working out of the Jerome, Idaho airport. The Lava Ridge Wind Project is mostly located in the NE training area of the Jerome Airport. The proposed 400, 700+ foot wind towers will present hazards to most all General Aviation training activities. These activities include low altitude ground reference, and emergency engine out practice maneuvers.	See responses to comments 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
8376-2	Rachel Espil	will aerial fire suppression capabilities be obstructed in an area prone to wildfire?	See responses to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 11535-60 (see in Table A-3i, Fire and Fuels Management).
8458-7	Sue Page	Also, there isn't any study of the affect on aviation. The effects on the radar system, the wake rolling of light aircraft, the effects of crop dusting down wind and even if it can be done safely or at all. Will the wake turbulence affect the fertilizer sprayed?	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 1053-3 (see in Table A-3o, Land Use and Realty, including Aviation).
8629-1	Cathy Schiers	I am also concerned about how this project will affect the crop-dusting flight paths and firefighting efforts on the farmland and rangeland, as the project will prohibit low level flying and change the course of flight patterns at the Jerome airfield.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
8638-2	Mark Southwick	Another important aspect of agriculture is being able to apply fertilizer, nutrients and pest control products to the plants and soils efficiently by air for better and more economic crops. Having 400 wind turbines extending to an altitude of more than 700' above ground level adjacent to crop lands would present a real hardship and danger to those applying the product and a great liability to property owners and those pilots and aircraft being used. The project would limit if not eliminate the opportunity for sound farming practices involving aircraft application. FAA rules and regulations certainly limit operating close to 700' high windmill props and turbines.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
8642-2	Carl Montgomery	The airspace restrictions for emergency aircraft, aircraft fighting fires, crop dusters, and others would be detrimental to individuals in critical situations, as well as those operating businesses in the area (namely farmers and ranchers).	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
8790-5	James Ritchie	4. As farmers we rely on having aerial application of certain products on our crops. Our aerial spraying company says this project will negatively impact their ability to apply chemicals to our crops. We are also concerned about the ability to apply fire retardant via the air during a wildfire event in the Star Lake allotment. Living in a rural area we are also concerned about the effect of this project as it relates to Life Flight	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
9173-1	Randy Quigley	I appreciate the opportunity to comment on the Lava Ridge proposed wind project. As an association of Agricultural Aerial Aviators, there are some concerns with this proposed project that we would like to bring to your attention. As you are aware, applying crop protection products by air requires working in a low level flight environment. Most aerial applications take place at approximately 20 feet above the ground, so safety is our top priority. In order to safely and effectively dispense products at these low levels, the pilots need to have safe ingress and egress to the ag fields of around 500 feet. With the proposed height of the wind turbines ranging from 390 to 740 feet, they present a safety issue and a challenge while applying to the agricultural fields adjacent to the proposed wind project. Not only is the height of these wind turbines a safety factor, there is also the wind turbulence component that is generated down wind from these massive windmills that presents a challenge. With the shear number of windmills in this project, the effect of this turbulence will undoubtedly affect the timing that aerial applicators can safely apply to the adjacent crops. Instead of being able to apply to these adjacent fields as in the past, the application will now have to be postponed until favorable winds can occur on the upwind side of these windmills. Because of this restriction, additional damage may result to farmer's crops as the pest will have additional time to decimate their crops while waiting for favorable up wind conditions. The location of the wind towers next to crop land is also a safety concern. Flying a few hundred feet next to these massive structures with the potential of unexpected turbulence is frightening. Due to this issue, we are suggesting that a minimum set back of two miles to crop lands be considered for a safety corridor for aerial application. This distance is based from turbulence and the height issues for proper safety requirements for ingress and egress into the adjacent farm fields. This is especially applicable to the croplands next to the Hidden Valley farming area. Another major concern is the lighting of these tall wind turbines during construction. FAA requires as per 14 CFR Part 77: In general any temporary or permanent structure, including all appurtenances, that exceeds an overall height of 200 feet (61m) above ground level (AGL), or exceeds any obstruction standard contained in should normally be marked and/or lighted. Normally, outside commercial lighting is not considered a sufficient reason to omit recommended marking and/or lighting. Recommendations on marking and/or lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structures and overall layout of design. The FAA may also recommend marking and/or lighting a structure that does not exceed 200 (61m) feet AGL or 14 CFR Part 77 standards because of its particular location. You can find additional guidance in Advisory Circular 70/7460-1M, Obstruction Marking and Lighting. This was not addressed during the construction phase of the EIS and we are concerned that at night, the height of finished and unfinished wind turbines as well as the huge cranes that are left with their booms upright will exceed the 200 feet restriction and for safety purposes some type of FAA approved lighting needs to be in place during the construction phase. Idaho currently has a MET Tower Marking Law in place that requires a flashing light on towers above (50) fifty feet that are located outside city limits. We hope that this law is already in affect for existing MET Towers as well as any proposed ones. This was also not addressed in the EIS. Here is the link for that law. https://legislature.idaho.gov/wp-content/uploads/sessioninfo/2012/legislation/H0511.pdf The	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1 [Affected Environment]) and to analyze how they might be affected by the project (see Section 3.8.2.2 [Impacts]). Aviation for fire suppression activities is discussed in Section 3.7 (Fire and Fuels Management). See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management) for additional analysis added to EIS Section 3.7 (Fire and Fuels Management). As described in Section 3.8.2.2 (Aviation) the project would not significantly impact or reduce the usefulness of the existing overlying FAA airspace, except for within 500 feet of obstructions, and there would be no significant impact to the use of the identified and registered airports in the analysis area. Pilot operations would be similar to other navigation hazards occurring within the analysis area from existing tall infrastructure, including transmission towers, communication towers, and met towers. Pilots operating under VFR in the associated Class E and Class G airspace in the analysis area would still be required to navigate using the "see and avoid" concept around the turbines or other obstructions (transmission towers or met towers). Regarding turbine lighting, it is anticipated that the FAA will require turbines and other tall structures exceeding height of 200 feet above the ground to be marked or lighted per FAA guidelines. MVE would be required to operate the project in compliance with the FAA's requirements for marking and lighting. Also see response to comment 7337-1 (see in Table A-3o, Land Use and Realty, including Aviation).

Comment ID	Commenter	Public Comment	Response to Comment
		proposed Lava Ridge Project encompasses a large tract of BLM land which has had a history of lightening strikes which causes fires and as such using aerial fire fighting tankers will be greatly inhibited when dropping fire retardants with the 740 feet wind turbines hidden in the smoke. Also the restoration projects for aerial reseeding will be impacted with the number of wind turbines dotting the terrain. We do hope that those considerations have been factored into the proposed project lay out and that safety corridors will be established to accomplish fire fighting as well as the aerial reseeding of the burn areas. After careful review of the EIS, I could not find the FAA's findings of their original assessment of impact on aviation. See their letter below: [Notice of Preliminary Findings from FAA] Why wasn't this included in the EIS? We as an Association feel that a decision on the project should not be made until the Federal Aviation Administration has had an opportunity to officially fully weigh in on the impact this will have on the airspace, airports and aviation in the area. The Idaho Agricultural Aviation Association recognizes that energy demands will increase over time, but the power that is generated in Idaho should be part of Idaho's power and not destined to some other out of state market. If Idaho has to give up land, Idaho should also enjoy that benefit and it shouldn't come as a sacrifice for safety nor the reduction of agricultural crops. Right now there is an inordinate amount of political enthusiasm and investor hype to jump into wind generation, but at what point is the loss of public lands, the curtailment of farming and ranching, the desecration of sacred and historical sites, as well as the loss of Diurnal Raptors enough to put the brakes on such enthusiasm. How many dead Raptors will it take to say enough is enough? We ask that you review our concerns for safety, so that we can safely continue to apply crop protection products to adjacent farmlands in this project. We also respectfully lend our support to the recently adopted Idaho's House of Representatives Concurrent Resolution Number 004 of a No Build Option. This bill outlines the concerns voiced through a unified opposition to the project by local governments, counties, highway districts, farm and ranch groups and Idahoans about Lava Ridge. This bill passed both the House and Senate unanimously and was adopted by the State and be doing so requests the Governor and Attorney General to take what legal actions are available to encourage the BLM to select the No Build Option. The voice of the people has spoken through this resolution which is a lot of voices to be reconciled with! Please don't be distracted by the current political hype and error on the side of caution. The concerns we have outlined needs more time to be studied in order to be fully reconciled. Warmest Regards, Randy Quigley President of the Idaho Agricultural Aviation Association	
9216-2	Jon McGregor	I am here to talk about the affects Lava Ridge wind project would have on aviation. Section 5.10.2 of BLM (2005) describes impacts to aviation with wind energy. BLM (2005) found that because a wind energy development project would to meet FAA criteria, no adverse impacts to aviation would be expected. MVE has not met FAA criteria mitigation for dealing with the tall wind structures. FAA has said that option A NO BUILD is the only choice. Therefore option A NO BUILD is the only choice for me.	Section 3.8.2 (Aviation) was added to the EIS to discuss aviation issues, including those related to airspace, airports, and aerial operations in the analysis area (see Section 3.8.2.1) and to analyze how they might be affected by the project (see Section 3.8.2.2). MVE filed a Form 7460-1, Notice of Proposed Construction or Alteration, with the FAA for Alternative B with a maximum turbine height of 660 feet AGL (approximately 4,933 feet amsl). The FAA issued an NPH on February 2, 2023, which initiated an FAA public comment period and aeronautical study (FAA 2023a [Aeronautical Study No. 2022-WTW-4666-OE]). The comment period closed on March 11, 2023. As part of the NPH, the FAA public notice contained a preliminary list of detailed impacts that would result in exceeding current federal obstruction standards (as per 14 CFR 77.17 (a)(1) and (3)) and the other effects on aeronautical operations (as per 14 CFR 77.29 (a)(1). The FAA aeronautical study is underway, and results of the final study were not available at the time of EIS publication. The analysis contained in the EIS references the preliminary analysis that was disclosed in the FAA public notice.
9504-3	Zack Lanie; Idaho Farm Bureau Federation	My second concern has to do with the aerial applicators that are relied on so heavily to apply chemical and pesticide via airplane to those local farmers in the proposed area. The proposed windmill heights has raised high concerns for the safety of those pilots as well as just being able to accomplish the job needed to get done when it comes to applying chemical to fields. Not only is there the aerial applicators for crops but there are also those pilots that are there that fly to help manage the coyote population in this area. With as many windmills that have been proposed, it would make it extremely difficult to effectively manage the coyote population.	See response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
9902-1	Mary Saucier	Magic Valley Energy/ LS Power does not have an approval from the FAA. Form 7460-1, Notice of Proposed Construction or Alteration, for ASN 2022-WTW-4666-OE. This application states Burley, Joslin Field and the Jerome airports will be negatively affected. Also the small landing strips will be affected like in Dietrich, Laidlaw and other private strips. This project will affect Gooding Airport to indirectly by loss of crop dusting services. These airports are critical for Air Support Emergency services. If Hailey Airport needs an airport for an emergency landing this project will increase the risks and possibly loss of an instrument landing.	See responses to comments 3224-1 (see in Table A-3o, Land Use and Realty, including Aviation) and 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation). Impacts to airspace, airports, and aerial operations in the analysis area are discussed in Section 3.8.2 (Aviation). The analysis area for aviation comprises the Alternative B siting corridors and a 15-mile buffer. The Gooding Airport is located outside of the aviation analysis area.

Livestock Grazing

Table A-3p. Livestock Grazing

Comment ID	Commenter	Public Comment	Response to Comment
10420-1	Darrin Lamb	The EIS is not done correctly. It violated the Taylor grazing act.	The EIS follows NEPA, FLPMA, and applicable CFRs and BLM manual guidance. See Section 3.9.1 (Grazing Allotments and Range Socioeconomic): "Existing livestock grazing permits would not be modified through this

Comment ID	Commenter	Public Comment	Response to Comment
			EIS. If part of the action alternatives would require modifications to grazing permits, this would be addressed in a subsequent NEPA analysis and permit actions, in accordance with CFR Subpart 4120, Grazing Regulations."
10421-2	Barbara Martien	[Vote no for wind towers on Lava Ridge.] Cattle grazing laws violated.	See response to comment 10420-1 (see in Table A-3p, Livestock Grazing).
10423-1	Scott Prow	I would like to point your attention to the second part of an article which seems to show that the BLM would be in violation of Federal Law if this project were to be initiated. Schumacher, Karen. "Is The BLM Violating Grazing Laws? Part 2." Redoubt News, 1 Apr 23	Also see response to comment 10420-1 (see in Table A-3p, Livestock Grazing). MVE submitted their application and preliminary plan of development in February 2020, and revised their plan in October 2022 and again in December 2023 (MVE 2023). As part of the EIS process, the BLM held public scoping and consultation meetings and initiated coordination with cooperating agencies and Tribes. Public scoping for the project was initiated on August 20, 2021, when the BLM published an NOI in the *Federal Register*. Two virtual public scoping meetings were held on September 8 and 9, 2021. Seven government entities are participating as cooperating agencies: the NPS, the USACE, the USFWS, the State of Idaho, Jerome County, Lincoln County, and Minidoka County. The project scoping report and the BLM's consultation and coordination documentation are available at https://eplanning.blm.gov/eplanning-ui/project/2013782/510. With release of the draft EIS, the BLM held public meetings in Shoshone and Twin Falls, Idaho; Portland, Oregon; and Seattle, Washington in late February and early March 2023. The BLM also held virtual meetings in February 2023. The BLM has now revised the EIS in response to public and agency comments.
10426-6	Casey Stevenson	[These are my concerns which have not been addressed by the EIS which will impact thousands of people, and need to be reevaluated. Here are my concerns:] In addition, Wind turbines can cause a flickering effect when the sun shines through the spinning blades, which may be annoying or even harmful to animals and humans. This can be particularly problematic for livestock, as the flicker effect can cause them to become agitated or stressed. The disturbance caused by the construction and operation of wind turbines can cause stress and anxiety in cattle, which can lead to a reduction in milk production and weight gain. Another effect would be behavioral changes in cattle, such as reduced grazing, increased aggression, and decreased socialization. Furthermore, the electromagnetic fields generated by the wind turbines can affect cattle's biological processes, such as their circadian rhythms and hormonal balances, leading to disruptions in their reproductive and metabolic functions. The construction and operation of wind turbines can cause disturbances in the local ecosystem, which can impact the availability and quality of pasturelands for livestock. The construction of access roads, foundations, and transmission lines can cause soil compaction, erosion, and changes in the surface hydrology, which can result in the loss of topsoil and reduced vegetation cover, leading to reduced forage availability. The use of herbicides to control vegetation around wind turbines can also have negative effects on livestock health by reducing soil biodiversity and microbial activity, which are essential for maintaining soil health and forage productivity.	See response to comment 11204-20 (see in Table A-3p, Livestock Grazing). Section 3.9.2 (Physiological Effects to Livestock) discusses physiological effects to livestock, including available published literature and analysis. An in-depth review was conducted on the effects of increased anthropogenic stress catalysts to cattle and sheep, specifically associated with shadow flicker, electromagnetism, noise, vehicle traffic, and a general increase in human presence. No published literature directly addressing shadow flicker and effects to livestock was identified. Helldin et al. (2012) does note that there were no documented visual impacts to terrestrial mammals from wind farms; however, there could be some cumulative effects from multiple wind projects adjacent to each other (size and number of wind projects leading to cumulative effects was not defined). Impacts to livestock grazing AUMs are discussed in Section 3.9.1 (Grazing Allotments and Range Socioeconomic). Vegetation is discussed in Section 3.15 (Vegetation), soils and hydrology are discussed in Sections 3.13 (Soils) and 3.17 (Water and Wetland Resources), respectively. All herbicide application will follow BLM, State of Idaho, and label guidelines. Applicant-committed measures in Table App4-2k are meant to address weed and pollinator habitat and include implementation of the Noxious Weed Management Plan (Appendix R in MVE [2023]) and use of a BLM-approved herbicide plan.
10427-2	Jess Bartlett	The damaging effects they've been shown to have on livestock? Have the detrimental affects to an area almost completely dependant on farms been considered?	See EIS analysis in Section 3.9.2 (Physiological Effects to Livestock) and AIB-34 and AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief).
11204-1	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	However, as explained herein, this illustration is a gross understatement of the "Acreage Unavailable for Livestock Grazing" because it only accounts for the actual disturbed areas, and not true zone of impact, as illustrated in DEIS Figure 3.9-1 (copy inserted above).	Determination of impacted areas, using potential ground disturbance and vegetation removal from the siting corridors, is described in Chapter 2 (Proposed Action and Alternatives) and Section 3.1.2 (Analysis Approach). The disturbance calculations outlined in those sections were used for the Section 3.9.1 (Grazing Allotments and Range Socioeconomic) analysis. The Grazing Coordination Plan (Appendix S in MVE [2023]) also defines the AUMs to potentially be affected by each project phase.
11204-4	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	DEIS did not consider or assess the "issues raised" through the public scoping period and consultation and coordination with the likes of the Permittees;	The issues raised through scoping and in response to public comments on the draft EIS are addressed within the EIS as issues analyzed in detail (in EIS Chapter 3 [Affected Environment and Impacts]) or as issues analyzed in brief (in EIS Appendix 3 [Issues Analyzed in Brief]). Issues raised by the permittees are being addressed in the Grazing Coordination Plan (Appendix S in MVE [2023]), EIS Sections 3.9 (Livestock Grazing) and 3.9.1 (Grazing Allotments and Range Socioeconomics), and AIB-16. Coordination between MVE, the BLM, and grazing permittees is ongoing and would occur throughout the life of the project, if authorized.
11204-13	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	VII. Lack of consideration and assessment of impacts to livestock grazing operations. A. The DEIS failed to consider and assess the authorization of the Permittees' applications to reactivate Suspended Use AUMs and approve additional AUM increases before processing the application for this wind power Project. See 2021 Comments, pgs. 4, 15, 19, 21; see also 2022 Comments, pgs. 9-10. Summary: BLM must not complete processing the application for this new Project until it processes (either first or simultaneously) the Permittees' previously pending applications to re-authorize our Suspended Use AUMs and make additional AUM increases based upon production monitoring. The 2021 Comments requested that the BLM evaluate activation of the Permittees Suspended use AUMs. BLM committed to reward the Permittees for their previous investments in the Star Lake Allotment by activating (at least) our Suspended Use AUMs some time ago. However, BLM has not processed our 2009 applications to activate our Suspended Use AUMs and make additional AUM increases based upon production monitoring that was conducted within the Star Lake Allotment. Now, the BLM is processing the application for this Project to construct a wind power facility within, in part, the Star Lake Allotment without having taken any action on our previously pending applications. See 2021 Comments at pg. 4. Our 2022 Comments contemplated an agreement for MVE to engage a NEPA contractor to pay for and to coordinate with BLM a permit renewal process for the Star Lake Allotment wherein one of the alternatives considered and assessed would be to re-activate our Suspended Use AUMs, and wherein another of the alternatives considered and assessed would be to increase our Permitted Use AUMs (beyond what would be	See EIS Sections 3.1.1 (Existing and Future Trends and Actions) and 3.9.1 (Grazing Allotments and Range Socioeconomics). Existing and future trends and actions are those that have occurred in the past and are expected to continue to occur into the future, including livestock grazing within allotments on public and private lands in the analysis area. During project construction, MVE has developed the Grazing Coordination Plan (Appendix S in MVE [2023]) with the grazing permittees in the analysis area to offset potential impacts to their grazing operations and forage availability for the estimated up to 3-year construction phase. The BLM added EIS Appendix 12 (Historical Livestock Actual Use and Utilization) to this EIS. The reduced forage availability (using AUMs) during project operation would be 1.3% or less of the active AUMs across all action alternatives (post-project, this reduction would be less than 1%). Because the average historical actual use within the Sid Butte and Star Lake allotments has been 68% and 94%, respectively, and the average historical utilization has been 46% for both allotments, there is sufficient forage availability to accommodate this estimated reduction (see EIS Appendix 12). Additionally, fire rehabilitation seedings have increased forage production across the project area such that there is additional abundant forage available above what is currently permitted. There is more forage available than what is currently in use and beyond what would be affected during operation and final reclamation. Livestock grazing permit changes are not part of evaluating MVE's application for a wind generation facility. Any grazing permit authorizations or changes warranted by the ROD will be completed through a separate permit

Comment ID	Commenter	Public Comment	Response to Comment
		authorized if our Suspended AUMs were reactivated). See 2022 Comments at pgs. 9-10. The DEIS did not adequately address this issue. The number of Permitted Use AUMs in the Star Lake Allotment is subject to change in accordance with 43 C.F.R. §§ 4110.3, 4110.3-3(b) (10-1-2005 Edition). On May 8, 2009, the Permittees submitted applications to reactivate their respective Suspended Use AUMs and to make additional AUM increases based upon production monitoring they conducted, all in accordance with 43 C.F.R. § 4110.3-1(b) (10-1-2005 Edition). These applications remain pending and have not yet been processed, apparently due to other priorities by the BLM. See 2021 Comments at pg. 15. To protect the public land resources in the 1960s, Star Lake Allotment permittees agreed to an AUM suspension with the understanding that the AUMs would be re-activated once the permittees implemented rotational management, and installed seedings, water developments, and fencing within the Allotment. The Permittees contend that such commitments were satisfied over 25 years ago and that the Suspended Use AUMs should be or should have already been reinstated. Permittees have also spent nearly $100,000 in production monitoring to demonstrate the availability of additional forage on a sustained-yield basis to support, at least, activation of their Suspended AUMs. For nearly 14-years now, the BLM has failed to process our 2009 applications, and now with this intended wind power Project, all hope fair treatment and a return on our investment are lost. See 2021 Comments at pg. 19. It is inappropriate and untimely for the BLM to consider this wind power Project which has the potential to interfere with our previous applications to activate (at least) our Suspended Use AUMs before the BLM has processed our previously pending applications. Authorization for a new multiple-use activity within the Star Lake Allotment is inappropriate if it reduces or precludes the ability to authorize previously submitted applications to re-authorize suspended AUMs and make additional AUM increases associated with our ongoing multiple-use activities within the Allotment. The DEIS completely fails to address the issue of evaluating our previously pending applications to re-authorize our Suspended Use AUMs and to make additional AUM increases based upon our production monitoring. Such applications were unquestionably a foreseeable element not considered or assessed. Our 2022 Comments (at pgs. 9-10) contemplated this as a potential future action (within 1-year after completion of the last construction subphase or within 4-years after completion of the first construction subphase within the Star Lake Allotment, whichever comes first). However, the interests of equity and fairness, if not the law too, actually demand that consideration of our previously pending applications to re-authorize our Suspended Use AUMs and to make additional AUM increases based upon production monitoring occur prior to, or simultaneously with, the processing of the application for the wind power Project.	action. Analysis to reauthorize suspended use is outside the scope of this wind project EIS. FLPMA provides the BLM the ability to prioritize evaluation of projects at BLM discretion.
11204-14	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Need for MVE to pay for lost AUMs due to temporary displacement or permanent elimination, or to pay for alternative forage, or to offset temporary non-use AUMs via acquisition. See 2021 Comments, pg. 17; see also 2022 Comments, pg. 4. Summary: The DEIS failed to adequately consider and assess MVE's ability and commitment to provide alternative feed sources for the loss of AUMs during all Project phases, or to pay fair market value for any temporarily displaced or permanently eliminated AUMs lost due to Project-related activities for which alternative feed sources are unable to be secured. The 2021 Comments asked if the applicant (MVE) is going to pay for the lost AUMs (either permanently eliminated or temporarily displaced) or is going to pay for alternative forage (either via hay or via leased private pasture) for the lost AUMs associated with the proposed Project. The DEIS purports to address these issues, as follows: • The DEIS states at pg. 3-232 that the Grazing Coordination Plan (Draft Appendix S of MVE [2022]) discloses that "MVE has committed to providing an equivalent feed source to grazing permittees for AUMs unavailable during construction and decommissioning." This portion of the DEIS goes on to state that equivalent feed sources "include, but are not limited to, range forage at other locations, private ground forage operations, feedlot space, or other commercial arrangements that MVE may agree to with permittees." • The DEIS reports at pg. 3-232 that under Alternative B, even though MVE would provide equivalent feed sources for the loss of AUMs during construction (and decommissioning as quoted above) "there is still some potential for grazing permittees to experience economic uncertainty and risk as they adapt their grazing operations to the changing conditions." The DEIS additionally reports "the broader livestock grazing community may experience a period of economic uncertainty and other adverse social effects (e.g., increased community stress) as the availability of feed sources within the overall community becomes increasingly scarce" (DEIS, pgs. 3-232 & 3-233). The DEIS concludes that these economic uncertainties would be reduced somewhat under the other action alternatives (Alternatives C, D, and E). • The DEIS anticipates that "the combined effect of all long-term AUM reductions may have rippling effects to the broader livestock grazing community leading to a period of economic uncertainty and other adverse social effects (e.g., increased community stress) as the availability of feed sources within the overall community becomes increasingly scarce" (DEIS, pg. 3-234). Again, the DEIS forecasts that these economic uncertainties and adverse social effects would be reduced somewhat under the other action alternatives (Alternatives C, D, and E). • The DEIS at pg. 3-280 states that during construction "MVE would provide feed sources for the loss of AUMs; therefore, there would be no impacts to livestock AUMs from construction" with respect to any of the action alternatives. • Table 3.9-3 of the DEIS at pg. 3-280 reports the number of Active AUMs that "could be temporarily reduced" for each action alternative "during decommissioning." • Supporting documents for the DEIS state "MVE is proposing a suite of measures to avoid, minimize, and mitigate the potential impacts to grazing permittees." These documents report that, among other things, such measures will "provide alternative forage for AUMs that are unavailable during construction and postconstruction reclamation periods." See DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-1. The Grazing Coordination Plan also states that for "AUMs that are unavailable during the construction and reclamation periods, MVE is committed to providing an equivalent feed source to affected grazing permittees" which "may take the form of range forage at other locations, private ground forage operations, feedlot space, or other commercial arrangements that MVE may agree to with permittees." See DEIS, Draft Appendix S,	Also see responses to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1). MVE has committed to providing alternative feed sources during construction (and decommissioning) through a variety of options and applying the permittees' current rest rotation approach, as noted in the Grazing Coordination Plan (Appendix S in MVE [2023]). These measures have also been included in Table 4-2f (EIS Appendix 4 [Mitigation]) as applicant-committed measures 43 through 48. Discussion of impacts to acres of available forage and AUMs can be found in Section 3.9.1 (Grazing Allotments and Range Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		Grazing Coordination Plan, pg. S-3. Here, as should be clear in reading the foregoing bullet points, the word "purports" is correctly used. The DEIS did not consider or assess the availability, or lack thereof, of an "equivalent feed source", i.e., range forage at other locations, private ground forage operations, feedlot space, or other commercial arrangements, during all phases of the proposed Project, i.e., construction, rehabilitation, operation, and decommissioning. Permittees contend that such an "equivalent feed source" will be non-existent at the scope that would be needed to implement all phases of the proposed Project. At a minimum, the DEIS should consider and assess the ability for MVE to fulfill its apparent promise / commitment. In fact, the DEIS correctly recognizes that the availability of feed sources within the overall community" will become "increasingly scarce" due to pressures imposed by Project-related activities. DEIS, pg. 3-234. To this end, the DEIS must consider and assess MVE's ability to implement its commitment to provide alternative feed sources for the loss of AUMs during all Project phases and must establish a term and condition that in the alternative MVE commits to pay fair market value for any temporarily displaced or permanently eliminated AUMs lost due to Project-related activities for which alternative feed sources are unable to be secured. While Permittees appreciate that the Taylor Grazing Act, 43 U.S.C. § 315b, does not "create any right, title, interest, or estate in or to the lands," see also Federal Land Policy and Management Act, 43 U.S.C. § 1752(j), financial compensation related to use or lack of use of public lands AUMs is not foreign to the grazing regulations, or even the Taylor Grazing Act. 43 C.F.R. § 4120.3-3(c) (10-1-2005 Edition) prescribes that when a permittee cannot make use of AUMs, an applicant can apply to activate such AUMs subject to the reasonable compensation for the use and maintenance of improvement and facilities of the permittee. See also 43 C.F.R. § 4120.3-6(c) (10-1-2005 Edition). The Taylor Grazing Act, 43 U.S.C. § 315q, prescribes that when the national defense "prevents" the use of the public lands for grazing, the permittee shall be paid for the 'fair and reasonable … losses suffered." In addition, there are "distinct investment-backed expectations" associated with the use and conveyance of Grazing Preferences and Permitted Use AUMs attached to "Base property." In fact, Idaho Code 25-901 prescribes that "a grazing preference right shall be considered an appurtenance of the base property through which the grazing preference is maintained.". The Internal Revenue Service even taxes any income derived from the use or lease of such AUMs and also taxes any capital gain derived from the sale of such AUMs.	
11204-15	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Given this, it is necessary for BLM to consider and assess optional mitigation to compensate for any lost AUMs for which equivalent feed sources are not secured as a product of the wind proposal during the construction phase, rehabilitation phase, operational phase, and decommissioning phase.	See response to comment 11204-13 (see in Table A-3p, Livestock Grazing).
11204-17	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	D. Need for MVE to pay for range improvement deterioration/damage and any associated mitigation projects. See 2021 Comments, pg. 17. Summary: The DEIS failed to adequately consider and assess MVE's commitment to provide compensation for changes made in all phases of the project, not just the construction phase. The 2021 Comments asked if the applicant (MVE) would "pay for any damage and/or repair to the existing public land range improvements" either permanently or temporarily impacted by the proposed Project. See 2021 Comments, pg. 17. The DEIS purports to address these issues, as follows: First, the DEIS describes the following commitments regarding impacts to range improvements in association with the proposed Project: Range improvement functionality would not be degraded from the existing condition. Any project changes to range improvements would maintain functionality (including stock 9 The amount of financial mitigation relative to such Project-related fire events is unknown beforehand because it would depend upon the size and damage level for any such fire event(s), though compensation for such fire damages would be determined by mutual agreement between MVE and the Permittees, or in the alternative, by binding, arbitration, not subject to appeal/challenge by any party. watering, fences, and cattle guards), would be coordinated beforehand with the permittees and the BLM, and would be paid for by MVE. DEIS, pgs. 3-278 & 3-279 (emphasis added). Consistent therewith, Appendix 3 of the DEIS reports: As per MVE (2022) Appendix S (Grazing Coordination Plan), range improvement functionality would not be degraded from the existing condition. Any project changes to range improvements would maintain functionality (including stock watering, fences, and cattle guards) and would be coordinated with the permittees and the BLM prior to project construction activities and would be paid for by MVE. As deemed necessary, this would include MVE paying for resource surveys (e.g., botany, wildlife, archaeology) prior to range improvement modification or construction. Therefore, impacts to range improvements would be effectively mitigated. DEIS, Table App3-1, Issue AIB-16, pg. App3-7 (emphasis added). Second, the Grazing Coordination Plan reports that "MVE is proposing a suite of measures to avoid, minimize, and mitigate the potential impacts to grazing permittees" which would, among other things, "maintain the function of range improvements." DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-1. Page S-2 of the Grazing Coordination Plan states that "MVE is proposing additions and modifications to range improvements" within affected allotments and reports that the "resource surveys and installation costs associated with these range improvements will be funded by MVE." See also DEIS Table App4-2f, Applicant- Committed Measures – Fencing and Range Improvements under Appendix 4 (Mitigation) of the DEIS for details regarding mitigation measures related to range improvements associated with the proposed Project. Because of the seemingly all-inclusive nature of this disclaimer, the DEIS omitted consideration and assessment of any kind regarding any Project-related changes to range improvements during all phases of the project, i.e., construction, rehabilitation, operation, and decommissioning. The Permittees project that changes to range improvements would need to occur to some degree in all phases of the proposed Project.	See response to comment 11204-19 (see in Table A-3p, Livestock Grazing).

Comment ID	Commenter	Public Comment	Response to Comment
11204-18	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	E. Need for MVE to pay for alternative or supplemental fences to mitigate any impacts due to the proposed Project. See 2021 Comments, pg. 17; see also Fence Issue (2022 Comments, pgs. 7-8). Summary: The DEIS failed to adequately consider and assess that some permanent fencing would be needed and that some existing fencing would need to be removed, particularly after coordination with Permittees and BLM before implementing any phase of the project. The 2021 Comments asked if the applicant (MVE) would pay for alternative or supplemental fences to mitigate any impacts (either permanent or temporary) with respect to Project related activities. 2021 Comments, pg. 17. The 2022 Comments stated that the Permittees oppose construction of an extensive new permanent fence network, but do not oppose construction of some select new permanent fences (to create strategic exclusion areas) and some select temporary fences during the construction (and decommissioning) phase(s) (2022 Comments, pgs. 7-8). The Permittees again voiced their opposition to the construction of an extensive new fence network around Project access roads or infrastructure with either permanent or temporary fences. Permittees oppose the fencing of the roads. Instead, the Permittees believe that their recommendation to divide the Project construction phase within the Star Lake Allotment into three separate subphases will reduce the potential for conflicts between construction activities and livestock operations and will greatly reduce the need for an extensive network of new fences, either permanent or temporary, during construction. The Permittees do not oppose construction of some select temporary fences during the construction (and decommissioning) phase(s) to prevent conflicts between Project activities and livestock operations and construction of some select new permanent fences (to create strategic exclusion areas) during the postconstruction and operational phases of the proposed Project. However, the Permittees urge that MVE coordinate and cooperate with them to determine the extent and site-specific locations for any new temporary or permanent fences constructed in association with the proposed Project if it is authorized. The DEIS describes the following commitments regarding fence improvements in association with the proposed Project: As part of the Grazing Coordination Plan, no permanent fencing or removal of existing fencing would occur. However, approximately 50 miles of temporary fences would be installed along primary access roads to alleviate concerns about excess traffic during construction and interim reclamation, and another 295 miles of temporary fencing would be installed surrounding work areas (with 20%–25% estimated for deployment at any given time). DEIS, pgs. 3-278 & 3-279 (emphasis added). It is erroneous to expect that the installation of temporary fences along primary access roads can “alleviate concerns about excess traffic” since the temporary fences themselves will require additional traffic for fence installation and removal and will not reduce traffic levels associated with other Project-related activities. Page S-2 of the Grazing Coordination Plan also reports “MVE is proposing no new permanent fencing and no removal of existing fencing in an effort to alleviate pasture fragmentation.” Instead, “to reduce the potential for livestock collisions with Project-related vehicles, collisions with general public traffic, reduce livestock stress and disturbance, improve livestock management, and reduce potential construction delays, MVE is proposing the installation of temporary fence (such as electric fence) during construction and reclamation periods” DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-2. The Plan projects that “up to approximately 295 miles of temporary fence may be deployed during construction and interim and final reclamation periods of the Project” with an expectation that approximately “20 to 25% of the temporary fence may be deployed at any given time” DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-3.10 Because of the seemingly all-inclusive nature of this disclaimer, the DEIS omitted consideration and assessment of any kind regarding construction of additional permanent fencing and removal of any existing fences during any Project phases, i.e., construction, rehabilitation, operation, and decommissioning. The Permittees project that changes to the existing fence layout will need to occur to some degree in all Project phases. The DEIS errs in stating that “no permanent fencing or removal of existing fencing would occur.” Related thereto, the 2022 Comments expressed the Permittees’ understanding that intended Project rehabilitation phases within the Star Lake Allotment would be for 1-year to 2-year periods after each construction phase is completed and would likely be limited to approximately a 300-foot diameter area around each of the wind turbines (2022 Comments, pg. 5). Such rehabilitation would / should be done at MVE’s expense. Any associated temporary fences around such areas would be constructed and maintained at MVE’s expense, and any such temporary fences would be removed after the expiration of the rehabilitation periods at MVE’s expense. 2022 Comments, pg. 5. Furthermore, any seeding around such areas should use crested wheatgrass because such grass is already a dominate vegetation component in the Star Lake Allotment, because it is well-adapted to colonize disturbed arid sites, and because it has proven abilities to protect the watershed and related resources.	See Section S3.4 (Star Lake Allotment Plans) in the Grazing Coordination Plan (Appendix S in MVE [2023]). MVE is proposing no new permanent fencing and no removal of existing fencing; MVE is proposing the installation of temporary fence during construction and reclamation periods. Three construction subphases for the Star Lake allotment are included in the Grazing Coordination Plan and evaluated in Alternatives B, C, D, and E. MVE has committed to constructing and maintaining temporary fences required for this project, at MVE’s expense. See also the Noxious Weed Management Plan (Appendix R in MVE [2023]). MVE will coordinate with the BLM botanist to develop an approved seed mix for the project.
11204-19	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Need for MVE to pay for alternative or supplemental water developments to mitigate any impacts due to the proposed Project (2021 Comments, pg. 17) and Water Development Issue (2022 Comments, pg. 8). The 2021 Comments asked if the applicant (MVE) would pay for alternative or supplemental water developments to mitigate any impacts (either permanent or temporary) with respect to Project related activities. 2021 Comments, pg. 17. The 2022 Comments stated that the Permittees opposed construction of the water developments initially proposed for the Project, but believe some new troughs and the modification of some existing troughs is necessary to improve livestock management during postconstruction and operational phases. 2022 Comments, pg. 8. The Permittees’ concerns with respect to this issue become increasingly serious as we study the DEIS and its supporting documents in greater detail. The proposed Project is anticipated to require a substantial amount of blasting to construct / improve access roads, crane paths, and Project infrastructure. We expect that such blasting (and crane use) will crush, collapse, or otherwise damage well casings, pipelines, and related infrastructure associated with our existing water developments, and may also damage water distribution canals. It is unclear if MVE’s commitment expressed through the DEIS that “[r]ange improvement functionality would not be degraded from the existing condition” and that any “changes to range improvements would maintain	See responses to comments 1042-12 (see in Table A-3cc, Mitigation – EIS Appendix 4), 11226-1 and 1042-14 (see in Table A-3z, Water and Wetland Resources), 8421-4 (see in Table A-3m, Human Health and Safety), and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1) regarding reclamation bonding, potential impacts to water wells from project construction, and MVE compensating grazing permittees for injured or killed livestock. MVE has committed to funding resource surveys and repair or installation costs for any range improvements needed to meet the Grazing Coordination Plan (Appendix S in MVE [2023]). The Grazing Coordination Plan details livestock management needs to meet the project phases, including BLM and permittee review of the detailed construction timing, if the project is authorized. Currently, the EIS assumes construction and decommissioning durations of up to 2 to 3 years with subphasing identified within the EIS, and a project operation phase of 30 years.

Comment ID	Commenter	Public Comment	Response to Comment
		functionality" (DEIS, pg. 3-279) extends to all Project-related activities, including blasting and crane operations. The DEIS needs to be amended to clarify that MVE will repair, replace, or pay compensation in a timely manner for any damage to existing infrastructure developments within or adjacent to the proposed Project siting and access corridors that results from any Project-related activities, including blasting and crane operations. Further, it is unclear if MVE's commitment expressed through the DEIS that "[r]ange improvement functionality would not be degraded from the existing condition" and that any "changes to range improvements would maintain functionality" (DEIS, pg. 3-279) extends to the "functionality" and "existing conditions" for the water rights associated with the Permittees water developments that would be impacted by the proposed Project. The DEIS needs to be amended to clarify that MVE will compensate the Permittees in a timely manner for any loss of value to their existing water rights that results from Project-related impacts to such water rights whether in the form of impacts to water quality, water quantity, water availability (i.e., static water depth), or other factors. The DEIS reports (at pgs. ES-x, 3-381, and App11-19) that "MVE would be required to have a reclamation bond" but does not disclose any other bonding requirements. The DEIS needs to be amended to establish a bonding requirement to ensure that funds are available when the Project is initiated to cover costs associated with MVE's commitments to prevent range improvement functionality from being "degraded from the existing condition" and that any "changes to range improvements would maintain functionality" (DEIS, pg. 3-279). In other words, a cash fund should be required so neither BLM nor Permittees have to go through some bonding claim process to be reimbursed for losses, particularly routine losses that would likely be common occur, i.e., a wind project truck hitting and killing/injuring livestock. The DEIS purports to address the water development issues, as follows: First, the DEIS describes the following commitments regarding water developments in association with the proposed Project: Additionally, up to 65 water troughs may be installed to facilitate livestock distribution or access to water. Pipeline disturbance for the water troughs would occur within the project work areas. Range improvement functionality would not be degraded from the existing condition. Any project changes to range improvements would maintain functionality (including stock watering, fences, and cattle guards), would be coordinated beforehand with the permittees and the BLM, and would be paid for by MVE. DEIS, pgs. 3-278 & 3-279 (emphasis added). Again, it is unclear if these commitments extend to all Project- related activities, including blasting and crane operations. Second, Table 2.4-1 of the DEIS anticipates that up to 65 new stockwater troughs and up to 54 new waterline miles would be constructed under Alternative B of the proposed Project, with fewer troughs and waterline miles being required under the other action alternatives. DEIS, pg. 2-6. Third, Page S-2 of the Grazing Coordination Plan states that "MVE is proposing additions and modifications to range improvements" within affected allotments. Page S-2 of the Grazing Coordination Plan also reports that the "resource surveys and installation costs associated with these range improvements will be funded by MVE." DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-2. See also DEIS Table App4-2f, Applicant-Committed Measures – Fencing and Range Improvements under Appendix 4 (Mitigation) of the DEIS for details regarding mitigation measures related to range improvements associated with the proposed Project. Notwithstanding, the DEIS omitted consideration and assessment of any alternative or supplemental water developments to mitigate any impacts due to the proposed Project during all phases of the project, i.e., construction, rehabilitation, operation, and decommissioning. It is projected that changes will need to occur to some degree in all phases, though knowing the location of the turbines and other components is just one element. As we have repeatedly stated herein, the timing of each phase and the intended grazing rotation (inclusive of the number of Permitted Use available) for each phase are inexorably intertwined elements to sustain and maintain any livestock operation. A wholly non-existent element in the DEIS is timing, i.e., timing as to advanced notice to Permittees prior to beginning any Project phase; timing as to notice to Permittees when work related to any phase would begin; and timing as to notice to Permittees when any phase would end.	
11204-20	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Lack of information on impacts due to sound pollution, electromagnetic disturbances, micro- environment alterations, changes to cattle distribution and concentration patterns. See 2021 Comments, pg. 18. The 2021 Comments expressed concerns and asked related questions with respect to the potential of the proposed Project to negatively impact the environment within the Star Lake Allotment and disrupt their grazing operations through potential physiological effects to their livestock, as follows: Permittees are informed that each wind turbine will emit sound approximately equivalent to a running lawn mower. Spaced at quarter mile increments there will be a constant drone. How does this affect livestock distribution within the Star Lake Allotment? What effect will increased electromagnetic fields have on livestock and wildlife health and reproduction? Permittees are informed that wind farms reduce precipitation and raise ground temperatures in the immediate area of the project. Is that true? Would that be true on the Star Lake Allotment as to its micro- environment? If yes, how will that be mitigated since that will directly, adversely impact the forage growth on the allotment? It has been found that cattle often cluster around wind turbines (e.g. for shade) where wind energy projects are located in grazing allotments. 2005 FPEIS-Wind, Volume 1, at page 5-57. How will that be mitigated, including any resulting disturbed areas? Permittees are concerned that any disturbed areas would/could likely impact achievement of applicable rangeland health standards. 2021 Comments, pg. 18. The DEIS does not adequately address these issues. Section 3.9.2 of the DEIS addresses potential physiological effects to livestock, and reports that data reviews failed to uncover "enough data on the physiological effects of free-ranging beef cattle and sheep to identify a quantitative measure for effects analysis; therefore, the analysis presents a qualitative discussion based on the best available science." DEIS, pg. 3-289. The DEIS claims that an "in-depth review was conducted on the effects of increased anthropogenic stress catalysts to cattle and sheep, specifically associated with shadow flicker, electromagnetism, noise, vehicle traffic, and a general increase in human presence" which failed to discover any "published literature directly addressing shadow flicker and effects to livestock." DEIS, pg. 3- 289.	Section 3.9.2 (Physiological Effects to Livestock) discusses physiological effects to livestock from construction and operation noise and EMFs, including a summary of available published literature regarding potential effects. Between the draft and final EIS, an additional literature search was conducted and summarized within this section of the final EIS. If new information becomes available regarding physiological effects to livestock from shadow flicker and electromagnetism, the BLM would work with MVE and the grazing permittees to amend the Grazing Coordination Plan (Appendix S in MVE [2023]) to include minimization or mitigation measures. A list of published literature reviewed in preparation of the EIS is provided in the Livestock Grazing citations within EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers). MVE developed the Grazing Coordination Plan in coordination with grazing permittees and this plan could be modified in the future, as deemed necessary by the permittees, the BLM, and MVE. Project effects to vegetation are discussed in Section 3.15 (Vegetation). Also see response to comment 11204-22 (see in Table A-3f, Climate and Greenhouse Gas Emissions) regarding potential changes to ground-level temperatures and humidity levels from turbine operation.

11204-21	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The DEIS states that "Helldin et al. (2012) do note that there were no documented visual impacts to terrestrial mammals" associated with wind projects, DEIS, pg. 3-289, but qualifies this statement with a finding that "there could be some cumulative effects from multiple wind projects adjacent to each other (size and number of wind projects leading to cumulative effects was not defined)." DEIS, pg. 3-290. Because the proposed Project has the potential to be the largest single wind project yet constructed within the United States, its effects may equal or exceed the cumulative effects from several adjoining smaller wind projects like those that are currently operating. The DEIS claims that electromagnetic fields "do not have a harmful impact to livestock (Burchard et al. 1996; Renaud and Bousquet 1999; Thompson et al. 1995; Wenzel et al. 2020)." DEIS, pg. 3-290. The DEIS reports that information regarding "vehicle traffic impacts to livestock was confined to vehicle transport scenarios with no applicable data on vehicle traffic impacts to livestock adjacent to roads." DEIS, pg. 3-290. The DEIS failed to find any "published research on noise effects to livestock specifically from wind turbines or roads" but did locate several papers that looked at noise impacts "under either intensely managed livestock operations (primarily confined operations) or for similar types of noise disturbances" which concluded that livestock are generally able to acclimatize to noise, "particularly those at less than 100 dB (Ames and Arehart 1972; Arehart and Ames 1972; Bond 1963; Harbers et al. 1975)." DEIS, pg. 3-290. The DEIS also reports that some studies "show some effects to livestock on a short-term basis within a range of 85 to 90 dB or greater; however, these were in confined management areas or buildings (Ames 1978; Broucek 2014 [also identified that farm animals adapt to noise]). DEIS, pg. 3-290. The DEIS reports that a wind turbines' sound power dissipates with distance, would be approximately 73.9 dB at ground level, and "would further dissipate with distance from the turbine." DEIS, pg. 3-290. Similarly, the DEIS reports that the Project's transformers would have a sound power of about 74.8 dB at a distance of 50 feet. DEIS, pg. 3-290. The Permittees assume that all transformers and transformer stations would have exclusionary fencing around their perimeters that would keep livestock and other creatures at least 50 feet away. The DEIS states that regarding the "potential for increased human presence to physiologically affect livestock, no direct research data were found" that analyzed physiological effects" and likewise failed to find research that quantifies livestock stress due to such factors in a "rangeland grazing scenario." DEIS, pg. 3-290. The DEIS concludes that under Alternative B, "impacts from noise, including noise from project construction and operation and recreational vehicles, could occur in nine allotments" but that the "best available scientific information indicates that no other livestock physiological effects would occur; however, many of these effects have not been studied on open-area-ranging livestock." DEIS, pg. 3-291. With respect to noise impacts to livestock, the DEIS concludes that under Alternative B, estimated "construction noise levels in grazing allotments at a distance of 50 feet or more from project activities, would be within the threshold of known information on livestock noise tolerance and adaptability." DEIS, pg. 3-291. The DEIS reports that noise impacts would be somewhat lower under the other action alternatives because of the fewer number of wind turbines that these alternatives would authorize. Thus, the DEIS states that, while noise associated with the proposed Project would be within levels acceptable to livestock, the information to reliably model other potential physiological effects to livestock in a range environment is unavailable. The DEIS errs in claiming to have it both ways, i.e., claiming noise is within acceptable levels, yet simultaneously admitting it lacks the information to support such claim.	The analysis was completed using the best available science. See response to comment 11204-20 (see in Table A-3p, Livestock Grazing).
11204-23	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The 2021 Comments state that it has been found that "cattle often cluster around wind turbines (e.g. for shade) where wind energy projects are located in grazing allotments" (see 2005 FPEIS-Wind, Volume 1, at page 5-57) and expressed concern that "resulting disturbed areas" could negatively impact achievement of applicable rangeland health standards (2021 Comments, pg.18). The DEIS and its associated Appendices only mention the phrase "Rangeland Health Standard" once. This reference to a rangeland health standard is made within Draft Appendix U (Greater Sage-grouse Mitigation Plan) in conjunction with MVE's "plans to purchase GRSG mitigation credits from the TerraWest Conservancy's (TerraWest) Eastern Idaho Greater Sage Grouse Habitat Bank (Habitat Bank), known as the 'Wilcox Ranch Conservation Bank' (WRCB)" (DEIS, pg. 1033, Draft Appendix U, Greater Sage-grouse Mitigation Plan, pg. U-14) and the related livestock grazing and range management goal for the WRCB to "manage livestock grazing in a manner that meets the BLM's Rangeland Health Standard while maintaining the current levels of high-quality greater sage-grouse habitat." DEIS, pg. 1035, Draft Appendix U, Greater Sage- grouse Mitigation Plan, pg. U-16. Thus, the sole DEIS reference to a "Rangeland Health Standard" has nothing to do with the potential for cattle to cluster around wind project infrastructure and thereby impact the ability to achieve applicable rangeland health standards. The DEIS needs to consider and assess the potential for cattle to cluster around the proposed Project's wind turbines which could create "disturbed areas" that could in turn negatively impact achievement of applicable rangeland health standards.	The Grazing Coordination Plan (Appendix S in MVE [2023]) will detail livestock management plans for the project phases. Disturbed sites will be reclaimed following the Reclamation Plan (Appendix E in MVE [2023]). Temporary fencing would be installed to restrict livestock from the project disturbed areas during construction, decommissioning, and reclamation. Review of whether rangeland health standards are being achieved would occur when the BLM reviews permit renewals for each allotment, which is a separate process from this review of MVE's application for a wind generation facility.
11204-25	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	H. Lack of information on status of existing Grazing Preferences and Permitted Use AUMs upon decommissioning if the proposed Project is authorized and results in devotion of the public lands within the Star Lake Allotment to wind energy development, in whole or in part. See 2021 Comments, pgs. 18-19. The 2021 Comments asked if the proposed Project is authorized and results in disposition of or devoting (in whole or in part) the public lands in the Star Lake Allotment to wind energy development, would "the existing Permittees (or their successors or assigns) continue to hold the existing Grazing Preferences and Permitted Use AUMs so to be first-in-line for the allocation [or re-allocation] of the forage within the Star Lake Allotment in the future (2021 Comments, pgs. 18-19)?" The DEIS does not adequately address this question. The DEIS and its associated Appendices never even use the phrases "grazing preference" or "permitted use AUMs."26 The DEIS does not even consider the possibility that the proposed Project could result in the public lands in the Star Lake Allotment (or other proposed Project areas) being devoted, in whole or in part, to a primary use such as wind energy development to the detriment of other multiple-use authorizations. See 43 C.F.R. § 4120.3-6(c) (10-1-2005 Edition). The DEIS reports that Project operation under Alternative B "would not physically preclude any other	Section 3.9.1 (Grazing Allotments and Range Socioeconomics) discusses the affected forage availability (using affected acreage and AUMs) for each action alternative. Livestock grazing permit changes are not part of this action to analyze the project. Any permit authorizations or changes warranted by the EIS ROD will be completed through a separate permit action.

Comment ID	Commenter	Public Comment	Response to Comment
		permitted uses (e.g., grazing and recreation) from the siting corridors, except where permanent infrastructure is sited (2,374 acres)" with additional work areas during operation and maintenance (6,740 acres) that "would also be unavailable for livestock grazing uses, specifically, due to lack of adequate livestock forage" for a total of 9,114 acres unavailable for livestock grazing during operation and maintenance (DEIS, pg. 3-266). The DEIS then reports in Table 3.8-2 (Construction and Operation Land Use Impacts by Action Alternative) that the acreage unavailable for livestock grazing during operation and maintenance would be somewhat lower under the other action alternatives (DEIS, pg. 3-266).	
11204-26	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Need for MVE to pay for the loss of livestock injured or killed by motor vehicles (2021 Comments, pg. 18) and related Road Issue to reimburse owners for Project-related livestock- vehicle injuries and fatalities. See 2022 Comments, pg. 7. The 2021 Comments noted that the proposed Project initially anticipated the construction of up to 350 miles of new roads across the entire project area to improve access by the applicant (MVE) and expressed concern that these roads would result in much higher travel speeds and increased traffic volume (2021 Comments, pg. 18). The 2022 Comments stated that the Permittees understood that the planned construction "includes construction/improvement of approximately 45 miles of access roads" (2022 Comments, pg.6). Both the 2021 and 2022 Comments expresses concern that the new and improved access roads associated with the proposed Project would endanger livestock and wildlife, especially at night, and asked if the applicant (MVE) would pay for livestock injured or killed by Project-related motor vehicle traffic (2021 Comments, pg. 18; 2022 Comments, pg. 7). The DEIS did not adequately address this issue. Table ES-1 of the DEIS at pg. ES-xi reports that the proposed Project will require 486 miles of new access roads and improvement of 147 miles of existing access roads (including 33 miles of new construction and 14 miles of improvement to existing roads for construction crane paths) under Alternative B, with fewer miles of new and improved access roads required under the other action alternatives (commensurate with the smaller number of wind turbines these alternatives would authorize). Under its discussion of potential noise impacts to livestock, the DEIS states "Applicant-committed measure 33 and mitigation measure N required by BLM policy (see EIS Appendix 4)" which together "establish speed limits on BLM roads and require project personnel to adhere to them, would help reduce the potential for herd displacement and deaths from livestock- vehicle collisions" (DEIS, pg. 3-292). The Grazing Coordination Plan reports that grazing permittees operating within the Project area have identified potential impacts that include livestock death due to: "Project-related vehicle collisions and entrapment within active construction sites" and "general public vehicle collisions, resulting from improved access road conditions and increased vehicle speeds." The Grazing Coordination Plan then reports "MVE is proposing a suite of measures to avoid, minimize, and mitigate the potential impacts to grazing permittees" which would, among other things, "greatly reduce the potential for vehicle-livestock collisions during Project construction, operation, and decommissioning periods…". See DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-1. The Grazing Coordination Plan states that "to reduce the potential for livestock collisions with Project- related vehicles, collisions with general public traffic, reduce livestock stress and disturbance, improve livestock management, and reduce potential construction delays, MVE is proposing the installation of temporary fence (such as electric fence) during construction and reclamation periods" (DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-2). See also DEIS, Appendix 11, pg. App11-16. However, actions that "reduce" potential livestock-vehicle collisions associated with the proposed Project will not eliminate such collisions.	See response to comment 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11204-27	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	B. Permittees requested that cattleguards be installed at all wind Project road crossings. See 2022 Comments, pgs. 6-7. The 2022 Comments requested that "cattleguards be installed by the Wind Company at all road-crossing fences" (2022 Comments, pgs. 6-7). The DEIS does not adequately address this issue. The DEIS reports that either gates "or cattle guards will be installed where openings are needed along range fences" (DEIS, pg. 613 [Appendix 1, Plan of Development, pg. 25]). With respect to the Star Lake Allotment specifically, the Grazing Coordination Plan states that wherever "new project access roads cross existing range fence, MVE will install cattle guards to reduce impacts to livestock operations" and that the road crossings "will be examined on an individual basis once the final road layout is determined to identify the final number and location of cattle guards." DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S-4 (emphasis added). While the Permittees appreciate the commitment MVE has made to install cattleguards whenever "new project access roads cross existing range fence" within the Star Lake Allotment, this does not satisfy the request that "cattleguards be installed by the Wind Company at all road-crossing fences" because there are from 83 to 147 miles of existing roads that are forecast to be improved to provide access to the proposed Project (DEIS, Table ES-1, pg. ES-xi).	See response to comment 11204-19 (see in Table A-3p, Livestock Grazing).
11204-28	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	C. Permittees requested that MVE assumes the cost and obligation to construct and maintain the roads and cattleguards needed in association with the proposed Project. See 2022 Comments, pg. 7. The 2022 Comments requested that the applicant (MVE) "assumes the cost and obligation to construct and maintain" Project-related roads and cattleguards if the Project is approved (2022 Comments, pg. 7). The DEIS does not adequately address this issue. The Grazing Coordination Plan states "MVE is proposing additions and modifications to range improvements within each of the Star Lake, Sid Butte, North Milner, Wildhorse, and Camp I allotments." The Grazing Coordination Plan further reports that "resource surveys and installation costs associated with these range improvements will be funded by MVE." See DEIS, Draft Appendix S, Grazing Coordination Plan, pg. S- 2. However, the Grazing Coordination Plan fails to disclose what party will be responsible for maintenance actions and costs associated with such Project-related range improvements.	See response to comment 11204-19 (see in Table A-3p, Livestock Grazing).
11204-40	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida,	"E. Socio-economic Analysis Related to the Proposed Sheep AUM Reductions	The Grazing Coordination Plan (Appendix S in MVE [2023]) clarifies that sheep grazing can occur in any of the pastures where conflict would not occur with construction activities, at the permittee's discretion. Sufficient AUMs

Comment ID	Commenter	Public Comment	Response to Comment
	James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The DEIS reports that the “Star Lake allotment would have 100% (1,492 AUMs) of their sheep AUMs made unavailable for the duration of construction and decommissioning” under Alternative B, with smaller sheep AUM reductions under Alternatives C and D (68.3%) and Alternative E (36.5%). DEIS, Table 3.6-13 and text, pg. 3-232; see also DEIS, Table 3.9-3, pg.3-280). Similarly, the DEIS reports that the Star Lake Allotment would have 100% (1,492 AUMs) of their sheep AUMs made unavailable for the duration of “operation and final reclamation (34 to 39 years total, depending on how long it takes to reach reclamation success criteria for grasses and forage for livestock)” under Alternative B, with smaller sheep AUM reductions under Alternatives C and D (68.3%) and Alternative E (36.5%) (DEIS, Table 3.6-14 and text, pgs. 3-233 & 3-234; also see DEIS, Table 3.9-5, pg.3-282). However, within such reports, the DEIS failed to consider and assess the conversion (or already the defacto conversation) of the sheep AUMs to cattle AUMs to mitigate these impacts to a sheep operator or sheep operation. Similarly, again, the DEIS fails to attach any dollar values to these reductions but merely reports them in in terms of magnitude (absolute number) or percentage of sheep AUMs reduced. Furthermore, the DEIS fails to disclose why the proposed Project is so incompatible with the sheep grazing operations in the Star Lake Allotment that it would cause 100% of the sheep AUMs to be unavailable during the entire Project life under Alternative B, or the majority (68.3%) to be unavailable under Alternatives C and D, or more than 1/3 (36.5%) to be unavailable under Alternative E. The failure of the DEIS to disclose why the proposed Project is so incompatible with the sheep grazing operations in the Star Lake Allotment that it would cause 100% of the sheep AUMs to be unavailable during the entire Project life under Alternative B (and significant portions of the sheep AUMs to be unavailable under the other action alternatives) needs to be corrected."	are available to provide grazing for all permitted sheep AUMs. Sheep permittees may need to be accommodated off-site during construction and reclamation at the discretion of the permittee. MVE is also offering alternative forage opportunities for sheep permittees. EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics) has been updated to reflect this revision in the Grazing Coordination Plan.
11211-4	Patrick Kelly	The quality of the habitat in the Project area varies. Nonnative vegetation such as cheatgrass and crested wheatgrass is present in some locations, and some portions of the Project site have been heavily damaged by cattle grazing. Other areas exhibit good quality habitat. Soil loss is of particular concern with this Project because of its soil type. In some portions of the site, pervasive pedestalling around bluebunch wheatgrass and other vegetation, indicates erosion and soil loss from cattle activity. Over time, trampling and concentrated hoof action have disturbed soils in some portions of the Project area and made them vulnerable to wind erosion. These areas still provide wildlife habitat, but the Project’s construction activity will undoubtedly lead to further soil loss, due to the loamy soils. The inevitable disturbance and accompanying soil loss associated with the Project’s construction activities will be additive to the historic and current soil loss directly attributable to livestock activity. If the massive footprint of the wind project is approved, it would be prudent to address and ameliorate as much of the root causes of future soil loss as possible because soil loss on the arid project site is an irretrievable resource in human time. Therefore, as a partial mitigation measure for the Project, we suggest reducing the other major factor contributing to soil loss. This can be done if there are willing sellers and a permanent grazing permit retirement process. Willing seller programs provide economic resources that can be immediately applied to local economies and help livestock producers and their families apply buyout funds to other local enterprises. In order to ensure soil protection and even soil development over geologic time, allotment buyouts and retirements need to be permanent. Appropriate language in the Lava Ridge EIS and Record of Decision would ensure the integrity and permanence of this multiple use application.	As described in EIS Section 3.9.1.1 (Livestock Grazing, Affected Environment, FLPMA (43 USC 1701 et seq.), Public Rangelands Improvement Act of 1978 (43 USC 1901 et seq.), and BLM manual guidance under 43 CFR direct management of livestock grazing on BLM lands. Specifically, the Public Rangelands Improvement Act states, “Except where the land use planning process required pursuant to Section 202 of the Federal Land Policy and Management Act (43 USC 1712) determines otherwise or the Secretary determines, and sets forth his reasons for this determination, that grazing uses should be discontinued (either temporarily or permanently) on certain lands, the goal of such management shall be to improve the range conditions of the public rangelands so that they become as productive as feasible in accordance with the rangeland management objectives established through the land use planning process, and consistent with the values and objectives listed in Sections 1901(a) and (b)(2) of this title” (43 CFR 1903(b). The BLM grazing allotments in the siting corridors were established through the land use planning process, as documented in the *Monument Resource Management Plan* (BLM 1986), subsequent amendments, and the associated Allotment Management Plan. While these laws and policies provide for temporary closure of grazing allotments under certain conditions, permanent reductions in or retirements of grazing allotments (that are not related to the disposal of BLM land) would require the BLM to prepare a new resource management plan or an amendment to the existing plan; any such action would require additional NEPA review. As described in EIS Section 3.13.1.2.2 (Soils, Alternative B), a number of measures would be implemented to minimize or avoid impacts related to soil erosion; see EIS Appendix 4 (Mitigation) for a complete list. Therefore, as stated in EIS Section 3.13.1.3 (Soils, Significance Determination), impacts to soils and plant growth materials would be minimized to an extent that no compensatory mitigation measures are proposed.
11369-1	Julie DeWolfe Arroyo	Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management states, "are to be used as the Bureau of Land Management's management goals for the betterment of the environment, protection of cultural resources, and sustained productivity of the range." page 3. Standard 2 (Riparian Areas and Wetlands) 4. Noxious weeds are not increasing. page 4. Standard 3 (Stream channel/Floodplain) 6. Noxious weeds are not increasing." page 5. Standard 4 (Native Plant Communities) 1. Native plant communities (flora and microbiotic crusts) are maintained or improved to ensure the proper functioning of ecological processes and continued productivity and diversity of native plant species." Standard 5 (Seedings) 1. In established seedings, the diversity of perennial species is not diminishing over time. 3. Noxious weeds are not increasing. page 6. The 18 page STANDARDS for Rangeland Health and Guidelines for Livestock Grazing Management are as those listed above. The Lava Ridge Wind Project will, in every way, negatively impact and destroy the environment and cultural resources, disrupt productivity of the range, plant species diversity, seedings, flora, microbiotic crusts, and in return destroy the fragile balance while increasing noxious weeds. Throughout the DEIS, BLM takes both authority over and responsibility for the proposed Lava Ridge Wind Turbine project area. I see a stark contrast between the existing STANDARD for the management area and the destructive plans of MVE and LS Power, these two issues cannot be reconciled.	The Idaho Standards for Rangeland Health and Guidelines for Livestock Grazing Management do not apply to wind energy development. The impacts from the proposed wind energy project to livestock grazing, soils, wildlife, cultural resources, vegetation, and other potentially impacted resources are analyzed in the EIS.
11394-2	Roger Johnson	where are the people who have range rights going to feed their cattle.	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases.
11396-2	Gina Jerke	Grazing cattle will be stopped for the ranchers during construction - how will the BLM handle each ranchers' AUM's for the season(s) and will they be allowed to graze cattle elsewhere?	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources.
11442-4	Kalena Kendell, William Kendell	As pointed out by LS Power’s Senior Director of Project Development, Luke Papez, the Magic Valley has “been impacted by multiple wildfires over the past two decades. It's not in its native state any longer," Papez said. "We saw that as a good factor to try to bring this type of infrastructure into that altered environment." To address the	Livestock impacts are discussed in EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics). The Grazing Coordination Plan is Appendix S in MVE (2023). Grazing would only be temporarily unavailable in the construction (or decommissioning) sites and work areas until these areas are reclaimed, estimated at two

Comment ID	Commenter	Public Comment	Response to Comment
		first point made by Papez: The land covering the proposed project area is prone to wildfires. The area has burned before, and in the dry, remote, and rocky area, cattle grazing seems to be perhaps the area's main preventative defense (at least, controllable defense) against wildfires. Every windmill farm that we have ever driven past is fenced off. There is a perimeter around the groupings of windmills so that cattle or other livestock cannot graze directly around the windmills. With such a large- scale project proposal in this dry and fire-prone area, we are left to wonder how LS Power in partnership with the BLM intends to limit the lands fire susceptibility by adding windmills to the area. It seems to me, that such infrastructure blocking out the ability for cattle to graze on large sections of dry grass will only increase fire hazard in the area. Idaho already has a fire issue. Every year, acres of forest and grassland burn. Magic Valley Energy's construction of the Lava Ridge Wind Project will only add to the issue. Where fire prevention via cattle grazing will be affected negatively, there is also the concern of fire management in the inevitable event of a fire near the windmills. Windmills that are the height of 2.5 football fields prevents effective arial firefighting. Arial firefighting is one of the most effective methods we have in modern fire management with less lives endangered.	growing seasons following construction (or decommissioning). These areas are predicted to have substantial portions of their vegetative cover (i.e., fuels) removed for project construction. Thus, grazing not occurring in these areas during construction would not lead to increased fuel loading. Any temporary changes to grazing would only occur during construction (or decommissioning). Any temporary changes to grazing should not yield meaningful impacts to fuel and fire dynamics in the project area. The EIS has also been revised to include additional discussion on decreased aerial wildfire suppression efficiency and fire risk from wind turbines.
11481-1	Idaho Wool Growers Association	The Idaho Wool Growers Association (IWGA) was established in 1893 as the primary voice for the sheep industry. Our members raise and run sheep across Idaho on private, state and federal lands. Currently, the sheep industry in Idaho accounts for approximately 220,000 animals with a large portion of those animals grazing on public land. The IWGA is OPPOSED to Alternatives B through E of the Lava Ridge Wind Project. These alternatives would reduce Animal Unit Month (AUMs); likely displace sheep from their offspring; reduce the ability to utilize aircraft to control predators and fight fire; and potentially displace members who utilize allotments to lamb out their bands of sheep.	See responses to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 11481-3 (see in Table A-3o, Land Use and Realty, including Aviation).
11481-4	Idaho Wool Growers Association	IWGA is concerned that if the project is too concentrated with road infrastructure, it could create the opportunity for those utilizing the roads for recreation to unintentionally separate ewes and their offspring thus having harmful effects for the offspring and producers.	Road impacts are discussed in Section 3.9 (Livestock Grazing) and applicant-committed measures are discussed in the Grazing Coordination Plan (Appendix S in MVE [2023]).
11491-21	Dean Dimond, Jennie Bateman	- In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: [...] 29. Full disclosure of data as to effects of 30-year project approval on current and future grazing viability pursuant to the Taylor Grazing Act and actual effects on ranching and wool growing in this project area, [...]	Livestock grazing impacts to allotments and livestock are analyzed in Section 3.9 (Livestock Grazing) and Section 3.9.1 (Grazing Allotments and Range Socioeconomics). The Section 3.9.1 analysis evaluates impacts to the livestock grazing economy and community. Impacts were estimated in the final EIS using actual AUMs used by grazing permittees and anticipating the potential for impacts during project construction, operation, and decommissioning.
11496-1	Danielle Gunn	I am a permittee on the Sid Butte allotment and would be directly impacted by this project. Upon review of the DEIS, I concluded this project will have several irreversible effects on the public lands in the proposed project area. One major effect would be primarily on agricultural uses, specifically, livestock production. Livestock production is the largest essential use of this acreage and is a necessary requirement for basic survival of humankind. Our country is experiencing a drastic, rapid reduction in open space needed for food production as more natural landscapes become developed and inhabited by a rapidly increasing population. Thus far, the United States agricultural industry has developed the technology and tools to continue meeting the increased demand for food. However, how far can technology push the environment to continue producing more pounds of food per acre to meet the needs of such rapid population expansion? This project will result in habitat loss, alterations, and fragmentation of this landscape. Many resources will be affected by the project regardless of measures taken to mitigate and/or minimize negative impacts. For these reasons, it is imperative for all parties involved and/or directly impacted by the project to carefully analyze the alternatives identified in the DEIS with logic and forethought for preserving agriculture, natural and cultural resources, sensitive areas, and open space while meeting the power needs of society. The DEIS cites little to no research about the impacts of wind turbine effects on livestock and wildlife. How do shadow flicker, additional noise and traffic, and disruption impact livestock and wildlife physiological responses? Research is needed to fully understand impacts on wildlife and livestock to make informed decisions and better mitigate the negative effects of large-scale wind energy projects.	Chapter 3 analyzes impacts of the project to resources present in the analysis areas, including those associated with wildlife, environmental justice and socioeconomics, cultural resources, fire and fuels management, livestock grazing forage and physiological effects, vegetation, and visual resources. A review of physiological effects to livestock, using best available science, is located in Section 3.9.2 (Physiological Effects to Livestock). Also see response to comment 11204-20 (see in Table A-3p, Livestock Grazing).
11496-3	Danielle Gunn	Our current knowledge and understanding of wind turbines indicate that this project could affect: • Natural resources • Livestock and wildlife health • Livestock and wildlife reproduction • Livestock and wildlife behavior and physiology/endocrine system impacts • Forage production • Access venues for individuals and groups that may display disrespect for animals, the land, and other natural resources. • Fire cycles due to increased human activity. • Range health through the introduction of invasive plant species and increased traffic. • Potential loss of native species • Aesthetic and emotional appeal The DEIS needs to provide more information on the above issues along with sustainable solutions.	Chapter 3 (Affected Environment and Impacts) of the draft EIS analyzes impacts of the project to resources present in the analysis areas, including those associated with wildlife, cultural resources, fire and fuels management, livestock grazing forage and physiological effects to livestock, transportation, vegetation, and visual resources. EIS Appendix 4 (Mitigation) details measures that avoid, minimize, or offset via compensatory mitigation the potential project impacts to these resources.
11496-5	Danielle Gunn	The DEIS calls for a reduction of livestock AUMs on Sid Butte and Star Lake allotments. However, communication with MVE indicates this would not be necessary for any permittee who wishes to remain on either allotment. It is imperative that the final EIS reflects no AUM reduction. Permittees should not be forced to reduce their AUMs, nor should they be forced to modify their grazing permits. If the Coordinated Grazing Plan is followed, forage production should remain at or above current levels. Additional pasture development through standard fencing practices or even virtual fencing on affected allotments will result in improved use of forage and water and could potentially increase the current forage production. There is absolutely no need to reduce AUMs. Further, reducing AUMs and modifying grazing permits could be viewed as a violation of the Taylor Grazing Act. There has also been discussion about permittees selling AUMs to MVE. If permittees want to sell their AUMs to MVE, other permittees should have the option to purchase or lease the AUMs. Overall, AUM reduction would	See response to comment 11204-13 (see in Table A-3p, Livestock Grazing). Livestock grazing permit changes are not part of the project. Permit authorizations or changes would be completed through a separate permit action. No permanent AUM permit reductions are evaluated in the alternatives as part of this project. The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including that all project fencing would be temporary and MVE would commit to providing alternative feed sources. See the affected acreage and AUM tables in Section 3.9.1 (Grazing Allotments and Range Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		have a significant negative impact on the livestock industry in these communities and increase fire hazards through loss of a key tool necessary for fuel reduction on rangeland. In relation to AUM reductions, the DEIS also calls for a significant reduction in acres for the affected grazing allotments. Every effort needs to be made to reduce affected acres and minimize the project's footprint.	
11496-8	Danielle Gunn	The final EIS needs to define the re-establishment period of five years and how that will impact livestock grazing. As written, I do not understand how re-establishment will impact livestock grazing practices or other land uses. In addition to decommissioning activities, areas that have been re-seeded typically are rested for two growing seasons as per federal guidelines, why is the DEIS calling for five years for re-seedings to establish? What impact will the re-seeding period have on livestock grazing?	Within the BLM public lands managed by the SFO, resumption of grazing typically occurs after two growing seasons following reseeding and reclamation efforts. MVE's Reclamation activities would up to 5 years of monitoring to confirm achievement of reclamation "success" objectives as defined by the BLM (applicant-committed measure 163). Reclamation of disturbed vegetation communities, with the exception of those with limited reclamation potential, is estimated to successfully revegetate to the point where livestock forage would be available, based on other reclamation efforts in the field office; see Section 3.9.1.2.2 (Alternative B [Proposed Action]). However, depending on the level of soil structure disturbance, soil type, ecological site, seed mix, and climate conditions, it could take additional years to meet success criteria. Minor post-project acreage losses are proposed as part of this project, which are being analyzed in this EIS. MVE has committed to prevent the introduction or spread of noxious weeds and invasive species (see applicant-committed measures in Table App4-2k). The Noxious Weed Management Plan (Appendix R in MVE [2023]) will be implemented for the project. The BLM, along with the MVE-provided rangeland coordinator, will be points of contact for permittees during the project construction phase. The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the management approaches for livestock grazing during the project.
11498-1	David Bateman	I am writing to express my concern about the lack of a comprehensive analysis of the effects of the Lava Ridge Wind Farm on grazing animals in and around the project area. While wind farms can bring many benefits, it is important to consider the potential impacts on the health and well-being of grazing animals in the area. Studies from other wind farms have shown that grazing animals can experience negative impacts, such as stress and reduced reproductive success, due to the noise, ground disturbances, fencing, and visual disturbances caused by wind turbines. It is crucial to conduct a comprehensive analysis of the potential impacts on grazing animals to ensure that their health and well-being are not compromised by the wind farm. One study that highlights the importance of such an analysis is the study of the effects of wind farms on livestock in Australia. This study found that grazing animals near wind farms showed increased levels of stress and reduced reproductive success due to the noise and visual disturbances caused by the wind turbines. The study concluded that a comprehensive analysis of the potential impacts on grazing animals was necessary to ensure that the wind farm did not compromise the health and well-being of the animals. Another study that underscores the need for a comprehensive analysis of the impacts on grazing animals is the study of the Cedar Creek Wind Farm in New York. This study found that grazing animals near the wind farm experienced changes in grazing behavior and reduced body weight due to the noise and visual disturbances caused by the wind turbines. The study concluded that a comprehensive analysis of the potential impacts on grazing animals was necessary to ensure that the wind farm did not compromise the health and well-being of the animals. Given these examples and the potential impacts of the Lava Ridge Wind Farm on grazing animals in the area, I urge you to conduct a comprehensive analysis of the potential impacts on the health and well-being of grazing animals. This analysis should include an evaluation of the noise, ground disturbances, fencing, and visual disturbances caused by the wind turbines and an assessment of the potential effects on grazing behavior and reproductive success. Thank you for your consideration of this important issue.	Section 3.9.2 (Physiological Effects to Livestock) discusses physiological effects to livestock in the analysis area. Effects to livestock outside the project area are outside the scope of this EIS analysis; however, it would be expected that impacts would be less than those described for the analysis area due to the greater distance of livestock located outside of the analysis area.
11508-7	Justin Gott, Daniel Gott, Josie Gott	Grazing cattle and sheep would cease on these acres. This a large grazing area for our local cattle and sheep ranchers and and has been for over a 100 years.	Livestock grazing will continue as outlined in the Grazing Coordination Plan (Appendix S in MVE [2023]).
11527-11	Richard Stover; State of Idaho	The FEIS must address and consider an extended Project time frame regarding grazing lessees.	Impacts to grazing allotments are included in EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics). Livestock grazing management will continue through the project as outlined in the Grazing Coordination Plan (Appendix S in MVE [2023]).
11535-117	Steven Andersen	Electromagnetic Fields and Low-Frequency Noise Effects on Wildlife and Terrestrial Animals Many farmers in the area rely on livestock for their livelihood. The above referenced studies indicate negative impacts of inaudible noise, including infrasound and low frequency noise on terrestrial animals. There needs to be a hard look into the impacts on cows in a rural setting, measuring daytime and nighttime ambient noise and ground vibrations (in the specific type of lava-rock found in the proposed project area) with sufficient sampling. Dairy cows are sensitive to their environment, and farmers throughout the world have reported "profound stress" caused by vibrations passing through the subsoil, which has caused a drop in milk production. Additionally, the noise impacts extend to animals and should not be discounted. Environmental stressors influence organismal biology, specifically, the endocrine system, of dairy and beef cattle.339 Such stress causes disease susceptibility, productive and reproductive performance issues and a decrease in milk production in dairy cows.340 The cumulative impacts of electrical and magnetic fields were not adequately studied in the DEIS. Specifically, similar projects with related studies have indicated a direct and demonstrable link between electromagnetic field strength and impacts on terrestrial animals. These direct impacts include behavior changes when in proximity to, or when crossing over, electromagnetic fields. Further, the addition of a transmission line within the right of way and the predicted impact of adding interconnection should be evaluated to determine the impact on field-exposure strength. Specifically, a study was conducted on the impacts to dairy cows and concluded exposure to electromagnetic fields resulted in increased progesterone and dry matter intake. 341 Additionally, exposure to electromagnetic fields has been	See response to comment 11204-20 (see in Table A-3p, Livestock Grazing). A literature review did not identify any publicly available literature indicating that vibration from operational turbines can significantly impact livestock. Concerns with vibration from wind turbines are primarily related to the generation of low-frequency noise (also known as infrasound). Although research in this area is limited, the predicted effects of infrasound are similar to those for noise at audible frequencies (Lovich and Ennen 2013). Section 3.9.2 (Physiological Effects to Livestock) provides a disclosure of potential construction and operation noise impacts to livestock. Lovich, J.E., and J.R. Ennen. 2013. Assessing the state of knowledge of utility-scale wind energy development and operation on non-volant terrestrial and marine wildlife. *Applied Energy* 103(2013):52–60.

Comment ID	Commenter	Public Comment	Response to Comment
		studied and shown to have a negative impact on dairy cows' milk production.342 The disturbance caused by the construction and operation of wind turbines can cause stress and anxiety in cattle, which can lead to behavioral changes such as reduced grazing, increased aggression, decreased socialization, a reduction in milk production and hormonal imbalances, leading to disruptions in reproductive and metabolic functions.	
11535-133	Steven Andersen	The DEIS recognizes the irreparable impact that this project will have on farmers and their livestock but does nothing to mitigate. The DEIS states "[t]he degree to which the broader livestock grazing community would be affected depends on the magnitude and duration of AUM reductions, as well as the communities' economic and social resiliency and flexibility."385 Moreover, it asserts "[p]ost-project (i.e., after final reclamation is complete), some areas could remain permanently unavailable (irreversible commitment) for livestock grazing because they would not be reclaimed (e.g., access roads) or because they would have limited reclamation potential for forage." 386 The DEIS glosses over the applicable communities' economic and social resiliency and lack of flexibility as to livestock grazing. In effect, it asserts an irreversible commitment without describing the extent to which the local livestock industry may be devastated. Additionally, it repeatedly estimates that final reclamation is estimated to be up to 5 years, but it does not provide support for that estimation.387 Moreover, even if a 5-year period is accurate as to livestock forage, the actual effect on livestock will linger longer.	Section 3.6 (Environmental Justice and Socioeconomics) evaluates the impacts of the project to local and regional social and economic functioning. Reclamation of disturbed vegetation communities, with the exception of those with limited reclamation potential, is estimated to successfully revegetate to the point where livestock forage would be available, based on other reclamation efforts in the field office; see Section 3.9.1.2.2 (Alternative B [Proposed Action]). However, depending on the level of soil structure disturbance, soil type, ecological site, seed mix, and climate conditions it could take additional years to meet success criteria.
11535-134	Steven Andersen	Much of Idaho's livestock industry relies on rangeland ecosystems for summer grazing and feed crops. Along with existing climate trends, the addition of this project could drastically harm livestock and grazing production. A case study by Wold et al. (2022) showed the economic impacts of drought on a ranching operation in south-central Idaho.390 Wold et al. found that the forage reductions caused by a 5-year severe drought resulted in a 10% reduction in herd size.391 A 10-year moderate drought resulted in a 4% reduction in herd size, both of which persist for up to 10 years after the end of the drought. 392 For a 300-head operation, a 10-year moderate drought resulted in a 16% reduction in average annual ranch income (an annual loss of ~$14,000 during the drought).393 And for a 300-head operation, a 5-year severe drought resulted in a 28% reduction in average annual ranch income (an annual loss of ~$23,000 during the drought).394 These impacts would be devastating when combined with the effects of this project given its magnitude and unprecedented uncertainty.	See Section 3.9.1 (Grazing Allotments and Range Socioeconomics) for a description of effects to the livestock economy.
11535-135	Steven Andersen	Likewise, the spread of invasive plant species in rangelands reduces forage availability for livestock operations. Julia et al. (2007) estimated the economic impact of yellow star thistle to Idaho's agricultural industry.395 Assuming an infestation of 266,000 acres, the yellow star thistle invasion reduced available forage for livestock by 221,858 AUMs per year.396 The direct and secondary (induced) economic impacts of the infestation to the agricultural sector were $10,124,000 per year (in 2005 USD). This is merely an estimate of one type of invasive plant species.397 The project could result in the spread of any number of invasive plant species even with the MVE-proposed mitigation efforts.	MVE has committed to prevent the introduction or spread of noxious weeds and invasive species (see applicant-committed measures in Table App4-2k). The Noxious Weed Management Plan (Appendix R in MVE [2023]) will be implemented for the project.
11535-136	Steven Andersen	Moreover, this project increases the potential for wildfires on and around livestock foraging areas. Increasing frequency and severity of wildfire events on rangeland ecosystems can create short- and long-term reductions in the quantity of forage available.398 Following a wildfire, public grazing allotments are closed for several years, meaning summer forage must come from an alternate source. Establishment of invasive annual grasses and the replacement of native vegetation with noxious weeds after a wildfire event can further reduce forage availability in the long-term. 399 Maher et al. (2013) simulated the economic impacts to a representative livestock producer from shortened wildfire return intervals and wildfire occurrence on a public grazing allotment.400 The results showed that after a wildfire, herd size is reduced by up to 40% due to reduced forage availability.401 In the years just after a wildfire event, ranch income is reduced by up to $60,000 and often requires short-term borrowing of up to $20,000.402 The likelihood of bankruptcy after a wildfire event on a grazing allotment is 22%, assuming average beef prices.403 The DEIS does not contemplate these economic effects.	See responses to comments 11442-4 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1). Wildfire potential is analyzed in Section 3.7 (Fire and Fuels Management). Potential qualitative impacts to the livestock grazing economy and community, is analyzed in Section 3.9.1 (Grazing Allotments and Range Socioeconomics). The Noxious Weed Management Plan (Appendix R in MVE [2023]) would be implemented as part of the project.
11535-137	Steven Andersen	The DEIS asserts that project noise could result in an effective loss of forage to livestock, but any impact is "not quantifiable because of the variability of how livestock may react to noise, availability of the forage at these locations, and active construction progression."404 Although such an impact may not be quantifiable, it is well documented that noise has a profound impact on livestock and wildlife.405 Accordingly, the DEIS, at a minimum, should assume that the impact from noise will render more a greater loss in livestock foraging area. Along with this basic assumption, the DEIS should conduct further assessment to quantify the direct effect of sound on individual livestock forage areas.	See response to comment 11204-20 (see in Table A-3p, Livestock Grazing).
11535-165	Steven Andersen	There is no analysis in the DEIS as to the impact of stray voltage on nearby animals, including dairy cows in the close vicinity of the proposed project. Stray voltage is known to affect dairy cows' appetites and significantly hurt milk production.443 The proposed massive project is in close proximity to large dairy farms, wholly reliant on their cows' health and milk production, in order to stay in operation. The exact point of interconnection has not been determined and there are insufficient specifics with reference to maintenance of electrical equipment, wire insulation and isolation practices intended to address the issue of stray voltage.	The POI would be fenced to avoid potential impacts to livestock at the interconnection. Interconnection would occur at the Midpoint Substation or along the SWIP-North. Also see response to comment 11204-20 (see in Table A-3p, Livestock Grazing). These additional literature summaries were added to the final EIS: "Three studies specifically researched livestock grazing under high-voltage transmission lines and concluded that the animals experienced no health problems associated with exposure over long-term periods (Amstutz and Miller 1980; Algers and Huntgren 1987; Angell et al. 1990). Additional studies, which exposed pregnant livestock to stray voltage and EMFs in control groups observed slight behavioral stress responses but not of a magnitude that would be attributed to a health hazard. Electric and magnetic fields do not have a harmful impact to livestock (Burchard et al. 1996; Renaud et al. 1999; Thompson et al. 1995; Wenzel et al. 2020). One study focused on the effects to livestock via stray voltage applied to the water trough and found that the exposure could be a mild stressor immediately after exposure but no impairment or impact on production was found (Rigalma et al. 2010)."

11552-3	Summer Osmond	The reduction of grazing will increase the risk of wildfire in this great area, in addition to the economic loss to local ranchers who depend on the use of public lands for grazing.	Livestock impacts are discussed in Section 3.9 (Livestock Grazing). Grazing coordination and planning is discussed in the Grazing Coordination Plan (Appendix S in MVE [2023]). Grazing would only be temporarily excluded in the construction sites and work areas. These areas are predicted to have substantial portions of their vegetative cover (i.e., fuels) removed. Thus, grazing exclusion should not lead to increased fuel loading. Any temporary changes to grazing would only occur during construction and decommissioning. These temporary impacts to grazing should not yield meaningful impacts to fuel and fire dynamics in the project area.
11554-9	Raul Labrador; Idaho Attorney General's Office	Seventh, the Project will also interfere with Idaho's ability to promote its cattle and ranching industry. See Idaho Code § 22-103(4) (requiring the Idaho Department of Agriculture to "[e]ncourage and promote in every practical manner, the interests of agriculture [and] the livestock industries.").	Livestock grazing will continue as outlined in the Grazing Coordination Plan (Appendix S in MVE [2023]) and as outlined in BLM guidelines following FLPMA.
11563-1	Idaho Cattle Association	the Idaho Cattle Association (ICA) submits the following comments on the Lava Ridge Environmental Impact Statement (EIS). ICA has clear policy that requires us to oppose any effort that would reduce the amount of grazing and available animal unit months (AUMs) on federal land. We are opposed to any permanent reduction in AUMs for existing grazing permittees and lessees. To the extent that the proposed massive Lava Ridge wind development has the potential to impact the ability of cattle producers in the area to pursue their livelihoods and restrict the use of their BLM grazing permits, we have concerns with the project. The most immediate concern is the displacement of livestock grazing AUMs during construction of the project. The uncertainty for ranchers about how they will feed their livestock, combined with the uncertainty of the duration of construction timeframe is very concerning. We understand that Magic Valley Energy has been working with permittees to find alternate forage and appreciate that effort, but it is unlikely that there are adequate alternative pasture sources for that quantity of livestock within a reasonable vicinity and in a way that won't unduly disrupt their livestock operations. With the significant volume of roads that will be constructed and then left permanently in place for turbine maintenance, there will be a permanent loss of available AUMs. The decrease in AUMs post construction is not only unnecessary but also an inaccurate representation of the forage that will be available, particularly with the rangeland restoration and mitigation efforts that are supposed to occur. The EIS provides for the development of some much-needed range improvements, which we support, but it is frustrating that increased AUM availability was not analyzed as part of this EIS process.	See responses to comments 11204-14 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11563-2	Idaho Cattle Association	the Idaho Cattle Association (ICA) submits the following comments on the Lava Ridge Environmental Impact Statement (EIS). [...] The impacted area of development is a high fire-frequency area. During construction, the reduction of grazing of fine fuels combined with increase of vehicles in the area exponentially increases the potential for a greater prevalence of wildfires. Post construction, the enormity of the wind turbines could prevent sufficient aerial attack on wildfires in the area. Additionally, significant fire risk will be created by the permanent increase of recreators and travelers that will be on the road system put in place for turbine management. We also have concerns about the strain the additional infrastructure, and required protection of it, will place on wildland firefighting efforts. Ranchers invest their own time and resources in protecting BLM land from the threat of fire in order to protect their own and their neighbors' livelihoods, their communities, and the landscape. It is most likely that the new infrastructure and wind turbines would certainly become a priority for requiring firefighting resources in the certain event of wildfire. We are concerned about more infrastructure in high fire frequency areas which would divert firefighting resources away from the rangeland and toward protecting the wind development.	See responses to comments 11442-4 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11563-4	Idaho Cattle Association	the Idaho Cattle Association (ICA) submits the following comments on the Lava Ridge Environmental Impact Statement (EIS). [...] All BLM land in Idaho provides habitat for wildlife and a significant portion for sage grouse. It is nonsensical to, on the one hand, be working towards conserving sage grouse habitat while on the other to be promoting projects that will obliterate that habitat. The cattle industry has undertaken significant effort to promote sage grouse habitat in harmony with sound grazing management practices, even while proper grazing is not considered a threat to the species. We are very concerned that if utility-scale energy projects are developed on BLM lands, the surrounding landscape will be used for mitigation of that massive impact. As if often the case, grazing permittees often bear the brunt of such efforts. Any reductions in grazing or changes in grazing management which limit livestock numbers or seasons of use, whether in the specific project area or outside of it, in the name of mitigating for energy development impacts will be unacceptable.	The BLM operates under a multiple use mandate through FLPMA, which states that resources and uses on public land must be used in a balanced combination that will best meet the needs of the people. This EIS analyzes the impacts of implementation of the project, which is an additional multiple use.
11563-5	Idaho Cattle Association	the Idaho Cattle Association (ICA) submits the following comments on the Lava Ridge Environmental Impact Statement (EIS).	The EIS evaluates potential impacts to plants in Section 3.15 and wildlife in Section 3.18. See also response to comment 11204-13 (see in Table A-3p, Livestock Grazing).

Comment ID	Commenter	Public Comment	Response to Comment
		[...] The immense size of the project is concerning. As mentioned above, the massive infrastructure will affect wildlife and plant communities. Yet, despite this, the environmental review process has been fast-tracked. It is frustrating that BLM grazing permittees have difficulties in getting approval to undertake minimally invasive management actions (i.e., hauling water to cattle, maintaining water and other range improvements, fixing fence, etc) yet a project covering 76,000 acres with miles of new roads and construction of enormous infrastructure is being has been on an accelerated path for approval with seemingly little regard to its environmental impacts relative to its impacts. The BLM's rapid timeline to achieve the required environmental review process, particularly on a project of this size and potential for negative impact, is concerning. It is particularly frustrating to our industry that a project of this scope can move through the process so rapidly while much smaller NEPA review, such as grazing permit renewals, have been stalled for years. Further, we have heard that some grazing-related reviews have been intentionally put on hold in order to fast track review of the Lava Ridge Wind Project.	
11576-4	Kelly Human	What are the potential direct impacts of blasting and the frequency of blasting twice per day on average for the two-year construction period on wildlife species flying and on the ground species. What about the impacts on cow calf operations holding grazing privileges and permits in the area? How long does it take to acclimate Livestock to blasting and the noise of turbines?	Impacts to avian and terrestrial wildlife from blasting are described in EIS Section 3.3.3 (Eagles) and Section 3.3.4 (Greater Sage-Grouse) and AIB-2 and AIB-56 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). See response to comment 12351-7 (see in Table A-3p, Livestock Grazing).
11615-4	Spencer Dixon	Ranchers that have to leave their leases for 2 years will lose their livelihood and likely their herds. You cannot "pause" a ranching operation. The cows need feed and the ranchers' rights to the land supersede magic valley energy. This is not considered in the EIS.	See response to comment 11204-13 (see in Table A-3p, Livestock Grazing).
11860-9	Shauna Robinson	The information in the DEIS about the history of sheep trailing in the proposed project area is inadequate. Since the late 1800s, livestock have been important to the industry and tradition of southern Idaho. Today, the SFO website describes this tradition as "part of the historic fabric in this area" with hundreds of allotments and permittees. The description continues with the fact that the "Shoshone Field Office has the most livestock crossing permits in Idaho," and that "trailing occurs across 87 allotments for a total of 366 trailing events; permittees often use historic trail routes that date back decades." When I asked in a RAC Subcommittee meeting about the sheep trailing routes across a potential construction area for the wind project and how the BLM would provide for the herders and impacted routes, the response was for the herders to simply find another route. There seemed to be a lack of concern toward the trailing.	Sheep trailing is an authorized use in the allotments with sheep AUMs or where this action has been authorized via the BLM (2013) livestock trailing EA. See EIS Section 3.9.1. Sufficient AUMs are available to provide grazing for all permitted sheep AUMs. Sheep permittees may need to be accommodated off-site during construction and reclamation at the discretion of the permittee. MVE is also offering alternative forage opportunities for sheep permittees. During project phases, sheep trailing could continue to occur across the project area, although they may need to avoid active work areas. The BLM would prioritize avoidance of physical impacts to any historic trails within the authorized project ROW that meet the National Register of Historic Places eligibility criteria. For more information on potential impacts to historic trails, see EIS Section 3.5 (Cultural Resources) and Appendix 6 of EIS Appendix 8. BLM. 2013. 2013 Shoshone Field Office Livestock Trailing Permit EA. Available at: https://eplanning.blm.gov/eplanning-ui/project/34006/570. Accessed January 19, 2024.
11873-15	Mary Schwartz, Frank Schwartz	17. The DEIS does not address some aspects of the impacts to livestock grazing. The analysis attempts to portray that displacement of livestock from normal grazing allotments use can be mitigated with compensation to allotment owners/permittees for the construction period as well as other periods where there is a loss of use. One factor that this does not take into account is that grazing allotments are an integral part of many livestock operations and annual ranch management planning. The grazing allotment use is not like a light switch that can be turned on off or on at will. The inability to use allotments, either temporarily, or in some cases, portions will be permanently lost, has a significant impact on the ranch operation and the annual planning. In the event an allotment area cannot be used in a given year, the rancher must find alternate range for whatever period the displacement will include. Availability of alternate range is most often a challenge. Availability of short-term alternative pastures in reasonable proximity to the normal range, such as that which will be necessary during the wind farm construction period, could be a problem. Further, the need for these alternate pastures could negatively impact other ranchers in addition to the affected permittees. And then there is the impact to the actual livestock and their productivity. Cattle and sheep learn pastures, including water, through use. Moving them to a different location which they have never used previously will result in inefficiencies and lost gain, likely for at least a full grazing season. This is a cost to the rancher, in addition to all other costs associated with finding and using an alternate pasture. Is the BLM intending to provide (and guarantee) the alternate range that will be needed during the project period? There are a number of these types of issues that accompany the displacement of livestock from their traditional range, that the DEIS analysis and mitigation planning has not addressed, and must be considered.	MVE has committed to providing alternative feed sources during the construction and reclamation phases for AUMs that are unavailable, as noted in the Grazing Coordination Plan (Appendix S in MVE [2023]). Additional text has been added to Section 3.9 (Livestock Grazing) to disclose potential impacts from moving livestock to alternate ranges.
11978-36	Magic Valley Energy, LLC	Section 3.9.2.3 – Blasting and Noise Impacts on Livestock Grazing 32. The DEIS states: "There would be potential irretrievable physiological effects to livestock from the construction and decommissioning equipment noise and blasting. These phases are each estimated to have a 2-year duration at the beginning and end of the project. There would also be potential longer-term (30 years) irretrievable physiological effects to livestock from the turbine noise during project operation." a. MVE Comment: The conclusion reached in Section 3.9.2.3 is not fully supported given the analysis of livestock leading up to this point. Physiological impacts to livestock, which are generally related to noise impacts, would likely be avoided during construction and decommissioning since disturbances would be limited to small areas throughout the Project and livestock can distance themselves from the disturbance areas. Similarly, during operations, noise will have little to no effect on livestock, considering livestock often congregate within the shade of turbine monopoles to escape the sun's heat16. In the event noise from a nearby turbine becomes a nuisance, the DEIS notes that livestock can simply move further than 50 feet away to avoid such concerns. Regarding any physiological impacts associated with feed or water, MVE has an	Although livestock can move 50 feet beyond transformers, there is still a potential irretrievable operational impact to livestock within 50 feet of the transformers. However, the noise levels on the ground at the turbine hub and below the blades is less than the threshold for livestock impacts, as determined in the literature review in Section 3.9.2 (Physiological Effects to Livestock). The last sentence about physiological effects to livestock from turbine noise has been removed. The language in Section 3.9.2.3 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) has been edited to clarify, "Irretrievable physiological impacts on livestock related to construction and decommissioning equipment noise and blasting is not anticipated given that temporary fencing would keep livestock greater than 50 feet away from equipment noise and 75 feet away from blasting. There would also be potential longer-term (30 years) irretrievable physiological effects to livestock not moving beyond 50 feet from transformers during project operation. It is possible that long-term operational exposure to EMFs could have irretrievable physiological impacts to livestock, not enough is known at this time to preclude these impacts."

Comment ID	Commenter	Public Comment	Response to Comment
		applicant-committed measure to provide equivalent feed source to grazing permittees for AUMS unavailable during construction and decommissioning, and an applicant- committed measure to add water troughs throughout grazing allotments, should linear disturbances reduce pathways to previous water sources. MVE suggests that this section be reworded in light of these facts as: “Irretrievable physiological impacts on livestock related to construction and decommissioning equipment noise and blasting is not anticipated given that livestock can move away from nearby work areas. Similarly, irretrievable physiological effects to livestock are not anticipated during operations because livestock can move outside of 50 feet from the turbine to reduce noise if needed.”	
11978-37	Magic Valley Energy, LLC	Section 3.6.5 – Livestock Grazing Economy 33. MVE Comment: The FEIS should note that MVE has worked extensively with project area grazing permittees to understand their current permits and operations and to avoid, minimize, or mitigate impacts that the Project will have on them. These efforts include repeated consultations with permittees regarding MVE’s Grazing Coordination Plan, found as Appendix S of the MVE POD. Other mitigation for fencing and range improvements are found in DEIS, Appendix 4, Table App4-2f. MVE has particularly focused on concerns raised by Star Lake Allotment permittees. Star Lake permittees could see 2.5% to 5% of cattle Animal Unit Months (AUMs) made unavailable during construction and decommissioning (DEIS Table 3.6-13) and 0.7% to 1.3% of cattle AUMs during operation and final reclamation (DEIS Table 3.6-14). The permittees’ comments were used to modify the Grazing Coordination Plan. MVE worked with other permittees to make their AUMs available to Star Lake permittees for any AUMs that may be displaced by the Project. MVE has repeatedly offered to meet with Star Lake permittees to further address any remaining concerns and facilitate allocation of AUMs by BLM to address those concerns. This effort is consistent with BLM’s strong encouragement of MVE/rancher agreements to address lost use of AUMs and compensation for lost range improvements, consistent with IM 2011-181. MVE has similarly engaged professional water consultants to address affected stockwater rights. MVE will continue to coordinate with the project area ranchers and their advisors to the extent they are willing to do so.	See the updated Grazing Coordination Plan (Appendix S in MVE [2023]) and EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics).
11978-126	Magic Valley Energy, LLC	28. Section 3.9.1.3 Table 3.9-8 MVE requests that Table 3.9-8 independently show how much the Project contributes to the cumulative unavailable acreages for livestock grazing (or a percentage of the acreage).	The percentages of affected project acreages are shown in Table 3.9-5, Affected Allotment Acreage during Operation and Final Reclamation.
11994-13	Danielle Gunn	Livestock permittees will need flexibility as we adjust to the changes in our grazing allotments. I am confident a balance can be achieved as agricultural practices combine with renewable energy options.	Coordination with livestock grazing permittees on grazing changes during the project are outlined in the Grazing Coordination Plan (Appendix S in MVE [2023]).
12239-4	Lisa Bjerke	I am also concerned about impacts on the land and water currently used for cattle grazing. The negative effects of the project on this historical use cannot be overstated, and the livelihoods of many Idaho families will be put at risk as a result.	Chapter 3 analyzes impacts of the project to resources present in the analysis areas, including those associated with local and regional socioeconomics (Section 3.6), land use (Section 3.8), livestock grazing (Section 3.9), vegetation (Section 3.15), and water (Section 3.17).
12351-7	Julie Lynn	Wind energy will kill countless birds, harass grazing anim,als due the high noise of the turbines. In northern Europe, wind energy has cause:d reindeer to leave the areas permanently.	A review of physiological effects to livestock, using the best available science, is located in Section 3.9.2 (Physiological Effects to Livestock). Based on best available science, noise impacts would only occur within 50 feet of transformers.
12540-2	Karen Schumacher	43 USC 315b states holders of grazing permits “are entitled to participate in the use of the range”. With this project, those entitlements are being taken away, a violation of the law. With this project land will not be available for grazing, a clear violation of federal law 43 CFR § 4130.2(e)(1) The ongoing destruction of the land with temporary fencing that is then removed for fencing in another area causes a cumulative overall significant impact which violates 40 CFR 1508.27(b)(7). According to this law, breaking up these small areas does not diminish the significance of the cumulative damage. It also violates 40 CFR 1508.7 43 U.S. Code § 1701 requires that the land will be managed in a manner that will provide food and habitat for domestic animals. The destruction of this land violates this law. 43 CFR § 4130.2(e)(1) states that grazing permits that have been issued remain available for livestock grazing. This right to grazing is being removed by the project, another law violation. In the BLM Mitigation Handbook it states "wind energy projects shall be developed in a manner that will not prevent other land uses, including...livestock grazing..." This whole project violates the BLM's own Mitigation Handbook directives.	Livestock grazing will continue as outlined in the Grazing Coordination Plan (Appendix S in MVE [2023]) and BLM guidelines following FLPMA. The BLM operates under a multiple use mandate through FLPMA, which states that resources and uses on public land must be used in a balanced combination that will best meet the needs of the people. This EIS analyzes the impacts of implementation of the project, which is an additional multiple use.
12685-2	Philip Gossi; Gooding-Lincoln County Farm Bureau	We wish to draw your attention to the complexities of livestock operations that will be impacted by the Lava Ridge Wind Project. It is hard to make an operation successful if part of the business cycle is removed. There are 42 producers that will be economically impacted. Please understand that the disruption of normal grazing activity, which includes eliminating or even temporally preventing use of BLM allotments, will have a direct negative effect. It is not an easy process to eliminate part or all of a herd and then start up again. Obviously this type of undertaking would affect many agricultural companies. For example: a decreased need for hay production would impact all supporting businesses such as seed, fertilizer and irrigation.	No permanent AUM permit reductions are included in the proposed alternatives as part of this project. The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources, if necessary. Livestock grazing permit changes are not evaluated as part of this project. Any permit authorizations or changes warranted by the EIS ROD will be completed through a separate permit action.
12685-7	Philip Gossi; Gooding-Lincoln County Farm Bureau	New roads - Increased public access will disturb wildlife and normal cattle grazing that currently co-exist. It also increases poaching and livestock theft. The new roads would encourage many outdoors activities that keep wildlife from habituating in this area. • Stray voltage - Research is not complete however, there is evidence of decreased milk production, with some cows discontinuing lactation all together. A decrease in cattle pregnancy rates has been reported. Stray voltage not only affects the allotment holders but neighboring private property as well. This can be referenced through studies from many states including Minnesota and Florida. • Predator control - Control of predators may be nonexistent because of a no-fly zone or the difficulty of flying through the proposed project. This may cause producers to lose livestock, due to predication.	See responses to comments 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation) and 11481-3 (see in Table A-3o, Land Use and Realty, including Aviation). Impacts to wildlife and livestock grazing are analyzed in Sections 3.18 (Wildlife) and 3.9 (Livestock Grazing, including physiological effects to livestock), respectively.

Comment ID	Commenter	Public Comment	Response to Comment
12916-3	Gina Jerke	Grazing cattle will be stopped for the ranchers during construction – how will the BLM handle each ranchers' AUM's for the season(s) and will they be allowed to graze cattle elsewhere?	MVE has committed to providing alternative feed sources during construction and reclamation phases for AUMs that are unavailable, as noted in the Grazing Coordination Plan (Appendix S in MVE [2023]).
12982-9	Jerry Taylor	The DEIS gives little attention to potentially significant impacts from blasting, on the unique geology underlying the project area, the hydrological impacts that may occur, the loss of habitat(s), or the potential damage to irrigation structures and/or private wells. Instead, it relies on future mitigation and future plan development (i.e. a "Blasting Plan"), which would enlist the services of a "Blasting Engineer" to craft specific plans, after the final EIS record of decision is issued, on where and how to blast. Why wait? ...What about impacts on cow calf operations holding grazing privileges and permits in the area? What would it do in terms of stress on livestock, calving, breed back, grazing compliance with existing permits and grazing syst~ms? Would it change the grazing patterns and make some areas unusable? The EIS suggests that grazing has occurred harmoniously with other wind farms in operation. How long did it take to acclimate livestock to blasting or the noise of turbines and the motion associated with turning blades? I have inadvertently caused livestock to move by firing a shotgun, while bird hunting. I'm confident that cows will leave faster when a dynamite blast occurs (two times per day on average, as predicted in the DEIS).	Details of the Blasting Plan are site specific and therefore would be finalized after an alternative is selected and micro-siting is completed. Blasting and noise impacts to livestock are analyzed in Section 3.9.2 (Physiological Effects to Livestock). Also see response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources) regarding impacts to hydrology and irrigation structures.
12982-16	Jerry Taylor	The DEIS is not clear on grazing impacts. It talks about reductions (i.e. "Reductions in AUMs"). believe it refers to "temporary, long-term and permanent" reductions. What precisely does this mean and how would it be justified, by what authority, and how specifically would reductions be applied? This needs in depth analysis and disclosure upfront, it certainly would be a significant impact on those holding grazing privileges. Bear in mind that, while grazing is a privilege, a grazing permit holder in good standing has a right to have his or her grazing permit renewed. Grazing permits can be transferred and base property can be sold, but grazing privileges remain active and available except for "just cause11 (trespass, decline in grazing capacity, etc.) or if the privileges are dedicated to another public land use through a Land Use Planning process. {in accordance with the Taylor Grazing Act, FLPMA, and the Public Rangeland Improvement Act). What happens to grazing if and when MVE leaves?	No permanent AUM permit reductions are included in the proposed alternatives as part of this project. The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources. Livestock grazing permit changes are not evaluated as part of this project. If any permit authorizations or changes are warranted by the EIS ROD, they will be completed through a separate permit action.
13006-29	Leon Smith	2) IfNo Action Alternative A is not selected, recommend the DEIS not be finalized until MVE has an agreement in place with the grazing permittees to their satisfaction, including a compensation plan for loss of livestock from construction, operation, maintenance, and decommissioning, including but not limited to fencing, fire, and weed control.	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the grazing management plan during the project.
13009-2	Roy Prescott	MVE's Coordinated Grazing Plan (CGP) indicates that the range improvements will function better after the project is installed than they do now. PresCo supports the installation of "up to 24 miles of pipeline and as many as 35 trough sites" on the Star Lake Allotment and "15 new trough sites and approximately 27 miles of new pipeline" on the Sid Butte Allotment. These range improvements are needed on the allotments whether the project is built or not. The wind project provides a mechanism to get these range improvements built. Grazing distribution will improve with the new troughs. New troughs on Sid Butte will be combined with the new pastures to allow greatly improved range management and an opportunity to efficiently provide for an efficient deferred grazing rotation for the multiple permittees, both sheep and cattle.	Range improvements installed as part of the project are outlined in the Grazing Coordination Plan (Appendix S in MVE [2023]).
13009-3	Roy Prescott	The DEIS calls for reduction in sheep AUMs on Sid Butte and Star Lake allotments. However, review of the Grazing Coordination Plan and communication with MVE, indicate that there should be no reduction in sheep AUMs on either allotment. MVE has communicated that mitigation will be available to sheep permittees (including PresCo) but reductions will not be required. The tables in the DEIS and our communications with MVE indicate that there should be no reduction in sheep AUMs. The final EIS should reflect no reduction in sheep AUMs.	The analysis for grazing allotments (Section 3.9.1 [Grazing Allotments and Range Socioeconomics]) uses acreage disturbance to quantify the potential for loss of forage availability (using AUMs) for each alternative. No permanent AUM permit reductions are included in the proposed alternatives as part of this project. The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources. Livestock grazing permit changes are not evaluated as part of this project. If any permit authorizations or changes are warranted by the EIS ROD, they will be completed through a separate permit action.
13009-4	Roy Prescott	The DEIS calls for a phased construction schedule. MVE has made arrangements that will reduce stocking rates by just over a third during the construction period on the Star Lake allotment. Since less than one third of the allotment will be impacted by construction at any given time, there should be no reduction required of permittees who chose to stay on the allotment. MVE has made similar arrangements on the Sid Butte allotment. No reduction of AUMs should be required for any permittees that wish to graze during the construction period. MVE listened to the Sid Butte permittee requests for an improved grazing system. We fully support the establishment of a 14-pastures grazing rotation. We believe that these new pastures will prove to be successful and should be made permanent. The GCP calls for "temporary establishment of 15 pastures" to be constructed on the Sid Butte Allotment and temporary fences to be built on Star Lake and North Milner. The DEIS maps show these pastures to be the same as (or similar to) the pasture changes the Sid Butte permittees requested from BLM and have communicated to MVE . The new plan will include 14 pastures instead of the existing 4. These pastures should be permanent. If the fences are built for the construction and interim restoration periods, they should be left in place for the duration of the operation period. These additional pastures will improve grazing management on the Sid Butte allotment and better allow permittees to meet rangeland and habitat objectives. It appears short sighted to use these pastures for only 4 years after going through the trouble to design and build them for the construction period. The fences that make up these pastures will also provide better separation of livestock from improved roads. Any temporary fences on Star Lake and North Milner should be evaluated to determine if they should be in place for the duration of the operation period. MVE has worked with Sid Butte permittees to contract sufficient AUMs to be used as non-use for mitigation during construction and restoration. There should be no	See responses to comments 11204-18 (see in Table A-3p, Livestock Grazing) and 13009-3(see in Table A-3p, Livestock Grazing).

Comment ID	Commenter	Public Comment	Response to Comment
		reason for permittees that do not want a reduction to have to take a reduction. All reduced AUMs should come from AUMs for which MVE has an agreement.	
13009-5	Roy Prescott	The DEIS calls for a rest rotation grazing plan for Star Lake and Sid Butte. A deferred rotation grazing plan would better allow grazing to meet habitat and rangeland objectives. This is particularly true if the deferred system reduces the amount of rangeland grazed during the critical growing season. A deferred system will better facilitate more grazing after the critical growing season (including the dormant season). Adding pastures and range improvements will facilitate the grazing plan and allow better distribution. The grazing season-of-use should be extended to allow additional dormant season grazing when conditions are right. The additional range improvements (fences, pipelines, and troughs) will improve control of grazing on the allotment and allow for better grazing distribution. These range improvements are critical to making the grazing system work with the addition of the wind turbines. If BLM grants the ROW, the range improvements should be included as a part of the plan.	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources and funding range improvements. Livestock grazing permit changes are not evaluated as part of this project. No permanent AUM permit reductions are included in the proposed alternatives as part of this project. No grazing permit authorizations or changes are being analyzed in this EIS. If any permit authorizations or changes are warranted by the EIS ROD, they will be completed through a separate permit action. See also responses to comments 11204-23 (see in Table A-3p, Livestock Grazing) and 11369-1 (see in Table A-3p, Livestock Grazing).
13009-6	Roy Prescott	The DEIS calls for a reduction of AUMs during construction, interim rehabilitation, and operation phases. The Star Lake permittees submitted documentation in 2009 to BLM that showed that Star Lake has more than enough forage to support restoration of suspended AUMs as well as an increase in stocking rates during favorable forage years. BLM should include this analysis when looking at the wind project. Once the new troughs and pasture fences are in place, currently unused forage will become available for livestock grazing. We think that this additional forage in combination with that demonstrated to be available in 2009 will indicate an increase in AUMs rather than the reduction called for in the DEIS. The 2009 data was only for Star Lake, but we believe the same to be true for Sid Butte. The improvements the CGP spells out for Sid Butte will improve distribution and access to currently unused forage to a level to support an increase in AUMs rather than a decrease	See response to comment 13009-5 (see in Table A-3p, Livestock Grazing).
13009-7	Roy Prescott	MVE has worked with Pres Co on the North Milner allotment. As the major AUM holder on that allotment, we believe that we can continue to work with MVE to offset any impacts. There should be no reduction in AUMs on North Milner during any phase. There are grazing management and range improvement options available to offset the impacts of the project without reducing AUMs. This si particularly true with Alternatives C or E where only 14 or 11 AUMs of forage would be impacted.	See response to comment 13009-5 (see in Table A-3p, Livestock Grazing).
3340-4	Sue Page	The LRWP will infringe upon the lives and livelihoods of many people that make a living from the land. The cattlemen will have to move their cattle from their BLM allotments during the construction of the project. These people have used this land for generations. Where will their herds be displaced to? Where will they acquire feed? Several farmers and dairymen will be surrounded by the wind turbines, essentially being imprisoned by the looming spires. How will the EMFs, turbine vibrations, and noise, impact their livestock?	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources. No permanent AUM permit reductions are included in the proposed alternatives as part of this project. Livestock grazing permit changes are not evaluated as part of this project. No grazing permit authorizations or changes are being analyzed in this EIS. If any permit authorizations or changes are warranted by the EIS ROD, they will be completed through a separate permit action. Section 3.9.2 (Physiological Effects to Livestock), including available published literature and analysis, discusses physiological effects to livestock.
3997-6	Angelee Eames	4.Post- construction reclamation will seed and allow cattle back on the land as stated in the EIS. How do you "mitigate" for cattlemen who will lose their allotments for two years of building? Where do those cattle go?	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources for phases where AUMs are unavailable due to the project.
5189-3	Traci Wood	It's said that the ones with grazing permits will be compensated. But is the compensation enough to make a difference, in the mean time how will they feed their cows, cost of hay is high as it is. And will they even be able to use the graze land again, or will it all be gated, controlled by the energy company?	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources for phases where AUMs are unavailable due to the project.
5331-4	Joan Hurlock	The LRWP will infringe upon the lives and livelihoods of many people that make a living from the land. The cattlemen will have to move their cattle from their BLM allotments during the construction of the project. These people have used this land for generations. Where will their herds be displaced to? Where will they acquire feed? Several farmers and dairymen will be surrounded by the wind turbines, essentially being imprisoned by the looming spires. How will the EMFs, turbine vibrations, and noise, impact their livestock? Their health?	See response to comment 3340-4 (see in Table A-3p, Livestock Grazing).
5896-14	Mike Tylka	Grazing. Local ranchers and businesses may be restricted from using legitimate grazing leases if this project moves forward costing them thousands of dollars with no compensation.	See response to comment 13009-5 (see in Table A-3p, Livestock Grazing).
6387-14	AJ Whitecotton	Local ranchers and businesses may be restricted from using legitimate grazing leases if this project moves forward costing them thousands of dollars with no compensation.	See response to comment 13009-5 (see in Table A-3p, Livestock Grazing).
7320-2	Lora Ohlensehlen	It is proposed that some ranchers will have grazing at another site temporarily. That was creative problem solving. However they should not lose any AUMs. Losing AUM's is totally unacceptable. The ranchers rights should be grandfathered in because they were there first. They should lose no AUMs. I understand that the proposed windmills will take up land space, but give or open up other BLM ground for the ranchers to graze on. They should not suffer consequences created by outsiders.	See responses to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 13009-5 (see in Table A-3p, Livestock Grazing). The BLM operates under a multiple use mandate through FLPMA, which states that resources and uses on public land must be used in a balanced combination that will best meet the needs of the people. This EIS analyzes the impacts of implementation of the project, which is an additional multiple use.
7321-3	Travis Wells	Grazing is also an important part of public land use. Construction of the turbines will limit the grazing that can occur because the area will be roped off and not accessible. Even after construction is complete, maintenance will also limit the area that can be grazed. Some cattle may also be frightened by the massive structures and then run away from them. This would break border fences and cost ranchers money.	See response to comment 3340-4 (see in Table A-3p, Livestock Grazing).
8642-4	Carl Montgomery	The amount of land available to graze will be drastically reduced by the Lava Ridge Wind Project, especially during construction. The amount of fencing Magic Valley Energy (the company responsible for the project) is	See response to comment 13009-5 (see in Table A-3p, Livestock Grazing).

Comment ID	Commenter	Public Comment	Response to Comment
		proposing to build will disrupt the grazing management and increase the cost and be a burden to the cattle producers. Other feed resources will have to be found, but as mentioned earlier this area is a desert that has been in a drought. Finding those resources will be costly, if not impossible. And as history has proven, once cattle have been removed from public lands they are not always allowed back due to various interest groups, and if they are it is almost always under altered circumstances. Cattle area tool to help manage the public lands and meet this mission of the BLM.	
8643-5	Steve Woods; Pam Woods	The impact of these turbines on cattle and wildlife is a yet to be proven issue. Even with smaller turbines, there has been possible high frequency and stray current adverse impact on cattle and wildlife. To embark on such a huge project over such a huge area with little or no time-proven results is irresponsible.	See responses to comments 11204-20 (see in Table A-3p, Livestock Grazing) and 11535-165 (see in Table A-3p, Livestock Grazing).
8790-2	James Ritchie	2. We have a grazing permit in the Star Lake allotment and believe that construction of this project will impact the aum's available, up to 1/3 or more based on a 3 phase construction period. Where will we find replacement feed and who will pay for it? The draft EIS doesn't address the economic impact to local families having their business devastated by this project.	The Grazing Coordination Plan (Appendix S in MVE [2023]) outlines the proposed plan for livestock grazing management during the project phases, including MVE committing to providing alternative feed sources and funding range improvements. Socioeconomic impacts, including those to the livestock grazing economy, are analyzed in Section 3.9.1 (Grazing Allotments and Range Socioeconomics).
9387-1	Jordan Beadz	The effect on cattle grazing also wildlife impact would be highly bad for all agriculture	Impacts to Livestock Grazing are analyzed in Section 3.9 and wildlife impacts are analyzed in Section 3.18 (Wildlife).
F2-3		Livestock grazing is not just a large economic factor in this area but also a cultural factor as well. Limiting grazing in response to the approval of this wind farm through reductions in AUM's and other ways changes the traditional uses of this land. This is a way of life for the multiple generations of farmers and ranchers in this area.	Section 3.9.1 (Grazing Allotments and Range Socioeconomics) describes the potential impacts to economic and cultural values. See also response to 11204-13 (see in Table A-3p, Livestock Grazing).

Minidoka War Relocation Center and Minidoka National Historic Site

In addition to the Minidoka War Relocation Center and Minidoka National Historic Site comments and the BLM's responses to these in Table A-3q below, please refer to Table A-1, Recurring Themes and Responses for Comments Opposing the Project Because of Minidoka War Relocation Center and Minidoka National Historic Site.

Table A-3q. Minidoka War Relocation Center and Minidoka National Historic Site

Comment ID	Commenter	Public Comment	Response to Comment
1052-1	Lawrence Matsuda	My name is Lawrence Matsuda and I was born in the Minidoka Idaho Concentration Camp-Block 26 Barrack 2. My mother, father, brother, grandfathers, grandmothers, uncles, aunts, and cousins were there for three years. My position is that: I support the NO windmill option (Option One) because there l s no feasible way to mitigate the impact of the project as well as the fact that this project functions as a 21ST century version of identity hijacking and identity theft. Being born in the Minidoka Concentration camp, I understand that there are two Americas and one has less justice by design. As a person from the lesser America I've witnessed or am familiar with freeways that destroyed African American areas in New Orleans, destruction of Black Wall Street, stadiums, freeways, and light rails scaring Seattle's Chinatown/Japantown, effects of the forced incarceration on the Japanese, California Chinese gold miner claim jumping, Native American reservations and much more. The historic pattern is clear. The lives and property of lesser Americans are to be exploited. Today faceless corporations understand the game and use bureaucratic rules/processes, lawyers, legalistic language to put forth projects that promise progress and high sounding ideals at the expense of the "other" America. Ironically, using their corporate business model to assess the Lava Ridge windmill project, my conclusion is that there is no upside for lesser Americans. It only brings grief and continued exploitation. So the question is, "What is in it for us?" The response is, "There is nothing good in it for us." The issue is similar to an identity theft scam where an anti-virus warning threat pops up on your computer screen and they tell you to click this link within four minutes or your bank account would be in jeopardy. The answer is the same for the Lava Ridge project. Just hit "DELETE". The Lava Ridge proposal is nothing more than a brazen attempt of bait and switch to steal Minidoka's identity. Through esoteric legalistic maneuvers Minidoka could be surrounded by windmills and become nothing more than a soulless power station of 400 feet tall windmills. The Minidoka historic site would be lost in the shadows of Lava Ridge turning blades of profit. Lost would be a reminder to America that the forced incarceration should never happen again and lost would be the sacred nature of a land that held 10,000 souls, where 400 were buried and hundreds born. Lost would be another tenuous fragment of lesser America that speaks to "liberty and justice for all."	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. The BLM is considering a No Action alternative for the project, by which it compares the potential impacts of the action alternative analyses in the EIS. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. At no point would Minidoka NHS be within the literal shadows or shadow flicker zone of wind turbine generators from the project; see EIS Section 3.16 (Visual Resources). Alternatives considered in the EIS, including the BLM Preferred Alternative, would include these setbacks. Action alternatives considered beyond MVE's Proposed Action would all work to further set back turbines from the Minidoka NHS area. Under no alternative would turbines surround Minidoka NHS. Although lessened, visual impacts would remain under any action alternative, including—as presented in the EIS—those that could affect the experience and sense of place; see Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). However, impacts would be mitigated, as stated in EIS Section 3.5; although this mitigation would not remove the impacts that remain after all measures to avoid and minimize impacts are applied. Mitigation efforts for the remaining impacts are meant to retain and preserve resource values in alternate forms or to return value through other means, such as retaining documentation of the impacted resource for future knowledge and interpreting and educating on historic properties and area history such as at Minidoka. One goal of mitigation would be to preserve information and convey knowledge of Minidoka NHS and enhance awareness of its history and the history of the Japanese American community. Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice are addressed in EIS Section 3.6.1. The BLM's environmental justice analysis complies with EO 12898 and the BLM's environmental justice guidance document (IM 2022-059) (see response to comment 11535-49), and response to comment 11535-50 (see both in Table A-3h, Environmental Justice and Socioeconomics) relating to meaningful engagement with environmental justice communities. The final EIS includes new Section 3.19 (Minidoka National Historic Site Interpretive Purpose), where impacts identified within EIS Sections 3.5, 3.6, and 3.16 are assessed in terms of how these would impact the interpretive purpose of Minidoka NHS under the supporting concepts (Civil and Constitutional Rights, People, Place, and WWII), through the four interpretive themes established through Public Law 110-229:

Comment ID	Commenter	Public Comment	Response to Comment
		As a result, I urge that the Minidoka site have NO windmills nearby. Corporate America already has non Minidoka alternatives that may cost a little more but would still turn a profit. To them the loss of the site would be a survivable write-off. But to those of us in the other America, no windmills means that Japanese Americans who sacrificed their lives in WWII did not die in vain and that the intergenerational after effects of the forced incarceration are more tolerable knowing that Minidoka is intact. Minidoka would then be able to maintain its identity as a shining beacon for justice. As a committee person, a vote against windmills means you can tell your children and grandchildren that you did something courageous that narrowed the equity gap between the two Americas in 2023. By voting "No" you prevented an identity theft that would have turned Minidoka into a shadow of Lava Ridge. Also you would have stopped a project that exploits "other" Americans as they have been countless times in the past.	• the story of the relocation of Japanese Americans during WWII to the Minidoka WRC and other centers across the United States; • the living conditions of the relocation centers; • the work performed by those incarcerated at the relocation centers; and • the contributions of the United States military made by Japanese Americans who had been incarcerated. In a ROD, following the final EIS, the BLM will decide to approve, approve with modification, or disapprove the project as proposed.
11297-6	Steven Upton, Linda Upton	What will this project do to the Minidoka National Monument?	Potential impacts that could result in an adverse effect to Minidoka NHS and the Minidoka WRC are addressed in the draft EIS Section 3.5 (Cultural Resources). Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
11305-1	Marleen Wallingford	My family was removed from their house in Portland in May 1942 and taken away from the city by train to parts unknown. It turned out to be a community,which was not even completed yet, was Minidoka which is Shoshone for broad expanse. This was to be there home for the next three years. I consider this a site of conscience. This is a physical reminder of what our country did when people let fear and prejudice guide their decisions rather than the rule of law. Our civil rights were grossly violated and we must never forget that our government policies ruined people's lives and cost millions of dollars because of racism. I am sympathetic to our need to find sustainable alternatives for our energy use but building these huge wind structures would forever ruin the experience of being at this sacred place to the Japanese American Community. I implore you to find alternative sites which does not compromise the ambience of the Minidoka National Historic Site. This is where my family was detained without any trial or judicial review. I have attended one of the Pilgrimage which had been held on a regular basis (until COVID) and I could feel the echos of my family in that space. I would consider how this project changes the environment similar to what we might object to if this wind farm was built adjoining one of our national parks like the Grand Canyon. These are sacred places that need to be preserved for ourselves and the larger world community.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. The BLM recognizes Minidoka NHS is a site of conscience, moral reflection, and community healing. This topic is addressed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) of the draft EIS. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
11306-1	Elaine Aoki, Emily Aoki Yamashita	April 16, 2023 Dear Kasey Prestwich and Shoshone Bureau of Land Management Members, We are writing to share our disappointment and objection to the Lava Ridge Draft Environmental Impact Statement (DEIS). While we support the need for renewable energy infrastructure, we oppose the identification of the Minidoka National Historical Site (the adjacent area as well as the partial area of the original site) as the location for this development. The DEIS fails to recognize the history and significance of the Minidoka NHS as a place of healing for the Japanese American Nikkei families who were unconstitutionally incarcerated as a result of Executive Order 9066. The Minidoka NHS not only represents a cultural landscape, but it also serves as a reminder and educational opportunity for future generations that acting on fear, xenophobia, and racism is never acceptable. By inappropriately identifying the Minidoka NHS as a place for "Tourists and Recreationalists," the Lava Ridge DEIS is undermining the generational trauma that has rippled through the Japanese American community because of the incarceration that took place on this land, and we urge the Shoshone BLM to reconsider using this significant site of history as the location for the windmill project. Our family represents five generations of Japanese Americans who have been personally impacted by the incarceration that took place at the Minidoka NHS. Due to the deep significance that this event has had on all of our lives, we have made continuous efforts to organize family pilgrimages to the Minidoka NHS to honor our elders who were forced into incarceration. Later generations of our family have been able to walk the landscape and hear stories of how their elders persevered through this act of injustice. By personally exploring the landscape, we were able to have an immersive understanding of the desolate location, inhumane living conditions, and destruction of family that our families were forced into. Even more significant, this visceral experience resonated emotionally within all of us, as we could feel our elder's confusion, rage, and suffering. After experiencing a year in Minidoka as an 18-year-old youth, our Nisei father enlisted and was placed with the US Army's Military Intelligence Service. This experience has influenced future generations as we have each taken action to leading and teaching others that equity and civil rights are not taken for granted. Family members continue to be K-12/Higher Education educators, writers, textbook writers, and painters to share the experiences of lives were effected by Minidoka. Even our younger members were influenced by Minidoka and became Annapolis graduates and Navy officers while another pursues graduate degrees and a professional work world in race, equity, and community diaspora. Therefore, we petition the Bureau of Land Management not to develop the Lava Ridge Wind Project on original and adjacent lands to the Minidoka NHS, as it represents past mistakes and future lessons for America as a whole. Those impacted by the wrongful incarceration deserve to have a protected space of cultural significance to honor and respectfully anchor their histories. Their stories need to be shared and remembered. We urge the BLM to consider the intergenerational trauma that occurred from the WWII Japanese American incarceration and understand the significance of the Minidoka NHS as reminder that equity and civil rights are not taken for granted in this country. We have not been convinced that this project can only occur on this site, nor have we been given justification that this project must be built on a historically significant area to the Japanese American community. Sincerely, Elaine M. Aoki, 3rd generation Minidoka family member Emily Aoki Yamashita, 4th generation Minidoka family member	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) acknowledges the historical significance of Minidoka NHS. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. The EIS describes concerns that, in addition to visual impact, extend to the emotional impact the appearance of the project on the landscape could have on the Japanese American communities' experience of the Minidoka WRC and Minidoka NHS. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. The BLM is considering a No Action alternative for the project. The potential impacts of all action alternatives are addressed in the EIS. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. In response to public comments on the draft EIS, the BLM identified the Preferred Alternative, described in the final EIS, which would further reduce project impacts to Minidoka NHS and the Minidoka WRC. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Varying degrees of impacts to Minidoka NHS would result under any of the action alternatives, and various mitigation measures would be applied, as stated in the EIS. The avoidance, minimization, and mitigation of impacts described in the EIS would support the preservation of Minidoka NHS. One goal of mitigation would be to preserve information and convey knowledge of Minidoka NHS and enhance awareness of its history and the history of the Japanese American community.

Comment ID	Commenter	Public Comment	Response to Comment
11315-5	Karen Atkinson	Comments are submitted via attached pdf document. [attachment] Dear Mr Prestwich: I'm an Alaska Native who had family removed from Alaska under Executive Order 9066 and sent to the Minidoka Relocation Center in Idaho. My great-uncle was Tsimshian and Japanese and lived in Ketchikan, Alaska. My great-uncle and his young family were removed from Alaska in 1942. My great-uncle was separated from his family and sent to the Minidoka Relocation Center. He was among the 45 Alaskans of both Alaska Native and Japanese ancestry who were incarcerated at Minidoka. My great-grandfather immigrated from Japan and made his home in Ketchikan, Alaska where he married a Tsimshian woman and owned a restaurant and commercial fishing boat. Immediately after the attack on Pearl Harbor, the U.S. Government wrongfully arrested my great-grandfather along with all of Alaska's first generation Japanese men and sent them to prisons in Lordsburg and Santa Fe, New Mexico. Most were fathers and grandfathers who were removed from Alaska and separated from their families. My great grandfather was separated from his family for the duration of the war. On behalf of my family, I am submitting this comment on the Lava Ridge Draft Environmental Impact Statement (DEIS) in support of Alternative A-the No Action Alternative due to the impacts the proposed large-scale industrial project would have on the Minidoka Relocation Center as a place of healing and commemoration for Alaska Natives to honor their family members who were wrongly incarcerated there. The indirect and direct effects of the Project on the historic footprint of the Minidoka Relocation Center and the Minidoka National Historic Site (MNHS) would be pervasive, destructive, and permanent. Because of their nature and scope, the effects cannot be adequately mitigated at the proposed site. Significance of Minidoka to Alaska Natives In 1942, the U.S. forcibly removed 145 Japanese Americans from their homes and communities in Alaska, most were from Southeast Alaska. These Alaskans were primarily women and children whose fathers and husbands were arrested and detained soon after Japan's attack on Pearl Harbor. About a third of the Alaskans removed under EO 9066 were of both Alaska Native and Japanese ancestry including Tlingit, Haida, Tsimshian, Aleut, Inupiat, and others. Most were children from marriages between Japanese men and Alaska Native women who lived in tight-knit communities. They came from unique backgrounds some were from Alaska Native villages in northern and western Alaska, some hunted and fished for a living, and others were well-established business owners from Southeast like my family. Most of the Alaskan Japanese families, including those of Alaska Native and Japanese descent, were incarcerated at the Minidoka Relocation Center thousands of miles from home, purposely located in a desolate and isolated area of Idaho. The forced removal had devastating impacts particularly on these Alaska Native families and created unthinkable hardships. In many cases families, like mine, were separated for the duration of the war. Some Alaska Native children were separated from their parents and went to Minidoka by themselves. Some Alaska Native wives went to Minidoka with her children to keep their family together. At Minidoka, Alaskan Japanese were purposely isolated from the outside world. For years, they lived in harsh, overcrowded conditions, surrounded by barbed wire fences and armed guards. Those of both Alaska Native and Japanese ancestry were even more isolated within the camp because they were torn from their Native communities and culture and lived in a desolate desert environment with people of an unfamiliar culture. Assigned to their own barracks block, they formed their own unique community at the center of the Minidoka camp to provide strength and support to one another. Significant Impacts on Alaska Natives Not Addressed Minidoka National Historic Site is of historic and spiritual significance to Alaska Natives because of the forced removal of the 45 Alaskans of both Alaska Native and Japanese ancestry that were incarcerated there. Executive Order 13175 Consultation and Coordination with Indian Tribal Governments (2000) and other federal laws and policies expressly require BLM to consult with Tribes and Alaska Natives early in the agency process to identify sites of historic, cultural, and sacred nature and to consider them in the agency decision-making processes. The DEIS does not describe or assess the impact of the project on Alaska Natives associated with Minidoka as required by federal law and policies. The DEIS only talks about the Japanese American community broadly. It fails to mention Alaska Natives and their descendants who would be impacted by the proposed wind project. Historic and Cultural Significance: The Minidoka National Historic Site tells the stories of the forced incarceration of Japanese Americans and Alaska Natives and ensures their stories are honored and preserved for future generations. Minidoka has significant historic, spiritual, and cultural associations with Alaska Natives. It is integral to the identity of the 45 Alaska Natives and their descendants who were removed from their homes, separated from their families, and detained in a purposely isolated environment thousands of miles from home. Minidoka is a focal point for cultural and religious practices as a sacred place for commemoration and healing. An unobstructed view of the sweeping vistas and desolate environment is essential to the immersive experience and practice of commemorating those that were incarcerated there. The unobstructed landscape and vistas associated with the Minidoka Relocation Center and its historic footprint are integral to the cultural practices associated with the healing and commemorative activities that occur at the site. Survivors and their relatives can make pilgrimages to heal the deep emotional trauma. The site is an acknowledgement of the injustice that happened here and the tragic consequences it had on so many Alaska Native families like mine. Environmental Setting: Because of its immersive setting and the sense of remoteness and isolation provided by the sweeping vistas of distant mountains, people who visit can experience what life must have been like for the Alaska Natives at Minidoka. The proposed Lava Ridge large-scale industrial project and its 400 wind turbines would tower over and encroach on the scenic vistas and destroy the ability to experience what it was like to be incarcerated at Minidoka and that feeling of being alone and secluded that my great-uncle experienced there. The unobstructed landscape and vistas associated with the Minidoka Relocation Center and its historic footprint are integral to the practices associated with the healing and commemorative activities that occur at the site. DEIS Alternatives I support Alternative A-No Action Alternative because it is the only alternative that protects the integrity of the fundamental resource values associated with the Minidoka National Historic Site and its historic footprint. This includes the site's environmental setting, historic and cultural values, and scenic resources and viewshed, including its immersive setting which allows camp survivors and	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. The BLM's scoping and consultation efforts are summarized in EIS Appendix 10, under Consultation and Coordination, and in the scoping report prepared for the project and posted on the BLM's project website (https://eplanning.blm.gov/eplanning-ui/project/2013782/510). The DOI Office of Collaborative Action and Dispute Resolution further conducted outreach efforts to the Japanese American communities in Idaho and throughout the United States with connections to Minidoka NHS to identify and consult on community interests and concerns and receive input on the project and produced a summary report on these efforts, as cited in the EIS, and also available on the BLM's project website. The BLM understands that Alaska Natives, including Alaska Native spouses and mixed Alaska Native and Nikkei children, were among the Nikkei population incarcerated at the Minidoka WRC. The NHPA Section 106 consulting parties representing the Minidoka-connected community include those with direct ties to Alaska, such as the Alaska Chapter of the JACL, and those from Alaska territory. The BLM is consulting with Native American Tribes with ancestral ties to the project area (see EIS Appendix 10, Section 106 Consultation and Government-to-Government Tribal Consultation). Alaska Native Tribes were not directly among interested parties or stakeholders identified during initial project scoping or through the NHPA Section 106 consultation process. Also see response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding the DOI's trust responsibilities, specific treaties that relate to federally recognized Tribes with ancestral ties to the project area, and the EIS's full consideration of impacts to resources that may be associated with tribal rights or interests. The description of Minidoka NHS and the Minidoka WRC included in EIS Sections 3.5 (Cultural Resources) and 3.6 (Environmental Justice and Socioeconomics) has been revised to properly reflect the different types of communities that were incarcerated at the site. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. At no place would wind turbine generators from the project literally tower over any part of Minidoka NHS. In response to public comments on the draft EIS, the BLM identified the Preferred Alternative, described in the final EIS, which would further reduce project impacts to Minidoka NHS and its setting within the greater Minidoka WRC. Regarding mitigation measures and associated consultation related to cultural resources, including Minidoka NHS, please see response to comment 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns). EIS Section 3.6 additionally considers mitigation measures related to adverse environmental justice community impacts. As noted in response to comment 11985-1 (see in Table A-3g, Cultural Resources and Native American Concerns): The current EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking to protect the historic properties associated with Minidoka NHS. The BLM is meeting all program and resource management planning requirements under the NHPA; NEPA; FLPMA; and other laws, regulations, and federal requirements; in advance of the project decision. The BLM will continue to plan for the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS, under a PA, completing the Section 106 process in consultation with consulting parties. No physical impacts from the project would result at Minidoka NHS. Varying degrees of non-physical impacts to Minidoka NHS would result under any of the action alternatives, and various mitigation measures would be applied, as stated in the EIS. The No Action alternative also remains an option. Regarding ACECs, please see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		descendants to better understand and connect to the lives of the people incarcerated at Minidoka and the hardships they endured. Additionally, I support the Greater Minidoka Area of Critical Environmental Concern (ACEC) to protect Minidoka's viewshed along with grazing, recreational access, migration corridors, raptors, Monarch butterflies, general aviation, and cultural sites and other values. The BLM's preferred project alternatives will have significant adverse effects on the the cultural practices of healing and commemoration associated with the Minidoka National Historic Site and its historic footprint. The impacts of large industrial scale turbines are permanent and can not be satisfactorily mitigated. The project will affect the viewshed and cultural landscape associated with the Minidoka National Historic Site. The project turbines will introduce a high concentration of large-scale industrial visual elements that are out of character with the Site's immersive setting that inextricably contributes to its historic and cultural significance. The altered viewshed would interfere with the healing and commemorative activities of Alaska Natives that occur at the Minidoka National Historic Site to honor their relatives who were incarcerated there. The proposed project is inconsistent with the MNHS enabling legislation, NEPA, and historic preservation laws. The Lava Ridge project would degrade and destroy the sense of isolation and desolation that my great-uncle experienced there. It demeans the memory and hardship that my uncle and the other Alaska Natives experienced at Minidoka. Their incarceration is a reminder of the tragic human consequences of government policies driven by systemic racism and hatred. Preserving the Minidoka Historical Site is a way to honor the Alaska Natives who were irreparably harmed as a result of government policies. The DEIS does not address the potential impacts the project would have on Alaska Natives ,,, historic and cultural associations and with the Minidoka Historic Site and its historic footprint and does not adequately provide for mitigation for impacts on Alaska Natives. Before finalizing the DEIS, BLM should consult with Alaska Native tribes and organizations regarding the impacts the Lava Ridge project would have on Alaska Native connections to the historic, religious, and cultural resources of the Minidoka War Relocation Center and Historic Site and its significance to Alaska Natives. Sincerely, Karen Atkinson Albuquerque, New Mexico cc: Honorable Deb Haaland Solicitor Robert Anderson Honorable Martin Heinrich Honorable Ben Ray Lujan Honorable Melanie Stansbury Advisory Council on Historic Preservation New Mexico Chapter-Japanese American Citizens League Alaska Chapter-Japanese American Citizens League	
11323-1	Mary Lou Sumioka	Minadoka is a memorial to Japanese-American incarceration. It deserves to a prominent, unsullied place in our landscape and history. Allowing a private company to develp the Lava Ridge Wind Project so close to the memorial would relegate it to an insignificant neighbor. Minadoka should be listed on the National Register of Historical Places because it is an historical place. It need to be protected for those of us who are intimately connected to those who were interned there, as well as for the general public who may be unaware of how American citizens of Japanese descent were summarliy rounded up in 'camps' such as Minadoka. Irony...so much irony. While my future mother-in-law and her family lived in horse stalls at Minadoka with sand whipping through cracks in the walls, my future father-in-law fought in the 442nd Regimental Combat Team, an all-Japanese unit in World War II. Not surprisingly, they were the most decorated unit of its size and length of service because they were sent on the dangerous missions, such as rescuing the 'Lost Battalion'. The Nisei (second generation) soldiers suffered heavy casualties...more than 800, to rescue a Texas National Guard team made up of approximately 275 white American soldiers. My father-in-law, a sergeant in the 442nd, wasn't involved in the rescue because he had already suffered a serious knee injury in Arno, Italy. Many years later, I wrote a letter to the editor of the Tacoma News Tribune protesting a comment published by another letter writer. The Puyallup Assembly Center (known by the name of 'Camp Harmony'...more irony) for Japanese-Americans before transport to the camp. Years later, the Puyallup Fair wanted to place a plalque inside the fairgrounds to commemorate that piece of history. A woman wrote to the paper complaining that if there was a plaque at all, it should be placed in the parking lot because, after all, Japanese-Americans were put in the camps 'for their own good'. I wrote a letter forcefully explaining why the plaque deserved a prominent place inside the grounds In those days, as a letter writer, I was required to include not only my name, but my address. Shortly afterward, I received a note on a News Tribune notepad railing the 'you and your kind always want something for nothing' (more irony). I'm caucasion with too white skin and very blue eyes. One final irony. My husband's aunt, also incarcerated at Minadoka, where armed guards manned the guard towers, made a scrapbook. She gathered up news and mementos of camp life. To me, it's heartbreaking. While locked up, the internees recreated American life: baseball games, school, proms, Scout troops... My mother-in-law taught in the high school, even thought she was only a few years older than her students. After graduating for the University of Washington, she talked her advisor because she wanted to become a teacher. He told her in no uncertain terms she would never be hired. She went on to earn her Master's in social workd and became nothing short of a legend at Seattle Childrens' Home Society and Ryther Child Care Center. My mother- and father-in-law are American heroes. They deserve a fitting memorial to commemorate their significant contributions to this country while at the same time suffering illegal incarceration, not to mention continuing racism.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing, and the EIS's address of impacts to the natural and cultural landscape surrounding Minidoka NHS. As noted in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site), Minidoka NHS is a nationally significant site listed on the NRHP under Criterion A (historic event). See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS.
11325-1	Louise Walsh	To Whom It May Concern, Regarding the Lava Ridge wind turbines. I was heartbroken to hear of this plan. Many of my neighbors and friends were interned at the Minidoka site during WWII. Our family cared for our neighbors farm so they would have something to return to, they are family to us, and we still keep in contact with their descendents. It would be a shame to desecrate the site. I have visited the site, and hope to visit many more times. It is a solemn place of reflection and rememberance. We as a society should never forget our shameful history. Under certain conditions the wind turbines can be heard for miles, this will greatly impact the Minidoka National Historic Site, and hinder the visitors oportunity to experience the site. And the site of wind turbines will negatively impact the view shed. Once the turbines are installed you will never be able to turn back, I think it is important to experience the isolation and views that are citizens of Japanese descent experienced. We are not	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing, and the EIS's address of impacts to the natural and cultural landscape surrounding Minidoka NHS. Analyses, as in Section 3.5 (Cultural Resources), have determined that while wind noise from operating turbines would be audible at Minidoka NHS under Alternative B, no perceptible turbine wind noise from the project would occur at Minidoka NHS under Alternatives C, D, or E. Also see response to comment 11315-5 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site), in general, and response to

Comment ID	Commenter	Public Comment	Response to Comment
		just tourists, we come to remember our past and our friends who have since passed. Please do not allow the Lava Ridge wind turbines to be installed. Sincerely, Louise Walsh 4621 154th Ave. Ct. East Sumner, WA 98390	comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns), regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. The BLM is considering a No Action alternative for the project in addition to the action alternative analyses in the EIS.
11337-1	Dave Shigaki	To: Shoshone BLM US Representative: Pramila Jayapal City/State of Residence: Seattle, WA I am a 4th generation Japanese-American living in Seattle, Washington. My parents, grandparents, and great-grandparents all were incarcerated during World War II in relocation camps - first in Camp Harmony in Puyallup, Washington, and then subsequently moved to Minidoka, Idaho. The camp location in Minidoka is significant; it was once believed that by moving people of japanese ancestry further inland, the risk of them contacting the nation of Japan would be diminished. The very thought of this is appalling and shameful. My parents, grandparents, and great-grandparents all suffered immeasurably during this time; traveling only with those belongings that they were able to carry, my family members made the best of a terrible situation where they were unjustly persecuted based solely on their appearance. Thankfully, all incarcerated family members were able to persevere through resilience and grit. I am writing this letter to request that the land where the former camp in Minidoka be preserved as a national historic site and to avoid an impairment of resources. It goes without saying that even today, in 2023, we continue to see racially motivated attacks and provocations. Our nation has become polarized; it is unfathomable that racially motivated harassment and attacks have become normalized. Even with the recent COVID pandemic and the associated violence against Asian Amercians, we as a nation continue to face racial challenges. That is why it is critically important to preserve monuments such as Minidoka as an International Site of Conscience, and continue to provide education and visibility on the unconstitutional removal of so many Japanese Americans from their homes and uprooting their lives. The proposal by the DEIS to use land surrounding Minidoka for wind farms shows a total lack of respect for this significant landmark. The DEIS inappropriately identifies Minidoka NHS as for "Tourists and Recreationalists" which reflects ignorance of the history of the location and its impacts. The DEIS also fails to recognize the importance of the cultural landscape and preserve the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its immersive educational experience. I urge you to reconsider the Lava Ridge development and preserve the camp in Minidoka, Idaho, and its surrounding area, as it represents a critical piece of US history that should not be forgotten.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. As noted in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site), Minidoka NHS is a nationally significant site listed on the NRHP under Criterion A (historic event). See response to comment 11315-5 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives.
11379-1	Kenichi Yabusaki	My Name is Kenichi Yabusaki. My parents, sister, and maternal grandparents were incarcerated in Camp Minidoka (Camp) for nearly three years (1942-45). My mother was carrying a fetus during the mass evacuation and lost her daughter in Camp a few days after her birth. I was born a prisoner of War in Minidoka in September 1944. Lava Ridge is a sacred ground inhabited by indigenous peoples thousands of years before White settlement. Anyone visiting the Minidoka and the land surrounding it is a guest. Building a wind farm on this land desecrates it and detracts from what Minidoka represents. Minidoka is only one of more than ten other major concentration camps that, in total, imprisoned nearly 120,000 innocent victims without due process. All those imprisoned are a testament to the human spirit. Minidoka is hallowed ground. My baby sister's ashes are part of Minidoka. To have towering wind turbines humming on Lava Ridge would bring bad karma, deprecate a historical site, and send a message that it should never be forgotten, as every Camp represents what the evil in politics in a democracy can do. I am against the construction of wind farms on Lava Ridge. Thank you for your consideration. Sincerely, Kenichi Yabusaki In memory of Shigeo, Toshiko, Naomi, Hisakichi, and Umeyo	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. The BLM recognizes that the Lava Ridge area, within which the project is proposed, contains places and landscapes that are spiritually and culturally significant to Native American Tribes. This topic is addressed in EIS Section 3.5.1 (Native American Resources). The BLM also understands the Japanese American and Minidoka-connected communities consider Minidoka NHS and the Minidoka WRC sacred and important historic places where learning and healing can be achieved through their continued preservation. This is discussed in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site). See response to comment 11337-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Also see response to comment 11325-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding analysis of turbine noise from the project occurring at Minidoka NHS. Please note that no wind turbine generators would be placed at Minidoka NHS under any action alternative.
11382-1	Paul Fujihara	My parents and relatives were incarcerated during World War 2 within these so called 'Relocation Camps'. They were forced to live in these crude concentration camps, behind barbed wire and patrolled by armed sentrys. They endured the dusty hot conditions of Summer, the freezing wintry weather of winter, with food supplies that were poor. communal showers and open toilets. They lost their homes, belongings, businesses and years of their lives. They felt alien, untrusted and un-American. They lost their pride and their sense of purpose. Now the impacts of their history will be swept under the rug with the changing times. I have been fortunate to have visited the Minidoka site, I felt moved by its sense of desolation, loneliness and absolute emptiness. Visitors to the site will not feel the same impact of visual and auditory loneliness. The feeling of despair and loss. We are not learning from our history. This important lesson needs to be shared in its entirety. Other races are being challenged now. I have watched the computer simulations and find them deceiving. I am quite familiar with cad animations and realize how they can be used to alter our perception of reality. By using a 'fisheye lens', we can minimize the visual impacts of the 'wind farm'. In actuality visitors will be able to see the tall towers and also hear the constant whoosh whoosh of the blades through the wind. I respectfully ask for NO ACTION be taken on the lava ridge project	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 11337-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Please also see response to comment 11325-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding analysis of turbine noise from the project occurring at Minidoka NHS. Please note that BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS. As noted in response to comment 11454-2 (see in Table A-3y, Visual Resources), dynamic simulations of wind turbine generators were provided for informational purposes, and these may vary in viewing accuracy depending on the resolution of the computer and monitor settings that the individual viewer may be using. The visual impacts for the project did not rely on the dynamic simulations but rather were further supported by the single-frame simulations contained in EIS Appendix 5 (Select Visual Resource Simulations) in the EIS and Appendix C in the visual resource technical report (SWCA 2024). Visual simulations have been developed as a tool to capture the impact of the project at a specific moment in time. Visual simulations for the project were developed using the methodology described in the project visual resources technical report in Section 5.2 (Visual Simulations and Contrast Rating Analysis) (SWCA 2024). Due to the high sensitivity of the landscape to change, individuals viewing the simulations may perceive them as understating the actual in-person impacts. Simulations are representative of single-frame 50-millimeter images. Panoramic images were created though stitching multiple single frame images together and no fisheye lens was used to create simulations. Dynamic simulations are representative of locations and operation frequency and video format used lacks the resolution to accurately simulate brightness and visibility over distance; therefore,

			these depictions are illustrative only. Also see response to comment 11458-5 (see in Table A-3y, Visual Resources).
11383-1	Chris Weir	My comments regarding the proposed Lava Ridge project are presented below: The project diminishes the experience at Minidoka NHS by causing irreparable harm to the Japanese American community and descendants of Minidoka incarcerees. It is an impediment to future Japanese American generations by causing noise pollution and visual impairment of the viewshed that their ancestors would have once seen. The Minidoka NHS is an immersive educational experience where reflection and healing of past historical events take place. This project would alter the experience of visiting the Minidoka NHS and make it difficult to fully immerse oneself with the environment. The BLM should analyze how this project would impact future generations of Japanese Americans ability and accessibility to learning about the Japanese American incarceration during WWII and the historic events that took place at the site. The visual/emotional impacts of the proposed Lava Ridge project opens up the wounds of intergenerational and historical trauma of government overreach within the Japanese American community. The Minidoka NHS is a place where the U.S. unjustly incarcerated Japanese and Japanese Americans without due process because of lack of political leadership and racist pedagogy of the time. This project is using federal lands near a historically/spiritually/culturally significant site to the Japanese American community to propose a windmill farm. It is in the best interest of the BLM to understand how this project contributes to the historical trauma and the racist history caused by the U.S. government. The BLM is using it's federal governance to alter the environment to affect the Japanese American community's capacity to tell its own stories and share their experience. Also, the classification of the Japanese Americans and descents of Minidoka incarcerees as tourist and recreationist is insensitive and perpetuates the racist believe that Japanese Americans as foreigners. This is the same racist thinking that justified the incarceration of Japanese and Japanese Americans in WWII. The Minidoka NHS was a location where folks were involuntary relocated to and made home. The community are stakeholders and deserve to be treated with respect. They have a vested interest on the usage of the land. This decision will affect the Minidoka NHS negatively and believe the BLM should conduct more analysis on the potential detrimental long term effects of the project on the Japanese American Community. In conclusion, the "No action" alternative should be the only choice for this project.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 11337-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Also see response to comment 11325-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding analysis of turbine noise from the project occurring at Minidoka NHS and response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. The potential for the project to cause psychological harm to members of the Japanese American community was determined, in part, through direct feedback received during the BLM's engagement efforts with the Japanese American community. In addition, in response to environmental justice–related public comments on the draft EIS regarding intergenerational and historical trauma, the BLM has reviewed literature provided by commenters and has incorporated information regarding the existing and extended consequences of historical trauma on former incarcerees into Section 3.6.1 (Environmental Justice Communities) of the EIS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. As noted in response to comment 11985-1 (see in Table A-3g, Cultural Resources and Native American Concerns): The current EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking to protect the historic properties associated with Minidoka NHS. The BLM is meeting all program and resource management planning requirements under the NHPA; NEPA; FLPMA; and other laws, regulations, and federal requirements; in advance of the current project. The BLM will continue to plan for the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS, under a PA, completing the Section 106 process in consultation with consulting parties. Varying degrees of non-physical impacts to Minidoka NHS would result under any of the action alternatives, and various mitigation measures would be applied as stated in the EIS. The BLM is considering a No Action alternative for the project, by which it compares the potential impacts of the action alternative analyses in the EIS. The BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project, and will not make a decision on these matters until after the PA (see EIS Appendix 8 [Cultural Resources Programmatic Agreement]) is signed and a project ROD is released. The BLM decision on the project will be stated in the ROD.
11384-1	Connie Masuoka, Mark Takiguchi; Japanese American Museum of Oregon	This comment is submitted on behalf of the Board, staff and community of the Japanese American Museum of Oregon. [attachment] Public Comment Form Lava Ridge Wind Project Draft Environmental Impact Statement On behalf of the Japanese American Museum of Oregon, we write in support of Alternative A- No action. The Minidoka National Historic Site is a unique site for education, memory, and healing. The other Alternatives allow an incursion into the viewshed that significantly disrupts the experience of this site of conscience. We take exception to the characterization in the DEIS that the degree of visual change proposed in the other Alternatives is "Moderate." To the vast majority of the Japanese American Community, this disruption of the viewshed is another painful erasure of history and a message that our needs and history are less important that other concerns. The barren, desolate, and lonely vistas that remain today must be protected in order to accurately communicate the perspective of the over 13,000 people who were unjustly incarcerated there. Recall that the majority of these US citizens had little to no experience with this foreign and isolated landscape, being moved mainly from the Pacific Northwest, an area of lush beauty and ample physical resources. The selection of this site as a wind farm is testament to its harsh conditions and that experience is key to understanding the cruelty inflicted upon our community. The Park Service, Friends of Minidoka, and other organizations are stewards of this historic land. In partnership with them, we facilitate regular pilgrimages, educational programs, and restoration efforts that create powerful experiences and memories. The impact of these programs would be severely compromised by having many visible wind turbines on the horizon. In conclusion, while we support renewable energy and wind power, we feel strongly that any option other than Alternative A- No Action will fail to protect the integrity of the Minidoka National Historic Site. More importantly, the survivors of the incarceration, their families and descendants, and all Americans deserve to have this historic land preserved for learning and repair of spirit. Sincerely, Mark Takiguchi Interim Deputy Director	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. The BLM has revised the visual sensitivity for Minidoka NHS and surrounding WRC to be high sensitivity instead of moderate (used in the draft EIS); see EIS Section 3.16 (Visual Resources). However, the degree of visual contrast for wind turbines will remain moderate based on visual contrast rating analyses in Section 3.16. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS; this analysis found that all action alternatives would result in a major impact to the NPS' ability to implement its interpretive purpose at Minidoka NHS. Please note that the BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Regarding mitigation measures and associated consultation related to cultural resources, including Minidoka NHS, please see response to comment 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns). EIS Section 3.6.1 (Environmental Justice Communities) additionally considers mitigation measures related to adverse environmental justice community impacts.
11455-1	Aiko E. Low	My grandmother, Asano Kanzaki was incarcerated at Minidoka. She had four American born sons who served in the US armed forces. Her oldest son, Akira never returned. Displayed in the window of her barracks were three silver stars and one gold star. Every mother, father, brother, sister at Minidoka had stories of hardships, sacrifices, loses and injustice. Minidoka is a National Historic Site where following generations of visitors come to learn from our country's mistake of mass racial hysteria. This is a solemn place where visitors come to honor and respect.	The BLM respectfully a'cepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War

Comment ID	Commenter	Public Comment	Response to Comment
			Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
11510-1	Cara Skillingstead	I am a fourth generation Japanese American descended from the Sakura family who was incarcerated at the Minidoka concentration camp during World War II - Family #35860, Barracks 17-F-S. This historic site holds deep and profound meaning for myself and my family as a representation of the deep wounds and intergenerational trauma that we live with to this day. It is critical to ensure the stories are not lost, diminished, or overpowered. As a national employee who serves people who are the most vulnerable to climate-related extreme weather and natural disasters, I understand the value of renewable energy for climate change resilience. However, for-profit companies often place the burden and environmental impacts of renewable and non-renewable energy sources on low-income, rural, and historically underinvested communities. These impacts often disproportionately impact communities of color. This proposal in particular would devastate the formerly incarcerated Japanese Americans who were held at Minidoka and their descendants. I acknowledge that there are many different agencies, people, and communities who are weighing in on this and who have different vested interests in this project and this land, but I urge you to please lift up the experiences, stories, and trauma of the wrongfully incarcerated Japanese Americans in the conversations about the placement and location of the wind farm project.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Impacts to historically underinvested communities are addressed in the EIS in Section 3.6.1 (Environmental Justice Communities). Impacts to Minidoka NHS as a historic property are analyzed in Sections 3.5 (Cultural Resources) and 3.16 (Visual Resources), including assessment in terms of how these would impact the interpretive purpose of Minidoka NHS under the supporting concepts (Civil and Constitutional Rights, People, Place, and WWII), through the four interpretive themes established through Public Law 110-229. See response to comment 7344-1 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding potential effects of the project on energy costs for consumers. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
11525-1	Erin Schmith	I am an employee at the Japanese American Museum of Oregon and my connection to the proposed site of the Lava Ridge Wind Project is that I work every day with Japanese American survivors and descendants who were incarcerated at the Minidoka concentration camp and other camps during World War II. The site is a symbol for the profound loss that the Japanese American community in the Pacific Northwest suffered due to WWII incarceration. It is important that this community has the opportunity to physically experience the land where Minidoka stood as a place of healing, discovery, and connection to the past. The Draft Environmental Impact Statement for the Lava Ridge project does not adequately address the full significance of the Minidoka National Historic Site and the ways that survivors and descendants of Japanese American incarceration experience and utilize the site in the proposed alternatives. Section 3.5 of the DEIS outlines the concerns of the Japanese American community. This section outlines how, beyond the legally defined adverse effects, the community "may consider impacts to be of further severity from a cultural perspective and harmful to their rights as a community." The report preparer found that, for the Japanese American community, no mitigation of project impacts could protect the site from the intrusion and desecration of...a sacred site." The draft EIS acknowledges these concerns but fails to fully take them into consideration in the proposed alternatives, which do not adequately protect Minidoka and the larger WPA footprint as a site sacred to the Japanese American community. All of the alternatives other than Alternative A fail to sufficiently protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS, as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site.
11525-2	Erin Schmith	Table 3.6-3 characterizes visitors to the Minidoka National Historic Site as "tourists and recreationists," which does not accurately reflect the purpose Japanese Americans and others have for visiting the site.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions made to correctly represent the Japanese American community and Japanese and Alaska Natives.
11546-4	Dan Sakura	In light of the Biden Administration's commitment to advance environmental justice and combat racial prejudice directed against the AAPI community, I was disappointed with BLM's August 2021 Notice of Intent to begin the NEPA compliance for the Lava Ridge project. With little or no consulta□on with the Japanese American and Alaska Native communities, the BLM announced this project located on the historic footprint of the Minidoka Relocation Center, which is sacred ground. If approved by BLM, the Lava Ridge project would mark a giant step backward in the fight for racial justice and America's racial reckoning especially as the Biden Administra□on is leading efforts to protect Tribal Sacred Sites, acknowledge the shameful history of Federal Indian Boarding Schools and considering a proposal to designate the Emmet Till-Mamie Till Mobley National Monument.	See responses to comment 11535-49 regarding Biden administration executive orders, and to comment 11535-50 (see both in Table A-3h, Environmental Justice and Socioeconomics) regarding consultation with Japanese Americans and Alaskans, and to comment 1395-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding siting of the project.
11572-1	Elissa Dingus	As an employee at the Japanese American Museum of Oregon, I am connected with the survivors and descendants of survivors of WWII incarceration who would be strongly affected by the proposed Lava Ridge Wind Project site. The Minidoka concentration camp is a symbol of the profound loss suffered by the Japanese American community in the Pacific Northwest during WWII. It is a place of healing, discovery, and connection to the past, and it is essential that this community has the opportunity to physically experience the land where Minidoka stood. However, the Draft Environmental Impact Statement for the Lava Ridge project fails to adequately address the significance of the Minidoka National Historic Site and the ways that survivors and descendants of Japanese American incarceration experience and utilize the site in the proposed alternatives. The proposed alternatives, other than Alternative A - No Action, fail to sufficiently protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience. Furthermore, the report does not accurately reflect the purpose of Japanese Americans and others who visit the Minidoka National	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions made to correctly represent the Japanese American community and Japanese and Alaska Natives. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS, as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Please also note that the BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS. The BLM has revised the visual sensitivity for Minidoka NHS and surrounding WRC to be

Comment ID	Commenter	Public Comment	Response to Comment
		Historic Site, characterizing them as "tourists and recreationists" in Table 3.6-3. Their experiences are not for the purpose of tourism and recreation. This is a space of deep healing and connection. The degree of visual change proposed by Alternatives C-E are also inaccurately characterized as "moderate" in the same table. For a project whose footprint exceeds the area of Seattle's city limits, "moderate" does not come close to feeling like an apt description. Additionally, while the DEIS claims that Alternative C would minimize and avoid visual, noise, and traffic effects, it acknowledges that these effects would not be eliminated altogether. This characterization fails to accurately reflect the impact on visitors to Minidoka.	high sensitivity, instead of moderate; see EIS Section 3.16 (Visual Resources). However, the degree of visual contrast for wind turbines will remain moderate based on visual contrast rating analyses in Section 3.16.
11585-2	Preservation Idaho	Preservation Idaho has worked for many years to support protections for the Minidoka National Historic Site. The 13,000 Japanese incarcerated at Minidoka and their descendants today consider this location sacred and there continues to be an active community that honors the experiences there. The placement of wind turbines just two miles away is an adverse effect and an act of disrespect of the significance of the history of the site. The KOP simulation of the visual impact is misleading in that it only shows turbines, omitting the transmission towers, wires, and connecting systems. The impact during the day and the night will be significant, distracting, and permanently diminishing. Protecting this viewshed is of the utmost importance to Minidoka and Preservation Idaho.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. See response to comment 11454-2 (see in Table A-3y, Visual Resources) for information about the transmission line structures. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. The nearest potential turbine placement relative to Minidoka NHS would vary under each of the action alternatives (see Appendix 9 [Cultural Resources Potentially Affected by the Action Alternatives] of EIS Appendix 8 for information on the distance of the nearest turbine siting corridor relative to previously recorded cultural resources potentially affected by the action alternatives, including Minidoka NHS, under Alternatives B, C, D, and E). Of the alternatives, Alternative E represents the farthest distance for potential turbine placement relative to Minidoka NHS, where nearest turbine siting corridor distance is 8.4 miles from Minidoka NHS. Additionally, the BLM's Preferred Alternative, which seeks to further reduce visual impacts to Minidoka NHS, is analyzed in the final EIS.
11593-1	Maya Abo Dominguez	In section 3.6.2.1.3, the DEIS references "Historical interactions between the Japanese American community, the federal government, and project developers" that "have been filled with ongoing points of frustration and conflict." This does not begin to sufficiently describe the situation. It is important to note that the BLM, NHS, NPS are all part of the Department of Interior, the same department as the War Relocation authority, which was transferred to the DoI February 16, 1942 as a result of EO 9423. This fact is absent from DEIS and should be made clear. It is not surprising then, that the same body that incarcerated my ancestors is considering a large wind project on the same site. I strongly urge that Alternative A - no action is taken and also request that the "Historical Interactions" referenced above is expanded to be more complete and highlight that both the WRA and BLM were/are a part of the DoI.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. EIS Section 3.6.1.1.1 (Existing and Future Trends and Actions) states, "Historical interactions between the Japanese American community, the federal government, and project developers have been filled with ongoing points of frustration and conflict, which has fostered feelings of distrust and being dishonored within the Japanese American community." The BLM considers this to adequately capture the sentiments expressed by the Japanese American community during engagement efforts conducted by the BLM. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Please note that the BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS. Please note that the project would not be sited on Minidoka NHS and is specifically excluded from any NPS-administered lands, where NPS decision-making authority would apply. The BLM is the lead federal agency, and the NPS has no authority in the BLM's decision making on the project. The NPS participates as a cooperating agency on the BLM's undertaking to uphold the NPS's mission and interests in preserving and managing Minidoka NHS, among other NPS concerns in the surrounding region. The Department of the Interior and the Secretary of the Interior do have overarching authority and oversight of the BLM.
11598-9	Idaho Conservation League	Minidoka National Historic Site As noted in our scoping comments, ICL is particularly concerned about potential impacts to the Minidoka National Historic Site, located northeast of Twin Falls, Idaho. Minidoka was one of the isolated internment sites that housed unjustly relocated and incarcerated Japanese Americans during World War II. Over 13,000 Japanese Americans were imprisoned at the site. Today, the National Park Service maintains the former camp as a memorial to those Americans of Japanese ancestry who were wrongfully incarcerated at the camp and as a reminder to our citizens of the injustice forced on so many through racial profiling, fear, and hatred. The original proposed Plan of Development includes wind turbines within just two miles of the Site and many within the original footprint of the 33,000 acre internment camp. At heights over 700 feet tall, these imposing structures, and associated electric lines, could dominate the viewshed for miles. This infrastructure could impact Minidoka visitors as they approach the site and attempt to experience the forced isolation that is part of the historical relevance of the site. None of the current alternatives adequately avoid, minimize, or mitigate the impact to the Minidoka site. The visual impacts of all the alternatives for Lava Ridge project to the Minidoka National Historic Site are significant and will alter the nature and feeling visitors derive from the stark and isolated location. Retaining the open vistas allows visitors to "better understand and connect to the daily lives at Minidoka" (Minidoka Foundation Document). In discussions with Friends of Minidoka, ICL staff learned about the importance of maintaining the feeling of isolation through Minidoka's viewshed. Friends of Minidoka	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Also see response to comment 11622- 4 regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Please note that the BLM has considered a No Action alternative for the project in addition to the action alternative analyses. in the EIS. See EIS Section 3.16 (Visual Resources) for analysis of the degree to which the project would or would not dominate views and restrict or retain open vistas from Minidoka NHS, including from KOPs such as the Honor Roll on the entry approach to the NHS and the visitor center, in relation to the various action alternatives. A discussion of the historic integrity, including feeling and setting, of Minidoka NHS is included in EIS Section 3.5 (Cultural Resources). Regarding mitigation measures and associated consultation related to cultural resources, including Minidoka NHS, please see response to comment 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns). EIS Section 3.6.1 (Environmental Justice Communities) additionally considers mitigation

Comment ID	Commenter	Public Comment	Response to Comment
		hosts annual pilgrimages to the historic site to pay homage to survivors and descendants of incarcerees. For many, maintaining the integrity of Minidoka is necessary to continue the remembrance of this civil rights violation and the resilience of the Japanese American community. Any project development in the area must respect this experience. As stated above, ICL again underscores its recommendation that the BLM use the opportunity afforded by this NEPA process to designate areas around the Minidoka National Historic Site as unavailable for future energy development and prioritize important areas for habitat restoration. These areas could be well-suited for site-specific protections via an Area of Critical Environmental Concern (ACEC) designation following additional public review.	measures related to adverse environmental justice community impacts. Regarding ACECs, please see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11603-1	Sheri Freemuth	I am deeply concerned by the lack of effective and timely resource management planning in this area. The Minidoka National Historic Site (NHS) is a critical area of cultural importance to state, region, and nation. The haphazard manner in which the federal public land agencies have established guidelines and policies for the surrounding lands, within their jurisdictions, has resulted in this unfortunate application.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. As stated in EIS Appendix 2, public lands in the analysis area are managed in accordance with the BLM SFO's monument RMP (BLM 1986), as amended, and the 2015 greater sage-grouse ARMPA (BLM 2015). The Proposed Action and alternatives described in this EIS are in conformance with both of these plans.
11610-1	Lisa Shiosaki Olsen; Intermountain District Council-Japanese American Citizens League	As you develop the EIS, I encourage the BLM to work with the National Park Service to ensure that all alternatives in the Draft Environmental Impact Statement preserve Minidoka's fundamental resources and values (FRV) unimpaired for the benefit of future generations. Specifically, I request that all of the alternatives preserve Minidoka's remote environmental setting, as provided in the Park's Foundation Document: "Minidoka's remote location in the high desert of Idaho provides an immersive setting that is fundamental to the visitor experience. Views of open fields and distant mountains create a sense of isolation on a vast landscape where Minidoka once stood…Extreme changes in temperature, the arid environment, and high winds that the people at Minidoka experienced are part of the environmental setting that are felt today. Experiencing this environmental setting allows visitors to better understand and connect to the daily lives at Minidoka."	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the EIS's address of impacts to the natural and cultural landscape surrounding Minidoka NHS. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Regarding mitigation measures and associated consultation related to cultural resources, including Minidoka NHS, please see response to comment 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns).
11617-1	Stephen Kitajo	The Lava Ridge Wind Project Stakeholder Assessment and Engagement Report was produced by Langdon Group/Keans & West for BLM in August of 2022, before the release of the DEIS. This report found that the BLM should try to engage with stakeholders for future meetings, saying that "appropriate meeting locations, dates and times should be coordinated with Local Japanese American community groups." When the BLM announced that a single public open house to discuss the DEIS would be held in the Seattle area in March 2023, the Japanese American community was surprised because no community groups were contacted to coordinate the open house. That report also found that increased "cultural competency training within BLM is warranted for meaningful engagement." When I attended the open house, I attempted to discuss with the BLM representatives how the Japanese American community in Seattle had a long history of being forced to live in certain areas of the city through redlining and racially restrictive housing covenants, and how Minidoka could be seen as a continuation of that injustice when looking at the community's history. Instead of a discussion, I found myself having to educate the representatives on this history. Based on the lack of cultural competency training and ability to meaningfully engage with the Japanese American community that I experienced at the open house, I do not believe the DEIS adequately incorporates the true significance of Minidoka to the Japanese American community. It would be irresponsible of the BLM to move forward with any action until this is adequately understood.	The final EIS was updated to include a section on the Minidoka NHS interpretive purpose, which addresses and assesses impacts under each project action alternative to the interpretive purposes established by law. See response to comment 11535-50 regarding meaningful outreach and engagement efforts conducted by the BLM and response to comment 11535-49 (see both in Table A-3h, Environmental Justice and Socioeconomics) regarding compliance with environmental justice–related executive orders.
11622-1	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	The Minidoka Pilgrimage dates back to 2003, when survivors and their descendents first journeyed to the former site of the Minidoka War Relocation Center from Seattle, Portland and across the country to share their stories, reunite with dear friends, and heal from the pain inflicted upon them by the unjust persecution and imprisonment by their own government. Since then, this has become an annual event and 2023 will mark our 20th pilgrimage event, including three that were hosted online due to the COVID19 pandemic. In 2001, President Bill Clinton designated the Minidoka Internment National Monument as the 385th unit of the National Park Service. The Pilgrimage's official inception came on the heels of the designation of Minidoka as a National Monument, wherein the site became a place of honor and healing, and not only of oppression and grim memorial. We seek to honor the courage and sacrifices of Japanese American veterans, Gold Star families and resistors, who spoke out against the unjust incarceration. As noted in our scoping letter submitted by survivors and descendants: Annually, many of us are drawn to the Minidoka Pilgrimage to remember, to heal and ally ourselves with those who confront injustice. Desolation creeps into our minds and bodies when we walk along the burning sandy paths. At the ceremonial conclusion of our pilgrimage, we bow our heads to honor the soldiers who made the ultimate sacrifice in defense of our freedoms. We can hear the wind flapping against the American flag as their names are read. To help understand the truth of the Minidoka incarceration, we are planning an in-person Pilgrimage this year from July 6-9, at Minidoka and the College of Southern Idaho in Twin Falls. We wish to invite you and the BLM team to join us for sessions at the College of Southern Idaho (July 7), a tour of the Minidoka (July 8), and a closing ceremony at the Honor Roll (July 9).	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Thank you for the invitation to experience the events held at Minidoka and please know that BLM specialists on the project have contemplated and planned to attend either those events cited, or other events at Minidoka NHS, as appropriate. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
11622-5	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	Significance The DEIS does not adequately describe the impact of the project on Minidoka's statement of significance, which includes the "most important resources and values of the park unit," such as Human, Civil, and Constitutional Rights.2 The Honor Roll is central to Minidoka's significance relating to patriotism, citizenship and choices: Minidoka National Historic Site provides a forum for understanding how Nikkei demonstrated	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation

Comment ID	Commenter	Public Comment	Response to Comment
		citizenship and patriotism through individual choices, which affected families and communities. Choices reflected a range of responses including serving valiantly in the military, supporting the war effort on the home front, and protesting the civil injustice.3 We have said much about how vital an untouched Minidoka National Historic Site is to the Japanese American community. We must also remind the BLM how important this site of conscience is to ALL American people. In order for reckoning and healing to occur for the United States as a whole, all Americans must know about the mistakes made by our country and the courage it took to offer apology, reparations, designate parks and memorials, and make significant funding investments to preserve and interpret Minidoka and other sites. This is the sign of a great nation. Minidoka and the important lesson it shares must not be impeded.	Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
11622-12	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	We agree with the Friends of Minidoka analysis of the BLM's inadequate and inappropriate description of Minidoka survivors and descendants as "tourists and recreationalists" in the DEIS. Tourists and recreationalists partake in activities for enjoyment and pleasure, with the privilege of selecting the locations they travel to and choosing the activities to engage in before returning home. It is important to remember that the Japanese American community did not have a choice in their location or their activities when they were forced into Minidoka, nor were they allowed to return to their homes, if they still had one. To say otherwise does not accurately portray the reality of their situation. We encourage BLM to accurately and adequately describe the Minidoka community in the final EIS.	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions made to correctly represent the Japanese American community and Japanese and Alaska Natives.
11652-2	Natasha Varner	To date, the voices of Minidoka survivors and their descendants have not been taken seriously as key stakeholders. As a case in point, the DEIS identifies Minidoka NHS as being a place for "Tourists and Recreationalists," failing to recognize that a primary constituent of the site consists of survivors and descendents of World War II incarceration. The community has consistently stated that Lava Ridge would result in a significant impairment of resources. As key stakeholders, their concerns should be accorded due respect in any plans that would impact the site.	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions made to correctly represent the Japanese American community and Japanese and Alaska Natives. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site.
11772-2	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	As the organizers of the annual Minidoka Pilgrimage, we understand the unique needs of survivors and descendants to be able to focus on the traumatic experiences of life at Minidoka, learn from other pilgrimage participants, and experience the sense of healing that the pilgrimage provides. We appreciate BLM adding KOP-16 (the view of the Honor Roll looking east). The views of the spinning turbine blades backlit by the morning light will dishonor those who served, those who did not come home and the sacrifices of Minidoka's 73 Gold Star families. One of the most important parts of the pilgrimage is the Closing Ceremony on the last day of the Pilgrimage at the Honor Roll, which is held in the morning to avoid the midday heat. At the closing ceremony, the audience faces the speakers and the reconstructed Honor Roll. It is a solemn occasion, similar to events honoring America's veterans at sites across the country. Along with a color guard and local veterans, we commemorate the military service of 1,000 Japanese Americans from Minidoka who served in the military. We clearly read the names of the 73 individuals who gave their lives to defend freedom while their families' freedom was taken away by their own government. This act unleashes a wash of visible and audible pain among the participants, as we create an opportunity to grieve together as a community both for the slain soldiers, and for our community as a whole. LS Power's deliberate decision to site the wind project in a location that serves as the visual backdrop of the Honor Roll reminds us of the Hood River incident in Oregon. In 1944, The American Legion removed 16 names of Japanese American soldiers from the county honor roll. After a national outcry, the American Legion restored the names to the Honor Roll in 1945.1 It also reminds us that LS Power previously sought to build the SWIP-N line on a ROW that would have towered over the Honor Roll and entrance to the park. We cannot help but find ourselves wondering how LS Power's next project will threaten the Honor Roll once more. The size and location of both Alternatives C & E would distract participants' attention from commemorative events, time with families and friends (both new and old), and healing painful emotional wounds. For example, a vital part of our Pilgrimage are the tours on the site which offer detailed interpretation of all of the buildings and and locations on the park site, including the foundation of the reception building, the recreated guard tower, the Honor Roll, the replica fence, the swimming hole, the fire station, the visitor center, the root cellar, the baseball field, and Block 22. In both site tour and Closing Ceremony instances, we are compelled to note a commonality. We acknowledge the creation of the KOPs, but these do not convey how the full experience of our ceremony and tours would be impacted by the visual distraction of multiple walls of wind turbines. Furthermore, if walls of wind turbines are built, each time they are on the site, survivors and descendants of the incarceration would be confronted with yet another piece of physical evidence as to how the United States government has dishonored their histories at this place. They would unfortunately also be reminded that Federal tax credits and tax dollars helped to fund and subsidize this project, and would have cause to once again question the United States' promises to right wrongs against us and offer us the dignity and justice we deserve.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. EIS Section 3.16 estimates the extent to which the action alternatives may or may not tend to commonly attract an observer's attention and view based on their various proposed turbine locations. Turbines would each have considerable spacing between them and the setbacks and orientation of turbine corridors would further assist in the visual spacing of the turbines as they would appear from Minidoka NHS. Please note that the application of KOPs, such as described in EIS Section 3.16 (Visual Resources), is only one aspect of how the BLM analyzed project impacts to Minidoka NHS.
11772-5	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	The DEIS does not adequately describe the impacts of the wind project on commemorative events and the Pilgrimage's ability to promote public understanding, education and involvement, another fundamental resource and value. Cultural Competency We agree with the Friends of Minidoka analysis of the BLM's inadequate and inappropriate description of Minidoka survivors and descendants as "tourists and recreationalists" in the DEIS. Tourists and recreationalists partake in activities for enjoyment and pleasure, with the privilege of selecting the locations they travel to and choosing the activities to engage in before returning home. It is important to remember that the Japanese American community did not have a choice in their location or their activities when	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.

Comment ID	Commenter	Public Comment	Response to Comment
		they were forced into Minidoka, nor were they allowed to return to their homes, if they still had one. To say otherwise does not accurately portray the reality of their situation. We encourage BLM to accurately and adequately describe the Minidoka community in the FEIS.	
11775-3	Stephen Kitajo	The DEIS also does not adequately convey the historical efforts of LS Power to disrupt and harm the Minidoka National Historic Site in their pursuit of profiting off the land that Japanese Americans labored over while incarcerated at Minidoka. In 2010, LS Power attempted to construct the SWIP-N power transmission line directly over the Honor Roll, one of the most iconic parts of Minidoka. While ultimately unsuccessful, LS Power then deliberately chose to propose placing towering wind turbines directly within the historic footprint of Minidoka with the Lava Ridge wind project. I, along with many others in the Japanese American community, am fed up with LS Power's greed and disregard for the importance that Minidoka has to us. I do not want to live the rest of my life wondering what LS Power's next threat to Minidoka will be or wondering how future descendants will be warding off LS Power when I am gone. The cumulative effects of LS Power's efforts are a major threat to Minidoka and warrant strong protections.	MVE outlines their consideration for siting the project in the general area and earlier efforts to develop the project in other locations. This information can be found in MVE (2023) and in Alternatives Considered by MVE (Appendix C in MVE [2023]).
11779-3	Chris Cody, Betsy Merritt; National Trust for Historic Preservation	If Alternative E or any other alternative that will result in adverse effects to Minidoka is selected, the establishment of protections for the remainder of Minidoka's viewshed on BLM land is of paramount importance. This project must not serve as a catalyst or encouragement for additional development, and an appropriate level of protection for Minidoka should be established to prevent future threats. In our view, a Section 106 agreement, negotiated through consultation, would be a useful mechanism for developing and enforcing these future safeguards. This is not the first time the National Trust and others have had to rally to the defense of Minidoka in response to proposals for nearby projects with adverse effects,6 and we would like to work with BLM on the development of enhanced protections for Minidoka (regardless of the outcome of this particular ROW grant) in the hopes that more permanent protection can be secured.	See response to comment 12859-8 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding BLM consideration of additional protections at Minidoka in addition to those practices described in the body of the EIS. Regarding development of enhanced, or permanent, protections for Minidoka's viewshed outside of the NPS-managed NHS within the greater WRC; it is important to note that there is much private land comprising this area that is used for agricultural purposes, and this should be considered toward the effectiveness of establishing uniform protections for the viewshed in so much as the BLM holds no authority on private land development. However, the BLM is interested in continued consultation of this on this topic with the National Trust for Historic Preservation under the NHPA Section 106 process for the project.
11808-2	Jon Ochi	The LRWP turbines would stand starkly around MNHS to create an "adverse effect" on the ambiance of MNHS. The unspoken message seems to say, "The MNHS is insignificant. Your sufferings were not more important than building these turbines which will dominate the horizon like the residents of Minidoka were once dominated and humiliated." Please read the quote from the National Historic Preservation Act of 1966 (the italics are mine): THE NATIONAL HISTORTIC PRESERVATION ACT AND SECTION 106 The National Historic Preservation Act (NHPA), which became law in 1966, establishes our national policy on the preservation of historic and cultural places. Adverse effect (Section 106)- Defined in Section 106 of the National Historic Preservation Act of 1966 (Section 106) regulations at 36 Code of Federal Regulations (CFR) Part 800.5. An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register of Historic Places (National Register) in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance, or be cumulative. Examples of adverse effects on historic properties include, but are not limited to: • Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance; • Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features; To summarize Point 1 (Disrespect to MNHS): The LRWP makes MNHS feel relatively "insignificant" compared to the 740 foot tall turbines. To Japanese Americans the MNHS provides tangible proof of extreme racial prejudice. Legally, the NHPA of 1966 prohibits "Adverse Effects" to historic properties. Adverse effects include, diminishing the "setting" and "feeling" and "change of character." Impacts can be "visual" even when "farther removed in distance." And finally, adverse effects can be "cumulative." Consider the Cumulative Effects of both the LRWP also the even larger Taurus Wind Project, located a mile west and north of MNHS.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. As noted in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site), Minidoka NHS is recognized as a nationally significant site listed on the NRHP under Criterion A (historic event). The analyses presented in the EIS have found that impacts to Minidoka NHS will be adverse. However, the EIS (Section 3.16 [Visual Resources]) has found that, with sufficient setbacks, the wind turbines from the project will not dominate the setting of Minidoka NHS. The EIS includes analyses of cumulative effects in the aforementioned sections. See response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Please note that the NHPA does not prohibit adverse effects to historic properties; the NHPA requires the lead federal agency to take into account the effects its undertakings will have on historic properties and to resolve adverse effects on historic properties through their avoidance, minimization, or mitigation. If an adverse effect from an undertaking is unavoidable, the NHPA requires the lead agency to consider measures to mitigate the adverse effect. Varying degrees of visual impacts to Minidoka NHS would result under any of the action alternatives, and various mitigation measures would be applied as stated in the EIS. The BLM is preparing a PA (see EIS Appendix 8 [Cultural Resources Programmatic Agreement) to complete review of the project under NHPA Section 106 and to address project effects.
11815-1	Liz Phillips	The main reason is that all the proposals A-E are all visually too close to the Minidoka Historical site. I am basing this by personal experience of wind turbines in Columbia County and the study done by UChicago Argonne, LLC, a U.S. Department of Energy Office of Science laboratory. https://www.google.com/url?sa=t&source=web&rct=j&url=https://blmwyomingvisual.anl.gov/docs/WindVITD.pdf&ved=2ahUKEwjd2eT0vu_9AhU2L0QIHYOmB8UQFnoECBQQAQ&usg=AOvVaw0eaZoXG-uSbzh1LO_aeUVz <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.google.com%2Furl%3Fsa%3Dt%26source%3Dweb%26rct%3Dj%26url%3Dhttps%3A%2F%2Fblmwyomingvisual.anl.gov%2Fdocs%2FWindVITD.pdf%26ved%3D2ahUKEwjd2eT0vu_9AhU2L0QIHYOmB8UQFnoECBQQAQ%26usg%3DAOvVaw0eaZoXG-uSbzh1LO_aeUVz&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C8999e1ed51194ac1bb7908db42094561%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638176380246435971%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C2000%7C%7C%7C&sdata=QhHPoj0tFT1x0ab0Pd2axBtTtEem0kYDYjH6LzLSujc%3D&reserved=0> Wind Turbine Visibility and Visual Impact Threshold Distances in Western Landscapes Abstract was from a study sponsored by the U.S. Department of the Interior Bureau of Land Management. 377 observations of five wind facilities in Wyoming and Colorado were made under various lighting and weather conditions. "The facilities were found to be visible to the unaided eye at 36 miles under optimal viewing conditions, with turbine blade movement often visible at 24 miles. Under favorable viewing conditions, the wind facilities were judged to be major foci of visual attention at up to 12 miles and likely noticed by casual observers at 23 miles." "A conservative interpretation suggests that for such facilities would be unlikely to be missed by casual observers at up to 20 miles and that the facilities could	The study *Wind Turbine Visibility and Visual Impact Threshold Distances in Western Landscapes* (Sullivan et al. 2012) is relied upon in the EIS, as cited in EIS Sections 3.5 (Cultural Resources) and 3.16 (Visual Resources) and listed in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers). The draft EIS did find adverse effects from project wind turbine visibility to Minidoka NHS under all action alternatives, with the degree of effects varying by distance. A project-specific VRI was collected and turbine visibility simulated, as referenced in the project visual resources technical report (SWCA 2024).

Comment ID	Commenter	Public Comment	Response to Comment
		be major sources of visual contrast at up to 10 miles showed visibility can be seen at 30 miles." Therefore the proposed 8-9 miles distance from the Minidoka Historical Site is too close	
11817-1	Satsuki Ina	There is an impact that is not addressed in your DEIS. The proposed Lava Ridge Wind Project would cause irreparable negative impacts to the viewshed and the immersive feeling at the site that is integral to the healing and educational experience at the site that takes place every day. It is like the many battlefield sites such as Gettysburg National Military Park in Pennsylvania that is preserved today and is now a sacred healing place for descendants and an important place for learning for the public. They should be protected from negative physical and non-physical impacts as stated in the National Parks mission: "The National Park Service preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations."	See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
11821-76	Laura Cunningham, Kevin Emmerich, WildLands Defense	Magic Valley, Idaho: This area is targeted for large-scale solar and wind energy projects. It contains culturally significant sites such as the Minidoka National Historic Site, the site of a former Japanese Internment camp during World War 2. There is great opposition to a proposed wind project in this area by the people who have a history with the site. The seek to turn the place on mourning into a place of healing.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
11842-2	Erin Nishijima	As an educator and graduate student, it is harmful mentally, emotionally, and spiritually to witness BLM (a powerful organization) taking advantage of a community of color and a sacred space that represents a devastating part of our history. By choosing to place Lava Ridge Wind Farm here, you are choosing to show youth and all communities of color that our feelings, words, values, and spaces aren't important. The DEIS fails to recognize the importance of preserving the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its immersive educational experience. Your motives directly do not reflect nor address cultural competency which President Biden mandates in his Executive Order on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders. <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.whitehouse.gov%2Fbriefing-room%2Fpresidential-actions%2F2023%2F02%2F16%2Fexecutive-order-on-further-advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cc45997f92a714abdb0c108db41f8df81%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638176309524563854%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C2000%7C%7C%7C&sdata=ZEQLtREazYEj%2Fdry9OVEI%2BRVR4%2Bq4HEiriyrQniwn2o%3D&reserved=0> DEIS states that the Lava Ridge Wind Farm turbines are "moderate" degrees of visual change to Minidoka NHS's viewshed yet I would disagree. This project fails to protect the integrity of the site as having wind turbines as tall (if not taller) than the Seattle Space Needle, would be hardly unnoticed. Minidoka National Historic Site is a prime example of a place of harm, discrimination, isolation, and injustice made visible for history remembrance, a place of congregation, and a physical space for those incarcerated and their descendants.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS. The BLM has revised the visual sensitivity for Minidoka NHS and surrounding WRC to be high sensitivity, instead of moderate; see EIS Section 3.16 (Visual Resources). However, the degree of visual contrast for wind turbines will remain moderate based on visual contrast rating analyses in Section 3.16. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site.
11869-24	Raul Labrador, Josh Turner; Idaho Attorney General's Office	Fourth, the Project will dishonor the Minidoka National Historical Site—a memorial to the injustice of Japanese American internment camps that serves as a powerful reminder of the perils of acquiescing to government overreach in times of crisis. By placing 400-foot-tall wind turbines around the Minidoka Site, the Lava Ridge Wind Farm will strip the site of its historical authenticity and lessen its impact.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Please note that in none of the action alternatives is Minidoka NHS surrounded by turbines. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
11886-5	Sandra Eto	The importance of the Minidoka WRC to the former internees, their descendants, and the American people is not just the buildings that remain or have been relocated to the 388 acres, or the "cultural resources" used to represent the WRC and all that transpired there. Today the environmental setting and its relatively vast expanse of emptiness, greeting the individuals arriving at the site, is integral to the internees' experience in that it evokes the desolation and harshness that greeted the prisoners after more than 2 days by train without knowing their fate. The NPS recognized this inextricable tie between the environmental setting and the Minidoka NHS in its action to add a conservation easement to the western boundary in 2012 (Federal Register, Vol. 77, No. 211, p. 65906), stating: The inclusion and acquisition of a conservation easement interest in this property will enable the National Park Service to preserve the open space and viewsheds of the general area and thereby more accurately interpret the events that took place during the Japanese-American internment here from 1942 to 1945.	See response to comment 11869-24 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
11886-6	Sandra Eto	The importance of the Minidoka NHS was emphasized in the Foundation Document, which states the Minidoka NHS offers the opportunity "…to interpret the historic events and lives impacted by the exclusion, forced removal, and unjust incarceration of Nikkei during World War II." (p. 7). The Foundation Document notes the site's listing in the NRHP stating, "With designation as a unit of the national park system in 2001, the historic site of Minidoka was protected for future generations and interprets its important civil rights lessons and the stories and lives in the individuals incarcerated there from 1942 to 1945." (p. 8). The Foundation Document recognizes the importance of the environmental setting in telling the story of the internees' experience, from the moment they arrived and throughout their residency: Minidoka's remote location in the high desert of Idaho provides an	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. As noted in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site), Minidoka NHS is a nationally significant site listed on the NRHP under Criterion A (historic event). Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as how the EIS addresses impacts to the natural and cultural landscape surrounding the site. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and

Comment ID	Commenter	Public Comment	Response to Comment
		immersive setting that is fundamental to the visitor experience. Views of open fields and distant mountains create a sense of isolation on a vast landscape where Minidoka once stood…. The smell of high desert sagebrush contributes to this environmental setting. Extreme changes in temperature, the arid environment, and high winds that the people at Minidoka experienced are part of the environmental setting that are felt today. Experiencing this environmental setting allows visitors to better understand and connect to the daily lives at Minidoka. (p. 13). Please note that included in the Fundamental Resources and Values identified for the Minidoka NHS, is commemoration and healing, wherein the document states, Minidoka and the Bainbridge Island Memorial provide places for engagement, reflection, and healing. These sites provoke connections to individuals affected by the World War II exclusion, forced removal, and unjust incarceration, and serves to commemorate those who survived this difficult chapter of American history.	Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS, further addressing NPS interpretive themes.
11886-7	Sandra Eto	Would approval of the proposed project, regardless of alternative, preclude implementation or constrain or restrict consideration of the currently identified planning and management goals and objectives in the Foundation Document? Approval of the proposed project, regardless of alternative, would be an irreversible and irretrievable loss of resources, regardless of whether the structures are to be removed after 30 years. As stated in the Foundation Document, cultural landscapes and viewsheds on the Minidoka NHS are considered fundamental resources and values that are essential (fundamental) to achieving the purpose of the park and maintaining its significance. Should these resources and values be impaired, the park purpose and/or significance could be jeopardized (p.13), particularly connection, commemoration, and healing.	See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS, further addressing NPS interpretive themes and considering effects to NPS plans/planning for Minidoka NHS. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site.
11978-30	Magic Valley Energy, LLC	Section 3.5.3 – Minidoka War Relocation Center and Minidoka National Historic Site 26. The DEIS states: "Figure 3.5-4 illustrates the simulated worst-case condition, estimated to occur up to 2% of the year due to prevailing wind direction, for Alternative B with 6-MW wind turbines, as viewed from KOP 1 (Minidoka NHS Visitor Center). The simulated turbines would be 1.7 miles from KOP 1. Figure 3.5-5 illustrates the simulated worst-case condition for Alternative B with 6- MW wind turbines, as viewed from KOP 2 (Minidoka NHS Block 22 Barracks) at a nearest distance of 5.0 miles from the KOP." a. MVE Comment: By showing only simulated postconstruction conditions and omitting existing conditions, Figures 3.5-4 and 3.5-5 may conceal the important contextual point that the large overhead electric transmission structures and transmission lines appearing in the foreground, which are among the most visually prominent features shown in the figures, represent existing infrastructure within the viewshed of the Minidoka National Historic Site. Omitting photographs of the existing conditions could confuse readers of the FEIS, who might misconstrue that the visually prominent transmission lines and transmission structures are part of the proposed Project. Readers making this inference would come away with a vastly exaggerated impression of the Project's visual impacts at the Minidoka National Historic Site. In order to more fairly represent the visual impacts of the Project, MVE requests that BLM either 1) add new figures to the DEIS that show the existing conditions for each KOP given for comparison to the figures (i.e., Figure 3.5- 4, Figure 3.5-5) representing visual resources under various alternatives, or 2) revise Figure 3.5-4 and Figure 3.5-5 to show both existing conditions and simulated post- construction conditions. In addition, FEIS language surrounding the existing figures should reference the new or revised figures, specifically describing that the transmission line in the immediate foreground is not affiliated with the Project, nor owned by MVE, to avoid potential confusion.	Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS, includes three figures showing both the existing condition and simulated condition for the Preferred Alternative for KOPs 1, 2, and 16. Additional text has been incorporated into the final EIS clarifying that the transmission line as seen in Figures 3.5-4 and 3.5-5 is existing infrastructure that is unrelated to the project or MVE.
11978-33	Magic Valley Energy, LLC	Section 3.6.2.2.2 – Environmental Justice and Socioeconomics: Noise Impacts 29. The DEIS states: "As described in the affected environment, the NPS modeled existing noise levels for Minidoka NHS to be approximately 32 dBA (NPS 2015). However, because Minidoka NHS and Minidoka WRC are considered sensitive noise receptors, the noise impact assessment performed for the project conservatively assumed existing background noise levels for NSAs within and near to Minidoka NHS and Minidoka WRC to be 19.3 dBA (Leq) or 27.9 dBA (Ldn), which is considered very quiet and comparable to the sound of rustling leaves or a soft whisper (SWCA 2022)." a. MVE Comment: Scientific analysis in the FEIS should aim to utilize the best data available. The DEIS mentions the NPS 2015 report that modeled existing noise levels specific to the Minidoka NHS (i.e., the location under analysis), reporting that the location-specific modeled existing noise level is approximately 32 dBA. Therefore, the noise analysis should be based on that location-specific 32-dBA noise level as the background noise level, instead of the 19.3 dBA (Leq) or 27.9 dBA (Ldn) that reflects a noise level used for typically quiet spaces, such as schools, libraries, hospitals, and places of worship. Using the 19.3 dBA (Leq) (27.9 dBA (Ldn)) background noise level does not represent the best available scientific data for the Minidoka NHS location in question and would result in an overstatement of the Project's effects. The existing noise levels for Minidoka NHS should be based on the NPS 2015 report (i.e., 32 dBA) in lieu of an arbitrarily applied background noise level of 19.3 dBA (Leq) (27.9 dBA (Ldn)).	Section 3.6.1 (Environmental Justice Communities) in the final EIS compares the previous NPS (2015) noise level assessment at Minidoka NHS with the noise parameters used by the BLM for assessing the project area both as a whole and for Minidoka NHS receptors. The discussion of noise at Minidoka NHS in Section 3.6 provides both the comparison with project assessments and with NPS (2015) assessments. In both cases, noise levels under the Proposed Alternative would increase over assessed baseline conditions.
11978-122	Magic Valley Energy, LLC	24. Section 3.05 Table 3.5-2 Overlap of the auditory component of the Non- physical APE with Minidoka NHS and WRC (acres/square miles) Table 3.5.2 Table 3.5.2 lists the auditory overlap of each Alternative with MNHS and WRC Together. These are separate resources with vastly differing resource areas. Combining the MNHS and WRC may overstate impacts to MNHS. This table would be more accurate if these two resources were represented separately.	Table 3.5.6 in Section 3.5 (Cultural Resources) of the final EIS includes separate rows for Minidoka NHS and Minidoka WRC auditory APE overlap.

Comment ID	Commenter	Public Comment	Response to Comment
11978-123	Magic Valley Energy, LLC	25. Section 3.05.4 “The NPS expressed concern that the impacts on dark skies above the park and direct line of sight to lights on the horizon could significantly alter visitors’ experience and capacity to view the nightscapes formerly experienced by incarcerated Japanese Americans at the camp (NPS 2021). Anticipated change in sky brightness is addressed in Section 3.16.2.2 with Alternative B analysis, and An Assessment of the Impact of Lighting at the Proposed Lava Ridge Wind Project on the Night Skies of the Craters of the Moon National Monument and the Minidoka National Historical Site supports that analysis (Dark Sky Partners 2022).” This statement may be confusing and misleading to the reader. MVE is requesting an edit to: "Although the NPS expressed concerns over the impact to dark skies above the park and direct line of sight to lights, Dark Sky Partners 2022 Report noted that brightness impacts from the Project would not be perceptible. Anticipated change in sky brightness is addressed in Section 3.16.2.2 with Alternative B analysis, and An Assessment of the Impact of Lighting at the Proposed Lava Ridge Wind Project on the Night Skies of the Craters of the Moon National Monument and the Minidoka National Historical Site."	The requested edit is incorporated into the final EIS.
12048-3	Karen Matsumoto	The Minidoka War Relocation Authority Center has been listed on the National Registry of Historic Places since 1979 – this designation places Minidoka on the official list of the Nation’s historic places worthy of preservation. Because Minidoka’s viewshed is a traditional cultural property, it is also eligible for listing on the National Register. We need to protect this important historic place, which also includes the viewshed from the site – the viewshed cannot be separated from the concentration camp site itself. Page 2 As you know, once the project is constructed, it will forever change the experience of former incarcerees and their families, as well as any visitors to Minidoka. The Minidoka Historic Site will be transformed from a sacred site to a place with diminished impact. The U.S. government promised the Japanese American community that the site would be a place honor those unjustly incarcerated, and to allow the wind project to proceed would blatantly disregard that promise.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics). Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM’s development of the Preferred Alternative. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS’s address of impacts to the natural and cultural landscape surrounding the site.
12080-1	Zoe Barker-Aderem	hank you for the opportunity to provide a comment on the unexceptable effects of the Lava Ridge Wind Project to the Minidoka National Historic Site. By completely changing the viewshed, the experience of those who survived camps at Minidoka NHS will be irreparably altered. The Minidoka NHS is a place of reflection and healing not just for survivors of the camps; but their descendants. While the DEIS may identify this as a tourist site, that's minimizing and inaccurate. These are necessary places for us to gather, learn, mourn, and get creative about how remembering the past can protect the future.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing and response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM’s development of the Preferred Alternative. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
12136-1	Diane Honda	A major component of one’s experience at the Minidoka National Historic Site (NHS) is its sense of isolation and desolation which helps a visitor understand the sense of abandonment incarcerees felt. Its viewshed – in the middle of no-where, a point of no return, a place without signs of civilization is central to that experience. Eye-catching wind towers will detract from that experience, become a point of focus, as will wind tower lights – even if sensor-based. Those visual impacts cannot be “subtracted” from a Minidoka NHS visitor viewshed experience. If they are there/lit, they become part of the visitor experience. The Minidoka National Historic Site is not a tourist attraction like Disney World. Categorizing the Sensitive View Group under Table 3.6-3 Environmental Justice Key Observation Points for KOP 1 & 2 as “Tourists and Recreationists” is insensitive (bordering on insulting) and demonstrates a lack of understanding what took place at this site and how that experience continues [see original letter for link that was here] to negatively affect members of the Japanese American community. This is a solemn and meaningful place in the Japanese American community. (One wouldn’t use “Tourists and Recreationists” to describe people visiting Dachau or Auschwitz Death Camps in Europe). Please do not use that term in the final document.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS, and response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS’s address of impacts to the natural and cultural landscape surrounding the site. The visual impacts at Minidoka NHS are further discussed in the EIS Sections 3.5 (Cultural Resources) and 3.16 (Visual Resources), including daytime turbine visibility and nighttime lighting effects from the project. Use of an ADLS would minimize the amount of time that red turbine lighting would be lit at night, only turning on when an aircraft is detected by the system.
12136-4	Diane Honda	Per the DEIS definition, the impact of this project constitutes an irreversible commitment of Minidoka NHS’s viewshed resource as well of the land resources immediately surrounding the Minidoka NHS. DEIS verbiage should be updated to document that reality. Once wind towers (and transmission lines) are installed, they become permanent parts of the landscape and permanently change an area. While the DEIS includes verbiage about project decommissioning, my husband, who sits on the board of directors of a wind tower energy company, said wind towers are rarely, if ever, decommissioned. Instead, they are upgraded, likely becoming larger and even more visible over time. Wind towers would likely impact the Minidoka NHS viewshed in perpetuity if this project is approved. Decommissioning wind towers is not a likely scenario. Again, DEIS verbiage should be updated to document that reality.	The project is required to consider and plan for decommissioning. At this time there is no proposal for upgrading or replacing project elements in the future, and it can only be speculated upon. Should such a proposal become a future consideration, MVE would need to undergo new and separate permitting review for those upgrades, including likely renewed environmental review under NEPA. All current project developments, including project construction, operation, maintenance, and decommissioning must fit within the scope of review analyzed in the EIS; the BLM will not permit actions outside the scope of review for this project. As stated in the EIS in Sections 3.5 (Cultural Resources) and 3.16 (Visual Resources), the visual impacts from the project are considered to be long-term in duration.
12139-1	Jonathan Narita	My name is Jonathan Narita. During World War II, my grandparents and their families were torn away from their homes, businesses, and lives in Seattle and were imprisoned in Camp Minidoka. They lost everything. After the war, it took them decades to rebuild and restart their lives, but still, three generations later, our family has not healed from the trauma from being violated and forcibly incarcerated against their will by the State. My Grandfather, George Nakagawa, was only a teenager when he was held at Minidoka. Whenever the topic of Minidoka came up, I could hear the pain in his voice and see the bitterness in his eyes. He would never talk about it much. That is, until my older sister convinced him to join her on a pilgrimage to the site. Back at the site,	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns. See response to comment

Comment ID	Commenter	Public Comment	Response to Comment
		amongst other survivors and their descendents, my sister watched him slowly open up. He shared with her memories and feelings that were unexpressed for decades, and my family was able to begin understanding, processing, and healing from these intergenerational emotional scars that we all feel but hadn't fully grasped. Minidoka is a place of great pain, suffering, and trauma for me and my family. But we have turned it into a sacred place of community, family, and healing. We are not tourists or recreationalists. To defile the viewshed and somber isolated ambience of the Minidoka National Historic Site with wind turbines would be to irreparably mar the visiting experience of the site, and would be to fail to protect the integrity of the site. I can't emphasize enough the amount of psychological harm that the wind project would have on my family and my community--it would be substantial. The push for renewable energy should not come at the expense of marginalized groups; and the expense here is vast; the expense is an impairment of resources. Wind turbines should not be visible from the historic footprint of Camp Minidoka.	12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site.
12159-5	Marie Matsuno, Dan Sakura	Traditional Cultural Property (TCP) description. I encourage the BLM to consider the impacts of the Lava Ridge project on the Minidoka Traditional Cultural Property (TCP), which has connections to Japanese Alaskan/Alaska Native families wrongfully incarcerated at Minidoka. The Minidoka TCP is connected to the cultural practices or beliefs of the living Japanese Alaskan community. It is rooted in our community's history and important in maintaining our continuing cultural identity. I agree with the TCP Report's findings Minidoka's "viewshed is an integral part of the visitor experience. Therefore, significant changes to this expansive, largely unobstructed viewshed would have negative consequences and adverse impacts to the integrity of the TCP."4	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. The BLM has addressed the TCP report in the final EIS at Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site). Also see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics). The BLM remains in consultation with SHPO and other interested consulting parties on the treatment of Minidoka NHS and other historic properties under the NHPA Section 106 process (36 CFR 800) and has prepared a PA to complete that process and address adverse effects to historic properties (see EIS Appendix 8 [Cultural Resources Programmatic Agreement]).
12193-1	Bill Kawahara	I had returned to the Minidoka Concentration Camp several times and each time I have found that it had brought back many memories that were way back in my mind, almost forgotten. Some of these memories were sad and others were happy but they were brought back after seeing the Camp after many years. I strongly believe that by populating the surrounding area with these wind machines, would destroy the history of the place that was such an important part of the Japanese-American experience. By changing the environment so drastically, any lessons possibly learned by future generations would be lost without capturing the feelings of desolation, nothingness, abandonment that was so deeply felt by the internees. History is so important.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed at EIS Section 3.6.1 (Environmental Justice Communities). Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
12195-2	Taryn Dabb	If erected on Minidoka National Historic Site, the wind project would erase an important part of history that impacted the lives of many innocent Japanese American families, including my own. The 740 foot tall turbines on 73,000 acres would not only impede the view but negatively alter the memorial and land that incarcerated 13,000 people. It's not fair to pit a community of color against the need for clean energy. Were there proposals to put this wind project at Arlington National Cemetery or the Washington Monument? Why would it be okay to put a wind farm on a piece of land that is so sacred to the Japanese American community? There has to be a more respectful place for this project! I am yonsei, a fourth generation American with Japanese heritage. Both of my paternal grandparents and their families were incarcerated at Minidoka. My grandpa left Minidoka to fight in the 442nd combat unit and came home with two Purple Hearts, a Bronze Star, a Presidential Unit Citation, a Combat Infantry Recognition Award and an Army Good Conduct Medal. The 442nd infantry regiment remains the most decorated unit in history. After reading the book Facing The Mountain by Daniel James Brown, I learned about what my grandpa would not speak of about his time fighting during the war. The brave Japanese American men were heroes who fought for a country who imprisoned their families because they looked like the enemy. Even though he was a war hero, my grandpa came home to discrimination, racism, disrespect and prejudice. Many Japanese Americans lost everything after coming home from being incarcerated. My grandparents had to work hard to rebuild their lives yet they were still not welcome in many communities. They weren't allowed to live in certain neighborhoods or belong to certain clubs because of their heritage. My grandparents didn't talk about their struggles but rather focused on establishing a better future for their family. There were bumps in the road and racial issues to overcome that my parents have shared with me but a lot has gone unsaid because it was not proper to complain about the past. My family wanted the younger generation to live in a better world than they did. The fact that I am still being 'othered' in my own community in the year 2023 tells me that the United States still has a long way to go with how it views race. Being asked when I arrived in the US, where I'm from, or where I learned English is a slap in the face. I belong here. My family belongs here. We have been in this country since the early 1900s yet people still treat me like I don't belong. My family has worked hard for everything we have but we still have to prove how American we are. History books in my schools briefly mentioned the imprisonment of Japanese Americans. There were never more than a few paragraphs describing the mistreatment of Japanese Americans. I started researching the truth about the incarcerations on my own and was finally able to see the extent of the emotional, physical, and generational impact the incarceration had on me and my family. For the Bureau of Land Management to take away a painful yet important piece of my family's history is unfathomable. It appears that the US is trying to bury a part of its history that it doesn't want the world or future generations to know the truth about. Information has been purposely left out of school books to make the United States look good. The Minidoka National Historic Site is a reminder of a mistake in the United States' history and putting up a wind farm won't erase the fact that it happened. It's a sacred place where descendents of imprisoned Japanese	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. No portion of the project would be constructed at Minidoka NHS. See response to comment 1395-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding project siting questions. Adverse project impacts to Minidoka NHS are considered at EIS Section 3.5 (Cultural Resources). Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and BLM's development of the Preferred Alternative. Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed at EIS Section 3.6.1 (Environmental Justice Communities). Mitigation of impacts that are not fully avoided or further minimizable are also addressed in the above-referenced EIS sections.

		Americans can pay their respects. It's also a place where people from any race can learn about the incarceration and lay their eyes on land where Japanese Americans were imprisoned. I haven't made it to the Minidoka National Historic Site yet but I hope to do the Minidoka Pilgrimage someday. I hope that when I get to see the place my grandparents were imprisoned, there aren't wind turbines as far as the eye can see. It's a sacred place that I want to take my two young boys to when they're old enough to understand the atrocities that happened to their family because they looked like the enemy. I want them to understand their ancestors' strength and perseverance despite suffering behind barbed wire fences, living in harsh climate and living conditions, and having their food rationed. Having wind turbines as far as the eye can see will take away from the impact that the hallowed ground represents.	
12241-1	Joe Abo	I am a former incarceree of the Tule Lake, WWII relocation camp in northern California. When our family was released from camp in 1946 I was five years old. The Tulelake area when we last visited several years ago was much like it was during WWII. However now an airfield has been proposed to cover a portion of the former camp thus desecrating what is considered hallowed ground for many incarcerees such as myself and is being fought against as many Japanese Americans are fighting against the Lava Ridge Wind Project in Idaho. It seems that government and others are forgetting what injustices have been done to minorities, in this case Japanese Americans, because of racial prejudice. If actions such as those occurring at Minidoka and Tule Lake are allowed to be completed the memories of these wrongful acts will be forgotten. This cannot be allowed to happen as we must learn from the mistakes of the past however shameful they may be. I have been to pilgrimages at Minidoka and Tule Lake and can only imagine what it must have been like for the incarcerees in 1942 arriving in a high desert landscape with blowing dust, surrounded by sagebrush, staring at their new homes, barracks, made of unpainted shiplap covered with tar paper. Other former incarcerees have expressed what a sensory experience it was to see the landscape and an old barrack of the war years on their pilgrimages. Also to show their descendants and friends that the camps really had existed and what it had been like.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed at EIS Section 3.6.1 (Environmental Justice Communities). Mitigation of impacts that are not fully avoided or further minimizable are also addressed in the above-referenced EIS sections. The final EIS includes new Section 3.19 (Minidoka National Historic Site Interpretive Purpose), where impacts identified within EIS Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources) are assessed in terms of how these would impact the interpretive purpose of Minidoka NHS.
12261-1	Kayo Natalie Hayashida Ong	I am a survivor of 2-1/2 years behind barbed wire fences at Minidoka. It's a solemn place - a reminder of war hysteria, prejudice and hardship suffered by my family because my immigrant grandparents were born in Japan. Leaving home on Bainbridge Island, WA, and transplanted to southern Idaho we faced a desolate land - treeless, dusty and void of all but packed earth and rows of tar papered barracks. Return trips as an adult remind me that this is a unique place in our Country's history. The quiet, open spaces, dotted by a few restored buildings under open skies, allow for reflection and tears. Why? Why? Why would the BLM permit a monstrous wind farm to pollute the sky and disrupt the quietude so near to this special place to those of us of Japanese descent who worked to bring life to this land? Are we less worthy of our rights as in 1942? Why? Why would the BLM allow the constant 'whoop' 'whoop' noise of the turning arms pollute the quiet? Why choose this flat land when the wind would be more efficient on higher ground? Would a massive wind farm be considered for the Black Hills? for Yellowstone? or other place set aside for future generation to reflect on the history and import of these places? You are charged to consider the impact and lasting importance of your decision. There are several alternatives balancing economics and conservation away from this historic site. The Minidoka National Historic Site needs your decision to preserve this area as a solemn, reflective place for future generations.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 1395-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding project siting questions. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, reducing noise, and avoiding physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
12272-1	Carrie Schwitters	I'm writing to ask that you locate the wind turbines far enough away from Minidoka, that others will have the same experience that we had. Minidoka is a reminder of an human event that the American government got wrong. Let's not add to that wrong by devaluing the human experience that occurred at Minidoka. The Japanese American community should be heard. Please listen to their request to have the turbines located further away.	See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Also see Section 3.19 (Minidoka National Historic Site Interpretive Purpose), newly added to the final EIS.
12299-2	Lori Saginaw	I urge you to consider that two generations of my family were imprisoned at this Minidoka Concentration Camp during World War II, forced to leave their livelihoods, homes, and college education in Seattle, Washington, a trauma that altered the paths of their lives forever after. Even though I did not experience this terrible round up and confinement myself, the trauma of it exists in my DNA and in that of my sons. Much research shines light on the reality of intergenerational trauma and all of its manifestations. Academicians (e.g.Nagata, D.K., Kim, J.H.J, & Wu, K. 2019 and Nagata, D.K. & Patel, R.A. 2021) document the legacy of trauma in second, third and now fourth generation Japanese Americans as a result of the incarceration. Pilgrimages to all ten of the concentration camp sites are conducted as part of a healing process. A massive wind farm surrounding Minidoka would make the experience of my ancestors inaccessible. Such an alteration to the site as it currently exists dishonors the past and compounds the injustice of the past. Its barren and remote setting defines its historic truth and that truth is respected by preserving this reality. This is why the Lava Ridge Wind Project would have catastrophic and detrimental impact. Its massive presence and disruption of the landscape would undermine the significance of and reason for the site's preservation. Two-thirds of the over 125,000 incarcerees were American citizens by birth. Such egregious and unconstitutional treatment on the part of this country's leadership cannot go unnoted, unstudied, or unscrutinized. There is an essential context that the landscape surrounding this National Historic Site provides in order to grasp a full understanding of the unjust experience of these children, women and men. Every American and especially those like me who are directly connected to this dark past need to see the landscape as it was, emptiness stretching as far as the eye can see, in order to begin to comprehend the weight and magnitude of their isolation. In order to stand in their shoes. This cannot be done if sitting on top of the largest wind farm in the United States, 400 wind turbines spanning 197,474 acres in full view from the Minidoka Historical Site. Such a display would irrevocably harm the viewshed. In DEIS terminology, it would be a gross	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities, and associated EIS revisions that have been made to address these concerns. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the potential impacts of the project on Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose). Please note that project turbines would not surround Minidoka NHS but would rather be located from north to east, varying depending on the project alternative. Please note further that, while the project represents a large-scale commercial wind energy development, the number of turbines proposed will not make it among the largest wind farms in the United States.

Comment ID	Commenter	Public Comment	Response to Comment
		impairment of resources. It would contradict the very history that is protected by its designation as an historical site. How can any visitor imagine the incarcees' experience without open views of desert and mountains? The Minidoka Historical Site must be preserved intact to properly commemorate, so that there can be healing from the history of the incarceration. As it exists, it is an essential resource to further public education in order to protect civil and constitutional rights in America. I emphasize that there is no alternative in the DEIS in which wind turbines (up to 740 feet tall) would not be visible from the MHS visitor center. Even Alternative E, with "the least number of visual impacts to the historic site", would be too massive, spanning 122,444 acres with 269 wind turbines. Any change to the landscape undermines the integrity of the Minidoka Historic Site (MHS) as a cultural, educational, and historic resource and irreparably alters the environmental setting of this WWII American concentration camp. The integrity of the viewshed is the determinant of the integrity of this historic marker of our history.	
12308-1	Alice Hikido	I am a 90 year old survivor of Minidoka, taken from my home in Juneau, Alaska when I was a child of nine. I remained there with my family without my father who was detained in a justice department camp in Santa Fe, New Mexico until the war ended and I was almost thirteen. Minidoka was a barren, dusty landscape so foreign to me who longed for the beautiful coastal mountains of Alaska. For many of the years following, I wanted to block out the experience of Minidoka from my psyche as it was a painful memory of captivity. You have heard many descriptions of the camp situation from others, so I feel that I don't need to again elaborate them for you. With the ending of the war, my father, mother, my young sister and I returned to our home in Juneau without my brothers, one was serving with the 442nd RCT in Europe. We picked up the broken pieces of our lives turning our backs on the memories of Minidoka. I later learned about the pilgrimages to Minidoka from my younger sister who was two at the time of our incarceration. She, of course, was too young to have any memory of Minidoka and now in her 70's, was curious to know where she spent her early years. She asked me to attend a pilgrimage with her, but returning to Minidoka was the last thing I ever wanted to do. However with her encouragement I reluctantly returned with her, wary of the memories I kept submerged. The experience of the pilgrimage was surprising. It turned out to be a healing time for me as I was able to let go of the memories keeping me captive as I shared the experience with other pilgrims. I now realized the importance of the site for all who were incarcerated there and also the importance that it carried for descendants. Not only that, but also for citizens of our nation to know that mistakes are made but are not to be forgotten. The Lava Ridge Project, as proposed with 400 wind turbines, over 700 feet tall within the view shed of Minidoka would have a tremendous negative visual and auditory impact upon the Minidoka National Historic Site, diminishing the powerful message Minidoka conveys. Family members who have attended the monthly Section 106 meetings continued to keep me informed. I volunteered to be interviewed by the Langsdon Group commissioned by BLM which is included in the Draft Environmental Impact Statement. I also volunteered to be a Consulting Party for the Programmatic Agreement. There are fewer and fewer survivors still living.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the potential impacts of the project on Minidoka NHS and the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
12323-1	Sharon Yorita	>From 1942 - 1945, approximately 13,000 Japanese Americans were imprisoned at Minidoka with armed military in guard towers to make certain they could not escape. The majority American citizens. You call us "tourists." Our "tourist" accommodations were one room, tar-papered barracks. A single light bulb, cots for beds and a pot bellied stove for bone-chilling winters. Dust storms were the norm. If these barracks were considered tourist hotel rooms, I would have certainly asked for my money back. We "tourists" also shared community toilets and showers. Our restaurants were mess halls where we could stand in long lines to feast on baked beans and sausages. It's now 2023, and you the Bureau of Land Management want to honor our sacrifice by building LavaRidge. We SURVIVORS of MINIDOKA say "NO" to LavaRidge. We've sacrificed enough. Respect how we have served our country of America.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. Please note that the BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS.
12343-1	Craig Murakami	It will significantly impact the Minidoka National Historic site and desecrate this monument. My parents and extended family were unjustly interned at this site and we grew up hearing many stories about their hardship and the desolate location of Minidoka. I have returned to this site with family and have witnessed the work being done by the National Park Department. This site will remind America about the the unjust incarceration of American citizens due to ignorance, fear, and racism and why it should never be repeated. My father, Kazuo Murakami, was a true American patriot who was interned at Tule Lake and Minidoka despite being an active member of the the Army Air Corp stationed in Arizona. Apparently, he was not East enough to avoid internment, and was reclassified as an enemy alien and sent to internment in his American Aircorp uniform. Until the day he passed away, he expressed how it was one of the saddest days of his life. Visitors and descendants can now begin to feel his saddest and dejection when visiting this isolated and sacred location in Minidoka. Despite this indignation, he de-enlisted from the Aircorp and enlisted into the 442nd infantry and fought in Italy and France. I have visited some of these European battlefields and have seen how Europe has preserved these sites to remind those that follow, the significance of these locations. Please do not allow the Lava Ridge project to proceed as it will visually and audibly effect the Minidoka National Historical site.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the potential impacts of the project on Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
12369-1	Wendy Watanabe	I am a 69-year-old third generation Japanese American, a descendent of family members who survived being imprisoned at Minidoka during WWII. Contrary to the term relocation center, my father, his sister, and their parents did not "relocate" but were involuntarily evacuated from their home in Seattle, Washington and incarcerated at what is now the Minidoka National Historic Site. Minidoka was one of the ten WW II concentration camps purposefully sited in remote areas of desert or swampland. My family, among the 125,000 people of Japanese ancestry who were forcibly removed to live behind barbed wire and guard towers, suffered from the grave injustice and unconstitutional violation of their rights. The profound impact of that trauma continues to felt	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community

Comment ID	Commenter	Public Comment	Response to Comment
		by me, subsequent generations of my family, and the Japanese American community. Research studies (e.g., Nagata, D.K., Kim, J.H.J, & Wu, K. 2019 and Nagata, D.K. & Patel, R.A. 2021) document the legacy of generational trauma in second, third and now fourth generation Japanese Americans as a result of the incarceration. Which is why a trip to Minidoka is a sacred journey. Being able to make a pilgrimage to Minidoka is part of an ongoing healing process. Immersed in its vast stretch of desolate landscape, we can reflect on the isolation that our family and our community must have felt. Their experience is made more real by being there. To characterize the Minidoka Historical Site as a place for tourists and recreationalists is to hide the significance of this site and compound the injustice of the past. Minidoka, like the other American concentration camps, was specifically chosen for its remoteness and undesirable topography. For my family members and 13,000 others who were incarcerated there, Minidoka was an empty desert stretching as far as the eye could see. The enormity of siting the largest wind farm in the United States, 400 wind turbines spanning 197,474 acres in full view of the Minidoka Historical Site, would irrevocably harm the viewshed, or in DEIS terminology, be an impairment of resources. The immersive feeling of isolation, protected at other National Parks, would be destroyed. The land around the Minidoka Historical Site is not simply empty land to be developed, no matter how useful the purpose. The open views of desert and mountains are fundamental to a visitor's experience and understanding of what it was like for people at Minidoka. The Minidoka Historical Site allows for commemoration of and healing from the history of the incarceration, and serves as an essential resource for furthering public education and involvement and understanding of the need to protect civil and constitutional rights in America.	and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. Please note further that, while the project represents a large-scale commercial wind energy development, the number of turbines proposed will not make it among the largest wind farms in the United States.
12476-1	Rebecca Kenison	Minidoka offers the opportunity for education for all of us on the historical unjust incarceration that occurred there. To those who did not have families who were incarcerated there, it provides an important opportunity to learn and, hopefully, to grow in knowledge and wisdom. DEIS does not include the importance of that education.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
12538-2	Clarke Kido	Comments on Key Observations Points (KOPs) · I examined the simulation of the wind turbines at the Minidoka visitor center (KOP 1). I was greatly disturbed to find that the turbine corridor totally engulfs the visitor center and surrounding vista. If the Lava Ridge Project is approved and built, my physical and emotional experiences at the Minidoka Site will be irreversibly damaged. · When I look at the simulation photos with the Minidoka honor roll (KOP 16), I am offended by the presence of the wind turbines, regardless of proximity. During previous visits to the honor roll, I located my father's name and remembered his bravery and sacrifices. Sometimes I shared stories with others who were likewise studying the honor roll. If the project is approved, I will not be able to experience the quiet solitude and respect for family.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the potential impacts of the project on Minidoka NHS. None of the project turbine corridors would be at Minidoka NHS under any project alternative. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and BLM's development of the Preferred Alternative. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
12559-1	Tammy Duncan	I am writing in opposition to the Lava Ridge Wind Project EIS. While I myself do not have family that was directly incarcerated at Minidoka, my friends, their families and grandparents and the legacy of American citizens of Japanese heritage have been greatly impacted and affected by the mass incarceration of American citizens during World War II at this site. This is an important historical site, It is an essential part of the American story that must be be maintained in it's authenticity (which means, without the disrruption of the wind farm) so we can learn from our own mistakes and acknowledge our own history, but also so that the families of survivors can continue to heal, reflect and connect on this land. The solmness and isloation of the landscape is part of the experiene at Minidoka that must be maintained. Forcable moving people from the safety, comfort and resources of their communities to this desolate landscale, is an essential part of the crime that we must bear witness to. The minimal and solemn "viewshed" must not be altered, as it is an essential part of history. The wind project and it's impact statement has completely ignored the cultural signifcance of Minidoka. Families of survivors that visit this location and underake this pilgraimage are not tourists. It is not recreation nor a fun family picnic. The implication in the DEIS that the visitors to this site are simply recereational tourists is an ignorant insult meant to obsure the signiicance of this location. Visitors to this site are seeking a connection to their past, to educate, to commune and to heal as a population of our American commnity that was directly effected by our own racism, and fear during world war II.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
12671-1	Sarah Suzuki	I am writing to comment on the proposed Lava Ridge Wind Project and its potential impacts on the Minidoka National Historic Site. As a fourth-generation Yonsei Asian American, the preservation of this site holds deep personal and historical significance for me, my family, and many others. Visiting the site allows me to honor my incarcerated relatives' memory, better understand their challenges during World War II, and connect with the broader narrative of Japanese American internment. Minidoka National Historic Site is a critical educational resource for understanding the complex history of Japanese American internment during World War II. It is a powerful reminder of preserving civil liberties and human rights (Nagata & Patel, 2021)[1]. The landscape's features, such as the remains of historical structures and natural elements like vegetation, contribute to the site's overall historical significance and emotional impact (Tufts Now, 2021)[2]. The proposed Lava Ridge Wind Project could have significant visual and emotional impacts on the Minidoka site. The presence of wind turbines	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities, and associated EIS revisions that have been made to address these concerns. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War

Comment ID	Commenter	Public Comment	Response to Comment
		would disrupt the site's remote and immersive setting, altering its character and undermining its historical and educational value. This would diminish my ability to connect with my family's history and hinder the healing process for survivors, descendants, and the American population. The DEIS for the Lava Ridge Wind Project needs to include several crucial aspects in its analysis, such as the importance of preserving the site's cultural landscape, the potential adverse psychological effects of incarceration at Minidoka (APA PsycBooks, 2021)[3], and the inappropriateness of identifying Minidoka NHS as "Tourists and recreationists." The impact on the site's "viewshed" is another concern. The wind turbines would be visible from various locations within the area, disrupting the visitor experience and the site's historical context. The DEIS states a "moderate" degree of visual change to Minidoka NHS's viewshed, which is insufficient to protect the integrity of the site (DEIS, Lava Ridge Wind Project)[3]. I recommend that the BLM thoroughly re-evaluate the proposed project in light of these concerns and consider modifications or alternative solutions that respect Minidoka's cultural, historical, and psychological significance.	Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS's address of impacts to the natural and cultural landscape surrounding the site. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose). Also see responses to comments 12859-21 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding potential psychological effects. The BLM has revised the visual sensitivity for Minidoka NHS and surrounding WRC to be high sensitivity, instead of moderate; see EIS Section 3.16 (Visual Resources). However, the degree of visual contrast for wind turbines will remain moderate based on visual contrast rating analyses in Section 3.16.
12859-7	Kristen Brengel, Robyn Achilles; Friends of Minidoka	FOM commissioned a TCP report and ethnographic survey. Based on interviews, oral histories, NPS planning documents, BLM analysis and extensive documentary evidence, the report concluded that the Minidoka is eligible for listing on the National Register of Historic Place as Traditional Cultural Property.32 Traditional cultural property is: … significant because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community (Parker and King 1998:1). TCPs draw upon a community's traditions, defined as the …beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices (Parker and King 1998:2). The report also includes GIS mapping and viewshed analysis to define the approximate TCP boundary.34 To determine eligibility, a traditional cultural landscape must meet four requirements: (1) tangible property, (2) integrity; (3) National Register of Historic Places Criteria; and (4) not be ineligible. • Tangible Property. "Minidoka is a geographically definable area that encompasses and is largely defined by the concentration of interrelated and linked buildings, sites, and viewshed surrounding the national monument." Integrity. The TCP Report finds that the Minidoka's TCP meets the integrity elements:36 o Relationship -- Feeling and Association. § Feeling. The TCP report found that the Minidoka TCP: "embodies and evokes this sense of the historic era both through the historic barracks and other buildings as well as through the expansive viewshed, serving to evoke feelings of isolation and remoteness that are a major part of the property…"37 § Association. The TCP report found that the TCP meets the association requirement: "… there is a clear continuation of association with the property evidenced through the annual return of Minidoka incarceree descendants to commemorate and memorialize those imprisoned there, [and] to the various events held at Minidoka…"38 o Condition -- Location, Design, Setting, Materials, and Workmanship. The report found that even with modern intrusions in the traditional cultural landscape, the TCP meets the condition test: "…the integrity of condition remains strong enough and intact enough to convey its historical narrative and the experience of the incarcerees. Even though there are now nearby farmlands, the expansive, unobstructed viewshed still conveys this sense of isolation and remoteness, an important aspect to the historic integrity of Minidoka."39 The report found that Minidoka also meets the condition requirements for location, design, setting, materials and workmanship.40 • National Register of Historic Places Criteria. To be determined eligible for listing, a property needs to meet at least one of four National Register criteria defined in regulations.41 The report found that the TCP meets all four Criteria A, B, C and D: o Criterion A: Association with events that have made a significant contribution to the broad patterns of our history. The Minidoka TCP "is directly associated with events that have had a major impact within American history. The forcible relocation and imprisonment of thousands of first and second-generation Japanese Americans [and Japanese Alaskans] at Minidoka (and the other WWII concentration camps) impacted the lives of countless Japanese Americans and continues to impact their lives today. Their story, one that continues to be told and further contextualized today, is a significant contribution to the broad patterns of American history."42 This finding is supported by numerous NPS findings relating to National Historic Landmark (NHL) designations of similar incarceration sites at Amache, Manzanar, Rohwer, Tule Lake, Heart Mountain, Topaz and Poston.43 The NHL designation represents a determination of national significance.44 The NPS has determined that Minidoka is "nationally significant." o Criterion B: Association with the lives of persons significant in our past. The Minidoka TCP "…is associated with the lives of multiple historically significant people, many of whom were heavily influenced by their experiences at the Minidoka concentration camp."46 While there is not space here to highlight all the lives of persons significant in our past associated with Minidoka, one person significant in our past is George Nakashima, the internationally acclaimed woodworker and furniture maker. In its National Historic Landmark nomination package for his home and workshop in New Hope, Pennsylvania, the NPS noted that "George Nakashima is one of America's most eminent furniture designer-craftsmen and a significant force within the American Craft movement of the mid-twentieth century, a seminal period for woodworking in the United States."47 National Register Bulletin 15 provides guidance to applying Criterion B regarding a person's association with a property, with a focus on the "person's productive life, reflecting the time period when he or she achieved significance." NPS described Nakashima's productive life while incarcerated at Minidoka: "The Nakashimas, including their newborn daughter Mira, were relocated to Camp Minidoka in Idaho. In George Nakashima's autobiography The Soul of a Tree, he describes the mass incarceration in the internment camps as 'a stupid and insensitive act, one by which my country could only hurt itself. It was a policy of unthinking racism.' Despite the horrendous circumstances, Nakashima made the best of his situation. As luck would have it, Japanese carpenter Gentaro Hikogawa was	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics). For clarification, the Minidoka property is a National Historic Site, not a National Historic Landmark as stated in the comment. The BLM remains in consultation with SHPO and other interested consulting parties on the treatment of historic properties under the NHPA Section 106 process (36 CFR 800) and has prepared a PA to complete that process and address adverse effects to historic properties (see EIS Appendix 8 [Cultural Resources Programmatic Agreement]).

Comment ID	Commenter	Public Comment	Response to Comment
		also incarcerated at the camp; Hikogawa was well-trained in the use of traditional Japanese hand tools and had an intimate knowledge of Japanese wood joinery. Hikogawa taught his skills to Nakashima, thus enhancing Nakashima's already considerable furniture making ability. They used scraps of wood and bitter-brush scavenged from the desert to make pieces of furniture that could enhance their primitive living conditions. While Nakashima claimed to bear no scars from the interment experience, it certainly strengthened his beliefs. As Mira explains, 'Fortunately, he was able to transform anger and negativity into the positive passion of conviction, the passionate creativity of his work, and the passion for beauty and perfection, which served him well.' Rather than building animosity because of his heritage, Mira points out that 'My father's insistence that he was a citizen of the world not limited by national or racial boundaries, enabled him to rise above prejudice and persecution, to embrace, rather than reject the Japanese culture and aesthetics as few, if any, of his fellow internees dared.'"48 o Criterion C. Represents a Significant and Distinguishable Entity. According to the TCP report, "the Minidoka TCP is a district with multiple important, character-defining components: the Minidoka national monument itself, but also the surrounding viewsheds defined by the rolling hills of sagebrush, the many rock outcrops, the peaks, and other elements that compose and characterize the sagebrush steppe landscape." Criterion D: Has yielded, or may be likely to yield, information important in prehistory or history. According to the TCP report, "[e]thnographic and archaeological studies have yielded information important to the history of the area. Future studies of the area will likely yield more information about the significance of both the Minidoka National Historic Site specifically, and the surrounding area generally."50 • Ineligibility Analysis. The TCP report found that the Minidoka TCP "does not fall under any of the ineligibility criteria and is therefore recommended to be eligible under criteria (a), (b), (c), and (d) as listed above."51 The Friends of Minidoka submitted the Traditional Cultural Property report to the Idaho SHPO. In February 2023, the SHPO determined that the area is TCP eligible based on meeting Criterion A. National Register eligibility is determined pursuant to 36 CFR § 800.4(c)(2) of the Advisory Council on Historic Preservation's Section 106 regulations52 as well as 36 CFR § 63.53 The eligibility determination is the responsibility of the lead federal agency, in this case, the BLM, often in coordination with the SHPO. The BLM's Monument RMP states that "[i]f properties that may be eligible for the National Register are discovered, the BLM will consult with the State Historic Preservation Officer (SHPO) and forward the documentation to the Keeper of the National Register to obtain a determination of eligibility in accordance with 36 CFR Part 63."	
12859-8	Kristen Brengel, Robyn Achilles; Friends of Minidoka	We also cite these authorities to provide a more complete list of laws, Executive Orders, Administration statements, policies and directives that relate to Minidoka and request that they be added to the FEIS. National Environment Policy Act (1969): In addition to its procedural requirements, NEPA includes substantive requirements via a congressional declaration of National Environmental Policy to: "…create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans."63 NEPA also includes substantive requirements relating to historic resources and scenery: "it is the continuing responsibility of the Federal Government to use all practicable means … [to] preserve important historic, cultural and natural aspects of our national heritage"64 and "assure for all Americans … esthetically and cultural pleasing surroundings."65 The Monument RMP cites NEPA's substantive authority as requiring BLM to "identify, evaluate, and protect cultural resources on public lands under its jurisdiction and to ensure the Bureau-initiated or Bureau-authorized actions do not inadvertently harm or destroy non-federal cultural resources."66 NEPA's substantive requirement to preserve historic sites was further clarified by Executive Order 11593, entitled "Protection and enhancement of the cultural environment," which was incorporated into the Monument RMP and therefore guides BLM management decisions.67 Executive Order 11593 establishes a federal policy that "[t]he Federal Government shall provide leadership in preserving, restoring and maintaining the historic and cultural environment of the Nation. Agencies of the executive branch of the Government (hereinafter referred to as "Federal agencies") shall (1) administer the cultural properties under their control in a spirit of stewardship and trusteeship for future generations, (2) initiate measures necessary to direct their policies, plans and programs in such a way that federally owned sites, structures, and objects of historical, architectural or archaeological significance are preserved, restored, and maintained for the inspiration and benefit of the people…" 68 Preserve America Executive Order 13287 (2003). The Preserve America Executive Order states that it is federal policy to "provide leadership in preserving America's heritage by actively advancing the protection, enhancement, and contemporary use of the historic properties owned by the Federal Government … and fostering a broader appreciation for the development of the United States and its underlying values … executive branch departments and agencies (''agency'' or ''agencies'') shall advance this policy through the protection and continued use of the historic properties owned by the Federal Government."69 Environmental Justice EO 12898 (1994) – Achieving environmental justice. Executive Order 12898 states that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations …."70 Emphasis added. Anti-discrimination provisions. In addition to the affirmative mandate to promote environmental justice, the Environmental Justice EO directs federal agencies to manage their programs so that they do not have the effect of "…subjecting persons (including populations) to discrimination under, such programs, policies, and activities, because of their race, color, or national origin."71 Advancing Racial Justice Executive Order (E.O. 13895). On January 20, 2021, President Biden signed a "Day One" Executive Order entitled "Advancing Racial Equity and Support for Underserved Communities through the Federal Government." EO 13895 states that "[a]ffirmatively advancing equity, civil rights, racial justice, and equal opportunity is the responsibility of the whole of our Government."72 The EO states that underserved communities who have been	The EIS meets NEPA requirements for the project. See response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics), in general. The EIS is in conformance with the BLM SFO's 1986 monument RMP (BLM 1986), the land management plan for the analysis area, and EO 11593 is incorporated into the plan. EO 11593 (issued in 1971) and EO 13287 (issued in 2003) are further complied with by following the current stipulations and guiding regulations of the NHPA, as amended, and as cited in the EIS and as is being done by the BLM. EIS Section 3.16 (Environmental Justice and Socioeconomics) specifically addresses the policy of EO 12898 as carried out by the BLM under the current NEPA regulations and as updated under EO 14096 (Revitalizing Our Nation's Commitment to Environmental Justice for All). See also the CEQ (1997) citation, Environmental Justice Guidance Under the National Environmental Policy Act, in the Environmental Justice and Socioeconomics section of the Literature Cited section in EIS Appendix 10. EIS Section 3.6 sufficiently considers impacts related to environmental justice concerns, as expressed under EO 14008 (Tackling the Climate Crisis at Home and Abroad [2021] and EO 14057 (Catalyzing Clean Energy Industries and Jobs Through Federal Sustainability). The BLM is proceeding consistent with agency mission, governing law, and applicable preservation standards, including EO 13287 (Preserve America) and EO 14091 (Advancing Racial Justice Executive Order). It should be noted that these orders (and the memorandum cited below) are intended only to improve the internal management of the federal government and not intended to, and do not, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, as each EO and the memorandum below state. Regarding the Presidential Memorandum Condemning and Combating Racism, Xenophobia, and Intolerance Against Asian Americans and Pacific Islanders in the United States (January 26, 2021), the BLM has taken action to ensure that official actions, documents, and statements do not exhibit or contribute to racism, xenophobia, and intolerance against Asian Americans and Pacific Islanders. See also the BLM's response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions to accurately represent the Japanese American community and Japanese and Alaska Natives. Regarding the consideration of an ACEC surrounding Minidoka NHS, as may relate to furthering the objectives of EO 14031 (Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders), see the BLM's response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) on the BLM evaluating the proposed ACEC designation through a separate process outside of the project (see final EIS Appendix 13 [Preliminary Evaluations of Potential Areas of Critical Environmental Concern]). Please note that the BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS; also see responses to comments 9275-5 (see in Table A-3ee, Alternatives) and 11535-7 (see in Table A-3ee, Alternatives). Proclamation 10341 (February 2022: Day of Remembrance of Japanese American Incarceration During World War II) is specifically cited in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site); however, please also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) to the EIS. Please note that the BLM has not included reference to all of the laws, regulations, orders, or memorandum it follows in the EIS, nor is that necessary; per the NEPA regulations at 40 CFR 1502.2(a), an EIS shall not be encyclopedic.

Comment ID	Commenter	Public Comment	Response to Comment
		denied “fair, just, and impartial treatment” include “Black, Latino, and Indigenous and Native American persons, Asian Americans and Pacific Islanders and other persons of color.”73 To implement the Racial Justice EO, Secretary Haaland highlighted President Biden’s Fiscal Year 2022 budget request to Congress which included funding increases for National Parks, including Minidoka NHS, that tell the stories of underrepresented communities. Presidential Memorandum Condemning and Combating Racism, Xenophobia, and Intolerance Against Asian Americans and Pacific Islanders in the United States. On January 26, 2021, President Biden sent a memorandum to federal actions directing that ““[e]xecutive departments and agencies (agencies) shall take all appropriate steps to ensure that official actions, documents, and statements, including those that pertain to the COVID-19 pandemic, do not exhibit or contribute to racism, xenophobia, and intolerance against Asian Americans and Pacific Islanders.”83 By impairing Minidoka’s values, approval of Alternatives C and E would run counter to this guidance. Executive Order on Tackling the Climate Crisis at Home and Abroad-- Environmental Justice. While the Administration’s Climate Crisis EO (#14008) establishes nationwide goals for renewable energy, it also requires that the response to climate change delivers environmental justice, not come at the expense of the environmental justice.84 Executive Order 14057, on “Catalyzing Clean Energy Industries and Jobs Through Federal Sustainability,” also includes environmental equity requirements: “[e]nvironmental justice can only be achieved by ensuring that all those affected by agency operations enjoy the same degree of protection from environmental and health hazards.” Executive Order on Advancing Equity, Justice and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islands.86 On May 28, 2021, President Biden signed Executive Order 14031 to establish the White House Initiative on Asian Americans, Native Hawaiians, and Pacific Islanders (AANHPI).87 The E.O. directed the Initiative to “advance equity, justice, and opportunity for AA and NHPI communities by coordinating Federal interagency policymaking and program development efforts to eliminate barriers to equity, justice, and opportunity faced by AA and NHPI communities, including by advancing policies, programs, and initiatives.” Approval of the ACEC and rejection of the Lava Ridge proposal would further the E.O.’s direction to: “promote inclusion and belonging for AA and NHPI communities, including by expanding public education and knowledge of AA and NHPI people and their diverse cultures, languages, and histories.” In January 2023, DOI issued a fact sheet which stated: “[p]er Executive Order 14031, DOI has identified five high-priority goals that will span the next two years. These goals will advance equity, justice, and opportunity for AA and NHPI communities … GOAL 4 Promote equity and inclusion by ensuring the history of AA and NHPIs is part of America’s storytelling.”93 Approval of the ACEC would demonstrate DOI’s commitment to ensure that AANHPI history is part of America’s storytelling. Presidential Proclamation “Day of Remembrance of Japanese American Incarceration During World War II, February 18, 2022:” To mark the 80th anniversary of the signing of E.O. 9066, President Biden noted that: “the National Park Service helps preserve several Japanese American incarceration camps. These tangible reminders of our history provide important spaces for reflection and learning about the injustices born of prejudice. Preserving incarceration sites as national parks and historic landmarks is proof of our Nation’s commitment to facing the wrongs of our past, to healing the pain still felt by survivors and their descendants, and to ensuring that we always remember why it matters that we never stop fighting for equality and justice for all. My Administration is committed to maintaining these national parks and landmarks for future generations and to combating xenophobia, hate, and intolerance — including through the reestablished White House Initiative on Asian Americans, Native Hawaiians, and Pacific Islanders. In the words of Dr. Frank Kitamoto, who was incarcerated as a child, ‘This is not just a Japanese American story but an American story with implications for the world.’”	
12859-19	Kristen Brengel, Robyn Achilles; Friends of Minidoka	3.5.3 Minidoka War Relocation Center and Minidoka National Historic Site P. 3-155 – While the BLM’s 2022 Stakeholder Assessment and Engagement Report summarizes the effects of the proposal on the Japanese American community, it only scratches the surface of the social and health impacts it would have on our community. Our comments on Section 3.6 address this issue further. P. 3-156 – As noted in our comments above, please include the following authorities in this section: Japanese American National Historic Landmark Theme Study Act of 1992.171 The P.L. 102-248 directed the Secretary of the Interior to prepare a National Historic Landmark (NHL) Theme Study “to identify the key sites in Japanese American history that illustrate the period in American history when personal justice was denied Japanese Americans” and directed the Secretary to study Minidoka and other sites. Norman Y. Mineta Japanese American Confinement Education (JACE) Act. In 2022, Congress passed the JACE Act (P.L. 117-328) to “provide competitive grants for the promotion of Japanese American confinement education as a means to understand the importance of democratic principles, use and abuse of power, and to raise awareness about the importance of cultural tolerance toward Japanese Americans, and for other purposes.” The law reauthorized the JACS grant program which includes Minidoka NHS as an eligible confinement site. Supplemental Appropriations Act, 2010. Section 2003 of P.L. 111-212 authorized the Secretary to realign the SWIP-N ROW to the west of the Minidoka NHS to protect the park from the direct effects of the power line. This legislation demonstrates Congressional support for Minidoka. Executive Order 13985 “Advancing Racial Equity and Support for Underserved Communities through the Federal Government,” dated January 20, 2021, and as furthered by a February 2023 EO. “Presidential Memorandum Condemning and Combating Racism, Xenophobia, and Intolerance Against Asian Americans and Pacific Islanders in the United States,” dated January 26, 2021.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) to the final EIS. That section reviews thematic concepts identified in NPS planning for Minidoka NHS preservation. Also see response to comment 12859-8 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding citation of laws, orders, and similar authorities. Also see response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics), in general. The BLM further records this input on these authorities here with the comments received.
12859-20	Kristen Brengel, Robyn Achilles; Friends of Minidoka	3.6.2.1.2 Dispersed Environmental Justice Populations The DEIS does not adequately describe the Japanese American Community, the impacts and effectiveness of mitigation measures. Rather than a “hard look” at the impacts of the Alternatives on the Japanese American community, the DEIS provides a very cursory analysis of impacts on our community. The Council on Environmental Quality NEPA regulations require that the human environment “shall be interpreted comprehensively to include the natural and physical environment and the	The affected environment presented in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) for the Minidoka WRC and NHS includes a description of the forced removal and incarceration of Japanese immigrants and Japanese Americans during WWII. Section 3.5.2 also incorporates by reference additional documents, such as the Minidoka National Monument General Management Plan, the Minidoka NHS foundation document, and the Lava Ridge Stakeholder Assessment and Engagement Report,

Comment ID	Commenter	Public Comment	Response to Comment
		relationship of people with that environment."173 The NEPA regulations also state that "[w]hen an environmental impact statement is prepared and economic or social and natural or physical environmental effects are interrelated, then the environmental impact statement will discuss all of these effects on the human environment." No baseline condition regarding the Japanese American Community. NEPA requires a baseline condition.175 "Establishing appropriate baseline conditions is critical to any NEPA analysis."176 While the DEIS references BLM's CADR Report, neither the CADR Report nor the DEIS includes a baseline condition of the Japanese American community. The DEIS should include the current condition of the Japanese American community in detail in order to detail the Alternatives' negative impacts on the Japanese American Community. The baseline condition should include the impact of the incarceration as offset by actions that uplift as outlined in this letter. This lack of information is likely due to the BLM's failure to follow DOI's policy guidance to engage with Environmental Justice communities early in the planning process.177 No analysis of substantial scholarly research on the Japanese American Community. Without commenting on the adequacy of the DEIS's analysis of avian species, bats, pollinators and insects, we note that the EIS includes 20 pages of listed scientific articles relating to Avian and Bat Species178 and seven pages on Pollinators and Insects.179 In contrast, the DEIS's Environmental Justice Section includes a reference to the CADR Report180 and NPS planning documents.181 There are scores of scholarly articles that describe the baseline social and health conditions of the Japanese American community. Professor Donna Nagata at the University of Michigan, for example, has published numerous articles over many years documenting the ongoing inter-generational trauma and psychological and health impacts of the incarceration on the Japanese American community. Other scholars have documented the therapeutic benefits from the commemorative events and pilgrimages.183 As noted in this letter, other scholars have described the condition of the broader AANHPI community resulting from COVID hate crimes and racial prejudice during the COVID pandemic. CEQ's NEPA regulations require that "[d]ata and analysis in a statement shall be commensurate with the importance of the impact."184 Because of the "disproportionately high and adverse impact on the Japanese American community,"185 we suggest the following detailed baseline conditions to include the following past actions: • Pre-World War II racial prejudice and exclusionary laws and policies, such as Alien Land Laws. • Forced removal and incarceration of the entire West Coast Japanese American community in World War II, to include family separations, loss of homes, businesses, farms, pets, jobs, friends, communities and lives on the west coast. • Stress and trauma of life in incarceration sites. • Post World War II, the breaking up of the community and racism. The baseline condition analysis can include actions that uplift the Japanese American community on the road to healing. These negative visual impacts lead directly to social effects on the Japanese American community. The Council on Environmental Quality (CEQ) NEPA regulations require analysis of social and health effects that are interrelated with environmental effects: (g) Effects or impacts means changes to the human environment from the proposed action or alternatives that are reasonably foreseeable	which include additional details on the history of the monument, the decreasing number of survivors, and the need to preserve their oral histories. The affected environment in Section 3.5.2 also describes the benefits of the NHS to the Minidoka-connected communities, in terms of opportunities for healing, commemoration, remembrance, and education. Additional discussion of commemorative events and directives that are intended to provide opportunities for education, commemoration, and uplifting of Minidoka-connected communities have been added to the environmental justice analysis in Section 3.6.1.1 (Affected Environment) in the EIS and in EIS Appendix 9 to provide more context within the affected environment. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns. See response to comment 11535-50 regarding meaningful engagement with environmental justice communities and response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding BLM compliance with environmental justice EOs. The entirety of the EIS complies with the requirements of NEPA for the project. The Environmental Justice section of the EIS (Section 3.6) specifically addresses the policy of EO 12898 for considering effects to disadvantaged communities and relies on Environmental Justice Guidance Under the National Environmental Policy Act (CEQ 1997), as cited in the Environmental Justice and Socioeconomics section of the Literature Cited in EIS Appendix 10. NEPA review does not require the creation of new studies, such as a baseline study document, but rather permits the BLM to apply existing data within its analyses. Section 3.6 provides sufficient background information to inform the BLM's analyses. NEPA does not require information to be exhaustive or encyclopedic. Also see response to comment 12859-21 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) to the final EIS.
12859-21	Kristen Brengel, Robyn Achilles; Friends of Minidoka	[Deficiencies cited regarding the Japanese American Community, the impacts and effectiveness of mitigation measures.] Psychological Effects. In addition to a baseline, courts have required agencies to assess both the physical and the psychological effects along with indirect and cumulative impacts on effected communities. In People Against Nuclear Energy, the Supreme Court held that "[a]ll the parties agree that effects on human health can be cognizable under NEPA, and that human health may include psychological health."186 In Access Fund v. Department of the Interior, the U.S. District Court (D. Idaho) held that: … psychological factors have to be weighed and evaluated by the NPS in reaching its management decision just as in another context a federal agency would have to measure the pollutants in a mountain stream to determine compliance with the Clean Water Act, even though the first is a 'subjective' assessment, while the latter is a 'scientific measurement.'"187 BLM's analysis does not include an analysis of the psychological impacts of the wind project, including an analysis of anxiety, depression and related physical health impacts. BLM also did not consider indirect and cumulative psychological impacts. For example, telling the stories of the incarceration is painful and has emotional impacts. As noted by Secretary Haaland at the Amache Roundtable in 2022, "I also know that reliving our trauma is never easy." There are cumulative impacts from the ongoing scourge of COVID hate crimes.	See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns.
12859-22	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Japanese Alaskans – families with both Japanese and Alaska Native ancestry The DEIS does not adequately describe or assess the impact of the project on Alaska Native survivors and descendants. "For EJ purposes, the definition of tribal populations is broad: 'a person having origins in any of the original peoples of North and South America (including Central America), and who maintains tribal affiliation or community attachment.' Any American Indian or Alaska Native qualifies. Membership in a federally recognized tribe is not required."188 The U.S. Government directed that Japanese Americans families in Alaska be relocated, leading to the forced removal of approximately 145 Japanese Alaskans from their homes and communities to Minidoka. Most of the Japanese Alaskan families, including those of Alaska Native and Japanese descent, were incarcerated at the Minidoka Relocation Center purposely located in a desolate and isolated area of Idaho. The forced removal had devastating impacts particularly on these Alaska Native families and created unthinkable hardships. At Minidoka, incarcerees with both Alaska Native and Japanese ancestry were even more isolated within the camp because they were torn from their Native communities and culture and lived in a desolate desert-like environment and with people of an unfamiliar culture—some hadn't associated before with Japanese Americans. Assigned to a separate barracks block (block 24), they formed their own unique community at the center of the Minidoka camp to provide strength and support to one another.189 As noted by Marie Matsuno, Japanese Alaskans had to overcome obstacles upon their return to Alaska Native communities, including being sent to boarding schools away from home.190 American Indian Religious Freedom Act. E.O. 13007 directs BLM to avoid harming sacred sites "to the extent practicable, permitted by law, and not clearly inconsistent with essential agency functions."	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal knowledge related to this important site and records this information for the project with the comment provided here. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. Also see response to comment 11315-5 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding Alaska Natives and the BLM's scoping and consultation efforts. See the introduction to EIS Section 3.5 (Cultural Resources) in specific reference to EO 13007.

Comment ID	Commenter	Public Comment	Response to Comment
		The Minidoka Honor roll and other features at Minidoka have cultural importance to Alaska Natives incarcerated at Minidoka and their descendants.	
12859-27	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Generational Change. The DEIS describes the Japanese American community with a very broad brush, without the necessary baseline conditions, including the generational changes. With the passage of time, we are losing Minidoka survivors. Minidoka survivors are now in the late-seventies, eighties and older. The Japanese American community is in a race against time to commemorate and preserve these sites to honor survivors and ensure that we honor survivors while they are still alive. The first generation of Minidoka descendants, who were born after the incarceration, are also advancing in age. Preserving these sites is critically important to provide meaning to the lives of their late-parents, grandparents and family members, many of whom served in the military. Through multi-generational visits to Minidoka, the Japanese American community seeks to engage the next generation of young people as stewards of Minidoka. Minidoka is our past and our future: Even though many of the ambitious goals of the Japanese American community have been realized, the pilgrimages continue to fulfill an important function. Nisei join their children and grandchildren on these journeys, and the rituals have become intergenerational affairs.50 As such, they provide the opportunity to share long-suppressed stories and feelings with one another.	See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and related comments 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) and 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) cited there. The affected environment presented in EIS Section 3.5.2 for Minidoka NHS describes the importance of preserving the historic site for continued learning and healing. Section 3.5.2 also incorporates by reference additional documents, such as the Minidoka National Monument General Management Plan, the Minidoka NHS foundation document, and the Lava Ridge Stakeholder Assessment and Engagement Report, which include additional details on the history of the monument, the decreasing number of survivors, and the need to preserve their oral histories. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) to the final EIS.
12859-36	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Definition of Recreational User and Tourists. While the DEIS does not define recreational users and tourists, its consultant lists recreational users as including “those involved in active recreation (e.g., hiking, off-highway vehicles, hunters) and those involved in more passive recreational activities (e.g., sightseeing or wildlife observation) … [a]s distinguished from recreational visitors, tourists may be just passing through the local area or staying for a period of varying duration to enjoy local attractions. Tourists typically come to the area for activities such as visiting historic or geologic sites, taking sightseeing tours, visiting friends and family, and attending festivals or events…”249 We recommend that BLM develop a more accurate definition of visitors to Minidoka.	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives.
12877-1	Emily Yoshioka	The Lava Ridge wind project will desecrate the Minidoka National Historic Site, which stands as a sacred place for the Japanese American community and an opportunity for education to any and all who visit. In 2015, I traveled to the Minidoka National Historic site with my family for the first time. I was able to experience Minidoka with my grandmother, whose memory was stirred by the physical reminders of camp: the barracks, the dry and dusty heat, and the horizon reaching far away. The immersive physical environment of Minidoka is powerful and must be protected for current and future generations. The wind project will have moderate to severe impacts on the viewshed from the Minidoka National Historic Site, causing a direct impairment of resources. The DEIS failed to include how the immersive environment of Minidoka will be preserved.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. The EIS analysis related to Minidoka NHS—see EIS Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources)—considers the perspective of a person on that site. The sense and feeling that Minidoka NHS is able to convey of its historical significance are among the immersive experiences considered in assessing impacts from the project to Minidoka NHS in EIS Section 3.5. EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) describes the purpose of Minidoka NHS, including its history and significance and how—beyond adverse effects to Minidoka NHS in terms of Section 106 of the NHPA—the Japanese American community considers project impacts to be of further severity from a cultural perspective and harmful to their rights. The EIS further describes concerns that, in addition to visual impact, extend to the emotional impact the appearance of the project on the landscape could have on the Japanese American community’s experience of the Minidoka WRC and Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) to the final EIS.
12877-2	Emily Yoshioka	I question the ability of the DEIS to adequately consider the impact that the Lava Ridge wind project will have on the Japanese American community. It was very frustrating to read the Minidoka National Historic Site as a place for “Tourists and Recreationalists.” This coded language reflects a long history of harmful euphemisms employed by the Federal government to refer to the forced removal and mass incarceration of Japanese people at American concentration camps. My pilgrimage to Minidoka is not as a tourist or a recreationalist. How can an evaluation that truly considers the weight of impact on the Japanese American community be ensured, given the lack of cultural competency in the DEIS (which President Biden calls for in the Executive Order on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) regarding inclusion of EO 14031 on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders.
12950-1	Susan Stacy	Comment No. 1: Significance of the viewshed from the Minidoka National Historic Site (Hunt War Relocation Center). The Japanese American community is not the only community with a profound interest in historic sites in the United States that commemorate a gross cancellation of the constitutional rights of American citizens during WWII. All Americans who have belonged to a group whose rights were abridged in our long history have a stake in Minidoka. This is a site of "conscience," not a tourist destination. It is not by accident that visitors who go to the Site use terms like "pilgrimage" to describe their purpose. Along with cancellation of rights, American citizens were forced to undergo extremely punitive conditions, which included removal from their homes and forced re-location to the most isolated, bereft, and harsh settings that could be found in the "inland" regions of the United States. Since a more "pleasant" setting would not have suited the punitive quality of the government's relocation, the purposes of the Minidoka National Historic Site - to "remember" the miscarriage of the US Constitution-includes preservation ofboth the site ofthe remains ofthe War Relocation Center and its stunningly harsh environment of "nowhere." The current proposal to derive energy from "wind" exploits one of the worst qualities this site offered to the prisoners at Minidoka. This is a historic irony that, in my view, has little to redeem it. To "enclose" the viewshed with wind turbines will obliterate the memory and the reality of "nowhere." It should not be permitted.	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing and comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS, as well as regarding the EIS’s address of impacts to the natural and cultural landscape surrounding the site. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, reducing noise, and avoiding physical project impacts at Minidoka NHS. Please note that under no proposed alternative would the project place wind turbine generators in layouts that would enclose the viewshed of Minidoka NHS. The project would be sited generally to the northeast, with the range of turbines differing from north to east of Minidoka NHS depending on action alternative. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM’s development of the Preferred Alternative.

Comment ID	Commenter	Public Comment	Response to Comment
12986-1	Victor Yamada	the proposed project and its discussed alternatives would cause significant impacts to the Minidoka National Historical Site. I am addressing significant impacts under 3 topics -Visual Resources, Cultural Resources, and Environmental Justice. Project Components - The wind structures (including the towers and extended vanes) would be up to 700 feet high. For comparison, these heights are similar to the Seattle Space Needle or a 70-story building. Visual Resources - The wind towers would be clearly visible at locations on the Minidoka National Historic Site. An unobstructed view of the sweeping vistas and desolate environment is essential to the immersive experience and practice of commemorating those who were incarcerated at the Site. Cultural Resources - The visual changes would significantly impact the setting, feeling, and association of Minidoka National Historic Site. The Site tells the stories of the forced incarceration of Japanese Americans and ensures they are honored and preserved for future generations. It is integral to the identify of the Japanese Americans taken from their homes, separated from their families, and imprisQned in a purposely isolated environment thousands of miles from home. Appendix 8, Cultural Resources Program Assessment, does not address these impacts. Environmental Justice - The proposed project and associated visual changes would have significant and adverse effects on the setting, feeling and experience at Minidoka National Historic Site. The Site is an acknowledgement of the injustice that happened to thousands of Japanese Americans. It notes the distinct population who suffered unique experiences before, during, and after incarceration associated with World War II.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and related comments 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) and 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) cited there. Please further note that the stipulations in the HPMP and specific HPTPs under the PA (EIS Appendix 8 [Cultural Resources Programmatic Agreement]), when finalized and executed would resolve adverse effects to historic properties when implemented, including mitigating adverse effects to those historic properties associated with Minidoka NHS. The PA in the draft EIS was in draft form to provide the public the opportunity to comment upon it.
13006-7	Leon Smith	8) Recommend that BLM include protective measures for the Minidoka NHS, MRC, and Minidoka TCP. Recommend BLM consider the impact on Alaskan natives that were incarcerated at MNHS and the social/health/trauma impact on the Japanese American community in greater detail. It is a sacred site. 9) If the project goes forward against the strong objection of the subcommittee, recommend that BLM include a methodology to mitigate the psychological impacts on Japanese Americans for the loss of their sacred ground and their sense of purpose. Minidoka gives their community a sense of purpose and meaning. It ties the past to current events and gives them a purpose.	See responses to comments 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site), 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site), and 12589-2. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns.
13019-1	Bill Gannon	I would like to comment after first seeing a misleading ad on Facebook that made no mention of the Japanese' horrible treatment during WWII and how this site is a meaningful reminder of this shameful American history. First of all, FB ads that don't give both sides a fair treatment are dishonest and shouldn't be legal, but for now that's where we are. However after some research it is my opinion that the windfarm should be allowed if the money-makers in the project are willing to negotiate some kind of settlement. It is my opinion that that should include a museum of the history of that area should be created and located in a large city like Boise so more people are educated on the issues.	See response to comment 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding mitigation considerations for Minidoka NHS.
1395-1	Julie Abo	I am a descendant of Minidoka incarceration camp survivors and I am a public historian. Imagine if Antietam or Gettysburg battlesites, now sacred grounds were surrounded my windmills. This would be unacceptable. So why is this being considered near the Minidoka National Historic site and on Shoshone Bannock ancestral lands? I feel the echo of the =93race prejudice, war hysteria and a failure of leadership=94 that was condemned by President Reagan is happening again. We need long term solutions, not a temporary fix until the next project comes along. There are already other projects in the pipeline. Let's site these projects appropriately from the start. Please, don't leave us out of this process again.	As stated in the Purpose and Need section of the EIS, MVE has applied for a ROW for the project and the need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V). The BLM has not yet decided, and would decide in a ROD on the project, whether to approve, approve with modifications, or disapprove the project. MVE (2023) presents the basis for wind energy generation siting in this area. The action alternatives in the EIS for developing the project consider various siting or layout alternatives that the BLM has analyzed based on and from which the BLM has arrived at its Preferred Alternative in the final EIS. These analyses throughout the EIS include assessment of the cumulative impacts of the project in relation to other reasonably foreseeable actions in the vicinity, including other proposed wind energy developments. The BLM has included and provided opportunities for input on the project since providing notice in the *Federal Register* and has since provided specific outreach to Japanese American communities.
2823-1	Kyle Kinoshiza	THE DEIS contains a number of objectionable features that end up minimizing the actual negative impact of any of the alternatives. One of the main problems which does this is the way in which they characterize the human communities impacted by the Lava Ridge project. First, they list the Japanese American and Native American communities with the forms of wildlife < treating these peoples as objects. There is a racist history of this manner of classifying these peoples that rationalized the marginalization and even genocidal treatment. Secondly, the characterization of our peoples as "tourists and recreationalists" mocks and trivializes our pilgrimages and the solemn history of racism behind our memorialization of the Minidoka National Historical Site and the Native American land. It allows the BLM to reduce the human impact of the Lava Ridge project to a slight inconvenience rather than the desecration of sacred sites and the disruption of the healing functions of this site and these lands. The DEIS characterization is minimizing the impact of Lava Ridge as a part of a long history of exclusion and forcible removal of Native tribal peoples and communities of color like Japanese Americans, its language is consistent with the justifications of colonization and racist treatment - another case of "White Washing". Change this language, and include in the DEIS much more information on the human impact of Lava Ridge.	See response to comment 3749-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
3506-1	Beth Harrington	I am writing to oppose any plan that would aversely affect the sacred Minidoka NHS site. Please see my comments I am concerned about the impact of wind farms on Lava Ridge on the Minidoka NHS. This is not a “tourism” site as implied in some of the proposal’s materials but an important source of healing for the Japanese American community. A wind farm plan that visually encroaches upon this place would destroy its integrity and dishonor the people who were held here unconstitutionally. I urge decisionmakers to reconsider any plan that would have a deleterious effect on this sacred location. Thank you.	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS’s address of impacts to the natural and cultural landscape surrounding the site.

Comment ID	Commenter	Public Comment	Response to Comment
3542-6	Sue Page	Why is the government even considering this plan when the possibility for destruction of the aquifer is a possibility? The possibility noted in all the proposals of potential damage to historical sites such as Wilson_Butte_Cave, Minidoka National Historic Site.	As stated in the Purpose and Need section of the EIS, MVE has applied for a ROW for the project, and the need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V); see response to comment 1395-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Regarding potential impacts related to the aquifer, see EIS Section 3.17 (Water and Wetland Resources). For potential impacts to cultural resources, including Wilson Butte Cave and Minidoka NHS, see EIS Section 3.5 (Cultural Resources).
3749-1	Kyle Kinoshita	I am writing this letter to express my extreme dissatisfaction with the Lava Ridge Draft Environmental Impact Statement (DEIS). There are aspects of the DEIS that reinforce my overall opposition to the Lava Ridge Wind Project. My perspective comes from being the son of an entire family which was incarcerated at the Minidoka War Relocation Center during World War II. My mother, father, aunts and uncles and grandparents were forcibly removed from Seattle and the Portland area in 1942 and placed in the Minidoka concentration camp. This was an extremely traumatic and life-altering event for our family. To hear that the Bureau of Land Management is considering allowing the construction of the Lava Ridge Wind Project to move forward and impact the Minidoka National Historic Site (NHS) is deplorable. The Lava Ridge Draft Environmental Impact Statement exacerbates the distressing aspects of the project. The entire DEIS minimizes the nature and historic importance of the Minidoka NHS. The NHS is place of solemn pilgrimage, reflection, and commemoration, in the same manner as many other sacred memorials and battle sites throughout the U.S. There are numerous places in the document that ignore or trivialize the historical importance of the NHS, but I will focus on a few. The document often refers to the those who visit the Minidoka NHS to honor their ancestors incarcerated here as “tourists and recreationalists” (pp. 276, 473, 474, 483, 486, just to name a few) and an “environmental justice group” (p. xviii of the Executive Summary), which would be impacted, on an equal level as would be the various forms of wildlife mentioned in the document’s table (see pp xv-xxiv). The insulting nature of how our community is characterized in this manner is obvious. Further, we do not visit the site for titillation or entertainment. We are an ethnic community who come to the site in remembrance of a devastating act of racism during World War II. These euphemisms are a degrading minimization of the crimes perpetrated against our community. Jewish pilgrims to European death camps, or Black African Americans commemorating sites such as the Edmund Pettus Bridge would never be called “tourists and recreationalists” or an “environmental justice group”, as that would be ridiculously ignorant. Yet the DEIS callously refers to our community remembering this tragic event in this manner. The authors of the DEIS would do well to read President Biden’s “Executive Order on Advancing Equity, Justice and Opportunity for Asian Americans, Native Hawaiians and Pacific Islanders” to understand their racist aggression. Although it largely ignores the importance of the Minidoka NHS to our community, as well as the detrimental impact of the wind farm project, the DEIS does make a halfhearted and highly minimal attempt to characterize the damage. On p. xviii, Alternative B it points out that “Native American Tribes and Japanese American communities would be subject to disproportionate high and adverse effects from changes to the setting, feeling, and visitor experience at Minidoka WRC and Minidoka NHS, and to physical and non-physical impacts to cultural resources.” Even Alternative E, characterized as the least impactful, points out that “(d)isproportionately high and adverse impacts to the Japanese American community and Native American Tribes would still occur”. But what are these “effects”? The DEIS still tiptoes around the fact that it is a site sacred to both Japanese Americans and Native American tribes because of acts of racism as well as land theft and genocide. With the gaping omission and silence around the political and social realities behind these historical legacies, the authors of the DEIS can comfortably characterize the alternatives in purely technical terms. The Minidoka National Monument was established in 2001 and declared a National Historic Site in 2008 as a site of historical importance, commemoration, and healing from collective trauma, where visitors can learn about the injustice of the wartime removal and incarceration of an entire community based solely on their race. It is a special place where people come to see, to learn, and to share, in some small measure, the experience facing Japanese Americans who were imprisoned by their own government so far from home. It is a space where visitors can contemplate lessons of our nation’s past that should never be forgotten or repeated again. That space will be irreparably diminished -- emotionally, visually, physically – by the intrusion of hundreds of massive wind turbines, transmission lines, power stations and roads next to the site. The DEIS makes light of these realities. I understand that there is an absent “Alternative A” in prior documentation but not mentioned in the DEIS which would not allow the project to move forward. This alternative is the only just course of action for the Bureau of Land Management. To conclude, the DEIS completely negates the fact that the Minidoka NHS is a sacred place of reflection and healing for Japanese Americans such as myself who am a descendant of incarcerated families. It is highly distressing to an entire community which was a target of racism to have their experience papered over by inaccuracies, mischaracterizations and technical jargon of the DEIS. I am also forwarding this letter to my elected U.S representative, Pramila Jayapal, and senators Patty Murray and Maria Cantwell.	The BLM respectfully accepts the additional detail regarding Minidoka NHS and personal experiences related to this important site and records this information for the project with the comment provided here. See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives, and the revision of the related text of the EIS. Within the EIS, under NEPA the BLM is required to analyze the areas of potential significant impact of the project on the human environment and the natural environment. Meeting the requirements of NEPA and assessing project impacts on the human environment, the BLM considers the impacts of the project on all potentially affected communities, in particular in EIS 3.6.1 (Environmental Justice Communities). This includes considering environmental justice under the law, regulations, and federal policy. Although other laws and regulations require the BLM to assess various aspects of the natural environment as well, including plants and animals, at no point does the BLM or the EIS compare the human environment and the important factors concerning potential impacts to people to the natural environment and the factors concerning impacts to plants or wildlife. Different methods are applied across these analyses, and at no point are either leveled in comparison or contrast to each other in the EIS. See EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) regarding inclusion of EO 14031 on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders. EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) describes the purpose of Minidoka NHS, including its history and significance and how—beyond adverse effects to Minidoka NHS in terms of Section 106 of the NHPA—the Japanese American community considers project impacts to be of further severity from a cultural perspective and harmful to their rights. The EIS further describes concerns that, in addition to visual impact, extend to the emotional impact the appearance of the project on the landscape could have on the Japanese American community’s experience of the Minidoka WRC and Minidoka NHS. Section 3.6.1 (Environmental Justice Communities) describes the importance of Minidoka NHS and WRC to the Japanese American community in terms of key components of the visitor and survivor experience, using information and phrasing obtained from the Minidoka NHS foundation document, NPS consultation, as well as the BLM’s direct engagement with the Japanese American community. The impact analysis presented in Section 3.6.1.2 (Impacts) took a hard look at the potential impacts of the project (i.e., noise, traffic, visual) on the visitor and survivor experience and heavily referenced the feelings and sentiments expressed by members of the Japanese American community throughout the impact analysis to present a strong message that any changes to the setting, feeling, and visitor experience at Minidoka NHS and the Minidoka WRC would be viewed by members of the Japanese American community as acts of intrusion and desecration to a sacred site and a continuation of racial injustice. The EIS fully recognizes the nature and importance of Minidoka NHS and of the potential project impacts to the site, even if it cannot express that nature and importance to the full satisfaction of everyone. The nature and importance of Minidoka NHS in particular is presented in EIS Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). However, to more fully address the significant aspects of Minidoka NHS, the BLM added a new section (Minidoka National Historic Site Interpretive Purpose) to the EIS (see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site)). The BLM and the NEPA process afford the Japanese American community and others the opportunity to express their sentiments and provide their views through comments, which the EIS then presents in this comments and responses section. As noted in response to comment 11985-1 (see in Table A-3g, Cultural Resources and Native American Concerns), the EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking to protect the historic properties associated with Minidoka NHS. The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, FLPMA, and other laws, regulations, and federal requirements, in advance of the current project. The BLM will continue to plan for the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS, under a PA, completing the Section 106 process in consultation with consulting parties. Varying degrees of non-physical impacts to Minidoka NHS would result under any of the action alternatives, and various mitigation measures would be applied as stated in the EIS. The BLM is considering a No Action alternative for the project, by which it compares the potential impacts of the action alternative analyses in the EIS. The BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project and will not make a decision on these matters until after the PA (see EIS Appendix 8 [Cultural Resources Programmatic Agreement]) is signed and a project ROD is released. The BLM decision on the project will be stated in the ROD.

Comment ID	Commenter	Public Comment	Response to Comment
			The No Action alternative for the project remains Alternative A in the EIS. Also see response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS.
3777-1	Adele Hetzel	Minidoka NHS could be improved with a partnership and donations from MVE to make it a place where people want to go to learn about and learn from the tragedy of what the Japanese-American community endured. However, I believe the turbines won't impact the desolation of the site.	See response to comment 4315-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
3811-2	Alwena Savage	I am concerned about Tribal Treaty Rights, and protection for Minidoka.	Tribal treaty rights are addressed in EIS Section 3.5.1 (Native American Resources). Minidoka NHS is addressed variously throughout the EIS, in particular within Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
4220-1	Sue Page	The photos of the Minidoka National Historic Site with tiny, hardly visible sticks in the background are insulting. The tallest structure at the site is the guard shack at 29 feet. The turbines are over 740ft with blade spans over the size of a football field. The photos don't show the blinking lights or let you hear the whoosh sound they will generate.	See response to comment 8458-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
4315-1	Alice Nicholson	I am grateful for the opportunity to comment on the draft EIS and urge you to move forward with alternative C, which allows this project to coexist with the Minidoka NHS without impacting the feeling of desolation.: Minidoka NHS could be improved with a partnership and donations from MVE to make it a place where people want to go to learn about and learn from the tragedy of what the Japanese-American community endured. However, I believe the turbines won't impact the desolation of the site.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed at EIS Section 3.6.1 (Environmental Justice Communities). One goal of mitigation would be to preserve information and convey knowledge of Minidoka NHS and enhance awareness of its history and the history of the Japanese American community.
4801-1	Kay Hummel	The cultural and historic significance of the original Minidoka camp acreage should not be underestimated or merely 'worked around' as if the current and very small designated National Historic site is all that matters or requires analysis. It is not a simple "tourist site." * The National Environmental Policy Act (NEPA) requires a full appraisal of all historical, cultural and religious impacts of this industrial siting decision. There are many negative ones. I do not see them all fully evaluated in the documents. Just one component is the extreme size and height of the MVE's machines -- their mass and sightline appearance is significant, even when viewed at four or five miles distance.	EIS Section 3.5 (Cultural Resources) assesses but is not limited to the impacts of the physical and non-physical (visual and auditory) impacts to cultural resources, inclusive of Minidoka NHS. The physical APE for the project would not overlap Minidoka NHS; however, non-physical impacts to Minidoka NHS and physical and non-physical impacts to the Minidoka WRC would occur under different action alternatives. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding impacts, preservation, and mitigation for Minidoka NHS. See responses to comments 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS. As further noted in response to comment 11985-1 (see in Table A-3g, Cultural Resources and Native American Concerns), the EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking to protect the historic properties associated with Minidoka NHS. The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, FLPMA, and other laws, regulations, and federal requirements, in advance of the current project.
5189-1	Traci Wood	What about the Minidoka National Historical Site, how will this impact the survivors and family members of those lost there. It will be desecrating a sacred site. It is not honorable or pleasant to those that come to this site for healing, memorials etc.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site), in general.
5322-1	Randal Elder	To whom it may concern: “They could take their windmill farms elsewhere, but we can't take Minidoka anywhere else,” said Tomita. https://www.king5.com/article/news/community/facing-race/japanese-internment-camp-survivors-southern-idaho/281-35b404cb-4560-4e17-87de-78bc76f67e86 <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.king5.com%2Farticle%2Fnews%2Fcommunity%2Ffacing-race%2Fjapanese-internment-camp-survivors-southern-idaho%2F281-35b404cb-4560-4e17-87de-78bc76f67e86&data=05%7C01%7CBLM_ID_LavaRidge%40BLM.gov%7Cae5ee643f0d444bfa09908db1e549703%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638137120880710829%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C1000%7C%7C%7C&sdata=Gi4Dm7PdzxMKFsxjY5%2BnPowlZNCQjG5VnmzQ0Z%2BLS2w%3D&reserved=0> I agree. Please do not place any turbines at or near Minidoka. Respectfully, Randal Elder 18830 51st pl w Lynnwood WA 98036	The BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS.
5331-1	Joan Hurlock	The Lava Ridge Wind Project (LRWP) will adversely impact the Japanese-American community because the 197,000 acre project site will be within the vicinity of the Minidoka War Relocation Center and National Historic Site. These monuments serve as a reminder of the atrocities meted out on the Japanese-American community. The MWRC and MNHS are vitally important to people like Janet and Dan. Where are the Social Justice Warriors? We must not forget…we must not intrude on the somber atmosphere…we must not destroy their history. One would think that this would be the ONE thing that would quash the Lava Ridge project….	Please note that the action alternatives described in the EIS, including the BLM Preferred Alternative in the final EIS, consider project siting that would be reduced from the cited 197,000 acres of the Proposed Action. The Proposed Action, action alternatives, and the BLM’s Preferred Alternative do not include turbines within Minidoka NHS. Alternatives C and E and the BLM’s Preferred Alternative do not include turbines within the Minidoka WRC. Also see response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) —regarding consideration of impacts on Minidoka NHS, the surrounding Minidoka WRC, and to the Japanese American and Minidoka-connected communities—and related comments 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) and 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) cited there.
6870-3	Name Not Provided	I support green energy but not this project. Green energy projects must be sited in locations that minimize impacts to nationally important places. Why was this project proposed next to Minidoka and on the historic	The project alternatives, including the BLM’s Preferred Alternative, would not locate project elements within the historic boundary of Minidoka NHS. The national importance and setting of Minidoka NHS were recognized in

Comment ID	Commenter	Public Comment	Response to Comment
		footprint of the Minidoka War Relocation Center? What was the BLM thinking? Did they not know or acknowledge the national importance of Minidoka and do proper site analysis and learn that the viewshed and environmental setting are intrinsic resources to Minidoka? The viewshed and setting are integral to the site and people's experience of it. How will my community be able to commemorate the injustice of the WWII incarceration and the 1,000 Nisei soldiers listed on the Honor Roll when there are hundreds of wind turbines spinning across the skyline and knowingly permitted by Secretary Haaland, Director Manning, Director Sams, and all the other government officials? Any wind turbines, no matter their height or distance, perpetrate further injustice on my community. The wind turbines will visually, experientially, intellectually, and emotionally wreck Minidoka National Historic Site for the Japanese American people and by extension the American people. The local Magic Valley community is aligning with the Japanese American community in opposition to Lava Ridge Wind Farm because they also understands the Lava Ridge Wind Project is further injustice and desecration. The historic preservation community sees this impact and injustice when they designated Minidoka as one of their 11 most endangered historic sites.	initial project scoping and addressed in the EIS; see Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose). Also see responses to comments 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, avoidance of physical project impacts at Minidoka NHS, and mitigation of non-physical impacts.
6876-2	Jonathan Jarvis	As Director, I worked alongside BLM Directors Bob Abbey and later Neil Kornze to ensure renewable energy projects were sited, sized and developed in a manner that did not significantly impact sites of our nation's natural and cultural history. Through numerous long discussions, we often agreed on a decision that achieved both. Occasionally, as Director, I needed to be clear that the impact of a proposed action could not be mitigated. For instance, I was directly involved in preventing LS Energy from building a power line through the Minidoka National Historic Site in 2010. It seems that LS Energy is back again, this time as subsidiary Magic Valley Energy with its Lava Ridge Wind Project and proposing another project that impacts a site essential to American history.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS is a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. Within the EIS, the BLM fully considers impacts to resources such as Minidoka NHS and migratory birds to understand how the potential impacts relate to laws, regulations, and policies.
6877-1	Anastasia Christman	As a former university professor of US history, I must oppose the proposed Lava Ridge wind turbine project. Among the courses I taught was one on historical monuments and historical memory in which we explored the way that public monuments are key to building a social history and especially to opening conversations about episodes of our history that encompass racism, violence, and oppression. The Mindoka National Heritage site is just one of these monuments. This site is becoming even more important as the generations who lived through illegal incarceration in these concentration camps pass on; subsequent generations must be able to go this site and experience, even if only in a small way, the ramifications of the unspeakably racist policy of Japanese American incarceration.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the mitigation of impacts to and preservation of Minidoka NHS.
6899-1	Japanese American Community	All of the action alternatives will impair the viewshed and environmental setting and feeling of the place. One of the main reasons Minidoka was selected as a concentration camp site was specifically because of its remoteness and distance from population centers. It was also selected because it was a large tract of government land, there could be work opportunities clearing the land and transforming it into agricultural lands, and to realize the goals of homesteading the west. The construction of the wind farm will entail massive road building, transporting construction materials, and the turbines. The operation of the wind farm will result in a horizon of spinning wind turbines permitted by the government. This will both impair the fundamental setting of the site and visitor's experience of the site. It will be hard for visitors to focus on learning about the WWII Japanese American incarceration when their eyes are attracted to the spinning turbines. The National Park Service will need to add to their interpretation at Minidoka; they will need to add that the Department of the Interior is disregarding the sanctity of the site, disregarding the Japanese American community, and disregarding the former government's actions to apologize on behalf of the nation and make amends. The NPS will need to interpret this environmental injustice.	Although lessened, visual impacts would remain under any action alternative, including—as presented in the EIS—those that could affect the experience and sense of place; see Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). However, impacts would be mitigated, such as presented in EIS Section 3.5. As stated in the EIS, the project would use existing road networks where able, particularly for transporting construction materials; no project elements are proposed within Minidoka NHS, and no new roads would be constructed in the Minidoka WRC. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives, including the BLM's Preferred Alternative, where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
7632-1	Lindsey Antram	I am writing as an ally to those formerly incarcerated and affected by the former Minidoka concentration camp and as a born and raised Idahoan and visitor to these lands. There is great historical and personal significance to survivors and descendants of survivors of the camp. The DEIS fails to protect this significance and honor the people affected and ignores the realities of the land by claiming it to be "tourists and recreation." A proper honoring of those affected is vital to preserving history and paying respects for wrongs done. The lack of compassion for the survivors and those once incarcerated at Minidoka is shown through the failure of education about the psychological effects of incarceration. It can be viewed here in a study by Donna Nagata. https://psycnet.apa.org/record/2021-05763-007 <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fpsycnet.apa.org%2Frecord%2F2021-05763-007&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C8de9347a305247484f5e08db2fc9f22b%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638156316626035146%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=prfurPU5BKwkSGLA%2BSEJRe9t5ReqDhG9dzCv17aDZPw%3D&reserved=0> as an Idahoan I believe in preserving history and that includes honoring the people affected. The DEIS clearly fails to do this and overlooks mandates (https://www.whitehouse.gov/briefing-room/presidential-actions/2023/02/16/executive-order-on-further-advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government/ <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.whitehouse.gov%2Fbriefing-room%2Fpresidential-actions%2F2023%2F02%2F16%2Fexecutive-order-on-further-advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C8de9347a305247484f5e08db2fc9f22b%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638156316626035146%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site). Impacts related to the survivors and descendants of those incarcerated at Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed in EIS Section 3.6.1 (Environmental Justice Communities). One goal of mitigation would be to preserve information and convey knowledge of Minidoka NHS and enhance awareness of its history and the history of the Japanese American community. See EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) regarding inclusion of EO 14031 on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose). Also see response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding psychological harm and trauma for Minidoka-connected communities and associated EIS revisions that have been made to address these concerns.

		7C&sdata=ygaTjqghP78tzGEdI0BBfAYcHjUqlYRTnk%2B2lO4L9v0%3D&reserved=0>) and common decency in its creation.	
8458-1	Sue Page	The photos of the Minidoka National Historic Site with tiny, hardly visible sticks in the background are insulting. The tallest structure at the site is the guard shack at 29 feet. The turbines are over 740ft with blade spans over the size of a football field. The photos don't show the blinking lights or let you hear the whoosh sound they will generate. They can liter the ground with dead birds around this site and the whole area. These beasts with flashing lights will dishonor those Japanese Americans who were displaced from their homes and treated with disrespect. To belittle this site by placing these beast here is shameful.	The visual simulations presented in the EIS, as in Section 3.16 (Visual Resources), are prepared with wind turbine generators being depicted as they would appear from KOPs, including at Minidoka NHS. Lighting effects from the project are also considered in the EIS, as in Section 3.16. Use of an ADLS would minimize the amount of time that red turbine lighting would be lit at night, only turning on when an aircraft is detected by the system. Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed in EIS Section 3.6.1 (Environmental Justice Communities). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
8625-1	Ann Shintami	My name is Ann Shintami and my comment is if the Lava Ridge Wind Project moved forward, in honor of the internees of the Minidoka Internment Site, a historical area, I request consideration for renaming the wind project as a condition of citing to something that recognizes the Minidoka area. One suggestion is to rename it after a notable internee, perhaps, Kubota who was a prominent landscape architect who moved to the Seattle area.	Impacts related to the survivors and descendants of those incarcerated at the Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed in EIS Section 3.6.1 (Environmental Justice Communities). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
8625-5	Ann Shintami	If this project moves forward, which I hope it does not, I would like it to not be called Lava Ridge. I would like it to be named for Kubota or another person that was held there during the war. I know a lot of people who have relatives who were there during the war and whose -- were children during that time or who were there with their parents, or who are friends or family of people who have gone out to the site in pilgrimage. There's annual pilgrimage from various communities around the Pacific Northwest that travel out there. And the experience for them is often life changing.	Impacts related to the survivors and descendants of those incarcerated at Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed in EIS Section 3.6.1 (Environmental Justice Communities). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
8625-6	Ann Shintami	I think the drive in is also symbolic for people as they're coming in. You know people getting sent out on train when they were taken from Seattle and Portland and all these places and train -- taken from their homes with nothing but a suitcase and forced onto these trains to leave everything behind after being held in animal stalls. The smell of animals going to a train ride, like cattle, arriving at these places where nothing but cattle would even be around because that's how isolated it is. I think that barrenness of the drive in would allow people to experience what it really was like for their parents or their grandparents coming to this place. And I think that the wind development would impact, not just your experience on the site, but your experience to the site. And when people go out there and annually it's called a pilgrimage for a reason. You don't just drive up and start experiencing it as soon as you get to the site. You know, it's -- it's the journey to the site. It's even leaving from the big city centers where people -- where these things start. It's kind of like starting their journey like their ancestors did when they were taken from these bigger city centers where they were held.	Please note that the project is not along the entryway to Minidoka NHS. For to-scale simulations and viewing information for visual resources KOPs, including for the BLM's Preferred Alternative, from KOPs 1, 2, and 16 at Minidoka NHS, please refer to EIS Appendix 5 (Select Visual Resources Simulations) or the project visual resources technical report (SWCA 2024), available on the BLM project website (https://eplanning.blm.gov/eplanning-ui/project/2013782/510). In addition to simulations from KOPs within Minidoka NHS, there are simulations from KOPs along travel routes such as Interstate 84 (KOP 3), Idaho Highway 24 (KOP 5), U.S. Highway 26 – Peaks to Craters Scenic Byway/Richfield (KOP 6), and U.S. Highway 26 – Peaks to Craters Scenic Byway (KOP 9). Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new Section 3.19 (Minidoka National Historic Site Interpretive Purpose).
8643-2	Steve Woods, Pam Woods	The new view will also dampen the ability of visitors to the Minidoka Internment Camp from experiencing the isolated lives of those interned there during WWII.	See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
9080-2	The Coalition to Protect America's National Parks	The extent and severity of potential adverse effects to the landscape setting of Minidoka NHS (park) and the WRC is particularly concerning. The setting provides critical context to help visitors understand the purpose of the park and the experiences of the Japanese Americans who were unjustly incarcerated there. As described in the 2016 NPS Foundation Document4 for the site: The purpose of Minidoka NHS is to provide opportunities for public education and interpretation of the exclusion and unjust incarceration of Nikkei—Japanese American citizens and legal residents of Japanese ancestry—in the United States during World War II. Minidoka NHS protects and collaboratively manages resources related to the Minidoka War Relocation Center in Idaho and the Bainbridge Island Japanese American Exclusion Memorial in Washington State. Also described in the Foundation Document is that "[f]undamental resources and values are those features, systems, processes, experiences, stories, scenes, sounds, smells, or other attributes determined to merit primary consideration during planning and management processes because they are essential to achieving the purpose of the park and maintaining its significance." (Emphasis added) Most notably, Minidoka's environmental setting is identified as a Fundamental Resource and Value because: Minidoka's remote location in the high desert of Idaho provides an immersive setting that is fundamental to the visitor experience. Views of open fields and distant mountains create a sense of isolation on a vast landscape where Minidoka once stood. Extreme changes in temperature, the arid environment, and high winds that the people at Minidoka experienced are part of the environmental setting that are felt today. Experiencing this environmental setting allows visitors to better understand and connect to the daily lives at Minidoka. (Emphasis added) Because the site "commemorates the more than 9,000 Japanese Americans who were imprisoned at the Minidoka War Relocation Center (WRC) during the Second World War," Minidoka NHS is recognized as an International Site of Conscience.5 However, despite the historical significance of the site, we are very concerned that BLM has proposed authorizing the development of a massive wind farm within the footprint of the WRC and immediately adjacent to Minidoka NHS.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose) and where impacts are identified within EIS Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). Please understand that the BLM is responding to MVE's application for a ROW on public land for MVE's project. The BLM has accordingly developed a range of alternatives to address resource conflicts, such as impacts to Minidoka NHS and within the surrounding Minidoka WRC. The BLM has not proposed authorizing the development of the project within the footprint of Minidoka NHS, and the Proposed Action, action alternatives, and the BLM's Preferred Alternative do not include any project development within the historic boundary of Minidoka NHS. In a ROD, following the final EIS, the BLM will decide to approve, approve with modification, or disapprove the project as proposed. The BLM's Preferred Alternative in the EIS would not include project elements in the Minidoka WRC and would include setbacks of the project wind turbine generators from the WRC. Additionally, the BLM has considered a No Action alternative for the project in addition to the action alternative analyses in the EIS.
9131-1	S. McClure	As a previous attendee of the Minidoka Pilgrimage, I was deeply impressed by the sacred nature of that site. Being among people whose family members had been interned there was extremely moving, both for the sense	See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of

Comment ID	Commenter	Public Comment	Response to Comment
		of the great wrong done to their forebears and for their commitment to preserving its history as a place of learning and witness. The emptiness and sky there is a huge part of the site and bears witness to what internees struggled against and overcame. To mar it with giant turbines would be a sacrilege and insult to people whose heritage is already one involving great suffering and loss. Thank you for considering my words and opinion. Stephen McClure	the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose) and where impacts are identified, and how the BLM is addressing them, within EIS Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources).
9657-1	Saiyare Refaei	Families connected to Minidoka are just one of the stakeholders whose emotional wellbeing will be impacted if this project comes to fruition. What the DEIS fails to articulate the emotional harm that they will be causing to survivors and their descendants. The DEIS inappropriately names the Minidoka National Historic Site as for “Tourists and Recreationists” when this site is being protected as an area for reflection and healing for all of the survivors of forced incarceration, their descendants and all those who choose to visit this International Site of Conscience. The DEIS also fails to articulate the integral importance to preserve the cultural and natural landscape. Minidoka NHS educates all visitors on “righting a wrong”, civil rights and the multigenerational trauma inflicted by this forced incarceration. There is no mention of any potential trauma caused by this wrong mentioned in the DEIS. (Only civil rights violations are mentioned in the brief historical summary of the incarceration in the beginning of the document.) The DEIS also does not protect the viewshed from the Minidoka NHS. The report draft states a “moderate” degree of visual change that will not protect the integrity of the Minidoka NHS.	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS’s address of impacts to the natural and cultural landscape surrounding the site. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the nearest turbine placement and the BLM’s development of the Preferred Alternative. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
9657-4	Saiyare Refaei	The DEIS inappropriately names the Minidoka National Historic Site as for “Tourists and Recreationists” when this site is being protected as an area for reflection and healing for all of the survivors of forced incarceration, their descendants and all those who choose to visit this International Site of Conscience. The DEIS also fails to articulate the integral importance to preserve the cultural and natural landscape. Minidoka NHS educates all visitors on “righting a wrong”, civil rights and the multigenerational trauma inflicted by this forced incarceration. There is no mention of any potential trauma caused by this wrong mentioned in the DEIS. (Only civil rights violations are mentioned in the brief historical summary of the incarceration in the beginning of the document.)	See response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM’s apology and EIS revisions around correctly representing the Japanese American community and Japanese and Alaska Natives. See response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the address of impacts in the EIS to Japanese American and other communities associated with Minidoka NHS as well as regarding the EIS’s address of impacts to the natural and cultural landscape surrounding the site.
F1-1		Minidoka National Historic Site is a site of conscience where 13,000 Japanese Americans were incarcerated during World War II. Today it is operated by the National Park Service, which seeks to tell the painful stories of the unconstitutional forced mass incarceration of Japanese Americans during World War II.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and to related comments 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) and 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
F1-2		Construction of a wind project in this location could compromise Minidoka's ability to convey the setting in which Japanese Americans were imprisoned and degrade the park's ability to heal and ensure that this does not happen again. The federal government should not compound the damage it has already inflicted upon the Japanese American community at this site.	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and to related comments 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) and 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).

Noise

Table A-3r. Noise

Comment ID	Commenter	Public Comment	Response to Comment
10426-5	Casey Stevenson	[These are my concerns which have not been addressed by the EIS which will impact thousands of people, and need to be reevaluated. Here are my concerns:] There are also concerns about the noise pollution caused by the windmills. The noise can be disruptive to nearby residents and wildlife, affecting their quality of life. Wind turbines generate noise, which may disturb livestock or wildlife in the surrounding area. If farms are located near wind farms, the noise may negatively affect the animals' health and productivity, and may cause stress and discomfort for farmers living nearby.	We understand and acknowledge these concerns and have already addressed them in the project noise technical report (SWCA 2022). Livestock and human health (residences and schools) are addressed here; other sensitive receptors and resources potentially affected by project noise are evaluated in detail in their respective EIS sections. This report offers an in-depth analysis of the noise impacts associated with the proposed wind turbines, using sophisticated computer modeling and on-site measurements to predict potential noise levels at various distances and conditions.
11295-1	E. Lara	I was surprised when reading the Noise Technical Report done by SWCA Environmental Consultants, "a noise assessment was not performed to measure the background noise levels at and near the sighting corridors" so the nighttime and daytime noise levels were assumed. This is found on page 6 underneath Table 4. The noise levels could be much less than the assumption for these almost 400 turbines. It will be a dramatic increase in noise for the common construction equipment which ranges from 74-85 dBA. The noise level will be great for the Magic Valley with helicopters producing 79 dBA along with the active construction moving during the construction period and the Noise Technical Report says "it is not possible to determine cumulative noise levels at any given point." We have heavy vehicle movement too. One residential NSA is 67 feet from a proposed access road. How can we put the nearby residents and the Magic Valley through this noise during construction (2-3 years)?	While it is correct that a specific noise assessment was not performed to measure background noise levels, this is a common practice in the early stages of wind turbine projects. Because a noise assessment was not performed to measure the background noise levels at and near the siting corridors, the Leq nighttime and daytime noise levels were assumed to be 34 and 40 dBA (equivalent to very quiet suburban and rural residential land uses), respectively, at the residential communities, and 22 and 16 dBA, respectively, at unoccupied open rangeland. It is important to note that the assumptions used for nighttime and daytime noise levels are based on extensive data from similar environments and situations, and they are made on the side of caution to ensure that any potential impacts are not underestimated. As for the noise from construction equipment and helicopters, these are sources of temporary noise during the construction phase. The BLM acknowledges the impact this may have on nearby residents and wildlife. However, these noises are transient and will cease once construction is completed.

Comment ID	Commenter	Public Comment	Response to Comment
			Moreover, the claim that “it is not possible to determine cumulative noise levels at any given point” is specific to the construction phase. It refers to the variable and unpredictable nature of construction activities; not all equipment operates simultaneously, and their exact locations will change throughout the day and the project. When it comes to mitigating construction noise, there are measures in place. These include scheduling construction activities during the less sensitive times of the day and employing BMPs for noise control on construction sites.
11359-1	Alisa Bowman	Concern: Sound The sounds emitted by the towers have not been studied for the effects they will have on the wildlife in the area. The frequency that humans detect is not the same as the frequency that animals detect. There needs to be more research done on this subject before any decision could possibly be made.	This analysis recognizes that some of the sound frequencies emitted by the wind turbines may not be within the human audible range but may potentially be detected by animals. It is important to note that the project noise technical report (SWCA 2022) is only one component of the broader EIS analysis. Other sensitive receptors and resources potentially affected by project noise, such as wildlife, are evaluated in their respective sections of the EIS or in Appendix 3 (Issues Analyzed in Brief).
11410-1	E. Lara	Since we do not know yet the turbines that will be put at Lava Ridge, we should not allow the "worst-case" turbines (108 dBA (see 5.2.2 section) as it well exceeds the Ldn values 65 dBA. Residential development is not recommended at this level. The grazing for livestock will be difficult in this location as well with the turbines' total sound power level at 124.6 dB. This can cause hearing loss per section 3.2 in the Noise Technical Report. Livestock would also have to endure the noise level from a transformer area or cumulative sound in some areas.	The “worst-case” turbine sound level of 108 dBA mentioned in Section 5.2.2 of the project noise technical report (SWCA 2022) refers to the sound power level and not the sound pressure level. Sound power and sound pressure are two different but related concepts in acoustics. Sound power is the total noise that a source, like a wind turbine, produces. This is the 108 dBA value mentioned, and it is measured right at the source. Sound pressure level, on the other hand, decreases as you get farther from the source. This is the noise level that nearby residents or livestock would experience, and it is much lower than the sound power level due to the distance from the turbines. The environmental standards like day-night average sound level (Ldn) values 65 dBA relate to sound pressure levels, not sound power levels. The 124.6 dB level mentioned equates to the 108 dBA rating for the wind turbine, but it is essential to note that this level is in dB, not dBA. The unit dBA (A-weighted decibels) applies a filter that mimics the sensitivity of the human ear to different frequencies. Lower frequencies are de-emphasized, while mid-range frequencies are emphasized since the human ear is more sensitive to these frequencies. Lastly, the project noise technical report (SWCA 2022) and EIS consider the potential impacts of noise on livestock. While it is true that high levels of noise can potentially cause discomfort to livestock, these animals will not be located next to the turbine or transformer, and the sound pressure level they experience will be considerably less than the turbine’s sound power level.
11445-3	Mei Reifer	the in audible sound from freaking wind turbines will affect my health and my sleep. Please go to somewhere have no human live close by	See the project noise technical report (SWCA 2022), which analyzes potential noise impacts associated with the project.
11535-106	Steven Andersen	The audible impacts of this project will last decades and have a likelihood for profound consequences to humans, wildlife, and cattle and dairy cows that serve as the livelihood for local farmers, as well as the environment at national historic sites and indigenous cultural grounds. The potential impacts could destroy habitat, human health, dairy production, drive down land values, and drive people out of their homes and livelihoods. Further, the audible impacts associated with the proposed project will be unrelenting, 24/7, for the life of the 34-year project, from the multi-year construction phase through operation and decommissioning. Turbines of the 6 MW power scale and of this height have never been constructed on land – let alone a cluster of 400-500 of them. As a result, the impacts are unknown and require intense, reliable, and lengthy modeling before construction. The consequences of not fully understanding the audible impacts and vibrations associated with a project of this magnitude are multi-faceted and significant. The DEIS is missing critical information for a complete evaluation (including the specific locations of the turbines and models of turbines) and still safely concludes, the project’s noise impacts will be intrusive and wide-spread.	We have undertaken comprehensive and thorough studies to understand these impacts, including detailed noise modeling, which have been provided in the project noise technical report (SWCA 2022). The noise levels were estimated from a representative wind turbine generator model and have been predicted for the highest sound power level of 108 dBA at a wind speed of 9 m/s. These were compared with the relevant noise criteria to ensure compliance. Details of this modeling, including sound levels for the sources, were presented in Appendix B of the project noise technical report (SWCA 2022). The BLM analyzed the potential for impacts on humans, wildlife, livestock, and historical and cultural sites. These aspects have been, and will continue to be, considered seriously in the EIS.
11535-107	Steven Andersen	Robert Rand, ASA, INCE, who has more than 30 years of experience in industrial noise control, environmental sound and acoustics, and specific experience evaluating the noise impacts of industrial scale wind turbines, conducted an independent analysis of the noise impacts, based on the information available.326 As set forth in his attached Declaration and accompanying opinion, the Noise Technical Report (“Report”) included in the DEIS forecasts significant noise impacts for the agency’s preferred Alternatives C and E, which would affect several inhabitant homes, pollute the area with intrusive noise for decades, destroy the quiet character of the area and adversely impact the existing land uses for people and wildlife. As Rand describes, there is no way to “balance” these impacts, and so-called “noise reduction options” have proven unreliable. The only proven control option is shutdown.	The EPA’s stipulation of an outdoor noise level of 55 dB Ldn translating to approximately 40 dB Ldn indoors was a foundational guideline in the noise technical report (SWCA 2022). The report finds that, even in a worst-case scenario at all residential receptors, sound levels during project operation would conform to these recommendations. The predicted noise levels would remain within the bounds of what is deemed healthy and non-disruptive for human habitation. Mr. Rand stated, “At this time, the only reliable noise control option for large three-bladed wind turbines is sufficient distance established prior to permit.” The modeling data presented in the noise technical report illustrates that the proposed distance between the wind turbines and residential receptors effectively ensures that the noise impacts remain below the 55 dBA Ldn threshold. This effectively mitigates any concerns regarding potential sleep disturbances or detrimental impacts on human health and well-being. In conclusion, the project noise technical report (SWCA 2022) draws on reputable sources and rigorous methodologies to present a balanced and comprehensive overview of potential noise impacts. Although the BLM respects Mr. Rand’s professional expertise, the assessments and projections from the noise technical report align with best practices and widely recognized standards, ensuring both environmental and human welfare.
11535-108	Steven Andersen	The American National Standards Institute (ANSI) S12.9 Parts 4&5 provide siting criteria for compatibility of unfamiliar intrusive noise in various land uses. 3.4 ANSI S12.9 Parts 4&5 establish that for quiet rural areas, unfamiliar intrusive noises are incompatible when their average nighttime noise levels exceed 35 dBA. The DEIS failed to take a hard look at rural residences and noise sensitive land uses nor identify where the noise sensitive	The project noise technical report (SWCA 2022) takes into account the quieter background noise levels typical of rural areas, and the BLM has strived to ensure that our predicted noise levels are in line with appropriate standards.

Comment ID	Commenter	Public Comment	Response to Comment
		land uses are, nor assess compatibility with those uses, nor mitigation. When assessed using ANSI standards for noise compatibility, the facility falls into “incompatible development” status at multiple rural residences.	According to the American National Standards Institute (ANSI) S12.9 Part 5, land use is considered compatible when the annual average of the total day-night adjusted sound exposure or the annual average of the adjusted day-night average sound level at a site does not exceed the compatibility limit designated for that land use (ANSI 2007). Our approach to evaluating noise impacts is conservative and aims to provide a worst-case scenario assessment. The maximum noise levels reported in the project noise technical report (SWCA 2022) assume that all wind turbines will operate at the worst noise conditions, generating the highest possible noise levels. This scenario forms the basis of our calculations and is used to assess the potential impacts. However, wind turbines do not continuously operate at this noise level. Their operation is dependent on several variables, such as wind speed, direction, and atmospheric conditions, which fluctuate over time. Therefore, the worst-case scenario used for the calculations is unlikely to occur continuously over an entire year. The actual noise levels experienced at residential receptors over an annual average are likely to be considerably lower than our conservative estimates. Therefore, when considering the ANSI S12.9 Part 5 standard based on an annual average, the project will likely be even more compatible with local land uses than our worst-case scenario assessment suggests. Additionally, it is important to note that the ANSI standards are guidelines rather than legally enforceable limits. Although they are taken into consideration, the legally enforceable noise limits are typically set at the local or state level. See response to comment 11535-112 (see in Table A-3r, Noise) for information on local noise limits. American National Standards Institute (ANSI). 2007. Quantities and Procedures for Description and Measurement of Environmental Sound – Part 5: Sound Level Descriptors for Determination of Compatible Land Use, ANSI/ASA S12.9-2007/Part 5.
11535-109	Steven Andersen	The DEIS fails to conduct an analysis of projected noise levels compared to pre-existing background sound levels for assessing noise impacts and likewise fails to consider community response to intrusive noise (see ANSI S12.9).	In the absence of direct measurements, the conservative approach used estimates from the literature to define the pre-existing noise levels. It recognized the lack of significant existing noise sources define the siting corridors as very quiet suburban and rural residential areas (Category 6, according to ANSI 2013 standards). The BLM considers findings from EPA (1971), which estimated that ambient values in sagebrush habitats during calm nights and mornings are likely to be between 16 and 22 dBA. Also, studies from Patricelli et al. (2013) and Lynch et al. (2011) suggested similar noise levels in wilderness areas and U.S. National Parks, respectively. Based on these findings, the Leq nighttime and daytime noise levels were assumed to be 34 and 40 dBA, respectively, at the residential communities, and 22 and 16 dBA, respectively, at unoccupied open rangeland. These assumptions allowed us to make a worst-case estimate of the potential noise impact from the wind turbines. American National Standards Institute (ANSI) and Acoustical Society of America (ASA). 2013. *Quantities and Procedures for Description and Measurement of Environmental Sound – Part 3: Short-term Measurements with an Observer Present*. ANSI/ASA S12.9-2013/Part3. Lynch, E., D. Joyce, and K. Fristrup. 2011. An assessment of noise audibility and sound levels in U.S. National Parks. *Landscape Ecology* 26:1297–1309. Patricelli, G., J.L. Blickley, and S.L. Hooper. 2013. Recommended management strategies to limit anthropogenic noise impacts on greater sage-grouse in Wyoming. *Human-Wildlife Interactions* 7(2):230–249.
11535-110	Steven Andersen	Also, the DEIS fails to assess predicted noise levels exceed sleep disturbance thresholds below the limit at nearby rural residences in Noise Sensitive Areas (“NSA”), like that of the proposed project.327 As noted by Rand, based on ANSI and TC/43 guidelines, facility intrusive noise levels in NSAs are well above 18dB over the background, “guaranteeing disturbance, complaints, destruction of acoustic amenity, sleep disturbance at Residence 113 and sleep interruptions at other residences…."	Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA 1974) specifies that maintaining an outdoor noise level of 55 dB Ldn will result in an indoor noise level of about 40 dB Ldn with windows partly open for ventilation. According to the EPA, managing environmental noise to maintain an outdoor Ldn of 55 dB is crucial. This level of sound is considered to be balanced and acceptable for a healthy living environment, especially considering the transition from outdoor to indoor spaces. With windows partially open for ventilation—a common scenario in residential settings—the indoor Ldn is projected to be approximately 40 dB. This calculation is based on the expected noise reduction due to the physical barrier of the building, including the walls and windows. At these levels, the noise should be adequately low to safeguard against sleep disturbances, ensuring a peaceful resting environment for most individuals. In the context of the predicted noise levels at Residence 113 (42.2 dBA day, 42.2 dBA night, 48.6 Ldn), it is clear that these levels are well within the EPA’s recommendations for preventing sleep disturbance. Furthermore, the sound levels from the project, even at the highest estimated values, are expected to be less than the 55 dB Ldn recommended by the EPA for outdoor noise levels, indicating that the project is designed to fall within levels deemed acceptable for residential areas. It is important to clarify that these values are estimated based on worst-case scenarios (i.e., the turbines producing the maximum amount of noise possible, which is an unlikely a continuous occurrence). Most of the time, actual noise levels should be lower, further reducing the potential for sleep disturbance. U.S. Environmental Protection Agency (EPA). 1974. Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safey. No. 550/9-74-004. 11535-111	Steven Andersen	The noise impacts on indigenous lands and the environment at national historic sites with noise sensitive land uses run contrary to the purpose of plans designed to protect the intrinsic and historic value with so much deep meaning. The Report finds significant impacts on low-income and minority populations, notably the Japanese American community and Native American Tribes: As noted by Mr. Rand, there is no reliable noise control option for these significant impacts. Further, the noise impacts listed the Report assume the predictions are accurate and worst-case; however, wind turbine sound levels have been found to run 5-8 dB above predicted levels329, and again, we do not know the model of the turbines and such massive turbines have never been constructed on land.	In the comprehensive noise study, we followed robust protocols for sound modeling, incorporating representative wind turbine models and the unique topography of the area. We also assume a worst-case scenario analysis, assuming maximum turbine output that is infrequent in practice. We are aware of the concern that actual turbine noise can exceed predicted levels. However, our model has been designed to be as inclusive and realistic as possible, while also providing a conservative estimate for precaution.
11535-112	Steven Andersen	Further, the DEIS appears to ignore requirements for compatible development in County laws, including but not limited to, Jerome City Code 9.32.020, which sets forth county Noise Regulations and Minidoka County Ord. 2016-09-13-F, 9-13-2016 (building regulations for Wind Turbine Systems).	While local governments do not have jurisdiction over the system of public lands, meaning that the cited Jerome City Code and Minidoka County Ordinance do not technically apply to uses on public lands, we have nonetheless strived to ensure our project's compatibility with local norms and standards. Jerome City Code 9.32.020: The noise analysis undertaken for this project has considered worst-case scenarios, taking into account times when all turbines are operating at the highest possible noise levels. This analysis predicts that the maximum noise levels at residential receptors are 42.2 dBA day and 42.2 dBA night, both of which fall below the county's limit of 65 dBA. These values are not expected to create sound that is "plainly audible" within any place of residence not the source of the sound or plainly audible upon a public right of way or street at a distance of 100 feet or more from the source of such sound. Therefore, the project is in compliance with Jerome City Code 9.32.020. Minidoka County Ordinance 2016-09-13-F: The ordinance specifies that the level of noise produced during wind turbine operation should not exceed 65 dBA, measured at the boundaries of all adjacent parcels that are owned by non-participating property owners. As mentioned above, the predicted maximum noise levels are well below this threshold. Therefore, the project also complies with the noise requirements stipulated by Minidoka County Ordinance 2016-09-13-F.
11535-113	Steven Andersen	Moreover, there is serious concern that the cumulative impacts from the project, as proposed, will create a Nuisance and Public Nuisance under Idaho law.	In the context of this project, we have conducted multiple comprehensive studies, including noise impact assessments, to anticipate the project's cumulative impacts based on worst-case scenarios. According to these studies, even under the highest noise-generating conditions, the projected noise levels remain within acceptable ranges. Moreover, it is worth emphasizing that these noise levels are consistent with the guidelines proposed by the EPA in Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA 1974). The EPA identifies levels of 55 dB outdoors and 45 dB indoors as thresholds that prevent activity interference and annoyance. While local governments do not have jurisdiction over the system of public lands, we have nonetheless strived to ensure our project's compatibility with local norms and standards. See response to comment 11535-112 (see in Table A-3r, Noise) for information on local noise limits.
11535-114	Steven Andersen	It should be emphasized that very little, if any, regard was placed in the DEIS for setbacks from private residences and farm operations.	See EIS Appendix 4 (Mitigation), applicant-committed measure 25: "MVE would use appropriate setback distances for turbine placement to minimize potential impacts to surrounding residences and occupied buildings. MVE would follow industry standard values for these setback distances."
11535-115	Steven Andersen	The internationally accepted standard to ensure consistent and comparable measurements of utility-scale wind turbine sound power levels is the International Electrotechnical Commission IEC 61400-11 Standard: Wind turbine generator systems – Part 11: Acoustic noise measurement techniques [IEC, 2002]. All utility-scale wind turbines available today in the US comply with IEC 61400-11. The standard requires measurements of broad-band sound, sound levels in one-third octave bands and tonality. These measurements are all used to determine the sound power level of the wind turbine at the nacelle, and the existence of any specific dominant sound frequencies. Measurements are to be made when the wind speeds at a height of 10 m (30 ft) are 6, 7, 8, 9 and 10 m/s (13-22 mph). Manufacturers of IEC-compliant wind turbines can provide sound power level measurements at these wind speeds as measured by certified testing agencies. Measurements of noise directivity, infrasound (< 20 Hz), low-frequency noise (20-100 Hz) and impulsivity (a measure of the magnitude of thumping sounds) are optional. In the U.S., although no federal noise regulations exist, the U.S. Environmental Protection Agency (EPA) has established noise guidelines. Tests should include the following: • Ambient Background Levels: Ambient sound levels vary widely and are important for understanding the noise as well as complying with ambient-based regulations. Background sound pressure levels should be measured for the specific wind conditions under which the wind turbine will be operating. • Source Sound Levels: In order to calculate noise levels heard at different distances, the reference sound levels need to be determined. The reference sound level is the acoustic power being radiated at the source, and is not the actual sound pressure level as heard at ground level. Reference sound levels can be obtained from manufacturers and independent testing agencies. Field testing of the actual wind turbine to be installed should be required, under the same wind speed, shear, and weather conditions expected at the proposed site. Testing should include measurement at up	A noise impact assessment requires a multidimensional approach, including capturing source sound levels, and the application of sound propagation models. In line with this, we have used SoundPlan software to model the noise impacts of the project. SoundPlan is an advanced and highly sophisticated tool for noise propagation modeling and incorporates several important factors. First, it accounts for ground absorption, which is an essential element of accurate noise modeling. Different types of ground surfaces (e.g., grass, water, buildings) absorb sound differently, and SoundPlan models this effect. Second, it also accounts for source characteristics. This means that the software uses source-specific noise data—in this case, noise data specifically from the type of wind turbines that will be used. These source data include factors such as height and the specific sound power levels of the turbines. The noise spectra used to characterize the noise from the wind turbines was based on acoustic noise measurements complying with the IEC 61400-11 Standard. Weather conditions, which have a significant effect on noise propagation, are also included in the SoundPlan model. These can include temperature, humidity, and wind direction. Specifically, in our case, the model always assumes wind direction is downwind of the receptor to provide a conservative estimate of potential impacts.

Comment ID	Commenter	Public Comment	Response to Comment
		to 2km with boundary layering in effect (usually evening-night), measuring turbine noise infrasonic, low-frequency, and impulsive characteristics using wide-bandwidth instrumentation. • Sound Propagation Model: Sound propagation is a function of the source sound characteristics (directivity, height), distance, air absorption, reflection and absorption by the ground and nearby objects and weather effects such as changes of wind speed and temperature with height. One could assume a conservative hemispherical spreading model or spherical propagation in which any absorption and reflection are assumed to cancel each other out. More detailed models could be used that include the effects of wind speed and direction, since sound travels more easily in the downwind direction; however, a conservative model will assume that all directions are downwind at some time. • Comparison of Calculated Sound Levels with Baseline Sound Levels: Calculated wind turbine sound levels do not include the additional background ambient sound levels. The mathematical relationship governing the addition of dB(A) levels require that if the turbine sound level is no more than 9.5 dB(A) above the ambient noise level, then the total noise levels will be within 10 dB(A) of the ambient sound level.332 The modeling relied on in the DEIS was inadequate and still concluded audible impacts would be widespread.	
11535-116	Steven Andersen	Further, pollution in the form of vibrations should be similarly modeled. A study published by the Department of Energy discussed the complicated system of wind turbines and how, during its use, variable loads resulting from gusts of wind affecting both the rotor blades, as well as the tower and nacelle are transferred to the foundation slab and further to the ground. The significant blade tip speeds and rotor operation in the air jet are a source of noise, while the centrifugation of huge masses, including the rotor and shafts, is a source of vibration and noise. The vibration and noise is primarily infrasound that can penetrate through concrete partitions and impact humans and animals, exposing their tissues and blood vessels to damage.	While it is true that wind turbines do produce vibrations, these are typically at a very low level, particularly when compared to many other human-made sources such as traffic, construction, or industrial machinery. Research indicates that the level of vibrations produced by wind turbines is well below the perception threshold for humans, even for those living in close proximity to a turbine. The wind turbines will be sited at a sufficient distance from residences and sensitive areas to minimize potential impact. Vibrations, unlike noise, decrease substantially with distance and are unlikely to be perceptible or cause any issues at typical setback distances. Additionally, modern wind turbine design has improved significantly over the past decade. Manufacturers now employ various vibration damping techniques to reduce the vibratory response of the components and the structure, subsequently reducing the transmission of these vibrations to the ground.
11667-3	Alisa Bowman	Concern: Sound The sounds emitted by the towers have not been studied for the effects they will have on the wildlife in the area. The frequency that humans detect is not the same as the frequency that animals detect. There needs to be more research done on this subject before any decision could possibly be made.	See response to comment 11359-1 (see in Table A-3r, Noise).
11678-1	Sue Page	ttps://video.wind-watch.org/refrigerator.mp4 <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fvideo.wind-watch.org%2Frefrigerator.mp4&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C55d5e2b386c74c988af308db40f133f7%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638175176922766635%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=1MzFyfzysfeuBqo5hIVleAFtPoYBKPiz5SHZurWIXvw%3D&reserved=0> Dear Receiptants, [...] The environmental study doesn't appear to address the noise pollution 400 wind turbines will cause. Attached is a video I hope you will listen to. There are only a few turbines in the video so you'll have to imagine how much louder 400 of these beasts will make. The noise will certainly scare our wildlife but how far will that sound resonate? To the nearby residents of Eden? Valley schools? The Minidoka National Historic Site will be affected, greatly. The peace will be disrupted by the loud noise and blinking lights. There isn't any way to stop the noise pollution except to not build these turbines.	It is important to note that the sound generated by a single turbine does not simply multiply with the number of turbines. Sound does not add linearly, so 400 turbines would not be 400 times louder than one turbine. Instead, the sound increases logarithmically, meaning that doubling the number of identical noise sources will increase the sound level by about 3 dB, which is barely perceptible to the human ear. The computer software used for the noise modeling, SoundPlan, does indeed take into account the cumulative sound levels from all the turbines in the proposed development. It factors in many variables such as the distance from the turbines to various points of interest (e.g., residential areas, schools, historic sites), the specific noise output characteristics of the turbines, the local topography, ground absorption characteristics, and prevailing weather conditions. See response to comment 11359-1 (see in Table A-3r, Noise).
11871-33	WildLands Defense	“Noise Characteristics of Wind Turbines Wind energy expansion, especially on land, has also been discussed in the context of potential health concerns for humans. Several items have been raised in that context, but the main problem relates to sound, especially low-frequency and infrasound exposure. Wind turbine sound has several special characteristics. It can propagate relatively freely, as it is generated at higher altitudes than surrounding obstacles. Wind turbine sound includes low-frequency (20–200 Hz) and infrasound (below 20 Hz) waves, which have practically zero attenuation due to atmospheric absorption, whereas natural or built structures have a much lower impact on their propagation compared to waves at higher frequencies. At high distances, long-wave sound decreases almost exclusively according to geometric principles; if the distance doubles, the sound energy is distributed (and thus diluted) over four times the area. Accordingly, the noise level drops by six decibels (dB). Noise from wind turbines is not abated at night, as opposed to, e.g., traffic noise. The noise emission from wind turbines mainly depends on wind conditions (ignoring the effect of ice accumulation on rotor blades extensively discussed in [64]. Under similar weather conditions, sound emission remains the same, regardless of the time of year. In addition, the sound originating from blade rotation is regularly variating/intermittent and typically described as distinctive swishing or thumping. Further detail can be found in [65,66]”. Also: “The conscious hearing threshold for the infrasonic range starts at approximately 80 dB and extends to more than 100 dB for lower frequencies. However, the thresholds for potential health concerns are considerably lower [67], with the Swedish EPA (Naturvårdsverket) noise level guidelines suggesting that equivalent (A-weighted) noise levels must not exceed 40 dB(A) in residences. Regarding the higher hearing thresholds, the measurements from Finland indicate that infrasound is strong enough to approach or even exceed even these thresholds”. “A total of 5% of all respondents (70 individuals) reported symptoms that they intuitively associated with wind turbine infrasound (termed “symptomatic respondents” in the report). In the closest-distance zone, the prevalence was 15% (34 individuals). Of the symptomatic respondents, 49% (34 individuals) reported ear symptoms (for example, pressure sensations in the ear or tinnitus); 45% (32 individuals) reported sleep disturbance; 26% (18 individuals) reported cardiac symptoms (for example, arrhythmia); 24% (17 individuals) reported headache; 21% (15 individuals) reported dizziness; 13% (9 individuals) reported anxiety; 9% (6 individuals) reported fatigue, high	The BLM acknowledges the information presented and would like to address your concerns with respect to our analysis and the wider context of wind turbine sound, particularly concerning low-frequency noise (LFN) and infrasound. It is well-acknowledged that wind turbine noise is different from other types of environmental noise, both in terms of its frequency components and its temporal patterns. As you rightly pointed out, wind turbine noise can propagate freely, has distinctive characteristics, and does not abate at night. The BLM also recognizes the special considerations associated with low-frequency and infrasound propagation. While wind turbines do produce LFN and infrasound, it is crucial to differentiate between sound that is measurable and sound that is perceptible or harmful to humans. Based on our modeling and the manufacturer’s comprehensive frequency data, the LFN levels modeled for the maximum impacted residential receptor range from 1.6 to 23.0 dB. To put this in context, these levels are well below the conscious hearing threshold for infrasonic range, which starts at approximately 80 dB, as mentioned in your comment. Thus, the LFN produced by the wind turbines in this project is not expected to be perceivable by the average human ear. Regarding health concerns related to LFN and infrasound, the BLM notes the studies and their findings mentioned in your comment. However, it is essential to emphasize that our analysis indicates that the LFN levels from the wind turbines are substantially below those thresholds. As such, while certain studies might show health effects at higher levels of LFN or infrasound, the projected levels from our project are not expected to result in such effects. Our noise impact analysis has been conducted adhering to local ordinances and regulations. While there are no specific guidelines targeting LFN for this project, we have ensured a holistic analysis by leveraging the manufacturer’s full frequency spectrum data in our assessment. The software employed, SoundPlan, is designed to encompass low-frequency noise considerations.

Comment ID	Commenter	Public Comment	Response to Comment
		blood pressure or joint and other aches; and 7% (5 individuals) reported nausea or difficulties in concentrating (data not shown here) [65]. Similar results were reported in a survey data collected in Germany [66]".	
11871-77	WildLands Defense	SWCA Lava Ridge Noise Study Concerns The SWCA report states: "Over the last decade, interest in understanding noise impacts on wildlife has been increasing rapidly. Recent research has demonstrated that noise can cause avoidance, flight, altered communication, reduced pair-bonding, reduced breeding success, increased stress, increased mortality in some species, and no effect or even the opposite effects in other species (Patricelli et al. 2013). Many of these behavioral and physiological impacts could occur at or below the 10-dB threshold. Further studies are needed on sage-grouse to determine whether the 10-dB threshold is insufficient, sufficient, or even too conservative (Patricelli et al. 2013). But the report goes on to try to mask understanding adverse impacts, and conduct analysis in a way that does not reflect what humans and animals actually perceive and experience, and effects of chronic noise exposure from turbines, substations, etc. An increase in sound level 10 dba = DOUBLING of the sound. • Source. The sources of sound are any generators of small back-and-forth motions (i.e., motions that transfer their motional energy to the transmission path where it is propagated). The acoustic characteristics of the sources are very important. Sources must generate sound of sufficient strength, approximate pitch, and duration so that the sound may be perceived and can cause adverse effects, compared with the natural ambient sounds. • "Transmission path" or medium. The "transmission path" or medium for sound or noise is most often the atmosphere (i.e., air). For the noise to be transmitted, the transmission path must support the free propagation of the small vibratory motions that make up the sound. Atmospheric conditions (e.g., wind speed and direction, temperature, humidity, precipitation) influence the attenuation of sound. Barriers and/or discontinuities (e.g., existing structures, topography, foliage, ground cover, etc.) that attenuate the flow of sound may compromise the path. For example, sound will travel very well across reflective surfaces such as water and pavement but can attenuate across rough surfaces (e.g., grass, loose soil). • _Proximity to NSAs. An NSA is defined as a location where a state of quietness is a basis for use or where excessive noise interferes with the normal use of the location. For this analysis, NSAs include residential areas, schools, sage-grouse leks, and raptor nests. The SWCA report uses an old out-dated Forest Service wildlife noise analysis from 2011. "U.S. Forest Service guidelines mention a noise threshold for wildlife impacts, stating not to exceed 10 dB above the background noise level "in or near habitat of wildlife known to be sensitive to noise during reproduction, roosting, or hibernation; or where habitat abandonment may be an issue". The SWCA impacts area is much too small: The SWCA report refers to noise impacts to Sage-grouse: There is evidence that noise from traffic has a significant impact on sage-grouse. Blickley et al. (2012) found a 73% decline in male attendance on leks exposed to traffic noise compared to their paired controls. Traffic noise also was also found to cause an increase in stress hormone levels (Blickley et al. 2012) and a disruption of strutting patterns on the lek (Blickley et al. 2012). Estimated noise impacts from traffic at the closest occupied lek (approximately 3.1 miles from access road) was estimated to be 25.2 dBA for a traffic level of 400 vehicles per hour.	Noise impacts can indeed vary across different species and environments, and chronic noise exposure can certainly be a concern. The project noise technical report (SWCA 2022) and the EIS have considered these factors. However, the specific threshold for significant noise impacts on wildlife such as sage-grouse is not definitively established. Regarding your comment on the impact area, the project noise technical report (SWCA 2022) has employed a conservative approach in defining the impact area, considering not just the immediate vicinity of the project but also areas farther away where sound may propagate under certain conditions. It is also considering sensitive locations, like sage-grouse leks and raptor nests, to ensure appropriate measures are taken to minimize impact. With respect to sage-grouse, it is worth pointing out that traffic noise, as investigated in the Blickley et al. (2012) study, is different in character from wind turbine noise and may be more disruptive to sage-grouse behavior.
11871-78	WildLands Defense	Blasting noise "within 300 ft of sensitive receptors – there has not been adequate analysis if sensitive receptors, seasonal differences in noise transmissions, etc.	To address this concern, the EIS does consider potential impacts from blasting activities. As mentioned, blasting operations would likely be necessary for clearing, grading, and excavation activities in areas with shallow bedrock. However, it is important to note that these activities are short term and would only occur during the construction phase of the project. Regarding the noise levels, our assessment indicates that the typical noise generated by blasting operations would be about 94 dBA at a distance of 50 feet, based on Federal Highway Administration (FHWA) data. With this level, at a distance of 0.5 mile to the closest residential receptor, the maximum noise level would be around 59.5 dBA, and at a distance of 3.1 miles to the nearest occupied sage-grouse lek it would be around 43.7 dBA. Although these levels are above the ambient noise levels, the duration of such noise is very brief and intermittent, which helps to limit the overall noise exposure. Furthermore, all blasting activities would adhere to the Blasting Plan Methodology (Appendix I in MVE [2023]), designed to minimize adverse impacts.
11871-79	WildLands Defense	5.2 Operational Noise: The noise levels at the identified NSAs in the vicinity of the project from the representative wind turbine generator model have been predicted for the highest sound power level (108 dB) at a wind speed of 9 meters per second (m/s) and compared with the relevant noise criteria, including the EPA's Ldn of 55 dBA at residential NSAs and 10 dBA above background levels at sage-grouse leks or raptor nests (as provided in Section 3.4). Additionally, transformers at the proposed substations were also included in the analysis . A word search of the noise report unearths not a single peep about infrasound and/or ultrasound generated by any structure or device foreseeably used on the site. There is no analysis of all the different frequencies emitted by turbines, potential differences in frequencies between turbine types, differences in sound frequency propagation at different elevations and different.	Our sound level analysis does indeed take into account a wide spectrum of frequencies, from 16 Hz to 8000 Hz. The decision to focus on this range is based on typical frequency ranges produced by wind turbines, and it includes both low frequency (infrasound) and audible sound ranges. Ultrasound frequencies, which are typically above 20,000 Hz, are generally not produced in significant levels by wind turbines. The noise modeling software, SoundPlan, which we have used for the analysis, uses input data that includes the sound power level and frequency spectrum for the turbine model under consideration. This spectrum reflects the different sound levels emitted by the turbine at different frequencies, providing a comprehensive representation of the noise that would be produced by the turbine operation. The sound power level used in our analysis, 108 dB at 9 m/s wind speed, is the highest sound power level emitted by the chosen turbine model. This was chosen to provide a conservative estimate of potential noise impacts. For each sensitive receptor (residential areas, sage-grouse leks, raptor nests), we compared the modeled sound levels with the relevant noise criteria, including the EPA's Ldn of 55 dBA for residential areas and 10 dBA above background levels for sage-grouse leks and raptor nests. In the case of substation transformers, they were also included in our noise analysis to ensure all potential significant noise sources were accounted for.

11871-81	WildLands Defense	SWCA estimates used 3 MW turbines, with noise up to 108 decibels. Hub height 98 meters. Noise impacts were estimated at height of 1.5 m. AGL. But what about Burrowing Owl and other species at ground level? What about noise transmission outward at turbine height – what are these levels, and how does this impact bats and other volant species? Don't different types/designs/brands of turbines and turbine parts emit different frequencies – including ultrasound??If so, how do they differ, and what are the ranges?	Regarding the noise transmission at ground level, our analysis did indeed take this into account. Although noise impacts were estimated at a height of 1.5 m AGL, this height is typically used as a standard measurement height for noise assessment, as it represents the typical height of human ears. However, the SoundPlan software used considers noise propagation in a three-dimensional model, which would include both higher and lower levels. Certainly, it is important to clarify that a 1.5-m difference between the modeled receiver height and the actual ground level is indeed not significant in the context of this noise analysis. This is due to the substantial distances between the noise sources (wind turbines) and the receptors being considered. Sound propagation diminishes with distance following the inverse square law, meaning that the intensity of sound decreases significantly with increasing distance from the source. Given the substantial distances between the turbines and the receptors in this study, a vertical adjustment of 1.5 m would not substantially affect the sound pressure level experienced at the receptor location. In the grand scheme of the noise model, this difference is minute and does not substantially influence the overall noise impact findings. This means that the noise impact at ground level was considered.
11871-82	WildLands Defense	Tus report is like something from 20 years ago, and is woefully out of step with current concerns and ever-mounting adverse impacts being experienced by residents and animals exposed to industrial wind facilities. See: https://www.nature.com/articles/s41598-021-97107-8 . "Wind turbines generate low-frequency noise (LFN, 20–200 Hz), which poses health risks to nearby residents. households built with concrete and equipped with airtight windows showed the highest LFdifference of 13.7 dB between indoors and outdoors. In view of the adverse health impacts of LFN exposure, there should be regulations on the requisite distances of wind turbines from residential communities for health protection. Effects of low-frequency noise from wind turbines on heart rate variability in healthy individuals Chun-Hsiang Chiu1, Shih-Chun Candice Lung1,2,3*, Nathan Chen1, Jing-Shiang Hwang4 & Ming-Chien Mark Tsou1. Wind turbines generate harmful low-frequency sounds. Also: https://www.sciencedirect.com/science/article/pii/S0013935120312573	Thank you for sharing these studies and expressing your concerns. The project noise technical report (SWCA 2022) is grounded in the most recent accepted standards for wind turbine noise assessment, employing state-of-the-art procedures for modeling and analysis. The BLM has considered the information presented in the articles provided. Specifically, the study from nature.com investigated settings with a distance of 500 m from turbines. In our analysis, the setbacks from residences are considerably greater than that, which can influence the extent of potential low-frequency noise exposure. Furthermore, a preliminary review of the same study indicates that during the summer, indoor exposure to LFN was attributed more to factors such as fans and indoor conversations rather than wind turbines, suggesting the need for a nuanced interpretation of the findings. Although the BLM respected the ongoing discussions and evolving research in this domain, especially regarding potential impacts on humans and wildlife, our primary objective remains to deliver an accurate and comprehensive assessment that aligns with current scientific consensus.
11978-31	Magic Valley Energy, LLC	27. The DEIS states: "An NPS model predicted mean noise levels in 2015 (including the average existing sound level with the influence of human-made sounds) at Minidoka NHS to be 6.0 dBA above the natural ambient sound level (NPS 2015). The results of the noise impact assessment (SWCA 2022a) indicate that operational noise levels near Minidoka NHS would range from 7.1 to 12.1 dBA above existing background levels…" a. MVE Comment: The terms "existing background" and "natural ambient sound" appear to be used interchangeably in the DEIS; however, when reviewing the two reports (NPS 2015 and SWCA 2022a) in detail, the analyses use two drastically different values for background sound levels, with NPS 2015 using 25 dBA and SWCA 2022a using 19.3 dBA. This may misinform the reader on the level of impact by creating an "apples to oranges" basis for comparison of sound impacts. A more accurate way to estimate the Project- related noise impact is to compare the existing sound levels at Minidoka National Historic Site (Minidoka NHS) to the estimated sound levels at Minidoka NHS during operation of the Project. According to Figure 3 of NPS 2015, the Minidoka NHS median existing sound level ranges from 31.3 to 32.5 dBA. According to Figure D-2 of SWCA 2022a, the Project alone (as Alternative B) would have an operational noise level at Minidoka NHS that ranges from 22 to 28 dBA. Since sound is additive, the total noise impact to Minidoka NHS is calculated by combining the existing sound levels at Minidoka NHS with the Project's operational noise. The following equation can be used to add two sound levels of differing dBA values, with $Ltotal$ being the total sound level, and $L1$ and $L2$ representing the two sound levels: [see following equation in pdf letter to show fractions, exponents, and subscripts] $L1$ $L2$ $Ltotal$ = 10 $* log10(1010 + 1010)$ To calculate the maximum impact, MVE used the lower end of the range from the Minidoka NHS existing sound level (31.3 dBA) for $L1$ and the maximum Project operational noise level (28 dBA) for $L2$. The resulting $Ltotal$ is 32.97 dBA. Therefore, the Project's maximum impact to Minidoka NHS will increase the existing noise from 31.3 dBA to 32.97 dBA. This equates to an increase of 1.67 dBA. SWCA 2022a notes that an increase in noise of 0-3 dBA is a barely perceptible to the human ear. This calculation considers sound values from Alternative B. Alternatives C, D, and E would result in even lower noise impacts. Since the maximum noise impacts for all Alternatives would be unnoticeable, MVE requests the FEIS reflect this conclusion and state that there will be no noise impacts at Minidoka NHS by the Project.	Because no site-specific noise monitoring was conducted for the analysis area, the EIS provides a discussion of results from both SWCA (2022) and NPS (2015). The BLM uniformly applied 19.3 dBA as the ambient sound level for the entire analysis area (this is the estimated level for rangeland unpopulated areas). This is a different baseline than used in NPS (2015); the NPS used 25 dBA plus 6 dBA as noted in the comment, for an estimated 31 dBA existing baseline sound level. Although existing baseline sound levels surrounding the siting corridors may be higher than 19.3 dBA (including those reported in NPS 2015), without site-specific monitoring results, the BLM conservatively used the lower ambient sound level in the noise technical report (SWCA 2022) and EIS analysis. See Figure D-2 in Appendix D of the SWCA (2022), Operational noise at residential receptors and schools. The EIS the used the outer edge of the modeled operation isopleths, as the distance from the turbines at which sound level would be <22 dBA; this distance is 2.2 miles from the turbine locations.
12177-2	Carol A. Overland	NOISE MODELING USING OTHER THAN 0.0 GROUND FACTOR IS MISLEADING Noise information presented in the DEIS is misleading because potential for noise impacts is grossly understated due to use of improper ground factor in noise modeling. First, regarding noise, the DEIS states: The average person perceives an increase in sound of above 3 dBa as readily noticeable, an increase of 10 dBa as doubling of the sound, and an increase of 20 dBa as a dramatic change (SWCA 2020a)… … a sound level of 60 dBa would be representative of normal conversation… DEIS, p. 3-145 and 3-146 (emphasis added). This focus is "perception," but a 3 dB(A) is a doubling of sound. Normal conversation is close and direct, noise from a wind turbine in Minnesota is prohibited above 50 dB(A)5, and in Wisconsin, 45 dB(A). [see pdf letter for image and sources] An NPS model predicted mean noise levels in 2015 (including the average existing sound level with the influence of humanmade sounds) at Minidoka NHS to be 6.0 dBA above the natural ambient sound level (NPS 2015)… … The results of the noise impact assessment (SWCA 2022a) indicate that operational noise levels near Minidoka NHS would range from 7.1 to 12.1 dBA above existing background levels and would range from 3.7 to 15.7 dBA above existing background levels from within Minidoka WRC (see Section 3.6 regarding Noise impacts on the	ISO 9613-2: Acoustics – Attenuation of sound during propagation outdoors – Part 2: General method of calculation provides a comprehensive methodology for predicting sound levels in outdoor environments. This includes atmospheric absorption, ground effect, surface reflection, and diffraction over barriers. Ground effect (or ground attenuation) refers to the changes in sound propagation due to interaction with the ground surface. Ground effect is influenced by several factors, including the type of ground cover, the distance between the source and receiver, the heights of the source and receiver, and the sound frequency. ISO 9613-2 calculates ground effect based on an "excess ground attenuation" term. This term depends on the geometric configuration of the source, receiver, and ground reflection point, as well as the acoustical properties of the ground surface. The ground surface is characterized by a ground factor, "G," which ranges from 0 (for a perfectly reflective, hard ground) to 1 (for a perfectly absorbent, soft ground). The value of G to use for a given ground surface can be determined from the guidance provided in the standard or other literature.

Comment ID	Commenter	Public Comment	Response to Comment
		Japanese American community). As noted in Section 3.6, these operational noise levels are all below the EPA's recommended noise standard of 55 dBA for residential land uses. DEIS, p. 3-157-158. Attached as Exhibit D please find a Comment I filed in a Minnesota Power Plant Siting Act hearing docket, raising the issue of misuse of ground factor. Misuse in modeling is use of a ground factor of other than 0.0 for an elevated source. The use of a 0.0 ground factor in modeling an elevated noise source has been addressed in testimony in Wisconsin dockets by two noise experts, that 0.0 is the ground factor to be used. The 0.0 ground factor for elevated sources is necessary because for an elevated noise source, the path to "receptors" is uninterrupted, it's a direct line, there is no ground absorption: [see pdf letter for image and sources] The use 0.0 of ground factor for wind is standard practice, and a 0.5 ground factor is NOT appropriate for wind because it's elevated. This was inadvertently confirmed by Applicant Badger Hollow's expert Mike Hankard's testimony in the Badger Hollow solar docket before Wisconsin's Public Service Commission (PSC Docket 9697-CE-100): [see pdf letter for image and sources] The use of a 0.5 ground factor is only appropriate for modeling predicted noise impacts for a ground source to a receptor on the ground to address muffling interference in between: [see pdf letter for image and sources] The introduction of ISO 9613-2, attached in full as Exhibit E, explains this simply: 7 .3 Ground effect (Agr} 7 .3.1 General method of calculation Ground attenuation, Agr• is mainly the result of sound reflected by the ground surface interfering with the sound propagating directly from source to receiver. Exhibit E, ISO 9613-2. The DEIS' Noise Technical Report, at page 18, claims a definition of ground factor i elevated source noise modeling. Dr. Schomer, who was part of committee that developed the ISO 9613-2 noise modeling standard, had an even more specific explanation, this from another Wisconsin wind docket. See attached Exhibit F, Schomer Testimony, pps. 569, et seq. See p. 571 of that testimony: A Yes. But to understand that is a question that was earlier. You've got a source up in the air and not on the ground, so does this standard really apply. And my answer was, it's the best we have, but you can't apply it exactly the way you would if it was on the ground because the source is as high in the air, it changes what the propagation is. So that the definition of what is hard and what is soft, you have a source that's 100 meters in the air on average. That's not on the ground as one of the other counsel's pointed out. And on p. 572: A No. It's only -- the only thing you have is an effect of the microphone height at your receiver. The other -- it doesn't -- it doesn't come down to the ground and then travel across the ground like this. It doesn't do that. What you're interested in is the path that goes straight from this up in the air source to your receiver, which may be near the ground, but you don't have any other path. If you do, it's because you don ' t have good propagation. In short, again, page 574, with an elevated source, from that source to the receptor, it's a direct hit: Q So if there's a source up in the air that's emitting sound, the sound's going to come down and it's going to hit the receptor before it hits the ground and absorbs; is that correct? A It's going to hit the receptor directly. There will be -- it gets confusing . And summing up on p. 576 of Dr. Schommer's testimony: Q But considering we have to use this model because we don't have anything better, the best way to use this model for a source that's 100 meters in the air is to use that 0.0 coefficient? A 0.00 is t he best you can do with this . Contrary to the experts' testimony, the Lava Ridge Noise Technical Report states that ground factors of the appropriate "0.0" was used, but also that the utterly unjustifiable and unsupportable ground factors of 0.6 and 1.0 were use for this elevated source! • To better represent the actual conditions of the project and to ensure that both hard and soft ground absorption were considered, acoustically hard sites, including surfaces such as pavement and bare hard ground, were asSUllled to have high reflectivity properties, and a ground absorption coefficient of0.0 was used. Ground cover near the project was analyzed using satellite imagery from Google Earth. A higher ground factor of 1.0 was defined for more absorptive ground, such as vegetation and loose soil. Semi-hard materials such as gravel were assumed to have a grom1d absorption coefficient of 0.6. See Noise Technical Report, p. 19. Noise modeling using anything but the 0.0 ground factor understates expected noise – garbage in, garbage out. Note that in the DEIS, Figure 3.5-3 confirms that there is NOTHING between the wind turbines, elevated, and the receptor on the ground: Bottom line: ... • The Noise Technical Report is garbage. The Noise Technical Report and related sections of the DEIS should be tossed out; noise modeling performed using ONLY a ground factor of 0.0, and a corrected Noise Technical Report and the DEIS revised and filed with notice and opportunity for public review and comment.	The calculation of excess ground attenuation involves a number of mathematical steps, including: • Calculating the direct and ground-reflected path lengths from the source to the receiver. • Calculating the "ray-path difference." • Using the ray-path difference, the source/receiver heights, and the ground factor G to calculate the excess ground attenuation in dB. Ray-path difference refers to the difference in distance between the direct path and the ground-reflected path from the sound source to the receiver. When sound is emitted from a source, it travels in all directions. If we consider a point source of sound and a receptor in an outdoor environment, there are generally two main paths the sound can take to reach the listener: • Direct Path: The straight-line path from the sound source directly to the listener. The length of this path depends on the positions and heights of the source and the receptor and their separation distance. • Ground-Reflected Path: This path involves the sound traveling from the source to the ground, reflecting off the ground surface, and then continuing to the listener. This path is typically longer than the direct path because the sound must travel down to the ground and back up to the listener. The difference in distance between these two paths is referred to as the ray-path difference. Differences between the direct and reflected sound waves lead to the received sound level variations. One factor in sound propagation is the ground factor, also referred to as "ground effect." This term denotes the impact of the ground or terrain on sound waves' absorption, reflection, and scattering. It plays a role in dictating how sound behaves once it has been produced, including how far it travels and how its intensity changes over distance. As described before, when a sound is produced, its waves will radiate from the source in all directions. Some waves will travel directly to the receiver, while others will interact with the ground surface. The nature of this interaction is dictated by a few key characteristics of the ground, which collectively contribute to the ground factor. One of these characteristics is the height of the source relative to the ground. This parameter becomes particularly important in situations involving large structures, such as wind turbines. The effect of the ground is most pronounced when the source is close to the ground level, as the direct path to the listener and the ground-reflected path are roughly equal in length. As the source height increases, the direct path becomes shorter and the ground-reflected path becomes longer, reducing the ground's influence. However, even for elevated noise sources, the ground still has an impact, especially over long distances. For instance, if the source is a tall structure like a wind turbine, and the receiver is closer to the ground, the sound waves from the turbine will still interact significantly with the ground before reaching the receiver. In the context of environmental noise propagation from wind farms or any other noise source, it is critical to use representative inputs in models to ensure the accuracy and reliability of predictions. Models are mathematical representations of real-world phenomena. They are designed to predict outcomes based on a set of input parameters. If these inputs do not represent the actual conditions, the model's outputs will not accurately reflect reality. The principle of "garbage in, garbage out" applies here: if incorrect or unrepresentative inputs are used, the results, regardless of how precise they may appear, can be misleading or incorrect. Take the ground factor (G) discussed before. The ground factor characterizes how much sound is reflected by the ground. Using an unrepresentative ground factor (like assuming G = 0.0 for all scenarios) can lead to a misestimation of the noise levels at the receiver's location. Therefore, a one-size-fits-all approach (i.e., G = 0.0) can produce a distorted picture of the noise impact. Moreover, the scenario modeled for this project included sources at ground level. When dealing with a mix of source heights, such as a wind farm with elevated sources like the turbine and ground-level sources like transformers, assuming a single ground factor (G = 0.0) for all sources is completely inappropriate. Like a wind turbine rotor, an elevated source primarily generates noise that travels above the ground before reaching a receiver, thus interacting less with the ground surface. Conversely, like a transformer, a ground-level source generates noise that interacts directly with the ground. In this case, the sound is significantly affected by ground absorption and reflection, which is determined by the ground factor (G). Therefore, to ensure accuracy in noise prediction models, a ground factor that accounts for the existing land cover conditions around the receptor and the source needs to be employed regardless of their height. Therefore, a noise modeling performed using ONLY a ground factor of 0.0 is completely unrepresentative of the actual conditions at the site.
12562-1	Sue Page	The environmental study doesn't appear to address the noise pollution 400 wind turbines will cause. Attached is a video I hope you will listen to. There are only a few turbines in the video so you'll have to imagine how much louder 400 of these beasts will make. The noise will certainly scare our wildlife but how far will that sound resonate? To the nearby residents of Eden? Valley schools? The Minidoka National Historic Site will be affected, greatly. The peace will be disrupted by the loud noise and blinking lights. There isn't any way to stop the noise pollution except to not build these turbines.	See response to comment 11678-1 (see in Table A-3r, Noise). The computer software used for the noise modeling, SoundPlan, does indeed take into account the cumulative sound levels from all the turbines in the proposed development. It factors in many variables such as the distance from the turbines to various points of interest (e.g., residential areas, schools, historic sites), the specific noise output characteristics of the turbines, the local topography, ground absorption characteristics, and prevailing weather conditions.

Comment ID	Commenter	Public Comment	Response to Comment
12879-2	Norma White	Low frequency noise (LFN) First of all, what is low frequency noise? It is noise, as the name suggests, at the lower frequencies of the audible range. It is general accepted to be within 20 to 200 hertz. Less than about 20 hertz is termed infrasound, because it is not usually audible to the human ear. ILFN (Infrasound–low frequency noise) is another abbreviation I shall use, as in some instances infrasound is comparable to LFN. Noise that can be felt. Unlike higher frequency noise, ILFN is not just audible – it is also perceptible! [1] The human ear can hear infrasound down to a frequency of 12 hertz, after which it is perceived as single cycles of the sounds along with a sensation of pressure at the eardrums. [2] ... Noise that is selective in who it disturbs I quote directly from the words of Dr Geoff Levanthall in a report prepared for DEFRA in 2003: LFN causes EXTREME distress to a number of people who are sensitive to its effects… Such sensitivity may be a result of heightened sensory response within the whole or part of the auditory range or may be acquired. The noise levels are often low, occurring in the region of the hearing threshold, where there are considerable individual differences. The World Health Organization is one of the bodies which recognizes the special place of low frequency noise as an environmental problem. [6] ILFN affects brain activity. According to a study done in Britain in 2003, people were exposed to an ILFN frequency of 17 hertz during a concert: The presence of the tone resulted in a significant number (22%) of respondents reporting anxiety, uneasiness, extreme sorrow, nervous feelings of revulsion or fear, chills down the spine and feelings of pressure on the chest. [30,31] In presenting the evidence to British Association for the Advancement of Science, Professor Richard Wiseman said, “These results suggest that low frequency sound can cause people to have unusual experiences even though they cannot consciously detect infrasound. [6] ... Noise that travels very long distances. Whilst it would be expected that the ILFN would rapidly dissipate like other forms of noise over distance, one must be careful to put this into context. According to Levanthall: The attenuation of sound in air… is very low at low frequencies. Other attenuating factors, such as absorption by the ground and shielding by barriers, are also low at low frequencies. The net result is that the very low frequencies of infrasound are not attenuated during propagation as much as higher frequencies. [10] Under conditions of 20 degrees Celcius at 70% humidity, Levanthall states that noise at 63Hz will dissipate at only 0.1dB/km – i.e. negligible losses. ... However, there is another factor to consider: noise dilution over distance. The loss according to Levanthall is about 6dB for each doubling of distance. However, what happens when dealing with 140 wind turbines in the region each producing ILFN? How does this noise energy “dilute” out over distance? It clearly doesn’t follow a simple model of dissipation and instead interacts with the ILFN from other wind turbines (and other industrial sources such as open-cycle gas plants, one of which is due to be built just outside the village at Dalton). What produces ILFN? Low frequency noise and infrasound are produced by machinery, both rotational and reciprocating, all forms of transport and turbulence. For example, typical sources might be, pumps, compressors, diesel engines, aircraft, shipping, combustion, air turbulence, wind and fans. [11] What about wind turbines? Wind turbines certainly do produce ILFN. They are reverse fan mega machinery of unprecedented proportions. Such rotating machinery moves at up to 290km/h on the outer tip of the blade. The span is the same as that of a jumbo jet, and the surface area of their blades is extensive (hundreds if not over one thousand square metres in larger models). Their generator weighs tens of tonnes. Although the larger wind turbines are “quieter” machines in terms of audible noise, they instead produce more ILFN. [12] Quiet backgrounds are associated with more noise annoyance The lack of background noise makes a dominant noise source more noticeable. Whilst this appears self-explanatory to any person living in rural area, it has also been the subject of investigation. [13] The Capital and Southern Tablelands regions have no major industrial sources of noise, save traffic noise in Canberra, and the large wind turbine installations started in late 2008. But isn’t the noise level within the “guidelines”? The question is: what guidelines? There are no current guidelines on low frequency noise that I am aware of that are being applied to the wind turbine industry. In fact some wind industry proponents suggest on online sites that wind turbines do not produce infrasound, even when there is evidence to the contrary. The character of wind turbine noise is known to make it especially intrusive, arising from amplitude modulation associated with blade passage past the tower, and the dominance of low frequencies in the received sound spectrum. These are implicated in sleep disturbance and deprivation, and the resultant adverse health effects. [14] Moreover, the A-frequency weighted sound pressure level or “sound level” is the most common sound descriptor. However, the A-weighting has a significant restriction in that it does not permit measurement or assessment of low frequency sound. Noise standards need to include appropriate measures to calculate the impact of low frequency noise and vibrations indoors at impacted dwellings. ... What are the peculiarities of wind turbine ILFN? Empirically, wind turbine ILFN travels upwind almost as well as it does downwind. (NASA has confirmed this observation with smaller wind turbine models). [19] It is also more intense during atmospheric inversions (consistent with the phenomenon described by Van den Berg [20,21]) and becomes dramatically worse when the atmosphere is moist, particularly prior to major rain events. Where are we heading to with ever increasing numbers of wind turbines? That is precisely what I wish you to think about. ... Research is required to establish the nature of the problem and its solutions. Meanwhile the only responsible position is to call for a moratorium on all wind developments. It is also necessary to ask questions about giving respite to the existing sufferers, particularly those who live at close range to the wind turbines where the problem is at its worst. Wind turbines should at least be SWITCHED OFF during sleeping hours, and particularly during weather conditions which are conducive to ILFN such as inversions, or pre-rain events. Wind turbines are not “farms”. They are industrial zones that create much ILFN and consequent grief.	While it is true that wind turbines can produce LFN and infrasound, it is also important to note that not all LFN is harmful or even perceptible to humans, and the levels produced by wind turbines are often below the threshold of human perception. The noise impact analysis performed was based on the local ordinances and regulations, and as correctly pointed out, there are currently no specific guidelines regarding LFN that apply to this project. However, the manufacturer’s data for the wind turbines, which includes a full frequency spectrum from 16 Hz to 8000 Hz, was used in our analysis, thereby including low frequency components. It is worth mentioning that the modeling software we used, SoundPlan, takes into account low-frequency noise. The LFN levels modeled for the maximum impacted residential receptor ranged from 1.6 to 23.0 dB. Therefore, the LFN estimated levels are not high enough to cause health effects.
2882-1	Mark Southwick, Vicki Southwick	Noises transferred through solids like lava are not included in the research and EIS. Therefore, the current EIS is incomplete and requires additional research and time to be considered complete and accurate.	I understand your concerns about noise transferred through solids, such as geological formations, which is also known as ground-borne noise or vibration. For the operational phase of wind turbines, several studies have shown that the levels of ground-borne vibration are typically very low and usually well below perception levels for

Comment ID	Commenter	Public Comment	Response to Comment
			humans and animals. These levels are usually much less than those generated by many other common sources, such as road traffic or even walking.
2925-1	Mark Southwick	Question 1: Where was the decibel rating for turbine noise obtained? Where are same scale turbines in operation for obtaining accurate related data? I was told the proposed turbines do not currently exist and therefore neither does the applicable data. Information from existing turbines half the size was translated and projected as accurate data for the proposed turbines. The 127.6 db reading is an estimate that comes from the proposed manufacturer of the 740' turbines, who has engineered but not produced any of those turbines. Question 2: What information did they use to establish the diminished decibel readings at the turbine base, the 2.5 mile distance and other locations they cited? Again, it was an estimate based on other criteria not researched or studied specific to LRWP's impact area, environment or proposed infrastructure. The same non LRWP specific calculations were applied to the decibel numbers associated with noise levels affecting conservation species, agricultural livestock and human habitat. Question 3: As I pass windfarm projects, it is always interesting to me how many turbines are not in operation. Information from the open house representatives indicated that wind conditions are expected to allow windmills in the project area to operate 30% of the time. How much of the remaining 70% of "dead" time is due to high winds. That observance leads me to ask the question, what research has been done to determine the noise level of 400 non operating 300' or longer turbine blades in high wind occurrences. When wind speeds are high enough that wind turbines cannot operate, the blades cut into the wind and like trees, buildings and other structures, the wind creates irritating whistles, noise and vibration at levels that are irritatingly detrimental to human and animal environments and habitat. The EIS gives an estimate of noise levels when the blades are rotating at operational speeds, but not when they are stationary with higher wind velocities. SWAC did not compile or study the days in high wind or the noise, whistles and vibration associated with static 300' turbine blades on the LRWP area of impact. Additionally, the sound transfer during turbine blade static time through underground lava would also be an area of impact research that is not included in the EIS.	You are correct in stating that projected sound levels are based on manufacturer specifications for the turbines proposed, which have not been constructed yet. This is a standard practice in wind farm planning. Sound levels are calculated based on measurements from existing, similar turbine models. This provides a reasonable and generally conservative estimate of the noise level. The noise modeling software, SoundPlan, which we have used for the analysis, uses input data that includes the sound power level and frequency spectrum for the turbine model under consideration. This spectrum reflects the different sound levels emitted by the turbine at different frequencies, providing a comprehensive representation of the noise that would be produced by the turbine operation. Wind turbines are designed to cease operation in very high winds for safety reasons. During these times, the blades are oriented in such a way to minimize wind resistance, which also minimizes the noise they produce. The whooshing noise associated with wind turbines is primarily produced by the movement of the blades, not the wind itself, so when the blades are not rotating, the noise levels are generally much lower.
3302-10	Susan Canham	Where is noise pollution addressed outside of a mere mention in regard to wildlife and cattle?	Noise impacts are addressed in the project noise technical report (SWCA 2022). Additionally, impacts on other resources are discussed in their respective sections of the draft EIS.
3990-1	Diana Nielson	In The Noise Technical Report for the Lava Ridge Project the draft EIS does not have information of the affects of Extreme Low Frequency (ELF) infrasound on wildlife or humans. The executive Summary, Abbreviations, 3. Noise Fundamentals and in 3.1 Definitions of Acoustical Terms: Infrasound and ELF is not mentioned. Also the cumulative noise on Table 6. is cut off on pages 10,11& 12. The cumulative affect is very important. Low frequency inaudible infrasound travels long distances especially when combined from several sources I am not in favor of the Lava Ridge Wind Turbine Project. Choose Alternative A A Concerned Citizen. Diana Nielson	The EIS does not currently include information on the effects of ELF infrasound. Infrasound (sound at frequencies below the human hearing range) and ELF infrasound can indeed be generated by wind turbines, although at levels significantly below the threshold for human perception. While the effect of such low-frequency sounds on human health is still under investigation, current scientific consensus generally holds that the levels produced by wind turbines do not pose a health risk. Note that the noise impact assessment was conducted based on local laws and regulations. Currently, there are no specific rules pertaining to LFN applicable to this project. That being said, we used the data provided by the wind turbine manufacturer in our analysis, which covers a comprehensive frequency range from 16 Hz to 8000 Hz, thus encompassing low-frequency components. It's important to highlight that our used modeling software, SoundPlan, does account for low-frequency noise. For the residential receptor most impacted by this project, the modeled LFN levels ranged from 1.6 to 23.0 dB. As such, the projected LFN levels are not anticipated to result in health-related concerns.
4259-1	Sheryl May	We will be living next to the desert where the wind farm will be close to our home. Our number one concern is noise from the turbines. After our research for every assurance That the decimals of noise are not destructive we find citizens living next to these wind farms, who are greatly distressed, and enormously, unhappy with the health effects from the noise. They find them selves with no recourse. They have reported such symptoms as nausea, dizziness, sensation of pressure in the air sleep disorders, headaches, and other symptoms. This is completely unacceptable. What can be done? We propose that it is required of the magic, Valley energy company by legal document. They install noise intervening machines at each turbine that is located close to feedlots dairies homes. This must be absolutely done by legal contract so that they cannot get the wind turbines installed and then walk away without devices in place to cancel the noise.	It is important to understand that various factors can influence perceived noise, including the distance between a turbine and a home, wind speed, and ambient noise levels. However, modern wind turbines are designed to be much quieter than their earlier counterparts. They are carefully engineered to minimize noise levels. While the noise-canceling technology has shown promise in controlled environments, its application to wide-scale outdoor environments is still being researched and has not yet proven to be fully effective or feasible.
4723-1	Sue Page	Any affect on human hearing will be amplified in animals. Some people who live in close proximity to wind turbines say they experience sleep disturbances, headaches and concentration problems. These symptoms and others could be explained as effects of infrasound, as well as constant humming and vibrations.	Research on the effects of wind turbine noise on human health, including symptoms like sleep disturbances, headaches, and concentration issues, suggests there is no strong evidence linking these complaints directly to wind turbines. Individual experiences can vary based on sensitivity and attitudes toward wind turbines. As for the impact on animals, reactions to wind turbines also vary greatly. Animals, like humans, vary significantly in their sensitivity to sound, depending on the species. While some animals may initially be disrupted, most adapt over time. Current research has not indicated significant impacts from wind turbine noise on terrestrial wildlife. Wind turbines do emit infrasound, which is a frequency below human perception, but at very low levels. The presence of infrasound from natural and other human-made sources in our environment is usually higher than that from wind turbines. Therefore, wind turbines are unlikely to significantly contribute to the health issues mentioned.
5189-5	Traci Wood	. What about the disruption of the 500 + days of blasting for us who live closer to the area?	In response to your concern, the EIS does take into consideration the potential effects of blasting activities. While blasting would probably be required for tasks such as clearing, grading, and excavation in areas where bedrock is near the surface, these activities are temporary and would only take place during the construction phase. As for the noise levels, our evaluation shows that blasting operations typically generate a noise level of

Comment ID	Commenter	Public Comment	Response to Comment
			about 94 dBA at 50 feet, according to data from the FHWA. Given this, at a distance of 0.5 mile to the nearest residential receptor, the maximum noise level would be approximately 59.5 dBA, and at a distance of 3.1 miles to the closest inhabited sage-grouse lek, it would be about 43.7 dBA. While these levels exceed the ambient noise levels, the noise from such activities is brief and sporadic, which helps to minimize overall noise exposure. Additionally, all blasting operations would follow the Blasting Plan Methodology (Appendix I in MVE [2023]), which is aimed at reducing negative impacts.
5189-7	Traci Wood	What about the noise pollution or the vibrations?	Ground-borne vibration generated by wind turbines are usually quite minimal, especially when compared with other human-made sources like traffic, construction, or industrial equipment. Studies have shown that the vibration levels created by wind turbines are significantly below the human perception threshold, even for those living close to a turbine. The placement of the wind turbines will be far enough from homes and sensitive locations to mitigate any potential effects. Furthermore, the design of modern wind turbines has greatly improved in the past decade. Today's manufacturers use a variety of vibration damping methods to lessen the vibratory response of the components and the structure, thereby reducing the transmission of these vibrations to the ground.
5438-1	Sue Page	There doesn't seem to be any mention in the EIS of exposure to humans or animals and the damage to organs and tissues. These machines will be running around the clock. The continuous vibrations will resonate into the ground and can be heard through concrete. In the attached study, it says long term exposure can cause lesions in the vascular, osteoarticular and nervous systems.	Regarding the vibrations caused by wind turbines, it is true that these machines do produce some level of vibration. However, research indicates that the amount is typically very low, especially when compared to other sources of vibration in the environment such as traffic, construction, and industrial machinery. These vibrations decrease substantially with distance and are unlikely to be perceptible or cause any health issues at typical distances from wind turbines.
5920-1	Kelly Varelmann	Has there been a study to find out how many miles away the blasting will be heard and felt?	Blasting impacts, including noise and vibration, typically decrease with distance. However, the exact distance at which blasting effects can be heard or felt varies based on several factors such as the specific blasting techniques used, the local geology, and atmospheric conditions. For the estimation of noise and vibration levels from blasting activities, the BLM typically relies on established scientific models and guidelines from organizations like the FHWA and the Mine Safety and Health Administration (MSHA). While there might not have been a direct study on how many miles away the blasting can be heard or felt for this project, the EIS does include an analysis of potential noise impacts from blasting activities.
6511-2	Kelly Varelmann	How will the noise from the extended daily blasting affect the nearby residents, livestock and wildlife? Has there been a study to find out how many miles away the blasting will be heard and felt?	See response to comment 5920-1 (see in Table A-3r, Noise). The potential impacts of blasting during construction are indeed taken into account in the EIS for the project. Noise and vibrations from blasting are highly localized and diminish quickly with distance due to the natural attenuation of sound and vibration through air and soil. Blasting is also a temporary activity and will only be carried out during the construction phase. A detailed analysis has been conducted, including the potential noise levels at various distances. Using data from the FHWA, we estimate that typical blasting operations would generate noise levels of about 94 dBA at a distance of 50 feet. This level decreases with distance, dropping to around 59.5 dBA at 0.5 mile, and around 43.7 dBA at 3.1 miles, which is the distance to the nearest occupied sage-grouse lek. Impacts on wildlife and livestock have also been assessed. While the sudden noise from blasting could temporarily disturb animals, wildlife typically adapts quickly to such disturbances. The short-term and localized nature of blasting activities further reduces the potential for significant impacts. Livestock is generally less sensitive to noise than wildlife.
6911-2	Barbara Williamson	Each fan creates a loud HUM which can be mind-numbing for those living nearby. In a remote area, it may have an unknown effect on animal life. If close to homes, people living there must live with the constant hum.	The sound generated by wind turbines is indeed a consideration in their placement and design. As the blades pass the turbine tower, the noise is often described as a swish or whoosh rather than a continuous hum. Turbine noise levels, in general, are based on the distance from the source to the turbine. In regard to human impact, research suggests that the noise produced by wind turbines is unlikely to cause any serious harm to humans.
7619-1	Diana Nielson	I Question the Quality of the Data in the Noise Technical Report for the Lava Ridge Wind Turbine Project and the FAA Application 7460-1, Notice of Proposed Construction or Alteration,. Which is correct? They both have different elevation data. The discrepancy is too wide to be acceptable. The FAA application is a requirement for Lava Ridge Wind Turbine Project. All Data submitted to the FAA must be accurate. While Comparing the FAA Application to the Noise Technical Report for the Lava Ridge Wind Project: Section 4 page 5 . Highlighted in Purple Ink. 4 EXISTING CONDITIONS A characterization of the landscape features, existing roads, and land use of the siting corridors and vicinity are provided in Section 2 above. The elevation of the siting corridors ranges from 3,900 to 4,600 feet. In all, 135 residential NSAs, 23 sage-grouse leks, 68 raptor nest locations and three schools were included in the analysis. Livestock grazing occurs throughout the area, and thus livestock were also included in the analysis. A map of the siting corridors showing the general location of the siting corridors and of the identified NSAs is provided in Figure 1. >From Page 3 of 24 in FAA Public Notice release 02/02/2023 Addressed to Chantry Dunlap, Magic Valley Energy, LLC 1610 Main Circle Drive, Suite 310, Chesterfield, MO Additional Information for ASN 2022-WTW-4666-OE Proposal: To construct and/or operate a(n) Wind Turbine to a height of 660 feet Above Ground Level, 4933 feet Above Mean Sea Level. Structure: Location: Latitude: Longitude: Heights: Wind Turbine Q18 Dietrich, ID 42-47-46.13N NAD 83 114-03-36.86W 4273 feet site elevation (SE) 660 feet above ground level (AGL) 4933 feet above mean sea level (AMSL) ASN /	See response to comment 10426-5 (see in Table A-3r, Noise). The project noise technical report (SWCA 2022) was prepared for the project. This report offers an in-depth analysis of the noise impacts associated with the proposed wind turbines, using sophisticated computer modeling and on-site measurements to predict potential noise levels at various distances and conditions. Livestock and human health (residences and schools) are addressed here; other sensitive receptors and resources potentially affected by project noise are evaluated in detail in their respective EIS sections. The BLM did not prepare the FAA notice referenced in the comment and therefore cannot speak to the elevation ranges included in that notice.

They both involve the Sage Grouse, Mule Deer, Pronghorn, Hawks, Eagles, pollinators (including batts, grazers and the residents of this area. Noise both audible and infrasound affects everything. Elevations of the towers affect many types of frequencies, EMF, ELF, VLF, EMR plus more. They also are a collision hazard for aircraft and wildlife.	
8458-3	Sue Page	How will that blasting effect the schools in Eden?	The closest school in Eden is situated approximately 6 miles south of the proposed turbine corridor. At this distance, the estimated sound level due to our operations would be 38 dBA. To put this in perspective, our previous assessments have assumed the Leq nighttime and daytime noise levels to be 34 and 40 dBA, respectively, at residential communities. This means the sound level at the school from the blasting would be within the range of what is considered typical for residential areas and well below what could be considered harmful or disruptive. Furthermore, it is essential to note that the duration of the noise from the blasting is very brief. Such short durations of noise are less likely to cause any significant disturbance, especially when you consider the usual ambient noise in a school environment during active hours.
8638-1	Mark Southwick	Constructing 400 turbines with a foundation base of 60' in diameter and a depth of 15' will transfer sound and vibration from those turbines for miles through underground lava. Like a guitar or piano soundboard, the noise transfer from the lava will be amplified in residences and other human or livestock habitat. It would also negatively impact the environment of animals nesting on rocks, trees, poles or in caves. Your report states that the turbines generate a 124.6db noise at the turbine level (321'), 73.9db at ground level and 85db at the rotating blades. All these levels are above federal minimum standards measured in open air and assume that surrounding animal and human habitat will be far enough away to allow a diminished impact, all while missing the noise and vibration impact the foundations would transfer via underground lava. Your report does not address or measure the impact that noise and vibration transfer through lava will have on animal habitat, residential and farming structural elements or human health effects.	In our analysis, the BLM considered the noise levels at the turbine and ground levels, and these figures were indeed taken in open-air conditions. However, it is important to clarify that the presented noise levels are maximum values under worst-case scenarios, and actual levels at any particular location depend on multiple factors including the distance from the turbine. In practice, noise levels decrease substantially with distance from the turbine. Regarding your concerns about vibrations and their propagation through the underground lava, please note that wind turbines are designed to minimize mechanical vibrations. Typically, any vibrations generated by a wind turbine are primarily localized to the turbine structure itself and do not translate into significant ground-borne vibrations. The vibrations caused by the operation of a wind turbine are usually well below the levels that could cause damage to buildings or other structures, or cause annoyance to people or animals.
8639-4	Mark Southwick	The above concerns as well as irritating sub-audible and hyper-audible noise along with irritating cyclic electrical vibrations are experienced by individuals near similar wind farms, though overlooked as affecting only a few .	In terms of subaudible noise, you are likely referring to infrasound, which is sound below the frequency range of human hearing (below 20 Hz). Wind turbines do generate infrasound, but numerous studies have shown that the levels are typically well below the threshold of perception for humans, and well below the levels at which health effects are known to occur. Hyper-audible noise, or ultrasound (above 20,000 Hz), is typically not produced in significant amounts by wind turbines. Ultrasound can be absorbed by the atmosphere over short distances, and its intensity decreases rapidly with distance from the source. Therefore, it is unlikely to be an issue for nearby residents.
8790-6	James Ritchie	5.The draft EIS doesn't address the constant noise and flicker from the rotating turbine blades and its effect on humans and livestock.	We understand and acknowledge these concerns and have already addressed them in the project noise technical report (SWCA 2022). Livestock and human health (residences and schools) are addressed here; other sensitive receptors and resources potentially affected by project noise are evaluated in detail in their respective EIS sections. The project noise technical report offers an in-depth analysis of the noise impacts associated with the proposed wind turbines, using sophisticated computer modeling and on-site measurements to predict potential noise levels at various distances and conditions.
9183-2	Julie DeWolfe	Infrasound/ Low Status Sound: Oxford Dictionary online defines infrasound as, “sound waves with frequencies below the lower limit of human audibility.” To Whom it may concern, After examining the EIS online and word searching Volume 1, Volume 2a, Volume 2b, and Volume 3, I was unable to find examination of INFRASOUND and its impact upon animals in nature, livestock, insects, and human beings. MVE representatives informed me, at the Canyon Crest open house, that nowhere else are there 740-foot turbines erected and producing power, perhaps the experimental size of Lava Ridge proposed turbines limit what may be known and studied about	Infrasound, which refers to sound waves with frequencies below the lower limit of audibility for humans, is indeed produced by many natural and human-made sources, including wind turbines. However, the levels of infrasound near wind farms have been found to be below the perception threshold for humans, and they are generally lower than levels produced by natural sources like the ocean and wind itself.

Comment ID	Commenter	Public Comment	Response to Comment
		them at this point, however, Lava Ridge Wind Project EIS does not appear to include research on infrasound at all. How might infrasound affect fractured basalt, ash layer, animal production, wildlife, insect communication, or human health? Many scientific studies have been published on the effects of infrasound, but these studies were on smaller turbines than the ones being proposed, I do not wish to be a test subject for the world's tallest turbines. Many studies point to very negative health impacts upon living creatures, even as far away as 10 miles from turbines. Experts have examined infrasound and determined that there are serious health effects. IOP Science Environmental research letters Infrasound and low frequency noise from wind turbines: exposure and health effects Abstract: "Wind turbines emit low frequency noise (LFN) and large turbines generally generate more LFN than small turbines." https://www.masterresource.org/wind-power-health-effects/infrasound-growing-liability-windpower/ <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.masterresource.org%2Fwind-power-health-effects%2Finfrasound-growing-liability-windpower%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cfce8fa9888c2492acc0808db3a99871e%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638168203306308897%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=EIY8ef6zuLsFLmdRMFiAmE2xRb7ubMr9pUktLeo4BdI%3D&reserved=0> ScienceDirect Renewable and Sustainable Energy Reviews Volume 168, October 2022, 112801 "While the number of studies on the impact of noise pollution on wildlife is increasing [29], very few focus on WTN [30]. Nonetheless, dedicated studies on WTN are important given that properties of sound, location of its source, and spatial propagation have all been found to vary greatly between land uses, and be crucially significant for determining the type and extent of anthropogenic noise effects on wildlife." https://www.sciencedirect.com/science/article/pii/S1364032122006852 <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.sciencedirect.com%2Fscience%2Farticle%2Fpii%2FS1364032122006852&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cfce8fa9888c2492acc0808db3a99871e%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638168203306308897%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=28oU4%2FHmKIOXL0eQrncMRKTDZiQdFk%2BB7YM8EEhASJU%3D&reserved=0> MasterResource Infrasound: A Growing Liability for Wind Power By Sherri Lange -- May 29, 2019 "Wind turbines appear to be at the apex of producing human discomfort, annoyance, and harm. In particular, infrasound and low-frequency noise (ILFN) harm because of impacts unique to this concoction of noise." "A recent Finnish assessment, scientifically valid and reproducible, found that infrasound (IS) only began to really attenuate after 15-20 km." (see Finnish assessment attachment A)	The potential effects of infrasound on human health and wildlife are complex and still an active area of research. However, the majority of studies conducted so far have not established a direct link between infrasound from wind turbines and health impacts in humans or animals. As you noted, the effects of wind turbine noise on wildlife are also not fully understood. Some research indicates that wildlife can be initially disrupted by the construction and operation of wind turbines, but populations usually adapt over time. Regarding your concerns about infrasound affecting fractured basalt, ash layers, and insect communication, these are indeed complex issues that require more research. At present, there is limited evidence to suggest significant impacts in these areas.

Paleontological Resources

Table A-3s. Paleontological Resources

Comment ID	Commenter	Public Comment	Response to Comment
11535-138	Steven Andersen	The DEIS analysis focuses on known paleontological resources in the area. However, the inherent nature of paleontology is that resources are unknown and not yet discovered.406 The DIES acknowledges as much, asserting the analysis area contains "high or moderate potential to yield fossils."407 The DEIS attempts to solve this problem by requiring a paleontologist evaluation prior to decommissioning. This type of measure conducted after the completion of the project would do little to mitigate the destruction of unknown paleontological resources during and throughout the entire construction and development phase of the project. In response to the paleontologist evaluation "a monitoring and inadvertent discovery plan would be developed to reduce the likelihood of impact to these resources."408 Again, monitoring the discovery or paleontological resources after the construction has already destroyed them is a hollow and inadequate mitigation effort. Moreover, this effort is only if "deemed necessary" but there is no assertion as to who deems this action necessary.	The EIS includes analysis detailed analysis for one paleontological issue: "How would ground disturbance associated with the project physically affect unknown paleontological resources in areas with mapped Quaternary-age alluvial and lacustrine (or playa) deposits?" Effects to paleontological resources from construction and decommissioning actions would be limited (or controlled) because of the minimal acres of Quaternary-age lacustrine or alluvial deposits within areas of potential disturbance. In addition, MVE's applicant-committed measures 97 through 99 (see Table App4-2j in EIS Appendix 4 [Mitigation]) would be implemented to reduce potential impacts to paleontological resources during construction by establishing a Paleontological Resources Treatment Plan (applicant-committed measure 97). The Paleontological Resources Treatment Plan (Appendix Q in MVE [2023]) would be further developed to outline processes for resource avoidance, assessment, monitoring, and notification of inadvertent discoveries. Applicant-committed measure 98: The Paleontological Resources Treatment Plan would do the following: • Address the education of construction and operations staff and the public on unauthorized collection (or impact) to fossils on public land • Outline guidelines for the avoidance, assessment, and notification of discovered fossils during ground-disturbing activities • Provide a monitoring plan of project ground-disturbing activities in areas of Quaternary-age alluvial and lacustrine (or playa) deposits • Outline guidelines for the preparation, identification, analysis, and curation of fossils that may be collected during monitoring • Provide a framework for the required paleontological monitoring report. Applicant-committed measure 99: Unexpected discovery of cultural or paleontological resources during construction would be brought to the attention of the responsible Authorized Officer immediately. MVE would halt work in the vicinity of the discovery to avoid further disturbance to the resources while they are being evaluated and appropriate next steps are being developed.

Comment ID	Commenter	Public Comment	Response to Comment
			The BLM will deem what mitigation measures would be necessary prior to, during, and following project construction. The EIS also includes rationale for analyzing these three potential issues in brief: "AIB-22: How would concrete foundations for turbines and other infrastructure affect access for scientific research to unknown paleontological resources in areas with Quaternary-age mapped geology? AIB-23: How would human access throughout the project affect the risk of looting or vandalism of known or unknown paleontological resources? AIB-24: How would ground disturbance at material source areas not yet determined (associated with project decommissioning and reclamation) physically affect known or unknown paleontological resources in areas with Quaternary-age mapped deposits?"
11978-127	Magic Valley Energy, LLC	29. Section 3.10.1.1 Paleontological Resources - Affected Environment "The remainder of the Quaternary-age alluvial and lacustrine (or playa) deposits in the siting corridors were deposited during heavy rain and rapid snow melt events in low areas, including between basalt flows, primarily during the Pleistocene and more rarely into recent times and are largely derived from erosion of glacial loess and the older Glenns Ferry Formation (Orthberg et al. 2012)." MVE notes the source name is incorrect. MVE requests the language be updated: "The remainder of the Quaternary-age alluvial and lacustrine (or playa) deposits in the siting corridors were deposited during heavy rain and rapid snow melt events in low areas, including between basalt flows, primarily during the Pleistocene and more rarely into recent times and are largely derived from erosion of glacial loess and the older Glenns Ferry Formation (Othberg et al. 2012)."	This typo has been corrected.
11978-128	Magic Valley Energy, LLC	30. Section 3.10.1.2.2 Paleontological Resources - Alt B "Alternative B work area ground disturbance combined with ground disturbance from existing and future trends and actions would total up to 156 acres or 12.6% of the total analysis area." MVE would appreciate clarification: Does this includes linear miles of roads?	As described in Section 3.10.1.1.1 (Existing and Future Trends and Actions), road impacts are disclosed in miles not acres.

Pollinators and Insects

Table A-3t. Pollinators and Insects

Comment ID	Commenter	Public Comment	Response to Comment
1050-1	Samuel DeGrey	While working for IDFG, I performed range and conservation status assessments for the State Wildlife Action Plan on a variety of insect species considered to be Species of Greatest Conservation Need (SGCN). SGCN species are generally those that are rare and at risk, and include many species that may be just as or more threatened than species federally listed under the Endagered Species Act. One species of rare native bee, Calliopsis barri (https://idfg.idaho.gov/species/taxa/1475434), has a projected range that overlaps with all alternatives of the Lava Ridge project. Calliopsis barri is an S1 SGCN, meaning it is, "Critically imperiled because of extreme rarity or because some factor of its biology makes it especially vulnerable to extinction (typically 5 or fewer occurrences)." Another rare bee, Ashmeadiella sculleni (https://idfg.idaho.gov/species/taxa/1475278), is known from Lincoln county, and while it is not known if it occurs within the proposed lava ridge project, its known habitat is nearby and it is highly possibly this bee also occurs within the region outlined by the project. A. sculleni is an S2 SGCN. Little is known about the population viability or habitat requirements of these two pollinators. The EIS addresses pollinators under section 3.11 , but it does not address either of the rare SGCN bees that likely occur within the proposed confines of lava ridge. Calliopsis barri is a pollinator of the Picabo milkvetch (Alexander et al. 2004), a rare plant which itself is listed among those potentially impacted in the EIS. The EIS repeatedly notes the potential risk to pollinators under section 3.11, including the following excerpts; "Large numbers of insects may be killed by wind turbines. A recent study in Germany estimated that a single turbine located in a temperate zone may kill up to 40 million flying insects per year" and "Decline of insect populations may also diminish their ecosystem function, such as pollination. Declines in pollinators can thus reduce the ability for plants to reproduce and maintain native vegetation community components." With all this in mind, the wind project may pose a serious threat to our local population of Calliopsis barri, particular if nesting sites are destroyed or individual bees killed, which may have a disproportionate affect on a species with a restricted, patchy range, and possibly natural low population numbers. This could then harm the Picabo milkvetch by reducing pollination rates of this very rare, Idaho endemic plant. The current EIS fails to address the risk to these bees, and severely underestimates the potential environmental risks associated with loss of these rare pollinators.	Habitat and range information for Idaho SGCNs were reviewed to determine which species may occur in the siting corridors and be affected by the project. The final EIS has been revised to include the rationale for species that were eliminated from detailed analysis in the EIS (see Tables App3-4 and App3-5 in EIS Appendix 3 [Issues Analyzed in Brief]). *Calliopsis barri* and *Asmeadiella sculleni* have been reclassified as SGINs in the updated Idaho SWAP (IDFG 2023) and therefore are not included in Table App3-4. SGINs are not addressed in the EIS due to the lack of information on these species. Impacts to these species, if they occur in the siting corridors, would be similar to those disclosed for Bureau of Land Management Special-Status Bumble Bees in EIS Section 3.11.4.2 (Impacts).
11224-4	Thomas Billington	Will BLM take responsibility for the loss of pollinators that grow our food in the Magic Valley?	Impacts to pollinators are discussed in EIS Section 3.11.1.2, which specifically discloses the potential for reductions in pollinator populations to diminish the ecosystem services they provide, including pollination of agricultural crops. Additional discussion is provided in Section 3.11.3.2 (Monarch Butterfly, Impacts) and Section 3.11.4.2 (Bureau of Land Management Special-Status Bumble Bees, Impacts). Although all action alternatives would impact pollinators to some degree, however studies quantifying the potential magnitude of this impact are lacking (Arcadis Belgium 2020). Approximately half of all existing wind energy turbines are located in cultivated

Comment ID	Commenter	Public Comment	Response to Comment
			cropland (Harrison-Atlas et al. 2022); concerns have been raised that continued conversion of farmland to wind energy development can reduce overall agricultural output (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017), but studies linking a reduction in crop productivity or yield due to wind turbine–caused pollinator declines are lacking. This issue cannot be analyzed in greater detail due to a lack of studies quantifying crop yield following pollinator loss as a result of wind turbines. 11503-1	Liz (No Last Name Provided)	The success of Magic Valley agriculture depends on the abundance of pollinators. This important aspect of nature is under threat in the Magic Valley if the proposed Lava Ridge Wind Turbine Project is allowed to be built. And from the EIS: "All action alternatives would have irretrievable effects on pollinators through habitat alteration and loss (from work areas and infrastructure) and through displacement, injury, or mortality (vehicle strikes; collision with turbine blades; and application of herbicides or pesticides, removal of vegetation). Habitat alteration and loss effects would last up to 84 years (34 years for project construction, operation, and decommissioning plus 50 years for vegetation to reestablish after final reclamation)." Page 3-310 This impact would be felt by agriculture in loss of productivity. Farmers are already dealing with a loss of bee pollinators due to disease and insecticides. "The presence of wind farms may strongly affect insect pollinator communities with potentially cascading ecosystem effects. Insects represent 80 per cent of the world's species, dominate terrestrial ecosystems, and provide critical ecosystem services such as food for animals and pollination. Insect pollinators are vital for ecosystem health and functioning, both in their native environments and in agricultural systems. Large numbers of insects may be killed by wind turbines, given that residue from insect carcasses on turbine blades creates drag that can decrease efficiency between 25-50 per cent. Turbine color and the heat generated during operation may attract insects and, in turn, bats and birds that feed on insects. Indeed, the majority of bats and birds killed by wind turbines are insectivorous species." https://www.technologytimes.pk/2020/04/14/insect-pollinators-windspeed-foraging-behavior/	The potential for impacts to pollinators to diminish the ecosystem services they provide, such as pollination of agricultural crops, is disclosed in EIS Section 3.11.1.2 (Pollinators, Impacts). This issue cannot be analyzed in greater detail due to a lack of studies quantifying crop yield following pollinator loss as a result of wind turbines (see response to comment 11297-5 [see in Table A-3t, Pollinators and Insects]).

Comment ID	Commenter	Public Comment	Response to Comment
11534-7	Matt Arnold, William Eubanks	Consider, for example, the DEIS and PEIS's examination of fugitive dust impacts on pollinators (e.g., bees), which serve vital ecosystem services for farmers in southern Idaho and elsewhere. As the DEIS forthrightly acknowledges, populations of "[w]ild pollinators . . . are in decline," and much of this decline is tied to the loss of native plant species on which pollinators depend for their habitat and diet. DEIS at 3-299-300. Roads and roadsides associated with wind projects are particularly dangerous for native plant species because they not only cause direct losses, but also because they foster the growth of more successful invasive species. Id. at 303 (explaining why roads are breeding grounds for invasive species); see also PEIS at 5-40 (discussing the myriad ways that "fugitive dust" may impact vegetation). In isolation, dust impacts might seem nominal; however, at industrial wind-energy sites covering tens of thousands of acres, like this one, they are a serious concern for native plants and pollinators since "[f]ugitive dust generation may be relatively high at wind energy development sites located in the more arid ecoregions." PEIS at 5- 40; see also DEIS at 3-358 (describing the analysis area as "arid" with "relative[ly] cold temperatures and [a] lack of moisture"). Despite all of this, the DEIS tiers its analysis of dust impacts on native plants and pollinators to the PEIS, claiming that "[the PEIS] discloses the potential effects of fugitive dust on vegetation and [pollinators], which include injury and mortality of vegetation and respiratory effects to wildlife." DEIS at App'x 3-22 (citing PEIS at 5-40–5-44). The PEIS, in turn, merely states that: [T]he significance of vegetation loss associated with a wind energy project depends on the amount of area disturbed, the types of plant communities (and the habitats they make up) that would be affected, the nature of the effect, the capacity for the disturbed habitat to recover (some habitat types may take a much longer time to recover than others), and whether listed or sensitive plants would be affected. These factors would determine whether the construction impacts to vegetation would be short or long term. DEIS at 5-38. This cursory statement cannot replace the "hard look" under NEPA that the agency owes to pollinators and the farmers that depend on them. Klamath–Siskiyou Wildlands Ctr. v. Bureau of Land Mgmt., 387 F.3d 989, 993 (9th Cir. 2004) ("General statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided." (quoting Ocean Advocates v. U.S. Army Corps of Eng'rs, 361 F.3d 1108, 1128 (9th Cir. 2004))). In fact, the Ninth Circuit has already cast doubt on the sufficiency of the generic analyses contained in the PEIS. See W. Watersheds Project v. Bureau of Land Mgmt., 443 Fed. App'x 278, 280 (9th Cir. 2011) (Graber, J., concurring) ("[T]iering to the 2005 [PEIS] does not cure [BLM's] lack of analysis" when the PEIS's "statement is as general and conclusory as the analysis appearing within the [EIS].").4	BLM (2005:5-44) states, "Fugitive dust generation during construction activities is expected to be short term and localized to the immediate area of the wind energy project and is not expected to result in any long-term individual or population-level effects." As described under AIB-59 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1, a number of measures would be implemented under all action alternatives to minimize or avoid impacts from fugitive dust generation; therefore, the effects of the action alternatives would be no greater than previously disclosed in BLM (2005), and further analysis is not warranted.
11535-74	Steven Andersen	The DEIS fails substantially to consider the negative, irreversible effects the project will have on the monarch butterfly habitat and population. Importantly, the DEIS provides only a cursory review of the potential injury to habitat, and greatly minimizes the effect of decreased availability of milkweed, nectar resources, and other general factors crucial for monarch butterfly population. As a threshold matter, the U.S. Fish & Wildlife Services has designated the monarch butterfly as a candidate under the Endangered Species Act.229 While status under the Endangered Species Act is currently pending, that does not diminish the importance of protection and conservation and does not obviate the BLM's responsibility in the DEIS to take a hard look at the environmental consequences. The fact is that the monarch butterfly population has seen a devastating decline since the 1980s, going from a reported 3-10 million butterflies, to 200-300 thousand butterflies in the early 2000s, all the way down to well below 30,000 butterflies in 2020 (a greater than 99% decline since the 1980s).230 The threat is glaring, yet not thoroughly considered in the DEIS.	The BLM is mandated to identify, protect, and manage sensitive species on the lands under its jurisdiction, outlined in BLM Manual 6840 – Special Status Species Management (BLM 2008). EIS Section 3.11.3.1 (Monarch Butterfly, Affected Environment) notes the observed population declines. EIS Section 3.11.3.2 (Monarch Butterfly, Impacts) provides a detailed analysis of potential impacts to breeding habitat under each alternative. The analysis used a 2019 modeling effort conducted by IDFG, which is the best available scientific information to disclose impacts to breeding habitat (IDFG 2019). Based on this analysis, between 28 and 99 acres of modeled breeding habitat would be replaced by project infrastructure (Table 3.11-8), which would be between 3% and 11% of total modeled breeding habitat in the analysis area. As monarch butterflies are foraging generalists, the EIS analysis states that impacts would be similar to those discussed for general pollinators in EIS Section 3.11.1.2 (Pollinators, Impacts). The EIS documents potential impacts to the species based on the available information.
11535-75	Steven Andersen	It is apparent from the language in the DEIS that conservation efforts have been gravely downplayed, and sufficient research has not been conducted. For example, there are passing remarks that try and minimize the irreparable effect the project will have, such as, "Idaho does not host overwintering or resident populations of monarchs,"231 "[g]iven the relatively small proportion of suitable breeding habitat, the analysis area is unlikely to support dense populations of milkweed that could provide high-quality breeding habitat for large numbers of monarch butterfly,"232 and "[o]verall, 74% of suitable habitat and 78% of optimal breeding habitat have been or will be affected by existing and future trends and actions."233 However, the DEIS admits that "[m]ilkweed specific surveys were not conducted in the siting corridors[,]" 234 "[n]o species-specific surveys have been conducted in the siting corridors[,]"235 and "the exact location of infrastructure and activities within the siting corridors is unknown at this time."236 Gauging the extent of habitat loss in the West at the landscape scale over time is a complex and challenging task even with sufficient research, but without conducting specific surveys on key resources such as milkweed or nectar makes it near impossible.237 The BLM has not carried its burden and has not fully addressed the adverse impacts on the monarch butterfly. The DEIS indicates milkweed was only "incidentally" recorded and considered during project surveys which is concerning given the importance milkweed plays on the monarch butterfly population and habitat. Specifically, a decrease in milkweed resources may leave monarchs with fewer resources on which to feed and lay their eggs, resulting in decreased recruitment for the population.238 Availability of milkweed is essential to monarch reproduction and survival, and its reduction is cited as a key driver in monarch declines.239 The Snake River Plain is a key breeding area in the West, including in Idaho, and any negative impact on the monarch butterfly population is likely to accelerate the extinction of the species.240 By only "incidentally" observing milkweed, and outright admitting that "[m]ilkweed specific surveys were not conducted in the siting corridors[,]"241 the DEIS fails substantially.	Additional project-specific measure zz in EIS Appendix 4 (Mitigation) would require MVE to conduct preconstruction surveys for milkweed and monarchs (including both eggs/larvae on milkweed and adult monarchs) in infrastructure and work areas from May through October, following the procedure outlined in applicant-committed measure 110, and to avoid removal and disturbance of milkweed.
11535-76	Steven Andersen	While the DEIS purports to support its conclusory statements with certain citations, it fails to address certain key conservation guidelines set forth in two primary sources, exposing its deficiencies: the 2020 Species Status Assessment (SSA) and the Western Monarch Butterfly Conservation Plan (as revised) (of which Idaho is a part). 242 In fact, the DEIS makes little to no mention of conservation efforts, only minor mitigation efforts generally	See response to comment 11535-75 (see in Table A-3t, Pollinators and Insects) for a description of milkweed avoidance requirements. Additionally, mitigation measure aaa in EIS Appendix 4 (Mitigation) would require MVE to avoid application of herbicides within 25 m of milkweed, and if herbicides are used, would require application be conducted in the early morning and evening to avoid pollinator active periods. Applicant-committed measure

Comment ID	Commenter	Public Comment	Response to Comment
		(which are not the same). The SSA and the Conservation Plan provide that the loss of milkweed and nectar resources (i.e., breeding and migratory habitat) has been targeted as the threat that can be most easily addressed through conservation efforts.243 Key aspects of the conservation of the monarch butterfly are protection, restoration, enhancement and creation of habitat. 244 These are central to recent monarch conservation strategies, thus highlighting the importance of restoring and enhancing milkweed and nectar resources.245 More specifically, a crucial part of the conservation is to enhance and maintain habitat in western States (including Idaho), by identifying and protecting existing habitat, and planting milkweed species and flowering plants that are appropriate for the location. The DEIS makes no mention of these efforts, and even worse, despite all of this available information, omits any proposed compensatory mitigation of any kind.	102 includes the incorporation of pollinator-friendly seed mixes for restoration and additional project-specific measure ll includes additional seed mix and habitat restoration requirements to benefit pollinators. Implementation of these measures would reduce the potential for disturbance or degradation of milkweed. The Western Monarch Butterfly Conservation Plan, 2019–2069 (Western Association of Fish and Wildlife Agencies 2019) has been incorporated into the final EIS. EIS Section 3.11.3.1 (Monarch Butterfly, Affected Environment) discloses the loss of breeding habitat, specifically milkweed host plants, as the primary cause for the decline of the monarch butterfly. As also disclosed in this section, the sagebrush steppe habitat in the siting corridors exhibit low suitability for milkweed or breeding monarchs, only 3.7% of the siting corridors are considered suitable habitat for monarchs and only 0.5% of the siting corridors are considered optimal monarch breeding habitat. The EIS has been revised to include additional mitigation measures recommended by the Xerces Society for monarch butterfly and pollinators in general (see project-specific mitigation measures zz, aaa, bbb, and ccc). A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation). Since monarch breeding habitat in the siting corridors is limited and would be mostly avoided (due to the implementation of avoidance buffers for wetlands and other water resources; see applicant-committed measure 136) and restoration measures would include reseeding with native seed mixes designed to benefit pollinators (applicant-committed measure 102), there would not be residual impacts to monarch butterfly that warrant compensatory mitigation under any of the action alternatives.
11535-78	Steven Andersen	Further, while the DEIS cites to the Xerces Society, it disregards completely their approach to monarch habitat conservation. The Xerces Society's approach (which is approved by the Idaho Governor's Office of Species Conservation) to monarch habitat conservation can be summarized by the following priorities, in order of importance: (1) identify, protect, and manage existing habitat to maintain its value for monarchs; (2) enhance existing habitat (if needed and appropriate) to improve its value for monarchs; and (3) restore habitat in areas where it occurred historically, but has been lost. No where in the DEIS does the BLM address these guidelines, despite citing to the Society generally.	The Western Monarch Butterfly Conservation Plan, 2019–2069 ((Western Association of Fish and Wildlife Agencies 2019) has been incorporated into the final EIS.
11535-79	Steven Andersen	Even more, the DEIS purports that "the majority of modeled monarch butterfly breeding habitat in the analysis area has already been or would be impacted by human development [and other factors]…and may no longer provide quality native habitat for monarch butterflies."249 However, this statement is made in the face of the admission that surveys have not been conducted and the siting area has not yet been selected. The DEIS also includes this, and many other statements similar in nature, without providing any proposed conservation methods or efforts (and as stated, expressly rejects compensatory mitigation at the very least). Thus, the BLM's proposed actions fly in the face of conservation guidelines, underplaying the catastrophic impact the project will have on the monarch butterfly population.	See response to comment 11535-76 (see in Table A-3t, Pollinators and Insects) for a description of avoidance and other pollinator-related minimization and mitigation measures that would be implemented. Implementation of these measures would reduce the potential for disturbance or degradation of milkweed, where present, and impacts would be unlikely to reach catastrophic levels.
11535-126	Steven Andersen	The DEIS underestimates the impact that this project will have on pollinators and the surrounding ecosystem. The presence of wind farms may strongly affect insect pollinator communities with potentially cascading ecosystem effects.367 Insects represent 80% of the world's species, dominate terrestrial ecosystems, and provide critical ecosystem services such as food for animals and pollination.368 Insect pollinators are vital for ecosystem health and functioning, both in their native environments and in agricultural systems.369 Large numbers of insects may be killed by wind turbines, given that residue from insect carcasses on turbine blades creates drag that can decrease efficiency between 25-50%.370 Turbine color and the heat generated during operation may attract insects and, in turn, bats and birds that feed on insects.371 Indeed, the majority of bats and birds killed by wind turbines are insectivorous species.372 In the last 10 years, the population of monarch butterflies that come to Idaho has already dropped by 99%. The DEIS fails to account for the loss of pollinators in the aggregate. A Princeton study suggests that "ongoing pollinator decline may unravel the very fabric that keeps plant diversity stable."374 Because pollinators are vital to the ecosystem, a decrease in their population leads to a decline in plant biodiversity. Notably, native species which depend on pollinators would be reduced and noxious weeds that do not depend on pollinators could increase.375 A loss in desirable vegetation in the area would ultimately affect larger herbivores in the area. Recent estimates suggest that around 87.5% of the world's flowering plant species are animal-pollinated.376 Reduced pollination of these plants will lead to lower seed or fruit set, lower plant regeneration rates and knock-on effects to the animals that rely on plants and their products for food.	Impacts to pollinators, including the monarch butterfly, are disclosed in EIS Section 3.11 (Pollinators and Insects). Section 3.11.1.1 (Pollinators, Affected Environment) describes the ecosystem services provided by pollinators as well as their importance in agricultural systems. DePaolo et al. (2016) provided references to studies that show several factors contributing to a loss of pollinators due to wind turbines. However, they admit that the impacts of wind energy facilities on insects are poorly understood. Their seed-set experiment indicated that late-blooming flowering plants experienced pollen-limitation and may experience population declines should pollinators decline, and many flowering species in their survey are also present in the project area. However, due to a lack of quantitative data linking wind turbine–caused pollinator loss to a decline in pollination, this issue cannot be analyzed quantitatively. Others have also raised concern with early estimates of insect fatalities at wind energy facilities (e.g., Voigt 2021), but there is currently no evidence that direct mortality from wind turbine collisions poses a major threat to insect populations (Arcadis Belgium 2020). See Section 3.11.1.2.2 (Pollinators, Alternative B [Proposed Action]) for a detailed description of the potential impacts to pollinators from habitat alteration and loss, and displacement, injury, or mortality. This section also discloses the potential for declines in local pollinator populations to diminish the ecosystem services they provide. As described in this section, the siting of turbines to minimize impacts to bats (applicant-committed measures 136 and 138) may also reduce the risk of mortality for pollinators because insect migration routes and bat movement may be coincident. A number of other measures that would be implemented to minimize or avoid impacts to pollinators are also described in this section; a complete list is provided EIS Appendix 4 (Mitigation). These also include measures to prevent the introduction or spread of weeds and other invasive plants and measures to restore native revegetation communities during interim and final reclamation; additional details are provided in the Noxious Weed Management Plan (Appendix R in MVE [2023]) and the Reclamation Plan (Appendix E in MVE [2023]). These measures would help offset any adverse impacts to local pollinator populations and reduce the potential for impacts to herbivores and other animals that rely on these plants for food. All action alternatives would impact pollinators to some degree; however, due to a lack of appropriately designed studies, the degree of this impact is currently unknown and cannot be analyzed quantitatively. Arcadis Belgium. 2020. *Business and nature working together: action by the energy sector to protect wild pollinators*. Technical guidance prepared by Arcadis Belgium for the European Commission under contract No. 07.0202/2018/795538/SER/ENV.D.2 Technical support related to the implementation of the EU Pollinators Initiative.

11535-139	Steven Andersen	There has not bee sufficient consideration given to the BLM's own policy concerning disposal of public lands in relation to species such as the St. Anthony Sand Dune Tiger Beetle. While the DEIS purports to address the irreparable impacts caused to this BLM special-status species, it fails to adequately address and mitigate the net loss that will inevitably occur from the disposal of public land for the project. Specifically, as to BLM lands, it is BLM policy (6840.06C) to ensure that actions authorized, funded, or carried out do not contribute to the need to list any of these (candidate) species as Threatened or Endangered. 409 Indeed, the disposal of public lands characterized by existing or potential beetle habitat would not be consistent with the BLM's guidance.410 Current concerns in the project area should preclude disposal,411 but the DEIS fails to take this into consideration.	None of the alternatives considered in the EIS include disposal of BLM lands; the BLM's purpose is to respond to MVE's application for a ROW grant. BLM Manual 6840.06 (BLM 2008) states, "Actions authorized by the BLM shall further the conservation and/or recovery of federally listed species and conservation of Bureau sensitive species." The manual's Glossary of Terms defines conserve as applied to BLM special-status species as "the use of programs, plans, and management practices to reduce or eliminate threats affecting the status of the species, or improve the condition of the species' habitat on BLM-administered lands" (BLM 2008). EIS Section 1.3 (Decision to be Made) describes the decision to be made by the BLM. EIS Section 3.3 (Avian and Bat Species), Section 3.11 (Pollinators and Insects), Section 3.15 (Vegetation), and Section 3.18 (Wildlife) describe potential impacts to BLM special-status species and the measures that would be implemented to minimize or avoid impacts to BLM special-status species. The St. Anthony sand dune tiger beetle (*Cicindela arenicola*) is discussed in EIS Section 3.11.2. EIS Appendix 4 (Mitigation) provides a complete list of mitigation measures, including potential compensatory mitigation for residual impacts to BLM special-status species. EIS Section 3.11.2.2.2 (Alternative B [Proposed Action]) discusses measures specific to the St. Anthony sand dune tiger beetle and EIS Section 3.11.2.5 (Compensatory Mitigation) discusses compensatory mitigation for this species.
11535-140	Steven Andersen	The DEIS dedicates only 3 and a half pages to the BLM special-status bumble bees, which includes the Western Bumble Bee (Bombus occidentalis). In doing so, the DEIS fails to address conservation efforts, including to the species' habitat, as well as the irreparable impact caused by the project. Currently, the Western Bumble Bee is currently under review for being listed as an endangered species, which the DEIS fails to include in its report. Bumble bees benefit in terms of species richness and abundance when there is a high abundance of nectar and pollen resources and a continuous availability of nectar throughout the season. Isolated patches of habitat, like those found in urban landscapes, have negative effects on species richness and abundance.415 These landscapes may not be sufficient to fully support B. occidentalis populations. Bumble bee populations may be negatively affected when nest sites and nectar and pollen sources are too isolated from one another. This occurs particularly in landscapes that include fragmented habitats, which the subject project would certainly cause. Even more, B. occidentalis mainly nests underground in abandoned rodent nests just below the surface, and therefore, the short period of observation conducted in the DEIS is insufficient to fully evaluate effects on this species. Isolated populations, caused by the project's fragmentation, may lead to a reduction of gene flow between the fragmented populations of plant species that depend on bumble bee visitation, which the DEIS did not consider.424 This, in turn, can cause a reduction of adequate gene flow between bumble bee colonies reliant on the plant species, and adequate gene flow in species helps to prevent inbreeding and maintain adaptive genetic variation.425 None of this was contemplated, and therefore mitigated, in the DEIS.	An updated status, discussion of conservation efforts, and potential for impacts to gene flow for western bumble bee has been incorporated into the final EIS. Additional minimization and mitigation measures and potential impacts have been incorporated into the final EIS.
11557-2	Deanna Weigel, Andy Weigel	several other proposed mitigation measures have no proven efficacy and/or rely on technology and methods that do not even exist currently. Examples include: Special-Status Plants: unproven treatment methods to restore dunes to suitable tiger beetle habitat	EIS Section 3.11.2.1 (St. Anthony Sand Dune Tiger Beetle, Affected Environment) discusses a study that was conducted in Idaho that evaluated the potential for restoration of dune habitats for tiger beetles with the selective application of herbicides to combat invasion of nonnative vegetation (Bouffard et al. 2009). The results of this pilot study demonstrated that application of imazapic has the potential to be an effective approach to reducing invasive annual grasses on sand dunes, while having little direct effect on beetles.
11598-13	Idaho Conservation League	Pollinators Insects have been found to have fatal interactions with wind turbines. While there are few studies that have been able to determine the exact impact of this energy infrastructure on pollinating insects, it appears that swarming and migrating arthropods are often killed by turbines. The DEIS cites one recent German study as attributing up to 40 million flying insect mortalities to a single turbine. Declines in insect populations can lead to a significant decline in the ecosystem services provided by these species, especially pollination. Additionally, much of 7 U.S. Dep't of Interior, Sec. Order No. 3362: Improving Habitat Quality in Western Big-Game Winter Range and Migration Corridors (Feb. 9, 2018). 8 Idaho Action Plan, Version 5.0 (IDFG, 2023) the habitat in the project area has been altered through many previously documented anthropogenic inputs. Nevertheless, several imperiled insects and polinator species are located in the analysis area, such as the monarch butterfly (IUCN Red-listed as endangered), St. Anthony Sand Dune Tiger Beetle (BLM special-species status) and Suckley's cuckoo/western bumble bees (BLM special-species status). With agriculture being the dominant land use near the project site, maintenance of healthy pollinator populations is especially important for the environmental and economic health of the area. ICL notes that simply improving habitat for pollinators or other sensitive insects within the project area may not be the best mitigation measure if these species may be harmed by turbine operations. We are pleased to see that MVE has proposed many actions associated with avoiding, minimizing, and in some cases providing compensatory mitigation, for impacts to pollinators and other insect species potentially impacted by the Lava Ridge project. ICL acknowledges that demonstrable results of a rigorous mitigation hierarchy may be difficult to ascertain, and suggests BLM and MVE look to the Xerces Society or similar pollinator focused organizations in developing meaningful mitigation.	The draft EIS incorporated several BMPs suggested by the Xerces Society in McKnight et al. (2018). These include the development of the Noxious Weed Management Plan (Appendix R in MVE [2023]) and avoidance of pesticides that are known to be toxic to bees and other pollinators (additional measure ccc). Two additional measures suggested by the Xerces Society (2018) were incorporated to the final EIS: 1) Use seed mixes that will ensure at least three different flowering species are blooming throughout the growing season. Use seed mixes that have a combination of wildflowers, succulents, thistles, perennial bunchgrasses, and shrubs; and 2) during interim and final reclamation, scatter slash collected during vegetation clearing and maintain or leave some undisturbed naturally occurring bare ground to provide microhabitats for ground-nesting bees (additional measure ll).
11871-4	WildLands Defense	Insects receive no surveys, despite wind turbines causing the death of very large numbers of insects.	During the development of the EIS, the BLM assessed the adequacy of baseline technical reports and accompanying data provided by MVE to confirm that the information is adequate to address EIS technical

Comment ID	Commenter	Public Comment	Response to Comment
			analysis requirements. This included the identification of data gaps and development of additional technical studies to address these needs. Through this process, the BLM obtained information on insects with the potential to occur in the siting corridors through a background literature search and coordination with IDFG. The information obtained through this process was sufficient to generally characterize the existing conditions for pollinators and other insects as described in EIS Section 3.11.1.1 (Pollinators, Affected Environment). Due to the potential for impacts to the St. Anthony sand dune tiger beetle, a BLM special-status species, the BLM determined that preconstruction baseline resource surveys for the species were warranted; the results of these surveys are summarized in EIS Section 3.11.2.1 (St. Anthony Sand Dune Tiger Beetle, Affected Environment). Although the agency scoping process and early coordination with IDFG did not identify a need for preconstruction baseline resource surveys for other BLM special-status insects, the BLM received a number of comments during the public scoping period that expressed specific concerns regarding the potential impacts to the monarch butterfly (a candidate for ESA listing and BLM special-status species) and BLM special-status bumble bees. In response to these comments, the BLM conducted additional analysis for these species (see EIS Section 3.11.3 [Monarch Butterfly] and EIS Section 3.11.4 [Bureau of Land Management Special-Status Bumble Bees]) and determined that additional measures to minimize or avoid impacts to these species were warranted. Specifically, additional measure zz, stipulates that "MVE would conduct preconstruction surveys for milkweed and monarchs (including both eggs/larvae on milkweed and adult monarchs) in infrastructure and work areas from May through October." Because other pollinators use habitats similar to the monarch butterfly, additional preconstruction baseline resource surveys for pollinators and other insects are not warranted. Incidental surveys for presence of sensitive pollinators would be implemented through the Environmental Compliance and Monitoring Plan, which would help inform the development of BMPs during construction (see additional measure ddd).
11871-28	WildLands Defense	Potential lethal impacts to, or disruption of, insect migrations: https://www.mdpi.com/2071-1050/14/23/16186 "When migrating insects reach maturity, and as soon as wind direction, wind speed, air temperature and season match with their intrinsic behavior patterns, they ascend above the turbulent surface layer of the atmosphere, which varies in height between 40 and 100 m above ground level [20]. There, they find strong, directional, undisturbed winds that they can use as transport vehicle to get to their preferred mating, breeding and feeding grounds, which contradicts the general assumption that flying insects are intrinsically safe from being captured by modern wind rotors that stand higher than their presumed flight boundary layer. Furthermore, it is likely that for efficiency reasons, insects do not rise much higher than necessary to find strong winds. This is the same reasoning that has motivated wind power developers to place rotors just above the turbulent surface layer. It is unsurprising that migrating insects and wind rotors sooner or later meet at the same places. Damaged insects have been found within wind farms, and in-depth analysis of related impacts and countermeasures [21]." Further: "Insect impingement is not a fiction; during the past 30 years, a considerable scientific and industrial effort has been dedicated to the development of rotor blade surfaces that resist erosion by airborne particles and the adherence of residues from such impacts. Erosion of the blade's leading edge reduces the economic lifetime of a wind farm, and residues sticking to the blade surface reduce the efficiency of power generation [35,36]. Particles under assessment include ice, sand and flying insects. In order to understand the phenomenon and to identify mitigating measures, part of the literature is dedicated to the quantification of insect impacts. Such studies quantify the "insect collection efficiency" of airfoils and the "rupture velocity" of insects as a function of their size and of the airfoil design [32,33,37]".	The potential for pollinators and other insects to experience injury or mortality from collisions with operational turbines is disclosed in EIS Section 3.11.1.2 (Pollinators, Impacts); see also EIS Section 3.11.3.2 (Monarch Butterfly, Impacts) and EIS Section 3.11.4.2 (Bureau of Land Management Special-Status Bumble Bees, Impacts). The EIS does not assume that that pollinator and other insect mortality would be reduced by taller turbines; conversely the potential for species that migrate at high altitudes to experience increased mortality from turbine collisions (while gaining or losing altitude) is described in EIS Section 3.11.3.2. As described in EIS Section 3.11.1.2, the siting of turbines to minimize impacts to bats (applicant-committed measures 136 and 138) may also reduce the risk of mortality for pollinators because insect migration routes and bat movement may be coincident. This section describes a number of other measures that would be implemented to minimize or avoid impacts to pollinators. Specific measures that would be implemented to minimize or avoid impacts to monarch butterflies and BLM special-status bumble bees are discussed in EIS Section 3.11.3.2 and Section 3.11.4.2, respectively. A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
11871-29	WildLands Defense	Strong evidence suggests that insect migration routes cross existing wind farm sites, and the height of insect migration over the ground coincides at least partially with the height of modern wind rotors [21,23,24,25,29]. Prominent examples that are possibly affected include the painted lady butterfly travelling between central Africa and Europe [17] and the monarch butterfly travelling between Mexico, the United States and Canada [26].	The potential for pollinators and other insects to experience injury or mortality from collisions with operational turbines is disclosed in EIS Section 3.11.1.2 (Pollinators, Impacts); see also EIS Section 3.11.3.2 (Monarch Butterfly, Impacts) and EIS Section 3.11.4.2 (Bureau of Land Management Special-Status Bumble Bees, Impacts). EIS Section 3.11.1.2 specifically discloses the potential for insect migration routes to overlap with wind energy facilities because of the wind currents that both rely on. EIS Section 3.11.3.2 specifically discloses impacts to migrating monarch butterflies. As described in EIS Section 3.11.1.2, the siting of turbines to minimize impacts to bats (applicant-committed measures 136 and 138) may also reduce the risk of mortality for pollinators because insect migration routes and bat movement may be coincident. This section describes a number of other measures that would be implemented to minimize or avoid impacts to pollinators. Specific measures that would be implemented to minimize or avoid impacts to monarch butterflies and BLM special-status bumble bees are discussed in EIS Section 3.11.3.2 and EIS Section 3.11.4.2, respectively. A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
11871-30	WildLands Defense	Damage to wind turbines caused by flying insects has been reported since the beginnings of wind power industry [32,36,40,42,46]. Since then, intensive efforts to avoid insect erosion and fouling of rotor blades have solved the problem of insect impingement for the wind industry but not for insects. At first glance, mitigation measures to protect insects from impingement seem feasible and affordable, and related losses of wind energy seem to be acceptable. We conclude that international energy policy and environmental protection standards should be adopted to understand and mitigate the impacts of wind power generation on flying insect populations".	The potential for pollinators and other insects to experience injury or mortality from collisions with operational turbines is disclosed in EIS Section 3.11.1.2 (Pollinators, Impacts); see also EIS Section 3.11.3.2 (Monarch Butterfly, Impacts) and EIS Section 3.11.4.2 (Bureau of Land Management Special-Status Bumble Bees, Impacts). The only mitigation measure discussed in the referenced article (Thess and Lengsfeld 2022) is the hypothetical use of LiDAR to detect approaching insect swarms and curtail turbines to avoid collisions. However, there are no references to any studies evaluating the feasibility or effectiveness of this potential mitigation measure. EIS Section 3.11.3.2 describes the measures that would be implemented to minimize or avoid impacts to pollinators. Specific measures that would be implemented to minimize or avoid impacts to monarch butterflies and BLM special-status bumble bees are discussed in EIS Section 3.11.3.2 and EIS Section 3.11.4.2, respectively. A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation). These include

			proactive measures to site turbines away from areas that may support higher concentrations of pollinators and other insects. Thess, A.D., and P. Lengsfeld. 2022. Side Effects of Wind Energy: Review of Three Topics–Status and Open Questions. *Sustainability* 14:16186.
11871-31	WildLands Defense	"Insect fatalities at wind turbines as biodiversity sinks" Christian C. Voigt,26 January 2021 https://doi.org/10.1111/csp2.366 " a single turbine located in the temperate zone might kill about 40 million insects per year. Furthermore, Scheimpflug Lidar measurements at operating wind turbines confirm a high insect activity in the risk zone of turbines". As swarming and migration are linked to mating and dispersal, respectively, fatalities at wind turbines may have profound effects on insect populations at various spatial scales. Some insects, such as hill-topping butterflies, may occur only in small populations at a local scale. Placing wind turbines close to these populations or to the corresponding mating areas of these insects, for example on a mountain ridge or hilltop (Figure 2), may largely affect local populations. In addition, decline of insect populations may also diminish their ecosystem function, including services like pollination. Currently, we lack data on how siting of wind turbines affect insect fatalities at turbines and thus, how turbine siting may impact local insect diversity and associated ecosystem functions. Migrating insects may get in contact with wind turbines when moving at aerial layers that are also suitable for wind energy production. A high fatality rate of migratory insects at wind turbines may have negative consequences for distant insect populations. However, it seems challenging to quantify the effect of turbine-related fatalities on populations of migratory insects because of the intrinsic difficulty in establishing connectivity between the site where insects are killed and the corresponding source populations. It is noteworthy that insect–wind turbine interactions may also affect predators hunting for insects at turbines. Aerial insectivores such as bats are well known for searching and hunting insects in proximity to wind turbines (Foo et al., 2017; Horn, Arnett, & Kunz, 2008; Johnson, 1957; Roeleke, Blohm, Kramer-Schadt, Yovel, & Voigt, 2016; Valdez & Cryan, 2013). Rydell and colleagues argued that the findings of diurnal flies in the stomachs of bat carcasses collected below wind turbines is indicative of bats hunting for flies resting on turbine structures (Rydell et al., 2016). Furthermore, it was argued that bat mortality at wind turbines is linked to insect migration in northern Europe (Rydell et al., 2010). Thus, insect attraction to wind turbines may impact trophic links associated with these insects, such as insect-mediated ecosystem functions and aerial predation of these insects at wind turbines. Concluding, interactions of insects with wind turbines have multifaceted consequences that reach across trophic levels and over larger spatial scales'.	The potential for pollinators and other insects to experience injury or mortality from collisions with operational turbines is disclosed in EIS Section 3.11.1.2 (Pollinators, Impacts); see also EIS Section 3.11.3.2 (Monarch Butterfly, Impacts) and EIS Section 3.11.4.2 (Bureau of Land Management Special-Status Bumble Bees, Impacts). This includes a discussion of the conclusions in Voigt (2021). Voigt, C.C. 2021. Insect fatalities at wind turbines as biodiversity sinks. Conservation Science and Practice. Available at: https://www.researchgate.net/publication/348790564_Insect_fatalities_at_wind_turbines_as_biodiversity_sinks. Accessed December 29, 2023.
11978-38	Magic Valley Energy, LLC	Section 3.11.2.2.2 – St. Anthony Sand Dune Tiger Beetle Impacts (Alternative B) 35. The DEIS states: "The project would affect St. Anthony sand dune tiger beetle habitat and populations through habitat alteration and loss (from work areas and placement of infrastructure and dune stabilization from expansion of nonnative vegetation) and injury or mortality (vehicle strikes and crushing of individuals by workers or construction equipment)." a. MVE Comment: Using the logic presented in the comments above, the Project would not be expected to affect individuals or populations of tiger beetles given the 0.5 mile buffer between occupied or good habitat and siting corridors and given the one instance of potential habitat fragmentation is only applicable to an area that is already isolated from any surrounding marginal or good habitat, thus unlikely to host tiger beetles. As such, MVE requests that the above-quoted language be removed in the FEIS. Further, applicant-committed measures that protect tiger beetles and their habitat will be implemented (i.e., where possible MVE will survey to mark for avoidance to sand dune tiger occupied and good habitat, to the extent feasible MVE will avoid newly identified occupied habitat, MVE will use silt fencing within 0.6 miles of occupied and good habitat, and MVE will implement a noxious weed plan). When analyzed collectively, this would remove the need for BLM-required additional measures (DEIS Appendix 4 Measures hh, ii, mm, nn) and tiger beetle related compensatory mitigation (DEIS Appendix 4 measures III, IV, and V), and MVE requests that these measures be removed in the FEIS.	While the BLM appreciates MVE's applicant-committed measures to minimize or avoid impacts to the St. Anthony sand dune tiger beetle and its habitat, all of the action alternatives would involve ground disturbance in mapped good and marginal habitat. All action alternatives also involve the placement of project infrastructure within potential dispersal habitat for the species. Since MVE has not committed to complete avoidance of all potential habitat and dispersal areas for the species, the EIS must disclose the potential for the action alternatives to cause habitat alteration, loss, and fragmentation, as well as the potential for direct injury and mortality. As described in EIS Section 3.11.2.1 (St. Anthony Sand Dune Tiger Beetle, Affected Environment), protection of smaller, isolated dunes like those present in the analysis area may be integral to the long-term preservation of the species. Because MVE has not committed to complete avoidance of these sensitive areas, the BLM has determined that additional measures need to be implemented to meet the BLM's obligation to ensure its decisions do not contribute to a loss of population viability or trend toward federal listing for any BLM special-status species. These additional measures are discussed in Section 3.11.2.2.2 (St. Anthony Sand Dune Tiger Beetle, Alternative B with Additional Measures); see also EIS Appendix 4 (Mitigation). As described in EIS Section 3.11.2.5 (St. Anthony Sand Dune Tiger Beetle, Compensatory Mitigation), with the implementation of these applicant-committed measures and additional mitigation, impacts to St. Anthony sand dune tiger beetle would be largely minimized or avoided. Compensatory mitigation would only be considered in the event that MVE determines complete avoidance is not feasible.
11978-39	Magic Valley Energy, LLC	36. The DEIS states: "The majority of project components would be located outside mapped St. Anthony sand dune tiger beetle habitat. The nearest turbine siting corridor would be approximately 0.15 mile south of the nearest mapped marginal habitat and approximately 0.5 mile southeast of the nearest mapped good habitat. St. Anthony sand dune tiger beetle individuals have been observed in both of these areas." a. MVE Comment: This language could be interpreted to mean that the beetles have been observed in the Project siting corridors, which is not the case. It should be noted that the siting corridors are 0.5 mi from the nearest occupied habitat (based on WEST and historical data records), and that beetles were only observed in habitat classified as good (veg cover <20%). Based on WEST's 2021 St. Anthony Sand Dune Tiger Beetle Memo ("2021 Memo") and historical Idaho Fish and Game (IDFG) data records (referenced in the 2021 Memo), the siting corridors are 0.5 miles from the nearest habitat classified as occupied habitat, and beetles have only been historically observed in habitat classified as good, where vegetation cover is noted as less than 20%. According to the 2021 Memo, some areas where the species was previously known to occur may no longer be suitable for the species due to disturbance resulting from clearing vegetation along the highway. MVE is requesting a change in FEIS to note that only good habitat is known to contain populations of St. Anthony Sand Dune Tiger Beetle, and siting corridors are 0.5 miles from the nearest occupied habitat.	The EIS has been updated to clarify that St. Anthony sand dune tiger beetles have not been observed within the siting corridors, and that the nearest occupied habitat is located 0.5 mile outside of the nearest siting corridor.
11978-40	Magic Valley Energy, LLC	37. The DEIS states: "No new access roads would be constructed within mapped St. Anthony sand dune tiger beetle habitat, though one new access road, connecting ID 24 and Owinza Road, would be constructed between	As described in EIS Section 3.11.2.1 (St. Anthony Sand Dune Tiger Beetle, Affected Environment), this species' known dispersal distance is 0.75 mile. Because not every dune area within 0.75 mile of the siting corridors was

Comment ID	Commenter	Public Comment	Response to Comment
		areas of poor and marginal mapped habitat south of ID 24 and marginal habitats located north of ID 24. No St. Anthony sand dune tiger beetle individuals have been recorded in these habitat areas; however, construction of the access road would contribute to fragmentation of dispersal areas between mapped habitats and may result in direct mortality of dispersing individuals if present in the mapped habitat areas adjacent to the new access road during construction and operation." a. MVE Comment: The one fragment of marginal habitat that would be separated from poor habitat by the new access road is unlikely to have a tiger beetle population, given that it is not classified as good habitat – which is the only classification of habitat that the 2021 Memo mentioned as having tiger beetle present during the survey efforts. In addition, this specific marginal habitat area is greater than 0.5 miles from any other marginal habitat, making it isolated and even less likely to be used by the beetles. As such, the new access road would not have an impact on occupied or good habitat; therefore, the DEIS statement quoted above should be removed as the new road construction given in the DEIS is unlikely to have any impact on habitat fragmentation within an area already unlikely to contain tiger beetles.	subject to species-specific survey and field habitat evaluation, the draft EIS must assume that there is the potential for individuals to be present anywhere potentially suitable habitat for this species is present, and account for potential impacts to dispersing individuals. Additionally, the noted marginal habitat that would be separated from adjacent poor habitats by the proposed access road would be within 0.75 mile of other marginal habitats; therefore, it is reasonable to assume that dispersal may occur.
11978-129	Magic Valley Energy, LLC	31. Section 3.11.1.1 - Pollinators and Insects - Affected Environment "Wild pollinators, such as the monarch butterfly (Danaus plexippus) (see Section 3.11.3 [Monarch Butterfly]) and a number of bumble bee species (see Section 3.11.4 [BLM Special-Status Bumble Bees]), are in decline (Idaho State Department of Agriculture 2016)." MVE requests the language be updated. The correct scientific name for the monarch butterfly is Danaus plexippus plexippus.	The EIS follows BLM, USFWS, and IDFG naming conventions, all of which list the monarch butterfly as "*Danaus plexippus*." Therefore, this change was not made in the final EIS.
11978-130	Magic Valley Energy, LLC	32. Section 3.11.2.3 - Pollinators and Insects - Irreversible and Irretrievable Commitments and Short Term Uses Versus Long Term Productivity "These effects would occur during the 34- year life of the project but would not be considered irreversible because the majority of existing tiger beetle habitat would be unaffected by the project and because the small number of individuals that may be killed would not be unlikely to result in a trend toward federal listing under the ESA or a loss of population viability." MVE requests the double negative be removed for clarification: "These effects would occur during the 34-year life of the project but would not be considered irreversible because the majority of existing tiger beetle habitat would be unaffected by the project and because the small number of individuals that may be killed would not be likely to result in a trend toward federal listing under the ESA or a loss of population viability."	Typo corrected.
11978-169	Magic Valley Energy, LLC	Section 3.11.2.1 – St. Anthony Sand Dune Tiger Beetle Affected Environment 34. MVE Comment: The depiction of poor habitat for St. Anthony Sand Dune Tiger Beetle in Figure 3.11-3 and any surrounding language should be removed since the analysis area given in the DEIS for St. Anthony sand dune tiger beetle is defined by good and marginal habitat for the species plus the area within 0.75 mile of this suitable habitat.	While the analysis area for the St. Anthony sand dune tiger beetle is based on a buffer (of 0.75 mile) around good and marginal habitat for the species, the impact indicators used to analyze this issue include "acres of ground disturbance in St. Anthony sand dune tiger beetle habitat," which includes acres of ground disturbance in poor habitat that falls within the analysis area. This change was not made in the final EIS.
12085-1	Richard Dinges	No where in the Bureau of Land Management's (BLM) draft Environmental Impact Statement (EIS) for the Lava Ridge wind turbine project is the effect of anthropogenic noise on terrestrial invertebrates considered. Terrestrial invertebrates use sound for mating activities, communicating with each other, for predator- prey dynamics, movement, habitat selection and physiology. There will be various sound wave frequencies generated during the construction phase from vehicles, construction equipment, blasting for tower bases, to name a few. Also, the blasting activity will generate substrate-borne anthropogenic noise. During wind turbine operation, anthropogenic noise will be generated by the wind turbines and the associated maintenance and operational activities. Nature always seeks a balanced ecosystem. If the effects of the Lava Ridge project on terrestrial invertebrates are not considered, an imbalanced ecosystem could bring serious consequences. One hallmark of this EIS is that although it goes into great detail about what the fatality rate may be of bats, birds, raptors, and pollinators, it never considers what the overall effect is on the ecosystem.	One study by Velilla et al. (2021) found that vibrational noise from operational turbines reduced earthworm abundance; however, this effect decreased with distance and was most pronounced within 32 to 64 m (105 to 210 feet). Further, the authors noted there were no similar sites nearby without wind turbines to serve as a control for the study; thus, it is impossible to determine how earthworm abundance in areas impacted by wind development compares to earthworm abundance in undeveloped areas. It is also unclear whether these findings are applicable to other similar size invertebrates, and the study noted that vibrational noise had no effect on smaller invertebrates. Even if the abundance of some terrestrial invertebrates is reduced within 210 feet of turbine bases, these effects would be limited to no more than 1,400 acres under any action alternative (3.5 acres per turbine [20-foot turbine diameter plus 210-foot disturbance buffer] × 400 turbines under Alternative B). Other project-related noise (such as blasting and construction activities) would be short term and localized to the immediate vicinity of active work areas. Given the short-term nature of most noise and vibration impacts and the very small area where terrestrial invertebrates could experience long-term effects from noise and vibrations, a more detailed analysis is not warranted. Velilla, E., E. Collinson, L. Bellato, M.P. Berg, and W. Halfwerk. 2021. Vibrational noise from wind energy-turbines negatively impacts earthworm abundance. *Oikos* 130(6):844–849. Available at: https://www.researchgate.net/publication/351143039_Vibrational_noise_from_wind_energy-turbines_negatively_impacts_earthworm_abundance?__cf_chl_tk=z1WsOG1MvE50plfOMclTY4guR8KhLyyKOTtJx..lIdE-1703807635-0-gaNycGzNEbs. Accessed December 28, 2023.
12085-4	Richard Dinges	Also, the effect of electromagnetic field (EMF) on the terrestrial invertebrates must be evaluated. There will be 56 miles of buried cable generating ground level EMF. During construction, significant 4 and 5 g cell phone activity will also take place generating high frequency EMF. My comments on the anthropogenic noise impact is based on a paper by Maggie Raboin and Damian O. Elias titled "Anthropogenic noise and the bioacoustics of terrestrial invertebrates". The link to the paper is enclosed. Of particular interest is a paper referenced in the above paper by Losely, J.E. and Vaughan, M. (2006). The economic value of ecological services provided by insects. The Lava Ridge wind project encompasses almost 200,000 acres of public lands and abuts and surrounds private lands which are mostly irrigated and grow a wide variety of crops. Thus the effect of this wind project on this entire area's ecosystem must be considered.	While the publicly available literature indicates that EMF radiation may impact invertebrate activity (Friesen and Havas 2019; Levitt et al. 2022; Wyszkowska et al. 2019), the literature also indicates that the EMF radiation levels at ground level beneath high-voltage (i.e., 500-kV) transmission lines and above buried medium-voltage (i.e., 230-kV) electrical cables is typically far below the threshold required to induce physiological or behavioral changes, but that flying insects within 1 m (3.3 feet) of high-voltage transmission lines may be affected (Middleton and Barnhart 2023; Wyszkowska et al. 2016). Buried collector lines would be much lower voltage (i.e., 34.5-kV), and the surrounding soil would provide insulation from EMF radiation. Therefore, it is unlikely that EMF radiation from buried collector lines (or new overhead collector and transmission lines) would have a measurable impact on terrestrial invertebrates. Higher frequency EMF radiation from modern 4G and 5G cell phone towers has been shown to effect flying invertebrates (i.e., bees) at greater distances (within 500 m [1,640 feet]) (Taye et al. 2017); effects from the EMF radiation emitted by cellphones require prolonged, close contact with the device (Panagopoulos et al. 2006). Since none of the alternatives include construction of cell towers, there would be no impacts to terrestrial invertebrates from EMF radiation associated with cellphones. Given the

12950-3	Susan Stacy	Comment No. 3. Native species of Bombus. (Bumblebees) I am not persuaded that the impact of the proposed project on native species of bumblebees is well understood or likely to be mitigated if the impact is negative.	EIS Section 3.11.4.2.2 (Alternative B [Proposed Action]) discloses that the project would have negative impacts on bumble bees. The final EIS has been revised to include additional mitigation measures for pollinators, such as specific seed mix requirements that would benefit these species (see additional measure ll).
1453-1	Tammy Foster	I have done a bit of research regarding the dwindling honeybee population. This is a very important subject for our agriculture and the local people who raise their own produce, and the need for honeybees to pollinate all plants. The population of Honeybees has dwindled far enough that farmers and gardeners are having trouble with the pollination of their corps. I read an article about the effect of windmill noise and vibrations, some audible to humans and others that are not audible to humans. The vibrations can travel much farther than audible sound and affect a vast area several miles from the wind farm itself. Downwind those low frequency vibrations can travel 50 KM from the source. In a report by H W Kircher titled Acoustical Communication of Honeybees, he finds the airborne sounds and vibrations play an important role in Honeybee communication. The article also states It come to light that Honeybees use sound and vibrations similar to sonar used by marine life and bats. Since vast areas are within affective range of low frequency sound levels emitted by wind farms, it is clear that there is a connection between low frequency sound produced by the wind turbines and the disappearance of Honeybees. The area with the most disappearance of Honeybees directly corresponds with that of operating wind farms.	The BLM is unaware of peer-reviewed literature documenting low-frequency noise from wind turbines traveling 50 km from the source; noise generally dissipates at rate of 6 dB for every doubling in distance. Thus, noise is expected to reach a level between 27 and 33 dB (background noise in a rural setting) between 1.2 and 2.4 km from each turbine. While the frequency range of acoustic communication by honeybees overlaps with the low-frequency sounds emitted by operation wind turbines, the BLM is not aware of peer-reviewed literature documenting impacts to honeybees from turbine noise.
3873-1	Julie DeWolfe	After examining the volumes online and doing word searches in Volume 1, Volume 2a, Volume 2b, and Volume 3, I was unable to find thorough scientific examination of subterranean species, specifically earth worms, if I have missed that section please direct me to the impact study of Arcteonais lomondi Aulodrilus americanus Aulodrilus limnobius Aulodrilus pigueti Aulodrilus pluriseta Chaetogaster diaphanus Chaetogaster diastrophus Dero digitata Dero furcata Driloleirus americanus Haplotaxis gordioides Ilyodrilus templetoni Kincaidiana hexatheca Limnodrilus claparedeianus Limnodrilus hoffmeisteri Limnodrilus profundicola Limnodrilus silvani Limnodrilus udekemianus Nais barbata Nais behningi Nais bicuspidalis Nais bretscheri Nais communis Nais elinguis Nais pardalis Nais simplex Nais variabilis Ophidonais serpentina Pristina aequiseta Pristina jenkinae Pristina leidyi Pristina osborni Quistradrilus multisetosus Rhyacodrilus coccineus Rhyacodrilus montana Rhyacodrilus sodalis Rhynchelmis diespluviae Rhynchelmis elrodi Rhynchelmis gustafsoni Rhynchelmis monsserratus Rhynchelmis rostrata Rhynchelmis utahensis Rhynchelmis yakimorum Slavina appendiculata Specaria josinae Spirosperma ferox Spirosperma nikolskyi Stylaria lacustris Stylodrilus heringianus Telmatodrilus vejdovskyi Tubifex tubifex Uncinais uncinate As listed on the Idaho Official Government Website for Idaho Fish and Game. https://idfg.idaho.gov/species/taxa/class/Animalia/Annelida/Oligochaeta <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fidfg.idaho.gov%2Fspecies%2Ftaxa%2F	As described in the response to comment 3873-2 (see in Table A-3t, Pollinators and Insects), impacts from noise and vibration would be temporary and highly localized. Additional short-term impacts could occur in work areas due to direct mortality or habitat alteration from ground disturbance, but earthworms would be expected to return to disturbed soils following construction (Vellila et al. [2021] found that soil conditions were not correlated with earthworm abundance). Given the short-term nature of most effects to earthworms and the highly localized nature of potential long-term effects (see comment 12085-1 in Table A-3t, Pollinators and Insects), a more detailed analysis is not warranted.

3873-2	Julie DeWolfe	"A major contributing source of anthropogenic vibrational noise comes from wind energy turbines, which are mainly found in rural or farming areas and sometimes cover a large land surface. The blades, the rotor and the shafts from wind turbines are supported by a tower that is usually anchored to a heavy concrete and steel rebar platform reaching up to nine meters in depth (Stammler and Ceranna 2016). These platforms are needed to withstand the weight of the turbine, and although they may additionally reduce some of the vibrational noise created by the turbine, they induce vibrations in the soil, mostly in the low frequency range <500 Hz (Stammler and Ceranna 2016). So far, we have little knowledge on how wind-turbine generated noise affects soil animals 4 The potential impact of noise on animals may depend on the overlap between an animal's body size and the spectral distribution of the vibrations that travel through the soil. Vibrations generated by wind energy turbines are typically low in frequency (< 500 Hz) and small-bodied animals (mesofauna, < 10 mm in size) might not be able to perceive, or even experience any strain from these low-frequency waves. Larger soil animals (macrofauna, > 1 cm in size), however, might be able to perceive low-frequency vibrations and can therefore be impacted by turbine noise through a perceptual mechanism. Among macrofauna, earthworms are particularly sensitive to low-frequency vibrations as they use vibrational cues to detect approaching predators (Catania 2008, Farina 2014). Earthworms are crucial ecosystem engineers (Jones et al. 1997) that are well known to influence soil structure, hydrology and nutrient quality as well as plant production (Clements et al. 1991, Van Groenigen et al. 2014, Bertrand et al. 2015). Vibratory noise from turbines may either mask, or mimic vibratory cues produced by approaching predators, such as moles, and earthworms may surface in response (Catania 2008, Dominonllai et al. 2020). An increased perception of predation pressure, or decreased response to predatory cues could both lead to a decline in earthworm abundance in areas with high vibrational noise, consequently affecting soil structure, water infiltration, nutrient cycling, carbon sequestration and more (Blouin et al. 2013, Bertrand et al. 2015)." https://www.researchgate.net/publication/351143039_Vibrational_noise_from_wind_energy-turbines_negatively_impacts_earthworm_abundance <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.researchgate.net%2Fpublication%2F351143039_Vibrational_noise_from_wind_energy-turbines_negatively_impacts_earthworm_abundance&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C8b8a67bf619647325a6d08db19e346ac%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638132236188915127%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=1%2FpDgsFWcCyWJf%2FC4nwrY0UaXT5vWpaw1oyAVB%2BECWU%3D&reserved=0> "Snails and other arthropods have vibration receptors along the entire body surface. Snakes, spiders, earth and slow worms, flies, ticks, mites, these and many more tiny creatures depend on vibrations to live and function, and significant change could devastate them." https://www.wind-watch.org/documents/unrecognised-wind-turbine-threat/ <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.wind-watch.org%2Fdocuments%2Funrecognised-wind-turbine-threat%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C8b8a67bf619647325a6d08db19e346ac%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638132236188915127%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=80CevAhK8E1wwu8%2FkbaMx8URBdToLA%2B%2BORPuEjfgBu8%3D&reserved=0> While we may view worms as lowly, many have done the research elsewhere and come to troubling conclusions that wind turbines are harmful to the lifecycle of earthworms, in turn when worms are harmed, killed, or removed from the environment it is quite clear that all of the life cycles that depend upon them will be negatively impacted. It is vitally important that we protect the balance of nature in our delicate high desert. It would be irresponsible to move forward with any project without studying the impact of turbine vibration on the lifecycle of worms.	Dean (2007) referenced in the comment raises concerns about the lack of study of the effects of vibrations from wind turbines but provides no empirical evidence that these vibrations negatively affect earthworms and other terrestrial invertebrates. See response to comment 12085-1 (see in Table A-3t, Pollinators and Insects) regarding the Velilla et al. (2021) study. Dean, D. 2007. 4772-1	Dean Dimond	Has the BLM considered the effect the windmills will have on Bees? Native bees are at risk of extinction. As a important part of my farm operation I have bee hives on my farm. One of the reason the bee hives on my place is so productive is because bees not only have my crop ground to feed from (and pollinate) But they also have the desert to feed from.They travel up to 5 miles from there hives. Bee are important part of our ecosystem. Native bees need there natural food source to survive and they do not adapt well to changed forage. Much of there natural forage will be destroyed during the construction of the windmills. I have been driving for many years and when I drive across a large open desert I hit and kill bees with my vehicle. This happens at a much higher rate the the faster you go. With the increase in traffic and roads the death rate will go up. With the windmills blades turning 200mph the death rate will sky rocket! Like I said earlier, native bees are at risk of extinction. Is the BLM going to issue a "Take" permit for the bees? Please protect our bees choose Alternate A!!!!!!!	Impacts to bees and other pollinators are described in EIS Section 3.11.1 (Pollinators); impacts to BLM special-status bumble bees are described in EIS Section 3.11.4 (Bureau of Land Management Special-Status Bumble Bees). Both sections describe the measures that would implemented to avoid or minimize impacts to bees and pollinators (see EIS Appendix 4 [Mitigation] for a complete list of mitigation measures). Take permits are only issued for species listed as threatened or endangered under the ESA. There is no species of bee that occurs in Idaho listed under the ESA; thus, no take permit can be issued for bees here.
5900-1	Name Not Provided	Insect fatalities: Your DEIS analysis of insects seems largely focused on pollination and extinction concerns (see Lava Ridge DEIS V 1. 3.11.1.1 Affected Environment) if I have missed the analysis of the hundreds of	EIS Section 3.1.2.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) defines irreversible and irretrievable commitments, which are related to the duration of the impact

Comment ID	Commenter	Public Comment	Response to Comment
		common ground dwelling insects, specifically that section on common beetles, their environment, and the impact of wind turbines on the more common species that are not threatened or strong pollinators, do direct me to that. You readily admit that the damage done to pollinators may have an irreversible and irretrievable end (3.11.1.3 page 3-310“Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) but just how would common insect loss impact food chain and life cycle for animals dependent upon them? It appears to me that a basic analysis of common species has not been done, I did not see yearly population estimates of the resident or common migratory insects, the average reproduction of the species, and how that may be altered, the death of common species both during construction and ongoing through collision, applied chemicals, habitat loss, or the reverse impact if the natural predator is impacted, killed, or driven out of the area by human activity or ongoing turbine noise. I didn’t see analysis on how insects and their larvae are used as a food source, or what feeders maybe impacted by a sudden or lasting disruptions of insect lifecycle. I can appreciate there was a limited survey of St. Anthony Sand Dune Tiger Beetle, but there are so many other insects that don’t seem to have been included. There could be catastrophic impacts on agriculture if those creatures that feed on crops are protected from their natural enemies by construction or functioning turbine activity. Beetles assist in decomposition, provide healthy soil by breaking down organic matter, break down waste, break down decaying wood into the soil, feed on dead plants & animals, and beetles seek out and feed on pests in the soil. Many ground beetle species have broad feeding habits, eating other insects and seeds of plants (including weeds). Beetles serve as food for many species, especially in the larval stage. The internet is awash in US Government webpages that identify the value of common beetles. Wind Turbines in Europe have become overwintering zones for invasive species. Turbines protect rodents and insects from being consumed by birds, and bats, and may deter ground predation as well. Heat produced by turbines attracts species of insects to overwinter which may prevent natural migration or winter kills that our area depends upon to balance certain species. Without in-depth study of the impact of 400 turbines in the Lava Ridge area, it would be reckless to move forward with any of the proposed options, except option A, to do nothing. No to turbines on Lava Ridge Insect fatalities at wind turbines as biodiversity sinks January 2021Conservation Science and Practice 3(5) DOI:10.1111/csp2.366 LicenseCC BY 4.0 Authors: Christian C Voigt Leibniz Institute for Zoo and Wildlife Research, Alfred-Kowalke-StraBe 17, 10315 Berlin, Germany. “Evidence is accumulating that insects are frequently killed by operating wind turbines, yet it is poorly understood if these fatalities cause population declines and changes in assemblage structures on various spatial scales… Recently, the annual loss of insect biomass at wind turbines was estimated for Germany to amount 1,200 t for the plant growth period, which equates to about 1.2 trillion killed insects per year, assuming 1 mg insect body mass… We need to understand (a) how attraction of insects to wind turbines affect fatality rates and interactions of insect predators with wind turbines. (b) We have to connect insect fatalities at wind turbines with source populations and evaluate if these fatalities add to the decline of insect populations and potentially the extinction of species. (c) We need to assess how fatalities at wind turbines change insect-mediated ecosystem services” https://www.researchgate.net/publication/348790564_Insect_fatalities_at_wind_turbines_as_biodiversity_sinks ResearchGate Wind Turbines as Overwintering Sites Attractive to an Invasive Lady Beetle, Harmonia axyridis Pallas (Coleoptera: Coccinellidae) October 2015The Coleopterists Bulletin DOI:10.1649/0010-065X-69.4.665 “One of the most invasive species of insects in Europe is the Asian lady beetle, Harmonia axyridis (Pallas, 1773). This species is often observed in anthropogenic areas, especially during autumn and winter when the adults enter buildings and start the overwintering process in large aggregations. On wind farms in intensively used farmland in Poland, H. axyridis uses wind turbines as overwintering sites. We hypothesize that H. axyridis adults are attracted to wind turbines for heat and protection from the wind.” https://www.researchgate.net/publication/281459499_Wind_Turbines_as_Overwintering_Sites_Attractive_to_an_Invasive_Lady_Beetle_Harmonia_axyridis_Pallas_Coleoptera_Coccinellidae For a list of beetles, see Idaho Official Government Website for Idaho Species, beetle. https://idfg.idaho.gov/species/taxa/explore?name=beetle&category=All&idapa=All Lava Ridge DEIS V 1. 3.11.1.1 Affected Environment “Most pollinators in this region are insects (e.g., bees, wasps, flies, beetles, butterflies, and moths), but hummingbirds also pollinate. More than 400 species of pollinators occur in the state of Idaho (Idaho State Department of Agriculture 2016). Bees (Hymenoptera) are the most well-studied and important pollinating insect, though flies (Diptera) also provide substantial pollination services (Larson et al. 2001; Ssymank et al. 2011). Other insects such as beetles (Coleoptera) and wasps (Hymenoptera) provide pollination services, though to a lesser extent (Kevan 1999). Butterflies and moths (Lepidoptera) have been documented pollinating wild plant species, including some flowering plants specially adapted for butterfly pollination (Fallon et al. 2014). At least 24 genera of native bees, 22 genera of butterflies, 24 genera of wasps, and six genera of moths occur in Idaho, some of which have been studied and are known”… In Volume 1 page 3-300 you do reference various insects, with a focus on pollinators, but seem to skip the totality of on-going insect death and its impact upon the foliage, aeration, food source for mammals, reptiles, amphibians, other insects, and birds. You admit the lack of data even for pollinators and that species are already in decline, those species that the project will knowingly impact. “Wild pollinators, such as the monarch butterfly (Danaus plexippus) (see Section 3.11.3 [Monarch Butterfly]) and a number of bumble bee species (see Section 3.11.4 [BLM Special-Status Bumble Bees]), are in decline (Idaho State Department of Agriculture 2016). Pollinator declines are attributed to the loss, degradation, and fragmentation of habitat (Kremen et al. 2002; Potts et al. 2010); introduced species (Memmott and Wasser 2002); the use of pesticides (Pisa et al. 2014); habitat disruption from grazing, mowing, and fire (Hatfield and LeBuhn 2007; Johst et al. 2006; Potts et al. 2005); and diseases and parasites (Altizer and Oberhauser 1999; Cameron et al. 2011; Colla et al. 2006; Davis and de Roode 2018). Data on local native pollinator populations are lacking.” 3.11.1.3 page 3-310 “Irreversible and	rather than the severity or magnitude. As described in EIS Section 3.11.1.4 (Pollinators, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), most of the impacts to pollinators from the action alternatives (i.e., habitat alteration and loss, displacement, injury, mortality) would be irretrievable, meaning that the resource can be renewed or restored following the action. Permanent losses of resources for pollinators (i.e., irreversible impacts), would be limited to the loss or alteration of pollinator habitat where roads are left in place following decommissioning and where disturbance occurs in very fragile soils (which would be no greater than 413 acres; see Table 3.13-4 in EIS Section 3.13 [Soils]). MVE would minimize disturbance on steep slopes (where most very fragile soils are located) (see applicant-committed measures 129 and 131 in EIS Appendix 4 [Mitigation]), and very fragile soils naturally have relatively little vegetative cover to provide habitat for pollinators (see EIS Section 3.15.2.1 [Native Upland Vegetation Communities, Impacts]) the irreversible impacts to pollinator habitat in the siting corridors would be minimal. The CEQ implementing regulations for NEPA at 40 CFR 1502.2 state, “(a) EISs shall not be encyclopedic” and “(b) EISs shall discuss impacts in proportion to their significance. There shall be only brief discussion of other than significant issues.” In order to comply with these requirements, the BLM identified issues for detailed analysis in the EIS through the internal and public scoping processes. Specific concerns were raised regarding insect pollinators, the St. Anthony sand dune tiger beetle (a BLM special-status species), monarch butterfly (a candidate for ESA listing and BLM special-status species), and BLM special-status bumble bees; these species are addressed in EIS Section 3.11 (Pollinators and Insects). EIS Section 3.11.1.2 (Pollinators, Impacts) specifically discloses the effects of insect mortality from collision with operational turbines, including a diminishment in the ecosystem services they provide. The study by Voigt (2021) referenced in the comment is also discussed in this section. Estimates of insect fatality rates, such as those presented by Voigt (2021), inherently account for any factors that attract insects to turbines, such as those described in the Dudek et al. (2015) study referenced in the comment. As described in response to comment 11297-5 (see in Table A-3t, Pollinators and Insects), impacts to ecosystem services provided by pollinators cannot be analyzed in greater detail due to a lack of studies quantifying this effect following pollinator loss as a result of wind turbines. Dudek, K., M. Dudek, and P. Tryjanowski. 2015. Wind Turbines as Overwintering Sites Attractive to an Invasive Lady Beetle, Hramonia Axyridis Pallas (Coleoptera: Coccinellidae). Available at: https://www.researchgate.net/publication/281459499_Wind_Turbines_as_Overwintering_Sites_Attractive_to_an_Invasive_Lady_Beetle_Harmonia_axyridis_Pallas_Coleoptera_Coccinellidae. Comment ID	Commenter	Public Comment	Response to Comment
		Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity All action alternatives would have irretrievable effects on pollinators through habitat alteration and loss (from work areas and infrastructure) and through displacement, injury, or mortality (vehicle strikes; collision with turbine blades; and application of herbicides or pesticides, removal of vegetation). Habitat alteration and loss effects would last up to 84 years (34 years for project construction, operation, and decommissioning plus 50 years for vegetation to reestablish after final reclamation). Displacement, injury, or mortality effects would occur during the 34-year life of the project. Additional irreversible effects would occur post-project where disturbance to fragile soils occurs (as described in Section 3.15.2 [Native Upland Vegetation Communities]) and where the BLM may choose to leave roads in place resulting in permanent habitat loss.”	
8382-3	Sue Page	In Volume 1 of EIS 3.11.1.3 Irreversible and Irretrievable Commitment and Short Term Uses Versus Long Term Productivity (see attached) 84 years of destruction 3.11 1.4 Compensatory Mitigation. NONE PROPOSED	EIS Section 3.1.2.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) defines irreversible and irretrievable commitments, which are related to the duration of the impact rather than the severity or magnitude. As described in EIS Section 3.11.1.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), most of the impacts to pollinators from the action alternatives (i.e., habitat alteration and loss, displacement, injury, mortality) would be irretrievable, meaning that the resource can be renewed or restored following the action. Permanent losses of resources for pollinators (i.e., irreversible impacts) would be limited to the loss or alteration of pollinator habitat where roads are left in place following decommissioning and where disturbance occurs in very fragile soils (which would be no greater than 413 acres; see Table 3.13-4 in EIS Section 3.13 [Soils]). MVE would minimize disturbance on steep slopes (where most very fragile soils are located) (see applicant-committed measures 129 and 131 in EIS Appendix 4 [Mitigation]), and very fragile soils naturally have relatively little vegetative cover to provide habitat for pollinators (see EIS Section 3.15.1.2 [Native Upland Vegetation Communities, Impacts]) the irreversible impacts to pollinator habitat in the siting corridors would be minimal. Therefore, compensatory mitigation for pollinators is not warranted.

Recreation

Table A-3u. Recreation

Comment ID	Commenter	Public Comment	Response to Comment
10419-1	Sandra Mitchell	Wind Energy is a rapidly growing form of renewable energy and it is of no surprise that there is great potential in Idaho. However, developing this project should not mean that recreation should be negatively impacted. The choice does not have to be 'one or the other'. Recreation is important to not only to the quality of life of Idahoans and their visitors but to the economic stability of many communities. To ensure that good decisions are made concerning recreation, please work with the local clubs and users to make sure that all roads and trails are included on your maps. Complete information needs to be available so folks can make informed decisions.	See response to comment 11527-10 (see in Table A-3u, Recreation) (see in Table A-3u, Recreation).
10529-1	John Hurley	The topic should address security and continued public access. I am afraid, in the future, a decision will be made to restrict public access in the vicinity of the wind towers. While visiting public lands, I see a lot of vandalisim and shooting damage to infrastructure and signage. Everything eventually gets shot up or torn up. Wind towers will not be immune from the problem. Multi-million dollar turbine blades will be rotating with bullet holes or damage to other components will be expensive to repair and maintain. Because this is a Presidential priority to deploy the project, it may come to the conclusion to restrict public access for National security. The wind tower company may petition the government to restict access. The area will need security cameras and special patrols by personnel including BLM employees. This will lead to animosity towards government and companies for spying on citizens. [...] Please give this topic your attention and understand the ramifications of limiting access to public lands.	See responses to comments 7320-3 (see in Table A-3u, Recreation) and 12934-5 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3).
11327-16	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	We ask that the BLM also include any relevant data from IDFG on upland bird hunting in the project area. IDFG’s Zone 4B currently has 120 sage-grouse tags available for a season running from September 17-October 31. There are also additional wing-shooting and upland game opportunities available in the project area- we ask that if IDFG data is available for these to include them in the project analysis.	Harvest statistics are not available for upland game birds on IDFG’s website, which is why the EIS only presents statistics for elk, deer, and pronghorn (see Table 3.12-2 in Section 3.12.1.1 [Affected Environment]).
11327-17	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	It is clear that, if any action alternative is selected in their current form, the hunting experience within the project area will be substantially altered. New road construction would increase the mileage of existing roads in the siting corridors by 121%, which will increase access to game species and negatively impact game populations in the long term. Increased human activity and motorized access will disturb big game species present in the project area and will likely cause wildlife to avoid siting corridors. This disturbance may push big game animals onto neighboring private lands, which further reduces opportunities for public land hunters. A loss in functional habitat for ungulates on BLM-managed land will cause avoidance conflicts with private landowners and agricultural producers. As is, GMU 53 cannot support many deer without unacceptable conflicts with agriculture, with depredation complaints already common.54 IDFG has documented more than 3,000 mule deer moving into GMU 53 during the harsh winter of 1985-1986, resulting in 54 depredation complaints. The Department has also	See response to comment 6009-1 (see in Table A-3u, Recreation).

Comment ID	Commenter	Public Comment	Response to Comment
		documented a substantial number of deer-vehicle collisions when mule deer move down into GMU 53 to escape harsh winters. As discussed in the DEIS, big game are likely to continue to avoid areas with ground disturbance until reclamation success is achieved, or 50 years beyond decommissioning. We believe the sheer size of the proposed project, as well as all of the action alternatives, will forever change hunting in the region by displacing wildlife off public land onto private lands, increasing depredation claims and management actions required to respond to depredation complaints, and fragmenting what is left of intact habitat currently utilized by ungulates. We do not believe sportsmen and women of Idaho will accept these generational impacts to the public land hunting opportunities that currently exist. These impacts may be reduced through a smaller project footprint and smarter corridor siting, but they are likely to persist even with these modifications.	
11491-17	Dean Dimond, Jennie Bateman	- In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: [...] 9. New information regarding security, effects of fencing and large structures on human and wildlife access to federal lands, [...] 12.Need new information on project scale effects on other aspects of human use of public lands in addition to grazing [...]	See response to comment 7320-3 (see in Table A-3u, Recreation).
11508-8	Justin Gott, Daniel Gott, Josie Gott	I believe that BLM needs to manage this area for the best public interest. Building the LavaRidge Wind Project is not in the publics best interest because the public will no longer be able to access this area.	As stated in EIS Section 1.2 (Purpose and Need), the need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V). Also see response to comment 7320-3 (see in Table A-3u, Recreation).
11527-10	Richard Stover; State of Idaho	The State of Idaho requested that the BLM perform a detailed off-highway vehicle (OHV) route inventory in the Project area in September of 2021. The DEIS summarizes proposed publicly available road mileage. However, this information does not address the need for an OHV inventory. In section 3.12.3.1, Affected Environment, the BLM defines OHV routes to include “roads or trails that are designated by the BLM as open or limited to OHV travel” in the entire Shoshone Field Office (p. 3-346). However, there is no known Travel Management Plan (TMP) for motorized access for the Project area, and no publicly facing BLM ground transportation linear features for Public Routes/Roads/Trails data that depicts inventoried OHV trail in the Project area. The BLM characterizes inventoried roads in the Project area as “OHV routes” or “OHV access” without specifically inventorying such routes for OHV trail character. While area roads may be OHV-legal (irrespective of TMP status), this does not equate to trail access. The BLM must not characterize road access as being the same OHV trail riding opportunity. The DEIS inadequately mentions trail-based OHV recreation and access in the Recreation section only referring to “OHV use” or “motorized access” presumably as analogs of OHV recreation (p. 3-333). Content in that section covering “driving for pleasure” refers to DEIS Appendix 3 (Issues Analyzed in Brief) Issue AIB-25. Appendix 3 refers back to the recreation section. These circular references do not contain an analysis of OHV opportunity. The omission of a thorough inventory and analysis of “OHV routes,” including defining trail characteristics where they exist, does not allow the public to evaluate the impact of the Project on OHV trail recreation opportunities. It is not possible to determine whether such opportunities exist in the area, nor whether there is potential to use this DEIS as a resource to propose and develop valued recreational opportunities. Recommendations for FEIS and ROD The FEIS must include an OHV route inventory throughout the Project area to define trail characteristics and determine OHV trail recreation opportunities.	Section 3.12.2 (Off-Highway Vehicle Opportunities and Experience) has been revised to clarify what kind of OHV data is currently available for the SFO planning area and that a detailed OHV inventory and TMP is not available at this time. Development of a TMP with a detailed OHV inventory constitutes a land use planning action that falls outside the scope of this NEPA analysis. Although trail character data is lacking, the BLM reasonably assumed that the recreational setting characteristics (RSCs) of OHV routes in the analysis area range from primitive to rural based on what is known about the overall landscape setting and character. The BLM also reviewed OHV route data that was provided by local clubs and compared it against datasets used in the EIS analysis to ensure that all existing routes were accounted for. AIB-25 analyses potential effects to dispersed recreational opportunities, such as driving for pleasure, in terms of changes to public access and changes to the landscape character and attractiveness of the area for recreational users. AIB-25 only refers back to the recreation analysis in Section 3.12 (Recreation) to inform readers that more specific analyses related to hunting and OHV can be found in that section.
11535-67	Steven Andersen	Because the development of this project will involve the cutting of new roads into previously inaccessible areas, public use of these areas will increase substantially. This increase in use is likely to result in increased fire danger, the spread of invasive species, vandalism, and disruption of habitat in remote, currently unaltered natural resource areas. Increased access leads to increased foot traffic from hikers fording streams, OHVs crossing streams or driving along stream beds, and increased fishing activities, which could result in impacts to shoreline and shallow water vegetation, increased erosion from shoreline areas disturbed by foot and vehicle traffic, disruption of stream bottoms that support invertebrate and fish populations, and increased fishing pressure.216 The DEIS fails to address how new roads and structures will alter previously unaltered and undisturbed natural lands.217 Nor does the DEIS address the extent to which the project will designate areas that must remain unaltered. In fact, the Project Development Manager confirmed that they have no firm plan for the location of the turbines and therefore, no firm plan on the location of the roads.218 Without this, the DEIS cannot possibly make an informed analysis of the impacts to the land.	The potential effects of increased public access and human activity on some of the natural resources mentioned by the commenter are addressed in EIS Appendix 3 (Issues Analyzed in Brief) related to looting and vandalism (AIB-23), wildlife (AIB-54, AIB-57, and AIB-61), and avian and bat species (AIB-2, AIB-3, and AIB-7). As stated in AIB-54, although improved public access may facilitate increased public use of the project area, there is also the potential for the project to deter some people from using the project area, particularly recreational users who prefer more remote and undeveloped settings.
11535-71	Steven Andersen	The DEIS also fails to adequately estimate illegal hunting in the area as a result of the access results. Moreover, it asserts that an increase of roads and access by up to 121% is unlikely to lead to changes in overall take of big game species without providing any reasoning behind why it is unlikely.	AIB-54 (EIS Appendix 3 [Issues Analyzed in Brief]) has been revised to include additional discussion of how project-related effects on hunting access and opportunities would affect big game populations, and the BLM’s rationale for determining those effects.
11535-120	Steven Andersen	The DEIS does not address the project’s impact to recreation on a cultural or economic level. Fishing, hunting, and wildlife viewing are long-standing traditions in Idaho. In 2016, BLM land in Idaho alone saw 466,100 fishermen, 296,500 hunters, and 193,500 wildlife watchers.355 The total expenditures related to these economic activities in 2016 were $295 million, supporting 2,559 jobs and $85 million in salaries and wages.356 Recreational use on BLM land also generated $33 million in federal, state, and local taxes (Pew Fact Sheet, 2018).357 About 5% of Idahoans participate in hunting; big game hunting is the most popular type of hunting in the state (USFWS, 2016). 358 On average, nearly 65,000 deer tags and 35,000 elk hunting tags are issued in wildlife management units in southern Idaho annually (Idaho Department of Fish and Game, 2021).359 The reduction in recreational activities necessarily involves a drastic decrease in state revenue and affects hundreds of thousands of individuals.	See responses to comments 11620-10 (see in Table A-3h, Environmental Justice and Socioeconomics) and 6009-1 (see in Table A-3u, Recreation).

Comment ID	Commenter	Public Comment	Response to Comment
11535-121	Steven Andersen	The DEIS does not adequately address this project's potential introduction of invasive species and its effect on recreation. Eiswerth et al. (2005) used economic data in combination with the national recreational survey to estimate the impacts of invasive plants on outdoor recreation in western states.360 They found that the total economic loss resulting from invasive species spread was estimated to be between $5.9 and $12.4 million per year.361 Moreover, out-of-state recreational expenditures were estimated to be reduced by $4.47 and $17 million depending on the annual rate of infestation.	As stated in AIB-57 (EIS Appendix 3 [Issues Analyzed in Brief]), MVE would implement various measures to reduce the likelihood of introduction and spread of nonnative species. This includes controlling weeds and nonnative invasive plants that result from construction, use, or maintenance authorized in their ROW grant. AIB-57 concludes that with these measures in place, the potential for the project to introduce or spread weeds and invasive plants would be low and the potential of these species to degrade wildlife habitats would also be low. Based on this analysis, invasive species introductions are not expected to cause noticeable changes to the recreation economy. Also see response to comment 11620-10 (see in Table A-3h, Environmental Justice and Socioeconomics).
11535-122	Steven Andersen	The aforementioned problems with respect to wildlife and big game are repeated in this section. Wind turbines can affect the local deer population by displacing them from their natural habitat. If the turbines are located in an area deer typically inhabit—which is the case here—they may avoid it altogether. This could lead to a decrease in the overall number of deer in the area, which could ultimately impact hunting success.363 Moreso, when the construction is complete, noise generated by the wind turbines can scare deer away, robbing generational hunters of their accustomed hunting locations. Additionally, once the wind turbines are operational, they may impact wind patterns and speed which may also have an impact on hunting. Understanding the direction the wind is blowing is crucial in deer hunting. Deer have a keen sense of smell and can smell people from at least 300 yards away. Hunters are advised to stay downwind to avoid deer smelling them. Wind turbines decrease the speed of the wind and increase turbulence by creating an atmospheric flow. They also decrease the speed of the wind, affecting deer hunting. The DEIS makes no mention of the connection between this project's tendency to decrease big game in the area and its effect on hunting. Rather, it focuses on the project's effects during the two-year construction period.	See response to comment 6009-1 (see in Table A-3u, Recreation).
11535-123	Steven Andersen	With respect to bird hunting, the DEIS states "[h]abitat loss and alteration from project development in wildlife tracts could affect the populations of upland game birds and other game species for which they are managed."364 As noted above, the operation of wind turbines will have an enormous impact on birds—bird game being no exception. For example, breeding pairs of ducks "may abandon otherwise suitable wetland habitat, display behavioral avoidance thereby reducing densities of pairs using wetlands near wind turbines, and experience mortality from collision with turbines and associated infrastructure."365 "Additionally, indirect effects on breeding ducks potentially include avoidance of associated grassland by nesting females, increased predation, or reduced reproduction."366 The DEIS does not account for these or similar effects of all bird game species.	Potential effects of the project on avian populations and their habitats are analyzed in EIS Section 3.3.2 (Avian Populations) and AIB-1 through AIB-5 in EIS Appendix 3 (Issues Analyzed in Brief). These analyses address potential direct and indirect effects to avian habitat, avian populations, and avian migration patterns resulting from collisions with turbines or vehicles, habitat loss, electrocution with power lines, and increased human activity and noise. Section 3.12.1 (Hunting and Trapping Access and Opportunities) has been revised to cross reference these sections when discussing potential effects to upland game bird populations and associated hunting opportunities.
11535-124	Steven Andersen	The DEIS claims that "temporary restrictions" would be implemented on land often used by Off-Highway Vehicle ("OHV") users. Yet, it does not disclose the duration or extent of these restrictions, seemingly leaving the decision to the discretion of MVE.	The duration of temporary access restrictions during construction and decommissioning are described in Table 3.12-1. Additional details are provided in Section 1.3.17 of MVE (2023). As stated in Table 3.12-1, during the 2-year construction and 2-year decommissioning periods, public access to siting corridors may be restricted for public safety. Although MVE (2023) states that the duration of public access restrictions in the siting corridors would be minimized wherever possible (e.g., on access roads), those details cannot be known at this time. Therefore, the recreation analysis assumes there would be temporary public access restrictions throughout the siting corridors for the 2-year construction period.
11535-125	Steven Andersen	Moreover, the consequences from dust plumes will have negative consequences on area recreation. As discussed herein, the water necessary for dust abatement is vastly underestimated, and planned control measures are inadequate.	Sections 3.12.2 (Off-Highway Vehicle Opportunities and Experience) and AIB-25 (EIS Appendix 3 [Issues Analyzed in Brief]) analyze potential effects to recreational uses, and both of these sections mentioned how air quality effects (e.g., dust) could contribute to an altered landscape setting and experience for recreational users. Also see response to comment 11488-1 (see Table A-3a, Air Quality).
11554-16	Raul Labrador; Idaho Attorney General's Office	Thus, the draft EIS concludes that hunting opportunities" will be significantly "diminished" due to the Project's "population-level" effects on mule deer and pronghorn. DEIS at EX-xxi; id. at 3-479–480. These "population-level effects" would be "irreversible," DEIS at 3-486, and would extend far beyond BLM land. Such effects will particularly burden tribal reserved rights in ways that will likely overtax Idaho lands and resources. Diminished wildlife habitats and tribal hunting grounds necessarily impact Idaho's right to manage its wildlife resources.	See response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
11620-7	Simone Griffin; BlueRibbon Coalition	Public land is commonly used to access trails for recreation purposes. Off-roading is popular and any project proposal needs to account for the effects to the recreation and motorized use community. A thorough inventory of all current trails needs to be completed so that the BLM is working with an accurate baseline. These area have a high recreation value for locals in the surrounding communities and any project proposed should be developed in a way that does not restrict access to users.	See response to comment 11527-10 (see in Table A-3u, Recreation).
11620-9	Simone Griffin; BlueRibbon Coalition	BRC believes that all users can and should be accommodated. This plan should ultimately identify reasonable standards for allowing dispersed camping. According to The Dyrt, a camping app, camping has grown immensely since 2019. Public lands are needing more camping facilities than ever before as almost 50% of campers are new campers. The number of people who use public land to camp is only growing every year. The BLM needs to strongly consider providing as many camping areas as possible as to not concentrate use in limited sites. Management strategies should be exhausted before restrictions and closures of areas to any type of recreational use. Better facilities to address waste issues need to be created before any restrictions. BRC supports all recreational activities if done responsibly.	See response to comment F2-9 (see in Table A-3u, Recreation).

Comment ID	Commenter	Public Comment	Response to Comment
11869-18	Raul Labrador, Josh Turner; Idaho Attorney General's Office	The Magic Valley region holds some of Idaho's best hunting land for big game, upland bird species, small game, and waterfowl.1 The Project will devastate wild game and other animals in the area. The draft EIS recognizes this fact but gives it no weight.	See response to comment 6009-1 (see in Table A-3u, Recreation).
11873-20	Mary Schwartz, Frank Schwartz	22. In the event the BLM chooses to move forward with this wind farm project, the road system network should be utilized by BLM as recreational motorized and nonmotorized routes during operations and should be retained for that purpose following the conclusion and decommissioning of the project. Table ES-2, Recreation, states that there will be new off highway vehicle use access and opportunities in siting corridors over the long term, however this use was not analyzed in the DEIS, so is misleading and is essentially a blind promise. If it is real, BLM should provide this commitment to recreation in writing as part of the windfarm decision. Regardless of the final decision, MVE should be required to place cattle guards (and bypasses) at every fence crossing to hopefully reduce the problem with people not leaving gates as they are found.	As described in Section 3.12.2 (Off-Highway Vehicle Opportunities and Experience), the addition of up to 486 miles of new access roads and the improvement of up to 147 miles of existing roads, which would be open to OHV users, would create new OHV access and opportunities in the siting corridors during project operation. As described in the Decommissioning Plan (Appendix L in MVE [2023]), access roads would either be removed or left in place during decommissioning, based on the preference of individual landowners or land management agencies. Section 3.12.2 has been revised to clarify that some access roads may be left in place for continued use by OHV and other recreational users, if the BLM determines this to be preferred in light of all resource and environmental considerations.
12236-2	David Bjerke	As you are no doubt aware, much of the land impacted by this project is currently used by many, many Idahoans for a variety of recreational purposes, including hiking and hunting. These recreational pursuits are a huge part of what makes Idaho unique among the states -- wild, open spaces where a person can go for enjoyment and renewal. The wind project would completely eliminate those recreational pursuits and change the character of Idaho substantially and negatively. The enormity of the project alone (200,000 acres of public land, up to 400 wind turbines, 486 miles of new roads, and over 200 miles of high-voltage, overhead collection and transmission lines) would completely destroy any recreational use.	See response to comment 7320-3 (see in Table A-3u, Recreation).
12968-12	Charles Brockway	Similarly, the impact on recreation activities in the project footprint would be monumental. The enjoyment of recreational activities in this area relies to a large degree on the remoteness and serenity of the area. The wind turbines would decimate - and in many areas completely destroy - the quality of recreation. Hunting activities would also be decimated. Alteration of seasonal habitat, the constant presence of sonic and subsonic noise, and the increased presence of human activity, will very likely result in a major reduction of game.	See response to comment 6009-1 (see in Table A-3u, Recreation).
13006-24	Leon Smith	1) Recommend BLM include additional analysis of long term direct and indirect, spatial impacts to recreation, based on the impacts to wildlife/avian/pollinators, and recreation distribution/displacement.	Given the lack of formally designated recreation sites (i.e., designated trails or campsites), the relatively homogenous distribution of OHV routes and habitat types throughout the siting corridors, and the fact that big game ranges encompass the majority of the siting corridors, the spatial distribution of recreational effects are assumed to be relatively uniform across the siting corridors.
13006-25	Leon Smith	2) Recommend BLM include recreation user map of ORV routes in the area.	See response to comment 11527-10 (see in Table A-3u, Recreation).
13006-26	Leon Smith	3) Recommend BLM incorporate relevant IDFG data for additional analysis of upland bird hunting experience.	See response to comment 11327-16 (see in Table A-3u, Recreation).
13006-27	Leon Smith	4) Recommend the DEIS clearly recognizes the State constitutional right to hunt, fish and trap on public lands, but that access may be temporarily restricted for safety purposes in places during construction.	The Proposed Action would have no effect on state hunting regulations. As stated in EIS Section 3.12.1 (Hunting and Trapping Access and Opportunities), public lands in the siting corridors would be open to hunting and trapping access for the public, with the exception of fenced restricted areas. The Proposed Action and alternatives are in conformance with applicable land use plans (see EIS Appendix 2). In addition, EIS Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies) demonstrates how the project would be consistent with applicable federal, state, and local statutes, regulations, and permit requirements. Responsibility for compliance during the construction, operations and maintenance, and eventual decommissioning of the project would rest with MVE.
1751-2	Tom Lajoie	Visual resource management also needs to be highly considered through this NEPA process according to FLPMA. Dispersed camping is a popular recreational activity that also needs to be protected through these plans	See response to comment F2-9 (see in Table A-3u, Recreation).
2927-1	Carol McNeil	AIB-25 states there are no designated recreation sites such as hiking trails or campgrounds. Please draw your attention to the attached map. The shaded areas are the MVE project. It also shows the interrogated trail system that has been developed over many years. This trail system keeps natural balance and harmony with the natural beauty of this high desert vista. All the recreational opportunities listed can enjoy this trail system. Please clarify how this could ever really be replaced. To reclaim this area and the wildlife would take well over the 34 years, more like 80 plus years. It still would not be what we have today. Alternative A, no action makes the best choice. Current generations and future generations of Magic Valley residents deserve to have this area kept in this natural state.	AIB-25 has been revised to clarify that motorized roads and OHV trails do occur within the siting corridors, and recreational uses associated with these facilities are addressed in EIS Section 3.12.2 (Off-Highway Vehicle Opportunities and Experience). Although designated campsites or hiking trails do not occur within the siting corridors, potential effects to dispersed recreational activities such as dispersed camping and hiking are analyzed in AIB-25.
3245-2	Aaron Larsp	AIB-25 states there are no designated recreation sites such as hiking trails and campgrounds. Please check out Google Earth for this area. It does show trails in this area. As far as campgrounds go, we do mostly dry camping with no benefit of campgrounds. Camping does not need campgrounds.	See response to comment 2927-1 (see in Table A-3u, Recreation).
6009-1	Douglas Miller	Hunting is a core cultural element - even a way of life in - Idaho. Any curtailment, restriction, or degradation of hunting opportunity and quality on public land that results from energy development is unacceptable. As noted in the draft EIS, each of the build alternatives will adversely impact hunting in multiple ways, including loss of public access to lands that have hunting values. Loss of existing access to public land is a key reason why hunter numbers are declining and the concomitant loss of conservation funding (see, for example: https://www.npr.org/2018/03/20/593001800/decline-in-hunters-threatens-how-u-s-pays-for-conservation <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.npr.org%2F2018%2F03%2F20%2F593001800%2Fdecline-in-hunters-threatens-how-u-s-pays-for-	EIS Section 3.12.1 (Hunting and Trapping Access and Opportunities) analyzes the potential effects of the project on hunting access and opportunities. This analysis discusses factors that would influence hunter participation such as accessibility via motorized roads, changes in the recreational quality of the area, and changes to big game populations. As described in this section, the project would increase the mileage of existing roads in the siting corridors, which would improve hunter access during operation. At the same time, big game avoidance of the siting corridors would have the potential to reduce hunting opportunities in the immediate project vicinity and increased ambient noise levels and visual changes to the landscape may cause some hunters to avoid the area during the life of the project. Therefore, the project would have both beneficial and adverse effects on hunting

		conservation&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cd72aa2c31eb0408f6e8008db24afa1da%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638144108974090882%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=EY2AiC1hT2g5OVzldLyAFN9ZLvntIn2%2FVPxfl6IzVw8%3D&reserved=0>) and cultural identity. The draft EIS does not provide an quantitative analysis of how each build alternative will impact hunter participation and the loss of funding for wildlife conservation programs. And, importantly, the draft EIS does not present an analysis of the impact of various alternatives on hunting season lengths, bag limits, number and availability of big game tags, hunting methods, and the like. Accordingly, only Alternative A can be judged acceptable. Further, the draft EIS is silent on the various alternatives' impacts on poaching. More roads commonly lead to an increase in poaching (see, for example: Jackson, S.D. 2000. Overview of Transportation Impacts on Wildlife Movement and Populations. Pp. 7-20 In Messmer, T.A. and B. West, (eds) Wildlife and Highways: Seeking Solutions to an Ecological and Socio-economic Dilemma. The Wildlife Society). All but Alternative A will require hundreds of miles of new roads. The draft EIS must therefore be revised to include a detailed analysis of the likely and probable impact of each alternative on poaching before a credible and comprehensive analysis and decision for the project can be made. In the absence of such a revision, the project application must be rejected on the presumption that increased road length and density will result in unacceptable and unmitigatable increases in poaching.	access and opportunities. Aside from qualitatively describing these countervailing effects on hunting access and opportunities, the BLM cannot quantify with any certainty what the net effect of the project would be on hunter participation rates. The BLM analyzed potential effects of the project on big game populations in Section 3.18.2 (Big Game Habitats and Populations). The BLM is not responsible for managing or enforcing hunting regulations (e.g., hunting seasons, allowable methods, bag limits, permits or tags) and therefore, the BLM cannot make statements about if, or how, IDFG hunting management actions would change in the future, with or without consideration of the Proposed Action. The BLM reviewed the Jackson (2000) article provided by the commenter regarding the effects of roads on wildlife and determined that it does not contradict or add any new information that is not already discussed in the EIS (see AIB-54 in EIS Appendix 3) with respect to how improved access can lead to increased hunting and illegal take of wildlife. Also see response to comment 11535-71 (see in Table A-3u, Recreation). Jackson, S.D. 2000. Overview of Transportation Impacts on Wildlife Movement and Populations. In *Wildlife and Highways: Seeking Solutions to an Ecological and Socio-economic Dilemma*, edited by T.A. Messmer and B. West, pp. 7–20. The Wildlife Society.
6075-5	Lorinda Grant, Douglas Grant	We also recreate in the areas that will be impacted by the turbines. They say that will not lose access to the BLM ground, is this guaranteed, probably not, because security fences will be constructed around said turbines making those trails in accessible.	See response to comment 7320-3 (see in Table A-3u, Recreation).
6382-1	Laurie Bourn	I am a hunter and trapper. I trap on the edge of the lavas by my home. I used to trap in the lava rocks just north east of my home until representative Simpson declared that area part of the Craters of the Moon Monument. I can no longer take my four wheeler out there to trap because of the "no motorized vehicle" designation. Now you are proposing a huge amount of windmills that are not environmentally friendly out on the desert within close proximity of the lava beds. These turbines will affect my hunting and trapping. If I cannot take my one four wheeler out on the lavas to trap, why are these people able to tear up the area?	The BLM is not responsible for managing or enforcing hunting regulations outside of BLM lands (e.g., IDFG hunting seasons, allowable methods, bag limits, permits or tags). As stated in EIS Section 3.12.1 (Hunting and Trapping Access and Opportunities), public lands in the siting corridors would be open to hunting and trapping access for the public, with the exception of fenced restricted areas. The Proposed Action and alternatives are in conformance with applicable land use plans (see EIS Appendix 2) and the project would not include any development within Craters of the Moon National Monument and Preserve.
6837-1	Mike Miller	On page 3-201 on the BLM EIS concerning visual analysis, it states " for areas farther removed form the siting corridors 10-30 miles, the degree of visual change would not appear unaltered to the casual observer with project elements being visible but not attracting attention. " Here in Idaho we value our wide open spaces. This siting of the wind farm in this location would totally ruin this area and the surrounding area far greater than 30 miles. The wind turbines on the hills above the Hagerman Valley (Bell Rapids Wind) have totally changed that area from scenic to ugly wing mills on the hills.. The proposed Lava ridge project will have taller turbines than those at the Bell Rapids farm. Whether you are hiking, enjoying the desert, riding horseback, or on an OHV, this proposed project will rob this area of anything it is currently.	The visual analysis performed for the EIS, as summarized Section 3.16.1 (Landscape Character and Scenic Quality), used the BLM's VRI and VRM methodology and contrast rating system to determine visual contrast and impact findings. Also see response to comment 11525-3 (see in Table A-3y, Visual Resources).
7320-3	Lora Ohlensehlen	I want ordinary citizens to still have the full right to travel on that desert road to recreate. The "security" of the windmills should not restrict the public's right to be in the area. I want to be able to continue to use this area, along with all the generations of my family, and ordinary citizens.	As stated in EIS Section 3.12.1 (Hunting and Trapping Access and Opportunities), public access to the siting corridors would be temporarily restricted during construction and decommissioning to protect public safety. MVE's applicant-committed measures 41 and 42 would be implemented during construction and would reduce the duration of public access restrictions to the extent practicable, while also ensuring public safety (see Table App4-2e in EIS Appendix 4 [Mitigation]). During the approximately 30-year operation period, public lands in the siting corridors would be open to the public, with the exception of fenced restricted areas such as the operation and maintenance facilities and substations. Up to approximately 2,219 acres of public lands would no longer be available for public use during operation of the project due to the footprint of infrastructure. However, up to approximately 486 miles of new access roads and 147 miles of improved access roads would be open to the public, which would facilitate improved public access in the area. Therefore, the project would not preclude recreational uses from continuing but would reduce the acreage available in the siting corridors and would modify the landscape setting of the area for recreational users.
7334-1	Terry Ruby	Secondly, my concern is about all the roadways that are proposed to be build in this area. My question to the power company is: How do you plan to protect your investment on these public lands? Just South of this area you have a population that is very outdoors oriented. These people are just looking for an area such as this with roadways they can run their ATV's, UTV's and whatever motorized vehicle they have. The outcry of these people in the event that this area is closed to them will be very loud and with lawyers involved and so on.	See response to comment 7320-3 (see in Table A-3u, Recreation).
F2-2		I am concerned the proposed wind project, if approved, will restrict access to users such as myself in this area. Public land should benefit as many users as possible and not just benefit a few corporations. Visitation on public lands have grown immensely over the past few years. The BLM should be looking at ways to provide access that will sustain the growing numbers of visitation, this project will decrease access.	See response to comment 7320-3 (see in Table A-3u, Recreation).
F2-8		In April of 2022 the Department of Interior released its Equity Action Plan which addresses the lack of access on public lands. In order to advance equity of access on public land for those with mobility impairment disabilities, it is important to recognize that discrimination towards Americans with disabilities within federal land management agencies is deeply rooted and hidden in plain sight. Motorized recreation is often the only way those with mobility impairment disabilities are able to access public lands. BLM should ensure that the plan complies with the Department of Interior's Equity Action Plan, which recognizes that restrictions on motorized access to public land create barriers of access to those with disabilities.	As described in Section 3.12.1 (Hunting and Trapping Access and Opportunities) and AIB-25, the project would increase the mileage of existing roads in the siting corridors, which would improve motorized access to public lands during operation. Temporary access restrictions would be implemented during construction and decommissioning to protect public safety. MVE's applicant-committed measures 41 and 42 would be implemented during construction and would reduce the duration of public access restrictions to the extent practicable, while also ensuring public safety (see Table App4-2e in EIS Appendix 4 [Mitigation]). Also see response to comment 7320-3 (see in Table A-3u, Recreation).

Comment ID	Commenter	Public Comment	Response to Comment
F2-9		Dispersed camping is a popular recreational activity that also needs to be protected through these plans. Any user conflicts or possible resource damage can be solved through management solutions other than closure and the BLM needs to implement these practices first.	Potential effects to dispersed recreational activities, including but not limited to dispersed camping, are analyzed in AIB-25 of EIS Appendix 3 (Issues Analyzed in Brief). AIB-25 has been revised to provide additional discussion and clarification on project-related effects to dispersed recreational opportunities during construction, operation, and decommissioning.

Soils

Table A-3v. Soils

Comment ID	Commenter	Public Comment	Response to Comment
10426-3	Casey Stevenson	[These are my concerns which have not been addressed by the EIS which will impact thousands of people, and need to be reevaluated. Here are my concerns:] The installation of wind turbines requires the construction of access roads, foundations, and transmission lines. These activities can lead to soil compaction, erosion, loss of top soil and alteration of the surface hydrology, which can affect the recharge of the aquifer. Additionally, the heavy equipment used during the construction of wind turbines can damage the soil structure and reduce soil porosity, which can affect soil aeration and water infiltration. This can negatively impact soil health by reducing the nutrient-holding capacity of the soil and reducing microbial activity. The operation of wind turbines can also lead to soil erosion as the spinning blades can create turbulence, which can lead to increased soil erosion and sedimentation. Furthermore, the use of herbicides to control vegetation around wind turbines can also have negative effects on soil health by reducing soil biodiversity and microbial activity, which are essential for maintaining soil health.	Compaction was added to soil impacts from ground disturbance. See EIS Section 3.13.1.2 (Soils, Impacts) for a discussion of the potential impacts to soils, including soil compaction, erosion, and topsoil loss, as well as the measures that would be implemented to minimize or avoid these impacts. Impacts related to soil compaction (including reduced porosity and decreased soil health) are accounted for in the summary of impacts to soils presented in EIS Table 3.13-4. Potential impacts to surface hydrology and the measures that would be implemented to minimize or avoid these impacts are described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief) (see AIB-47). A complete list of avoidance and minimization measures is provided in EIS Appendix 4 (Mitigation). As described in EIS Section 3.17.1.1 (Groundwater Quantity, Affected Environment), the ESPA covers an area of approximately 10,800 square miles and recharging groundwater recharge in the ESPA "occurs via multiple resources including annual precipitation and tributary basin underflow. Irrigation water infiltration provides the largest source of aquifer recharge, resulting in approximately 60% of total recharge to the ESPA (USNRC 2006)." None of the alternatives would impact tributary basin underflow or irrigation water infiltration, and the greatest amount of ground disturbance under any action alternative would be approximately 9,114 acres (14.24 square miles) or 0.1% of the ESPA. Additionally, most impacts related to soil compaction would be short-term since interim reclamation would be implemented in work areas following disturbance, which would include measures to decompact soils, as described in the Reclamation Plan (Appendix E in MVE [2023]). Therefore, it is unlikely that any of the action alternatives would have a measurable impact on recharge of the ESPA. The BLM is unaware of any peer-reviewed literature documenting soil erosion due to turbulence from operational wind turbines. App3-1 in EIS Appendix 3 (Issues Analyzed in Brief) describes the potential impacts to wildlife from herbicide use (see AIB-57) and has been updated to include impacts to soils and vegetation. As described in this table, MVE would be required to use BLM-approved herbicides and obtain written approval from BLM for all herbicide application plans. Effects from the use of BLM-approved herbicides are disclosed in in the 2007 and 2017 BLM vegetation treatments using herbicides programmatic EISs (BLM 2007, 2016) and are not repeated in this EIS; all herbicide applications would adhere to the standard operating procedures identified in BLM (2007) and BLM (2016).
11223-4	Kelly Human	That area and the type of soil's there will yield an extreme dust problem with all of the travel that will be required.	See EIS Section 3.2 (Air Quality) for a discussion of fugitive dust impacts and the measures that would be implemented to minimize or avoid these impacts (see EIS Appendix 4 [Mitigation] for a complete list of mitigation measures).
11535-173	Steven Andersen	Moreover, the DEIS fails to consider that the area is already susceptible to soil erosion due to a history of wildfires, as described in the Monument RMP.	Existing and future trends and actions that have and would continue to affect soils in the analysis area, including past wildfires, are described in Section 3.13.1.1.1 (Soils, Existing and Future Trends and Actions). This section has been revised to clarify that where past wildfires have occurred soils may be more susceptible to erosion. However, as described in Section 3.7.1.1.5 (Fires and Fuels Management, Existing and Future Trends and Actions), approximately 74% of the siting corridors have been reseeded, which reduces the potential for future soil erosion in these areas. EIS Section 3.13.1.2.2 (Soils, Alternative B [Proposed Action]) describes a number of measures that would be implemented to minimize or avoid soil erosion, a complete list is provided in EIS Appendix 4 (Mitigation).
11615-2	Spencer Dixon	Microplastic pollution will be shed from the leading edge erosion of turbine. This is a well documented phenomenon but is not addressed in the EIS. This will poison our soil for 100s if not 1000s of years.	See response to comment 11686-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11962-1	Cassie Christensen, Tyler Christensen	The BLM is responsible for management of lands, the most important component of our lands is our topsoil. Without our topsoil, even water doesn't have a purpose. The topic of destroying our top soil has not been properly addressed. In a time of carbon crisis disturbing the virgin top soil and releasing millions of years of natural Carbon storage into the atmosphere seems foolish. Potential soil carbon loss is not even discussed in the draft EIS. According to the 1American University in Washington D.C., by reducing soil disturbance, we can reduce and reverse our Carbon Exchange. Especially, when we implement the proper management of grazing of cattle, which the Bureau of Land Management was put in place to do. Proposal B will feature 400 turbines that will disrupt 197,474 acres of land (5,516 acres that will be permanently destroyed according to the draft EIS) that has been relatively undisrupted. This will be detrimental to our lands while this project is in place and the damage that is created with be everlasting. A plan should be made to restore the lands, most importantly the topsoil. Could the BLM perform a soil health analysis and also a soil carbon audit on all land being used for this project. Is it even possible for Magic Valley Energy to restore the topsoil that took millions of years to form to	See Section 3.13.1.2.2 (Soils, Alternative B [Proposed Action]) for an analysis of impacts to soils, including topsoil. As described in this section, topsoil would be salvaged and stockpiled during construction to the extent practicable and redistributed across the 6,740 acres of temporary work areas following construction; additional details are provided in the Reclamation Plan (Appendix E in MVE [2023]). Irretrievable (i.e., permanent) impacts to soils would be limited to those areas where disturbance occurs in very fragile soils, where permanent concrete footings are left in place, where soil horizon mixing occurs, and in all infrastructure areas. The BLM does not plan to do a soil health analysis or a soil carbon audit in the project area.

Comment ID	Commenter	Public Comment	Response to Comment
		current status? Could a budget be made for restoring the 486 miles of roads, 147 miles of improved roads and 197,474 acres of land to current soil health. Please consider these options our beloved grasslands are essential; they need protection and regeneration, not destruction and desertification.	
11978-131	Magic Valley Energy, LLC	33. Section 3.13.1 - Soils - Soil and Plant Growth Materials "This EIS assumes very fragile soils would have limited reclamation potential, and impacts would be permanent." "In areas where concrete foundations deeper than 3 feet below surrounding grade would remain in place, soils may be affected permanently." MVE believes the term 'permanent' is not clearly defined and suggests removing these sentences or replacing 'permanent' with terms like 'irreversible' or 'irretrievable' if applicable to the situation.	Permanent impacts are those that cannot or will not be reversed by reclamation activities following decommissioning; added here "(defined as irreversible in Section 3.1.2.4".
11978-132	Magic Valley Energy, LLC	34. Section 3.13.1 - Soils - Soil and Plant Growth Materials Use of Highly Fragile Soils versus Very Fragile Sources. A global comment to be made throughout the FEIS: Very Fragile Soils is not the proper term per the NCRS. Highly Fragile Soils is the correct term, and is used in some portions of the DEIS. MVE requests that Highly Fragile Soils is the term used and for both consistency and clarity throughout the final EIS.	The fragile soils terminology in the EIS are based on the SSURGO Fragile Soils Index Descriptions, which are provided in the metadata for the NRCS Web Soil Survey (NRCS 2020a), which was used to identify fragile soils in the siting corridors. As described in NRCS (2020a), Soils are placed into interpretive classes based on their index rating, which ranges from 0 to 1. An index rating of 1 is the most fragile, while a rating of zero is the least fragile. Interpretive classes are as follows: Not Fragile (0–0.009), Slightly Fragile, (0.010–0.209), Moderately Fragile (0.210–0.409), Highly Fragile (0.410–0.609), Very Fragile (0.610–0.809), and Extremely Fragile (0.810–1.0). "Highly fragile" has been changed to "very fragile" throughout the EIS for accuracy and consistency.
12865-3	Regina Smith	AIB-32: how would the project affect hydric soils in the siting corridors and how many acres would be affected? The DEIS pretty much admits there will be no topsoil left after they're done with the project. This could prevent vegetation recovery and reduce the quality of livestock grazing and wildlife habitat. Page 3–367 states there would be irretrievable soil impacts from permanent concrete footings that may leech minerals into the surrounding soils…. AIB-32 in volume 3, Page App3-12, again states impact context is so low that detailed analysis is not even needed. Supporting rational states " MVE would design the project to avoid wetlands and low areas, where hydric soils are present, to the extent practicable"…. Who gets to determine when things are practical, feasible, or cost-effective, as so many of their mitigation measures are provisioned? This DEIS is fraught with opinions and assumptions. These questions are far too serious to be "AIB". These questions need serious consideration.	As described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief), a number of measures would be implemented to minimize or avoid impacts to hydric soils (see AIB-33); a complete list is provided in EIS Appendix 4 (Mitigation). Since hydric soils most often occur in wetlands and riparian areas, and near waterbodies, the 100-foot no-ground-disturbance buffer that would be applied to these features (applicant-committed measure 136) would further reduce the potential for impacts to hydric soils. Where disturbance cannot be avoided, MVE would be required to prepare site-specific plans and measures to mitigate impacts (applicant-committed measure 123). While this may not completely eliminate impacts to hydric soils, the magnitude of any remaining impacts to hydric soils would be so low that additional analysis is not warranted in the EIS. The practicability or feasibility of mitigation measures described in the EIS (i.e., measures that include language such as "where practical" or "where feasible") would be determined by the BLM and MVE. The BLM has developed additional mitigation measures as needed to further minimize or avoid impacts to sensitive resources (refer to Tables App4-3, App4-4, and App4-5 in EIS Appendix 4). EIS Section 3.13.1.2 (Soils, Impacts) discusses impacts to topsoil; Table 3.13-4 summarizes the impacts to soils in the analysis area, including the amount of topsoil that would be salvaged. As described in this section, topsoil salvaged during construction would be stockpiled and spread back on disturbed areas following construction, which would help minimize topsoil loss, although topsoil loss in infrastructure areas is assumed to be permanent because it would not be feasible to stockpile topsoil salvaged from those areas over the 30-year operation period. Other irreversible and irretrievable impacts to soils, including leaching from concrete foundations and mixing of soil horizons, are disclosed in Section 3.13.1.4 (Soils, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity).
13003-2	Lynden Osborne	Having been a public land user for many years I would like to share what effect ground disturbance had on our allotments. We had four major sources of ground disturbance: small vehicle off-road users, regular vehicle traffic on established roadways, National Guard vehicles on ungrazed pastures and livestock watering areas. • Small vehicle off-road traffic was primarily motorcycles and four-wheelers. These users often followed established cattle trails but would sometimes carve out a special track if not just passing through the allotment. That track would only get bigger as the area became more popular. The wind blew topsoil away and an even deeper, wider track was created. • large vehicle traffic on established allotment roadways was similar to bike and four-wheeler traffic on tracks and on cattle trails. The dirt roads tended to tum to powder with use. The wind blew and the paths got deeper and wider. Whenever a rock outcropping was uncovered, vehicle traffic would sometimes make a new path around it. • The National Guard held training exercises on the ungrazed portion of our allotment about every other year throughout the 1990's. They generally came with 50-60 vehicles, both wheeled and track. Each training year these vehicles traversed large swaths of ground turning up berms and stirring soil which the wind then dispersed. The roads simply deteriorated into a fine powder anywhere from four to eight inches deep. All of that powder then blew out of the newly created ruts. That type of high use changed some of the ground permanently. • Livestock watering areas were another place where the ground was disturbed, and dust would blow. It was a downright inhospitable place to be for man and beast on a windy day. These gathering areas for cows could be one to two acres in size.	The Access Roads section in EIS Appendix 11 (Project Elements Common to All Action Alternatives) describes the construction and maintenance of access roads; the only travel that would occur off of established access roads is overland crane travel. EIS Section 3.2 (Air Quality) discusses impacts related to fugitive dust and EIS Section 3.13 (Soils) discusses impacts to soil and plant growth materials (including topsoil). As described in both of these sections, a number of measures would be implemented to minimize or avoid impacts related to fugitive dust and topsoil loss; a complete list is provided in EIS Appendix 4 (Mitigation). Also see the Reclamation Plan (Appendix E in MVE [2023]) for a description of interim reclamation and revegetation measures that would be implemented in work areas following construction.
3811-4	Alwena Savage	2-What will be the effect of magnesium chloride after 30 years? How long will it stay in the soil after the turbines are gone?	Lewis (1999) found that the use of magnesium chloride as a deicer for roads is highly unlikely to cause or contribute to environmental damage at distances greater than 20 yards from the roadway. MVE does not propose to apply magnesium chloride as a deicer on project roads. Magnesium chloride applications for dust control on project access roads would only occur once per year during the construction period (although a second application may be required in some high-traffic areas) and would not occur during operations. Magnesium chloride application rates for dust control would be similar to those for deicing but occur much less frequently. Therefore, the use of magnesium chloride for dust control during project construction is not anticipated to result in any adverse effects or long-term increase in soil concentrations of magnesium chloride. Lewis, W.M. 1999. *Studies of Environmental Effects of Magnesium Chloride Deicer in Colorado, Final Report*. Report No. CDOT-DTD-R-99-10. Denver: Colorado Department of Transportation Research Branch.

Comment ID	Commenter	Public Comment	Response to Comment
5896-17	Mike Tylka	Soil and Plant Group Materials. One of our SRCP Board members operates a business in land and soil use and this project would greatly infringe on an already fragile desert environment. Noxious weed spread and soil degradation would result.	Impacts to soils are disclosed in EIS Section 3.13.1.2 (Soils, Impacts). Impacts related to weeds and other invasive plant species are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief) (see AIB-41). Both sections describe the measures that would be implemented to minimize or avoid these impacts; refer to EIS Appendix 4 (Mitigation) for a complete list. Additional information can be found in the Reclamation Plan (Appendix E in MVE [2023]) and the Noxious Weed Management Plan (Appendix R in MVE [2023]).
7359-1	Name Not Provided	The turbine wind farm impacts their entire farm and neighboring farms. Building and maintaining a turbine requires heavy equipment that damages dirt drainage tiles under fields, which then effects drainage in surrounding fields. Drainage problems can hurt crop yields and even stop a farmer from being able to plant in the first place.	Under all action alternatives, turbine construction and maintenance would occur within the siting corridors, which do not include active agricultural fields. Heavy equipment and vehicles would access the siting corridors area via access roads that are immediately adjacent to agricultural fields. However, as described in EIS Section 3.14.1 (Traffic Patterns), primary access routes were identified based on consideration of roadway limitations (e.g., size, weight, and seasonal restrictions), and MVE would improve roads as necessary to accommodate heavy or oversized equipment. MVE would also be responsible for obtaining required approvals from ITD or the local highway districts and would comply with the terms and conditions of those approvals. Further, MVE would be required to coordinate with ITD and the local highway districts to determine if additional maintenance would be required and to coordinate on repairs to roadways following project construction. Given that no heavy equipment use or vehicle travel would occur in agricultural fields, that the existing roads in the analysis area already accommodate heavy equipment and vehicles associated with agricultural operations, and that MVE would improve and repair access roads as necessary to accommodate heavy equipment and vehicle traffic associated with the project, there would be a very low potential for damage to drainage tiles and other agricultural infrastructure. Additionally, wind energy projects occur in agricultural areas around the world; there is no evidence to date that they have damaged crop yields.

Transportation

10471-2	Brett Lemmons	We then have our 2 lane country roads that are not set up for a large project, who will pay to repair that? Idaho?	AIB-37 and AIB-38 in EIS Appendix 3 (Issues Analyzed in Brief) of the EIS address the potential effects of project construction and operation on maintenance needs for major public roads. As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project construction. If any impacts occur to existing major public roads, MVE would be required to address those impacts. These requirements would be disclosed as part of the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
11199-1	J Yamamoto, B Yamamoto, D. Miller, S Okamura, T. Robison, M Woods, M. Yamamoto-Howland, R Yamamoto, K Waters, G Watanabe, J Nakanishi, D. Nakanishi, J Naito, P Okamura Sr., W. Nakanishi, N Yamamoto, S. Yamamoto, T Hadway, T. Waters, K Hadway, K Yamamoto, C. Waters, B. Farner, R Yamamoto-Farner, D. Yamamoto	In addition, the assembly of all the turbines will present additional on- going traffic to an already congested, construction ridden I-84.	Section 3.14.1 (Traffic Patterns) of the EIS analyzes how traffic associated with the project would affect existing traffic patterns (including changes to annual average daily traffic and level of service) on major public roads.
11204-29	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	D. Permittees requested to limit Project-related access road development to "existing roads" with additional construction of "side-access roads." See 2022 Comments, pg. 6. The 2022 Comments requested that access to the proposed Project infrastructure use "existing roads" and that "side-access roads" be constructed only to the extent necessary (2022 Comments, pg. 6). The DEIS addresses this request superficially but appears to fail to implement the request with meaningful substance. The DEIS at pg. 3-123 reports that "MVE would maximize use of existing roads, thereby keeping new construction to a minimum (applicant-committed measure 38)" (also see similar applicant-committed measure 17). The Draft Appendix J of the DEIS (Road Design, Traffic and Transportation Plan) reports: "Maximum use will be made of existing roads, thus keeping new construction to a minimum" (DEIS, Draft Appendix J [Road Design, Traffic and Transportation Plan], pg. J-4). Similar statements are made by the DEIS Appendices at the following pages: Appendix M, pgs. 56 & 58-59; Appendix T, pg.T-30; Appendix U, pgs. U-12 & U-a-3; and Appendix 11, pg. App11-8. Despite frequent repetition of the claim within the DEIS that the proposed Project would maximize use of existing roads to keep new construction to a minimum, the fact is that each action alternative anticipates more than twice as many miles of "new" access roads when compared to miles of "existing roads" to be "improved" for project access. This casts doubt on whether any real effort was made in the planning process to prioritize the use of existing roads for Project	Existing roads within siting corridors include both paved and unpaved roads, which may not be appropriate for project-related use due to safety or design concerns. The majority of existing roads in siting corridors (approx. 300 out of the 400 total) are unpaved and many are used for OHV travel.

Comment ID	Commenter	Public Comment	Response to Comment
		access over the construction of “new” roads. This is particularly true when one sees that the DEIS reports that there are “approximately 401 miles of existing roads (paved and unpaved)” in the analysis area (the proposed Project’s siting corridors) for pollinators (DEIS, pg. 3-303) and compares this value to the anticipated construction of anywhere from 272 to 486 miles of new roads to access the Project under the action alternatives (DEIS, pg. ES-xi). A proposed Project that would require from 68% to 121% as many new miles of road within the Project siting corridors as the 401 miles of road already existing therein does not prioritized the use of existing roads for Project access.	
11362-1	Gena Anderson	I have concerns regarding what will happen to our roadways, including the interstate and county roads. Interstate 84 already has sections that have deteriorated and are hard to drive on. I have seen the convoy of vehicles that it takes to move just one wind turbine blade. With the amount of semi-trucks and pilot vehicles that this project would require, our roads will have a significant increase in use. My question is, who will be responsible to repair Idaho's roads when they deteriorate from the extra truck traffic? I appreciate your time in reading this letter and considering my concerns.	AIB-37 and AIB-387 in EIS Appendix 3 (Issues Analyzed in Brief) of the EIS address the potential effects of project construction and operation on maintenance needs for major public roads. As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project construction. If any impacts occur to existing major public roads, MVE would be required to address those impacts. These requirements would be disclosed as part of the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE’s responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
11411-6	Rayma Cates	Windmill construction is major construction. Large scale equipment and many, many trucks of gravel and cement are required to build a windfarm. Local roads will be harmed by the traffic and heavy equipment.	Section 3.14.1 (Traffic Patterns) of the EIS analyzes how the project would affect traffic patterns on major public roads. AIB-37, AIB-38, and AIB-39 in EIS Appendix 3 (Issues Analyzed in Brief) of the EIS address the potential effects of project construction and operation on maintenance needs for major public roads and roads on BLM lands. As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project construction. If any impacts occur to existing major public roads, MVE would be required to address those impacts. These requirements would be disclosed as part of the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). In addition, as stated in AIB-39, MVE would be required to maintain roads on BLM lands and allow public access of the road network. AIB-37 and AIB-38 have been updated to reference Section 1.3.9 of MVE (2023), which states that “all existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins.”
11500-1	Jonathan Bateman	I am writing to bring attention to the potential negative effects of the Lava Ridge Wind Farm on the county highway districts in the project area. In particular, I am concerned about the impact of adding miles of access roads for the wind farm, and the potential for increased maintenance and repair costs for the county highway districts. Studies from other wind farms have shown that adding miles of access roads for wind turbines can have negative effects on county highway districts. For example, a study of the effects of wind farms on county roads in Texas found that the construction of wind turbines and associated access roads led to increased wear and tear on county roads, which resulted in higher maintenance and repair costs for county highway districts. Another study of the effects of wind farms on county roads in Oklahoma found similar results. Given these examples and the potential negative impacts of the Lava Ridge Wind Farm on the county highway districts in the area, I urge you to conduct a comprehensive analysis of the potential impacts on county roads in the area. This analysis should include an evaluation of all the potential costs to county highway districts for maintaining and repairing roads affected by the wind farm's access roads.	Impacts to public roads are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-37 through AIB-39. As described in these AIBs, MVE is responsible for obtaining the appropriate permits for the use of public roads and for addressing any impacts to public roads resulting from the project. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE’s responsibilities surrounding anticipated maintenance and repair needs during construction and operation. Also, applicant-committed measure 38 (in EIS Appendix 4 [Mitigation]), would minimize effects to roads by ensuring that all existing public roads that are used or improved by MVE during the course of construction would be left in a condition that is as good as or better than their condition when the construction period begins in accordance with [MVE’s] agreements with the associated governing body. Roadways identified for use would be videotaped and accompanied by supporting notes prior to construction.
11511-1	Elizabeth (No Last Name Provided)	I recently drove to and from Sun Valley from Twin Falls. I carefully noticed how the flow of traffic was impacted by a wide-load transportation convoy while I was driving on Highway 93. There was a huge line of vehicles behind this convoy on the two-lane highway stretch which traveled very slowly. This is already a heavily travelled road every day. What danger would be added to daily travel on Highway 93 with the addition of up to 2,427,698 trips, some transporting the massive equipment during the project? (according to Table 2.4-3. Traffic Details on Page 2.9 of the Lava Ridge Environmental Impact Statement.)	Section 3.14 (Transportation) of the EIS analyzes how traffic patterns on major public roads would be affected by project-related construction, operation, and decommissioning trips. As discussed in Section 3.14, the project would increase traffic volumes and cause delays at entrances during construction, and traffic-control measures would be implemented during construction to ensure safety and to minimize traffic congestion.
11535-142	Steven Andersen	The full extent of this project requires the expansion of existing roads and the building of new ones. The DEIS states that some or all intersections involved would require some improvements to accommodate turning requirements for construction vehicles, and to resolve other conflicts with road signs, property fences, light poles, height clearances, fire hydrants, or buildings. This project necessitates improvements to intersections, bridges, and expansion of existing highways. While the DEIS addresses the necessary improvements at length, it provides no timetable for any of the improvements. The construction of all these moving parts certainly will affect the duration of the project as well as the traffic analysis. Without a specific timeframe for these improvements, the DEIS’s conclusions cannot be relied upon.	Roadway improvements would occur during the 2-year construction period. As stated in MVE (2023), MVE plans to begin construction after all applicable permits and approvals for construction have been obtained. MVE (2023) estimated construction would occur between 2023 and 2025 (see Section 1.1 of MVE [2023]); however, this schedule is subject to change based on permitting timelines.
11535-143	Steven Andersen	Additionally, the DEIS proposes traffic management strategies. Yet, these strategies are only proposals and cannot be trusted with any certainty. The DEIS states that certain strategies “would be considered” or “may be scheduled.” There is no indication of what party will be considering or scheduling these measures. Moreover, the phrasing implies that the measures are completely discretionary. As such, the DEIS cannot rely on them in its analysis.	The traffic management measures listed in EIS Appendix 4 (Mitigation), Table App4-2e, of the EIS are applicant-committed measures (i.e., MVE’s responsibility) and are not discretionary. These measures are part of the Proposed Action and were used to evaluate the impacts described in Chapter 3 (Affected Environment and Impacts).
11614-1	Amy Alves	One issue that was not addressed in the EIS is the impact on the communities of Eden and Hazelton of construction traffic through our small town. The EIS and Luke Papez have discussed that during the construction phase, there would be thousands of trips made by vehicles through both of these towns. My concern is that the planned routes are not rated for large trucks and heavy construction vehicles. Parts of these roads are single	Section 3.14 (Transportation) of the EIS shows the location of the project’s proposed haul routes and access roads on Figure 3.14-2. This figure also shows where the towns of Eden and Hazelton are relative to the proposed haul routes and access roads. As shown on Figure 3.14-2, there is an alternate primary haul route and access road that crosses through the town of Eden; no haul routes or access roads cross through the town of

Comment ID	Commenter	Public Comment	Response to Comment
		lane roads through residential neighborhoods that would be inappropriate for such large vehicles transporting construction equipment and wind turbine parts. The roads are not wide enough, nor are they rated for such heavy construction vehicles. The proposed constructions routes through Eden and Hazelton are also on school bus routes that would pose safety issues for students. The Lava Ridge project is inappropriate for this area as the construction would cause safety issues for school busses, students walking to and from bus stops, and the residents of Eden and Hazelton.	Hazelton. Alternate primary routes are described in Section 3.14.1.1.1 (Roadways) as roads that may be used for turbine delivery if primary routes become overly congested or inaccessible, and proposed access roads would be used as secondary routes. Section 3.14.1.1.3 (Traffic Volume and Level of Service) explains that most (95%–99%) of the project construction vehicles would access the siting corridors along U.S. 93 and ID 24; for this reason, MVE's transportation assessment for the project evaluated project effects to the roadway capacity LOS for these two delivery routes only. Although it is unknown how many trips would occur on the alternate haul route and access road that crosses through the town of Eden, MVE would coordinate with ITD and the local highway districts to determine if additional maintenance would be required and to coordinate on repairs to roadways following project construction. As stated in Section 1.3.9 of MVE (2023), all existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins. In addition, roadway improvements would be made to accommodate anticipated vehicle loads, turning requirements, and other conflicts, as needed.
11787-3	Representative Jack Nelsen	LS Power has not met with any road departments or highway districts. They are skirting the issues of the use of and damage to local roadways by heavy equipment used during the construction process. It is not only the responsible thing to do – it is necessary to leave the communities whole and in better shape than when the project began. These issues must be addressed before a project can be given the green light.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. As stated in Section 1.3.9 of MVE (2023), all existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins in accordance with the project's agreements with the associated governing body. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
11788-2	Representative Jack Nelsen	2. There has been no contact from LS Power to the local road departments and highway districts. The traffic from the construction as well as road damage due to heavy equipment has not been addressed. Nor has any thought been given to the dust generated by driving equipment through the desert.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation. The effects of fugitive dust on various types of resources have been analyzed throughout the EIS in the following sections: AIB-9, AIB-49, and AIB-59 of EIS Appendix 3 (Issues Analyzed in Brief); Section 3.2 (Air Quality); Section 3.4 (Climate and Greenhouse Gases); Section 3.5 (Cultural Resources); Section 3.6.1 (Environmental Justice Communities); Section 3.16 (Visual Resources); and Section 3.18 (Wildlife). In addition, EIS Appendix 4 (Mitigation) includes several applicant-committed measures to prevent and minimize the effects of dust (see Table App4-2l in EIS Appendix 4).
11978-135	Magic Valley Energy, LLC	37. Section 3.14.1.2.2 Transportation - Alternative B (Proposed Action) "Alternative B would generate a total of 810,930 one-way trips during the 2-year construction period, with an average of 7,724 trips per week or 1,103 trips per day (Table 3.14-3) (RCC 2022)." The total number of trips – 810,930 – does not match up with Table 3.14-3 Vehicle Trip Estimates by Action Alternative, which shows 812,882 trips total for construction. Please reconcile.	The text has been revised to be consistent with the number of trips reported in Table 3.14-4.
11978-136	Magic Valley Energy, LLC	38. Section 3.14.1.2.2 Transportation - Alternative B (Proposed Action) "The maximum number of operation and maintenance workers commuting to the site on a single day would be 60 ; however, the number of operation and maintenance workers would be closer to 40 during operation. These additional trips would have no noticeable effect on existing roadways within the analysis area, and existing LOS would remain unchanged." In the MVE 2022 POD Section 4.3, it is noted that up to 75 workers may be commuting to the site in a single day. Additionally, the same section of the POD states there are estimated to be 20 full-time workers that consistently go to the site, rather than 40 as stated in the DEIS. MVE asks the language be updated: "The maximum number of operation and maintenance workers commuting to the site on a single day would be 75 ; however, the number of operation and maintenance workers would be closer to 20 during operation. These additional trips would have no noticeable effect on existing roadways within the analysis area, and existing LOS would remain unchanged."	Revised as suggested.
12233-5	Elizabeth Lampert	The EIS does not mention the potential environmental damage to maintain dirt access roads with chemicals to mitigate for dust and vegetation control.	Potential mitigation measures related to dust control and the use of chemical palliatives are included in EIS Appendix 4 (Mitigation), Table App4-2l. In addition, project-specific mitigation measure f (EIS Appendix 4, Table App4-4) would prohibit the application of palliatives within 150 feet of surface water features; this measure would be a part of Alternatives C–E, and the Preferred Alternative would be added as mitigation to Alternative B.
1230-1	Carolyn Dimond	Our concerns about access roads to get to the wind farm. These roads are improved for current public transport. The current roads have been built and maintained by local taxpayer funds. The DIES states in their components section of EIS report, that roads will need to be improved, but doesn't state their commitment to do so, and says nothing about maintaining public roads. These roads were built with local weight limits in mind. The vehicles using these roads are permitted for these weights only. Huge oversized, both in weight and length, trucks will destroy these roads and will cost taxpayers money to repair and maintain. The load limits are not set up for	AIB-37 and AIB-38 in EIS Appendix 3 (Issues Analyzed in Brief) of the EIS address the potential effects of project construction and operation on maintenance needs for major public roads. As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project construction. If any impacts occur to existing major public roads, MVE would be required to address those impacts. These requirements would be disclosed as part of the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). As stated in Section 1.3.9 of MVE (2023), all existing public roads that are

Comment ID	Commenter	Public Comment	Response to Comment
		mega sized loads, nor do area residents want them to be. They are also not set up for wide load turning. It is simple that 2.4 million trips is going to cost tremendous amounts of money and loss of property for the right of ways. One lady stated that she was being bullied into letting them use her property. Yes, she had been approached by MVE and threatened with emanate domain if she didn't sell the needed property to make the turns. It just doesn't affect the roads close to the project but all the roads leading to the project clear across the state.	used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
12371-3	Alan Hansten; Northside Canal Company	Next, the construction activities stand to impact NSCC operations due to the use of various county roads to access the proposed project. There are only certain access points to the Lava Ridge area, including crossing certain bridges over NSCC canals. The sheer volume of traffic and large machinery that are required for this project may threaten the viability of those bridges and access points. This was not evaluated by BLM in the draft EIS.	MVE's transportation assessment for the project (cited as Mott MacDonald 2021a in the EIS) evaluated the load bearing capacity of bridges along haul routes using bridge inspection data from ITD, and identified four bridge crossings of concern (one along U.S. 93, two along ID 24, and one along 750 East Road) that may require improvements to accommodate anticipated vehicle loads (see Section 3.14 [Transportation] of the EIS).
12398-20	US Environmental Protection Agency	Transportation and Installation of Large Land-based Turbines Given the potential logistical challenges for the transport of large land-based turbines in the rural area of the project, EPA recommends the FEIS include: • A summary of the commercial availability of land-based wind turbine components that can meet potential transportation challenges for large diameter towers and blades. • A more detailed description of possible transportation routes of the turbine component deliveries to the project site including a discussion of whether there are likely limitations (e.g., existing bridges or highway underpasses that are too low or narrow), for transporting the turbines. Ensure the discussion includes proposed turbines larger than 3-MW. Describe measures or modifications that may be necessary to address the limitations. • Discuss project permits and other authorizations that will be necessary for transportation of oversized and heavy turbine loads, and conditions to reduce impacts to existing transportation infrastructure and networks.	Figure 3.14-2 in Section 3.14 (Transportation) of the EIS, shows the location of the project's proposed primary haul routes, alternate haul routes, and access roads. As described in Section 3.14.1.1.1 (Roadways), primary routes include major highways and arterial roadways that would be used to access the siting corridors from the surrounding regions; alternate routes may be used for turbine delivery if primary routes become overly congested or inaccessible, and proposed access roads in the siting corridors would be used as secondary routes. As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE does not currently have information regarding the origin of turbine components, equipment, and materials. MVE will have limited control over what routes are used outside of the project's immediate surrounding area. As stated in Section J-3 of the Road Design, Traffic and Transportation Plan, much of the existing road network will require improvements, and final road dimensions will be influenced by turbine model selection and requirements from the engineering, procurement, and construction contractor. Turbine component delivery will likely require the expansion of intersections at existing roadways to accommodate larger loads. Where road intersection improvements are required to accommodate extra-long vehicles, potential upgrades could include relocating signs, placement of temporary paving, and the use of flaggers, as needed. Permits and approvals that would be necessary for transportation of oversize and overweight vehicle loads are listed in EIS Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies) and are further discussed in AIB-38 of EIS Appendix 3 (Issues Analyzed in Brief). As stated in AIB-38, MVE would be required to obtain permits from the appropriate state and local jurisdictions for transportation of oversized and heavy loads. Through these permitting authorities, MVE would be required to follow all requirements for traffic control and other traffic and safety BMPs, as required by the permitting agencies.
12398-21	US Environmental Protection Agency	The U.S. Department of Energy acknowledges challenges for the transportation and installation of large turbines for land-based wind. DOE reports that the hub height for utility-scale land-based wind turbines has increased 66% since 1998–1999, to about 308 feet in 2021. Large rotor blades that cannot be folded or bent limit the routes trucks can take and the radius of their turns, and tower diameters may not fit under bridges or highway overpasses. DOE is addressing these transportation and logistical challenges through its research projects, such as: • Designing turbines with more slender and flexible blades that can navigate through curves in roads and rail lines. • Supporting efforts to develop tall turbine towers that can be produced on site.17 The DEIS describes proposed turbine hub heights up to 460 feet above the ground, depending on the turbine model and size selected. The turbine rotor blades would extend between 130 and 280 feet from the hub with a rotor diameter between 260 and 560 feet. When a blade is in line with the turbine tower, the maximum height would be between 390 and 740 feet.18 The DEIS includes the following assumptions related to turbine component delivery for the transportation analysis: • Delivery of equipment and materials would enter the analysis area by I-84 or by private rail since specific turbine component delivery routes are unknown. Routes would be determined by the turbine manufacturer and not until closer to the start of construction. • MVE or its contractors and suppliers would be responsible for permitting oversized loads associated with the project, including turbine component delivery.19 The DEIS provides limited information on the transport of turbine component deliveries to the project site on existing highways and roads. This is a concern since the NEPA analyses assume 3-MW and larger 6-MW turbines, and all action alternatives include a proposed rotor blade diameter between 260 and 560 feet and a rotor swept area between 53,100 and 246,400 square feet. Further, the project's Road Design, Traffic and Transportation Plan uses 2-MW and 3-MW turbines as typical examples and likely underrepresent impacts from larger proposed turbines.20	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE does not currently have information regarding the origin of turbine components, equipment, and materials, and MVE will have limited control over what routes are used outside of the project's immediate surrounding area. The details of the design methodologies and specifications included in the Road Design, Traffic and Transportation Plan accommodate the known turbine delivery requirements as of 2022. MVE acknowledges that, as turbine technology evolves, there may be requirements for new turbine technologies that deviate from what is described in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). As stated in AIB-38 (EIS Appendix 3 [Issues Analyzed in Brief] of the EIS), MVE would be required to obtain permits from the appropriate state and local jurisdictions for transportation of oversized and heavy loads. Through these permitting authorities, MVE would be required to follow all requirements for traffic control and other traffic and safety BMPs, as required by the permitting agencies.
12469-6	Mike Telford	Roads The DEIS states in 3.8.1.13 under right of ways "Proposed utility development……. Follow existing ROW routes". This is an impossibility in the first place because the DEIS anticipates from 370 to 400 plus miles of new roads. Road districts are passing regulations to prohibit use of their roads. The DEIS does not address the topography of the area. (see topographical maps). It may appear to be relatively flat. But it is not. There are ravines 50 to 100+ feet deep. There are unseen lava tubes as well as those that are collapsed. There are high ridges and deep crevasses leading to the world-famous Aquifer, which is the life blood of Idaho. Because of the sheer size of the turbines proposed the roads will have to be straight and long and fairly flat for the way oversized loads to move over. All existing roads and ROW are very curvy and follows the terrane. The DEIS does not address any of these extra requirements or there impacts on the land or cultural as well as living systems that are out there. The deep fills must come from somewhere and the deep cuts and blasting required are not in the estimates. The DEIS does not address the effects of the kind of road construction that would be required and their impacts. I will mention only a few.	The referenced statement in Section 3.8.1.1.3 has been revised to clarify that the statement comes from the RMP and is referencing the affected environment (i.e., past and present utility developments) and is not referring to the proposed utility developments associated with the Proposed Action. Section 3.14 (Transportation) of the EIS describes how roadway improvements would be necessary to accommodate construction vehicles. The Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]) provides further details regarding the design of access roads and the types of roadway improvements that would be required. Section 3.13 (Soils) of the EIS addresses project-related effects to soils resulting from ground disturbance. Section 3.13 references several AIBs that further evaluate potential impacts to geology and soils (see AIB-30 through AIB-36 in EIS Appendix 3 [Issues Analyzed in Brief]).

Comment ID	Commenter	Public Comment	Response to Comment
12471-1	Regina Smith	In the transportation section, 3.14 page 3–370, " most of the construction workers would be coming from the west and south on US 93 from Jerome and Twin Falls." In the socio-economic section, 3.6, the construction workers are expected to live in Jerome, Lincoln, Minidoka counties. (Table 3.6–4) Twin Falls is not part of the analysis. This DEIS is inadequate for the size and scope of this project. Inconsistencies are frequent. The resources and/or impacts are a series of hits and misses. Some impacts are analysed on some resources, while other resources are analysed or not. Case in point, the construction workers commute or residential areas. MVE is analysing one thing and proposing something else. Their conclusions are invariably low and non-significant as a result.	EIS Section 3.6 (Environmental Justice and Socioeconomics) assumes that construction workers would include a mixture of both local (i.e., already residing in the tri-county area) and non-local workers (i.e., from the towns of Twin Falls or Burley, which are just outside the tri-county analysis area but within approximately 10 miles of the project) (see Section 3.6.2.2.2 [Alternative B {Proposed Action}]). Section 3.6 does not make any assumptions about the relative distribution of construction workers from individual towns or counties. EIS Section 3.14 (Transportation) assumes that most of the construction workers would be coming from the west and south on U.S. 93 (i.e., from the heavily populated cities of Jerome and Twin Falls, in Jerome and Twin Falls Counties, respectively) (see Section 3.14.1.2.2). However, Section 3.14 does not assume that all construction workers would reside in Jerome or Twin Falls and does not dismiss the potential for some construction workers to reside in other towns or counties. Therefore, Sections 3.6 and 3.14 are consistent and do not make contradictory assumptions about the origin of construction workers.
12984-1	Tony Owens	We are writing on behalf of the Shoshone Highway District #2. We are aware of the initial ROAD USE AGREEMENT which has been circulated, along with the ZOOM meeting held several months ago. The Highway District has not been contacted further regarding this matter. At this point the Shoshone Highway District #2 will be taking the position that the Highway District is not in favor of the Lava Ridge Project. The reason for this position is that the Shoshone Highway District is unable to ascertain the possible impact on the Highway District due to a significant lack of detailed information concerning the project, including but not necessarily limited to: 1. The Highway District needs detailed information concerning the county roads which the project intends to utilize during the preconstruction and construction process and including any possible alternated roads which may be utilized.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
12984-2	Tony Owens	2. The Highway District needs detailed information concerning the anticipated traffic during the preconstruction and construction process and the anticipated traffic subsequent to the completion of the project regarding utilization, repairs and maintenance. The Highway District needs a reasonable schedule for the timing of the various stages of the project	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
12984-3	Tony Owens	3. The Highway District needs sufficient time to evaluate the information provided concerning the project to determine the nature, extent and possible impact on the county roads sought to be utilized.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
12984-4	Tony Owens	4. The Highway District may require, at the expense of the project proponent, a report outlining the existing road structure, pavement depth, load capacity and may, in the District's discretion require load Ground Penetrating Radar Survey along the entire length of the county road(s) sought to be utilized. In the case of gravel roads, the District may require a load Ground Penetrating Radar Survey along the entire length of the county road(s) sought to be utilized. 5. The District may require an engineered study as to any required turn radius along the county road route(s) proposed to be utilized.	The BLM has considered the potential requirements from local highway districts and as appropriate has integrated those requirements within project avoidance and minimization measures.
12984-5	Tony Owens	6. In the event the road(s) sought to be utilized are insufficient to properly handle the anticipated utilization by the project proponent, then the road(s) sought to be utilized will need to be brought to appropriate necessary standards to handle the anticipated utilization for the project. The cost of the improvement to the road{s) shall be accomplished at the sole cost and expense of the project proponent and shall either be performed by the District or by a third party approved by the District and subject to the approval of the construction by the District. The District may require reasonable sums to be deposited by the project proponent to ensure the timely performance of the modifications/improvements or may require a bond to be posted to cover the faithful performance of the modifications/improvement. In the case of gravel roads, the District may require the road to be modified to meet the requirements of the proposed project, including, but not limited to additional road base, dust inhibitors or other improvements and on-going maintenance at the sole cost and expense of the project proponent. The District may also impose special speed restrictions along the proposed routes and or prohibit use of certain roads during particular times of the year, e.g. Spring thaw.	The BLM's proposed mitigation measures related to roads and traffic are included in EIS Appendix 4 (Mitigation), Table App4-2e. MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. Local highway districts may impose additional mitigation requirements through their own permitting processes. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
12984-6	Tony Owens	7. Upon completion of the foregoing requirements, the District will issue a written permit for the project which will have additional terms and conditions regarding the timing, usage of the county road(s) in use and cost of repair, replacement for any damages to the road{s) utilized.	The BLM has considered the potential requirements from local highway districts and as appropriate has integrated those requirements within project avoidance and minimization measures.
12989-1	Jim Meeks	In the Lava Ridge wind project draft environmental impact statement: Volume 1, page 3-3, figure 3.1-1 and in volume 2a, appendix J-1 through J-8, does not specify or identify the "specific" road access routes. We cannot analyze the impact on the specific access route because the draft statement data is incomplete. We say no to any access routes until we are able to analyze the impact. On 9-15-21 @ Renew Coffee Shop in Jerome, Idaho, Lava Ridge wind staff (V-pres. Mark Milburn and his staff) told us "that access would be gained	Figure 3.14-2 in Section 3.14 (Transportation) of the EIS, shows the location of the project's proposed primary haul routes, alternate haul routes, and access roads. As described in Section 3.14.1.1.1 (Roadways), primary routes include major highways and arterial roadways that would be used to access the siting corridors from the surrounding regions; alternate routes may be used for turbine delivery if primary routes become overly

Comment ID	Commenter	Public Comment	Response to Comment
		from private property owners (like us) by either giving us a lot of money for our land to expand the roads." If we refused to sell we were told: "There is always imminent domain."	congested or inaccessible, and proposed access roads in the siting corridors would be used as secondary routes. As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE road construction and use will be coordinated with ROW and special use authorization holders, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan.
13006-34	Leon Smith	9) If No Action Alternative A is not selected, recommend the DEIS not be finalized until MVE has an agreement in place with local Highway and Irrigation Districts that maintain highways, bridges and other public conveyances in the project area.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
13008-14	Scott Hauser	3) The DEIS does a decent job of estimating the use of the roads, and it can be stated that, comparatively speaking, there will be high levels of traffic during construction. This will create a lot of noise and dust. Therefore, have the impacts of public use of the newly constructed roads been incorporated into the analysis on road use?	Public use of newly constructed roads is considered in the analysis in AIB-26 (How would the project impact public motorized access?) of EIS Appendix 3 (Issues Analyzed in Brief). In addition, effects to public access for hunting, trapping, and OHV users are addressed in EIS Section 3.12 (Recreation), and effects to big game from improved hunting access is analyzed in AIB-54 of EIS Appendix 3.
13012-6	Heather Saunders	Basalt is only part of the problem. The composition of the soil in southern Idaho will also complicate construction and necessitate building miles of roads to gain access to the area. ... Poof dust is what we call the result of heavy vehicles driving over Idaho dirt; it turns into a river of particles so fine it flows like water. That's the neat thing about clay; in both its wettest and driest states it acts like a liquid. While the area in question has a rock base they're going to have to deal with the dirt sitting on top of that rock, and that means building roads. How much wildlife habitat will be lost to those roads? They will need to keep them in place to facilitate maintenance and replacement of parts.	EIS Section 3.18 (Wildlife) analyzes the effects of access roads on wildlife habitat in several different contexts. See also AIB-54 through AIB-63 (in EIS Appendix 4 [Mitigation]) for additional analysis of project effects on wildlife species and habitats.
13013-1	David Warren	Please accept my comments concerning the Lava Ridge Wind Turbine Project EIS concerning Fugitive Dust Emissions that will be produced during the construction, operations and decommissioning of the project. According to Tables 2.4-1Project Components by Action Alternative, 2.4-2 Access Road Categories and Mileage within the Citing Corridors and 2.4-3 Traffic Details and Construction phase of the Lava Ridge Wind Project 486 miles of new roads will be constructed. Fugitive Dust Emissions will be generated and has potential to impact the air quality of the surrounding area. Magic Valley Energy proposes to use a chemical dust palliative such as Magnesium Chloride (MgCI), p3-20. Magnesium Chloride is used to control dust. Being a water soluble compound, when applied to road surfaces the MgCI will eventually be absorbed into the soil and research has shown that this will have a negative impact on soil, water, and vegetation. Water is in fact applied to the road surface first to prompt the MgCI to penetrate the soil surface to a greater depth. I will address the volume of water that is required during the application (spraying) of the MgCI. MgCI can degrade the condition of the soil by sealing the surface and by the salinization of the soil. Plant growth is affected. MgCI will even kill plant growth. I have had personal experience where MgCI killed lodge pole pine trees that were approximately 30 years old. I have no doubt that any of the vegetation on this arid area could be stunted or killed. MgCI is applied at the rate of½ gallon per square yard. As stated the Lava Wind Turbine Project proposes that 486 miles of road be constructed, please keep in mind there is no mention of the acreage of land that will be created for staging sites and construction sites that will need dust abatement. These calculations of MgCI and water only apply to the roads. MgCI weighs 11.8 pounds per gallon. The volume of MgCI for a single application to the proposed roads is 3,564,000 gallons or 21,028 tons. Also 1,782,000 gallons of water are required for that single application. With these proposed roads being created out of pristine (virgin) soil the first year will require three applications approximately 60 day apart to abate the dust, or 10,692,000 gallons of MgCI or 63,084 tons. Water required for application 5,346,000 gallons. Year two of construction would require the same 3 number of applications and the same volume of MgCI and water. The remaining 30 years of operation would require one application per year if not two. The two year decommissioning phase will require the same volume of MgCI to be applied as the initial two year construction phase. With this volume of MgCI being applied, and being applied over the Snake River Aquifer which lies under a substrate of fractured basalt, a very porous rock formation that allows most surface water to infiltrate in to the Snake River Aquifer. The MgCI infiltrating the Snake River Aquifer can cause pollution in the Aquifer which pollutes the surrounding wells.	See response to comment 3811-4 (in Table A-3v, Soils).
1361-2	Dean Dimond	In reviewing the DEIS I see that LS Power failed to make any kind of agreement with the Highway districts. In fact, all the local Highway district have submitted letters to the BLM opposing Lava Ridge. They expressed some very real problems that LS power needed to answer BEFORE the DEIS was released.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
2100-3	Office of Governor Brad Little, Office of Lieutenant Governor Scott Bedke, Office of US Senator Mike Crapo, Office of US	We are also concerned that hauling large turbine blades, hubs, and towers will be detrimental to Idaho's roads and highways. Idaho has and continues to make historic investments in transportation infrastructure.	AIB-37 and AIB-38 in EIS Appendix 3 (Issues Analyzed in Brief) address the potential effects of project construction and operation on maintenance needs for major public roads. As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project

Comment ID	Commenter	Public Comment	Response to Comment
	Senator Jim Risch, Office of Congressman Mike Simpson	The BLM needs to ensure our investments are not undone by this project and that Magic Valley Energy fully funds any damage that wind turbine components cause to the local transportation infrastructure.	construction. If any impacts occur to existing major public roads, MVE would be required to address those impacts. These requirements would be disclosed as part of the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). All existing public roads that are used or improved by MVE during the course of construction would be left in a condition that is as good as or better than their condition when the construction period begins (see applicant-committed measure 38 in EIS Appendix 4 [Mitigation]). Project access roads would be maintained by MVE throughout the life of the project. The BLM's issued ROW would include a stipulation that requires MVE to maintain the roads and allow public access of the road network. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
3041-1	Cameron Stauffer	In evaluating the EIS for the Lava Wind Project, there are issues in transportation planning. The highway districts in local areas have expressed real concern for the project. These are plans that should have been made before the EIS was proposed. Currently the highways and roads would not be able to handle the influx in traffic or construction. Additionally, the proposed routes, that would need to be improved before starting, would have to use private land for improvement.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. All existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins in accordance with the project's agreements with the associated governing body. As stated in Section 3.14 (Transportation), the BLM does not have the authority to approve or deny the use of the public roads managed by ITD and the local highway districts for the project. MVE would be responsible for obtaining required approvals from ITD or the local highway districts and would comply with the terms and conditions of those approvals. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
3042-1	Cameron Stauffer	Continuing, local highway districts have not been approached in the planning of transportation, which will also need enormous infrastructure improvement.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
3241-2	Dwight Bingham	We are writing on behalf of the Dietrich Highway District. We are aware of the initial ROAD USE AGREEMENT which has been circulated, along with the ZOOM meeting held several months ago. The Highway district has not been contacted further regarding this matter. At this point the Dietrich Highway District will be ta king the position that the Highway District is not in favor of the Lava Ridge Project. The reason for this position is that the Dietrich Highway District is unable to ascertain the possible impact of the Highway District due to a significant lack of detailed information concerning the project, including, but not limited to: 1. The District needs detailed information concerning the county roads which the project intends to utilize during the preconstruction and construction process and including any possible alternate roads which may be utilized. 2. The District needs detailed information concerning the anticipated traffic during the preconstruction and construction process and the anticipated traffic subsequent to completition of the project regarding utilization, repairs and maintenance. The District needs a reasonable schedule for the timing of the various stages of the project. 3. The District needs sufficient time to evaluate the information provided concerning the project to determine the nature, extent and possible impact on the county roads sought to be utilized. 4. The District may require, at the expense of the project proponent, a report outlining the existing road structure, pavement depth, load capacity and may, in the District's discretion require load Ground Penetrating Radar Survey along the entire length of the county road(s) sought to be utilized. In the case of gravel roads, the District may require a load Ground Penetrating Radar Survey along the entire length of the county road(s) sought to be utilized. 5. The District may require an engineered study as to any required turn radius along the county road route(s) proposed to be utilized. 6. In the event the road(s) sought to be utilized are insufficient to properly handle the anticipated utilization by the project proponent, then the road(s) sought to be utilized will need to be brought to appropriate necessary standards to handle the anticipated utilization for the project. The cost of the improvement to the road(s) shall be accomplished at the sole cost and expense the project proponent and shall either be performed by the District or by a third party approved by the District and subject to the approval of the construction by the District. The District may require reasonable sums to be deposited by the project proponent to ensure the timely performance of the modifications/improvements or may require a bond to be posted to cover the faithful performance of the modifications/improvement. In the case of gravel roads, the District may require the road to be modified to meet the requirements of the proposed project, including, but not limited to additional road base, dust inhibitors, or other improvements and on-going maintenance at the sole cost and expense of the project proponent. The District my also impose special speed restrictions along the proposed routes and or prohibit use of certain roads during particular times of the year, e.g. Spring Thaw. 7. Upon completion of the foregoing requirements, the District will issue a written permit for the project which will have additional terms and conditions regarding the timing, usage of the county road(s)in use and cost of repair, replacement for any damage to the road(s) utilized. A copy of this letter is being sent to the Idaho Transportation Department and local legislators for our District to	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. As stated in Section 3.14 (Transportation), the BLM does not have the authority to approve or deny the use of the public roads managed by ITD and the local highway districts for the project. MVE would be responsible for obtaining required approvals from ITD or the local highway districts and would comply with the terms and conditions of those approvals. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.

Comment ID	Commenter	Public Comment	Response to Comment
		keep them informed as to the status of the project as will as the Bureau of Land Management. The District is happy to visit with you in more detail about the matter at your convenience. Please feel free to contact any Commissioner or Scott Zimmers, Superintendent of the Dietrich Highway District.	
3997-1	Angelee Eames	To all concerned: Several issues jump out to me in the DEIS. Please review my comments and determine if they are fully answered in the EIS and a common response by LS Power and MVE they will "mitigate any issue that occurs." 1. According to the EIS 486 miles of new roads and 147 miles of road improvements to existing roads. How and when will MVE and LS pay to improve public roads-does BLM pay to build county roads that will ultimately have huge traffic impacts- The County Commissioners in Jerome, Lincoln and MInidoka have all come out with statements in opposition to this Lava Ridge Project. They know it will cost their counties-not benefit them! Roads can be ruined by heavy trucks driving heavy loads to and from the project's 300 square miles.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. All existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins in accordance with the project's agreements with the associated governing body. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
4966-1	Brinya Olmstead	My family and I drove out to the south side of the proposed project last week and the desert roads were muddy and virtually unpassable unless you wanted to risk getting stuck every couple miles and tearing up the surrounding grassland by driving off road. We turned around, but what is LS Power going to do in these conditions? Won't there be a significant amount of time each winter that they are unable to work due to unpassable roads? I read that they are going to build 600 miles of road to accomplish this project. The amount of gravel and maintenance that will be required to keep these roads passable to heavy equipment during the winter months seems to me that it will be Very disruptive to the native wild life and beauty of our desert. This will not end with the end of construction as I can only assume that these gigantic windmills will need constant maintenance that can only be performed with large equipment.	MVE's proposal for roadway maintenance is described in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]) and in EIS Appendix 3 (Issues Analyzed in Brief) (see AIB-37 through AIB-39). As described in Section J-5 (Post Construction Access Road Maintenance) of the Road Design, Traffic and Transportation Plan, the project access roads will need to provide all-weather access and will require periodic maintenance throughout the life of the project. Certain natural events, such as winter storms and major rainfall events, may require immediate access road maintenance. Typical maintenance activities include monitoring, blading, surface replacement, dust abatement, spot repairs, slide removal, ditch cleaning, culvert cleaning, litter cleanup, noxious weed control, and snow removal. The effects of maintenance activities (including but not limited to access road maintenance) on wildlife are analyzed in EIS Section 3.18 (Wildlife). As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project construction. All existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins. In addition, as stated in AIB-39, MVE would be required to maintain roads on BLM lands and allow public access of the road network. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.
5189-9	Traci Wood	What about all the roads and traffic? Does it affect the Jerome Air Port? Our Emergency systems, plane flying during wildfire season fighting the BLM fires?	Project-related effects on wildfire response and suppression efforts (including, but not limited to, aerial suppression efforts) are analyzed in EIS Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression). Project-related effects on aviation uses (e.g., airports) and first responder communication pathways are analyzed in EIS Section 3.8 (Land Use and Realty). Project-related effects on emergency responders are further analyzed in AIB-11 of EIS Appendix 3 (Issues Analyzed in Brief).
5367-1	Harold Dimond, Carolyn Dimond	Our concerns about access roads to get to the wind farm. These roads are improved for current public transport. The current roads have been built and maintained by local taxpayer funds. The DIES states in their components section of EIS report, that roads will need to be improved, but doesn't state their commitment to do so, and says nothing about maintaining public roads. These roads were built with local weight limits in mind. The vehicles using these roads are permitted for these weights only. Huge oversized, both in weight and length, trucks will destroy these roads and will cost taxpayers money to repair and maintain. The load limits are not set up for mega sized loads, nor do area residents want them to be. They are also not set up for wide load turning. It is simple that 2.4 million trips is going to cost tremendous amounts of money and loss of property for the right of ways. One lady stated that she was being bullied into letting them use her property. Yes, she had been approached by MVE and threatened with emanate domain if she didn't sell the needed property to make the turns. It just doesn't affect the roads close to the project but all the roads leading to the project clear across the state. Please consider all these ramifications in your decision and not allow them to come to our valley.	See response to comment 11411-6 (see in Table A-3w, Transportation).
5896-10	Mike Tylka	Local commerce roadblocks. 400 towers will require 4,000 trips of major components such as tower tubes, nacelles and blades to the sites. We have many individuals in the area that have to commute to the Wood River Valley to work. We have local commodity transport such as milk, sugar beets, cattle, sheep and grain that have to go to market. Transporting these oversize pieces of equipment on the arterial highways from the interstate to their destination will hamper commerce.	EIS Section 3.14 (Transportation) analyzes how traffic associated with the project would affect existing traffic patterns on major public roads, including I-84, U.S. 93, ID 24, ID 25, and local county roads. As stated in Section 3.14.1.2.2 (Impacts, Alternative B [Proposed Action]) construction-related vehicles would temporarily change traffic patterns on U.S. 93 and ID 24 in the analysis area through increased passenger and commercial trips, temporary lane closures and detours during proposed roadway improvements at siting corridor entrances, and increased congestion and travel times. Temporary lane restrictions, road closures, or other traffic delays would also occur during roadway improvements. It is unlikely that construction traffic would affect I-84 or other roadways near the I-84 corridor where exiting traffic counts are high. However, short-term delays at intersections along the haul route may occur during turbine component delivery. Although the LOS for U.S. 93 and ID 24 would be reduced during peak hour construction traffic, most segments of U.S. 93 and ID 24 would maintain an LOS D or better, which ITD considers acceptable for peak hour conditions. Only one short segment of U.S. 93 north of ID 25 would be reduced to an LOS E during peak hour traffic, and traffic management strategies would be considered to minimize this impact. In addition, degraded LOS conditions are based on the peak week of construction and would not occur during the entire 2-year construction period. MVE's applicant-committed measures 31 through 42 (see EIS Appendix 4, Table App4-2e) would be implemented and would reduce potential impacts to traffic patterns in the analysis area during construction and operation by limiting use of roads outside work areas, through the use of traffic control measures, by repairing and restoring roads postconstruction, and by coordinating any changes to traffic patterns with local authorities and right-holders

Comment ID	Commenter	Public Comment	Response to Comment
			within the siting corridors. Based on the results presented in the EIS analysis, the effects of project related traffic on local commerce are not expected to be measurable to a degree that would warrant detailed analysis of effects in the EIS.
7318-1	Linda (No Last Name Provided)	Local roads,bridges and highway damage from large trucks. Our local communities will be mostly responsible for fixing the damage and where will that money come from?	AIB-37 and AIB-38 in EIS Appendix 3 (Issues Analyzed in Brief) address the potential effects of project construction and operation on maintenance needs for major public roads. As stated in AIB-38, MVE would coordinate with ITD and the local highway districts regarding the need for repairs to roadways following project construction. If any impacts occur to existing major public roads, MVE would be required to address those impacts. These requirements would be disclosed as part of the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). All existing public roads that are used or improved by MVE during the course of construction would be left in a condition that is as good as or better than their condition when the construction period begins (see applicant-committed measure 38 in EIS Appendix 4). Project access roads would be maintained by MVE throughout the life of the project. The BLM's issued ROW would include a stipulation that requires MVE to maintain the roads and allow public access of the road network.
7334-2	Terry Ruby	Then lets talk about the dust these vehicles will generate. The roadways out there now turn to powder in the summer and muck in the winter and spring. Who is going to be responsible for maintaining these roadways?	EIS Section 3.2.1 (Construction Air Quality and Air Quality–Related Values) analyzes potential effects of the project on dust and air quality. MVE's proposal for roadway maintenance is described in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]) and in Appendix 3 (Issues Analyzed in Brief) of the EIS (see AIB-37 through AIB-39). As described in Section J-5 (Post Construction Access Road Maintenance) of the Road Design, Traffic and Transportation Plan, the project access roads will need to provide all-weather access and will require periodic maintenance throughout the life of the project. Certain natural events, such as winter storms and major rainfall events, may require immediate access road maintenance. Typical maintenance activities include monitoring, blading, surface replacement, dust abatement, spot repairs, slide removal, ditch cleaning, culvert cleaning, litter cleanup, noxious weed control, and snow removal. See response to comment 8640-2 (see in Table A-3w, Transportation) regarding MVE's maintenance responsivities.
8640-2	Jarred Moore	The Highway District has received a copy of the letter that was presented by Minidoka Highway District addressing their concerns about the Lava Ridge Project moving forward. At this time the Hillsdale Highway District would have to CONCUR with Minidoka Highway's concerns that were stated, but not necessarily limited to future concerns that may have not been identified yet.	As stated in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), MVE will comply with any required road design and will acquire any necessary permits related to traffic and transportation for the project. MVE will coordinate with local planning authorities regarding increased traffic during the construction phase, and specific issues of concern will be addressed and incorporated into the Road Design, Traffic and Transportation Plan. All existing public roads that are used or improved by MVE during the course of construction will be left in a condition that is as good as or better than their condition when the construction period begins in accordance with the project's agreements with the associated governing body. As stated in Section 3.14 (Transportation), the BLM does not have the authority to approve or deny the use of the public roads managed by ITD and the local highway districts for the project. MVE would be responsible for obtaining required approvals from ITD or the local highway districts and would comply with the terms and conditions of those approvals. At this time, the BLM understands that MVE initiated their engagement efforts with local highway districts in 2021 and would continue working with them to identify potential issues associated with project-related use of district roads and MVE's responsibilities surrounding anticipated maintenance and repair needs during construction and operation.

Vegetation

Table A-3x. Vegetation

Comment ID	Commenter	Public Comment	Response to Comment
10482-1	Joseph Alexander	According to the EIS it does not seem to have sufficient data at the time of the publication of the document, your map is out of date so this should make your application non valid. This is from the EIS 'The Project layout was not available at the time of survey; therefore, the Study Area was defined as the entire Project area (Figure 1). The vegetation assessment included agency coordination, a desktop assessment, and field survey. Details are provided below'	See Section 3.1.2.3 (Siting Corridor). The text provided by the commenter is not from the EIS; this text is a quote from the vegetation assessment memo (WEST 2020). As stated in EIS Section 3.15 (Vegetation), the EIS used a variety of vegetation data (not limited to WEST 2020), which were sufficient for the NEPA analysis.
11204-31	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	F. Permittees requested that MVE assumes the cost and obligation to implement weed control and garbage removal adjacent to Project-related roads. See 2022 Comments, pg. 7 & 9. The 2022 Comments requested that the applicant (MVE) "assumes the cost and obligation to mitigate any weed control and garbage removal adjacent to the roads" associated with the proposed Project if it is approved (2022 Comments, pg. 7). The 2022 Comments also requested that such costs and obligations regarding weed control and garbage removal be applied to all "as constructed" Project-related facilities during each phase of the proposed Project (2022 Comments, pg. 9). The DEIS does not adequately address this issue.	See EIS Appendix 4 (Mitigation) for a complete list of measures that would be implemented to minimize or avoid impacts related to nonnative plants and noxious weeds. All measures would be MVE's responsibility. Alternative B describes MVE's proposal, which does not explicitly state they would bear the cost of all measures. However, the BLM would require additional measures; these measures are described throughout the EIS as Alternative B with Additional Measures. If the BLM selects Alternative B, the additional measures would be required. Those measures would also be required for the other action alternatives because they would be included as part of the alternatives' description (i.e., they would not be additional measures, they would be part of the alternative description from the start). The BLM can suggest changes to MVE (2023); however, if MVE chooses not to make the changes, then the BLM can enforce the changes by adding additional mitigation measures through the NEPA process.

Comment ID	Commenter	Public Comment	Response to Comment
		Under its analysis of avian and bat species, section 3.3 of the DEIS reports under “Alternative B with Additional Measures” that additional measures would be imposed to minimize impacts, including “Measure rr” which would make MVE “responsible for control of weed and nonnative species that result from construction, use, or maintenance authorized in their ROW grant” and would require MVE to “coordinate with the Authorized Officer and/or local authorities for acceptable weed control measures (within limits imposed in the grant stipulations) prior to implementing weed treatments” (DEIS, pg. 3-124). See also DEIS, pgs. 3-234, 3- 254, 3-283, 3-308, and 3-482. The fact that these measures are discussed under analysis of the Alternative titled “Alternative B with Additional Measures” implies that MVE would not bear responsibility for the “control of weed and nonnative species” and would not need to “coordinate with the Authorized Officer and/or local authorities… prior to implementing weed treatments” under Alternative B as submitted by the applicant (MVE). Draft Appendix R (Draft Noxious Weed Management Plan) attached to the DEIS reports that the purpose of the Noxious Weed Management Plan is to: “report the results of a baseline noxious weed inventory… provide guidance for controlling noxious weeds during Project construction, operation, and reclamation, and provide an overview of Best Management Practices (BMPs) that will be implemented for the life of the Project.” DEIS, Draft Appendix R, Draft Noxious Weed Management Plan, pg. R-1. It is unclear why the DEIS chose to address potential shortcomings of the Draft Noxious Weed Management Plan by evaluating additional weed control and treatment stipulations (measures) under an Alternative titled “Alternative B with Additional Measures” rather than simply direct that the Draft Noxious Weed Management Plan be amended to remedy identified shortcomings. The DEIS needs to clarify that MVE “assumes the cost and obligation” for “weed control” and “garbage removal adjacent to the roads” and all other Project-related facilities during each phase of the proposed Project.	At publication of the draft EIS, and the Noxious Weed Management Plan (Appendix R in MVE [2023]) and other appendices in MVE (2023) were in draft form, with the intent that they would be updated during the development of the final EIS and ROW grant, if issued. MVE has committed to maintaining the project in a sanitary condition at all times, including the proper disposal and removal of trash within their authorized ROW (see applicant-committed measure 82 in EIS Appendix 4 [Mitigation]); additional details are in the Health and Safety Plan (Appendix F in MVE [2023]).
11363-1	Jason Parker; Tri-County Noxious Weed Control	I am writing to express my concern about the presence of noxious weeds on the property within the Lava Ridge Project. As you are aware, noxious weeds are invasive and can cause harm to the environment, agriculture, and human health. Our department is committed to monitoring and enforcing noxious weed control in our community. We want to work with you to ensure that Lava Ridge Project is in compliance with state and local regulations regarding noxious weed control. We understand that controlling noxious weeds can be a challenging and ongoing task. However, it is essential to protect the environment and the community from their harmful effects. We urge you to take the necessary steps to manage and control the noxious weeds within the Lava Ridge Project. Our department will be monitoring the project area for noxious weeds, and we will take enforcement action if necessary. We hope that you will work with us to prevent the spread of noxious weeds and maintain a healthy environment for our community. Please feel free to contact us if you have any questions or concerns about noxious weed control. Sincerely, Jason Parker Superintendent Tri-County Noxious Weed Department Serving Gooding, Jerome, and Lincoln Counties	The Noxious Weed Management Plan (Appendix R in MVE [2023]) describes ISDA rules governing noxious weeds and the measures that would be implemented to identify, monitor, and treat noxious weed populations throughout the life of the project. EIS Appendix 4 (Mitigation) includes a complete list of mitigation measures that would be implemented to minimize or avoid impacts related to nonnative plant species, including BLM-required measure ooo, which states, “MVE would be responsible for control of weed and nonnative species that result from construction, use, or maintenance authorized in their ROW grant. MVE must coordinate with the Authorized Officer and/or local authorities for acceptable weed control measures (within limits imposed in the grant stipulations) prior to implementing weed treatments.”
11426-1	Lisa Scharin	I hope that the impacts of clearing too much forest is considered-since we are losing forests to deforestation, wildfires and development as it is now. [...] We need to transition to clean, renewable energy-this is very important-it is also equally important to make sure that we do not negate any progress toward that by destroying what forests we have left-this we know forests are vital carbon sink holes-providing also-clean air and helping to reduce erosion and old growth forests can resist major wild fire risks. If there is a way to streamline this project to reduce clearing and disrupting this area-I hope that you make that a priority in moving forward. If there is an area that is already cleared and can be used to litigate altering pristine areas-PLEASE use that area! The less impact and altering this project creates-the better! We really cannot afford to lose more forests and must protect wildlife habitat too	As described in EIS Section 3.15.1.1 (Affected Environment), the analysis area is composed mostly of sagebrush steppe and grassland vegetation; forests and woodlands are not present. Impacts to native upland vegetation are summarized in EIS Table 3.15-3. See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures that would be implemented to minimize or avoid impacts to native vegetation and wildlife habitat.
11487-2	Idaho Noxious Weed Control Association	We have state law and administrative rules that assist in prioritizing which noxious weeds or invasive species should be eradicated, controlled and prevented. The first tier of a project on this scale is prevention. Additionally, prevention can be easily overlooked if deadlines are trying to be met by those constructing the project. Once a noxious weed or invasive species is introduced to an area it can be very difficult, if not impossible, to eradicate it. Negotiated rulemaking will be occurring this summer (2023) on the noxious weed list. If a species does get moved to a different category during the rulemaking session, this plan should be adaptable to those changes. If changes are made, this plan should be reviewed and changed as well. We appreciate the opportunity to comment on the Lava Ridge Wind Project.	The Noxious Weed Management Plan (Appendix R in MVE [2023]) describes ISDA rules governing noxious weeds and the measures that would be implemented to identify, monitor, and treat noxious weed populations throughout the life of the project. The Noxious Weed Management Plan provides for noxious weed monitoring and control over the life of the project and will be updated as needed to address revisions to ISDA’s noxious weed rules and BLM treatment recommendations. EIS Appendix 4 (Mitigation) includes a complete list of mitigation measures that would be implemented to minimize or avoid impacts related to nonnative plant species, including BLM-required measure ooo, which states, “MVE would be responsible for control of weed and nonnative species that result from construction, use, or maintenance authorized in their ROW grant. MVE must coordinate with the Authorized Officer and/or local authorities for acceptable weed control measures (within limits imposed in the grant stipulations) prior to implementing weed treatments.”
11535-70	Steven Andersen	Furthermore, increased use of surrounding BLM-administered lands, resulting from additional access corridors (via new access roads and utility and transmission corridors) could also affect vegetation through direct injury to vegetation, the legal and illegal take of plants, and the introduction of invasive vegetation. The DEIS fails to adequately address how the spread of noxious weeds from vehicles coming in and out for construction activities will be mitigated. It also neglects any mention of illegal take of plants.	The Noxious Weed Management Plan (Appendix R in MVE [2023]) describes the measures that would be implemented to identify, monitor, and treat noxious weed populations throughout the life of the project. EIS Appendix 4 (Mitigation) includes a complete list of mitigation measures that would be implemented to minimize or avoid impacts related to nonnative plant species, including additional measures not specified in the Noxious Weed Management Plan. Impacts to vegetation from the introduction or spread of weeds and other invasive plant species are described under AIB-41 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1. As described under AIB-43 in EIS Appendix 3, Table App3-1, there are no plant species listed under the ESA that occur in the siting corridors. The term “take” as it applies to threatened and endangered species only applies to species listed under the ESA and is therefore not mentioned in this analysis. Special-status plant species that have the potential to occur in the

Comment ID	Commenter	Public Comment	Response to Comment
			siting corridors are not at high risk of illegal collection, and potential impacts to them, as disclosed in EIS Section 3.15.2 (Bureau of Land Management Special-Status Plants), would not be unlawful.
11535-72	Steven Andersen	The DEIS does not address herbicide exposure to vegetation and animals. The DEIS's assertion that exposures are "not expected," cannot be relied upon. Site maintenance activities may include the licensed application of herbicides (i.e., pesticides) to control vegetation along access roads, utility and transmission corridors, and around support buildings and turbine towers. Herbicide use may be in addition to, or in lieu of, mowing. The accidental spill of herbicides may result in environmental concentrations exceeding licensed levels, and these herbicides could migrate off site and affect native vegetation in surrounding areas.	See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures that would be implemented to minimize or avoid impacts from leaks and spills of potentially hazardous materials. Potential impacts to wildlife from herbicide use are described under AIB-58 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1.
11535-146	Steven Andersen	Moreover, much of the analysis focuses on the reclamation of the area after decommissioning of the project. Yet, because of the fragility of these species, there may very well be nothing left to reclaim after the 34-year life of the project. As these special-status plants are some of the most sensitive and fragile in the region, they merit much greater protection.	As described in EIS Section 3.15.1.2.2 (Native Upland Vegetation, Alternative B), interim reclamation would be implemented in work areas following construction; the goal of final reclamation following decommissioning would be to establish vegetation communities in disturbed areas that are comparable to the vegetation community in adjacent undisturbed areas rather than restore disturbed areas to preconstruction conditions. EIS Appendix 4 (Mitigation) includes a complete list of measures that would be implemented to ensure successful reclamation of disturbed areas, including monitoring of reclamation until desired plant communities are restored (applicant-committed measure 163 and BLM-required mitigation measure P). MVE would be required to purchase a reclamation bond and would be held to BLM-approved reclamation success criteria (applicant-committed measure 164). Additional details are provided in the Reclamation Plan (Appendix E in MVE [2023]). Impacts to habitat for BLM special-status plants that occur in wetland habitats would be largely minimized or avoided through the implementation of MVE's applicant-committed measures and additional measures required by the BLM. These mitigation measures also include preconstruction clearance surveys in potential habitat for BLM special-status plants that has not been previously surveyed and avoidance or mitigation of impacts to special-status plant populations identified during these surveys (if any); see EIS Appendix 4 for a complete list of mitigation measures.
11536-1	Richard Llewellyn	Foremost, the scientific literature describing attempts to restore sage steppe plant communities after disturbance is replete with cautionary findings emphasizing the difficulty in re-establishing native communities regardless of the methods and materials employed –indeed, the lack of certainty in the endeavor is the common denominator across these studies.1 Interannual variation in precipitation has long been recognized as a major determining factor in the success of restoration efforts:2 indeed prominent researchers speak of the "exceptional warm wet spring of Great Basin mythology" necessary for success of re-establishment of native perennials on difficult sites, such as those infested by medusahead grass (Taeniatherum caput-medusae).3 Even apparent success in initial establishment of a foundational species like sagebrush4 may wane or fail a decade later due to a phenomenon known as 'transient population dynamics'5 – failures that are expected to increase in the upland sagebrush steppe with expected patterns of climate change. The expected impacts of climate change are not explicitly taken into account in this EIS in evaluating the likelihood that necessary sage steppe restoration efforts will be successful. Considering that the EIS describes the expected timeline for mitigation of mature plant communities to be 84 years, a realistic account of the expected effects of climate change on these efforts is essential.	As described in EIS Section 3.15.1.2.2 (Native Upland Vegetation Impacts, Alternative B [Proposed Action]), the goal of reclamation would be to establish vegetation communities in disturbed areas that are comparable to the vegetation community in adjacent undisturbed areas rather than restore disturbed areas to preconstruction conditions. This accounts for any changes to vegetation communities that may occur from climate change and other factors during the 34-year life of the project and 50-year vegetation recovery period. The EIS also acknowledges that disturbance in very fragile soils is unlikely to be successfully restored. EIS Appendix 4 (Mitigation) includes a complete list of measures that would be implemented to ensure successful reclamation of disturbed areas, including monitoring of reclamation until desired plant communities are restored (applicant-committed measure 163 and BLM-required mitigation measure P). MVE would be required to purchase a reclamation bond and would be held to BLM-approved reclamation success criteria. Additional details are provided in in the Reclamation Plan (Appendix E in MVE [2023]).
11536-2	Richard Llewellyn	The EIS generally describes the degree in which plant communities have been invaded by exotic species, but does little to distinguish the impacts that invasion by distinct species are likely to have – for example, the difference in bulbous bluegrass (Poa bulbosa), commonly found onsite, from the more problematic winter annual grasses. As such, the descriptions of percent of cover by native vs non-native species are not indicative of restoration potential. The EIS largely condenses the impacts of the winter annual grasses into the challenges presented by cheatgrass (Bromus tectorum) on future fire likelihoods, site mitigation, and native plant restoration multiple times. While cheatgrass invasion represents a major and well-studied problem, the occurrence of medusahead rye (Taeniatherum caput-medusae) and its potential to replace cheatgrass7 as an even more destructive and fire promoting exotic8 that effectively smothers soil crust communities with its silica-rich thatch9, is not addressed in the EIS. Currently, large tracts of medusahead rye have become permanently established on rangelands to the east, and any major activity on public lands that disturbs soils in this region must particularize restoration or mitigation efforts in the context of this looming threat.	EIS Section 3.15 (Vegetation) describes existing conditions for vegetation in the siting corridors. EIS Section 3.15.1.1 (Native Upland Vegetation, Affected Environment) summarizes AIM data available for the siting corridors (BLM 2022a); there are no records of medusahead rye in the siting corridors. Although the species may spread to the siting corridors in the future even if the project were not implemented, if the project is approved, a number of measures would be implemented to minimize or avoid the introduction and spread of weeds and other invasive species (a complete list of measures is in EIS Appendix 4 [Mitigation]). Additional details on weed management are provided in the Noxious Weed Management Plan (Appendix R in MVE [2023]). Measures would be implemented to ensure successful reclamation of disturbed areas, including monitoring of reclamation until desired plant communities are restored (applicant-committed measure 163 and BLM-required mitigation measure P in EIS Appendix 4). MVE would be required to purchase a reclamation bond and would be held to BLM-approved reclamation success criteria. Additional details are in the Reclamation Plan (Appendix E in MVE [2023]).
11536-3	Richard Llewellyn	More broadly, the EIS, while acknowledging that restoration of fragile soil sites representing about 12% of the overall site analyzed (about 84000 acres) may never be successful, fails to provide the most basic quantitative models of the successful restoration or mitigation that the EIS is fundamentally dependent upon for the larger area, and how success is defined. Qualitative, probabilistic models describing restoration, even with known inadequacies, need to be presented, so that the public may understand the factors and weights that are considered when the agency concludes that "These effects could last up to 84 years (34 years project construction, operation, and decommissioning plus 50 years for vegetation to reestablish after final reclamation) but would not be irreversible because most of this disturbance would be reclaimed or restored in the long term."	For the purposes of analysis, the EIS assumes that highly fragile soils are unlikely to be successfully restored and would remain permanently disturbed. As stated in the EIS, 84 years refers to areas that are not in highly fragile soils. EIS Sections 3.13.1.4 (Soils, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), and 3.15.1.4 (Vegetation, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) state that "[i]rreversible impacts would occur from ground disturbance in very fragile soils where reclamation potential would be limited because of limiting revegetation factors." And that "highly fragile soils are unlikely to be successfully restored and would remain permanently disturbed following the project." As described in EIS Section 3.15.1 (Native Upland Vegetation Communities), the assumption that native vegetation communities would require up to 50 years to become re-established is based on a review of publicly available literature on the recovery times of the most prevalent native vegetation communities in the siting corridors (i.e., sagebrush steppe and perennial grassland). Because the goal of reclamation would be to establish vegetation communities in disturbed areas that are comparable to the vegetation community in adjacent undisturbed areas (rather than to restore preconstruction vegetation communities, which are

Comment ID	Commenter	Public Comment	Response to Comment
			predominantly nonnative-dominated), any revegetation efforts would inherently account for climate change induced alterations to native vegetation communities over the 34-year life of the project; see Section 3.15.1.2.2 (Native Upland Vegetation Communities, Alternative B). Seed mixes for reclamation would be developed in coordination with the BLM botanist, which would ensure that species best adapted to the environment at the time of reclamation are selected; additional details are provided in the Reclamation Plan (Appendix E in MVE [2023]) and the Noxious Weed Management Plan (Appendix R in MVE [2023]). As described in Section 3.15.1.2.2, MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria, which would ensure that desired vegetation communities are restored following decommissioning (see also BLM-required mitigation measure P). Therefore, probabilistic modeling to quantify the recovery of native vegetation communities during reclamation would not lead to a more informed analysis.
11536-10	Richard Llewellyn	Likewise, EIS statements such as “Project ground disturbance could increase the likelihood of introduction and spread of nonnative plants…” muddle rather than clarify the agency’s application of basic research to restoration efforts. An overwhelming conclusion of this research is that ground disturbance does rather than ‘could increase the likelihood of introduction and spread of nonnative plants’ in areas where the relevant nonnative plants exist regionally – the project site in its entirety – the only question is to the magnitude of the increased likelihood.	EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1 discusses the potential for the project to increase the introduction or spread of weeds and other invasive species in the siting corridors (see AIB-41). As described in this table, a number of measures would be implemented to minimize or avoid impacts from the introduction or spread of weeds and other invasive species (refer to EIS Appendix 4 [Mitigation] for a complete list). With the implementation of these measures, it is not expected that all ground disturbance would introduce or spread weeds and other invasive species, and therefore, “could” is more appropriate than “would.”
11563-3	Idaho Cattle Association	the Idaho Cattle Association (ICA) submits the following comments on the Lava Ridge Environmental Impact Statement (EIS). [...] The level of disturbance that this project will create is vast. The ensuing invasion of cheat grass and other invasive species is a big threat. These species have proven challenging in turning back and pose a tremendous fire risk. Although the EIS contains a mitigation plan in managing for these risks and effects, we worry about the long-term effects of the project and of the ability or requirements of Magic Valley Energy to maintain improvements for the life of the project.	Mitigation measures (detailed in EIS Appendix 4 [Mitigation]) would be implemented to ensure successful reclamation of disturbed areas, including monitoring of reclamation until desired plant communities are restored (applicant-committed measure 163 and BLM-required mitigation measure P). MVE would be required to purchase a reclamation bond and would be held to BLM-approved reclamation success criteria. Additional details are in the Reclamation Plan (Appendix E in MVE [2023]). Additionally, applicants are required to demonstrate financial and technical capability as part of the BLM ROW application process. MVE (2023) Section 1.6 (Financial and Technical Capability of Applicant) provides this documentation.
11776-4	Regina Smith	Surface disturbances increase the growth of non-native species such as cheatgrass, Russian thistle, and a variety of others. The impacts on these species are not analysed.	EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1, discusses impacts related to the introduction and spread of weeds and other nonnative plant species (see AIB-1, AIB-41, and AIB-57).
11849-2	Charles Brockway	Another unique feature of the area is the presence of a consistent native grassland containing little or no downy brome (cheatgrass). Almost all areas in southern Idaho, when left alone, become infested with cheatgrass, but the Lava Ridge area is one of the very few that do not. The EIS fails to adequately consider the impact of the construction and ongoing activities on the native grassland. Again, no scientifically-defensible, site-specific modeling has been conducted on the grassland impact.	See EIS Section 3.15.1 (Native Upland Vegetation Communities) for a summary of data showing the current plant species composition in the project area and the impacts to native upland vegetation, including grasslands.
11871-25	WildLands Defense	Please also assess the impacts of the construction disturbance in proliferation of flammable annual grasses. For example, Townsend’s Ground Squirrels in the Morley Nelson Snake River Birds of Prey Area are known to suffer population reductions during drought stress years in lands dominated by exotic annuals. Increased climate change effects such as higher temperatures are causing significant cheatgrass expansion. See Van Horne et al 1997. https://www.jstor.org/stable/2963457 Livestock grazing exacerbates flammable weed infestation and spread, making lands less resistant to cheatgrass and less resilient when suffering disturbance. See Reisner et al. 2013, Williamson et al. 2019.	Effects to wildlife habitat from the introduction and spread of weeds and other invasive species are described under AIB-57 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1. As stated in this table, BLM (2005) discloses potential effects to wildlife habitat from the construction, operation, and decommissioning of a wind energy facility, including effects from the introduction or spread of weeds and other invasive species. The table also describes the measures that would be implemented to minimize or avoid effects from the introduction or spread of weeds and other invasive species (see EIS Appendix 4 [Mitigation] for a complete list); additional details are in the Noxious Weed Management Plan (Appendix R in MVE [2023]). With the implementation of these measures, effects would be no greater than previously disclosed in BLM (2005) and detailed analysis in this EIS is not warranted. See EIS Section 3.7 (Fire and Fuels Management) for a discussion of potential impacts related to wildfire risk; Section 3.7.1.1.5 (Fire and Fuels Management, Existing and Future Trends and Actions) discloses the potential for climate change and livestock to increase the presence and spread of nonnative species and alter the natural fire regime.
11871-34	WildLands Defense	M-12 shows the consultants used outdated Landfire Vegetation and other data. There is a need on-the-ground current vegetation community data, and detailed mapping and analysis of cheat, medusahead, rush skeleton weed forage kochia, cwg, etc. presence. This is also critical for understanding rehab actions.	EIS Section 3.15.1.1 (Affected Environment) describes native upland vegetation communities in the siting corridors, including existing and future trends related to invasion by weeds and other nonnative plant species. The EIS uses the most current version of LANDFIRE vegetation data available from the USGS and DOA (2013). Because changes to plant communities may have occurred since the most recent LANDFIRE vegetation data was published in 2013, more recent on-the-ground data from AIM surveys in and near the siting corridors was included in describing the current vegetation community. Details on weed control and reclamation measures can be found in the Reclamation Plan (Appendix E in MVE [2023]), the Noxious Weed Management Plan (Appendix R in MVE [2023]), and EIS Appendix 4 (Mitigation).
11871-68	WildLands Defense	EIS Vegetation Appendix Document The Appendix states: “Overall, vegetation communities present within the Study Area have been altered by domestic livestock grazing and the introduction of non-native species, such as cheatgrass. Cheatgrass composed more than 50% cover in 8 of the 20 sample plots. Cheatgrass invasion has contributed to a more frequent and often more intense fire cycle, which has further facilitated its spread throughout the intermountain west region (Balsch et al. 2012). Based on BLM data (2019), review of aerial imagery, and observations made during the field survey, numerous wildfires have occurred over the last 35 years, including within the last several years. In addition to cheatgrass and other non-native invasive species proliferating in burned areas, many of the burned areas appear to have been predominantly seeded with crested wheatgrass, likely in an effort to quell the spread of cheatgrass and help stabilize soils. The results of the field survey suggest the overall vegetation composition and condition within much of the Study Area is predominantly	EIS Section 3.15.1 (Native Upland Vegetation Communities) describes vegetation communities in the siting corridors and the data sources used in the EIS. These communities are also depicted in EIS Figure 3.15-1 (Vegetation analysis area). Additional information on sagebrush steppe vegetation in the siting corridors is presented in EIS Section 3.3.4 (Greater Sage-Grouse). Biological soil crusts are discussed in EIS Section 3.13.1 (Soils and Plant Growth Materials); as described in the impacts analysis (EIS Section 3.13.1.2 [Impacts]), the analysis assumes that biological soil crusts are present throughout the siting corridors because their actual extent is unknown. EIS Section 3.15.2.1 (Bureau of Land Management Special-Status Plants, Affected Environment) summarizes the baseline resource inventories conducted for BLM special-status plants; no BLM special-status plant surveys were conducted in 2022. As described in this section, while the July 2020 habitat assessment occurred too late

Comment ID	Commenter	Public Comment	Response to Comment
		disturbed and composed of non-native grasses. WEST recognizes the timing of the field survey may have resulted in fewer native forbs being detected and plant diversity may be higher than was recorded during the survey. However, it should also be recognized that some of the native plants that occurred historically in the Study Area may have been displaced over time (i.e., outcompeted) by invasion/establishment of non-native species. While some sensitive plant species can tolerate various levels of disturbance, they often occupy niche (i.e., micro) habitats within disturbed areas. The degraded vegetation communities encountered throughout the Study Area may be unsuitable for many of the above sensitive species; however, there is potential for some of the above species, particularly the Astralagus species, to occur in microhabitats within degraded areas in the Project. MVE anticipates pre- …". Regrettably, no adequate map of actual on-the ground current vegetation communities and biocrusts to be found here. The proposed rehab efforts are also highly uncertain and use the very same methods that have failed so spectacularly in the past to promote biodiversity and species conservation. Consultant surveys were conducted much too late for rare plants in the 2022 drought year.	in the season to detect most BLM special-status plants, the intent of the habitat assessment was to verify the results of the desktop analysis for vegetation and assess the potential for habitats in the siting corridors to support BLM special-status plants (rather than to identify individual occurrences of these species). The results of this habitat assessment were used to identify survey transects for BLM special-status plant surveys; as described in the *Sensitive Plant Species Survey Report – Lava Ridge Wind Project*. (WEST 2021), the 2021 BLM special-status plant surveys were split into three separate survey efforts timed to coincide with the flowering period of all targeted plant species. The possibility that the unusually dry conditions immediately preceding the 2021 surveys could have contributed to the lack of BLM special-status plant observations and the need for additional site-specific surveys prior to disturbance are disclosed in EIS Section 3.15.2.1. MVE has committed to preconstruction clearance surveys and avoidance (or relocation) of BLM special-status plant populations (applicant-committed measures 12, 109, and 110; see EIS Section 3.15.2.2 (Bureau of Land Management Special-Status Plants, Impacts). Where avoidance is not possible, additional measure kkk requires MVE to mitigate impacts to BLM special-status plants. A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation). This list includes a number of measures that would be implemented to improve the success of reclamation efforts, including five years of monitoring, adherence to BLM-approved reclamation success criteria, and the use of adaptive management when reclamation efforts are not trending toward desired vegetation communities. Additional details are in in the Reclamation Plan (Appendix E in MVE [2023]). MVE would also be required to hold a reclamation bond, which would ensure that the BLM has the financial means to implement further reclamation if MVE is unable to meet BLM-approved reclamation success criteria; see EIS Section 3.15.2.2.
11978-137	Magic Valley Energy, LLC	39. Section 3.15.2.2.2 Vegetation - Alternative B (Proposed Action) "Therefore, acres of work area ground disturbance could last for up to 84 years (34 years project construction, operation, and decommissioning plus 50 years for vegetation to reestablish after final reclamation)." MVE asks the language be updated, as reclamation has the potential to meet criteria prior to 50 years: "Therefore, acres of work area ground disturbance could last for up to 84 years (34 years project construction, operation, and decommissioning plus up to 50 years for vegetation to reestablish after final reclamation)."	Revised as requested.
11496-7	Danielle Gunn	The wind project will increase fire hazards significantly. The DEIS does not provide an adequate fire plan. A complete list of contacts and chain of command needs to be established to manage any fire incidents. A fire plan should be developed and made available to the permittees. All MVE employees should be trained in fire prevention and management. The DEIS discusses re-seeding vegetation in disturbed areas. However, it does not mention what grass, forb, and shrub species will be used. These seed mixes need to be identified. Are introduced grasses allowed in the mixes or will they be 100% native? Introduced grasses have a history of quicker establishment and higher success rate while native species can take time to flourish and may fail completely. The DEIS discusses weed management but not in great detail. All noxious, invasive, and weedy annual plant species need to be identified in the final EIS. All potential herbicides must be listed and distributed to permittees. Permittees must be notified of what herbicides are used as many chemicals pass through the rumen unaffected and can cause crop damage if livestock are moved from a treated area to a non-treated area with sensitive crops.	A Fire Protection and Prevention Plan is provided in Section F-6 (Fire Protection and Prevention Plan) of the Health and Safety Plan (Appendix F in MVE [2023]). This plan includes details on employee training, emergency contacts, and roles and responsibilities. Details on reclamation methods are provided in the Reclamation Plan (Appendix E in MVE [2023]). EIS Appendix 4 (Mitigation) provides a complete list of measures that would be implemented to minimize or avoid impacts associated with nonnative plants and noxious weeds (including the use of a BLM-approved, weed-free seed mix), as well as herbicide applications. Additional details on nonnative plant and noxious weed management can be found in the Noxious Weed Management Plan (Appendix R in MVE [2023]). Section 3 (Baseline Noxious Weed Inventory) of the Noxious Weed Management Plan describes the baseline noxious weed inventory conducted for the project; noxious weeds detected during these inventories are listed in Table 1. Section 4.3 (Revegetation Recommendations) of the Noxious Weed Management Plan describes the seeding techniques (see Section 4.3.1) and seed mix (Section 4.3.2) that would be used during revegetation efforts. The BLM typically does not specify seed mixes more than a year ahead of seeding because seed availability varies annually and best practices are continuously improved in response to new data. As stated in Section 4.3.2, "MVE will coordinate with the BLM botanist to develop an approved seed mix for the project. A Project-specific seed mix will help ensure native plants are actively growing throughout the growing season to benefit pollinator species and reduce opportunities for noxious weeds to establish and spread." In regard to herbicide applications, EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1 (Preliminary Issues Analyzed in Brief and Supporting Rationale), AIB-58 states "MVE would comply with the applicable federal and state laws and regulations concerning the use of herbicides and other similar substances in all activities/operations, including the standard operating procedures described in the 2007 and 2017 BLM vegetation treatments using herbicides programmatic EISs (BLM 2007, 2016) (applicant-committed measure 101 and BLM-required measure Z). Prior to the use of herbicides, MVE would obtain from the BLM a written approval of a plan showing the type and quantity of material to be used, pest(s) to be controlled, method of application, location of storage and disposal of containers, and any other information deemed necessary. Herbicides would not be permanently stored on public lands, and applicator(s) would hold a current applicator's license or be under the direct supervision of a licensed applicator. MVE would provide an annual report to the BLM to report type and quantities of herbicides applied to public lands." There is no requirement to notify permittees of herbicide applications on BLM land. MVE will be required to use BLM-approved chemicals but will not be required to notify permittees.
12071-1	Richard Dinges	A very noticeable feature of the Bureau of Land Management's (BLM) draft Environmental Impact Statement (EIS) for the Lava Ridge wind turbine project is that it addresses in some detail the fatalities that will be experienced by bats, birds, raptors and butterflies with impact from the operating turbines. However , no consideration is given as to what effect this will have on the ecosystem as a whole. The Lava Ridge project itself occupies nearly 200,000 acres of public lands. It abuts and partially surrounds private land that is primarily irrigated crop lands A wide variety of crops are grown on these lands. The entire area's ecosystem must be considered when evaluating this project. This evaluation is clearly absent from the EIS. The construction and	Effects to wildlife are discussed in EIS Section 3.3 (Avian and Bat Species), EIS Section 3.11 (Pollinators and Insects), and EIS Section 3.18 (Wildlife); effects to vegetation are discussed in EIS Section 3.15 (Vegetation). Additional discussion of impacts to wildlife and vegetation are in EIS Appendix 3 (Issues Analyzed in Brief), including impacts to farmland (AIB-34) and impacts to crop dusting are in Section 3.8.2 (Aviation) (see Table App3-1 [Preliminary Issues Analyzed in Brief and Supporting Rationale]).

Comment ID	Commenter	Public Comment	Response to Comment
		decommissioning phase only focuses on the activities associated with these phases, but does not address the effects it will have on the wildlife and vegetation. The overall effect on the area's ecosystem is not considered.	
12469-3	Mike Telford	The DEIS does not address the fragile nature of a high mountain desert environment. These environments take decades to make very small almost unrecognizable changes. I have lived here for 49 years and from personal experience have seen how very slow recover from disturbance of any kind can be. The DEIS ignores this scientific fact. I believe BLM has all that information.	The nature of high mountain desert vegetation communities were considered when describing the duration of impacts to vegetation, which are stated to be the life of the project (34 years) plus 50 years for reclamation (the longest estimated time for native vegetation communities to reestablish): a total of 84 years, as described in EIS Section 3.15.1 (Native Upland Vegetation Communities). EIS Section 3.13.1.1 (Soils, Affected Environment) describes very fragile soils in the siting corridors. As stated throughout the resource analysis sections in Chapter 3 (Affected Environment and Impacts), highly fragile soils naturally have relatively little vegetative cover, and are unlikely to be successfully restored and would remain permanently disturbed following the project. EIS Appendix 4 (Mitigation) describes the measures that would be implemented to minimize or avoid disturbance.
13003-6	Lynden Osborne	Another cause for soils within the Lava Ridge wind farm to be dryer would be ground disturbance associated with scraping, digging and pushing dirt around to build the 486 mites of new road, the 400 tower bases, the 56 miles of powerline trench, the waterlines, fences, staging areas, and maintenance facilities. Once the ground is disturbed to the extent described in the DEIS, and vegetation is uprooted, I believe that it will be virtually impossible to rehabilitate the affected desert. Anything that leads to bare ground being left unattended, will allow opportunistic weeds to become established.	Effects to soils from ground disturbance associated with work areas and infrastructure are disclosed in EIS Section 3.13.1.2 (Soils, Impacts) and summarized in Table 3.13-4 in this section. This section also describes the measures that would be implemented to minimize or avoid impacts to soils, including interim reclamation of work areas following construction; a complete list is provided in EIS Appendix 4 (Mitigation). Additional details can be found in in the Reclamation Plan (Appendix E in MVE [2023]) and the Noxious Weed Management Plan (Appendix R in MVE [2023]). Irreversible and irretrievable impacts to soils, including disturbance in very fragile soils and loss of biological soil crusts are disclosed in EIS Section 3.13.1.4 (Soils, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity). Reclamation mitigation measures would be implemented to ensure successful reclamation of disturbed areas, including monitoring of reclamation until desired plant communities are restored (applicant-committed measure 163 and BLM-required mitigation measure P in EIS Appendix 4). MVE would be required to purchase a reclamation bond and would be held to BLM-approved reclamation success criteria. Additional details are in the Reclamation Plan (Appendix E in MVE [2023]).
22-1	Patricia Higgins	Site preparation with vegetation removal and "treatment" with fences what kind of treatment ?	The EIS does not describe any “treatments” with fencing. Table 2.4-1 in EIS Section 2.4 (Alternative B [Proposed Action]) summarizes project components by action alternative, including ground disturbance from work areas and infrastructure and miles of temporary livestock fencing. Site preparation methods and temporary livestock fencing are described in greater detail in EIS Appendix 11 (Project Elements Common to All Action Alternatives) and the Grazing Coordination Plan (Appendix S in MVE [2023]).
3140-5	Susan Page	What plants will be destroyed? What habitats will be destroyed belonging to owls just to name one.	EIS Section 3.15 (Vegetation) discusses the potential impacts to native upland vegetation and BLM special-status plants. Also see AIB-41 through AIB-44 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). Impacts to wildlife habitat, including habitat for owls and other avian species, are also described in Table App3-1 (see AIB-1, AIB-57, AIB-58, AIB-60, AIB-61, AIB-62, and AIB-63).
3251-1	Michael Ottley	Cassia County Noxious Weed Control does not support or oppose the Lave Ridge project. We are concerned with the impact the Lava Ridge Windmill Project will have on the introduction and establishment of noxious and invasive weeds. We understand the project is nearly 200,000 acres in size and will have roughly 600 miles of roads. This will create a lot of disturbed ground which is an ideal environment for the introduction and establishment of noxious and invasive weeds. We think this project needs a detailed plan of action for noxious and invasive weed control to so noxious and invasive weeds do not become established in the area. The plan should include the actions below. The most important part of the plan needs to be prevention. This involves making sure all vehicles and construction equipment are clean when they arrive at the site. Washing and removing all dirt and debris that may contain weed seeds should be done at their previous construction site. This is like what firefighting crews do before moving to a new fire. The second part of the plan should be revegetation of disturbed constriction sites and roadsides with desirable grasses so there is no bare ground for noxious and invasive weeds to get a foothold to become established. Monitoring the whole area must be done to detect noxious and invasive weeds as early as possible and before they become established in large areas. Monitoring must be done throughout the growing season to find new plants in the area so they can be controlled before they become established. Control measures like mechanical control, or herbicides, need to be done on a regular, timely basis to prevent noxious and invasive weeds from going to seed and spreading throughout the project. Failure to implement any of these will most likely result in the establishment and spread of noxious and invasive weeds throughout the project. The weeds will also spread to neighboring areas of the project, and neighboring Counties. Once noxious and invasive weeds become established it is harder to get them under control and will cost a lot more money to control them. We would also like to see the Noxious Weed Superintendents from the Counties near the project involved in making and implementing the weed control plan. These are local people with the knowledge of what weeds to be on the lookout for, and the best way to prevent noxious and invasive weeds from becoming established in the project area. We understand that green energy projects like Lava Ridge are going to happen as we move to using more renewable energy. But areas where these projects are built MUST be protected from noxious and invasive weeds, and MUST have a complete plan for the prevention, monitoring, and control of the noxious and invasive weeds that could become established in the project area, and then move to surrounding areas and Counties. Michael T. Ottley Cassia County Noxious Weed & Invasive Species Superintendent	EIS Section 3.15.1 (Native Upland Vegetation Communities) discloses the potential for ground disturbance and other project activities to introduce or spread weeds and other invasive plants; a complete list of the measures that would be implemented to minimize or avoid these effects is in EIS Appendix 4 (Mitigation). The Noxious Weed Management Plan (Appendix R in MVE [2023]) describes ISDA rules governing noxious weeds and the measures that would be implemented to identify, monitor, and treat noxious weed populations throughout the life of the project. EIS Appendix 4 (Mitigation) includes a complete list of mitigation measures that would be implemented to minimize or avoid impacts related to nonnative plant species, including additional measure ooo, which states, “MVE would be responsible for control of weed and nonnative species that result from construction, use, or maintenance authorized in their ROW grant. MVE must coordinate with the Authorized Officer and/or local authorities for acceptable weed control measures (within limits imposed in the grant stipulations) prior to implementing weed treatments.” The BLM appreciates the Noxious Weed Superintendents’ interest in this project and looks forward to further discussion about how counties’ Noxious Weed Control Programs can most effectively be involved in the planning process and coordinating weed control efforts. Other preventative measures include inspection and cleaning of equipment, machinery, and vehicles prior to entry to the project (applicant-committed measures 104 and 105, and additional measure nnn); minimizing travel through areas infested with noxious weeds (applicant-committed measure 106); and discouraging weed establishment at project-related storage and staging yards through regular site inspections and [BLM-approved] herbicide applications (applicant-committed measure 107). As described in EIS Section 2.3.2.1 (Work Area Disturbance), temporary work areas needed for construction would receive interim reclamation following construction; interim reclamation measures are described in in the Reclamation Plan (Appendix E in MVE [2023]). As described in the Reclamation Plan, reseeding will use BLM-approved seed mixes; additional details on seed mixes are provided in the Noxious Weed Management Plan (Appendix R in MVE [2023]). The Noxious Weed Management Plan describes the monitoring and control measures that would be implemented throughout the life of the project.

Comment ID	Commenter	Public Comment	Response to Comment
3725-4	Jerry Ball	When sagebrush and native grasses are disturbed and/or destroyed by the Lava Ridge Wind Project and LS Energy, it will never be the same. The disturbed sagebrush by LS Energy during construction of roads and wind turbine imprints will overcome the landscape with weeds throughout the impact area and blow onto the surrounding lands devastating the landscape. We farm by BLM ground in Minidoka County Idaho. In 2021 a high voltage transmission line was upgraded. Poles were removed and new structures installed. This disrupted the landscape damaging sagebrush and native grasses under the lines. It will take many years before the landscape will be back to where it was before construction. This was just a small project compared to the Lava Ridge Wind Project proposal of over 70,000 acres. Construction of roads, transmission lines and wind turbine footprints, will compromise the landscape. Weed seeds present with no competition from native species in the native habitat will overcome the landscape throughout the impact area and blow onto surrounding lands.	The nature of high mountain desert vegetation communities were considered when describing the duration of impacts to vegetation, which are stated to be the life of the project (34 years) plus 50 years for reclamation (the longest estimated time for native vegetation communities to re-establish): a total of 84 years, as described in EIS Section 3.15.1 (Native Upland Vegetation Communities). Measures would be implemented to ensure successful reclamation of disturbed areas, including monitoring of reclamation until desired plant communities are restored (applicant-committed measure 163 and BLM-required mitigation measure P in EIS Appendix 4 [Mitigation]). MVE would be required to purchase a reclamation bond and would be held to BLM-approved reclamation success criteria. Additional details are in the Reclamation Plan (Appendix E in MVE [2023]). EIS Section 3.13.1.1 (Soils, Affected Environment) describes very fragile soils in the siting corridors. As stated throughout the resource analysis sections in Chapter 3 (Affected Environment and Impacts), highly fragile soils naturally have relatively little vegetative cover, and are unlikely to be successfully restored and would remain permanently disturbed following the project. EIS Appendix 4 (Mitigation) describes the measures that would be implemented to minimize or avoid disturbance. Discussion of the potential impacts of weeds and other invasive plants on native upland vegetation and revegetation success is provided in AIB-41 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1. Both EIS Section 3.15.1 (Native Upland Vegetation Communities) and Table App3-1 describe the measures that would be implemented to minimize or avoid impacts related to weeds and other invasive plants; a complete list is provided in EIS Appendix 4. Additional details are in the Noxious Weed Management Plan (Appendix R in MVE [2023]).
5331-6	Joan Hurlock	The LRWP will be situated on Bureau of Land Management ground. This is PUBLIC land. According to their mission statement, the BLM is “to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations”. The addition of almost 500 miles of roads will result in thousands of acres of ground disturbance and will increase the spread and occurrence of invasive weed species. To mitigate this, LS Power will utilize BLM-approved herbicides. These can include products like Roundup and 2,4-D amine. Don’t get me wrong – I love to use the stuff in my own yard. But how will the use of these chemicals on tens of thousands of acres, for 34 years (the lifespan of the project), sustain the health of public lands and the health of the public that utilizes the same land for enjoyment and recreational purposes?	AIB-58 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1, describes impacts to wildlife from herbicide use. The EIS tiers to the 2007 and 2017 BLM programmatic EISs (BLM 2007, 2016) regarding vegetation treatments using herbicides, which disclose the effects of BLM-approved herbicides on human health and safety. See EIS Appendix 4 (Mitigation) for a complete list of measures that would be implemented to minimize or avoid impacts related to herbicide use, which include required use of BLM-approved herbicides and BLM-approval of all planned herbicide applications throughout the life of the project.
5896-1	Mike Tylka	Additionally all ground disturbance throughout the area will result in wind transport of invasive species of weeds.	Discussion of the potential impacts of weeds and other invasive plants on native upland vegetation and revegetation success is provided in AIB-41 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1). Both EIS Section 3.15.1 (Native Upland Vegetation Communities) and Table App3-1 describe the measures that would be implemented to minimize or avoid impacts related to weeds and other invasive plants; a complete list is provided in EIS Appendix 4 (Mitigation). Additional details are in the Noxious Weed Management Plan (Appendix R in MVE [2023]).
6903-9	Todd Wells	The closure of these grazing lands for the project development will allow the overgrowth of noxious and invasive weeds. While chemical control may be considered in an attempt to control weed populations, the successful control of these weed species in this scenario is not proven. Additionally, chemical residues should remain a concern for grazing animals.	EIS Section 3.9 (Livestock Grazing) discusses potential impacts to livestock grazing; none of the alternatives include closure of grazing lands. As described in this section, portions of some allotments would be temporarily unavailable during construction and decommissioning; these short-term impacts are summarized in EIS Table 3.9-3 and EIS Table 3.9-4. Areas occupied by project infrastructure would be unavailable for grazing during project operations and final reclamation as summarized in EIS Table 3.9-5 and EIS Table 3.9-6. No more than 1.3% of any allotment would be unavailable during operations and reclamation under any of the action alternatives. In coordination with BLM and affected grazing permit holders, MVE has developed the Grazing Coordination Plan (Appendix S in MVE [2023]) that would be implemented throughout the life of the project to minimize or avoid impacts to livestock grazing operations. Additional avoidance and minimization measures are listed in EIS Appendix 4 (Mitigation). EIS Appendix 4 also describes the measures that would be implemented to minimize or avoid impacts related to weeds and other invasive plants, including implementation of the Noxious Weed Management Plan (Appendix R in MVE [2023]). As described under AIB-41 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1, with the implementation of these measures the potential for the project to introduce or spread invasive plants would be low. Impacts to livestock from the use of BLM-approved herbicides are disclosed in the 2007 and 2017 BLM vegetation treatments using herbicides programmatic EISs (BLM 2007, 2016) and do not need to be reanalyzed.
7321-5	Travis Wells	Compaction from the construction equipment will hinder new vegetative growth. New vegetation would probably be cheatgrass and not native grasses and brushes.	EIS Section 3.15.1 (Native Upland Vegetation Communities) describes potential impacts to native upland vegetation; soil compaction is discussed further in EIS Section 3.13 (Soils). Impacts related to the introduction and spread of weeds and other invasive plants are described under AIB-41 and AIB-57 in EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1. As described in these sections, a number of measures would be implemented to minimize or avoid impacts related to weeds and other invasive plants; a complete list is provided in EIS Appendix 4 (Mitigation). Additional details can be found in the Noxious Weed Management Plan (Appendix R in MVE [2023]).
7334-3	Terry Ruby	Third, coming from my professional experiences as a Noxious Weed Control Superintendent in the proposed area, any construction brings the opening of ground to the infestation of Invasive Plant Species. The control of these species is the responsibility of the landowner. My experience with the Bureau of Land Management and their weed control efforts has been a good one, don't get me wrong here, these people work their tails off with never enough resources to do the job correctly. I for see the problem with invasive species in this area being way out of control. That being said, the lease holders for grazing in this area will have to drastically cut their numbers do to the unpalatable plant species that will certainly be growing there.	EIS Section 3.9 (Livestock Grazing) discusses potential impacts to livestock grazing. EIS Appendix 4 (Mitigation) describes the measures that would be implemented to minimize or avoid impacts related to weeds and other invasive plants, including implementation of the Noxious Weed Management Plan (Appendix R in MVE [2023]). With the implementation of these measures, the potential for the project to introduce or spread invasive plants would be low (see AIB-41 in EIS Appendix 3, Table App3-1).

Comment ID	Commenter	Public Comment	Response to Comment
7743-1	Joan Hurlock	According to the DEIS regarding the Lava Ridge Wind Project, up to 9,114 acres of ground would be disturbed with the construction of 486 miles of roads, concrete foundations for wind turbines, substations, operation and maintenance facilities, battery storage warehouse, MET towers and up to 56 miles of underground collector lines. This ground disturbance will result in loss of native vegetation, and increase the growth of invasive weeds. To mitigate this, Magic Valley Energy will control weed growth utilizing a variety of methods, including applying BLM-approved herbicides. The list of recommended herbicides can be found in Appendix R - Noxious Weed Management Plan, Table 2. Noxious Weed Species… and Herbicide Treatments, page R-8. The named herbicides include: Telar, Milestone, Curtail, Tordon 22K, and glyphosate. The following lists the concerns with each herbicide: Telar (chlorsulfuron) – highly toxic to aquatic life, acts as both a pesticide and an herbicide, can cause respiratory distress and urea compound poisoning. Milestone (amino pyralid) – can enter the food chain via manure, and is a concern for vegetable growers. It affects potatoes, tomatoes and beans, resulting in deformed plants and poor yields. Curtail (clopyralid)- persists in dead plants and compost and is damaging to peas, tomatoes, and sunflowers; renders potatoes, spinach and lettuce inedible; has been de-registered for use on domestic lawns and has been banned in several states. Tordon 22K (picloram potassium)- does not adhere to soil and may leach into groundwater, where grazing occurs on picloram treated hay; dung from grazing animals has broadleaf killing potency; picloram was combined with other herbicides to make Agent White and was used to enhance Agent Orange during the Vietnam War. Dicamba – the sale and use of this is now illegal due to the harmful effects on crops – it can cause damage to and affect the yields of non-target crops; has been linked to cancer and harms wildlife; significant leaching into ground water is possible. Glyphosate – has been linked to cancer, liver disease, and infertility; fatal to most all vegetation. How does the use of these herbicides accomplish the BLM's mission "to sustain health, diversity, and productivity of public lands for the use and enjoyment of present and future generations"? These products can be detrimental to vegetation, crops, wildlife, humans, and water quality. How does the use of these herbicides sustain the health of BLM land and surrounding private property? How can the lands continue to be used for the enjoyment of people who are adverse to the use of herbicides, due to medical sensitivities to chemicals? How does the use of these herbicides contribute to the health of wildlife that consume treated vegetation? Located in and around the proposed Lava Ridge site are several organic dairies – Sunrise Organic Dairy, Horizon Organic Dairy, and Hidden Valley Organic Dairy. How will the use of these herbicides affect their organic status? How will MVE mitigate the dairies' financial losses in the event their dairies become contaminated and they lose their organic classification? Also located within the proposed Lava Ridge site are many small reservoirs: Hope, Hidden, Rabbit Lake, Pintail, Corral, Tumbleweed. There are also several small lakes: Sid Lake, #1 and #2, Sand, Duck, Mallard, Zero, Star and New Years. Several of the BLM-approved herbicides have been known to leach into groundwater. How will MVE mitigate the contamination of these bodies of water? The construction of new roads, support buildings and structures, and turbine platforms will increase the growth of invasive weed species and thus increase the use of herbicides to treat the disturbed areas of ground. The potential for contamination of surrounding crop land, dairies, bodies of water, and the potential health hazards associated with these chemicals is too great a risk to take.	EIS Appendix 3 (Issues Analyzed in Brief), Table App3-1, AIB-58 states, "MVE would comply with the applicable federal and state laws and regulations concerning the use of herbicides and other similar substances in all activities/operations, including the standard operating procedures described in the 2007 and 2017 BLM vegetation treatments using herbicides programmatic EISs (BLM 2007, 2016) (applicant-committed measure 101 and BLM-required measure Z). Prior to the use of herbicides, MVE would obtain from the BLM a written approval of a plan showing the type and quantity of material to be used, pest(s) to be controlled, method of application, location of storage and disposal of containers, and any other information deemed necessary. Herbicides would not be permanently stored on public lands, and applicator(s) would hold a current applicator's license or be under the direct supervision of a licensed applicator. MVE would provide an annual report to the BLM to report type and quantities of herbicides applied to public lands." Impacts from the use of BLM-approved herbicides are disclosed in the 2007 and 2017 BLM vegetation treatments using herbicides programmatic EISs (BLM 2007, 2016) and do not need to be reanalyzed.
8631-2	Julie Stadtherr	The preferred Alternative B will have soil disturbances to 9114 acres. According to the EIS some soil areas may be impacted up to 125 years and very fragile areas will never recover. The area adjacent to the concrete turbine foundations will be permanently damaged. The removal of sagebrush and other vegetation in deserts have negative impacts on the ecosystem. These impacts include loss of biodiversity, changes in soil structure and hydrology, and increased vulnerability to invasive species. Sagebrush and other vegetation play an important role in supporting desert biodiversity. By removing these plants, you can eliminate important habitat for many species of animals and insects. This can lead to declines in population sizes and even extinction for some species. Plants play a crucial role in maintaining soil structure and preventing erosion. The removal of vegetation can lead to changes in soil structure and a reduction in soil stability, which can make it more difficult for other plants to establish and survive. Without the vegetation will this soil just blow away? Additionally, plants play an important role in retaining moisture in the soil, which can impact local hydrology. This area is over the Snake River Plain aquifer. The removal of vegetation can create opportunities for invasive plant species to establish themselves. These invasive species can outcompete native species and change the composition of the desert ecosystem. This can further reduce biodiversity and lead to a decline in the overall health of the desert ecosystem.	As described in EIS Section 3.15.1.1 (Native Upland Vegetation Communities, Affected Environment), vegetation in the siting corridors has been heavily influenced by past events that have led to the introduction and spread of nonnative plants, particularly winter annual grasses such as cheatgrass and crested wheatgrass. Additional details on sagebrush communities in the siting corridors are provided in Section 3.3.4.1.1 (Sage-Grouse Habitat); sagebrush cover in the siting corridors is depicted in Figure 3.3-8. Disturbance in areas with > 10% sagebrush cover for each alternative is summarized in Table 3.3-25. The measures that would be implemented to minimize or avoid impacts to greater sage-grouse (see Section 3.3.4.2 [Greater Sage-Grouse, Impacts] and EIS Appendix 4 [Mitigation]) would also reduce impacts to sagebrush communities because the greatest concentration of sagebrush vegetation in the siting corridors coincides with areas occupied by greater sage-grouse. This would also reduce the effects to other species are that are highly dependent on sagebrush vegetation, such as pygmy rabbit (see EIS Section 3.18.4 [Pygmy Rabbit]). Impacts to soils, including altered soil structure and decreased stability, are disclosed in Section 3.13.1.2 (Soils, Impacts). As described in this section, a number of measures would be implemented to minimize or avoid impacts to soils; a complete list is provided in EIS Appendix 4. These measures include interim reclamation in work areas that would help restore soil structure and function, re-establish native vegetation, and control weeds and other invasive plants; additional details are in the Reclamation Plan (Appendix E in MVE [2023]) and the Noxious Weed Management Plan (Appendix R in MVE [2023]). As described under AIB-41, EIS Appendix 3, Table App3-1, with the implementation of these measures, the potential for the project to introduce or spread invasive plants would be low. Impacts to the ESPA are discussed in EIS Section 3.17.1 (Groundwater Quantity). As described in EIS Section 3.17.1.1 (Groundwater Quantity, Affected Environment), the ESPA covers an area of approximately 10,800 square miles and recharging groundwater recharge in the ESPA "occurs via multiple resources including annual precipitation and tributary basin underflow. Irrigation water infiltration provides the largest source of aquifer recharge, resulting in approximately 60% of total recharge to the ESPA (USNRC 2006)." None of the alternatives would impact tributary basin underflow or irrigation water infiltration, and the greatest amount of ground disturbance under any action alternative would be approximately 9,114 acres (14.24 square miles) or 0.1% of the ESPA. While there would be permanent impacts to soils in the infrastructure area, most impacts to soils in work areas would be short term since interim reclamation would be implemented in work areas following

Comment ID	Commenter	Public Comment	Response to Comment
			disturbance, which would include measures to decompact soils as described in the Reclamation Plan. Therefore, it is unlikely that any of the action alternatives would have a measurable impact on recharge of the ESPA.

Visual Resources

Table A-3y. Visual Resources

Comment ID	Commenter	Public Comment	Response to Comment
11201-1	Name Not Provided	This wind project will not only harm agriculture land and take away hunting for locals it will also stunt Idahos beauty.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
11210-5	Sheldon Ramsay	Furthermore, you have a visual impact which is completely incompatible with the natural environment of the region.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
11353-1	Don Wind, Dave Price; Oregon-California Trails Association	Page ES-xiii, Alternative E (Reduced Southern Corridors) Page 3-185, Section 3.5.6.2.5, Alternative E (Reduced Southern Corridors) The Oregon-California Trails Association (OCTA) is concerned about the visual impacts to the Oregon Trail located south and southwest of the project area proposed by Magic Valley Energy (MVE). The project generates adverse effects to the viewshed from the Trail during the day and at night. The experience of current and future generations of recreational visitors, students, educators and historians visiting the Trail will be adversely affected by the sight of rotating wind turbines above the northern horizon. Clearly, these adverse effects will harm the aesthetics of the Trail that visitors expect. If the project application is approved by the BLM, OCTA would favor the least intrusive option, Alternative E. This alternative would reduce southern corridors and place the closest wind turbines the furthest distance from the Oregon Trail, thereby reducing adverse visual effects.	KOP 4, Milner Historic Recreation Area base photography and simulations were taken on the Oregon Trail just south (9.4 miles) of the project. Visual impacts resulting from the development of the project at that location were assessed as minor for all alternatives (see Section 3.16.1.1.2 [Key Observation Points] in EIS Appendix 9). KOP selection was coordinated closely with the BLM and NPS for selection of areas, including the Oregon Trail, to represent sensitive viewing locations and areas within the analysis area. See Section 3.16 for disclosure of potential visual resources impacts from the project.
11353-3	Don Wind, Dave Price; Oregon-California Trails Association	Page 3-422, Section 3.16.2, Night Skies Page App4-4, Table App4-2c, Applicant-Committed Measures – Visual Resources, Lighting, and EMF Page App11-13, Project Lighting All action alternatives suffer from overall degradation of the high-quality viewing of the night skies in the area. Effects from project lighting will be observed throughout the entire region, far beyond the boundary of the currently defined project APE. This will definitely detract from the overall setting and feeling of the Oregon Trail in southern Idaho, negatively impacting the visitor experience along the Trail and at the various camping sites located on or near the Trail itself. OCTA fully supports the applicant-committed measures that have been proposed to address this issue, and deems them to be critical to the final approval of the project. MVE needs to do everything possible to minimize the impact to the viewing of the night skies throughout the area. One of these measures, the Aircraft Detection Lighting System (ADLS), is of particular importance as this one measure alone is expected to reduce the adverse effect to the night skies by almost 90%. If the project application is approved by the BLM, minimizing the light emissions from the turbine lights, as well as all other light sources within the project infrastructure, should remain a high priority for the construction and operation of this facility.	This applicant-committed measure would be applied to all action alternatives.
11411-5	Rayma Cates	There are times of the year when my house gets flickering light from the windmills.	Section 3.16.2 (Night Skies) of the EIS provides analysis of potential impacts from turbine operation to night skies, including use of the ADLS to reduce night sky impacts. Section 3.16.3 (Shadow Flicker) provides analysis of potential shadow flicker impacts to residences surrounding the action alternatives.
11423-4	Barbara Martien	The project impact on the visual appearance is not realistically protraited.	Visual simulations for the project were developed using the methodology described in Section 5.2 (Visual Simulations and Contrast Rating Analysis) in the project visual resources technical report (SWCA 2024). A digital rendering of project components were superimposed on the KOP baseline photographs of each location to illustrate a simulated representation of how the project may appear based on conditions observed during the documentation of the baseline photography. The created simulations cannot account for all situations that may influence an observer's view (i.e., influences include atmospheric, seasonal, and lighting conditions). The most common turbine color (light gray) was used for these simulations, as noted by the FAA. After the creation of simulations, visual impacts were then measured using the baseline photography as existing conditions, the simulated conditions, and contrast rating methodology as laid out by the BLM.
11454-2	Andrew Abo	I reviewed the visual simulations of the different alternatives. It was pointed out that the transmission lines were not included in the simulations. Furthermore there are significant video compression artifacts that make the turbines pop in and out even on a 30 inch monitor making it difficult to get a true sense of the visual impact. Thus, I think we should err on the side that the visual impact will be somewhat worse than presented.	The 500-kV transmission lines are proposed to be co-located in an existing transmission line corridor; see Figure 3.16-1 in EIS Section 3.16.1.1 (Landscape Character and Scenic Quality, Affected Environment), which contains existing transmission components and access roads. Although the new transmission structures would introduce additional visual impacts, it is lessened by the existing structures in the corridor. The primary cause of visual impacts from project components would occur from the wind turbines, and the transmission lines would be visually subordinate; see Section 3.16.1.2.2 (Alternative B [Proposed Action]). The dynamic simulations were provided for informational purposes only and may vary based on accuracy and resolution, which may vary based on computer and monitor settings. The visual impacts for the project were not calculated based on the dynamic simulations but rather the single-frame simulations contained in EIS Appendix 5 (Select Visual Resource Simulations) in the EIS and Appendix C in the project visual resources technical report (SWCA 2024). Due to the high sensitivity of the landscape to change, individuals viewing the simulations

Comment ID	Commenter	Public Comment	Response to Comment
			may perceive them as understating the actual in-person impacts. The simulations have been developed as a tool to capture the impact of the project at a specific moment in time to help understand the potential impacts of the project.
11458-5	Kathy McKenzie, Bret McKenzie	Scenic visual affects--the computer " simulations" of the visual effects were & are faulty--one can look at any of the existing winds farms in the area at different times/hours of the day and see that in real time/real life the visual disturbance of view is disturbing no matter what time of day or season it	Visual simulations for the project were developed using the methodology described in Section 5.2 (Visual Simulations and Contrast Rating Analysis) in the project visual resources technical report (SWCA 2024). A digital rendering of project components was superimposed on the KOP baseline photographs of each location to illustrate a simulated representation of how the project may appear based on conditions observed during the documentation of the baseline photography. The most common turbine color (light gray) was used for these simulations, as noted by the FAA. The created simulations cannot account for all situations that may influence an observer's view (i.e., atmospheric, seasonal and lighting conditions). Due to the high sensitivity of the landscape to change, individuals viewing the simulations may perceive them as understating the actual in-person impacts. The simulations have been developed as a tool to capture the impact of the project at a specific moment in time to help understand the potential impacts of the project.
11458-8	Kathy McKenzie, Bret McKenzie	The Perrine Bridge in Twin Falls is 486 feet above the Snake River--These never before used Turbines average 64 to 264 feet higher than that bridge--BLM, how many of you have stood on that bridge and looked down then up?	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
11525-3	Erin Schmith	The table also characterizes the degree of visual changed proposed by Alternatives C-E as moderate. I don't agree with that characterization, and even a "Moderate" degree of visual change fails to protect the integrity of Minidoka NHS.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS; this analysis found that all action alternatives would result in a major impact to the NPS' ability to implement its interpretive purpose at Minidoka NHS. The methodology to calculate the degree of change for all alternatives follows the BLM's contrast rating process detailed in BLM Manual Section 8431. This process assesses the contrast introduced by the project on the existing conditions of the landscape. This process was followed for each proposed alternative. Each alternative is affected differently by the distance to the nearest visible turbine, topography, existing vegetation and existing structures. BLM contrast rating sheets were prepared for each alternative at each KOP incorporating environmental factors (atmospheric conditions, topography, and existing vegetation structures) and supporting photographic simulations. Each alternative is affected differently at each KOP. For further detail on this process, see Section 5.2 (Visual Simulations and Contrast Rating Analysis) in the project visual resources technical report (SWCA 2024).
11535-147	Steven Andersen	As presented, the visual assessment is inadequate to account for the visual impacts of the wind turbines and associated infrastructure and must be amended to accurately assess adverse impacts and to determine appropriate avoidance or mitigation measures from additional vantage points. Those vantage points should include all historic districts, and all properties listed or eligible for listing, in the National Register, and any National Historic Landmarks. Vantage points for revised simulations should include key recreation sites including the Seattle Ridge, Sun Valley ski resort and key recreational sites around Seattle Ridge recreational mountains used by skiers.	KOPs were chosen to represent specific places, areas and features that have visual importance relative to one's home, social, business, and recreation environment. This includes where the public would view the project from both a stationary (e.g., residential areas) and or a linear (e.g., major roadway) locations. The KOPs chosen for this project were chosen with coordination with the BLM SFO and cooperating agencies. Project mitigation for impacts is outlined in EIS Appendix 4 (Mitigation).
11535-148	Steven Andersen	The Department of Interior supported a study by Argonne National Laboratory into the visual impacts of utility-scale wind facilities in the western United States.429 The turbines were found to be visible to the unaided eye at 36 miles with turbine blade movement visible at 24 miles.430 They were judged to be major foci of visual attention up to 12 miles. The study suggests that an appropriate radius for visual impact analyses is up to 30 miles. Of note, the study provides that turbines may reach a height of 400 feet, whereas the project is proposing turbines nearly double that height. Here, the locations of the turbines is not known and so it is impossible to even model observation points, viewpoint elevation, lighting conditions (angle of the sun and viewing angle) and other situational variables, which are all critical factors when assessing visual impacts of turbines. It doesn't appear the BLM relies on the same visual assessment modeling used in the Argonne study, and without explanation. However, using this methodology, it is clear the turbines will be a source of significant visual contrast.	The methodology for the visual analysis was reviewed and is comparable to the methodology used for other recent BLM wind turbine projects within the western United States. For clarity and continuity with the Visual and Cultural Resources EIS sections, the impact findings using the BLM Contrast Rating methodology was crosswalked with the Argonne Visibility Level Rating methodology and is contained in a new appendix in the project visual resources technical report (SWCA 2024).
11535-149	Steven Andersen	When assessing the visual resource contrast rating, the BLM should have designated interim Visual Resource Management classes, since none are designated in the Monument RMP, in order to guide its actions, including mitigation.	See Section 3.16.1 (Landscape Character and Scenic Quality). BLM (1986b) did not establish VRM classes. The BLM and NPS (2007) established VRM classes for Craters of the Moon National Monument; however, these class management objectives are not applicable to the project because installation of project components would not occur on Craters of the Moon National Monument. The BLM determined and added project-specific interim VRM classes and objectives to the final EIS, please see Section 3.16.1.
11535-150	Steven Andersen	Further, the sensitivity level analysis for the SLRUs in the DEIS fails to account for several factors including the deep levels of sensitivity associated with the area (beyond a common "higher sensitivity" rating) and the inability to estimate the visual disturbance of structures on a scale never constructed.	The components used by the BLM to assess the inherent value of the existing landscape are combined into the Visual Resource Inventory (VRI) process. This process includes Scenic Quality (visual appeal of the landscape), Sensitivity Level (accounting for the attitudes and perceptions held by people regarding the landscape and the public's sensitivity for noticeable change in the environment) and Distance Zones (areas where the project may be visible from high traffic areas like major roadways). These components combine to an overall VRI class. These components are summarized in EIS Section 3.16.1.1 (Landscape Character and Scenic Quality, Affected Environment) of the visual resources section of the EIS and in further detail in Section 4.1 (Visual Resource Inventory and Values) in the project visual resources technical report (SWCA 2024).

Comment ID	Commenter	Public Comment	Response to Comment
11535-152	Steven Andersen	The EIS needs to address how the project will address lightning impacts, including during the construction phase. The agency should consider visual impacts of lightning at each proposed turbine's base and reflections that impact aviation.	Construction lighting (which would be temporary) is discussed in EIS Section 3.16.2.2.2 (Alternative B [Proposed Action]), and the impacts were assessed to remain at a similar level to the current conditions of scattered light from nearby towns. Lighting impacts to night skies is discussed in the EIS in Section 3.16.2 (Night Skies). No lighting would be located at the base of the turbines and mitigation for lighting for the turbines and any other facilities is detailed in EIS Appendix 4 (Mitigation).
11551-1	Erin Shigaki	The DEIS contradicts its finding of harm by stating that Alternatives C and E would only provoke a "moderate" visual change. I am aware that you did not use the maximum height wind turbines (6mw at 740 feet tall) in your various Key Observation Point images. I find this disturbing and misleading. I know from creating my own basic visualizations, that the large turbines are taller than Seattle buildings such as the Space Needle and the Smith Tower, and that the largest proposed Alternative would create a footprint larger than the entire City of Seattle. I understand what walls of wind turbines at this scale will do to the viewshed and one's experience on the Minidoka NHS. A project of this magnitude cannot but harm the viewshed, immersive educational experience, and what NPS has done to create a monument that provokes a feeling and association of the historic events that happened there. I cannot agree then with the BLM's findings that Alternative C and E would incur only a "moderate" degree of visual change to Minidoka NHS's viewshed.	See response to comment 11458-5 (see in Table A-3y, Visual Resources) for details on simulation creation. Some KOPs offered similar views of the project across project alternatives; therefore, simulations were only created for one of them. Select simulations are contained in EIS Appendix 5 (Select Visual Resource Simulations) and in Appendix C in the project visual resources technical report (SWCA 2024). Impact determinations are consistent with our impact criteria table in both the EIS and project visual resources technical report (SWCA 2024) in Table 3.16-2.
11557-5	Deanna Weigel, Andy Weigel	One last comment on visual resources, KOPs discussed in the survey show major impacts to visual resources. Mitigation measures such as low gloss and gray paint may alleviate the impact to the visual resources from a peripheral view at certain times of the day, but are woefully insufficient. The honest reality is that there is no true mitigation for the viewshed destruction caused by 400, 740 ft tall wind turbines.	The EIS discloses potential major impacts to visual resources in Section 3.16 (Visual Resources). All mitigation measures for the project are contained within EIS Appendix 4 (Mitigation). These mitigation measures represent the BMPs for minimizing impacts of wind turbines to date. All visual impacts are not completely avoidable because of the aboveground nature of the project but mitigation and minimization of impacts for this project would be followed as described in EIS Appendix 4.
11574-1	Jared Orton	Furthermore, the computer-generated renderings of the windmill towers do not accurately represent the visual impact that this project would have on the surrounding landscape. The visual appeal of our public land is a precious resource that should not be taken for granted. I urge the BLM to take into consideration the impact that windmill development would have on the visual appeal of the surrounding areas and the disturbance to the conservation of the public lands before approving this project.	See response to comment 11535-147.
11598-30	Idaho Conservation League	Visual simulations On the tour people were trying to visualize the impacts of the turbines from various key observation points. The technology, information and funding currently exist to provide this information to the public now via draft visual simulations from major viewpoints. These observation points would be based on a photograph and be overlaid with the wind turbine and transmission lines configuration per each alternative. The ability for users to examine alternative viewsheds (i.e. to scroll left or right for a 180-degree view of the landscape and to zoom in as desired) could be adapted to incorporate the range of alternatives. While we appreciate that the tour included Sid Butte, the fact that Sid Butte is not a Key Observation Point is unacceptable given the prominence and popularity of this viewpoint. We recommend adding this site as a Key Observation Point. We recommend that the BLM post these draft visual simulations on the BLM Lava Ridge website with the note that these may be further modified in the DEIS. If these alternatives include turbines of different heights, this should be factored in as well.	Sid Butte is included in the draft EIS as KOP 17.
11615-7	Spencer Dixon	The visual pollution on these turbines will rob the magic valley of its rural farming feel and look and turn it into a nightmare of white industrialized wasteland and ever present glowing red lights of night time pollution creating dark sky issues. I can't state this enough that the visual impact on the local residents will be great and are not taken seriously in the EIS as well as the impact it would have on the Hunt relocation camps visitors. I have been there and the project would harm the peace and tranquility that is there.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. Night skies mitigation measures, including the ADLS, are detailed in Section 3.16.2 (Night Skies) of the EIS and EIS Appendix 4 (Mitigation).
11620-3	Simone Griffin; BlueRibbon Coalition	Visual resource management also needs to be highly considered through this NEPA process according to FLPMA. The recreational and visual values with be severely depleted with the approval of the wind farm. I do not believe the BLM can approve this project and uphold their responsibilities to manage visual resources on this public land.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See Chapter 1 (Introduction) of the EIS for information on the project, its purpose and need and the decision to be made by the BLM.
11622-6	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	Visual Contrast Modeling. Rather than BLM's finding of Moderate visual change, we recommend that BLM adopt the Argonne model which better captures the impacts of visual change on user groups. Specifically, we believe that the visual impacts analysis of Alternatives C & E should find that the impacts at the Honor Roll and other Minidoka KOPs be defined as Argonne Class 5 or 6: Argonne Class 5: Strongly attracts visual attention of views in general direction of study subject, but not the most prominent or dominant feature in the view. Attention may be drawn by strong contrast in form, line, color, texture, or luminance. An object/phenomenon contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, draws viewer attention immediately and tends to hold viewer attention, but is not prominent enough to dominate the view. In addition to strong contrasts in form, line, color, texture, and luminance (such as reflections) associated with the study subject, it may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape elements. Argonne Class 6: Dominates view because of structure or facility size (for views in its general direction) and strong contrasts in form, line, color, texture, or luminance An object/phenomenon with strong visual contrasts that is of such large size that it is the major focus of visual attention and dominates the view. The large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources associated with the study subject	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See response to comment 11535-148 (see in Table A-3y, Visual Resources) for information on the Argonne Visibility Level Rating methodology.

Comment ID	Commenter	Public Comment	Response to Comment
		may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape elements.	
11625-1	John Arkoosh	I drove through the maze of roads that connects the wind towers, It was not a peaceful place to be. It was busy, not busy with people, it was busy with distractions and annoyances. Despite the best efforts of the BLM to do a thorough visual impact study, after driving to Bell Rapids that day I came to realize DEIS visual simulations are seriously deficient. I don't believe the misery of such impacts can be conveyed through a screen or on a piece of paper but seeing and hearing it firsthand and realizing what it is to come with this project is sickening me and my family. There is no mitigation that can compensate for these impacts.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See response to comment 11458-5 (see in Table A-3y, Visual Resources) for methodology of the creation of simulations. See response to comment 11557-5 (see in Table A-3y, Visual Resources) for information about project mitigation.
11667-10	Alisa Bowman	Concern: Qualify of life for the immediate neighbors will decline Some of the reasons people live in the area is for the solitude, views, and quality of life. With 74o foot towers with flashing red lights on top in their backyard, this impacts those that have been here their entire lives. Please protect the current residents' way of life and do not allow the greed of a corporation to ruin their lifestyle. Concern: Visual impact The 740 foot tall towers with flashing red lights dotting the landscape will forever change the wide-open public land that was set aside for all of the public to enjoy. The public would no longer be able to enjoy this land. Only a greedy corporation from out -of-state with interests in financial gain would ruin it for the residents and visitors that come to Idaho for a wild and scenic experience.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See response to comment 11411-5 (see in Table A-3y, Visual Resources) for details on night skies impacts.
11772-4	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	Visual Contrast Modeling. Rather than BLM's finding of Moderate visual change, we recommend that BLM adopt the Argonne model which better captures the impacts of visual change on user groups. Specifically, we believe that the visual impacts analysis of Alternatives C & E should find that the impacts at the Honor Roll and other Minidoka KOPs be defined as Argonne Class 5 or 6: Argonne Class 5: Strongly attracts visual attention of views in general direction of study subject, but not the most prominent or dominant feature in the view. Attention may be drawn by strong contrast in form, line, color, texture, or luminance. An object/phenomenon contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, draws viewer attention immediately and tends to hold viewer attention, but is not prominent enough to dominate the view. In addition to strong contrasts in form, line, color, texture, and luminance (such as reflections) associated with the study subject, it may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape elements. Argonne Class 6: Dominates view because of structure or facility size (for views in its general direction) and strong contrasts in form, line, color, texture, or luminance An object/phenomenon with strong visual contrasts that is of such large size that it is the major focus of visual attention and dominates the view. The large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape elements.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See response to comment 11535-148 (see in Table A-3y, Visual Resources) regarding the Argonne Visibility Level Rating methodology.
11860-11	Shauna Robinson	The KOPs made to simulate the look of the wind turbines from the visitors center at Minidoka were inadequate and misleading. The simulation only shows turbines, omitting the transmission towers, wires, and connecting systems, and any sound recordings of the noise turbines would create, audible for up to 2.2 miles (3-176). The light for the daytime simulation makes the white towers hard to see, plus the wide-angle view makes the towers appear farther in the distance than they really would be in person. The turbines in the evening simulation were more noticeable, but still lacked all the associated wires, electrical towers, etc. Also, what would this scene be like at night with all the blinking red lights required for the safety of aerial traffic? The dark skies certainly would be diminished. Given the impacts on the viewsheds that would "detract noticeably" (3-177), disrupt the sense of isolation, and diminish Minidoka's historic integrity, there should be no thought whatsoever about placing wind turbines anywhere close to the site. Keeping wind turbines out of the viewsheds allows descendants of survivors and family members a unique chance to share the sense of remoteness and seclusion their relatives experienced.	See response to comment 11454-2 (see in Table A-3y, Visual Resources) for information about the transmission line structures. See responses to comments 11454-2 (see in Table A-3y, Visual Resources) and 11535-147 (see in Table A-3y, Visual Resources) for details about simulations. See response to comment 11411-5 (see in Table A-3y, Visual Resources) for details about impacts to night skies.
11964-1	Matt Bridges	BLM's mission statement is to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations. Located on the U.S. Department of the Interior (DOI) web site (DOI.gov) is an article titled "Twinkle Twinkle, 16 Awesome Public Lands for Star Gazing. (5, April 2023), Subtitle: "Some of the last harbors of dark skies, public lands provide unspoiled views of the stars glittering above". In this article it states: "After the sun goes down, the skies above America's public lands come alive. Some of the last harbors of dark skies, public lands provide unspoiled views of the stars glittering above. While fewer than 500 stars may be visible at night in urban areas because of light pollution, you can see up to 15,000 stars on some public lands across the country. We're working to protect these truly dark skies for visitors to enjoy." Visitors and Citizens seek sights such as these where the proposed Lava Ridge Project would impact viewsheds. Two nearby sites would be: Craters of the Moon National Monument and Preserve, and the Minidoka National Historic Site. Not included in the DEIS is a specific evaluation from The Natural Sounds and Night Skies Division of the Nation Park Service. This division supports NPS units' system wide. They provide "assistance in collecting baseline data for ambient acoustic and night sky quality, identifying source specific impacts and engineered solutions to reduce, mitigate or prevent anthropogenic noise and excessive light in and around parks and national trails." However, in the DEIS it states under 3.16.2.3 Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity Under all action alternatives, "there would be an irretrievable long-term effect from changes in brightness of the night sky at CRMO and Minidoka NHS during the 30-year operation period. These long-term effects would remain until turbines are removed from the landscape during decommissioning. Short-term effects on night skies would also occur during the 2-year construction	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. The BLM will review all components of the project and make a decision on the project as detailed in the EIS Section 1.3 (Decision to be Made). See Section 3.16.2 (Night Skies) for disclosure of potential impacts to night skies. All information regarding the project can be found as disclosed at https://eplanning.blm.gov/eplanning-ui/project/2013782/510.

Comment ID	Commenter	Public Comment	Response to Comment
		period." A naturally dark night sky is more than a scenic canvas; it is part of a complex ecosystem that supports both natural and cultural resources. https://www.nps.gov/orgs/1050/index.htm For this reason, please select Alternative A, the No Build Option	
11978-41	Magic Valley Energy, LLC	38. The DEIS states: "For this analysis, the immediate foreground is defined as the area within 2 miles of the project components previously described, the foreground is from 2 to 10 miles, the middleground is from 10 to 20 miles, and the background is from 20 to 30 miles (Figure 3.16-3)." a. MVE Comment: The use of immediate foreground, foreground, middleground, and background visual distance zones are represented as 0-2 miles, 2-10 miles, 10-20 miles, and 20-30 miles, respectively. These visual distance zones are referenced by Sullivan et al. 2012 as applicable to wind turbines, since the visual distance zones encompass larger areas than typical to account for the scale and motion of a wind turbine. However, when looking at Figure 3.16-1, these visual distance zones were incorrectly applied to the 500-kV transmission lines. MVE requests that the FEIS be updated to use visual distance zones specific to transmission lines, which can be found in a separate Sullivan et al. 201417 report, and are defined as follows: 1. Lattice a. 500 kV: Maximum distance at which one could be seen by the unaided eye was approximately 17.2 miles (pg 24). "For this observation, only the towers were visible, skylined on the distant ridge. The towers were judged to be near the limit of visibility. They appeared tiny and would not likely be visible to a casual observer; however, in this case, the observers were scanning the landscape closely and specifically looking for transmission facilities. At this distance, only a very short vertical line contrast was visible for each tower, and thus the towers were not recognizable as transmission towers per se" (pg 25). Beyond 11 miles, they were judged to be too small and faint to be noticed by most casual observers. i. Paper suggests 12-13 mile distance be sure all facilities likely to be visible are included. 2. Monopole a. 500 kV monopole towers were observed up to 11.1 miles and may have been visible from greater distances. They were observed beyond 10 miles in two separate observations. They were judged not likely to be visible to casual observers beyond 8 miles. By updating the 500 kV line to visual distance zones used in Sullivan et al 2014, the background distance zone would decrease from 20-30 miles, to approximately 12-17 miles. Immediate foreground, foreground, middleground, would then have subsequent lower distance ranges. The non-physical Area of Potential Effect (APE) would be decreased in Alternative B, and substantially decreased in Alternatives C, D, and E, as the 500 kV transmission line becomes more isolated from the turbine corridors, which have larger impacts. Visual impacts to KOP 1, KOP 2, KOP 11, KOP 7, KOP 8, and KOP 10, may also be reduced by this change since they are closer to the 500 kV transmission line than they are to siting corridors.	The immediate foreground (0–2 miles), foreground (2–10 miles), middleground (10–20 miles), and background (20– 39 miles) visual distance zones were given the same emphasis for both the turbine corridors and the 500-kV transmission lines, which would represent a visual worst-case scenario for the transmission lines. While the 500-kV line may not be as visible as the turbines at this distance, the BLM decided to be more conservative in its analysis approach. As part of the public comment process, there has been extensive concern and consistent theme of the large, expansive views associated with this landscape. The analysis area and distances used in this approach helps to support the analysis of the large, expansive views within this landscape.
11978-42	Magic Valley Energy, LLC	Section 3.16.1.2.5 Visual Resources – Landscape Character and Scenic Quality (Alternative E) 39. The DEIS states: "Impacts to other KOPs (5, 6, 7, 8, 9, 10 (East), 11, 12 13, 14, and 15) would remain the same as Alternatives B, C and D." a. MVE Comment: This language is written under the analysis for Alternative E. However, Alternative E should have reduced impacts at all KOPS when compared to Alternative B, and reduced impacts to some KOPS when compared to Alternatives C and D. As such, MVE requests that BLM revise this statement to read: "Alternative E would have reduced impacts to KOPs 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 15 when compared to Alternatives B and would have reduced impacts to KOPs 1, 2, 3, 4, and 11 when compared to Alternatives C and D.	After reviewing the comment and the draft EIS, this text has been updated.
11978-43	Magic Valley Energy, LLC	40. The DEIS states in Table 3.16-5 that the degree of visual change at KOP 2 (Minidoka NHS – Block 22 Barracks) is "major" for Alternative C but "moderate" for Alternative D. a. MVE Comment: Based on MVE's review of the BLM's January 2023 Visual Resources Technical Report for the Lava Ridge Wind Project, the differences in the simulated conditions apparent for Alternatives C and D are sufficiently immaterial that it would be appropriate for BLM to revise the degree of visual change designated in Table 3.16-4 for Alternative C to match that of Alternative D, i.e., both visual change ratings would be "moderate". MVE notes that the visual impacts from Alternative C would be substantively identical to the moderate impacts of Alternative D since Alternative C includes many of the same corridors in proximity to Minidoka NHS as Alternative D, but with slightly shorter turbine corridors along the southwestern portion of the project area. Additionally, as reflected in Table 3.16-5 of the DEIS, the distance to the nearest turbine siting corridor, which is the primary determinant for the prominence of the Project features within the viewshed, is 6.5 miles for both Alternatives C and D. To the extent that the KOP 2 visual simulation for Alternative C in the January 2023 DEIS Visual Resources Technical Report may depict more turbines that are faintly visible near the horizon relative to Alternative D, MVE contends that the difference in visual prominence between the two alternatives is not discernable to most viewers and that a qualitative distinction between the two alternatives is not supported by the simulations. As previously mentioned, the DEIS also seems to support this conclusion, as these distant turbines are the sole turbines analyzed in Alternative H, which was identified as an alternative that eliminates potential visual impacts to Minidoka NHS. The negligible differences between the two simulations at KOP 2 are illustrated in Figure 1 below. MVE notes that we anticipate these same principles will apply at KOP 16 (i.e., KOP 16 degree of visual change in Table 3.16-5 is "moderate" for Alternatives C, D, and E) when KOP 16 is added to the table in the FEIS. Figure 1. Comparison Between Alternatives B and C at KOP 2 [see figure in pdf letter	After a review of the comment from MVE impact findings at KOP 2, Alternative C has been edited to moderate.
11978-44	Magic Valley Energy, LLC	Section 3.16.2.2.2 Visual Resources – Impacts to Night Skies 41. The DEIS states: "Under all five scenarios, overhead sky brightness as viewed from the selected observation point at Minidoka NHS would increase between 0.5% to 2.2%, depending on the lighting scenario, which would not be perceptible to human observers..." (excerpt from a 3- paragraph discussion of night skies impacts at Minidoka NHS). a. MVE Comment: The Minidoka NHS visitor center closes nightly during times of year when the Minidoka NHS is open,	The BLM recommends not removing Minidoka for night sky analysis because it is open year-round and is open to walking tours 24 hours a day.

Comment ID	Commenter	Public Comment	Response to Comment
		and the grounds and trails close at sunset18. Accordingly, Project lighting impacts to night skies at the Minidoka NHS would not appear to be a relevant issue, and the related analysis should be removed from the DEIS.	
11978-138	Magic Valley Energy, LLC	40. Section 3.16.1.1.2 Visual Resources - Key Observation Points “The siting corridors are in an area of moderate sensitivity. Figure 3.16-2 illustrates the visual sensitivity ratings for the analysis area (see additional details in SWCA [2022]).” It is unclear how the sensitivity units are delineated in the DEIS. MVE recommends that Table 5 from the referenced SWCA 2022 report should be incorporated into the FEIS for clarification.	Table 5 from the project visual resources technical report (SWCA 2024) is included in the EIS as Table 3.16-2 in EIS Section 3.16.1 (Landscape Character and Scenic Quality). Sensitivity level ratings are developed following BLM policy (BLM Manual Handbook 8400 [BLM 1984]) as well as input and information from BLM staff.
11978-139	Magic Valley Energy, LLC	41. Section 3.16.1.2.2 Visual Resources - Key Observation Points “This visual change correlates to visibility level 6 with strong visual contrast that the project dominates the field of view and is a major focus of visual attention. In addition to size and contrasts in form, line, color, and texture, the movement of the turbine blades contribute substantially to drawing viewer attention.” Visibility level is not defined in the DEIS. MVE recommends listing out the differences of visibility levels for clarification.	See response to comment 11535-148 (see in Table A-3y, Visual Resources).
11978-140	Magic Valley Energy, LLC	42. Section 3.16.2 Visual Resources - Night Skies “The analysis area for night skies is the nightscapes viewed from CRMO and Minidoka NHS. The duration of effects to night skies would be the life of the project, from construction through decommissioning and reclamation (34 years).” MVE requests that the reference to reclamation removed, as lighting would only occur through decommissioning. An update could be: “The analysis area for night skies is the nightscapes viewed from CRMO and Minidoka NHS. The duration of effects to night skies would be the life of the project, from construction through decommissioning (34 years).” Also note that MVE previously commented (comment 41) about removing the Minidoka NHS night skies analysis as the site is not open after dark.	After reviewing the comment and EIS wording, the text has been updated and reclamation has been removed. The BLM recommends not removing Minidoka for night sky analysis because it is open year-round and is open to walking tours 24 hours a day.
12054-9	Kevin Emmerich	Visual Impacts: The VRM classes set VRM objectives for lands in each class, as well as the level of visual change in the landscape character that is allowed as a result of proposed management activities. The objectives and allowed levels of change for each of the four VRM classes are as follows: • VRM Class I Objective: To preserve the existing character of the landscape. Allowed Level of Change: This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. • VRM Class II Objective: To retain the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape. • VRM Class III Objective: To partially retain the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape should be moderate. Management activities may attract attention, but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape. • VRM Class IV Objective: To provide for management activities which require major modification of the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape can be high. Management activities may dominate the view and may be the major focus of viewer attention. However, the impact of these activities should be minimized through careful siting, minimal disturbance, and repeating the basic elements of form, line, color, and texture within the existing setting. Since Visual Resources were not evaluated by the Monument RMP, the default VRM Class is VRM Class IV. This is the lowest class that encourages big developments like Lava Ridge. We feel that both the BLM and Magic Valley Energy LLC. are taking advantage of a loophole in the planning process and that is very irresponsible.	See response to comment 12538-4 (see in Table A-3y, Visual Resources).
12165-1	Jerry Holton	I noticed in the EIS Book 4 it shows the differences in the sizes of the windmills and distances. The ones that are shared in that book are not even close to being the same as in real life. I will share some pics off the page that shows from .25 miles out to 4 miles. Even in the pictures that were shared at the Lincoln Community event and over at Canyon Crest event they are not even to scale. You can not get accurate comments when the pictures that are being shown are not to scale. Even in the areas about the distances in the EIS that shows from say the Honor Roll at Minidoka camp or the barricks. They are not close to scale. I took pictures and used my GPS and Onx mapping system to get distances. I will be sharing a few of my pictures so that you can see the differences. This is very frustrating as its deceiving people from seeing the true scale and making a better-informed decision off what is being shown. [...] Here are 4 pictures. Like stated Mileage is written on the pics. Pictures are looking from Wendell area towards Bell Rapids.	See responses to comments 11458-5 (see in Table A-3y, Visual Resources) and 11535-147 (see in Table A-3y, Visual Resources).
12228-2	Jane Dyndiuk	Lastly, we will be able to see these gigantic structures from every hill top in the Wood River Valley, ruining our enjoyment of the wilderness.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
12338-2	National Park Service	Topic #2 – Discrepancies in Visual Resources Impact Conclusions Section: 3.16.1.2.3 Visual Resources Page: 3-419 Alternative C: The NPS recommends additional explanation on the writer’s determination in the draft EIS of the degree of visual change (major vs moderate) for Key Observation Point 1 (Visitor Center) and Key Observation Point 2 (Block 22) in Alternative C. • On page 3-419 in the draft EIS, visual impacts to Key Observation Point 2 (Block 22) “would be similar to Alternative B (major overall)”. This is also reflected in Table 3.16-7. However, on page 45 in the Visual Resources Technical Report, visual impacts at Key Observation Point 2 “would be reduced from major to moderate". • Key Observation Point 2 (Block 22) is listed as “major” in the degree of visual change. The draft EIS describes the difference in the degree of visual change between Key Observation Point 1 and Key Observation Point 2 as due to the focus of the viewer’s attention to the east (page 3-413). However, Key Observation Point 1 and Key Observation Point 2 are less than 0.1-mile apart and viewers	Impact ratings at KOPs 1 and 2 have been revisited and adjusted on CRWs and Table 3.16-6. See response to comment 11535-148 (see in Table A-3y, Visual Resources) for information on the Argonne Visibility Level Rating methodology.

Comment ID	Commenter	Public Comment	Response to Comment
		at both locations experience a similar view of the surrounding landscape. • Key Observation Point 16 (Honor Roll) is 0.36- and 0.44-miles from Key Observation Point 1 and Key Observation Point 2, respectively, but is listed as “major” in the degree of visual change in the Visual Resources Technical Report. • The photo simulations provided in the draft EIS at each Key Observation Point only represent a portion of the entire view, an estimated ~ 35-40 degrees of the horizon. Panoramic simulations, however, would reveal that the full extent of the views from Key Observation Point 1 and Key Observation Point 2 are virtually the same (~71 degrees of the horizon for Alternate C) as far as the overall visibility of the project. Given the identical views of the landscape at these Key Observation Points, this would suggest that the visual impacts are also the same. • According to the 2012 BLM-commissioned Argonne National Laboratory study used to support the visual resources analysis, both Key Observation Points 1 and 2, at 5.5 and 6.5 miles, respectively, to the nearest turbine siting corridor, would be considered a “be a major focus of visual attention, tending to attract and hold visual attention because of strong contrast in form, line, texture, color, or motion”. This level is used to describe facilities occurring within 10 miles and based on observations of turbines 400 feet in height, far shorter than the proposed turbines for this project. • Impacts to Key Observation Point 1 are described as major in the narrative under Impacts for Alternative C in the Non-Physical Impacts section for Cultural Resources (Section 3.5.6.2.3).	
12338-3	National Park Service	Section: 3.16.1.2.4 and 3.16.1.2.5 Visual Resources Page: 3-419 to 3-421 Alternatives D & E: The NPS would appreciate an opportunity to discuss the draft EIS’s determination that the project would have “moderate” visual impacts under Alternatives D and E. As described in Table 3.16-5, Alternative D is located at 5.5 miles and Alternative E is located at a distance of 8.5 miles from both Minidoka Key Observation Points 1 (Visitor Center) and 2 (Block 22). Multiple turbines in both alternatives would be within the foreground distance zone for tourists and recreational users.	After reviewing the simulations and contrast ratings, the impact findings for Alternative E have been reduced to minor as compared to Alternative D, which are moderate.
12338-6	National Park Service	Section: Executive Summary Page: ES-xv to ES-xxiv, Table ES-2 The NPS recommends inclusion of night sky impacts within the visual resources section.	Impacts to night skies are summarized in Table ES-2 in the EIS Executive Summary.
12338-13	National Park Service	Section: 3.16.1.1.2 Visual Resources Page: 3-403 Summary table: To facilitate a comparison of impacts for each alternative at each Key Observation Point, we suggest including in a summary table that includes the following measures: degrees of the horizon (that turbines will be visible); miles (of the span) that turbines will be visible on the horizon from each Key Observation Point; and number of turbines visible (all or in part) from the Key Observation Point.	These additional details are now available as Appendix F of the project visual resources technical report (SWCA 2024) to facilitate the commenter’s comparison of impacts for each alternative from each KOP.
12465-2	Regina Smith	Visual impacts are commonly considered non-physical. Simulations of Minidoka and Butte Cave, show the negative visual impacts on the horizon. This same horizon will be seen by most if not all dispersed recreational activities: photography, wildlife viewing, rock hounding, winter snow activities, OHV, night sky viewing, hunting, camping, horseback riding; all these activities, except perhaps spelunking. In the case of photography, the impacts could be considered physical and irreversible. Other activities could be considered closely related, i.e. Wildlife viewing, nighttime viewing, and the remoteness for which the site of Minidoka War Relocation site was selected, would be irretrievably lost. Cumulative impacts, irreversible and irretrievable impacts are not even discussed for the dispersed recreational activities listed at the beginning of this section. The disregard for residents and tourists alike is appalling.	Additional language discussing recreational activities has been added to EIS Sections 3.16.1.1.1 (Existing and Future Trends and Actions), 3.16.1.2 (Impacts), and 3.16.1.2.7 (Cumulative Impacts).
12538-4	Clarke Kido	Comments about the BLM Visual Resource Management Process During my review of the Lava Ridge Wind draft EIS, I came upon references to the Visual Resource Management (VRM) process. · I looked at the Visual Resource Rating worksheet for KOP 1 as shown in Visual Technical Report Appendix B. At the bottom of the worksheet, the degree of contrast is marked as Strong regarding structures. The VRM sheet is checked as Long Term. I was not surprised by these ratings. · At the bottom of KOP 1 Worksheet Question 2 asks “Does the project meet visual resource management objectives?” There is entry space allotted to indicate Yes or No, but the space is left unmarked. There is a note: “Explain on reserve side.” · On the reverse side of the worksheet, the following statement is provided for Item 2: “The 1986 Monument RMP for the Shoshone Field Office does not designate VRM Class Objectives for the planning area per current BLM VRM policy.” I am puzzled by this statement. · My concern is regarding the completeness of the Visual Resource Management Process. The question 2 for meeting visual resource management objectives is left unanswered. The explanatory note merely indicates that the BLM Shoshone RMP (1986) does not provide guidance to perform such analysis. · Without a yes or no determination, coupled with the absence of VRM guidance in the BLM Shoshone RMP, my question is where is the evidence to show that the EIS requirements for VRM analysis has been completed? These VRM questions apply to other KOPs.	See response to comment 11535-149 (see in Table A-3y, Visual Resources) and comment 12538-4 (see in Table A-3y, Visual Resources) for more information. BLM visual contrast rating forms were updated to reflect project-specific interim VRM classes and conformance.
12859-32	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Alternative C & E. Impairment of the Park’s Fundamental Resources and Values. Because of the negative impacts of both Alternatives C and E, this section will comment on both Alternatives’ impairment of Minidoka’s fundamental resources and values which would violate the NPS Organic Act, NPS Policies and other authorities. In 2006, the NPS completed its GMP which NPS adopted through a record of decision (ROD) based on the GMP/Final Environmental Impact Statement. The ROD’s Selected Action provides that “[o]n site education and interpretation will be accomplished through a wide range of visitor experiences, including immersion into the historic scene, interaction with a variety of educational and interpretive media and personal services, and participation in creative and self-directed activities.”234 The final Minidoka GMP identified maintaining the park’s immersive setting, scenic vistas of the surrounding landscape, and living conditions during World War II as park	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. The project is being proposed on public lands managed by the BLM. The location of project infrastructure would be located in areas adjacent to Minidoka NHS, a site managed by the NPS, but no portion of the project would be located on lands within the jurisdiction of the NPS. The NPS is a cooperating agency, and the BLM has worked with the NPS closely to ensure the EIS evaluates potential impacts to NPS units and associated resources. The NPS is also participating as a consulting party within the Section 106 process and has actively

Comment ID	Commenter	Public Comment	Response to Comment
		priorities:235 • Desired future conditions and goals for adjacent lands: “[t]he vastness, isolation, and open character of site’s desert environment that existed during the historic period are maintained through collaborative partnerships and cooperative efforts with surrounding landowners and others.” • Scenic Resource Management goals: o “Scenic viewing areas and interpretive overlooks along the northern boundary of the site and within the east end site will be developed to provide panoramic views of the physical extent of the historic residential areas.” o “[t]he NPS will collaborate with neighboring landowners to assist in the protection of historically significant distant views to the surrounding areas.” • Education and interpretation will be accomplished “through immersion into the historic scene,” and “[t]he use of historically accurate buildings, features, and their site context will provide visitors with an opportunity to experience a high level of interest in living conditions associated with the historic period.” • Contemplative setting and sense of openness: “[t]he historic open space will provide a contemplative setting with restored historic pathways and the historic perimeter fence, along with interpretive trails and waysides that will allow for self-guided exploration. The historic open space will provide a sense of openness that was apparent during the historic period.” • Interpretative themes: o “The setting and location of Minidoka, with its isolation, openness, and distance from the Pacific Coast, are characteristic of the War Relocation Authority’s site selection criteria.” o “Internees transformed undeveloped arid land into irrigated agricultural fields in and around the Minidoka Relocation Center. The present-day agricultural character of the Hunt area is the legacy of the internees’ labor during World War II.” o Agricultural development following World War II. The NPS’s 2016 Foundation Document further refined the General Management Plan and summarized the park’s fundamental resources and values including: • Environmental Setting: “Minidoka’s remote location in the high desert of Idaho provides an immersive setting that is fundamental to the visitor experience. Views of open fields and distant mountains create a sense of isolation on a vast landscape where Minidoka once stood…Extreme changes in temperature, the arid environment, and high winds that the people at Minidoka experienced are part of the environmental setting that are felt today. Experiencing this environmental setting allows visitors to better understand and connect to the daily lives at Minidoka.” • Commemoration and Healing: Minidoka provides a place “… for engagement, reflection, and healing. These sites provoke connections to individuals affected by the World War II exclusion, forced removal, and unjust incarceration, and serves to commemorate those who survived this difficult chapter of American history.” • Public Understanding, Education, and Involvement: “Educating and engaging the public in understanding the history of the incarceration of Japanese Americans during World War II, the fragile nature of civil rights, and the need to protect civil and constitutional rights in the United States is essential...At Minidoka, special events such as the pilgrimage and the civil liberties symposium connect the public to the history that occurred here and its significance today.” While an improvement over LS Power’s Plan of Development, Alternatives C and E would have significant negative visual impacts on Minidoka NHS’s fundamental resources and values, the Minidoka Relocation Center and Minidoka TCP. As depicted in the DEIS, Alternatives C and E with both the 3 and 6 MW turbines are clearly visible from KOP 1 (Visitor Center), KOP 2 (Barracks Block 22) and KOP 16 (Honor Roll). The ACEC petition also identifies the significant negative visual impacts on other parts of the park including the fire station/water tower, reconstructed guard tower, and multiple reflective stops located throughout the park.237 Based on the visual models, the visual impacts are significantly worse in the mornings, based on the backlighting of the turbines by the rising sun. Because of inherent limitations in printed and computerbased images, the DEIS’s static and dynamic visual simulations do not accurately convey the real world on the ground impacts on the park’s resources and visitors. Also, there is a high level of subjectivity in BLM’s ratings analysis, as each rater has his or her own perception. BLM’s dynamic simulations show a wall of wind turbines that would occupy a significant percentage of the park viewshed and would damage the park’s fundamental resource values and have significant negative impacts on both feeling and association. The dynamic simulations depict the shorter 3 MW wind turbines (545 feet), rather than the larger 6 MW turbines (740 feet). In analyzing Alternative H, BLM notes that there is lesser wind resources at lower elevation. The dynamic simulations also do not show the harmful impacts of the turbine lights on the night-sky.	participated in the preparation of the PA that would stipulate the process necessary to comply with Section 106 obligations. KOP selections, which represent sensitive viewing locations, including the Minidoka Visitors Center, Block 22 Barracks, and the Honor Roll KOPs, were coordinated closely with the BLM and NPS. See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project, including the BLM visual contrast rating analysis. To ensure limited subjectivity during the contrast rating process, multiple BLM and NPS team members participated in the process and iterative rounds of rating occurred. For further information on the visual simulations for the project please see responses to comments 11423-4, 11454-2, and 11458-5 (see in Table A-3y, Visual Resources). MVE has committed to mitigating night sky impacts as detailed in EIS Section 3.16.2 (Night Skies). Mitigation for lighting for the turbines and any other facilities is detailed in EIS Appendix 4 (Mitigation).
12859-33	Kristen Brengel, Robyn Achilles; Friends of Minidoka	BLM’s analysis does not evaluate the visual impacts from the “glinting.” According to a study by the Argonne National Laboratory: Blade glinting is the brief, often repeated flash of point-like light reflection from wind turbine blades, typically seen near the hub.	Recent studies have shown that blade glinting has been mitigated by anti-reflective coating on modern turbines and was not considered as part of the analysis. See study here: https://www.dit.sa.gov.au/__data/assets/pdf_file/0003/451587/422E00317_2g_-_Shadow_Flicker_and_Blade_Glint_Assessment.pdf
12859-34	Kristen Brengel, Robyn Achilles; Friends of Minidoka	BLM’s analysis does not evaluate the visual impacts from the “strobe effect.” According to a study by the Argonne National Laboratory: Shadows of turbine blades falling on towers when the sun is at a low elevation can cause a strobe-like effect as the blade shadow passes the lit tower repeatedly. In some instances, this can add substantially to the visibility of the wind facility.	The “strobe effect” referenced in your comment is referred to in the EIS as “shadow flicker,” and the analysis of this phenomenon is contained in Section 3.16.3 (Shadow Flicker).
12859-37	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Additional KOPs – Historic Fire Station (former Herrmann farm). BLM’s limited selection of KOPs at Minidoka does not accurately assess the visual impacts on sensitive user groups. The old fire station is located on higher ground and would enable the BLM to get a better understanding of the impacts on the park.	The BLM and NPS coordinated on the location of KOPs that were included as part of the analysis.
12859-39	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Visual Resource Contrast Rating. BLM did not follow its policies relating to visual resource contrast ratings with regard to degrees of visual change. BLM policy requires field offices to designate visual resource management classes.253 However, the Monument RMP does not include have VRM classes.254 The BLM policy for this case is “[w]here there are no RMP approved objectives, interim Visual Resource Management (VRM) classes	See responses to comment 11535-149 (see in Table A-3y, Visual Resources) and comment 12538-4 (see in Table A-3y, Visual Resources). The BLM determined and added project-specific interim VRM classes and objectives to the final EIS; please see Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.

Comment ID	Commenter	Public Comment	Response to Comment
		will be developed using the guidelines in Handbook H-8410-1 except: (1) The inventory will be limited to the area affected by the project; and (2) the VRM classes will reflect the management decision made in existing RMP's."255 While BLM completed project related visual resource inventories,256 the Visual Resources Technical Report said it would not evaluate conformance with existing or interim VRMs, as required by BLM policy.257 Identifying interim VRMs will help guide agency actions, including mitigation.258 For Alternatives C and E, the BLM describes the impacts on the Minidoka KOP's as "moderate." The purpose of determining degrees of visual change, whether major or moderate, is to compare those findings with the RMP's VRMs, or interim VRM classes.259 Please include interim VRM's in the DEIS.	
12859-40	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Degree of Visual Change. The DEIS states that both alternatives C & E would have moderate degrees of visual change based on a percentage of visible acres within the distance zone. BLM's distance zones are defined as immediate foreground (0-2 miles), foreground (2-10 miles), middleground (10-20 miles), and background (20-30 miles). BLM's should consider a model developed by researchers at the Argonne National Laboratory, which was commissioned by BLM, which shows major impacts at farther distances.260 The Argonne analysis found that: "[u]nder favorable viewing conditions, the wind facilities were judged to be major foci of visual attention at up to 19 km (12 mi) and likely to be noticed by casual observers at >37 km (23 mi). A conservative interpretation suggests that …facilities could be major sources of visual contrast at up to 16 km (10 mi)."261 We encourage BLM to consider the Argonne methodology because it more accurately assesses the impacts.	The analysis and determination of distance zones used in this EIS was based on *Wind Turbine Visibility and Visual Impact Threshold Distances in Western Landscapes* (Sullivan et al. 2012). The project visual resources technical report (SWCA 2024) describes this in Sections 1.1, 4.1.3, and 5.1. See also response to comment 11535-148 (see in Table A-3y, Visual Resources) for information related to the Argonne Visibility Level Rating methodology.
12859-41	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Sensitivity Level Analysis. The DEIS's visual resource inventory is based on its Sensitivity Level finding of Moderate. BLM policy requires field office to prepare sensitivity level analysis, based on high, medium or low sensitivity levels "by analyzing the various indicators of public concern:"262 Below are the rating elements taken from BLM Form 8400-6 Sensitivity Level Rating Sheet: 1. Type of Users. Visual sensitivity will vary with the type of users. Recreational sightseers may be highly sensitive to any changes in visual quality, whereas workers who pass through the area on a regular basis may not be as sensitive to change. 2. Amount of Use. Areas seen and used by large numbers of people are potentially more sensitive. Protection of visual values usually becomes more important as the number of viewers increase. 3. Public Interest. The visual quality of an area may be of concern to local, State, or National groups. Indicators of this concern are usually expressed in public meetings, letters, newspaper or magazine articles, newsletters, land-use plans, etc. Public controversy created in response to proposed activities that would change the landscape character should also be considered. 4. Adjacent Land Uses. The interrelationship with land uses in adjacent lands can affect the visual sensitivity of an area. For example, an area within the view shed of a residential area may be very sensitive, whereas an area surrounded by commercially developed lands may not be visually sensitive. 5. Special Areas. Management objectives for special areas such as Natural Areas, Wilderness Areas or Wilderness Study Areas, Wild and Scenic Rivers, Scenic Areas, Scenic Roads or Trails, and Areas of Critical Environmental Concern (ACEC), frequently require special consideration for the protection of the visual values. This does not necessarily mean that these areas are scenic, but rather that one of the management objectives may be to preserve the natural landscape setting. The management objectives for these areas may be used as a basis for assigning sensitivity levels. 6. Other Factors. Consider any other information such as research or studies that includes indicators of visual sensitivity. The DEIS rated the Twin Falls Metro SLRU (#01) and Wilson and Kimama Buttes SLRU (#05) as "moderate" for sensitivity level rating.263 The Visual Resources Technical Report found that "the combination of the amount of use, diverse user groups, public interest associated with locations within the area, and designated special areas (e.g., Minidoka Historic Site and the Snake River Canyon) have relative visual importance. This also means that there is a moderate level of tolerance related to visual changes within the landscape in general based on the degree of modifications that currently exist. It should be noted that localized sensitive groups occur within the SLRU (e.g., Minidoka Historic Site visitors) where the surrounding visual context and character of the area is important and of higher sensitivity to visual change from a cultural-visual perspective than the typical visitor due to the significance of the site and historical context." The BLM's moderate sensitivity level ratings for the two SLRUs is based on flawed analysis. It does not appear that the BLM considered the Minidoka TCP when it found a moderate sensitivity level rating. There is a high level of public concern about the Twin Falls SLRU (#01) and Wilson and Kimama Buttes SLRU (05) to support a finding that the sensitivity level rating is high.	As a result of the public process, the degree of visual sensitivity (SLRU) associated with the VRI for Minidoka NHS and Minidoka WRC has been re-evaluated and adjusted accordingly based on public and agency input.
12859-42	Kristen Brengel, Robyn Achilles; Friends of Minidoka	The following suggested analysis and ranking is based on BLM Form 8400-6 Sensitivity Level Rating Sheet: 1.Types of user. Because of the importance of Minidoka as a place for healing and learning, the Japanese American community is highly sensitive to any changes in visual quality. The Japanese American community has fought to preserve Minidoka's viewshed to preserve the immersive setting, feeling of isolation and to interpret the living conditions of Minidoka incarcerees, as required by Congress. BLM's stakeholder report found that the Japanese American community has deep and unique connections to the scenery around Minidoka.264 Also, the Lava Ridge Subcommittee received information highlighting the importance of maintaining visual quality for recreational users and the immersive experience: Suggested ranking: "Maintenance of visual quality is a major concern for most users" High 2. Amount of use. According to the BLM's table for classifying the amount of use "recreation sites, with greater than 10,000 visitor days/year," merits a high ranking for visitor use. In 2022, Minidoka National Historic Site received 13,717 visitors.265 This does not include recreational visits to the public lands and use of roads and highways through the project area. Suggested ranking: "Maintenance of visual quality becomes more important as the level of use increases" High (based on the BLM's Table for Classifying Amount of Use) 3.Public Interest. LS Power's Lava Ridge proposal has generated a high level of public interest both locally and nationally as demonstrated by: scoping letters submitted to BLM, articles and press coverage in local, regional and national news outlets, designation of Minidoka as one of the 11 most endangered sites by the	See response to comment 12859-41 (see in Table A-3y, Visual Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		National Trust for Historic Preservation in 2022, extensive public comment and participation in the BLM's Lava Ridge Subcommittee including a very large turnout for the June 2022 tour, letters of opposition, public comments, and the Subcommittee's final report, several large Stop Lava Ridge meetings in Jerome starting in May 2022 and running through February 2023, letters to the editor of the Twin Falls Times-News, the Stop Lava Ridge web-page and facebook group. The high level of controversy is also demonstrated by the letter to BLM signed by the Governor, Lt. Governor and Members of the Idaho Congressional delegation in February 2023, unanimous passage of House Concurrent Resolution #4 opposing the project in the Idaho Legislature, questions from Mike Simpson to the Secretary and BLM Director at March 2023 budget hearings before the House Interior Appropriations Subcommittee, a seven county anti-Lava Ridge resolution attended by several hundred people,266 and an anti-Lava Ridge rally in Twin Falls on April 11, 2023. Suggested ranking: "Maintenance of visual quality is a major public issue" High 4. Adjacent Land Use. The Minidoka National Historic Site and Minidoka Relocation Centers are adjacent land uses.267 The National Park Service, through its management planning, has identified the viewshed as a fundamental resource and value to be managed unimpaired. Suggested ranking: "Maintenance of visual quality to sustain adjacent land use objectives is very important" High 5. Special Area. Minidoka is a Presidentially-designated and Congressionally-ratified unit of the National Park System. Congress has given specific guidance for the management of the Minidoka Relocation Center. Suggested ranking: "Maintenance of visual quality to sustain Special Area management objectives is very important" High 6. Other Factors. As noted above, the Friends of Minidoka commissioned a report that found that Minidoka's viewshed located in the Twin Falls and nearby SLRUs is Traditional Cultural Property (TCP). The Idaho SHPO has concurred with a finding that the TCP is eligible for listing on the National Register of Historic Places. As noted above, the Friends of Minidoka submitted a petition to BLM to designate the area as an Area of Critical Environmental Concern, which is currently being reviewed. And as noted above, there is substantial guidance from the Biden Administration relating to racial and environmental justice, AANHPI heritage, underserved communities and telling the whole story. In addition, the BLM should address how the Twin Falls and Wilson and Kimama Butte SLRUs were delineated. BLM policy states that SLRU "boundaries will depend on the factor that is driving the sensitivity consideration. Consequently, a thorough review of the factors referred to in IIIA [Sensitivity Level Analysis - Factors to Consider listed above] should be completed before any attempt is made to delineate SLRU's." 268 These factors include the TCP and proposed ACEC.	
13006-28	Leon Smith	5) Recommend examining the visual impact on the alpine ski experience from the Seattle Ridge at the Sun Valley resort.	KOPs were chosen to represent specific places, areas, and features that have visual importance relative to one's home, social, business, and recreation environment. This includes where the public would view the project from both stationary (e.g., residential areas) and or linear (e.g., major roadway) locations. The KOPs were chosen for this project in coordination with the BLM SFO and cooperating agencies. Project mitigation for impacts is outlined in EIS Appendix 4 (Mitigation).
2827-1	Brian Ito	I appreciate the visual simulations. They have confirmed my belief that these wind turbines will adversely affect a visitors experience of the Minidoka concentration camp site. I believe the visual impact, in reality, will be even greater than depicted in the visual simulations.	See response to comment 11458-5 (see in Table A-3y, Visual Resources).
3244-1	Cindy Bitzenburg, Jim Bitzenburg	We have reviewed the project's Draft Environmental Impact Statement, and we believe the portion of the EIS dealing with the visual impacts of the project vastly underestimates the overall visual contamination that the project would have on the entire Magic Valley. The Key Observation Points (KOP) discussed so extensively in the EIS do not address the effects that the majority of the Magic Valley would experience from the project.	The KOP selection process was used to identify locations surrounding the project that would be most representative of viewers in the area. This process and reasoning for KOP selection is discussed in Section 4.2 (Sensitive Viewers and Key Observation Points) in the project visual resources technical report (SWCA 2024).
3502-1	Diana Nielson	I am opposed to the Lava Ridge Wind Turbine Project Concerning Visual Resources Simulations: I have taken many photos at similar distances. The images and image angles diminish the visual impact of the Wind Turbines. See Vol 4a Appendix 5. VRS 1 of 13 Kop 5 Alternating distance from Idaho Highway 24. There isn't a physical point of reference used in the photos. About my Images:Here is an actual photo at 2 miles of 400 foot tall wind turbines with my Nikon D7500 cropped frame. I am not a professional photographer. Milner Butte Wind Project 13 Turbines online in 2011: each turbine 1.5MW hub 262.5 ft Rotar Diameter 270.67 ft total Hight 398.622 feet. Taken with my Nikon D7500 at 2 miles Wind Turbines are 1.5 MW Zoomed in so the Semi Tractor trailer can be seen to help compare with 400 foot turbines. Semi is 1 mile closer than the turbines on Hwy 30. 400 foot turbine on Burley Butte. Photo taken from Sugar Beet Dump ND HWY 30. The Photo's below are from APP C V19 KOP 16 Technical Report of the the Honor Roll. The photos do not represent what you would see if you were there to look at the Honor Roll and are close enough to read. The Honor Roll is elevated on a hill. This photo is so far back it appears downhill.. The photographer is standing far back so you can't even read the names.	See responses to comments 11458-5 (see in Table A-3y, Visual Resources) and 11535-147 (see in Table A-3y, Visual Resources) for information regarding simulations. KOP selection was coordinated closely with the BLM and NPS for selection of areas to represent sensitive viewing locations and areas within the analysis area.
5177-2	Valerie Chappell	Another quality of life negative impact is shadow flicker. Shadow flicker is a phenomenon that occurs when the sun is low on the horizon and is interrupted by the blades of wind turbines casting rapidly moving shadows in nearby homes and other buildings. This can cause significant annoyance and disruption to daily life, as well as health problems such as headaches and disrupted sleep patterns. The proposed Lava Ridge Wind Project has the potential to cause significant shadow flicker in nearby homes and buildings, negatively impacting the quality of life for residents. This is particularly concerning, as the project is proposed in a densely populated area with many homes and other structures that could be affected.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. Section 3.16.3 (Shadow Flicker) provides analysis of potential shadow flicker impacts to residences surrounding the action alternatives.
5180-1	Leo Malberg	I am wondering why the wind towers can't be placed so not be in eye sight of the the encampment area. Don't know why not. I hardly believe that there is not suffent land area futher north (or) east of the monument. If not	The BLM has worked with the NPS and Magic Valley to select alternatives that would reduce the number of turbines in view from Minidoka NHS. Additionally, areas north and east of Craters of the Moon National Monument and Preserve are outside the area of the siting corridors.

Comment ID	Commenter	Public Comment	Response to Comment
		perhaps the project managers need to cut-back on the amount of towers to the area that would impac the monument site. Pretty sure that they have Grandfather righs in that area if that means anything.	
6868-5	Barbara Martien	Noted that the following areas were not completely covered. [...] The report seems to minimize the size and appearance of the wind turbines. The ones that I see north of Pendleton Oregon have a huge impact seen for miles.	See responses to comments 11454-2 (see in Table A-3y, Visual Resources) and 11535-147 (see in Table A-3y, Visual Resources).
6870-2	Name Not Provided	The DEIS talks a lot about visual resources and levels of impact to Minidoka. I have studied the visual simulations online, and the posters at the public meetings misrepresented the severity of impacts. Why did the posters only show 3MW turbines instead of 6MW turbines? Also, the Honor Roll simulations were mislabeled as Visitor Center. Using the smaller turbines is not telling the whole truth in the public meetings. It was apparent that the intent was to minimize the severity of the alternatives and impacts to Minidoka.	After reviewing this comment, the BLM has found the mislabeled simulations and provided the correct name.
6913-8	Public Comments Canyon Crest Events Center	I would like to the comment on the illustrations they have photographed from the internment camp with the proposed windmills in the background. The size of the windmills don't depict the actual size they will be. I live at the end of East Road facing the power lines that are in these photos. The windmills should have been photographed from a nearby distance to show the difference in height and size of the existing transmission lines that are approximately 100 feet tall. I believe that would give the public a much better understanding of the scope of this project. Many believe that that was purposely done in order to gain more support for this project.	KOP locations were chosen through cooperation of the BLM and NPS. See responses to comments 11535-147 and 11458-5 (see both in Table A-3y, Visual Resources).
8629-3	Cathy Schiers	Additionally, these 400 windmills could be 700 feet tall with blinking lights. This not only impacts southern Idaho's dark night skies	All alternatives and both the 3-MW and 6-MW turbines, met towers, and associated infrastructure over 200 feet tall would employ an ADLS system that detects when aircraft is within 25 miles of the turbines. Using this system, the aviation lighting would be off approximately 92% of the time. See Section 3.16.2 (Night Skies) for more details on night skies and impacts.
8643-1	Steve Woods, Pam Woods	There will no doubt be a huge esthetic impact on the views of the Sawtooth mountains that Southern Idahoans now enjoy. Nearly 400 turbines over 700 feet tall will cloud the pristine view enjoyed all day. And 400 flashing lights at night won't be that enjoyable either.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See response to comment 11411-5 (see in Table A-3y, Visual Resources) for details on night skies impacts.
9080-16	The Coalition to Protect America's National Parks	4. Prior to receiving the Project proposal, BLM had failed to conduct a baseline Visual Resource Management (VRM) inventory or classification22 that would have provided much needed landscape management objectives for the Project area – In principle, BLM should have prepared a baseline VRM inventory and management classification assessment during one of its previous land use planning processes for the area well before considering a project proposal of this magnitude. Under BLM's VRM system, the Class rating determines the landscape management objectives for the area. In this case, the 1986 Monument RMP23 did not include a VRM management classification or landscape management objectives that would serve as a baseline for determining the appropriateness of future development proposals. In addition, the RMP also did not recognize or consider the historical significance of the Minidoka WRC or contemplate the creation of Minidoka Internment National Monument by Presidential Proclamation in 2001 or the establishment of Minidoka NHS by act of Congress in 2008. As a result, protecting visual resources and landscape scenic values from the perspective of the Minidoka NHS or the WRC had never been formally considered by BLM before it received the LRWP proposal. Most concerning is that BLM waited until late in the DEIS planning process to finally determine that the project area would be considered a Class IV VRM area, which is the least protected class of visual resources in BLM's VRM system. See the Visual Resources Technical Report for the Lava Ridge Wind Project24 dated January 2023, which is 34th document listed on the Project website. Based on its completion date, this key report identifying the project area as a Class IV VRM area was not finalized until literally a few days or a few weeks before the DEIS was issued for public review. According to BLM Manual H-8410-125 on "Visual Resource Inventory," a Class IV rating allows "management activities which require major modifications of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention." (Emphasis added) In other words, a Class IV rating provides little if any protection to viewsheds within or near the Project area, which in this case includes visual resources as seen from the perspective of Minidoka NHS and the WRC, and from Native American cultural sites such as Wilson Butte Cave.	See response to comment 12859-38 (see in Table A-3h, Environmental Justice and Socioeconomics). For more information about the VRI, see response to comment 11535-150 (see in Table A-3y, Visual Resources). For more information about the project-specific interim VRM process, see response to comment 11535-149 (see in Table A-3y, Visual Resources).
9080-18	The Coalition to Protect America's National Parks	In our scoping comments26 dated October 20, 2021, we voiced the concern that "if BLM were to conduct a baseline visual resource inventory or classification for the project area now only AFTER a massive wind farm has already been proposed, the classification results will be controversial regardless of outcome." In essence, waiting to determine the VRM Class and related landscape management objectives until after a major development has been proposed is out of compliance with BLM VRM procedures and creates the appearance of a conflict of interest on BLM's part. For that reason, in our scoping comments we strongly recommended that "BLM and NPS hire an independent third-party consultant, such as the Argonne National Laboratory,27 to conduct such a baseline assessment and VRM classification" so that the results would appear unbiased and credible. However, it appears that a BLM contractor, SWCA Environmental Consultants, conducted the VRM assessment for the Project; and SWCA has determined that "the visual resources within the project area would fall primarily under Class IV, with smaller portions of both Class II and III." The basis for this finding is not revealed until Section 4.1.4 of the Visual Resources Technical Report for the Lava Ridge Wind Project_508 (report),28 which is the 34th document listed on the BLM eplanning website. SWCA's VRM analysis and determination are not adequately described or explained in the DEIS proper or in its appendices. However, it appears that BLM has adopted SWCA's recommendation, as indicated by Figure 3.16-4 in the DEIS, which is a	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. Also see response to comment 12859-38 (see in Table A-3h, Environmental Justice and Socioeconomics). For more information about the VRI, see response to comment 11535-150 (see in Table A-3y, Visual Resources). For more information about the project-specific interim VRM process, see response to comment 11535-149 (see in Table A-3y, Visual Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		color coded map that indicates the project area is considered a Class IV area. The figure in the DEIS is the same as "Figure 5. Visual resource inventory classes for the analysis area" in the contractor's report. Because SWCA's technical report is dated "January 2023," it suggests that BLM has adopted a last minute recommendation that BLM should allow the highest level of development and visual resource impacts within the Project area. Based on the respective landscape management objective descriptions, it seems that a Class IV rating is the only result that would allow the Project to move forward at this location.	
9080-19	The Coalition to Protect America's National Parks	BLM's determination that the project area is a Class IV visual resource area at this stage of the planning process is problematic for several reasons. First, as explained on the BLM Visual Resource Management (VRM) Classes website,29 "[w]hen Visual Resource Management (VRM) class objectives are designated for the lands in an RMP, management actions and allowable uses are determined that reflect the VRM class objectives." (Emphasis added) In this case, BLM had no VRM class objective(s) to serve as a basis for determining if the proposed Project is appropriate or allowable. Similarly, BLM IM 2009-04330 states, in part: "The BLM Land Use Planning Handbook requires that VRM management classes be identified in land use plans based on inventories of visual resources as well as management considerations for other potential land uses… The VRM management classes are intended to establish landscape management objectives for a variety of surface disturbing activities." (Emphasis added) In this case, the classification analysis was conducted and VRM landscape management objectives were determined only after a major project proposal had been submitted and accepted by BLM as the Proposed Action.	See response to comment 12859-38 (see in Table A-3h, Environmental Justice and Socioeconomics). For more information about the VRI, see response to comment 11535-150 (see in Table A-3y, Visual Resources). For more information about the project-specific interim VRM process, see response to comment 11535-149 (see in Table A-3y, Visual Resources).
9080-20	The Coalition to Protect America's National Parks	Second, it is a concern that the determination of the Class IV rating for the project area is not described until a technical report that is the 34th document listed on the BLM eplanning website.31 It would have been appropriate to provide a summary of the VRM class analysis and determination in the body of the DEIS (such as in Chapter 2 or 3 or in an Appendix), where it would have been more apparent and more likely to be subject to public review and comment. It appears the only information about the Class IV rating in the DEIS proper is the color coded map provided in previously mentioned Figure 3.16-4.	See response to comment 11535-149 (see in Table A-3y, Visual Resources).
9080-21	The Coalition to Protect America's National Parks	Third, the impact of BLM's failure to previously establish VRM-related landscape management objectives in the area surrounding Minidoka WRC is clearly reflected in MVE's siting decision, which is described in MVE's Plan of Development (POD) in DEIS Appendix C.32 Section C-2 on Alternative Project Locations indicates that MVE initially focused on several other locations that ultimately were found to be in conflict with sage grouse habitat protections. This resulted in the "lead federal and state agencies to encourage MVE to seek another alternative location for wind energy development… MVE proceeded to renew its siting analysis… Special emphasis was placed on avoiding areas designated as priority or important sage grouse habitat. As a result of these extensive siting efforts, MVE has identified the current Project area." (Emphasis added) Notably, in MVE's evaluation of "the current Project area," there is no mention of the area's VRM Class rating or landscape management objectives (presumably because there were none), or related concerns about visual resources in the vicinity of Minidoka NHS or the WRC. In contrast, the POD goes on to say that MVE ruled out another location based on potential conflicts with Class III visual resources. See Appendix C, Subsection 3-1.1.1, which states: "MVE considered placement of wind turbines and substations within a Visual Resource Management (VRM) Class III area along Highway 24… However, it is not certain that wind turbines and substations will meet the VRM Class III management objectives… The current Proposed Action has removed all wind turbines and substations from the VRM Class III area." (Emphasis added) In other words, MVE recognized and avoided potential conflicts of building a wind farm in another location with a Class III rating; but absent any existing VRM Class rating for the Project area, MVE apparently did not anticipate and/or was not informed by BLM of potential conflicts with the protection of visual resources surrounding Minidoka NHS.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. Also see responses to comments 12859-38 (see in Table A-3h, Environmental Justice and Socioeconomics) and 12538-41. For more information about the project-specific interim VRM process, see response to comment 11535-149 (see in Table A-3y, Visual Resources).
9080-22	The Coalition to Protect America's National Parks	Fourth, the BLM should have been well aware of wind turbine visibility and visual impact threshold distances in western landscapes. A 2012 study33 of wind turbine visibility in western landscapes conducted by the Argonne National Laboratory for the BLM found that: Under favorable viewing conditions, the wind facilities were judged to be major foci of visual attention at up to 19 km (12 mi) and likely to be noticed by casual observers at >37 km (23 mi). A conservative interpretation suggests that for such facilities, an appropriate radius for visual impact analyses would be 48 km (30 mi), that the facilities would be unlikely to be missed by casual observers at up to 32 km (20 mi), and that the facilities could be major sources of visual contrast at up to 16 km (10 mi). (Emphasis added) Yet BLM has entertained multiple action alternatives that would allow industrial-scale wind turbines in close proximity to culturally significant resources, such as Minidoka NHS, the WRC, and Wilson Butte Cave. All action alternatives would allow turbines at distances the 2012 study found "could be major sources of visual contrast" (i.e., within 10 miles); and "unlikely to be missed by casual observers" (i.e., within 20 miles).	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See response to comment 11535-148 (see in Table A-3y, Visual Resources) for information on the Argonne Visibility Level Rating methodology.
9080-23	The Coalition to Protect America's National Parks	Last but not least, the proximity of wind turbines to sensitive viewing locations in each of the action alternatives is fundamentally at odds with BLM guidance described in "Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands" (BMPs),34 published in 2013. Specifically, Section 6.2.1, p. 141, of the BMPs recommends: "Site [alternative energy] facilities and ROWs outside of sensitive viewsheds or as far as possible from sensitive viewing locations." (Emphasis added) Given the proposed size of the wind turbines, a minimal setback of 0.5 mile from the boundary of Minidoka NHS or 1.0 mile from Wilson Butte Cave, as proposed under Alternative B, are obviously not "outside of sensitive viewsheds or as far away as possible from sensitive viewing locations." Why did BLM not follow its own BMPs "for reducing visual impacts of renewable energy facilities on BLM-administered lands?"	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. Throughout the preparation of the EIS, the BLM has used the mitigation hierarchy to identify measures and alternatives that would avoid and minimize potential impacts. The development of measures and alternatives have been informed by the robust suite of outreach efforts that the BLM facilitated throughout the preparation of the EIS. The BLM provided opportunities for input early on through coordination with stakeholders and

Comment ID	Commenter	Public Comment	Response to Comment
			cooperating agencies and incorporated input from the public throughout the preparation of the EIS. These outreach efforts have resulted in considering elements that have the potential to minimize adverse impacts. Through completion of the BLM's evaluation of the project consistent with NEPA, a decision will be based on an analysis of the full range of potential impacts with consideration for the use of appropriate BMPs.
9080-47	The Coalition to Protect America's National Parks	G. Section 3.16 Visual Resources (p. 3-196) – As described in the DEIS, "[t]he SFO Monument Resource Management Plan (BLM 1986b) does not establish Visual Resource Management (VRM) classes or associated management objectives for BLM public lands in the siting corridors; for this reason, conformance with BLM VRM objectives was not determined in this analysis." (Emphasis added) As background, see General Comment 4 above, which we will not repeat in full here. We have numerous concerns about BLM's failure to determine the VRM class or related VRM management objectives before the Project proposal had reached its current stage of development: • In principle, BLM should have prepared a baseline VRM inventory and classification assessment well before considering a project proposal of this magnitude because the VRM classification determines the landscape management objectives related to how much future development and related impacts would be appropriate. Lacking such objectives, BLM had no basis for evaluating the appropriateness of the wind project (i.e., how much development and/or VRM impacts should be allowed based on the management objectives) when it was first proposed. • The impact of BLM's failure to previously establish VRM management objectives in the area surrounding Minidoka NHS is reflected in MVE's siting decision. As described in MVE's Plan of Development (POD) in Appendix C,55 MVE avoided a different project location due to potential conflicts with VRM Class III visual resources and instead focused on the current project location. Absent any existing VRM Class rating or landscape management objectives for the Project area, it seems that MVE did not anticipate or was not informed of potential conflicts with the protection of visual resources surrounding Minidoka NHS. • In our scoping comments, we strongly recommended that "BLM and NPS hire an independent third-party consultant, such as the Argonne National Laboratory56, to conduct such a baseline assessment and VRM classification" so that the results would appear unbiased and credible. However, BLM did not do that. Instead, based on a contractor's study BLM has given the project area a Class IV VRM rating as indicated in Figure 3.16-4 (p. 3-407). The figure's color-coded illustration categorizes the Project Area as Class IV, which will allow the greatest amount of development and visual resource impacts within the project area. • Last but not least, even lacking previously established VRM-related landscape management objectives for the Project area, allowing a massive industrial-scale wind farm in close proximity to culturally sensitive resources, such as Minidoka NHS, the WRC, and Wilson Butte Cave, is fundamentally at odds with BLM's 2013 "Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands."57 Specifically, Section 6.2.1, p. 141, recommends: "Site [alternative energy] facilities and ROWs outside of sensitive viewsheds or as far as possible from sensitive viewing locations." (Emphasis added) A setback of as little as 0.5 miles from the Minidoka NHS boundary is obviously not "outside of sensitive viewsheds or as far away as possible from sensitive viewing locations." At its current location, the Project is in direct conflict with BLM's own 2013 BMPs for reducing visual impacts of renewable energy facilities on BLM-administered lands.	See Section 3.16 for disclosure of potential visual resources impacts from the project. See response to comment 12859-38 (see in Table A-3h, Environmental Justice and Socioeconomics). For more information about the Minidoka sensitivity rating unit see comment 12538-41. For more information about the VRI, see response to comment 11535-150 (see in Table A-3y, Visual Resources). For more information about the project-specific interim VRM process, see response to comment 11535-149 (see in Table A-3y, Visual Resources). The BLM has worked with the NPS and Magic Valley to select alternatives that would reduce the number of turbines in view from Minidoka NHS. The BLM will review all components of the project and make a decision on the project as detailed in EIS Section 1.3 (Decision to be Made).
9080-48	The Coalition to Protect America's National Parks	H. Subsection 3.16.1.2.2 Alternative B Visual Impacts, Key Observation Points (p. 3-413 to 3-418) – This section of the DEIS describes the "degree of visual change" from the perspective of the following viewer groups: Travelers; Tourists and Recreationists; and Residents. Notably absent from the analysis are two viewer groups with strong cultural connections to the site(s), which are the Japanese American Community which has a close connection to Minidoka NHS (KOP 1); and Native American Tribes which have a close connection to Wilson Butte Cave (KOP 10). The discussion in the "Tourists and Recreationists" section acknowledges such groups, without actually naming them, by stating: "Select sensitive viewer groups visiting Minidoka NHS may have impacts beyond the casual viewer in that they could experience the setting from a visual-cultural perspective disproportionally higher than the typical visitor." However, despite this statement, the DEIS goes on to characterize the visual impacts only from the perspective of the typical Tourist and Recreationist, and not from the perspective of the "select sensitive viewer groups." As a result, this section of the DEIS comes across to the reader as if BLM has mischaracterized Minidoka survivors and descendants and/or Native Americans as being the same as "Tourists and Recreationists," which would be inappropriate. To address this concern, we recommend that BLM describe visual impacts for an additional viewer group in the applicable sections of the analysis. The additional viewer group could be called something like "Viewers with Cultural Connections to the Site" and should include Minidoka survivors and descendants and/or Native Americans, depending on which KOP is being discussed. The added analysis should include not only a narrative description of the degree of visual impacts from the viewer groups' perspective, but also an additional Table 3.16-x titled "Degrees of Visual Change for Viewers with Cultural Connections to the Site."	The EIS has been revised to address sensitive viewers to Minidoka NHS as site visitors and recreationalists to meet the concerns of the Japanese American community and the sensitivity related to Minidoka NHS. The BLM feels the categorization of visitors addresses those concerns. Further information on impacts related to locations of cultural significance are located in Section 3.5 (Cultural Resources) and Section 3.6.1 (Environmental Justice Communities).
9657-5	Saiyare Refaei	The DEIS also does not protect the viewshed from the Minidoka NHS. The report draft states a "moderate" degree of visual change that will not protect the integrity of the Minidoka NHS.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
F2-6		The recreational and visual values with be severely depleted with the approval of the wind farm. I do not believe the BLM can approve this project and uphold their responsibilities to manage visual resources on this public land.	See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project. See Chapter 1 (Introduction) for information on the project, its purpose and need and the decision to be made by the BLM.

Water and Wetland Resources

Comment ID	Commenter	Public Comment	Response to Comment
1042-14	WildLands Defense	The presence of considerable amounts of basalt bedrock will necessitate blasting for both construction of roads and the building of towers and infrastructure. An estimated two blasts per day for 525 days is anticipated during construction. The blasting will contribute to overall noise, and many residents have expressed concern that the blasting may have an effect on the aquifer. [This is a major concern, as excavating soils and exposing and/or blasting impacts to cracks and fissures in lava can be highly unpredictable and cause serious water loss, and there is not adequate analysis of this significant impact. How will this impact canals in the area?].... [This ignores the loss of water through all the bulldozed off soil layers and as a result of cracks and fissures in the lava from blasting that may extend over a large area. Adequate geotechnical and geological studies have not been done].	Additional text was added to EIS Section 3.17.1 (Groundwater Quantity) to clarify that blasting is not anticipated to change groundwater quantity. New EIS Sections 3.17.2 (Existing Groundwater Wells and Canals) and 3.17.3 (Groundwater Quality) were added to analyze the effects of the project on existing wells and on groundwater quality. MVE has added applicant-committed measures 91 to 93, which include both pre- and post-blast inspection of wells within 300 feet of a blast (MVE 2023). If it is determined by the post-blast inspection that the blast caused damage to the structure, MVE would repair the damage. For Alternative B with Additional Measures and Alternatives C–E and the Preferred Alternative, the BLM has also added additional project-specific measures to further avoid and minimize potential effects from project blasting. As described in Sections 3.17.2 (Existing Groundwater Wells) and 3.17.3 (Groundwater Quality), with the additional measures in place, impacts to existing wells and groundwater quality would be largely avoided. See also AIB-34 for analysis of “How would the project affect prime and unique farmland or productive soils in the vicinity of the project and how many acres would be affected?”
10426-2	Casey Stevenson	These are my concerns which have not been addressed by the EIS which will impact thousands of people, and need to be reevaluated. Here are my concerns: Concerns on aquifer The installation of windmills in areas close to aquifers has raised concerns about the potential impact on the groundwater supply. Aquifers are underground reservoirs that hold water, which is crucial for human consumption, agriculture, and industrial use. The construction and operation of wind turbines can release contaminants into the soil and groundwater, such as lubricating oils. These contaminants can migrate to the groundwater and affect its quality. Furthermore, the operation of wind turbines can also lead to soil erosion as the spinning blades can create turbulence, which can lead to increased soil erosion and sedimentation. If the sedimentation enters the aquifer, it can reduce the aquifer's capacity to store water and, in some cases, contaminate it.	Additional text was added to EIS Section 3.17.1 (Groundwater Quantity) to clarify that blasting is not anticipated to change groundwater quantity. New EIS Section 3.17.3 (Groundwater Quality) was added to analyze the effects of the project on groundwater quality. For Alternative B with Additional Measures and Alternatives C–E and the Preferred Alternative, the BLM has also added an additional project-specific measures to further avoid and minimize potential effects from the project. With these additional measures in place, impacts to groundwater quality would be largely avoided.
10444-1	Myron Huettig	My brother has a ranch near the water recharge site on the Milner gooding canal. When recharge water flows out of the canal, forming a large lake, it only takes a week for this water to disappear when the water is turned off. Blasting in the area will damage this site at a great expense to magic valley farmers. [...] When low head hydro plants were put in the Milner Northside canal, the blasting needed to construct the reservoirs had a detrimental impact on local homeowners domestic wells as the water in the wells had become polluted from the canal water. The blasting needed for the windmills could have a similar effect on the snake river plain aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
10448-1	Daniel Michaels	I believe the EIS generated for this project is extremely flawed. The EIS does not address the impact to the underlying aquifer by blasting foundation holes into the volcanic rock.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
10477-3	Brenda Ford	Another thing that should be considered is when installing the windmills they will have to blast away the lava rock. We don't know where the Lost River runs, they could accidentally destroy it along with our aquifer if they aren't careful with how they blast.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
10509-1	Sue Page	There have been absolutely no factual tests to ensure the safety of the aquifer beneath the Lava strata. No consideration of Mitigation Costs to replace the irreplaceable the lost of water to our valleys.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
10512-3	S. (No Last Name Provided)	My own well went dry in 2016 and I had deepen it due to falling levels of the Snake River Aquifer. What downstream effects will it have on agricultural deep wells for irrigating? How many residents will have to invest thousands of dollars to deepen or redrill their wells to be able to reside at their location? If new deep well permits are not being handed out to farmers, why are any new permits being considered for the Lava Ridge project which has no local benefit since it is owned by out of state interests and the power will not even go to Idaho residents but to California and Nevada?	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources).
1054-3	Jeff Juker	What are the effects on the aquifer going to be?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
10543-1	Traci Wood	Drilling wells, the blasting and vibrations could potentially mess up our aquifer. [...] There hasn't been sufficient studies done to the satisfaction of the people of Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
10563-1	Roy Hubert	On February 15, 2023, Magic Valley Energy paid for an advertisement, about the water use needed for the Lava Ridge Wind Project. They stated: "The water required to support construction activities will not add to the cumulative use of water in the region, drawing instead from the rental of water from the Water Supply Bank." I have personally rented water through the Water Bank and know that is available at times and not available other times. I talked to the staff on the State Water Board, they told me that water in Lincoln, Jerome, and Minidoka counties is very scarce. When I told them that Magic Valley Energy plans to drill 6 new wells, I was told that they don't normally transfer water if a new well I drilled. This company will be drilling 6 new wells! (EIS Pg 511) Just a few years ago my home well went dry, as did others in this area, because the ground water had dropped and we all had to drill our wells deeper. That is when several farmers decided to help the aquifer recharge and use surface water from the Water Bank when it was available to irrigate their crops so the aquifer would recharge itself. Some day they will need all of this ground water again, and when they do, I want it to be used to grow crops for food, not to supply electricity to California. When we say that blasting could contaminate our ground	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		water, they use such vague terms as "I wouldn't expect it to impact the ground water" and "I assume the vibration would be dissipated." (Blasting V/I 3.2, pp 3-12) I drove to Joseph City, Arizona where the people were told that they didn't think that blasting for footings would impact the ground water. They were wrong. My brother, who lived in Joseph City and taught school there, told me that within a few short years the city had to pipe water from 20 miles away because their water was contaminated. The EIS states that it will take the equivalent of water that would be used to irrigate 75 acres of land. On one of the project tours, Mr. Weber, who is involved with sprinkling roads to control the dust, estimates it would be more like 900 + acres just to sprinkle the roads they plan to build.	
1082-1	Cameron Stauffer	Upon reviewing the EIS for the Lava Ridge Wind Project, there is insufficient information on the effect of water quality throughout the construction process, during operation, and recovery period. With a project this large, proposed in an area with an aquifer, this is extremely unsound planning. The traffic alone could impact the quality of the water in the aquifer. Construction, blasting, run off, temperature, etc... for example could bring change to the aquifer that needs to be considered. Additionally, the proposed 34 years operation could also have impacts on the quality of the water. While the EIS mentions "groundwater quantity" it fails to mention quality impacts on the water. "Implementation of MVE's applicant-committed measures to minimize ground vibrations or instability from blasting or excavating (measures 88, 91, and 123) (see EIS Appendix 4, Table App4-2) would reduce potential impacts to wells, springs, and aquifers during construction. In addition, measure AA required by BLM policy would require monitoring of groundwater use, which would inform water availability and potential adaptive management if needed." As stated, there will be impacts to wells, springs, and aquifers during construction. The risks taken here on effecting water sources are not adequately explained. Furthermore, the surrounding area is agricultural, and as such depends on the canals flowing near these projects. "Areas of groundwater discharge and recharge and their potential relationships with surface water bodies shall be identified prior to blasting and excavating. If construction activities near aquifer recharge areas cannot be avoided, they would be closely monitored to reduce the potential for contamination of said aquifer." The EIS has established there is potential for contamination but has not made a clear plan to address these issues or avoid them. Fuels, and other materials used for maintenance and construction these projects should also be looked at closer. Their impact on water in the area should be addressed more thoroughly.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11195-3	Sandra Callen	We have an aquifer that has provided water to this area for millions of years. This will damage and leave the area without the water needed to sustain our farm ground, fisheries, and recreation.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11212-2	Ruth Muir, Ira Muir, Sherri Roche	This project threatens our precious water resources. I can not understand why blasting into a fragile aquifer would even be considered. This aquifer is the lifeblood for Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11223-2	Kelly Human	The proposed area has a tremendous aquifer running underneath it.My father drilled and Irrigation well and developed farm ground in that area in the 70s. As I remember the water table had standing water at less than 200feet underground. That whole area has many lava flows, sinkholes and caves and caverns underground.These are all inter-related to the water flowing under that area. I do not have the well logs as we sold the farm and moved away but that area is still farmed.When we drilled the well and I believe it was a 20 inch hole the well driller showed us how to see the water flowing the ground through the use of A mirror and sunlight. I believe there has not been enough study to the effects on our giant aquifer that runs under that area. They propose blasting four hundred holes for bases for the windmills. I am curious how deep they will need to blast the bases to hold up a 750 foot tall windmill? I certainly believe there is a possibility for damage to the underground aquifer. Do they have good numbers on where the water table lies?Our aquifer runs from eastern Idaho and some of the water is discharged in springs along the Snake River.The aquifer is the life blood of the north side of the canyon. It's supplies drinking water to people from their private Wells and supplies a great deal of irrigation water. The springs also provide drinking water for the city of Twin Falls and supplies freshwater for all of the trout hatchery's north of Buhl, Idaho.Our area is unlike any areaThat they have placed wind turbines. We have wind turbines on the bell rapid project which were placed on private property. The water table in that area is extremely deep.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11223-3	Kelly Human	The amount of blasting required to build these roads in addition to the blasting for the construction has the possibility to forever altar our aquifer and underground water flow. I have another point with the Gooding Milner Canal. It flows all through that area that they are proposing and that water is the lifeblood for many farmers. As mentioned earlier The basalt caves as well as the general rock formations increase the probability of leaks in the canal and water quantity loss and water quality issues underground. As Brian Olmstead the former manager of the Twin Falls Canal company stated At one of our meetings. When they blasted the basalt south of Kimberly they cracked the basalt and contaminated all the Drinking water wells in that area.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11225-1	Jeannie Billington	I am greatly concerned with the proven effects windmills have on our wildlife, insects, endangered species, migratory deer, the aquifer, and our environment and ecosystems as a whole. This includes the negative effects of chemicals sprayed during construction and in the future. The astronomical use of water during construction may in fact harm our food production, not only locally but on a national scale. As a grandma, I want to ensure a future for my grandchildren and generations after that, if the aquifer is damaged that future will not exist in Idaho. The aquifer drains into the snake river at points such as Thousand Springs, and if the water flow is limited or stunted there will be no water to send downstream for farms in Oregon and Washington, effectively limiting food production on the entire west coast	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
11226-1	Clare Josaitis	The DEIS indicates that water for this enormous proposed project would be withdrawn from the Eastern Snake River Aquifer. It took the State of Idaho well over 20 years to adjudicate every single drop of water in the Snake River Basin for farmers and ranchers in the Magic Valley, as well as, private use by households/domestic use wells, located throughout the surrounding communities which are going to be affected by this proposed project. MVE is not entitled to and should not be using ANY water from the Snake River. How would MVE acquire the stratospherically enormous amount of water they would need for the proposed project (for any action alternative)? The DEIS mentions the use of six wells by MVE. Does MVE hold the water rights to these wells? It is not explicitly stated. If MVE does not, how is water going to be obtained for this proposed project? Some of the math in the DEIS is quite incorrect. Could you please show your math calculations in the document or in an appendix? This project would use substantially more water than the 400 acre-feet indicated.	In response to public comments, MVE revised water quantities estimated for the project. These details were updated in Chapter 2 and Section 3.17 of the EIS. As described in MVE (2023) Section 1.3.11, the water required to support construction activities would not add to the cumulative use of water in the region. The project's water for construction would come from previously permitted sources that are already allocated for use. MVE would lease water through the Water Supply Bank, acquiring existing water rights, or purchasing water from commercial sources. MVE may divert the leased or acquired water rights to the proposed new wells in the project area in an effort to minimize the need to truck water into the project area.
11227-1	Clare Josaitis	The DEIS states that "Transmissivity [of water in the aquifer] ... does have spatial variations based on geology and other factors. Transmissivity is an important factor in considering the effects of water withdrawal from an aquifer; ...." There is no analysis in the DEIS that I can find that discusses stability of the underground lava tubes/aquifer or their ability withstand the forces of blasting, nor their ability to support these multi-ton wind turbines. A GE 1.5 mega-watt model weighs over 160 tons (nacelle, tower, and blades). Have an independent geotechnical engineer, structural engineer, and geologist been involved in analyzing the underground lava tubes/aquifer as to whether they can withstand the pressures and stresses imposed by blasting, construction activities, placement of wind turbines, and subsequent vibrational forces? Can the lava tubes support the proposed wind turbines for the entire length of the project without any risk to the integrity of the Snake River Aquifer? Has there been any analysis as to the risk of collapse and the effects of potential collapse of lava tubes and the transmissivity of water in the Snake River Aquifer if spatial variations are compromised? The entirety of the Magic Valley, besides other downstream users, depends upon the Snake River Aquifer. ISU.edu states that groundwater flows most rapidly in the upper 9- to 150 meters of the basalts, "which is the most productive portion of the aquifer. Interconnected pore spaces in the rubble tops of lava flows transmit water very readily." To what extent is wind turbine construction, blasting, weight of the turbines, and subsequent vibrational forces going to affect "the interconnect pore spaces in the rubbly tops of lava flows" that readily transmit water through the aquifer? How much compression would occur to the "rubbly tops of the lava flow flows" from the pressure and forces of the wind turbines, thereby affecting the flow and transmissivity of water through the aquifer? If independent studies have not been done, how can an informed decision be made? It is critical to know the totality of effects these wind turbines will have the Snake River Aquifer. Any loss or degradation to the Snake River Aquifer would most definitely irretrievable and irreversible, and could never be compensated for or recovered.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11228-1	Gary Smith	My concerns are about the Snake River Aquifer Region that will be under this project. Major concerns are the stress from blasting and the added weight on the lava bedrock that forms the ceiling of the aquifer. I was told they will only blast and drill to 12 feet or enough to hold the 50' to 70' diameter concrete foundations that will hold the tower and turbine. After learning that it increased my concerns of all that added weight and stress to the lava bedrock that is part of the aquifer and the purification ecosystem that is the life blood of the Magic Valley, Treasure Valley, and most of Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11228-2	Gary Smith	Below are my new questions and concerns to BLM Management: Kasey, Thank you for getting back to me. I looked through the material and was not able to find any detailed information on the foundations that will be built to hold the wind turbines. Could you send me the link and page number. Foundation concerns: 1) Will the foundation be cemented to the lava bedrock as part of the foundation. 2) Can you provide any independent studies that have been done or examples of this being done before. Will the concrete foundation be poured or attached to a lava bed surface to support a max of a 740' wind turbine. 3) Is it correct that these will be the largest wind turbine in the US? 4) While the foundations will be about 200' in places above the ceiling of the aquifers have studies been done by independent firms/universities about that much weight and stress on the aquifer formation and structure now and over time? 5) My concern being the fragile structure of lava rock between the surface and the aquifer with the added weight and stress of the wind turbine, the tower, and the foundation. Any independent studies on these concerns would be helpful. While I live miles away from the site the aquifer is the life blood of both Magic Valley, Treasure Valley and Idaho and my concern is for the future of my family and the future of Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11229-1	Gary Smith	Below is a report from ISU. It clearly states that the Snake River Plain controls the economy of much of southern Idaho, north and west of Pocatello. with very little data available on the impact of adding this much stress and weight onto the lava bedrock above the Snake River Plain Aquifer why would BLM risk what could be irreversible damage when other locations that are ecofriendly and provide the same benefits. I ask that you not approve this project at this location to protect the Idaho bloodline natural resource. Snake River Plain aquifer The Snake River Plain aquifer underlies the Snake River Plain, which extends from near the western boundary of Yellowstone National Park in eastern Idaho to the Idaho-Oregon border where the Snake River enters Hells	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		Canyon. The Snake River Plain controls the economy of much of southern Idaho, north and west of Pocatello (Stearns and others, 1938). Three million acres of farmland on the Snake River Plain are irrigated, with approximately one third from wells and the remaining two thirds from canals. This extensive irrigation system is the primary reason that Idaho has the highest per capita water consumption in the U.S. PDF slideshows: Water and the Snake River Plain by Paul Link - https://www.isu.edu/digitalgeologyidaho/srp-aquifer/ Overview of the Snake River Plain aquifer	
11232-1	Juanita Young	The Snake River aquifer is vital to the economy of Idaho, without it farm lands would disappear. Unless you all are terribly behind the times..we want to support small, local farms, that produce real food...not mega farms that are producing food that is toxic to human beings. The toxic chemical cocktail in the dynamite (ammonia nitrate and diesel) will penetrate the porous lava rock. Our hydrologist said it will penetrate down to the aquifer. Thus making the water unusable by man or beast.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11233-1	Janet Nesbitt	I am very concerned about this entire project, but most of all the impact it will have on our aquifer. My concern is the fragile nature of the lava rock between the surface and the aquifer itself in view of the stress of the multitudes of foundations requiring continuous drilling and blasting to be put in. Not to mention the ongoing extra weight and stress of the wind turbines and the towers. The lava bedrock that is part of the aquifer has been referred to as being part of the purification ecosystem that is the lifeblood of both Magic Valley, Treasure Valley and Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources) and AIB-31 in EIS Appendix 3 (“Is the surface geology in the siting corridors suitable for the project infrastructure? Is collapse/subsidence a concern, and if not, why?”).
11234-1	Myron Huettig	We have an Erie Lake sized aquifer underneath this area that provides water for thousands of farm acres down stream. The blasting for 400 bases the windmills will require will devastate and forever change the depth and flow of this water that makes its way to the thousand Springs area and other springs flowing into the Snake River. We cannot disturb the natural flow we currently have for a " green project " that is not green at all. Please see the importance of protecting this water source for all the people who depend upon it.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11238-2	Angela Mooney	Several large corporations produce food in the Magic Valley that is shipped worldwide, The depend on the water of the aquifer. That aquifer is sacred and is more important than any other commodity in the nation...that aquifer right there. Lamb Weston, Chobani, Standlee Hay, Falls Brand, Cliff Bar, Glanbia Chese and Agropur Cheese factories. They rely on the crops that feed the cattle that make the milk, or the fields that grow the potatoes and other crops. Your are looking at a global dynamic here. Interrupt the water, you interrupt food production and it's impact is millions, not just a few thousand residents of the Magic Valley. The blasts to lay foundations these monstrous, never-before-built towers, twice as tall as any wind mills every built, will definitely have an impact that is irreversible, ever, on that ancient water source.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11240-1	Name Not Provided	The aquifer is ancient, sacred ground that feeds the farms, ranches, dairies, and factories that produce food for millions. The vibrations from blasting, and from the windmills over the next few decades, will deconstruct what is left in the aquifer ceiling. It will also affect our health. This has been proven and litigated. The historical sights should be preserved and respected. The wildlife that will be effected will devastate the cycle structure and ecosystem that exists in our beautiful state. This can cause devastating effects on the surrounding states ecosystems as well. Damaging the aquifer will have devastating consequences on, not only southern Idaho, but Western and Eastern Idaho as well. The impact on the water supply will be irreversible. The unique natural design of the aquifer is delicate and should be preserved at all costs.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11262-1	Clare Josaitis	The comment corrects & replaces my original comment submitted on 4/15/2023. Thank you. The DEIS states that "Transmissivity [of water in the aquifer] ... does have spatial variations based on geology and other factors. Transmissivity is an important factor in considering the effects of water withdrawal from an aquifer ....". There is no analysis in the DEIS that I can find that discusses stability of the underground lava tubes/aquifer or their ability to withstand the forces of blasting, nor their ability to support these multi-ton wind turbines. A GE 1.5 mega-watt model weighs over 160 tons (nacelle, tower, and blades). Has an independent geotechnical engineer, structural engineer, and geologist been involved in analyzing the underground lava tubes/aquifer as to whether they can withstand the pressures and stresses imposed by blasting, construction activities, placement of wind turbines, and subsequent vibrational forces? Can the lava tubes support the proposed wind turbines for the entire length of the project without any risk to the integrity of the Snake River Aquifer? Has there been any analysis as to the risk of collapse and the effects of potential collapse of lava tubes and the transmissivity of water in the Snake River Aquifer if spatial variations are compromised? The entirety of the Magic Valley, besides other downstream users, depends upon the Snake River Aquifer. ISU.edu states that groundwater flows most rapidly in the upper 90 to 150 meters of the basalts, "which is the most productive portion of the aquifer. Interconnected pore spaces in the rubble tops of lava flows transmit water very readily." To what extent is wind turbine construction, blasting, weight of the turbines, and subsequent vibrational forces going to affect "the interconnect pore spaces in the rubbly tops of lava flows" that readily transmit water through the aquifer? How much compression would occur to the "rubbly tops of the lava flow flows" from the pressure and forces of the wind turbines, thereby affecting the flow and transmissivity of water through the aquifer? If independent studies have not been done, how can an informed decision be made? It is critical to know the totality of the effects these wind turbines will have the Snake River Aquifer. Any loss or degradation to the Snake River Aquifer would most definitely be irretrievable and irreversible, and could never be compensated for or recovered.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11297-2	Steven Upton, Linda Upton	The blasting will not only destroy artifacts, drive off the wildlife, but what about our ground water and aquifer? The Lava Ridge project sits right on top of the Snake River Plains aquifer. This supplies water to hundreds of thousands of people. Concrete foundations 75 feet diameter, 12 feet deep will require blasting for 525 days,	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		twice per day, blasting all over the top of aquifer, using high explosives and will amount to 126.000 lbs of explosives used. Blast waves are comparable to an earthquake. How will this affect our aquifer? If our aquifer is damaged, how will LS Power aka Magic Valley Energy take care of this issue?	
11309-1	Gena Anderson	I have many concerns about the Lava Ridge wind project, but in this letter I will focus on the aquifer. My concern is the damage that could happen to the aquifer and to our water supply that is crucial to the lives of so many people, businesses, and livestock. How can the residents of the Magic Valley be assured that the blasting needed for the concrete bases will not affect the aquifer? How can we be assured that the weight of the massive concrete bases in addition to the weight of the wind turbines will not damage the lava rock? How can we be assured that disturbing the aquifer will not contaminate the water supply? Where will LS Power be when the aquifer is damaged and the Magic Valley water supply is no longer available? Will LS Power be held responsible and if they are how will the situation be rectified?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11326-2	Filip Camacho, Tasha Sorensen	Alarmingly, an estimated 130,390,000 gallons of water would be required to conduct project operations just for Lava Ridge. The DEIS fails to address impacts to water resources and surrounding communities. As homeowners, with a private well, we are very concerned about de-watering of wells and direct and indirect impacts to water quality and quantity. If the BLM chooses an action alternative, we request homeowners and surrounding communities receive a thorough water analysis of existing wells and community water sources, monitoring of these wells and a guarantee that any direct or indirect impacts from installing and maintaining (way too tall) wind towers will not affect the quantity and quality of groundwater. In addition, the BLM should require a water budget analysis adjacent to all affected communities, ranches, farms, homesteads and others. The use of large quantities of water pumped from groundwater resources creates potential long-term effects on the stability and longevity of aquifers, seeps, springs, wetlands, etc. Groundwater is the largest source of freshwater for all life. Questions about the source, quantity, quality and recyclability of water are one of the most important considerations in the potential siting and development of this project. The DEIS states that water will come from existing irrigation districts or private landowners. We recommend a thorough water-right analysis identifying capacity of allocatable groundwater as well as an analysis of the impacts of blasting through and fracturing lava rock above the Snake River aquifer. Lave rock is easily fractured and the DEIS fails to account for any impacts to subsurface water resources. Water rights and water allocation issues have increasingly become more and more controversial. The provision of large quantities of water and its effects on water rights of surrounding communities and other large--scale users of water is causing significant concern among communities with local and state governments opposing projects. In fact, in south- central Idaho where many large-scale utility renewable energy projects are slated for permitting and development there is a moratorium on all new water allocations including any allocation from the Water Supply Bank.6 When we contacted the Idaho Division of Water Resources, they had never been consulted about Lava Ridge or any of the other proposed projects in the area.7	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11327-18	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	VII. Water Water rights and water allocation issues have become increasingly controversial across the West. The use of large quantities of water and its effects on water rights of surrounding communities and other large-scale users of water is causing local and state governments to show concern or oppose projects. Idaho is no exception- Idaho Department of Water Resources has placed a moratorium on all new water allocations in southern Idaho.55 While the DEIS states that the project proponent would acquire water for operations through negotiations and purchases with other private landowners or irrigation companies, we ask that the BLM seek greater coordination with Idaho Department of Water Resources to outline the scarcity of water availability in the area.	The State of Idaho is a cooperating agency on the EIS and is aware of the project and its proposed water use needs. Text was added to EIS Section 3.17.1.2.2 (Groundwater Quantity, Impacts) to address the role of the moratorium on project water use. Also see response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11333-1	Creighton Knight	I am writing in response to the EIS for the Lava Ridge Wind Turbine project. My concerns are that on page 511 of the EIS, the author determined that impact on the aquifer would be negligible. I believe this is not accurate and the concerns should be fully vetted before approving this project. Concerns and Questions Unanswered or Not Fully Vetted in the EIS: Blasting 2x per day for over 500 days. The EIS report on pg 511 reads that impacts will be negligible on the aquifer. This simply isn't true by common sense, reason, and by historical precedent in this area of aquifer and domestic well contamination caused by even small scale blasting of the lava rock. Blasting lava rock causes problems with nearby wells. According to Brian Olmstead, a 21 year veteran and former General Mgr of the Twin Falls Canal Co.,in 2006-07 while deepening the existing canal channel during construction of the Midway Power Plant, surrounding wells were contaminated with bacteria and other pollutants. The blasting of the canal channel opened cracks and fissures within the lava beds and contaminated underground water supplies. Citizens became ill from the contaminated wells. The Canal Company had to complete extensive remediation for the impacted citizens. Another event was the North Gooding Power Plant built in the lava rock north of Gooding. Lots of blasting was done in 2016 to improve plant capacity. When snowmelt and rainwater entered in the spring of 2017, the water fell through the new cracks and fissures caused from the blasting and it contaminated the aquifer. Due to disruption of the lava rock structure from the blasting, the natural filtering effects of the lava rock were damaged and allowed unfiltered water into the aquifer. Domestic wells were likewise contaminated and the Gooding Health department had to get involved to protect people's health. The main point is that blasting the lava rock opens up new cracks and creates fissures which allow run off water a more direct access to the aquifer and thus contaminates it. The examples cited here are part of the public record. The EIS does not acknowledge these occurrences nor the risks that 500+ days of blasting will have on the lava beds which filter our aquifer. If the examples above negatively impacted the aquifer and groundwater safety, how much more will a very large scale project with over 500 days of blasting impact	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		groundwater? How can an EIS skip over the most important resource in Idaho, which is our groundwater? This omission calls into question the seriousness and accuracy of the EIS in determining the true impacts the windmill project will have on the ecology. It also represents a lack of understanding by LS Power and the EIS authors of how vitally important the aquifer is to the entire economy and livelihood of Southern Idaho, and how blasting away at its structure will negatively impact it. If approved, the blasting from the construction of the tower bases will likely damage the lava bed and open the aquifer to contamination. What will LS Power do then? What can be done then? Nothing can be done; the damage will be permanent. As you weigh out the EIS and the comments supporting or questioning it's efficacy, I ask that you consider the precedents of how limited blasting contaminated groundwater. I also ask that you logically deduce how 500+ days of major blasting will not do even more damage to the aquifer.	
11346-1	George Parker, John Arkoosh	The Snake River Plain Aquifer and the canal systems are the life blood of our valley and our state. The DEIS does not adequately evaluate and address the possible negative impacts to these resources. Turbines shedding PFAS, as well as oils and other fluids are a contamination concern. Seismic activity due to blasting and turbine vibrations may change or divert water flows, or possibly open fissures allowing contamination or draining canals. An in depth study of possible effects is a imperative and a bond must be posted by the applicant to assure any damages will be wholly compensated. Such bond would likely need to be capable to cover damages in the hundreds of millions, possibly several billion dollars.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). In addition, MVE would be required to have a reclamation bond. This was clarified in EIS Appendix 4 (Mitigation), as applicant-committed measure 164.
11359-2	Alisa Bowman	Concern: The Snake River Plain Aquifer The Snake River Aquifer is central to Southern Idaho's prosperity. If this water becomes contaminated or dries up due to the projected wind farm, it will be detrimental to the livelihood of the area's residents and have a domino effect on the entire state. The Magic Valley is a huge agricultural contributor to the state/nation/world. Agriculture needs water. Who knows what the effect of all of the blasting on the fractured basalt for the DEEP foundations and construction of the towers will have on the water. Towers of this size have never been built before. We will not be a guinea pig for the rest of the world. It is inevitable that the water table would be compromised. How much? We may not know until it is too late! We NEED to PROTECT OUR WATER!	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11360-1	Sergio Arroyo Jr.	As a blaster, I have worked in many countries with many types of different soils, rocks, and blasting materials. There is absolutely no way that anyone can guarantee that the Snake River Aquifer would not be breached and contaminated by the over 500 days of blasting (at the proposed depth) over lava rock, with lava tubes running through it, and ash layers throughout. In an area where wells are collapsed and affected by distant seismic activity, we already know earth movements alter our water quality, and we know the ash layers often are unstable enough to require wells be cased. "Blasting emissions were estimated assuming two blasts per day for 525 days assuming 120 pounds of ammonium nitrate-fuel oil per blast using AP-42 Explosive Detonation factors. DEIS V 1, 3-12." Blasting at this rate does not allow time to x-ray each blast to make sure they have not fractured or breached the aquifer, so that they could begin emergency repairs to mitigate damage caused by the blast. Do they even have a crew of experts on site daily throughout the blasting period to implement emergency repair?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). MVE also added details to MVE (2023) regarding blasting and the Blasting Plan Methodology (Appendix I in MVE [2023]).
11360-5	Sergio Arroyo Jr.	"Measure bbb: MVE would gain a clear understanding of the local hydrogeology as determined by Idaho Department of Water Resources and the BLM. Areas of groundwater discharge and recharge and their potential relationships with surface water bodies shall be identified prior to blasting and excavating" DEIS v 1, 3-440 "MVE would GAIN A CLEAR UNDERSTANDING". This project is not an educational project for MVE or its inexperienced employees. BLM workers have no experience and are not qualified to determine anything related to blasting over an aquifer. Only experienced blasters and experienced water experts have been field tested for "clear understanding". The EPA has established guidelines for single source aquifers, which this aquifer is. "Title:EPA Sole Source Aquifers ...The SSA protection program is authorized by section 1424(e) of the Safe Drinking Water Act of 1974 (Public Law 93-523, 42 U.S.C. 300 et seq.). This program is designed to protect drinking water supplies in areas with few or no alternative sources to the ground water resource, and where, ifto the ground water resource, and where, if contamination occurred, using an alternative source would be extremely expensive. EPA defines a sole or principal source aquifer as an aquifer that supplies at least 50 percent of the drinking water consumed in the area overlying the aquifer. These areas may have no alternative drinking water source(s) that could physically, legally and economically supply all those who depend on the aquifer for drinking water...All proposed projects receiving federal funds are subject to review to ensure that they do not endanger the water source" epa.gov	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11396-1	Gina Jerke	the Snake River Aquifer. How will all the blasting/drilling affect our aquifer? What is the real risk of contamination to our water? Will their wells deplete the aquifer and hinder farming?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11400-1	Deborah Hillier	The obvious detriment to our water supply is crucial, and every one understands two years will never be enough, and it will go on and on sucking us dry, and having devastating effects on farm production,	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources).
11414-1	Sue Page	In review of the EIS I don't believe the issue of water use and the amount of water requirements for the cement for foundations, for dust control on dirt roads vs. the amount of water for irrigation, dairy farms, industrial companies such as Chobani, Lamb Weston and the sugar beet factory.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
11414-2	Sue Page	There hasn't been any study or discussion of Mitigation should the blasting and vibrations rupture the aquifer system. Who will pay and how will the system be repaired? Who will pay to fix neighboring water wells if they are contaminated? Where is the time line for repairs? What is the plan to get water to all of Southern Idaho if the aquifer is crushed? Who will be responsible for the cost and repair? What time line will be in place?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11418-1	John Etcheto	I own property that is 4 miles due west from Eden Idaho. It is a small family ranch that has been in my family for 4 generations. Our drinking water on the property comes from a well and we have ground watering rights for livestock. I have numerous concerns about the windmills, but near the top of that list is the effect that blasting will have on the aquafer. I've heard that the blasting that will be required for the construction of the windmills will go on for 525 days. All of that blasting could lead to contamination of the aquifer, which could have a devastating impact on life in our area.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11420-1	Joyce Flick	Aquifers could be effected with the blasting to build the base for the turbines.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11429-2	Felicia Poteet	he safety considerations of wind turbines of such drastic size are also a concern. Additionally, how deep the concrete footings must be placed for such a huge turbine. I'm concerned this could affect our aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11433-2	Tom Zuiderveld	has the very real possibility of doing irreversible damage to our aquifer that is the life blood of the Magic Valley.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11443-1	Kelly Human	The Gooding Milner Canal runs from April to November and longer in times of aquifer recharge. The canal supplies irrigation water to area farmers as well as drinking water to livestock and all of the above mentioned wildlife.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11458-4	Kathy McKenzie, Bret McKenzie	Water Use--There has been extensive mitigations over the last 8 years or more with IGWA, water use and the level of Idaho's aquifer. The mitigations have included many and in some places extreme curtailment of water use designed to raise the level of Idaho's depleted aquifer. These mitigations have resulted in slower than projected replenishment of Idaho's aquifer. Can the BLM justify the drilling of new wells by an out of State entity for the use of Idaho's water when Idaho has curtailed that use from its own citizens and businesses due to the depletion of our aquifer??	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources).
11461-1	Shirl Bennett	My primary concern is for the Snake River aquifer. I could not find any studies in the EIS which showed how blasting in the lava rock would effect that aquifer. My fear is that irreparable damage could be done.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11478-1	Sandra Thompson	As residents of Jerome County who live less than 3 miles of this site we are concerned about the permanent destruction this project will cause to our desert environment and our aquifer. We believe the lava fields under this site can not withstand the initial blasting and subsequent weight of these windmills. That aquifer is the lifeblood of southern Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11490-2	Liz Niccum	There already exists many wind turbines in Southern Idaho. None have been built on top of the Snake River Plain Aquifer. This aquifer is essential to the Magic Valley. Where in the world does such a place exist like the Magic Valley? This is a unique location with a fragile water system. Blasting daily for two years to remove tons of basalt to make room for cement foundations will jeopardize the aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11491-16	Dean Dimond, Jennie Bateman	- In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: […] 11.Information missing for effects on perennial and year-round “live” streams, [...]	Perennial streams are described and quantified in Section 3.17.4 (Wetlands and Surface Waters). Additional text was added to clarify impacts to waters.
11508-1	Justin Gott, Daniel Gott, Josie Gott	1. The project will be built over one of the largest aquifers in the United States. I understand there will be over 500 days of rock blasting and that could affect if not change the aquifer and that is something we can never get back	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11508-6	Justin Gott, Daniel Gott, Josie Gott	The roads and base of the wind turbines will need weed control and if Roundup, 2,4D, Milestone is applied then it would leak into the aquifer.	See AIB-47 in EIS Appendix 3: How would inadvertent spills or leaks from the storage or application of herbicides or the use or production of hazardous materials and wastes during construction and operation affect surface water or groundwater quality? See AIB-58 in EIS Appendix 3: How would herbicide use impact soils, vegetation, and wildlife?
11516-2	Liz Niccum	many other issues like the threat to the Snake River Plain Aquifer from excessive underground stress from repeated blasting during construction not investigated in the Lava Ridge Environmental Impact Statement.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11521-1	Angela Mooney	Aquifer: As we read over the DEIS, the aquifer is mentioned only in relationship to a plan to use that water. That alone is alarming, as it is the lifeline of an economy that literally helps feed the nation. Even the proposed 3 percent per year would significantly impact such food production that feeds our factories: Falls Brand, Lamb Weston, Glanbia Cheese, Chobani, Amalgamated Sugar, Cliff Bar, the dairies that feed into these food production giants, the livestock that does the same, and so many other channels of production that are found in most grocery stores throughout the nation and the world. Not to mention the best potatoes in the world.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
11534-19	Matt Arnold, William Eubanks	The DEIS's Discussion of Potential Impacts to the Eastern Snake River Plain Aquifer is Woefully Inadequate As planned, the Project will be constructed directly above the Eastern Snake River Plain Aquifer ("Aquifer"), which spans at least 10,800 square-miles between Twin Falls and Fremont, Idaho. DEIS at 3-435, 3-437. While the Aquifer contains "as much as 1 billion acre-feet of water," only "100 to 200 million acre-feet," stored in the "top few hundred feet," are accessible to ground-water wells. Id. at 3-437. The vast majority of the Aquifer (90%) is composed of highly fractured basalt, measuring "just a few feet to tens of feet thick." Idaho Nat'l Lab., Idaho's Treasure; the Eastern Snake River Plain Aquifer at 3 (May 2005), https://bit.ly/3omBqyh.15 The fractures between these basalt formations are where the Aquifer's water is held and transported. Id. at 4. According to the Idaho Department of Water Resources, the Aquifer "is a key element of southern Idaho's economy," as the farmers and business-owners who rely on it "produce[] approximately 21% of all goods and services within the State of Idaho—resulting in an estimated annual value of $10 billion." Eastern Snake River Plain Aquifer CAMP, IDAHO DEP'T WATER RES. (last updated Feb. 22, 2022, 2:46 PM MT), https://bit.ly/3A6Dhdh. In fact, the Aquifer accounts for "roughly 2.1 million irrigated acres . . . , which is approximately 60% of Idaho's total." DEIS at 3-437. Moreover, the Aquifer is classified by the U.S. Environmental Protection Agency as a "sole source aquifer," meaning that "it supplies at least 50% of the drinking water for people living above the aquifer and [] there is no alternative source of drinking water that could physically, legally and economically supply all those that depend on [it]." Idaho Nat'l Lab., supra at 1. Given that a significant portion of Idaho's economy relies on the Aquifer, local stakeholders—including SLR, its members, and supporters—understandably harbor serious concerns about the effects that the Project's construction, operation, and decommissioning may have on this critical water source. Chief amongst these concerns is the possibility that blasting and excavations associated with building Project infrastructure may irreparably contaminate the Aquifer and/or collapse the basalt voids (or "lava tubes"), thereby making groundwater inaccessible or more expensive to obtain. The DEIS, however, fails to include any meaningful discussion of these potential impacts. Instead, it summarily concludes that some unidentified "[m]itigation would reduce impacts below significance." DEIS at App'x 3-18. To the extent the DEIS actually discloses that mitigation it merely consists of the Project proponent "gain[ing] a clear understanding of the local hydrogeology" and "closely monitor[ing]" blasting/excavation "to reduce the potential for contamination of said aquifer." Id. But not only does the DEIS fail to specify what might actually be done "to reduce the potential" contamination, id., it also fails to explain why this will sufficiently mitigate potential environmental harms. In fact, by acknowledging that neither MVE nor BLM has "a clear understanding of the local hydrogeology," the DEIS practically admits that it does not know if adequate mitigation is even possible. See id. In circumstances like these, reviewing courts have routinely rejected an agency's reliance on undefined or amorphous mitigation measures to sidestep consideration of important environmental impacts. See Am. Rivers v. Fed. Energy Reg. Comm'n, 895 F.3d 32, 54 (D.C. Cir. 2018) ("Given the exceptional importance of maintaining minimum dissolved oxygen levels to the aquatic ecosystem, it was irrational for the Commission to cast those significant environmental impacts aside in reliance on some sort of mitigation measures, which the Commission was content to leave as 'TBD.'"); see also Neighbors of Cuddy Mtn. v. U.S. Forest Serv., 137 F.3d 1372, 1380 (9th Cir. 1998) (Because "'[m]itigation must be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated,' '[a] mere listing of mitigation measures is insufficient to qualify as the reasoned discussion required by NEPA.'" (quoting Carmel–By–The–Sea v. U.S. Dep't of Transp., 123 F.3d 1142, 1154 (9th Cir. 1997) and Nw. Indian Cemetery Protective Ass'n v. Peterson, 795 F.2d 688, 697 (9th Cir. 1986))); S. Fork Band Council of W. Shoshone v. U.S. Dep't of Interior, 588 F.3d 718, 727 (9th Cir. 2009) ("The Supreme Court has required a mitigation discussion precisely for the purpose of evaluating whether anticipated environmental impacts can be avoided. A mitigation discussion without at least some evaluation of effectiveness is useless in making that determination." (citing Robertson, 490 U.S. at 351-52)).	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11534-20	Matt Arnold, William Eubanks	The DEIS Fails to Engage in Any Qualitative Examination of the Project's Likely Impacts on Wetlands According to the DEIS, "[t]here are approximately 8,816 acres of wetlands and 1,709 miles of watercourses in the analysis area," including "551 acres of wetlands and 90 miles of watercourses" within the siting corridors themselves. DEIS 3-443. Nowhere in the DEIS, however, does BLM provide any qualitative evaluation of these thousands of acres of wetlands and miles of watercourses. Instead, BLM simply tallies up the acreage/mileage and concludes that due to aspirational "implementation of water-related applicant-committed measures and other mitigation . . . impacts to wetlands and surface waters would be largely avoided." Id. at 3- 447.16 Under NEPA, this is not enough. The Act obligates BLM to take a "hard look" at impacts on wetlands, including an assessment of what role these wetlands and watercourses play in local ecosystems—i.e., the "actual environmental effects." Klamath–Siskiyou Wildlands Ctr. v. Bureau of Land Mgmt., 387 F.3d 989, 995 (9th Cir. 2004) (emphasis in original). BLM might, for example, endeavor to understand whether these wetlands are important for recharging the local aquifer, or whether the watercourses are an important source of water for migrating species in an otherwise arid locale. Without this information, the public is merely left to guess at what impact the loss of these wetlands might have on the local environment. This is precisely why the Ninth Circuit has consistently rejected the kind of purely quantitative approach employed by BLM here. Id. ("[W]hile a tally of the total road construction anticipated in the [] watershed is definitely a good start to an adequate analysis, stating the total miles of roads to be constructed is similar to merely stating the sum of the acres to be harvested—it is not a description of actual environmental effects."); see also Or. Nat. Res. Council Fund v. Brong, 492 F.3d 1120, 1133-34 (9th Cir. 2007) (same); Lands Council v. Powell, 395 F.3d 1019, 1027 (9th Cir. 2005) (same).	Additional text was added to EIS Section 3.17.4 (Wetlands and Surface Waters) to provide context for the role that wetlands play in the ecosystem. Text already stated what the functional effects to wetlands would be as a result of project ground disturbance.
11535-66	Steven Andersen	As an initial matter, the exact location of the turbines and roads is not defined in the DEIS, making analysis of the vast land and aquifer impacts difficult, if not impossible, to meaningfully analyze. What analysis is provided in the DEIS is vague and arbitrary. For example, the DEIS states that the analysis is located in the Snake River	The EIS does not say the project area is in the floodplain. Section 3.16.1.1 (Landscape Character and Scenic Quality, Affected Environment) states that the Visual Resources "analysis area is located within the Snake River Plain section of the Columbia Plateau physiographic region, which is characterized by a volcanic plateau with

Comment ID	Commenter	Public Comment	Response to Comment
		floodplain but also asserts that “[t]here are no mapped floodplains in the siting corridors (Federal Emergency Management Agency 2020).”212 Moreover, it asserts that both access roads and riparian areas would be avoided “if practical” or “to the extent practicable.”213 If impractical, “appropriate design features would be used to reduce erosion and sedimentation.”214 This vague and ambiguous language does not provide sufficient direction or guidance.215 As rain-on-snow events continue to increase in the Northwest, many rivers are experiencing a high frequency of extreme winter flood events. These events often result in channel scouring and degraded habitats since rivers have been disconnected from their floodplain and have no release valve for these high flows. Construction of roads and other infrastructure should not impede the movement of water from the stream channel to the floodplain during flood events. Culverts must be sized to accommodate flood flows so that they do not constrict high flows and contribute to further degradation of the stream channel during a flood event. These procedures must be followed strictly and cannot be avoided due to mere practicality.	sediment deposits as a result of the Snake River floodplain (Fenneman 1931).” The visual resources analysis area is the area within 30 miles of the siting corridors.
11535-127	Steven Andersen	The construction, operation, and decommissioning of a wind farm has the potential to impact groundwater quality, quantity, and the established groundwater flow regime.377 Changes to the local water environment can affect receptors such as wells, springs, wetlands and waterways, and can also have implications for groundwater dependent ecology and land stability. 378 Already, the DEIS vastly underestimates the amount of water needed during the construction phase of the project. Even more, the construction phase itself has been grossly underestimated, as was pointed out in numerous comments. Indeed, the engineering for the project has not occurred and site specifics have not even been determined. The topography of the Idaho desert will require an excess amount of water to prevent dust pollution from the project’s many new access roads, and moreover, a project of this magnitude proposed can lead to pollution from spills or leaks of fuel or oil which can contaminate the groundwater. None of this was thoughtfully analyzed.	See responses to comments 1042-14 and 10426-2 (see both in Table A-3z, Water and Wetland Resources).
11535-128	Steven Andersen	There is no consideration in the DEIS for the effect that blasting for the turbine foundations will have on both surface water and ground water. Although the impact of blasting has been widely studied, the consequences of blasting in the Eastern Snake River Plain Aquifer have never been studied and the effects of this amount of blasting is not accounted for. Moreover, the percolation rates differ depending on the type of sedimentary rock. The DEIS does not account for the changes in porosity, which affects runoff collection and potential aquifer collection. Because the DEIS does not even state with certainty the exact location of the wind turbine foundations, no location-specific soil analysis of percolation can be done.379 Therefore, further analysis regarding the long-term impact of a project of this scale should be conducted before this project can be approved.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11535-129	Steven Andersen	The DEIS fails to take into account that the ESPA is a critical and sensitive water resource for Idaho – and one that is already over-appropriated. Significant work has been invested to fund aquifer recharge projects in the area, and the DEIS fails to consider impacts both practically and on the water rights of ground water pumpers, farmers and ranchers, water right holders in the Snake and Columbia River systems, fisheries, and tribes, and also impacts to recreation. Specifically, the DEIS grossly understates the issue of over-appropriation (which already exists) by stating, “[t]otal water consumption by the project would be less than 0.001% of the overall amount of water within the ESPA.”	See responses to comments 1042-14 and 10426-2 (see both in Table A-3z, Water and Wetland Resources).
11535-130	Steven Andersen	The DEIS fails to adequately account for the type and number of domestic wells in the area and the range of potential impacts to wells and water supply caused by blasting. Further, the geology of the area where blasting is to occur has not been adequately studied. The DEIS fails to account for the propensity of blasting to cause uncontrolled leaks from the canal due to cracks and fissures in lava tubes and vents. There is also a risk that blasting can introduce contamination into domestic wells, particularly given the porous nature of the rock and lava bed, which occurred when blasting occurred near Kimberly, Idaho in 2007.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11535-131	Steven Andersen	Finally, the DEIS grossly misrepresents the state of water storage when it boldly claims, “volume of water stored in the aquifer is so large that the effects would not be substantial.”381 All of the water that flows out of the aquifer and into the Snake River already has valid water rights against it, i.e., resulting in over-appropriation. The agency fails to consider these competing rights, which would necessarily require mining the aquifer with very deep wells, deeper than the outflow elevations of the discharge springs of the ESPA. In short, the DEIS fails substantially to account for and mitigate the impacts to the aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11535-132	Steven Andersen	The DEIS fails to adequately address and provide mitigation for adverse impacts to water resources. Indeed, there has been no thorough or thoughtful consideration at all. The DEIS states, “MVE would complete site-specific wetland surveys once an alternative is selected and the final design is complete. Based on the U.S. Army Corps of Engineers’ (USACE’s) jurisdictional determination at that time, final acres of wetland impacts may be less than those described in this EIS because final project siting would avoid wetlands to the extent practicable.” 382 This raises two glaring concerns: (1) there has been no meaningful survey conducted; and (2) the location of the turbines has not yet been determined. Notwithstanding the foregoing admissions, the DEIS boldly claims, “effects are not expected to be substantial.”383 Given the perplexing inadequacies, it is apparent the DEIS failed to take a hard look at wetlands and surface waters. Even the proposed design features do not adequately protect water resources because they are not presented in a way that demonstrates how specific water quality targets would be met. Specifically, the features fail to discuss performance goals, including water quality standards, physical site constraints, and fail to evaluate effectiveness of proposed best management practices relative to target pollutants.384 In short, the DEIS fails substantially in its obligation to thoroughly review impacts to wetlands and surface waters.	As stated in Section 3.1.2.2 (Tiering to the 2005 Programmatic Wind Environmental Impact Statement), the EIS tiers to (BLM (2005a), including the implementation of BMPs for wind energy development on BLM public lands. The effectiveness of these BMPs is analyzed in BLM (2005a), and the BMPs are included in Appendix A of the ROD – Implementation of BLM (2005b). To receive a Section 404 permit from the USACE, the project would have to meet national water resource standards. BMPs, including those for erosion controls related to water quality, would have to comply with county, state, and federal standards. See also AIB-48 in EIS Appendix 3: How would the project affect surface water quality through stormwater runoff or disruption of soils and sediments?

Comment ID	Commenter	Public Comment	Response to Comment
11535-159	Steven Andersen	The DEIS fails to identify which sections of the Clean Water Act may influence construction and maintenance of the project, including but not limited to, Sections 301, 303(d), 302, 303, 319, 402, 402 and 404. A Clean Water Act Section 404 permit is presumably required for this project, but the DEIS fails to clarify exactly what EPA authority and review responsibilities the EPA will have.	The project would comply with sections of the CWA deemed necessary by the USACE, EPA, and IDEQ. EIS Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies) lists the major relevant agency actions and authorities that must be obtained or considered for the project. The relevant actions and authorities provided in this appendix are not meant to be comprehensive.
11535-160	Steven Andersen	The DEIS fails to adequately explore the potential to exacerbate the exceedance of water quality standards through construction surface disturbance, and operation and maintenance activities.	Potential effects to groundwater quality are addressed in EIS Section 3.17.3 (Groundwater Quality). Potential effects to surface water quality are addressed in EIS Appendix 3, AIB-47, AIB-48, and AIB-49.
11535-161	Steven Andersen	The DEIS does not contain sufficient information to determine if any action alternative could be the Least Environmentally Damaging Practicable Alternative to be permitted under Section 404 of the Clean Water Act.	As described in EIS Section 3.17.4 (Wetlands and Surface Waters), the EIS analysis overestimates impacts to wetlands and waters. The overestimation applies to all action alternatives and thus the EIS provides an effective comparison of alternatives (see EIS Table 3.17-13 [Ground Disturbance in Wetland and Waters by Action Alternative]).
11535-162	Steven Andersen	The project would cause direct impacts on water resources by localized alteration of hydrology and indirect impacts on water quality. The engineering for the project has not even been completed, and the DEIS is relying on MVE's hydrogeologic analysis from 2021, relying completely on groundwater for the duration of the project. The quantity of groundwater needed is unknown. There is insufficient analysis of project-related erosion or a plan for how sedimentation into streams will be addressed. The DEIS also fails to adequately account for impacts due to blasting and hazardous materials contamination.	In response to public comments, MVE updated the anticipated water use for the project, as documented in EIS Section 2 (Proposed Action and Alternatives), EIS Section 3.17.1 (Groundwater Quantity), and MVE (2023). See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources) for information related to impacts related to blasting. EIS Section 3.17.4 (Wetlands and Surface Waters) describes impacts to surface water quality, as does EIS Appendix 3, AIB-47, AIB-48, and AIB-49.
11535-163	Steven Andersen	The DEIS also fails to analyze if construction activities and impacts on groundwater resources for public drinking water would comply with The Safe Drinking Water Act.	See response to comment 11535-159 (see in Table A-3z, Water and Wetland Resources).
11535-164	Steven Andersen	The DEIS presents a Wetlands and Waters Desktop Assessment based on public data sources, and the assessment itself repeatedly recommends that field data be collected and field verification occur for accurate results. The Aquatic Resources Inventory Report – performed by MVE's paid contractor, WEST, occurred in dry conditions and was not comprehensive. An objective, comprehensive field survey of all water wells and springs in potential blasting zones needs to be performed, after engineering occurs, identifying consequences of disturbance, and a comprehensive contamination plan presented for public evaluation.	As described in EIS Section 3.17.4 (Wetlands and Surface Waters), final wetland surveys and resulting micrositing would determine if a CWA Section 404 permit is required for the project. If an Individual Permit is needed, a public comment period would be required. See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources) for more information about existing wells near the project.
11547-1	Lowell Ihler, Carol Ihler	1. The aquifer was not adequately address in the DEIS. There have not been studies done to know how the blasting needed to erect up to 400 wind turbines 700 feet tall would affect the land and the aquifer substructure. This is a very porous area as demonstrated by the recharge ponds and loss of water from the canal system . Also, the weight of the massive concrete base and the turbines on this area is a concern. Once the aquifer is damaged, there would be no restoring it!This isn't something that LS Power could mitigate with money. Even the slightest damage could cause wells to go dry and or contaminate the water system for many communities and farms that depend on this water source.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11552-2	Summer Osmond	It is unstated what the amount of water that the company's construction will require, and where this water will be found. Is the Magic Valley Energy LLC also applying for water rights for the construction phase as well as the postconstruction fire abatement? If not, where will this water be found and used come from? Even during the construction phase, they mention the use of water to dig through the rocky ground to install the bases for the wind towers. Where will this tremendous amount of water come from? There are no specific details listed for any of their planned water uses as to how they plan to acquire those waters. In an area of this size, 140,000 acres, this will require adaptation to the land management plans, travel management plans, fire management plans, in addition to required changes to grazing, recreation, realty, hydrology, archaeology, and mining as well. The risk of potential poisoning and contamination of our aquifer, as well as local water sites cannot be ignored.	See responses to comments 1042-14 and 10426-2 (see both in Table A-3z, Water and Wetland Resources).
11554-2	Raul Labrador; Idaho Attorney General's Office	Our Constitution creates a system of "dual sovereignty." Printz v. United States, 521 U.S. 898, 918 (cleaned up). When the States entered the Union, they "retained a residuary and inviolable sovereignty." Id. at 919 (quoting The Federalist No. 39 (J. Madison)). One of the states' retained powers is the right to hold title over all non-navigable waters. United States v. Utah, 283 U.S. 64, 75 (1931). The States have had a "traditional and primary power over . . . water use." Solid Waste Agency of Northern Cook Cnty. v. United States Army Corps of Engineers, 531 U.S. 159, 174 (2001) (SWANCC); see also 33 U.S.C. § 1251(b) ("It is the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States to . . . plan the development and use (including restoration, preservation, and enhancement) of land and water resources"). So the law has long recognized a state's ownership of its waters as "an essential attribute of [its] sovereignty." Idaho v. Coeur d'Alene Tribe of Idaho, 521 U.S. 261, 283 (1997). The draft EIS acknowledges that "all action alternatives" will have "long-term irretrievable impacts on" Idaho's wetlands and surface waters. DEIS at 3-447. Ground disturbance from building and operating the wind farm will "remove or alter wetlands, change their function, change the rate and quantity of runoff from the fill footprint, compact soils, and alter flow patterns." DEIS 3-444. The Project could also pollute Idaho groundwater and surface water through inadvertent spills of hazardous materials, soil disruption. DEIS at 3-442, id. at Appendix 3-17–18. The draft EIS irresponsibly entrusts MVE to mitigate these impacts while at the same time conceding that even perfect compliance with these mitigation measures "would reduce but not eliminate potential impacts to wetlands and waters." DEIS at 3-445. The draft EIS also fails to analyze how these impacts will affect Idaho's sovereign interests over its waters or even acknowledge that Idaho has such an interest.5 And by failing to account for Idaho's sovereign interest in its water, the draft EIS also falls short of the requirements of NEPA and the FLPMA. See Ctr. for Biological Diversity v. Dep't of Interior, 623 F.3d 633, 641 (9th Cir. 2010) (NEPA requires agencies to take "a 'hard look' at the	The State of Idaho is a cooperating agency on the EIS and is aware of the project and its proposed water use needs.

Comment ID	Commenter	Public Comment	Response to Comment
		environmental consequences of its proposed actions"); see also 43 U.S.C. § 1701(a)(8) (requiring the Bureau to manage public lands in a manner that "will protect the quality of [its] water resource").	
11557-1	Deanna Weigel, Andy Weigel	The Lava Ridge project poses a serious potential threat to waters of the state that comprise the Eastern Snake River Plain Aquifer (ESPA), which is a key element of southwest Idaho's economy. This project puts this resource at risk while providing unsubstantial analysis of potential impacts and understated consequences associated with the risks that have been identified. Water is undoubtedly one of the most precious and vital resources in the state of Idaho. The state has dedicated significant resources over several decades to adjudicate water rights associated with the Snake River and the ESPA. In fact, Idaho has one of the most sophisticated and successful water rights management programs in the Western US. In recent years Idaho has implemented an incredibly effective aquifer management plan, resulting in the first year over year increase to the aquifer storage volume in decades. Too many industries and people rely on this resource to put it at risk, let alone without the sort of rigorous and targeted evaluation it deserves. This project must not be approved until the substantial risks it poses to the quality and quantity of the water in the ESPA have been fully vetted and satisfactory mitigation measures have been identified and committed to.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11561-1	Nicki Kroese	I have spent many hours reviewing the EIS for the Lava Ridge Wind project. I am most concerned about the potential for damage to the Snake River Aquifer and the inability to make repairs. If you were to study the history of similar projects you will find numerous problems. Starting with construction this project subjects our groundwater to pollution from oil spills and herbicides. It continues with cancer causing explosives residue blown deeply into the earth. Eventually, motor failures will cause more oil spills. I believe the job of the BLM is to protect and preserve our lands. The Snake River Aquifer is the life blood of the Magic Valley. The EIS is unable to outline mitigation of any damage to the water flows.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources) and EIS Appendix 3, AIB-47: How would inadvertent spills or leaks from the storage or application of herbicides or the use or production of hazardous materials and wastes during construction and operation affect surface water or groundwater quality?
11576-1	Kelly Human	I see several short comings in the EIS. It does not give the unique geology, hydrology and aquifer underlying the project the critical attention needed. The aquifer is the size of Lake Erie The Federal Policy and Management act of October 1976 states "The secretary shall prepare and maintain on a continuing basis and inventory of all public lands and their resources and other values" the BLM doesn't have the inventory base it needs to go forward with the EIS at this time. The EIS relies too much on future studies which should be conducted upfront to properly inform the impact section of the EIS. It relies too much on future mitigation analysis agreements, plans and mitigation compensation. The company knows where they want to locate towers, battery sites, roads, powerlines etc. perhaps some trust drilling would be in order first to help inform the blasting plan and answer the questions like what are the potential impacts of blasting on the aquifer, surrounding wells and existing water rights. What are the potential impacts to the Northside Canal and laterals the Gooding Milner Canal and its laterals? The major conduits of irrigation water supplying hundreds of thousands of acres of farmland didn't even show up on the EIS Mabs. No discussion was offered of the potential significant impacts from blasting adjacent to the structures could they be breached or undermined?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11598-20	Idaho Conservation League	Impacts of construction on groundwater Given that this project is proposed over the Eastern Snake Plain Aquifer (ESPA), a sole-source aquifer that provides drinking water for nearly 300,000 people, the BLM should place extra scrutiny on the project's potential impacts to groundwater, both in terms of water quality and quantity. The project proponent should be required to use industry-leading best management practices with regards to preventing potential groundwater contamination. The project proponent should also be required to take all reasonable steps to minimize their water usage, and accordingly, their withdrawals from the ESPA. This project should also include regular monitoring of a geographically representative suite of existing wells across the project area to screen for impacts to water quality and/or quality as the project progresses (if approved). Mechanisms should be put in place to notify the BLM and Idaho DEQ of any exceedances of Idaho's groundwater quality standards and require corrective action. A formal groundwater monitoring plan should be included with the FEIS summarizing all of these items (and more). If this project is to move forward, ICL supports the inclusion of Measure bbb, which stipulates: MVE would gain a clear understanding of the local hydrogeology as determined by Idaho Department of Water Resources and the BLM. Areas of groundwater discharge and recharge and their potential relationships with surface water bodies shall be identified prior to blasting and excavating. If construction activities near aquifer recharge areas cannot be avoided, they would be closely monitored to reduce the potential for contamination of said aquifer. We further encourage the BLM to include this sort of mitigation measure in future renewable energy projects of this scope and scale that are proposed above the Eastern Snake Plain Aquifer.	As per BLM-Required Measure AA, MVE would be required to monitor groundwater use (EIS Appendix 4 [Mitigation]). Also see response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11605-1	Sheila West	I have examined the EIS and can find no mention of studies on potential damage to the aquifer that lies under the proposed site. Extensive studies need to be made to ensure the aquifer that supplies water to the Magic Valley and areas along the Snake River as far as Boise is not damaged.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11615-8	Spencer Dixon	I do not think the project's effects on our aquifer have been adequately studied.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11627-1	Ruth and Mel Harder	What will the effects of blasting for over 500 days, the non-calculated combined weight estimate of 400 plus gigantic turbines, towers and bases be? The overlaying roof over the aquifer is pourous and fractured. If the blasting collapses the protective cover over the aquifer, what then? Who will be held responsible for contimation? Who will be held responsible for the livelihoods of property owners, families and businesses that rely directly on this life source?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
11640-3	Amber Madsen	We rely on our aquifer to provide clean, life-giving water for not only our citizens, but our farmlands that provide food for us and many parts of the country. The economy and life that is established here is dependent on this water. This area above our aquifer is too valuable to risk with the unknowns. Anyone who has been around any minor explosion would have no doubt that the disruption of the ground with the vast amount of explosions over the extensive timeframe could do no less than compromise the aquifer below. We cannot take that risk.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). See also AIB-34.
11667-1	Alisa Bowman	Concern: The Snake River Plain Aquifer The Snake River Aquifer is central to Southern Idaho's prosperity. If this water becomes contaminated or dries up due to the projected wind farm, it will be detrimental to the livelihood of the area's residents and have a domino effect on the entire state. The Magic Valley is a huge agricultural contributor to the state/nation/world. Agriculture needs water. Who knows what the effect of all of the blasting on the fractured basalt for the DEEP foundations and construction of the towers will have on the water. Towers of this size have never been built before. We will not be a guinea pig for the rest of the world. It is inevitable that the water table would be compromised. How much? We may not know until it is too late! We NEED to PROTECT OUR WATER!	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11723-2	David Robinson	this is not the right area to be blasting over the aquafer then having petroleum leaks seeping through the lava and into our drinking water	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11728-1	Juanita Young	The Snake River aquifer is vital to the economy of Idaho, without it farm lands would disappear. Unless you all are terribly behind the times..we want to support small, local farms, that produce real food…not mega farms that are producing food that is toxic to human beings. The toxic chemical cocktail in the dynamite (ammonia nitrate and diesel) will penetrate the porous lava rock. Our hydrologist said it will penetrate down to the aquifer. Thus making the water unusable by man or beast.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11743-1	Neva McGregor	we believe that the Snake River aquifer is at serious risk if these huge wind turbine's are built over the top of the aquifer. Our son is a geologist and can not believe that no test drilling or seismic testing have been done. This aquifer is the life blood of the entire southern third of Idaho,reaching from Yellow Stone Park west to the Idaho Oregon border. If this aquifer is contaminated or shut off the result would be catastrophic. There could be hundreds of billions of dollars in lost revenues that could never be replaced.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11753-2	Mary Rios	This monstrosity of a project will not only be an eyesore, it could possibly damage our Snake River aquifer, which could cause major issues for the residents of this state, or even the demise of our state's population. Due to the basalt bedrock, this company plans on blasting, two times a day, for a period of 525 days. That is every single day for almost two years. This New York based company claims that it won't damage the aquifer. But how do they, or we, know if this is the case? There is no way of knowing until they start blasting. (The blasting will definitely affect the air quality, as well, for animals and humans.)	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11761-1	Carolyn Firth	The project is located within the Eastern Snake Plain Aquifer (ESPA) Groundwater Management Area. According to the Idaho Department of Water Resources (IDWR), a Groundwater Management Area (GWMA) is all or part of a groundwater basin that may be approaching the conditions of a Critical Groundwater Area (CGWA), which is defined by IDWR as all or part of a groundwater basin that does not have sufficient groundwater to provide a reasonably-safe supply for irrigation or other uses at the current or projected rates of withdrawal. It is my understanding that the electricity generated by the Lava Ridge project will be sold out of state, and not even used in Idaho. So I question why Magic Valley Energy, LLC (MVE) should be allowed to use a limited resource (groundwater) that ultimately does not even benefit Idaho. I also question the estimates provided by MVE about the amount of groundwater that will be used. I think their estimates are much lower than what the actual requirements will be. Groundwater is a very precious resource to the farming economy of Minidoka County, and there has been a steady decline of the aquifer levels over the years. The Environmental Impact Statement (EIS) does not address the possible (and likely) negative effect that widespread blasting will have on groundwater flow paths. There seems to be an assumption that there will be no effect. In addition, the weight of the concrete foundations and the turbines themselves could permanently disrupt groundwater flow paths. Another concern I have is the close vicinity of a portion of the Lava Ridge project to the Milepost 31 ESPA groundwater recharge site. This site has been used very effectively in the past for recharging the aquifer during the winter. Blasting and erecting huge wind turbines could have a negative effect on groundwater flow paths which would disrupt or prevent the recharge that has been so successful in the past. These issues have not been addressed by the EIS.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11776-1	Regina Smith	The water & wetlands section talks about the amount of water that is expected to be used. Page, 3–440. Estimates project will locations would be 1400 to 11600 feet from existing ground water wells. Those numbers translate to slightly over quarter of a mile up to 2 miles. Private landowners are concerned that their water will be depleted temporarily or permanently.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources).
11776-3	Regina Smith	Section 3.17.2.1 affected environment. " in the siting corridors, there will be 551 acres of wetlands, and 90 miles of water courses). 551 acres of wetlands and 90 miles of water courses that " ground disturbance would remove or altar wetlands, change their function, change, the rate and quality of run-off from the fill footprint, compact soils, and altar, flow patterns." Page 3–444. There is no discussion on canal crossings	see response to comment 11534-20 (see in Table A-3z, Water and Wetland Resources).
11786-1	Tomie Knight, Frank Knight	Dynamiting for over 500 days, twice a day could put pressures on the aquifer, totally unknown, especially at the depth proposed. There are no guarantees that the aquifer will survive without damage or without contamination.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		Water for numerous cities and towns may be affected. This is a huge cost to the people of our communities that will possibly be negatively impacted by this project.	
11787-2	Representative Jack Nelsen	The proposed area of impact has a layer of cinders below the surface. Repeated blasting in this cinder structure can have an adverse effect on surrounding wells. A local canal company experienced just that while blasting to build a canal. Surrounding domestic wells were damaged and the canal company was given the responsibility of replacing them. LS Power has not addressed how they will respond to that sort of potential damage.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11822-8	Bob & Linda Sojka	My PhD is in soil science. I have significant understanding of a range of water issues. In my opinion the aquifer risk analysis for this project is inadequate, given that the number one natural resource issue has always been and will always be water security for those of us living in Idaho's high desert. The amount of drilling, blasting, concentrated load imposition and structural vibration associated with the development of the wind project and the operation of the turbines over the long term has an unknown potential to collapse, reroute or block flow of water within the expansive underlying layer of fractured basalt of this region with irreparable consequences to the ecosystem and to those who depend on water for agricultural use and the full range of Southern Idaho's water needs for human activity.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11822-9	Bob & Linda Sojka	Many instances of wind turbine failure have resulted in large releases of contaminant chemicals into the surrounding soil with potential transmission into groundwater and the aquifer. This project is not worth putting the Snake River Aquifer at such risk.	See AIB-47 in EIS Appendix 3: How would inadvertent spills or leaks from the storage or application of herbicides or the use or production of hazardous materials and wastes during construction and operation affect surface water or groundwater quality?
11822-10	Bob & Linda Sojka	The cursory review of largely outdated and insufficiently use-specific soil surveys assessing water issues in the affected construction area likewise appears inadequate given the unforeseen scope and intensively disruptive nature of the project's combined impacts.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11849-5	Charles Brockway	The EIS does not address the potential effect of sonic or subsonic shocks on the fractured basalt aquifer, and the subsequent potential impact on groundwater well productivity. Wells completed in fractured basalt derive water from sporadic zones of rock fracturing. Fractures can be altered by seismic activity.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11849-7	Charles Brockway	The proposed groundwater usage of 400 acre-feet will be nearly 100% consumptive to the aquifer. The Eastern Snake Plan Aquifer Moratorium prohibits the appropriation of new consumptive groundwater or surface water rights. The proposed volume of water is too large to be covered under water exemptions provided for in Idaho code. The EIS fails to assess how this volume of water will be diverted legally at this location.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
11871-35	WildLands Defense	Playa Biota Ignored Why is there no systematic sampling and analysis of playa biota? The reports state that "a number of isolated freshwater emergent or forested/shrub wetlands were identified in the NWI database, the majority of which are playas". "Forty-six of these features were evaluated during the field survey, sixteen of which met wetland criteria and could provide nesting and foraging habitat for a number of wildlife species. The remaining playas were ephemeral resources which, during periods of heavy rain or snowmelt, may also provide wildlife habitat".	The BBCS (Appendix M in MVE [2023]) briefly summarizes relevant habitat conditions in the siting corridors, including playas and other ephemeral surface waters that may provide habitat for birds and bats when inundated. See the EIS for a description of wildlife associated with these habitats, specifically Sections 3.3.1.1.2 (Bat Populations, Bat Use in the Siting Corridors), 3.3.2.1 (Avian Populations, Affected Environment), 3.3.3.1 (Eagles, Affected Environment), and 3.18.3.1 (Amphibians, Affected Environment). Because of the ephemeral nature of the playas and vernal pools in the siting corridors, wildlife use of these habitats is intermittent, and the results of any effort to systematically survey these habitats would be highly dependent on recent precipitation patterns. Further, because of their ephemeral nature, these surface water features do not provide perennial habitat for any wetland-obligate or aquatic organisms. Therefore, when inundated, these surface water features likely support a similar suite of wildlife species as found elsewhere in the siting corridors. In addition to the EIS sections listed above, descriptions of wildlife that use the siting corridors and the data sources evaluated can also be found in Sections 3.3.4.1 (Greater Sage-Grouse, Affected Environment), 3.11.1.1 (Pollinators, Affected Environment), 3.11.2.1 (St. Anthony Sand Dune Tiger Beetle, Affected Environment), 3.11.3.1 (Monarch Butterfly, Affected Environment), 3.11.4.1 (Bureau of Land Management Special-Status Bumble Bees, Affected Environment), 3.18.1.1 (Wildlife Movement, Affected Environment), 3.18.2.1 (Big Game Habitats and Populations, Affected Environment), and 3.18.4.1 (Pygmy Rabbit, Affected Environment). The BLM special-status plant surveys, including targeted surveys of a subset of the ephemeral surface water features in the siting corridors, are described in EIS Section 3.15.3.1 (BLM Special-Status Plants, Affected Environment).
11871-36	WildLands Defense	Bureau of Reclamation Withdrawal Why is there no discussion of the Bureau of Reclamation withdrawal? Three irrigation canals are near the Lava Ridge siting corridors: the Milner- Gooding Canal, Dietrich Main Canal, and North Side Main Canal. These canals are within existing ROWs on federal, state, and private lands. Even though canals are mentioned in the alternatives comparisons, there is no hard look analysis of biological, geological and other impacts of this massive development. Due to the proximity of several canal features, this area may be a magnet for migrating birds, insects and bats that will suffer mortality. Blasting and other intensive disturbance may create fissures in underlying strata that impact canals and water features.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11871-69	WildLands Defense	Wetlands https://eplanning.blm.gov/public_projects/2013782/200493266/20072201/250078383/210211%20Lava%20Ridge%20Wetlands%20and%20Waters%20Assessment_508%20Final.pdf There is no information on wetland animal surveys – for example, for fairy shrimp. There is no information on insects despite mention of Tiger beetles in the EIS.	Table App3-5 was added to EIS Appendix 3 (Issues Analyzed in Brief) to address aquatic species not analyzed in detail.

Comment ID	Commenter	Public Comment	Response to Comment
		Maps – Vol 2b – has no maps – BLM claims maps will be provided prior to construction. This is NOT adequate - a SEIS must be prepared.	
11881-9	Barbara Browning	Excessive water use, depleting aquifer Olmstead said that after 22 years working on water issues, he didn't think there was room for any new withdrawals from the aquifer, which he said has been declining since the 1960s. The construction of the concrete pads, roads, and elements of dirt work will require 130 million gallons of water, drawn from six new wells. The use of water has raised concerns that other users access to water might be diminished.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2.2 (Groundwater Quantity, Environmental Consequences) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
11909-1	Kevin Trainor	Depletion of the aquifer to build the project. (I have not seen a number for how many cubic ft of water it will take for construction of the concrete foundations , nor whose water right will be used for that)	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources).
11909-2	Kevin Trainor	Nor have I seen any estimate of what the depletion to the aquifer will be. How many wells will have to be deepened (and how far) during the construction and after completion. The Snake River Aquifer is basically a perched aquifer fed by mountain snow runoff. A fracture of the basalt floor of the aquifer by all the blasting could cause a loss of a lot of the aquifer water.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11911-2	Eila Olmstead	Additionally, the DEIS is lacking in critical attention and detailed analysis of the aquifer and its unique geology/hydrology and the fact that it is a sole source aquifer for our region. How will the blasting impact our aquifer, canals/laterals in close proximity, existing wells nearby. In a similar vein, the water rights requires for the project have not been secured. And since the Eastern Snake River Aquifer has already been fully allocated, any water rights will be at the expense of existing users (drying up existing farmland). If this is the case the DEIS needs to address the impacts of a loss of farmland on our area/citizens/businesses where the economy is largely based off of agriculture.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11915-7	Kim Peyman	We have been reassured by this wind farm company that they will not damage, nor deplete our aquifer because it constantly replenishes itself. Their piling holes will not be drilled so deep as to pierce through into the aquifer. Another ploy to elicit our cooperation? While this may be true, we cannot discount the enormous amount of water that will be required to build these towers and continue to maintain them. A few of the proposals require water in the billions-of-gallons, with the other options not too far behind in their demands. How many farmers and ranchers do you know that want to give their water away? Our neighbors may be, whether they want to or not because this company intends on drilling three new wells into our aquifer to "supplement" their water needs. I am unaware if they are offering any compensation or not for the water they take. Proceed with caution here! Water is a limited resource here in the desert, and we can barely make it through irrigation season right now. Imagine what it might be like if we allow their wells to be drilled. What if our farming and ranching neighbors lose their pivot wells? What if all of our domestic wells run dry? What then? Will this company pay to have our pivot and private wells deepened or re-drilled elsewhere? Would this even help in this case? I pray my 410-foot-deep domestic well will survive the invasion. I do not even want to think about the ramifications of our aquifer becoming contaminated. More than likely, as with most conglomerate companies, they would weasel their way out of responsibility claiming they were not at fault due to some technicality. Ultimately, we will be the ones left holding the empty bag, or aquifer in this case.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11920-1	Liesl Schernthanner	In addition, several of the proposed turbines would be located adjacent to seasonal wetlands and watering areas, further impacting wildlife and causing environmental damage.	Impacts to wetlands are described in EIS Section 3.17.4.
11926-1	Name Not Provided, Susan Jesser	Need to protect the Eastern Snake River Plain Aquifer: damage to our water supply with the project using up to 98,650,000 gallons of water during construction alone would take water needed for farming, ranching and wildlife, danger of added weight from 400 wind turbines with 740 feet tall and 7 substations on the lava bedrock/aquifer and blasting destruction to the aquifer	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11943-7	Mary Kevan	They also require frequent maintenance, leak oil and will interfere with the local groundwater.	See AIB-47 in EIS Appendix 3: How would inadvertent spills or leaks from the storage or application of herbicides or the use or production of hazardous materials and wastes during construction and operation affect surface water or groundwater quality?
11962-2	Cassie Christensen, Tyler Christensen	The biggest concerning factor in this project will be the water. Clean water is becoming scarcer with every economic event. It is one of our most valuable resource, even though we don't always look at it that way, coming from an area where we are spoiled with great drinking water and most years, we have plenty of water to grow our crops and still pass it down the line. However, our aquifer is becoming more and more fragile and it is unsure of the damage that will be created from blasting, or the vibration on the Earth from the solid base of concrete molded into it in 400 concrete bases. These concrete bases are not even sure in size yet due to the fact that they have never been made before. This fact alone should be enough to stop this proposition to build on the BLM. The concrete bases will inhibit the Earths natural mechanics of allowing water back into the soil. The destruction of our ecosystem will greatly impact this area and I will have more information on that topic in my Carbon Exchange letter. It is also terrifying to think of the Blasting that will take place over our aquifer. 5The Snake River Basin supports most of the Idaho's agriculture and is home to eight of the ten most populated cities in the state. In order to erect on the scale that needs to be done in order to get the windmills erected, we could detrimentally affect our aquifer which provides 889,000 acres of water to farmlands which provide the food we need for our country. The irreversible damage that could be done to Southern Idaho would greatly impact the entire United States. 6When we look at history, the Great Plains has still not recovered from the impacts of the dust bowl that happened more than 50 years ago. Our deserts are fragile and we are in a constant struggle with	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		run off. Once our topsoil is depleted, we will become nonexistent due to the destruction of our ecosystem. The more we can protect the undeveloped lands the better chance we give our future. I have lived in multiple states and traveled all over the United States, Idaho is one state that has it all. We have a great water supply which we can control, most days are sunny and most of our energy is sustainably sourced from hydroelectricity. These things make us a powerhouse for growing crops and creating a strong economy. The risk of something happening to our aquifer seems like it outweighs the reward. Our water supply could easily become tainted from blasting or bedrock shearing from the vibration of the windmills. [...] If you travel through the area North of the proposed site there are several natural hot springs, some of them that are too hot to touch, isn't that a good indication of how fragile our Earth truly is? It doesn't seem fragile because of its vastness, but the synergism between all creatures and their habitat has only lightly been understood. I have personally walked through caves that look like just a hole in the ground but once you get in, there are larger than a house. Will these be protected? How will the local community be compensated if they all need to drill new wells due to depth changes in the aquifer? What about a filtration system if the water becomes tainted from blasting? This area in the Magic Valley is full of farms, dairies and ranches. What will we do if our water source is decimated? No amount of money in the world will help us recover.	
11968-6	Cheryl Sandy	Blasting and drilling may negatively Impact our Aquafir which could be irreparable.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11979-2	Louisa Gauger	To date you have done a really good job at management. However, this project will decimate the whole area, and destroy our economy in the state of Idaho as the blasting that will take place will destroy our aquifer, which in turn will destroy our ag-based economy. I refer you to a study done in the 80s on the damage done to another aquifer. Without water everything dies. Please think long range on this. If they want to place wind farms on public lands (or even private lands) it should not be on top of fragile, lava based aquifers.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11991-6	Julie Abo	I am concerned about two blasts per day during construction, especially if construction is predicted to take two years. I'm concerned about the long lasting effects on wildlife and the Snake River Aquifer. See "Blasting Alternative C Blasting - 2 blasts/day construction; Alternative E Blasting 2 blasts/day construction (page 2-6). This blasting would cause irreparable damage that could not be reclaimed. Water Usage Can Southern Idaho afford to divert this much of their groundwater? DEIS page 2-6: "Groundwater wells Alternative C Water use 5 construction; 4 remain open during operation and decommissioning; Alternative E Water use 4 construction; 4 remain open during operation and decommissioning. I am concerned about the Snake River Aquifer, "The ESPA is the largest aquifer in Idaho and a truly priceless resource (ICL 2021 Groundwater Report," which runs underground directly under the area where the Lava Ridge Wind Project is proposed. In its 2021 Groundwater Report, The Idaho Conservation League has observed that "For decades, water in the Snake River, its tributaries, and its aquifer has been polluted and overdrawn, resulting in poor water quality and declining flows." Furthermore, has there been testing to decide if the groundwater will be protected from further contamination?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12004-2	Douglas Miller	Each of the build alternatives is projected to use an enormous and unsustainable amount of water. This water belongs in the Snake River Aquifer and, if not diverted for Lava Ridge, would make its way into the Snake River. Analysis of more than 100 years of stream flow data for the Snake River at King Hill provided by the United States Geological Survey (see https://waterdata.usgs.gov) shows that the build alternatives will use 82% - 117% of the median daily stream flow in the Snake River. Lava Ridge would thus effectively dewater the Snake River for a day; the consequences would be disastrous for the environment and and economy. Therefore it must be concluded that the only viable option is Alternative A "No Build."	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12057-3	A. Ben Crouch	5. The effects construction will have on a very sensitive and life-sustaining aquifer, specifically the dynamiting and blasting of over 400 tower locations directly over said aquifer. What kind of damage will drilling and blasting, all that extensive concrete work, and vehicle traffic have on the aquifer? No one – absolutely no one has gone on record to unequivocally say that if will not damage the aquifer. If the project does go through, what kind of reparations could ever take care of potentially irreversible damages?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12057-4	A. Ben Crouch	6. What about the irreparable damage of a possible 30-year period of leaking oil and lubricants from 400 wind turbines contaminating the ground, aquifer, and ground water?	See AIB-47 in EIS Appendix 3: How would inadvertent spills or leaks from the storage or application of herbicides or the use or production of hazardous materials and wastes during construction and operation affect surface water or groundwater quality?
12059-3	Martin Bender	I am concerned about potential damage to the Magic Valley aquifer by the Lava Ridge Wind Project, as everyone (from urban residents to farmers and ranchers) depends on the water in the aquifer. The reason I bring up the aquifer is that it has been reported that if Lava Ridge is to go ahead there will be significant blasting around the aquifer to make way for construction, which could damage the aquifer (to say nothing of the colossal water requirements for laying down the foundations of each turbine, which according to the Idaho Conservation Blog is "21,600 gallons of water"[3]). A parting thought on the aquifer; none of the sources I have read do mention what sort of aid or restitution the Magic Valley can expect if the aquifer is damaged as a result of the Lava Ridge Wind Project. Though considering how the train derailments around East Palestine, Ohio, have been handled, I feel that if such a similar situation were to happen in Idaho, we can expect little to no help	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12065-1	Donna Zuck	Construction of the Lava Ridge Project will result in the destruction of the native soils and plant growth due to earth moving, blasting, and placement of concrete footings- which will not be removed after the life of the facility, just buried. The DEIS reports (see page 3-52) the area analyzed in the study is located in the Snake River Plains	Fragile soils and impacts to soil from concrete are described in EIS Section 3.13.1 (Soil and Plant Growth Materials). See also response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		Major Land Resource Area and has 80,308 acres classified as "fragile," and 3,814 ares considered "very fragile." According to the study these biological soil crusts have recovery rates of 2000-3000 years. The local area is expected to take 125 years and the DEIS reports some areas would have irreversible damage due to the concrete footings. These chunks of concrete may leech contaminants into the soil continuing the pollution long after the "reclamation" is completed. As water percolates through the soil will this pollution reach the aquifer?	
12090-1	Chris Bender	1. This project will affect our precious aquifer. The Snake River Aquifer supplies water to about one million acres of irrigated land, including 600,000 acres of irrigated agriculture in our high desert plains home. The key word there is "desert". We are often in drought conditions in Southern Idaho. The Lava Ridge project estimated it will require 130 million gallons of water just during the construction phase. As much as we all would like to hope that is a conservative & accurate figure, it could be much more than that, reducing available water sources for the dairies & agricultural businesses located in Southern Idaho, as well as reducing water for the residents. That is assuming the blasting required to construct the Lava Ridge wind project does not outright destroy the aquifer. Parts of the aquifer are already damaged, and no blasting has taken place yet. In the proposal, it is expected to require "an estimated two blasts per day for 525 days is anticipated during construction". ... Reading through the proposals and studies, I did not see any sort of guarantee that our water sources in the aquifer would be safe from blasting, or any sort of restitution or assistance for Southern Idaho if this valuable resource was obliterated.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12123-1	Kelly Kroese	The Lava Ridge EIS fails to adequately address potential damage and mitigation of damage to the Snake River Aquifer. Our aquifer is directly below the Lava Ridge Wind Project area and it will be affected! No one can predict what the effect will be, because there are no projects even remotely comparable to the Lava Ridge Project. Disrupting the ground with that many explosives, in that many locations, for that amount of time can only harm our precious aquifer. Also, vibrations and other disruptions to the area will have an impact on the aquifer as well. There have been recharge projects going on in the same area designation as the Lava Ridge Wind Project for years, so you the BLM know this area is too valuable to the lives of all inhabitants of Southern Idaho to be compromised.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12142-2	Michael Taylor>	It greatly concerns me that this project as it has been proposed does not adequately address the environmental impacts upon the the area involved. The aquifer provides the lifeblood of our valley. I would like to see environmental impact analysis of placing hundreds of these large windmills over the Snake River Aquifer for the next 30 -50 years.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12188-2	Tom and Megan Ashenbrener	Possibly the single most devastating effect is the real possibility of vibration and blasting caused harm to the basalt layers beneath these windmills, and the potential damage to that layering over our Southern Idaho aquifer. We all know the importance of water, and the importance of the aquifer as a storage vessel for that water. This project should be denied on the real and likely basis of permanent damage to our aquifer and the water that is our lifeblood.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12226-3	Ted Deetz	EIS Section AIB46 also states “With these plans and prevention measures in place, the risk of potential impacts to surface and groundwater quality from inadvertent leaks or spills would be low”. Comment: Mitigation does not address the long term damage to the ESPA. They know, BLM knows, elected officials know and the public knows that this project will have long term damaging effects on the ESPA. It always takes years to show up but it always does. I have personally seen this happen in several location with less disturbance to the environment. It is always mitigated by water districts drilling new wells and damming new water ways to be able to mix and blend water to meet standards set by the Safe Drinking Water Act. The PWSD has approximately 50 surface water and groundwater wells to help meet the SDWA standards.	The project would be required to meet local, state, and federal water quality standards, including the implementation of spill plans and prevention measures.
12226-5	Ted Deetz	EIS Section AIB49 also states that “The project would be designed to avoid creating hydrologic conduits between two aquifers during foundation excavation and other activities…these measures are expected to prevent contamination of groundwater from excavation or blasting”. Comment: This statement is admitting that hazardous materials will contaminate the shallow aquifers, but they will try to prevent the contamination from contaminating other shallow aquifers near by. Due to the basalt and lava tubes in the proposed Lava Ridge project, all of these un used shallow aquifers collect the contamination and eventually the contamination will find its way into the ESPA.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12307-28	Dean Dimond	Information missing for effects on perennial and year-round “live” streams,	See response to comment 11491-16 (see in Table A-3z, Water and Wetland Resources).
1232-1	Carolyn Dimond	Our comments on ground water issues found & not found in EIS 3.17.1 pg. 3-433 & EIS Appendix 2 are as follows: We were particularly interested in comments made by Brian Olmstead at a February 2 meeting held in Jerome, where he stated that he had experienced contamination of wells near blasting that was done when building a substation for the Twin Falls Canal Company. After searching the EIS, we could not find where this issue was properly addressed and evaluated. This is of MAJOR concern. Not only was the contamination not properly addressed neither was there any mention of how blasting hundreds of times to build foundations for the turbines could alter or even plug the aquifer—nor were the effects of heavy equipment and trucks traveling excessively over the aquifer and cause vibrations with the probability of ground shifting in the basalt and changing underground water travel and sources. We have personal knowledge of some wells in this area right now	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		showing signs of caving. We suggest that this evidence needs to be addressed and that there is probable changes of devasting consequences to the water that supplies many of our homes,, farms, even our very livelihoods and also having life threatening consequences to underground habitats of the local wildlife.	
12351-4	Julie C Lynn	• Building the project will use huge amounts of Idaho's most precious resource, water.	In response to public comments on the project, MVE updated the anticipated water use for the project, as documented in EIS Section 2 (Proposed Action and Alternatives), EIS Section 3.17.1 (Groundwater Quantity), and MVE (2023).
12371-1	Alan Hansten; Northside Canal Company	the North Side Canal Company ("NSCC"). NSCC is a Carey Act non-profit irrigation company that delivers irrigation water to approximately 2,100 shareholders on approximately 158,000 acres of farmland across Jerome, Gooding, and Elmore Counties. NSCC holds storage and natural flow rights to the Snake River, notably at American Falls Reservoir. The Snake River is hydraulically connected to the Eastern Snake Plain Aquifer (ESPA), and NSCC relies upon the aquifer to help fill its water supplies. NSCC operates and maintains hundreds of miles of canals, laterals and pipelines to deliver irrigation water to its shareholders. The viability of the ESPA is important to NSCC and its continued water delivery operations, including for groundwater recharge at various locations including Wilson Lake and the Wilson Canyon recharge site. The Idaho Department of Water Resources recently issued an amended moratorium order in the fall of 2022, prohibiting further consumptive uses of the ESPA. The BLMS's draft environmental impact statement (EIS) does not evaluate the alternatives and projected water use in light of the existing moratorium. The applicant's projected water uses appear questionable in light of the hundreds of miles of road building and construction activities associated with the proposed wind project.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
12371-2	Alan Hansten; Northside Canal Company	NSCC is particularly concerned about the proposed construction of the Lava Ridge Wind Project, notably the BLM's preferred alternatives (C and E), and the potential impact on the ESPA which in turn could impact surface water supplies to the Snake River. The preferred alternatives propose to construct hundreds of either 3 or 6 MW turbines spanning over 120,000 acres. The alternatives further identify over 400 miles of new access roads. The proposed blasting associated with the turbine pads and access roads is problematic if those activities could negatively impact groundwater flows, including flows in the Near Blackfoot to Minidoka reach. The draft EIS only analyzes the proposed water use by the project, not the negative impacts on the water supply due to construction actions. Given the topography and geology in the project area, with extensive lava flows and rock, it is likely that construction will require extensive blasting and excavation. It does not appear that BLM has given adequate consideration and evaluation of the proposed impacts of such construction on the ESPA in the draft EIS, and whether those activities will impact water supplies to local farmers, including NSCC shareholders and other private water users. If the construction blasting changes aquifer levels or water production in spring resources, NSCC's shareholders and other surface water users will be negatively impacted. NSCC requests the BLM to consider these factors in evaluating which alternative to choose as the preferred one in the final EIS. Further evaluation and investigation of the proposed construction actions and whether or not those will negatively impact the ESPA and hydraulically connected surface water sources like the Snake River should be specifically undertaken by BLM prior to finalizing the EIS.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12398-8	US Environmental Protection Agency	Potential Impacts to Surface Water and Aquatic Resources The project activities may impact water quality and aquatic resources, resulting in removal and alteration of wetlands, changes in their function, runoff from the fill footprint, compact soils, and alteration of flow patterns. Because of these impacts, EPA recommends the FEIS: • Provide information on the most recent EPA-approved Water Quality Standards for the State of Idaho and implications for water quality protection within the analysis area. It will be important for the public to know the State WQS to determine the extent to which this project will impact water quality. The DEIS discusses wetlands and surface water in the project area but does not identify streams, their current water quality status, criteria to meet, and beneficial uses. • Discuss the project impacts analyses and conclusions based on the most recent WQS information. Where WQS are exceeded, it will be important for the FEIS to discuss how impaired waterways will be restored. • Describe the antidegradation considerations in the Idaho Water Quality Standards for surface waters and indicate whether additional actions could be required to reduce or offset impacts from the Project. The DEIS does not currently include information on Idaho antidegradation policies and project compliance with the policies.	See response to comment 11535-159 (see in Table A-3z, Water and Wetland Resources).
12398-9	US Environmental Protection Agency	• Include the most current information regarding the status of the Clean Water Act (CWA) Section 401 certification and Section 404 permit application processes, as well as conditions to protect water quality in the analysis area waterways. The DEIS indicates that there are approximately 551 acres of wetlands and 90 miles of watercourses in the siting corridors; and that work areas disturbance in wetlands will range from 27 to 44 acres and in watercourses from 3 to7 miles. Similarly, infrastructure ground disturbance in wetlands will range between 8 and15 acres and in watercourses between 1 and3 miles.	See response to comment 11535-159 (see in Table A-3z, Water and Wetland Resources).
12398-10	US Environmental Protection Agency	• Include up-to-date information on the National Pollutant Discharge Elimination System permit application processes including measures to protect water quality and development of Storm Water Pollution Prevention Plans, reporting, and monitoring. The DEIS indicates that project construction will disturb an area of more than 1 acre of land, which would subject the project to NPDES permitting requirements for discharges to waters of the United States and accompanying Stormwater Pollution Prevention Plans, as well as best management practices,	See response to comment 11535-159 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		may be required. • Describe plans to coordinate with Idaho Department of Environmental Quality (IDEQ) and all affected tribes to ensure that state and tribal water resources are protected from impacts associated with activities under the proposed action.	
12398-11	US Environmental Protection Agency	The DEIS indicates that water quality may be adversely affected if the project construction activities (surface pavement, earthwork and grading, excavations, access roads and road improvements, etc.) alter local hydrology such that erosion carries sediment to surface waters and pollutants to local drainages and the underlying aquifer. In addition, land disturbance, material storage, waste and wastewater disposal, inadvertent chemical or hazardous liquid spills, and compaction produced by vehicular traffic can all affect recharge to the local aquifer and groundwater quality. The DEIS states that BMPs and mitigation will be used to minimize these impacts. EPA recommends that this aspect of the project be monitored to ensure that water quality is protected.	Through applicant-committed measure 120, MVE would treat and monitor stormwater. The final Stormwater Pollution Prevention Plan (Appendix D in MVE [2023]) will be prepared in accordance with federal, state, and local regulations and approved by the BLM prior to implementation. The Stormwater Pollution Prevention Plan would provide temporary and permanent sediment and erosion control designs and would identify practices to control erosion and sediment and treat and monitor stormwater (where necessary). The BLM's additional project-specific mitigation measure nn would require MVE to develop an Environmental Compliance and Monitoring Program to ensure that environmental conditions are monitored and required mitigation measures are implemented during the construction, operation, and decommissioning phases.
12400-2	Elizabeth Lampert	The EIS does not mention the potential damage or mitigation to the underground aquifer as 400 wind turbine footings would need to be blasted into the rock formation above said acquirer as part of construction. In fact, the EIS does not give the approximate dimensions of a footing to accommodate the wind turbine structure. The EIS does however dimension the height and width of the wind turbine to be between 390 to 740 feet tall. Why not mention the footing size.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12469-8	Mike Telford	The East Snake Plain Aquifer (ESPA) is one on the largest and most productive in the world. It supplies most of the culinary water from Ashton to Glens Ferry. You will get many comments and concerns that the DEIS fails to address and which there is no possible mitigation to the risks to the aquifer, however minimal, associated with Lava Ridge. My Previous comments about the roads also apply to the aquifer. I'm confident you will receive many comments about the aquifer and I urge you to realize that all Aquifer issues demand Alternative A... The ESPA water capacity was increased starting when surface irrigation began in the late 1800's. Water was kept in the irrigation canals throughout the winter for livestock water and for culinary use. These activities filled the aquifer and increased out flow at 1000 springs and other spring discharges. In 1950's Palisades was built and the winter flows stopped. The Aquifer began to be pumped for further development of Agriculture and urban development. Sprinkler irrigation began to expand and increased efficiency of irrigation in the 60, 70, 80, and 90's decreased recharge. Moratoriums and water calls, with resulting laws suit have followed for decades. These disputes continue currently. Pump irrigators have been under severe restrictions and unable to fully irrigate all of their water right acres. There is simply no water for Lava Ridge. Again, leaving Alternative A as the only option... All of this short history and complications of water, is not addressed in the DEIS.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12651-2	Debbie Rutan	I am very concerned about the aquifer system. What damage could be caused by the drilling, use of explosives (stress and shock waves, contamination from chemicals in the explosives), weight of the concrete foundations and turbines, amount of water to be used for project? We have been in a drought for years. water from aquifer supplies water to much of southern Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12685-5	Philip Gossi; Gooding-Lincoln County Farm Bureau	• Water-The lava flow that is present in the area causes uncertain water distribution. Changing a basin's water draw could easily affect current water rights within our already critical water area. A proposed amount of 90-120 million gallon of water to build the project, would also affect the levels in the aquifer.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
12865-2	Regina Smith	During the recent signing of multi-county resolution No. 2023–01. There were several concerns voiced about project impacts on the aquifer. Blasting is a huge concern. This is not addressed. These communities are in the direct path of this project. Drinking water, wells and irrigation are huge concerns. Sources with experience state the aquifer is shallow, meaning, not deep under the surface. Wells can become contaminated or dry up. Well casings can be cracked, contaminated groundwater can seep under houses. These events have happened.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12867-5	Steve Lampert	The EIS does not mention the potential damage or mitigation to the underground aquifer as 400 wind turbine footings would need to be blasted into the rock formation above said acquirer as part of construction. In fact, the EIS does not give the approximate dimensions of a footing to accommodate the wind turbine structure. The EIS does however dimension the height and width of the wind turbine to be between 390 to 740 feet tall. Why not mention the footing size.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12881-1	Nicki Kroese	I am most concerned about the potential for damage to the Snake River Aquifer and the inability to make repairs. If you were to study the history of similar projects you will find numerous problems. Starting with construction this project subjects our groundwater to pollution from oil spills and herbicides. It continues with cancer causing explosives residue blown deeply into the earth. Eventually, motor failures will cause more oil spills. I believe the job of the BLM is to protect and preserve our lands. The Snake River Aquifer is the life blood of the Magic Valley. The EIS is unable to outline mitigation of any damage to the water flows.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12906-1	Lyle Johnstone	Creating hydrologic conduits between two aquifers during foundation excavation and other activities will be avoided. 3.5.5.1.1 EXISTING AND FUTURE TRENDS AND ACTIONS Existing and future trends and actions have likely impacted or would have ongoing impacts on cultural resources in and near the physical APE. Impacts physically altering cultural resources by introducing ground-disturbing activities include trends and actions such	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		as agricultural land use, private property development, livestock grazing and associated infrastructure, motorized access, existing and proposed linear features (e.g., roads, transmission lines, railroads), electrical substations, existing and proposed wind and solar development, irrigation canals, aquifer recharge sites and monitoring wells, ESR and vegetation treatment projects, and existing ROW projects. In addition, linear features with permanent access roads increase the opportunity for motorized access throughout the area, potentially increasing access to sensitive This EIS statement is invalid and makes NO GUARANTEE that the aquifer(s) will be protected! Protection of the Snake River Plain Aquifer (SRPA) is imperative. SRPA provides drinking water to hundreds of thousands of people. Not to mention 2.5 million acres of farm ground is irrigated from this Aquifer; approximately 330,000 dairy cows in Idaho, the majority of them in Gooding and Jerome counties. These dairies must water cows and replacement-heifers everyday with groundwater from Aquifer. As well as many feedlot cattle in the affected area. Page: 3-165 D-1 Magic Valley Energy Reference: Plan of Development: Appendix D	
12913-2	Jeanie Suprise	My main concern is the impacts to the Snake River Aquifer from the blasting and added weight and stress to the lava bedrock which is part of the aquifer and purification ecosystem for south-central Idaho effecting Magic Valley, possibly Treasure Valley & most of Idaho. I feel with no studies on the possible damages that would be caused if loss of water or blockage of aquifer that would effect so many ag businesses, farmers, habitats, cattlemen, ranchers, wildlife, and families if these 700 feet towers are built and damaged done with this 34 year project (2 years to construct, 30 year operation & 2 years to supposedly restore grounds).	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12916-2	Gina Jerke	I don't believe that there will be "minimal to no damage" as stated in the DEIS. All habitat will be adversely affected not to mention the Snake River Aquifer. How will all the blasting/drilling affect our aquifer? What is the real risk of contamination to our water? Will their wells deplete the aquifer and hinder farming?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12922-2	Nikki Engkraf	The Lava Ridge project in particular will negatively impact and greatly threaten our aquifer. Our water resources are used across the lands for our farmers to yield healthy crops. As it is in recent years past they have already experienced a decreased in supply from our inadequate amounts of snow in the winter months. I have heard of a few local farmers in Lincoln County who's wells have already run dry - this means our aquifer is already diminishing with it's current load and should not be unnecessarily impacted any further. My house, my neighbors houses, and my parent house in Twin Falls County all run off of a wells - if our wells run dry as an effect of this project, who bears the expense to drill the well deeper to restore our water use? Same question poses for all the residents in the rural areas where this project will effect more closely - who will bear the expense of restoring their water? I am saddened to think that many Idaho residents will be left without water and may have to leave their generational homesteads because they can't afford to restore it themselves.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12927-2	John Arkoosh	The Snake River Plain Aquifer and the canal systems are the life blood of our valley and our state. The DEIS does not adequately evaluate and address the possible negative impacts to these resources. Turbines shedding PFAS, as well as oils and other fluids are a contamination concern. Seismic activity due to blasting and turbine vibrations may change or divert water flows, or possibly open fissures allowing contamination or draining canals. An in-depth study of possible effects is a imperative and a bond must be posted by the applicant to assure any damages will be wholly compensated. Such bond would likely need to be capable to cover damages in the hundreds of millions, possibly several billion dollars.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12931-1	Becky Cowger	One of my major concerns is in the building of the extremely tall wind turbines/wind farm being planned above our Snake River Aquifer. Extremely tall wind turbines take up a huge area and tons of concrete for their foundational support plus miles and miles of new roads to access every turbine. LS Power cannot determine nor can they predict what the 525 days of blasting will cause below the surface. LS Power has NOT done their due diligence for the Snake River Aquifer for the Lava Ridge Project.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12935-2	Mary Lou Panatopoulos	Personally, my main concern is for the aquifer, as I expressed to you at the Open House in Shoshone. However, concern for the ranchers, the wildlife, the historic significance of the Hunt Project, the damage to the land in building the roads and pillars are of more than significant concern. I could go on, but won't. How can more wells be drilled when we have been recharging the aquifer for several years now? Allowing more wells does not make any practical sense to me.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12938-2	Paul Kaiser	Our soil is fragile, throughout all of the proposed wind turbine area. These wind turbines are heavy and being placed over our aquifer would severely damage it. Below the surface are thousands of cracks, lava tubes, and delicate/fragile soils,with basalt rock, sinkholes, the possibility of ruining our aquifer is of great concern to me. Blasting: as per 3.2 of the EIS. It is a known fact that this much blasting which will be twice a day for 525 days is in excess of what the land can sustain. The force of this blasting is known to send shock waves through the soil. As per Brian Olmstead's comments in the Northside Journal, dated March 2023 section B page 13. The Twin Falls Canal Co blasted for the Midway power plant south of Kimberly in 2007, every domestic well within three quarters of a mile was contaminated with coliform bacteria. Twin Falls Canal Company immediately drilled new deeper wells, with more casings, and were able to restore pure water to these residents. According to the same article "will all of these mega blasts for the construction open any leaks in the nearby Milner Gooding canal? In the early1900's when the canals were blasted they had to seal humderds of leaks for many years in order to get the water to the thirsty crops. According to the EIS LS power and Magic Valley energy will not be responsible for damage to wells or aquafer and quite frankly once the damage is done it will never be able to be repaired.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
12948-1	Jim Peyman	I don't know where they think they're going to get the water they'll need without screwing someone over. Taking someone's water Out West can get you killed! Average water well depths around here are 250-300 feet deep. A 700-foot-tall wind tower erected using pilings would have to be drilled to a depth of around 350 feet deep. Where do you think the bottom of the hole will end up? I would hate to think of the consequences if the aquifer is contaminated. Blasting over our aquifer without really knowing the short- and long-term effects is absurd!	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12949-2	Ralph Kincheloe, Connie Kincheloe	In Twin Falls County, blasting to remove rock to work on the canal impacted wells within a 3/4 mile radius of the area. The canal company was forced to re-drill every well for the homes/farms in that area. We live over the largest single source aquifer in the United States. It stretches from Wyoming to Mountain Home, Idaho, and even down in to Nevada. https://epa.maps.arcgis.com/apps/webappviewer/index.html?id=9ebb047ba3ec41ada1877155fe31356b In 2015, after years of fighting over precious water and mitigation, water users came to an agreement to protect our water source. https://www.boisestatepublicradio.org/news/2020-07-13/five-years-after-water-rights-agreement-idahos-largest-aquifer-is improving "Aquifers and surface water are drinking water systems that my be impacted by development. The Safe Drinking Water Act of 1974 requires protection of drinking water systems that are the sole or principal drinking water source for an area and which, if contaminated, would create a significant hazard to public health." https://www.hudexchange.info/programs/environmental-review/sole-source aquifers/ We understand the value of water and what a precious commodity it is. Any activity above our aquifer that has the potential to damage or contaminate our single source aquifer to a point of irreversible damage should not be allowed. It is the lifeblood of southern Idaho. Given all of this information regarding the blasting that will be required for all of the turbine bases and the roads that will need to be built to accommodate the large turbine blades, we have grave concerns over the possibility of fracturing and contamination of our aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12966-2	Ted Deetz	The only other mention of the effects on the ESPA I could find is in AIB46 and AIB49 and there is no discussion of the long term effects on ESPA.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12966-4	Ted Deetz	EIS Section AI846 also states "With these plans and prevention measures in place, the risk of potential impacts to surface and groundwater quality from inadvertent leaks or spills would be low". Comment: Mitigation does not address the long term damage to the ESPA. They know, SLM knows, elected officials know and the public knows that this project will have long term damaging effects on the ESPA. It always takes years to show up but it always does. I have personally seen this happen in several location with less disturbance to the environment. It is always mitigated by water districts drilling new wells and damming new water ways to be able to mix and blend water to meet standards set by the Safe Drinking Water Act. The PWSD has approximately 50 surface water and groundwater wells to help meet the SDWA standards.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12966-5	Ted Deetz	EIS Section AIB49 states that "Areas of groundwater discharge and recharge and their potential relationships with surface waterbodies shall be identified prior to blasting and excavating. If construction activities near aquifer recharge areas cannot be avoided, they would be closely monitored to reduce the potential for contamination of said aquifer". Comment: Who makes the decision on what cannot be avoided? Contractors always come in and do their thing. MVE has already mapped out over 500 gps coordinates for windmill locations. It is apparent that MVE is already in the "go mode" I have seen this happen on almost all large corporate projects. They always have a PR person on site that is very skilled in the law and very diplomatic. They want to be your best friend and want to buy lunch or what ever.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12966-6	Ted Deetz	EIS Section AIB49 also states that "The project would be designed to avoid creating hydrologic conduits between two aquifers during foundation excavation and other activities... these measures are expected to prevent contamination of groundwater from excavation or blasting". Comment: This statement is admitting that hazardous materials will contaminate the shallow aquifers, but they will try to prevent the contamination from contaminating other shallow aquifers near by. Due to the basalt and lava tubes in the proposed Lava Ridge project, all of these un used shallow aquifers collect the contamination and eventually the contamination will find its way into the ESPA.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12968-8	Charles Brockway	The EIS does not address the potential effect of sonic or subsonic shocks on the fractured basalt aquifer, and the subsequent potential impact on groundwater well productivity. Wells completed in fractured basalt derive water from sporadic zones of rock fracturing. Fractures can be altered by seismic activity.	Repeat to comment 11849-5 (see in Table A-3z, Water and Wetland Resources). See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Blasting occurs regularly over the ESPA without resulting in sonic shocks.
12968-11	Charles Brockway	The proposed groundwater usage of 400 acre-feet will be nearly 100% consumptive to the aquifer. The Eastern Snake Plan Aquifer Moratorium prohibits the appropriation of new consumptive groundwater or surface water rights. The proposed volume of water is too large to be covered under water exemptions provided for in Idaho code. The EIS fails to assess how this volume of water will be diverted legally at this location.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
12976-3	James Komadina	v. COMMENT - The DEIS is silent on regional and local hydrological issues. MVE has not even conducted a cursory review of existing information as follows: 1. Groundwater Levels I Idaho Department of Water Resources (Serve Idaho) 2. Maps and Spatial Data I Idaho Department of Water Resources (Serve Idaho) Blasting impacts on local aquifers used for agriculture and potable service have not been described in the DEIS. A regional and local structural geological review would focus attention on potential areas of mixing and enable placement of monitoring wells to ensure blasting impacts are properly mitigated. The agency is ignorant of the presence of	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		shallow aquifers and their potential to be impacted without a multi-year baseline hydrological monitoring program having been completed. As such, a review of the adequacy of POD Appendix I is not possible.	
12982-5	Jerry Taylor	The DEIS does not give the unique geology, hydrology, and aquifer underlying the project area the critical attention and detailed analysis that is required. The Eastern Snake River Aquifer (which is roughly the size of Lake Erie, in volume) is contained within and flows through basalt lava formations, primarily. ("Snake River Plain Aquifer", isu.ed). These lava formations are very porous, as a result of gases trapped and released as the extruded lava cooled. The basalt is also highly fractured. Basalt lava is also known for its highly variable porosity, ranging from tiny pores to lava tubes and caverns many yards in diameter. Water in the aquifer flows through lava tubes, fractures and hollows of all sizes and shapes for miles following the path of least resistance, from north to south and east to west, generally. Some lava tubes express at the surface as large caves, or fractured rock outcrops, which provide critical habitat and hibernacula for wildlife, as described in the DEIS. The Eastern Snake River Aquifer has been fully adjudicated for water rights, as of 2014. In 2018, the static water level of the aquifer dropped for the first time, since monitoring began. That is to say, the lowest rechargeable pool was reached and exceeded, with more water being pumped than can be expected to recharge in a given year. In May of 1992, the Idaho Department of Water Resources (IDWR) issued a moratorium on new pumping and diversions within the Eastern Snake aquifer management area, including Basin 37, within which the proposed Lava Ridge Project would exist. In October of 2022, IDWR issued an amended Snake River Basin Moratorium Order, which expanded the reach of the previous moratorium. In December of 2022, IDWR Director., Gary Spackman, issued a "Notice of Final Order Curtailing Ground Water Rights Junior to May 31., 1989; Affirm and Amend Ground Water Rights Curtailment List-Surface Water Coalition Delivery Calf'. This Order clearly lays out that " ... ground water rights junior to May 31, 1989 remain subject to curtailment under the November Shortfall Order." Putting those junior water rights holders on notice that part or all of their water rights may be withheld. The principle of "first in time, first in right" gives deference to senior water right holders. As of the last time I checked with IDWR, MVE or its affiliates currently hold no current water rights in Basin 37. The DEIS says MVE intends to acquire water rights or lease water from the Idaho Water Bank, which, as I understand it, does not have enough water currently available, and MVE would be behind other existing water right holders in priority to secure access to the Water Bank. Since MVE has no current water rights, is unable to secure new water rights Uunior to May 31, 1989) and water rights are necessary to construct and operate the wind farm, why did BLM accept the Rights of Way application in the first place? Why was this EIS process begun? The company might argue that they plan to buy and dry up existing farm land, and transfer sufficient water rights (senior to May 31, 1989) to meet its needs. The problem here is, this would require a change of "Beneficial Use" from agricultural to commercial or industrial, while there are existing agricultural demands that would demand this water. I don't know if this could be done or not, but BLM must consult with IDWR and answer the questions. If valid water rights can't be secured, this project is dead in the water, and there has been a terrible waste of taxpayer dollars. The DEIS should be suspended immediately until MVE acquires necessary water rights. If they do come from the loss of existing farmland, the significant impacts of such acquisition (loss of farmland) should be analyzed in full and upfront.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022). See also AIB-34 "How would the project affect prime and unique farmland or productive soils in the vicinity of the project and how many acres would be affected?"
12982-7	Jerry Taylor	The DEIS gives little attention to potentially significant impacts from blasting, on the unique geology underlying the project area, the hydrological impacts that may occur, the loss of habitat(s), or the potential damage to irrigation structures and/or private wells. Instead, it relies on future mitigation and future plan development (i.e. a "Blasting Plan"), which would enlist the services of a "Blasting Engineer" to craft specific plans, after the final EIS record of decision is issued, on where and how to blast. Why wait? The company knows where it wants to locate towers, battery sites, roads, powerlines, etc. Perhaps some test drilling would be in order first, to help inform the blasting plan and answer questions like: What are the potential impacts of blasting on the aquifer, surrounding wells and valid existing water rights? What are the potential impacts to the Northside Canal and associated irrigation laterals, which provide water to 177,000 acres of farm ground? What about the Milner Gooding Canal and its laterals? These major conduits of irrigation water, supplying hundreds of thousands of acers of farmland, didn't even show up on the DEIS maps! No discussion was offered of the potential significant impacts from blasting adjacent to these structures. Could they be breached or undermined?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
13003-3	Lynden Osborne	The Aquifer, the Canal System and Blasting Developers state that blasting will occur for approximately 500 days. In the DEIS there is a section addressing contamination of surface water and ground water. It's interesting that blasting is considered in that scenario, but there is no mention of the potential for blasting to affect the integrity of both the aquifer and the canal system. Have any studies been made regarding this aspect of our water resource? If so, what would mitigation look like? Could the entire west side of the valley be without canal delivered irrigation water for a season or more? Blasting to the extent proposed by the Lava Ridge project developers is worrisome. Especially regarding the project's proximity to one of the main aquifer recharge areas.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
13008-6	Scott Hauser	Appendix M, Aquatic Resources (section 2.2), is an explanation of the delineation of wetlands. Though the DEIS states in multiple places that aquatic resources will be avoided to the greatest extent possible, this still leaves the opportunity for wetlands to be impacted. For example, many of these wetland features are seasonal playas, making it conceivable that this avoidance may not be considered important by the BLM project team. However, due to this being a semi-arid environment, the aquatic resources in this area are of great importance to wildlife. These playas are highly valuable to migrating and breeding bird species that frequent the area. Because this is a semi-arid region, it is vital to protect wetland areas as temperatures continue to increase and have extreme fluctuation periods due to climate change.	The BLM would require that wetlands of all types be avoided to the extent practicable. However, if avoidance of wetlands results in additional impacts to other resources, then the BLM would consider these and may allow unavoidable work in wetlands with specified mitigation measures in place.

Comment ID	Commenter	Public Comment	Response to Comment
13008-16	Scott Hauser	Further, the use of magnesium chloride or other suitable compounds should be further discussed. There is no evaluation of where or how much of these compounds may be used. There is no mention of restricting their use on water crossings or near wetland areas. USRT strongly supports further exploration into the impacts from dust and options for dust prevention.	See response to comment 3811-4 (in Table A-3v, Soils) and 13012-10.
13012-4	Heather Saunders	As far as the more practical considerations go, let's start with the construction phase of this project. They want to dig how many wells? Water is one of our primary concerns. The Idaho Department of Water Resources stopped granting new well permits last year because the aquifer is already over allocated and is not getting recharged properly. I'm sure the company found a pet hydrologist willing to say whatever they pay him or her to say; Glanbia did the same thing before they fired up their monster well near Richfield back in 2007. And, despite their pet hydrologist's predictions that their project would not affect the local ground water, eleven wells in the area went dry in just the first year. A larger number went dry in the second year. I had to add 100 feet to my own well, which is now located at a depth of 600 feet. The shaft has a bend so it can't be drilled any deeper; if my well goes dry again I'll have to spend $S0-$100K to dig a new one. So I am not thrilled with the idea of any additional drains on the existing aquifer, no matter how temporary.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
13012-5	Heather Saunders	The blasting is a concern for every entity that draws water from the aquifer. Basalt is notoriously rigid and the concussive effects of blasting are likely to cause fractures that currently do not exist. While such factures can be beneficial and provide additional areas for underground water storage, the negative effects are a little scary to contemplate. What size are the blasts they plan? How far will the concussive waves travel through basalt? Are we absolutely certain that any fracturing that results from the blasting will not have the negative effect of lowering the level of the aquifer? That could be devastating to both rural and urban areas. ... A study conducted by the New Hampshire Department of Environmental Services ("Rock Blasting and Water Quality; Measures That Can be Taken To Protect Water Quality and Mitigate Impacts") was more suited to my investigation and it describes two ways that blasting can negatively affect groundwater. The first is contamination of groundwater resulting from the release of a regulated or unregulated substance into the ground water. The sheer depth of Idaho's aquifers and the filtering effect of the intervening layers of sand and clay make such a possibility unlikely; however, contamination would still be possible via direction introduction into a well. The more likely problem for this area is agitation of the subsurface that could cause turbidity in groundwater to increase, causing problems and additional expenses for the end users of that water. I have enough ground basalt coming through my water system and I get the added benefit of being forced to replace mechanical elements of my system on a regular basis.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
13014-2	Ellis Gooch, Carl Pendleton	As set forth in the EIS Section 3.17.1.2.2., it is estimated that the project will consume approximately 400 acre feet of groundwater and proposes to do so by the construction of six groundwater wells. / The initial failing of the EIS is that it does not mention that on October 21, 2022, the Director of the Idaho Department of Water Resources issued an Amended Snake River Basin Moratorium Order ("Order"). The Order suspends action on the processing and approval of presently pending and new applications for permits to appropriate water from the Snake River upstream from Swan Falls Dam and all surface and groundwater sources. The EIS attempts to minimize the amount of water that would be used in comparison to the total groundwater available in the ESPA. The amount of water that will be used by the project is irrelevant-the moratorium order prohibits the development of new water rights. The Order prevents the project from using new groundwater rights for the purposes described in the EIS. This issue must be considered in light of the fact that there has been a water call made by surface water users against groundwater users on the ESPA, and the matter has been in litigation since 2005.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
13014-3	Ellis Gooch, Carl Pendleton	Further, the EIS minimizes the impact from the development of the project. The project requires blasting and excavation multiple times a day over an almost two year period. The basalt landscape is subject to fracturing resulting from blasting and excavation. The EIS relies upon implementation of the applicant's "committed measures" to minimize ground vibrations or instabilities and claims that the applicant's measures would "reduce potential impact wells, springs, and aquifers during construction". This finding is not supported by the evidence of fracturing that has occurred during other drillings and construction projects in the area. There is a substantial risk that fracturing could lead to degradation of groundwater quality. Despite these issues, the EIS does not provide for mitigation to either the water source for the groundwater pumping or for potential injury to water quality.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
13024-3	Keith Stone	Additionally I am worried about our water. This area suffered from a major water call just a few years ago related to the temperature of water being discharged to a downstream water user, a fish hatchery. I worry about the unintended consequence of blasting in the proposed area, and the impact to water clarity and quality to users along the snake river canyon. If water clarity or quality are negatively impacted, a water call could impact farming and livelihood all along the Upper Snake River Basin.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
13026-1	Ruth Dimond	We feel that the impact study for the Lava Ridge Project was not sufficient. The reason this area is called Mafic Valley is because of the water. The North side of the Snake River was brought into production because of the Snake River Aquifer. During the meeting held at the Jerome Airport 2/2/2023, a gentleman spoke up and told us he had worked for the Canal Company. They put a power plant along one of the Laterals. It required blasting to accomplish the project. The blasting changed the flow of water to the domestic wells at several homes in the area. They lost their water. The Canal Company had to drill new wells for those homes. If that comparatively small project had that kind of affect it stands to reason that the amount of blasting it would take for the Lava	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		Ridge Project would be devastating to many more people who are dependent on the Snake River Aquifer for Irrigation and culinary water.	
1470-1	Mryon Huettig	There's a recharge site on the Milner gooding canal just south of the proposed area. Recharging the aquifer is important to the farming community and finding suitable sites isn't easy. Blasting the lava rock in other places along the canals have changed what happens to the wells and water flow in and near the blasting. This could effect the current recharge site we now use. I'm a farmer my whole life south of Hazelton and have deep irrigation wells and have seen changes in the wells over the years.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
1670-2	Vanessa Harper	Idaho has been in a drought, and we don't have the water to be giving away to a project like this. We also do not want any blasting going on anywhere near our aquifer. There is not a one of you who knows what blasting the area will do to the water veins that run to the wells that serve Idahoans and their livelihoods.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
1689-1	Tammy Larson	In order to build these wind turbines there will be a lot of blasting through lava rock. Our aquifer is fragile at best. What is all the blasting going to do to our water supply? I don't see any way for that to not effect the citizens negatively.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
1844-1	Matt Reifer	Please provide me with supporting calculations for how the water use was determined shown in Tabel ES-1.	In response to public comments on the project, MVE updated the anticipated water use for the project, as documented in EIS Section 2 (Proposed Action and Alternatives), EIS Section 3.17.1 (Groundwater Quantity), and MVE (2023).
1975-1	Sue Williams	The DEIS fails to address any protections against potential contamination to the Eastern Snake River Plain Aquifer, which has been designated as a Sole Source (drinking water) aquifer by the Environmental Protection Agency. All of the communities surrounding this proposed development depend on this sole source aquifer for their drinking water. Any contamination of it is unthinkable and unacceptable. The Region 10 of the Environmental Protection Agency, James Robinson, has no record of any application from MVE, or any other entity, applying to build over this designated sole source aquifer. Since this proposed project will be built entirely over the designated sole source aquifer, MVE must make an application to the EPA and comply with all building guidelines and restrictions, as well as all operating and decommissioning guidelines and restrictions, in order to safeguard this critical drinking water source.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Sole source aquifer designations establish a review area where the EPA reviews projects that will both 1) be located within the review area, and 2) receive federal funding. Because the Lava Ridge Wind Project will not receive federal funding, it does not require EPA review.
1990-1	Sharon Rogenmoser	We need to ensure that the aquifer is not adversely impacted. I support wind energy, but not at the risk of impacting water sources.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2074-1	Sue Williams	The DEIS has no map showing an overlay of the domestic and agricultural wells in the area with the locations of each of the 400 wind turbine foundations and other project building foundations. There is no analysis data provided by MVE that the blasting that will be required for these new foundations will have no or minimal impact on the continued water supply of wells in the immediate area. With the proposed foundation sizes estimated at 50-75 ft in diameter and up to 12 ft deep, on a variety of hard basaltic flows, MVE needs to show they have examined this potential impact of the proposed ANFO blasting they will use and what the impact will be on these adjacent wells. BLM needs to require this additional work from MVE and that the results of this additional work be included in a further draft EIS for public comment.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2314-1	Mike Tylka	Blasting. When blasting occurs in the near corridor where I live, we can feel it in the house. Those living near the site will also experience this effect day in and day out. As I am on well water, I have concerns that the amount of blasting could potentially alter the underground flow of water to me and the other residents of Jerome County. It could potentially affect the flow of water to the city of Twin Falls. In addition, continual blasting could introduce potential toxins into the water supply. • Water supply. We do have a finite supply of water in the valley. Even though we have access outside the Magic Valley to a water source, we have to ask. “Why should we allow a significant drain on an existing resource?”	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2572-1	Sue Williams	I have read the DEIS and cannot find a map which dislays the locations of each of the domestic and agricultural wells currently present in and around the proposed 197,000 acre site overlaid by the locations of each of the 400 wind turbines. Would you please provide such a map so that substantive comments can be made prior to the deadline.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2848-1	Kim Browne	My concern is the amount of water that it will need to use - when this area is in a drought and has been for many years. Besides the area is ag-will the blastings & drillings affect the ground water in these areas- all new wells and what they will do to the well tat are already here in these areas.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
2849-1	Lorie Race	My concerns deal with the negative impact of the project on bats, deer & antelope that inhabit our region. Also where in the world would that amount of water come from that is needed for the complete drilling. We live in a desert in the middle of a drought. How will the drilling affect the geology of our waters?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2852-1	Mike Telford	1. The construction of 300+ miles of roads and the super heavy equipment plans. The blasting of these huge, approximately 200' holes will have impacts on all the deep wells in the area. The irrigation wells that are from 150-500' deep are all incased. They go through rock & [indecipherable] filled with water. The slightest disturbance could render them unusable. A very in depth study needs to be done before and of this should be considered. Even then the needs are too great. 2. Our farmland water will drop - nobody will [indecipherable].	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2872-1	Vicki Vandever	I live downriver from the huge, incredible, very pure, aquifer that will run underneath these windmills. With all of the construction that will be taking place to install these windmills. I have concerns about what it will do to the underground aquifer. This concern is only the beginning. These windmills will be running for many years. My bigger concern is what it will do over the years with the constant vibrations that will come from these windmills. Can you guarantee that the aquifer will be unharmed? How can you guarantee that? What kind of study would be able to prove that it would have no effect over many years? How would I know that this study is not biased? I also am concerned about all of the demolition of these windmills and when it would be time to take the windmills down. What effect will this have on the aquifer? This is a very vital aquifer used for various purposes.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2883-1	Gary Cox	The IDWR doesn't have a "clear understanding" of the underground geology of the aquifer. The extent of blasting damage and the impact upon the flow of water through the aquifer is not assessed adequately to justify approval. The unintended consequences of such damage to the underground structure could seriously reduce or eliminate the availability of water to the farms, ranches, dairies, and communities dependent upon their wells to draw state-permitted water from the aquifer. The same concern could be voiced for surface canal water. Blasting the underground rock structure could easily open "sink holes" in the canals where none now exist and the canal water drain into such an opening and be gone forever.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2893-1	Sue Williams	I am against approval of any of the proposed Alternatives for the development of the Lava Ridge wind farm based on the following concern for the lack of an EPA permit for construction on a designated Sole Source aquifer, the Eastern Snake River Plain Aquifer. Contact with Region 10 Environmental Protection Agency - Water Resources Administrator, James Robinson, indicates that no application permit is on file from either MVE or LS Power requesting approval to construct the Lava Ridge wind farm. This permit is required by the EPA because the area in question for the project is directly over the designated Sole Source aquifer, which provides sole source drinking water for Twin Falls, Jerome, Lincoln, and Minidoka Counties. Impacts including initial construction blasting, accidental leaks from the 400 wind turbines of contaminating fluids, structure fires involving the 900 liters of oil contained in the nacelle, and wildland fire suppression efforts are all clear and present contamination dangers to this drinking water source.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Sole source aquifer designations establish a review area where the EPA reviews projects that will both 1) be located within the review area, and 2) receive federal funding. Because the Lava Ridge Wind Project will not receive federal funding, it does not require EPA review.
2894-1	Sue Williams	The DEIS has no map showing the locations of each domestic and agricultural well in the area overlaid with the locations of each of the wind turbine foundations in each Alternative and the foundations of each of the proposed support buildings and roadways. There is no analysis data provided by MVE as to what effect on the local wells all of the blasting required for these new foundations will have on current water production.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2922-1	Nancy Dafty	AIB-49 states MVE would closely monitor to reduce the potential for contamination of said aquifer. Closely monitoring this blast area will not be enough. Damage to our aquifer could happen in a heart beat. If something as far away as Challis can cause damage, what could this blasting do?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
2937-1	Kevin Grey	Appendix 3-17 of the draft EIS speaks too briefly of the possibility of damage to underground water supplies and the measures that will be taken to avoid damaging or contaminating existing aquifers. More disturbing is the absence of a clause of cancellation (or at a minimum, steps for repair/mitigation) should construction of the windmill bases (the necessary blasting, especially) create an adverse situation.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3040-2	Cameron Stauffer	In evaluating the EIS for the Lava Wind Project, it lacks description of what each turbine will take to be constructed. Should there be a concern for springs, canals, and aquifer. The EIS needs to consider in further detail the future and long-term impacts of water in the area. [...] Quality, quantity, and continued use of the water should be looked at further.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3062-2	Kate Lopez	Research should be done to look at the results of extensive, deep well drilling on the aquifer or the damage that fracking has done to the underground environment around those sites. Vast disturbance equal to the drilling for 400 turbines will create an unstable area that has the potential to infect the aquifer and southern Idaho drinking water. LS Power won't help us out of that one. We have to protect ourselves now.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3107-1	Julee Austin	I'm writing to voice my concern about the wells that will be drilled in the Eastern Snake Plain Aquifer for the Lava Ridge project. Over time, according to the EIS (Table ES-1; pg. ES-xi), millions of gallons of water (depending on which Alternative is chosen), will be pumped from these wells, which, in turn, will decrease the water table of	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		the aquifer. Water from the surrounding area will naturally slowly refill the aquifer water table, which will then lower the water table from the surrounding private and public wells in the area. Lava_Ridge_DEIS_V1_ExecSum-Chapters.pdf Referencing the You tube video "How do water wells work": If the water is pumped rapidly, which I'm presuming will happen (due to time constraints), this can create a "cone of depression" around the bottom of the well. This will also lower the water table even more from surrounding wells as it refills the cone of depression. Both of these scenarios will eventually decrease the capacity of the nearby wells, and then the wells further out, and so on. If enough water is pumped over time, the water table can lower permanently, which, in turn, could cause the ground surface to go down over time. The ground surface can go down hundreds of feet over years. https://www.youtube.com/results?search_query=how+do+water+wells+work%3A+concerning+reality None of these problems are noted in the EIS.	
3140-4	Susan Page	Will the constant vibration of the heavy equipment cause contamination to the aquifer system. Who pays for the cleaning of the water? Who will be responsible to repair or replace damages. How can the natural water system be repaired?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3168-2	Lisa Dobra	I would like to know what is the resolution should the aquifer become damaged do to blasting or vibration.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3200-1	Name Not Provided	Since this project is most likely going to have possible effects on the aquifer and ground water are there any plans to require LS power to pay for periodic well testing (weekly, monthly, ?) for every well in the magic valley to test for contamination for the life of the project 30+ years and beyond. Should contamination occur what is the resolution ?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3230-2	Gary Carney	Every single industry in Southern Idaho relies on the aquifer and there may be severe damages to the aquifer. The Snake River Plains aquifer is responsible for millions of acres of farm ground and there are recharge stations throughout this project. This could cause serious loss of crop production. The crop production would decimate our dairy, beef, fish, sugar, potato and other agricultural based industries. There has been very little study done to ensure the safety of the Snake River Plains Aquifer, and the needs to be more due diligence involved.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3302-5	Susan Canham	[...] how do they [turbines] affect the aquifer?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3340-2	Sue Page	The LRWP will be sited directly on top of the fragile Snake River Plains Aquifer. The SRPA supplies water to hundreds of thousands of residents. What impact will 525 days of blasting have on our precious aquifer? What happens if it is irreversibly damaged? How will LS Power mitigate their way out of destroying and/or contaminating the source of our water? Do the humans matter? Will the BLM listen to men like Brian, Terry, and Gar - men that have vast knowledge and experience with water issues and the aquifer? How does MVE account for the discrepancy in their water usage calculations. Those with a water background, have calculated a much greater water usage than MVE has determined. These experts have voiced concerns regarding the aquifer. What happens if private wells are damaged or contaminated? People like Julia and Sergio – whose land and well are near the project site – do their lives and property matter? Is the potential for harm to our source of water the ONE thing that will end the nightmare about to descend upon us?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3349-1	Carolyn Dimond, Harold Dimond	Our comments on canal water issues NOT found in EIS 3.17.1 page 3-433 Through the EIS report we couldn't find even acknowledgement of canal water running through the sitting corridors, let alone issues with canals in amongst the project.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3440-1	Chris Mershon	My biggest concern for this project is the potential damage to the Upper Snake River Plain aquifer with the amount of dynamite which will be used for the excavation process for the footings and foundations for each of the wind turbines. I live in an area where dynamite was used on some of the early development of the Horizon Crest subdivision north of Kimberly, ID. The earliest foundations were set using dynamite to break up rock for the foundation and septic systems. As the development grew, this practice had to stop as several wells were collapsed using this practice. The aquifer is the life blood of southern Idaho. I would recommend additional due diligence from an unbiased 3rd party evaluate this process rather than listen to the politically drive sponsors of this project.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3542-5	Sue Page	Why is the government even considering this plan when the possibility for destruction of the aquifer is a possibility? Idahos way of life should not be put in jeopardy. The sole source aquifer of drinking water for Southern Idaho could be destroyed and water contaminated.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3602-1	Sue Page	The greatest concern, which has not been tested or studied, is the vulnerable of the Snake River Plain Aquifer. The proposed site is on the Snake River Plain which is part of the Volcanic Geographical Axial spanning westward from Yellowstone eastward and known as a Volcanic Hotspot. The sole source of drinking water for Southern Idaho known as the Eastern Snake River Aquifer runs underneath this proposed site and there is no study provided by the EPA or the IDWR that takes into consideration the effects the heavyweight vehicles, equipment vibrations, blasting and digging, and the weight of the foundations and wind turbine will have on the Sole Source Aquifer. This system must be protected.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
3725-5	Jerry Ball	he water needed for this project is also of grave concern. The Eastern Idaho Snake River Aquifer is a gem of Idaho. It provides water for agriculture, homeowners and cities throughout Southern Idaho. However, it is in grave danger. The water table is declining at an estimated amount of 1 to 1 ½ feet per year. Our deep well and homestead wells have declined at these rates for a number of years. Any more water taken from this aquifer will jeopardize Southern Idaho Ag, homeowners and city water supplies.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3768-3	Sue Page	What is the plan for replacing the Snake River Aquifer which is the sole source of water for Southern Idaho. How will that get replaced and who will pay for the damage? The water will be there but will it be able to supply Southern Idaho's needs in its current condition or will and who will be responsible for replacement. How can anyone replace what Mother Nature has created?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3997-2	Angelee Eames	2. The EIS states they will conduct 2 blasts per day for 525 days for the construction. What will happen to the aquifer ? The air? The wildlife? They only state they will try for a 1,000 foot barrier from residences,wells or water bodies.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3998-3	Sue Page	What will happen to the Sole Source Aquifer? There is no way to repair the destruction of the Aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
4028-1	Sue Page	Lava Ridge Wind Project spreads over the Snake River Plain Aquifer, the sole source of water for Southern Idaho. This project consists of 400 740ft tall turbines with foundations requirements of blasting into the ground 50 to 60 ft deep and 60 ft diameter. Over 2 million pounds of cement and steel. There isn't any study, as of this moment, of how blasting twice a day for a reported 500 days will impact the underground water system we need to survive. This is our sole source of drinking water. To allow this project to move forward could cause irreparable damage to the aquifer system. Stop any further review or consideration of building on this site. We cannot allow the potential of destruction to occur. Sue Page Kimberly Idaho https://www.wind-watch.org/documents/wind-farms-and-groundwater-impacts-a-practice-guide-to-eia-and-planning-considerations/ <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.wind-watch.org%2Fdocuments%2Fwind-farms-and-groundwater-impacts-a-practice-guide-to-eia-and-planning-considerations%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cf76f5b87abad4178ebe208db18e9b863%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638131164349349811%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=qMp27ZuNg5SshP9isc8AcqMGnef%2FmTi84LNgQDMgAKY%3D&reserved=0>	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
4030-1	Julee Austin	RE: GROUNDWATER/WELLS To whom it may concern, I'm writing this letter because I have some serious concerns regarding possible well and aquifer contaminations and complications in and around the project area. The Eastern Snake Aquifer Plain is the lifeblood of the Magic Valley and Eastern Idaho. The water it provides is used for drinking water, irrigation of crops, and for industrial purposes. Damage to or contamination of the aquifer and surrounding wells could have devastating economic, health, and environmental consequences. I see in the EIS MVE's Appendix F & G, that there are plans in place to mitigate health and safety and potential spills. I appreciate the plans and feel that they have been well thought out, but what has not been addressed is what consequences construction can have on groundwater supplies and what remedies are available. According to the Northern Ireland Environment Agency, during different parts of the construction phases, the impacts in groundwater from constructing a windfarm can include changes in groundwater flow and distribution, and reduction in storage. Also, during different parts of the construction phases, there can be impacts from disturbance of contaminated soil and pollution from spills or leaks. https://www.wind-watch.org/documents/wind-farms-and-groundwater-impacts-a-practice-guide-to-eia-and-planning-considerations/#:~:text=Author%3A%20Northern%20Ireland%20Environment%20Agency%20What%20impact%20can,groundwater%20quantity%20and%2For%20the%20established%20groundwater%20flow%20regime. I'm including an example of a story about the Marsh Line Wind Farm in Ontario, Canada (built over an aquifer), where there were numerous problems with nearby wells, and therefore, drinking water. I realize that the geology of their aquifer is different than ours, but the problem is the potential complications were not addressed ahead of time, and now the homeowner is paying the price of this disaster. https://www.groundwatercanada.com/wind-turbines-and-water-wells-opinion-4260/#:~:text=Simply%20stated%2C%20wind%20towers%2C%20for%20generating%20electrical%20power%2C,agreed%20to%20have%20towers%20erected%20on%20their%20land. The plan to build this project over the Eastern Snake Aquifer Plain that serves most of southern Idaho causes great concern for the future of the area. Therefore, I am choosing Alternative A for No Build.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
41-2	Carson Simper, Clement Simper, Rhoda Simper, Lexi Simper	Drilling of wells on public land that can't possibly be monitored to regulate how much water is pumped from them out of an aquifer that is already seriously depleted by drought I find that the EIS from the BLM does not offer enough data to convince me that the blasting will not affect the aquifer underneath. The aquifer is a natural formation that has been untouched for thousands of years. It feeds all of the Magic Valley with ground water. The blasting, and digging by both excavators and bulldozers could disrupt and disturb it in ways that we can't predict. This could potentially have devastating repercussions for thousands of well users throughout the valley.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
4751-2	Joan Hurlock	A second concern regarding the amount and type of blasting that will take place, is how will 525 days of blasting, with a high explosive impact the Snake River Aquifer? According to an attached excerpt from a research paper titled, "The Effects of Seismic Blasting on Shallow Water Wells and Aquifers in Western North Dakota", the author concludes "Significant changes were noted during the experiment and suggest that blasting can have a permanent significant effect on the physical environment of the aquifer ", and "Subjecting an aquifer to extended	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		vibration, which reportedly can be felt at distances over 1 mile, for extended periods of time, may be more harmful that a single blast impulse". Local water experts agree that the aquifer is fragile and can be easily cracked and damaged. How will Magic Valley Energy mitigate the potential permanent damage to the aquifer and the resulting decrease of the water supply? How will the quality of the water be impacted? While the same paper cited above concludes that the quality of the water is temporarily negatively effected, the author also concludes "The breakdown products of explosives and plastics need to be studied to determine if any potentially dangerous compounds are being introduced into the groundwater environment by practices considered by many to be completely benign." How does Magic Valley energy plan to mitigate the potential effects to the quality of the water supplied by the Snake River Aquifer?	
5183-1	Gary Smith	My primary question is since attending the Capital Clarity online yesterday that was streamed from the Idaho Capital, I learned that to install the Lava Ridge Wind Turbines towers that hundreds of holes will have to be blasted into the lava bedrock that is over the Snake River Plain Aquifer. My immediate concern is the stress and damage that this blasting could do to the structure of the Snake River Plain Aquifer. In addition, the 400 plus 740-foot towers that will be placed in those holes could create more stress from wind and weather that could add to potential stress on the lava bedrock and the aquifer below. That aquifer supplies not only the Magic Valley but extends to Boise and Star and the rest of the Treasure Valley. Since there is a possibility of damage to the aquifer, the water flow and purification process I am bringing this to your attention and that of our elected leaders. I believe all the "communities" that use that aquifer for their water and depend on it every day should have been notified and included from the beginning to meet both NEPA and EIS requirements.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5189-2	Traci Wood	I have concerns with the drilling of 6 wells, 4 of which will be permanent. We already have a drought going on. Does this drilling of these wells impact our well systems at our homes?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5213-1	Sue Page	There has not been any study conducted on the effects blasting over twice a day over 500 plus days will have on the Snake River Plain Aquifer, which is the sole source of drinking water for Southern Idaho. No answers to what this effect, on top of the daily heavy equipment driving over the volcanic lava beds or through the towns leading into the construction zones will have on the aquifer or the probable contamination of the water. Please be reminded that this area is also in the Volcanic Geographical Hotspot which runs from Yellowstone westward through this area onward.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5220-1	Susan Jesser	There are many issues with Lava Ridge but today I want to address the Eastern Snake Plain Aquifer. Can you please help me understand how Magic Valley Energy plans to put 400 wind turbines in southern Idaho? I talked to a kind, helpful employee at Idaho Water Resources in Magic Valley and he pointed me to the Idaho government website. There is a map of the Eastern Snake River Plain Aquifer and a plan to protect that water source. Isn't this plan still in place? How can BLM consider not protecting this aquifer? There is no way even the wisest geologist, engineers, etc. (Plus, they are probably on Magic Valley Energy's pay-roll.) can know the issues of blasting, drilling, placing even 40 turbines (not to mention 400) on Lava Ridge could cause. Please tell me the weight of just one of those turbine monsters will weigh? Have you been to Box Canyon? Niagara Springs? Ritter Island? etc. The sparkling, crystal clear water at these locations comes from the Eastern Snake Plain Aquifer. The Executive Summary on page 7 is copied below since the plan is 37 pages. https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fidwr.idaho.gov%2Fwp-content%2Fuploads%2Fsites%2F2%2Fiwrb%2F2008%2F20080129-ESPA-CAMP.pdf&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C7941fd2a79aa47b3632108db20b9b1d6%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638139754158923900%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=0nyWxLymNdJE1dEwPgjjCS1zMrU%2FYYAVUqLw7oLx3h4%3D&reserved=0 "The ESPA region produces approximately 21 percent of all goods and services within the State of Idaho resulting in an estimated value of $10 billion annually. Water is the critical element for this productivity. The Plan establishes a long-term program for managing water supply and demand in the ESPA through a phased approach to implementation, together with an adaptive management process to allow for adjustments or changes in management techniques as implementation proceeds. Due to the inherent complexities in the management and responses of the river and aquifer to water budget changes, a very deliberate choice was made to incrementally implement the various mechanisms proposed in this Plan. The long-term objective of the Plan is to incrementally achieve a net ESPA water budget change of 600 thousand acre-feet (kaf) annually. It is projected that this hydrologic goal can be achieved by the year 2030 through implementation of a mix of management actions including, but not limited to, aquifer recharge, ground-to-surface water conversions, and demand reduction strategies. The Plan sets forth actions which stabilize and improve spring flows, aquifer levels, and river flows across the Eastern Snake Plain. The goal of the Plan is to: "Sustain the economic viability and social and environmental health of the Eastern Snake Plain by adaptively managing a balance between water use and supplies." The objectives of the Plan are to: 1. Increase predictability for water users by managing for a reliable supply. 2. Create alternatives to administrative curtailment. 3. Manage overall demand for water within the Eastern Snake Plain. 4. Increase recharge to the aquifer. 5. Reduce withdrawals from the aquifer. Immediate implementation of the Plan is necessary to achieve the stated goal and objectives. The Plan approaches the 600 kaf target in phases. The Plan Phase I (1–10 years) hydrologic target is a water budget change between 200 kaf and 300 kaf. Phase I includes site-specific implementation actions based on the anticipated hydrologic effect of those actions, as outlined in Section 3.2.1. The water budget adjustment mechanisms include: A. Ground water to surface water conversions. B. Managed aquifer recharge. C. Demand reduction, including: 1. Surface water conservation. 2.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).

		Crop mix modification in the Aberdeen/ Bingham groundwater district. 3. Buyouts, buy-downs, and/or subordination agreements. 4. Rotating fallowing, dry-year lease agreements, and Conservation Reserve Enhancement Program (CREP) enhancements. D. Pilot weather modification program. E. Minimizing loss of incidental recharge. To ensure that the valuable input of stakeholders continues during the implementation of Phase I and the design and implementation of subsequent phases, this Plan establishes an Implementation Committee. This committee will provide recommendations to the Board concerning Phase I implementation, assessment of Phase I effectiveness, definition of subsequent phases, and coordination of activities necessary for implementation. This committee will also evaluate the effectiveness and viability of continuing Plan implementation during Phase I. The Implementation Committee will include representation, at a minimum, from all interest groups currently represented on the ESPA Advisory Committee."	
5331-3	Joan Hurlock	The LRWP will be sited directly on top of the fragile Snake River Plains Aquifer. The SRPA supplies water to hundreds of thousands of residents. What impact will 525 days of blasting have on our precious aquifer? What happens if it is irreversibly damaged? How will LS Power mitigate their way out of destroying and/or contaminating the source of our water? Do the humans matter? Will the BLM listen to men like Brian, Terry, and Gar - men that have vast knowledge and experience with water issues and the aquifer? How does MVE account for the discrepancy in their water usage calculations. Those with a water background, have calculated a much greater water usage than MVE has determined. These experts have voiced concerns regarding the aquifer. What happens if private wells are damaged or contaminated? People like Julia and Sergio – whose land and well are near the project site – do their lives and property matter? Is the potential for harm to our source of water the ONE thing that will end the nightmare about to descend upon us?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5341-1	Vicki Vandever	I live downriver from the huge, incredible, very pure, aquifer that will run underneath these windmills. With all of the construction that will be taking place to install these windmills. I have concerns about what it will do to the underground aquifer. This concern is only the beginning. These windmills will be running for many years. My bigger concern is what it will do over the years with the constant vibrations that will come from these windmills. Can you guarantee that the aquifer will be unharmed? How can you guarantee that? What kind of study would be able to prove that it would have no effect over many years? How would I know that this study is not biased? I also am concerned about all of the demolition of these windmills and when it would be time to take the windmills down. What effect will this have on the aquifer? This is a very vital aquifer used for various purposes.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5362-1	Harold Dimond, Carolyn Dimond	Our comments on ground water issues found & not found in EIS 3.17.1 pg. 3-433 & EIS Appendix 2 are as follows: We were particularly interested in comments made by Brian Olmstead at a February 2 meeting held in Jerome, where he stated that he had experienced contamination of wells near blasting that was done when building a substation for the Twin Falls Canal Company. After searching the EIS, we could not find where this issue was properly addressed and evaluated. This is of MAJOR concern. Not only was the contamination not properly addressed neither was there any mention of how blasting hundreds of times to build foundations for the turbines could alter or even plug the aquifer—nor were the effects of heavy equipment and trucks traveling excessively over the aquifer and cause vibrations with the probability of ground shifting in the basalt and changing underground water travel and sources. We have personal knowledge of some wells in this area right now showing signs of caving. We suggest that this evidence needs to be addressed and that there is probable changes of devasting consequences to the water that supplies many of our homes,, farms, even our very livelihoods and also having life threatening consequences to underground habitats of the local wildlife.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5441-1	Stephanie Novacek	ow would groundwater withdrawals needed for the project affect groundwater quantity in the area? DEIS pg. 3-441 states “Even if future trends double the demand to the aquifer, the volume of water stored in the aquifer is so large that the effects would not be substantial.” Our aquifer is a finite source of water. The citizens of Magic valley are not willing to play Russian Roulette with our water supply. Why should LS Power be allowed to conduct twice daily blasting that could possibly affect the aquifer? Who is willing to legally testify there would be no damage to the groundwater, the lava tubes or the EISRA? Is LS Power prepared to correct any affected water levels their six wells may have on surrounding established wells, such as deepening or drilling new wells for the land owners? I doubt even LS Power’s bank account could possibly cover the costs of damaging the largest aquifer in the U.S. How would project ground disturbance affect wetlands and surface waters (e.g., streams, canals, and ponds) in the analysis area? The Gooding-Milner Canal had multiple leaking sites that took years to mend. If LS Power affects this water delivery system during the agricultural growing season, will they be ready to pay everyone for crops that would be affected? This could include alfalfa fields that are on 4 -5 year rotation. If a farmer’s first year alfalfa planting is damaged due to irrigation interruption, an 80 acre field could equate to $300,000 payment to one individual.(80acres x 2.5T= 200T x $300((current price))= $60,000 x 5 years = $300,000)	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project’s use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
5820-1	Brian Olmstead	All areas in the aquifer have different percolation rates. IWRB that I am a member of has tried other recharge sites in Lava Rock that will hardly take any water. One of those was near Wendell along the North Side Canal on a lava bed. Mile Post 31 and Wilson Canyon are BY FAR the best recharge sites in the State of Idaho because of the extremely porous nature of the Lava Beds there! The more porous, the more likely contamination. So it is true that ITD or others have blasted in lava rock, and not had a contamination event, or at least not a reported one. In road building you are usually blasting or cutting through a ridge, and filling in a low area. If it were the opposite and the blasting occurred in the same area that a lot of water collects, I contend there would be a much	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		higher likelihood of contamination, depending on how porous the lava they exposed is. Has every blast site in the Lava Ridge area been evaluated for porosity, and runoff collection? Sure doesn't say so in the DEIS	
5821-1	Brian Olmstead	And Just so I mention another flaw in the DEIS: I am confident that hundreds of blasts within 2 miles of the Milner Canal will open new or previously sealed sinkholes that if occur during the summer could certainly cause a crop catastrophe! One other thing I mentioned to you yesterday: During spring melts, like what is happening now, bacteria laden water always collects in low areas that now have soil that filters that water and slowly percolates it into the porous lava strata below. So, if any of the blast areas for tower foundations are in a low area, that same run-off water now instead of collecting and slowly filtering, will travel very rapidly into the aquifer (exactly like MP 31 does) and will carry pollutants with it. Any area like this now becomes in my opinion a new man made recharge site and should require monitoring wells just like ALL of the recharge sites we at IWRB have created above the ESPA! These monitoring wells are very expensive and have to be monitored in perpetuity by IWRB.. the same requirement should apply to the Applicant. The water quality in the ESPA cannot be risked for ANY REASON!	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5882-1	Jeff Juker	Who is going to moniter the water used for construction? We live on an aquifer that has provided the Magic Valley for years. If this project is approved we stand to loose that water. Please consider this among the many other issues	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022). Also, per BLM-required measure AA, MVE would have to monitor water use on project groundwater wells.
5896-7	Mike Tylka	Blasting. When blasting occurs in the near corridor where I live, we can feel it in the house. Those living near the site will also experience this effect day in and day out. As I am on well water, I have concerns that the amount of blasting could potentially alter the underground flow of water to me and the other residents of Jerome County. It could potentially affect the flow of water to the city of Twin Falls. In addition, continual blasting could introduce potential toxins into the water supply.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5896-8	Mike Tylka	Water supply. We do have a finite supply of water in the valley. Even though we have access outside the Magic Valley to a water source, we have to ask. "Why should we allow a significant drain on an existing resource?"	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
5920-3	Kelly Varelmann	I believe most importantly, 500+ days of 2X day underground blasting will most certainly have unknown effects on our already compromised aquifer. Why would the BLM even be considering endangering our aquifer? How will this affect the water supplies of the nearby towns and cities not to mention the irrigation water of the many farms and ranches down the line?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6000-1	Todd Grant	I am very much concerned about the under ground water aquifer system under the wind turbine project. I am very concerned that this could upset the aquifer system through out Idaho.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6032-3	Peter Richardson	The investor-owned utility serving the project area in Southern Idaho, Idaho Power, has significant amounts of coal generation in its resource stack. Idaho Power and PacifiCorp jointly own the Jim Bridger coal plant near Rock Springs, Wyoming. In addition, Idaho Power and NV Energy own equal shares of the North Valmy Coal Plant in Northern Nevada. In total, Idaho Power relies on the Bridger (707 MW) and Valmy (261 MW) coal plants for over 840 MW or about 25% of its capacity needs.8 Coal and gas plants consume tremendous amounts of water to generate electricity. Because Lava Ridge will displace imported power used by Idaho Power (as discussed above) Lava Ridge will actually REDUCE water consumption to the extent that displaced power is currently generated at the power company's coal and gas plants. A good rule of thumb is that any displaced electricity will roughly equal the utility's overall generation mix. In this instance, about one out of every four kilowatts of power displaced by Lava Ridge comes from the company's water consuming behemoths, the Jim Bridger and Valmy Coal Plants.9 According to the Wyoming Water Development Office, the Bridger coal plant consumes (with no return flow whatsoever) approximately 34,000-acre feet of water from the Green River every year. That water is simply evaporated into the atmosphere in one of the Plant's cooling towers. 10 According to the Wyoming Water Development Office, the Jim Bridger Plant is a zero-discharge facility - meaning the water taken from the Green River is lost forever to any further beneficial usage downstream. The Green River is, of course, a major source of water to the upper Colorado River system, which is in the midst of a record shattering drought. The Valmy plant in northern Nevada consumes about 1,500 acre feet of ground water annually. Valmy uses groundwater sources that are pumped from the Humboldt River basin.11 Although the Green River and the Humboldt River are not part of the Snake River/Columbia River drainage system. It is irresponsible to ignore the fact that Lava Ridge will reduce water consumption activities in two drought impacted river basins in the Western US.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
6075-1	Lorinda Grant, Douglas Grant	We are concerned with the damage the blasting may cause to our homes well water and the water we use to water our crops during the farming season. The aquifer is located under the ground that MVE plans to blast for base construction of the turbines. Will this blasting effect that aquifer? Will the water levels change? Is MVE going to cover the cost of us having to dig deeper and/or new wells? Will it contaminate the aquifer that we survive on?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6339-1	Chris Austin	So my biggest concern is the aquifer and water contamination. I'm hearing that the MVE doesn't think the blasting is going to affect the aquifer, but what if it does? We have not discussed this, and I can't imagine how	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		high explosives won't affect it. I strongly believe that we need some guarantees and some alternate plans if it does.	
6354-1	Jean Mollenkopf Moore	The LRWP will be sited directly on top of the fragile Snake River Plains Aquifer. The SRPA supplies water to hundreds of thousands of residents. What impact will 525 days of blasting have on our precious Aquiver? Wells will go dry.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6387-2	AJ Whitecotton	As I am on well water, I have concerns that the amount of blasting could potentially alter the underground flow of water to me and the other residents of Jerome County. It could potentially affect the flow of water to the city of Twin Falls. In addition, continual blasting could introduce potential toxins into the water supply. [...] We do have a finite supply of water in the valley. Even though we have access outside the Magic Valley to a water source, we have to ask. "Why should we allow a significant drain on an existing resource?"	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6511-1	Kelly Varelmann	I believe most importantly, 500+ days of 2X day underground blasting will most certainly have unknown effects on our already compromised aquifer. Why would the BLM even be considering endangering our aquifer? How will this affect the water supplies of the nearby towns and cities not to mention the irrigation water of the many farms and ranches down the line?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6525-1	Mike Miller	Due to water levels in the ESPA dropping , in 2015,and after years of litigation between the Idaho Ground Water Appropriators and the Surface Water Coalition of Magic Valley an agreement was reached to reduce water usage by 240,000 acre ft. and the Magic Valley Coalition agreed to only use water between April1 thru Oct. 31.* Hence this time 2015 , more lawsuits have been filed between the ground water users and the surface irrigators, and junior water right holders have had to curtail irrigation volumes even more.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
6843-3	Charlene Phillips	Regular maintenance of the windmills requires a huge use of two of our limited natural resources----oil and water. As the area is primarily considered as desert, the question becomes "What water rights do they have?:	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
6848-3	Gary Smith	If the applicant, BLM and all agencies involved in this application and decision process cannot demonstrate with certified proof that their blasting and the stress of the wind turbine towers on the lava bed over time will not change the natural aquifer and agree to repair any and all damage to the aquifer if and when discovered then I ask that BLM does not approve this project at Lava Ridge.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6868-3	Barbara Martien	Noted that the following areas were not completely covered. [...] Effect of blasting on aquifer system and the effect on the Snake River. The Snake river is a vital resource to many communities.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6903-7	Todd Wells	-The impact of the development of the proposed project could likely have severe, unknown impacts on the underlying aquifer. Drilling, blasting, and countless loads of heavy traffic has been shown in other areas to negatively impact underlying aquifers.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
6910-4	Public Comments Lincoln County Community Center	I talked to Phil Hummer on the Water Resource Board and I have personally rented water from the water bank; sometimes it's available, sometimes it isn't. Mr. Hummer, I ask him, I says, do we have a lot of water bank water available here? And he said, depends on what part of Idaho you're in. And I mentioned, I says, Lincoln County, Jerome County, and Minidoka County. He says, it is very short here. I said, so if somebody wanted to come in and buy a lot of water rights, would it be available? And he questioned it. He said -- and then I asked, if they are going to drill wells to get their -- I want to make sure I don't get surface water and groundwater mixed up here -- drill wells to get groundwater? He says, we don't want any wells drilled. We'll let them buy water, but we don't want them to drill wells. They're going to drill six wells. This is insane. My well went dry at home, my house well, a few years ago, and a number of others did, also, because the groundwater level went down. So some good meaning farmers in the area said, well -- who were irrigating all of their ground with groundwater, said, we will buy some surface water and irrigate as much crop ground as they can, which amounted to hundreds of acres, if not thousands of acres, and we will use that water instead of pumping groundwater. And that was at great cost to them because they had to put underground pipe in so that they could bring the surface water to irrigate their crops.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
6910-8	Public Comments Lincoln County Community Center	At this farm location, all our irrigation water is from the aquifer, which is deep wells. My residential potable water is also from the aquifer. One of my concerns is with the blasting that will need to take place to secure the windmill bases, that it has the potential to contaminate the groundwater for agriculture use and also for my home. I have concerns over diminishing and depleting the aquifer through the blasting. There hasn't been a sufficient or significant amount of studies done to quantify the effect of blasting to see how it could affect the aquifer, so more time is needed to conduct these studies.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
7330-1	Sue Page	There hasn't been any geophysical on-site testing to determine if the terrain of the Snake River Plain Aquifer is a viable option. The area sits on top of the Volcanic Geographical Axial spanning westward from Yellowstone through Craters of the Moon and further west through Shoshone and Salmon Falls ad onwards. There hasn't been any testing of this Lava strata to prove that blasting with 126,000 pounds of ANFO for 500 plus days at twice a day, just for the foundations, then the actual foundation weight coupled with the turbines and blades.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
		Then the weight of the wind turbine coupled with the vibrations caused by the spinning will go down into the ground and radiate down and outward for how far and wide? Will the constant vibrations cause further fractures in the basalt causing the ground to crush and either contaminate or stop the flow of the aquifer all together? Mitigation clause notes no consideration. So if testing isn't done and the lava fields give way crushing the sole source of water for Southern Idaho how will and who will pay for something that is irreversible and nonreparable?	
7332-1	Gary Smith	I am writing about the Lava Ridge Wind Turbine Project. I live in Star, ID and our city limits border on BLM land and we rely on the Snake River Plain Aquifer that runs under Boise and Star. Any interruption of the water from that aquifer would impact my family my community and many other Idahoans in Treasure Valley and the Magic Valley. I learned that this project sits on top of the Snake River Plain Aquifer that supplies water to both the Magic Valley and the Treasure Valley. The site that is proposed is made of basalt lava flows. This fragile bedrock provides a natural purification system and channeling for the water in the Snake River Plain aquifer. I have also learned that to install these massive towers, that hundreds if not thousands of holes will need to be "blasted" into that lava bed that makes up the aquifer. Blasting fragile material like this and placing 400+ 740-foot wind towers into the lava bed to me does not sound like the best location for a wind turbine farm. In my opinion the continuous stress on these towers from wind and weather and weight over time could, in my opinion lead to damage to the lava bed and the aquifer and its ability to supply water to our communities without interruption or worst total blockage. I am asking my Congressional leaders to investigate how this project could impact the Snake River Plain Aquifer a key part of the Idaho ecosystem and request that BLM deny this application at this location.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
7371-2	Mary Leavitt	Water concerns are at the top of my oppostion list. We worry about our water, and the possiblilty of contamination, reduction of water resources available, and the worst case scenario of the planned seismic blasting of the lava rock creating major problems with the aquifer. Our residential well in Buhl draws from the aquifer. Our irrigation, crops, livestock, power generation, and fish propegation for our Hagerman property all depend on spring water that flows from the lava cliff walls along the Hagerman Valley. Any disruption in the aquifer- be it contamination, reduced flows, etc. will result in catastrophe for us, and THOUSANDS of others in the the Magic Valley. There is insufficiant data in the DEIS to offset these concerns, and frankly there is no liability large enough to cover damages for LS Power/Magic Valley Energy set forth should our water source be negatively impacted.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
7382-2	Diana Nielson	Aquatic Resources Inventory Report is inadequate and mentions very little about seasonal water pooling that is utilized by migratory waterfowl and for natural aquifer recharge. Not a single lake, reservoir or canal mentioned by name for the local community. Our desert is alive because water is such a critical need. Reference from page 13 is data that is seasonal: weather reference in not reliable resource for information for this area, yet is does say it was a below average water year. The Shoshone, Dietrich zip codes refer you to a weather tower in Richfield. Other parts of Hidden Valley refer you to Burley Weather station. Other area Twin Falls.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). As mentioned in EIS Section 3.17 (Water and Wetland Resources), numerous data sources were used in the EIS (the EIS was not limited to Aquatic Resources Inventory Report (WEST 2021)).
7382-3	Diana Nielson	Appendix A page 5 of 39. Why use numbers lay people have a hard time referring to and not add the to the codes regional names that are recognized by locals. The coding is not viewable (that I can find) on your references. The soil maps are difficult to identify an area also. I had to use multiple sources to find the areas. Mule Shoe Lake w-kl-001 w is wetland: above unnamed area is wetland Owinza Butte Lake W KF-002w wetland and it is split into 2 portions Western EcoSystems Technology, Inc. (WEST) 2021. Lava Ridge Waters and Wetland Desktop Screening and Field Survey Methods. T echnical Memorandom. Prepared for Magic Valley Energy, LLC, Chesterfield, Missouri. Prepared by Western EcoSystems Technology, Inc. Laramie, Wyoming. July 6, 2021.	This report was not prepared by the BLM. This report provides background material to the BLM's EIS analysis.
7382-4	Diana Nielson	From Ref Page 13 The page used as reference has error 404 page not available and the data was very old if used. The EPA has new Wetland Rules and Regs. US Army Corps of Engineers (USACE). 2008. Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region. J. S. Wakeley, R. W. Lichvar, and C. V. Noble, eds. ERDC/EL TR-08-28. Wetlands Regulatory Assistance Program. US Army Engineer Research and Development Center (ERDC), Vicksburg, Mississippi. September 2008. Available online: http:// www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb1046489.pdf	See response to comment 7382-3 (see in Table A-3z, Water and Wetland Resources).
7416-1	Sue Page	Part of the Snake River Plain Aquifer is southwest of Lava Ridge and in harms way, as well. Thousand Springs will be destroyed if we allow blasting to occur at Lava Ridge or at any other site in this Snake River Plain. The whole Plain is constructed of gravel, lose sediment and basalt which is what allows the water to freely flow. Please listen to this video and determine for yourselves, how can the fractures not be destroyed by the blasting, heavyweight equipment and the vibrations of these huge beast.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
7612-2	Nathan Thompson	I am concerned about the negative impacts this will have to the wildlife in the area, peoples access to the property, farmers around the proposed area, and importantly the underground water that will most certainly be affected by the blasting that will be required to build this wind farm. I have a well in the area that my family uses for drinking water, and don't trust that my water will not be affected.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
7757-1	Jana Kaiser	The placement of these wind turbines, the tallest and largest in Idaho and the nation, will be directly over our aquifer. I understand there will be blasting 2 times a day for over 500 days. I recently listened to Brian Olmstead head of Twin Falls Canal Co and with his permission I use his remarks here. The Twin Falls Canal Co blasted a half mile along the canal to install a seasonal hydro power plant on the Low line canal, this was a number of years ago. The blasting resulted in damage to every well within three-quarters of a mile from the blasting. The damage caused by the blasting was taken care of by Twin Falls Canal Co who made repairs to those wells, and bore the financial losses to do what's right by the Idaho citizens. I have neighbors who are taking water samples to be tested to determine a base for the quality of their water today, with the idea that they may need this information in the years to come. I have studied and reviewed the ground water information in the EIS page 3-352 3.13-1. The ground is listed and divided into 19 areas 2 areas are listed as Very Fragile 1 Moderately Fragile and the remaining 15 areas are Fragile. All the features we view above the ground: Wilson cave, Lava fields north of Shoshone, Craters of the Moon, are also found under the ground, lava tubes, caves, rivers, lakes, and they are comprised of basalt from lava flows, and yes this is an extremely fragile soil/rock formation, and it's a fact that this rock is easily changed, eroded and damaged. The blasting materials will be 120 pounds twice a day of high explosive ANFO (ammonium nitrate fuel oil) which produces a shader & destroy effect with shock waves both below and above the ground. The time frame is expected to be 525 days. Provided there are no delays subject to weather and working conditions. The damage blasting will cause will be considerable. However on page 3-441 3.17.1-4 it states: " With the implementation of ground water related applicant-committed measures and other mitigation residual effects in ground water quality are not expected and compensatory mitigation is not proposed." The construction and blasting will create fractures, sinkholes, and increase the aeration of the ground, which will contaminate the groundwater. I find it irresponsible to allow this type of abuse to our public lands, watersheds and aquifer. Along with their irresponsible behavior we the Idaho citizens will suffer from loss of value of our homes, land, and farms. We will bear the cost (if at all possible) of repairing or replacing wells, both domestic and agricultural.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8113-3	Dawn Leiske	We cannot afford to lose our water from haphazard blasting into our aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8206-3	Sheryl May	We are concerned with the drilling and blasting, and its affect on the aquifer	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8256-4	Sue Page	The brutal attack on top of the Snake River Plain Aquifer blasting for over 500 days using 126,000 pounds of nitrate and fuel oil (ANFO), which is transported by tanker truck and pumped into the holes. When filled with ANFO, a blasthole 400 mm (about 16 inches) in diameter and 7.5 metres (about 25 feet) deep can develop about one billion horsepower.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8376-4	Rachel Espil	Impacts on water? Drought and a vastly growing population are already taking their toll on the water in the region, what will this project do to an increasingly scarce and prized resource?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8421-2	Brian Olmstead	Today I want to talk about how terrible the estimates of water-use are in this totally glossed-over DEIS, and other impacts to the aquifer that are not addressed at all! I worked for Twin Falls Canal Company for 22 years, was General Manager from 2008-2021, and dealt with Eastern Snake Plain Aquifer issues on a daily basis. This aquifer provides at least ½ of the natural flow water used by Magic Valley Farmers every year! The amount of water in the ESPA has been declining steadily for 60+ years now and has reached an absolutely critical level! The State of Idaho and thousands of Idaho water users are spending millions of dollars each year to try to stop this decline and reach a sustainable level of water in the ESPA, because it IS the lifeblood of Idaho! There has been a moratorium on any new irrigation or commercial well drilling on the ESPA for many years now. So, in my opinion, we should not allow even one drop of water to be withdrawn to support this ill-conceived, poorly planned, and wrongly sited project!	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
8421-6	Brian Olmstead	Uncontrolled canal losses during the irrigation season are a BAD thing, and will be a major disaster for thousands of acres of downstream crops! I don't see this in the DEIS either.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8450-2	Sue Page	Lava Ridge Wind Project spreads over the Snake River Plain Aquifer, the sole source of water for Southern Idaho. This project consists of 400 740ft tall turbines with foundations requirements of blasting into the ground 50 to 60 ft deep and 60 ft diameter. Over 2 million pounds of cement and steel. There isn't any study, as of this moment, of how blasting twice a day for a reported 500 days will impact the underground water system we need to survive. This is our sole source of drinking water. To allow this project to move forward could cause irreparable damage to the aquifer system.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8458-4	Sue Page	Structures at Minidoka National Historic Site or the aquifer running underground?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8500-2	Sue Page	There has not been any substantial testing proving the Snake River Plain Aquifer is capable of withstanding the effects of this many 740ft Space Needle sized turbines.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8630-1	Joseph Aitken	Our concern is the lava Ride Wind Project may cause our water well to be reduced in quality and reliability due to the blasting of wind turbine foundations in the hard lava rock area. Any blasting that causes deep lava cracking of the aquifer floor may cause the current floor to diminish and or be lost to new levels below our group.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8642-3	Carl Montgomery	Beyond the issues stated above, water use by the wind farm would be a pull from a vital resource to the area. It may or may not be a substantial amount comparatively, but when considering this project will be in a desert that	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2

Comment ID	Commenter	Public Comment	Response to Comment
		has been in a drought with current users being restricted, it is not responsible to add more strain to the aquafer and overall water situation.	(Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
8643-3	Steve Woods, Pam Woods	A question must be asked about the impact of explosives used to prepare the bases of the towers and other structures. The proposed area is full of lava beds. The structure of the lava beds is important to the collection and quality of aquifer recharge water. Potential collapse of the lava structure cannot be ignored. There are sensitive lava tubes throughout the area.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8670-1	Nancy Huddleston, Terrell Huddleston	My wife and I are 72 and are life long residents of Idaho. Nancy lived in Kooskia and Kamiah until she graduated from the U of I when she married me and moved to Buhl. I have lived in Twin Falls and Buhl my whole life except when attending the U of I where I obtained a masters degree in Fish Culture and Disease. I worked 40 years in the Idaho aquaculture industry for Clear Springs Foods as farm operations manager for most of my career. I was responsible for water flow measurement and reporting spring flow measurement where Clear Springs Foods held water rights for approximately 870 cfs of spring flow (aquaculture water rights are non-comsumptive) from the Eastern Snake Plain Aquifer (ESPA). I am very familiar with water rights and spring flows from the ESPA and their relationship to the Snake River, downstream/upstream water rights and impacts to resident and anadromous fish populations in the Snake and Columbia River systems. My comments will focus primarily on groundwater pages 3-433 to 3-447. There are things that I did not see mentioned in these pages such as the fact that the ESPA is an over-appropriated water resource where there are more water rights issued against the ESPA than there are groundwater or spring flows emanating from the aquifer. In the 1980s groundwater rights holders established the Idaho Water Alliance (IWA) to fund and establish aquifer recharge projects which could take surface water in high snow pack years to be diverted or conveyed to aquifer recharge sites where the water would be charge the aquifer to help stem the declining and over-appropriated spring flows. I was the president of the IWA during most of the 1990s. After more than 30 years of effort and investment by water right holders and the State of Idaho, aquifer recharge is a meaningful program today. Surface water in good snow years is recharged into the ESPA. Ground water pumpers, farmers and ranchers, formed Idaho Ground Water Associations (IGWA) groups. The IGWA groups tax themselves based on their water rights to fund aquifer recharge to mitigate loss of unfulfilled water to senior water rights holders. Seniors had placed calls on junior right holders. These actions were taken due to the Prior Appropriations Doctrine or first in time is first in right. Idaho has helped fund and manage aquifer recharge by appropriations in good budget years to pay for conveyance costs of recharge water through our canal systems above the aquifer and for development of recharge site structures. The Idaho Water Resource Department has assisted through funding an Aquifer Recharge Coordinator position. Twin Falls, Eden, Hazelton, Kimberly, Jerome, Gooding, Wendell, Hagerman, Buhl, and Bliss all get most of their municipal water from the ESPA as do most of the upstream municipalities. The water rights against the ESPA are not just local farmers and ranchers, aquaculture both private and public, and municipalities, but also a myriad of downstream water rights holders in the Snake and Columbia River systems including resident and anadromous fisheries, hydropower, irrigation, recreation, tribal, and navigation to name a few. There is no or little mention of these considerations in the pages that I reference in the EIS. Comments about the vast size of the ESPA and the high transmissivity and instantaneous recovery (section 3.17.1.1) make the ground water for wind turbines seem like a small ask. Those with investment of time and money into protecting and stabilizing groundwater from the ESPA know that it is a sensitive critical water resource for Idaho. It is an integral and very large component of the Snake River system. The EIS makes the ESPA seem like a limitless water resource when in truth every drop of flow has prior claims against it. Following are quotes from just the first paragraph of page 3-440: "Total water consumption by the project would be less than 0.001% of the overall amount of water within the ESPA. A hydrologic analysis of the project indicates that project groundwater use would drawdown existing groundwater wells close to the project wells 0.00 to 0.04 feet after 30 days of continuous pumping. None of the project phases would impact aquifer recharge to the Snake River." The EIS paints a very different picture than the over-appropriated scenario I have described above. It is a combination of all the water rights that make the ESPA not able to supply water to all the water rights. The first paragraph 3.17.1.2.6 CUMULATIVE IMPACTS on page 344.1: "The project (400 acre feet over 34 years) when combined with existing and future trends and actions (1.14 million acre-feet annually) would be a very small portion of overall aquifer discharge (approximately 8.22 million acre feet of water annually, most of which flows into the Snake River). Even if future trends double the demand to the aquifer, the volume of water stored in the aquifer is so large that the effects would not be substantial." The paragraph above certainly emphasizes the idea that any water consumed relative to the Lava Ridge project is simply not significant. These pages reference 600 gallons per minute total rate of water pumping for the project from 6 wells (alternative B). 600 gpm/454 gpm/cfs = 1.322 cfs x 1.983 af/day/cfs = 2.622 af/day x 364 days/yr = 954.4 af/yr x 34 years = 32,450 af over 34 years, not 400 af over 34 years as stated above. Equally ridiculous is the idea that if future trends double, the aquifer volume is so large that the effects would not be substantial. All of the water that flows out of the aquifer and into the Snake River already has valid water rights against it, ie over-appropriated. To harvest more water would require mining the aquifer with very deep wells which are deeper than the outflow elevations of the discharge springs of the ESPA. These are big errors and poor levels of explanation and understanding. It is mentioned that water for roads can be pumped from canals, but that water also requires water rights and some crops won't get watered. It is also mentioned that little of the water may actually get used while it is also mentioned that water may be needed for plant mitigation/ restoration long term, as well as dust control, and even for mitigation for feed for ranchers.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).

Comment ID	Commenter	Public Comment	Response to Comment
8683-4	Wayne Fischer	3.17.1 Ground Water This is my biggest concern and send chills up my back. Blasting for 520 days, twice a day to dig very large holes in the ground to support the base of these wind generators, will most likely destroy the lava aquifer under each wind generates for a mile of two. Lava is a very soft porous rock where the water in the aquifer slowly moves downhill to Thousand Spring on the north side of the Snake River Canyon. The aquifer also provides ground water for numerous farms, several cities and many rural homes as well. Where is the study that proves that the aquifer will not be heavily damage or even be totally destroyed? There should be absolutely no effect of any kind to the aquifer and the ground water. Note that the ground water moves very slowly through the aquifer, so it would take years before any damaged done would be documented. And then if there was extensive damage or destruction of the aquifer, there would be no way of rectifying the damage.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8741-1	Richard Dinges	Construction of the Lava Ridge wind farm will have a detrimental effect on the underlying aquifer. The Snake River Plane Aquifer runs beneath the Lava Ridge project. The water flows in a very circuitous route beneath the surface. There is solid basalt, fractured basalt, layers of sand and layers of gravel. Over centuries, the water flow has established a pattern that is recognized by the wells that draw from it. With a projected two year time period of construction and with blasting every day to prepare foundations for the turbine towers, the effect on the aquifer flow can be profound. The shock waves from the dynamite blasts could cause some water flow routes to become blocked. The downstream effects may take months, even years to show up. Wells could dry up or require deepening. The economic loss would be born by the user with no recourse to the project developer for compensation. With a situation that cannot guarantee no harm will come to the aquifer flow, one must error on the side of caution. The NO BUILD OPTION must be selected. If this project goes forth, it will be under the proviso of LETS BUILD IT AND THE WE WILL FIND OUT WHAT THE PROBLEMS ARE.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
9289-2	Steve Ballard	One of the main concerns I have is the water that they will used to construct and maintain roads from dust abatement. Water is a precious commodity here in the state. Even when the project is completed they will still have to use water for dust abatement. Which has not been calculated in the project.	See response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
9473-2	Jeffrey Warren	One major concern is the Snake River Aquifer beneath the proposed site. Can you effectively test for and/or predict what will happen after all the blasting with high explosives that must occur to construct such a project? What effect will that have on our precious water supply? Petroleum products are used to maintain wind turbines, what effect will years of leakage from 400 turbines have on our water supply?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
9690-1	Stephanie Novacek	I am writing to express my absolute opposition to the Lava Ridge proposed wind site in Jerome, Lincoln and Minidoka counties. My main objection is due to the possibly unknown affects on our Eastern Snake River Aquifer. Below are three items(in blue) that are inaccurately addressed by the DEIS: "Peak construction would occur between weeks 14 and 54, and groundwater use would be highest during that time." The DEIS does not address groundwater consumption rate during the peak agricultural growing season and how it would avoid drawdown on the surrounding wells. During the hot summer growing season, water is paramount to farmers. Any interruption to an irrigation schedule can be devastating during July or August typical temperatures. It can severely reduce total crop yields(hay tonnage, sugar beet tonnage, 100cwt of beans or grains). "A hydrogeologic analysis for the project indicates that project groundwater use would drawdown existing groundwater wells close to the project wells 0.00 to 0.04 feet after 30 days of continuous pumping (Idaho Water Engineering 2021). (Though the exact location of the groundwater wells would be determined during final design, estimated project well locations would be 1,400 to 11,600 feet from existing groundwater wells.)" The project impacts to groundwater quantity would be measurable but would not be apparent to adjacent water users, including during the highest project groundwater use during construction. The DEIS does not address the possibilities of affecting existing groundwater wells, since it does not know the location and/or depth of each and every water table and established wells. Measure bbb: MVE would gain a clear understanding of the local hydrogeology as determined by Idaho Department of Water Resources and the BLM. Areas of groundwater discharge and recharge and their potential relationships with surface water bodies shall be identified prior to blasting and excavating. If construction activities near aquifer recharge areas cannot be avoided, they would be closely monitored to reduce the potential for contamination of said aquifer. This measure would further reduce impacts to groundwater quantity by ensuring that existing conditions are thoroughly understood before construction. "if construction activities near aquifer recharge areas cannot be avoided, they would be closely monitored to reduce the potential for contamination of said aquifer". This statement indicates they grossly lack understanding of our underground aquifer and it's maintained level of cleanliness and availability to South Central Idaho. It should be illegal for any turbine site to be located anywhere near aquifer recharge areas. Idaho's aquifer provides water for homes, businesses and agriculture from Rigby to Fruitland. Why the risk of the possible damage to the ESRA is even considered remains a mystery to me. If damage to surrounding wells or the infrastructure of the aquifer were to happen, who will pay? I doubt even LS Power has enough financial security to cover the conceivable litigation costs of such a ruinous event.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Also see response to comment 10426-2 (see in Table A-3z, Water and Wetland Resources). Text was added to EIS Section 3.17.1.2 (Groundwater Quantity, Impacts) to clarify the project's use of water rights and relation to the *Amended Snake River Basin Moratorium* (IDWR 2022).
9913-1	Michael and Susan Pohanka	My wife Susan and I are opposed to Lava Ridge project for the following two reasons. First our domestic water comes from our well in which our pump sets at 135 ft. The turbines will be set over the aquifer which is our main source of our water. Knowing the depths that the foundations will have to be dug for the wind turbines, the only only way to get to those depths for the foundations is to blast through the lava rock. There is no doubt that the cinders will end up being in the water that will destroy ours and other domestic pumps. The cinders will eat through the impellers thus having to replace our variable speed drive pump and the estimated cost to replace our domestic pump is estimated at approximately $3,500.00.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Wildlife, including Big Game

Table A-3aa. Wildlife, including Big Game

Comment ID	Commenter	Public Comment	Response to Comment
1042-8	WildLands Defense	Further, we are dismayed that BLM has let the WEST consultants slide by with this shoddy industry-biased wildlife analysis. An example of BLM negligence is Pygmy Rabbits – where there have been no actual current on the ground surveys – instead the EIS states: "Potential pygmy rabbit habitat in and around the siting corridors was identified using a desktop assessment (WEST 2021a) that considered vegetation type, soil depth, and fire history factors (Rachlow and Svancara 2006). Approximately 31,761 acres of potential pygmy rabbit habitat were identified (WEST 2021a); 17,571 of those acres are located in the siting corridors, which is the analysis area for pygmy rabbit (see Figure 3.18-7). Because the soil and vegetation data used in the desktop analysis are relatively coarse, they may not capture all potential habitat pygmy rabbit habitat in the siting corridors. For example, some of the area south of Sid Butte in the easternmost siting corridors contains suitable soils and mature sagebrush …".; This illustrates how shoddily the company treats wildlife – the company sits in the office and runs some models – without ever looking at the land.	Preliminary desktop habitat assessments were used to identify areas for field verification surveys as described in Section 3.18.4.1 (Pygmy Rabbit, Affected Environment). Although these field verification surveys did not cover all of the suitable pygmy rabbit habitat in the siting corridors, preconstruction pygmy rabbit clearance surveys would be required in all suitable pygmy rabbit habitat (see additional measure eee).
1042-17	WildLands Defense	The sound of such gargantuan turbines disturbing areas many miles from the project and further disrupting nesting, wintering, breeding wildlife must all be assessed with detailed noise studies and visual studies in the local environmental over all seasons and weather conditions. What frequencies will turbines of this immense type produce? How will project sights and sounds disrupt bat hibernacula, nesting birds, wintering sage-grouse, wintering big game, nesting migratory songbirds, and people's pets – both alone and combined?	The results of the project-specific viewshed analysis (SWCA 2024) are summarized in EIS Section 3.16 (Visual Resources) and the results of the project noise technical report (SWCA 2022) are discussed throughout the resource sections in EIS Chapter 3 (Affected Environment and Impacts) and AIBs in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief), as appropriate. Impacts to bat roosting habitat are disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat), impacts to greater sage-grouse are disclosed in EIS Section 3.3.4 (Greater Sage-Grouse), impacts to big game are disclosed in EIS Section 3.18.2 (Big Game Habitats and Populations), and impacts to migratory birds are disclosed in EIS Section 3.3.2 (Avian Populations); see also Table App3-1 in EIS Appendix 3. Noise impacts in residential areas are also disclosed in Table App3-1 (see AIB-20).
10432-1	JoEllen Clayton	Another thought concerning the waste of Idaho land is where will the wildlife go when they no longer have a habit to live in? Closer to cities and towns in Idaho? That would be detrimental to the well being of both human and wildlife. Wouldn't that cause the human-wildlife conflict to spiral out of control?	Effects to wildlife, including disturbance and displacement, are discussed in EIS Section 3.18 (Wildlife).
10512-8	S. (No Last Name Provided)	There is also the pygmy rabbit which has an S3 rating for species of greatest needs and their populations are weak but there good populations of them in Lincoln County and Jerome County. Is it a good idea to tear up thousands of acres of habitat to put these wind turbines in with their accompanying roads and traffic? Once again, another significant miss in the EIS.	Effects to pygmy rabbit and its habitat are described in EIS Section 3.18.4 (Pygmy Rabbit). No pygmy rabbits or their sign were detected during MVE's pygmy rabbit surveys. Although these field verification surveys did not cover all of the suitable pygmy rabbit habitat in the siting corridors, preconstruction pygmy rabbit clearance surveys would be required in all suitable pygmy rabbit habitat (see additional measure eee).
1083-1	Richard Gailey	The area that is platted for the wind farm is some of the best cotton tail rabbit hunting I have found. It is perfect habitat for the cotton tail rabbit. It is also great habitat for the pygmy rabbit, which once was in abundance in the Western United States. Now they find themselves on a list of endangered or species of greatest conservation need. There are thirteen species in Idaho on this list, five which are bats, which could greatly be affected by these huge wind-mills, and a secondary affect would be an increase of the bug population that would plague the farmers who in turn would have to use more chemicals on their fields to try to control them. The increase in chemicals would increase the damage to our environment added as a result of the so called green energy project proposed. It has been proven that chemicals have an effect on different species of bird life. Chemicals have been banned that proved to have an effect on the birds eggs, which in the early seventies put Bald Eagles on the endangered species list. Banning certain chemicals help restore the Eagle populations, but cut the effectiveness of insect control. No chemical can replace the natural control lost with the loss of the bats in the area,	Potential impacts to pygmy rabbit are disclosed in EIS Section 3.18.4 (Pygmy Rabbit) and potential impacts to bats (including those designated as SGCNs) are disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat). Other special-status species are addressed throughout EIS Chapter 3 (Affected Environment and Impacts) and EIS Appendix 3 (Issues Analyzed in Brief). Approximately half of all existing wind energy turbines are located in cultivated cropland (Harrison-Atlas et al. 2022); concerns have been raised that continued conversion of farmland to wind energy development can reduce overall agricultural output (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017), but in none of these cases has a reduction in crop productivity or yields due to increased populations of harmful insects been documented. Given the prevalence of wind energy turbines in agricultural lands and the lack of documented declines in crop productivity in the vicinity of these turbines, it is unlikely that that there would be increases in harmful insect populations that would have negative economic consequences for the local agricultural economy. Accessed December 29, 2023.
11326-6	Filip Camacho, Tasha Sorensen	Unfortunately, in the West, both dark sky sanctuaries and intact public land ecosystems are becoming rarer and rarer. In November of 2022, the Bureau of Land Management (BLM) issued Instruction Memorandum IM 2023-005 addressing habitat connectivity on public lands. As fish and wildlife habitat across the West becomes increasingly fragmented and functionally challenged, remaining habitat will become increasingly less resilient and able to sustain robust fish and wildlife populations, especially in transition ecosystems similar to those areas	IM 2023-005 instructs BLM state offices to conduct an assessment of existing priority habitats on BLM land and the connectivity between them, which is intended to guide future land use planning efforts and decisions that involve habitat conservation and restoration. The potential impacts to special-status wildlife were carefully considered during project siting and the development of the range alternatives analyzed in the EIS. In addition to MVE's applicant-committed measures, the BLM has developed a number of other mitigation measures to

Comment ID	Commenter	Public Comment	Response to Comment
		surrounding Dietrich, Shoshone, Gooding, Richfield and others. These transition landscapes provide much needed food, water, shelter and space for seasonal migrations, especially for big game species and migratory birds. In the proposed project area, migrating and resident avian and terrestrial species would be significantly impacted and the range of Alternative in the DEIS fails to consider those impacts.	minimize or avoid impacts to wildlife that would be included in the terms and conditions of the ROW grant, if one is issued (see EIS Appendix 4 [Mitigation]). EIS Section 3.18 (Wildlife) describes migratory habitat and routes in the analysis area and discloses the potential for significant impacts to big game species and wildlife movement in general. Impacts to migratory birds are disclosed in EIS Section 3.3 (Avian and Bat Species); see also EIS Appendix 3 (Issues Analyzed in Brief). The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the location and use of mapped migration and movement corridors and stopover sites, and the range of potential impacts on these corridors and stopover sites based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The BLM worked closely with IDFG to compile and analyze the best available information to disclose impacts to big game migratory corridors as accurately as is possible. The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use, including additional stopover sites that have been identified. See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).
11326-7	Filip Camacho, Tasha Sorensen	Transmission and interconnection infrastructure, needed to get energy resources to market, could easily be the largest threat to intact public lands, outdoor recreation and fish and wildlife habitats across the West. We need an all of the above energy strategy in the U.S. that includes both traditional and renewable energy resources. With rapidly changing technology, the BLM should review project requirements for consistency with technological advances. The BLM should consider whether these features adequately account for and mitigate the impacts of wind development for big game and avian species. Federal land management agencies need to prioritize improving protections for migratory animals instead of just looking at curtailment strategies used to mitigate or manage loss. This information is lacking in the DEIS.	Regional transmission infrastructure is beyond the scope of this EIS. Big game are discussed in EIS Section 3.18.2 (Big Game Habitats and Populations) and avian species are discussed in EIS Section 3.3 (Avian and Bat Species). These sections describe the mitigation measures that would be implemented to minimize or avoid impacts to these species; see EIS Appendix 4 (Mitigation) for a complete list of mitigation measures.
11336-2	Nathan Schutte	2. Vibrations. It has been discussed that these large sized wind turbines can produce vibrations that effect several species of birds, bats, mammals, and humans. I didn't see any study on how the vibrations directly related to the wind turbines would affect the local wildlife and human population. The project site sits on large Lava Rock deposits and vibrations from the footings could carry long distances and have a negative effect on the area. With the quantity and size of the proposed turbines, this effect would be double in compared to the size of turbines that have actually been constructed in the wind industry.	A literature review did not identify any publicly available literature indicating that vibration from operational turbines can significantly impact wildlife. Concerns with vibration from wind turbines are primarily related to the generation of low-frequency noise (also known as infrasound). Although research in this area is limited, the predicted effects of infrasound are similar to those for noise at audible frequencies (Lovich and Ennen 2013). The discussion of impacts to wildlife from noise in EIS Section 3.18 (Wildlife) and EIS Appendix 3 (Issues Analyzed in Brief) provide sufficient disclosure of effects to wildlife from noise, and therefore, further analysis of impacts from infrasound in the EIS is not warranted. See also the response to comment 3873-2 (see in Table A-3t, Pollinators and Insects) for a discussion of impacts to terrestrial invertebrates from vibrations caused by wind turbines.
11458-2	Kathy McKenzie, Bret McKenzie	Raptor & Bats--the use of " May" help save lives & " does not Appear " to threaten populations is very very weak. The " Appear to be" death counts are summarized from comparing existing wind farms but when the peak level of deaths have occurred from this oversized experimental project no MVE Take Permit from IF&G is going to stop the continuing destruction of Idaho's wildlife--it will be too late and beyond the control of Idaho. With the death of so many raptors & bats an environmental imbalance will happen resulting in an over population of rodents & insects in this state, effecting our framers and households alike.	As stated in EIS Section 3.3.1 (Bat Populations and Roosting Habitat) and EIS Section 3.3.2 (Avian Populations), the estimated avian and bat fatality rates presented in Table 3.3-4 and Table 3.3-12 are not intended to be precise predictions but are presented to allow for a meaningful comparison between the alternatives. These fatality estimates also do not account for the implementation of mitigation measures that would be implemented to minimize or avoid impacts to bats and birds; see EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts), EIS Section 3.3.2.2 (Avian Populations, Impacts), and EIS Appendix 4 (Mitigation). IDFG would not issue a take permit for the project because no such permit exists. As described in EIS Section 3.3.3.2.2 (Eagles, Alternative B [Proposed Action]), MVE has applied for an eagle ITP from USFWS, the issuance of which is a decision separate from BLM's decision to grant MVE a ROW for the project, and the USFWS is evaluating the effects of granting the ITP in a separate NEPA document.
11491-25	Dean Dimond, Jennie Bateman	8. New information and specific changes in wildlife corridors on federal lands due to number of acres and densities of proposed project	Impacts to general wildlife movement are disclosed in EIS Section 3.18.1 (Wildlife Movement [non-game mammals and reptiles]); additional species-specific discussion, including impacts to known migratory corridors, are disclosed in EIS Section 3.18.2 (Big Game Habitats and Populations). These analyses were prepared with the best available scientific data; refer to the data sources listed in the introduction to each section for additional details.
11491-26	Dean Dimond, Jennie Bateman	20. New information detail of impacts on wildlife and fisheries from the state G&F Agency regarding impacts on wildlife corridors.	See response to comment 11491-25 (see in Table A-3aa, Wildlife, including Big Game) regarding wildlife corridors and data sources evaluated in the EIS, which includes data obtained through coordination with IDFG and other state and federal agencies. Impacts to wildlife are disclosed in EIS Section 3.18 (Wildlife); see also EIS Section 3.3 (Avian and Bat Species), and EIS Section 3.11 (Pollinators and Insects). Impacts to fish are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief).
11499-1	Sarah Corran	I am writing to highlight the negative effects of the Lava Ridge Wind Farm on the desert ecosystem in and around the project area. In particular, I am concerned about the impact of the wind farm's access roads and the increased recreational vehicle traffic that may result from the project. Studies from other wind farms have shown that adding miles and miles of access roads to remote areas can have negative effects on the surrounding ecosystem. These roads can fragment habitats, create barriers to wildlife movement, and lead to soil erosion and runoff. Additionally, the increase in recreational vehicle traffic that may result from the project can further exacerbate these impacts by disturbing the climate and ecosystem. One study that highlights the importance of such an analysis is the study of the effects of wind farms on the Mojave Desert ecosystem in California. This study found that the construction of wind turbines and associated access roads led to habitat fragmentation, soil erosion, and an increase in the number of invasive plant species. The study concluded that a comprehensive analysis of the potential impacts on the desert ecosystem was necessary to ensure that the wind farm did not compromise the health and well-being of the ecosystem. Another study that underscores the need for a	Refer to Table 2.4-1 and Table 2.4-2 in EIS Section 2.4 (Alternative B [Proposed Action]) for details on new and improved roads that would be constructed for each of the action alternatives. Impacts from road construction and improvement are discussed in detail in numerous resource sections in EIS Chapter 3 (Affected Environment and Impacts). Miles of new and improved access roads are used as impact indicators for several resources. A number of mitigation measures would be implemented to minimize or avoid effects associated with project access roads; a complete list is provided in EIS Appendix 4 (Mitigation). Habitat fragmentation from roads is discussed in EIS Section 3.18 (Wildlife), soil erosion is discussed in EIS Section 3.13 (Soils), and impacts to water resources from runoff are discussed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief; see AIB-48). Effects from increased recreational vehicle traffic are discussed for many of the resources analyzed in detail in EIS Chapter 3 and resources analyzed in brief in Table App3-1.

Comment ID	Commenter	Public Comment	Response to Comment
		comprehensive analysis of the impacts of wind farms on the surrounding ecosystem is the study of the Maple Ridge Wind Farm in New York. This study found that the construction of wind turbines and associated access roads led to the fragmentation of the surrounding forest and wetland habitats, which had negative effects on the ecosystem as a whole. The study concluded that a comprehensive analysis of the potential impacts on the surrounding ecosystem was necessary to ensure that the wind farm did not compromise the health and well-being of the ecosystem. Given these examples and the potential negative impacts of the Lava Ridge Wind Farm on the desert ecosystem in the area, I urge you to conduct a comprehensive analysis of the potential impacts on the surrounding ecosystem. This analysis should include an evaluation of the potential impacts of the wind farm's access roads on habitat fragmentation, soil erosion, and runoff, as well as an assessment of the potential effects of increased recreational vehicle traffic on the climate and ecosystem.	
11527-14	Richard Stover; State of Idaho	The DEIS states that each of the Project's action alternatives would likely have adverse effects on existing wildlife resources, including habitat and populations of migratory pronghorn, migratory mule deer, greater sage-grouse, migratory birds, and bats that occur at least seasonally in the Project area. These wildlife resources are priorities for the State of Idaho. Thus, the FEIS and ROD must fully analyze and disclose Project effects of each action alternative on these priority wildlife resources and fully mitigate for adverse Project effects of the selected alternative, including avoidance, minimization, and compensatory mitigation measures as appropriate.	Pronghorn, mule deer, greater sage-grouse, migratory birds, and bats are discussed in EIS Sections 3.18.2 (Big Game Habitats and Populations), 3.3.4 (Greater Sage-Grouse), 3.3.2 (Avian Populations), and 3.3.1 (Bat Populations and Roosting Habitat), respectively; see also EIS Appendix 3 (Issues Analyzed in Brief). Other wildlife species are addressed in EIS Sections 3.3.3 (Eagles), 3.11 (Pollinators and Insects), 3.18 (Wildlife Movement), 3.18.3 (Amphibians), and 3.18.4 (Pygmy Rabbit); see also EIS Section 3.15 (Vegetation). Each of these sections analyzes and discloses the effects of the action alternatives on wildlife and their habitat and described the mitigation measures that would be implemented to minimize or avoid these impacts, as well as potential compensatory mitigation measures (where warranted); see also EIS Appendix 4 (Mitigation).
11535-12	Steven Andersen	The DEIS relies heavily on databases, literature, and deficient site-specific surveys, rendering the DEIS woefully inadequate as to baseline impacts. While review of literature and databases is an important subset of regional presence-absence data, it cannot replace focused or protocol surveys that provide site-specific accuracy and essential information on irreparable impacts. Even sophisticated models are known to consistently underestimate real world presence-absence data—which is even more true in this project given its unprecedented magnitude. 20 It is apparent from the DEIS that the analysis did not adequately consider estimates of occupancy of various target species. More specifically, while the DEIS may have attempted to detect the presence of target species, such as avian population, wildlife, amphibians, etc.—even at that it wholly failed—the DEIS did not consider the absence of target species, even though those target species may in fact occupy the territory. An observed absence could be the result of the survey method failing to detect the presence of the species that is actually resident at the location (e.g., the species was then-currently present elsewhere within its home range).21 However, that does not mean that the species is necessarily "absent." The DEIS makes this mistake throughout generally all of the impact sections concerning target species. Ignoring such detection of "absent" target species creates a false baseline, i.e., a "false absence." In other words, the effect of ignoring imperfect detection is that estimates of occupancy and related parameters can be (and are) biased, resulting in misleading inferences about the system and leading to erroneous management (or development) decisions.22 The results of any purported analysis that ignores such detection therefore represents only a surveyor's ability to find the target species in the landscape, not where the species actually is in the landscape. 23 At its simplest, a bird species (which the DEIS purportedly analyzed) may simply fail to call during a timed audio survey, or an animal (such as big game, which the DEIS also purportedly analyzed), may not happen to walk across a tracking plate or within view of a surveyor (if one is even present).24 The DEIS did not take this into account for any of the identified wildlife species, and the BLM must conduct substantial site-specific25 surveys for each of the target species—modern technology does not resolve the non-detection issue.	The baseline resource studies conducted for the project are one of many sources that were evaluated in the determination of which species may be present in the siting corridors. See the data sources listed in the introduction to each resource section in Chapter 3 (Affected Environment and Impacts) for additional details.
11535-61	Steven Andersen	Furthermore, the DEIS does not address fire impacts on animals. "Fire may affect wildlife through (1) direct mortality, (2) reduction of habitat, or (3) a reduction in habitat quality."205 As discussed above, short-term and long-term fire effects on wildlife are related to fire impacts on vegetation, which in turn affect habitat quality and quantity, including the availability of forage shelter.206 Moreover, "[l]ong-term changes in vegetation from a fire (such as loss of sagebrush or the invasion or increase of nonnative annual grasses) may affect food availability and quality and habitat availability for wildlife; the changes could also increase the risk from predation for some species[.]"207 Additionally, fires directly impact certain burrowing animals. Reports show the death of burrowing animals from asphyxiation in their burrows during fires.	The BLM has included a discussion on how invasive plant species alter fire regimes. The BLM has also described how the changing fire regimes could negatively impact wildlife, including sensitive species, such as sage-grouse.
11535-65	Steven Andersen	Wildfire Cumulative Effects The project's potential to ignite fires and interfere with suppression of wildfires in an area known for high wildfire risk should be considered in conjunction with the impacts of the region's recent history of wildfire events. Not only is interference with fire suppression inconsistent with the Monument RMP (as outlined above), it further will degrade wildlife habitat (already struggling to recover from past wildfires), further aggravate soil erosion and negatively impact fragile soils, destroy natural vegetation (relied upon by wildlife and cattle), increase noxious weeds, threaten livestock, crops, property, and human life, and have serious, long-term impacts on the entire regional ecosystem. This region cannot withstand cumulative effects from wildfires alone.	The BLM has included a discussion on how invasive plant species alter fire regimes. The BLM has also described how the changing fire regimes could negatively impact greater sage-grouse and other special-status species that rely on sagebrush habitat, wildlife, and livestock grazing.
11535-73	Steven Andersen	Moreover, the DEIS states that "exposure to contaminants such as herbicides may impact individuals" it makes no mention of herbicide exposure to vegetation and wildlife. During operation of a wind energy project, wildlife may be exposed to accidental spills or releases of pesticides, fuel, or hazardous materials. Exposure to these materials could affect reproduction, growth, development, or survival of exposed individuals. If the magnitude and extent of the spill and subsequent exposure are sufficient, population level effects may be incurred.	Impacts to vegetation and wildlife from herbicide exposure and impacts associated with herbicide leaks and spills are described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-47 and AIB-58. Herbicides will be applied in accordance with the procedures described in the Noxious Weed Management Plan (Appendix R in MVE [2023]).

Comment ID	Commenter	Public Comment	Response to Comment
11535-87	Steven Andersen	Wind energy has the potential to contribute to the problems associated with habitat loss and fragmentation despite the fact that a matrix of relatively undisturbed habitat can exist among turbines and other infrastructure. In fact, species that avoid vertical structures and need large unfragmented habitats are especially at risk to wind energy development. Wind requires less infrastructure but result in higher levels of habitat fragmentation, because their impacts are geographically scattered rather than concentrated. 269 The associated infrastructure required to support an array of turbines—such as roads and transmission lines—represents an even larger potential threat to wildlife because such infrastructure can result in extensive habitat fragmentation and can provide avenues for invasion by exotic species.270 The DEIS does not consider these issues.	The disturbance estimates and associated analysis of impacts to wildlife from habitat fragmentation are described in EIS Section 3.18 (Wildlife); additional discussion of effects to wildlife habitat and habitat use, including effects from the introduction or spread of nonnative plant species is provided in Table App3-1 of EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1, AIB-8, AIB-41, AIB-57, AIB-61, AIB-62, and AIB-63. Nonnative plants will be controlled in accordance with the procedures described in the Noxious Weed Management Plan (Appendix R in MVE [2023]).
11535-144	Steven Andersen	One of the biggest threats to BLM special-status plants is the use of herbicides, for which the DEIS wholly fails to account. The specific section of the DEIS that addresses BLM special-status plants makes no mention of the application of herbicides.	See EIS Appendix 4 (Mitigation) for a complete description of mitigation measures that would be implemented to minimize or avoid impacts to BLM special-status plants, including BLM approval of all herbicide applications, adherence with the SOPs in the 2007 and 2017 BLM vegetation treatments using herbicides programmatic EISs (BLM 2007, 2016) (applicant-committed measure 101 and BLM-required measure Z), and avoidance or mitigation of impacts to BLM special-status plant populations during operations (additional measure kkk). Therefore, impacts to BLM special-status plants from herbicide applications are not anticipated.
11535-145	Steven Andersen	In fact, it is expressly admitted that “MVE has not committed to complete avoidance of BLM special-status plants.”427 This is crucial because many of the mitigation efforts are applied under the discretion of MVE. For example, if MVE determines avoidance of construction in areas of sensitive resources is not feasible, “construction would be allowed to proceed with approval from the Authorized Officer, and MVE would consider relocation of plants per the direction of the BLM.” 428 It would seem that what is feasible is completely under MVE’s discretion and all it has to do is consider relocation of plants.	See EIS Sections 3.15.1.2.2 and 3.15.2.2.2 for a description of additional avoidance and minimization measures that are not included in MVE (2023) but would be included in the terms and conditions of the ROW permit, if a ROW is granted and Alternative B is selected. This includes additional project-specific measure kkk, which would require MVE to avoid conducting any construction, maintenance, or decommissioning activities that would disturb BLM-listed sensitive plant individuals and habitat until the BLM determines sufficient mitigation measures are implemented. These measures would also apply to Alternatives C–E and the Preferred Alternative.
11535-157	Steven Andersen	The DEIS lumps all wildlife movement together under one section. Yet, “the specific effects of turbine construction and presence may be modulated by habitat type (e.g., grassland or forests), the habitat suitability at the site, the wind turbine type (e.g., height, size, configuration of a wind park) and species-related behavioral traits (e.g., disturbance sensitivity, antipredator behaviour),”434 which ultimately makes “displacement effects due to wind turbine development also highly species specific.”435 “[E]ven if the effect of wind turbines on a species is unknown, evidence-based information on species’ habitat selection and spatial requirements is often largely available or can be generated with relatively low effort from existing data sources.”436 Experts recommend that “this knowledge should be applied to determine prohibition zones for wind turbine development and advocate that the precautionary principle is used to protect viable populations of species and not only individuals.437 Each road built displaces terrestrial wildlife and impacts wildlife populations and causes stress and elevated energy use for those that remain. The DEIS must conduct a species-specific movement analysis to truly understand the extent to which species will be displaced from the land.	As stated in EIS Section 3.18.1.1 (Wildlife Movement [non-game mammals and reptiles], Affected Environment), “Sagebrush steppe habitat supports a variety of wildlife species; a review of existing data sources (IDFG 2020) identified occurrences of four amphibian species, 73 bird species, 12 fish species, eight invertebrate species, 13 mammal species, and nine reptile species in the siting corridors and surrounding region, though these data likely underestimate the local biodiversity, especially for smaller, less-studied taxa. Pollinators and insects are discussed in Section 3.11, big game species are discussed in Section 3.18.2, amphibians are discussed in Section 3.18.3, and avian and bat species are discussed in Section 3.3. Fish are analyzed in brief (AIB-55 and AIB-56) in EIS Appendix 3. Therefore, the discussion in this section focuses on the following species not discussed in other sections of this appendix and EIS: Small mammal species such as shrews (*Sorex* spp.), voles, rabbits, squirrels (including Piute ground squirrel), and mice Larger non-game mammals such as coyote (*Canis latrans*), yellow-bellied marmot (*Marmota flaviventris*), and skunks A variety of reptiles such as lizards and numerous species of snake”
11535-158	Steven Andersen	This section does not account for the decrease in genetic diversity caused by impeded wildlife movement. Roads can serve as barriers to the movements of small mammals as well as those of large ungulates and carnivores.438 The reduction of animal movement associated with roads also serves to genetically isolate populations. Gerlach and Musolf (2000) indicated that highways had an important effect on gene flow and genetic structuring of bank voles (Clethrionomys glareolus) in Germany.439 Moreover, Epps et al. (2005) reported that highways contributed to the rapid decline of 27 populations of desert bighorn sheep (Ovis canadensis) because gene flow was eliminated between populations, resulting in a rapid reduction in the genetic diversity of desert bighorn sheep populations.440 Lode (2000) concluded that road traffic effectively isolated the vertebrate populations he studied by influencing species demography and population exchanges.441 Furthermore, Forman (1998) believed that the barrier effect that subdivides populations, thereby imposing genetic consequences on these populations, is one of the most important effects roads impose on ecological communities.442 The DEIS fails to consider, let alone provide mitigation measures for the foregoing irreparable impacts.	Decreased gene flow is one of many affects associated with habitat fragmentation and barriers to wildlife movement (see EIS Section 3.18.1 [Wildlife Movement (non-game mammals and reptiles)]); impacts to big game from habitat fragmentation and barriers to movement are disclosed in EIS Section 3.18.2 (Big Game Habitats and Populations). See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game). Species-specific analysis of the relationship between habitat fragmentation and gene flow is provided in EIS Section 3.18.4.2.2 (Pygmy Rabbit, Alternative B [Proposed Action]). Further discussion in the EIS would be inconsistent with 40 CFR 1502.2(a).
11535-166	Steven Andersen	The DEIS did not take a hard look at the irreparable impacts to amphibians in the proposed siting corridor (even less where the turbine location is still unknown). Specifically, “[t]hus, while BLM (2005) provides sufficient disclosure and analysis of the effect of habitat loss on general wildlife species … additional site-specific discussion of potential impacts to amphibian breeding habitat is warranted.”444 This additional “site-specific discussion” has not yet been conducted, despite the agency indicating it is necessary. Importantly, because this site-specific discussion has not been conducted, the DEIS indicates that thus far, “[t]he only amphibian species that has been documented in the siting corridors is western toad (Anaxyrus boreas).” 445 This is concerning because not only is the western toad located in the proposed siting corridor, but also the western chorus frog, northern leopard frog, great basin spadefoot toad, boreal chorus frog, and sierran treefrog.446 None of these amphibians were given proper attention during the analysis.	See EIS Section 3.18.3.1 (Amphibians, Affected Environment) for a description of amphibian species that may occur in the siting corridors. Impacts to amphibians are described in EIS Section 3.18.3.2 (Amphibians, Impacts).
11535-167	Steven Andersen	The DEIS also failed to adequately consider the impact roads will have on amphibians. As stated in the DEIS, the project proposes at a minimum 101 miles of new roads, with a maximum of 486 miles of new road.447 This magnitude of land disturbance and fragmentation will cause irreparable harm to the local amphibian population. Habitat requirements of amphibians vary seasonally, and thus, distribution of resources across the landscape relative to roads can influence mortality.448 These resources are associated with refuge, mates, and prey that	EIS Section 3.18.3.1 (Amphibians, Affected Environment) describes amphibian use in the siting corridors, including patterns of habitat use and typical dispersal distances. EIS Section 3.18.1.2 (Wildlife Movement [non-game mammals and reptiles], Impacts) describes affects to wildlife movement from habitat fragmentation and

Comment ID	Commenter	Public Comment	Response to Comment
		tend to be concentrated in distinct habitats that are patchily distributed.449 Amphibians migrate in mass numbers between breeding ponds and terrestrial habitats.450 These taxa are therefore dependent on “landscape complementation” (a measure of proximity of critical habitat types and dispersal ability of the organism) to successfully complete their life cycles.451 When roads fragment such habitats, the probability that individuals will be killed or injured by traffic during movements in search of resources, increases, as does the resistance of the landscape to such movements.	injury or mortality from vehicle strikes on project access roads; additional details specific to amphibians are provided in Section 3.18.3.2 (Amphibians, Impacts).
11535-168	Steven Andersen	Further, the DEIS fails to take a hard look at the impact of “off-road” effects, as pertaining to amphibians. The combined outer limits of the manifold ecological effects involving species, soil, and water that extend beyond the road surface describe a “road-effect zone.” 453 The zone is irregular with boundaries dependent on the sequence of ecological variables, and disparate effect-distances due to nature’s directional flows such as slope, wind, and habitat suitability on opposite sides of a road.454 The data suggests that the combined effects (thermal, hydrological, chemical and material pollutants, sediments, noise, invasion of roadside species, and human access affecting wildlife, fire, and sensitive habitats) extend outward for greater than 100 meters from the road edge.	See EIS Section 3.18.3.2 (Amphibians, Impacts) for a discussion of potential indirect effects to amphibian breeding habitat, including effects from noise and human presence, stormwater runoff, pollution, and sedimentation. Impacts related to increased fire risk are described in EIS Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression). Potential impacts to wildlife habitat from the introduction or spread of nonnative plant species are described in Table App3-1 of EIS Appendix 3 (Issues Analyzed in Brief); see AIB-57. EIS Section 3.18.3.2.2 (Amphibians, Alternative B) describes avoidance and minimization that would be implemented to minimize or avoid impacts to amphibians and their breeding habitat, which includes preconstruction surveys and avoidance of disturbance within 330 feet (approximately 100 meters) of occupied habitat or additional mitigation where avoidance is not possible (additional measure cc, also see EIS Appendix 4 [Mitigation]). This buffer is consistent with the Habitat Management Guidelines recommended by Partners in Amphibian and Reptile Conservation (Pilliod and Wind 2008) and is of sufficient size to address indirect impacts to habitat from access road construction. Additionally, as specified in applicant-committed measure 123, “Where impacts on wetlands are not avoidable, site-specific crossing plans and measures to mitigate impacts would be submitted to the appropriate regulatory agency. MVE would implement the applicable U.S. Army Corps of Engineers (USACE), Idaho Department of Water Resources (IDWR), and BLM standards (e.g., erosion and sediment control measures, culverts sized in accordance with USACE and BLM standards, etc.) for all road crossings or other work in wetlands or waters to ensure protection of water quality and to maintain the hydrology of affected areas.” Pilliod, D.S., and E. Wind (eds.). 2008. *Habitat Management Guidelines for Amphibians and Reptiles of the Northwestern United States and Western Canada*. Technical Publication HMG-4. Birmingham, Alabama: Partners in Amphibian and Reptile Conservation.
11535-169	Steven Andersen	Problems arise when wildlife use road systems for movement, because roads are designed to serve as travel corridors for human purposes that do not provide the quality of environment necessary for wildlife health—which the DEIS does not take into account.456 Unlike natural corridors, roads frequently cross both topographic and environmental contours thereby fragmenting a range of different habitat types, extending the range of impacts to many wildlife groups possessing a diversity of life history strategies.457 Road construction results in habitat destruction with a replacement zone of intense human activity and subsequent alteration of wildlife habitats and behavior.458 The transformation of physical conditions on and adjacent to roads eliminates areas of continuous habitat and simultaneously creates edge effects that extend beyond the duration and extent of construction; something greatly compounded in this case given the unprecedented magnitude of the Lava Ridge project.459 These edge effects create habitat of compromised quality, which can result in wildlife death that actually occurs off-road.	See EIS Section 3.18.1.2 (Wildlife Movement [non-game mammals and reptiles], Impacts) for a discussion of impacts to wildlife movement, including direct and indirect effects from construction of new access roads and increased vehicle traffic. Additional discussion of indirect effects to wildlife habitat from access road construction can be found in the biological resource sections in Chapter 3 as well as Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief).
11536-8	Richard Llewellyn	Herein lies an acceptance of an almost certainty for failure for restoration, and belies the larger assumptions and pretenses of the entire EIS – successful restoration of the sage steppe plant community, and the foundational sage brush, is essential to mitigate harm to populations such as raptors, bats, and ungulates, especially pronghorn. Although the referenced cover and diversity thresholds are absent from the EIS, and could not be located online, the overwhelming conclusion of scientific evaluation of restoration efforts is that a 5 year time frame is unrealistically optimistic to achieve and ensure native sage steppe community restoration after disturbance.	The assumed timeframe for recovery of sagebrush steppe is 50 years; final reclamation would begin in year 34, after decommissioning is complete and continue through year 39, at a minimum. Complete recovery of sagebrush steppe vegetation would not be expected until year 84. As described in EIS Section 3.15.1.2.2 (Native Upland Vegetation Communities, Alternative B [Proposed Action]), MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria, which would ensure that desired vegetation communities are restored following decommissioning (see also BLM-required measure P).
11547-3	Lowell Ihler, Carol Ihler	3. Our understanding is that BLM is to protect the land and wildlife and manage it for all people and wildlife. This is public land and NO corporation should be allowed to destroy it with huge wind turbines and and noise that no one is certain that it will not affect the animals and people in a negative way. Studies have been done in other countries as well that show there are possible effects to people and animals, both those that live above ground and those that burrow or live underground. In the United States there are documented accounts of how wind turbines in the ocean are affecting the whales and other sea life.No reason to believe that the turbines won't affect the wildlife here in the same way. The DEIS states it would take 80 years to restore some of the lost wildlife etc. Why would that be allowed when it is the duty of BLM and the Fish and Game to protect these species.	Adverse effects on wildlife and humans from construction, operation, and decommissioning of the project are disclosed in EIS Chapter 3 (Affected Environment and Impacts) and EIS Appendix 3 (Issues Analyzed in Brief). The 84-year analysis timeframe for biological resources is based on the estimated time it would take sagebrush steppe vegetation to fully recover following decommissioning. Areas subject to interim reclamation or where grassland vegetation is the target of reclamation would recover sooner (although mature vegetation may not develop in work areas if they are disturbed again following interim reclamation). Species that depend heavily on mature sagebrush steppe vegetation were given careful consideration in the development of alternatives and the analysis in the EIS; see EIS Sections 3.3.4 (Greater Sage-grouse)] and 3.18.4 (Pygmy Rabbit). A number of mitigation measures would be implemented to minimize or avoid impacts to wildlife and ensure the selected alternative is consistent with state and federal wildlife management goals; see EIS Appendix 4 (Mitigation).
11576-2	Kelly Human	The EIS project significant impacts on federally protected birds and species of concerns such as eagles. They suggest future mitigation would make up for habitat loss and or the killing of these birds. The company was allowed to promise avoidance to the extent feasible or promise "mitigation and compensation quote to by the agencies and stakeholders off with the promises of future investment and habitat improvement elsewhere this is totally ridiculous and the BLM Knows this. There was a time when BLM put restrictions on building projects within a mile of a single eagle nest. The same is true for grouse leks And other critical habitat. The BLM should	See EIS Sections 3.3.3 (Eagles) and 3.3.4 (Greater Sage-grouse) for detailed discussions of the potential impacts to greater sage-grouse and bald and golden eagles, as well as the mitigation measures that would be implemented to minimize or avoid impacts to these species. The potential impacts to special-status wildlife, were carefully considered during project siting and the development of the range alternatives analyzed in the EIS. In addition to MVE’s applicant-committed measures, the BLM has developed a number of other mitigation measures to minimize or avoid impacts to wildlife that would be included in the terms and conditions of the ROW grant, if one is issued (see EIS Appendix 4 [Mitigation]). As required by BLM policy, relevant RDFs from the

Comment ID	Commenter	Public Comment	Response to Comment
		reject pie in the sky promises of future mitigation. How about the bats and the other birds that will be killed? [...] What about the grazing? what about all of the deer antelope and other wild game in the area?	greater sage-grouse ARMPA (BLM 2015) would also be implemented. As described in EIS Section 3.3.3.2.2 (Eagles, Alternative B), there are currently no eagle nests within 2.5 miles of the siting corridors and additional raptor nest surveys would occur prior to construction so that avoidance buffers can be established if new eagle nests are established in or near the siting corridors. Applicant-committed measures 139-140 and 144-148 in EIS Appendix 4 (Mitigation) provide additional restrictions on construction and maintenance activities in proximity to known eagle nests. This section also describes mitigation measures that would be implemented to minimize or avoid other impacts to eagles and discusses postconstruction eagle fatality monitoring requirements and adaptive management measures that could be implemented to reduce eagle fatalities, if necessary. As described in EIS Section 3.3.3.4 (Eagles, Compensatory Mitigation), the USFWS will be responsible for making a decision on MVE's eagle ITP application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines. The greater sage-grouse is not an ESA-listed species, and thus, there is no critical habitat for this species; there are no other designated or proposed critical habitats in the siting corridors and vicinity. No siting corridors would be located within 3.1 miles of occupied sage-grouse leks (see Figure 3.3-8) and there are no important or priority habitat areas in the siting corridors (see Table 3.3-12). EIS Section 3.3.4.2.2 (Greater Sage-Grouse, Alternative B) describes additional mitigation measures that would be implemented to minimize or avoid impacts to greater sage-grouse and their habitat, including avoidance buffers and seasonal activity restrictions. As described in the EIS Section 3.3.4.4 (Greater Sage-Grouse, Compensatory Mitigation), the HQT is the standard method for calculating the amount of compensatory mitigation necessary to meet the net conservation gain standard established in the greater sage-grouse ARMPA (BLM 2015); see also EIS Appendix 4 and the GRSG Mitigation Plan (Appendix U in MVE [2023]). Impacts to other avian species are disclosed in EIS Section 3.3.2 (Avian Populations), impacts to bats are disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat), impacts to big game and other wildlife are disclosed in EIS Section 3.18 (Wildlife), and impacts to livestock grazing are disclosed in EIS Section 3.9 (Livestock Grazing); see also EIS Appendix 3 (Issues Analyzed in Brief).
11598-11	Idaho Conservation League	Wildlife and Natural Habitats General Wildlife Comments ICL appreciates that the project area is located outside Greater Sage-grouse Priority and Important Habitat Management Areas, Wilderness Study Areas, Areas of Critical Environmental Concern and known habitat for threatened and endangered species. ICL supports the continued use of this initial screening process to look for potentially suitable sites, but the process should also consider additional wildlife issues. Despite this area being previously impacted to various degrees by habitat degradation and fragmentation, there are still a number of wildlife species present that could be adversely affected, including a small population of sage-grouse, other avian species associated with sagebrush steppe ecosystems, pygmy rabbits, bats and ungulates such as pronghorn and mule deer. Potentially affected reptiles and amphibians include sagebrush short horned lizards, desert horned lizards, western rattlesnakes, western toads, and northern leopard frogs. Loss of sagebrush, compaction of soils, and destruction of ground burrows from construction of the Lava Ridge project could result in declining populations of native reptiles in the project area. Alteration of the landscape for turbine construction could reduce moist locations that are essential for amphibian survival. Any landscape level analysis of how to best meet our region's energy goals must include a robust discussion of how project proposals can avoid, minimize and mitigate anticipated impacts to Idaho's wildlife resources. A full inventory of BLM lands eligible for energy project proposals should be made by evaluating factors necessary to maintain health and integrity of the sage-steppe ecosystem while also providing for the region's growth and energy needs. Due to historic land use practices, wildfire, invasive plants, development pressures and climate change, this unique ecosystem is rapidly vanishing in size, connectivity and resiliency. Areas of highest quality wildlife habitat and connectivity should be prioritized for protection and restoration, and taken into consideration during project evaluation. The wildlife resource component of a lands inventory that screens for appropriate project locations must include site, species and seasonality dimensions of plant and animal life history characteristics. A comprehensive regional solar and wind development plan must include additional research and analysis of wildlife impacts that involves input from the Idaho Dep't of Fish & Game, other federal agencies and a wide variety of NGOs. This work should also consider and predict outcomes based on cumulative, aggregated effects of potential future projects. During evaluation, specific proposals should include long-term baseline monitoring, smart macro/micro-siting, and iterative impact avoidance strategies as well as mitigation strategies to provide a net conservation gain wherever possible. Best attempts should be made to assess both local and population-level impacts, as preconstruction modeling expectations may not correlate to evidence gathered after during and after construction and operation. In summary, there are no current alternatives that would adequately avoid and minimize Lava Ridge project impacts to wildlife resources and, as has been stated in other sections of this comment, ICL asks the BLM to conduct a supplemental DEIS. Development of new alternatives should include the following elements during analysis: ● needs analysis of wildlife population impacts, migrations and connectivity at the population level ● analysis of seasonal, weather, day-period shutdowns and curtailments to account for migrations and feeding habits of avian species and bats ● analysis of species-site-season characteristics while addressing potential wildlife effects, as well as design elements and inter-annual observations (Schuster et al. 2015)4 ● consider low reproduction rates of some species ● use most recent IDFG data on big game (migrations, densities, populations impacts), including avoiding the Owinza pronghorn migration route ● large-scale mitigation opportunities for long-term landscape-level wildlife displacement and irreversible/irretrievable impacts ● include cultural and recreational considerations into wildlife analysis during construction, operations and maintenance of project facilities ● construction timing as partial minimization ● include nonphysical project impacts on wildlife such as ground vibration, noise, shadow flicker ● no new access roads should be left in place permanently	The impacts to wildlife from the construction, operation, and decommissioning of a wind energy facility vary greatly between species and depend on a number of species- and site-specific variables. This EIS tiers to BLM (2005:5-43), which concluded that "Any effects of habitat reduction, disturbance, or fragmentation on wildlife would be related to the type and abundance of the habitats affected and to the wildlife that occur in those habitats. For example, on large sites (e.g., 1,000 acres [405 ha] or more), habitat effects could represent a significant impact to local wildlife, especially to species whose affected habitats are uncommon and not well represented in the surrounding landscape. In contrast, fewer impacts would be expected, in general, for wind projects located on previously disturbed lands that have not been adequately restored or reclaimed (e.g., open pit mining sites)." BLM (2005:5-43) also concluded that "The overall affect [sic] of construction-related injury or death on local wildlife populations would depend on a number of factors. The number and types of species present at the site that could be affected would be a function of the habitat that could be disturbed. The abundance of the affected species on the site and in surrounding areas would have a direct influence on population level effects. Impacts to common and abundant species may be expected to have less population-level effects than would the loss of individuals from a species that is uncommon. The greater the size of the project site, the greater the potential for more individual wildlife to be injured or killed. Finally, the timing of construction activities could directly affect the number of individual wildlife injured. For example, construction during the reproductive period of ground-nesting birds, such as sage-grouse, would have a greater potential to kill or injure birds than would construction at a different time." To comply with 40 CFR 1502.2(b), EIS Chapter 3 (Affected Environment and Impacts) discloses impacts to wildlife that have the potential to be significant, while EIS Appendix 3 (Issues Analyzed in Brief) discloses impacts to wildlife that are unlikely to be significant. Since mature sagebrush steppe vegetation and ephemeral aquatic habitats are the most limited and important habitat types in the region, EIS Chapter 3 focuses on special-status species (i.e., those with small, declining, or vulnerable populations) that depend heavily on those habitat types (e.g., western toad, greater sage-grouse, and pygmy rabbit). Additional discussion is provided in EIS Appendix 3 for special-status species that are less likely to experience population-level impacts and for habitat impacts that are unlikely to be significant. The potential impacts to special-status wildlife, and those that depend on sagebrush steppe habitats in particular, were carefully considered during project siting and the development of the range alternatives analyzed in the EIS, including the new Preferred Alternative analyzed in the final EIS. In addition to MVE's applicant-committed measures, the BLM has developed a number of other mitigation measures to minimize or avoid impacts to wildlife that would be included in the terms and conditions of the ROW grant, if one is issued (see EIS Appendix 4 [Mitigation]). These include both measures to limit disturbance in sensitive habitats, as well as timing restrictions to avoid impacts during times when wildlife are most vulnerable, and adaptive management measures such as curtailment. EIS Chapter 3 (Affected Environment and Impacts) addresses the analysis elements listed in the comment.

Comment ID	Commenter	Public Comment	Response to Comment
11598-14	Idaho Conservation League	mphibians Much of the amphibian habitat in the project area is seasonal and/or ephemeral, including canals, excavated tanks, vernal pools, playas and other wetlands. The 14,000 acre analysis area has been surveyed to varying degrees, but some data presented is over 15 years old. Nevertheless, at least one IDFG Tier 2 SGCN species, the western toad, has been observed in the project area. Other species recorded include Great Basin spadefoot, boreal chorus frog, and Sierran treefrog. Due to conversion of native vegetation and endemic wetland areas into a predominantly agricultural regime, it is presumed that much of the breeding habitat in the analysis area has been lost - likely decades ago. However, conclusions in the DEIS show that opportunistic amphibians continue to use habitat where it can support their needs. BLM and MVE should conduct further investigations into functional amphibian habitat in the analysis area. Appropriate safeguards against threats such as runoff, sedimentation, increased road densities/traffic and acoustic masking effects must be implemented from the beginning of construction to protect what might remain of possible breeding habitat. Because potential amphibian habitat represents such a small area compared to other wildlife, thoughtful efforts to minimize impacts could lead to positive outcomes for populations that do exist. Proposed actions described in Alternative B's "additional measures" are the type of minimization tactics that would be helpful, including establishing sufficient breeding habitat buffers. We also recommend that dormant equipment should not be left in wetlands or other possible amphibian habitat for any period of time.	As described in Section 3.18.3.2.2 (Amphibians, Alternative B with Additional Measures), these additional measures would be included in the terms and conditions of the ROW permit if a ROW is granted and Alternative B is selected; Alternatives C–E and the Preferred Alternative would also implement these measures. EIS Appendix 4 (Mitigation) describes additional measures that would be implemented to minimize or avoid impacts to wetlands, including additional measure vvv in Table App4-4, which states, "Equipment would not be left in a wetland or watercourse overnight or for a period of no longer than 12 hours to minimize the potential for spills or leaks." Also, additional measure cc states, "For amphibian habitat avoidance, MVE would survey for amphibians and their breeding habitat within 330 feet of all wetlands in the ground disturbance footprint beginning at the outer edge of hydric vegetation and wetland soil. If breeding habitat is occupied, MVE would coordinate with BLM to identify appropriate mitigation measures before construction." This measure would be required under Alternatives C–E and the Preferred Alternative and would be considered as additional mitigation for Alternative B. Additionally, as specified in applicant-committed measure 123, "Where impacts on wetlands are not avoidable, site-specific crossing plans and measures to mitigate impacts would be submitted to the appropriate regulatory agency. MVE would implement the applicable U.S. Army Corps of Engineers (USACE), Idaho Department of Water Resources (IDWR), and BLM standards (e.g., erosion and sediment control measures, culverts sized in accordance with USACE and BLM standards, etc.) for all road crossings or other work in wetlands or waters to ensure protection of water quality and to maintain the hydrology of affected areas."
11598-15	Idaho Conservation League	Pygmy Rabbits Due primarily to impaired habitat conditions in much of their historic range, pygmy rabbits have been proposed for ESA-listing on three occasions in recent decades, most recently in March of this year. Pygmy rabbits are also listed as Tier 3 SGCN species in Idaho and have BLM Special Species Status designations in all regions of the Twin Falls Field Office. Although sections of degraded habitat in the 17,500 acre project analysis area were documented and characterized in the DEIS, there are still portions of the area that have not yet been surveyed. There are an additional 14,000 acres identified (West 2012a) as potential pygmy rabbit habitat located outside proposed siting corridors. In proposing any new alternatives in a supplemental draft EIS, ICL encourages additional survey efforts within and adjacent to siting corridors to better understand the extent of viable pygmy rabbit habitat in the area. Due in part to a lack of recent data, the DEIS notes that no conclusions can be made at this time about the presence of pygmy rabbits in the area. Further degradation of the quality and connectivity of the already compromised landscape could preclude habitat utilization and genetic exchange within any breeding populations that may be present. It is also important to understand more about pygmy rabbit populations in the area because proposed techniques to minimize impacts such as flushing individuals from burrows and relocation to areas of suitable habitat would likely be difficult after construction was already initiated. Those techniques would be equally as problematic for species like greater sage-grouse, which the DEIS points out share similar habitat requirements to pygmy rabbits. Pygmy rabbits have not evolved to adapt to large landscape disturbances within their home range. Because of this, there are predation risks associated with long-range dispersal strategies, in the event that individuals or small populations become displaced during project construction or operations. ICL asserts that more habitat and population analysis study work is needed, given the fragmented nature of habitat near the project area and the likelihood that MVE's proposed activities would create further barriers to pygmy rabbit movement. Given pygmy rabbits use a life history strategy predicated on burrowing, noise from turbine operations and extensive road networks are another potential disturbance factor mentioned in the DEIS that may be difficult to minimize or mitigate. Adding to habitat threats is the recently documented presence of disease within pygmy rabbit populations, including rabbit hemorrhagic disease virus 2 (RHDV2) and sylvatic plague.9 Due to a combination of all these factors and the imperiled status of pygmy rabbits across their historic range, the BLM should be concerned that there is not better information on this species in the project area. ICL believes these issues should be addressed through a Supplemental DEIS.	Impacts to sensitive wildlife, including pygmy rabbit and greater sage-grouse, were given careful consideration during project siting and the development of the range alternatives analyzed in the EIS. In addition to MVE's applicant-committed measures, the BLM has identified a number of other mitigation measures to minimize or avoid impacts to wildlife (including pygmy rabbit and greater sage-grouse) that would be included in the terms and conditions of the ROW grant, if one is issued (see EIS Appendix 4 [Mitigation]). Specific to pygmy rabbit, while there was insufficient data to conclusively state that pygmy rabbits do not currently inhabit the 3,500 acres of unsurveyed pygmy rabbit habitat in the siting corridors, EIS Section 3.18.4 (Pygmy Rabbit) describes the low likelihood that large populations are present based on the lack of recent observations (despite MVE's targeted site-specific surveys in suitable pygmy rabbit habitat) and the generally poor habitat conditions that have arisen from the combined effects of past fire, reseeding efforts, livestock grazing, and human development. Additional pygmy rabbit surveys would be required prior to construction (additional measure eee) and additional measures to avoid or minimize impacts to any occupied habitat identified during these surveys; see EIS Section 3.18.4.2.2 (Pygmy Rabbit, Alternative B [Proposed Action]) and EIS Appendix 4. Thus, as stated in EIS Section 3.18.4.2.7 (Pygmy Rabbit, Cumulative Effects), "Because all action alternatives include measures to identify and avoid occupied pygmy rabbit habitat or otherwise mitigate impacts, and because there are unlikely to be large populations of pygmy rabbits in the analysis area, it is unlikely that the project's contribution to cumulative effects to pygmy rabbits and their breeding habitat would cause a trend toward federal listing."
11620-5	Simone Griffin; BlueRibbon Coalition	BLM needs to adequately analyze the effects this project will have on birds, insects and other animals that migrate through this area and the harms that wind turbines have on them. It is shown through various studies that animals are harmed during the construction of wind farms as well as the use of wind farms. This is a long term change to wildlife and habitat that could greatly harm the wildlife and habitat BLM claims to protect.	Impacts to wildlife, including birds, insects, and migratory game, and the mitigation measures that would be implemented to minimize or avoid those impacts are described in EIS Sections 3.3 (Avian and Bat Species), 3.11 (Pollinators and Insects), and 3.18 (Wildlife); also see EIS Appendix 3 (Issues Analyzed in Brief) and EIS Appendix 4 (Mitigation).
11747-4	Eric Hess	4. Generated ground currents negatively affect all animal life.	While the publicly available literature indicates that EMF radiation may impact invertebrate activity (Friesen and Havas 2019; Levitt et al. 2022; Wyszkowska et al. 2019), the literature also indicates that the EMF radiation levels at ground-level beneath high-voltage (i.e., 500 kV) transmission lines and above buried medium-voltage (i.e., 230 kV) electrical cables is typically far below the threshold required to induce physiological or behavioral changes, but that flying insects within 1 meter (3.3 feet) of high-voltage transmission lines may be affected (Middleton and Barnhart 2023; Wyszkowska et al. 2016). Buried collector lines would be much lower voltage (i.e., 34.5 kV) and the surrounding soil would provide insulation from EMF radiation. Thus, impacts to wildlife from electrical currents associated with project infrastructure do not warrant further discussion in the EIS. Friesen, M., and M. Havas. 2019. Effects of non-ionizing electromagnetic pollution on invertebrates, including pollinators such as honey bees: what we know, what we don't know, and what we need to know. In *Working Landscapes. Proceedings of the 12th Prairie Conservation and Endangered Species Conference, February 2019, Winnipeg, Manitoba*, edited by D. Danyluk, pp. 127–138. 11782-7	Ken Fitch	For the Natural Resource issues, does the construction and operation create impacts beyond collisional takings and disruption of corridors both on land and in air that may be far greater when a larger diminished regional natural environment may be a factor- especially in this era of climate change?	See Table 3.4-3 in EIS Section 3.4.1.2.2 (Construction Greenhouse Gas Emissions, Alternative B) for estimates of the direct and indirect greenhouse emissions as well as Table 3.4-5 in EIS Section 3.4.2.2.2 (Operations Greenhouse Gas Emissions, Alternative B). In addition, EIS Appendix 4 (Mitigation) includes a list of the applicant-committed measures to encourage carpooling among construction workers and minimize excessive exhaust emissions from construction equipment.
11849-4	Charles Brockway	The EIS does not adequately address the effect of construction activities, including sonic and subsonic shocks, on wildlife.	Impacts to wildlife from blasting are disclosed in EIS Section 3.18 (Wildlife) impacts to eagles from blasting are disclosed in EIS Section 3.3.3 (Eagles) and impacts to greater sage-grouse from blasting are disclosed in EIS Section 3.3.4 (Greater Sage-grouse); see also AIB-2 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). Blasting would be limited to twice a day during construction, and a number of measures would be implemented to minimize or avoid impacts from blasting, such as vibration; see EIS Appendix 4 (Mitigation) for a complete list of mitigation measures.
11871-6	WildLands Defense	There is minimum information on the surrounding landscape, and the degree of habitat fragmentation fragmentation that currently exists for native biota, as well as on the population of local and regional project-impacted species.	See the biological resource sections in EIS Chapter 3 (Affected Environment and Impacts) for an analysis of impacts to wildlife species; information on existing habitat disturbance and fragmentation is presented in the Existing and Future Trends and Actions and Cumulative Impacts sections.
11871-50	WildLands Defense	Year 1 Report Table 9 shows only 5 mammal species observed. It is impossible to believe that other species of lizards, gopher snakes, western chorus frogs, badgers, weasels, cottontail rabbits and jackrabbits, etc. were not observed. The EIS is devoid of any site-specific hard look analysis at the mammals, reptiles, amphibians and insects that may inhabit or migrate through this landscape. The report states that 15 species of concern observed – 6 associated with sagebrush habitat. This means that 9 are associated with the grasslands that BLM treats as a sacrifice zone here in order to try to wedge turbines in to a landscape where they should not be placed.	Table 9 in the year 1 Avian use study (WEST 2021a) lists non-avian wildlife observed incidentally during the first year of avian use surveys. See EIS Section 3.18 (Wildlife) for a description of mammals, amphibians, and reptiles that may occur in the siting corridors; bats and avian species are described in EIS Section 3.3 (Avian and Bat Species) and Table App3-2 and Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief), and pollinators and other insects are described in EIS Section 3.11 (Pollinators and Insects). Impacts to special-status avian species, including those that use grassland habitats, are disclosed in EIS Section 3.3 and Table App3-3 in EIS Appendix 3. Table App3-4 and Table App3-5 have been added to EIS Appendix 3 to provide details on other BLM-sensitive wildlife species. Mitigation measures to minimize or avoid impacts wildlife are listed in EIS Appendix 4 (Mitigation).
11871-62	WildLands Defense	WEST only recorded 3 mammal species observations pronghorn, Mule deer, Pite ground squirrel. There is no mammal study at all. Not even a mention of Cottontails, Jackrabbits, Voles, Kangaroo rats, and other species that are important prey for many raptor species.	See response to comment 11871-50 (see in Table A-3aa, Wildlife, including Big Game).
11871-83	WildLands Defense	Noise pollution from wind turbines and its effects on wildlife: A cross-national analysis of current policies and planning regulations . Teff-Seker a b, O. Berger-Tal c, Y. Lehnardt c, N. Teschner b https://doi.org/10.1016/j.rser.2022.112801 “In terms of WTN effects on wildlife, the focus of this study, there is evidence that WTN could have negative impacts on habitat quality and wildlife [2]; Dooling et al., 2002; Dai et al., 2015). As onshore windfarms are often located in rural or other non-urban areas [19], the impact of WTN on the natural acoustic environment is particularly important. However, as shown below, while the potentially adverse effects of WTN on humans are being studied and regulated by planning and building laws, the same scrutiny has not been applied to examining or reducing potentially adverse effects of WTN on wildlife. The impact of noise pollution on wildlife is still largely ignored in environmental impact assessments (EIAs) during planning processes, and there is insufficient mapping of wildlife species and their noise sensitivity, even in areas considered biodiversity hotspots [2]”. And: “Potential effects of noise pollution and wind turbine noise on wildlife Noise pollution influences the acoustic environment even far from anthropogenic centers, in remote areas that include critical habitats for endangered species [20]. Noise pollution negatively impacts wildlife by disrupting mechanisms that are crucial for their survival [5,21,22]. In particular, noise can: 1) cause physiological damage such as chronic, high levels of stress hormones [23], or actual hearing loss [24]; 2) be directly perceived by animals as a threat, causing them to increase costly anti-predatory behaviors at the expense of foraging, or flee the affected area altogether, leading to functional habitat loss [25]; 3) distract foragers, reducing their efficiency of finding and handling food (Dominoni et al., 2021); 4) hinder animal communication by reducing the distance at which a signal can be detected [26], limiting the ability of the signal to reach its intended recipient, and decreasing the amount of information that can be extracted from a signal, such as the sound of an approaching predator or potential prey [27,28]. These mechanisms are not mutually exclusive, and the role that each plays in determining the impact of noise pollution varies by species. Not all species react to noise in the same way, due to differing sensitivities to noise, context, and life-history [1,5]. Overall, noise pollution alters animals’ communities, reduces their overall survival and fitness, and contributes to the decline of global biodiversity [22]”. And: “Traffic is the most widely studied source of anthropogenic noise [29]. [32] compared the spectral properties of WTN and traffic noise, and suggested that a combination of highway noise and WTN might create	Impacts to wildlife from turbine noise and increased vehicle traffic in the siting corridors are disclosed in EIS Section 3.18 (Wildlife). Species-specific discussions are provided as appropriate (e.g., EIS Sections 3.18.2 [Big Game Habitats and Populations] and 3.18.4 [Pygmy Rabbit]). Impacts to sensitive avian species from noise are disclosed in EIS Sections 3.3.3 (Eagles) and 3.3.4 (Greater Sage-Grouse). See also AIB-2, AIB-8, and AIB-61 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). Additional species-specific analysis of noise impacts would be inconsistent with 40 CFR 1502.2. There are no ESA listed threatened or endangered species present in the siting corridors, nor are any proposed or designated critical habitats present. As stated by Teff-Seker et al. (2022), additional species-specific data on wind turbine noise impacts would need to be gathered to lead to more informed analyses and the development of mitigation measures; such investigations are beyond the scope of this EIS, which has been prepared with the best available scientific data. Teff-Seker, Y., O. Berger-Tal, Y. Lehnardt, and N. Teschner. 2022. Noise pollution from wind turbines and its effects on wildlife: A cross-national analysis of current policies and planning regulations. *Renewable and Sustainable Energy Reviews* 168(2022):112801.

Comment ID	Commenter	Public Comment	Response to Comment
		a greater, more complex disturbance, rather than one masking the other. Specifically, WTN alters the natural acoustic environment by inducing airborne loud broadband sound [33] which is within the hearing range of many animals [34], including most bird species [35]. A few other studies have also looked at the effects of WTN on other wildlife with mixed results. For example [36], found that WTN affects the California ground squirrel's antipredator behavior, causing a higher level of alertness attributed to loss of auditory capacities.	
11871-117	WildLands Defense	And: “Sound can be considered as either sound power or sound pressure. Sound power is the total acoustic power emitted by a source and can be used to predict how far the sound will travel and what the sound levels could be at various distances from the source. It is measured at the source, making it independent of the dB level where it is received. Conversely, sound pressure reflects the sound level received and perceived by the listener. And: The amplitude, frequency, and sequence (i.e., temporal pattern) of WTN can differ widely, and dramatically change the type and level of WTN impact on humans and wildlife. Most studies of the effects of WTN on people pertain to low-frequency noise, between 20 and 200 Hz. Outdoor WTN levels upwards of around 40 Hz normally exceed the hearing thresholds of indoor areas, although this might vary depending on noise insulation standards [48]. Sound frequency is also important when addressing WTN effects on wildlife, since WTN is usually characterized by a broad band range, with changes in the WTN spectrum observed in the frequency range of 200–5000 Hz [49], which overlaps with the hearing range of many wildlife species [34], particularly birds [35].	Impacts to wildlife from turbine noise are disclosed in EIS Section 3.18 (Wildlife), which concluded that there would be long-term effects to wildlife use in the siting corridors due to turbine noise. Avian species would experience similar effects, though the frequency of avian collisions with operational turbines indicates that most species are likely to continue using the siting corridors during long-term operations.
11873-9	Mary Schwartz, Frank Schwartz	9. The DEIS does not estimate the impacts to reptiles and other wildlife during the construction phase. The construction activities will obviously kill a significant number of snakes, lizards, mammals, insects, etc. during the road building, site preparation and vehicular and equipment traffic during the construction period. Impacts to this fauna will continue during the operations and decommissioning phases. This environmental impact for all project phases should be addressed in the DEIS.	EIS Section 3.18.1.2 (Wildlife Movement [non-game mammals and reptiles], Impacts) discloses the potential for injury or mortality of wildlife from vehicle strikes on project access roads as well as indirect effects related to noise and human presence during all phases, including specific discussion of impacts to reptiles.
11873-11	Mary Schwartz, Frank Schwartz	11. The DEIS does not address the impact of emf and vibration from the wind turbines on the impaired navigation of birds, bats, bees and other flying insects. The DEIS is incomplete without addressing the potential significance of this impact.	While the publicly available literature indicates that EMF radiation may impact invertebrate activity (Friesen and Havas 2019; Levitt et al. 2022; Wyszkowska et al. 2019), the literature also indicates that the EMF radiation levels at ground-level beneath high-voltage (i.e., 500 kV) transmission lines and above buried medium-voltage (i.e., 230 kV) electrical cables is typically far below the threshold required to induce physiological or behavioral changes, but that flying insects within 1 meter (3.3 feet) of high-voltage transmission lines may be affected (Middleton and Barnhart 2023; Wyszkowska et al. 2016). Buried collector lines would be much lower voltage (i.e., 34.5 kV) and the surrounding soil would provide insulation from EMF radiation. Thus, impacts to wildlife from electrical currents associated with project infrastructure do not warrant further discussion in the EIS. There is no publicly available literature documenting impaired avian or bat navigation from EMF radiation associated with wind turbines and transmission lines, nor any literature to support the conclusion that vibrations from turbines affect the navigation of any wildlife. Friesen, M., and M. Havas. 2019. Effects of non-ionizing electromagnetic pollution on invertebrates, including pollinators such as honey bees: what we know, what we don't know, and what we need to know. In *Working Landscapes. 11911-1	Eila Olmstead	The majestic plateaus and landscapes of Southern Idaho, while beautiful, are also incredible habitat for a wide variety of creatures and provide a crucial corridor of uninterrupted nature for wildlife. The DEIS inadequately addresses the impact of blasting and the frequency of blasting (2x per day over a 2 year construction period) on the wildlife in/and that migrate through the project area. Not to mention the impact to grazing, breeding/calves, and general stress to the cattle industry.	As stated in EIS Section 3.18.1.2.2 (Wildlife Movement [non-game mammals and reptiles], Alternative B), “Blasting would also occur approximately twice per day during the 2-year construction period. While individual blasts may disturb or displace wildlife, they would be unlikely to lead to long-term effects on wildlife movement because blasting would not occur repeatedly in the same area over a long period of time.” Additional species-specific discussion is provided in EIS Sections 3.18.2.2 (Big Game Habitats and Populations, Impacts) and 3.3.3.2 (Eagles, Impacts). Impacts to livestock grazing from blasting are described in EIS Section 3.9.2.2.2 (Physiological Effects to Livestock, Impacts). See also AIB-2 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief).

Comment ID	Commenter	Public Comment	Response to Comment
11969-2	Jessica McDonald	The Lava Ridge EIS fails to adequately address potential damage and mitigation of damage to our wildlife. In the EIS it specifically states that it will kill federally protected bald eagles that live in the area. This is only the one species I am referencing from the EIS, but there are many more species of birds, eagles, and land-dwelling creatures that are going to be impacted and ultimately killed as well. While some findings are listed in the EIS there are many issues that are not mentioned. You, the BLM, know this area is too valuable to the lives of all inhabitants of Southern Idaho to be compromised.	See EIS Appendix 3 (Issues Analyzed in Brief) for a description of issues and species analyzed in brief.
11971-3	Heidi Mickelson	The damage to the environment and to the wildlife in the area is a huge concern and does not appear to have been adequately addressed in the EIS.	Effects to wildlife are disclosed in EIS Sections 3.3 (Avian and Bat Species), 3.11 (Pollinators and Insects), and 3.18 (Wildlife), and in EIS Appendix 3 (Issues Analyzed in Brief). Mitigation measures that would be implemented to minimize or avoid impacts to wildlife are listed in EIS Appendix 4 (Mitigation).
11978-46	Magic Valley Energy, LLC	Section 3.18.3.2.2 Wildlife – Amphibians (Alternative B with Additional Measures) 43. The DEIS states: "Additional measures that would minimize impacts to amphibians are listed in Table App4-4 in EIS Appendix 4 and include the following" a. MVE Comment: The Project siting corridors occur within an area largely categorized as desert sagebrush steppe habitat that is substantially impacted by livestock and invasive and noxious weed species, with relatively few aquatic resources to support amphibian populations. Based on the analysis presented in the DEIS, MVE contends that the Project's impacts to amphibian species populations are minor to negligible and do not warrant detailed analysis, much less a set of BLM-required additional mitigation measures as set forth in the DEIS. As drafted, the DEIS analyzes potential impacts to five amphibian species: western toad, Great Basin spadefoot, boreal chorus frog, Sierran treefrog, and Northern Pacific chorus frog, only one of which (western toad) has actually been documented to occur within the Project siting corridors. The IDFG and BLM conservation status for each species is listed below19: • Western toad – State Rank S2 (Imperiled because of rarity or because other factors demonstrably make it very vulnerable to extinction; typically 6 to 20 occurrences); IDFG Tier 2 SGCN; BLM sensitive species; MVE also notes that the western toad holds a global rank designation of G4 (apparently secure) • Great Basin spadefoot – State Rank S4 (Not rare and apparently secure, but with cause for long-term concern; usually more than 100 occurrences); not a BLM sensitive species • Boreal chorus frog – State Rank S4 (Not rare and apparently secure, but with cause for long-term concern; usually more than 100 occurrences); not a BLM sensitive species • Sierran treefrog – State Rank S5 (demonstrably widespread, abundant, and secure); not a BLM sensitive species • Northern Pacific chorus frog – Not listed in the IDFG Species Conservation Status web tool; described in the DEIS as the most commonly identified amphibian species in IDFG's inventory in southwest Idaho; not a BLM sensitive species Of the five species analyzed in the DEIS, four are common amphibian species, including the Great Basin spadefoot, boreal chorus frog, Sierran treefrog, and northern Pacific chorus frog. The only amphibian species with a special status designation noted in the DEIS is the western toad (Anaxyrus boreas), which is a species found throughout the Western United States and is listed as a Tier 2 SGCN by IDFG and as a sensitive species for the BLM SFO. Per the DEIS, western toads are primarily terrestrial but are typically found near a permanent water source. However, the DEIS explains that the only sources of permanent surface water in the analysis area are human made features such as irrigation canals and stock tanks that generally lack suitable substrates or vegetation for egg laying. Given this, the DEIS concludes that the analysis area does not provide suitable breeding habitat for the western toad; thus, there would be little to no impact to breeding habitat for the species (permanently wet areas) under any of the action alternatives, even without the additional measures listed by BLM in the DEIS. Also, based on the analysis in the DEIS, there is no concern expressed that the Project would have any significant impacts or affect any amphibian species such that the population of the species would trend downward toward causing the species to become listed as endangered or threatened. Based on this set of facts, MVE requests that BLM move the analysis of amphibian impacts to Appendix 3 of the FEIS (Issues Analyzed in Brief). With no significant impacts for any amphibian species documented in the DEIS and no suitable breeding habitat for the western toad present in the analysis area, and considering that BLM's mitigation principles call for mitigation measures to be commensurate with the level of impact to the environmental resource, the Project's minor to negligible level of potential impact to amphibian species does not warrant additional mitigation measures beyond those measures committed to by MVE in the Plan of Development, including, but not limited to, the key measures listed below that will have the effect of avoiding and minimizing impacts to amphibian species: • Per the provisions of Applicant-Committed Measure #3, reduce or avoid impacts to ecologically important habitats. • Per the provisions of Applicant-Committed Measure #117, MVE will protect water quality by preparing and implementing a stormwater pollution prevention plan (SWPPP) in accordance with federal, state, and local regulations, which will be approved by the BLM. • Per the provisions of Applicant-Committed Measure #120, where impacts on wetlands are not avoidable, MVE will prepare and submit site-specific crossing plans and measures to mitigate impacts to the appropriate regulatory agency. MVE will implement the applicable U.S. Army Corps of Engineers (USACE), Idaho Department of Water Resources (IDWR), and BLM standards (e.g., erosion and sediment control measures, culverts sized in accordance with USACE and BLM standards, etc.) for all road crossings or other work in wetlands or waters to ensure protection of water quality and to maintain the hydrology of affected areas. • Per the provisions of Applicant-Committed Measure #121, MVE will design access roads to minimize stream crossings where feasible. Where practical, structures crossing streams would be designed to not decrease channel stability or increase water velocity. • Per the provisions of Applicant-Committed Measure #124, MVE will design access roads to be located away from drainage bottoms and avoid wetlands, if practical. If drainage bottoms and wetlands cannot be avoided, appropriate design features would be used to reduce erosion and sedimentation. • Per the provisions of Applicant-Committed Measure #133, MVE will avoid ground disturbance within 100 feet of wetlands, streams, and riparian areas and prepare BLM-approved	As described in EIS Section 3.18.3 (Amphibians) the issue analyzed in the EIS includes both effects to amphibian populations and amphibian breeding habitat in the siting corridors; the primary impact indicator for the analysis is acres of ground disturbance in potential amphibian breeding habitat. As described in EIS Section 3.18.3.2.2 (Amphibians, Alternative B), BLM (2005) states "any habitat effects could represent a significant impact to local wildlife, especially to species whose affected habitats are uncommon and not well represented in the surrounding landscape" (BLM 2005:5–43). Although amphibian species that occur in the analysis area use a variety of upland habitats outside the breeding season, all of these species rely on vegetated aquatic habitats for reproduction. Because these habitats are uncommon in the analysis area, amphibians may be disproportionately affected by the loss or alteration of these habitats due to the project. Thus, while BLM (2005) provides sufficient disclosure and analysis of the effect of habitat loss on general wildlife species (and thus was not analyzed in detail; see AIB-61 in EIS Appendix 3), additional site-specific discussion of potential impacts to amphibian breeding habitat is warranted." As described in EIS Section 3.18.3.1, several amphibian species that may occur in the siting corridors are capable of dispersing long distances across dry upland habitats and opportunistically select nesting sites based on the availability of surface water; this is especially important for the Great Basin spadefoot, which relies on "explosive" breeding seasons in particularly wet years (when vernal pools and playas are inundated). Thus, it would be inappropriate to conclude that the siting corridors do not provide breeding habitat for amphibians because they lack large, permanent surface waters. As described in EIS Section 3.18.3.2 (Amphibians, Impacts), none of the action alternatives are expected to result in population-level impacts to amphibians. While BLM appreciates that MVE has committed to a number of measures to minimize or avoid impacts to surface water, wetlands, and other important habitats in the siting corridors, these measures lack specificity and enforceability. Further, preconstruction baseline resource surveys only sampled a portion of the ephemeral surface water features in the siting corridors and surveys were not designed to detect potential amphibian breeding habitat. The only additional mitigation measure the BLM would require for amphibians is preconstruction surveys of potential amphibian breeding habitat and avoidance or mitigation of impacts to occupied habitat (additional measure cc; see EIS Section 3.18.3.2.2 [Amphibians, Alternative B with Additional Measures]). Since MVE's other applicant-committed measures would limit development in areas considered potential amphibian breeding habitat (i.e., within 330 feet of wetlands, riparian areas, and surface water), these surveys would only be required in the limited instances where avoidance of such habitats is not feasible.

Comment ID	Commenter	Public Comment	Response to Comment
		site-specific plans and measures to mitigate these impacts for any surface disturbances within 100 feet of wetlands, streams, and riparian areas. • Per the provisions of Applicant-Committed Measure #138, no turbines would occur within 1,000 feet of irrigation canals to minimize impacts to bats and avian species attracted to such features. Based on the foregoing, whether or not BLM moves the amphibian analysis to the Issues Analyzed in Brief appendix of the FEIS, MVE requests that BLM remove the additional amphibian-related mitigation measures in Section 3.18.3.2.2 in the FEIS and Appendix 4 Table App4-4 Additional Measure "t" as these measures are not warranted based on the minor to negligible impacts to amphibian species documented in the DEIS and the extensive Applicant-Committed Measures that MVE will implement that will protect amphibians.	
11978-47	Magic Valley Energy, LLC	44. The DEIS states: "Under Alternative B, approximately 1,164 acres of potential amphibian breeding habitat would be disturbed by the project (8% of the habitat in the analysis area) (Table 3.18-4)." a. MVE Comment: The FEIS should explain how this acreage of potential amphibian breeding habitat was calculated. In addition, MVE suggests that the IDFG inventory, which found only 15% of vernal pools were actually sufficient breeding habitat, be incorporated into this analysis if BLM has not already done so.	See response to comment 11978-46 (see in Table A-3aa, Wildlife, including Big Game). The methodology for calculating disturbance acreages presented in EIS Chapter 3 (Affected Environment and Impacts) is described in EIS Section 3.1.2.3 (Introduction and Methodology, Siting Corridors). The suitability of vernal pools for amphibian breeding varies between years based on the extent and duration of inundation and without systematic surveys of all ephemeral surface waters in the siting corridors, it is impossible to determine which should be excluded as potential amphibian breeding habitat. Due to the variability in this habitat and the lack of systematic preconstruction surveys, the BLM would require preconstruction surveys in potential amphibian breeding habitat and mitigation of impacts to occupied habitat (additional measure cc).
11978-142	Magic Valley Energy, LLC	44. Section 3.18.1.3 Wildlife - Irreversible and Irretrievable Commitments and Short Term Uses Versus Long Term Productivity "All action alternatives would have irretrievable impacts on wildlife movement from habitat loss and fragmentation caused by ground disturbance for up to 84 years (34-year life of the project plus 50 years for vegetation to reestablish after final reclamation)." MVE notes that reclamation should be stated as 'up to 50 years' for reclamation activities, and as reclamation could be met prior to 50 years. MVE requests the language be changed: "All action alternatives would have irretrievable impacts on wildlife movement from habitat loss and fragmentation caused by ground disturbance for up to 84 years (34-year life of the project plus up to 50 years for vegetation to reestablish after final reclamation)."	Revised as requested.
11978-144	Magic Valley Energy, LLC	46. Section 3.18.3 Wildlife - Amphibians "For this analysis, amphibian breeding habitat is defined as riparian or wetland vegetation (Figure 3.18-6), water features (including irrigation canals), and the area within 330 feet (50 m) of these vegetation types and water sources." MVE asks the conversion be corrected: "For this analysis, amphibian breeding habitat is defined as riparian or wetland vegetation (Figure 3.18-6), water features (including irrigation canals), and the area within 330 feet (100 m) of these vegetation types and water sources."	Typo corrected.
11978-145	Magic Valley Energy, LLC	47. Section 3.18.3.2.6 Wild Life - Cumulative Impacts "As described above, approximately 86% of the analysis is disturbed (contains roads and other development); is an existing ROW; has been converted to agriculture or rural residential; is dominated by nonnative vegetation; is proposed for other renewable energy development; or has been subjected to wildfire, vegetation treatments, and reseeding." MVE asks the word 'area' be inserted for ease of reading: "As described above, approximately 86% of the analysis area is disturbed (contains roads and other development); is an existing ROW; has been converted to agriculture or rural residential; is dominated by nonnative vegetation; is proposed for other renewable energy development; or has been subjected to wildfire, vegetation treatments, and reseeding."	Typo corrected.
11978-160	Magic Valley Energy, LLC	62. Appendix 4- App4-2n, #142 "Avian diverters would be installed and maintained on all guy wires/lines of all existing or any new temporary meteorological (Met) towers, and where guy wires are necessary, appropriate guy guards would be installed at the base of the guy wires." MVE requests the addition of specifying language to match the USFWS 2022: "If applicable, avian diverters will be maintained on all guy wires/lines of all existing or any new temporary meteorological (Met) towers, and where guy wires are necessary, appropriate guy guards would be installed at the base of the guy wires."	The measure appears as written in the BBCS (Appendix M in MVE [2023]) and has not been revised.
12004-3	Douglas Miller	Further, the draft EIS does not address the impacts on Idaho's imperiled and endangered anadromous fishes (e.g., salmon and steelhead) which rely of large volumes of water being kept in the Snake River, particularly to assist downstream migration of smolts and stabilizing water temperatures to aid upstream migration of adults (see http://www.snakeriversalmonsolutions.org/Idaho's_Contribution.aspx <https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwww.snakeriversalmonsolutions.org%2FIdaho%27s_Contribution.aspx&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C9b7b11daa5d5499ecdfb08db41b2d6a5%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638176008583883772%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=Lb2chyUQfstvdLxcC%2FpzautdxrXwFPKTegMKDqjMlNY%3D&reserved=0> .) Lava Ridge will deprive Idaho's anadromous fishes of the lifegiving water they require. Since a comprehensive analysis of the impact of Lava Ridge on Idaho's anadromous fishes has not been conducted and made available for public review and comment, Alternative A "No Build" is the only acceptable option.	Additional information was added to EIS Appendix 3 (Issues Analyzed in Brief) under AIB-55 and AIB-56 to address impacts to fish species. AIB-55: How would the project affect fish species and associated in-stream habitat? AIB-56: How would the project water use and blasting affect fish species, including salmon and steelhead (listed under the ESA)?
12054-7	Kevin Emmerich	Equally, BLM should consider curtailment alternative for wildlife during different activity periods. This would require the applicant to shut down operations during important wildlife activity. These could include curtailment during golden eagle nesting, curtailment near sage grouse leks, curtailment during spring and fall migration for birds and curtailment during pronghorn wintering.	Curtailment has been included as an adaptive management measure under all action alternatives; as described in the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation), the results of postconstruction avian and bat fatality monitoring would inform the development of species-specific curtailment strategies and technologies (e.g., sensor-based curtailment).

Comment ID	Commenter	Public Comment	Response to Comment
12142-3	Michael Taylor	Disruption or damage to this could destroy our agricultural way of life. Also the environmental impact upon our desert wildlife. How will this impact, migrating elk, mule deer, migratory birds and raptors?	See EIS Section 3.18.2 (Big Game Habitats and Populations) for a discussion of impacts to big game habitats and populations; impacts to migratory birds and raptors are discussed in EIS Section 3.3.2 (Avian Populations); see also EIS Section 3.3.3 (Eagles), EIS Section 3.3.4 (Greater Sage-Grouse), and EIS Appendix 3 (Issues Analyzed in Brief).
12201-4	Renee Kuross	In addition, several of the proposed turbines would be located adjacent to seasonal wetlands and watering areas, whose disruption will further increase the loss of wildlife	The exact locations of turbines have not been determined at this time; the EIS analyzes siting corridors in which turbines and other project infrastructure would be placed; see EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction). A number of mitigation measures would be implemented to limit the placement of turbines and other project infrastructure in the vicinity of wetlands, surface water, and other important habitat features in the siting corridors; see EIS Appendix 4 (Mitigation).
12220-1	Matt Bridges	According to the Lava Ridge Wind Project DEIS, the Burrowing Owl was listed as a “Species Analyzed in Detail” (Volume 1, Section 3.3.2.1.2, Species Analyzed in Detail, p. 3-80). However, this analysis failed to include Nesting. In Table 3.3-4, Occupied (non-Eagle) Raptor Nests within 1 Mile of Siting Corridors, Burrowing Owl nests were not targeted during the study; however nests were observed incidentally during two other biological surveys. In fact, nests were not targeted during either year of survey. Page 3-67 of the DEIS states ”the species analyzed in detail in this EIS meet all three of the following criteria: 1. The species has been observed in the siting corridors or has the potential to occur in the siting corridors because breeding, foraging, or migratory stopover habitat for the species is present and the species has been recorded in similar habitats within 4 miles of the siting corridors. 2. The species has a moderate to high potential of colliding with turbines based on if and how the species uses the RSH (rotor-swept height) and the frequency with which the species has been detected as fatalities at existing wind energy facilities. 3. The species has one or more demographic characteristics that make it susceptible to small increases in mortality; namely, they have a small and declining population in BCR 9, are long-lived, have a low reproductive rate, and are dependent on high annual survivorship to sustain their population.” The Burrowing Owl clearly meets these minimum requirements. Why was Nesting not studied for this owl? The USFS lists the Burrowing Owl as a National Bird of Conservation Concern and designates high-priority conservation status to the species in five Bird Conservation Regions relevant to USFS Region 2 (BCR 9.11,16,17,18), Idaho state rank of S2B Species of greatest Conservation Need Tier 2, Bureau of Land Management Sensitive Species Type 2 and Idaho Wildlife Classification Protected Nongame. The burrowing owl is a migrating bird, and the Lava Ridge project site is in the northwestern part of the breeding area. This bird is classified as endangered in Canada and threatened in Mexico. The owl’s range is declining. Furthermore, the Burrowing Owl is misrepresented as “nocturnal”; it is diurnal. Being crepuscular in nature, The Burrowing Owl hunts for insects during the twilight hours. The addition of 486 miles of new roads increases the likelihood of fatality from a vehicle impact, especially during the low light hours when it is hunting. This owl uses dung to attract food in the form of bugs. Thus, changes in grazing and mammal migration affect available mammal dung to line their nest and vestibule of the burrow opening. The bird lives in a particular ecosystem and removal of grazing livestock from the area during project construction will greatly impact the Burrowing Owl’s nesting abilities. The DEIS suggestions for mitigation are to monitor the owl for two years, post construction, and to construct artificial nesting habitat off site. To monitor after the fact is ineffective. To attempt to relocate the breeding grounds of a migratory bird so it does not impact the project or vice-versa certainly impacts the land habitat and compromises the many uses of public lands. The public wants to see these amazing birds in their natural habitat. Please consider the fact that after construction is far too late to observe, evaluate and determine impact on a Species and to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations. Why was the Burrowing Owl nesting ground not targeted in the survey? Due to the Burrowing Owl’s threatened status, a further, more thorough analysis needs to be conducted to determine the impacts the Lava Ridge wind project will have on its survival as a species.	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), the BLM would require MVE to implement targeted burrowing owl surveys prior to construction because of the lack of targeted surveys for these species during the avian use studies (BLM-required measure q; also see Table App4-4 in EIS Appendix 4 [Mitigation]).
12239-3	Lisa Bjerke	In addition, the project’s proximity to seasonal wetlands and wildlife watering areas will very negatively impact and most likely decrease the numbers of wildlife who formerly depended on those sites.	A number of mitigation measures would be implemented to limit the placement of turbines and other project infrastructure in the vicinity of wetlands, surface water, and other important habitat features in the siting corridors; see EIS Appendix 4 (Mitigation).
12307-15	Dean Dimond	Need analysis of effects on USFWS petitions to delist grizzlies and wolves now or future,	Neither of these species are present within the analysis area. These species have been added to the final EIS in Table App3-4 in EIS Appendix 3 (Issues Analyzed in Brief).
12307-24	Dean Dimond	New information detail of impacts on wildlife and fisheries from the state G&F Agency regarding impacts on wildlife corridors.	The analysis in the EIS is based on the best publicly available data, including MVE’s project-specific baseline resource surveys. As described in Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), the State of Idaho (including IDFG) is a cooperating agency in the preparation of this EIS and was consulted in the development of the analysis of impacts to wildlife and the development of mitigation measures to minimize or avoid those impacts. The analysis of impacts to migratory big game used radiotelemetry data from collared animals collected by IDFG as part of studies that are ongoing at the time of this final EIS (see EIS Section 3.18.2 [Big Game Habitats and Populations]).
12307-27	Dean Dimond	New information regarding security, effects of fencing and large structures on human and wildlife access to federal lands,	As described in EIS Section 3.12 (Recreation), access to BLM land in the siting corridors would be temporarily restricted during the 2-year construction period, but access would be increased during the 30-year operation period due to the proposed road improvements and new access road construction; see also AIB-25 through AIB-28 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). Impacts to wildlife movement are disclosed in

Comment ID	Commenter	Public Comment	Response to Comment
			EIS Section 3.18 (Wildlife). See response to comment 12307-24 (see in Table A-3aa, Wildlife, including Big Game) for a discussion of data sources evaluated in the EIS and coordination with IDFG.
12307-35	Dean Dimond	New information and specific changes in wildlife corridors on federal lands due to number of acres and densities of proposed project,	See response to comment 12307-24 (see in Table A-3aa, Wildlife, including Big Game).
12453-4	Alexia Deetz	This reminds me, neither the coyotes, jack rabbits or bees are mentioned in the above referenced “Impact Statement”, yet, they do live in the desert environment in question.	Impacts to general wildlife (including coyotes and rabbits) are discussed in EIS Section 3.18.1 (Wildlife Movement [non-game mammals and reptiles]), impacts to bees are disclosed in EIS Section 3.11.1 (Pollinators) and EIS Section 3.11.4 (Bureau of Land Management Special-Status Bumble Bees).
12469-7	Mike Telford	All the magic valley is growing in population. Some at alarming rates. Rupert and Paul on the east, Burley to the south, Hazelton/Eden and the greater Twin Falls area to the southwest, Jerome to the west and the Hailey/SunValley to the Northwest, Shoshone, and Dietrich nearest to the project. In the future this area even without the 380 plus miles of roads will see increased use. However, multiply use will end and the favor and enjoyment of a remote and somewhat wild area close to enjoy, will be dusty roads with little left to go for. This sitting in the heart of a growing population is ill conceived at best. The DIES makes no mention of these issues. The only justification is the ill-advised designation of an area suitable for energy development. To maintain a true multiple use area which is BLM’s stated mission on the cover of the DIES, the area will need further protections for wildlife. Fragile cultural sites for future generation to learn from and enjoy, will require protection. Next year will mark my 50th year farming and being a part of all this area every day. BLM personnel, while they are great, come and go. Studies come for a little while and draw sometimes short-term incorrect conclusions. The direction of the changes even without this destructive project have mostly not protected the resource. I can state unequivocally that every species except elk have declined. Birds, foxes, badgers, Burrowing owls, Hawkes. Antelope just to name a few. The DEIS recognizes that there will be impacts without addressing what if anything could be done. Over and over the DEIS declares that the impacts, although not precise, will not move the specie toward endangered status. All those assumptions and models are based on data, most of which is not even from the subject area. It may be true that nation wide of even statewide that may be true. However, for this area of unique high mountain desert park surrounded with growing population eager to experience it, it will be gone forever. Many of the species will be extinct in this entire area if this project is not stopped. The impacts of the roads disrupting the fragile environment from Jerome to Rupert and from mountains on the north, and south to the freeway will forever be altered. None of that is addressed adequately in the DEIS.	None of the alternatives in the EIS include designation of a renewable energy development zone or any other land use designation. The BLM’s purpose is to respond to MVE’s application for a ROW grant to construct, operate and maintain, and decommission a wind energy facility on public lands in compliance with FLPMA (see EIS Section 1.2 [Purpose and Need]); EIS Section 1.3 (Decision to be Made) describes the decisions to be made by the BLM. Cumulative impacts from continued population growth and human development is discussed throughout the Cumulative Impacts sections in the EIS Chapter 3 (Affected Environment and Impacts), as appropriate. However, the siting corridors are located on BLM land, which is generally unavailable for residential and other urban or rural development. Thus, most cumulative impacts associated with future development would occur outside the siting corridors. Impacts to wildlife are disclosed in EIS Sections 3.3 (Avian and Bat Species), 3.11 (Pollinators and Insects), and 3.18 (Wildlife); see also EIS Appendix 3 (Issues Analyzed in Brief). These sections summarize data sources evaluated in the impacts analysis, which include project-specific baseline resource inventories conducted by MVE over a period of 2 years. Additional site-specific information was obtained through a background literature search, coordination with state and federal agencies, and literature provided in public scoping comments. Each of these sections also describes how the implementation of mitigation measures would minimize or avoid impacts to wildlife and discloses any irreversible or irretrievable impacts (as defined in EIS Section 3.1.2.4 [Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity]) that would occur after the implementation of mitigation; see EIS Appendix 4 (Mitigation) for a complete list of mitigation measures.
12469-12	Mike Telford	The DEIS states that the corridors are .5 miles wide. While the roads may be much smaller than that the impacts to the entire half mile must be assumed and considering the terrain may well disrupt the entire corridor. There are many of the 27 species of animal that live or nest in the ground. Burrowing Owls, snakes, and rodents to name a few. Rodents are near the bottom of the food chain and not only are the direct destruction of habitat impacts not considered but there is nothing about the impacts of the one half mile strips cutting the habitat up and the effect on the food supply to birds of prey, snakes Badgers, and the like.	As described in EIS Section 3.1.2.3 (Introduction and Methodology, Siting Corridors), each of the action alternatives would disturb approximately 10% to 11% of the siting corridors. Impacts to wildlife movement, including impacts related to habitat fragmentation, are disclosed in EIS Section 3.18 (Wildlife). Additional discussion of impacts to wildlife habitat is presented in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). Loose soils created by ground disturbance during construction can improve habitat for burrowing mammals such as rodents; this can lead to increased prey availability for avian predators but can also put these predators at risk of turbine collisions when hunting. Therefore, a number of mitigation measures would be implemented to discourage burrowing mammals from using these disturbed areas to minimize or avoid impacts to raptors and other avian predators; see EIS Appendix 4 (Mitigation).
12685-6	Philip Gossi; Gooding-Lincoln County Farm Bureau	New roads - Increased public access will disturb wildlife and normal cattle grazing that currently co-exist. It also increases poaching and livestock theft. The new roads would encourage many outdoors activities that keep wildlife from habituating in this area.	The effects of new roads and increased public access on wildlife are disclosed in EIS Section 3.18 (Wildlife) and Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). The grazing allotments in the siting corridors are already accessible by existing access roads and increased public access following construction would be unlikely to substantially alter existing grazing operations or increase livestock theft. Therefore, further analysis in the EIS is not warranted.
12914-1	David Luper	I would like to address a concern/discrepancy that I found in the Draft Environmental Impact Statement regarding the Burrowing Owl. Information regarding this species is wildly contradictive in the DEIS. They range from “not present” in 2021 (although page 3-82 states that current nests likely went undetected) to populations would be “greatly affected”, and “further study is needed due to this species not being ‘targeted’ in this study”. As stated in the DEIS on pages 3-76 the Burrowing Owl is one of 4 species that was determined to be at risk for a population decrease from this proposed project. Further study is needed on all 4 species. The Western Burrowing Owl, Short-Eared Owl, Ferruginous Hawk, Short-Billed Curlew all need detailed and species specific independent studies before any project is allowed to move forward. On pages 3-80 the DEIS states that “Given that project raptor nest and avian use surveys were not designed to assess burrowing owl use or nesting, the species is likely underrepresented in the survey data, and burrowing owl use and nesting in the siting corridors may be higher than the data would suggest.” The DEIS further states in the same paragraph that, “a very high burrowing owl fatality rates were observed at one existing wind energy facility in California.” In short the EIS states that mortality rates could be extremely high and further study is needed. The current DEIS has little about the Burrowing Owl. What it does state is that we have not attempted an in depth look at the effects this could have on the local population of Burrowing Owls. The DEIS states on page 3-71 that the BCR-9 population of Burrowing Owls is estimated to be 60,000 individuals or 6% of the total population. The DEIS also states on 3-71 that in BCR-9 the mortality could be a few or as many as a thousand. This would be a substantial hit to the local population. It further states that “Given that western burrowing owls are known to breed in the siting corridors and likely depend on high reproductive output and adult survivorship to maintain their population in BCR 9, even a relatively small increase in fatalities during the breeding season, or a small reduction in reproductive output, could impact their population in BCR 9.” In summary DEIS states in its own pages that mortality would be high	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), the BLM would require MVE to implement targeted burrowing owl surveys prior to construction because of the lack of targeted surveys for these species during the avian use studies (additional measure q; also see Table App4-4 in EIS Appendix 4 [Mitigation]). EIS Appendix 4 also describes postconstruction monitoring that would be implemented to assess avian fatality rates, adaptive management measures that would be implemented to address high avian fatality rates, and additional monitoring to assess the effectiveness of adaptive management measures.

Comment ID	Commenter	Public Comment	Response to Comment
		and the population would suffer significantly. The DEIS in its entirety has not addressed scientifically how this would affect the Burrowing Owl. There is speculation at best written on its pages. All data about the owl is inconclusive and borrowed from other studies where the Burrowing Owl was simply observed while studying other species. State and Federal authorities have listed the Western Burrowing Owl as a Tier 2, species of great conservation need.	
12982-8	Jerry Taylor	The DEIS gives little attention to potentially significant impacts from blasting, on the unique geology underlying the project area, the hydrological impacts that may occur, the loss of habitat(s), or the potential damage to irrigation structures and/or private wells. Instead, it relies on future mitigation and future plan development (i.e. a "Blasting Plan"), which would enlist the services of a "Blasting Engineer" to craft specific plans, after the final EIS record of decision is issued, on where and how to blast. Why wait? ... What would be the potential direct impacts of blasting and the frequency of blasting (twice per day on average, for the two year construction period) on wildlife species (avian and terrestrial)?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). A full blasting plan cannot be developed until turbine/infrastructure micro-siting is complete and geotechnical investigations have been conducted to determine where blasting will be necessary. The environmental protection measures in Section I-6 of the Blasting Plan Methodology (Appendix I in MVE [2023]) and EIS Appendix 4 (Mitigation) would constrain when and where blasting would occur. Further, as described in the Blasting Plan Methodology, the blasting contractor must comply with all applicable federal, state, and local laws and regulations that pertain to explosives, and the blasting plan must be approved by the appropriate state or federal agencies and the BLM prior to the BLM issuing notice to proceed. Potential impacts to wildlife from blasting are disclosed in EIS Section 3.18 (Wildlife); impacts to avian species from blasting are disclosed in AIB-2 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief).
12985-4	Jerry Heimerdinger	Approval of an energy project of this magnitude would have a severe net negative impact upon this almost virgin sagebrush steppe ecosystem that must be the priority of this Environmental Impact Statement. Upon reviewing the Lava Ridge Wind Project map, I noticed the projected acreage of BLM land is almost totally confined by agricultural land. This small, fragile ecosystem would be highly fragmented. (Habitat fragmentation) The natural migration route of the BLM land between the ag. land of Dietrich and that of Hidden Valley would be severely interrupted. (Also, west between Dietrich and Jerome ag. Land) In effect, the natural state of this land would be critically compromised if the Lava Ridge Wind Project were approved. Providing habitat for wildlife, open spaces where people find fun, recreation, and renewal, conserving America's western heritage, and food for livestock, is difficult enough. These uses should be a priority over constructing a huge wind turbine farm to harvest the natural resource of wind.	See EIS Section 3.18 (Wildlife) for a discussion of impacts related to habitat fragmentation and migration routes; this section includes a description of the measures that would be implemented to minimize or avoid these effects (see EIS Appendix 4 [Mitigation] for additional details).
12988-7	Melody Asher	Western Burrowing Owl Your DEIS says "Alternative B could result in more western burrowing owl fatalities than the other action alternatives because it would have the most bird fatalities overall. Although burrowing owl fatalities are relatively uncommon at most existing U.S. wind energy facilities, very high burrowing owl fatality rates were observed at one existing wind energy facility in California where a large population of breeding owls was present. Given that project raptor nest and avian use surveys were not designed to assess burrowing owl use or nesting, the species is likely underrepresented in the survey data, and burrowing owl use and nesting in the siting corridors may be higher than the data would suggest; thus, more fatalities may occur than expected. Given this, the possibility that fatalities resulting from collision with operational turbines could adversely affect the western burrowing owl population in BCR 9 cannot be ruled out. This would especially apply when the impact of numerous facilities across the landscape is considered (see Section 3.3.2.2.6 [Cumulative Impacts]" BUOW is a migratory owl species that is a threatened species in Mexico, an endangered species in Canada and is on the U.S. Fish and Wildlife Service's list of species of conservation concern. I did not see any Burrowing Owls (BUOW) the other day in the Lava Ridge area but that doesn't mean they are not out there ... ! have noticed that we do not have as many BUOW as we used to - they are not in areas that they used to be seen in every year so I am worried about their population and don't think we need to lose anymore. I think the BUOW needs studied in the area before making a decision to put in the wind turbine farm.	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), the BLM would require MVE to implement targeted burrowing owl surveys prior to construction because of the lack of targeted surveys for these species during the avian use studies (additional measure q; also see Table App4-4 in EIS Appendix 4). EIS Appendix 4 (Mitigation) also describes postconstruction monitoring that would be implemented to assess avian fatality rates, adaptive management measures that would be implemented to address high avian fatality rates, and additional monitoring to assess the effectiveness of adaptive management measures.
13000-11	Nathan Small	ribes' Fish and Wildlife Department Mission Statement Consistent with the Tribes' Snake River policy, the Tribes' Fish and Wildlife Department developed the following mission statement to provide additional guidance to program managers and Department personnel. The mission of the Shoshone-Bannock Tribes Fish & Wildlife Department is to protect, restore, and enhance, fish and wildlife related resources in accordance with the Tribes' unique interests and vested rights in such resources and their habitats, including the inherent, aboriginal and treaty protected rights of Tribes members to fair process and the priority rights to harvest pursuant to the Fort Bridger Treaty of July 3, 1868 (15 Stat.673). The Department is guided by a collective Tribal vision for responsible management, creating and implementing programs for fish, wildlife and their habitats. Through holistic action implementation the Department engages each year in habitat restoration, vegetation management, technical consultation, production measures, research, monitoring and evaluation efforts for a variety of species. Using the best available science, traditional ecological knowledge, and integrated and innovative project planning the Department is able to deliver a wide-array of technical expertise for fish, wildlife, and plants. Our initial assessment of the project proposal does indicate a potential for irretrievable landscape level disturbances for a number of culturally important species and their habitat (bats, sage grouse, raptors, and big game animals). From the perspective of fish and wildlife species, the conversion of this landscape to an industrial power facility would irreversibly alter the species composition in the area.	Each resource section in EIS Chapter 3 (Affected Environment and Impacts) discloses the irreversible and irretrievable impacts that would occur. As described in these sections, there would be irreversible impacts to individual wildlife during the 84-year analysis period, but most impacts would not be irreversible because most habitat would be restored in the long term, and because impacts would not result in a loss of population viability or trend toward federal listing for any species.
13006-10	Leon Smith	Wildlife/Avian 1) Recommend BLM include more detailed analysis of population level impacts and population connectivity, not just habitat connectivity.	The discussion of impacts to avian species and other wildlife in the EIS focuses on impacts to populations, and the geographic extent of populations was considered when developing the analysis area for each section; see EIS Sections 3.3 (Avian and Bat Species), 3.11 (Pollinators and Insects), and 3.18 (Wildlife). For most terrestrial wildlife, habitat connectivity is directly correlated with population connectivity. Impacts to general wildlife movement are disclosed in EIS Section 3.18.1.2 (Wildlife Movement, Impacts), which concluded that habitat loss and fragmentation from permanent project infrastructure and temporary work area disturbance would limit

Comment ID	Commenter	Public Comment	Response to Comment
			wildlife movement and isolate populations. To comply with 40 CFR 1502.2, additional species-specific discussion is only provided for those species that have the greatest potential to be significantly impacted by habitat loss and fragmentation; see EIS Sections 3.11.2 (St. Anthony Sand Dune Tiger Beetle), 3.18.2 (Big Game Habitats and Populations), 3.18.3 (Amphibians), and 3.18.4 (Pygmy Rabbit). Most volant (flying) species (i.e., birds and bats) are highly mobile and have well-mixed populations that are unlikely to experience reduced connectivity; as with terrestrial wildlife, species-specific analysis is only provided for those species that have the greatest potential to be significant impacted by habitat loss and fragmentation; see EIS Section 3.3.4 (Greater Sage-Grouse). Additional discussion of impacts to avian and bat habitat and migratory behavior is provided in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1, AIB-5, and AIB-8.
13006-13	Leon Smith	4) Recommend the DEIS includes a clearer description of duration/type of temporary fencing at different phases of the project and an analysis of temporary fence impacts to wildlife. Ensure commitment that new fencing associated with the project is truly temporary if an action alternative is selected.	Additional details on temporary fencing can be found in EIS Appendix 11 (Project Elements Common to All Action Alternatives) and the Grazing Coordination Plan (Appendix S in MVE [2023]). Impacts to wildlife from temporary fencing are described in Section 3.18 (Wildlife).
1689-4	Tammy Larson	As a citizen that lives near the proposed site I often see wild life. This includes Bald Eagles, elk, mule deer, coyotes, antelope, sage grouse, kangaroo rats, rabbits, wolves, mountain lions, bats, hawks, and so many more. These wind turbines pose a threat to their habitats, hunting grounds, and their feeding areas. Those that manage to survive this major disruption will be forced onto lands of farmers and into cities. Having them on farms will destroy farmers crops. The BLM land rightfully is land for the animals.	Impacts to birds and bats are disclosed in EIS Section 3.3 (Avian and Bat Species), impacts to pollinators and insects are disclosed in EIS Section 3.11 (Pollinators and Insects), and impacts to other terrestrial wildlife are disclosed in EIS Section 3.18 (Wildlife). Approximately half of all existing wind energy turbines are located in cultivated cropland (Harrison-Atlas et al. 2022); concerns have been raised that continued conversion of farmland to wind energy development can reduce overall agricultural output (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017) but in none of these cases has damage to crops from displaced wildlife been raised as a substantial concern. Given the prevalence of wind energy turbines in agricultural lands and the lack of documented declines in crop productivity in the vicinity of these turbines, it is unlikely that that displaced wildlife would have negative economic consequences for the local agricultural economy. Accessed December 29, 2023.
2656-1	Judy Siak	I can not in all good conscience say yes to this as you're killing eagles and other birds . You need to find a way to let the birds know that they are there. By either reflectors or something.	See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures that would be implemented to minimize or avoid impacts to eagles and other avian species.
3062-3	Kate Lopez	Construction decibel levels are expected to be 87-92. That is almost 6 times the current levels. And how do animals complain? They just die. Adequate analysis of animal population disturbance has not been done.	Impacts to wildlife from noise and human disturbance are disclosed in EIS Section 3.18 (Wildlife) and Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief).
3073-1	Becky Ipsen	These are bigger windmills than we currently have in this state. No long term studies have been done to realize the affects of these on our wildlife. Windmills are known to kill many birds of prey.	EIS Section 3.3.2 (Avian Populations) describes the relationship between turbine size and avian fatality rates.
3078-1	Curtis & Marsha Jones	There are a variety of over 40 plants and animals that are on the Idaho Endangered Species and Threatened Lists along with many that were previously endangered and could be again threatened. How will these plants and animals be protected from the Lava Ridge projects. What studies have been completed as to the nature of these plants and animals, needs, patterns, habitats and the impacts of what is being proposed? In addition, what about the project's health and personal impacts to humans? Endangered Species - Threatened: -Burrowing Owl -Limpet -Springsnail -Kootenai River White Sturgeon -Sandhill and Whooping Cranes -Snake River Physa Snail -Snake River Sockeye Salmon -Water Fowl -Woodland Caribou	Species listed as threated or endangered under the ESA are designated at the federal level, the state of Idaho does not designate threatened or endangered species; however, IDFG has identified SGCNs for Idaho. The IPaC report for the project (USFWS n.d. [2023]) indicates that no threatened or endangered species or critical habitats occur in the siting corridors and surrounding vicinity; however, the BLM is currently consulting with the USFWS on potential impacts to the threatened yellow-billed cuckoo, as described in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Impacts to western burrowing owl are disclosed in EIS Section 3.3.2 (Avian Populations). U.S. Fish and Wildlife Service. n.d. [2023]. Information for Planning and Consultation (IPac). To be provided by the Bureau of Land Management.
3163-1	Rick Aitchison	Lets do a study for a period of time not less than 36 Months, (1st) To determine Environmental Impact to include endangered species.	MVE conducted baseline resource inventories for vegetation and wildlife over a 2-year period, the results of which are summarized in the relevant Affected Environment sections in EIS Chapter 3 (Affected Environment and Impacts), along with additional data obtained through the BLM's background literature review and coordination with state and federal agencies. See EIS Appendix 3 (Issues Analyzed in Brief) for a discussion of potential impacts to ESA-listed species. Impacts to monarch butterfly, a candidate for ESA listing, are disclosed in EIS Section 3.11.3 (Monarch Butterfly).

Comment ID	Commenter	Public Comment	Response to Comment
3256-4	Regina Smith	Hunters and other outdoor recreationists have already predicted wildlife will move out of the area. Under future trends where are the wildlife going to go.	See EIS Section 3.18 (Wildlife) for a description of effects to wildlife from disturbance and displacement.
3340-1	Sue Page	The LRWP will adversely affect the wildlife that makes the Lava Ridge area its home. The deer, pronghorn, elk, Pygmy rabbit, to name a few. The construction of 486 miles of new roads throughout the area will greatly fragment the natural habitat and displace the wildlife, as well as decrease the vegetation these animals rely upon to survive. Construction of this project will require 525 days of blasting with 126,000 pounds of the high explosive, ANFO. Unlike the low explosives, black powder and smokeless powder, which function by “pushing” objects out of place, a high explosive acts by shattering and destroying, unleashing tremendous noise and shock waves. Will this violence cause the wildlife to flee, never to return?	Impacts to wildlife from habitat loss and fragmentation, roads and infrastructure, and noise and blasting are disclosed in EIS Section 3.18 (Wildlife); see also AIB-2 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). EIS Section 3.18 also describes the mitigation measures that would be implemented to minimize or avoid these effects; see also EIS Appendix 4 (Mitigation).
3997-4	Angelee Eames	How does MVE "mitigate" the killing of wildlife as we now know it to exist?	See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures.
41-1	Carson Simper, Clement Simper, Rhoda Simper, Lexi Simper	Wildlife animals that live out there and winter there that will move to a new range or decrease in population. The EIS glosses over these numbers.	The potential for significant impacts to wildlife are disclosed in EIS Chapter 3 (Affected Environment and Impacts). This chapter also describes the mitigation measures that would be implemented to minimize or avoid impacts to wildlife (see also EIS Appendix 4 [Mitigation]).
4183-1	Susan Kohn	I would ask first what do you plan on doing with the animals who live on that land ? Kind regards, Susan Kohn sue_kohn6@hotmail.com	See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures.
4331-1	Marsha Jones	Please stop Lava Ridge. There are a variety of both plants and animals that are on the Idaho Endangered Species and Threatened Lists along with many that were previously endangered and could be again threatened. How will these plants and animals be protected from the Lava Ridge projects? What studies have been completed as to the nature of these plants and animals, needs, patterns, habitats and the impacts of what is being proposed? In addition, what about the project’s health and personal impacts to humans? Endangered: Burrowing Owl Limpet Springsnail Kootenai River White Sturgeon Sandhill and Whooping Cranes Snake River Physa Snail Snake River Sockeye Salmon Water Fowl Woodland Caribou Threatened List Bliss Rapids Snail Bull Trout Canada Lynx Grizzly bear MacFarlane’s Four-o’Clock (plant) Northern Idaho ground squirrel Slickspot Peppergrass (plant) Spalding’s Catchfly (plant) Steelhead Trout Chinook Salmon Ute Ladies’-Tresses (plant) Whitebark pine (plant) Yellow-billed Cuckoo Proposed Threatened/Candidate Little Brown Bat Monarch Butterfly Northern Bog Lemming Suckley’s Cuckoo Bumble Bee Western Bumble Bee Western Ridged Mussel Previously Endangered / Previous Candidate (could be endangered again by these projects) Bald Eagle Christs Paintbrush (plant) Columbia Spotted Frog Goose Creek Milkvetch (plant) Gray Wolf Greater Sage-Grouse Idaho Springsnail North American Wolverine Packard’s Milkvetch (plant) Peregrine Falcon Southern Idaho Ground Squirrel Utah Valvata Snail Water Howellia (plant)	Species listed as threated or endangered under the ESA are designated at the federal level, the state of Idaho does not designate threatened or endangered species; however, IDFG has identified SGCNs for Idaho. The IPaC report for the project (USFWS n.d. [2023]) indicates that no threatened or endangered species or critical habitats occur in the siting corridors and surrounding vicinity; however, the BLM is currently consulting with USFWS on potential impacts to the threatened yellow-billed cuckoo, as described in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Tables App3-4 and App3-5 were added to EIS Appendix 3 in the final EIS to disclose BLM’s rationale for excluding other special-status species with the potential to occur in the siting corridors from detailed analysis in the EIS. Impacts to western burrowing owl are disclosed in EIS Section 3.3.2 (Avian Populations), impacts to bald eagle are disclosed in EIS Section 3.3.3 (Eagles), impacts to greater sage-grouse are disclosed in EIS Section 3.3.4 (Greater Sage-Grouse), impacts to little brown bat are disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat), impacts to monarch butterfly are disclosed in EIS Section 3.11.3 (Monarch Butterfly), impacts to Suckley’s cuckoo bumble bee and western bumble bee are disclosed in EIS Section 3.11.4 (Bureau of Land Management Special-Status Bumble Bees).
4751-1	Joan Hurlock	On page 3-12 of the EIS report there is an obscure reference to the blasting that will take place during the construction phase of the project. From the report one learns that “Blasting emissions were estimated assuming two blasts per day for 525 days assuming 120 pounds of ammonium nitrate-fuel oil per blast using AP-42 Explosive Detonation factors”. Over 525 days, 126,000 pounds of ammonium nitrate-fuel oil (ANFO) explosive will be used throughout the project site. This is very concerning. Ammonium nitrate-fuel oil (ANFO) explosive is classified as a high explosive. This is based on the velocity at which an explosive detonates. The use of a low explosive will produce a “pushing” effect, whereas a high explosive is designed to “shatter and destroy”. There are several concerns that need to be addressed regarding this amount and type of blasting that will take place. The first concern is the impact the amount of daily blasting, for 525 days, will have on wildlife. On page 3-479 of the EIS, it is pointed out that noise can alter behavioral patterns in animals. It has been shown that noise from aircraft “increases animal vigilance, induces a flight response and habitat displacement, which may result in reduced fitness of the animals”. This was observed to occur with disturbance from aircraft. How much more so will wildlife be impacted by the noise produced by daily blasting? Will the animal displacement be temporary or permanent? Will wildlife return after 525 days of sustained blasting? The areas that wildlife will be displaced from provide important winter habitat. Will winter mortality increase if wildlife avoids their wintering ground? The report also states that the blasting noise will meet “quiet” standards at 3.1 miles from the blasting site. Based on personal experience, I contend that the blast noise will not meet “quiet” standards at that distance, and that the effects from the blast pressure waves can be felt from at least seven miles away. It is my opinion that it may be several years before wildlife returns to the area of impact.	As stated in EIS Section 3.18.1.2.2 (Wildlife Movement [non-game mammals and reptiles], Alternative B), “While individual blasts may disturb or displace wildlife, they would be unlikely to lead to long-term effects on wildlife movement because blasting would not occur repeatedly in the same area over a long period of time.” Mitigation measures would be implemented to minimize the effects to special-status wildlife from blasting; see EIS Appendix 4 (Mitigation).
5331-2	Joan Hurlock	The LRWP will adversely affect the wildlife that makes the Lava Ridge area its home. The deer, pronghorn, elk, Pygmy rabbit, to name a few. The construction of 486 miles of new roads throughout the area will greatly fragment the natural habitat and displace the wildlife, as well as decrease the vegetation these animals rely upon to survive. Construction of this project will require 525 days of blasting with 126,000 pounds of the high explosive, ANFO. Unlike the low explosives, black powder and smokeless powder, which function by “pushing” objects out of place, a high explosive acts by shattering and destroying, unleashing tremendous noise and shock waves. Will this violence cause the wildlife to flee, never to return?	As stated in EIS Section 3.18.1.2.2 (Wildlife Movement [non-game mammals and reptiles], Alternative B), “While individual blasts may disturb or displace wildlife, they would be unlikely to lead to long-term effects on wildlife movement because blasting would not occur repeatedly in the same area over a long period of time.”
5791-1	Paul Kaiser, Jana Kaiser	Good day, I am writing today to ask that you deny LS energy based on our concerns for the wildlife. This was addressed in the EIS on page 29.It states the wildlife movement even with minimization measures would substantially fragment remaining wildlife habitat connectivity and could greatly impair the ability of wildlife to move through the analysis area. Information found in sections 3.18 1.1.1 which states “ These projects would add more roads, fences, transmission lines and human activity to the analysis area all of which could be barriers	Impacts to sensitive wildlife, including big game, were given careful consideration during project siting and the development of the range alternatives analyzed in the EIS. While there are sensitive habitats and species within the siting corridors and immediate vicinity, critical habitat for ESA listed species has not been proposed or designated in the siting corridors and immediate vicinity, and there are no state or federal special land use designations present (such as ACECs, National Wildlife Refuges, state Wildlife Management Areas, etc.) In

Comment ID	Commenter	Public Comment	Response to Comment
		to wildlife movement." The EIS on page 29 states that mule deer and pronghorn will have the greatest loss and disturbance and displacement from noise and human activity resulting in the greatest injury and direct mortality from collision with vehicles. We would sum it up this way, we already have wildlife pushed to areas that pose harm to themselves and humans. Areas in Idaho already have mountain lions that roam around town endangering children, pets, and adults. The county roads and highways surrounding the BLM land have incurred many collisions of big game with vehicles, this is never a good outcome for either species. Why would we push it to the limits and increase the endangerment of big game and the residents of Idaho? We attended a BLM presentation on Feb 23 in Twin Falls, the map of Idaho was shown, with layer after layer added to indicate the protected lands, such as forest, include, big game migration routes etc. By the time it was complete all of Idaho was under some level of protection. Why are you now willing to make concessions on these protections? I am asking that you deny the Lava Ridge wind turbines and leave the wildlife a place to call home. We choose option A.	addition to MVE's applicant-committed measures, the BLM has developed a number of other mitigation measures to minimize or avoid impacts to wildlife (including greater sage-grouse and big game) that would be included in the terms and conditions of the ROW grant, if one is issued (see EIS Appendix 4 [Mitigation]).
6075-4	Lorinda Grant, Douglas Grant	The turbines will be visible for miles which will destroy the rural nature of the area. And destroy the natural habitat of the desert ground the turbines will be on. The migration of the deer, elk and antelope will be severely impacted. We have wildlife migrating across our property and see the patterns on an annual basis. There are many types of birds that will be severely impacted by the windmills. There are eagles, hawks, owls, sage grouse and waterfowl the travel through the impacted area. Their populations will be significantly reduced. We rely on bees, and the other insects that help pollinate our crops the turbines would destroy the population of these insects thereby causing financial difficulties to the farmers in the area.	The potential for significant impacts to wildlife (including big game, avian species, and pollinators and other insects) are disclosed in EIS Chapter 3 (Affected Environment and Impacts). This chapter also describes the mitigation measures that would be implemented to minimize or avoid impacts to wildlife (see also EIS Appendix 4 [Mitigation]). Impacts to pollinators are discussed in EIS Section 3.11.1.2, which specifically discloses the potential for reductions in pollinator populations to diminish the ecosystem services they provide, including pollination of agricultural crops. Additional discussion is provided in Section 3.11.3.2 (Monarch Butterfly, Impacts) and Section 3.11.4.2 (Bureau of Land Management Special-Status Bumble Bees, Impacts). All action alternatives would impact pollinators to some degree; however, studies quantifying the magnitude of this impact are lacking (Arcadis Belgium 2020). Approximately half of all existing wind energy turbines are located in cultivated cropland (Harrison-Atlas et al. 2022); concerns have been raised that continued conversion of farmland to wind energy development can reduce overall agricultural output (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017) but studies linking a reduction in crop productivity or yields due to pollinator declines from wind turbine mortality are lacking. Given the prevalence of wind energy turbines in agricultural lands and the lack of documented declines in crop productivity in the vicinity of these turbines, it is unlikely that that direct mortality of pollinators and other insects from collisions with operational wind turbines would have negative economic consequences for the local agricultural economy. Arcadis Belgium. 2020. *Business and nature working together: action by the energy sector to protect wild pollinators*. Technical guidance prepared by Arcadis Belgium for the European Commission under contract No. 07.0202/2018/795538/SER/ENV.D.2 Technical support related to the implementation of the EU Pollinators Initiative. Accessed December 29, 2023.
6511-3	Kelly Varelmann	The wildlife will undoubtedly flee….will they return? Will their natural habitats even be available if they do return?	As stated in EIS Section 3.18.1.2.2 (Wildlife Movement [non-game mammals and reptiles], Alternative B), "While individual blasts may disturb or displace wildlife, they would be unlikely to lead to long-term effects on wildlife movement because blasting would not occur repeatedly in the same area over a long period of time."
6858-1	Adam McWade	My concern is the understated impacts across greater sage grouse and wintering big game habitat. As a state and in general western states are allocating resources to support dwindling sage grouse populations. Yet we want to implement a project that won't just cause the disturbance states in the analysis. That is once everything has been built in place, during construction the travel and road building and other activities will be continuous for years impacting habitat usage across species. It seems a counter intuitive to say we want to save this species while also endangering key areas and habitat that is already fractured and shrinking. Secondly as we have experienced later winters and habitat increase disturbance and habitat fracturing could be more detrimental to populations. Have we seen studies from other areas including Wyoming where such projects have been proposed? Have any real impact studies been done or are these estimates based on assumptions and best case scenarios?	We are not aware of studies evaluating the influence of late winters and habitat fragmentation or reduction of habitat on sage-grouse, though there are studies predicting effects from climate change and increased disturbance (e.g., see Heinrichs et al. [2019]). EIS Section 3.3.4.2.2 (Alternative B), describes impacts to habitat, habitat fragmentation and connectivity among leks within the affected population. The BLM (2015) defines three categories of habitat based on quality: Priority HMAs where restrictions on development are highest, Important HMAs, and General HMAs considered lower quality habitat with poor connectivity and fewer males. The project is proposed in General HMA, although only a portion of the project is in sage-grouse habitat. As described in EIS Appendix 4, Mitigation, there are numerous restrictions on development within buffers around leks and mitigation measures that would be required to protect sage-grouse and their habitat as much as possible. The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing; see Section 3.18.2.2.2 (Big Game Habitats and Populations, Impacts). The BLM worked closely with IDFG to compile and analyze the best available information to disclose impacts to big game winter habitat and population-level effects as accurately as is possible.

6869-1	Kade Pincock	That land is crucial wildlife habitat that will be totally destroyed by the infrastructure that is going to be built. I read something that said this won't affect Idahos wildlife but I just can't believe that especially when that desert is very much alive with deer and elk at this time of year when they are pushed down out of their summer ranges	See EIS Section 3.18 (Wildlife) for a description of impacts to wildlife, including big game.
6885-3	Louis Zamora; Twin Falls Canal Company	Again whether it be a bird or mammal all these animals travel to different areas of Southern Idaho and the EIS should have covered the whole Magic Valley Region to see what the true impact really is. Please keep the Magic Valley Magic and pic Option A of no-build. More studies need to be done to see how it would impact our and the animal's lifestyles.	The analysis areas for biological resources are described in the introduction to each resource section in the EIS, for most wildlife species the analysis area extends well beyond the siting corridors.
6903-1	Todd Wells	Because research and studies conducted in other areas is not directly correlated to this site, I believe that specific, detailed evaluations of these specific resources and unique populations should be required prior to any development of the proposed area. Wildlife resources--As home to a wide variety of wildlife including deer, antelope, multiple raptor species, bats, sage grouse, monarch butterflies, and a multitude of other desert dwelling animals, the impact of wind turbines is largely unknown. Several studies in other regions have indicated that the effects can be very detrimental to some of these species. The impact of a multi-year development of the site and construction of the turbines will have a negative impact on all of these animals, from which we don't know how they will recover. Additionally, once construction is finished the turbines can continue to have a negative impact on the population of many of the avian species.	Wildlife (including big game) are discussed in EIS Section 3.18 (Wildlife), avian and bat species (including greater sage-grouse) are discussed in EIS Section 3.1 (Avian and Bat Species), and monarch butterflies are discussed in EIS Section 3.11.3 (Monarch Butterfly); see also EIS Appendix 3 (Issues Analyzed in Brief).
6903-8	Todd Wells	Chemical application to control invasive and noxious weed population has questionable success in rangeland situations; chemical residues may also serve as a immediate and long-term risk to terrestrial wildlife and avian species. We can't risk these unknown impacts; they will affect the environment directly and indirectly to an extent that won't be known for many years.	As described in EIS Section 3.15 (Vegetation), much of the siting corridors are already dominated by nonnative species such as cheatgrass and crested wheatgrass due to past disturbances and reseeding efforts. While the siting corridors are situated within active rangelands, project herbicide applications are not intended to restore rangeland or eliminate existing infestations of noxious weeds and other nonnative plant species. As described in the Noxious Weed Management Plan (Appendix R in MVE [2023]), the primary objectives of the plan are to prevent the introduction of new noxious weed populations and to eliminate or contain the spread of existing noxious weed populations on site throughout the life of the project. The Noxious Weed Management Plan also describes preventative measures that would be implemented to minimize or avoid new noxious weed infestations and the spread of existing infestations; see also EIS Appendix 4 (Mitigation). These measures would reduce the need for herbicide applications within MVE's ROW (if one is granted). Impacts to wildlife from herbicide use are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-58. As described in this table, this issue was not analyzed in detail in the EIS because these effects have been previously analyzed by the BLM (2007, 2016) and because impacts would be minimal with the implementation of applicant-committed and BLM-required mitigation measures.
6909-1	Tim Waters	In the study I did not see mentioned about stripped chipmunks snow shoe rabbits and bald eagles all of which I have seen while moving cows in the desert.	General wildlife (including small mammals) are discussed in EIS Section 3.18.1 (Wildlife Movement [non-game mammals and reptiles]), eagles (including bald eagles) are discussed in EIS Section 3.3.3 (Eagles); see also EIS Appendix 3 (Issues Analyzed in Brief).
7320-4	Lora Ohlensehlen	Lastly I am concerned about the wildlife in the proposed area of building. Wildlife has not been documented as strongly as it has been in the past. The current EIS seemed to gloss over the environmental impact of the long term building of this project. It is also concerning that the consequences of the wind mills on the bird, bat, and insect populations have been marginalized.	The impacts to wildlife from the construction, operation, and decommissioning of a wind energy facility vary greatly between species and depend on a number of species- and site-specific variables. To comply with 40 CFR 1502.2(b) the EIS focuses on resource and species impacts that are significant while providing only brief discussion of other issues. EIS Chapter 3 (Affected Environment and Impacts) discloses impacts to wildlife that could be significant, while EIS Appendix 3 (Issues Analyzed in Brief) discloses impacts to wildlife that are unlikely to be significant. Potential impacts to wildlife were carefully considered during project siting and the development of the range alternatives analyzed in the EIS. In addition to MVE's applicant-committed measures, the BLM has developed a number of other mitigation measures to minimize or avoid impacts to wildlife (including sensitive birds, bats, and insects) that would be included in the terms and conditions of the ROW grant, if one is issued (see EIS Appendix 4 [Mitigation]).
8657-1	Richard Dinges	I have not found any consideration regarding the impact of low-level Electromagnetic Field (EMF) effects in the draft Environmental Impact Statement (EIS) for the proposed Lava Ridge wind project on the wildlife and plants within this project. It cannot be denied that an EMF field will be generated along the buried and overhead power lines. This field can easily be quantified. The strength of this field is directly proportional to the current and inversely proportional to the distance from the conductor. A map of this EMF MUST be generated and overlaid on the project area. This will allow the effect of this EMF on the wildlife and plants to be evaluated. Of special concern should be the bats and Monarch butterflies. Bat fatalities from collision with the turbine blades, disorientation from EMF, infrasound, and construction activities could prove to be catastrophic for the bat population. Also not considered is the impact on wildlife from the high frequency cell phone activity that will be present in the project area during construction. The two year construction period will see a high volume of workers coming into their job sites, truck traffic bringing material ,supplies, and turbine components into the project area, and all nature of construction equipment and service trucks traversing the area. Essentially every worker will be carrying a cell phone. Workers will be making personal calls and there will be a significant amount of of contractor work direction. It is probable that some contractors will have their own private communication systems. The cell phone traffic will be both 4 and 5 g. The frequencies of the private contractors communication systems will need to be evaluated. My above comments are based on several recently published papers by B.	Impacts to bats are disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat) and impacts to monarch butterfly are disclosed in EIS Section 3.11.3 (Monarch Butterfly); see also EIS Appendix 3 (Issues Analyzed in Brief). While the publicly available literature indicates that EMF radiation may impact invertebrate activity (Friesen and Havas 2019; Levitt et al. 2022; Wyszkowska et al. 2019), the literature also indicates that the EMF radiation levels at ground-level beneath high-voltage (i.e., 500 kV) transmission lines and above buried medium voltage (i.e., 230 kV) electrical cables is typically far below the threshold required to induce physiological or behavioral changes, but that flying insects within 1 meter (3.3 feet) of high-voltage transmission lines may be affected (Middleton and Barnhart 2023; Wyszkowska et al. 2016). Buried collector lines would be much lower voltage (i.e., 34.5 kV), and the surrounding soil would provide insulation from EMF radiation. Therefore, it is unlikely that EMF radiation from buried collector lines (or new overhead collector and transmission lines) would have a measurable impact on wildlife. Higher frequency EMF radiation from modern 4G and 5G cell phone towers has been shown to effect flying invertebrates (i.e., bees) at greater distances (within 500 meters [1,640 feet]) (Taye et al. 2017), effects from the EMF radiation emitted by cellphones require prolonged, close contact with the device (Panagopoulos et al. 2006). The Levitt et al. (2021a, 2021b, 2021c, 2022) articles referenced in the comment are summaries of existing literature and focus primarily on the effects of cell phone communication networks and the development of new communication technologies, such as 5G

		Blake Levitt, Henry C. Lai and Albert M. Manville II. They are: (1) “Low-level EMF effects on wildlife and plants: What research tells us about an ecosystem approach”, (2) “Effects of non-ionizing electromagnetic fields on flora and fauna, part 1. Rising ambient EMF levels in the environment.” (3) “Effects of non-ionizing electromagnetic fields on flora and fauna, part 2 impacts: how species interact with natural and man-made EMF.” (4) “Effects of non-ionizing electromagnetic fields on flora and fauna. Part 3. Exposure standards, public policy, laws, and future direction.” Copies of these papers are attached. One only needs to look to the east coast and the shores of New Jersey to see a potential result of not fully considering all factors relating to siting a wind project. Dead whales and dolphins are washing up on the beaches of New Jersey. It is suspected that activity with efforts to map the ocean floor for wind turbine placement is responsible for this happening. A New Jersey congressman, Jefferson Van Dorn, recently held a congressional hearing on the Jersey shore and has introduced a resolution in the US House to pause activity on this project until further studies can be conducted. I do not believe that a decision on the Lava Ridge EIS can be reached without evaluating the effects of the EMF. THE PLANTS AND WILDLIFE WILL BE AFFECTED BY THE EMF FROM THIS PROJECT. At this time a NO BUILD OPTION SHOULD BE SELECTED.	wireless networks. Effects related to EMF from aboveground transmission lines were primarily limited to species that spend prolonged periods in close proximity to transmission lines, such as birds that nest on transmission structures and bees (which are discussed above). Since none of the alternatives include construction of cell towers or other radio frequency communication systems, there would be no impacts to terrestrial invertebrates from EMF radiation associated with cell phone activity. Aboveground transmission lines would be constructed in accordance with APLIC (2006, 2012) guidelines (see applicant-committed measures 29 and 30 in EIS Appendix 4 [Mitigation]); these include the use of perch and nest deterrents on transmission line structures, which would minimize the potential for effects to avian species from EMF radiation. Given the low potential for impacts to wildlife from EMF radiation generated by transmission lines, a more detailed analysis is not warranted. Friesen, M., and M. Havas. 2019. 8683-5	Wayne Fischer	3.18.1 Wildlife I am very concerned about the wildlife that normally move thru this area and the adverse effects the project will have. The project area has been relatively undisturbed and still wide open where wildlife has moved and graze for thousands of years. The Magic Valley Energy says this area is not in a native state because of fire. I disagree. Fire has been part of this ecosystem since the start of time and always will be because of lightning storms that go through the area. Fires are a natural event and result in the generation of new plant life that feed and shelters all sorts of wildlife. This project will have lasting and catastrophic effects on all wildlife native to the area. The draft EIS as not properly addressed this issue as well.	Native upland vegetation in the siting corridors is described in EIS Section 3.15.1 (Native Upland Vegetation Communities). Impacts to wildlife are disclosed in EIS Section 3.18 (Wildlife); see also EIS Appendix 3 (Issues Analyzed in Brief).
9473-5	Jeffrey Warren	There are a number of animal species in the area that are being protected. How will those protections be maintained?	EIS Appendix 4 (Mitigation) provides a complete list of mitigation measures.
9504-2	Zack Lanier; Idaho Farm Bureau Federation	The first concern I have has to do with the wildlife migration corridors and the disruption this project will have on them. The wildlife already struggle with winter habitat disappearing throughout the whole state. This project will continue to push wildlife out of critical habitat areas. Not only will it force wildlife to leave the area, but this project will force wildlife onto the local farmers operations causing damage to their crops and property. This may also	Impacts to wildlife movement and big game habitat and migration corridors, including displacement and increased predation, are disclosed in EIS Section 3.18 (Wildlife). As described in this section, a number of mitigation measures would be implemented to minimize or avoid these impacts; see EIS Appendix 4 (Mitigation) for a complete list of mitigation measures. Therefore, further analysis in the EIS is not warranted.

Comment ID	Commenter	Public Comment	Response to Comment
		cause the need for possible increase of depredation of the wildlife. This is negative for the wildlife as well as the farmers in the area.	
9657-2	Saiyare Refaei	I would also like to see the report address any migratory species including the bald eagle, greater sage-grouse, bats, mule deer and pronghorn that may be impacted by the installation of the 400 wind towers. (see ES-xvi & ES-xvii) The cumulative impact of the lifetime of the project is ultimately negatively impacting all of these populations in addition to all of the ground disturbances.	Migratory birds and bats (including bald eagle and greater sage-grouse) are addressed in EIS Section 3.3 (Avian and Bat Species), migratory wildlife (including mule deer and pronghorn) are addressed in EIS Section 3.18 (Wildlife); see also EIS Section 3.11 (Pollinators and Insects) and EIS Appendix 3 (Issues Analyzed in Brief). Each EIS Section includes analysis and disclosure of the impacts of the action alternatives, a discussion of cumulative impacts, and a description of the mitigation measures that would be implemented to minimize or avoid impacts; also see EIS Appendix 4 (Mitigation).
F2-7		BLM needs to adequately analyze the effects this project will have on birds, insects and other animals that migrate through this area and the harms that wind turbines have on them. It is shown through various studies that animals are harmed during the construction of wind farms as well as the use of wind farms. This is a long term change to wildlife and habitat that could greatly harm the wildlife and habitat BLM claims to protect.	Impacts to birds are disclosed in EIS Section 3.3 (Avian and Bat Species), impacts to insects are disclosed in EIS Section 3.11 (Insects and Pollinators), and impacts to other wildlife are disclosed in EIS Section 3.18 (Wildlife); see also EIS Appendix 3 (Issues Analyzed in Brief).
10512-7	S. (No Last Name Provided)	The lands also provide winter range and refuge for migrating populations of mule deer and pronghorn antelope. The big game animals rely on this area to escape deep snow and predators from their former summer range. I have witnessed herds of several hundred antelope from Star Lake to Wilson Butte to Eden every winter. I have archery hunted mule deer many times in the same areas and come November, the resident populations receive an influx of hundreds to thousands of migrant populations seeking grounds to winter on. I am not sure how the EIS could rate this habitat so low when I have witnessed for several years these massive herds that rely on this habitat to survive. It would be a drastic mistake to ruin this habitat with this project for these migrant populations and it would have a devastating effect on them with the loss of habitat and added stress from increased human impacts.	The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the current status of populations and distribution and the importance of existing winter range for mule deer and pronghorn, and the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]).
11327-2	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	The DEIS fails to adequately consider impacts to big game and their migrations. The BLM must develop new alternatives that avoid impacts to wildlife and wildlife migrations in the project area. a) Importance of Seasonal Ranges and Migration Routes – Negative Impacts of Wind Development Inadequately Accounted For Big game species such as pronghorn, mule deer, and elk migrate between winter and summer seasonal ranges to increase survival. On landscapes where they occur, migrations are increasingly considered a critical behavior to enhance ungulate foraging opportunities and avoid deep snow.7 Migratory behavior allows animals to access forage at peak phenology8, which often carries nutritional benefits and increases individual fitness that supports population persistence and ecosystem function.9As the human footprint continues to expand, the migratory journeys of ungulates are becoming increasingly difficult, threatening the long-term persistence of existing migrations.10 Long-term studies of mule deer have found population-level effects from natural gas development, despite aggressive onsite mitigation efforts and a 45% reduction in deer harvest.11 Additionally, migrating deer reduce stopover use, increase their travel speed, and sometimes detour around development infrastructure and activity. While research on the effects of wind development on pronghorn is still emerging, evidence to date is very concerning. Taylor et al. (2016) found that proximity to a wind facility did not affect winter survival of pronghorn, but it did change patterns of space use by females.12 This latter piece is important given that populations are driven by females and their ability to reproduce sufficient young at or above replacement levels. Exposure to further disturbance during this already risky timeframe – such as being pushed to use of lower quality habitat - may impact survival and overall health of these populations. Smith et al. (2020) found evidence that pronghorn avoided wind turbines in winters after development within their winter home ranges. This has important implications for wind development projects like Lava Ridge, where development may be occuring in areas known to fulfull important seasonal requirements for pronghorn populations. Thus, special consideration must be given when contemplating further development to landscapes used by pronghorn during winter as they are already predisposed to high mortality rates on winter range due to harsh environmental conditions and high energy demands. Recent scientific publications have also increased our understanding of how wind development impacts migrating pronghorn. Milligan et al. (2023) found that migrating pronghorn avoided turbines when selecting stopover sites in spring and winter, selected areas farther from turbines at a small scale in spring and winter, moved more quickly near turbines in spring (although pronghorn moved more slowly near turbines in the fall), and reduced fidelity to migration routes relative to wind turbines under construction in both spring and fall. The behavioral adjustments pronghorn made relative to wind turbines could reduce the functional benefits of their migration, such as foraging success or the availability of specific routes, over the long term.13 The researchers cautioned that behavioral adjustments pronghorn made relative to wind turbines could reduce the functional benefits of their migration, such as foraging success or the availability of specific routes, over the long term. They also warned that “[a]s development continues to accumulate, behavioral adjustments during migration could lead to population-level consequences, such as fitness impacts from reduced foraging opportunities or the loss of specific migration routes that may only manifest in the long term. Development thresholds that cause the loss of existing migrations remain unknown for ungulates, but our study clarifies that wind- energy development is among the anthropogenic factors that can disrupt migratory behavior across formerly intact landscapes.” While we acknowledge the need for long-term studies for pronghorn (as has been done with mule deer and oil and gas development), the aforementioned research findings strongly suggest that BLM must proceed with a cautious mindset. Unfortunately, we are not convinced this mindset has been adopted in the DEIS, as all of the action alternatives place siting corridors directly over the identified Owinza pronghorn route and in important winter and migratory habitat for mule deer. Animals within the Owinza pronghorn herd migrate upwards of 103 miles seasonally, traversing through lava fields below the Mount Bennett Hills and in the	See response to comment 3150-2 (see in Table A-3aa, Wildlife, including Big Game). With the exception of Milligan et al. (2023), the draft EIS incorporated the cited literature into the big game impact analysis. The final EIS has been revised to incorporate the Milligan et al. (2023) paper, to include the most recent available literature on the topic.

Comment ID	Commenter	Public Comment	Response to Comment
		Snake River Plains to the western edge of the Wood River Valley, as displayed in Figure 1.14 Individuals in this herd spend 17 days in the spring and 12 days in the fall migrating, on average. [map] Figure 1. Migration routes and stopovers of the Owinza pronghorn herd. [map] Figure 2. Range of Alternatives and the Southern Terminus of the Owinza Pronghorn Route Pronghorn have recently been categorized as a Species of Greatest Conservation Need (SGCN) under Idaho Department of Fish & Game (IDFG) 2022 draft State Wildlife Action Plan (SWAP). In the draft SWAP, pronghorn were highlighted as a high-profile SGCN occurring in Desert & Semidesert habitats that are potentially influenced by energy production and mining.16 IDFG has made it a priority to "Inform regulatory authorities, project proponents, and industry about opportunities to reduce negative effects on SGCN (e.g. facility siting; construction, operations, and maintenance BMPs; and human activity and noise reduction)…and…Implement BMPs that reduce SGCN disturbance in important locations and during important periods (e.g., Pronghorn on winter range…)".17 We appreciate the honesty in the BLM's conclusion when broadly analyzing cumulative effects in the DEIS-for example- "Existing big game habitat may not support the same density of individuals as unaltered landscapes and existing unfragmented or altered habitats are likely important resources for populations in the analysis area…The effect would be greatest for wintering populations of pronghorn and mule deer, as development would be concentrated in the area south of ID24 in an area that provides important winter habitat." (emphasis added) That said, the DEIS lacks specificity when analyzing functional habitat loss for pronghorn and mule deer due to behavioral avoidance and displacement from wind turbines or associated infrastructure. The analysis seems to only reference direct habitat loss from vegetation removal for the installation of wind turbines. The sheer size of the proposed project- up to 312.5 square miles and over 197,474 acres-will result in substantial functional habitat loss due to behavioral avoidance. It is clear there are still too many unknowns about pronghorn and mule deer behavior and tolerance to wind energy development in occupied winter range to even consider a project of this magnitude at this time.	
11327-3	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	b) Temporary Livestock Fencing Alternative B would place upwards of 395 miles of temporary livestock fences along roads to isolate livestock pastures. While the BLM states that fences would be constructed using wildlife-friendly guidelines, the substantial increase in new linear boundaries will likely cause pronghorn to avoid areas or shift behavioral patterns elsewhere. Even wildlife-friendly fencing can cause entanglement and death, sustained injuries, habitat fragmentation, and barriers to movement. Pronghorn have fidelity to the known-crossing sites and specifically travel to these locations when selecting to cross. 18 It is likely that this a learned behavior component to the fidelity of known-crossing sites, with females teaching young the spatial location of sites and how to navigate the bottom wire. 19 Thus, new fencing (even wildlife-friendly fencing) in any season has the potential to negatively impact pronghorn and especially if snow levels exceed 18". Given this, we ask that the BLM provide clarity as to what is meant by 'temporary fencing'. The DEIS states that temporary fencing may be deployed at any given time during the two years of construction and in the two years of decommissioning. We are led to believe that "temporary" means that all fences associated with the project that are deployed during construction would be taken down during project operations, deployed again during decommissioning, and then removed once reclamation is completed. If this is not the case, the BLM should clarify this section, as 395 miles of fencing has substantial impacts to wildlife within the project area. Even the least obtrusive alternative would place up to 222 miles of temporary fencing, meaning all action alternatives' fencing would result in substantial impacts to wildlife species throughout the life of the project. An example is in western Wyoming, where required fencing around an industrial-scale solar farm ultimately blocked access to and reduces connectivity between formerly available habitats for pronghorn. Resident pronghorn lost year-round habitat and had to modify their movements accordingly, and migratory pronghorn could no longer move through the area during migration, affecting migrations that extended up to 225 km away.20 When several hundred pronghorn encountered the fence boundary and moved into the adjacent highway, catastrophic collisions were avoided when Wyoming Game and Fish personnel provided escape routes via opened ROW gates.21	The EIS discloses the range of potential impacts from temporary fencing on big game movement based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The Flagging, Fencing, and Signage Plan (Appendix K in MVE [2023]) includes the following definition of "temporary fencing": Combination of one or more of the following fencing materials will be installed by the construction contractor: rope (1/4-inch diameter in yellow or orange coloring), plastic or fabric tape, and safety fencing. The Grazing Coordination Plan (Appendix S in MVE [2023]) includes a detailed description of temporary livestock fencing and locations during construction, decommissioning, and reclamation. The Grazing Coordination Plan estimates that 20 to 25% of temporary fencing would be deployed at any one time, and no new permanent fencing and no removal of existing fencing is anticipated. The exception to this would be the fencing that would be installed around substations and other facilities, as required by OSHA regulation (29 CFR 1926.966(e)(2)).
11327-4	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	c) Avoidance In its' alternative development, the BLM too quickly jumped to minimizing and mitigating impacts to big game populations rather than proper analysis into avoiding impacts. This runs counter to the BLM's mitigation hierarchy of avoidance, minimization, and mitigation of unavoidable adverse impacts. The BLM concludes that all action alternatives would have irretrievable impacts on wildlife movement from habitat loss and fragmentation caused by ground disturbance for up to 84 years. We look to the BLM to follow mitigation guidance set by Instruction Memorandum (IM) No. 2021-046 Reinstating the Bureau of Land Management (BLM) Manual Section (MS-1794) and Handbook (H-1794-1) on Mitigation. The IM provides policies to: 1) Implement consistent principles and procedures for mitigation in the BLM's authorization of public land uses; 2) Apply mitigation to address reasonably foreseeable impacts to resources (and their values, services, and/or functions) from public land uses; and 3) Follow the mitigation hierarchy by first avoiding damage to the public lands and resources; second, minimizing damage that cannot be avoided; and third, compensating for any residual impacts to important, scarce, or sensitive resources or resources protected by law.(Emphasis added) For pronghorn, the alternatives provide no assurances that avoid their migration route; the alternatives provide no effort to minimize direct disturbance within their migration route; and the DEIS contains weak mitigation language to ensure that unavoidable impacts would be effectively mitigated.	BLM's Mitigation Handbook (H-1794-1) was used to develop the mitigation plan included in the final EIS, which follows the hierarchy of avoidance, minimization, and mitigation. See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).
11336-3	Nathan Schutte	3. This project is not in character or in harmony with the area. The wind turbines would be an alien element and would completely change the character of the Idaho desert. With it not being in harmony, it would have a major impact on the native wildlife and their natural migration corridors. To get a better understanding, I requested the big game migration corridors from The Idaho Department of Fish and Game and overlaid them on the Lava Ridge Project Area. I have attached Figure 1 that shows the main big game migration corridors that come down	The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the location and use of mapped migration and movement corridors, and the range of potential impacts on these migration and movement corridors based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).

Comment ID	Commenter	Public Comment	Response to Comment
		from the Wood River Valley and then they move through and into what is proposed to be the main part of the Lava Ridge Project. The corridors are illustrated with a bright green color. This shows that the project is in major conflict with the migration corridors. How will this be handled? I also included the readme data request from the Idaho Department of Fish and Game as reference as to where I received the data for the green lines shown in Figure 1.	
11527-4	Richard Stover; State of Idaho	IDFG has initiated radiotelemetry tracking and data collection within the Project area to support big game management programs. IDFG's effort has produced information about seasonal habitat and migration routes for the Owinza pronghorn winter herd (Kauffman et al. 2022a). Analysis of radiotelemetry data for the migratory mule deer herd wintering in the Project area is underway, and products are forthcoming. The importance of conserving or restoring big game migration and seasonal habitat is highlighted in Department of the Interior Secretarial Order 3362, which prioritizes "minimizing development that would fragment winter range and primary migration corridors," and the Idaho Action Plan for Implementing the Department of the Interior Secretarial Order 3362 (IDFG 2022). Protecting and improving movements and migration is also identified as a priority in IDFG's Mule Deer Management Plan (IDFG 2019) and draft Pronghorn Management Plan (IDFG 2023 in review). New research highlights the importance of stopover areas within pronghorn migration routes. The Owinza pronghorn migration, including stopover areas, occurs in the Project area. Stopover areas are patches of higher-quality forage needed to maintain energy reserves during migration. Projects that reduce stopover habitat within migration routes can adversely affect migratory big game, such as pronghorn (see Milligan et al. 2023). Comments on DEIS The DEIS action Alternative B would have the greatest adverse effects on pronghorn and mule deer migration and winter habitat quantity, quality, and connectivity. DEIS action Alternatives C, D, and E (pp. 2-12 – 2-14) would each implement measures intended to reduce adverse Project effects on these migratory big game populations. Removing siting corridors north of State Highway ID-24 may partially reduce fragmentation of big game migration routes and winter range. BLM's Preferred Alternative C (p. 2-13) precludes siting corridors northwest of the Kinport- Midpoint transmission line, which might also reduce adverse effects on migratory big game. Recommendations for the FEIS and ROD Although DEIS text (p.3-469) addresses migratory mule deer, the FEIS needs to include up-to- date information that can be provided by IDFG. Figure 3.18-2 (p. 3-465) presents incomplete information. The "mule deer migration route" layer (green) does not include a migration route for mule deer applicable to the Project area but displays migration routes adjacent to the proposed Project area. IDFG is developing a new migration map with radiotelemetry data for the Owinza mule deer winter herd that includes migration routes within the Project area. This map is expected to be released in April or May of 2023. The FEIS must include updated information for mule deer migration. The FEIS's and ROD's selected Project alternative must maintain connectivity of big game seasonal ranges by avoiding mule deer and pronghorn migration routes. For example, the selected alternative must avoid siting corridors north of State Highway ID-24 (as described in Alternatives C, D, E) and northwest of the Kinport-Midpoint transmission line (as described in Alternatives C and D).	The BLM appreciates the continued coordination and collaboration efforts of IDFG on this EIS. The updated mule deer migration route was not available at the time of publication of the draft EIS; however, it is included for analysis in the final EIS.
11535-80	Steven Andersen	Potential impacts which are not sufficiently analyzed on large ungulates like mule deer and pronghorn antelope include impediments to free movement, creation of migration bottlenecks, and reduction in effective winter range size.	The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the location and use of mapped migration and movement corridors, and the range of potential impacts on these migration and movement corridors based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]).
11535-81	Steven Andersen	The DEIS does not include all possible impacts to big game. Its analysis focuses almost exclusively on Mule Deer and Pronghorn. The DEIS concludes that the project would be unlikely to have a measurable effect on elk populations but does not provide an in-depth analysis as to possible effects of the elk population. Impacts to big game such as black bears, wolfs, bighorn sheep, and mountain lions are not analyzed.	The CEQ implementing regulations for NEPA at 40 CFR 1502.2 state that "(a) EISs shall not be encyclopedic" and "(b) EISs shall discuss impacts in proportion to their significance. There shall be only brief discussion of other than significant issues." In order to comply with these requirements, the BLM identified issues for detailed analysis in the EIS through the internal and public scoping processes. No specific concerns with elk or mountain lions were raised during this time. Bighorn sheep and wolves are not known to occur within the project area; therefore, these species were not included for analysis.
11535-82	Steven Andersen	Experts have noted how fragile elk are to human interference. On winter ranges, elk are highly susceptible to disturbance. They are so sensitive to human disturbance that even cross-country skiers can cause significant stress to wintering animals.255 Ferguson and Keith (1982) found that while cross-country skiers did not influence overall elk distribution on the landscape, elk avoided heavily-used ski trails.256 Disturbance during this time of year can be particularly costly, since the metabolic costs of locomotion are up to five times as great when snows are deep. To the degree that wind power facilities involve human presence in crucial ranges during the most sensitive time periods, these developments may tend to displace elk from their preferred habitats into marginal ranges, where habitat conditions may be poor or where they may be forced to compete with resident animals already at or near their carrying capacity.	Elk are discussed in EIS Appendix 3, Wildlife AIB-62, which describes that elk herds in southern Idaho are generally robust, and populations are limited more by depredation control than by habitat suitability. The EIS determined that the project would not have a measurable effect on local elk populations.
11535-83	Steven Andersen	The DEIS wrongfully presumes that this project will not have a long-term effect on big game. It states that "[o]ver time, big game use of the siting corridors may improve as work areas are restored and big game individuals become acclimated to the infrastructure areas."258 However, it provides no support for this conclusion. For mule deer, Sawyer et al. (2005) found that in the Pinedale area, wellfield development caused abandonment of mule deer crucial winter ranges for years at a time, and ultimately resulted in a 46% decline in mule deer populations, while herds in undeveloped areas showed a much smaller decline over the same period; the affected population has yet to recover to pre-disturbance levels.259 Indeed, experts have noted that long-term effects should be expected if the construction phase of the project extends over a period of years.	The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The summary statement in the Habitat Loss and Alteration discussion states, "There is little available information regarding the effects of wind development on pronghorn and mule deer; however, both species generally demonstrate avoidance of areas of development, and habituation to presence of human disturbance is not apparent. Therefore, it can be assumed that avoidance of development related to noise and human activity that are audible or visible beyond the project ground disturbance footprint would contribute to long-term habitat losses for both species beyond the project ground disturbance footprint." The full section summary discloses the likelihood of population-level effects for mule deer and pronghorn.

Comment ID	Commenter	Public Comment	Response to Comment
11535-84	Steven Andersen	The DEIS also fails to look at the effect of big game in the aggregate. Deficiency in any one species can have profound impacts on the ecosystem as a whole. This deficiency is significant because many non-volant animals are protected as sensitive or culturally important species (e.g., game animals) that are already at risk from other forms of human development. Still others are important for their ecological roles and intrinsic value. 261 Ecological impacts may also include so-called cascading effects, because the species within the same ecosystem has ecological relations to one another. This means that an effect on one species may in turn affect many other species, thus creating a cascade effect. Cascade effects may result in different types of interactions, such as competition, predation, parasitism or symbiosis, depending on their effect or mechanism.262 Moreover, changes in spatial distribution of individual species due to human activity can cause similar cascade effects as predation risk. For example, large predators such as wolves and brown bears often avoid areas of high human activity, which can create a predation free area to which prey species may be attracted.263 This spatial redistribution of large herbivores may in turn impact local vegetation structure and lead to less available forage in the areas that are actually used.	See response to comment 11554-15 (see in Table A-3aa, Wildlife, including Big Game).
11535-85	Steven Andersen	The DEIS underestimates the impact of roads on big game. Access to wind turbines for maintenance and other operational purposes requires roads that have well-documented negative effects on wildlife as reviewed by Lovich and Ennen for solar energy developments. Effects include direct mortality and habitat fragmentation, which can extend far beyond the physical surface of the road, and noise. However, with this increase of prey abundance, larger predatory wildlife could be more susceptible to vehicle strikes. The DEIS asserts that fragmentation through new roads could have positive effects that offset any negative ones. However, in a review of the effects of roads on wildlife, Fahrig and Rytwinski concluded that roads have an overall negative effect on wildlife.	The commenter fails to identify how the EIS makes a direct connection between roads and the probability of increased abundance of prey species. The EIS states, “In addition, the new roads would contribute to increased disturbance from human noise and activity, increase direct mortality of mule deer and pronghorn collisions with vehicles, and increase access for hunters. The increase in road density would also contribute to existing fragmentation and habitat degradation in the analysis areas.” See the Wildlife Movement discussion in Section 3.18.2.2.2 (Big Game Habitats and Populations, Impacts). The EIS also states “Overall, these studies suggest that wind energy infrastructure has little to no effect on smaller terrestrial wildlife species, but that increasing road density is likely to have negative impacts on most wildlife species.” See the Roads and Infrastructure discussion in Section 3.18.1.2.2 (Wildlife Movement [non-game mammals and reptiles], Alternative B [Proposed Action]).
11535-86	Steven Andersen	The DEIS states “[d]isplacement of mule deer and pronghorn due to noise would cease after decommissioning once human noise and activity are reduced.”266 There is no support for this statement. Moreover, wind turbines produce noise which will continue to affect big game for the life of the project. Wind energy generation produces infrasound due to turbulence associated with spinning turbines producing vibrations that can propagate for tens of km and are detectable on broadband seismometers. Sounds produced by turbines are below the audible range of humans but can cause houses and other nearby structures to vibrate. The effects of these vibrations on wildlife may be similar to those associated with noise. Some animals are sensitive to frequencies below 40 Hz and are “exceptionally good” at perceiving low-frequency vibrations through their skin. Low-frequency stimuli from these sounds or vibrations are within the perceptible range of some animals that show unusual behavior before earthquakes.267 Long term exposure to sound can stress wildlife and alter behavior. Furthermore, experts have suggested that exposure to the electromagnetic nature of the wind turbines can be harmful to wildlife. These studies suggested that chronic exposure to athermal electromagnetic radiation could impact nervous, cardiovascular, reproductive, and immune system.	Impacts to big game from noise is discussed in EIS Section 3.18.2.2.2 (Big Game Habitats and Populations, Impacts), which specifically discloses the impact from noise disturbance associated with turbine operations on big game behavior and potential avoidance response. Noise associated with the project would occur during the 2-year construction period, 30-year operation period, and 2-year decommissioning period, which would result in approximately 34 years of noise. The BLM’s background literature review did not identify any publicly available literature indicating that vibration from operational turbines can significantly impact wildlife. Concerns with vibration from wind turbines are primarily related to the generation of low-frequency noise (also known as infrasound). Although research in this area is limited, the predicted effects of infrasound are similar to those for noise at audible frequencies (Lovich and Ennen 2013). The discussion of impacts to wildlife from noise in EIS Section 3.18 (Wildlife) and EIS Appendix 3 (Issues Analyzed in Brief) provide sufficient disclosure of effects to wildlife from noise, and therefore, further analysis of impacts from infrasound in the EIS is not warranted. Also see the response to comment 3873-2 (see in Table A-3t, Pollinators and Insects) for a discussion of impacts to terrestrial invertebrates from vibrations caused by wind turbines.
11535-88	Steven Andersen	The DEIS fails to address the overall effect of greater access to this region on illegal poaching and take of big game. The DEIS concludes that the magnitude of the effect of illegal take of big game cannot be estimated but the project itself is unlikely to lead to changes in overall take of big game species.271 Bromley suggests that hunting and poaching of wildlife was a problem associated with oil and gas exploration and development in wildlands.272 Similar scenarios could be envisioned at wind energy sites such as with this project. Bromley urges that firearms should not even be allowed on the project site and in vehicles using facility access roads.	The CEQ implementing regulations for NEPA at 40 CFR 1502.2 state that “(a) EISs shall not be encyclopedic” and “(b) EISs shall discuss impacts in proportion to their significance. There shall be only brief discussion of other than significant issues.” In order to comply with these requirements, the BLM identified issues for detailed analysis in the EIS through the internal and public scoping processes. The EIS states, “Because the new and improved roads would be open to public use, new roads would also increase the level of motorized access for hunters and other recreationists that may either directly kill mule deer and pronghorn (via vehicle strikes or hunting [see Section 3.12 (Recreation) for more detail]) or disturb or displace individuals due to human noise and activity.” See the Roads and Infrastructure discussion in Section 3.18.1.2.2 (Wildlife Movement [non-game mammals and reptiles], Alternative B [Proposed Action]). The potential for increased illegal take (poaching) is discussed in EIS Appendix 3, Wildlife AIB-54. Although it is assumed that illegal take (poaching) would increase as a result of improved access, the magnitude of this effect cannot be reasonably estimated.
11554-15	Raul Labrador; Idaho Attorney General’s Office	The Magic Valley region holds some of Idaho’s best hunting land for big game, upland bird species, small game, and waterfowl.1 The Project will devastate wild game and other animals in the area. The draft EIS recognizes this fact but gives it no weight. The agency admits that the Project will “substantially fragment” wildlife habitat and “greatly impair the ability of wildlife to move through the” 200,000 acres of public land the wind farm would occupy. DEIS at ES-xxiii. But the draft EIS fails to address the Project’s impact on Idaho wildlife. To start, the draft EIS only analyzes the Project’s impact on mule deer and pronghorn—it fails to analyze, or even consider, the Project’s impact on other game species. See DEIS at 3-462. Even so, this narrow analysis finds that the Project will irreversibly harm Idaho’s wildlife. For example, the draft EIS concludes that the Project would (1) permanently alter or destroy the seasonal habitat for mule deer and pronghorn, injure and kill many of these animals, DEIS at ES-xxiii; (2) permanently alter the habitat for deer and pronghorn and increase mortality for the species, DEIS at 3-477; (3) harm animals through turbine noise, vibration, and shadow flickering, id.; and (4) kill and injure many mule deer and pronghorn due to increased human activity—such as higher road density and construction activity. Id	The potential for impacts to general wildlife (which is inclusive of non-pronghorn and mule deer game species) is discussed in EIS Appendix 3, Wildlife AIB-61. BLM (2005) discloses effects to foraging resources and territory use for wildlife species resulting from the construction and operation of a wind energy facility (BLM 2005:5-35–5-85), which include the long-term loss of habitat within turbine, building, and access road footprints, and a long-term decrease in habitat quality within utility and transmission line corridors. Wildlife may also be displaced from suitable habitat due to noise and increased human presence. Beyond the issues discussed in detail in Sections 3.12.1 (Hunting and Trapping Access and Opportunities), 3.18.1 (Wildlife Movement [non-game mammals and reptiles]), and 3.18.2 (Big Game Habitats and Populations), project-specific disclosure of effects to foraging habitat and/or migratory and territory use for general wildlife would not exceed the level of effects included in BLM (2005). The CEQ implementing regulations for NEPA at 40 CFR 1502.2 state that “(a) EISs shall not be encyclopedic” and “(b) EISs shall discuss impacts in proportion to their significance. There shall be only brief discussion of other than significant issues.” In order to comply with these requirements, the BLM identified issues for detailed analysis in the EIS through the internal and public scoping processes.
11598-12	Idaho Conservation League	Big Game The Lava Ridge Wind Project analysis area is adjacent to two big game Winter Range and Migration Priority Areas for mule deer and pronghorn (Smoky-Boise Complex Priority Area and the Big Desert-Mountain Valley Complex Priority Area) as described in IDFG’s Idaho Action Plan (IDFG 2022). Pronghorn are also a	Cumulative impacts on big game from other proposed renewable energy projects within the analysis areas are disclosed in Section 3.18.2.2.7 (Big Game Habitats and Populations, Cumulative Impacts). The EIS states, “Development of planned energy projects would result in alteration of available habitat beyond that associated

Comment ID	Commenter	Public Comment	Response to Comment
		Species of Greatest Conservation Need (SGCN), as listed in 4 Schuster E, Bulling L, Köppel J (2015) Consolidating the State of Knowledge: A Synoptical Review of Wind 811 Energy's Wildlife Effects. Environ Manage 56:300–331. doi: 10.1007/s00267-015-0501-5 Idaho's State Wildlife Action Plan. The analysis area for habitat used by mule deer and pronghorn is roughly 2.5 million acres and 1.5 million acres, respectively. Both species use the analysis area for essential winter range and, in the case of pronghorn, for stopover habitat. Ongoing studies by IDFG could also discover significant usage for stopover habitat and migration corridors by mule deer, as well. Pronghorn are also presumed to be using the area as fawning habitat. Approximately 87% of the analysis area has been altered due to agriculture, nonnative plants, roads, development, wildfire, vegetation treatments and reseeding projects. While fragmented habitat has concentrated wildlife movement in the remaining areas of relatively undisturbed habitats, wild ungulates have regularly found refuge in the area, especially during winters of extreme severity. However, low-quality forage due to recent fire events and agriculture/grazing practices may have reduced population fitness and carrying capacity compared to earlier periods with plentiful native plant forage. Current degraded range conditions also increase levels of competition amongst and between herds, leading to inevitable mortality increases. Considering all this, the fact that the DEIS calculates 84 years of additional vegetative impacts (i.e. habitat) through the decommissioning phase of the project, is especially concerning. In general, mule deer and pronghorn have not demonstrated an ability to adapt to industrialized habitats or habituate to human presence. Instead, those species tend to alter their behavior to avoid areas of disturbance and development. This requires higher energy expenditures at a time when wild ungulates are most reserve-depleted. Additionally, while the range of project alternatives allows for different sized footprints, they all present a similar variety of anthropogenic factors (roads, traffic, fencing, noise/"acoustic masking", human activity, infrastructure, etc.) that will likely reduce the individual and herd fitness of mule deer and pronghorn that use the area. These threats will impact movement, population migration connectivity and general behavioral responses to construction, operation and decommissioning activities. Other associated activities, such as increasing OHV/ORV use on lands within or directly adjacent to the project will further compound challenges to mule deer and pronghorn. Adding to these challenges, at least two other major industrial projects are planned for areas to the west of the Lava Ridge project - the Taurus Wind Project and the 500kV SWIP-North transmission line running to central Nevada. Should Lava Ridge be permitted in any of the BLM's current iterations, mule deer and pronghorn would likely be displaced to the east and west of the project area due to high levels of ground disturbance and degraded habitat mentioned above. The adaptive behavioral response to move to another area may ultimately be ineffective if these other areas also become developed. This scenario demands that BLM consider cumulative impacts from other industrial proposals, particularly in such close proximity to the Lava Ridge project. Perhaps equally as relevant as displacement from critical winter range (and associated biological stresses), all action alternatives for the Lava Ridge project are located in the highly significant north-south Owinza Pronghorn Migration Route5. Increasingly, evidence shows us that movement patterns are learned throughout a population of animals and loss of that "herd memory" and the associated behavior traits, can have profound effects on their long-term viability. We cannot support any alternative that would place turbines and associated industrial disturbance within the north-south travel corridor providing access to wintering habitat for one of the most consequential pronghorn populations in Idaho. Interestingly, mapping data documenting the route were based on only two mild winters (DEIS 3-473). Should ongoing pronghorn tracking efforts in the area produce viable data for the 2022-2023 winter, the BLM should examine differences of how animals used the same corridor and range during a winter of high snowfall and above-average precipitation. As pointed out in Figure 1, there are significant portions of the project area that are outside the Owinza Pronghorn Migration Route that may be able to support a wind development project with a smaller footprint. If the BLM develops such an alternative, the agency should also examine the scientific literature to see what type of buffer might be needed and what design features (timing for construction activities, etc.) are most effective at minimizing impacts. In terms of mitigating remaining impacts to pronghorn, we recommend that the BLM consult with the IDFG to identify several limiting factors to big game in that area. Potential mitigation activities could include establishing a significant fund to evaluate, remove or upgrade fences to allow easier passage for pronghorn or to revegetate degraded areas with native vegetation, among other efforts. Significant and meaningful guidance has been set forth in recent documents emphasizing the importance of incorporating migration corridors and movement ecology into public lands planning and wildlife management policy. For example, the Council on Environmental Quality memorandum "Guidance for Federal Departments and Agencies on Ecological Connectivity and Wildlife Corridors"6 articulates several important points intended to inform federal decision-making about public lands: ● Connectivity and corridors should factor into high-level planning and decision-making at Federal agencies as well as into individual decisions that lead to well-sited and planned projects. 5 Kauffman, et al. (2022). Ungulate migrations of the western United States, volume 2. 10.3133/sir20225008. 6www.whitehouse.gov/wp-content/uploads/2023/03/230318-Corridors-connectivity-guidance-memo-final-draft-fo rmatted.pdf ● Agencies should incorporate consideration of connectivity and corridors into the guidance for planning, siting, operation, and maintenance of Federal investments, including renewable energy development and infrastructure. ● In carrying out large-scale planning required by statutory mandates, Federal agencies should consider updating inventories of Federal resources under their associated management plans to assess connectivity and corridors. Such inventories can inform project siting decisions, protective designations, and where to carry out habitat restoration to enhance or restore connectivity between blocks of intact habitat. ● Designing infrastructure to facilitate wildlife movement, ecosystem processes, and ecosystem services ● Avoiding or minimizing adverse impacts that would fragment habitat identified as a priority for connectivity or corridors, and where not possible, offsetting or compensating for these impacts ● Federal agencies are encouraged to adopt proactive approaches in developing their proposed actions and projects, and	with the project footprints, and big game species avoidance behavior of areas of new development would further reduce remaining habitat availability in the analysis area and may result in an increase in depredation of agricultural crops near the project. The effects of habitat loss, disturbance from human activity and noise, and movement barriers would be greatest for wintering and migrating Owinza populations of both species, as development in the analysis area would be concentrated in the area south of ID 24 in an area that provides important winter habitat and resources during severe winters." The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use. The final EIS also includes a Mitigation Framework for Big Game (see EIS Appendix 4 [Mitigation]). The mitigation framework outlines compensatory mitigation strategies that would be implemented based on affected habitat quantity and quality.

Comment ID	Commenter	Public Comment	Response to Comment
		to incorporate project siting and design elements that conserve, enhance, protect, or restore connectivity and corridors. ● Through the NEPA review process, Federal agencies can consider measures to advance corridors and connectivity as components of proposed actions, alternatives to proposed actions, or mitigation for proposed actions' effects. In addition to the recent memo on corridors and connectivity, SO 33627 also provides directives on the subject, as does IDFG's Idaho Action Plan8. ICL believes the future of a transitioning energy mix on BLM lands in Idaho must include siting decisions based on the guidance principles described above. Current land use practices, native vegetation restoration strategies and fire management tools must also be examined to arrive at practices that support intact migration corridors, connected habitats and healthy winter range for mule deer and pronghorn, as well as a wide diversity of nongame wildlife.	
11629-2	Ruth Harder	-This project would interfere with migration routes and grazing areas of big game animals. As they are pushed from BLM land, they would be forced onto private properties. Would this lead to relocation or depredation hunts?	The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The summary statement for this section states, "habitat loss and fragmentation in winter habitat may cause individuals to move into areas with higher human-wildlife conflict, such as agricultural fields or roadways, which may increase risk of direct mortality."
11634-5	Name Not Provided	A wildlife issue that requires additional examination is the impact of the proposed Lava Ridge Wind Project on migration corridors for big game including elk, mule deer, and pronghorn. In 2018, the Secretary of the Interior published Secretarial Order #3362: Improving Habitat Quality in Western Big-Game Winter Range and Migration Corridors, which "directs appropriate bureaus within the Department of the Interior (Department) to work in close partnership with the states of... Idaho... to enhance and improve the quality of big-game winter range and migration corridor habitat on Federal lands...". The information the DEIS uses to assess potential impacts to big game winter range and migration corridors, specifically in the context of the objectives of SO #3362, is inadequate. The analysis of the proposed project to elk migration is wholly missing from the DEIS--despite the clear inclusion of data showing successful elk hunting (as well as deer and pronghorn) in the project area.	The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The BLM is working closely with IDFG to compile and analyze the best available information to disclose impacts as accurately as possible. The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use. See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game). Elk are discussed in EIS Appendix 3, Wildlife AIB-62, which describes that elk populations in the siting corridors and vicinity comprise small numbers of resident individuals and that the local population is being actively managed to maintain or reduce resident populations, with the goal of reducing competition for forage with mule deer and agricultural conflicts. The EIS determined that the project would not have a measurable effect on local elk populations. The CEQ implementing regulations for NEPA at 40 CFR 1502.2 state that "(a) EISs shall not be encyclopedic" and "(b) EISs shall discuss impacts in proportion to their significance. There shall be only brief discussion of other than significant issues." In order to comply with these requirements, the BLM identified issues for detailed analysis in the EIS through the internal and public scoping processes. No specific concerns with elk migration were raised during this time.
11871-15	WildLands Defense	Owinza- Gooding Pronghorn Routes The DEIS lacks adequate pre-decisional analysis and alternative actions to address and protect the Owinza pronghorn migration route, identified in a recent USGS wildlife corridor report. See: https://idahowildlife.org/news/big-game-migrations-habitat-connectivity-continue-to-be-central-focus-for-department-of-interior https://pubs.usgs.gov/sir/2022/5088/sir20225088.pdf The USGS site also includes concerns about increasing climate change stresses and threats impacting native ungulate habitats: https://pubs.er.usgs.gov/publication/cir1493, (Malpeli 2022). Ungulate Migration in a Changing Climate—An Initial Assessment of Climate Impacts, Management Priorities, and Science Needs "Migratory behavior among ungulates in the Western United States occurs in response to changing forage quality and quantity, weather patterns, and predation risk. As snow melts and vegetation green-up begins in late spring and early summer, many migratory ungulates leave their winter range and move to higher elevation summer ranges to access high-quality forage and areas with vegetative cover for protection during fawning. Ungulates remain on these ranges until the fall when increasing snowfall and decreasing temperatures trigger them to migrate back to their lower elevation winter ranges. While researchers have begun to assess the effects of physical barriers such as roads and energy infrastructure on migration, less attention has been paid to understanding how changing climate conditions might affect ungulate movements and range habitats. Does earlier spring green-up make ungulates leave their winter ranges sooner? Do persistent drought conditions reduce the carrying capacity of seasonal range habitats or lead to shifts in migration pathways? These and other questions remain largely unanswered but could have cascading effects on ungulate population dynamics and migratory behavior". "Physical barriers to movement such as roads and fences were identified as a core concern. In addition, the primary research needs of States are the acquisition and analysis of data on ungulate movements, to refine delineation of winter range, summer range, and corridors, and to support a better understanding of how ungulates use these habitats. When it comes to understanding climate effects, managers were more concerned with understanding the vulnerability of winter- and summer-range habitats than the vulnerability of migration corridors because of the influence of summer and winter forage on ungulate condition and reproductive success. Managers were also concerned about how forage quality and quantity might change because of stressors such as drought, wildfire, and invasive species and how they might need to alter habitat-treatment strategies as a result". The USGS Reports show the need for adequate scientific baseline data on numerous specific habitat components: "While migrating between seasonal ranges, animals require access to adequate forage to maintain and renew energy reserves. As a result, many long-distance migrants spend part of their migration period in habitat patches along movement routes known as "stopovers," where animals can rest and forage (Dingle and Drake, 2007). This phenomenon is well-studied among flying avian migrants but not among land migrants (Sawyer and Kauffman, 2011). The emerging literature on the use of stopovers by ungulates demonstrates that these sites play a crucial role in their migration strategies. Most notably, Sawyer and Kauffman (2011) found that mule deer in Wyoming spent 95 percent of spring and autumn migration in stopover sites. Seidler and others (2015) found that pronghorn in Wyoming spent a significant portion of the spring migration period (78 percent) in stopovers. These sites had higher forage quality than movement corridors, and deer used the same stopover sites for years. During their	The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the location and use of mapped migration and movement corridors and stopover sites, and the range of potential impacts on these corridors and stopover sites based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The BLM is working closely with IDFG to compile and analyze the best available information to disclose impacts as accurately as possible. The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use, including additional stopover sites that have been identified. See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).

Comment ID	Commenter	Public Comment	Response to Comment
		spring migration, deer used stopover sites 44 days before peak green-up (Seidler and others, 2015), enabling them to exploit vegetation during the period of growth when plants are more easily digestible. Had deer not used these sites, they would have arrived on their summer ranges several weeks before optimal forage conditions. These results suggest that ungulates can reduce the amount of time they need to spend on the winter range by using stopover sites …". "The results of these and other studies led to a growing awareness about the importance of conservation strategies that prioritize stopover locations and the maintenance of connectivity between those locations …".	
11871-16	WildLands Defense	USGS Reports describe: "Migratory Bottlenecks. Bottlenecks are features of migration routes that can influence ungulate movements. Bottlenecks are narrow areas along migration routes where landscape features such as vegetation, topography, or human development restrict the width of the corridor and, therefore, animal movements (Sawyer and others, 2005). Bottlenecks are often less than 1 km wide and can be as narrow as 100 meters (m) (Berger and others, 2006). Because of their small area, minor changes to the habitat in these corridors can completely sever established migration routes. Anthropogenic threats to migration and seasonal ranges. The anthropogenic threats facing migratory ungulates in the Western United States are numerous but can be grouped into two broad categories: (1) threats that affect habitat quality on seasonal ranges and migration routes and (2) threats that affect movement during migration. Environmental conditions drive some threats; others are the result of human disturbance. Anthropogenic threats to ungulates include urbanization, residential development, transportation infrastructure, fences, energy development, and the conversion of natural land cover to agriculture (Christie and others, 2015), and can result in both habitat loss and the disruption of migration. Fences – can block or later movement, can cause mortality. [There is no baseline of the status of habitats and populations of big game using this particular landscape – and the adverse conditions and barriers they may already face (roads, powerlines, housing development, fire loss of shrubs needed in hard winters, failed BLM fire rehabs. Etc.) Studies suggest that ungulates alter their migratory behavior in response to energy development. For example, Sawyer and others (2013) found that mule deer can migrate through moderate levels of energy development, but in areas of intense development, behavioral changes were identified, including detouring from traditional migration routes, increasing the rate of movement, reducing the use of stopover sites, and reducing the use of migration routes".	See response to comment 11871-15 (see in Table A-3aa, Wildlife, including Big Game). Additionally, The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the current effects of conditions such as existing movement barriers, habitat fragmentation, and forage conditions in Sections 3.18.2.1.1 (Mule Deer, Existing and Future Trends and Actions) and 3.18.2.1.2 (Pronghorn, Existing and Future Trends and Actions). This information represents the best available scientific information at the time of writing.
11871-17	WildLands Defense	Given the extensive human development in many areas of the Snake River plain and the region - with roads, extensive fencing barriers and hazards, wildfire habitat losses, flawed and failed BLM fire rehabs , wildlife habitat degradation and competition with livestock, and overall escalating human disturbance, Pronghorn across this Snake River plain landscape really have few to no other choices of places to go in winter at present. Will populations of these animals be wiped out on public lands - as massive industrial energy sprawl descends? Will they have no place to go to survive winters? The full cumulative effects on all the winter range habitat conditions across lower elevation lands are also planned to potentially be crammed full of industrial energy projects and this has not been critically assessed in a hard look NEPA analysis. There are an immense number of other foreseeable industrial energy projects, and walls of existing private land wind turbies.. See Basin and Range Watch and WildLands Defense comments on the new BLM Solar EIS scoping. Further, the infrastructure bill is laden with huge subsidies that may lead speculators to destroy sensitive species habitats and public lands recreational use areas for industrial energy projects that turn out to be failures. See map of known BLM energy ROW applications in only this central portion of the Snake River region -and it does NOT show all the private land projects: This map of public lands "renewables" projects shows - based on just applications now and not others that may be foreseeable – that there will be no place for Pronghorn (and many other species to inhabit or move to fulfill their seasonal needs. The map does not show the veritable Wall of wind farms on private lands all across the Snake River plain from east of Mountain Home to the Wyoming border. USGS Ungulate Migrations Vol. 2 – Owinza https://pubs.usgs.gov/sir/2022/5008/sir20225008.pdf Owinza-Gooding Pronghorn Migration "The Owinza pronghorn winter herd migrates by weaving through lava fields below the Mount Bennett Hills and further to the east in the Snake River Plains in Idaho (fig. 37). The seasonal migration moves north, traversing the Picabo Hills into the eastern side of Camas Prairie and west side of the Wood River Valley. This summer range is shared with members of the Gooding herd to the west. Wildlife unfriendly fencing, lava fields, and vehicular traffic endanger the ability of the herd to conduct this seasonal migration. Wildfire and the subsequent invasion of cheatgrass further degrade natural habitat. Future housing development in the Wood River Valley and associated energy developments are likely to challenge the longevity of this seasonal migration". Wild ungulates - like many other wildlife species – are adversely impacted and stressed by industrial wind and transmission lines in ways not yet fully understood: Wind Turbine Stress on Ungulates: https://www.sciencedirect.com/science/article/pii/S1470160X20305951 "We examined the impact of wind farms on the stress levels in roe deer based on seven wind farms of various sizes (of 12–27 turbines) in eastern Poland. Fecal cortisol concentration was assessed with the ELISA method in droppings collected during the winter period. We found that the roe deer exhibited an elevated stress level in the area of larger farms, but such response was not found in the case of smaller wind farms. The roe deer were also characterized by a higher stress level in areas of wolf predation, but this factor was less important. Both the area of the farm and the number of turbines explained the phenomenon of the increased stress in the roe deer. We estimated 824 ha or 18 turbines as a threshold level of the impact of wind farms on the cortisol concentration in the roe deer. We conclude, that turbines should be concentrated in the smallest possible area". "… given the economic and cultural importance of ungulate species and their known sensitivity to other forms of anthropopressure, understanding wind energy impacts on these species should be a high priority. It should be remembered that wind farms are often built far away from human settlements, i.e. in wildlife refuges (Helldin et al., 2012).	See response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game). The analysis areas for direct, indirect, and cumulative impacts to mule deer and pronghorn were developed in collaboration with IDFG and are based on the best available scientific information (recent radiotelemetry data and habitat modeling) and the knowledge of regional subject matter experts. These analysis areas represent an estimation of the annual range (inclusive of winter and summer seasonal ranges and identified likely migration routes) of the population of mule deer and pronghorn that use winter habitat located in and near the siting corridors (see Section 3.18.2 [Big Game Habitats and Populations] for a detailed description of how these analysis areas were delineated and the contributing data). CEQ Regulations define a cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions [RFFAs] regardless of what agency (Federal or non-Federal) or person undertakes such other actions" at CFR 1508.7. RFFAs are actions that may affect projected impacts of a proposal and are not remote or speculative. The BLM developed the RFFAs within Section 3.1.1 in coordination with cooperating agencies and in response to public input.

Comment ID	Commenter	Public Comment	Response to Comment
		Therefore, the introduction of wind farm infrastructure into such a refuge can potentially disturb wildlife populations". Very harmful impacts of wind turbines impacts to reindeer are attracting world-wide attention: "Norway wind turbines should be torn down, reindeer herders say: Norway should dismantle two large wind farms that were stripped of their licences for jeopardising traditional reindeer husbandry, herders from the indigenous Sami community said on Friday …The country's supreme court last month ruled that the Storheia and Roan wind farms, located on the Fosen peninsula in central Norway, violated herders' rights under international conventions, and found their operating permits invalid". Also: "Reindeer herders in the Nordic country say the sight and sound of giant wind turbines frighten their animals and thus disrupt age-old traditions". "Reindeer and wind turbines cannot coexist." Also "We find greater changes in the animals' land use after the establishment of wind power than in previous research in Norway and Sweden, says researcher Sindre Eftestøl to Klassekampen. Together with colleagues from the Norwegian University of Environmental and Life Sciences, he has been researching the reindeer herd of Frode Utsi and Rákkonjárga reindeer owners since 2011. The reindeer graze in an area within a ten kilometer radius of the wind turbines significantly smaller than before. They graze more frequently in other areas. There are signs that the animals dislike the sight of the wind turbines. During the calving period, reindeer largely get calves in areas where the turbines are not visible. The migration patterns of the reindeer have changed. The research was done by attaching GPS collars to 30 reindeer. Information from reindeer owners in the area is then compared against movement data from the herd. There is mostly a large correspondence between the reindeer owners' experiences and the GPS data. Rákkonjárga has a reindeer herd near Berlevåg in the summer, where 15 wind turbines have been installed. The turbines scare the reindeer: - We are most afraid of clear weather and good visibility. Then reindeer see the wind turbines, then they turn. We have a lot of extra work to herd the animals north, says Utsi to Klassekampen. He fears that the situation may get worse, because another 15 wind turbines are planned in the same area. - Then there will be even smaller grazing areas in the north. The pressure on the rest of the grazing areas will be even greater, says Utsi to Klassekampen". https://onlinelibrary.wiley.com/doi/full/10.1002/ece3.4476 https://reindeerherding.org/news/195-reindeer-and-wind-turbines-cannot-coexist https://www.reuters.com/business/environment/norway-wind-turbines-should-be-torn-down-reindeer-herders-say-2021-11-12/ Pronghorn Turbine Avoidance: " … showed that pronghorn did not, in fact, like being around wind turbines in winter. But Beck and others could not determine the exact physical toll that aversion has on pronghorn. So in 2018, the Wyoming Game and Fish Department, the USGS Cooperative Fish and Wildlife Unit at the University of Wyoming and Invenergy, then PacifiCorp, paid for a six-year study looking more in depth at the question of what impact wind turbines have on pronghorn, both in the winter and summer". AND: "With three years of the study done, coop director Matthew Kauffman can off er a few clues. First, wind turbines do displace pronghorn, which in return lose valuable food especially in winter months. Second, and maybe even more importantly, more than a decade of animal tracking data shows it's possible to site wind turbines in places that have less of an effect on Wyoming's speedgoats in a way that still allows for wind development. "We know there is a negative effect, and we would fully expect that to translate that animals don't eat as much, they don't put on as much fat, they don't survive the winter as well and have as many young, all of those are logical," Kauffman said. "But our methods end up being somewhat crude when we try to connect that to reduced survival or population growth …". https://www.wyomingnews.com/rocketminer/news/state/sum-of-avoidance-studies-show-pronghorn-avoid-wind-turbines/article_423a9a0a-c0f0-50f9-9c5e-af4d288c1990.html Smith et al. 2019: https://www.sciencedirect.com/science/article/abs/pii/S1550742419301150 "Few studies have evaluated the response of ungulate populations to wind energy development. Recent demand for wind-generated electricity coupled with a tendency for wind-energy facilities to be sited within suitable pronghorn (Antilocapra americana) winter range make this a critical issue for conservation of this icon of western North America. We evaluated pronghorn response to wind energy development at the winter home range scale, as well as within individual winter home ranges using data collected from 47 adult female pronghorn equipped with Global Positioning System transmitters. At both scales, we developed separate resource selection models for pronghorn before (winter 2010) and after (winters 2011 and 2012) development of the Dunlap Ranch wind energy facility in south-central Wyoming to evaluate the potential impacts of wind energy infrastructure on pronghorn winter resource selection. In general, pronghorn winter resource selection was correlated with greater sagebrush (Artemisia spp.) cover, lower snow depth, and lower slopes before and after wind energy development at both scales. At the larger scale, pronghorn selected home ranges closer to wind turbines during all winters. Within home ranges, pronghorn selected areas closer to future locations of wind turbines at Dunlap Ranch during 2010 before turbine erection. However, we found evidence that pronghorn avoided wind turbines in winters after development within their winter home ranges. This relationship was most evident during winter 2011, which coincided with the most severe winter of our study. Long-term replicated studies will be necessary to make inferences for pronghorn populations exposed to wind energy development in different environments and scales than we evaluated. Nonetheless, in the absence of additional information on how ungulates respond to wind energy development, our finding that pronghorn avoided wind turbines within their winter home ranges has important implications for future wind development projects, particularly in areas known to fulfill important seasonal requirements of pronghorn populations. See also Milligan et al. 2021. https://esajournals.onlinelibrary.wiley.com/doi/full/10.1002/ecs2.3850 Also Milligan et al. 2023: https://onlinelibrary.wiley.com/doi/full/10.1002/ece3.9687 Ecosphere. Variable effects of wind-energy development on seasonal habitat selection of pronghorn Megan C. Milligan, Aaron N. Johnston, Jeffrey L. Beck, Kurt T. Smith, Kaitlyn L. Taylor, Embere Hall, Lee Knox, Teal Cufaude, Cody Wallace, Geneva Chong, Matthew J. Kauffman First published: 09 December 2021 https://doi.org/10.1002/ecs2.3850 "There was a trend toward increased displacement during the study and behavioral avoidance was apparent for individuals in close	

Comment ID	Commenter	Public Comment	Response to Comment
		proximity to turbines. However, pronghorn were highly variable in their fine-scale habitat selection, across both individuals and years, which could make effects of wind energy development difficult to detect. Nevertheless, some individuals, particularly those close to wind-energy facilities, did avoid turbines, which could translate to population-level behavioral or demographic changes over time and affect the resilience and stability of the population. Over time, the accumulation of development, including wind turbines, roads, and fences, can both limit movement and fragment habitat, potentially reaching a critical threshold beyond which populations are negatively impacted". Avoid migratory pathways and leks. This project does neither. http://wildlife.org/wp-content/uploads/2014/12/TWS_Impacts-of-Wind-Energy-Development-on-Wildlife_Dec-2014.pdfa Mule Deer. https://wyofile.com/study-mule-deer-other-species-struggle-to-adapt-to-altered-habitats/ 'A 2017 study by Sawyer showed that the Sublette mule deer herd declined by about 40% over 15 years. They "made fine scale-behavioral changes to avoid habitat close to infrastructure, yet they continued to return to the same winter range year after year," the paper reads. Less winter range meant less food, which meant fewer animals could survive. That's why some proposed solutions, such as off-site mitigation for energy development, may not work, the researchers say. That's why some proposed solutions, such as off-site mitigation for energy development, may not work, the researchers say. The best solution, Merkle said, is to conserve existing migration routes for future generations" A relevant article on site fidelity – and how harmful loss or degradation of specific habitats may be: Site fidelity as a maladaptive behavior in the Anthropocene Jerod A Merkle, Briana Abrahms, Jonathan B Armstrong, Hall Sawyer, Daniel P Costa, Anna D Chalfoun. First published: 11 January 2022 https://doi.org/10.1002/fee.2456 Citations: 10 "Site fidelity, or the behavior of returning to previously visited locations, has been observed across taxa and ecosystems. By developing familiarity with a particular location, site fidelity provides a range of benefits and is advantageous in stable or predictable environments. However, the Anthropocene is characterized by rates of environmental change that outpace the evolutionary history of extant taxa, which can result in site fidelity becoming maladaptive".	
11873-19	Mary Schwartz, Frank Schwartz	21. Impacts to big game and wildlife presented in the DEIS are generally not acceptable during the construction, operation and decommissioning periods. Proposed mitigative measures do not resolve the impacts. This includes the impacts to habitat, wildlife movement and populations as noted in Table ES-2, as well as other things addressed in this set of comments which were not considered in the draft EIS	See response to comment 6885-2 (see in Table A-3aa, Wildlife, including Big Game).
11978-45	Magic Valley Energy, LLC	Section 3.18.2.2.2 Wildlife – Big Game Impacts (Alternative B) 42. The DEIS states: "Project activities that would impact mule deer and pronghorn include human activities (e.g., vehicle use, construction equipment, maintenance activities), wind turbine operation (e.g., noise, vibration, shadow flicker caused by moving blades), and ground disturbance that would remove or alter habitat." a. MVE Comment: MVE and its biological resources consultants are aware of no scientific evidence demonstrating that noise, vibration, or shadow flicker from operating turbines cause avoidance or other impacts to mule deer and pronghorn. MVE therefore requests that this language be removed from the analysis, unless these impacts have been demonstrated in the literature.	Several studies on noise disturbance of ungulate species, include mule deer and pronghorn, have been conducted and while no specific threshold has been identified, the studies describe that wildlife responses begin at approximately 40 dBA (Shannon et al. 2016). A recent study of mule deer habitat use on a natural gas field indicate that use decreases under high noise conditions of 77 dB(C) (Kleist et al. 2021). A study of Sonoran pronghorn responses to noise on a military training range in Arizona indicates that pronghorn use decreased in areas with greater noise (more than 55 dB) (Landon et al. 2003). As the ground level noise from operational turbines has been modeled at 73.9 dB from the turbine hub and 85.3 dB from the blade, there is sufficient evidence to estimate that noise from turbine operations would have an effect on mule deer and pronghorn habitat use in the vicinity of turbines. These studies have been incorporated into the final EIS. The sentence was revised to state, "Project activities that would impact mule deer and pronghorn include human activities associated with project construction and operation (e.g., noise, vehicle use, construction equipment, maintenance activities), wind turbine operation (e.g., noise) and ground disturbance that would remove or alter habitat."
12934-1	Rob Thornberry, Theodore Roosevelt Conservation Partnership	Unfortunately, none of the four action alternatives in the Lava Ridge DEIS address the current needs of the Owinza pronghorn herd, which migrates annually to winter range within the project area. In 2019 and 2020, Idaho Department of Fish and Game biologists captured 11 pronghorn does and fitted them with GPS collars. These pronghorns move as many as 103 miles from the summer range in the Picabo Hills to the winter range, which could soon be covered in windmills. Although the DEIS outlines significant loss of pronghorn habitat in the analysis area, the DEIS's action alternatives do not adequately address the project's further fragmentation of this finite pronghorn migration corridor and winter range. The latest research on the effects of utility-scale wind development on pronghorn documents variable habitat loss due to behavioral avoidance and displacement away from areas near wind turbines.1 Behavioral avoidance of wind turbines has also been demonstrated when pronghorn select stopover sites in spring and during winter. Pronghorn also moved more quickly near turbines in spring and reduced fidelity to migration routes relative to wind turbines under construction in both spring and fall.2 These behavioral adjustments made by pronghorn relative to wind turbines could reduce foraging success and the functional benefits of their migration over the long term. Loss of migration corridors could hamper pronghorn long term. All four action alternatives truncate the Owinza pronghorn migration and do not account for functional habitat loss due to behavioral avoidance and displacement near wind turbines. And although BLM and the applicant acknowledge the project could have population level effects on the area's pronghorn herd, there appears to be little in the action alternatives that applies the mitigation hierarchy of avoidance, minimization, and (as a last resort) mitigation of unavoidable adverse impacts. Simply put, the four action alternatives miss the mark on all accounts: they provide no effort to avoid the migration route; there appears to be no effort to minimize direct ground disturbance within the mapped migration route; and the plan's mitigation language is too vague to ensure that impacts will be effectively offset. Maintaining connectivity between geographic areas – winter ranges, summer ranges and transition areas – is essential to the long-term viability of wildlife populations and the economies that survive on these resources. Accessing seasonal ranges is vital for the existence of sustainably managed populations of big game animals. Migration between seasonal ranges has nutritional underpinnings and disturbance potentially alters the net benefits of migration if animals avoid	The BLM is working closely with IDFG to compile and analyze the best available information to disclose impacts as accurately as possible. The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use. The BLM's Mitigation Handbook (H-1794-1) was used to develop the mitigation plan included in the final EIS, which follows the hierarchy of avoidance, minimization, and mitigation. See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).

Comment ID	Commenter	Public Comment	Response to Comment
		developed areas or move through them too quickly to meet foraging requirements necessary to maintain healthy survival and reproduction rates. Without the ability to move freely between the best habitat conditions on any one range, degradation and habitat loss on other ranges can't be offset. Intact habitat that supports both short and long-distance migration needs aids animals in coping with seasonally variable conditions that driven by availability of resources, harsh climatic conditions, predators, parasites, disease, and other factors related to reproduction such as mate procurement, drought, breeding sites, and juvenile survival.	
13000-6	Nathan Small	The Tribes would like the BLM to consider the following comments while making your recommendations for evaluation in the final EIS and particularly when drafting the Record of Decision for the project.... The analysis of impacts to wildlife relies on stale information. Big Game Migration route information is approximately 15 years old.	The BLM is working closely with IDFG to compile and analyze the best available information to disclose impacts as accurately as possible. The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use.
13006-11	Leon Smith	2) Recommend BLM use most current Fish and Game data on big game density, populations, migration routes and noise impacts (regarding the model used, 15 yr old data).	See response to comment 13000-6 (see in Table A-3aa, Wildlife, including Big Game).
13006-18	Leon Smith	9) Recommend BLM work with IDFG to analyze a potential of private land depredation and the resulting issues, as big game are displaced from public lands onto private lands, including the additional depredation cost to IDFG and sportsmen.	The potential for increased depredation on private lands has been incorporated into the final EIS analysis. Future depredation costs cannot be quantified and would be the responsibility of IDFG and are outside the scope of this analysis.
1953-1	Allan Lloyd	The elk and deer and many other species use these areas for winter habitat. It is a proven fact that wind turbines make high pitched noises that disrupt the environment and will make these areas uninhabitable for these animals and birds. This habitat will be ruined for hundreds of years into the future. Why is the BLM not protecting these animals?	Impacts to big game from noise is discussed in EIS Section 3.18.2.2.2 (Big Game Habitats and Populations, Impacts), which specifically discloses the impact from noise disturbance associated with turbine operations on big game behavior and potential avoidance response. Noise associated with the project would occur during the 2-year construction period, 30-year operation period, and 2-year decommissioning period, which would result in approximately 34 years of noise, not hundreds of years as noted by the commenter. EIS Appendix 4 (Mitigation) includes a complete list of design features and minimization and mitigation measures that would be implemented to minimize or avoid impacts to big game species.
3150-2	Cameron Stauffer	First, how will the Lava Wind project effect the thousands of big game animals most notably, deer, and pronghorn? Big game populations are increasingly under pressure because of urban sprawl in Idaho. According to Idaho Fish and Game, depredation is a chronic issue the state faces when managing wildlife. Winter habitat and adequate migration corridors are crucial to having healthy heard dynamics, as well as limiting depredation. Collisions with big game also increase with population growth and inadequate migration corridors. After conversation with IDFG and BLM, it is impossible to know what will happen to the big game populations, or their behaviors, if the project is approved. Depending on the proposal, up to 2,427,698 vehicle trips, 270-486 miles of new roads, up to 395 miles of temporary fence, up to 9,114 acres of disturbance, 5 new substations, 525 blasting days, etc. The EIS does state this will affect the behavior of big game and goes into some detail on how they hope to mitigate the effects. However, there is very little information when it comes to numerous questions that arise. The EIS cannot say if big game will leave the area entirely, partially, or if they will make new migration paths. At the BLM open house, it was said directly; it is impossible to say how much of a behavioral impact this proposal will have, as well as if it will have a population impact on any of the big game species.	The BLM acknowledges that it is currently uncertain how big game species will respond to the project, if approved. The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The analysis notes that the intensity of effects would be correlated with environmental conditions, such as winter severity, which cannot be predicted into the future with reasonable accuracy. As a result of this uncertainty, the EIS includes a Mitigation Framework for Big Game (see EIS Appendix 4). See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).
3230-3	Gary Carney	Our elk herds winter throughout this range. I have personally witnessed elk and deer herds in the hundreds and antelope herds in the thousands. All of these animals use this ground as their winter range. The elk herds in North America have already been depleted and there are many programs to try to establish elk in different parts of the country. This however, is a winter range that has worked traditionally for thousands of years and herds will be likely be forced into less livable areas. Again, very little due diligence has been done to address these serious issues. Idaho is blessed with having If the elk leave, the hunters will have to go elsewhere. This may seem like a problem to the hunter, but makes a bigger problem for the sport of hunting and the issue overall issue of conservation. Elk, antelope, deer, sage grouse, migratory birds, and many other species are hunted on the Kimama Desert, and practicing hunters will be going elsewhere for their harvests. The unintended consequence will force sportsmen to different areas and this will have a serious adverse affect on our public lands throughout the state and neighboring states. Again, more due diligence is required.	The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the current status of populations and distribution and important of winter range for mule deer and pronghorn, and the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). Elk are discussed in EIS Appendix 3, Wildlife AIB-62, which describes that elk herds in southern Idaho are generally robust, and populations are limited more by depredation control than by habitat suitability. The EIS determined that the project would not have a measurable effect on local elk populations. See also the Impacts analysis provided in Section 3.12.1 (Hunting and Trapping Access and Opportunities).
5896-15	Mike Tylka	Hunting. Any largescale project of this kind has a severe disruption on large game populations such as deer, pronghorn and elk population. This project is located in the migratory path of these animals. I have personally witnessed hundreds of deer in the wintertime near the canyon rim. Acquaintances of mine have harvested trophy elk from the project area.	See response to comment 3230-3 (see in Table A-3aa, Wildlife, including Big Game).
6868-4	Barbara Martien	More long term detail on the effect to the pronghorns. The plan goes right thru their migration pathway. As noted on the map.	The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). The BLM worked closely with IDFG to compile and analyze the best available information to disclose impacts as accurately as is possible. The final EIS incorporates new information collected since the publication of the draft EIS regarding pronghorn and mule deer movement and habitat use. See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).
6885-2	Louis Zamora; Twin Falls Canal Company	Deer, Elk, and other big game will struggle. If we cover the land with projects, it will limit places for these animal's roam and thrive. Right now there are road closures on BLM lands to protect wintering big game. In BLM's own press release it stated "The Bureau of Land Management Burley Field Office will extend the seasonal motorized travel closure in the South Hills area, south of Twin Falls, to Saturday, April 15, 2023. Roads in the area are still snow covered and wintering deer herds are hanging in the lower elevation areas, needing	The EIS discloses current conditions (see Section 3.18.2.1 [Big Game Habitats and Populations, Affected Environment]), including the current status of populations and distribution and important of winter range for mule deer and pronghorn, and the range of potential impacts based on the most recent scientific literature at the time

Comment ID	Commenter	Public Comment	Response to Comment
		additional protection." I know this was for the South Hills but there are wintering animals in the Lava Ridge and Taurus areas too. As winter fat reserves on these animals are running low it is crucial to not harass these animals and cause further stress and or mortality to them. Thousands of vehicles and all the construction sites (road, windmills, powerlines, blasting, etc.) would definitely cause stress. One reason animals migrate and winter in these areas is because of how few roads there are, which limits some of the contact with us humans. By adding hundreds of miles of roads the interaction between us and the animals grows exponentially and the chances of causing stress to the animals grows exponentially.	of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]). See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).
7784-2	Barbara Martien	This complex will have a lasting impact on the natural habitat of the Pronghorn and many other wild life in the area.	The EIS discloses the range of potential impacts based on the most recent scientific literature at the time of writing (see Section 3.18.2.2.2 [Big Game Habitats and Populations, Impacts]).

Project Element Topics

Applicant's Interest and Objectives

Table A-3bb. Applicant's Interests and Objectives

Comment ID	Commenter	Public Comment	Response to Comment
1042-22	WildLands Defense	The Lava Ridge Wind Project, proposed by Magic Valley Energy and LS Power for public lands in Jerome, Lincoln and Shoshone counties, would dwarf south-central Idaho's existing turbines in both number and height. [WHY is there a "need" for both the number and heights proposed by this greedy developer?	MVE outlines their purpose and need for the project in Section 1.2 in MVE (2023) as follows: "MVE's purpose for the project is to reliably and economically produce renewable energy with wind turbine generators for delivery to power markets in the western United States, including those markets accessed via interconnection to the existing Midpoint Substation or to an alternative new substation constructed along the permitted, but not yet constructed, Southwest Intertie Project – Northern Portion . . . The need for the project arises from regulatory, utility, and consumer driven objectives to incorporate increasing amounts of renewable/carbon free energy sources into energy supply portfolios. Substantial amounts of new renewable energy resources are required to meet this need. A majority of states in the western U.S. have specific renewable energy goals."
1054-5	Jeff Juker	Is the energy contracted to anyone?	See response to comment 1042-22 (see in Table A-3bb, Applicant's Interests and Objectives). At this time MVE has not identified a power purchase agreement with a specific utility as they will not be able to commit to supplying energy needs until after a decision is confirmed on the project by the BLM.
11782-6	Ken Fitch	For the applicant, is this the optimal location for this entity in terms of actual efficient production (especially with any adjustments determined through the NEPA process)? There are some who are questioning these matters.	MVE outlines their consideration for siting the project in the general area and earlier efforts to develop the project in other locations. This information can be found in MVE (2023) and in Alternatives Considered by MVE (Appendix C in MVE [2023]).
11787-1	Representative Jack Nelsen	My largest overriding concern is the fact that LS Power has done absolutely nothing to mitigate the effects of their project on the local communities. Other than a few feel-good community meetings, LS Power has made zero effort to meet with local road departments, highways districts and other governmental agencies and offices of the surrounding communities. To think they can propose (and push) a project of this magnitude while circumnavigating the local communities and its citizen concerns is appalling.	EIS Appendix 4 provides a description of applicant-committed measures and other measures being considered by the BLM for the purpose of avoiding and minimizing impacts. These measures have been developed following BLM policies and informed through both the BLM's and MVE's outreach with stakeholders (including highway districts and local county commissioners). In the evaluation of MVE's proposal, the BLM has implemented a robust public process facilitating the recite of thousands of comments that have been used to inform the preparation of the EIS and will ultimately inform the BLM's decision.
11822-5	Bob & Linda Sojka	The user distance issue is also important because of the extravagant transmission losses associated with siting so far from the dominant points of use. That distance-induced transmission loss underscores a monumentally flawed design/operational/cost consideration.	MVE outlines their purpose and need for the project in Section 1.2 in MVE (2023) as follows: "MVE's purpose for the project is to reliably and economically produce renewable energy with wind turbine generators for delivery to power markets in the western United States, including those markets accessed via interconnection to the existing Midpoint Substation or to an alternative new substation constructed along the permitted, but not yet constructed, Southwest Intertie Project – Northern Portion." In order to supply energy markets across the western United States MVE would need to use the transmission lines that contribute to providing a reliable energy grid in the western United States. The use, operation, and maintenance of the larger electrical system is outside the scope of the BLM's evaluation of the project. The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. MVE completed siting analysis and used the latest computer modeling to assist in their selection of the project area as a viable wind energy facility. MVE has also established meteorological stations to gather additional information on the wind resources within the project area.

Comment ID	Commenter	Public Comment	Response to Comment
11873-18	Mary Schwartz, Frank Schwartz	20. MVE should be responsible for funding an independent study/analysis to address the compatibility with or impact to virtual fence systems from emf, structures and their location, or other aspects of the wind farm. The findings should be documented in the DEIS.	An evaluation of known communication interference issues is described in EIS Section 3.8 (Land Use and Realty) and will be re-evaluated after a final design of the project. Expected interference will be address prior to an NTP with construction is granted, if an authorization is granted.
12059-2	Martin Bender	Magic Valley Energy (which despite the name “Magic Valley” theoretically indicates it should be entirely founded and based in Idaho) is a branch of LS Power, a New York Company, as reported by Magic Valley Energy’s website, and local news. The fact that a New York-based company is interested in Idaho is disconcerting to me (more so in the sense that they seem to be only interested in making use of our resources for their benefit). Though the most upsetting part of this to me, is that the power generated by Lava Ridge may not be used to help Idahoans, instead could well be shipped out to California for use there, per reporting from Idaho GOP Chairwoman Dorothy Moon[1]. Of course, considering that LS Power has business in California, I can’t help but wonder if the goal of Lava Ridge is simply to make energy for California to use (but out of state so it doesn’t mess up California’s environment), or if there are other reasons it is being pushed on Idahoans. Regardless, I believe there is a strong conflict of interest at play in this situation.	MVE outlines their purpose and need for the project in Section 1.2 in MVE (2023) as follows: “MVE’s purpose for the project is to reliably and economically produce renewable energy with wind turbine generators for delivery to power markets in the western United States, including those markets accessed via interconnection to the existing Midpoint Substation or to an alternative new substation constructed along the permitted, but not yet constructed, Southwest Intertie Project – Northern Portion. . . . The need for the project arises from regulatory, utility, and consumer driven objectives to incorporate increasing amounts of renewable/carbon free energy sources into energy supply portfolios. Substantial amounts of new renewable energy resources are required to meet this need. A majority of states in the western U.S. have specific renewable energy goals.”
12083-2	Adrian Arp	Another concern related to the business side of the Lava Ridge project is the possibility that it would be sold in the future. Recently, when Luke Papez of MVE was asked if MVE was forbidden from selling the Lava Ridge enterprise sometime in the future, he stated that there was nothing to prohibit this company from selling Lava Ridge. For the sake of National security and US sovereignty, provisions must be in writing, prohibiting the sale of the Lava Ridge project to any foreign adversaries such as China or Russia.	If an authorization is granted by the BLM to MVE and the business is subsequently sold, the BLM would follow all laws, regulations, and policies for assigning the rights granted to MVE to the new owner.
12976-6	James Komadina	d. The LS Power website provides the following information that, in conjunction with the 'One Nevada Transmission Line' and 'Harry Allen to Eldorado 500KV Transmission Line', the SWIP North Intertie Project can be described as "SWIP North is a 285-mile 500 kV transmission line under development in Idaho and Nevada. SWIP North will provide new transmission capability to deliver renewable wind, geothermal and solar energy resources north and south by resolving a significant missing link in the western grid. In addition the project will enable bulk reliability enhancements, congestion relief, economic energy exchange, and energy imbalance market opportunities through connectivity of the Northwest and Mountain West electricity markets to the Desert Southwest and California ISO." i. The DOE Office of Energy Efficiency and Renewable Energy Land-Based Wind Market Report: 2022 Edition, Executive Summary notes "Wind power purchase agreement prices have been drifting higher since about 2018, with a recent range from below $20/MWh to more than $30/MWh." "Among the regions reporting data, CAISO ("California Independent System Operator") features the highest pricing (~$52/MWh once converted to 2021 dollar terms)". 11. The socio-economic study, Black, G., and S. Peterson. 2020. Economic and Fiscal Impacts Report: Two Proposed Southern Idaho Wind/arms and the SWIP-North Transmission Line in Southern Idaho and Eastern Nevada, discloses the 2020 estimated capital cost of Lava Ridge and SWIP North to be $1.367 billion and $0.548 billion, respectively. m. The 2022 signed Inflation Reduction Act ("IRA") allows for the following Production Tax Credits for Electricity from Renewables: 1. "Base Credit Amount: $0.03/kW, inflation adjusted 2. Bonus Credit Amount: Credit is increased by 5 times for projects meeting prevailing wage and registered apprenticeship requirements. Credit is increased by 10% if the project meets certain domestic content requirements for steel, iron, and manufactured products. Credit is increased by 10% if located in an energy community." 1v. COMMENT - DEIS disclosures and commercial reason indicate that all visual, cultural, and recreational impacts of Lava Ridge will be borne by citizens of the greater Twin Falls area while the generated power will be delivered to CASIO. The expected interstate power flows need to be clearly presented in the DEIS.	MVE outlines their purpose and need for the project in Section 1.2 in MVE (2023) as follows: “MVE’s purpose for the project is to reliably and economically produce renewable energy with wind turbine generators for delivery to power markets in the western United States, including those markets accessed via interconnection to the existing Midpoint Substation or to an alternative new substation constructed along the permitted, but not yet constructed, Southwest Intertie Project – Northern Portion.” In order to supply energy markets across the western United States, MVE would need to use the transmission lines that contribute to providing a reliable energy grid in the western United States. The use, operation, and maintenance of the larger electrical system is outside the scope of the BLM’s evaluation of the project. See response to comment 11787-1 (see in Table A-3bb, Applicant's Interests and Objectives).
12985-3	Jerry Heimerdinger	• Magic Valley Energy is interested in this project to make money. • MVE often sells its projects after completion. • MVE would sell the electricity to the highest bidder ... Las Vegas & California ... not Idaho. ... MVE (LS Power) claims they deserve to construct a massive (largest in Idaho, near the largest in the nation) wind turbine project in the proposed area. MVE communicates that this project will be highly monetarily beneficial to our communities during the construction period and then lesser so during operation. This company is enthusiastic about providing renewable wind turbine energy by providing (500 megawatts?) of clean energy to Idaho to help our state achieve it's 2000 mw sustainable energy goal by 2045. MVE claims they can construct and operate this project with minimal impact to the environment. I agree that the growth of renewable energy is a priority for our energy demands. However, I feel that the facts and opinions I have included in my letter exceedingly contradicts MVE's claims of minimal impact to the environment.	The BLM follows applicable laws, regulations, and policies that guide the preparation of the EIS and inform the evaluation of proposals like the project. This includes making use of reliable existing data and resources to describe the existing conditions and inform the analysis of potential impacts. Throughout the preparation of the EIS, the BLM has obtained the relevant data and information needed to prepare the EIS. This information has come from project specific surveys, publications and analytical documents prepared by cooperating agencies and other reliable resources, and from information supplied by individuals and stakeholder groups.
13003-1	Lynden Osborne	I do not believe that public lands are the place for any wind farms, let alone this farm that greatly exceeds in size any similar facility to date in the United States. Magic Valley Energy and LS Power plan to make their debut on public lands with the largest wind farm in the country. In my opinion, wind generation projects should be built and maintained on private property. The individual property owner will generally steward his property in a manner that will protect and maintain its value and the value of properties in his neighborhood. He is motivated by ownership to ensure that a corporation which leases his land will ultimately do no harm. Corporations serve their shareholders and do not always make the best stewards or neighbors.	The BLM’s purpose and need for action arises from the BLM’s responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS is a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM’s decision.
8643-6	Steve Woods, Pam Woods	Furthermore, it is generally best practice to place the power source closest to the load for several reasons. One is efficiency. One is reduced cost of transmission lines. One is amount of real estate involved. Yet another that should be considered in today's environment is security from damage, be it intentional or unintentional (sabotage, wind, wildfires, earthquakes, etc).	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM’s purpose and need for action arises from the BLM’s responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS is a brief

Comment ID	Commenter	Public Comment	Response to Comment
			and specific statement that provides clarity to the proposal being evaluated. This structure is in line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyze impacts, and inform the BLM's decision.

Mitigation – EIS Appendix 4

Table A-3cc. Mitigation – EIS Appendix 4

Comment ID	Commenter	Public Comment	Response to Comment
1042-6	WildLands Defense	We strongly object to BLM's method of estimating "disturbance" -i.e. the land area bulldozed off, as it greatly fails to assess fragmentation and the totality of habitat loss and disturbance effects – including myriad forms of disturbance that do bot bulldoze the land. This is especially flawed for a huge wind project that sprawls over an immense landscape. With a project this gargantuan, with so many turbines and so much landscape-level disruption. Any "mitigation" and "minimization" measures must fully consider the entire area a dead zone and write-off for wildlife of many species except those that thrive in highly degraded, disturbed landscapes. The failure of BLM to admit that the impacts will not be able to be properly mitigated for migratory birds, Golden Eagles and other raptors, Sage-grouse, rare bats and a host of other native biota.	Impacts to wildlife from habitat fragmentation are analyzed in detail in EIS Section 3.18 (Wildlife). In addition to acres of temporary disturbance, quantitative impact indicators for habitat fragmentation considered in this section include miles of new and improved access roads and changes in road density, traffic volume, miles of temporary fence, the proximity of infrastructure to mapped wildlife linkages, and acres of noise and human activity in seasonal habitat (for mule deer and pronghorn). A number of mitigation measures would be implemented to minimize or avoid effects from habitat fragmentation, as well as or restoration of disturbed areas, as described throughout the impacts analyses in EIS Section 3.18. A robust mitigation framework for avian and bat species (including greater sage-grouse, golden eagle, other raptors, and special-status bats) that includes postconstruction fatality monitoring, adaptive management measures (including curtailment), and potential compensatory mitigation measures has been developed in accordance with the *USFWS Land Based Wind Energy Guidelines* (USFWS 2013) (see EIS Section 3.3 [Avian and Bat Species]). A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
1042-12	WildLands Defense	[We request that alternatives that include the wind farm proponent purchasing a 308 sq. mile land area of private land as mitigation for this industrial wind development be analyzed, as well as posting a bond for the value of all properties harmfully impacted by the project].	As described in applicant-committed measure 164, MVE would be required to purchase a reclamation bond for the project prior to BLM issuance of NTP. The value of the bond will be determined by the BLM based on information provided in the Reclamation Cost Estimate prepared by MVE. Compensatory mitigation measures under consideration by the BLM include the purchase or acquisition of conservation lands to offset impacts, as appropriate. A complete list of mitigation measures, including mitigation frameworks, is provided in EIS Appendix 4 (Mitigation).
1042-28	WildLands Defense	Magic Valley Energy said the spinning blades could be stopped during periods when birds are passing through, in hopes of reducing bird deaths. [Well, we have a bridge on the East Coast to sell to BLM if the agency actually believes this will be followed by the wind company or will be effective. Given the great failure to conduct adequate project studies of migration and species actual presence beforehand as exhibited in the EIS, this is shown to be yet another uncertain promise likely to be broken and not followed].	MVE conducted 2 years of avian use surveys (WEST 2021a, 2023) to characterize temporal variation in avian use in the siting corridors. This data, along with information collected during the postconstruction avian and bat fatality monitoring (applicant-committed measure 150) would be evaluated by the TAC to determine whether a curtailment strategy is needed to reduce avian (or bat) fatalities (applicant-committed measures 157 and 158). This curtailment strategy would be tailored to periods or locations of peak fatality risk, as indicated by the data collected during preconstruction avian use surveys and postconstruction fatality monitoring. The curtailment strategy may be further informed by using local weather data and radar or sensors that can detect approaching birds, as described in applicant-committed measure 158 and the BBCS (Appendix M in MVE [2023]). As described in additional project-specific mitigation measure nn, MVE would be required to implement additional monitoring to assess the effectiveness of adaptive management measures implemented, including the curtailment strategy. MVE's compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring (applicant-committed measure 150 and additional project-specific mitigation measure oo). A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
1042-29	WildLands Defense	Magic Valley Energy has developed a Bird and Bat Conservation Strategy to try and mitigate impacts to bird and bat populations. During the operating period, Magic Valley Energy will study bird collisions, and make adaptive strategies if necessary to reduce collisions, or to compensate by creating off-site habitat. [We strongly object to any reliance on the inadequate EIS information that does not even include thorough migration and on-the ground inventories for a broad range of species, and the poor EIS analysis where consultants often grasp at straws to try to minimize revealing the magnitude and scale of habitat losses and population effects].	The analysis in the EIS is based on a review of the best publicly available literature and information. MVE has conducted a number of additional project-specific baseline resource inventories, including bat acoustic monitoring and avian use, raptor nest, and sage-grouse lek surveys. Additional species-specific surveys would be required, for example, Additional project-specific mitigation measures q and r would require surveys for burrowing owls and short-eared owls. The analysis in EIS Chapter 3 (Affected Environment and Impacts) discloses the need for mitigation measures to avoid or minimize impacts to avian and bat populations from turbine collisions, as well as the potential that adaptive management measures (including curtailment) and compensatory mitigation (including studies of the geographic origin of fatalities) may be necessary to further reduce or offset the remaining impacts. A complete list of required mitigation measures is provided in EIS Appendix 4 (Mitigation).
10435-2	M. Chapman	Minidoka is a national treasure for many people. We must keep this as it was as a reminder so it doesn't happen again. [...] we should use some of the energy profits towards making the Minidoka site (or others in the West) a national park or more accessible and visible.	The Proposed Action, action alternatives, and the BLM's Preferred Alternative for the project would not include project elements within the historic boundary of Minidoka NHS. Action alternatives considered beyond MVE's Proposed Action would all work to further set back turbines from the Minidoka NHS area. Although lessened, visual impacts would remain under any action alternative, including—as presented in the EIS—those that could affect the experience and sense of place; see Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). Impacts would be mitigated, as stated in EIS Section 3.5; although this mitigation would not remove the impacts that remain after all measures to avoid and minimize impacts are applied. Mitigation efforts for the remaining impacts are meant to retain and preserve resource values in alternate forms or through to return value through other means, such as retaining documentation of the impacted

Comment ID	Commenter	Public Comment	Response to Comment
			resource for future knowledge and interpreting and educating on historic properties and area history such as at Minidoka. One goal of mitigation would be to preserve information and convey knowledge of Minidoka NHS and enhance awareness of its history and the history of the Japanese American community.
1050-3	Samuel DeGrey	The best course of action would be Alternative A, with Alternative's D & E being the next best. Furthermore, it would be prudent to designate all exluded portions of the reduced alternatives as a reserve, so that the project is not simply expanded later to the originally intended extent once infrustructure is in place.	The BLM is evaluating an application for a wind energy generation facility. Also see responses to comments 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) and 12859-46 (see in Table A-3gg, Cumulative Effects).
1053-5	Susan Page	What is the plan to protect our animals? Protect the migration cycles of birds and animals?	See EIS Appendix 4 (Mitigation) for a complete list of measures that would be implemented to minimize or avoid impacts to wildlife, including migratory birds.
11211-5	Patrick Kelly; Western Watersheds Project	In addition, during reclamation of infrastructure projects, even properly planned and executed seeding efforts can and do fail. Therefore, seeding activities must be accompanied by a two-growing-season rest period from livestock grazing to enable the best chance for re-vegetation establishment and survival. The long-term planning process associated with a project as large as this one will allow for seed collection from the same ecological sites and for growth of sagebrush seedlings. Successful sagebrush seedings are notoriously difficult. However, containerized seedlings have a much higher establishment rate. Planting containerized seedlings requires an organizational infrastructure of seed collection, germination, growth and planting. BLM's Seeds of Success program has been working with institutional partners in the Great Basin. Those efforts could perhaps be expanded to incorporate reclamation of this Project, both interim and long term. Areas of the Project site that are designated habitat management areas for greater sage-grouse should be re-seeded with native species chosen to support greater sage-grouse.	See additional project-specific mitigation measure mm in EIS Appendix 4 (Mitigation). Also MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria (applicant-committed measures 163 and 164).
11224-3	Thomas Billington	When the aquifer is damaged, both by being blasted, by being redirected by crushed soils during blasting, and the pollution from the chemicals used to clear the ground and manage the dust, will BLM take liability for the damage?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11230-2	Lenny Schelling	Will Magic Valley Energy and LS Power be liable when the wells start drying up?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11271-1	Clare Josaitis	All the various Issues Analyzed in Brief depend heavily on mitigation to reduce impacts below significance. There is a huge number of issues 'hanging their hat' on the implementation of mitigation measures in order for any of the action alternatives to successfully not have a significant impact to the human environment or natural resources identified. This may possibly work, MAYBE and ONLY IF, the mitigation measure is actually implemented. And if implemented still there is no absolute guarantee of impact below significance. And who is going to monitor and ensure all these mitigation measures are implemented? Who is going to document it so that the public can check records that the mitigation measures have been implemented and whether they are truly working?	The mitigation measures described in EIS Appendix 4 (Mitigation) would be included in the terms and conditions of MVE's ROW authorization, if granted. The Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describes procedures for monitoring and enforcement of mitigation measures. As described in additional project-specific mitigation measures nn and oo, MVE's compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring.
11315-4	Karen Atkinson	Mitigation: The Compensatory Mitigation Section (3.6.2.4.2) does not adequately provide for mitigation for the impacts on Alaska Natives.	See response to comment 12338-4 (see in Table A-3g, Cultural Resources and Native American Concerns). Also see response to comment 11315-5 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding Alaska Natives and EIS revisions regarding properly reflecting the different types of communities that were incarcerated at the Minidoka WRC.
11327-6	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	d) Mitigation Requirements Section 3.12.2.4 outlines compensatory mitigation measures that could be applied if applicant- committed measures do not eliminate impacts on big game species. We believe the language in this section is overly weak, vague, and does not provide us with confidence that mitigation measures would actually be applied. For example, the DEIS states, "The following compensatory mitigation measure could be applied if BLM determines it is warranted: Measure I: If post- construction carcass monitoring (mitigation measure VII), IDFG telemetry data, and/or annual winter counts indicate impacts to big game or avoidance of the area by big game, then consider the following…"(Emphasis added).22 The BLM should add more concrete language that requires the project applicant to take steps to implement effective mitigation measures that would make up for the functional loss of big game habitat in the project area. In its recently released draft Pronghorn Management Plan, IDFG outlined objectives and priorities it hopes to achieve over the next six years, including improving the quality of pronghorn population monitoring data to better estimate population size and understand population trends, collaborating with private landowners, land management agencies, and others to incorporate measures in land use and resource management plans that benefit pronghorn habitat, and increasing knowledge of pronghorn survival, habitat use, genetics, and other factors affecting pronghorn populations, movements, and migrations.23 The project applicant should commit to contributing significant financial resources towards these objectives if the project were to be approved, and the BLM should include this commitment in Section 3.12.2.4.	Both additional project-specific mitigation and compensatory mitigation were further detailed for the final EIS regarding big game. See EIS Appendix 4 (Mitigation) for more details.
11327-13	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	b) Compensatory Mitigation Additional mitigation options should be considered for this project, beyond solely relying on retrofitting of power lines to abate electrocution risk. Options should include use of non-toxic ammunition for hunting and removal of animal carcasses from highways, which could reduce Golden Eagle mortality from secondary lead poisoning and vehicle collisions, respectively 40,41,42. i) Carcass Removal Vehicle collisions are a reoccurring source of Golden Eagle deaths, as they are attracted to these high- risk	As described in EIS Section 3.3.3.4 (Eagles, Compensatory Mitigation), the USFWS will be responsible for making a decision on MVE's eagle ITP application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines. Compensatory mitigation requirements would be re-evaluated every 5 years by the USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5), including a pole retrofit program. Additional measures may be

Comment ID	Commenter	Public Comment	Response to Comment
		areas of food sources provided by roadkill carcasses 43,44. This accounts for an estimated 1% annual mortality in the western U.S.45 Lonsdorf et al. (2018) devised a methodology to estimate Golden Eagle vehicle collision rates based on eagle densities, road traffic volume, and animal carcass abundance and then used these predictions to analyze potential mitigation credits controlling for carcass number, traffic volume, and background carcass removals. Based on work in Wyoming, the authors emphasize the cost effectiveness and ease of implementation this strategy offers and propose it as an alternative to power pole retrofits. This mitigation strategy has already proven successful in connection with this project and should be a recognized mitigation option going forward. Multiple mitigation strategies should be pursued to ensure that mitigation benefits occur as close to the project area as possible. Thus, care needs to be taken to not entirely remove this potentially important food source or place them in an area where greater conflicts could arise. The disturbances caused by the project may cause displacement and behavioral changes amongst these apex predators/scavengers, further adding food scavenging challenges in a more fragmented landscape. Slater et al. (2022) recommend that roadkill be moved at least 12 meters from the road to increase eagle use and decrease flushing 4-fold relative to behavior observed at the road edge46. Because flushing from roadkill is believed to be the primary cause of eagle–vehicle strikes, informed roadkill management has the potential to reduce human-caused mortality of Golden Eagles. It is also worth noting that recent work by Millsap et al. (2022) found that starvation was a much higher source of Golden Eagle mortality, particularly for Y1 eagles, than previously believed47. ii) Lead Abatement Big game are plentiful at all times of the year in the area proposed for the Lava Ridge Wind Project. In regards to Golden Eagles (and Ferruginous Hawks48), winter is the time of greatest carcass availability for scavenging, especially as gut piles from hunting activity become available just as other food sources are becoming scarce. In groundbreaking work by Slabe et al. (2022), unexpectedly high frequencies of lead poisoning were detected in Golden Eagles, both chronic (47%) and acute (7-35%)49. Crandall et al. (2020) shared preliminary results with the Wyoming Golden Eagle Working Group of a non-lead ammunition distribution program in an area northwest of Laramie, Wyoming50. Their preliminary data suggested that non-lead ammunition programs are a successful and cost-effective form of compensatory mitigation to offset Golden Eagle mortalities in geographic areas with wind facilities. Approaches to estimating mitigation credits from lead abatement, both through providing ammunition free to hunters as well as gut pile removal, have been developed by Cochrane et al. (2015),51 who note that the main obstacle to evaluating lead mitigation and other potential actions is the low number of eagles predicted to be taken or actually taken at individual wind facilities, an issue that could be overcome through integrating data across many projects with a collaborative and coordinated research program.	identified by the USFWS during the eagle permitting process and will be described in their associated NEPA document.
11327-22	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	i) Curtailment The DEIS notes that a curtailment strategy would be developed in coordination with the USFWS, IDFG, OSC, and that the BLM and would define standard operating procedures for operation during different seasons (i.e., migratory periods) and different times of day. Curtailment of should not be focused on nesting season but year-round, especially given the concerningly high predicted mortality rates associated with all the alternatives and the additional proposed Tauraus Wind Project, located immediately northwest of the Lava Ridge Wind Project (would be similar in size and scale to the Lava Ridge Wind Project).	As described in EIS Section 3.3.3.2.2 (Eagles, Alternative B [Proposed Action]), "strategic curtailment procedures would focus on periods and locations of peak risk to birds and bats based on the results of postconstruction monitoring," which may or may not correspond to nesting or migratory periods. The curtailment strategy may be further informed by using local weather data and radar or sensors that can detect approaching birds, as described in applicant-committed measure 158 and the BBCS (Appendix M in MVE [2023]). As described in applicant-committed measure 159, MVE would be required to implement additional monitoring to assess the effectiveness of the curtailment strategy and other adaptive management measures implemented. MVE's compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring (additional project-specific mitigation measures nn and oo). A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
11336-1	Nathan Schutte	1. Mitigation. The word mitigation is used extensively and there is a mitigation section in Volume 3, appendix 4. My main concern is that mitigation is very expensive and can be a serious challenge to provide, especially for this size of project. Where and how will the mitigation be provided? How can this amount of mitigation be guaranteed? I wonder with this large amount of mitigation; if is it even possible to provide?	The mitigation measures described in EIS Appendix 4 (Mitigation) would be included in the terms and stipulations of MVE's ROW authorization, if granted. The Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describes procedures for monitoring and enforcement of mitigation measures. As described in additional project-specific mitigation measure oo, MVE's compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring.
11481-2	Idaho Wool Growers Association	Alternatives B through E would reduce the AUMs on the allotments. These alternatives propose improving infrastructure through a number of allotments. Currently, there is limited and worn-out infrastructure through the allotments. IWGA would hope that improvement in infrastructure through roads and water troughs would help grazing availability in the area, therefore ideally maintaining the same amount of AUM's on the allotments.	See responses to comments 11204-13 and 11204-19 (see in Table A-3p, Livestock Grazing).
11491-10	Dean Dimond, Jennie Bateman	The BLM has not provided a tangible analysis of impacts on their jurisdictional authorities and the costs of public access maintenance and hazard mitigation. No tangible mention is made as to the adverse effects on human health and the customs, culture and livability within the counties, tribal and private lands within the project area.	See EIS Section 3.6 (Environmental Justice and Socioeconomics) for a detailed analysis of impacts to local and regional communities, as well as impacts to Tribal communities and dispersed environmental justice populations. Human health is addressed in EIS Appendix 3 (Issues Analyzed in Brief), AIB-10 through AIB-14. As described in EIS Section 3.14.1 (Traffic Patterns), The BLM does not have the authority to approve or deny the use of the public roads managed by ITD and the local highway districts for the project. MVE would be responsible for obtaining required approvals from ITD or the local highway districts and would comply with the terms and conditions of those approvals. MVE has also committed to restoring public roads to a condition that is as good as or better than their condition when the construction period begins (see applicant-committed measure 38).
11496-9	Danielle Gunn	Further, permanent post project acreage loss as written in the DEIS is not acceptable. Acreage should be restored to pre-project numbers following the project.	See response to comment 11204-13 (see in Table A-3p, Livestock Grazing).

Comment ID	Commenter	Public Comment	Response to Comment
11527-3	Richard Stover; State of Idaho	The State's expectation is that compensatory mitigation will be offered. The DEIS outlines a compensatory mitigation measure ("Measure I") that "may be warranted" for big game. Compensatory mitigation, including adaptive monitoring and management, must be designed to fully offset adverse Project effects based on habitat acreage and must consider the loss of habitat quantity, quality, and connectivity. Compensatory mitigation measures must define effectiveness metrics for successful implementation and completion that would ideally improve the Owinza big game winter range conditions to benefit the affected pronghorn and mule deer populations.	See response to comment 11527-15 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11527-8	Richard Stover; State of Idaho	During FEIS analyses and Mitigation Plan development, the BLM's primary focus for sage-grouse credit projects to offset adverse Project effects (i.e., debits) should be in areas designated as Priority Habitat Management Area (PHMA) and Important Habitat Management Area (IHMA). This should preferably occur within the local fine-scale area and adjacent local-fine scale areas where adverse Project effects will occur. If this cannot be implemented, analysis and implementation of credit projects must occur in the same Idaho Conservation Area where adverse effects will occur. If that is not feasible, credit projects must be focused in PHMA and IHMA of other Idaho Conservation Areas as a last resort and in coordination with the State of Idaho. For example, direct and indirect adverse Project effects on sage-grouse are anticipated in the Craters of the Moon and Timmerman Hills Fine Scale Areas within the Desert Conservation Area. Therefore, the FEIS must first analyze compensatory mitigation and develop a Mitigation Plan for the PHMA and IHMA of these two fine scale areas and adjacent fine scale areas. Next, the FEIS must analyze options for compensatory mitigation in other fine scale areas that are not adjacent to the Project area but within the Desert Conservation Area. Lastly, BLM must analyze options in other Idaho Conservation Areas. The BLM must analyze all compensatory mitigation mechanisms potentially available (e.g., In- Lieu Fee, Conservation Banks, and Permittee Responsible Mitigation) and not limit analysis to just one mechanism. The FEIS must also analyze a range of potential compensatory mitigation options and activities to offset the Project's estimated adverse effects on sage-grouse. Examples of compensatory mitigation activities could include the following: (1) tall structure removal (inactive or unnecessary powerlines, communication towers, etc.), (2) wet meadow restoration, (3) juniper and invasive species removal, (4) sagebrush reestablishment, (5) desirable forb and grass reestablishment, (6) disturbed site rehabilitation, and (7) existing habitat preservation (e.g., conservation easements, conservation rights of way, leases, etc.) The State of Idaho's HQT is based on a no-net-loss concept for compensatory mitigation. HQT analyses provided to the BLM for the DEIS considered and estimated direct and indirect Project effects on sage-grouse habitat quality and quantity calculated in terms of functional acres. The State recommends that all anticipated adverse Project effects on sage-grouse habitat functional acres (debits) be adequately and effectively replaced/offset with credits as estimated with the HQT. Other principles that must be analyzed in the FEIS and incorporated in the Mitigation Plan and ROD include the following (see Executive Order 2022-03, which contains the "Idaho Sage-Steppe Mitigation Principles" document as an Appendix): • Effectiveness/Durability: performance standards should be in place to maintain expected benefits. Performance standards are an important component of mitigation plans for demonstrating that intended benefits are meeting established standards in a qualitative, repeatable way. • Duration: the length of time the Project adversely affects sage-grouse should match the length of time the mitigation benefits sage-grouse. • Timeliness: compensatory mitigation should be in place to benefit affected sage-grouse populations before or at the same time adverse effects accrue to sage-grouse. If compensatory mitigation initiates after adverse effects accrue, an accounting of lag times between impact and offset should be conducted. • Risk and Uncertainty: tools or approaches must be in place to effectively limit the risk of failed mitigation if projects do not deliver anticipated benefits. Such tools may include reserve accounts, phased release of credits, compliance and enforcement mechanisms, and legal/financial protections. • Tracking and Transparency: mitigation projects should demonstrate to regulators, stakeholders, and the interested public that benefits are real and lasting. • Additionality: Mitigation should create an additional benefit to sage-grouse.	Since publication of the draft EIS, the BLM has continued to work with IDFG and MVE to develop mitigation for greater sage-grouse. This is reflected in EIS Section 3.3.4 (Greater Sage-Grouse) and in the Additional Project-Specific Mitigation and Compensatory Mitigation sections, as well as the Mitigation Framework for Greater Sage-Grouse section, in EIS Appendix 4 (Mitigation).
11527-9	Richard Stover; State of Idaho	The Project is expected to affect migratory birds and bats, particularly migratory tree bats (silver- haired bat, hoary bat) and raptors, each of which have relatively long lifespans and low reproductive output. Many adverse population effects of wind energy projects on migratory birds and bats can be effectively avoided or minimized with measures. Examples of such measures include turbine siting, operational curtailment, and deterrents. Approaches to effectively optimally site wind energy infrastructure and avoid or minimize turbine- associated mortality continue to be developed and improved. For example, the DEIS states that acoustic deterrent technology has current limitations but is improving. A variety of new technologies that could expand the effectiveness of deterrents to reduce bat mortality are under development and might become available during the Project's lifetime. Comments on DEIS Multiple migratory bird- and bat-related avoidance, minimization, and compensatory mitigation measures are described in the DEIS for the Preferred Alternatives (p. 3-54), including the following: (1) Mitigation Measures j-s, (2) Postconstruction mortality monitoring for a minimum of 2 years, (3) Potential adaptive management including curtailment, and (4) Compensatory mitigation. For birds and bats to be adequately considered and conserved, each of these measures must be analyzed in the FEIS. The Project applicant intends to consider compensatory mitigation for bats under a scenario of any action alternative (p. 3-57). However, as stated in the DEIS, the species anticipated to be most affected by the Project would be hoary and silver-haired bats. These species are tree-roosting bats that are not reliant on caves/mines, and their populations have not been affected by white-nose syndrome. Therefore, the proposed compensatory mitigation measures VII ("Contribute funds to survey abandoned mines for bats and, if used, close with bat-friendly gates") and VIII ("Contribute funds to assist with research on white nose syndrome and vaccination against white nose syndrome") would not offset adverse Project effects on these migratory tree-roosting bats. The Project applicant intends to implement compensatory mitigation for migratory birds adversely affected by the Project. However,	Since publication of the draft EIS, the BLM has continued to work with IDFG to develop mitigation for avian and bat species. This is reflected in Section 3.3.1 (Bat Populations and Roosting Habitat), Section 3.3.2 (Avian Populations), and the Additional Project-Specific Mitigation and Compensatory Mitigation sections in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
		Measures IX and X address only two species of birds, and Measure XI offers only to “consider” measures for other species. Recommendations for FEIS and ROD The FEIS and ROD must analyze mechanisms for adaptive monitoring and management to improve avoidance and minimization techniques as methods and technologies to conserve migratory birds and bats are likely to advance throughout the Project’s 34-year lifespan. For example, the effectiveness of acoustic deterrent technology might improve during the Project’s lifetime. Avoidance, minimization, and compensatory mitigation measures must be designed specifically for affected migratory birds and bats (hoary and silver-haired bats). Robust monitoring and adaptive management components must focus on avoidance and minimization by supporting effective combinations of deterrents and curtailment as part of Project operations. Adaptive management could include funding scientific projects to inform and improve bird and bat conservation relative to the Project and for Idaho (e.g., studies and testing of acoustic deterrent technology, etc.). Compensatory mitigation must consider on-site risks and seek to improve conditions for Project- affected migratory bird and bat populations, including prioritizing the enhancement of habitat adjacent to the Project area. The FEIS must clearly describe and analyze only the required mitigation or voluntary mitigation activities to which the Project applicant is committed to fulfill. Proposed Mitigation Measures IX, X and XI might benefit special-status avian populations affected by the Project. Within the FEIS and ROD, the proposed Measure XI (“Consider measures for other special-status species and other species of concern, as determined through postconstruction monitoring”) must include a framework for quantifying compensatory mitigation based on functional acreages of lost and fragmented habitat and Project-caused mortality. Compensatory mitigation requirements should be habitat-based and quantified with the best available data, postconstruction monitoring, and adaptive management. The implementation of compensatory mitigation must be prioritized in proximity to the Project area to benefit populations affected by Project construction and operations.	
11527-12	Richard Stover; State of Idaho	The Project will negatively impact local grazing practices well beyond its 34-year lifespan in the absence of comprehensive mitigation measures and a clear reclamation plan. Depending on the selected alternative, up to nine federal grazing allotments will experience animal unit month (AUM) reductions due to the construction of wind turbines, power substations, operation and maintenance facilities, battery energy storage units, transmission lines, cable junction boxes, and communication facilities. Road construction and related project work disturbances will result in the spread of invasive weeds, increased fire frequency, and dust generation that creates unpalatable forage. This could cause additional unaccounted for AUM reductions in any affected allotment. The applicant has indicated that compensatory mitigation in the form of alternative feed sources will be provided to affected permittees during Project construction (2-years) to offset the loss of AUMs. However, the applicant has not indicated that compensatory mitigation will be offered during the operation (30-years), decommissioning (2-years), and final reclamation (~5-years) phases of the Project despite the fact that these phases will experience “a temporary reduction in AUMs.” The applicant has committed to additional measures intended to reduce the loss of AUMs; however, the State of Idaho is concerned about the efficacy of such measures. Moreover, the State of Idaho is concerned about the cumulative socioeconomic impact from reduced AUMs over the course of the Project’s 34-years and 5-years for regrowth of forage post-reclamation. Because AUM reductions over the Project’s lifetime will result in significant impacts to affected permittees, the State of Idaho has a vested interest in the success of the applicant’s reclamation plan and the restoration of native vegetation post-Project. The State of Idaho is concerned that the goals and objectives of the reclamation plan could lead to confusion. For example, the reclamation plan makes statements like, “Reclamation success is defined by the re-establishment of vegetation and topography compared to conditions in the surrounding area at the time of reclamation” (p. 3- 358). However, if non-native species dominate the Project area, the reclamation plan should not try to restore pre-Project conditions. The reclamation plan also states that the applicant “will not be responsible for meeting reclamation success criteria in the event reclaimed areas are impacted by non-Project related disturbances like grazing, public recreation, or non-Project caused fires” (p. E-4).The State of Idaho requests assurances that the applicant will fulfill its reclamation commitments. Any alternative chosen must be contingent upon Project modifications that outline comprehensive compensatory mitigation measures along with a clear and committed reclamation plan that can ensure the current value of rangeland practices are not diminished over time. Recommendations for FEIS and ROD The FEIS must include additional compensatory measures for all affected permittees through all phases of the Project in which AUM reductions will occur to avoid strain on such an integral component of the state and local economy. While assessing the logistics of the compensatory mitigation, the State of Idaho encourages careful attention to the location and feasibility of alternate feed locations, costs associated with additional hauling requirements, availability of supplemental feed in an already strained local economy, and using the most current data to assign dollar amounts to AUMs. The goal of the reclamation plan should maximize the site's ecological potential by restoring native grasses, forbs, and shrubs (not non-native species).	See response to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1). See also Section 3.15.1 for the affected environment and impacts analysis for Native Upland Vegetation Communities; Figure 3.15-1 shows the proportion of the analysis area dominated by both native and nonnative vegetation.
11527-15	Richard Stover; State of Idaho	The State of Idaho’s technical comments on the DEIS and recommendations for the FEIS and ROD are therefore intended to promote the following: • Avoid disrupting wildlife migrations during Project construction, operation, and decommissioning. • Avoid disrupting big game migration routes with infrastructure or activities that would impede access to seasonal ranges, including crucial winter range needed by big game during harsh winter conditions. • Avoid and minimize loss and fragmentation of wildlife habitat, particularly sagebrush and riparian habitat. • Avoid and minimize adverse effects on wildlife-based recreation, including hunting and trapping. • Offset unavoidable, residual adverse Project effects with adequate and effective compensatory mitigation. FEIS analyses must quantify acreages of unavoidable habitat loss and implement compensatory mitigation to enhance habitat quantity, quality, and connectivity for affected wildlife populations (e.g., through habitat restoration, enhancement, and protection from additional future loss). Compensatory mitigation should be	In response to public comments on the draft EIS, the BLM worked with IDFG to draft additional project-specific mitigation and compensatory mitigation for big game. These edits are reflected in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
		habitat-based, designed with a priority to enhance and protect wildlife habitat and populations within the Project area and adjacent landscapes affected by the Project, and include adaptive monitoring and management to ensure mitigation effectiveness.	
11534-9	Matt Arnold, William Eubanks	BLM should consider alternatives that condition authorization on operational limits that further reduce impacts to avian and bat species. These should include, for example, restrictions on the Project's cut-in speed. Studies have found that even modest increases to a wind project's cut-in speed significantly reduces bat mortalities, with only "marginal annual power loss." See, e.g., Edward B. Arnett et al., Altering Turbine Speed Reduces Bat Mortality at Wind-Energy Facilities, 9 FRONTIERS IN ECOLOGY 209, 2019, 214 (2011) ("Relatively small changes to wind- turbine operation resulted in nightly reductions in bat mortality, ranging from 44% to 93%, with marginal annual power loss (≤ 1% of total annual output). Our findings suggest that increasing turbine cut-in speeds at wind facilities in areas of conservation concern during times when active bats may be at particular risk from turbines could mitigate this detrimental aspect of wind-energy generation.").5 The modest reduction in power output (e.g., ≤ 1% of the annual total) associated with conditioning authorization on higher cut-in speeds makes this alternative both "economically practical" and "feasible." 43 C.F.R. § 46.420(b). Moreover, it represents a mid-range alternative that squarely meets BLM's purpose and need. Id.; see also DEIS at 1-1 (defining the purpose as "respond[ing] to MVE's application for a ROW grant to construct, operate and maintain, and decommission a wind energy facility on public lands . . ."; defining the need as "manag[ing] public lands for multiple use and sustained yield"). Indeed, federal agencies routinely analyze cut-in speed alternatives when evaluating wind-energy projects under NEPA, precisely because this is an extremely valuable tool for disproportionately reducing wildlife impacts without jeopardizing a wind-energy project's ultimate viability. See, e.g., U.S. Fish & Wildlife Serv., Final Environmental Impact Statement for Proposed Habitat Conservation Plan and Incidental Take Permit for the Fowler Ridge Wind Farm in Benton County, Indiana (Dec. 2013), https://bit.ly/41J1fH5 (analyzing in detail a 3.5 m/s cut-in speed "feathered" alternative, a 5.0 m/s cut-in speed alternative, and a 6.5 m/s cut-in speed alternative; ultimately selecting the 5.0 m/s cut-in speed alternative).6 Where, as here, a proposed mid-range alternative entails only minimal economic losses in exchange for significant benefits to the ecosystem the agency is tasked with managing, BLM may not lawfully avoid analyzing that alternative under NEPA. See, e.g., Union Neighbors United, Inc. v. Jewell, 831 F.3d 564, 577 (D.C. Cir. 2016) (requiring agency to analyze "a realistic mid-range alternative with a cut-in speed that would take materially fewer bats than [Project proponent]'s proposal while allowing the project to go forward" because "[a]lthough an agency need not examine an infinite number of alternatives in infinite detail, examining a reasonable alternative that could potentially take fewer bats than [the existing alternatives] would inform both the public and the decisionmaker by sharply defining the issues and providing a clear basis for choice among options" (internal quotation marks and citations omitted)).7	Required mitigation for all action alternatives include feathering turbine blades when wind speeds are below the manufacturer's cut-in speed for the turbine (see applicant-committed measure 160). Feathering turbine blades when wind speeds are above the manufacturer's cut-in speed is known as curtailment, which is one of the adaptive management measures that may be implemented if avian or bat fatalities exceed acceptable thresholds, as determined by the TAC (see additional measures y and nn). Raising the cut-in speed for all turbines is considered "blanket curtailment." Curtailment strategies that target peak periods or locations of peak risk using information from postconstruction fatality monitoring, local weather data, or sensors that detect approaching birds and bats are preferred over blanket curtailment because they effectively reduce avian and bat fatalities while minimizing the financial impact of reduced power output from the facility. Curtailment strategies and other adaptive management measures for avian and bat species are discussed in detail in EIS Section 3.3 (Avian and Bat Species); additional details are in the BBCS (Appendix M in MVE [2023]).
11534-10	Matt Arnold, William Eubanks	BLM's consideration of alternatives fails to consider other protective wildlife measures that are known to reduce fatalities to avian species at little relative cost to a project proponent. The DEIS asserts in the context of the sage grouse that for "all action alternatives," "MVE would bury powerlines where feasible"; "[i]f this is not feasible, MVE would ensure that high-risk segments are marked with collision-diverter devices or as latest science indicates." DEIS at 3-118. But this highlights several deficiencies in BLM's NEPA analysis. First, with respect to the sage grouse, there is no analysis—let alone an explanation or enumerated criteria—for what will be deemed "high-risk segments" warranting underground powerlines or, at minimum, the installation of collision-diverter devices to deter birds from flying into above-ground lines. Nor is it clear what constitutes a "high-risk segment" warranting action to protect the sage grouse, something that BLM or the self-interested Project proponent will be determining only after issuance of BLM's final decision. Failing to disclose these essential details of the Project—and ensuring that they will be based on a rigorous application of modern scientific principles—clearly fail to comply with NEPA's requirements. Second, with respect to avian species more broadly (many of which are protected from death and injury by the Migratory Bird Treaty Act ("MBTA") in the absence of express authorization of the U.S. Fish and Wildlife Service to "take" these members of these species), the DEIS fails to consider any action alternatives in which the dozens of miles of above-ground Project-related transmission lines (or even a substantial majority of such lines) would be marked with collision-diverter devices. Yet it is well-established, including in guidance from the federal agency with relevant statutory and subject-matter expertise on migratory birds, that collision- flight diverters can drastically reduce avian mortality from transmission lines. Cf. U.S. Fish & Wildlife Serv., Region 6 Guidance for Minimizing Effects from Power Line Projects Within the Whooping Crane Migration Corridor (Feb. 4, 2010), https://bit.ly/3UPNhB6 (citing studies for the proposition that collision-diverter devices can reduce avian mortality by 50% to 80%, and recommending that all transmission lines near "documented high use areas" should be buried underground or at least marked with collision-diverter devices).8 Accordingly, as with cut-in speed alternatives to reduce bat mortality, BLM must consider collision-diverter device alternatives that can feasibly and economically reduce fatalities of federally protected birds, in order to satisfy BLM's duty to rigorously evaluate reasonable alternatives. In sum, BLM's DEIS fails to consider and analyze a reasonable range of action alternatives by failing to consider any operational variations related to turbine cut-in speeds, burying of transmission lines, and transmission line collision-diverter devices. A supplemental DEIS is necessary to examine these additional, feasible alternatives in detail, and to allow the public to meaningfully comment on those additional options for operating the Project.	The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with a preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tiers 4 and 5). MVE has conducted Tier 1 through 3 studies, has a draft BBCS (Appendix M in MVE [2023]) in accordance with USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential for population-level effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities. Under all action alternatives, all aboveground transmission lines would be designed and constructed in accordance with APLIC guidelines for reducing avian collision risk; see applicant-committed measure 30. Additionally, diverters would be required on all guy wires (BLM-required measure l).
11535-31	Steven Andersen	The DEIS fails to acknowledge and consider important mitigation and conservation measures for individual species. For example, notwithstanding that the DEIS does not provide any specific location for the turbines generally,122 but it also does not address placement of facilities and infrastructure away from home ranges and	As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction), "Although the exact location of infrastructure and activities within the siting corridors is unknown at this time, evaluating the entirety of the siting corridors for potential impacts provides flexibility to site the project components where

Comment ID	Commenter	Public Comment	Response to Comment
		foraging areas. Wind turbines and associated electrical facilities should be placed a minimum of 2 miles from, for example, ferruginous hawk home ranges and foraging distances—this would certainly not be limited to just ferruginous hawks. There is no indication the DEIS considered these types of mitigation measures.	necessary (from both resources and engineering perspectives) within the siting corridors. The project's final design and engineering would be completed after the BLM has issued a ROD and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. The project's final design would identify the specific location for all infrastructure and project activities and would be approved by the BLM Authorized Officer. This EIS identifies and considers effects to resources present within the siting corridors, allowing for identification of areas with fewer impacts or specific resource trade-offs. This identification of resource constraints within the siting corridors provides flexibility for the project design to adjust through site-specific engineering for the final layout. The action alternatives consider different configurations of the siting corridors to avoid or minimize potential effects. These configurations are described by alternative below." A number of species-specific avoidance buffers for turbine placement would be implemented; see, for example, applicant-committed measure 138, which includes a 2-mile avoidance buffer for eagle nests and 1-mile avoidance buffer for ferruginous hawk nests. Avoidance buffers would also be implemented for habitat features that are important to sensitive wildlife, such as the irrigation canals (see applicant-committed measure 138). See EIS Appendix 4 (Mitigation) for a complete list of required mitigation measures.
11535-41	Steven Andersen	The proposed turbines are the largest onshore wind turbines ever to be built and operated. As the DEIS notes, the turbines are up to 740 feet tall, with a max rotor diameter of 560 feet.150 Thus, the numbers presented and relied upon in the DEIS do not, and cannot, account for the unauthorized eagle take from this type of project, without further detailed analysis. The DEIS essentially requests that MVE be allowed to experiment with the mortality rate of eagles after-the-fact. Specifically, the DEIS states that there is a variation in risk which is "likely influenced by topography, prey resource availability, and eagle behavior…Implementation of curtailment at turbines determined to be at higher risk for collision by eagles (as identified through monitoring) may reduce the risk of eagle mortality from turbine strikes." 151 In other words, the request is that the EIS be approved so that MVE can then monitor the eagles more closely and determine the mortality rate. The obligation in the DEIS is to provide the plans for conservation and mitigation beforehand, not after-the-fact.	More details regarding eagle monitoring, conservation, and mitigation plans are typically developed through the ITP process with the USFWS, which is separate from the EIS process.
11535-43	Steven Andersen	Furthermore, the DEIS proposes insufficient and/or ineffective mitigation efforts. The DEIS admittedly does not have a plan if maintenance and "other activities" cannot be conducted outside of the nesting season, and states only that "MVE would coordinate with the USFWS."159 Given the documented and admitted negative impact the project will have on eagles, the speculative claim that MVE will coordinate with USFWS is not a "hard look" into what mitigation efforts are necessary now, not in the future. Also, the DEIS proposes to construct "[a]vian diverters," and states MVE will "equip aboveground facilities…with structures or devices that discourage perching or nesting of raptors and ravens."160 However, it then highlights the flaw with such approach in stating that, although "[detector-based systems] have shown promising results for eagles[,] these systems involved small sets of turbines and thus cannot be extrapolated to estimate facility-wide fatality reductions."161 The proposed project does not involve "small sets of turbines," and therefore, the proposed curtailment efforts asserted are baseless.	See response to comment 11535-41 (see in Table A-3cc, Mitigation – EIS Appendix 4). As described in EIS Section 3.3.3.1 (Eagles, Affected Environment), the nearest active eagle nest identified during MVE's raptor nest surveys (WEST 2020, 2021b) is more than 2 miles from the nearest siting corridors, and only two other active eagle nests were identified within 10 miles of the siting corridors. This section also notes the lack of preferred nesting substrates for eagles in the siting corridors. Applicant-committed measure 140 requires MVE to restrict non-emergency maintenance or other activities to outside the eagle nesting season (January 1 to August 31) if these activities would occur within 1 mile of an occupied golden eagle nest, and would adhere to the USFWS (2007) guidelines for any occupied bald eagle nest. Since there are currently no active eagle nests in the siting corridors, it is not possible to develop site-specific mitigation requirements at this time. As stated in EIS Section 3.3.3.2.2 (Eagles, Alternative B [Proposed Action]), "Avian diverters would be installed and maintained on all guy wires/lines of all existing or any new temporary met towers, and where guy wires are necessary, appropriate guy guards would be installed at the base of the guy wires (applicant-committed measure 142)" and "When practicable for collector lines, MVE would use tubular structures to reduce the ability of birds to perch and to reduce risk of collision (applicant-committed measure 143). MVE would equip aboveground facilities (buildings and other structures where birds could perch or nest) with structures or devices that discourage perching or nesting of raptors and ravens (BLM-required measure K). These measures would minimize the likelihood of eagles perching or nesting on project structures, which may reduce the potential for electrocution or collision with the structures." Detector-based systems, as used in the EIS, refers to turbine curtailment strategies that use sensors to detect approaching eagles and automatically curtail turbines, which is unrelated to the use of avian diverters or perching/nesting deterrents.
11535-44	Steven Andersen	Finally, the DEIS admits that based on the projected fatality rates, which are grossly underestimated, the "total cumulative annual permitted and unauthorized take under all action alternatives is likely to contribute to ongoing golden eagle population declines if not offset by compensatory mitigation[.]" 162 Absolutely no compensatory mitigation is proposed in the DEIS. As just one example, it has been found that mitigation of turbine-associated mortality occurring in other parts of the western United States could have local benefits, i.e., local benefits on the subject area in Idaho.163 However, the DEIS makes no mention of how the project will or could work with other wind farm projects as a form of compensatory mitigation to offset eagle mortalities. The mitigation efforts have been sorely overlooked in the DEIS.	As described in EIS Section 3.3.3.4 (Eagles, Compensatory Mitigation), "The Eagle Permit Rule (50 CFR 22.80(c)(1)(i)) requires compensatory mitigation for 'any permit authorizing take that would exceed the applicable eagle management unit take limits . . . [which] must ensure the preservation of the affected eagle species by reducing another form of ongoing mortality by an amount equal to or greater than the unavoidable mortality, or increasing the eagle population by a greater amount.' The USFWS will be responsible for making a decision on MVE's eagle ITP application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines. Compensatory mitigation requirements would be re-evaluated every 5 years by the USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5), including a pole retrofit program. Additional measures may be identified by the USFWS during the eagle permitting process and will be described in the associated NEPA document."
11535-53	Steven Andersen	There was also no mitigation outlined for these communities should the project proceed, and Alternative A is not selected. The DEIS discusses the "irretrievable effects to low-income and minority populations" and then in the following section provides that there will be no compensatory mitigation due to applicant-committed measures. "Mitigation measures outlined or analyzed in an environmental assessment, environmental impact statement, or record of decision, whenever feasible, should address significant and adverse environmental effects of proposed Federal actions on minority communities and low-income communities."	As described in EIS Section 3.1.2.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), "The irretrievable commitment of a resource means that, although committed, the resource can be renewed or restored following the action" while "The irreversible commitment of a resource means that, once committed, the resource is permanently lost to other potential uses." Thus, these terms are related to the duration of impacts rather than their severity. EIS Section 3.6.1.2.2 (Environmental Justice Communities, Alternative B [Proposed Action]) describes a number of mitigation measures that would be implemented to minimize or avoid impacts to low-income and minority populations, most of which are short-term impacts associated with construction and decommissioning. With the implementation of the measures, it is not anticipated that there would be residual impacts to low-income and minority populations that warrant the

Comment ID	Commenter	Public Comment	Response to Comment
			implementation of compensatory mitigation measures. The EIS acknowledges the potential for residual impacts to other dispersed environmental justice communities (i.e., the Japanese American community and Native American Tribes) and identifies potential compensatory mitigation measures for these impacts (see EIS Section 3.6.1.4.1 [Compensatory Mitigation, Dispersed Environmental Justice Populations]).
11535-57	Steven Andersen	The DEIS also does not conduct any formal appraisals or rely on valuations by a qualified appraiser, nor does it address mitigation payments to landowners whose property value will be affected by this project. The government is charging up to $1,000,000 per acre to wind farms for leasing its land. 199 Yet, a farmer whose property abuts that land and has the structure towering over his or her property is not being offered any remuneration for its impacts (impacts so vast they had to be studied in an 1800-page EIS). Many of our clients tell us they will no longer be able to operate their farms if the project is approved. Several are second or third generation farmers, who have invested into Idaho land.200 The DEIS should have addressed economic mitigation for losses due to impacts on land values and income for surrounding farms (due to negative effects on dairy cows, beef cows, crops, and workforce). See also Recreation comments.	See responses to comments 13006-35 and 11535-56 (see in Table A-3h, Environmental Justice and Socioeconomics).
11535-63	Steven Andersen	The DEIS asserts a confidence that through mitigation efforts, “there would be no residual effects to the risk of human-caused or natural-caused wildfire ignition and spread or wildfire response and suppression efforts that would warrant compensatory mitigation.” However, this sense of confidence gives undue weight to mitigation efforts even though there can be no guarantee that mitigation measures would be implemented or ultimately effective.210 As provided for below in comments related to aviation, wildfire mitigation would be stunted by the presence of 400 plus turbines.	The mitigation measures described in EIS Appendix 4 (Mitigation) would be included in the terms and stipulations of MVE’s ROW authorization, if granted. The Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describes procedures for monitoring and enforcement of mitigation measures. As described in additional project-specific mitigation measures nn and oo, MVE’s compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring. EIS Section 3.7.1.2 (Wildfire Ignition, Spread, Response, and Suppression, Impacts) discloses the potential for the alternatives to interfere with aerial fire suppression efforts and describes a number of measures that would be implemented to minimize or avoid impacts to fire response and suppression. This section also notes the potential for the increased fragmentation of the landscape to break up fuel continuity, potentially reducing the potential for large fire spread, and increased access to fire responders in the siting corridors from new access road construction. Since these measures would effectively reduce the potential impacts to fire response and suppression, compensatory mitigation is not warranted.
11535-89	Steven Andersen	Additionally, the DEIS wrongfully assumes that many of these issues can be regulated through mitigation efforts. However, these mitigation efforts often rely on action by specific individuals such as driving with caution towards animals and maintaining a strict speed limit. These mitigation efforts are merely wishful thinking without including consequences for violation or institutional oversight. Likewise, many of the other mitigation efforts listed are ambiguous and depend solely on the judgment of the project managers who have incentives that stand directly in opposition to preservation of wildlife.	The mitigation measures described in EIS Appendix 4 (Mitigation) would be included in the terms and stipulations of MVE’s ROW authorization, if granted. The Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describes procedures for monitoring and enforcement of mitigation measures. As described in additional project-specific mitigation measures nn and oo, MVE’s compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring. While some mitigation measures allow for discretion by MVE or its construction contractors, these measures specify what additional steps must be taken if avoidance is not possible, such as development of site-specific mitigation strategies and coordination with the BLM, the TAC, and other agencies.
11536-9	Richard Llewellyn	However, any merits of that conclusion must be beyond the scope of this EIS. What must be established here are the scientifically valid expectations that impacts can be mitigated by restoration efforts, as the same process is relied upon in more pristine areas. If the EIS fails to meet this requirement in a project of this magnitude, as it does, the public cannot expect the agency to meet it elsewhere.	See response to comment 11563-3 (see in Table A-3x, Vegetation).
11541-1	Jonathan van Harmelen	The Bureau of Land Management should cooperate with the Japanese American community to negotiate a settlement over the location of the Lave Ridge Wind Farm Project. The Minidoka Historic Site is one of a few federally recognized sites related to the Japanese American experience, and is one of three camp sites (out of ten) preserved by the National Parks Service. Very few historic landmarks capture the tragedy of the wartime incarceration of Japanese Americans like the camps themselves, and Minidoka is important both as a site of remembrance for camp survivors and their descendants and a place for Americans to learn about the history of racism in the U.S. Few doubt the need for the Lava Ridge Project, along with other clean energy projects, in combatting climate change. Yet these projects should not damage the historical integrity of national landmarks like the Minidoka Historic Site. As camp survivors have previously stated, the construction of the turbines would generate pollution and could potentially damage the historic site. Most of all, it would eliminate the sense of isolation that defined the incarceration experience and traumatized those confined. The federal government intentionally placed the camps on federal lands located in rural areas to avoid contact with nearby communities, and now eighty years later the legacy of this policy now resurfaces with the BLM's decision to construct the Lava Ridge Project next to the camp site. If the BLM respects the Japanese American community as a stakeholder in the site selection process for the Lava Ridge Project, it will listen to the community's desires and cooperate with the selection process. If it does so, the Lava Ridge Project can serve as a model for cooperation between the federal government and local communities with regards to future clean energy projects.	See analysis presented in Sections 3.5.5.2, 3.6.1.2, and 3.19. See response to comment 9080-46 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11554-17	Raul Labrador; Idaho Attorney General’s Office	The agency’s recommended alternatives do not mitigate the harm. They also would “have irreversible impacts on mule deer and pronghorn from human activities (e.g., vehicle use, construction equipment, maintenance activities), wind turbine operation (e.g. noise, vibration, shadow flicker caused by moving blades) and ground disturbance that would remove or alter habitat.” DEIS at 3-485. As noted above, Idaho maintains the right and responsibility to “preserve, protect, and perpetuate” its wild game populations and to “provide continued supplies of such wildlife for hunting, fishing and trapping.” Idaho Code § 36-103(a). MVE’s devastation to Idaho wild game is a clear invasion of Idaho’s legal rights.	The State of Idaho is a cooperating agency on the EIS. The BLM worked with IDFG to draft mitigation for the project. The draft EIS did not identify an agency-preferred alternative or make any recommendations as to which alternative should be selected.

Comment ID	Commenter	Public Comment	Response to Comment
11585-5	Preservation Idaho	Protections of historic sites such as the Milner-Gooding Canal and the Wilson Butte Cave, a National Register site, are not being considered and there are many other caves in the area that will be impacted along with the natural flora and fauna that have made this area their home for hundreds/thousands of years. Adverse impacts on historic sites and activities such as sheep trailing will also be permanent. These are all part of Idaho's history and their preservation is both appropriate and crucial to the overall management of Idaho resources.	See response to comment 11534-18 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the EIS's address of cultural resources, including historic sites and historic properties. See response to comment 11915-1 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding avoiding, minimizing, or mitigating adverse effects to important cultural resources, including the Wilson Butte Cave historic property, and caves and buttes of cultural significance to Tribes and others. Also see response to comment 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding identification and assessment of effects to historic properties prior to project construction. See also response to comment 11860-9 (see in Table A-3p, Livestock Grazing).
11598-21	Idaho Conservation League	Light pollution We appreciate the light pollution mitigation measures included in the DEIS. However, if this project is to move forward, the BLM should include robust dark sky monitoring during the construction and initial operation phase of the project to verify that the project is indeed not measurably impacting dark skies, especially at Craters of the Moon NP. For mitigation, the developer could help support voluntary efforts for additional light shielding in and around interested communities and Dark Sky designated areas.	Because avoidance and minimization measures would largely reduce impacts so that changes in brightness added from the project would not be perceptible to the human eye (see EIS Section 3.16.2 [Night Skies]) except near the horizon, monitoring and compensatory mitigation is not warranted. MVE is already minimizing light used for the project to the extent allowed by law (FAA regulations).
11598-27	Idaho Conservation League	Based on the public comments regarding visual effects to the Minidoka National Historic Site, we recommend that the BLM consider adding a viewshed buffer around Minidoka based on the Visual Resource Management classification system as part of a Resource Management Plan amendment. The exact distance could be based on discussions between members of the Japanese American community, the BLM and Magic Valley Energy/LS Power. There may also be sites of cultural significance to Shoshone-Bannock and Shoshone-Paiute tribal members that could be addressed through similar means.	For more information about the project-specific interim VRM process, see response to comment 11535-149 (see in Table A-3y, Visual Resources). See response to comment 9080-46 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11618-3	Bif Brigman	What y'all are missing is what about the harm that cannot be mitigated? What about the things that compensatory mitigation can't address for the harm that is being inflicted or the thing being taken? You expect people to comment on mitigation when no amount of money can replace what is being proposed here. We know you don't want us to see your grandma. But if we did, how much would you want? Your process is flawed and has been flawed since the beginning. Why did BLM say no to an area south of Twin Falls because of Sage grouse but thought it is just fine to impact the resources of one of the rare National Landmarks for Japanese Americans in the whole nation. And the only one in the state of Idaho.	The BLM has not yet issued a decision regarding the project. All alternatives represent a trade-off between resources and uses and it is not possible, nor required, that all adverse effects of the alternatives be eliminated or mitigated. The purpose of the EIS is to disclose each alternative's impacts on the human and natural environment, including those impacts that cannot be completely avoided or minimized. Where residual impacts would remain after the implementation of mitigation measures, compensatory mitigation has been proposed, in accordance with the BLM mitigation framework.
11782-5	Ken Fitch	There is mention of compensatory mitigation. However, there is no adequate compensation for the abridgment and disruption of the experience of place with its specific environment central to the cultural importance of this place. As a NPS site (and also on BLM land), it is the location itself with all its features, including its climate, that is being set aside for protection on a specific piece of land, not in a photograph of video of such or an exhibit. The compensatory mitigation would appear as an especially cynical gesture to Japanese Americans, aware that compensation is nowhere near actually adequate to redress deep impacts of the removal and cultural shredding experienced for the events over 60 years ago This was the case with the $20,000 compensation offered several decades ago, although the acknowledgment was a step toward healing, but now to inflict another action of cultural disrespect followed by an attempt for compensation as mitigation would reopen wounds.	The analysis presented in Section 3.6.1 (Environmental Justice Communities) acknowledges how any adverse effects to Minidoka NHS and Minidoka WRC would have the potential to cause psychological harm to members of the Japanese American community by perpetuating and reinforcing existing feelings of anger, injustice, distrust, and being dishonored within the community, and by potentially diminishing the ability of the community to benefit from healing rituals and practices centered around Minidoka NHS. Additional information has been added to Section 3.6.1.4 (Compensatory Mitigation) to convey the sentiments of the Japanese American and Minidoka-connected communities toward compensatory mitigation for project-related impacts. Also see response to comment 11383-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
11788-1	Representative Jack Nelsen	My largest overriding concern is the fact that LS Power has done absolutely nothing in the way of mitigating the effects of the Lava Ridge Wind Project's effects on the surrounding communities. Other than some feel good community gatherings, they have not met with county commissioners, highway districts, and other governmental officials of the communities affected by the project. That in and of itself is concerning to think a project of this magnitude has tried to circumnavigate the core of the communities and the concerns of its citizens.	EIS Section 3.6 (Environmental Justice and Socioeconomics) describes mitigation measures that would be implemented to minimize or avoid impacts to local communities and the regional economy. A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation). MVE and the BLM have coordinated directly with stakeholders such as grazing allotees and the Japanese American community throughout the development of the EIS. The BLM conducted a robust public involvement process for the EIS, which includes ongoing coordination with local and state government agencies and officials. While a number of mitigation measures have been incorporated into the EIS to address concerns raised by these agencies and officials, MVE is responsible for obtaining all other required federal, state, and local permits and approvals, as described in EIS Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies).
11860-6	Shauna Robinson	The DEIS information on the cultural and natural importance of playas to the high desert in the proposed project area is inadequate. Playas are seasonal water sources that support migrating wildlife in the spring. Birds often use them as resting spots during their spring migration. In fact, in early April while driving east of Wilson Butte, my husband and I noticed a playa with numerous waterfowl, such as Scaups and Green-tailed Teals, on it. We also observed mule deer and pronghorn in the area and it would be safe to assume they, too, took advantage of the playa's water. Geologically, playas are quite interesting, created when prehistoric lakes dried up. Additionally, these shallow basins or ephemeral ponds can be useful to climate research, as they hold information about both past and present climates (USGS). Culturally, indigenous people used playas as sources of water in the spring and as a source of food. The Native Americans harvested tiny fairy shrimp, which are commonly found in the waters of the playa, and after the playa dries up, the shrimp go dormant until seasonal waters come again. The Lava Ridge project area has many playas of varying sizes, all important to birds, insects, amphibians, large and small animals, and some vegetation. Many of these water features are at risk because of potential construction of wind turbines and the great amount of ground disturbance. Especially concerning is how reclamation attempts may be difficult or impossible for damaged playas (3-492), which becomes a permanent loss of water sources for wildlife. The BLM should provide for extra protection of these vital desert features, through buffer zones or avoidance.	The EIS discloses the importance of playas in the siting corridors for wildlife, including migratory birds (see Section 3.3.2.1 [Avian Populations, Affected Environment]), pollinators (see Section 3.11.1.1 [Pollinators, Affected Environment]), and amphibians (see Section 3.18.3.1 [Amphibians, Affected Environment]). A number of mitigation measures would be implemented to minimize or avoid impacts to wetlands and other surface water, and site-specific mitigation plans would be developed where impacts cannot be avoided (see applicant-committed measures 120, 124, 129, 132, 136, and 138). These measures include a 100-foot avoidance buffer for all wetlands, streams, and riparian areas. This avoidance buffer would be increased to 330 feet anywhere amphibian breeding activity is confirmed during preconstruction surveys (see additional project-specific measure cc). A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
11871-106	WildLands Defense	At M-62: The Adaptive Management is deficient, and is not based on adequate and honest analysis of avian, bat and other biota Impacts. The Report refers to Thresholds: Levels of mortality for a particular bird or bat species of concern that could result in population-level impacts as determined through consultation between MVE, USFWS, and BLM based on best available science; or ”Mass casualty” events where more than 10 fatalities are recorded at a turbine during a single search. If the above levels of mortality are exceeded, postconstruction monitoring data will be further evaluated to determine if the probable cause of the mortality is associated with collision with wind turbine blades or possible other causes (e.g., predation), evaluate if the primary species …”. “ species] impacted are of conservation concern, and whether feasible mitigation options are available to reduce impacts. Conservation benefits realized from existing mitigation commitments from MVE as outlined in Appendices T (Eagle Conservation Plan) and U (Greater Sage Grouse Mitigation Plan) will also be considered in the evaluation of impacts for their benefit to species of concern beyond those targeted for mitigation.	The BBCS is Appendix M in MVE (2023). Readers should refer to EIS Appendix 4 (Mitigation) for a complete list of required mitigation measures, which include a number of additional mitigation measures for birds. The measures from the draft EIS have been revised and expanded for the final EIS to clarify the adaptive management and compensatory mitigation measures that would be required. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B [Proposed Action]), “It is impossible to accurately predict the fatality rate for the Lava Ridge Wind Project because preconstruction use is not correlated with postconstruction fatality rates (WEST 2011).” Due in part to the uncertainty in quantifying fatality rates prior to construction, mitigation measures include postconstruction avian fatality monitoring. The TAC would use data from this fatality monitoring to assess avian fatality rates and determine which adaptive management measures need to be implemented to reduce fatalities (if any). Additional monitoring would be required to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation. This strategy is consistent with the USFWS’s land-based wind energy guidelines (USFWS 2012).
11873-16	Mary Schwartz, Frank Schwartz	18. The addition of roads, fences, structures, facilities and areas of exclusion as well as traffic, human activity, noise and vibration, relocated water, emf, etc. will influence the movement of livestock in the wind farm area, during the construction, operation, decommissioning and, as applicable, the post-decommissioning periods. These modified livestock travel patterns could result in areas of heavier use as well as areas of inadequate use of the allotments/pastures. If the BLM approves any of this windfarm proposal, BLM should provide all permittees a waiver of any liability associated with the changes in livestock use of the areas. Permittees should not be responsible for any future impacts associated with livestock use in these areas that result from BLM's decision to move forward with this wind farm project.	See response to comment 11204-13 (see in Table A-3p, Livestock Grazing).
11873-17	Mary Schwartz, Frank Schwartz	19. The wind energy company (MVE or successor) should be required to provide money annually to Counties, the BLM and the U.S. Treasury in the amount of lost grazing revenues associated with any reduced AUMs, temporary and permanent, including the period following the final wind farm decommissioning and area restoration.	See response to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11886-8	Sandra Eto	1. The DEIS describes the impacts from Alternative B and includes applicant-committed measures that are part of project design, mitigation required by BLM policy, and additional project-specific mitigation. It appears project-specific mitigation includes avoidance and minimization activities that are incorporated into construction-related specifications, field best management practices and the like. Once these three types of mitigation are taken into consideration, the residual impacts from Alternative B are then described. If you look at Appendix 4, Table 4-3, however, it appears that the third type of “additional project-specific mitigation” is not automatically considered for application to Alternative B and some discretion is allowed on whether or not they are applied to Alternative B. BLM would then decide whether additional compensatory mitigation would be required as part of Alternative B. This type of mitigation would be applied to offset residual impacts that would prohibit or inhibit BLM from complying with its own laws and policies, or impact important, scarce, or sensitive resources. The final EIS would then provide a description of the residual impacts warranting compensatory mitigation and the type and amount of compensatory mitigation that would be required.	See response to comment 11886-10 (see in Table A-3cc, Mitigation – EIS Appendix 4) regarding the implementation of mitigation measures under Alternative B. As stated in additional measure a, “Where applicant-committed measures (Table App4-2) are written only for specified project phases (i.e., construction, operation, or decommissioning), the BLM would require that MVE implement them regardless of the project phase if those measures would reduce impacts to resources. For measures regarding pre-clearance, the BLM would determine what would require pre-clearance during maintenance and decommissioning” (see Table App4-4 in EIS Appendix 4 [Mitigation]). A description of how the additional measures from Table App4-4 would further minimize or avoid impacts is provided after the list of measures in the Alternative B with Additional Measures sections throughout EIS Chapter 3 (Affected Environment and Impacts).
11886-9	Sandra Eto	2. For Alternatives C, D, and E, the impacts, application of mitigation measures and description of residual impacts assume all four types of mitigation measures will be fully applied to these alternatives automatically. Residual impacts will be those that remain after applicant- committed measures, mitigation required by BLM policy, additional project-specific mitigation, and compensatory mitigation have been applied. No interpolation of impacts would need to be pieced together by the reader. The description of impacts from Alternatives C, D, and E would be completely disclosed with no interpolation or interpretation necessary.	As described in the response to comment 11886-10 (see in Table A-3cc, Mitigation – EIS Appendix 4), the mitigation measures listed in EIS Appendix 4 (Mitigation) would be required for all action alternatives.
11886-10	Sandra Eto	3. Looking at Appendix 4, Table App4-1. Types of Mitigation (p. App4-1), it appears I did not unpack the DEIS description very well. However, my main point, which can be seen in the Table, is that the way in which Alternative B’s impacts are handled are not the same as for those of Alternatives C, D, and E. It takes a lot more thought and work to ascertain what the impacts are from Alternative B, and what the mitigated impacts are after applying up to three types of mitigation, two of which cannot yet be assumed to apply to Alternative B. When you are not comparing apples to apples, it makes it difficult to evaluate the alternatives’ comparative merits, or even understand what the residual impacts are for the proposed alternative. It also should be noted that measures from the historic properties management plan are not even included in this DEIS.	The mitigation measures listed in EIS Appendix 4 (Mitigation) would be required under all action alternatives, including Alternative B. As stated throughout the impact analyses in EIS Chapter 3 (Affected Environment and Impacts), "In addition to applicant-committed measures and mitigation required by BLM policy (see Tables App4-2 and App4-3 in EIS Appendix 4) that would be implemented under Alternative B, the BLM would apply additional measures (see Table App4-4 in EIS Appendix 4) to minimize impacts under Alternative B. Although these measures are not included as part of MVE’s Proposed Action (Alternative B), these measures would be included in the terms and conditions of the ROW permit if a ROW is granted and Alternative B is selected.” EIS Section 3.5.3 (Cultural Resources, Programmatic Agreement) and EIS Appendix 8 (Cultural Resources Programmatic Agreement) describe the process for developing HPTPs when adverse effects to historic properties cannot be entirely avoided, as well as the potential measures that would be included in these plans.
11978-6	Magic Valley Energy, LLC	Section 3.1.2.1 – Analysis Approach to Mitigation 7. The DEIS States: “The project would be subject to applicant-committed measures, mitigation required by BLM policy, and additional project-specific mitigation as described in Section 2.3.4 (Avoidance and Minimization) and DEIS Appendix 4 (Mitigation). The DEIS impact analyses assume the project would include implementation of these measures and disclose remaining impacts. To compensate for remaining impacts, the BLM may also consider compensatory mitigation.” a. MVE Comment: Throughout the DEIS, BLM notes the need to add additional project- specific mitigation measures. The FEIS should note that the applicant-committed measures will be made mandatory through the Record of Decision. Because these measures will be mandatory, the BLM should recognize that there are situations where these applicant-committed measures will obviate the need for additional project-specific mitigation measures. See, for example, comment 10 below addressing how applicant- committed measures render additional BLM mitigation	The additional project-specific mitigation measures listed in Table App4-4 in EIS Appendix 4 (Mitigation) were developed to address impacts that remain after the implementation of all applicant-committed measures. Any redundancy between additional-project specific mitigation measures and applicant-committed measures are a result of the need for more stringent mitigation measures than proposed by MVE or because of the need to clarify ambiguous language in measures proposed by MVE.

Comment ID	Commenter	Public Comment	Response to Comment
		measures unnecessary. Other instances where additional mitigation measures are not warranted are listed in subsequent MVE comments under the appropriate section, including additional measures listed in the analyses for avian and bat species, amphibians, pollinators and insects, and water and wetlands.	
11978-10	Magic Valley Energy, LLC	Section 3.2.1.2.2 and Section 3.2.2.2.2– Air Quality for Alternative B with Additional Measures during Construction and Operation 10. MVE Comment: As previously commented in this comment letter, the DEIS states that additional measures would be applied to the Project to further minimize impact to air quality. The Project's annual construction emissions are given for Alternative B, and the DEIS states that these activities would not exceed federal or state ambient air quality standards. Further, operational emissions for Alternative B in the DEIS Table 3.2-6 are shown to represent less than 1% of any total existing emission rate listed for each county (CO2, NOX, SOX, PM10, PM2.5, VOC, and HAPs). Given that estimated operations emissions are a fraction of the estimated construction emissions, which have already been determined not to exceed air quality standards and to be minor, it logically follows that operational emissions impacts would be far less than the minor impacts determined for construction emissions. Further, Alternatives C, D, and E would all have lower emissions than Alternative B throughout the life of the Project. Moreover, the applicant-committed measures for reducing emissions, such as water spray, which can reduce dust by 75% on unpaved roads with little water spray2, would further reduce these already low-impact emission rates. Based on this information, requirements for additional BLM measures would have diminished value in their implementation or would be redundant with applicant-committed measures and would therefore not be warranted: • Measure b: Tier 4 compliant generators would be used when available during construction to reduce nitrogen oxide (NOx) emissions. • Measure c: MVE and its contractors would control dust to the extent that off-site transport of visible dust plumes is eliminated. Water would be used as a dust control method during the life of the project to prevent safety hazards or nuisances on access roads and in construction zones near residential and commercial areas, along major highways and interstates, and near cultural and historic resources. (This measure adds to applicant-committed measure 111.) • Measure e: Construction activities may be limited or scaled back to reduce off-site transport where practice water application would be ineffective at controlling dust. Operations that can be controlled or that produce minor or very little dust would continue as normal/scheduled. Section 3.2.2.2– Air Quality Operational Impacts	Additional project-specific mitigation are measures needed to further avoid or minimize impacts so that compensatory mitigation is not needed. The BLM feels these measures are needed.
11978-20	Magic Valley Energy, LLC	18. MVE Comment: When holistically looking at the bat analysis through the MVE requested changes presented within this Section (i.e., use of minimum bat fatality range, use of applicant-committed measures, no 30-year maximum fatality estimate, use of new data) the Project's impacts to bat species are unlikely to be moderate to high under Alternative B. Instead, MVE anticipates that Alternative B would likely have a low impact to bat species, and Alternatives C, D, and E would be expected to have even lower impacts, as the Project alternatives decrease in turbine count and are sited farther away from potential foraging habitat (i.e., canals). Based on these conclusions (i.e., that impacts to bat species would be low), the BLM-required additional measures and compensatory mitigation measures presented in the DEIS would not be warranted. This view is consistent with Section 3.3.1.3 - Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity, where the DEIS states: "…these effects would not be irreversible because they would be unlikely to result in a trend toward listing under the ESA or a loss of population viability." Therefore, the requirements for additional measures and compensatory mitigation measures should be removed from the FEIS, since this does not follow the BLM's mitigation principles, which call for mitigation measures to be commensurate with the level of impact to the environmental resource.	The conclusion in EIS Section 3.3.1.3 (Bat Populations and Roosting Habitat, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) that effects of the action alternatives would not be irreversible because they would be unlikely to result in a trend toward federal listing under the ESA or a loss of population viability is based on the conclusion that the facility has been properly sited and that mitigation measures, including adaptive management, would be effective at minimizing bat fatalities. However, as noted in the analysis assumptions in EIS Section 3.3.1 (Bat Populations and Roosting Habitat), preconstruction bat acoustic activity does not appear to be correlated with observed bat fatality rates following construction. EIS Section 3.3.1.1 (Bat Populations and Roosting Habitat, Affected Environment) discloses the lack of accurate estimates of bat population sizes and trends, and EIS Section 3.3.1.1.3 (Bat Populations and Roosting Habitat, Existing and Future Trends and Actions) discusses how the continued spread of WNS introduces further uncertainty in predicting the magnitude of impacts to some bat populations in the long-term. While postconstruction bat fatality monitoring will provide an opportunity to assess actual bat fatality rates and determine which adaptive management measures need to be implemented to reduce bat fatalities (if any), it will be necessary to continue evaluating new data and literature on bat populations and the impacts of wind energy development on those populations over the 30-year operation phase. Thus, while the data currently available do not indicate that compensatory mitigation will be needed for bats, the need for such mitigation may arise as conditions change in the future. The final EIS includes new and revised mitigation measures that describe the TAC's role in evaluating the results of postconstruction fatality monitoring data and using the best available science and technology to recommend appropriate adaptive management and compensatory mitigation measures.
11978-25	Magic Valley Energy, LLC	21. MVE Comment: When holistically looking at the avian analysis through the MVE requested changes presented within this Section (i.e., inclusion of minimum fatality range, no non-eagle avian species impacts) the Project's impacts to these avian species are unlikely to be moderately to highly impacted by the Project under Alternative B. Instead, MVE anticipates that Alternative B would likely have a low impact to non-eagle avian species, and Alternatives C, D, and E would be expected to have even lower impacts, as the Project alternatives decrease in turbine count and are sited further away from potential avian use features (i.e., canals). Based on these conclusions (i.e., that impacts to species would be low), the BLM-required additional measures and compensatory mitigation measures presented in the DEIS would not be warranted. This view is consistent with Section 3.3.2.3 - Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity, where the DEIS states: "…these effects would not be irreversible because they would be unlikely to result in a trend toward listing under the ESA or a loss of population viability." Therefore, the requirements for additional measures and compensatory mitigation measures should be removed from the FEIS, since this does not follow the BLM's mitigation principles, which call for mitigation measures to be commensurate with the level of impact to the environmental resource.	See response to comment 11978-20 (see in Table A-3cc, Mitigation – EIS Appendix 4). As with bats, there is uncertainty in predicting avian fatality rates and the future status of avian populations in the analysis area (see EIS Section 3.3.2 [Avian Populations]). Therefore, the same postconstruction fatality monitoring requirements apply to birds, and the TAC will be responsible for evaluating the monitoring results of and using the best available science and technology to recommend appropriate adaptive management and compensatory mitigation measures, when deemed appropriate.
11978-48	Magic Valley Energy, LLC	45. Appendix 4- Table App4-3, E "Place infrastructure in already disturbed locations where the habitat has not been fully restored." (BLM 2015 RDF #54) MVE Comment: While MVE will co-locate Project infrastructure within already disturbed locations to the maximum extent feasible, e.g., by using existing roads and co-locating linear	If the project is authorized by the BLM, applicable greater sage-grouse ARMPA (2015) RDFs will be included as terms and conditions of MVE's ROW grant. The RDFs included in the EIS were those that could be successfully applied as criteria informing the design of action alternatives or implemented as terms and conditions.

Comment ID	Commenter	Public Comment	Response to Comment
		infrastructure in existing linear corridors as feasible, the Project area does not offer a sufficient area of already disturbed locations where the habitat has not been fully restored to site any of the action alternatives under review. Thus, this RDF is not applicable due to the site-specific conditions of the Project (RDF variation criterion #1), and MVE requests that this measure be removed. MVE recommends that BLM add a statement to Section 3.3.4.2.2 in the third paragraph after Table 3.3- 14 to specify that BLM 2015 RDF #54 is not applicable due to the rationale described in this comment.	
11978-49	Magic Valley Energy, LLC	46. Appendix 4- Table App4-3, F “Co-locate linear facilities within one mile of existing linear facilities.” (BLM 2015 RDF #56) MVE Comment: MVE will co-locate linear facilities within one mile of existing linear facilities as feasible; however, the Project spans a large area, and all action alternatives under review will require siting some linear facilities more than one mile from existing linear facilities. Thus, this RDF is not applicable due to the site-specific conditions of the Project (RDF variation criterion #1), and MVE requests that this measure be removed. MVE recommends that BLM modify the text in Section 3.3.4.2.2 in the third paragraph after Table 3.3-14 to specify that BLM 2015 RDF #56 is not applicable due to the rationale described in this comment.	See response to comment 11978-48 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-50	Magic Valley Energy, LLC	47. Appendix 4- Table App4-3, J “Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.” (BLM 2015 RDF #62) MVE Comment: MVE will co-locate its new utility developments and transportation routes within existing utility or transportation corridors as feasible; however, the Project spans a large area, and all action alternatives under review will require siting some utility developments and transportation routes outside of existing utility or transportation corridors. Thus, this RDF is not applicable since there are not enough existing utility or transportation corridors within the Project siting corridors to co-locate all Project utility and transportation components such as collector lines and roads within existing corridors. MVE requests that the measure be removed, and MVE recommends that BLM modify the text in Section 3.3.4.2.2 in the third paragraph after Table 3.3- 14 to specify that BLM 2015 RDF #62 is not applicable due to the rationale described in this comment.	See response to comment 11978-48 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-51	Magic Valley Energy, LLC	49. Appendix 4- Table App4-3, M “BLM would not issue ROW for new energy development roads, unless for a temporary use consistent with all other terms and conditions in the ARMPA (BLM 2015).” (BLM 2015 RDF #90) MVE Comment: RDF #90 in BLM 2015 reads, “Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.” (emphasis added) This RDF does not prohibit BLM issuing ROWs for energy development roads; it only prohibits counties from being issued ROWs over energy development roads. This prohibition may be to prevent the additional traffic and maintenance impacts that could result from converting well- regulated energy and mineral development roads to county roads where the road users might have less regard for BLM standards. It appears that this RDF was not intended to be applied to energy development permittees such as MVE; thus, MVE requests that this measure be deleted.	See response to comment 11978-48 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-52	Magic Valley Energy, LLC	50. Appendix 4- Table App4-4, a “Where applicant-committed measures (Table App4-2) are written only for specified project phases (i.e., construction, operation, or decommissioning), the BLM would require that MVE implement them regardless of the project phase if those measures would reduce impacts to resources, where feasible. For measures regarding pre-clearance, the BLM would determine what would require pre-clearance during maintenance and decommissioning.” MVE Comment: As previously mentioned in the comment letter, this additional measure is not warranted as the applicant-committed mitigation measures detailed for each phase are specifically tailored towards avoiding and minimizing impacts efficiently and effectively for that particular phase of the Project life. BLM’s 2005 Final Programmatic Environmental Impact Statement on Wind Energy Development on BLM-Administered Lands in the Western United States (the “Wind Energy PEIS”) supports the strategy of applying purposeful measures under differing phases, as shown in the following excerpts20: • Construction. “All control and mitigation measures established for the project in the POD and the resource-specific management plans that are part of the POD shall be maintained and implemented throughout the construction phase, as appropriate.” • Operation. “All control and mitigation measures established for the project in the POD and the resource-specific management plans that are part of the POD shall be maintained and implemented throughout the operational phase, as appropriate. These control and mitigation measures shall be reviewed and revised, as needed, to address changing conditions or requirements at the site, throughout the operational phase. This adaptive management approach would help ensure the impacts from operations are kept to a minimum." • Decommissioning. “All management plans, BMPs, and stipulations developed for the construction phase shall be applied to similar activities during the decommissioning phase.” As detailed above, the Wind Energy PEIS clearly views phase-specific mitigation measures and BMPs as appropriate for wind energy projects on BLM-administered lands. Moreover, requiring phase-tailored measures to apply across all project phases could result in unintended consequences or absurd results, such as prohibiting maintenance activities during operation without first conducting clearance surveys for sensitive wildlife and plant species which could result in significant delays in necessary equipment maintenance, or forcing excessive water use by requiring unpaved Project roads to be watered during operations. Thus, for consistency with BLM policy established in the Wind Energy PEIS and to avoid unintended consequences and absurd results, MVE requests that BLM delete this measure in the FEIS.	The comment misinterprets the meaning of BLM (2015), which specifically states that “all control and mitigation measures established for the project in MVE (2023) and the resource-specific management plans that are part of MVE (2023) shall be maintained and implemented throughout the operational phase, as appropriate” (BLM 2015:2-23 and “All management plans, BMPs, and stipulations developed for the construction phase shall be applied to similar activities during the decommissioning phase” (BLM 2015:2-24). Thus, additional measure a is consistent with the recommended BMPs in BLM (2015). As stated in additional measure a, construction measures would only be required during operations and decommissioning if those measures would reduce impacts to resources, and only where feasible. The measure also specifically states that the BLM would have discretion to determine whether preconstruction clearance measures are warranted for operations or decommissioning activities. This is consistent with the recommendation in BLM (2015) that [construction] control and mitigation measures be reviewed and revised, as needed, to address changing conditions or requirements at the site, and would ensure this measure does not have “unintended consequences” or “absurd results.” Therefore, no revisions are necessary.
11978-53	Magic Valley Energy, LLC	51. Appendix 4- Table App4-4, b Tier 4 compliant generators would be used when available during construction to reduce nitrogen oxide (NOx) emissions.” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 10 in this comment letter. [see MVE pdf letter, comment 10 on page 7] In addition, MVE notes that a requirement for Tier 4 generators is not warranted since the analysis in the DEIS	The BLM’s best practices include use of Tier 4 compliant generators when available. This measure would be included in MVE’s ROW grant, if the project authorized.

Comment ID	Commenter	Public Comment	Response to Comment
		demonstrates no concerns regarding NOX emissions or ambient pollutant concentrations. As such, MVE requests that this measure be removed from the FEIS on either premise.	
11978-54	Magic Valley Energy, LLC	52. Appendix 4- Table App4-4, c “MVE and its contractors would control dust to the extent that off-site transport of visible dust plumes is eliminated. Water would be used as a dust control method during the life of the project to prevent safety hazards or nuisances on access roads and in construction zones near residential and commercial areas, along major highways and interstates, and near cultural and historic resources. (This measure adds to applicant-committed measure 111.)” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 10 in this comment letter [see MVE pdf letter, comment 10 on page 7]; however, if this measure will not be removed, the following comment applies: In the interest of conserving water, MVE requests that BLM revise this measure to include additional dust suppression techniques beyond water spray that are listed in Appendix O of the POD, including stabilization with gravel/aggregate and treatment with dust palliative products. The revised measure would read as follows: “MVE and its contractors would control dust to the extent that off-site transport of visible dust plumes is eliminated. Dust control methods, including water, surface stabilization with gravel/aggregate, or dust palliatives such as magnesium chloride (or other palliatives approved by BLM), will be used throughout the life of the project to prevent safety hazards or nuisances on access roads and in construction zones near residential and commercial areas, along major highways and interstates, and near cultural and historic resources. (This measure adds to applicant-committed measure 111.)”	Measures in Table App4-4 are additional to measures in Tables App4-2 and App4-3. The measures in Table App4-4 do not necessarily replace measures in Tables App4-2 and App4-3, they may modify and improve upon them.
11978-55	Magic Valley Energy, LLC	53. Appendix 4- Table App4-4, e “Construction activities may be limited or scaled back to reduce off-site transport where practice water application would be ineffective at controlling dust. Operations that can be controlled or that produce minor or very little dust would continue as normal/scheduled.” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 10 in this comment letter. [see MVE pdf letter, comment 10 on page 7]	See response to comment 11978-78 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-56	Magic Valley Energy, LLC	54. Appendix 4- Table App4-4, j Turbines would not be placed within 0.25 mile of known bat roosts. Other infrastructure within that buffer would be minimized. MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 in this comment letter [see MVE pdf letter, comment 18 on page 13]. In addition, WEST surveys and historical data show no known bat roosts within 0.25 of a turbine for any alternative. As such, MVE requests that this measure be removed from the FEIS on either premise.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B [Proposed Action]), “Roosting has been documented at the lava crater near NABat station 89781-NE in the siting corridors and could be disturbed under Alternative B.” Given the increased potential for bat collisions with operational turbines in the vicinity of this roost site, the BLM has included additional measure n as a means of proactively reducing impacts to bats from the project. As described in the response to comment 11978-20 (see in Table A-3cc, Mitigation – EIS Appendix 4), the conclusion that impacts to bats are not expected to result in a trend toward ESA listing or loss of population viability are based on the implementation of all mitigation measures, including additional measure n. Therefore, no revisions are necessary.
11978-57	Magic Valley Energy, LLC	55. Appendix 4- Table App4-4, k “Phase construction by 1) concentrating work in a small percentage of the project area during the breeding season, and 2) spreading work over multiple years to only incrementally impact birds in a given area/landscape over time.” MVE Comment: MVE requests that BLM remove this measure since all applicable seasonal restrictions and nest buffers for avian species are already addressed in detail in other sections of the DEIS, including DEIS Section 3.3 for sage grouse and POD Appendices M, P, and T for other avian species. This measure k only adds ambiguity about how seasonal restrictions will be implemented and raises questions regarding how MVE would comply with the measure (what defines concentration of work? what defines a small percentage? How many years? What type of landscape?). Additionally, this measure does not seem to be backed by scientific research (i.e., would artificially prolonging construction and dispersing construction activity in the Project area over multiple years actually reduce impacts to bird populations relative to more concentrated construction over a shorter duration?)	See response to comment 11978-78 (see in Table A-3cc, Mitigation – EIS Appendix 4). Added “to the extent feasible” to this measure. Species-specific measures also provide additional details.
11978-58	Magic Valley Energy, LLC	56. Appendix 4- Table App4-4, m “MVE would include methods targeting burrowing owls in preconstruction surveys. Methods for avian use and nest surveys have not included these methods and therefore nests may go undetected.” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 21 in this comment letter. [see MVE pdf letter, comment 21 on page 19]	As described in EIS Section 3.3.2.1.2 (Avian Populations, Species Analyzed in Detail), “Ten burrowing owls were recorded during the first year of avian use surveys (WEST 2021a), though actual burrowing owl use is likely to be higher because surveys were not designed to detect the species.” Additionally, the western burrowing owl is a BLM sensitive species and is afforded protection under the MBTA. If preconstruction surveys do not include methods that target western burrowing owls, construction activities could result in violations of the MBTA and impacts that would be inconsistent with BLM direction for management of sensitive species, as well as the BLM and USFWS’s MOU implementing EO 13186 (see EIS Section 3.3.2.1 [Avian Populations, Affected Environment]). Therefore, no revisions are necessary.
11978-59	Magic Valley Energy, LLC	57. Appendix 4- Table App4-4, n “Apply the following to postconstruction avian and bat fatality monitoring. a. The timing of surveys should coincide with times when bats are active in the area, or if data are limited, surveys should occur year-round. b. For fatality monitoring, select wind turbines at random or via a systematic random approach. c. Establish a search plot at least ½ the height of the wind turbine with a minimum plot width of at least 120 meters from the turbine. d. Define, using GPS, the searchable area and identify the different visibility classes within each plot. e. Delineate transect lines, within the plot, in most situations, no further than 6 m apart, but this may vary from 3–10 meters, depending on ground cover.” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 and comment 21 in this comment letter. [see MVE pdf letter, comment 18 on page 13 and comment 21 on page 19]	Postconstruction fatality monitoring is intended to better quantify avian and bat fatality rates during operations and determine which adaptive management measures need to be implemented to reduce fatalities, if any. The protocol for carcass searches is dictated by the best available science and literature (not the estimated magnitude of impact to avian and bat populations) and may be further modified by the TAC, if deemed appropriate (see measure u). Additional measure n has been replaced with measure u, which refers to the full Avian and Bat Postconstruction Monitoring Plan that has been added to EIS Appendix 4 (Mitigation).
11978-60	Magic Valley Energy, LLC	58. Appendix 4- Table App4-4, o “Consult with BCI, the TAC, state and federal agencies, or other experts in bat-wind energy experts to determine the best minimization strategy for the species occurring in the area.” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 in this comment letter. [see MVE pdf letter, comment 18 on page 13] In addition, the BLM and cooperating agencies with	As described in the response to comment 11978-20 (see in Table A-3cc, Mitigation – EIS Appendix 4), there is uncertainty in quantifying the magnitude of impacts to bats over the 30-year operation phase, and the TAC will need to continuously evaluate new data, literature, and technologies as they become available to determine the best course of action for minimizing bat fatalities that exceed acceptable thresholds. The BLM appreciates

Comment ID	Commenter	Public Comment	Response to Comment
		expertise on avian and bat issues (e.g., USFWS and IDFG) have reviewed and commented accordingly to MVE's BBCS and worked in concert with MVE to develop the extensive mitigation strategies detailed in the BBCS. Therefore, no further consultation is needed as minimization strategies have been implemented with the appropriate cooperating agencies. As such, MVE requests that this measure be removed from the FEIS on either premise.	MVE's coordination with the USFWS, IDFG, and others; however, the continued consultation requirements described in additional project-specific measure w have been included at the specific request of IDFG and others that have expressed concern that the measures MVE has committed to in the BBCS will be insufficient to address the potential impacts to bat populations from collisions with operational turbines.
11978-61	Magic Valley Energy, LLC	59. Appendix 4- Table App4-4, p "Use data collected by the wind turbines or meteorological towers to relate bat fatality to weather and operational variables." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 in this comment letter. [see MVE pdf letter, comment 18 on page 13] In addition, this has already been implemented in the BBCS as part of the adaptive management strategy. As such, MVE requests that this measure be removed from the FEIS on either premise.	As described in response to comment 11978-20 (see in Table A-3cc, Mitigation – EIS Appendix 4), there is uncertainty in quantifying the magnitude of impacts to bats over the 30-year operation phase, and the TAC will need to continuously evaluate new data, literature, and technologies as they become available to determine the best course of action for minimizing bat fatalities that exceed acceptable thresholds. The adaptive management strategy in the BBCS states that MVE will "consider" model-driven curtailment strategies that correlate bat activity with weather conditions. By requiring that bat fatality data be related to weather data collected by met towers or wind turbines, additional project-specific measure v provides assurance that adaptive management measures implemented to reduce bat fatalities (including curtailment) would be targeted to periods or locations of peak collision risk for bats, which would help minimize the financial impact of implementing adaptive management measures by limiting their scope and duration. Therefore, no revisions are necessary.
11978-62	Magic Valley Energy, LLC	60. Appendix 4- Table App4-4, q "As part of MVE's adaptive management (applicant-committed measure 157), if ferruginous hawk fatalities are observed, implement Tier 5 studies (as per the WEG [USFWS 2012]) to further assess the potential for population-level effects following construction. This could include annual raptor nest monitoring over the life of the facility so that turbines within 1 mile of those nests can be curtailed (applicant-committed measure 158)." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 21 in this comment letter. [see MVE pdf letter, comment 21 on page 19] In addition, MVE's BBCS (POD Appendix M) details the adaptive management procedures that apply to all avian species, including ferruginous hawk. The adaptive management section of the BBCS prescribes measures including additional on-site studies, installation of anti-perching devices, and strategic curtailment targeting high risk locations and time periods, all of which would serve to ensure that impacts to ferruginous hawks would be avoided, minimized, or compensated appropriately. As such, MVE requests that this measure be deleted for this reason as well, since its goals are already accomplished via the BBCS. If this measure will not be removed, MVE suggests revising this language as follows: "As part of MVE's adaptive management (applicant-committed measure 157), if ferruginous hawk fatalities are observed, implement Tier 5 studies (as per the WEG [USFWS 2012]) to further assess the potential for population-level effects following construction. This could include annual raptor nest monitoring over the life of the facility so that turbines within 1 mile of those nests can be curtailed if turbines within this distance present a risk to nesting ferruginous hawk based on nest monitoring data." (added language underlined)	Siting corridors were adjusted to avoid known active ferruginous hawk nests, and it may be necessary during operation to curtail turbines near active ferruginous hawk nests not previously detected. The TAC would provide adaptive management recommendations based on the results of postconstruction monitoring.
11978-63	Magic Valley Energy, LLC	61. Appendix 4- Table App4-4, s "Continue with acoustic monitoring and roost surveys (for a duration determined by BLM) to document the presence or absence of important roost sites to inform adaptive management (including curtailment)." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 21 in this comment letter. [see MVE pdf letter, comment 21 on page 19] Also, additional acoustic monitoring and roost surveys would not supply useful information for curtailment that has not already been provided through previous surveys. In addition, MVE has already completed surveys in accordance with the wind energy guidelines, and additional postconstruction surveys are not warranted since adaptive management strategies will be based on postconstruction monitoring as detailed in the BBCS (POD Appendix M). As such, MVE requests that this measure be removed from the FEIS on either premise.	See responses to comments 11978-20 and 11978-25 (see in Table A-3cc, Mitigation – EIS Appendix 4) and 12130-28, 12982-14, and 13008-12 (see in Table A-3b, Bats). Former measure s is now measure aa in EIS Appendix 4 (Mitigation).
11978-64	Magic Valley Energy, LLC	62. Appendix 4- Table App4-4, t "For amphibian habitat avoidance, MVE would survey for amphibians and their breeding habitat within 330 feet of all wetlands in the ground disturbance footprint beginning at the outer edge of hydric vegetation and wetland soil. If breeding habitat is occupied, MVE would coordinate with BLM to identify appropriate mitigation measures before construction." MVE Comment: As detailed in comment 43 of this comment letter, [see MVE pdf letter, comment 43 on page 31] MVE contends that this measure should be deleted since the analysis in the DEIS does not demonstrate any impacts that warrant additional mitigation measures beyond the applicant-committed measures that will effectively protect amphibian species.	See response to comment 11978-46 (see in Table A-3aa, Wildlife, including Big Game).
11978-65	Magic Valley Energy, LLC	63. Appendix 4- Table App4-4, u "During all project phases, MVE would avoid anthropogenic disturbance in big game winter range (assumed to be the entirety of the siting corridors) to the fullest extent (per Idaho IB2021-003 [BLM 2020b]). Generally, mule deer and pronghorn are on winter range from November 15-April 30, but specific dates may be adjusted in coordination with the IDFG regional office. If project activities cannot be avoided during the winter season, MVE would coordinate with the BLM and IDFG prior to NTP to develop standard operating procedures and adaptive management practices that isolate disturbance in the project area so that animals can use wintering areas without unnecessary disturbance. MVE would be required to include a phased approach for construction, maintenance, and decommissioning activities to minimize intrusion on the winter and migration seasons. MVE, BLM, and IDFG would use the following factors to evaluate when adjustments to the intensity or location of activities would be required throughout the wintering and migration seasons: 1. Animal presence or absence (i.e., high or low abundance) 2. Animal condition 3. Weather severity 4. Habitat condition and availability 5. Site location 6. Timing 7. Kind and duration of disruptive activity expected (short term vs. longer term) For example, if during winter, animals were present in the siting corridors or were in poor condition, if there was severe weather (especially for a long period), or it was late in the season when energy reserves may be more depleted, then construction in the area would be adjusted to shift the location, duration, or intensity to	Based on available habitat and distribution information and IDFG and BLM observations, it is reasonable to assume that the full project footprint contains important winter habitat for pronghorn and mule deer. Final mitigation measures for the project include seasonal restrictions for construction and decommissioning activities between January 1 and April 15, and a recommendation to avoid maintenance and repair activities between January 1 and April 30 during the operations phase. A variance process for requests to modify these seasonal restrictions and/or other mitigation measures at site-specific locations is outlined in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
		minimize or avoid effects to big game." MVE Comment: MVE requests removal of "assumed to be the entirety of the siting corridors." It is understood that big game individuals could be found throughout the entire Project area, however the Project area does not contain important mule deer wintering areas such as migration stopover areas or migration routes (DEIS Figure 3.18-2) and only partially overlaps with pronghorn migration routes and stopover areas within the Owinza Migration Route (DEIS Figure 3.18-3). If an alternative does not overlap with migration routes or stop over areas, then it should be expected that project activities could continue during the wintering months and impacts could be avoided to big game. Imposing seasonal restrictions on construction in areas outside of the mapped wintering and migration areas would present an undue burden to Project construction and would result in additional environmental impacts by extending the duration of construction over a longer period. Additionally, Idaho IB2021-003 does not require 1) coordination between BLM, IDFG, and MVE regarding standard operating procedures and adaptive management prior to BLM's issuance of a Notice to Proceed (NTP) with construction, or 2) using a "phased approach" for construction, maintenance, and decommissioning activities, since the need for and appropriateness of such measures will be highly situational and may not be possible to determine in advance of the NTP due to construction conditions and weather conditions that may change after the NTP is granted. As such, the phased approach and pre-NTP coordination requirements should be removed. Moreover, Idaho IB2021-003 states that "[f]or transparency, informing the public in NEPA that exceptions and waivers to seasonal restrictions may be granted in certain circumstances may be appropriate." The language in the DEIS does not explicitly state that exceptions or waivers to the restrictions may be authorized in accordance with the terms of Idaho IB2021-003, so MVE recommends that the DEIS measure language be revised to inform the public as suggested in the IB. To incorporate the concepts discussed above and to better match the language from Idaho IB 2021-003, MVE requests that the measure "u" in Table App4-4 be revised to read as follows: "During all project phases, seasonal restrictions within big game winter range typically will apply from November 15 through April 30 each year per IB2021-003 [BLM 2020b]. These dates, as specified, are general in nature and may be adjusted as needed in coordination with the BLM and IDFG. Exceptions and waivers to the seasonal restriction periods may be granted in certain circumstances in accordance with the provisions of BLM 2020b. In considering waivers, modifications, and/or exceptions to seasonal restrictions, the following are examples of factors to be evaluated per BLM 2020b: 1. Animal presence or absence (i.e., high or low abundance) 2. Animal condition 3. Weather severity 4. Habitat condition and availability 5. Site location 6. Timing 7. Kind and duration of disruptive activity expected (short term vs. longer term)"	
11978-66	Magic Valley Energy, LLC	64. Appendix 4- Table App4-4, w "Adaptively manage impacts to big game by supporting long-term telemetry and annual winter counts conducted by IDFG and/or BLM. Use these data to: • Identify, with IDFG, potential pinch points where pronghorn movement may be impacted by the project (especially near the intersection of the project with Highway 24). If pinch points are identified, ensure project fencing in the area allows for big game movement. • Minimize construction traffic volume (if a pinch point is identified) along the route with high game movement, particularly if big game may be migrating to or from their winter range. Focus mitigation efforts and adaptively mange by removing fences, closing roads, reducing speed limits, installing signage, and/or rehabilitating native plants." MVE Comments: a) In order to make this mitigation measure more specific, MVE requests that the introductory language be revised to read as follows: "Adaptively manage impacts to big game by providing funds to purchase up to 20 GPS collars to support long-term telemetry and annual winter counts conducted by IDFG and/or BLM. Use these data to:" (revised portion underlined) b) MVE suggests the following changes to the last bullet point, given that MVE's wildlife friendly fences will support grazing and protection, and BLM manages road closures for the public: Minimize construction traffic volume (if a pinch point is identified) along the route with high game movement, particularly if big game may be migrating to or from their winter range. Focus mitigation efforts and adaptively mange by installing wildlife friendly fencing, reducing speed limits, installing signage, and/or rehabilitating native plants. (revised portion underlined) [see MVE pdf letter, page 43 for underlined text]	Regarding wildlife-friendly fencing, BLM-required measure Y was retained and measure cccc was added: "The BLM would apply more recent fence guidance to BLM fencing handbook H-1741-1 (BLM 1989) [BLM-required measure Y in Table App4-3], such as *A Landowner's Guide to Wildlife Friendly Fences* (Paige 2012). These recommendations include a maximum height (40 inches) and minimum bottom wire height (18 inches) that would facilitate big game passage."
11978-67	Magic Valley Energy, LLC	65. Appendix 4- Table App4-4, aa "MVE would work with owners and operators of communication systems located within and surrounding the project to determine where there is a potential for EMF. Prior to construction of infrastructure that has the potential to result in interference, MVE would work with the owner/operator of the impacted communication system to ensure modifications to the project design, or the communication infrastructure would facilitate the use of the communication without impacts." MVE Comment: This issue is evaluated in DEIS Appendix 3 (Issues Analyzed in Brief), where the analysis commits that mitigation would reduce impacts below significance. MVE requests this language be updated for consistency with the POD and the language in DEIS Appendix 3: "Prior to construction of infrastructure that has the potential to result in significant adverse impacts through EMF, MVE would work with the owner/operator of the impacted communication system to come to a solution." (revised portion underlined)	Measure revised to state, "MVE would work with operators of communication systems located within and surrounding the project to determine where there is a potential for electromagnetic interference (EMI; e.g., impacts to radar, microwave, television, and radio transmissions). Prior to construction, MVE would work with the operator of the potentially impacted communication system to ensure modifications to the project design to reduce potential interference."
11978-68	Magic Valley Energy, LLC	66. Appendix 4- Table App4-4, cc "Fuel storage (for construction, maintenance and decommissioning vehicles and equipment) would be a temporary activity occurring only for as long as is needed to support those activities." MVE Comment: MVE suggests removal of "maintenance," as this measure only applies to construction (and subsequently decommissioning) in the Wind Energy PEIS.	As described in the response to comment 11978-52 (see in Table A-3cc, Mitigation – EIS Appendix 4), BLM (2015) recommends that control and mitigation measures implemented during construction should continue to be implemented during operations. Therefore, no revision is necessary.
11978-69	Magic Valley Energy, LLC	67. Appendix 4- Table App4-4, ee "A paleontological evaluation would be completed prior to decommissioning to determine the potential of material source areas not yet determined (associated with project decommissioning and reclamation) to contain	Revised additional measure (now labeled yy), to clarify the paleontological evaluation would only apply to material source locations that have not been previously evaluated for the project.

Comment ID	Commenter	Public Comment	Response to Comment
		paleontological resources. If deemed necessary, a monitoring and inadvertent discovery plan would be developed to reduce the likelihood of impact to these resources." MVE Comment: MVE requests removal of this measure, as decommissioning of a wind energy development project has a negligible potential for affecting paleontological resources because the decommissioning areas will overlap the construction disturbance areas, which means the resources would have been evaluated and treated by a qualified professional prior to construction (per the mitigation measures as described in Section 5.2.5).	
11978-70	Magic Valley Energy, LLC	68. Appendix 4- Table App4-4, hh "Insecticide use is prohibited except where explicitly authorized by the BLM Field Manager." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter. [see MVE pdf letter, comment 35 on page 26]	MVE Comment 35 is specific to the St. Anthony sand dune tiger beetle and is addressed in the response to comment 11978-38 (see in Table A-3t, Pollinators and Insects). The prohibition of insecticide use without authorization is intended to minimize impacts to all insects and pollinators. The BLM's authority to develop required mitigation for inclusion in the terms and stipulation of a ROW grant are not limited to those impacts are expected to be significant. In the case of the St. Anthony sand dune tiger beetle and other BLM-sensitive species, the BLM has a responsibility to identify and implement proactive mitigation measures that would minimize or avoid impacts before they occur. Therefore, no revisions are necessary.
11978-71	Magic Valley Energy, LLC	48. Appendix 4- Table App4-3, K "MVE would equip aboveground facilities (buildings and other structures where birds could perch or nest) with structures or devices that discourage perching or nesting of raptors and ravens." (BLM 2015 RDF #70) MVE Comment: As RDF #70 in BLM 2015 does not include the words "perch" or "perching," MVE requests removal of these terms in the FEIS to match the language in BLM 2015: "MVE would equip aboveground facilities (buildings and other structures where birds could nest) with structures or devices that discourage nesting of raptors and ravens."	See response to comment 11978-48 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-72	Magic Valley Energy, LLC	69. Appendix 4- Table App4-4, ii "Do not use pesticides known to be toxic to bees or other pollinators. Avoid applying multiple pesticide formulations at one time. Apply pesticides at the lowest legal effective application rate and using targeted application methods. Time pesticide application to avoid pollinator exposure as per McKnight et al. (2018)." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter; [see MVE pdf letter, comment 35 on page 26] however, if this measure will not be removed, the following comment applies: MVE suggests this language be updated to match McKnight et al. 2018: "Do not use pesticides known to be toxic to bees or other pollinators, when at-risk species are present. Avoid applying multiple pesticide formulations at one time. Apply pesticides at the lowest legal effective application rate and using targeted application methods. Time pesticide application to avoid pollinator exposure as per McKnight et al. (2018)." (revised portion underlined)	Measure not edited to include ", when at-risk species are present."
11978-73	Magic Valley Energy, LLC	70. Appendix 4- Table App4-4, jj "Sensitive species surveys (applicant-committed measure 12) would include surveys for presence of sensitive pollinators (i.e., monarch butterfly, Suckley's cuckoo bumble bee, and western bumble bee) from May through October." MVE Comment: MVE requests removal of this measure. Pollinators can migrate/move from one area to another rather easily, which may render survey efforts uninformative. The mitigation measures (applicant-committed. other BLM additional measures, and compensatory mitigation) have already captured strategies to not only protect pollinators, but also provide benefits for the species. These include the lowering speed limits, addition of milkweed surveys, removal of noxious weeds, seeding with desired plant species in an effort to provide a better habitat. Compensatory measures listed in the DEIS such as funding restoration for sensitive plants (Measure II) and funding riparian habitat improvements (Measure VI) effectively serve as measures and compensatory mitigation for pollinators.	This measure has been deleted. Survey requirements for monarch butterfly have been combined with the milkweed survey requirements in measure zz. The preconstruction survey requirements for Suckley's cuckoo bumble bee and western bumble bee have been changed to indicate that these species will be recorded incidentally as part of the WIRS.
11978-75	Magic Valley Energy, LLC	71. Appendix 4- Table App4-4, kk "If it is not possible for MVE to design the project to completely avoid prime farmland and farmland of statewide importance, MVE would minimize or mitigate impacts to prime farmland and farmland of statewide importance as determined by BLM" MVE Comment: MVE notes that wind development is compatible with agricultural use of lands as evidenced by numerous wind facilities that coexist with agricultural areas (both croplands and grazing lands) throughout the U.S. and elsewhere. Additionally, the Project will not result in permanent impacts to prime farmland or farmland of statewide importance since MVE will reclaim temporary disturbances after construction in accordance with our postconstruction reclamation requirements and MVE will have a bonded post-decommissioning reclamation plan in place that will ensure the land will remain suitable for agricultural use at the end of the Project life. As such, the Project's extensive reclamation requirements will sufficiently minimize and mitigate all impacts to prime farmland and farmland of statewide importance, and as such, no additional mitigation is needed. Moreover, prime farmland and farmland of statewide importance mapping layers provided to the BLM all carried the designation "if irrigated", and MVE noted in our review that these areas do not appear to be irrigated in any locations where they overlap with the Project siting corridors. It seems likely that actually irrigating these lands and using them for agricultural production would have the potential for significant environmental impacts in terms of water usage and surface disturbance impacts to sensitive biological and cultural resources, which would require detailed NEPA review by BLM prior to any such activities being undertaken. Based on the foregoing, MVE proposes that this measure be deleted in the FEIS and a note added in the FEIS Issues Analyzed in Brief section specifying that MVE's postconstruction and post- decommissioning reclamation plans will be sufficient to mitigate all impacts to these farmland types.	This measure supports the AIB-34 analysis rationale. Measure not edited.
11978-76	Magic Valley Energy, LLC	72. Appendix 4- Table App4-4, ll "Construction, maintenance, and decommissioning activities would not be performed during periods when the soil is too wet to adequately support equipment. If such equipment creates	Requested edit not made. This is now measure hhh in the final EIS.

Comment ID	Commenter	Public Comment	Response to Comment
		ruts in excess of 5 inches deep. The soil would be deemed too wet to adequately support it." MVE Comment: MVE requests this language be updated as follows to allow the use of rigid matting if needed to provide a stabilized surface on which to operate equipment while preventing rutting of the surface: "Construction, maintenance, and decommissioning activities would not be performed during periods when the soil is too wet to adequately support equipment. If such equipment creates ruts in excess of 5 inches deep for 100 feet, rigid matting may be used to create a stable pathway until soils are able to adequately support equipment. Otherwise, the soil would be deemed too wet to adequately support it." (revised portion underlined)	
11978-77	Magic Valley Energy, LLC	73. Appendix 4- Table App4-4, mm "MVE would evaluate whether project construction activities and infrastructure could occur outside of 0.75-mile of potential and occupied St. Anthony sand dune tiger beetle habitat. Where it is not possible to avoid these areas, field surveys would be conducted and project construction would avoid new identified or potential or occupied habitat to the extent feasible allowing for access along existing roads. Avoid fragmenting habitats with roads within 0.75 miles of occupied tiger beetle habitat to allow for dispersal. Minimize new infrastructure and the density of infrastructure near dune complexes." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter. [see MVE pdf letter, comment 35 on page 26] In addition, MVE's applicant-committed measures provide equivalent or better protections to the species, and any additional measures are unnecessary. As such, MVE requests that this measure be removed from the FEIS on either premise. However; if this measure will not be removed, the following comment applies: MVE requests changing the language for consistency with the measures described in DEIS Section 3.11.2.2.2: "MVE would evaluate whether project construction activities and infrastructure could occur outside of 0.75-mile of good or occupied St. Anthony sand dune tiger beetle habitat. Where it is not possible to avoid these areas, field surveys would be conducted and project construction would avoid occupied habitat to the extent feasible allowing for access along existing roads. Avoid fragmenting habitats with roads within 0.75 miles of occupied tiger beetle habitat to allow for dispersal. Minimize new infrastructure and the density of infrastructure near dune complexes." (revised portion underlined)	Requested edit not made. The BLM has revised this measure since the draft EIS.
11978-78	Magic Valley Energy, LLC	74. Appendix 4- Table App4-4, nn "Limit construction personnel walking across sand dunes." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter. [see MVE pdf letter, comment 35 on page 26]	As stated in Section 2.1.C of the BLM Mitigation Manual (BLM 2021), "The BLM will identifies and considers mitigation to address impacts to resources in NEPA analyses for proposed public land uses, and, as appropriate, requires mitigation to address impacts to resources in the associated decision documents and land use authorizations ([Manual] Chapter 6 and [Manual] Chapter 7). The BLM will identify, consider, and, as appropriate, require mitigation, to address reasonably foreseeable impacts, whether or not the impacts are "significant" (as defined by 40 CFR 1508.1). The BLM has authority to require appropriate mitigation under a variety of authorities, including FLPMA (Manual Section 1.3)."
11978-79	Magic Valley Energy, LLC	75. Appendix 4- Table App4-4, oo "MVE would avoid disturbance to known BLM-listed sensitive plant individuals and habitat. If BLM, in coordination with MVE, determines that avoidance of all sensitive plant locations is not achievable the BLM would determine if MVE can proceed with construction, maintenance, or decommissioning activities after considering the species present and the type and intensity of the activity planned in the specific location. If disturbance and impact to the special-status species is expected to contribute to a population decline resulting in a trend to federal listing under the ESA, the activity would not be authorized until mitigation measures would be sufficient to reverse this trend. If it would result in a loss in individual plants or population viability that would not be expected to contribute to a trend to federal listing, mitigation stated in applicant- committed measure 107 would be required prior to proceeding." MVE Comment: MVE requests the addition of a time limit for a BLM response in order to prevent costly construction delays that could also result in higher environmental impacts due to prolonged construction. The revised measure would read as follows: "MVE would avoid disturbance to known BLM-listed sensitive plant individuals and habitat. If BLM, in coordination with MVE, determines that avoidance of all sensitive plant locations is not achievable the BLM would determine if MVE can proceed with construction, maintenance, or decommissioning activities after considering the species present and the type and intensity of the activity planned in the specific location. If disturbance and impact to the special-status species is expected to contribute to a population decline resulting in a trend to federal listing under the ESA, the activity would not be authorized until mitigation measures would be sufficient to reverse this trend. For any mitigation proposal submitted by MVE, the BLM would review the proposal and either request additional information or provide authorization within 10 days; mitigation proposals for which no response is received within 10 days would be deemed approved. If it would result in a loss in individual plants or population viability that would not be expected to contribute to a trend to federal listing, mitigation stated in applicant- committed measure 107 would be required prior to proceeding." (revised portion underlined)	No revision made to this measure. The BLM and MVE review and response timeframes and responsibilities are included in the Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]).
11978-80	Magic Valley Energy, LLC	76. Appendix 4- Table App4-4, pp "MVE would work with FAA to adjust turbine height or micro siting as needed to avoid impacts to Jerome Airport airspace." MVE Comment: MVE requests updating this measure language to reflect that there is a wide range of mechanisms by which the Project may address airspace concerns in accordance with FAA regulations: "MVE would work with FAA as needed to ensure that the Project is designed to meet FAA regulations with respect to Jerome Airport airspace."	Revision incorporated.
11978-81	Magic Valley Energy, LLC	77. Appendix 4- Table App4-4, xx "Use of dull gray porcelain or polymer insulators to reduce insulator visibility." MVE Comment: MVE requests removal of this measure, as insulators will not have a noticeable effect on the visual resources given the insulators will not be a prominent visual element in the viewscape. Glass insulators offer benefits such as longer lifespan - which may eliminate the need to replace insulators during the life of the	This measure was removed.

Comment ID	Commenter	Public Comment	Response to Comment
		Project, which can prevent or minimize operation and maintenance disturbances. Additionally, glass insulators already occur on transmission line infrastructure in existing rights-of-way that extend through the Project area.	
11978-82	Magic Valley Energy, LLC	78. Appendix 4- Table App4-4, aaa "If necessary to install project infrastructure in wetlands or drainages (including ephemeral channels), installation would occur during dry periods or if areas are wetted, and if dewatering is needed, it would occur in well vegetated areas. Buried collector lines would route around wetlands; overhead collector lines may cross wetlands." MVE Comment: MVE previously discussed wetland measures with BLM and added Applicant- Committed Measures 117, 120, and 122 (among MVE's other measures 117 through 134 to protect wetlands and water quality) to the POD. These Applicant-Committed Measures address the wetland protections that we understand BLM intended to ensure with Table App4-4 item aaa. As such, we request that BLM remove this measure from the FEIS.	See additional project-specific measure www which includes more specific requirements for construction, where avoidance of wetlands is not possible, that are not addressed in MVE's applicant-committed measures. No revisions are necessary.
11978-83	Magic Valley Energy, LLC	79. Appendix 4-Table App4-5. MVE Comment: As a comment globally applicable to each compensatory mitigation measure listed in Table App4-5, MVE proposes that BLM add an option for MVE to satisfy the mitigation measure by contributing to a mitigation fund by which the mitigation for that resource would be accomplished by a third party.	Added "Table App4-5 describes compensatory mitigation options. These options are not meant to limit compensatory mitigation measures; in the future, the BLM and MVE may consider other measures not listed in Table App4-5." to the first paragraph before Table App4-5.
11978-84	Magic Valley Energy, LLC	80. Appendix 4-Table App4-5, I "If postconstruction carcass monitoring (mitigation measure VII), IDFG telemetry data, and/or annual winter counts indicate impacts to big game or avoidance of the area by big game, then consider the following: • Fence removal or modification and habitat enhancement in areas inside but as well as immediately adjacent to the project area. • If big game movement across Highway 24 becomes more concentrated and/or wildlife-vehicle collisions increase after the project begins, add measures that would reduce mortalities, e.g. sensors that would detect animals approaching the highway and warn drivers. • Improve big game winter habitat south of the project area by planting sagebrush and bitterbrush, treating invasive annual grasses with herbicide, and seeding perennial grass. • Modify or remove existing fences within the Smokey-Boise and/or Big Desert- Mountain Valley Complex Secretarial Order 3362 Priority Areas. • Plant or seed shrubs such as bitterbrush and sagebrush on winter ranges that are currently limited in browse or shrub cover. • Could augment current/ongoing fire rehabilitation or restoration efforts nearby or in other important areas within the Smokey-Boise and Big Desert-Mountain Valleys SO3362 priority areas. • Control noxious or invasive weeds on winter range." MVE Comment: Regarding collisions on Highway 24, collisions could be increased by a number of factors, such as variability in population numbers or population density in a given area, residential development, weather, food source availability, etc. Therefore, it would not be logical to attribute all increases in collisions to the Project. MVE requests specification of this measure: "If post- construction carcass monitoring (mitigation measure VII), IDFG telemetry data, and/or annual winter counts demonstrate Project-caused impacts to big game or Project-caused avoidance of the area by big game that is expected to contribute to a population decline resulting in a trend to federal listing under the ESA, then consider the following…" (revised portions underlined)	This request was not incorporated into the mitigation measures, as the threshold of "contribute to a population decline resulting in a trend to federal listing under the ESA" is inappropriate for species with local population concerns. Pronghorn and mule deer populations range across the western United States, and contribution of a single project would be unlikely to contribute to population losses to the degree at which listing under the ESA would be warranted. As such, the request is not an appropriate metric with which to trigger the need for compensatory mitigation to address local population losses that may result from the project.
11978-85	Magic Valley Energy, LLC	81. Appendix 4- Table App4-5, II "If MVE determines avoidance of sensitive plants is not feasible, construction would be allowed to proceed, and MVE would fund restoration at degraded population sites in coordination with BLM." MVE Comment: Since effects to individual plants or small stands of plants would not be expected to have population-level effects or warrant mitigation, MVE requests this measure specify that compensatory mitigation is required only when the Project has a negative effect on species populations: "If MVE determines avoidance of sensitive plants is not feasible, construction would be allowed to proceed in coordination with BLM. If the Project impacts are expected to contribute to a population decline resulting in a trend to federal listing under the ESA, MVE would fund restoration at degraded population sites at a 1:1 ratio in coordination with BLM."	This measure has been combined into additional measure kkk: "MVE would avoid disturbance to known BLM special-status plant individuals and habitat. If BLM determines that avoidance of all special-status plant locations is not achievable, the BLM would determine whether MVE can proceed with construction, maintenance, or decommissioning activities after considering the species present and the type and intensity of the activity planned in the specific location. If disturbance and impact to the BLM special-status species would occur, BLM would require MVE to complete: • Seed collection and banking from the impacted population(s). • Plant propagation with a portion of the seed collected, and out-planting to suitable reclaimed areas and other habitat in the area. MVE would implement these measures as directed by the BLM, following BLM (2008b)."
11978-86	Magic Valley Energy, LLC	82. Appendix 4- Table App4-5, III "Purchase or acquire through exchange lands with existing tiger beetle habitats or dunes occurring on private or state lands. Opportunities may occur off-site, such as the dune areas north of Lake Walcott between Rupert and American Falls, Idaho." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter; [see MVE pdf letter, comment 35 on page 26] however, if this measure will not be removed, the following comment applies: MVE has requested above that Table App4-4 additional mitigation measure mm be worded as follows: "MVE would evaluate whether project construction activities and infrastructure could occur outside of 0.75-mile of good or occupied St. Anthony sand dune tiger beetle habitat. Where it is not possible to avoid these areas, field surveys would be conducted and project construction would avoid occupied habitat to the extent feasible allowing for access along existing roads." Given that Table App4-4 additional mitigation measure mm would adequately protect good and occupied tiger beetle habitat by siting infrastructure outside of a standard 0.75-mile radius, compensatory mitigation does not seem warranted unless the Project causes population level impacts by creating new surface disturbance to good or occupied tiger beetle habitat. As such MVE requests that measure III be changed to read, "If the Project causes population level impacts via new surface disturbance to good or occupied habitat, MVE will purchase or acquire through exchange lands with existing tiger beetle habitats or	See response to comment 11978-38 (see in Table A-3t. Pollinators and Insects). This additional measure (formerly "mm", now "iii") has been revised to "If placement of infrastructure or construction activities within 0.75-mile of potential St. Anthony sand dune tiger beetle identified in WEST (2020) cannot be avoided, MVE would conduct pre-construction field verification surveys following the same methodology described in WEST (2020). Surveys must occur during the appropriate detection window (April through June). No construction activities or infrastructure would be allowed within occupied St. Anthony sand dune tiger beetle habitat; avoid fragmenting habitats with new roads within 0.75 mile of occupied tiger beetle habitat to allow for dispersal, allowing for access along existing roads. Minimize new infrastructure and the density of infrastructure near occupied tiger beetle habitat. MVE would be required to consult with BLM on measures to minimize impacts to tiger beetles and their habitat." The final EIS states: "With the implementation of applicant-committed measures and additional mitigation, including avoidance of occupied habitat (see EIS Appendix 4), impacts to St. Anthony sand dune tiger beetle would be largely minimized or avoided. If during site-specific project design the BLM and MVE determine complete avoidance of potential habitat is not feasible, compensatory mitigation measures (see Table App4-5 in EIS Appendix 4) would be warranted and could include the following:

Comment ID	Commenter	Public Comment	Response to Comment
		dunes occurring on private or state lands. Opportunities may occur off-site, such as the dune areas north of Lake Walcott between Rupert and American Falls, Idaho."	• Measure II: Purchase or acquire through exchange lands with existing tiger beetle habitats or dunes occurring on private or state lands. Opportunities may occur off-site, such as the dune areas north of Lake Walcott between Rupert and American Falls, Idaho. • Measure III: Treat noxious or invasive weeds (i.e., cheatgrass, Russian thistle, others) in or adjacent to dunes/dune complexes to reduce undesirable/nonnative vegetation cover on dunes. • Measure IV: Where dunes have been previously stabilized by perennial grass seedings, consider chemical treatment or other disturbance to reduce grass cover to foster tiger beetle habitat and restore the natural integrity of dune complexes."
11978-87	Magic Valley Energy, LLC	83. Appendix 4- Table App4-5, IV "Treat noxious or invasive weeds (i.e., cheatgrass, Russian thistle, others) in or adjacent to dunes/dune complexes to reduce undesirable/nonnative vegetation cover on dunes." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter; [see MVE pdf letter, comment 35 on page 26] however, if this measure will not be removed, the following comment applies: As discussed above, given that the revised version of Table App4-4 additional mitigation measure mm would adequately protect good and occupied tiger beetle habitat by siting infrastructure outside of a standard 0.75-mile radius, compensatory mitigation does not seem warranted unless the Project causes population level impacts by creating new surface disturbance to good or occupied tiger beetle habitat. As such, MVE requests that measure IV be changed to read: "If the Project causes population level impacts via new surface disturbance to good or occupied habitat, MVE will treat noxious or invasive weeds (i.e., cheatgrass, Russian thistle, others) in or adjacent to dunes/dune complexes to reduce undesirable/nonnative vegetation cover on dunes."	See response to comment 11978-86 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11978-88	Magic Valley Energy, LLC	84. Appendix 4- Table App4-5, V "Where dunes have been previously stabilized by perennial grass seedings, consider chemical treatment or other disturbance to reduce grass cover to foster tiger beetle habitat and restore the natural integrity of dune complexes." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 35 in this comment letter; [see MVE pdf letter, comment 35 on page 26] however, if this measure will not be removed, the following comment applies: As discussed above, given that the revised version of Table App4-4 additional mitigation measure mm would adequately protect good and occupied tiger beetle habitat by siting infrastructure outside of a standard 0.75-mile radius, compensatory mitigation does not seem warranted unless the Project causes population level impacts by creating new surface disturbance to good or occupied tiger beetle habitat. As such, MVE requests that measure IV be changed to read, "If the Project causes population level impacts via new surface disturbance to good or occupied habitat, where dunes have been previously stabilized by perennial grass seedings, MVE will consider chemical treatment or other disturbance to reduce grass cover to foster tiger beetle habitat and aid in the restoration of the dune complexes.	See response to comment 11978-86 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11978-89	Magic Valley Energy, LLC	85. Appendix 4-Table App4-5, VI "Contribute to riparian habitat improvement project to improve bat foraging habitat." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 in this comment letter; [see MVE pdf letter, comment 18 on page 13] however, if this measure will not be removed, the following comment applies: MVE suggests changing to: "Contribute funds to riparian habitat improvement projects to improve bat foraging habitat." (revised portion underlined)	See response to comment 11978-116 (see in Table A-3b. Bats). Minor text revision made.
11978-90	Magic Valley Energy, LLC	87. Appendix 4-Table App4-5, VIII "Contribute funds to assist with research on white nose syndrome and vaccination against white nose syndrome." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 in this comment letter; [see MVE pdf letter, comment 18 on page 13] however, if this measure will not be removed, the following comment applies: Such contributions would only seem warranted in the event that the Project causes population-level impacts that could result in a trend toward federal listing. MVE proposes that the measure be revised to read as follows: "If Project impacts cause a population decline resulting in a trend toward federal listing under the ESA, MVE will contribute funds to assist with research on white nose syndrome and vaccination against white nose syndrome."	The measures listed in "Types of Mitigation Actions" (see Mitigation Framework for Birds and Bats in EIS Appendix 4) are examples of the types of compensatory mitigation measures that may be considered for bats. The TAC will be responsible for reviewing the results of postconstruction fatality monitoring and recommending compensatory mitigation measures, as warranted, based on the best available science and technology at that time. EIS Section 3.3.1.4 (Bat Populations and Roosting Habitat, Compensatory Mitigation) states that compensatory mitigation would be required, if adaptive management measures do not reduce fatalities below the adaptive management threshold. The adaptive management threshold would be developed by the TAC and would be based on species' population trends and current meta-analysis of wind energy impact on birds and bats.
11978-91	Magic Valley Energy, LLC	88. Appendix 4-Table App4-5, IX "Construct and maintain artificial nesting platforms for ferruginous hawks in appropriate habitats off-site." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 21 in this comment letter; [see MVE pdf letter, comment 21 on page 19] however, if this measure will not be removed, the following comment applies: Such measures would only seem warranted in the event that the Project causes population-level impacts that could result in a trend toward federal listing. Additionally, MVE does not have expertise in constructing and maintaining nesting platforms. As such, MVE proposes that the measure be revised to read as follows: "If Project impacts cause a population decline resulting in a trend toward federal listing under the ESA, MVE will contribute funds to construct and maintain artificial nesting platforms for ferruginous hawks in appropriate habitats off-site."	See responses to comments 11978-83 (see in Table A-3cc, Mitigation – EIS Appendix 4) and 11978-90 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-92	Magic Valley Energy, LLC	89. Appendix 4-Table App4-5, X "Construct and maintain artificial nest burrows for burrowing owls in appropriate habitats off- site." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 21 in this comment letter; [see MVE pdf letter, comment 21 on page 19] however, if this measure will not be removed, the following comment applies: Such measures would only seem warranted in the event that the Project causes population-level impacts that could result in a trend toward federal listing. Additionally, MVE does not have expertise in constructing or maintaining artificial burrows. As such, MVE proposes that the	See responses to comments 11978-83 (see in Table A-3cc, Mitigation – EIS Appendix 4) and 11978-90 (see in Table A-3cc, Mitigation – EIS Appendix 4).

Comment ID	Commenter	Public Comment	Response to Comment
		measure be revised to read as follows: "If Project impacts cause a population decline resulting in a trend toward federal listing under the ESA, MVE will contribute funds to construct and maintain artificial nesting burrows for burrowing owls in appropriate habitats off-site."	
11978-93	Magic Valley Energy, LLC	90. Appendix 4-Table App4-5, XI "Consider measures for other special-status species and other species of concern, as determined through postconstruction monitoring." MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 21 in this comment letter. [see MVE pdf letter, comment 21 on page 19] Additionally, the primary affected resource listed in the table for this measure is avian and bat species. MVE notes that the Project's BBCS (POD Appendix M) is applicable to other special-status avian and bat species and provides detailed procedures for conducting postconstruction monitoring and adaptive management requirements, which include additional avoidance, minimization, and compensation measures applicable to other special status avian and bat species. Measure XI is therefore redundant with the BBCS requirements. As such, MVE requests that this measure be removed from the FEIS on either premise.	This measure clarifies that the TAC may recommend, and the BLM Authorized Officer may require, compensatory mitigation for any special-status avian species (not just those discussed in the EIS or BBCS) if postconstruction monitoring indicates such measures are warranted. Therefore, no revision is necessary.
11978-94	Magic Valley Energy, LLC	91. Appendix 4-Table App4-5, XIII "If impacts to sensitive plants during ground-disturbing activities cannot be avoided, MVE would implement the following: • Seed collection and banking from impacted population(s). • Plant propagation with a portion of the seed collected, and out-planting to suitable reclaimed areas and other habitat in the area. • A comprehensive weed treatment plan. Conserving a currently unprotected occurrence of these plant species, including a conservation easement and funding to manage the species in perpetuity, would be considered where the above measures are not feasible, and it is appropriate for the species." MVE Comment: Compensatory Mitigation Measure II already captures the essence of this compensatory mitigation goal, as funding through Compensatory Mitigation Measure II can be used to complete the objectives stated. In addition, when evaluated in conjunction with applicant- committed measures, additional mitigation measures, and Compensatory Mitigation Measure II, any residual impacts would be negligible. Requiring a conservation easement and funding in perpetuity does not follow the BLM's mitigation principles, which call for mitigation measures to be commensurate with the level of impact to the environmental resource. MVE requests that this measure be removed in the FEIS.	See response to comment 11978-85 (see in Table A-3cc, Mitigation – EIS Appendix 4).
11978-95	Magic Valley Energy, LLC	92. Appendix 4-Table App4-5, XIV "MVE would fund the design and preparation of an ethnographic study and report related to Minidoka National Historic Site. This would be accomplished in close coordinate with Japanese American Stakeholders and the National Park Service." MVE Comment: The Table App4-5 mitigation measures are described in the DEIS as compensatory mitigation measures that could be applied to alternatives if significant impacts are expected to remain after applicant-committed measures, required mitigation, and additional avoidance and minimization measures are implemented. Ethnographic information would be part of the context provided in the cultural resource surveys and potentially the Historic (Properties Management Plan) to be prepared as part of the National Historic Preservation Act (NHPA) Section 106 consultation process. A Programmatic Agreement (PA) is currently being prepared by the Section 106 Consulting Parties that will set forth the process to be followed in executing the Section 106 process for the Project. Certain actions to be carried out under the PA, such as cultural resources field surveys and reporting, will not be completed until after the BLM's record of decision is issued. As such, the need for this mitigation measure (DEIS Table App4-5, item XIV) would not be known until after the BLM's Record of Decision is issued. As such, MVE requests that this measure be removed in the FEIS, and the need for ethnographic information would be addressed in the Section 106 process to prevent the potential for conflicting requirements.	Compensatory Mitigation Measures VI and VII were updated in the final EIS, per coordination with the BLM, based on draft EIS comments regarding ethnographic studies not being an acceptable form of mitigation.
11978-96	Magic Valley Energy, LLC	93. Appendix 4-Table App4-5, XV "MVE would fund the design and preparation of an ethnographic study and report related to Shoshone-Bannock Tribes and Shoshone-Paiute Tribes. This would be accomplished in close coordinate with these Native American Tribes." MVE Comment: As discussed in the comment above, the need for this mitigation measure (DEIS Table App4-5, item XV) would not be known until later in the Section 106 consultation process after the BLM's Record of Decision is issued. As such, MVE requests that this measure be removed in the FEIS, and the need for ethnographic information would be addressed in the Section 106 process to prevent the potential for conflicting requirements.	Compensatory Mitigation Measures VI and VII were updated to remove potential ethnographic studies.
11978-97	Magic Valley Energy, LLC	94. Appendix 4-Table App4-5, XVI "MVE would establish a fund to be used based on recommendations from a committee that would be established and comprise Minidoka NHS stakeholders with an emphasis on including representatives of Japanese American organizations. Recommendations from the committee would focus on enhancing the fundamental values of Minidoka NHS so that it will continue to provide opportunities for commemoration and healing through pilgrimages and provide opportunities for bettering humanity as a site of conscience. Recommendations from the committee may include but are not limited to the following: • Establishing conservation easements to preserve the visual character of the surrounding landscape • Removal of existing visual intrusions within close proximity to Minidoka NHS that take away from meeting its fundamental values Increasing access to pilgrimages and educational materials that provide a better understanding of the history associated with Minidoka NHS." MVE Comment: All mitigation measures, including compensatory mitigation measures, that are built around protections for cultural resources would be most appropriately addressed in the Section 106 process through the Programmatic Agreement, Historic Properties Management Plan, or Historic Preservation Treatment Plans to avoid conflicting management requirements. MVE requests that this measure be deleted in the FEIS and left to be addressed through the Section 106 process.	Also see response to comment 11978-95 (see in Table A-3cc, Mitigation – EIS Appendix 4). The EIS text in Section 3.5.3 (Programmatic Agreement) clarifies that the PA specifies potential avoidance, minimization, and mitigation measures and where avoidance would not eliminate adverse effects, final measures for minimization or mitigation of adverse effects would be included in an HPMP and HPTPs for specific properties, which would be developed pursuant to the stipulations of the PA. The measures listed in Alternative B with the Additional Measures portions of Section 3.5.4.2.2 and Section 3.5.5.2.2, are mitigation that the BLM would apply to Alternative B and are applicable to other resources (not only cultural resources); these measures will remain in the final EIS. The stipulations listed in EIS Section 3.5.3 that the "BLM would ensure the design of the project includes" have been removed from the final EIS, consistent with PA version updates beyond the draft EIS. The BLM's priority for treatment of adverse effects to historic properties is avoidance, minimization, mitigation. Mitigation should be commensurate with the nature of the adverse effect. Where such mitigation would not adequately resolve adverse effects, and would result in residual impacts to the affected communities (Japanese American and Minidoka-connected communities and Tribes), compensatory mitigation can be applied. The compensatory mitigation text in Section 3.5.5.4 in Cultural Resources was updated to include a sentence clarifying that similar to development of measures to avoid, minimize, or mitigate non-physical impacts to cultural resources under the HPMP as part of the project's PA, compensatory mitigation measures (should the BLM

Comment ID	Commenter	Public Comment	Response to Comment
			determine these are warranted), would be developed and implemented through the Section 106 consultation process under the HPMP, under the PA.
11978-114	Magic Valley Energy, LLC	16. Section 3.03.1.2.2 - Bat Populations “Using data collected during post- construction monitoring, MVE would develop curtailment strategies in coordination with the BLM, USFWS, IDFG, and Idaho Governor’s Office of Species Conservation (OSC) (applicant-committed measure 158).” MVE requests changing existing language to better capture postconstruction curtailment and monitoring strategies: “If needed to further reduce fatalities, MVE would use the data collected during postconstruction monitoring to develop curtailment strategies to avoid population-level impacts to species of concern in coordination with the BLM, USFWS, IDFG, and Idaho Governor’s Office of Species Conservation (OSC) (applicant-committed measure 158).”	Mitigation measures related to curtailment have been revised and clarified in the final EIS; therefore, the requested revision is no longer necessary.
11978-115	Magic Valley Energy, LLC	17. Section 3.03.1.2.2 - Bat Populations “The curtailment strategy would describe the type and number of detection devices required for successful implementation and would include an adaptive management framework that identifies how fatalities would be monitored and when adjustments would be necessary to further reduce fatalities.” MVE requests the FEIS should state the following to align with the POD: “The curtailment strategy would describe the type and number of detection devices required for successful implementation and would include an adaptive management framework that identifies how fatalities would be monitored and when adjustments would be necessary to further reduce fatalities. Alongside the implementation of other mitigation strategies, the cost effectiveness of curtailment strategies will be taken into consideration when evaluating their potential viability.”	References to MVE’s BBCS have been provided in this section, and it is not necessary to repeat these details here. This language is also included in the full mitigation measure (applicant-committed measure 158) in EIS Appendix 4 (Mitigation).
11978-146	Magic Valley Energy, LLC	48. Appendix 4- App4-2c, #23 “Where practical, lighting at both the operation and maintenance facilities and substations located within 0.5 mile of the turbines would include at a minimum the following: Lights with motion or heat sensors and switches would be used to keep lights off when not required. Outdoor facility lighting would be designed with light caps and/or directed downward to minimize off-site glare. The use of high-intensity lighting, steady- burning lights, or bright lights such as sodium vapor, quartz, halogen, or other bright spotlights would be minimized. All internal turbine nacelle and tower lighting would be extinguished when unoccupied. Turbine doors would not have exterior lights installed at the entrance.” MVE is noting that exterior lighting of turbine doors is a required safety feature. To accommodate this, MVE suggests changing the language to: “Where practical, lighting at both the operation and maintenance facilities and substations located within 0.5 mile of the turbines would include at a minimum the following: Lights with motion or heat sensors and switches would be used to keep lights off when not required. Outdoor facility lighting would be designed with light caps and/or directed downward to minimize off-site glare. The use of high-intensity lighting, steady-burning lights, or bright lights such as sodium vapor, quartz, halogen, or other bright spotlights would be minimized. All internal turbine nacelle and tower lighting would be extinguished when unoccupied. The exterior lights at turbine entrance doors will be turned off unless they are needed for safe entrance/exit to the turbine or for O&M activities. Exterior turbine entrance door lights will be operated by a switch, motion detector, or remotely through the SCADA system.”	Applicant-committed measure 23 in Table App4-2c has been revised as requested.
11978-147	Magic Valley Energy, LLC	49. Appendix 4- App4-2e, #34 “Roads negatively affected by construction would be returned to preconstruction condition.“ This measure should be deleted as it is covered more aptly in measure #39, which further matches the language in the POD: All existing public roads that are used or improved by MVE during the course of construction would be left in a condition that is as good as or better than their condition when the construction period begins. Roadways identified for use would be videotaped and accompanied by supporting notes prior to construction.	Edit made as requested.
11978-148	Magic Valley Energy, LLC	50. Appendix 4- App4-2e, #35 “Where road intersection improvements would be required to accommodate extra-long vehicles, potential upgrades could include placement of relocating signs, placement of temporary paving, and use of flaggers, as needed. Upon completion of construction, most intersection improvements would be restored to a condition sufficient for the operations phase of the project. Intersection improvements would be re-established during the operation and maintenance phase, as needed, to accommodate large equipment (for example, replacing a wind turbine blade).” This measure should be modified to match the language in the POD: “Where road intersection improvements would be required to accommodate extra-long vehicles, potential upgrades could include placement of relocating signs, placement of temporary paving, and use of flaggers, as needed. Upon completion of construction, some intersection improvements would be restored to a condition sufficient for the operations phase of the project. Intersection improvements would be re-established during the operation and maintenance phase, as needed, to accommodate large equipment (for example, replacing a wind turbine blade).”	Edit made as requested.
11978-150	Magic Valley Energy, LLC	52. Appendix 4- App4-2h, #72 “Construction vehicles (trucks, bulldozers, etc.), helicopters (if required), and equipment (pumps, generators, etc.) would be fueled and serviced in designated areas that are flat.” This measure should be removed, as it has been updated. and is now accurately addressed in Applicant-Committed mitigation measure #134: “Construction vehicles (trucks, bulldozers, etc.), helicopters (if required), and equipment (pumps, generators, etc.) generally would be fueled and serviced in designated areas. Refueling locations would generally be flat. Fueling or refueling would not occur within 50 feet of a wetland or watercourse. Every effort would be made to minimize the threat of a fuel spill during refueling and servicing and secondary containment measures would be located at all fuel handling areas.”	This is now applicant-committed measure 71 in Table App4-2g and has been combined with the draft EIS applicant-committed measure 134 referred to in this comment.

Comment ID	Commenter	Public Comment	Response to Comment
11978-151	Magic Valley Energy, LLC	53. Appendix 4- App4-2m, #122 “Roadside ditches and culverts would be used to prevent ponding of runoff storm water and to minimize erosion of aggregate road base where needed. If culverts or drainage crossings are needed, they would be designed for a 25-year or greater storm frequency, without the development of a static head at the pipe inlet.“ The requirement to design culverts or drainage crossings without the development of a static head at the pipe inlet would cause unnecessary additional disturbance because of larger pipes and/or a greater number of pipes that would be needed to convey water flow, and is not typical for this type of engineering design. MVE requests this measure be updated to match the language in the POD, which already details MVE’s efforts to meet the BLM standards and those of cooperating agencies: “MVE will implement the applicable U.S. Army Corps of Engineers (USACE), Idaho Department of Water Resources (IDWR), and BLM standards (e.g., erosion and sediment control measures, culverts sized in accordance with USACE and BLM standards, etc.) for all road crossings or other work in wetlands or waters to ensure protection of water quality and to maintain the hydrology of affected areas.” “The roadway grade and culvert size should be balanced to avoid head and velocity damage.”	The measure was updated to reflect both the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]), which specifies the 25-year design, and the Stormwater Pollution Prevention Plan (Appendix D in MVE [2023]), which describes MVE’s efforts, as mentioned by the commenter.
11978-152	Magic Valley Energy, LLC	54. Appendix 4- App4-2m, #126 “Where practical, MVE would avoid altering existing drainage systems in sensitive areas such as erodible soils or steep slopes.” MVE requests an edit to the table to match the language in the POD: “Where practical, MVE would avoid altering existing drainage systems in sensitive areas such as erodible soils or steep slopes, with considerations given to such scenarios as road design and safety.”	Edits made as requested.
11978-153	Magic Valley Energy, LLC	55. Appendix 4- App4-2m, #127 “Where practical, access roads would be designed so that changes to surface water runoff are avoided and erosion is not initiated.” MVE requests an edit to the table to match the language in the POD: “Access roads will be designed so that changes to surface water runoff are avoided and erosion is not initiated. If changes to surface water runoff cannot be avoided, design features will be implemented to minimize impacts.”	Edits made as requested.
11978-154	Magic Valley Energy, LLC	56. Appendix 4- App4-2n, #135 “Scientifically rigorous avian and bat use surveys would be conducted; the amount and extent of ecological baseline data required would be determined by BLM. Full study plans and methodologies, as approved by the requisite state/federal agencies, would be implemented to characterize the existing resource conditions in the Project area.” This measure should be removed as biological studies, study plans, and methodologies have already been conducted and completed. Removing this measure will avoid any confusion with preconstruction requirements.	This applicant-committed measure has been removed from Table App4-2n.
11978-155	Magic Valley Energy, LLC	57. Appendix 4- App4-2n, #136 “Riparian areas would be avoided to the extent practical; however, full avoidance may not be practical.” MVE requests an edit to the table to match the language in the POD: “100-foot no-ground-disturbance buffer would be applied to all wetlands, streams, and riparian areas. If disturbance to such areas cannot be avoided, MVE would prepare site-specific plans and measures (e.g., erosion and sediment control measures, culverts sized in accordance with USACE and BLM standards, etc.) to mitigate impacts.”	Applicant-committed measure 136 in Table App4-2n has been deleted. This measure is duplicative of applicant-committed measure 136 in Table App4-2m.
11978-156	Magic Valley Energy, LLC	58. Appendix 4- App4-2n, #137 “A bird and bat conservation strategy and an environmental construction and compliance monitoring plan would be drafted to avoid and minimize effects to birds and bats.” The Construction Monitoring Plan (CMP; Appendix P) is more applicable here than the Environmental Compliance Monitoring Plan (ECMP; Appendix Q): “A bird and bat conservation strategy and a construction monitoring plan would be drafted to avoid and minimize effects to birds and bats.”	Added the Construction Monitoring Plan to the measure.
11978-157	Magic Valley Energy, LLC	59. Appendix 4- App4-2n, #138 “Turbines would be sited to minimize impacts to birds and bats through the following features: • No turbines would occur within 2.0 miles of an occupied golden eagle nest. • No turbines would occur within 1 mile of an occupied ferruginous hawk nest. • No Project infrastructure would occur on BLM-managed lands within 3.1 miles of greater sage-grouse leks in compliance with the BLM’s Approved Resource Management Plan Amendment, in order to minimize impacts to native sagebrush habitats. • The project would avoid conservation easements and protected lands. Wetlands and other waters would be avoided to the greatest extent practicable. No turbines would occur within 1,000 feet of irrigation canals to minimize impacts to bats and avian species attracted to such features.” MVE has actively removed turbines from within the stated buffers of known nest locations. To more accurately state this measure, MVE requests an edit to: “Turbines have been sited to minimize impacts to birds and bats through the following features: • All turbines were removed within 2.0 miles of an occupied golden eagle nest. • All turbines were removed within 1 mile of an occupied ferruginous hawk nest. • The Project layout was revised to remove all Project infrastructure on BLM-managed lands within 3.1 miles of greater sage-grouse leks in compliance with the BLM’s Approved Resource Management Plan Amendment, in order to minimize impacts to native sagebrush habitats. • The project has avoided conservation easements and protected lands. Wetlands and other waters were avoided to the greatest extent practicable. No turbines would occur within 1,000 feet of irrigation canals to minimize impacts to bats and avian species attracted to such features.’ [From POD Appendix M, Section 5.2:] “If new raptor nests were constructed in proximity to turbine corridors in the future, MVE will coordinate with BLM and USFWS about an appropriate course of action.”	As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction), “The project’s final design and engineering would be completed after the BLM has issued a record of decision (ROD) and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. The project’s final design would identify the specific location for all infrastructure and project activities and would be approved by the BLM Authorized Officer.” Therefore, these changes to applicant-committed measure 138 in Table App4-2n would not be appropriate.

Comment ID	Commenter	Public Comment	Response to Comment
11978-158	Magic Valley Energy, LLC	60. Appendix 4- App4-2n, #139 “Clearing of trees, native vegetation, or vegetated ground surfaces would occur outside the migratory bird nesting season (as listed in Table P-a1 in Appendix P of the POD), to the extent practicable. Vegetation clearing conducted during the nesting season would be done under the supervision of a compliance monitor to who would identify nests for avoidance prior to construction. Active nests would be marked/staked with the appropriate buffer and construction activities would not occur within the buffer until a biologist determines the nest is no longer active. When a nest is no longer active, nest marking sticks or flagging would be removed and the construction company notified that activities can resume.” MVE requests an edit to the table to match the language in the POD, where the full paragraph states the full intention: “Marked nests will be avoided during construction while the nest is active. Nests will be checked up to once per week to determine if they are still active. In some cases, nests can be checked from a distance by observing if a bird is present on a nest or if a bird is bringing food items to nestlings. Care will be taken to not flush the bird if at all possible. In other cases, nests may need to be checked at the nest and flushing of a bird may occur. Nests will not be approached if there are birds such as corvids in the vicinity (Martin and Geupel 1993); Environmental monitors will watch for predatory birds, which could indicate where nests are located. When a nest is no longer active, nest marking sticks or flagging will be removed and the construction company notified that activities can resume within the nest buffer.”	The measure as written accurately captures the nest identification and avoidance measures that MVE has committed to. Procedures for monitoring active nests during construction are described in the BBCS and do not need to be repeated here because they would not lead to a more informed analysis.
11978-161	Magic Valley Energy, LLC	63. Appendix 4- App4-2n, #151 “As part of MVE’s Eagle Incidental Take Permit, eagle fatality monitoring would be conducted by a qualified independent third- party who would provide all data from monitoring efforts directly to the Migratory Bird Permit Office.” This measure should match the terms agreed to by USFWS and as outlined in the POD: “As part of MVE’s Eagle Incidental Take Permit, eagle fatality monitoring would be conducted.”	This measure has been revised to read, “Eagle fatality monitoring would be conducted in accordance with the terms of MVE’s Eagle Incidental Take Permit.”
11978-162	Magic Valley Energy, LLC	64. Appendix 4- App4-2o, #162 “Foundations for turbines, transformers, met towers, substations, Operation and Maintenance facilities, and other above ground infrastructure would be removed to a minimum of three feet below surrounding grade and covered with soil.” MVE anticipates that the O&M buildings may not be at the end of its useful life at the time of decommissioning, and as described in L-3.7 of the POD the buildings may be sold or donated rather than demolished. MVE recommends either removing O&M facilities from Measure Number 162 or add a qualifying statement such as “Foundations for turbines, transformers, met towers, substations, decommissioned Operation and Maintenance facilities, and other above ground infrastructure would be removed to a minimum of three feet below surrounding grade and covered with soil.”	Applicant-committed measure 162 in Table App4-2o has been revised as requested and combined with measure 163 (see response to comment 11978-163 [see in Table A-3cc, Mitigation – EIS Appendix 4]).
11978-163	Magic Valley Energy, LLC	65. Appendix 4- App4-2o, #163 “Turbines, transformers, met towers, substations, Operation and Maintenance facilities, and other above ground infrastructure would be removed, as would buried infrastructure, such as the collector system or fiber optic cable, that is less than two feet below grade. (Cables buried more than two feet will remain in place.)” Measure Number 162 already addresses above ground infrastructure. MVE recommends revising Measure Number 163 to align with what is proposed in the POD Appendix L: “Underground cables buried less than two feet below grade will be removed, and cables buried more than two feet will remain in place.”	Measure 163 has been combined with applicant-committed measure 162.
11978-171	Magic Valley Energy, LLC	86. Appendix 4- Table App4-5, VII “Contribute funds to survey abandoned mines for bats and, if used, close with bat-friendly gates.” MVE Comment: MVE anticipates this measure will be removed in the FEIS based on comment 18 in this comment letter.	As described in the response to comment 11978-20 (see in Table A-3cc, Mitigation – EIS Appendix 4), the TAC will be responsible for evaluating postconstruction bat fatality monitoring results and for recommending compensatory mitigation measures when deemed appropriate.
11991-15	Julie Abo	Who is going to measure if the comparison of these potential measurements of sound and sight and physical impacts to birds, bats etc..and the actual outcomes? And what will happen if the negative impacts exceed the estimates of the DEIS and eventual EIS? Is there any means of ensuring these agreements have not been violated? This is not clear to me and I do not have confidence that such measurements will be taken nor LS Power would be held accountable to those measurements.	The mitigation measures described in EIS Appendix 4 (Mitigation) would be included in the terms and stipulations of MVE’s ROW authorization, if granted. The Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describes procedures for monitoring and enforcement of mitigation measures. As described in measure oo, MVE’s compliance manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring.
11991-20	Julie Abo	Although the Programmatic Agreement attempts to address mitigation measures to resolve the negative impacts, it is not an acceptable resolution as the negative impacts persist. “Measures under the PA to minimize and mitigate adverse effects would range across a variety of approaches for historic properties including Minidoka NHS and WRC and other TCPs or Tribal resources. These measures would serve to address physical, non-physical (visual, auditory, atmospheric), and cumulative impacts to cultural resources. Potential measures could include monitoring and addressing post-review discoveries (see EIS Appendix 8).” (page 3-159) Cultural resources cannot be reconstituted once they are damaged or moved. They are completely irretrievable or able to be replaced. These cultural resources are part and parcel of the landscape and its spiritual and historical significance. It’s already been disturbed to perform this DEIS. “Power (2021) identifies 362 cultural resources in its study area. Of these cultural resources, 139 are in the physical APE.” (page 3-164)	The cultural resources in Power (2021) were identified through a Class I cultural resources inventory, which relies entirely on data obtained from previous archaeological investigations within the APE. Class III pedestrian cultural surveys would be required prior to BLM issuance of an NTP, if a ROW is grant is issued. These surveys use non-invasive methods that would not disturb cultural resources. Therefore, no disturbance to cultural resources has occurred, nor will disturbance to cultural resources occur as part of the surveys or as a result of the preparation of this EIS. Avoidance, minimization, or mitigation of historic properties would be implemented pursuant to the PA for the project and would be made conditions of ROW approval in the ROD. Further monitoring of cultural resources, as specified under the PA, is intended to ensure that historic properties are not inadvertently damaged during construction, post-review discoveries will be treated in accordance with the unanticipated discovery procedures described on page 19 of the draft PA (EIS Appendix 8). Where adverse effects to historic properties cannot be avoided, HPTPs describing site-specific mitigation measures will be prepared and included in the HPMP. Refer to pages 16–19 of the draft PA (EIS Appendix 8) for additional details.
12108-1	David Hickok	One of the biggest issues I have with the project is the shear number of birds and bats that will be killed including eagles and sage grouse. When I asked about the plan to minimize these loses, I was told that the wind farm would “miϴgate” these loses. However, the presenters could not tell me how these loses would be	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B [Proposed Action]), “The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting

Comment ID	Commenter	Public Comment	Response to Comment
		“miϴgated”. Does that just mean pay a fine or make sure the populaϴon is the same in 35 years as it is today? Reading the EIS Document did not add any details as to how this would happen. For this reason alone, the proposed wind farm should be stopped.	corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]).” Also see EIS Section 2.3.4 (Avoidance and Minimization) and the BBCS (Appendix M in MVE [2023]). Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). “Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project.” However, this section also notes, “This reduction may already be accounted for in the avian fatality estimates presented in Table 3.3-12 because the estimates are based on fatality averages across numerous existing wind energy facilities, and thus, may already account for variability in siting considerations (e.g., other wind facilities may have also sited their turbines to avoid known raptor nests)” and “Due to the degree of variability among species and among individual wind energy facilities, preconstruction avian use is a poor predictor of avian fatality rates observed following construction (WEST 2011). Therefore, it is difficult to predict fatality rates for individual avian species.” Due in part to the uncertainty in quantifying fatality rates prior to construction, mitigation measures include postconstruction avian fatality monitoring to assess actual avian fatality rates and determine which adaptive management measures need to be implemented to reduce fatalities (if any), as well as additional monitoring to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the USFWS’s land-based wind energy guidelines (USFWS 2012).
12130-12	Brenda Pace	Since future postconstruction fatality studies and mitigation are applicable to all bats that may use the Lava Ridge project area, this request may seem inconsequential. However, the interplay between decisions made in the DEIS and implementation of adaptive management through the Bird and Bat Conservation Strategy (BBCS) are flexible and may be subject to change over the lifetime of the project. I believe this presents a potential for exclusion of Townsend’s big-eared bats from future adaptive management and potentially important conservation action, which is unacceptable. Mitigation. Appendix 4 of the DEIS presents mitigation measures that will help to avoid, minimize, and mitigate adverse impacts of the Lava Ridge project. It is essential that all four of the mitigation types detailed in DEIS Appendix 4 (Table 4-1) be implemented for any action alternatives developed for the Lava Ridge project. This includes full incorporation of relevant measures into the Bird and Bat Conservation Strategy that will guide mitigation in the postconstruction timeframe.	See response to comment 12130-11 (see in Table A-3b, Bats). Postconstruction bat fatality monitoring will provide an opportunity to assess the fatality rates for all bat species, including Townsend’s big-eared bat, and determine whether adaptive management measures are needed to reduce fatalities. The mitigation measures listed in EIS Appendix 4 (Mitigation) would be required under all action alternatives and would be included in the terms and stipulations of the ROW grant, if issued. The BBCS (Appendix M in MVE [2023]) is a document prepared by MVE; additional mitigation measures for birds and bats that are not in the BBCS are listed in Table App4-4. As with other mitigation measures, these would be required under all action alternatives and would be included in the terms and stipulations of the ROW grant, if issued. Additional types of compensatory mitigation actions that would be considered are described in the Mitigation Framework for Birds and Bats in EIS Appendix 4.
12130-13	Brenda Pace	Applicant-Committed Measure #137 states that a Bird and Bat Conservation Strategy will be “drafted” but there is no indication it will be implemented. The same is true of #94 related to a “Historic Properties Treatment Plan for cultural resources. #137 also commits to “avoid and minimize” impacts to birds and bats but does not mention mitigation. These are semantic, but could present unacceptable loopholes. I recommend that they be reworded.	The BBCS and HPTPs are required documents that must be approved by the BLM Authorized Officer prior to issuance of an NTP, if a ROW is granted. As described in the response to comment 12130-12 (see in Table A-3cc, Mitigation – EIS Appendix 4), all mitigation measures (which include avoidance and minimization measures) listed in EIS Appendix 4 (Mitigation) would be required under all action alternatives and would be included in the terms and stipulations of the ROW grant, if issued. Thus, all of the plans that would be drafted would be implemented.
12130-15	Brenda Pace	Applicant-Committed Measure #153 describes employee training on how to handle dead or injured birds or bats. In addition to being held every three years, as indicated, I recommend that this training should be mandatory for all new hires.	Additional project-specific measure pp requires training for all new hires.
12130-16	Brenda Pace	Applicant-Committed Measure #160 appears to be a voluntary preemptive curtailment strategy that will save the lives of some birds and bats. I commend MVE for implementing this measure as long as it is put into practice at the beginning of turbine operations and not just as a curtailment strategy to be implemented after postconstruction fatality surveys are completed.	Applicant-committed measure 160 states that turbine blades will be feathered when wind speeds are below the manufacturer’s cut-in speed (i.e., the speed at which wind turbines begin generating electricity). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B [Proposed Action]), this type of feathering is not considered “curtailment” because it does not reduce the power generated by the turbines. Curtailment is defined as feathering turbine blades when wind speeds exceed the manufacturer’s cut-in speed because it reduces (or curtails) the power generated by the turbines.
12130-17	Brenda Pace	Additional Mitigation Measure “n” describes postconstruction avian and bat fatality monitoring. Based on long term research on bat activity at the Idaho National Laboratory on the northeastern Snake River Plain (DOE-ID 2018), I recommend that the timing of bat surveys should coincide with a minimum timeframe of April through September, when bats are most active in the region. Furthermore, I recommend that within this active period, it is essential that surveys be completed on a weekly basis, and on a bi-weekly basis during the Fall migration period in August and September (Kunz et al. 2007, Smallwood 2020). I recommend that searcher efficiency and carcass persistence trials must also be completed per standard guidelines (USFWS 2012, WDFW 2009, WGFD 2021). I recommend that reports must be prepared and shared with the BLM, IDFG, USFWS, local and regional bat biologists and researchers, and provided or at least summarized for inclusion in public data archives.	The BBCS in Appendix M of MVE (2023) has been updated to include an Avian and Bat Postconstruction Monitoring Plan that provides a more detailed description of the protocols that would be implemented and clarifies the responsibilities of the TAC, which include determining the appropriate interval for carcass searches. EIS Appendix 4 (Mitigation) has also been updated as needed to reflect the changes in the BBCS and to provide additional details on the TAC; see applicant-committed measure 150 and additional measures u, w, y, aa, and mm.
12130-18	Brenda Pace	Additional Mitigation Measure “o” describes consultation necessary to determine the best strategies to minimize impacts found during postconstruction fatality surveys and implement adaptive management. The acronyms “BCI” and “TAC” are not defined, but in this context, they likely refer to “Bat Conservation International” and a “Technical Advisory Committee.” I strongly support this requirement to establish a “TAC” for broadening the group that will review post?construction fatality data and recommend mitigations for bats and birds. I recommend that the BLM consider including wildlife biologists from Craters of the Moon National Monument and Minidoka National Wildlife Refuge, Idaho Universities (including the Intermountain Bird Observatory), and the Idaho Bat Working Group (Rita Dixon and Bill Doering, POCs), and East Idaho Bat Collaborative (David Dressel POC).	See response to comment 12130-17 (see in Table A-3cc, Mitigation – EIS Appendix 4); EIS Appendix 4 (Mitigation) has been revised to include additional details on the TAC. As described in additional project-specific measure mm, the TAC will consist of resource specialists from the BLM, USFWS, OSC, and IDFG. The TAC will be responsible for continually re-evaluating the potential impacts to avian and bat species based on the results of postconstruction fatality monitoring, the latest publicly available data and literature on avian and bat populations, and the potential impacts of wind energy development on these species to determine which adaptive management or compensatory mitigation measures should be implemented to reduce fatalities, if any.

Comment ID	Commenter	Public Comment	Response to Comment
		These individuals will provide essential unique perspectives on bats and birds to establish meaningful thresholds for fatality, implement mitigation strategies, and ensure that adaptive management is employed for the life of the Lava Ridge Wind project.	
12130-19	Brenda Pace	Additional Mitigation Measure “s” describes continued acoustic monitoring for bat use of the Lava Ridge Wind project area to inform adaptive management. To be most useful for this application, I recommend that this acoustic monitoring must continue through the proposed two years of postconstruction fatality monitoring and on a less frequent, systematic basis for the life of the project.	Additional project-specific measure aa was revised to clarify that the BLM Authorized Officer (in consideration of the TAC’s recommendations) would determine the duration of the surveys.
12130-20	Brenda Pace	Additional Mitigation Measure “v” describes winter road maintenance relative to big game winter use of the Lava Ridge project area. In this context, I recommend that periodic breaks be created in the snow banks along plowed roads to allow for escape routes for big game.	The final EIS has been revised to include additional project-specific measure ii, which requires that gaps at least 100 feet wide be left in snow berms at least every 1/4 mile to accommodate big game movement.
12130-21	Brenda Pace	Additional Mitigation Measure “eee” addresses wildlife entrapment specifically related to vertical pipes and birds. I recommend that this measure be expanded to include mitigation measures (ramps) to prevent wildlife entrapment in new and existing livestock troughs and open water storage tanks (Anderson et al. 2021).	BLM-required measure T requires MVE to “Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by greater sage-grouse and other wildlife,” as required by BLM (2015). Also, the final EIS was revised to include additional measure ffff, which requires the use of escape ramps in open trenches.
12130-22	Brenda Pace	Compensatory mitigation is addressed in the DEIS Appendix 4 (Table 4-5). I recommend implementation of all the mitigation measures outlined in this Table. Regional wildlife biologists from Craters of the Moon National Monument and Minidoka National Wildlife Refuge and active researchers from Idaho universities and bat/bird organizations like the Intermountain Bird Observatory, Idaho Bat Working Group, and SE Idaho Bat Collaborative, would be in a unique position to understand research and management needs for birds and bats. I recommend that these individuals and groups be consulted to tailor compensatory mitigation measures for the Lava Ridge Wind project. Based on my own experience, I recommend that measures related to research on bat maternity colonies (Call et al. 2018), bat, bird and insect tracking with Motus nanotechnology and towers (Taylor et al. 2017), bat guano analysis (DNA, carbon isotope) to aid in population estimates, habitat use, and diet (Scholz and Voight 2022), and baseline studies of bat insect prey (e.g., light trapping, DNA and stable isotope analyses of moth wings collected from bat roosts) (Walker et al. 2016).	EIS Appendix 4 (Mitigation) has been revised to include additional details on the TAC. As described in additional project-specific measure mm, the TAC will consist of resource specialists from the BLM, USFWS, OSC, and IDFG. The TAC will be responsible for continually reevaluating the potential impacts to avian and bat species based on the results of postconstruction fatality monitoring and the latest publicly available data and literature on avian and bat populations and the potential impacts of wind energy development on these species to determine which adaptive management or compensatory mitigation measures should be implemented to reduce fatalities, if any. The compensatory mitigation measures presented in the Mitigation Frameworks in EIS Appendix 4 are examples of the types of mitigation that the TAC may recommend but do not represent an exhaustive list since new science and technologies will be developed over the 30-year operation phase.
12130-29	Brenda Pace	In BBCS Section 6.1, there is no indication of when postconstruction fatality surveys are to be conducted for birds and bats. Following published standards (Kunz 2007, USFWS 2012, WGFD 2021), I recommend that bird fatality surveys be conducted on a year-round basis and that bat fatality surveys be conducted from April through September, or possibly even longer from March – October. Additionally, Section 6.1 defines the search interval for all postconstruction fatality surveys as a “minimum of 14 days.” While this may be suitable for large raptors, as required by USFWS consultation for the Lava Ridge project Eagle Take Permit, it is not suitable for small birds or bats (Kunz 2007, Smallwood 2020). Following the published standards, I recommend that bat surveys be conducted weekly from April to August and biweekly in August and September. Small bird 10 surveys should also be more frequent than the 14-day minimum in the Spring, Summer and Fall seasons.	The BBCS in the final EIS has been updated to include an Avian and Bat Postconstruction Monitoring Plan that provides a more detailed description of the protocols that would be implemented and clarifies the responsibilities of the TAC, which include determining the appropriate interval for carcass searches. EIS Appendix 4 (Mitigation) has also been updated as needed to reflect the changes in the BBCS and to provide additional details on the TAC; see applicant-committed measure 150 and additional measure mm.
12130-30	Brenda Pace	Section 6.5 describes yearly reporting on postconstruction fatality monitoring and review by USFWS, BLM, and IDFG. I recommend that these reports be prepared in a manner that will allow them to be shared with the public and to open access databases such as the American Wind Wildlife Institute’s documents library (https://awwic.nacse.org/), where they can be used to better understand how wildlife interacts with wind energy.	The Bird and Bat Conservation Strategy (Appendix M in MVE [2023]) protocols will be finalized in coordination with the TAC and could include sharing reports via open access databases such as the American Wind Wildlife Institute’s documents library (https://awwic.nacse.org/). The TAC would include resource specialists from the BLM, OSC, USFWS, and IDFG.
12130-33	Brenda Pace	• Applicant-Committed Measure #157 outlines vague thresholds for bird and bat fatalities that will likely result in no adaptive management to address fatalities.	While the draft EIS noted that consultation with the TAC would be necessary to determine the best minimization strategy for the species occurring in the area, the final EIS has been revised to include additional details on the role of the TAC (see additional measures w, y, and mm) and the thresholds that would trigger an adaptive management response (see additional measures w and nn).
12130-34	Brenda Pace	• Applicant-Committed Measure #150 describes a long-term postconstruction survey protocol for detecting large-bird carcasses that is unsuitable for small birds or bats.	See response to comment 12130-29 (see in Table A-3cc, Mitigation – EIS Appendix 4).
12130-36	Brenda Pace	In addition, per my comments above on “Additional Mitigation Measure ‘o’” (DEIS Appendix 4, Table 4-4), I recommend that a “Technical Advisory Committee” be established to review post?construction fatality data and implement mitigation and adaptive management along with USFWS, BLM, and IDFG. Membership on this TAC should be inclusive of local wildlife biologists, University personnel, and other knowledgeable individuals from the Idaho Bat Working Group and East Idaho Bat Collaborative. While I have the deepest respect for USFWS, BLM and IDFG personnel, I believe it is essential to balance the perspectives and interests of these parties with up-to-date local knowledge and expertise.	EIS Appendix 4 (Mitigation) has been revised to include additional details on the TAC. As described in additional project-specific measure mm the TAC will consist of resource specialists from the BLM, USFWS, OSC, and IDFG. The TAC will be responsible for continually reevaluating the potential impacts to avian and bat species based on the results of postconstruction fatality monitoring and the latest publicly available data and literature on avian and bat populations and the potential impacts of wind energy development on these species to determine which adaptive management or compensatory mitigation measures should be implemented to reduce fatalities, if any.
12226-1	Ted Deetz	EIS Section 3.17.1.4 Compensatory Mitigation states that “MVE would develop and implement a hazardous materials management plan”. Comment: I guess BLM has to approve the plan before they see it? A plan for prevention must be determined before approval. I say this because I have been down this road as a member of the PWSD. If it is not clearly covered before approval it will never be implemented. If the prevention plan is not covered before approval, just small tokens of mitigation and a lot of “rubber stamped paperwork” is all that will happen. The only other mention of the effects on the ESPA I could find is in AIB46 and AIB49 and there is no discussion of the long term effects on ESPA.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). All plans would have to be approved by the BLM prior to construction notice to proceed.

Comment ID	Commenter	Public Comment	Response to Comment
12338-10	National Park Service	Section: Appendix 4 (Mitigation) Page: App 4-4 The NPS recommends inclusion of clear facility lighting specifications for minimized uplight (e.g., full cut-off, uplight rating 0), and minimized blue light (e.g., <3000k correlated color temperature) for Measure 23 in Table App 4-2c.	The BLM would not authorize construction notice to proceed until MVE provides a final POD; MVE (2023) includes MVE's project plans as of December 2023.
12338-11	National Park Service	Section: Appendix 4 (Mitigation) Page: App 4-15, Table App 4-2l The NPS appreciates the dust mitigation measures incorporated in tables 4-2 (applicant committed mitigation measures for dust) and 4-3 (BLM-required mitigation measures) of appendix 4. The NPS recommends the following additional dust mitigation measures are added to this list: (1) Require real-time air quality monitoring at least during construction to ensure the effectiveness of dust mitigation and to determine whether long-term monitoring is necessary. (2) Identify potential high use access roads and include specific paving requirements. This recommendation is partially addressed under construction requirements by noting that the applicant will "Identify potential high use access roads and consider paving requirements." (3) Require paving for high-use, long-term parking and staging areas. (4) Require the application of gravel or acrylic polymer for unpaved parking and staging areas with high dust emission potential (e.g., exposed soils, high silt content). (5) Require mulch for exposed or disturbed areas that are not suitable for gravel with high dust emission potential (e.g., exposed soils, high silt content). (6) Require the use of natural or manmade wind breaks at large construction sites and staging areas where ongoing dust emissions are occurring to minimize particle entrainment at the site. (7) Provide specified training activities for company employees and contractors on dust mitigation strategies.	The BLM would not authorize construction notice to proceed until MVE provides a final POD; MVE (2023) includes MVE's project plans as of December 2023.
12338-12	National Park Service	Section: Appendix 4 (Mitigation) Page: App 4-15 The NPS appreciates the incorporation of Measure #116 in Appendix 4, Table App 4-2l (on page App 4-15) to protect air quality. The NPS recommends including additional detail in Measure #116 to ensure the mitigation measure is effective. For example, the measure should identify what monitoring would be employed and what thresholds would be used to determine acceptable/unacceptable levels of dust.	The BLM would not authorize construction notice to proceed until MVE provides a final POD; MVE (2023) includes MVE's project plans as of December 2023.
12465-3	Regina Smith	The mere term carcasses defines it all. They have already counted the carcasses from other projects, and they have predicted numbers, but they offer no real mitigation, yet throughout the document they claim there will be no significant impacts. The few avoidances or minimizing steps presented are preferenced with "if cost-effective" or "if feasible". These are loopholes not mitigation. ... If actual mitigation of impacts cannot be developed before the project, counting carcasses afterwards is useless.	As stated in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B [Proposed Action]), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]) (see EIS Section 2.3.4, Avoidance and Minimization, and Appendix M of MVE [2023]). Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project." The draft EIS presented a range of different adaptive management and compensatory mitigation measures as examples of the measures that the TAC may recommend based on the best currently available scientific data and literature. EIS Appendix 4 (Mitigation) has been revised to include additional details on the TAC. As described in additional project-specific measure mm, the TAC will consist of resource specialists from the BLM, USFWS, OSC, and IDFG. The TAC will be responsible for continually re-evaluating the potential impacts to avian and bat species based on the results of postconstruction fatality monitoring and the latest publicly available data and literature on avian and bat populations and the potential impacts of wind energy development on these species to determine which adaptive management or compensatory mitigation measures should be implemented to reduce fatalities, if any. As described in EIS Section 3.3.2.2.2, additional monitoring would be required to assess the effectiveness of adaptive management measures.
12538-3	Clarke Kido	I cite the observations, analyses, and conclusions of the draft EIS as part of my basis to oppose the project. · Section 3.5.3 says "The Japanese American community has expressed that no mitigation of project impacts could protect the site from the intrusion and desecration of, what to the community is considered, a sacred site." · Section 3.5.5.3 says "An irreversible effect on cultural resources could occur under all action alternatives where the project does not avoid physical impacts to cultural resources." · Section 3.5.6.3 says "Long-term effects (visual and auditory impacts) on the preservation of cultural resources would persist until operations cease and the aboveground infrastructure is removed. This would include related irreversible effects to significant cultural resources of the Japanese American community and of Native American Tribes." · Section 3.6.2.3 says "Japanese American communities and Native American Tribes would be subject to disproportionately high and adverse long-term irretrievable effects from increased noise, changes to the visual character and inherent scenic quality of the analysis area, and non-physical impacts to cultural resources. Comments on Compensatory Mitigation · Appendix 4, Table App4-5 says "Implementation of [compensatory mitigation] measures XIV and XV would not directly reduce any project-related effects but would aim to compensate for project-related effects indirectly by funding studies which are desired by the Japanese American community and Native American Tribes." My comment is that measures XIV and XV are token attempts to appease the affected parties. The proposed ethnographic studies, while desired, cannot begin to offset the physical, cultural and emotional damages that will last for the 30+ year lifespan of the project, perhaps forever. · Appendix 4, Table App4-5 says "Measure XVI: MVE would establish a fund to be used based on recommendations from a committee that would be established and comprise Minidoka NHS stakeholders with an emphasis on including representatives of Japanese American organizations. Recommendations from the committee would focus on enhancing the fundamental values of Minidoka NHS so that it will continue to provide opportunities for commemoration and healing through pilgrimages and provide opportunities for bettering humanity as a site of conscience. Recommendations from the committee may include but are not limited to the following: o Establishing	The mitigation measures referenced in EIS Appendix 4 (Mitigation) have been revised. See the "Mitigation Framework for Key Resources and Values Associated with Minidoka National Historic Site" in EIS Appendix 4. Also see responses to comments 9080-15 (see in Table A-3cc, Mitigation – EIS Appendix 4) and 11782-5 (see in Table A-3cc, Mitigation – EIS Appendix 4).

Comment ID	Commenter	Public Comment	Response to Comment
		conservation easements to preserve the visual character of the surrounding landscape o Removal of existing visual intrusions within close proximity to Minidoka NHS that take away from meeting its fundamental values o Increasing access to pilgrimages and educational materials that provide a better understanding of the history associated with Minidoka NHS" My comment is that I need more information to judge the merits of mitigation measure MVI.	
12859-43	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Mitigation. While we appreciate BLM's efforts to minimize damage to Minidoka's cultural and historic values, Alternatives C and E have "disproportionately high and adverse impacts to the Japanese American community and Native American tribes."270 This proposed wind project suffers from intrusive viewshed impacts to Minidoka National Historic Site BLM must follow the mitigation hierarchy in evaluating those impacts. The DEIS does not adequately identify mitigation measures that would offset the disproportionate adverse impacts. As noted above, these Alternatives do not conform with requirements in the BLM's Monument Resource Management Plan (RMP) to preserve Japanese American Traditional Cultural Property (TCP) and other cultural values.	See response to comment 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns).
12927-3	John Arkoosh	The DEIS talks about applicant committed measures and compensatory mitigation but does not define in any detail what these will consist of. The DEIS is woefully insufficient in terms of mitigation strategies, such strategies must be clearly and completely defined before any build alternative is permitted.	More detail was added to EIS Appendix 4 (Mitigation), which has a complete list of mitigation measures and a definition of each type of mitigation. Additional details can be found in the various plans attached to MVE (2023) and the other sources cited throughout this appendix.
12934-4	Rob Thornberry, Theodore Roosevelt Conservation Partnership	Strengthen compensatory mitigation language. In Figure 3.18.2.4, the language regarding compensatory mitigation for the effects of the project on big game migrations is vague, and therefore meaningless. For example, the language currently says: "If postconstruction carcass monitoring (mitigation measure VII), IDFG telemetry data, and/or annual winter counts indicate impacts to big game or avoidance of the area by big game, then consider the following …" The existing language offers no assurance the applicant or BLM will take action to implement effective mitigation measures for functional loss of pronghorn habitat that is likely to impact the Owinza herd. The phrasing should include measurable thresholds and concrete actions the applicant will undertake to fulfill its mitigation obligations to address unavoidable adverse impacts, should they occur. In a draft of the pronghorn management plan currently out for public comment, the IDFG identified six goals. The first three goals are: (1) Improve the quality of pronghorn population monitoring data to better estimate population size and understand population trends; (2) collaborate with private landowners, land management agencies, and others to incorporate measures in land use and resource management plans that benefit pronghorn habitat; and (3) increase knowledge of pronghorn survival, habitat use, genetics, and other factors affecting pronghorn populations, movements, and migrations. The applicant and BLM should consider language within the proposed plan to address the needs of pronghorn as stated by the IDFG.	An additional mitigation measure (measure mm) described in EIS Appendix 4 (Mitigation) describes the establishment and responsibilities of a TAC. The TAC will be established to determine the need for avoidance, minimization, adaptive management, and compensatory mitigation (including for big game) for the life of the project, and will consist of resource specialists from the BLM, USFWS, IDFG, and OSC. The TAC will be responsible for reviewing monitoring results and identifying the impact thresholds over which compensatory mitigation would be required, as well as identifying specific actions for compensatory mitigation.
12966-3	Ted Deetz	EIS Section AIB46 states that "MVE would develop and implement a hazardous materials management plan". Comment: Again, plans should be developed prior to approval. There is no mention of the long term effects on the ESPA. The supposed plan will only address Storage, Use, Transportation and Disposal of hazardous materials and no mention of prevention of hazardous materials such as the tons of ammonium nitrate fuel residue that is forced into the basalt and surrounding environment. This is not a "Green Project".	All plans would be approved by the BLM prior to an NTP, not before the ROD.
12982-13	Jerry Taylor	The DEIS cavalierly projects significant impacts on federally protected avian species and species of concern, and suggests future mitigation would make up for habitat loss and/or projected "take" (i.e. death} of significant numbers of individuals from several protected species. The company(s) are allowed to promise avoidance "to the extent feasible", or promise "mitigation compensation" to buy the agencies and stake holders off with promises of future investment in habitat improvement elsewhere, etc. This is a joke, and BLM knows it or should know it. Sagebrush/grass habitat is being lost every year at an alarming rate due to wildfire, cheatgrass invasion, and encroachment from development in the urban interface and on dispersed private wildlands. There is no more land to buy in reality that would offset the amount lost every year. Habitat improvement is a drop in the bucket compared to the overall decline. So "Mitigation Compensation" in the way of payments to government agencies to go forth and do good work to offset significant impacts is an exercise in futility. There was a time when BLM put restrictions on building projects within a mile of a single eagle nest, that might fledge and eaglet or two in a good year. The same is true for sage grouse leks, and critical habitat. Now the government agencies seem to be willing to allow them to be slapped from the sky with impunity and in great numbers. Bold statements of "take" (mortality) in consultation with BLM, USFW, etc. How things have changed and not for the better. BLM should reject pie in the sky promises of future mitigation and do proper analysis of impacts up front.	The analysis in EIS Chapter 3 (Affected Environment and Impacts) discloses the need for mitigation measures to avoid or minimize impacts to special-status avian species from turbine collisions as well as the potential that adaptive management measures (including curtailment) and compensatory mitigation (including studies of the geographic origin of fatalities) may be necessary to further reduce or offset the remaining impacts. A complete list of required mitigation measures is provided in EIS Appendix 4 (Mitigation); this includes MVE's applicant-committed measures as well as additional measures required by BLM policy, additional project-specific mitigation developed by the BLM to address impacts that have not been sufficiently minimized by MVE's applicant-committed measures, and potential compensatory mitigation measures. Compensatory mitigation options are not limited to the acquisition of conservation easements or funding habitat restoration projects; the TAC would be responsible for recommending the most appropriate compensatory mitigation measures for the project, based on the results of postconstruction monitoring and the best available science and technology available at that time (see additional measure mm). This would include recommending appropriate mitigation ratios to ensure that residual impacts are adequately offset. Compensatory mitigation for greater sage-grouse must meet the requirements established in BLM (2015a). It is the USFWS's jurisdiction to make the decision on MVE's eagle ITP and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines. All mitigation measures described in EIS Appendix 4 would be included in the terms and stipulations of MVE's ROW authorization, if granted. The Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describes procedures for monitoring and enforcement of mitigation measures. As described in measures nn and oo, MVE's Compliance Manager would be required to submit annual reports to the TAC, the BLM, and other relevant agencies documenting compliance with required mitigation measures and the results of any required monitoring. As described in EIS Section 3.3.3.2.2 (Eagles, Alternative B [Proposed Action]), there are no eagle nests within 2.5 miles of the siting corridors. MVE has also committed to additional preconstruction surveys to identify new raptor nest locations and to establish the status of previously identified raptor nests (applicant-committed measure 146). Avoidance buffers and additional mitigation measures would be required if any new eagle nests are detected; see applicant-committed measures 138, 140, and 144. Greater sage-grouse leks were considered in early project design and the siting corridors were adjusted to avoid placement of infrastructure within 3.1 miles of known leks. A number of additional mitigation measures for

Comment ID	Commenter	Public Comment	Response to Comment
			greater sage-grouse, including activity-specific avoidance buffers and timing requirements, would be implemented as described in EIS Section 3.3.4.2.2 (Greater Sage-Grouse, Alternative B [Proposed Action]).
12993-1	Jim Meeks	In the Lava Ridge wind project draft environmental impact statement: Volume 3 appendix 4 "Mitigation" table app 4-2f; 44-66: The reduction of available grazing acres coupled with the wind river project proposed "fencing" is a death threat to grazing animals from range fires. It is also guaranteed bankruptcy for the grazer producers. Seriously, there is no viable or affordable alternative for other food sources (hay or alternate pastures) for the grazer producers. The draft prescribed "mitigation" for such is dishonest.	See responses to comments 11204-13 and 11204-19 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
13003-7	Lynden Osborne	As stated in App3-14 Vegetation AIB-41, Vegetation will be rehabilitated... 'to the greatest extent feasible". In the end who will determine what feasible means?	AIB-42 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief), describes that MVE would be required to consult with the BLM when determining where avoidance of environmentally sensitive areas would be feasible. As described in EIS Section 3.15.1.2.2 (Native Upland Vegetation Communities, Alternative B [Proposed Action]) MVE would be required to purchase a reclamation bond prior to construction and would be held to BLM-approved reclamation success criteria. These success criteria are described in Section E-2.2 in the Reclamation Plan (Appendix E in MVE [2023]). The final EIS has been revised to include additional details on the reclamation bond; see applicant-committed measure 164 in EIS Appendix 4 (Mitigation).
13006-2	Leon Smith	3) Recommend that BLM modify the DEIS to identify more compensatory mitigation for cultural resources, treaty rights and environmental justice issues. Recommend BLM modify the DEIS to include acquiring land as mitigation at a higher rate than the loss to account for the impacts, in addition to other possible treaty rights mitigations, and outline the timeframe and a mechanism to acquire the land.	Some of the mitigation measures in EIS Appendix 4 (Mitigation) and EIS Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) related to environmental justice and cultural resources have been revised. Due to the ongoing nature of Section 106 and government-to-government consultation, which are key drivers in identifying potential impacts and determining appropriate forms of avoidance, minimization, and mitigation for cultural resources and environmental justice populations, more specific compensatory mitigation measures cannot be determined at this time. Also see response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding Tribal Treaty Rights.
13006-8	Leon Smith	10) If the project goes forward against the strong objection of the subcommittee, the BLM should include a specific process to acquire conservation easements to preserve adjacent private lands in the compensatory mitigation section to ensure that mitigation is durable/effective.	The acquisition of conservation easements would be considered as a potential compensatory mitigation measure as described in the Mitigation Frameworks in EIS Appendix 4. The BLM Authorized Officer will determine final compensatory mitigation measure requirements based on recommendations from the TAC (for biological resources) and a committee of Minidoka NHS stakeholders (for impacts to Minidoka NHS and the Japanese American community). The final EIS has been revised to provide additional details on the TAC and compensatory mitigation plans.
13006-16	Leon Smith	7) Recommend a preemptive seasonal curtailment strategy to reduce bat mortality, rather than waiting for high mortality to start curtailment.	As stated in applicant-committed measure 160, MVE would feather turbine blades when wind speeds are below the manufacturer's cut-in speed (i.e., the speed at which the turbine begins generating electricity). Although this is not considered curtailment because it does not reduce the power generated by the turbines, it would provide a means for pre-emptively reducing bat fatalities because it prevents turbines from rotating rapidly at low wind speeds, when bats are most active. As described in EIS Section 3.3.1.2.2 (Alternative B [Proposed Action]), the need for a curtailment strategy would be determined based on the results of postconstruction avian and bat fatality monitoring; if a curtailment strategy is implemented, it would be tailored to the periods and locations of peak risk for bats, as determined by the TAC. The final EIS has been revised to include additional information on the responsibilities of the TAC and the thresholds that would trigger an adaptive management response; see additional measure mm.
13006-19	Leon Smith	10) Recommend BLM add more detail to the DEIS regarding mitigation measures for wildlife with consideration of long-term displacement impacts and irreversible/irretrievable losses that cannot be mitigated.	Impacts to wildlife, including displacement, and the measures that would be implemented to minimize or avoid those impacts are described in EIS Section 3.18 (Wildlife). Irreversible and irretrievable impacts are also disclosed in this section, and compensatory mitigation measures to offset these impacts have been recommended, where warranted. The final EIS has been revised to include additional details on compensatory mitigation, including the Mitigation Framework for Big Game (EIS Appendix 4).
13006-20	Leon Smith	11) Recommend BLM consult with IDFG and NPS bat experts locally to craft specifically tailored fatality thresholds that would lead to operational curtailment and compensatory mitigation for bats in this region, as well as other species.	EIS Appendix 4 (Mitigation) has been revised to include additional details on the TAC. As described in additional measure mm, the TAC will consist of resource specialists from the BLM, USFWS, OSC, and IDFG. The TAC will be responsible for continually re-evaluating the potential impacts to avian and bat species based on the results of postconstruction fatality monitoring and the latest publicly available data and literature on avian and bat populations and the potential impacts of wind energy development on these species to determine the adaptive management or compensatory mitigation measures that should be implemented to reduce fatalities, if any.
13008-5	Scott Hauser	Appendix I, Blast Plan Methodology (section 1-6) makes no mention of taking wildlife health and protection into account. This raises concerns and many questions. USRT suggests enacting an environmental protection plan for wildlife, specifically birds. Sage-grouse leks and other important bird species may be at risk from blasting and construction operations. USRT suggests avoiding blasting during nesting periods or verifying that blasting will occur far enough away to not disturb nesting birds.	The project has been designed to avoid greater sage-grouse leks and species-specific construction avoidance measures, including species-specific avoidance buffers for active bird nests and sage-grouse leks, where construction avoidance buffers may not be sufficient to prevent impacts from blasting, additional blasting-specific avoidance buffers have been established; see, for example, additional measure m that prohibits blasting in the nest buffers of all BLM special-status birds as outlined in IDIB-2020-014 (BLM 2020a). A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
13008-10	Scott Hauser	The diurnal raptors section states, "The likelihood of collision is highly variable and dependent upon the interaction of site location, season, and species-specific behaviors." The DEIS leaves questions as to how this variability will be dealt with. Are there plans to monitor this, and determine if Lava Ridge is going to have an impact on the raptor population? What mitigation efforts will be made to rectify a high likelihood of collisions within the Lava Ridge Project?	EIS Section 3.3.2 (Avian Populations), EIS Section 3.3.3 (Eagles), and EIS Section 3.3.4 (Greater Sage-Grouse) describe the mitigation measures that would be implemented to minimize, avoid, or offset impact to avian species, including raptors. The mitigation measures include a minimum of 2 years of postconstruction avian fatality monitoring (see applicant-committed measure 150). Additional details are provided in the GRSG Mitigation Plan (Appendix U in MVE [2023]), BBCS (Appendix M in MVE [2023]), and Eagle Conservation Plan (Appendix T in MVE [2023]) as well as EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
13015-1	Diane Meeks, Jim Meeks	In the Lava Ridge Wind Project Draft Environmental Impact statement: Volume 1, Chapter 3.3.1.4 states that only with the final EIS ..."Final residual impacts and compensatory mitigation plan would be required..." We say no until a complete "Final and detailed "mitigation" draft is issued for our review.	The final EIS has been revised to include additional details on compensatory mitigation requirements and resource-specific mitigation plans have prepared as appropriate and included in the appendices to the final EIS. These types of plans are not required for a ROD but would have to be approved by the BLM prior to any potential NTP.
1325-1	Mike Gerrity	I support efforts to reduce the killing of birds. Please consider mitigating bird deaths by trapping feral cats. Cats kills billions of birds every year.	Although contributing funds to programs that spay and neuter stray or feral cats was not specifically listed as a potential compensatory mitigation measure in the EIS, the TAC will be responsible for evaluating the result of postconstruction avian fatality monitoring and recommending adaptive management and compensatory mitigation measures based on the best available scientific data and literature (see additional project-specific measure mm).
24-1	Timothy Ekeberg	Permanent scarring of the lands will occur even after the so called decommissioning. If and very likely when most of these companies cease to exist the taxpayers will be held to pay for decommissioning this project. There are numerous studies showing the regular failure across our Nation and other Nations of these wind generators because the cost to do proper maintenance and upgrade them are not only extremely costly that requires extremely expensive and specialized equipment and crews to do the maintenance and upgrades. This destroys projected returns on investment. These maintenance and upgrades are grossly under estimated by the company trying to sell this project.	As described in in applicant-committed measure 164, “MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria.” The final EIS has been revised to include additional details on the reclamation bond; see applicant-committed measure 164.
2915-6	Roger Twitchell	who specifically would have the authority to implement the mitigation measures such as feathering? Could MVE or their customers veto implementation of mitigation measures? Who would be the final arbiter and what time frame would be needed to implement a mitigation measure when needed?	The mitigation measures listed in EIS Appendix 4 (Mitigation) would be required under all action alternatives and would be included in the terms and conditions of the ROW grant, if issued. The BLM Authorized Officer has the authority to enforce the terms of the grant and take punitive actions, including cancellation of the ROW grant, if MVE fails to comply with those terms. The BLM Authorized Officer may modify the ROW grant at any time to include new or revised terms and conditions, as warranted. A complete list of required mitigation measures is provided in EIS Appendix 4, which includes details on monitoring and reporting requirements, as well as potential adaptive management and compensatory mitigation measures. The TAC would be responsible for regularly evaluating postconstruction monitoring and compliance reports and advising the BLM Authorized Officer on appropriate adaptive management and compensatory mitigation measures for biological resources. The final EIS has been revised to include additional details on the TAC and their responsibilities; see additional project-specific measure mm. A committee of Minidoka NHS stakeholders would be established to provide recommendations to the BLM Authorized Officer for compensatory mitigation measures to address impacts to Minidoka NHS and the Japanese American and Minidoka-connected communities.
2920-3	Regina Smith	The compensatory mitigation (3.6.3.4, pg. 3-223) is "There would be no residual effects..." I maintain the project itself will be a residual effect.	There would be no residual effects to community services, employment, and housing availability that would require compensatory mitigation because “[t]he project would not have irreversible or irretrievable effects on community services, employment, or housing availability. There would be a short-term increase in population during the 2-year construction and decommissioning periods that would increase the demand for community services such as public schools or law enforcement; however, a long-term population increase and demand for community services is not anticipated. The project would also have beneficial long-term effects on community services from increased tax revenues over the 34-year life of the project,” as stated in EIS Section 3.6.2.3 (Community Services, Employment, and Housing Availability, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity). All action alternatives would result in residual effects to some resources, as described throughout the relevant sections in EIS Chapter 3 (Affected Environment and Impacts).
2930-1	Regina Smith	In Appendix F of the POD. F-6.3 line 16, states "All vehicles will have a fire extinguisher. At least one motorized vehicle in each active construction area still contain: shovel, Pulaski, hardhat etc." Measure 61 volume three page App 4-9 says the same thing. Shouldn't all passenger type vehicles carry this equipment in case of fire? And I would presume all the workers would carry hardhats, gloves and eye protection. There is no mention of personal protection equipment (PPE.) I wouldn't know about requirements for non-passenger equipment such as cranes, cement trucks, or helicopters etc.	The Health and Safety Plan (Appendix F in MVE [2023]) is the source of applicant-committed measure 61. The requirement for fire extinguishers applies to all service vehicles used for the project. This measure also states that at least one motorized vehicle in each construction area carry basic fire suppression equipment. This provides sufficient fire protection for each work site, and requiring all passenger vehicles and construction equipment to be equipped with similar fire protection equipment would be unnecessary and redundant. The PPE requirements listed in applicant-committed measure 61 are intended to ensure that personnel have sufficient PPE to implement basic fire suppression attempts. Additional PPE measures for construction, operations, and decommissioning activities will be included elsewhere in the Health and Safety Plan, as described in applicant-committed measure 65.
2939-3	George Solverson	A remarkable study demonstrated a reduction of bird strikes by 70% by simply integrating a "single" dark color blade on each tower should not have been dismissed out of hand without further written rational from the FAA. Transparency for all mitigation/monitoring actions and assurances needs to be made available to the public for the life of the project.	As described in EIS Section 2.9.5 (Alternative Components), the BLM evaluated painting one turbine blade black on each turbine because this has been documented to reduce bird fatalities by 70% in Europe (May et al. 2020). However, this would not comply with FAA standards (FAA 2020) and was not carried forward for detailed analysis. The marking standards outlined in FAA (2020) are required for aviation safety.
3074-1	Benjamin Byers	I support the Lava Ridge project, however, I don't think Alternative B is a suitable option for the communities impacted. Strong rules for MVE during construction and operation should be upheld to minimize the impacts to wildlife and surrounding communities. It is very critical that lighting is minimized to mitigate impacts on surrounding dark sky areas.	See EIS Chapter 3 (Affected Environment and Impacts) for a discussion of mitigation measures that would be implemented to minimize or avoid impacts to wildlife and night skies. A complete list of required mitigation measures is provided in EIS Appendix 4 (Mitigation).
3165-1	Lorand Layton	It seems to me that if after all the speeches are given and thoughts. expressed and before permission given to continue with the lava ridge project. there should be an agreement to provide the state of Idaho a percentage of	Details regarding mitigation can be found in EIS Appendix 4 (Mitigation). As described there, MVE would leave all existing public roads that are used or improved by MVE during the course of construction in a condition that is

Comment ID	Commenter	Public Comment	Response to Comment
		the electrical power generated on and in the state of Idaho. In the form of rental and payment for Roads, Water, and Niceties used in the building and Maintenance of the facilities. And payment for any damages caused during the Installation of the project Caled Lava Ridge.	as good as or better than their condition when the construction period begins in accordance with MVE's agreements with the associated governing body (applicant-committed measure 38).
3169-2	Name Not Provided	will LS power be required to post a bond to cover any damages caused by the project.	See response to comment 24-1 (see in Table A-3cc, Mitigation – EIS Appendix 4).
3255-1	Regina Smith	Page 1- 5, last paragraph, "Issues that were identified..., where applicant-committed measures or other mitigation would reduce impacts below significance,..." There are literally hundreds of measures in this document. Some of which may be beneficial and others are meaningless. Under avian and bat species. Section 3.3.1.4 Compensatory mitigation Page 3-57 Measure VII "Contribute funds to survey abandon mines for bats and, if used, close with bat friendly gates. How does this lessen the impacts on bat collisions into windmills? It doesn't. In Nevada, the Abandoned Mine Survey has already completed most of this type of work. If this type of survey has been completed in Idaho then once again MVE is contributing nothing. Page 3-87, Measure XI "consider measures for other special-status species and species of concern, as determined through post construction monitoring. How is this a mitigation measure? In other words, let's go ahead and build this and see what happens. Really? Obviously the post construction surveys that they used for this analysis haven't worked. How does this constitute mitigation of impacts on bats? Or other species? Measure 158, on page APP 4-22, must've been written in conjunction with the previous measure. It starts with "a curtailment plan would be considered... only if such efforts are demonstrated to be cost-effective..." Assuming this plan were developed, when w;0uld this curtailment plan be developed? 1 year? 10 years into the operation? It reads as though MVE will be developing these curtailment strategies with very little consultation with governing agencies. The first bullet goes on to say that "peak periods and locations would be identified based on post construction fatality monitoring results..." Study should be started before construction. Flyways and routes of different species along with seasons are probably already charted. Mitigation plans need to be developed from predictive models based on known studies. It is irresponsible not to use and develop studies in advance. The bird sensors and monitors discussed elsewhere could be mounted on towers to record activity in various locations. Raptor studies have been in used for years. Powerlines run through the area currently. Why should MVE get a "get out of jail free card" for killing these threatened and endangered and special-status species? If they are released from liability, MVE won't need to bother with mitigation measures. Who is going to monitor to se_ that these measures are completed? Studies like these should be one in advance. Certain surveys have to be done in advance of construction mandated by law. For instance the class Ill cultural resources inventory. Meaningful mitigation measures can be developed simultaneously if not sooner.	Compensatory mitigation, by definition, is not intended to directly minimize or avoid impacts resulting from the project. Instead, the purpose of compensatory mitigation is to offset (or compensate for) impacts of the project that cannot be entirely avoided. Compensatory mitigation is the last tier in the mitigation hierarchy and is only considered after avoidance, minimization, and adaptive management measures have been implemented. "Types of [Compensatory] Mitigation Actions" that would be considered for bats are provided in "Mitigation Framework for Birds and Bats" (in EIS Appendix 4). These measures would offset impacts to bats from collisions with operational turbines at the project by improving habitat for bats elsewhere. Species-specific mitigation measures have been developed for avian species analyzed in detail in the EIS; however, as disclosed in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B [Proposed Action]), "It is impossible to accurately predict the fatality rate for the Lava Ridge Wind Project because preconstruction use is not correlated with postconstruction fatality rates (WEST 2011)." Therefore, the "Mitigation Framework for Birds and Bats" is intended to provide flexibility in developing appropriate mitigation measures in the event that there are higher than anticipated impacts to other BLM-sensitive avian species (i.e., species that were dismissed from detailed analysis in the EIS; see Table App3-3 in EIS Appendix 3 [Issues Analyzed in Brief]). Although it is not anticipated that mitigation measures will need to be developed for these species, the purpose of the postconstruction avian fatality monitoring is to assess the actual avian fatality rates at the project and determine which adaptive management measures need to be implemented to reduce fatalities, if any. As described in applicant-committed measure 158, MVE would develop the curtailment strategy in coordination with the USFWS, BLM, IDFG, and OSC. Additional measure mm requires coordination with the TAC in determining appropriate species-specific mitigation measures. While applicant-committed measure 158 only considers implementing curtailment after other adaptive management measures have been proven to be unsuccessful, additional measure y was added in the final EIS to clarify that the TAC would be responsible for evaluating the results of postconstruction avian and bat fatality monitoring and recommending appropriate adaptive management measures (including curtailment strategies) to the BLM Authorized Officer, if warranted. The final EIS has been revised to include additional details on the TAC and clarify its role in recommending appropriate mitigation measures; see additional measure mm in EIS Appendix 4 (Mitigation). While a minimum of 1 year of postconstruction fatality monitoring would be necessary to determine whether avian or bat fatality rates exceed acceptable thresholds, the BLM Authorized Officer has the authority to require MVE to implement a curtailment strategy at any time during the 30-year operation phase. As described in EIS Section 3.3 (Avian and Bat Species), MVE has conducted a number of baseline resource inventories, including 2 years of avian use surveys, raptor nest surveys, and bat acoustic monitoring to characterize avian and bat use in the siting corridors. The results of these inventories were used to refine the locations of the siting corridors and develop avoidance buffers for high-use or sensitive areas; for example, no turbines would be placed within 1,000 feet of the agricultural canals in the siting corridors (see applicant-committed measure 138) or within 0.25 mile of known bat roosts (see additional measure n). As described in EIS Section 3.3, the project has also been sited outside of major migratory flyways for birds and bats and does not contain habitats or topography that would attract migrating birds and bats. However, as stated above, postconstruction fatality monitoring provides an opportunity to assess actual avian and bat fatality rates and determine which adaptive management measures need to be implemented to reduce fatalities, if any. This strategy is consistent with the recommendations in the USFWS's land-based wind energy guidelines (USFWS 2012). As described in Table App3-2 through Table App3-5, no species listed as threatened or endangered under the ESA occur in the siting corridors; additional consultation with the USFWS would be required if any species occurring in the siting corridors become listed in the future. MVE has not been released from liability and must comply with the MBTA and BGEPA. MBTA compliance is discussed in EIS Section 3.3.2.2 (Avian Populations, Impacts), and BGEPA compliance is discussed in EIS Section 3.3.3.2 (Eagles, Impacts). MVE's compliance manager is responsible for monitoring for compliance with required mitigation measures, including postconstruction avian and bat fatality monitoring. The final EIS has been revised to include additional details on the compliance manager as well as reporting requirements (see additional measure oo). As described in EIS Section 3.5.5 (Cultural Resources, Physical Impacts), pedestrian cultural resource surveys would be required prior to construction; additional details are provided in EIS Appendix 8 (Cultural Resources Programmatic Agreement).
3302-2	Susan Canham	What do you mean by "compensatory mitigation" if adaptive management practices for bats and birds are not successful?	As described under Compensatory Mitigation in EIS Appendix 4 (Mitigation), "Compensatory mitigation measures in Table App4-5 could be applied to alternatives if residual impacts are expected to remain after applicant-committed measures, required mitigation, and additional avoidance and minimization measures are implemented (BLM 2021)." Compensatory mitigation measures do not directly minimize or avoid impacts resulting from the project. Instead, the purpose of compensatory mitigation is to offset (or compensate for) impacts of the project that cannot be entirely avoided.
3350-1	Danielle Hughes	Lava ridge. This is an early draft and I feel strongly it should not ve public. However, I thought you should have the ideas in a minor way. Theoretically edit more and such. Not sure worth more time at moment. If it is I will edit and send formally in OK form for public viewing. Reconceptualize Celebrate and enjoy it including multicultural center and park that celebrates Idaho and the world. Enjoy the wind turbines in the area they are in. Create a public area where people can enjoy being there. A big rambling outdoor area integrated with the wind	The BLM is responding to MVE's application for a wind generation facility on public land that connects to the Midpoint Substation or SWIP-North. New parks are outside the scope of the EIS; however, a number of potential compensatory mitigation measures are being considered and are described in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
		turbines that does not interfere with grazing or environment. The center can include the arts, the environment, history, culture, exercise and a diverse energy system that is in nature including active in area industry and culture already. It is possible to include in the proposed planned passenger train from Salt Lake City, Utah to Boise, Idaho with a stop at the center along the existing tracks there to enjoy the diversity of Idaho largely outdoors The energy system could have an option to have some power produced to stay in idaho if there is a need. For example, Boise in the last some years had a power outage when the school district returned from spring break and turned back on all the copiers. The energy system could largely be the wind turbines. A water wheel of a small size approximately 6 feet in diameter showing the concept in a functional way. Hydropower is more than that and that can be included in text on signage. A small solar part that utilizes current and new technology completes the system. Less than a linear mile of sections total of that. Maybe walking and snow shoe and cross country scenic paths including birdwatching nature and exercise and meditation stops as well as enjoy the combined contemporary sounds of idaho with nature and industry in harmony (Carl Sandburg poem type quietly current on inspiration board) Architecture evocative of existing including silhouette. Likely open structures for much of it. Long low with peaked metal roof close to horizon. But not only. Blends in and almost unseen. A cultural area that includes a smallish outdoor stage for theater, dance, film and more. Stage including theater outdoors that features plays from each continent annually as well as idaho writers and Shakspeare and the Greeks. (Copyright free plays partly) Sculptures around in various configurations including groupings. A bunch together here in a meaningful diverse supportive inclusive welcoming way. Peoples, time periods, and parts of Idaho etc. An outdoor mural that highlights Idaho and its people. Features people of idaho. Hundreds. Close enough to census stats. Including people from each of the tribes and major immigrant groups. Has learning stations that feature the history, environment, people and culture of idaho including downloadable pds of writers including poems about idaho and prose and essays. These can be traditional park type signage. A language center where people can learn the many languages of Idaho including native basque and many more. Free pdf and audio files including a download station there so can enjoy it outdoors in the environment. Explore the music of Idaho including created here including performance. This can possibly have a not extremely expensive or difficult start option. Approximately layout hoped for. Start core and lay in a start. See if extra is around including previous in storage that can be used for the thirty year life span of the project. For example nature stem trail learning stop sign explaining something. The walking trail. One of the buildings including picnic seating in one end for a third of the building. Idaho legislature sometimes authorizes sculpture and this can be a nice place for such. A brick wall about ten feet tall is possible across part of an area. Note: proposed world peace monument in South west idaho could have a pleasant with this.	
3500-2	Alta Toler	Also, what are you doing to minimize the killing of birds and bats? Have you looked into different colors so that they are more visible to flying animals? This current style machine, with wide, huge blades, contributes to the death of many animals and unless you have investigated how to correct this then this is NOT a good project. It is time to upgrade and find better solutions to these old-style wind generators. I want us to be more energy independent, but I want us to be smarter about it. https://www.sciencedaily.com/releases/2021/04/210427085752.htm BEST WISHES, Alta Toler Alta Toler ALTATOLER@GMAIL.COM	Measures that would be implemented to minimize, avoid, or offset impacts to avian and bat species are discussed in EIS Section 3.3 (Avian and Bat Species). As described in EIS Section 2.9.5 (Alternative Components), “The BLM evaluated painting one turbine blade black on each turbine because this has been documented to reduce bird fatalities by 70% in Europe (May et al. 2020). However, this would not comply with FAA standards (FAA 2020) and was not carried forward for detailed analysis.” The vertical turbines described in the news article referenced in the comment are still in the very early stages of development, and there are no commercially available models that could be used for this project.
36-1	Jim Kuehn	Any power generated by any turbines built in the state of Idaho and shipped out of state, should have a substantial tax placed on the exported energy and placed in a fund to mitigate wildlife damage, environmental damage and benefit upgrading, maintaining and expansion of existing and potential new sustainable energy projects that keep the generated power in the state of Idaho. Before this project gets approved and moves forward, the developers of this project need to provide a bond that is 2.5X the estimated cost of 100% removal and restoration of the land this or any other ESG project that the BLM is contemplating allowing on their ground in the state of Idaho.	The BLM is responding to MVE’s application for a wind generation facility on public land that connects to the Midpoint Substation or SWIP-North. New taxes are outside the scope of the EIS; however, a number of potential compensatory mitigation measures are being considered for impacts to wildlife and other resources, which include providing funds to programs that conserve or enhance habitat for wildlife (see, for example the “Types of Mitigation Actions” in the Mitigation Frameworks in EIS Appendix 4). As described in applicant-committed measure 164, “MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria.” The final EIS has been revised to include additional details on the reclamation bond; see applicant-committed measure 164.
4558-2	Joan Hurlock	According to Tables 2.4-1 Project Components by Action Alternative, 2.4-2 Access Road Categories and Mileage within the Citing Corridors, and 2.4-3 Traffic Details, the construction phase of the Lava Ridge Wind Project will include the addition of up to 486 miles of new roads and up to 2.4 million vehicle trips for the duration of the construction phase. The generation of Fugitive Dust Emissions will be substantial and has the potential to impact the air quality. To mitigate this, Magic Valley Energy proposes posting 25 mph speed limit signs (p 3-19), spraying water on the access roads and using a chemical dust palliative such as Magnesium Chloride (MgCl), p 3-20. Posting speed limit signs is not effective and are largely ignored. Using water to control dust will utilize a resource that is scarce in the Magic Valley, as we are experiencing a multi-year drought. Because these mitigation methods will have little impact on controlling fugitive dust emissions, it is likely the chemical dust palliative, MgCl, will be necessary to control fugitive dust emissions. It is MgCl that I will address. Magnesium Chloride is used to control dust and is also used as a chemical deicer on winter roads. Being a water soluble compound, when applied to road surfaces, the MgCl will eventually dissolve and research has shown this negatively impacts soil, water, and vegetation. The use of Magnesium chloride can lead to soil degradation by causing soil sealing, destabilization of aggregate and land salinization. The application of MgCl on access roads can suppress plant growth by impacting plant photosynthesis and plant respiration. And most importantly, McCl can pollute ground and drinking water. The Lava Ridge project area is situated atop the Snake River Aquifer. What will the temporary and/or cumulative permanent effects be to the aquifer, area wells, and to the Snake River when the MgCl dissolves and eventually leaches into these sources of water? How does Magic Valley Energy plan to mitigate the contamination to these sources of water? Included with this letter is a research paper	See response to comment 3811-4 (in Table A-3v, Soils). The magnesium chloride application rates would be well below the level that would be expected to result in measurable impacts to soil and water resources or cause damage to vehicles. As described in EIS Section 3.2.1.2.2 (Air Quality, Alternative B with Additional Measures), “MVE and its contractors would control dust to the extent that off-site transport of visible dust plumes is eliminated” (see additional measure e). A number of other preventative measures are described here that would reduce the need for water applications to control dust. The final EIS has been revised to include additional details on construction monitoring and reporting requirements. A complete list of required mitigation measures is provided in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
		that evaluates the effects of MgCl on the environment, as well as the sales literature produced by Snow & Ice Salt & Chemicals Unlimited, LLC. Even this literature has a statement that MgCl can be harmful to the environment. Also included is an article that discusses MgCl and the effects it has on vehicles. According to the article, " Magnesium Chloride is especially corrosive to metals, and therefore vehicles". See the attached "What is Mag Chloride & What Does It Do To Your Car?". The solution to preventing corrosion is to remove the chemical with soap and water. Was the additional water that will be used to clean all of the machinery and employee vehicles, taken in to consideration in the water usage totals? Will Magic Valley Energy pay for the damage done to vehicles and equipment that is caused by the corrosive nature of MgCl? According to pages 3-351,352, & 353 of the EIS report, the Soil Surveys revealed that 95% of the soil in the project area is classified as fragile and 4.5% is very fragile. The disturbance to the biological soil crusts may have impacts that last up to 125 years and others will have permanent impacts due to the concrete pillars that will remain indefinitely under the ground upon decommissioning of the project.	
5213-4	Sue Page	3.11.1.4 COMPENSATORY MITIGATION No Compensatory Mitigation is proposed!!!	Compensatory mitigation measures are not proposed for pollinators; this is because it is not anticipated that there would be residual impacts to pollinators after the implementation of applicant-committed and additional project-specific mitigation measures, which would largely minimize or avoid impacts to pollinators. Species-specific compensatory mitigation measures have been developed for the St. Anthony sand dune tiger beetle, which are described in EIS Section 3.11.2.5 (St. Anthony Sand Dune Tiger Beetle, Compensatory Mitigation). Compensatory mitigation measures for other resources are described throughout the relevant sections in EIS Chapter 3 (Affected Environment and Impacts); a complete list is provided in Table App4-5 in EIS Appendix 4 (Mitigation). The final EIS has been revised to include additional details on compensatory mitigation, where appropriate (see the Mitigation Frameworks in EIS Appendix 4).
6836-1	Karleen Davis	hope that we can find some mitigations that will retain the emotional and historical value of the Minidoka National Historical Site. I hope visitors to the Minidoka Historical Site will have an emotional experience and come to understand the human toll of this tragedy. Although, I haven't found any ground level photos from the camp facing south. But I do see in the aerial photos, the earth berms around the camp. I suggest that re-installation of these berms will help visitors to fell hemmed in and isolated the way Japanese Americans felt there. And will help to mitigate the visual impact of the turbines 2 miles away.	See analysis presented in Sections 3.5.5.2, 3.6.1.2, and 3.19. See response to comment 9080-46 (see in Table A-3cc. Mitigation – EIS Appendix 4).
8-2	Patrick Williams	Though the EIS will cover the required items, the intangibles are still not addressed. Kills of local and migratory birds needs to be better considered. For example, the wind farm on Maui requires finding and reporting all birds kills; of which the company is required to pay fines for each kill. If this project must proceed--investment in painting one blade of each windmill a dark or black color. This is proven to provide contrast so birds can actually see the blades.	ESA ITPs have been required for wind energy developments in Hawaii due to the potential for ESA listed and threatened and endangered species to be killed by collisions with operational turbines. While ESA ITPs specify compensatory mitigation requirements for incidental take authorized by the permit, which may include payments to mitigation funds, the BLM is not aware of any fines being issued for ITP violations at Hawaiian wind energy facilities. An ITP is not required for the Lava Ridge project because threatened and endangered species do not occur in the siting corridors. Should any species occurring in the siting corridors become listed under the ESA in the future, additional consultation with the USFWS would be required. As described in EIS Section 3.3 (Avian and Bat Species), a number of mitigation measures would be implemented to minimize or avoid impacts to avian and bat species, and a minimum of 2 years of standardized postconstruction avian and bat fatality monitoring would be implemented to assess actual avian and bat fatality rates and determine which adaptive management measures need to be implemented to reduce fatalities, if any. Bald and golden eagles are not listed under the ESA but are protected under the BGEPA; the USFWS issues ITPs for incidental take of eagles in accordance with the Eagle Permit Rule. As described in EIS Section 3.3.3.4 (Eagles, Compensatory Mitigation), "The USFWS will be responsible for making a decision on MVE's eagle incidental take permit application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines." Painting one turbine blade black was not analyzed in detail in the EIS because it would not be compliant with FAA regulations (see EIS Section 2.9.5 [Alternative Components]).
8629-5	Cathy Schiers	What are the mitigation plans if there is an oil spill and the oil seeps into the porous lava beds? The aquifer is right below those lava beds, and that is a concern for the health and safety of Idaho residents, plants, and wildlife.	A new issue was added to the EIS to address groundwater quality: Section 3.17.3 (Groundwater Quality). Also, see AIB-47 in EIS Appendix 3 (Issues Analyzed in Brief): How would inadvertent spills or leaks from the storage or application of herbicides or the use or production of hazardous materials and wastes during construction and operation affect surface water or groundwater quality?
9080-15	The Coalition to Protect America's National Parks	3. The DEIS contains confusing and inconsistent information regarding potential compensatory mitigation for Dispersed Environmental Justice Populations (the Japanese American Community and Native American Tribes) – DEIS Appendix B, Table App4-5, on Potential Compensatory Mitigation Measures, Items XIV-XVI indicates that MVE will provide the following compensatory mitigation to Environmental Justice Populations: • XIV. MVE would fund the design and preparation of an ethnographic study and report related to Minidoka National Historic Site. This would be accomplished in close coordinate with Japanese American Stakeholders and the National Park Service. • XV. MVE would fund the design and preparation of an ethnographic study and report related to Shoshone-Bannock Tribes and Shoshone-Paiute Tribes. This would be accomplished in close coordinate with these Native American Tribes. • XVI. MVE would establish a fund to be used based on recommendations from a committee that would be established and comprise Minidoka NHS stakeholders with an emphasis on including representatives of Japanese American organizations. Recommendations from the committee would focus on enhancing the fundamental values of Minidoka NHS so that it will continue to provide opportunities for commemoration and healing through pilgrimages and provide opportunities for bettering humanity as a site of	EIS Appendix 4 presents the compensatory mitigation measures in Table App4-5 as measures that "could be applied to alternatives if residual impacts are expected to remain after applicant-committed measures, required mitigation, and additional avoidance and minimization measures are implemented (BLM 2021). Potential compensatory mitigation in Table App4-5 could be included in compensatory mitigation plans if the BLM determines they are warranted." This is consistent with how the measures are presented throughout the Chapter 3 analyses; for example, Section 3.6.1.4.1 (Compensatory Mitigation for Dispersed Environmental Justice Populations) was revised to state that "the following compensatory mitigation measures could be applied to any action alternative if the BLM determines it is warranted." Under NEPA, the purpose of an EIS is to provide the BLM decision-maker, with enough information to make an informed decision on whether or not to grant the ROW, and whether or not to attach terms and conditions, including compensatory mitigation measures. This is why mitigation measures are presented as "potential" since the BLM has not yet made their decision on the requested ROW prior to issuing the ROD. Should compensatory mitigation be warranted, compensatory mitigation would be developed through consultation with consulting parties and government-to-government

Comment ID	Commenter	Public Comment	Response to Comment
		conscience. Recommendations from the committee may include but are not limited to the following: o Establishing conservation easements to preserve the visual character of the surrounding landscape o Removal of existing visual intrusions within close proximity to Minidoka NHS that take away from meeting its fundamental values o Increasing access to pilgrimages and educational materials that provide a better understanding of the history associated with Minidoka NHS The above section of Appendix B creates the impression that MVE would provide the listed compensatory mitigation regardless of which action alternative is selected. However, for the majority of impact topics discussed in Chapter 3 of the DEIS, BLM states, in effect, "that compensatory mitigation would not be warranted." The only two impact areas that could possibly result in compensatory mitigation for the Japanese American Community and Native American Tribes are "Cultural Resources" and "Environmental Justice and Socioeconomics." However, both Sections 3.5.6.4 and 3.6.2.4.2 in Chapter 3 state specifically that (for Cultural Resources and Environmental Justice and Socioeconomics respectively) the "compensatory mitigation measures could be applied to [only] Alternative B [but only] if the BLM determines it is warranted (see EIS Appendix 4)." (Emphasis added) These statements that "compensatory mitigation could apply [only] to Alternative B" are both confusing and concerning because BLM has elsewhere created an expectation among the Japanese American Community and Native American Tribes that the proposed compensatory mitigation measures would apply regardless of which action alternative is ultimately selected. BLM should correct the wording in these two sections of the DEIS (or in Appendix B, if needed) to accurately reflect BLM's intent about compensatory mitigation.	consultation as part of the NHPA Section 106 process under the HPMP of the PA (draft provided as EIS Appendix 8).
9080-38	The Coalition to Protect America's National Parks	D. Section 2.3.4 Avoidance and Minimization (p. 2-4) – This section provides a brief overview of the concept of mitigation, which is defined in the Council on Environmental Quality's (CEQ) NEPA regulations (40 CFR 1508.1(s)) as "avoiding, minimizing, rectifying, reducing over time, or compensating for impacts of a proposed action." In plain terms, there is a significant difference between "avoidance" (meaning "no impacts occur") and the other levels of "mitigation" listed in the CEQ definition, all of which would allow varying degrees of adverse effects. As we will discuss later in these comments, we are very concerned that throughout the DEIS BLM focuses primarily on avoiding only physical adverse effects to protected cultural and historic sites such as Minidoka NHS, the WRC, and Wilson Butte Cave. In contrast, all action alternatives would readily allow non-physical adverse effects such as major visual intrusions and noise that would adversely affect the protected sites. Later in this letter we will comment on the proposed mitigation measures, which are described in Appendix 4 of the DEIS.	The Mitigation Framework provided in EIS Appendix 4 (Mitigation) describes the BLM's mitigation hierarchy and differences between the types of mitigation (avoidance, minimization, rehabilitation, and compensatory mitigation).
9080-45	The Coalition to Protect America's National Parks	E. Section 3.5.6.4 Compensatory Mitigation for Cultural Resources (p. 3-188) – As background, see General Comment 3 above. This section of the DEIS states that "[e]ven with the implementation of avoidance, minimization, and mitigation measures, residual impacts to the Japanese American community and Native American Tribes could still occur." It goes on to include a confusing if not misleading statement regarding the applicability of compensatory mitigation under the proposed Programmatic Agreement (PA) described in Appendix 4. (The draft PA creates the impression that the compensatory mitigations measures would apply to any/all of the action alternatives.) However, p. 3-188 of the DEIS states: "The following compensatory mitigation measures could be applied to Alternative B if the BLM determines it is warranted (see EIS Appendix 4: Table App 4-5)." (Emphasis added) The statement that "compensatory mitigation could apply only to Alternative B" is both confusing and concerning because BLM has created an expectation among the Japanese American Community and Native American Tribes that the proposed compensatory mitigation would apply regardless of which action alternative is ultimately selected. BLM should correct the wording in this section of the DEIS (or in Appendix B, if needed) to accurately reflect BLM's intent about compensatory mitigation.	See response to comment 9080-15 (see in Table A-3cc, Mitigation – EIS Appendix 4).
9080-46	The Coalition to Protect America's National Parks	F. Section 3.6.2.4.2 Compensatory Mitigation for Dispersed Environmental Justice Populations (pp. 216-217) – This concern is similar to the above comment. With regard to the Japanese American Community, this section states that compensatory mitigation measures "could be applied to Alternative B if the BLM determines it is warranted." With regard to Native American Tribes, this section states that "[t]he following compensatory mitigation measure could be applied to Alternative B if the BLM determines it is warranted." (Emphasis added) These statements that compensatory mitigation could apply only to Alternative B are both confusing and concerning because BLM has created an expectation among the Japanese American Community and Native American Tribes that the proposed compensatory mitigation would apply regardless of which action alternative is ultimately selected. BLM should correct the wording in this section of the DEIS (or in Appendix B, if needed) to accurately reflect BLM's intent about compensatory mitigation.	Revisions were made in the EIS to these Compensatory Mitigation sections, as well as the measures in Table App4-5. Compensatory mitigation frameworks were developed and are provided in EIS Appendix 4: • Key Resources and Values Associated with Minidoka National Historic Site • Greater Sage-grouse • Big Game • Birds and Bats
9080-56	The Coalition to Protect America's National Parks	5. APPENDIX 4. Mitigation – Multiple tables in this appendix list numerous "applicant committed measures" that are purported to lessen the severity of the many adverse effects that would be caused by the Project. However, very few of the proposed mitigation measures actually result in the "avoidance" of adverse effects, even though "avoidance" is the most effective form of mitigation. For example, Table App4-2c lists measures #18-28 intended to reduce impacts related to "Visual Resources, Lighting, and EMF." The measures listed are generally common sense things like turning off unneeded lights at night; and painting facilities including the giant wind turbines with dull colors and/or non-reflective finishes, rather than bright colors or highly reflective finishes. While these measures undoubtedly would reduce unnecessary exaggeration of the visibility of the wind turbines (e.g., that could otherwise be caused by unnecessary lighting or extremely colorful or highly reflective paint jobs), they would do little to actually prevent or avoid significant visual impacts due in large part to the size, number, and proximity of the turbines to affected sites. Our observation has been that there is no such thing as a paint job that will make a 500-to-700 foot tall wind turbine blend into the background scenery, especially at the inadequate	See response to comment 9080-15 (see in Table A-3cc, Mitigation – EIS Appendix 4). Regarding additional consideration of avoidance measures, project redesign and the range of alternatives considered in the EIS incorporate additional avoidance and minimization of adverse effects to Minidoka NHS and a variety of other resources, such as other historic properties, although all historic resources are not fully avoidable by project adverse effects under any alternative. See response to comment 12177-1 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding setbacks as related to cultural resources.

Comment ID	Commenter	Public Comment	Response to Comment
		setback distances proposed in each of the action alternatives. The turbines will still be readily visible, especially in an open landscape such as that surrounding Minidoka NHS. True avoidance of visual impacts involving wind farms is primarily accomplished through siting decision(s), which is where this Project proposal falls short. BLM is considering a number of action alternatives that would allow multiple rows of very large wind turbines to be constructed in close proximity to significant historical and cultural sites.	
9080-57	The Coalition to Protect America's National Parks	In addition, Table App4-2j lists Applicant-Committed Mitigation Measures # 94-96 related to Cultural Resources. These include a "historic properties treatment plan (HPTP) and a paleontological resources treatment plan (PRTP) [that] would be drafted prior to construction." It is not clear from the description which entities would be involved in the preparation and/or review of the respective plans. In addition to BLM, the National Park Service, Native American Tribes, the Japanese American Community, and the Idaho State Historic Preservation Officer (SHPO), we ask that the Advisory Council of Historic Preservation71 (ACHP) be actively involved in the preparation and review of the respective plans. In total, the project is highly controversial and concerning because it presents so many potential threats to the preservation of historic properties and associated cultural resources within the Project area. It is essential that the programmatic agreement, treatment plans, mitigation measures, any related actions and processes developed to avoid or minimize adverse effects on historic resources are widely perceived as credible. We believe the best way to ensure credibility in this case is to have the active participation of the ACHP.	See response to comment 6900-1 (see in Table A-3ff, Consultation and Coordination). The ACHP is actively participating in the NHPA Section 106 consultation process for the project, including reviews of the PA as it continues to be developed, and the consideration of supporting documents specified by the PA, such as the HPMP and HPTPs.
9080-58	The Coalition to Protect America's National Parks	To repeat an earlier comment, the introduction to the section on Compensatory Mitigation beginning on p. App4-33 creates the impression that the potential compensatory mitigation measures listed in Table App4-5 (including measures XIV-XVI related to "environmental justice, cultural resources") could/would apply to any/all of the action alternatives. We call your attention to our previous comments about DEIS sections 3.5.6.4 (Cultural Resources) and 3.6.3.4.2 (Environmental Justice Communities) which, in contrast to Appendix 4, state that the proposed compensatory mitigation "could be applied [only] to Alternative B." We (again) request that BLM fix this discrepancy so that the intended application of compensatory mitigation for the Japanese American Community and Native American Tribes is clear and consistent throughout the EIS.	See response to comment 9080-15 (see in Table A-3cc, Mitigation – EIS Appendix 4).

1030-1	Linda Denning	Also, please consider that there is no good way to dispose of the massive blades should they ever need to be dismantled.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
1040-1	Name Not Provided	I also understand they leak oil and they need to have regular oil changes, what does this do to our land,	The Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]) describes BMPs and requirements that address how potential oil leaks or spills would be addressed.
1040-2	Name Not Provided	What do you do with them when the become outdated?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste), and see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
1042-25	WildLands Defense	Where will gravel come from and what is the pollution footprint– what other land will be destroyed for gravel alone? Where will all materials used in turbines and all other components originate, and what toxic pollution will be associated with mining and processing and what will be contaminated?].	Section 2.8 of MVE (2023) discusses the source and use of gravel.
10427-3	Jess Bartlett	How about the excessive number of wells that will be drilled for the incoming work force, and the strain that will put on our already limited water supply?	The use of groundwater wells is discussed in Section 1.3.11 of MVE (2023).
10471-4	Brett Lemmons	Have you ever heard a pinhole in a blade of a wind generator? It echoes for miles, how long would it take their maintenance crew to shut down this unit with a pinhole and repair it? The maintenance crews for the Hagerman Valley wind farm take 3 days to show up.	Maintenance and operation of the proposed facility are discussed in Section 4.0 of MVE (2023).
10508-2	Susan Johnson	And the proposed project is only to be in place for 34 years? All of this disruption and permanently ruining our public lands for thirty-four years? Who is going to do reclamation?	The authorization holder will be required to complete the reclamation. See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
1051-1	Bill Baker	1. My concern is that the wind turbines be located as close to the final users as possible. Routing long distance across uninhabited areas leaves the transmission line towers exposed to possible damage by groups like those that have been attacking electrical substations.	The market demand for renewable electricity is described in Section 1.2 of MVE (2023).
1051-2	Bill Baker	2. If these generators prove to be unprofitable and are abandon. Who cleans them up and at what cost to the tax payers?	See response to comment 12925-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
1071-2	Don Campbell	2) the Environmental Impact Statement should include how components of the wind farm will be disposed of after their useful life; who will pay for the dismantling and disposal.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).

Comment ID	Commenter	Public Comment	Response to Comment
11189-3	Anthony Lombardi	Wind turbines are also made with "Carbon Composite blades"... that go out of balance and must be replaced, which Mojave and Tehachapi, Calif. Have found out the hard way. Massive trenches were dug to " bury" the blades, which will leach chemicals from the adhesives and the materials themselves for years and years.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
11204-6	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Permittees are particularly disturbed by the lack of consideration and assessment as to timing in the DEIS. Timing is a material, critical element because it provides the necessary sideboard for how, if at all, the Permittees can sustain their respective livestock operations relative to the actual implementation of the construction phase, rehabilitation phase, operational phase, and decommissioning phase. The lack of disclosure as to the actual timing of each phase makes it effectively impossible for BLM to adequately assess livestock impacts, and also makes it effectively impossible for the Permittees to comment to the actions / mitigations currently considered and assessed in the DEIS.	See the Grazing Coordination Plan (Appendix S in MVE [2023]). MVE will coordinate timing specifics with the BLM and grazing permittees during all project phases.
11204-7	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	I. Lack of identified wind resource potential in the Project area. See 2021 Comments, pgs. 4-6. Summary: The DEIS needs to be revised to verify that a commercially viable wind resource potential exists to support the proposed Project based upon empirical evidence rather than vague claims. The 2021 Comments noted that there is an "apparent lack of wind potential within the Star Lake Allotment according to the U.S. Department of the Interior itself" and concluded that because "little or no wind potential exists, it seems the project is doomed at the outset." 2021 Comments, pg. 4. According to a Wind study report by the USDI, "the wind potential to support a Wind Project upon the public lands within the Star Lake Allotment is non-existent in some parts and low in other parts," 2021 Comments, pg. 5, while areas to the southeast and to the southwest of the Allotment have "Medium" and "High" wind resource potential, 2021 Comments, pg. 6. The DEIS did not adequately address this issue. The Project requires a viable wind resource potential to be successful. However, the wind resource potential to support a wind power generation project upon the public lands within the Star Lake Allotment was rated non-existent in some parts and low in other parts according to a 2005 Wind study report by USDI.3 In fact, the DEIS "tiers to the BLM's Final Programmatic Environmental Impact Statement for Wind Energy Development on BLM-Administered Lands in the Western United States (BLM 2005a)," DEIS, pg. 1-7, indicating explicit knowledge by USDI-BLM and by MVE of such wind study report, and such lack of wind resource within the Star Lake Allotment. The 2005 Wind study report found that areas outside the boundary of the Star Lake Allotment, i.e., to the southeast and to the southwest, have "Medium" and "High" wind resource potential. See 2021 Comments, pgs. 4-6. The DEIS and its supporting documents make some superficial claims that a viable wind resource potential exists to support the proposed Project. The Project's Plan of Development states: The proposed Project location was selected based on the quality of the wind resource in the area, the power markets accessible by existing and planned transmission lines in the area, the availability of suitable land, and the absence of land use constraints such as wildlife management areas, areas of critical environmental concern ("ACECs"), designated wilderness areas, wilderness study areas ("WSAs"), roadless areas, and other restrictive land use designations. DEIS, pg. 591 [Appendix 1, Plan of Development, pg. 3] (emphasis added). The plan of development for the project also states: MVE currently has eight (8) temporary preconstruction meteorological towers ("met towers") installed across the Project site to record wind conditions. MVE also deployed a LiDAR to record wind speeds at higher elevations and confirm other atmospheric conditions suggested by the met tower data. DEIS, pg. 645 [Appendix 1, Plan of Development, pg. 57] (emphasis added). However, despite these claims, the DEIS fails to disclose, or even to summarize, such purported "wind resource" or data to document that a commercially viable wind resource potential exists to support the proposed Project. The DEIS even admits that: Site-specific data for wind variability within the project area were not available to the BLM, but it is generally understood that the wind resource varies with topographic features and associated changes in elevation that are present across the project area. DEIS, pg. 2-17 (bold and underline emphasis added). This is analogous to BLM considering and assessing a FLPMA Road Right-of-Way across the public lands that is surrounded by private land owned by others, i.e., the non-applicant. If the applicant cannot get access across the adjacent private land, then BLM considering and assessing a FLPMA Road Right-of-Way across the isolated public lands is meaningless and a waste of public resources and time. In this case, if there is not a viable wind resource to support the proposed wind Project, considering and assessing a Wind Right-of-Way is meaningless and an entire waste of public resources and time. The admitted lack of "[s]ite-specific data for wind variability within the project area," DEIS, pg. 2-17, is a fatal flaw in the NEPA process, given that the: Alternatives were developed using subsets of the Proposed Action siting corridors because the Proposed Action siting corridors were developed considering wind resource data and requirements needed to develop a technically feasible project. DEIS, pg. 2-1. Given the admitted lack of "wind resource data" and given the best evidence, i.e., 2005 Wind study, has rated the Project area as having non-existent or low wind resource potential for wind power projects, it goes without saying that the proposal is damned before it even gets started. Further, vague statements as to any claimed "wind resource" currently in the POD are inadequate, particularly for NEPA purposes.	See Section 1.2 of MVE (2023). The BLM is evaluating MVE's project application. MVE has gathered meteorological information from their eight towers across the project. This information is more current than information presented in the 2005 wind study (BLM 2005a). The BLM considered wind resource information that was presented by staff from the National Renewable Energy Laboratory (NREL) and downloaded from Global Wind Atlas (2023). The BLM reviewed the modeled average wind speed at 100 m for the analysis area and the Proposed Action turbine corridors overlap with the higher values from this information. Global Wind Atlas. 2023. Welcome to the Global Wind Atlas. Available at: https://globalwindatlas.info/en. Accessed December 28, 2023.
11204-10	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	V. Lack of specific information as to planning and timing during the construction phase and operation & maintenance phase of the Project. See 2021 Comments, pg. 4. Summary: The DEIS needs to be revised to disclose and analyze a "worst-case scenario" that includes site-specific impacts that would result from the proposed Project assuming the maximum of 400 3-MW wind turbines or 349 6-MW wind turbines were installed at specified "final" locations that just / barely comply with the minimum setbacks evaluated. In other words, such "worst-case scenario" analysis would project a "final" location for every wind turbine that would be installed under a 3-MW or 6-MW operational scenario to just / barely achieve compliance with the minimum setbacks established by the DEIS sideboards, and then disclose the impacts that would result from such worst-case wind turbine siting locations. Page 4 of the 2021 Comments acknowledged receipt of the April 5, 2021 Notice	The EIS describes the assumption used for construction timing and duration.

Comment ID	Commenter	Public Comment	Response to Comment
		("Notice"), relating to the proposed Project (Right-of-Way Serial No. IDI-39174) impacting, among other lands, the public lands in the Star Lake Allotment. The Notice invited comments on "site-specific issues on how the proposed project may impact your grazing operations" including "on-the-ground grazing mitigation, such as grazing practices, seasonal movements, range improvements (e.g., moving fences, water distribution), rerouting access, etc.". The 2021 Comments noted that it is a difficult challenge to provide site-specific comments regarding such grazing matters when the environmental documentation regarding the Project provides little or no site-specific information relative to the Star Lake Allotment particularly as to timing of the actual implementation of the construction phase, rehabilitation phase, operational phase, and decommissioning phase. 2021 Comments, pg.4.	
11204-12	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	VI. The Construction phase is likely to exceed the projected 2-year timeframe, see 2021 Comments, pgs. 4 & 16, and related Permittees' request to divide the Construction phase into three subphases within the Star Lake Allotment. See 2022 Comments, pgs. 4-5. Summary: Assuming and subject to the disclosure of the location and timing specifics, as addressed in the above Sections, the DEIS needs to be revised to reduce resource impacts during construction by stipulating that the Project avoids construction activities when road-bases and soils are saturated and prone to muddy conditions (resulting in excessive rutting, displacement, and compaction) and avoids periods when soils are likely frozen and would require heavier equipment to break loose and work. The DEIS should limit construction (and decommissioning) activities to the period between June 1 and October 31 each year. Construction (and decommissioning) activities within the Star Lake Allotment should be spread out over at least a 3- year construction period with one of three (3) subphases being constructed between June 1 and October 31 each year (if the Project is authorized). Any shorter construction period within the Star Lake Allotment would be incompatible with, or excessively disruptive to, ongoing grazing operations. If the 4-year construction timeframe within the Star Lake Allotment consisting of 3 consecutive 16-month periods requested under the 2022 Comments is objectionable to MVE, the DEIS should be revised to a 3-year construction period within the Star Lake Allotment with one of the three subphases being constructed between June 1 and October 31 each year (if the Project is authorized). We view any shorter construction period within the Star Lake Allotment as being incompatible with, or excessively disruptive to, our ongoing grazing operations. The 2021 Comments and 2022 Comments opined that it was unrealistic to anticipate that the project construction phase could be completed within a 2-year timeframe (2021 Comments, pgs. 4 & 16 [and 2022 Comments, pg. 3, footnote 4]) during a 16-month period from June 1 in year 1 through September 30 of Year 2 (2022 Comments, pg. 4). Instead, the 2022 Comments requested that the construction phase of the Project be divided into three (3) subphases within the Star Lake Allotment, as follows: • Subphase 1 = public lands within the southeastern portion of the Star Lake Allotment during "one" 16-month construction period (2022 Comments, pg. 4); • Subphase 2 = public lands within the northeastern portion of the Star Lake Allotment during "another" 16-month construction period (2022 Comments, pgs. 4-5); and, • Subphase 3 = public lands within the western portion of the Star Lake Allotment during "one" (a third) 16-month construction period (2022 Comments, pg. 5). Thus, the Permittees requested in their 2022 Comments that the construction phase of the Project be divided into three (3) subphases within the Star Lake Allotment and anticipated that such construction subphases would spread the construction over three separate 16-month periods for an overall construction phase lasting 48 months (a 4-year period). The DEIS did not adequately address these issues. While the DEIS states that the construction schedule within the Star Lake Allotment would be divided "into three subphases" so that construction occurs in approximately 1/3 of the Star Lake Allotment at any given time (DEIS, pgs. 2-3, 3-233, and 3-279), the DEIS still lacks specific information regarding planning and timing relative to these three construction subphases. Similarly, the DEIS omits any consideration and assessment of the same relative to the rehabilitation phase. Furthermore, the DEIS anticipates that the three construction subphases within the Star Lake Allotment will still be completed "during the 2-year construction phase" originally projected for the Project (DEIS, pg. 3- 233). Again, the Permittees urge that the construction phase of the Project within the Star Lake Allotment, if authorized, be spread over a longer timeframe to reduce the potential for conflicts between construction activities and livestock operations and to reduce the amount of temporary infrastructure necessary during construction. Timing is a material element because it provides the necessary sideboard for MVE to plan and implement construction and rehabilitation, and more importantly, it provides the absolutely necessary sideboard for the Permittees as to notice and planning of their respective livestock operations. Permittees cannot be reasonably asked to accommodate any construction or rehabilitation plan without significant pre-notice, i.e., at least 1-year. Also, while the Permittees request that the construction schedule within the Star Lake Allotment be divided "into three subphases" to spread construction over a timeframe longer than the anticipated 2-year period to reduce potential conflicts between construction activities and livestock operations, an excessively lengthy construction period would also be problematic. Some Permittees heard suggestions from BLM personnel that the actual construction period for the proposed Project may end up spanning a period as long as 20 years. Any construction period that exceeds 4 years is totally unworkable for the Permittees as such long-term interruptions to their livestock operations would irreversibly destabilize them, even to a degree that they could be vulnerable to bankruptcy. BLM has a wealth of knowledge as to grazing management and grazing systems. Allotment Management Plans and Planning are even a cornerstone element within the Federal Land Policy and Management Act, 43 U.S.C. § 1752(d). This would factually and legally indicate that BLM is capable of demanding from the applicant the specifics as to location and timing as to all phases from which BLM, Permittees, and Interested Publics could then comment to develop an AMP, assuming such specifics are compatible with maintaining and sustaining the Permittee's current livestock operation throughout each of the	These comments have been considered in adjustments made to construction timing and duration within the Star Lake allotment.

Comment ID	Commenter	Public Comment	Response to Comment
		four (4) phases. Again, the lack of specifics as to location and timing unreasonably prejudices this entire process as against the Permittees and for the applicant, i.e., MVE, i.e., Wind Company.	
11204-30	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	E. Permittees requested for a "25 MPH speed limit" upon wind project roads See 2022 Comments, pg. 6. The 2022 Comments requested establishment of a "25 MPH speed limit" upon wind project roads during pre- and postconstruction phases and during the operational phase of the proposed Project (2022 Comments, pg. 6). The DEIS does not adequately address this issue. The DEIS reports that "speed limits" would be implemented to reduce potential impacts to livestock grazing from project-related traffic (DEIS, pg. 3-281) but fails to specify what speed any such limits would be set to for particular Project roads or road types. The DEIS references applicant-committed measure 33 and mitigation measure N "which establish speed limits on BLM roads and require project personnel to adhere to them" (DEIS, pg. 3-292) but again fails to specify what any such speed limits would be. The DEIS states that during construction "personnel would also be instructed and required to adhere to speed limits commensurate with road types, traffic volumes, vehicle types, and site-specific conditions to ensure safe and efficient traffic flow" (DEIS, pg. 3-371) but again fails to specify what any such speed limits would be set to for any "road types, traffic volumes, vehicle types, and site-specific conditions…". The DEIS reports "Project personnel during all project phases would be required to drive 25 mph or less on non-public project roads, be alert for wildlife, and use additional caution in low-visibility conditions when driving any vehicle (applicant-committed measure 33)." DEIS, pg. 3-97 (emphasis added). See also DEIS, pgs. 3-123, 3-457, 3-478, J-8, M-58, T-32, T-33, U-a-8, App3-5, App3-18, App3-22, and App4-6 (applicant- committed measure 33). The DEIS further states that MVE would "enforce a 25-mph speed limit on private project access roads (applicant-committed measure 33)." DEIS, pg. 3-504 (emphasis added). These DEIS statements indicate that a 25-mph speed limit would only be established and enforced for non-public (private) Project roads and do not specify any speed limits that would be established for roads on BLM administered public land or other public roads. The only statement in the DEIS that implies that a 25-mph speed limit might be established and enforced on all Project roads is in Appendix M where it is reported that all Project "personnel will obey posted speed limits (25 mph or less) on Project roads." DEIS, Appendix M, Lava Ridge Bird and Bat Conservation Strategy, pg. M-59). However, Appendix M previously explicitly states that the 25-mph speed limit is applicable to "non- public Project roads." DEIS, Appendix M, pg. M-58.	Specific speed limits are identified in measures evaluated in the EIS.
11204-32	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The Plan of Development attached to the DEIS includes Appendix F (Health and Safety Plan) which reports that the ROW associated with the proposed Project "will be maintained in a sanitary condition at all times" with all waste materials "disposed of at an appropriate waste disposal site" and defines "waste" as "all discarded matter including, but not limited to, human waste, trash, garbage, refuse, oil drums, petroleum products, ash, and equipment that are a result of the Project Team's activities." DEIS, pg. 694, Appendix 1, Plan of Development in its Appendix F, pg. F-3. Such waste disposal commitment would appear to indicate that MVE "assumes the cost and obligation" for "garbage removal adjacent to the roads" and all "as constructed" Project-related facilities during each phase of the proposed Project (2022 Comments, pgs. 7 & 9). The DEIS needs to clarify that MVE "assumes the cost and obligation" for "weed control" and "garbage removal adjacent to the roads" and all other Project-related facilities during each phase of the proposed Project.	The terms and conditions related to weed control and garbage removal are described within MVE (2023) and additional measures in EIS Appendix 4 (Mitigation).
11204-34	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	Table App4-2g (Applicant-Committed Measures – Fire) reports under Measure Number 50: "A fire protection and prevention plan would be implemented and would outline responsibilities, notification procedures, fire prevention measures and precautions, fire suppression equipment, initial response procedures, and post-fire rehabilitation strategies related to the Project" (DEIS, pg. App4-8). It is unclear if the responsibilities outlined by the fire protection and prevention plan include financial responsibilities associated with suppression and rehabilitation for Project-related fires. Table App4-2g reports under Measure Number 51: "The project team would be responsible for taking immediate steps to suppress a Project-related fire and would be responsible for post-fire rehabilitation" (DEIS, pg. App4-8). It is unclear if these project team responsibilities include paying for the costs associated with suppression and rehabilitation for "Project-related" fires. Furthermore, the DEIS does not appear to contain any measures to ensure that MVE is responsible for paying for the value of AUMs lost due to forage reductions from future "Project-related" fires. The DEIS needs to clarify that MVE would be responsible for paying for the costs associated with suppression and rehabilitation for "Project-related" fires, would be responsible for paying compensation for any lost AUMs resulting from "Project-related" fires, and would be responsible for paying compensation for any livestock injured or killed due to any "Project-related" fires.	Table App4-2g (in EIS Appendix 4 [Mitigation]) includes applicant-committed mitigation measures regarding fire and fuels management. Specifically applicant-committed measures 49 through 51 provide details on the [MVE] project team responsibilities for initial suppression and response. Per the BLM Fire Planning Handbook (H-9211-1), fire trespass refers to the occurrence of unauthorized fire on BLM lands where the source of ignition is a result of human activity and there is evidence of negligence or intent. For human-caused fires where negligence or intent can be established, actions must be taken to recover the cost of suppression activities, emergency stabilization and rehabilitation treatments, and damages to the resources and improvements. The BLM investigates and pursues cost recovery of any liable individual; this could include MVE. Also see response to comment 11204-14 (see in Table A-3p, Livestock Grazing), EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics), and the Grazing Coordination Plan (Appendix S in MVE [2023]). Permittees would not be compensated for minor permanent reduction in forage availability from the project (see EIS Appendix 12 [Historical Livestock Actual Use and Utilization]). Fire rehabilitation seedings have increased forage production across the project area, such that there is additional abundant forage available, above what is currently permitted. There is more forage available than what is currently in use and beyond what would be permanently affected. Following the Idaho Open Range Law (Idaho Code 25-2118), if project traffic injures or kills livestock, MVE would compensate those grazing permittees for injured or lost livestock.
11204-43	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	XI. Lack of information on decommissioning the wind project after its expected life has elapsed. See 2021 Comments, pg. 18. The 2021 Comments asked if the proposed Project is authorized, "what will happen when the useful life of the project ends or the economics result in the need to abandon the project" and "what is the plan for decommissioning?" The DEIS devotes significant space to discussing the decommissioning or final reclamation phase of the proposed Project and analyzing related impacts. However, the DEIS information regarding the decommissioning phase generally contains the same deficiencies that are discussed in detail above with respect to the construction phase.	As described in the EIS, the potential for impacts from the decommissioning phase would be similar to those described for the construction phase. Also see response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11222-2	Donald Campbell	I have not seen the requirement for "spinning reserve" addressed in any media or other informational sources. Wind across southern Idaho is not necessarily predictable. As such, any reliance on wind power of a project this	See Section 1.2 of MVE (2023). MVE's project aides in President Biden's administrative priorities as well as numerous state goals of using renewable energy sources. While wind may be variable, the project will reliably

Comment ID	Commenter	Public Comment	Response to Comment
		size, or any size for that matter, requires a source of dependable power at least as large as that proposed. Thus, Idaho Power and/or another entity will need to have a dependable source of electrical capacity, in excess of that proposed by Lava Ridge, off-line but ready to deliver power at a moment's notice. The cost of providing "spinning reserve" is a requirement and cannot be ignored. Because electrical power cannot be effectively stored, a separate and dependable power plant has to be running 24/7/365. In other words, a coal-fired, natural gas fired, or nuclear plant has to be on-line and able to fulfill all electricity requirements when the wind stops blowing. This effectively nullifies any "climate change" benefits of having wind as a power source.	and economically produce renewable energy for power markets in the western United States, including those markets accessed via interconnection to the existing Midpoint Substation, or to a new substation, ultimately making the transmission of energy more reliable as energy use increases. GHG emissions that would be avoided if the project were constructed are described in EIS Section 3.4 (Climate Change and Greenhouse Gases).
11278-2	Daniel Eyre	This is only the first project. Blasting in this area will damage the cap on the aquifer, I am a retired army engineer, demolitions specialist and this was my specialty. These companies don't care about Idaho, this project will destroy our environment, just looking at the mortality rates will tell you this. This company, will declare bankruptcy at the end of the wind farm life and will leave Idaho tax payers with the burden of cleanup. And, has anyone noticed that is no recycle program for any of the windmills or materials?? Just some thoughts on phase one of a four phase program, which a lot of people do not know of.	See the Blasting Plan Methodology (Appendix I in MVE [2023]). The plan outlines how the blasting plan will be developed in coordination with the BLM to mitigate risks and potential impacts associated with blasting procedures. Overall, MVE (2023) includes several environmental protection measures to be implemented to mitigate impacts to water sources and wildlife. As stated in the environmental protection measures, blasting will avoid ground blasting within 1,000 feet of waterbodies and wells to the maximum extent possible. Regarding clean-up, MVE (2023) includes several appendices, including the Decommissioning Plan (Appendix L in MVE [2023]) and the Reclamation Plan (Appendix E in MVE [2023]), describing the decommissioning and reclamation of disturbed sites with goals to reclaim disturbed areas to conditions similar to the surrounding areas at time of reclamation with specific reclamation standards. The final Decommissioning Plan will be approved by the appropriate state and federal agencies, including the BLM. Additionally, MVE states they will prioritize the re-use, recycling, or scrap value of decommissioned project components as much as possible. See Section L-2 of the Decommissioning Plan that specifically discusses how decommissioned project components will be handled.
11285-1	Jerry K Dodds, Joellen Dodds	When they are no longer useful, how will they be removed? It will be a huge undertaking and more expensive than probably anticipated. There is better, new, technology available. Why is it not being esplored?	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11188-5 (see in Table A-3jj, Legal or Policy Compliance).
11290-1	James Keating	The true environmental impact of products must be considered from cradle to grave - and that includes recycling and disposal. In fact. we have yet to devise any way to adequately dispose of or recycle wind turbines. Metal can be recycled but the composite blade material cannot. These will all have to be dissambeled buried somewhere. Where will that be? That will requre destruction of yet more land and ecosystems. Large windmill farms will mean large windmill graves at their end of use. How about all of the (fossil) energy that goes into production, installation, repair, and decommission of the many, many (hundreds of miles) of these towering turbines and high voltage transmission lines that must be used to connect these turbines? Again, this information is purposfully missing from the discussion.	See responses to comment 11344-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1) and comment 12976-12 (see in Table A-3f, Climate and Greenhouse Gas Emissions) regarding lifecycle emissions from wind energy. See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) regarding turbine disposal.
11313-1	Name Not Provided	The Lava Ridge Project will have to take down and do some thing with the Windmill Blades and towers as they break down and are not longer project worthy. WHERE ARE THEY GOING TO BURRY ALL THAT OUT DATED AND USELESS EQUIPMET? What part of ranch and farm land will they need to use as there is a large mass of towers and blades to be installed with this project. The old mine shafts are not a very good idea that use either.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). See Section 6.0 of MVE (2023) for representative drawings and figures of project components.
11344-1	Richard Williams	First, these giant wind turbines are not carbon or oil neutral. The entire premise behind the efficiency of the these machines is skewed. By the times the machines would create more energy than it took to create them, the machines are typically needing major repairs or have fallen apart. This EIS fails to address the impact of continual repair and degradation of the blades where small erosion of surfaces will drip on the land and leach into the soil.	According to references summarized in NREL (2021), total GHG lifecycle emissions from wind power energy are estimated at 13g CO2e/kWh, whereas natural gas, oil, and coal are estimated at 37, 65, and 77 times greater, respectively. Other renewable energy sources range from 8 to 52g CO_2e/kWh, and nuclear is estimated at 13g CO_2e/kWh. Also see response to comment 11667-5 (see in Table A-3l, Hazardous Materials and Solid Waste) regarding leaks and spills from turbines and the response to comment 11686-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1) regarding leading-edge erosion and the potential for soil contamination. National Renewable Energy Laboratory (NREL). 2021. LifeCycle Greenhouse Gas Emissions from Electricity Generation: Update. Available at: https://www.nrel.gov/docs/fy21osti/80580.pdf. Accessed December 28, 2023.
11360-2	Sergio Arroyo Jr.	"Measure i: Blasting would not occur on days where wind speeds are expected to exceed 25 mph" DEIS V 1, 3-20. Idaho wind speeds vary in seconds, do they receive meteorological updates every second? Do they have a private fire crew on hand for every blast or do they rely on the BLM and taxpayer funded fire suppression? If they have a fire outbreak, will they reimburse the taxpayers since they are a private company, fire suppression should not be funded by taxpayers.	Wildfire ignition, spread, response, and suppression are analyzed in detail in EIS Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression). Specific mitigation measures that would be implemented to minimize or avoid affects associated with project-related wildfires are listed in EIS Appendix 4 (Mitigation) and in Section F-6 (Fire Protection and Prevention Plan) in the Health and Safety Plan (Appendix F in MVE [2023]). Section F-6 also describes each entities responsibilities in the event of a project-related wildlife (see Section F-6.1). Additional fire protection measures specific to blasting are described in Section I-5.2 the Blasting Plan Methodology (Appendix I in MVE [2023]), which include posting fire suppression personnel at the blast site during high fire danger periods and prohibiting blasting during extreme fire danger periods. Blasting personnel will be equipped with portable weather stations (e.g., Kestrel), which allow wind speeds to be measured at the blast site. The MVE project team is responsible for initial fire suppression activities. Applicant-committed measure 50 states “The project team would be responsible for taking immediate steps to suppress a Project-related fire and would be responsible for post-fire rehabilitation. The project team would take aggressive action to prevent and suppress fires on and adjacent to the project areas. If a fire starts in the project area, the project team would initiate and implement fire suppression activities until relieved by the appropriate fire agencies. Fire suppression personnel and equipment would be dispatched by the project team within 15 minutes from the time a fire is reported.” The BLM is typically the primary fire responder on lands managed by the BLM, even when private infrastructure that poses heightened wildfire risk is situated on it. Currently, in addition to the BLM, rangeland fire protection associations (RFPAs), and rural volunteer fire departments throughout the project area also provide structural

Comment ID	Commenter	Public Comment	Response to Comment
			fire protection and wildland fire initial attack within their jurisdictional boundaries. The closest forces concept, regardless of agency, is used to minimize response times to an incident on the BLM lands in the project area. See response to comment 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1) regarding financial responsibility for fire suppression.
11360-4	Sergio Arroyo Jr.	What are the credentials of the blaster, does he have experience in subsurface blasting? His credentials need to be scrutinized for the necessary experience and training for this specific depth. To put it in perspective, just because a guy has been blasting for 30 years doesn't mean he knows how to blast underwater. Local blasters largely have experience at shallow depth for footings, ponds, irrigation lines, and above ground road construction to remove rock, not underground over aquifer.	See the Blasting Plan Methodology (Appendix I in MVE [2023]). Blasting will comply with all applicable permits and laws, including the credentials of the blaster.
11372-3	Jamie Kohtz	The need for clean energy is actually causing tremendous waste. The turbine blades which are not easy to recycle, are piling up in states all over the US. Some are buried, while others are just sitting in piles at sites. The EIS does not address cleanup, recycling, etc. Where will the turbines be taken during decommission? Dumped in the desert? Idaho landfills? The waste and damage this does to the environment does not justify the clean energy gained from a windmill.	See responses to comments 11873-7 and 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11405-1	Gena Anderson	I have several concerns regarding this project, but want to focus on what happens to these wind turbines when they no longer operate. My understanding is that they are not recyclable, so where do they go? And will the concrete bases become a permanent fixture to our landscape?	See responses to comments 11873-7 and 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11411-4	Rayma Cates	Large transmission lines create an additional fire hazard for Idaho's farm and range land.	See the Health and Safety Plan (Appendix F in MVE [2023]). Section F-6 details Fire Protection and Prevention Plan. This plan details measures that will reduce the risk of starting fires and how to suppress fires in the event one does occur.
11411-7	Rayma Cates	Windfarms have a limited useful life and the land will not be returned to it's original condition.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). See also the Reclamation Plan (Appendix E in MVE [2023]).
11428-1	David Briggs	End of life for wind energy means dealing with replacing windmill parts every so many years. Blades aren't recyclable. They're huge.	See responses to comments 11873-7 and 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11463-1	Diane Christiansen	The proposed electric output is unproven and will not benefit Idaho.	See MVE (2023), Section 1.3 (General Facility Description, Design, and Operation), which discusses estimated output.
11466-1	John Arkoosh	The DEIS does not sufficiently evaluate the hazards of Ice throw, to humans and animals in the project area. https://www.americanexperiment.org/mn-wind-turbines-shut-down-over-safety-concerns-from-ice-updated/ https://savethehuronmountains.org/2018/06/26/a-wind-turbine-flings-400-lb-chunk-of-ice-1000-feet/ https://www.windsystemsmag.com/construction-24/ https://stopthesethings.com/2018/02/22/deadly-cool-wind-turbine-throws-ice-chunks-into-us-college/	Impacts to human health and safety are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-10, AIB-11, AIB-12, and AIB-13. In response to public comments, AIB-14—"Would ice throw or ice shed from turbine blades pose risk of injury to workers and the public?"—has been included in the final EIS.
11487-3	Idaho Noxious Weed Control Association	However, the INWCA is concerned about the unforeseen effects from the disruptions to the environment, and movement of noxious weeds and invasive species across the landscape. If this project does take flight, the INWCA would strongly urge that the applicant or property owner take sufficient steps to create and follow a detailed plan to prevent, control and if it should occur, eradicate noxious weeds in the disturbed areas. [...] The Draft Environmental Impact Statement provides an overview of the noxious weeds and invasive species located in the project area. See Lava Ridge Wind Project, Draft Appendix R: Noxious Weed Management Plan. This plan is a starting point but needs to have the ability to adapt to current needs. It should be noted that there are always new chemistries emerging alongside innovative techniques on how to manage noxious weeds. Since this project will likely take years to complete, the management plan should provide flexibility for notifying the applicant of new species, and adapting or creating Best Management Practices for the applicant to stay up to date on preventing and controlling noxious weeds.	The most current version of the Noxious Weed Management Plan (currently Appendix R in MVE [2023]) will be provided with the final EIS. This is a draft plan, and prior to construction, the BLM would approve MVE's final plan.
11491-28	Dean Dimond, Jennie Bateman	2. no detailed description of maintenance and turbine failures,	Project O&M is described in EIS Appendix 11 (Project Elements Common to All Action Alternatives) and MVE (2023).
11491-36	Dean Dimond, Jennie Bateman	27. Disposal plan for retired turbines and all wind generation parts,	See Section F-5 (Waste Management Plan) of the Health and Safety Plan (Appendix F in MVE [2023]). See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (see in Table A-3l, Hazardous Materials and Solid Waste).
11496-4	Danielle Gunn	The project will also affect rural communities and how they currently function. Magic Valley Energy (MVE) has conducted reasonable outreach to affected permittees, rural communities, and other public entities to mitigate the negative impacts of the project. However, no contingencies have been developed to address unforeseen impacts. It is pertinent to provide flexibility to land users, particularly permittees, when unforeseen damage and impact occur. The final EIS must include a section for managing unforeseen or unexpected problems.	As described in the Grazing Coordination Plan (Appendix S in MVE [2023]): "During the construction and reclamation periods, MVE will provide a rangeland coordinator to act as a single point of contact for grazing permittees should issues arise during these periods of the project. The rangeland coordinator will manage the resolution of any project-related damages to range improvements and livestock conflicts with project activities. The rangeland coordinator will maintain frequent communications with grazing permittees to provide advance notice of construction plans in actively grazed pastures, ensure awareness of stockwater pipeline locations and functionality, ascertain permittees' plans for livestock movement between pastures, and undertake those actions deemed reasonable to facilitate a cooperative use of the public lands by both the grazing permittees and the project. The rangeland coordinator will also coordinate with the construction contractor to take corrective actions when dust emissions from construction activities are elevated, and to inform construction crews regarding best practices for construction tasks that occur in proximity to livestock."

Comment ID	Commenter	Public Comment	Response to Comment
			Impacts to livestock grazing and rural communities are disclosed in EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics) and EIS Section 3.6 (Environmental Justice and Socioeconomics). Also see AIB-12, AIB-16, and AIB-20 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). See also responses to comments 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
11496-10	Danielle Gunn	The DEIS needs to identify who will be responsible for enforcing the EIS and Grazing Coordination Plan. The DEIS should analyze and answer the following questions: • Who will inspect equipment for weed seeds and hazardous materials? • Who will ensure weed free materials are being used so invasive and/or noxious plant and insect species are not spread to pristine areas? • Who will provide communication to permittees and how their livestock will be managed during construction phases? • How much time will be given for livestock permittees to move livestock when necessary? The DEIS and Grazing Coordination Plan state MVE will pay for all range improvements. However, it is not clear if MVE will pay for power bills for pumping water and other unforeseen expenses that occur as a result of disruption to our current livestock grazing practices.	The Construction Monitoring Plan (Appendix P in MVE [2023]) and the Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) describe the procedures for implementing the mitigation measures described in MVE (2023), including the Grazing Coordination Plan (Appendix S in MVE [2023]) and EIS Appendix 4 (Mitigation). EIS Appendix 4 has been revised to include additional project-specific mitigation measures that provide further details on clarifications on required components of the Environmental Compliance and Monitoring Plan, the responsibility of MVE's compliance manager to monitor for and enforce compliance with required mitigation measures, and annual reporting requirements. Also see response to comment 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1). Regarding power bills to operate water pumps, see MVE (2023) Section S3.1. The rangeland coordinator will manage the resolution of any project-related damages to range improvements and livestock conflicts with project activities.
11504-2	Gary Smith	Until the full extent of potential damage to the aquifer can be determined a lease agreement should not be approved. The current Terms and Conditions do not cover the total damages and until fully understood this lease agreement should not be approved.	If approved, the terms and conditions will be included in the ROD after the final EIS and additional BLM-required stipulations are determined.
11516-1	Liz Niccum	I have lived here in this valley for 18 years and I am a meteorologist. I watch the weather daily, I pay attention to the effect the Magic Valley has on weather systems and for the what kind of long range weather scenarios form during the different seasons. The Magic Valley is located at the widest part of the terrain in Southern Idaho and storms tend to weaken here. In the summer, we have persistent days of no winds. Will a wind farm produce sufficient energy to justify its presence here? Will non-renewable fossil fuels come to the rescue when wind production is low? Will intense winds aloft stress and then topple the massively tall towers as has happened in other countries?	Applicants are required to demonstrate financial and technical capability as part of the BLM ROW application process. MVE (2023) Section 1.6 (Financial and Technical Capability of Applicant) provides this documentation.
11534-17	Matt Arnold, William Eubanks	The DEIS Fails to Examine the Project's Risk of Ice Shedding and Ice Throw, Including Strategies to Mitigate that Risk As with any tall structure built in Idaho, wind turbines can and do accumulate ice when ambient temperatures reach freezing or near-freezing temperatures. As temperatures or operating conditions change, this ice may then be "shed" from or "thrown" by the turbines. This has serious safety implications for those people and livestock nearby the Project site, as "[a]ny ice that is accumulated may be shed from the turbine due to both gravity and the mechanical forces of the rotating blades." David Wahl & Philippe Giguere, Ice Shedding and Ice Throw – Risk and Mitigation, GE ENERGY, https://invent.ge/3nYqk25 (last visited Apr. 11, 2023). In fact, "rotating turbine blades may propel ice fragments some distance from the turbine—up to several hundred meters," which "may cause damage to structures and vehicles, and injury to site personnel and the general public, unless adequate measures are put in place for protection." Id.; see also Colin Morgan et al., Assessment of Safety Risk Arising from Wind Turbine Icing, BOREAS IV, March 1998, https://bit.ly/3MA5eBF (proposing guidelines to address turbine icing risks). This danger is increased by the fact that the Project includes turbines that are significantly larger and will operate at a higher speed than any existing wind project. The DEIS does not examine the Project's potential for ice shedding or throw, or how these risks can be mitigated. This should be addressed in the final EIS.	See response to comment 11466-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11535-68	Steven Andersen	Moreover, the DEIS does not speak to the type of roads that will be constructed or what materials will be used for construction. Presumably, sand, gravel and quarry stone would be needed during the construction phase. These materials would most likely be mined as close to the potential wind energy development site as possible. If existing quarries were not used to provide these resources, excavation from a new source would disturb the land surface…creating the potential local soil erosion. Thus, as described in the opinion from Civil Science (Exhibit 51), road construction has a much wider impact than is outlined in the DEIS.	See response to comment 11499-1 (see in Table A-3aa, Wildlife, including Big Game) for a description of the analysis of access road construction and improvements in the EIS. Refer to the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]) for details on road design and construction.
11535-119	Steven Andersen	Without engineering, turbine models, and siting specifics, the wake effects and consequent performance of the turbines cannot be known or analyzed. Wake effects can significantly decrease power production and increase electricity costs.351 Wake losses occur when wind speed is below the rated value and turbines are partially aligned to the angle of the incoming wind. Wake effects are complex and involve a variety of factors including turbulence and rotation; cumulative effects; distance between turbines (wake increases when wind turbines are placed in close proximity to avoid land and transmission line constraints).352 Wake effects can degrade wind farm efficiency by 40%.353 As discussed in our comments regarding site suitability, anticipated wind speeds in the proposed project area are anticipated to be deficient, and there are no specifics regarding siting or models of the turbines, let alone the necessary detailed analysis of predicted wake measurements to gauge productivity, whether the project is even "efficient" and to assess potential mitigation measures against underperformance.	As described in Section 1.3.4 of MVE (2023): "Several factors influence the number and size of wind turbines for any given project and make it impractical to identify with certainty the exact characteristics of the turbine during the early development stage. Manufacturers' advancement in turbine technology during the wind project development period can offer opportunities to deploy more efficient models that are better suited to the Project area's wind resource. Ultimately, the selection of a specific turbine model is an iterative process that considers the wind resource, siting constraints, mitigation requirements, and the timing of a specific turbine's availability in relation to the construction schedule. While the specific turbine model and its associated size characteristics will not be known until late in the development phase, MVE is able to define the anticipated range of potential wind turbine units that may be sited within the Project including the number of units as well as a range of key sizing characteristics." As described in Section 1.3.5 of MVE (2023): "The preliminary turbine locations have been proposed within siting corridors to allow for the flexibility to microsite individual turbines based on site-specific engineering or resource constraints. . . . Should MVE identify an engineering issue within the proposed turbine locations, or determine that relocating proposed turbines to alternate turbine areas will increase project efficiency, MVE may elect to make that adjustment. . . . Final

Comment ID	Commenter	Public Comment	Response to Comment
			placement of the Project components will be informed by environmental constraints and site-specific engineering considerations including, but not limited to, geotechnical, topographic, and wind resource properties." As described in Alternatives Considered by MVE (Appendix C in MVE [2023]), MVE considered multiple sites for the project and selected this location with the help of the latest computer modeling software and assistance from leading consultants in meteorology and wind development. Emphasis was also placed on avoiding impacts to important and priority sage-grouse habitat.
11536-5	Richard Llewellyn	Moreover, the responsibilities of the applicant, the methodologies that will be employed, and the incremental and final evaluation procedures of restoration are either absent, vague, referenced in documents not easily available to the public, or left for future determination by the BLM. As such, the EIS fails to provide the public any assurance that undefined restoration efforts will ultimately be successful in part or whole. For example, the EIS states in multiple locations "Apply applicant-committed measure 98 at the soonest appropriate time of year recommended by a BLM Botanist (and prior to the following growing season) to avoid invasive species establishment." However, this measure 98 is not defined within the EIS, and attempts to locate it in the associated documents (eg the Lava Wind Project POD June 2021) show only a 'measure 98' that deals with counting bird carcasses to assess turbine caused mortality. As 'measure 98' is evoked to reduce 'the likelihood of introduction and spread of nonnative plants' – a likelihood that is the subject of so many research projects that, if successful measures are discovered or developed, will lead to reliably successful restoration efforts – it is essential that this measure is described in full within the EIS.	Applicant-committed measure 98 is now measure 101 in Table App4-2k (Applicant-Committed Measures – Weeds and Vegetation): "MVE would comply with the applicable Federal and State Laws and regulations concerning the use of herbicides and other similar substances in all activities/operations. Herbicides would be used only in accordance with their registered uses and within the limitations imposed by the Secretary of the Interior (BLM 2019a). Prior to the use of herbicides, MVE would obtain from the BLM a written approval of a plan showing the type and quantity of material to be used, pest(s) to be controlled, method of application, location of storage and disposal of containers, and any other information deemed necessary. Herbicides would not be permanently stored on public lands, and applicator(s) would hold a current applicator's license or be under the direct supervision of a licensed applicator. MVE would provide an annual report to the BLM to report type and quantities of herbicides applied to public lands." MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria. Applicant-committed measures, as well as other mitigation, were further clarified in the final EIS. Appendix 4 (Mitigation) details reclamation efforts in Table App4-2o (Applicant-Committed Measures – Reclamation and Decommissioning). See also BLM-required measures P and Q. Refer to the Reclamation Plan (Appendix E in MVE [2023]) for additional details on reclamation methods and requirements.
11536-7	Richard Llewellyn	The expected efforts, liabilities, and responsibilities of the applicant for sage steppe restoration that are described within the EIS demonstrate a remarkable incongruence with the general scientific consensus of uncertainty, long time frames, and dependence on ever less predictable precipitation patterns for initial establishment that make almost guarantee that many if not most of the restoration efforts will require repeated application before success. For example, the following paragraph (EIS 3-381) describes the applicant (MVE) responsibilities with respect to restoration, but the referenced MVE[2022] could not be located online. "MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria for MVE's vegetation treatment and weed management plan. The goal of reclamation would be to establish vegetation communities in disturbed areas that are comparable to the vegetation community in adjacent undisturbed areas. Postconstruction reclamation monitoring would be conducted by MVE and would include qualitative and quantitative (line-point intercept transects, etc.) assessments of the cover and diversity of vegetation present after reclamation. MVE has committed to up to 5 years of reclamation monitoring (applicant-committed measure 164). If desired cover and diversity thresholds (see Appendix E in MVE [2022] for details) have not been met after 5 years, MVE would coordinate with the BLM on possible adjustments to the criteria or the use of adaptive management procedures to address revegetation challenges. However, BLM policy requires desired plant communities to be restored in all disturbed areas (required mitigation measure P). Use of irrigation (as necessary) and mulching would also be required to expedite interim reclamation in work areas (required mitigation measure Q)." Those criteria that are described are vague – eg "are comparable to the vegetation community in adjacent undisturbed areas," while applicant responsibilities are appallingly inadequate "MVE has committed up to 5 years of reclamation monitoring" – in this case, an order of magnitude less than the 84 years that the agency expects for revegetation efforts to mature (34 years of construction to decommission, plus 50 years of plant community development). Compounding the discrepancy between agency expectations and applicant responsibilities is "If desired cover and diversity thresholds (see Appendix E in MVE [2022] for details) have not been met after 5 years, MVE would coordinate with the BLM on possible adjustments to the criteria or the use of adaptive management procedures to address revegetation challenges."	See the Reclamation Plan (Appendix E in MVE [2023]) for success criteria after temporary and permanent disturbances. See the Decommissioning Plan (Appendix L in MVE [2023]) for reclamation efforts after decommissioning.
11547-6	Lowell Ihler, Carol Ihler	Even though LS Power would have to put up a bond to "ensure" the wind turbines would be decommissioned, nothing can assure us that they would be removed and the land returned to its native state. After so much upheaval and 400+ miles of roads this can't be undone. Even the the concrete bases would not be removed. No one can know what the cost will be in 20 years or so to remove the turbines so a bond is only a start as to the actual cost. Who is to say if LS Power will even be around in 20 years and who will be responsible then?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
11552-1	Summer Osmond	The poor plan of development submitted by Magic Valley Energy LLC is laughable, and vague at best in so many critical areas, such as preconstruction, water rights, water development and use, mitigation measures, construction, postconstruction and reclamation. It is unstated what the amount of water that the company's construction will require, and where this water will be found. Is the Magic Valley Energy LLC also applying for water rights for the construction phase as well as the postconstruction fire abatement? If not, where will this water be found and used come from? Even during the construction phase, they mention the use of water to dig through the rocky ground to install the bases for the wind towers. Where will this tremendous amount of water come from? There are no specific details listed for any of their planned water uses as to how they plan to acquire those waters.	See Section 1.3.11 of MVE (2023) for water usage, amounts, and sources.
11552-4	Summer Osmond	The project is proposed to function for 34 years, but what is covered in the reclamation plan? Will the entire site, including all of the roads be reclaimed, and how do they plan to remove the bases of the wind tower? What is the bonding in a project of this size and scope?	See the Reclamation Plan (Appendix E in MVE [2023]) for details regarding reclamation. See also the Decommissioning Plan (Appendix L in MVE [2023]). See comment 11598-22 (see in Table A-3dd, Plan of Development – EIS Appendix 1) for bonding information.

Comment ID	Commenter	Public Comment	Response to Comment
11576-3	Kelly Human	What about the waste that is generated by lava ridge? Where are they going to recycle the worn out parts?	See responses to comments 11873-7 and 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11598-22	Idaho Conservation League	Reclamation Reclamation is a key component of large projects like Lava Ridge being proposed for public lands. According to the DEIS, the project proponent is required to have a reclamation bond in place prior to beginning substantial work on the project. We request that MVE's Reclamation Plan be made available for public review and comment. The BLM should disclose additional information in the FEIS regarding the expected amount of the reclamation bond, how it is calculated, the discount rates, when it is anticipated to be finalized (if the project moves forward) and the financial mechanism. We note that the BLM recently included bonding estimates in the draft Environmental Assessment for the Granite Creek Place Mining Project in the Four Rivers Field Office. The BLM should also provide additional details regarding how and where the wind turbine blades will be disposed of, as this is a long-standing concern associated with wind energy projects.	See response to comment 11536-5 (see in Table A-3dd, Plan of Development – EIS Appendix 1). The Reclamation Plan is provided as Appendix E in MVE (2023). MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria. The bond is typically attached to the notice to proceed, after the ROW grant is authorized, but prior to ground disturbance. Additional details on the reclamation bond and the reclamation cost estimate have been added to EIS Appendix 4 (Mitigation) as applicant-committed measure 164. The Decommissioning Plan (Appendix L in MVE [2023]) provides additional details on decommissioning, including disposal of turbine blades.
11615-3	Spencer Dixon	It is a huge waste of resources to tear up our wilderness only to "reclaim" it in 30 years when the decommissioning starts. I do not think it is adequate land bond protection to ensure the project will be decommissioned properly. There will be a greater need for electricity in the future so to plan on the removal in 30 short years seems to be the height of corporate greed and government complacency if this is allowed. These turbines are offshore size and and not been studied for on land use	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
11635-1	Bucky Whittier	The depth of these turbines cannot be as shallow as we've heard. For 700' structures and with the Southern Idaho winds they have to be closer to 200'+ deep, as in specifically, 192' in the North Sea. They must also have to include massive guy wire assemblies, further degrading the landscape.	See response to comment 11833-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11670-2	Greg Bryant	Who pays for the backup energy when the wind doesn't blow?	In the event the project does not output the expected energy due to unforeseen circumstances, energy is still delivered onto the grid through existing connections and sources. The presence of the Lava Ridge Wind Project would only increase grid stability, but would not decrease energy stability if not built or experiencing an unforeseen event.
11686-1	Joan Hurlock	Please accept my comment regarding the Lava Ridge Wind Project DEIS as it relates to the health of public lands and the shedding of tons of microplastics across the desert. Wind turbine blades are composed of balsa wood, fiberglass, and epoxy, with Bisphenol-A (BPA) comprising approximately 40% of the epoxy. BPAs are frequently banned substances due to their link to almost 80 diseases, including testicular cancer, and reproductive disorders. BPAs are also known as endocrine disrupters and neurotoxins. Studies have shown that wind turbine blades experience "leading edge erosion", which is the shedding of the epoxy coating, due to wind, rain and hail. One turbine will shed about 136 pounds of BPAs annually. It has been estimated that a 400 turbine project will shed almost 25 TONS of these toxic chemicals per year. Here is a link to the article where information about microplastic shedding can be found: https://breakingviewsnz.blogspot.com/2023/02/ian-bradford-more-problems-with-wind.html <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fbreakingviewsnz.blogspot.com%2F2023%2F02%2Fian-bradford-more-problems-with-wind.html&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C527970c7cc154df994bd08db40f11ff9%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638175176595480024%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=Nd%2BtgQCqj7yX9gxKIRlDleGzD1KAiM7MWzMrvs19idY%3D&reserved=0> Noticeably absent from the DEIS is any study related to the shedding of microplastics from wind turbine blades. How far are the epoxy resins distributed across the land? What effects will tons of BPAs strewn across the desert have on water quality, especially with the Snake River Plains Aquifer below the surface of the Lava Ridge project? Will these BPAs leach in to the groundwater? The mission of the BLM is "to sustain the health, diversity, and productivity of public lands…". How will the shed BPAs impact the health of wildlife, livestock, humans and agricultural crops in the surrounding area? Will the milk produced from the nearby organic dairies be contaminated with BPAs? How does blade shedding facilitate the BLM's mission of sustaining health? Will LS Power/Magic Valley Energy be held liable in the ensuing years if there is an increase in cancer rates, infertility, or other health problems?	The referenced opinion piece (Bradford 2023) was based on a self-published report by The Turbine Group (2021) that did not undergo peer review. Further, this report was based on a study of uncoated turbine blade tips (where blade speed is highest and erosion is most severe) under worst-case conditions and was later refuted by the author of the original study (American Clean Power 2023). As noted by American Clean Power (2023), in real-world conditions, blades are coated with nontoxic materials to protect the epoxy/fiberglass layers of the blade itself, with extra reinforcement along the tip. Thus, the limited amount of material shed from erosion of the protective layer is generally nontoxic. Additionally, the epoxy glue used to manufacture turbine blades contains only microscopic traces of BPA after the epoxy hardens in the factory, prior to delivery to the project site. Thus, there is extremely low potential for emissions of BPA or other potentially harmful chemicals, and no further analysis is warranted. American Clean Power. 2023. Claims vs. Facts: Microplastics and BPA in Wind Turbine Blades. Available at: https://cleanpower.org/resources/microplastics-and-bpa-in-wind-turbine-blades/. Accessed January 5, 2024. Bradford, I. 2023. Ian Bradford: More problems with wind farms. Wind Turbine Blades are Shedding Tonnes of Toxic Microplastics. Available at: https://breakingviewsnz.blogspot.com/2023/02/ian-bradford-more-problems-with-wind.html. Accessed December 28, 2023. The Turbine Group. 2021. *Leading Edge erosion and pollution from wind turbine blades, 5th edition - English*. 11722-1	Charlotte Erickson	Also concerns about how we dispose of wind turbines.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11740-3	Logan Dimond	Furthermore, there are concerns about the manufacturing and disposal of wind turbines, which require significant amounts of raw materials, energy, and water for their production, and can generate waste and emissions during their manufacturing and decommissioning processes. Additionally, wind turbines have a finite lifespan and need to be replaced after a certain period, resulting in additional waste and potential environmental impacts	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11747-3	Eric Hess	5.What guarantees do we have that the turbines will be completely decommissioned and where will they be disposed of, leaving a pockmarked landscape of concrete foundations?	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11411-7 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11753-6	Mary Rios	These wind turbines will have to be shut down if the Idaho winds get to be 50 mph or higher. Windstorms occur from October to July in this state, according to www.nrc.gov. That is 10 months out of the year. So, with that information, how often will these turbines be shut down and not working? What research has been done on that?	As stated in Section 1.3.7 (Ancillary Facilities and Buildings) of MVE (2023), "Multiple permanent meteorological towers will be placed in the Project area to monitor the weather conditions and inform efficient operation of the wind turbines."

Comment ID	Commenter	Public Comment	Response to Comment
			As stated in Section C-2 (Alternative Project Locations) of the Alternatives Considered by MVE (Appendix C in MVE [2023]), the project was sited "with the help of the latest computer modeling software and assistance from leading consultants in meteorology and wind development."
11782-3	Ken Fitch	And indeed, the applicant for the adjacent project is under no such long -term requirement for a venture that has been stated in one of the presentations as for a 30 years span. After 30 years, what happens then? Abandonment or reclamation, or new innovations and innovative contraptions corresponding to the delivery mechanisms in vogue at that time?	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11411-7 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
11833-2	Bob Hassoldt	Returning to Appendix M, section 5.3.1, Operational Procedures, Facility Operation, lines 23-25, is the following: "MVE will feather the turbine blades when wind speeds are below the manufacturer's cut-in speed, which will significantly reduce rotational speed during periods when the turbines are not generating power." While that is a common mitigation procedure the question is: What is the cut-in speed of these turbines? That figure is not presented in any of these documents and doesn't look like it can be since MVE hasn't designated a turbine manufacturer at this time. That adds another measure of uncertainty to this analysis.	Section 1.0 of MVE (2023) discusses turbine selection and associated characteristics.
11871-112	WildLands Defense	Turbines Are Falling Apart, and May Cause Wildfires A recent news article describes: "The skinny blade, as tall as an 11-story building and weighing more than four Toyota Camrys, soared the full length of a football field. It plowed a furrow 4-feet deep in the wheat stubble where it eventually landed. Heavy-duty bolts that once kept the blade fastened to the tower scattered around the turbine base like shrapnel, some spiked deep into the soil. "Someone could have been killed or badly injured," said Kathryn McCullough, whose husband, Kevin, farms under about half of Biglow Canyon's turbines – including the one that lost its blade. The broken bolts preceding the incident weren't the only warning signs of problems at PGE's flagship wind facility, which opened 15 years ago amid a push to expand green energy technology in Oregon and nationally. But it took the so-called "blade liberation" for PGE to take urgent action at Biglow Canyon, one of Oregon's largest wind farms, shutting down all 217 turbines for testing and keeping some out of service for at least four months." Also: "An investigation by The Oregonian/OregonLive has found that the seemingly isolated blade incident is part of a wider set of maintenance problems and equipment failures that are now undercutting electricity generation at Biglow Canyon, shortchanging ratepayers and landowners, and putting those who cultivate crops under the turbines – and potentially their farmland itself – at risk. Among the findings: • PGE has failed to report public safety incidents at Biglow Canyon, in potential violation of its operating agreement with the state. The utility hasn't disclosed incidents where hatches, metal disks and blade bolts have fallen off turbines from a height of about 265 feet. PGE has questioned whether such incidents meet the reporting threshold, but regulators insist even small objects may be a hazard to anyone near a turbine because they can reach almost 90 mph when falling. • PGE knowingly operated at least four turbines at Biglow Canyon with broken blade bolts, in one case for nearly a year, maintenance records show. Those bolts clamp blades to the rotor and bear the stress of wind and motion. Research indicates that broken bolts, while not uncommon, can become a serious problem leading to catastrophic blade failures like the one in February. • Oil leaks from Biglow Canyon's wind turbines and transformers are environmental and fire hazards. The turbines have been plagued by leaks of oil and lubricants that coat towers and blades and spit on to their gravel pads and surrounding fields. Transformers have ruptured regularly, causing two fires and spilling about 3,000 gallons of mineral oil into surrounding soil that prompted expensive cleanups. • The number of problems PGE has disclosed to regulators is out of line with other wind farms. Since 2010, PGE has reported more than a dozen oil spills and other incidents at Biglow Canyon with the potential to affect public safety — about three times more than any other wind farm regulated by the state. But state officials only recently began pressing PGE to explain those troubles.	See Section F-6 (Fire Protection and Prevention Plan) in the Health and Safety Plan (Appendix F in MVE [2023]); the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]); and Section 4.0 (Operations and Maintenance) of MVE (2023).
11871-114	WildLands Defense	Catastrophic failures typically result from a cascading set of events. "Usually, the first bolt will break due to fatigue, and after a number of other bolt breakages the rest will break due to overload," he wrote. https://projects.oregonlive.com/wind-farms/ There is much danger and risk from these industrial wind facilities, and they have no place on public lands where perennially under-staffed BLM will not sufficiently be able to track harms. As WLD found when reading the very old Monument RMP, BLM was supposed to produce a Pronghorn Plan for the animals in this area of Idaho – and never got around to doing one – between 1986 and 2023! How can the public be expected to believe this facility will be sufficiently monitored and compliance with any "mitigation measures" and safety matters will be enforced?	See Section 4.0 (Operations and Maintenance) of MVE (2023), which outlines routine, long-term, and emergency maintenance. See also Section 2.0 (Roles and Responsibilities) of the Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) for information regarding the roles and responsibilities.
11873-5	Mary Schwartz, Frank Schwartz	5. Since wind power is not economical without being heavily subsidized, there is a significant risk associated with the potential abandonment of the project infrastructure at the end of the design life, or sooner if the subsidies are ended sooner. The US taxpayers and residents of the state of Idaho would be saddled with this legacy. A mandatory component of all of these wind projects should be that the companies (developers and operators) are required to pay into a fund over the life of the project that will cover the complete costs of decommissioning, cleanup and restoration of the project sites at the end of life. The fund that these companies pay into should be administered by the state of Idaho, and not the Federal government, to assure the complete removal of all associated infrastructure is in fact accomplished. Without having such a fund, no wind or solar projects should ever be considered. The BLM should never allow a project such as this to proceed without having the financial assurance covering the complete removal of infrastructure and restoration of the impacted area.	See the Decommissioning Plan (Appendix L in MVE [2023]) and the Reclamation Plan (Appendix E in MVE [2023]). See comment 11598-22 (see in Table A-3dd, Plan of Development – EIS Appendix 1) for bonding information.
11873-8	Mary Schwartz, Frank Schwartz	8. The DEIS Appendix 11 indicates that the battery storage system will be electrochemical batteries. The DEIS currently does not evaluate potential environmental impacts associated with battery storage system and passes	See AIB-45 in EIS Appendix 3, Issues Analyzed in Brief: How would hazardous materials and wastes generated by the project be managed? Would they exceed capacities of approved disposal facilities?

Comment ID	Commenter	Public Comment	Response to Comment
		it off as something that will be defined after an alternative is selected, but indicates it will support thousands of megawatt hours of storage potential. This battery storage system represents a large hazard and safety issue for the project. These electrochemical batteries are hazardous material and represent a large hazardous waste legacy at the end of life. There is no analysis in this DEIS for this environmental hazard during transportation, installation, operation and decommissioning and the associated potential environmental impacts. While it is understood that details get finalized during design, the DEIS should be providing an enveloping analysis, covering the range of potential scenarios associated with the batteries and system. The DEIS is incomplete without addressing the potential significance of this impact.	
11899-1	Diana Nielson	In the draft EIS I can't find the OSHA standards mentioned. I can find where Berming is mentioned in areas in case of leaks, and dust abatement, but nothing of who will respond in case of an emergency.	Emergency response procedures are described in the Health and Safety Plan (Appendix F in MVE [2023]). Spill control measures are described in the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]).
11899-3	Diana Nielson	Between fuels, explosives,Solvents, human waste, oil leaks we need to have a inventory list with the MDS sheets. The public and the workforce need an actual functional disaster plan that Community Hospitals can provide life saving procedures with the appropriate information. Will the employees be educated? Who will be in charge of Hazard recognition and where will contaminates be disposed? Where will the Toxic chemical lists be available and where will the MDS be kept?	See the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]).
11899-4	Diana Nielson	Will this project follow the EPA standards? Lava Ridge Wind Turbine Project mentions they need to acquire the Storm Water Protection Plan SWPP from the EPA. In areas so porous they are used for recharge and are over the Snake River Aquifer that is a Single Source Aquifer, who will be held accountable if their SWPP fails?	See the Stormwater Pollution Prevention Plan (Appendix D in MVE [2023]).
11915-4	Kim Peyman	Will these batteries be disposed of in Idaho, or is there a plan to recycle these batteries? To what expense and for whom? What becomes of the 700 gallons of crude oil and hydraulic fluid that each turbine needs to operate? Replacement of these fluids is necessary every nine months. So, over their lifetime of 20 years, replacement of these fluids will be done at least 27 times per unit. You do the math (27 x 700 x too many). I thought the idea of these wind farm projects was to reduce the use of fossil fuels. This does not sound to me like a reduction in fossil fuel usage. How many roads are going to be "improved" to afford big rigs access to these turbines in order to build and service them? In the words of Joni Mitchell, "They paved paradise, put up a parking lot!"2 Please do not allow this to happen to our public lands. I wonder what will become of those huge towers and blades when they can no longer be of service in 20 years? Will they remain as an obnoxious, alien part of our backyard? Will they end up in our landfills? This whole wind farm proposal seems to add up to a very toxic arrangement for the residents of this affected area (animal and man alike), and potentially, for the State of Idaho.	See responses to comments 11873-7 and 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
11962-4	Cassie Christensen, Tyler Christensen	Also in regards to the Carbon Exchange, what will happen when the mills are dismantled? Currently, the only way to recycle a windmill is to ship it back to China. Will this also be factored into the Carbon Emissions put off by this project? What about the construction of the turbines? 3Do they ever offset their emission of complete building and disposal, especially because they only have a lifespan of 20 years?	See response to comment 11873-7 and 11926-11 (see in Table A-3l, Hazardous Materials and Solid Waste) and comment 1042-10 (see in Table A-3f, Climate and Greenhouse Gas Emissions).
11962-10	Cassie Christensen, Tyler Christensen	Will Magic Valley Electric also be responsible for the replacement/repair of our county roads? The entry point also has not been stated and in order to gather such a plan, shouldn't the proposed travel path be determined before the project could be approved? In Appendix J-a Figures there are multiple diagrams for 2.0-3.0 MW turbines presented, this information is irrelevant to the 6.0 MW turbines which have been proposed. Even in Volume 2a-Page 7, only a 3MW example is used. What research has been presented on the 6 MW turbines? How will the development plans change for the larger turbines? I would assume that they would need to double, possibly triple the road width, subgrade and aggregate thickness, turn radaii leading to the site on public and country roads. What will happen if there is a house close to the road? How do they propose to work around structures that are already in place? Who will be responsible for roadways (even though all of the money from this subsidized project will come from tax payers money one way or another, but will it be Federal or State)?	See MVE (2023), which describes turbine information, road construction and road maintenance.
11970-2	Janet Keegan	V2A, Appendix 1, 5.1.4, page 66: Cultural and Historic Resource Sites and Values: This section of the POD is so vague it is laughable. As stated above, the MNHS and MWRC is a well-known site to LS Power the mother company of MVE. There is no mention of the sites in the POD. The date of the original application by MVE to the BLM is not published in the DEIS. However, it is known that the BLM notified the grazers of the project as early as 2020 and was in negotiations with them regarding mitigation. The JA Community was not notified until 2021.	See response to comment 9080-24 (see in Table A-3jj, Legal or Policy Compliance).
12018-1	Jerry Davis	The lifetime of the blades is appropriately 20 years. The replacement of the blades requires that the old ones be dealt with. To date nothing has been created to deal with the blades but to bury them. Burying them close by is the preferred method since they are very expensive to move to another location.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
12050-2	Roger LeRoy Miller	You have also left out how you plan to replace the blades when they are no longer useable. Will you then create enormous blade graveyards? What will be the environmental impact then? Why is there no estimate of the estimated life expectancy of each blade?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
12057-5	A. Ben Crouch	7. What about a decommission plan? When Magic Valley Energy pulls out in 30 years, are they planning on removing all of the foundations? What will they do with the actual windmills when they are done?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).

Comment ID	Commenter	Public Comment	Response to Comment
12233-6	Elizabeth Lampert	The EIS does not mention the potential damage or mitigation to the underground aquifer as 400 wind turbine footings would need to be blasted into the rock formation above said acquirer as part of construction. In fact, the EIS does not give the approximate dimensions of a footing to accommodate the wind turbine structure. The EIS does however dimension the height and width of the wind turbine to be between 390 to 740 feet tall. Why not mention the footing size.	See response to comment 3140-3 (see in Table A-3j, Geology) along with the General Facility Description, Design, and Operation (Section 1.3 of MVE [2023]) for information about the turbine size. Also, as mentioned in the Blasting Plan Methodology (Appendix I in MVE [2023]), "blasting will be used only in areas where traditional excavation and earth moving equipment and practices are unable to accomplish the excavation."
12307-12	Dean Dimond	no detailed description of maintenance and turbine failures,	See Section 4.0 (Operations and Maintenance) of MVE (2023).
12307-16	Dean Dimond	no wildland fire prevention with plan for emergency shutdown of wind turbines, 5. No provision for access in prescribed burning for sagebrush as required treatment for habitat greater prairie sage leks and sagebrush communities,	A Fire Protection and Prevention Plan was provided with the draft EIS in Section F.6 (Fire Protection and Prevention Plan) in the Health and Safety Plan (Appendix F in MVE [2023]). Impacts to Fuels Reduction and Habitat Restoration Projects are disclosed in EIS Section 3.7.2 (Fuels Reduction and Habitat Restoration Projects).
12307-19	Dean Dimond	Disposal plan for retired turbines and all wind generation parts,	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
12307-30	Dean Dimond	Seasonal access including snow/ ice load on wind turbines including breakdowns and access for snow and grass fire fuel load removal,	See AIB-37 and AIB-39 in EIS Appendix 3 (Issues Analyzed in Brief) for a description of impacts related to access for road maintenance. Additionally, AIB-14 was added to the final EIS to disclose impacts from turbine ice throw. Impacts to fuels management are analyzed in EIS Section 3.7 (Fire and Fuels Management).
12454-2	John MacMillan, Kathy MacMillan	the Lava Ridge Wind Project lists in its description that the "project area spans 197,474 acres" or 308.6 square miles which is approximately 1/3 the size of the state of Rhode Island! The project components and infrastructure "includes corridors which are to be one half mile wide and cover 84,385 acres" which is 131.8 square miles; this is an enormous Idaho land mass to turn over to this or any company. They conclude by stating that "the project infrastructure proposed within the corridors is estimated to have a 2,374-acre footprint and a total disturbance of 9,114 acres." The calculation discrepancies in their area of impacted acreage are not only huge, but mind boggling! No one can overlook the difference between 9,114 acres and 197,474 acres.	The "general project area" under Alternative B is 197,474 acres, which is the general area within a polygon around the project site. It is larger than the area that would be disturbed. The "siting corridors" (as described in EIS Section 3.1.2.3 [Siting Corridors]), are approximately 0.5-mile-wide corridors where infrastructure would be sited. The "ground disturbance" would be the actual work area or infrastructure disturbance within the siting corridors. This is summarized in EIS Table 2.4-1. The actual ground disturbance from the project would be substantially smaller than the overall project area or even the siting corridors.
12776-1	Brian Olmstead	The Time to construct this giant Wind Energy Project along with all power lines, transmission lines, new roads etc is completely misleading. This is one of the largest construction projects ever built in the State of Idaho, and it is not even in the realm of possibility that LS Power could complete it in two years! LS Power knows, you know, and I know that with the scope of this project, the present supply lines, labor availability, cement availability, steel availability, and all the weather, terrain, and access problems, this project will take a minimum of 5 years to complete. All of the wildlife disruptions, ranching disruptions, county road disruptions, noise disruptions, quality of life for neighbors etc. are completely underestimated by this ridiculous attempt at a DEIS. LS Power has no intention of getting this project done within the timeframe they propose.	See Section 1.1 (Introduction) of MVE (2023). MVE's anticipated schedule for the Project includes: 1) a development period during which the applicable permits and approvals are sought, targeting completion of development during the second calendar quarter of 2023; 2) an approximately two year construction timeframe with initial commercial operations commencing during the fourth calendar quarter of 2025; 3) an operation phase of up to 30 years; and 4) a two year decommissioning phase that would occur if the right-of way ("ROW") grant is not renewed. See also Section 2.3.3 (Project Phases and Duration). The project is proposed such that the entire development may be constructed in a single continuous period or divided into two or more individual subphases that entail a portion of the overall project. The EIS analysis assumes an approximate project schedule consisting of three phases: 2 years of construction, up to 30 years of operation and maintenance, and 2 years of decommissioning for Alternative B. Alternatives C through E and the Preferred Alternative would have the same operation and maintenance phase but would have construction and decommissioning phases of up to 3 years. Construction and decommissioning for all action alternatives may occur continuously or with gaps of time in between. If construction occurs with gaps of time in between, it could take longer than 2 to 3 years.
12835-1	Greg Johnson	I have concerns regarding the number of employees that will be coming to our area in RVs, possibly tents, or overloading our hotel accommodations in the surrounding area. I would like to know since all of the RV parks are currently full where are they going to house the employees. Are they going to allow RVs to be parked out on BLM property. Are they going to set up a Wastewater handling facility? Are they going to be creating new RV parks that have not been discussed or permitted. Do any of the wastewater treatment plants in the area have the necessary dump stations and treatment capacity to handle the waste from all of the porta potties that they may try to use on the work sites. Having been in charge of a wastewater treatment plant I know what happens to a wastewater treatment plant if there are too many chemicals and too many solids that come into the plant if the plant can't sustain the high BOD (biochemical oxygen demand) and have enough dissolved oxygen in the water or the capacity to increase the amount of air that needs to go into breaking down the load that could come into the wastewater treatment plant. Also, can enough potable water be provided in the work area to accommodate 700 workers. Is the Bureau of Land Management going to give out permits to allow recreational vehicles to be scattered throughout the property? Who is going to monitor if they are dumping on the ground and hoping that no one will notice? The average Idaho resident uses 168 gallons per day of water. If you multiply that by 700 workers we will need 117,600 gallons per day of water which will end up going mostly to the wastewater treatment plant in the form of urea and BOD. Who will pay if necessary upgrades need to be made to handle the increased Wastewater influent flow to a plant that may be running at capacity already. Each Wastewater Treatment Plant in the United States operates on a National Pollutant Discharge Elimination System (NPDES)permit. The fines if a wastewater treatment plant violates this permit are extremely high. They can range from $1 per gallon to upwards of $10 per gallon for every gallon of water that has not been completely treated and has made contact with any surface outside of the treatment plant including waterways. If the excess load causes this violation who is going to pay the fine?	See responses to comments 11869-9 and 11869-11 (see in Table A-3h, Environmental Justice and Socioeconomics).
12867-2	Steve Lampert	The EIS does not mention the potential environmental damage to maintain dirt access roads with chemicals to mitigate for dust and vegetation control.	See response to comment 3811-4 (in Table A-3v, Soils) for a discussion of impacts from the application of chemical palliatives for fugitive dust control on access roads. Impacts from herbicide application are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-47 and AIB-58. Species-specific impacts

Comment ID	Commenter	Public Comment	Response to Comment
			from herbicide application are also disclosed in EIS Sections 3.11 (Pollinators and Insects), 3.18.3 (Amphibians), and 3.18.4 (Pygmy Rabbit).
12904-1	Lyle Johnstone	E-3 Preconstruction Activities Preconstruction surveys, such as those outlined in the POD and POD Appendix N: Historic Properties Treatment Plan, Appendix P: Lava Ridge Construction Monitoring Plan, and Appendix Q: Paleontological Resources Treatment Plan, focus on protection of sensitive areas and resources identified for preservation. The limitations of areas to be disturbed would be defined prior to the disturbance to support resource protection and to guide reclamation implementation. Limits would be staked or flagged as necessary. Construction activities would be limited to these areas to prevent adverse effects on sensitive areas. When construction and reclamation are complete, stakes and flags would be removed. Historic Protection of Milner Gooding Canal, is a historic site, this would make many miles of the canal protected, the construction preparation sites, camp sites for the construction phase of the canal. This is not being addressed in the EIS and is completely overlooked by LS Power and BLM. Page: E-3 Preconstruction Activities Reference: Appendix E	See response to comment 12276-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
12925-2	John Haux	However, one issue I have failed to see in the information I have gleaned is who is funding this project. There are no financials on either LS Power or Magic Valley Energy. This is extremely concerning for me. You have a major project on public land which will greatly impact : wildlife, agriculture, aviation, recreation, environment and who knows what else and no information as to where the funding comes from. Further, there is no benefit from the output of the project for Idaho. There may be some local benefit for a short period during construction but there is no promise for even that. I cannot support any public project which does not present full financial disclosure. Can you provide information as the where the funding for this project comes from, government, private party and if so whom in detail?	For local economic benefit information please see the responses to comments 11372-2 and 11789-1 (see in Table A-3h, Environmental Justice and Socioeconomics). The financial and technical capability of MVE is described in Section 1.6 (Financial and Technical Capability of Applicant) in MVE (2023). MVE would be required to purchase a reclamation bond prior to notice to proceed for construction if a ROW grant is issued. Additional details on the methodology for calculating the value of the reclamation bond have been added to the Decommissioning Plan (Appendix L in MVE [2023]); see also applicant-committed measure 164.
12933-1	Tony Martinez	Hi there so just trying to voice my concerns on this lava ridge project. One of them is the affect it will have on our aquifer especially for how much they have blast. Then also with all the oil out consumes and what will happen when they have to change the oil or if it leaks what affects it will have with the environment around it. I know we have windmills already but the size of these ones are are substantially bigger and for that matter what affects it will have around wildlife of the energy it puts out for how much they produce.	See response to comment 11278-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1) for information on the effects blasting will have on the aquifers. For information on oil leaks, also see the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]). For information regarding wildlife, see the response to comment 11598-11 (see in Table A-3aa, Wildlife, including Big Game).
12973-1	Cathy Schiers	What plans are in place for disposal of the equipment when it fails, wears out, or is no longer functioning? Will Idaho land also be required for landfills for the giant turbine parts and equipment?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
12973-2	Cathy Schiers	What are the mitigation plans if there is an oil spill and the oil seeps into the porous lava beds? The aquifer is right below those lava beds, and that is a concern for the health and safety of Idaho residents, plants, and wildlife. It will affect us all.	See the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]).
12976-1	James Komadina	1. Baseline Data Acquisition a. The DEIS presents Meteorology and Climate in Section 3.2.1.1.3. The source documents are found in Appendix 10-12: Midwestern Regional Climate Center.2022 and U.S. Climate Data.2022. BLM PEIS 2005a, Section 2.2.3.2.2 lists General requirements for the Plan of Development ("POD") and specifically in Section 3.1.1 notes that "Site monitoring and testing involve the collection of sufficient amounts of meteorological data to accurately characterize the wind regime. These data are used to support decisions on whether the wind resources at the site are suitable for development and, if so, the appropriate number, type and location of wind turbines." Further, "Meteorological data, such as data on wind speed and direction, wind shear, temperature, and humidity, are typically collected over a period of at least 1 year. However, some developers may choose to collect data for as long as 3 years to account for anticipated annual weather variations." Alternative B will encumber approximately 309 square miles of public lands. Other than the meager Twin Falls data cited, the DEIS contains no site-specific meteorological data which would comply with BLM PEIS 2005a criteria. i. COMMENT - The DEIS does not adequately describe project economic viability based on site wind resources, turbine siting decision making meteorological information, baseline air quality and sufficiency data nor has it included topographic maps indicating potential turbine locations for Alternatives B, C, D and E.	Section 2.2.3.2.2 of BLM (2005a) lists BMPs for POD preparation; there are no BMPs in this section that require proponents to collect or provide detailed information on wind resources or local meteorology in the project area. Section 3.1.1 of BLM (2005a) describes site monitoring and testing activities that are likely to occur as part of a wind energy project, which include the deployment of met towers to collect local meteorological data. This data is used by proponents to inform the design of their projects and there is no requirement that this data be disclosed to the public or evaluated in the EIS. As described under Meteorological Towers in EIS Appendix 11 (Project Elements Common to All Action Alternatives), there are currently eight temporary preconstruction met towers installed across the site to record wind conditions. This section also describes the additional met towers that would be installed during project construction if a ROW grant is issued. Refer to Figures 2.4-1 (Action alternatives comparison) and 2.4-2 (Action alternatives comparison by siting corridor types) in EIS Chapter 2 for maps of the siting corridors under each action alternative. As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction), “The project’s final design and engineering would be completed after the BLM has issued a record of decision (ROD) and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. The project’s final design would identify the specific location for all infrastructure and project activities and would be approved by the BLM Authorized Officer. This EIS identifies and considers effects to resources present within the siting corridors, allowing for identification of areas with fewer impacts or specific resource trade-offs. This identification of resource constraints within the siting corridors provides flexibility for the project design to adjust through site-specific engineering for the final layout. The action alternatives consider different configurations of the siting corridors to avoid or minimize potential effects.”
12976-2	James Komadina	b. BLM PEIS 2005a, Section 2.2.3.2.2 lists General requirements for the POD and specifically for: i. Storm Water "Operators shall develop a storm water management plan for the site to ensure compliance with applicable regulations and prevent off-site migration of contaminated storm water or increased soil erosion." 1. POD Appendix D describes MVE's Storm Water Plan. 11. Excavation and Blasting Activities "Operators shall avoid creating hydrologic conduits between two aquifers during foundation excavation and other activities." 1. POD Appendix I describes MVE's Blasting Plan. 111. POD Section 5.1.2 describes the impacted lands as rangeland, irrigated cropland, prime farmland and single-family residences. 1v. COMMENT- The absence of baseline meteorological data for the Project area does not allow for an estimation of Probable Maximum Precipitation ("PMP") events to be made and hence, the required storm water structures and procedures are not addressed in POD Appendix D other than stating that the construction contractor will develop these. MVE is the responsible party for informing the BLM and public at large of its plans to control storm water from impacted lands. Idaho assumed primacy ofEPA's Storm Water programs for Construction and Industrial Activities in July 2021, which	See Section 3.2 (Meteorological Towers) of MVE (2023). The BLM is evaluating MVE’s project application. MVE has gathered meteorological information from their eight towers across the project. Also see the response to comment 8421-4 (see in Table A-3m, Human Health and Safety).

Comment ID	Commenter	Public Comment	Response to Comment
		requires obtaining authorization for discharges prior to construction activities. Yet no description of pollution prevention and Best Management Practices are provided. As such, a review of the adequacy of POD Appendix Dis not possible.	
12976-5	James Komadina	c. Among the numerous problems inherent with renewable energy is that the source of these low intensity power generation methods is not proximal to the end users, thus requiring interconnection to the existing electrical grid or construction of new power lines to the grid. Both of these interconnection methods are required by the proposed DEIS action to achieve an economic outcome. i. In the February 25, 2022 BLM National NEPA Register, it is noted that, "As currently authorized, the Southwest Intertie Project (SWIP), now owned by Great Basin Transmission LLC, is inclusive of two (2) segments of transmission line. The southern segment, SWIP South, runs from Robinson Substation outside of Ely, Nevada to the Harry Allen Substation in Clark County, Nevada. This segment has been constructed and in operation since 2014. The northern segment, SWIP North, has been authorized but has not yet been constructed. SWIP North is a 275-mile, single circuit 500 kilovolt (kV) transmission line and ancillary facilities from the Robinson Substation, located northwest of Ely, Nevada, to the Midpoint Substation, located north of Jerome, Idaho." 11. Great Basin Transmission LLC is owned by LS Power, the owner ofMVE. 111. The DOE Office of Energy Efficiency and Renewable Energy Land-Based Wind Market Report: 2022 Edition Executive Summary notes that "A record-high 247 GW of wind power capacity now exists in transmission interconnection queues, but solar and storage are growing at a much more rapid pace." This observation is further supported by a January 23, 2023 Wall Street Journal article Renewable Energy Draws Billions of Dollars but Installations Don't Get Built by Jennifer Hiller. 1v. BLM PEIS 2005a, Section 6.4.3.2 expresses that "The interconnection Feasibility Study preliminarily evaluates the feasibility of the proposed interconnection to the transmission system. The study should consist of a power flow and short-circuit analysis and provide a list of facilities, a nonbinding good-faith estimate of cost responsibility, and a nonbinding good-faith estimated time to construct." v. Page 56 of the DEIS POD states that "MVE has executed a Large Generator Interconnection Agreement with Idaho Power Company ("IPC"). The next step of the process is for IPC to design, procure, and construct the interconnection facilities necessary to accommodate the Project." v1. COMMENT - The DEIS is silent on the BLM PEIS 2005a requirements. MVE must provide the information set forth in 2c (iv), above, as part of this DEIS process. vu. COMMENT - MVE must provide all related interconnection information, such as transmission alignment(s) and substation location(s), as part ofthis DEIS process.	See Section 1.3.6 (General Facility Description, Design, and Operation) for information on the substations, and Section 6.0 (Maps) for proposed substation locations in MVE (2023).
12976-7	James Komadina	e. The Executive Summary (ES-ix) and POD (page 20) briefly describe a lithium battery facility to be located within the permitted DEIS ROW. MVE's ownership has experience with these types of installations. i. LS Power Energizes Largest Battery Storage Project in the World: the 250 MW Gateway Project in California-LS Power The DEIS is silent on the design, location and safety systems to be associated with this portion of the entire system. ii. Crews battle Tesla battery fire at Moorabool, near Geelong- ABC News 111. COMMENT - Material aspects of the proposed battery plant, including but not limited to the design criteria, mechanism, size, maintenance practices, fire suppression systems and location must be disclosed in this DEIS.	See Section F-6 (Fire Protection and Prevention Plan) in the Health and Safety Plan (Appendix F in MVE [2023]) for information regarding fire suppression. See Section 6.0 (Maps) of MVE (2023), for proposed location information. Design criteria, mechanism, and size would be speculative at this point, but preliminary information can be found in Section 1.3.6 (Substations and Transmission Lines) of MVE (2023).
12976-9	James Komadina	3. Reclamation Plan a. The DEIS presents a Reclamation and Decommissioning Plan in Appendices E and L, respectively. BLM PEIS 2005a, Section 2.2.3.2.5 lists General requirements for the POD. i. Recent NEPA EIS actions have provided for the funding of irrevocable financial assurance instruments for the purpose of decommissioning, reclamation and closure. See 1 FINAL ROSEMONT ROD.PDF (defense.gov) as well as final EIS I Resolution Copper Project and Land Exchange Environmental Impact Statement (resolutionrnineeis.us). 11. For third party investors and the greater public, International Financial Reporting Standards ("IFRS") IFRIC 1 describes the process and necessary financial steps to address reclamation and closure liabilities: https://www.ifrs.org/issued-standards/list-of standards/ifric-1-changes-in-existing-decommissioning restoration-and-similar-liabilities. 111. This DEIS and POD are silent on these matters. As set forth in 2b(i), above, it is critical to calculate Decommissioning and Reclamation costs using 2023 dollar estimates based upon existing technologies along with definition of estimated accuracy levels, subject to future review and approval of the BLM. 1. Such Decommissioning and Reclamation costs must be inflated to the end of the Project life and discounted back to present values to fully describe MVE's anticipated balance sheet liabilities and the public's financial exposure at large through the BLM. a. Mr. Berra is correct, the future is tough to define but current energy policies have driven the cost of fossil fuel energy up markedly with no sign of abatement in the near term The February 4, 2023 Wall Street Joumal lead article, Hiring Shows Surprising Strength by David Hanson, describes a year on year CPI increase well over 6% and private sector wage increases well over 4% for the period 2021 to date. It would appear that a 5% per annum cost inflation factor is reasonable for the life of this POD. b. Appendix 10-33 of Interagency Working Group on Social Cost of Greenhouse Gases (IWG). 2021. Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide. Interim Estimates under Executive Order 13990 provides insightful guidance that supports "lower discount rates when a rule has important intergenerational benefits or costs, agencies may consider conducting additional sensitivity analysis using discount rates below 2.5 percent." 1v. COMMENT- Using the input variables presented in 2d(i) to (iii), a financial model for the 6MW installation indicates an annual EBITDA of $161 million to $289 million for 25% to 45% capacity factors, respectively. Should the IRA taxpayer provided public subsidies be met under the Bonus Labor Credit for union labor utilization, EBITDA increases to $848 million and $1527 million under the capacity factors examined. The resulting payback period is less than 2.5 years for both capacity cases. Without adequate financial closure and reclamation bonds, the operator has no incentive to perform these actions at the end of the approved ROW license. v. COMMENT-To fully apprise BLM and the public ofMVE's Decommissioning and Reclamation costs,	See response to comment 11598-22 (see in Table A-3dd, Plan of Development – EIS Appendix 1).

Comment ID	Commenter	Public Comment	Response to Comment
		these expenses must be calculated and clearly set forth based upon industry operating factors for all equipment utilized in support of such actions, using current R. S. Means equipment rates, Davis-Bacon labor rates hourly wages and fuel costs, and based upon existing technologies and solid waste disposal methods. These future costs should be inflated using a 5% per annum factor to the end of the ROW license and then discounted back to present using a 2.5% or lower factor. IFRIC 1 guidance should be used. Given the uncertainty of future financial markets, the BLM must require an irrevocable cash bond covering the full liability be provided by MVE prior to commencement of any activities contemplated by the DEIS.	
12978-3	Susan Jesser	10. Wind turbines are not green or clean energy. How many gallons of oil does each turbine take to operate? Are battery operated trucks, cranes, bulldozers, etc. used to build the project?	GHG emissions associated with the project are disclosed in EIS Section 3.4 (Climate and Greenhouse Gases). While approximately 600 liters (158.5 gallons) of oil, lubricants, and other petroleum products are used in each turbine, these fluids typically only require replacement once every 5 to 10 years (see Section 4.1.1 of MVE [2023]). Thus, the amount of petroleum products used during operation would be relatively small in comparison to conventional power generation sources and does not warrant further analysis.
12982-6	Jerry Taylor	There is a similar question regarding acquisition of legal access. Has the proponent acquired legal access through private lands or identified specific parcels of private land, where such access would be pursued? If not, why not? Are they pushing ahead, based on promises of future actions, in order to set the stage for future condemnation actions under the cover of Imminent Domain? I suspect so. If these actions (i.e. significant impacts on the human environment, of which farm and ranch families are certainly a part) are expected, they should be disclosed upfront and analyzed in full! Otherwise, BLM will be guilty of "piece meal planning". I understand that MVE has approached land owners about access and has been rebuffed. The DEIS should be suspended until such time as MVE secures legal access required to construct and operate, hopefully on a willing seller/ willing buyer basis.	See the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). Most of the access will be done during the construction phase, which can be largely done from U.S. 93 and ID 24.
12982-12	Jerry Taylor	The "Blasting Plan", with analysis and input from a Certified Blasting Engineer must be done before the DEIS proceeds. A Certified Blasting Engineer is needed upfront to help inform the impacts that can be expected both above and below ground. The "Blasting Plan" should be fleshed out upfront and included in the DEIS to help inform specific resource impacts and cumulative impacts expected. If not, BLM will be guilty of piece meal planning and the required disclosure of potentially significant impacts and cumulative impacts will not be possible.	See the Blasting Plan Methodology (Appendix I in MVE [2023]). The plan is to be prepared by a construction contractor and will be reviewed by applicable parties prior to implementation.
12990-1	Jim Meeks	In the Lava Ridge wind draft environmental impact statement: Volume 1, Appendix 3.2 completely omits any data about the turbine wings being treated with toxic PFAS. Table ES-2 "air quality" has the same omission. How can we address the detrimental impacts to our air, ground and water quality when the draft omits mention of PFAS? We say no to any PFAS treated turbine blades.	See response to comment 11686-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
13000-13	Nathan Small	Obsolete forms of energy generation cannot be considered as end-state structures, so the Tribes would also request the NEPA document completely evaluate the closure plan for this proposed facility and the rehabilitation of all disturbed areas at the completion of this project at the end of the lease term.	See the Decommissioning Plan (Appendix L in MVE [2023]) and the Reclamation Plan (Appendix E in MVE [2023]).
13003-5	Lynden Osborne	Disturbed soil, once exposed to wind and sun, is dryer than undisturbed soil, ultimately affecting revegetation efforts. The Lava Ridge Project developers, according to the written plan, expect to have annual rainfall of twelve inches to aid vegetative restoration. That number might be overly optimistic. From 2006 to 2020, I recorded an average of 7.6 inches of annual rainfll with one year yielding only 2.7 inches. Granted, while I am located twenty miles from the project area, this 4.4- inch difference seems rather substantial. As stated previously, dry conditions not only lead to more dust, but dry conditions generally inhibit plant propagation. According to the DEIS, the windmills will cause the air near them to be warmer and dryer. Surely, this would also make the soil dose to them warmer and dryer making it very difficult to reestablish desirable vegetation.	See response to comment 12976-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1). As stated in MVE's applicant-committed measures 163 and 164 in EIS Appendix 4 (Mitigation), MVE would be held to reclamation success criteria. Reclamation areas would be monitored until the success criteria is met or up to 5 years following the initial or additional reclamation activities. Monitoring and additional measures may extend beyond 5 years if success criteria are not met. Reclamation success is defined by the re-establishment of vegetation and topography compared to conditions in the surrounding area at the time of reclamation. MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria.
13004-1	Jim Meeks	In the Lava Ridge wind project draft environmental impact statement: Volume 2a, appendix I1 through I6 does not address the specific depth of blasting or excavation. We cannot analyze the impact of either because the draft statement data is incomplete.	See the Blasting Plan Methodology (Appendix I in MVE [2023]). The blasting contractor will be responsible for preparing and implementing the Blasting Plan and must comply with all applicable federal, state, and local laws and regulations. No blasting operations will be undertaken until appropriate permits and approvals have been obtained. The depth of the blasts will vary by site, and blasting will only be used in areas where traditional excavation and earth moving equipment are unable to accomplish the excavation.
13008-2	Scott Hauser	In section 1.3.16, the DEIS states, "Project fences will only be installed as necessary. A chain-link fence will be installed around the Project O&M facilities and substations for safety. In instances where permanent fences are meant to be a barrier only to livestock or vehicles, wildlife friendly fencing will be used. In other instances security fencing will be used as necessary to protect MVE property (e.g., O&M buildings, substations) or prevent injury to non-MVE personnel, livestock, and wildlife." It is unclear if all fencing will be chain-link or if other types of fencing will be used. It is also unclear as to what "wildlife friendly fencing" refers to. Does this include flagging/installing strike guards for sage-grouse and clean strands of wire for Pronghorn? It would be beneficial if the DEIS expanded on what type of fencing would be permanently (life of the project) installed and what type of measures will be included for wildlife friendly fencing.	See response to comment 13006-13 (see in Table A-3aa, Wildlife, including Big Game) and the Flagging, Fencing, and Signage Plan (Appendix K in MVE [2023]). A combination of rope, plastic, and safety fencing will be used in addition to flagging and signage.
13008-3	Scott Hauser	Roads and traffic will have an impact in the short and long term. USRT has a few questions regarding these potential impacts: 1) How many miles of road will be established and maintained throughout the life of the	Miles of new and improved access roads by type are provided for each action alternative in Table 2.4-2. As described in EIS Appendix 11 (Project Elements Common to All Action Alternatives), project access roads would generally be open to the public, although access may be restricted during certain construction and O&M activities for public safety. The BLM would evaluate project access roads for decommissioning at the end of the

Comment ID	Commenter	Public Comment	Response to Comment
		project? 2) Are these roads open to the public? If they are open to the public, is there consideration of whether these roads will last beyond the life of the project?	project, the analysis in EIS Chapter 3 (Affected Environment and Impacts) assumes that all project access roads would be permanently retained.
13012-7	Heather Saunders	The bigger concerns in the wind turbine industry are fire and lightning (which usually leads to fire). According to an article published by Fire Safety Science, a peer-reviewed journal of the International Association of Fire Safety Science, the tendency of wind turbines to catch fire is one of the major challenges facing the industry. What plan is in place to prevent a wind turbine fire from escalating into a major wildfire, particularly considering the remote location? Will the company responsible for any catastrophes have an escrow account established to pay damages to farmers, ranchers and homeowners who may end up losing herds, fields and homes to an uncontrolled wildfire started by one of their turbines? Are they prepared to cover the costs of fighting such a fire? I spent 16 years working in disaster services for a local county and I know exactly how much it costs to fight a wildfire. Taxpayers should not be held accountable for financing the cost of fighting a major wildfire started by a private company in the pursuit of profit. According to that same article, although progress has been made since 2002, fires are still a major problem for the industry resulting in 30-40% of the losses suffered. How much wildlife and how many people are being endangered with this project that will not benefit our state in a way we consider to be meaningful?	A Fire Prevention and Protection Plan is provided as Section F.6 (Fire Prevention and Protection Plan) in the Health and Safety Plan (Appendix F in MVE [2023]). See response to comment 11360-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1) for a discussion of fire suppression responsibilities in the project area. Impacts to wildfire ignition, spread, response, and suppression are disclosed in EIS Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression).
13012-9	Heather Saunders	As you know, we don't have a lot of tall anything in that area to attract lightning away from wind turbines, which means they are going to need a top notch grounding system. The problem I expect them to encounter is that the grounding rod needs to have better contact with moisture in the ground than the tower footings to be effective (Solar Age Magazine). I farm in southern Idaho and I can assure you that moisture in the soil is something we lack. We have had years when the soil was so dry it actually became hydrophobic; we had to till thewater into the soil to get it to stay put. When the soil gets that dry it also picks up a lot of static electricity. Static electricity can have serious detrimental effects on wind turbines, causing problems throughout every system. The drier the air, the higher the probability that static electricity will cause problems, and Idaho has very dry air indeed. Experts say that relative humidity of 40% is required to control static in the air; southern Idaho's relative humidity in the summer months is well below that number (Climatology of the Idaho National Laboratory 4th Edition, June 2018), indicating a need for additional and robust static protection in any such installation (M.S. Davis and M.R. Madani, "Investigation into the Effects of Static Electricity on Wind Turbine Systems," 2018, pp.1-7, doi: l.1109/IRSEC.2018.8703008). According to Davis and Madani, an unnamed German study stated that lightning strikes account for 80% of wind turbine insurance claims. One German installation on Helgeland Island was shut down after only 3 years because the insurance company refused to cover any further losses due to lightning (totaling over half a million dollars at that point). The same thing could easily happen here in Idaho. Is this company prepared to decommission this installation and pay whatever amount is necessary to return it to its pristine state if it turns out to be too costly to maintain?	As described in Appendix C (Alternatives Considered by MVE) in MVE (2023), MVE considered multiple sites for the project and selected this location with the help of the latest computer modeling software and assistance from leading consultants in meteorology and wind development. Emphasis was also placed on avoiding impacts to important and priority sage-grouse habitat. MVE would be responsible for repairing or replacing any turbines damaged by lightning or static electricity. As described in the Decommissioning Plan (Appendix L in MVE [2023]), MVE would be required to purchase a reclamation bond prior to notice to proceed for construction, if a ROW grant is issued. Additional details on the methodology for calculating the value of the bond have been added to the Decommissioning Plan; see also applicant-committed measure 164 in EIS Appendix 4 (Mitigation).
13012-10	Heather Saunders	Another common problem with wind turbines is leading edge erosion, which begins the moment a wind turbine goes online. Here we have wind driven dust that includes erosive particles of both basalt and rhyolite. Basalt is a relatively hard mineral with a Mohs of 6; rhyolite contains a quartz base and can be even harder (quartz is 8 on the Mohs scale). Both of these substances are considerably harder than the plastic/fiberglass covering on the blades of wind turbines, and wind driven dust composed of these elements will cause the breakdown of the leading edge. Dust that manages to penetrate the windmill will cause even greater damage; nothing can destroy mechanical workings of all types like volcanic material. Metal is no defense.	See response to comment 11686-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
13012-11	Heather Saunders	Warming is also a problem with wind turbines. A 2018 study conducted by scientists from Harvard that was published in the academic journal Joule found that wind turbines cause significant local increases in surface temperatures in the areas where they are located. The typical Idaho summer is already set on broil; how much higher did they wish it to go? Further, the warming impact of the turbines was higher than the expected impact on warming from the turbines. This study was conducted in Minnesota where they don't have ground composed largely of basalt that also absorbs heat and raises temperatures. Minnesota is also much closer to sea level than Idaho is, a factor can weigh heavily of the efficiency of wind turbines. Higher temperatures make both wind turbines and solar panels less efficient. Solar panels lose 10-25% of their efficiency in high temperatures; for wind turbines the loss of efficiency is dependent upon the air density. However, at temperatures over 113 degrees wind turbines start to shut down, according to an article in Fortune magazine. There tends to be more wind in areas of higher temperatures, but the weatherization of wind turbines has concentrated more on preparing them for cold environments than hot environments. We don't get many days that are that hot, but we do get them...usually multiples in a row. Here's the part that I don't understand, and maybe you can get these guys to explain it to you. Why are so many companies determined to build wind farms in a state that is so unsuited to it? Yes, Idaho has a fantastic wind map but that is only one quarter of the equation. The efficiency of wind turbines is based upon temperature, the air density (which is also based on temperature), the rotor diameter, and the wind speed. Wind turbines are designed for optimal operation at an air density of 1.225 kg/m"3 and at temperatures well below 104 degrees Fahrenheit. The 104 degree F figure is the temperature at which wind turbines start to overheat. The average air density in southern Idaho is 1.06 kg/m"3 and we have multiple days above 104 degrees (Climatology of the Idaho National Laboratory 4th Edition, June 2018). In 2022 Boise had 25 days of temperatures over 100 degrees, and has been consistently above ten days of 100 degree temperatures since 2006. Things don't get any cooler as you go east. It seems that the further you get from the rivers, the hotter the temperature gets and the longer the high temperatures last. Southern Idaho is obviously not	See Section 1.2 (Purpose and Need for the Project) of MVE (2023). The project location was selected based on the quality of the wind resource in the area, the power markets accessible by existing and planned transmission lines in the area, the availability of suitable land, and the absence of land use constraints.

Comment ID	Commenter	Public Comment	Response to Comment
		as suitable a place for wind turbines as other areas (wind speeds not withstanding), with temperature extremes and air densities that will guarantee a hit to the efficiency of this installation.	
13012-13	Heather Saunders	At the end of the turbines lifetime we have waste. Non-recyclable turbine blades are clogging our landfills. Experts in the field expect the waste from wind turbines to increase to hundreds of thousands of metric tons before 2030. Are you going to ensure that all that waste is shipped to the people who are actually benefitting from the electricity this project will produce?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
13024-4	Keith Stone	There are other concerns, such as disposal of the massive turbine blades that cannot be recycled or composted. Our pristine high desert areas should be protected and not subjected to the blasting, construction equipment, foundations, maintenance crews, and waste disposal that will certainly be required with the proposed project. I	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
1334-1	Ranger Cook	If this boondoggle is allowed to proceed, please make sure money is put in escrow for end of life of the windmillsaEUR|..before start. The citizens of Idaho should not be left to clean up a skeletal mess	See response to comment 12925-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
1953-2	Allan Lloyd	In 15 to 20 years these huge machines will be piles of rusting metal with thousands of pounds of concrete under the ground. What will you do with them then?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
1984-1	Sue Williams	There is no plan in the DEIS that shows what MVE's plan is for fire suppression on a wind turbine and on the wildland that surrounds the structure. While MVE presents a periodic maintenance plan for the turbines, there is no acknowledgement of the difficulty of suppressing a wind turbine fire from either an internal fault in the nacelle or from a lightning strike, igniting the 600-900 liters of oil. Records show that most wind turbines that catch fire cannot be suppressed directly due to the excessive height of the nacelle. The standard practice is to allow the fire to burn itself out destroying the nacelle and the structure. This is unacceptable due to the danger of a fire spreading to the surrounding wildland, destroying wildlife habitat, and endangering farms and ranches in the immediate area. Further, there is no plan in the DEIS showing what MVE's plan is for suppressing a wildland fire in the project area. Not addressing the potential effects on the surrounding communities in terms of the cost to fight such a wildland fire, the lack of sufficient personnel and equipment, and the inability of possible slurry bombers to access the site, make this a serious deficiency in the DEIS.	We have included additional discussion in the impacts analysis in EIS Section 3.7 (Fire and Fuels Management) concerning fire risk associated with wind turbines. See also MVE's Fire Protection and Prevention Plan—located in Section F-6 of the Health and Safety Plan (Appendix F in MVE [2023]).
2096-1	Nancy Anna Caldwell	I feel energy such as windmills is a creative idea. And we need sustainable energy. I saw the destruction in TX after their huge freeze. What makes your system more sustainable in freezing temperatures ? Not to mention the birds that fly into the windmills? Are your windmills less susceptible to freezing weather and how do you plan on disposing of windmills that get damaged?	Turbines are equipped with sophisticated monitoring equipment that provide the operator with up-to-date information regarding environmental conditions that inform turbine operations. This monitoring equipment allows the operator to shut down turbines in the event that ambient temperatures exceed the turbine operating envelope. Turbines installed in Texas do not require, and are typically not equipped with, cold weather packages (CWPs) that are offered by the major wind turbine manufacturers. These CWPs can include, but are not limited to heating systems within the gearbox, generator and electrical cabinets to keep components and fluids warm, as well as specialty lubricants designed to allow operations in cold weather climates. Turbines without CWPs can operate down to an ambient temperature of around -15℃ (5℉). Turbines with CWPs installed can operate down to an ambient temperature of around -30℃ (-22℉). The turbines installed at Lava Ridge would be equipped with CWPs. Bird strikes are one of several factors that can cause wear and tear on turbine blades; turbine blades would be replaced as needed during operations and maintenance, as described under Project Operation and Maintenance in EIS Appendix 11 (Project Elements Common to All Action Alternatives) and Section 4.0 (Operations and Maintenance) in MVE (2023). Disposal and recycling of turbine blades and other project components is described in the Decommissioning Plan (Appendix L in MVE [2023]).
2208-1	Katie Powell	Site preparation with vegetation removal and "treatment" with fences what kind of treatment ?	See response to comment 11487-2 (see in Table A-3x, Vegetation).
23-1	John & Mary Mills	I have seen many wind projects all over the Western USA and none have the size of the towers to be used at Lava Ridge. Why? Why not shorter say 200' instead of 750'.	See response to comment 1042-2 (see in Table A-3ee, Alternatives). Larger rotor diameters allow wind turbines to sweep more area, capture more wind, and produce more electricity.
2314-6	Mike Tylka	Wind generators have limited life span and no effective method to recycle their components. How much initial energy is invested in their manufacture?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) regarding turbine disposal and comment 11344-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1) regarding lifecycle emissions associated with wind turbines.
2385-1	Bob Stokes	Who would benefit from this massive project? Idaho residents? Or will the electricity be delivered to California?	As described in Section 1.2 (Purpose and Need for the Project) of MVE (2023), the project would interconnect at the existing Midpoint Substation or SWIP-North line; existing and planned transmission pathways will allow power from the project to be delivered to load serving entities in several western U.S. states, including Idaho and California. Economic impacts of the project are described in EIS Section 3.6 (Environmental Justice and Socioeconomics).
2459-1	John	What is your plan to dispose of the turbine blades after being replaced? More forever chemicals???	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
2842-1	Matt Delaney	There was not enough information to me that showed how efficiently the impacts would be. 200 to 400 turbines, 2-5 substitution whether or not the interconnect would be midarny sub or SWIFT? One battery storage does not sound reliable for 2-5 collector subs. There does not seem to be the design of the project in place or set in stone to make an accurate assumption of the environmental impacts. For the long term. Nothing was evident to who would be held accountable. These projects are bought & sold several times and the energy is not efficient and likely to be used locally.	Refer to MVE (2023) for a detailed description of the project. As described in the Decommissioning Plan (Appendix L in MVE [2023]), MVE would be required to purchase a reclamation prior to notice to proceed for construction, if a ROW grant is issued. Additional details on the methodology for calculating the value of the reclamation bond have been added to the Decommissioning Plan; see also applicant-committed measure 164.

Comment ID	Commenter	Public Comment	Response to Comment
2863-2	Brock Dille	The EIS doesn't mention support and rather Idaho Power can transmit the power. There is no guarantee that when each turbine is all the end of life, restoration will occur. How do ensure restoration will occur as defined in the EIS?	The power generated would interconnect with the existing Idaho Power Midpoint substation or a new interconnection substation located along the SWIP-North alignment, as mentioned in Section 1.1 (Introduction) of MVE (2023). See the Decommissioning Plan (Appendix L in MVE [2023]) and the Reclamation Plan (Appendix E in MVE [2023]). The terms and conditions within in an authorization, if approved, would require a reclamation bond prior to an NTP with construction is issued.
2878-2	Scott Prow	Nowhere in the EIS does it speak to the size of a 3-MW turbine. In light of this oversight I cannot know for sure the actual height of a shorter 3-MW turbine and this inconsistency (between the 2-MW and 3-MW turbines) gives me pause and I question what else in this EIS may be wanting or disingenuous. Because of this I cannot support this project and would propose Alternative "A" -No Action. Respectfully,	See Section 1.3.4 (Number and Size of Wind Turbines) of MVE (2023). Several factors influence the size and number of wind turbines with a minimum height of 390 feet and a maximum of 740 feet.
2895-1	Sue Williams	While MVE presents a plan for periodic maintenance for the turbines, there is no acknowledgement of fire occurrences and their plan for suppression of a wind turbine or a resulting wildland fire. Public records indicate that it is standard wind farm practice to allow the nacelle to bum out completely, exposing the ground to contamination from fluids and burning plastic components from the collapsing structure. If the turbine's blades are moving while on fire, there is significant danger of ignition of the wildland surrounding the structure, destroying wildlife habitat and endangering farms and ranches in the immediate area.	MVE's Fire Protection and Prevention Plan is located in Section F-6 of the Health and Safety Plan (Appendix F in MVE [2023]). EIS Section 3.7 (Fire and Fuels Management) describes the potential for project-related fire ignition, spread, response, and suppression.
2915-4	Roger Twitchell	Another issue, one which is not addressed in the DEIS is security. The proposed wind turbines, under any alternative would be spread out over a huge area. As recently demonstrated, electrical substations in the US are vulnerable to vandalism/sabotage. The wind turbines would provide a target for similar assault and would be harder to protect than a substation. Would MVE provide area wide security for the wind turbines? Would the public lands on which the wind turbines are proposed to be located remain open or be closed to the general public?	See response to comment 12934-5 (see in Table A-3n, Issues Analyzed in Brief – EIS Appendix 3).
2915-5	Roger Twitchell	Also, for MVE to respond, where will the components for the wind turbines be sourced? Where are the environmental impacts analyzed?	See EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) and EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions). It would be speculative to guess where the wind turbines will be sourced from at this point in time.
2928-1	Julie Stadtherr	I do not think that this issue has been addressed sufficiently. Exactly how do you mitigate for blasting damage far below the surface of the ground? Are there any studies that show conclusively that this blasting, other construction activity and building gigantic, ground vibrating structures on top of a lava aquifer causes no damage? Will MVE be held legally liable and required to replace any wells in the region, meaning ANY AREA that derives its water from the Snake River Plain Aquifer, should water volume or water quality be affected?	See response to comment 11278-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1) and the Blasting Plan Methodology (Appendix I in MVE [2023]).
2933-1	Alwena Sauage	1. Will the wind turbines be replaced when they were out after 20-30 years? or are they just going to be thrown out? If they cannot be replaced - then wind turbines are an unstable source of power. Pt 2 of 2 2. What will be the harmful effect of magnesium chloride after he wind turbines are gone? (like 30 years) 3. Does LS power own the turbines that are already in Idaho? How many are in production? Who has contracted with LS power for existing power? This should be public knowledge? Where can I find this information?	LS Power does not currently operate wind turbines in Idaho. Contracting for the power that would be generated from the project has not yet been established. See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) regarding turbine disposal. See response to comment 3811-4 (see in Table A-3v, Soils) regarding impacts from the use of magnesium chloride as a dust palliative.
2939-5	George Solverson	last, the Qecommission Plan needs to address the risks in dealing with the substantial tower, blade, and battery waste stream. Where will the landfill be located to bury the unrecyclable blades and will the dump site include more solid waste from other planned wind facilities?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
3032-1	Robert Johnson	If that is not enough I would ask that you get more data on the long term effects of the loss of vegetation,birds,big game ,and small game ,what kind of help of recovery ,if at all, at the end of the projects life span , I also did not see where there was an actual end date of the program ,just a time frame,for the life span of the windmills ,or is the project permanent and who would be responsible for tearing out all of the roads and fences that will be built, and where will all of these windmills be destroyed or buried.There are many un answered questions just alot of information on how much damage that will be caused.	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste), 11554-15 (see in Table A-3aa, Wildlife, including Big Game), and 6075-4 (see in Table A-3aa, Wildlife, including Big Game). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
3044-1	Name Not Provided	The article stated it will supply 350,000 homes with electricity. So, does one windmill power 1,000 plus homes with power for 24 hours per day? That seems to me an exaggeration. I would assume you have verified evidence to exactly how much power this Power Plant will supply. I did not see verified numbers on your website.	Table 2.4-1 in EIS Section 2.4 (Alternative B [Proposed Action]) lists the estimated annual power generation of the project under each action alternative based on a net capacity factor of 35-45%. Annual net capacity factor is the ratio of the net electricity generated in 1 year to the energy that could have been generated at continuous full-power operation in 1 year. Annual power generation is presented in TWh; neither the EIS nor MVE (2023) make any statements as to the number of homes that would be powered by the project. Estimates for the number of homes that can be powered per MW of generation capacity vary widely, but even at the lower end (100 homes per MW) a single 3-MW turbine could power 300 homes and a single 6-MW turbine could power 600 homes. Thus, at maximum capacity, the project would provide enough power for more than 200,000 homes. When the full range of estimates is considered, the number of homes powered at maximum capacity could be close to 2,000,000.

Comment ID	Commenter	Public Comment	Response to Comment
3055-2	Karen Matsumoto	Monitoring of construction and operation of the wind farm was not clearly outlined or evaluated in the DEIS document. Who is accountable?	See the Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]). The plan outlines the roles and responsibilities of the compliance team in executing the plan and describes their reporting relationships.
3072-2	Matt Delaney	The EIS can not be accurately completed when the design of the project is still in question. There are A through E options? MVE could answer and do not have a plan as to how the foundations of the turbines are going to be built? How can a study be accurate when the details for the project are not there.	The BLM is evaluating the potential impacts from Alternatives A through E via this EIS NEPA process. If the BLM selects an action alternative, MVE would conduct site-specific geotechnical studies (MVE 2023) and summarized details in EIS Appendix 11 (Project Elements Common to All Action Alternatives). See also EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction): "Although the exact location of infrastructure and activities within the siting corridors is unknown at this time, evaluating the entirety of the siting corridors for potential impacts provides flexibility to site the project components where necessary (from both resources and engineering perspectives) within the siting corridors. The project's final design and engineering would be completed after the BLM has issued a record of decision (ROD) and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. The project's final design would identify the specific location for all infrastructure and project activities and would be approved by the BLM Authorized Officer. This EIS identifies and considers effects to resources present within the siting corridors, allowing for identification of areas with fewer impacts or specific resource trade-offs. This identification of resource constraints within the siting corridors provides flexibility for the project design to adjust through site-specific engineering for the final layout. The action alternatives consider different configurations of the siting corridors to avoid or minimize potential effects. These configurations are described by alternative below."
3073-2	Becky Ipsen	4) The loss of use of the land to our cattlemen and recreationists. 5) What do we do with the waste? Windmill after windmill are taking up large landfills in Wyoming at this time. Why can't we recycle these? If the government was serious about saving our resources then why are these large projects not made to be recycled and low impact?	See response to comment 13006-24 (see in Table A-3u, Recreation) regarding recreationalists, along with the Decommissioning Plan (Appendix L in MVE [2023]) and the Grazing Coordination Plan (Appendix S in MVE [2023]). MVE will prioritize the re-use, recycling, or scrap value of the decommissioned project components over direct disposal in approved landfill facilities. New industrial technologies that recycle turbine blades are currently gaining traction in the marketplace and are expected to increase in utilization over the life span of the project.
3084-3	Julee Austin	but what has not been addressed is what consequences construction can have on groundwater supplies and what remedies are available.	See response to comment 8421-4 (see in Table A-3m, Human Health and Safety) and the Stormwater Pollution Prevention Plan (Appendix D in MVE [2023])
3092-1	Jeff Juker	Will the land be put back as it was found at end of life of the project? Who will guarantee this if so and provide funding to do so?	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11411-7 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
3115-1	Virginia White	I am against wind farms until the industry recycles their structures. The mining industry is required to reclaim where they mine, leaving the site beautiful and usable. I am very concerned about the environmental impact of the turbine blades when they fail at the end of productivity. The first generation of turbine blades are now failing and cannot be recycled. I have heard some are being buried in farm fields. Why would Idaho want to build wind farms with no plans to recycle these huge turbines? Building wind farms without plans to recycle these turbine blades is a terrible way of polluting our beautiful land in Idaho. It is irresponsible to continue building wind farms until this problem is solved.	MVE will prioritize the re-use, recycling, or scrap value of decommissioned Project components over direct disposal in approved landfill facilities as stated in the Decommissioning Plan (Appendix L in MVE [2023]).
3140-1	Susan Page	Where is the plan showing how the blades will be de-iced? The Idaho weather will cause freezing effects to the blades which will require chemicals sprayed on them. How? One new method is for drones to spray chemicals into the air and onto the blades. How will that chemical effect the surrounding area? The wildlife but more importantly the recreational activities by hunters of ducks and geese that fly through the area as well as the sound of the drones scaring the wildlife out of an area used for lots of winter activities.	AIB-14 was added to EIS Appendix 3 (Issues Analyzed in Brief): Would ice throw or ice shed from turbine blades pose risk of injury to workers and the public? Application of deicers for turbine blades or the use of drones are not proposed under any action alternative. Site-specific meteorological data collected by MVE indicates a relatively low potential for icing.
3150-4	Cameron Stauffer	Continuing at the BLM open house, the public was made aware that one of, if not the biggest, driving factor for "green energy" development, is because of the current political administration. This project is slated for two years of construction, 32 years of operation, and up to 50 years for full reclamation of native habitat. In the best-case scenario, this is an 84-year project being determined by a four-year administration. When asked at the open house; what would happen if MVE forfeits their bonds for the project? There was no answer, and it undoubtedly would leave the landscape worse off.	See responses to comments 11782-6 (see in Table A-3bb, Applicant's Interests and Objectives) and 12059-2 (see in Table A-3bb, Applicant's Interests and Objectives).
3163-4	Rick Aitchison	If the Project goes Forward we should Take Small Steps 10 Windmills with follow up studies and not Add more Windmills for at least 1 year from the First 10 Windmills are Implemented.	The BLM is responding to MVE's application for an up to 400 turbine wind generation facility. Part of the project proposal is construction phasing, see Section 2.3 of MVE (2023). The application did not request phasing installation of only 10 turbines per year. This construction approach would render the project uneconomical.
3163-5	Rick Aitchison	Mandate only American Manufactured Parts are Used.	Refer to EIS Section 1.3 (Decision to be Made) for a description of the decisions the BLM is evaluating in this EIS. Decisions regarding materials sources and manufacturing are outside the scope of this EIS.
3163-8	Rick Aitchison	Mandate Preventive Maintenance Procedures are Followed.	Operational staff will perform routine maintenance, long-term maintenance, and emergency work as needed. Routine maintenance typically occurs every 6 months to a year, as described in the Operations and Maintenance section of MVE (2023).
3163-9	Rick Aitchison	Use Local Builders or Construction Companies to Build Roads.	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
3204-1	Carol Pelazini	I understand that wind turbines are being proposed for Idaho. That will be a tremendous and horrendous project. It will destroy the grandeur and majesty of the Idaho landscape. I moved to Idaho 11 years ago from Redlands, CA. Between Redlands (city east of San Bernardino) and Palm Springs there are two windmill farms. I read in	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). MVE will prioritize re-use, recycling, or scrap value of decommissioned project components over direct disposal in approved landfills, as covered in the Decommissioning Plan (Appendix L in MVE [2023]). For information related to effects

Comment ID	Commenter	Public Comment	Response to Comment
		our local paper before moving that they were known as Condor Cuisinarts due to the large number of dead birds underneath. Even though the wind blows there almost constantly some of the turbines are still making me wonder about the maintenance and therefore the efficiency. Where do the worn out parts go? To the landfills? I'm well aware of the need for renewable energy but windmills are not the answer. They pose a great threat to our environment.	on avian populations please see comments 12469-10 (see in Table A-3d, Eagles) and 13012-8 (see in Table A-3, Birds). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
3250-2	Joni Nakayama Kimoto	I am also greatly concerned over the safety and the possible risks of equipment failure once the turbines are operating. There is an article in the Oregonian dated August 24, 2022, where Biglow Canyon's wind farm in the Columbia River Gorge, experienced disastrous turbine failure. The article cited that broken bolts and nuts detached a wind turbine blade. This 8 ton blade separated from the turbine and soared the full length of a football field, plowing into a nearby farmer's field 4 feet deep. The blade is like shrapnel and spiked deep into the soil. The nuts, bolts and hatch doors fell from a height of 265 feet, and reached 90 mph, maybe a hazard to anybody nearby. How would that compare to the height of the Lava Ridge turbines at 740 feet high? How many tons will one Lava Ridge blade be and how far can it fly? Article also stated that oil leaks and lubricants from Biglow Canyon's wind turbines are environmental and fire hazards, if not properly maintained as they age. Would Lava Ridge guarantee preventative maintenance so as not to impact the safety of nearby Minidoka's site?	See Section 4.0 (Operations and Maintenance) of MVE (2023) for scheduled wind turbine maintenance plans. Also see the Health and Safety Plan (Appendix F in MVE [2023]).
3302-8	Susan Canham	What is the energy source of operating the battery energy storage system and its energy cost?	The battery storage system would be powered by the wind turbines and is discussed in Section 1.3.6 of MVE (2023).
3477-2	Rebecca Loomis	Are batteries part of this project? There are no batteries to store the power generated. No battery system could store the amount of energy needed to power cities.	Batteries will be a part of the project and are covered in Section 1.3.6 of MVE (2023).
3500-1	Alta Toler	I would ask that you look into vertical wind machines. They do less damage and provide as much or more energy.	See response to comment 1043-1 (see in Table A-3ee, Alternatives).
3508-1	Russell LeJeune	I suggest your organization assure the landowners that they will not be responsible for maintaining and removing the turbines should a change in operation or redirection occur.	Operational staff will perform maintenance as mentioned in Section 4.0 (Operations and Maintenance) of MVE (2023).
4542-1	Judy Stockham	According to the EIS, even with mitigation and strict adherence to the plan in decommissioning, it will take 50 years for the projects footprint to be no longer visible. This is a fragile ecosystem that will be virtually damaged/changed for three-quarters of a century. That will be past the lifetime of myself, my children, and my grandchildren. The one thing that will outlive the project and remediation are the turbine blades which will be here for the life of the earth. A fact that will over whelm and local landfill and what about the long-term consequences of burying these blades. The taller higher-capacity turbines produce even more waste and they will need to be cut up onsite before removing them. What harmful effect will be produced when cutting/grinding these fiberglass blades into a more manageable size? This could pose a risk to all inhabited areas that are in the winds path as they bring these harmful particles out from the site. Wind turbine blades pose the greatest challenge to end-of-use considerations.	See the Decommissioning Plan (Appendix L in MVE [2023]), which states that MVE anticipates that the decommissioning activities for the project can be completed over a 2-year period. It will also be conducted in strict accordance with the Health and Safety Plan (Appendix F in MVE [2023]).
4542-2	Judy Stockham	The taller turbines (both proposal heights) should be rejected as the studies on these high capacity towers is still incomplete. Bloomberg (1-23-2023) reported on these taller towers buckling and falling on top of themselves. According to Bloomberg, Siemens Energy revised down their earnings outlook for 2023 citing higher than expected costs caused by flaws. “There’s a hesitancy among insurers and lenders about these big models that haven’t been tested yet. The technology alarm bells are ringing”. Therefore, with an abundance of caution no approvals should be issued for the taller towers and the application should be re-submitted with average height not to exceed that of towers already built within the Magic Valley. Most wind farms are maxed at 229 ft towers with 164 ft long blades. EIS noted turbine blade motion will affect weather at the surface: warmer at night and cooler during the day. According to a study by the University of Delaware wind projects can have unintended effects on local weather in the form of minimal though statistically significant impact when it comes to wind speed and reduced precipitation at nearby locations. This would affect an already arid desert land and the re-planting of grasses may not be viable due to a decrease in moisture. Journal of Physics (2022) states “as wind turbines are getting bigger in size, designs are becoming more light weight and consequently the ratio of the aerodynamic over the inertial loading increases”. “This makes the turbines more prone to Stallin Vortex Induced Vibrations. This may appear during locked or in idling mode”. Is the turbine safe during these vibrations and to what extent will the increased vibrations and noise affect any wildlife, humans, or occupied areas. Again it seems these very tall turbines have not sufficiently been studied for their influence on aerodynamic behavior and its influence on the physical environment.	The size of the turbines proposed for the project are within the range of turbines installed at existing U.S. wind energy facilities (see, for example, the discussion in EIS Section 3.3 [Avian and Bat Species]). Impacts related to changes in air flow and surface temperatures from wind turbine operations are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-44. See response to comment 11336-2 (see in Table A-3aa, Wildlife, including Big Game) for a discussion of impacts to wildlife from turbine vibrations and noise.
4770-3	Brinya Olmstead	I have read that LS Power proposed to complete this project in two years. I do not believe that construction timeline to be probable or possible. I worked for Western Construction for 3 years on road projects throughout southern Idaho and have seen first hand how many things can go wrong, especially when moving large amounts of earth in a previously undisturbed area. My family and I drove out to the south side of the proposed project last week and the desert roads were muddy and virtually unpassable unless you wanted to risk getting stuck every couple miles and tearing up the surrounding grassland by driving off road. We turned around, but what is LS Power going to do in these conditions? Won't there be a significant amount of time each winter that they are unable to work due to unpassable roads? I read that they are going to build 600 miles of road to accomplish this project. The amount of gravel and maintenance that will be required to keep these roads passable to heavy equipment during the winter months seems to me that it will be Very disruptive to the native wild life and beauty	See responses to comments 11204-12 (see in Table A-3dd, Plan of Development – EIS Appendix 1) and 11535-142 (see in Table A-3w Transportation).

Comment ID	Commenter	Public Comment	Response to Comment
		of our desert. This will not end with the end of construction as I can only assume that these gigantic windmills will need constant maintenance that can only be performed with large equipment.	
5332-1	Marilyn Broek	A 2 year construction project. Ridiculous to even say such a thing. Of course there is small print stating that the construction 2 years could be split into 2 or more phases. That means there are no limits on the construction time. And it is stated that construction will avoid eagle nesting times(Jan thru end of August). As well as other time restricted construction windows. So many Applicant Committed Measures that need to be tabulated. Who is going to monitor developer to see that their commitments are realized? I have little confidence that the developer will follow through on his commitments. Words are cheap, once construction starts, funny how the worker bees didn't know they were not supposed to doze thru that area.	See Section 2.0 (Construction of Facilities) of MVE (2023).
5332-3	Marilyn Broek	Aggregates. Very few road projects in Idaho are new roads. We add lanes and widen and improve existing. 400 miles of new roads proposed for this project is more than Idaho has built in 40 years. Where is this road aggregate supposed to come from? Not from the lava that will be blasted from the foundation locations. It is dirty and soft. Often not allowed on State, FAA, Federal roads because of its lousy properties. And, draft EIS says need 3 on site concrete batch plants. How much concrete are we talking about? Concrete aggregate is difficult to find and crush. It must be so clean. And cement. Where is it supposed to come from? Our concrete paving projects have a difficult and spendy supply chain issue every year.	See responses to comments 6387-6 (see in Table A-3k, Mineral Resources) and 11535-142 (see in Table A-3w, Transportation).
5453-1	Brett Smith	My biggest concern with this project is the "fact" that wind turbine generators are not reusable / recyclable, but I've since learned that this is not entirely true (please convin me that such is so).	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
5503-2	Mark Hofhine	The major concerns I have are in regards to environmental views, waste, materials and wildlife. It appears MVE says they will mitigate wildlife issues somewhat but there will still be a lot of loss. How can I trust that MVE will care about the environment and resources? Where are the materials coming from? Many of the wind turbines in the US come from China. Has the structural integrity of these items been fully evaluated? Tall structures are more susceptible to structural fatigue. Where will the waste go? The aesthetics looks like it will be significantly impacted. The existing windmills are really an eyesore. Why would this be any different? Information provided says everyone in the magic valley area will see the windmills.	For information regarding wildlife, see the response to comment 11598-11 (see in Table A-3aa, Wildlife, including Big Game). Also see Section 5.0 (Environmental Considerations) of MVE (2023), which states, "protecting the environment and working with local communities are two important factors of MVE's development philosophy." Guessing the source for project materials would be speculative at this point. For information regarding how project components will be disposed at the end of their life span, see the Decommissioning Plan (Appendix L in MVE [2023]). For information about visual resources, see the response to comment 6837-1 (see in Table A-3u, Recreation).
6064-1	Raiza Giorgi	ind and solar have ridiculous costs to not just keep them maintained, but have you looked into how wind and solar are disposed once they are no longer viable? Aside from the environmental impact, wind farms are extremely noisy and they are a aesthetic blight on the landscape. Wind turbine blades can be extremely hazardous to birds, especially turbines that are built near migratory flight pattern areas. Wind turbines are very susceptible to damage from lightning because of their tall and metallic form, which, in very few cases can be dangerous for nearby animals or people. Another big disadvantage of wind energy is that no matter how great the technology becomes, a wind turbine will never be able to be more than 59.3% efficient according Betz's Law. Betz's law states that the wind which passes through the blades of a wind turbine can never be captured to more than a 59.3% efficiency because of the physical laws of moving parcels of air.	For information regarding the disposal of project materials, please see the Decommissioning Plan (Appendix L in MVE [2023]). See response to comment 11410-1 (see in Table A-3r, Noise) regarding noise levels, and comment regarding avian studies.
6382-2	Laurie Bourn	There will be lots of trucks and tractors and whatever other fuel guzzling vehicles needed to put these up all along OUR lava beds. And, these blades are not recyclible... where are you going to bury them? Plus, all of the fossil fuels just to lubricate them. Plus, all of the coal energy to manufacture them.	See the Decommissioning Plan (Appendix L in MVE [2023]) for information regarding the disposal of project components and Section F-5 (Waste Management Plan) of the Health and Safety Plan (Appendix F in MVE [2023]).
6382-3	Laurie Bourn	And, these blades are not recyclible... where are you going to bury them?	See response to comment 6382-2 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
656-1	Beth Elliott	What happens when mother nature comes through with any ice storm, tornadoes or hurricanes? Are these wind turbines strong enough to hold up to mother nature?	See response to comment 12398-16 (see in Table A-3f, Climate and Greenhouse Gas Emissions).
6820-3	Chris Callen	Who will clean these up when they fail?	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11491-28 (see in Table A-3f, Climate and Greenhouse Gas Emissions). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
6829-1	Linda Bush	I am 100% against wind farms anywhere. What happens when there is no wind? Do generators keep them going? Generators run on fossil fuels? How about the birds that get killed? What happens when the blades are no longer working? What landfill do they go in to stay forever? Put them on John Kerry or Al Gores property. The wind farms by Palm Springs are not working more than they are. Not a good idea. Please do not destroy Idaho with these monstrosities.	Generators collect power from the wind turbine and will not be used to power the turbines and is covered in the Section 1.3 (General Facility Description, Design, and Operation) of MVE (2023). Impacts on birds and bats are discussed in Section 5.0 (Environmental Considerations) of MVE (2023). See the Decommissioning Plan (Appendix L in MVE [2023]) for information pertaining to blades at the end of their life cycle.

Comment ID	Commenter	Public Comment	Response to Comment
6840-1	David Thedens	Consider the construction of a smaller 120 foot turbine. Diesel powered earth movers must dig a significant hole for a foundation. Then up to 63 fully loaded diesel powered concrete trucks will be needed to pour the rebar (from china) reinforced foundation. Where is the nearest concrete factory? Diesel powered semi must transport the various blades and towers to the site where diesel powered crane will be used to assemble the unit. The 120 foot blades only last 5 to 10 years depending upon how many bird strikes occur. How many ducks, geese, and eagles are projected to die? Fiberglass has no half life. The current disposition is to bury the fractured blades in Montana. Major source of pollution. What is LS Powers current disposal proposal? The 120 foot turbines have a service life of 20 years. What is the service life of the larger turbines? Will LS Power remove the massive concrete foundations and the massive towers when they abandon the site? Currently there are 57,000 windmills producing 9% of the US energy production. To replace the fossil fuel generation of natural gas (40%) and coal (20%) we would need to build 360000 windmills whereas the US currently builds a little more than 3000 a year. Not practical at all. 75,000 windmills have been built, and I assume the off line or retired turbines are still standing. Eyesores forever.	See Section 3.4.1.2.2 (Alternative B [Proposed Action]) Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) of the draft EIS for estimates of the direct and indirect greenhouse emissions as well as Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) in EIS Section 3.4.2.2.2 (Alternative B [Proposed Action]). See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) regarding turbine disposal and response to comment 11344-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1) regarding lifecycle GHG emissions. Impacts to avian populations from turbine collisions are described in EIS Section 3.3.2 (Avian Populations). As described in EIS Appendix 11 (Project Elements Common to All Action Alternatives), wind turbines would be completely removed during decommissioning and foundations would be removed to a depth of at least 3 feet.
6840-2	David Thedens	Of course LS Power will just declare bankruptcy after the profit dwindles leaving Idaho to dismantle the waste.	MVE, the BLM, and any other applicable agencies will meet prior to formal decommissioning per the Decommissioning Plan (Appendix L in MVE [2023]).
6868-1	Barbara Martie	Noted that the following areas were not completely covered. [...] The blade replacement and disposal has not been fully addressed. Blades are too long to be placed on trucks so need to be cut down to fit for removal. What is the effect of the fiberglass that would pollute the land? From what I have read blade replacement is no a minor matter 8,000 a year. Where would the blades be disposed until recycling blades becomes a reality? Local landfills introduce another environmental impact. Size of trucks to move the blades out of the area. Blade disposal is a key issue to affect the community.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
6883-2	Ron Moody	The EIS for Alternative B doesn't adequately address how these behemoth towers will be disposed of once their relatively short lifespan is reached. This will cause an environmental disaster for future generations.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
7333-1	Kenneth Hansen	Quoting Windpower Engineering Development, "Some wind farms report up to 20% annual energy production losses due to icing," says Matthew Wadham-Gagnon, a Pro-ject Manager at TechnoCentre eolien (TCE). TCE is a Canadian organization that sup-ports wind-industry development through research, technology transfer, and technical assistance for business. In addition to production losses, ice accretion can affect the structural design load case of a blade, as well as other components in a wind turbine. For example, ice shedding from a blade can damage other blades or hit the roof of the nacelle, adds Wadham-Gagnon. But quantifying or predicting the exact effects icing may have on a wind farm -- say, for a proposal or business case made to a financier -- is challenging because weather conditions change. "Icing could have a significant effect on the annual production of a wind project. It depends on the frequency, duration, se-verity, and intensity of icing which varies from year to year, site to site, and turbine to turbine, says Wadham-Gagnon." Then follows a list of developing methods to address the icing problem. I would suggest that this area is not suitable for the proposed 740' high wind turbines. The weather frequently brings sticky snow as well as heavy frost, and the possibility of an ice storm. It is not proven that propeller blades of that size can withstand the potential snow and ice loads.	See response to comment 11466-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
7339-2	Matt F.	In addition to the reduction in power output, turbine collapses present obvious safety issues. BLM should begin scrutinizing the warranty agreements that the project applicants have with the turbine manufacturers, as well as what insurance mechanisms are in place to replace the turbines when they collapse, which will inevitably happen. As the articles noted above, insurers are raising their premiums. This will no doubt lead to the applicants balking at paying for insurance. BLM should remain firm on this and require them to have insurance for every single piece of property involved in the project.	MVE would be responsible for purchasing appropriate insurance for wind turbines and other project infrastructure at their own discretion. As described in EIS Appendix 11 (Project Elements Common to All Action Alternatives) MVE would be required to purchase a reclamation bond prior to notice to proceed if the project is authorized. Also see response to comment 7346-1 (see in Table A-3jj, Legal or Policy Compliance).
7343-1	Matt F.	Please accept my comment regarding the Lava Ridge Wind Project EIS as it relates to the authority of BLM to completely halt the project during the operations phase, should it be approved. At the moment, and likely into the future, BLM is being asked to approve the usage of technology and associated machinery at a scale which has not been used before in previous BLM approvals in Idaho. For example, the EIS states on pp 2-4: "The generation capacity of Alternative B would be nearly 25% more than the largest existing wind facility in the United States" This means there is uncertainty on what the exact outcomes will be once the project enters the operations phase. BLM does its best to extrapolate from existing projects, but it can never be 100% certain. For that reason, if any alternative other than A, no build, is approved, BLM should put a caveat in their approval which states that if the impacts become unreasonably damaging to the environment, people, property or businesses, that they reserve the right to shut down the project completely at any point during the operations phase. This will help protect the public from negative impacts which were impossible to foresee during the EIS stage.	The NEPA process provides a disclosure of potential impacts using the best-available information at the time the NEPA analysis is conducted. It is not necessary to be 100% certain to conduct a meaningful analysis and comparison of alternatives. If the project is authorized, the BLM will continue to manage lands within the SFO for multiple use according to the BLM SFO's *Monument Resource Management Plan* (BLM 1986), as amended. The BLM will coordinate project operation details with MVE throughout the 30-year ROW grant.
7345-1	Matt F.	Please accept my comment regarding the Lava Ridge Wind Project EIS as it relates to the Rectification of Non-Compliance by the project applicant, Magic Valley Energy. The draft EIS volume 2a, appendix V and volume 3, appendix 10 discuss environmental compliance, monitoring and mitigation. They focus mainly on the construction phase of the project and do not satisfactorily address issues that can and will arise during the operations phase of the project. Specifically, they do not propose a person/method of contact, or a formal dispute resolution process which can be completed in a timely manner. Meaning, when a person, structure or business is injured in some way by the operation of the wind turbines, there is no formal process for the injured	See the Health and Safety Plan (Appendix F in MVE [2023]) along with the response to comment 11204-24 (see in Table A-3m, Human Health and Safety). MVE is committed to responsible management in all areas of health, safety, security, and environment. A more detailed Health and Safety Plan will be developed by the project team in cooperation with the BLM prior to construction.

Comment ID	Commenter	Public Comment	Response to Comment
		party to file any type of grievance or notice of non-compliance. For example, in volume 1 page 3-431, Measure ww discusses how shadow flicker will be handled. It says turbines which are impacting residences with shadow flicker can be turned off while that is the case. However, what is the remedy for when more shadow flicker than predicted occurs? Or when it is occurring, but due to an oversight, MVE has not shut off those turbines? Who should the residents contact so they can order MVE to come into compliance with Measure ww? Further, the EIS doesn't account for emergency situations. Imagine a scenario in which a resident in the path of shadow flicker has a visiting relative who has something akin to photosensitive epilepsy in which flickering lights can trigger a seizure. That visiting relative immediately begins showing symptoms after they arrive at the resident's home. However, it is on a Sunday afternoon, when personnel are not in the BLM or MVE offices. Who or what is the emergency contact the resident can contact to have the turbine shut off immediately? Last, when a complaint is lodged, how long should the injured party expect to wait for MVE to become compliant? The EIS does not call this out, so it's safe to assume that residents could be left to suffer for weeks or months before MVE is brought into compliance. Therefore, if any alternative other than A is approved, there should be a 24 hour point of contact available for residents and businesses in the area to call to report non-compliance or other emergencies, such as a turbine catching on fire, which often happens. This point of contact should have emergency authority to order MVE to immediately come into compliance by whatever means are necessary, including shutting off turbines. Approving any alternative other than A without providing such a mechanism for compliance enforcement, dispute resolution and a requirement for a 24-hour point of contact is gross negligence because these injuries and disputes will inevitably happen.	
7376-1	Name Not Provided	I work for a local company that handles the communications not only for our company but also the local First Responders in the area. When the last windmills came to town out at Bell Rapids we ran into some issues with the communication system for the Regional 911 system. I was currently in charge of taking care of the communication system between the remote towers of the 911 system. We discovered that the Wind Turbines can cause a interference issue with the communications between the towers, by causing a disturbance in the FCC coordinated pathways between the towers. We talked with the engineers with the State of Oregon who had already experienced the interference that these turbines cause. In the Oregon case turbines had to be removed that were causing the issue. We were lucky enough to catch this early on and work with the engineers doing the project here in the Magic Valley to eliminate that issue from happening here. So now being not only a part of taking care of the 911 system, but also have our own FCC pathways going thru this area. I would like to see a similar approach taken to solve the issue before it happens. I know these construction guys promise the world. But until everyone is at the table and discussing the issue, things slip thru the cracks and are missed. With these being FCC coordinated pathways. All entities who have these licensed in the areas that will be impacted will have the right to request the removal of the turbine for interference issues. The owners should realize there could be a significant financial impact on their companies if this were to happen. So it makes since to get all the facts out there before a determination is made on these things.	MVE may investigate means of improving wireless communications on-site and will explore voice and data communication options through local providers per Section 3.3 (Related Facilities and Systems) in MVE (2023).
75-2	Janet Meredith	Please use the new Hemp batteries for storage as they last longer & are more eco friendly the previous types.	The proposed battery energy storage system will “consist of racks of electrochemical batteries,” as mentioned in Section 1.3.6 (Substations and Transmission Lines) of MVE (2023).
7794-2	Jefferie Wilson	Why aren’t we concerned about using renewable part, part that are recyclable, like the blades.	See Section L-2 (Disposal of Project Components) in the Decommissioning Plan (Appendix L in MVE [2023]), which states, “MVE will prioritize the re-use, recycling, or scrap value of decommissioned project components over direct disposal. . . . New industrial technologies that recycle turbine blades are currently gaining traction in the marketplace and are expected to increase in utilization over the lifespan of the project.”
8281-2	Ronald Buck	Battery technology to store large amounts (power in hundreds of Mega Watts) of power is nearly impractical and will create a hazard waste problem when they would have to be replaced along with disposable of blades once they have served their life span.	See Section F-5 (Waste Management Plan) of the Health and Safety Plan (Appendix F in MVE [2023]). See response to comment 869-4 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
8421-3	Brian Olmstead	LS Power estimates they will only use about 304 acre ft of water during the 2 year construction phase. From my experience working with TFCC crews building and maintaining over 1,000 miles of dirt and gravel roads, I submit to you that if they plan on any reasonable dust control plan for their 500+ miles of new roads, just for dust control, they will need at least 3,000 acre/ft per year. (I will send you my calculations if requested). So for their 2 year construction (which they know is an impossibly short time to build this huge project) that would be 6,000 acre/ft! 20 times their estimate just for dust control. There are a couple of other options they could use for dust control: 1. No dust control, just let all their workers and everybody living on all sides live with choking dust. 2. Gravel all the roads, which again from my experience with TFCC, would take somewhere over 1 million cubic yards of gravel. (again with LOTS of water for compaction and to control dust.) 3. They could apply a chemical dust control method like Mag Chloride; which of course is basically a soil sterilant and has lots of bad consequences for the desert plants and wildlife.	See responses to comments 10509-1 (see in Table A-3z, Water and Wetland Resources), 1042-14 (see in Table A-3z, Water and Wetland Resources), and 3811-4 (in Table A-3v, Soils).
8670-2	Nancy Huddleston, Terrell Huddleston	I can’t imagine managing this Lava Ridge project during construction, operation, or decommissioning. Who is going to monitor that work is progressing properly? Who will enforce compliance with this EIS once it is corrected? The Lava Ridge engineers will get well paid, Las Vegas and California will get very expensive power, China will get paid for manufacturing, but BLM, Idaho and taxpayers will be left dealing with Lava Ridge after we correct course and install something that will address our needs like small nuclear power plants. California, Idaho, and BLM will each be far ahead to walk away from these ill-conceived wind turbine projects. The headaches are just beginning, many more are proposed!	See the Decommissioning Plan (Appendix L in MVE [2023]), the Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]), and the Construction Monitoring Plan (Appendix P in MVE [2023]).

Comment ID	Commenter	Public Comment	Response to Comment
869-4	Michael Crout	You show the advantages but is it really worth it, having another country handle the dirty aspect of production. A country that doesn't have the same EPA rules/laws as the U.S. Whatever is polluting the earth in one area will pollute the whole planet. Nothings mentioned about maintenance and the side effects of items that are not recyclable. In short, is this a dog and pony show that's doing more damage than good. Effective yes, taking a look at the whole, efficient no.?	Maintenance is discussed in Section 4.0 in MVE (2023), and the Decommissioning Plan (Appendix L in MVE [2023]) covers disposal of project components, including prioritizing "the re-use, recycling, or scrap value of decommissioned Project components over direct disposal."
878-1	Cathy Lee	Thank you for the opportunity to provide feedback on the Lava Ridge project as part of the public permitting process. I know that wind power seems like a good source of energy and that new temporary jobs would open up while the turbines are being installed but what happens in a few years when these turbines start to break down? Will the company that installed them be able to repair them? Is it cost effective to repair them or will they be left standing on the land forming a graveyard of wind turbines?	There will be O&M buildings on site that allow staff to perform "routine maintenance, long-term maintenance, and emergency work" per Section 4.0 (Operations and Maintenance) of MVE (2023).
8984-1	Diana Nielson	The Decommissioning is more destructive than the construction of Lava Ridge. The disturbance of the struggling ecosystems to recover from the construction and maintenance of Lava Ridge Wind Turbine Project. More loss of fagile soils, vegetation, habitat, mule deer, pronghorn, elk, sage grouse, pigmy rabbits, Bob cats, bats, badgers, coyotes, fox, skinks, lizards, snakes, burrowing owls, eagles, monarch butterflies and the list goes on and on. The grazers will be displaced again and it will take decades. Generations of recreational choices will be lost. Concerning Volume 1, Chapter 3 Appendix 11 pages 11-19 The decommissioning doesn't mention where the wind turbines will be disposed and recycled. How will all of the synthetic oils will be disposed? Where will the the rare earth minerals go? How will the Wind Turbines be taken down? It is very expensive to do. Will they be taken down in pieces or will the use of explosives to drop them over and down be used? Where can they be recycled? The wind turbines are supposed to decrease carbons. The rare earth minerals the magnets in the generators are made with produce toxic heavy metal and radioactive waste. The Rare earth minerals that will be used in the Large Battery Storage Stations: Where will they be disposed? Where is the Large Storage Battery recycle facility? We use these rare earth minerals in lasers and other equipment but that waste is very small compared to one 4 or 6 MW Generator in a Wind Turbine. The decommissioning will disrupt the ecological systems that will still be trying to recover from the construction and maintenance phases. The Decommissioning plan is speculative and inadequate. The consequential damages can not be recovered. To build the Wind Turbines is more distruction and waste. The excuse of carbon emission reduction is invalid when you consider the cascade of other toxic wastes and the carbons it takes to build the Lava Ridge Project. Rare Earth Elements: A Resource Constraint of the Energy Transition kleinmanenergy.upenn.edu Lava Ridge Wind Project Draft Environmental Impact Statement Appendix 11. Project Elements Common to All Action Alternatives. Page 11-19 The blue ink questions the draft EIS project Project Decommissioning and Final Reclamation Prior to formal decommissioning, MVE, the BLM, and any other applicable agencies would meet to determine whether specific infrastructure or civil works offer public benefits and if they should remain in place (e.g., specific roadways or infrastructure). If the agencies determine that it is in the public interest for some project infrastructure to remain, appropriate steps would be taken to secure the necessary approvals or transfer of ownership. Project decommissioning and reclamation (hereafter referred to as decommissioning) would be completed over a 2-year period. The estimated duration of decommissioning is based on the amount of equipment mobilized, crew sizes, weather and climate conditions, and overall productivity. The goal of decommissioning would be to remove the installed power generation equipment and return the site to similar conditions as the undisturbed surrounding areas, as much as is feasible. The major activities required for the decommissioning would be as follows: • Remove wind turbines and met towers. How will the wind turbines be taken down? The current practice on Bell Rapids is using explosives because to dismantle is to expensive. Other projects on Public Land have been abandoned by the project owners and the government left with the responsibility of reclamation. (In example Pope Shannon mine in Lemhi County the USFS was stuck with reclamation and the Bond didn't cover the expense) • Remove overhead electrical system and lines buried less than 2 feet below grade What will be considered grade? The original surface of the land or the build site? • Remove structural foundations in accordance with a BLM-approved Decommissioning Plan (preliminary draft in Appendix L of MVE [2022]) They are not removing the structures this statement is misleading. • Remove roads not desired for other purposes The removal of roads will re-disturb what soil and vegetation has taken root. This also will disrupt the wildlife again. • Re-grade and recontour the disturbed area. The contour of the Lava Ridges, Blow outs, cinder cones and Lava Tubes you will not be able to restore or recontour geological features. This also will contribute to the Fugitive dust with the covering of vegetation, wetlands, cultural sites and more soil erosion . • Reapply topsoil and revegetate How will fragile topsoils be saved? Some of the vegetation is very slow growing and who will maintain the invasive vegetation after the lease is up? 5 years is not lang enough to nurture fragile soil with slow growing native vegetation. The disassembly and removal of wind turbines and met towers, including the large components that make up a wind turbine, would essentially be the reverse order of the installation activities. Further details on decommissioning are in MVE's Decommissioning Plan (Appendix L of MVE [2022]) and summarized below. What is the guarantee this will be done? A Bond is only monetary and does not pay for wildlife and cultural loses. Disturbed areas would be reclaimed postconstruction following MVE's Reclamation Plan (Appendix E of MVE [2022]). MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria. Reclamation areas would be monitored until the success criteria is met or up to 5 years following the initial reclamation activities. If at the end of the fifth year of monitoring a reclaimed area does not meet the reclamation success criteria, MVE and the BLM Authorized Officer would	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).

Comment ID	Commenter	Public Comment	Response to Comment
		discuss possible adjustments to the criteria or the use of adaptive management procedures to address revegetation challenges. Reclamation success is defined by the re-establishment of vegetation and topography compared to conditions in the surrounding area at the time of reclamation. This definition is inadequate, weak and not attainable. You can't recline what has been destroyed. The glossing over the destruction is misleading. Option A: No Build is the only option. Stop Lava Ridge! Stop Salmon Falls! Stop Taurus! A concerned citizen Diana Nielson	
9013-1	Jerry Daniels	Dear Mr. Prestwich, [Form I am writing to express my views on Magic Valley Energy's Lava Ridge Project.: 93.3%] You do not need to be spending millions on destroying land so that you can impress the democrats!! Everybody knows that you NEVER get out of wind power what you put into it!! You create unsightly landscapes and have to use extreme amounts of oil, anyway!! And then there is the massive oil leaks that happen!! What about the massive energy consumed to make the parts? The use of fuel to transport the parts? The output of the windmill is too small compared to the energy put into building and transporting it! Anybody in there right mind would say no to this! SINCERELY	The project is estimated to generate 500 kV of energy (Section 1.1 [Introduction] of MVE [2023]) and possible oil leaks are addressed in the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]). See response to comment 11188-5 (see in Table A-3jj, Legal or Policy Compliance).
9080-37	The Coalition to Protect America's National Parks	C. Section 2.3.3 Project Phases and Duration (p. 2-3) – As described, "[t]he EIS analysis assumes an approximate project schedule consisting of three phases: 2 years of construction, up to 30 years of operation and maintenance, and 2 years of decommissioning." (Emphasis added) We ask BLM to explain the basis for its assumption that the wind farm would have an operational lifespan of (only) 30 years. We cannot imagine that would be the case, particularly considering the considerable investment MVE would need to make in constructing, operating, and maintaining such a massive wind farm. Based on the proposed action, we fully expect adverse effects to cultural sites would be so long-term that they are, in effect, permanent. If BLM decides to approve the proposed wind farm in any form and is serious about limiting the duration of its operation, then we request that BLM formalize the assumed 30- year limit with a "date certain" expiration date in the ROW grant that includes only two additional years for decommissioning and removal of the wind farm. If BLM is not willing to enforce its "30-year assumption" with such a measure, then BLM should at least be transparent about the fact that the adverse effects of the wind farm are likely to last longer than 30 years.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
9473-3	Jeffrey Warren	How will fire abatement be implemented? You won't be able to fight fires from the air with turbines that tall. Reports say that the wind pattern in this area is poor at best. Why not find a better site?	See AIB-11 in EIS Appendix 3 (Issues Analyzed in Brief): How would the project impact emergency responders that serve the project vicinity? Impacts to fire suppression, including aerial suppression, are disclosed in EIS Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression). As described in Section 1.2 (Purpose and Need) in MVE (2023), "The proposed Project location was selected based on the quality of the wind resource in the area, the power markets accessible by existing and planned transmission lines in the area, the availability of suitable land, and the absence of land use constraints."
956-2	Bill Doll	What is the plan for recycling these windmills in 20 years when their generation efficiency drops to the point where the produce no electricity?	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
9591-2	John Barry	I'd also like to know what is to be done with these monstrosities after their lifetimes have expired.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Also see response to comment 11926-11 (in Table A-3l, Hazardous Materials and Solid Waste).
9778-1	William LaMunyan	Does the power created at lava ridge stay in Idaho for Idaho usage?	See response to comment 11822-5 (see in Table A-3bb, Applicant's Interests and Objectives).

Comment ID	Commenter	Public Comment	Response to Comment
1022-3	Amy	After analyzing the project and listening to public comments, I urge you to now move your Lava Ridge to a more appropriate site for generating power for the States of Nevada and California.	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. Moving the project to Nevada or California would not meet this part of the BLM's purpose and need to respond to MVE's application.
1042-2	WildLands Defense	There is no adequate range of alternatives. A Supplemental EIS must be prepared, with a range of reasonable alternatives using DIFFERENT and innovative types of much shorter and less lethal turbines, and with development of far fewer turbines closer together must be considered, as well as comparisons with how much energy would be generated with solar arrays, the relative greenhouse gas emissions, etc	The EIS describes the alternative development process in Chapter 2 (Proposed Action and Alternatives). The BLM will consider all alternatives analyzed in detail in the EIS and the mitigation measures in Appendix 4 (Mitigation), when making the decision whether to authorize MVE's project. The BLM is responding to MVE's application for a wind generation facility, not a solar generation facility. Evaluating solar panels would not meet the BLM's purpose and need to respond to MVE's application. Turbine size, design, layout, and siting corridors were developed considering wind resource data and requirements needed to develop a technically feasible project. In MVE (2023), see Section 1.0 (Project

Comment ID	Commenter	Public Comment	Response to Comment
			Description), which includes Section 1.3 (General Facility Description, Design, and Operation) and Section 1.4 (Alternatives Considered by Applicant), as well as Alternatives Considered by MVE (Appendix C in MVE [2023]). For information about the turbines and construction, see Section 2.9 (Wind Turbines) of MVE (2023). If the project is authorized, the turbine specifications will be determined by MVE (see Section 5.3 [Design Criteria] of MVE [2023]). For information about greenhouse gas emissions see EIS Section 3.4 (Climate and Greenhouse Gases).
1042-24	Wildlands Defense	[The DEIS fails to analyze a truly REASONABLE alternatives range –and fails to take into account the full range environmental degradation and impacts and reduced value to private lands, and fails to examine alternatives such as much reduced turbine height, entirely different turbine designs, etc.].	See response to comment 1042-2 (see in Table A-3ee, Alternatives). Environmental impacts are addressed in EIS Chapter 3 (Affected Environment and Impacts), including Section 3.6.4 (Residential Property Values). Additional environmental considerations are addressed in EIS Appendix 3 (Issues Analyzed in Brief).
1043-1	KS McMullin	Instead of making tall wind fans, that have to be turned in the direction of the wind, would it not be more practical to make vertical wind mills? They do no have to be turned and they take up less room making easier to have more turbines in less space.	The BLM is responding to MVE's application for a wind generation facility. If the project is authorized, the turbine specifications will be determined by MVE.
10471-1	Brett Lemmons	if California, Oregon want/need power, let them destroy their public lands, that should be the TOP OF THE LIST.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
10492-2	Michael Lavey	I firmly believe that electrification projects should be foremost associated with a more local need. Build these kinds of big intrusive projects where direct use and benefit occur	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
10494-1	Name Not Provided	There are other locations that are appropriate and can reach Biden's goal of permitting 25 GW by 2025 on public lands. This location should be removed from the potential projects;	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
10500-2	Nancy	There is plenty of land in California and Nevada to install them, the power is for them, let them have them, leave our beautiful state alone.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
10504-2	Bryan Russell	private land and private dollars is the only way this should happen.	The BLM is responding to MVE's application for a wind generation facility on public land. Evaluating non-BLM land would not meet the BLM's purpose and need to respond to MVE's application.
10505-1	Name Not Provided	Please site wind turbines so that there is the least impact to wildlife. It is possible to move forward with the project, maybe at a smaller scale or with re-siting of turbines, and protect some of the most important wildlife values, particularly for migration.	The EIS addressed environmental analysis in Chapter 3 (Affected Environment and Impacts). The following environmental considerations are addressed in this chapter: air quality, avian and bat species, climate and greenhouse gases, cultural resources, environmental justice and socioeconomics, fire and fuels management, land use and realty, livestock grazing, paleontological resources, pollinators and insects, recreation, soils, transportation, vegetation, visual resources, water and wetland resources, and wildlife. Information about migration and impacts to migration as a result of the Proposed Action and alternatives can be found in Section 3.3 (Avian and Bat Species). Specifically, you can read about bat use in the siting corridors in Section 3.3.1.1.2 and impacts (to bats) in Section 3.3.1.2. You can read about avian use in the siting corridors in Section 3.3.2.1.1 and impacts (to avian species) in Section 3.3.2.2.
10509-3	Sue Page	Build these 740ft beasts were they can best service the end user, Nevada or California.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11204-3	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	DEIS did not: (a) develop an adequate range of alternatives to address resource conflicts, particularly relative to public land livestock grazing upon the Star Lake Allotment;	The EIS provides analysis on livestock grazing impacts in several sections. Section 3.9 (Livestock Grazing) analyzes the impacts of the Proposed Action and alternatives in detail. Additionally, information about livestock grazing and the Star Lake allotment can be found in the Grazing Coordination Plan (Appendix S in MVE [2023]). As demonstrated in the alternatives comparison tables throughout Section 3.9.1.2 (Impacts), the range of impacts varies among alternatives. See also response to comment 1042-2 (see in Table A-3ee, Alternatives).
11209-1	Linda Ando	The opportunity to consider other alternative Wind Project lands that are not encroaching historic sites is an option that can be explored.	See response to comment 11455-2 (see in Table A-3ee, Alternatives).
11269-1	Clare Josaitis	According to the BLM's Final Programmatic Environmental Impact Statement for Wind Energy Development on BLM-Administered Lands in the Western United States (BLM 2005a), to which this DEIS tiers, the wind resource potential was measured by the DOE's National Renewable Energy Laboratory (NREL). According to the maps in Wind Energy EIS, the wind resource potential measured in the proposed project areas is "low". EPA.gov states that wind turbines are 20% to 40% efficient at converting wind into energy. Given the low wind resource rating and the inefficiency of wind turbines for producing energy, how can there be any justification in building these turbines?	The BLM is responding to MVE's application for a wind generation facility. The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. MVE completed sitting analysis and the latest computer modeling to assist in their selection of the project area as a viable wind energy facility. MVE has also established meteorological stations to gather additional information on the wind resources within the project area. MVE outlines their consideration for siting the project in the general area and earlier efforts to develop the project in other locations. This information can be found in MVE (2023) and in Alternatives Considered by MVE (Appendix C in MVE [2023]).
11327-5	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	Given the highly sensitive relationship between successful migration and population resiliency, we recommend the BLM develop new alternatives that completely avoid siting corridors in the path of these migrating and wintering animals.	See response to comment 11327-7 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
11327-7	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	III. Given conflicting nature of alternatives presented in DEIS, BLM must provide new alternative(s) that takes all wildlife into account. When viewed through the lens of multiple wildlife species, specifically pronghorn and Greater Sage-grouse (sage-grouse), our organizations are troubled by the range of action alternatives. It seems that, if an action alternative must be selected, wildlife advocates would be forced to choose between increased development within the Owinza pronghorn migration or increased development in some of the last remaining intact sagebrush East of Crestview road, which sage- grouse have been known to occupy (comments related to Greater sage-grouse are further below). For example, Alternative D eliminates siting corridors East of Crestview road, but maintains a greater number of turbines and corridors throughout the path of the Owinza pronghorn migration, especially at its southern terminus. Alternative E eliminates much of the development within the southern terminus of the migration route but places siting corridors East of Crestview road and wraps around the eastern edge of the Greater sage-grouse lek buffer, as shown in Figure 2. We do not support this approach – of having to choose which species, both iconic Idaho native species revered by sportsmen and outdoor recreationists, will receive be fortunate to experience fewer negative impacts at the other's expense. In our scoping comments, we asked if the BLM found "an overlap of the project area in functionally available winter range, alternatives that minimize impacts to these areas or avoid them altogether must be developed and considered." We are greatly disappointed that the BLM did not take this suggestion into consideration when developing the range of alternatives. Because of the development in the identified Owinza pronghorn migration route in each of the action alternatives, we cannot support any action alternative. Therefore, BLM should develop a new alternative(s) that takes all wildlife into account.	The EIS provides information on alternatives and the alternative development process in Chapter 2 (Proposed Action and Alternatives). The BLM evaluated a Preferred Alternative in the final EIS that provides an assessment of reduced disturbance to big game migration routes and winter concentration areas. Impacts to pronghorn can be found in Section 3.18.2.2 (Impacts). Impacts to greater sage-grouse can be found in Section 3.3.4.2 (Impacts).
11354-1	Robert Hendricks	Should it be decided to move forward with any level of wind development in this area, I suggest a notably smaller alternate be investigated that would focus construction generally adjacent to and South of Highway 24, extend no further South than the noted West-side Energy line and be bounded to the East by Crestview Rd...essentially this proposal includes only those development areas that are common to both Alternative D and Alternative E (per Fig. ES-2). This proposal would still allow for key energy infrastructure connections, would cause notably less overall land use disturbance and siting issues, and would still provide for future expansion opportunities should the project ultimately prove to be as minimally disruptive to both game and avian species as it is currently being presented. My request in this situation would be for the BLM to ONLY move forward in small increments.	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. The EIS provides information regarding the alternative development process in Chapter 2 (Proposed Action and Alternatives). Section 2.8 (Preferred Alternative) provides further details and rational regarding alternatives the agency considered but were eliminated from detailed analysis. The BLM has prepared a full and detailed analysis with robust public participation with the NEPA process supporting requirements for a hard look in BLM decision-making.
11393-1	Lawrence Cates	TAke the project to California or Nevada where the power will be used.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11396-7	Gina Jerke	I don't believe that there will be "minimal to no damage" as stated in the DEIS. All habitat will be adversely affected[...]	The EIS addressed environmental analysis in Chapter 3 (Affected Environment and Impacts). The following environmental considerations are addressed in this chapter: air quality, avian and bat species, climate and greenhouse gases, cultural resources, environmental justice and socioeconomics, fire and fuels management, land use and realty, livestock grazing, paleontological resources, pollinators and insects, recreation, soils, transportation, vegetation, visual resources, water and wetland resources, and wildlife. The EIS provides information on impacts on wildlife specifically in Sections 3.18.1.2, 3.18.3.2, and 3.18.4.2.
11411-1	Rayma Cates	Windfarms should be located closer to the states where the power is needed.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11445-2	Mei Reifer	if some one want it should build in their on private land	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11455-2	Aiko E. Low	I would like that the turbine heights be diminished if they are respectfully placed close to Minidoka National Historic Site. A few "standard size" turbine towers placed farther away, instead of the newer, taller versions, would be less of an eyesore and less disruptive. Moving the bulk of the turbine towers farther away would not eliminate them from view but the noise would be reduce.	The BLM evaluated a Preferred Alternative in the final EIS that includes a maximum turbine tip height limit for all turbines of 660 feet. The Preferred Alternative also increases the distance of turbine corridors from Minidoka NHS. The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. Also see response to comment 1042-2 (see in Table A-3ee, Alternatives). Alternatives, including those considering nearby historical sites can be found in Chapter 2 (Proposed Action and Alternatives). "A siting consideration for alternatives development was the proximity of the project to the Minidoka NHS, a World War II–era Japanese American incarceration site located in Jerome County. As described further in Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site), the incarceration site encompasses approximately 152 acres and is managed by the NPS. The site comprises the central portion of the original approximately 34,000-acre Minidoka WRC. The area within the Minidoka WRC boundary is now a mixture of federal, state-, and privately-owned land. Because scoping comments identified the potential for impacts to the Minidoka NHS, alternatives were developed to avoid or minimize impacts to the site. Impacts to both Minidoka NHS and Minidoka WRC are described in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities)." See also response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
11458-6	Kathy McKenzie	Existing electrical corridors must be used and incorporated in any of the alternatives --If the application is approved.	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. Figure 1.3-1 of the EIS shows the proposed siting corridor layered with the existing transmission corridors. Table 2.4-1 shows project components by action alternative, including information regarding substations, interconnection, and collector lines. Figure 2.4-1 shows the siting corridors of each alternative layered with transmission corridors. Detailed information about electrical infrastructure can be found in EIS Section 3.1 (Introduction and Methodology) as well as in Section 2.10 (Electrical) in MVE (2023).
11468-3	Randy McCarron, Jane McCarron	I've been told this energy will be sent to California. California is in trouble because of their inefficient green energy policies. Let them figure out solutions to their own problems	See response to comment 1022-3 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
11507-2	Kathryn	Magic Valley Energy, a private business, needs to purchase private land if they are wanting to install hundreds of wind turbines for their business.	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. The BLM makes decisions regarding managing public lands, and so private land development is out of scope for this EIS.
11518-4	Karen Steenhof	The BLM should take a more comprehensive look across all of southern Idaho to identify any alternative areas that might be appropriate for large-scale renewable energy development. Any such analysis should include a detailed evaluation of impacts on all sensitive wildlife species including not only eagles, bats, sage-grouse, and pronghorn but also Long-billed Curlews, Burrowing Owls, Short-eared Owls, Ferruginous Hawks, and Brewer's Sparrows. Populations of most of these species are already declining.	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. Projects sites outside this application are out of scope for this EIS.
11521-3	Angela Mooney	Relocate this where it is not over an aquifer, where the blasts that will occur to lay the cement foundations will not impact the ceiling of an aquifer this size and of this significance.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). Additional information about groundwater contamination is found in the issue analyzed in brief, AIB-47. The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-North. Project sites outside this application are out of the scope for this EIS.
11524-1	Name Not Provided	To Lava Ridge, you should put them in CA. Or Nevada. Nevada has plenty of wind areas where no on lives close by.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11534-8	Matt Arnold, William Eubanks	As outlined above, the Project's four action alternatives differ only with respect to the locations of their respective siting corridors. See supra at 4-5; see also DEIS at 2-4–14. None of those alternatives, however, consider any operational restrictions, including those that might benefit wildlife by dramatically reducing the number of fatalities and injuries resulting from the Project. Although the Project proponent has ostensibly committed to certain "curtailment measures" for all action alternatives, these are limited to feathering and would only be implemented "when wind speeds are below the cut-in speed for the turbine (i.e., the speed at which wind turbines begin generating electricity)." DEIS at 3-47. In other words, the curtailment measures only apply when it is economically advantageous for the Project proponent, MVE. NEPA, however, requires Department of Interior agencies to consider all "alternatives that are technically and economically practical or feasible and meet the purpose and need of the proposed action." 43 C.F.R. § 46.420(b)-(c) (emphases added); see also 40 C.F.R. § 1502.14. Given the significant population-level effects threatened by the Project, infra, e.g., at 16- 17, BLM should consider alternatives that condition authorization on operational limits that further reduce impacts to avian and bat species.	The BLM added additional project-specific mitigation measures to stipulate that the BLM Authorized Officer may require the implementation of a curtailment strategy at any time, even if other adaptive management measures have not yet been implemented. The curtailment strategy will include different levels of curtailment (e.g., cut-in speed, number of turbines, season/duration) to allow for an assessment of which variables have the strongest effect on fatalities. The BLM, USFWS, and MVE are coordinating regarding details of the BBCS (Appendix M in MVE [2023]) and Eagle Conservation Plan (Appendix T in MVE [2023]), and these would be applied to the project, if authorized.
11535-6	Steven Andersen	By failing to consider interconnection of the proposed action for SWIP North and LS Power's interconnection, the impact analysis and comparison in the DEIS to a No Action Alternative is flawed from inception. The No Action Alternative permits a comparison of the environmental consequences of the status quo to the consequences of the proposed action, which cannot be done without a complete picture of the entire project.	The EIS provides information regarding the project description in Chapter 1 (Introduction). Additional information on the project elements and construction is provided in MVE (2023). In MVE (2023), descriptions of the construction of electrical components can be found in Section 2.0 (Construction of Facilities). Additionally, information regarding transmission system interconnection can be found in Section 3.0, Related Facilities and Systems. These actions and their impacts are included in the NEPA analysis provided in the EIS. Information about the detailed impacts analysis by issue can be found in Chapter 3 (Affected Environment and Impacts).
11535-7	Steven Andersen	Further, the No Action Alternative was inadequately discussed and analyzed, which means it was not an accurate baseline for the other alternatives. The DEIS states that the Purpose and Need of the proposal is to broadly respond to MVE's application for a ROW to construct, operate, maintain, and decommission a wind energy facility on federal land. But the DEIS analyzes the consequences of the No Action Alternative by simply focusing on federal and regional renewable energy goals, noting that those goals would have to be met using other alternative energy projects at other locations. In fact, at a hearing on the FY 2024 budget requests for the BLM, when Congressman Mike Simpson asked BLM Director Stone-Manning about the Lava Ridge project's consequences on habitat and the environment, she began by answering, "…we are working hard to meet Congress's request that we get 25 gigawatts of renewable energy and the President's request that we get 25 gigawatts of renewable energy on our public lands by 2025…." 7 It is concerning that political pressure to meet arbitrary goals is primarily influencing the analysis of the No Action Alternative, rather than any identifiable environmental impacts. Further, the proposed action and need, as defined in the DEIS, is for a wind energy facility on federal land. To assert "green energy" benefits will be obtained in the region is speculative at best. The BLM would effectively allow degradation of Idaho land (the geographic region being considered in the DEIS) to put additional wind energy on the open energy market with the stated benefit of contributing to federal initiatives. The only potential benefits of the project – to arguably expand "clean" energy – would not be realized in the region burdened by the environmental impacts (Idaho), as the energy will, in all likelihood, never be consumed in Idaho. Consequently, the No Action Alternative will have no negative impacts for the region subject to the Proposed Action but may have political repercussions for an agency under pressure to meet federal renewable energy goals. Nevertheless, this is misplaced in a NEPA analysis. Without adequately establishing the No Action Alternative, the other alternatives cannot be meaningfully analyzed in comparison.	The BLM's project purpose and need and decision to be made are described in Sections 1.2 and 1.3, respectively. The BLM considered each alternative, including the No Action alternative, presented in the EIS. EIS Chapter 2 provides information on the alternatives development process (Section 2.1) and on the No Action alternative (Section 2.2). Under Alternative A, no project impacts would occur; the potential for ongoing and future impacts would be the same as those described in each Chapter 3 Affected Environment section for existing and future trends and actions.
11535-8	Steven Andersen	DEIS TREATMENT OF ALTERNATIVES SHOWS AN IMPROPER BIAS IN FAVOR OF THE PROPOSED ACTION The treatment of alternatives shows a clear bias in favor of the Proposed Action, and thus, the DEIS fails to give substantial treatment to the other alternatives, as is required.	The BLM decision to be made is described in Section 1.3, as follows: "This EIS provides the information and environmental analysis necessary to inform the BLM's Authorized Officer and the public about the potential environmental impacts from the project. The BLM decision to be made will include • whether to grant, grant with modification, or deny a ROW to construct, operate and maintain, and decommission the proposed wind energy facility on public lands;

Comment ID	Commenter	Public Comment	Response to Comment
			• the most appropriate location for the project on public lands; and • the terms and conditions (stipulations) for the construction, operation and maintenance, and decommissioning of the wind energy facility on public lands that should be applied to the ROW." Full descriptions of the alternative development process and action alternatives is provided in Chapter 2 (Proposed Action and Alternatives).
11535-10	Steven Andersen	The DEIS falls well short of devoting substantially similar treatment to alternatives as it does to the Proposed Action. The DEIS is glaringly biased in favor of the Proposed Action. To illustrate as much, one need only look at the brief and bare nature of the discussions for the various Alternatives presented for each of the identified affected environment and impacts. For example: - With respect to greater sage-grouse, the DEIS spends pages 3-115 to 3-124 on the Proposed Action's impacts, a total of 9 pages. Conversely, Alternatives C-E on the impacts to greater sage-grouse consist of less than one page each, at most.16 - With respect to bats, the DEIS spends pages 3-44 to 3-53 on the Proposed Action's impacts, a total of 9 pages. Conversely, Alternatives C-E on the impacts to bats consist of less than one page each, at most.17 - With respect to avian populations, the DEIS spends pages 3-72 to 3-84 on the Proposed Action's impacts, a total of 12 pages. Conversely, Alternatives C-E on the impacts to avian populations of a combined two total pages, 3-84 to 3-85. - With respect to environmental justice and socioeconomics, the DEIS spends pages 3-197 to 3-210 on the Proposed Action's impacts, a total of 13 pages. Conversely, Alternatives C-E on the impacts to environmental justice and socioeconomics consist of only 3 and a half pages, at most.18 - With respect to Alternative A, the DEIS simply points to the federal government's alternative energy goals, acknowledging the political pressure upon the agency, rather than a reasoned analysis of environmental consequences. It does not state that the goals cannot be met with projects elsewhere but just that they will need to be met with alternative projects. Examples are riddled throughout the DEIS. It is undisputable the DEIS failed to devote the same degree of analysis to each of the alternatives for each of the identified impacts (not to mention those impacts that have not been identified), and consequently, the DEIS is wholly unsatisfactory. Further, there is not an adequate range of alternatives. The selection determination of alternatives was subjective and not based on defined criteria. Wind energy can be selectively developed on sites that are already disturbed (e.g., reclaimed mines, agricultural fields, industrial sites) because of the widespread availability of this resource.19 The proposed plan here would require undisturbed land to be sacrificed. No alternative includes placing this project on a site already disturbed.	See comment responses to 1022-3 (see in Table A-3ee, Alternatives) and 11598-7 (see in Table A-3ee, Alternatives). Also, Alternative B is the largest alternative, making it the most impactful to resources and resulting in the most analysis language. Other alternatives were developed to reduce impacts and result in less resource disturbance and effects, making those analyses shorter. Not repeating text that describes the types of effects that may occur across multiple alternatives is standard in an EIS.
11535-11	Steven Andersen	Additionally, without specifics on the siting of the turbines within the alternatives, it is impossible to analyze most of the environmental impacts, including but not limited to, radio and electromagnetic interference, noise, consequences caused by roadways, environmental justice and impacts to wildlife, and therefore to ensure suitable alternatives are being considered and appropriately compared.	Methodology of the impacts analysis of turbine siting corridors is provided in Section 3.1 (Introduction and Methodology) of the EIS; also see response to comment 1042-2 (see in Table A-3ee, Alternatives). Find a detailed analysis of electromagnetic interference in Section 3.8.1.1, roads in Section 3.14, wildlife in Section 3.18, and environmental justice in Section 3.6. Noise-related impacts are discussed in several sections specific to the issue analyzed; analysis of noise impacts on avian and bat species can be found in Section 3.3; impacts to environmental justice communities can be found in Section 3.6.1; impacts to cultural resources can be found in Section 3.5; impacts to wildlife can be found in Section 3.18; and impacts to livestock can be found in Section 3.9. Table ES-2 summarizes and compares the impacts of the action alternatives on the issues analyzed in the EIS.
11535-151	Steven Andersen	The DEIS fails to provide an alternative (other than Alternative A) that makes any colorable attempt to minimize aesthetic impacts by noticeably reducing the height of the turbines or scale of the project.	The EIS provides information on the impacts to visual resources in Section 3.16 (Visual Resources) and includes impacts to travelers, visitors, and residents. Visual impacts are also analyzed in Sections 3.5 (Cultural Resources) and 3.19 (Minidoka National Historic Site Interpretive Purpose). Table 3.16-4 compares the visual impact of each alternative. Mitigation measures to minimize impacts can be found in Tables App4-2 and App4-3 in EIS Appendix 4 (Mitigation) and additional project-specific measures can be found in Table App4-4 in EIS Appendix 4.
11535-171	Steven Andersen	Further, as reiterated herein, without knowing the location of infrastructure and activities within the general corridors, the efficiency (see discussion on wake effect), potential impacts, and overall site suitability, cannot be adequately analyzed. The exact location does matter – for purposes of analyzing construction disturbance, wake effect, roads, electromagnetic interference, socioeconomic impacts, habitat interference, noise, etc.	See response to comment 11535-11 (see in Table A-3ee, Alternatives).
11598-5	Idaho Conservation League	Another alternative that the BLM could investigate is a greatly reduced turbine configuration in the gap between pronghorn, sage-grouse habitat, the Minidoka National Historic Site and Wilson Butte Cave. See figure 1 below showing the narrow band in the middle of Alternative C. These other alternatives would still need to be reviewed by the public to see if they sufficiently address concerns.	See response to comment 11598-7 (see in Table A-3ee, Alternatives).
11598-7	Idaho Conservation League	Alternatives not in the DEIS One alternative that the BLM did not develop in detail is permanent protections of the Pronghorn Migration Route, remaining areas with conservation value for sage-grouse, the viewshed around the Minidoka National Historic Site and original relocation center area, and Wilson Butte Cave and other cultural areas. ICL recommends the BLM develop a proposal that analyzes these protections and then evaluates the potential for turbine strings in between these protected areas (essentially the middle of Alternative C), or deem the entire area unsuitable for development. See figure 1 below. 2 https://www.blm.gov/policy/im-2023-005-change-1 3https://www.whitehouse.gov/wp-content/uploads/2023/03/230318-Corridors-connectivity-guidance-memo-final- draft-formatted.pdf Figure 1. Alternative C overlaid on Pronghorn migration route and Sage Grouse Habitat.	The EIS provides information on the alternative development process in Chapter 2 (Proposed Action and Alternatives), including a description and rationale for alternatives that were considered but eliminated from detailed analysis. Information about the analysis of issues are provided in Chapter 3 (Affected Environment and Impacts). Impacts to pronghorn can be found in Section 3.18 (Wildlife); impacts to cultural sites, including Minidoka NHS and Wilson Butte Cave, can be found in Section 3.5 (Cultural Resources); impacts to greater sage-grouse can be found in Section 3.3.4, and impacts to visual resources can be found in Section 3.16 (Visual Resources). Also see response to comment 1042-2 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
11634-7	Name Not Provided	In drafting the DEIS, an alternative that addressed concerns of the Japanese American community was briefly considered, but not fully investigated in the DEIS. The reasons for not including this alternative are arbitrary, and the DEIS is inadequate as a result. The Lava Ridge Wind Project will have significant affects to the Minidoka National Historic Site Japanese Internment Camp and subsequently, the Japanese American community. Public Law 109-441, "An Act to provide for the preservation of the historic confinement sites where Japanese Americans were detained during World War II, and for other purposes," was passed in an effort to preserve sites such as Minidoka, and this project is in opposition to the intent of Congress in passing Public Law 109-441 and in opposition of the legislation that created Minidoka National Historic Site. The intent of Congress to preserve Japanese Internment/Confinement Sites is further demonstrated in the recent passage (2023) of the Norman Y. Mineta Japanese American Confinement Education Act. This federal legislation reauthorizes the Japanese American Confinement Site (JACS) program to educate Americans on the incarceration of Japanese Americans during World War II. Given all this, the BLM should have fully investigated the Alternative intended to preserve the Minidoka National Historic Site and support the Japanese American community.	See response to comment 11455-2 (Table A-3ee, Alternatives).
11645-1	Berry Swinney	This project will cause unforseen damage to countless Idahoan family's and industry wildlife and our beautiful countryside for what so California can have more power, they do have wind and they need power build it where it's needed no sense running power lines thousands of mile when it can all be had right there at less cost and no destruction of Idaho.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11737-2	Jay Theiler	Alternative uses for the land such as cattle grazing that are sustainable and which provide more public benefits while minimizing the environmental impacts on public lands would be preferable.	See response to comment 1022-3 (see in Table A-3ee, Alternatives). Also, the EIS includes Section 3.9 evaluating the potential impacts to livestock grazing from the project.
11746-2	Bonnie Marshall	Let the Lava Ridge investors build the windmills in California, where the electricity will be used.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11779-2	Chris Cody, Betsy Merritt; National Trust for Historical Preservation	The National Trust also supports Alternative H, which was designed to completely avoid adverse effects to the Minidoka National Historic Site (“Minidoka”).3 The National Trust specifically requested the development of this alternative in our October 20, 2021 letter. Unfortunately, BLM’s analysis concluded that Alternative H would generate only 20% of the electricity compared to the applicant’s proposal, but would require the same amount of transmission infrastructure.4 Nonetheless, we continue to support it as an appropriate alternative given Minidoka’s extremely high level of historic significance and its status as a National Historic Site.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). See Section 2.9.4 for rationale for not analyzing Alternative H in detail.
11821-6	Laura Cunningham, Kevin Emmerich, WildLands Defense	Visual Resources buffers of at least 10 miles from new substations and transmission infrastructure should be considered to protect viewscapes for lands with wilderness characters, historic trails, national park units and state park units, and cultural landscapes important to Tribes. Variance Process	See response to comment 11455-2 (see in Table A-3ee, Alternatives). Also see Section 3.16 (Visual Resources) of the EIS.
11821-50	Laura Cunningham, Kevin Emmerich, WildLands Defense	BLM must consider the following alternatives and/or alternatives based on a combination of elements of: A distributed generation alternative; An energy conservation alternative; A degraded lands alternative; A private land alternative; [...] An alternative that would exclude all environmentally sensitive areas, Area of Critical Environmental Concerns (ACEC), Lands with Wilderness Characteristics, protection of ALL remaining areas with native shrub/tree vegetation cover present; all areas of habitat for Sage-grouse, Pygmy Rabbit, and sensitive and declining migratory birds like Sagebrush Sparrow, Loggerhead Shrike, and Pinyon Jay; areas of cultural and/or historical significance.	See responses to comments to 1022-3 (see in Table A-3ee, Alternatives) and 11598-7 (see in Table A-3ee, Alternatives).
11833-1	Bob Hassoldt	The statement in section 3.3.2, page 128: “There are no previous studies of a wind facility of the size proposed, nor have there been studies of any facilities with turbines as large as those proposed for the Lava Ridge Wind Project and it is unknown how these differences would affect avian fatalities during operation.”, when combined with this sentence in section 2.4, page 54: “The generation capacity of Alternative B would be nearly 25% more than the largest existing wind facility in the United States.”, indicate that the environmental evaluation of this project is in completely new territory. That being the case, the final EIS is going to require a higher degree of confidence to be scientifically valid. While we will never get perfect knowledge, a confidence level of 98% versus 95% would be an appropriate level to base any decisions on. If that can’t be achieved then the project should not be approved or severely scaled back to an even lower level than the Alternative D option.	A description of the project purpose and need is provided in Section 1.2 (Purpose and Need for the Project) in MVE (2023) and in Section 1.2 (Purpose and Need) of the EIS. Section 1.3 (Decision to be Made) in the EIS, also states the following: “This EIS provides the information and environmental analysis necessary to inform the BLM’s Authorized Officer and the public about the potential environmental impacts from the project. The BLM decision to be made will include • whether to grant, grant with modification, or deny a ROW to construct, operate and maintain, and decommission the proposed wind energy facility on public lands; • the most appropriate location for the project on public lands; and • the terms and conditions (stipulations) for the construction, operation and maintenance, and decommissioning of the wind energy facility on public lands that should be applied to the ROW.”
11849-3	Charles Brockway	No consideration was made of the land-use efficiency of wind farms as opposed to other established power generation technologies. Wind farms normally have total land requirements ranging from 40 to 80 acres per installed megawatt capacity, as opposed to coal, natural gas, and nuclear facilities at 12 to 13 acres per megawatt. But the proposed action has an incredible land use of 160 acres per megawatt or about 2.7 times the average for wind farms and 13 times the typical coal or nuclear plant land use requirement. If a similar calculation is made over the total life of the wind farm, the intermittent nature of wind makes the project even less viable: the land area per total megawatt-hour generated increases to about 20 times that of coal, natural gas, and nuclear. The BLM is charged with managing public lands in an optimal manner for multiple public uses. The proposed wind project should be rejected on its face as a grossly inefficient and wasteful use of public land resources. Approval of the proposed action would be contrary to the agency's legal obligation. The	See response to comment 1022-3 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
		alternatives evaluated in the EIS are not actual alternatives - they are just slight variations on the same land-intensive, inefficient technology.	
11866-2	Jen Pierce	So where does that leave us? The 'no action' alternative is not acceptable, because we absolutely must reduce atmospheric carbon dioxide to ensure a healthy, functioning, and habitable planet for ourselves, our children, and our grandchildren. The other options (B,C, D, and E) are really not acceptable either because of the impacts on cultural and natural resources. (I believe there used to be an 'alternative H'? What happened to that alternative?) In particular, the cultural and historic significance of the original Minidoka camp acreage must be honored and considered.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). Alternative H is described in Section 2.9.4.
11871-1	WildLands Defense	EIS Table ES-2 does not lay out comparisons between alternatives in a fair and balanced manner. There is also no 'No Action alternative in this Table". It does not provide adequate and systematic alternatives element comparisons.	Table ES-2 is a summary comparison of the impacts of the action alternatives on the issues analyzed in the EIS. Alternative A (No Action alternative) is not compared in this table because there would be no project impacts as a result of denying the project and project development not occurring. Detailed information on the impacts of each alternative (including the No Action Alternative) for the issues analyzed is provided in Chapter 3 (Affected Environmental and Impacts). Section 3.1 (Introduction and Methodology) includes a description of the EIS analysis methodology.
11871-10	WildLands Defense	Table ES-2 contains imbalanced and vague, nebulous comparisons underlain by a significant lack of systematic baseline environmental and biological information and analysis (discussed below)– which is critical for developing and assessing alternatives and making legitimate comparisons among various alternatives. It is also critical for assessing how severe project harms will turn out to be, and for holding the wind developer to any claimed mitigation promises.	Table ES-2 provides a summary comparison of the issues analyzed in the EIS. Chapter 3 (Affected Environment and Impacts) provides information regarding the detailed analysis of each issue and action alternative. A description of the methodology is provided in Section 3.1 (Introduction and Methodology). Information regarding the roles and responsibilities of MVE and the BLM can be found in the Environmental Compliance Monitoring Plan (Appendix V in MVE [2023]) regarding environmental compliance.
11871-13	WildLands Defense	Why is there an "Alt. B with additional Measures"? Why isn't this laid out as a clear separate alternative? The alternatives are all fraught with tremendous uncertain - given the flaws in underlying data and EIS NEPA analysis. The biological reports, and NMPs ad supposed "mitigation" measures are filled with weasel words and "outs". The consultant report language related to an avian and bat and other documents is a prime example. It is impossible to adequately evaluate and compare alternatives without much more certainty certainty – not the uncertain wording regarding what would be considered as "additional measures"? The missing information must be developed as part of a new alternative in a SEIS process.	The EIS provides information regarding the alternative development process in Chapter 2 (Proposed Action and Alternatives). Table ES-2 provides and compares the impacts of the action alternatives on the issues analyzed in the EIS. Chapter 3 (Affected Environment and Impacts) provides information on the environmental issues analyzed in the EIS. Section 3.1(Introduction and Methodology) includes a description of the methodology used for this EIS analysis.
11871-19	WildLands Defense	Simplistic comparisons are made. Example: "Same as Alt. C but Alt. C avoids areas with higher sagebrush". Where is an adequate map? Aren't a significant number of sensitive species associated with non-sagebrush areas? Where are areas of recovering sage? Recovering rabbitbrush? Where is an alternative that avoids habitats of "grassland" sensitive species, too – as they appear to out-number the sagebrush sensitive species? Is one group being sacrificed for the other?	See response to comment 11871-13 (see in Table A-3ee, Alternatives).
11873-3	Mary Schwartz, Frank Schwartz	None of the action alternatives proposed provide an acceptable reduction in environmental impacts.	The EIS provides information on the alternative development process in Chapter 2 (Proposed Action and Alternatives), and an analysis of the impacts of the Proposed Action and alternative actions in Chapter 3 (Affected Environment and Impacts).
11886-11	Sandra Eto	According to the DEIS (Ch. 2.1, p. 2-1): A range of alternatives was developed and alternatives were carried forward for detailed analysis if they 1) met the BLM's purpose and need, 2) were technically and economically feasible, 3) addressed the substantive issues identified in scoping, 4) reduced potential adverse environmental effects or addressed resource conflicts when compared with the proponent's project, and 5) were consistent with management objectives outlined in BLM (1986), as amended. If Alternatives C, D, and E, which have been developed as reasonable alternatives that address substantive issues raised in scoping, reduce potential adverse environmental effects and address resource conflicts when compared with the proponent's proposed project, I question why BLM would consider approving an Alternative B that would not necessarily include the most comprehensive mitigation approach that the pared down alternatives are being held to? I would argue the proponent would benefit the most from this approach. Certainly, Alternative B would result in the most adverse impacts, especially to the environment, including the Minidoka NHS, which would adversely affect the survivors of the World War II Japanese American internment camps, their descendants, and the American people.	See response to comment 1042-2 (see in Table A-3ee, Alternatives)
11941-2	Helen Ogden, Wayne Ogden	To Lava Ridge, you should put them in CA. Or Nevada. Nevada has plenty of wind areas where no on lives close by.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
11942-2	Richard Ito	While not being an expert on EIS reports, I would have expected the appropriate place in the report to as fully as reasonably possible to address this concern would be in the "no build option" section although it actually belongs in each analyzed project possibility assumption. In addition but related, I would think it appropriate to further discuss alternative sites and alternative means other than the proposed rotating wing style mega towers.	See response to comment 1042-2 (see in Table A-3ee, Alternatives).
11949-2	Victor Yamada	Avoidance of Impacts – A revised Lava Ridge project should consider moving the wind towers away from the Minidoka National Historic Site (buffer zone) and using smaller turbines so that structures would not be visible at the Historic Site.	See response to comment 11455-2 (Table A-3ee, Alternatives).
11978-3	Magic Valley Energy, LLC	Section 2.8 BLM Alternatives Considered But Eliminated From Detailed Analysis 4. The DEIS states: "Two of the core siting requirements, wind resource quality and access to suitable transmission, reduce the feasibility	See response to comment 12859-18 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
		of Alternative H compared to the Proposed Action and other action alternatives." a. MVE Comment: For clarity, the FEIS should state here that when compared to other action alternatives, Alternative H includes only those corridors furthest away from the proposed point of interconnection (Midpoint Substation or SWIP-N), and greatly restricts the number and maximum height of turbines that may be deployed, which substantially reduces the generation potential of the Project. However, the lengths of the transmission and collector lines required to support development of these furthest corridors would not be reduced proportionally with the reduced generation potential. Alternative H would require installation of comparatively long transmission line and collector line lengths to transport a much smaller amount of energy. The disproportion between the generation potential and transmission line length created under Alternative H would result in an increase in project costs on a dollars per megawatt delivered basis. Additionally, Project economics would be further degraded with the restriction to limit the turbine height to 545 feet, preventing deployment of the latest models of efficient turbine technologies. Taken together, these factors so severely affect the resulting cost of energy that they render Alternative H economically infeasible.	
11991-22	Julie Abo	I would support the creation of a new alternative or reviving of omitted alternatives, such as Alternative H that that resolves the problem that Alternatives B through E, "the federal undertaking could alter any of the characteristics that qualify the resource for the NRHP in a manner that would diminish the integrity of the resource's location, design, setting, materials, workmanship, feeling, or association (36 CFR 800.5(a)(1))" directly and indirectly and in light of the increasingly negative cumulative effects with the mention of the two projects that are currently being planned to the East and West of Lava Ridge as mentioned in this DEIS. (page 3-144) However, I am still concerned that Alternative H does not meet the needs of the Native American Tribes and their concerns about the irreversible damage on cultural resources.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). The EIS provides information about Native American resources in Section 3.5.1 and in Section 3.6.1 (Environmental Justice Communities).
12054-4	Kevin Emmerich	The BLM is also reviewing a new rule that would emphasize and recognize Conservation as a land use.3 Under the proposed rule, the BLM would elevate conservation to be on equal footing with other permitted uses for federal land — such as mining, green energy, grazing, or oil and gas permitting — that have historically taken precedence. It defines conservation as pertaining to both the protection and restoration of public lands. The proposed rule would also amend the existing Area of Critical Environmental Concern (ACEC) regulations to better ensure that the BLM is meeting FLPMA's command to give priority to the designation and protection of ACECs. The proposed regulatory changes would emphasize ACECs as the principal designation for protecting important natural, cultural, and scenic resources, and establish a more comprehensive framework for the BLM to identify, evaluate, and consider special management attention for ACECs in land use planning. ACECs are areas where special management attention is needed to protect important historic, cultural, and scenic values, fish, or wildlife resources, or other natural systems or processes, or to protect human life and safety from natural hazards. The proposed rule clarifies and expands existing ACEC regulations to better ensure that the BLM is meeting FLPMA's command to give priority to the designation and protection of these important areas. These proposed regulatory changes support and enhance BLM's protection of intact landscapes through ACEC designation and better leverage this statutory tool for ecosystem resilience. To implement FLPMA's direction to "give priority to the designation and protection of areas of critical environmental concern," the BLM follows regulatory requirements found at 43 CFR 1610.7-2 and policy instruction found in Manual Section 1613. The BLM currently inventories, evaluates, and designates ACECs requiring special management direction as part of the land use planning process. The BLM's land use planning process guides BLM resource management decisions in a manner that allows the BLM to respond to issues and to consider trade-offs among environmental, social, and economic values. Further, the planning process requires coordination, cooperation, and consultation, and provides other opportunities for public involvement that can foster relationships, build trust, and result in durable decision making. As part of this rulemaking, the BLM proposes establishing procedures that require consideration of ecosystem resilience, landscape-level needs, and rapidly changing landscape conditions in designating and managing ACECs. The BLM may also revise the ACEC manual and develop an ACEC handbook to integrate the existing rule as well as the changes proposed in this rulemaking, if finalized, into policy. The BLM would thus provide additional guidance for how to incorporate ACECs into resource management decisions in a way that considers trade-offs among environmental, social, and economic values during land use planning. The Friends of Minidoka have recently submitted a nomination for an Area of Critical Environmental Concern that is intended to be considered as an alternative to the proposed wind project. While it is not considered in the DEIS, it should be added. The role of the Purpose and Need Statement is to define the range of alternative so we want to see more conservation measure in the statement.	Designation of an ACEC is outside the scope of this EIS, the purpose and need of which is to respond to MVE's application. Changing the purpose and need of this EIS would not respond to the application the BLM has received. The BLM can receive and consider ACEC proposals at any time, but any designation would take place outside of this EIS. The draft Conservation Rule is not in place yet and may be revised based on the ongoing public comment period. If an organization wanted to apply for a conservation easement under the new rule, it would have to wait for the rule to be finalized. Changing the purpose and need of this EIS based on a draft rule would not be appropriate.
12054-5	Kevin Emmerich	Alternatives: The DEIS does not recognize or list a full range of reasonable alternatives. The NEPA directs the BLM to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources;..." (NEPA Sec102(2)(E)). We appreciate that the BLM has chosen two smaller alternatives as their preferred alternatives, but even the smallest footprint alternative would still develop 122,444 acres! It would also place 244 turbines, over 700 feet tall trough out the view-scape. Alternative E would still be visible from the Minidoka National Historic Site, kill over 8,000 bats per year, 10,000 birds per year, 8 golden eagles per year, would lose 560 acres of sage grouse and pygmy rabbit habitat, and impact pronghorn migration.	The EIS provides information regarding the alternative development process in Chapter 2 (Proposed Action and Alternatives). Section 2.8 (Preferred Alternative) provides further details and rational regarding alternatives the agency considered but which were eliminated from detailed analysis. The BLM has prepared a full and detailed analysis with robust public participation with the NEPA process supporting requirements for a hard look in BLM decision-making.
12054-8	Kevin Emmerich	Under NEPA, BLM is required to consider alternatives "outside of the jurisdiction of the lead agency."	The BLM will consider all alternatives and options included in the EIS and consistent with NEPA review requirements.

Comment ID	Commenter	Public Comment	Response to Comment
		The Environmental Protection Agency has identified 15 million acres of brownfield in the USA that would be suitable for renewable energy.4 The BLM can't direct a developer onto private lands but can choose a No Action Alternative based on numbers for distributed energy.	
12130-1	Brenda Pace	I am concerned that the BLM was not provided with detailed information on specific turbines and their output potential for use in designing alternatives ("Site-specific data for wind variability within the project area were not available to the BLM" DEIS pg 2-17). Turbine-specific information is essential to support decisions about micro-siting to avoid/reduce impacts to resources that occupy specific locations. The generalized "turbine array" information that was available to BLM prevented the development of alternatives for project footprints that would have been truly responsive to the distribution of sensitive resources by preventing the consideration of smaller groupings of turbines in the development of alternatives. Instead, all proposed alternatives include long ½ mile-wide areas of potential disturbance that dissect the entire area and affect habitat connectivity no matter which alternative is chosen. I understand that some of this wind resource information is proprietary and would present a risk of loss to Magic Valley Energy (MVE) if released to the public, which might include other companies that may want to develop their own wind projects in the same area. However, it should have been provided to the BLM and since it wasn't, the NEPA analysis is significantly less nuanced in the development of unique alternatives. It surely could have been possible to trust the BLM with this information, while restricting its distribution to the public at large.	See response to comment 1042-24 (see in Table A-3ee, Alternatives).
12130-2	Brenda Pace	I recommend that BLM consider if another alternative that is based on specific turbine locations, possibly in smaller and more widely spaced concentrations, rather than in multiple, long ½ mile-wide strings, would offer greater flexibility in micro siting project components and reducing impacts.	See response to comment 1042-24 (see in Table A-3ee, Alternatives).
12136-2	Diane Honda	Page 3-156 under 3.5 Cultural Resources of the Draft Environmental Impact Statement (DEIS) states: "The openness and undeveloped landscape are vital to the historic character and purpose of Minidoka NHS. These defining characteristics—expansiveness, remoteness, high desert, and agrarian terrain—convey the government's site criteria and the long-lasting effects of that intentional decision-making process." (BLM 2022) While various sections of the DEIS cite the impact of the proposed Lava Wind Project on the Minidoka National Historic Site (NHS), aside from Alternative A, none of the proposed DEIS Alternatives protect the land surrounding the Minidoka NHS from changes that will impact Minidoka NHS's purpose. The "least-worst" impact cited is 'A "moderate" degree of visual change to Minidoka NHS's viewshed'. That change would make it difficult, if not impossible for the Minidoka NHS to offer its visitors an immersive experience akin to what its prisoners endured. This experiential component must be preserved so visitors can absorb Minidoka NHS's energy, learn what happened there, and heal. The DEIS should be expanded to include how Minidoka NHS's sense of place can be preserved if this project as well as other proposed projects in the area are permitted to proceed.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). Also, a new section and analysis was added to the EIS, Section 3.19: "How would the impacts identified within the draft EIS affect the NPS interpretive purpose of Minidoka NHS?" Section 3.19 discusses how project visual impacts could potentially change the Minidoka NHS visitor experience (Section 3.16, Visual Resources).
12225-2	Sarah Halvorson	Locating this project in California or Nevada closer to its intended destination greatly minimizes this cost and risks.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
12365-2	Jerry Davis	hope you will reconsider a greatly scaled down proposal, carefully planned to minimize wildlife impacts.	The EIS addressed environmental analysis in Chapter 3 (Affected Environment and Impacts). The following environmental considerations are addressed in this chapter: air quality, avian and bat species, climate and greenhouse gases, cultural resources, environmental justice and socioeconomics, fire and fuels management, land use and realty, livestock grazing, paleontological resources, pollinators and insects, recreation, soils, transportation, vegetation, visual resources, water and wetland resources, and wildlife. The EIS provides information on impacts on wildlife specifically in Sections 3.18.1.2, 3.18.3.2, and 3.18.4.2. Alternatives and the alternatives development process are covered in detail in EIS Chapter 2 (Proposed Action and Alternatives). The size of the project area and siting corridors, as well as the number of turbines, are shown in Table 2.4-1.
12370-1	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	We acknowledge our "alternative" reference to Alternative E but, as we stated in our comments, such reference remains subject to the "modifications … as discussed in more detail" in our comments dated April 14, 2023. We wish to be clear that the "modifications … as discussed in more detail" in our comments dated April 14, 2023, implicate a significantly smaller footprint than that stated in Alternative E, and likely outside of the Star Lake Allotment.	The EIS provides information regarding Alternatives in Chapter 2 (Proposed Action and Alternatives).
12398-4	Environmental Protection Agency	• Specific to the disproportionate cultural impacts of the proposed project on Japanese American community at the Minidoka War Relocation Center and Minidoka National Historic Site: further evaluate Alternative H, eliminated from the detailed analysis, which has the potential to avoid anticipated major visual effects that result in disproportional cultural impacts. EPA notes that although Alternative E will minimize impacts, major impacts to cultural resources will remain, even after application of mitigation measures.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). As described in Section 2.9.4 (Alternative H), Alternative H does not meet the purpose and need of the project.
12859-18	Kristen Brengel, Robyn Achilles; Friends of Minidoka	2.8 BLM Alternatives Considered but Eliminated from Detailed Analysis In the letter sent to BLM on July 8, 2022, Japanese American organizations and partners asked BLM to "develop and analyze an additional alternative in the draft EIS that would avoid any adverse impacts on the Minidoka Relocation Center and Minidoka NHS."154 While we were pleased that BLM developed Alternative H, BLM's finding that Alternative H	See response to comment 11455-2 (see in Table A-3ee, Alternatives). The BLM added to Section 2.9.4 more explanation and information sources for why Alternative H would be economically infeasible. BLM reviewed publicly available wind speed data for the project area from NREL and the Global Wind Atlas (Argonne National Laboratory 2023; Davis et al. 2023). BLM prepared simulations for 17 key observation points (KOPs)

Comment ID	Commenter	Public Comment	Response to Comment
		was not economically feasible and therefore not considered as an alternative is based on inadequate information.155 CEQ regulations require BLM to analyze "a reasonable range of alternatives that are technically and economically feasible."156 BLM's feasibility conclusion was based on unsupported reasoning and analysis regarding both wind speed and transmission availability and costs. In considering Alternative H, the BLM states that a combination of poor wind quality and distance from the Mid-Point Substation and SWIP-N line makes Alternative H infeasible. BLM's Alternative H is based on siting corridors with 84 3 MW turbines (545 feet). In terms of wind quality, BLM did not review "[s]ite-specific data for wind variability within the project area." It based its feasibility analysis on a general understanding "that the wind resource varies with topographic features and associated changes in elevation …" BLM later states that some of the turbine locations "would be located in areas assumed to have a lower quality wind resource …" However, BLM does not base this analysis on detailed wind speed information that the company presumably could provide to BLM to support its analysis. A cursory review of Alternative H shows similar wind resources to other parts of the project area. A portion of Alternative H is in the vicinity of Kimama and Sid Buttes, high points in the project area, with a higher base elevation and better wind speeds. The NREL's Wind Supply Curve Interactive map shows that the area proposed for Alternative H has an average capacity of 287 (MW) and wind speeds between 6.55 and 6.92 miles per hour, which are similar to the overall Lava Ridge project area.157 Also, the Global Wind Atlas shows that the area proposed for Alternative H has wind resources that are similar to the rest of the project area.158 Based on the NREL and Global Wind Atlas interactive maps, the wind quality in Alternative H appears similar to wind quality throughout the project area.159 The NREL nationwide wind speed maps show higher wind speeds at higher elevations. In terms of BLM's dynamic visual simulations, posted on its E Planning web-site, BLM's simulations feature 3 MW turbines to minimize the visual impacts.160 However, in its discussion of Alternative H, it says that the wind quality for 3 MW turbines "has less potential for generating electricity … [and] lower wind potential."161 The BLM also cited the lack of "access to suitable transmission" and the need to build 19 miles of new 500 kV transmission line as another reason to find that Alternative H is not economically feasible. However, as noted by BLM in its 2023 "Energy Overview Map,"162 Alternative H is either bisected by or immediately adjacent to several existing and permitted power lines located between the Borah and Midpoint substations including: • Kinport to Midpoint existing 345 kV power line (bisecting Alternative H) • Midpoint to Adelaide existing 345 kV power line (located in the 2009 WEC 49-112 corridor.)163 • Midpoint to Borah existing 345 kV power line.164 • Midpoint to Valmy existing 345 KV power line (located within WEC Corridor 112-226).165 • Gateway West permitted 500 kV power line (Borah-to-Midpoint bisecting of Alt. H) (upgrade of existing Kinport to Midpoint line to 500 kv)166 • Westwide Energy Corridor (WEC) – Segment 49-112 o 2009 WEC corridor (immediately south of Alternative H, Midpoint to Adelaide.)167 o Proposed 2022 realignment along Gateway West corridor (which bisects Alt. H) 168 • Borah-to-Hunt, existing 203kV power line While Idaho Power identified transmission constraints west of Midpoint, between the Magic Valley and Boise,169 Idaho Power's 2021 Integrated Resource Plan (IRP) did not identify any transmission constraints between Borah and Midpoint (where Alternative H would interconnect). According to Magic Valley Energy, it has executed a Large Generator Interconnection Agreement with Idaho Power Company. BLM makes an assumption that Alternative H needs to connect to the Midpoint Substation or SWIP-N and that LS Power would need to build an additional 19 miles of 500 kV power line which would increase the cost of Alternative H. However, Alternative H has ample existing and planned transmission, as pointed out by LS Power's own Plan of Development, in and around Alternative H. The FEIS should address whether an interconnection to the existing or planned transmission closer to Alternative H is technically feasible and if so, if it would change BLM's conclusions about the economic viability of Alternative H. BLM also states that because Alternative H would provide 252 MW, or only 20 percent of the electricity generation it is economically infeasible. Because of the large size of the Plan of Development (POD) and its associated unacceptable impacts, this 20% reasoning is also flawed. The DEIS should consider the absolute size of Alternative H, not its relation to the original POD. Idaho has several wind projects of this size currently operating in Idaho including: • Burley – 34 turbines generating 51 MW. • American Falls – 44 turbines generating 79 MW • Mountain Home – 80 turbines generating 180 MW. Also, a project that is 20% of the original POD would have lower cost to build and operate. We recommend that the BLM reexamine whether the Alternative H is economically viable or if it is needed to help LS Power secure its financing to construct the SWIP-N line which is connected to the Lava Ridge project.	for a range of turbine sizes, 3-MW and 6-MW for Alternatives B, C, D, and E, and 5-MW for the Preferred Alternative. Select visual simulations are available in EIS Appendix 5; all simulations prepared for the project are available in Appendix C of the Visual Resources Technical Report (SWCA 2024).
12934-3	Rob Thornberry, Theodore Roosevelt Conservation Partnership	TRCP asks the BLM to consider the following changes and additions to the DEIS: ... Provide a true conservation alternative. Despite the known concerns around the effects of industrial wind farming on pronghorn behavior, all four of the action alternatives develop infrastructure in a known migration route. The TRCP suggests building an alternative that avoids all intrusion on the known Owinza pronghorn migration route. An example of an alternative that accounts for migration projections can be found in Figure 2.8-1 in the Executive Summary. The table lists alternatives considered by BLM but eliminated from detailed analysis.	The EIS provides information regarding the alternative development process in Chapter 2 (Proposed Action and Alternatives). Information on the impacts to pronghorn is included in Section 3.18.1 (Wildlife Movement [non-game mammals and reptiles]) and Section 3.18.2 (Big Game Habitats and Populations).
12985-2	Jerry Heimerdinger	I am experiencing difficulty coming up with reasonable alternatives to MVE's proposal specifically. Drastically reducing the magnitude of the project's size would be an idea. Fifty to one hundred turbines? If the project were approved with modifications, it could be a model for future projects elsewhere. Substantially scaled down, extremely high and enforced rehabilitation of the ravaged ecosystem, and stringent and forceful decommissioning of any kind would make these types of projects more feasible.	The EIS provides information regarding the alternative development process in Chapter 2 (Proposed Action and Alternatives). A comparison of the turbine numbers and sizes for each alternative is provided in Table 2.4-1. Information regarding proposed mitigation, including applicant-committed measures, BLM-required measures, and additional project-specific mitigation can be found in EIS Appendix 4 (Mitigation). The project Decommissioning Plan is provided in Appendix L in MVE (2023). The BLM will consider each alternative and option analyzed in the EIS.

Comment ID	Commenter	Public Comment	Response to Comment
12986-2	Victor Yamada	Avoidance of Impacts - A revised Lava Ridge project should consider moving the wind towers away from the Minidoka National Historic Site (buffer zone) and using smaller turbines so that structures would not be visible at the Historic Site.	See response to comment 11455-2 (see in Table A-3ee, Alternatives).
13006-12	Leon Smith	3) Recommend that BLM's action alternatives avoid or minimizes impacts to both sage grouse habitat and the Owinza pronghorn migration route. There is no existing alternative that avoids the pronghorn migration route. Action alternatives should not include siting corridors in migration routes.	The EIS provides information about impacts to greater sage-grouse in Section 3.3.4, and pronghorn in Section 3.18.2, including analysis of each alternative on the species. information regarding the alternative development process is provided in Chapter 2 (Proposed Action and Alternatives).
1311-2	David Mollineaux	I am concerned about this project. If all the energy generated from this project goes to California and Nevada, then why not build it in those states. Why should we have the impact here?	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
165-2	Ash Marshall	I encourage you to approve Alternative C. Alternative C reduces the impacts to and still allows a good amount of turbines to produce clean, renewable energy for Idaho, our neighboring states, and most importantly, our children. Wind energy nets zero greenhouse gasses and uses a resource that is unlimited. The maintenance for a wind turbine is minimal, especially when considering that it generates power from a resource that we will never run out of. To me, the biggest environmental consideration is how much water this project would need, as 70% of Idaho is in some stage of drought right now, even after the heavy snowfall recently.	The BLM will consider all alternatives and relevant options analyzed in the EIS. Impacts of each alternative are discussed in Chapter 3 (Affected Environment and Impacts), including air quality, climate and GHGs, water and wetland resources, and wildlife. Information about the project operation and maintenance is provided in Section 4.0 (Operations and Maintenance) in MVE (2023).
2825-1	Keith Dunbar	Support of alternative "E", with modification. Remove most westerly line of turbines closest to the historic footprint of the internment camp.	The BLM will consider all alternatives and relevant options analyzed in the EIS. See response to comment 11455-2 (see in Table A-3ee, Alternatives) regarding impacts to Minidoka NHS.
3062-1	Kate Lopez	There are other public lands where blasting into bedrock can be avoided. Why not select another site, or amend the management use plan to eliminate this area from "renewable" use potential?	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
3227-1	Mark Schneider	I do prefer that the wind turbines be of the smaller design and not the larger type.	See response to comment 1042-2 (see in Table A-3ee, Alternatives).
3369-2	LuAnn Craner	There are better options: a) Wind Panels - no blades, b) Aeromine Tech have 50% more energy than solar using 10% of space. c) Power Nest wind turbines and solar together on rooftops in cities. d) AIR FOILS - no external moving parts, air foils have no problems with bad weather, can use wind as low as 5 mph. e) also vertical Induced Vibration Resonant wind generators, and IceWind windmills.	See response to comment 3715-1 (see in Table A-3ee, Alternatives).
3575-1	Sue Page	Suggestions Move to areas that do not impact the towns, cities, historical sites or aquifer around the turbines. 1. Wells, NV along Hwy 80. This area has as much wind, easier access to move transmission lines south towards the end users Las Vegas and California. 2. Replace and rebuild abandoned wind turbines already in California in Palm Springs, Indio, Bakersfield to name a few. 3. Build in California at Eagle Mountain, Imperial Sand Dunes, Lake Crowley or Mono Lake to name a few locations. Stop Lava Ridge Wind and all alternative suggestions.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
3715-1	No Name Provided	I vote NO on Lava Ridge Wind Project. 1) There are better options: a) Wind Panels - no blades, b) Aeromine Tech have 50% more energy than solar using 10% of space. c) Power Nest wind turbines and solar together on roof tops in cities. d) AIR FOILS - no external moving parts, air foils have no problems with bad weather, can use wind as low as 5 mph. e) also vertical Induced Vibration Resonant wind generators, and IceWind windmills.	See response to comment 1042-2 (see in Table A-3ee, Alternatives) regarding turbine design. Alternative generation technology and locations do not meet the purpose and need of this project (see response to comment 1022-3 in Table A-3ee, Alternatives).
39-1	Colten Michael	I'd like to start by saying that I appreciate that this project is under consideration for construction in Idaho. New energy resources are needed to meet increasing demand, and I'd rather have the resources sourced in Idaho so that our utility payments go to companies and employees in the local community. With that said, I'd like to advocate for alternative B or C. I believe that the larger scale of this project, here and now, is needed to meet energy demand in Idaho and beyond. However, given the state of supply chains in the electric utility industry and the concerns of fellow Idahoans about the large footprint (especially near the Minidoka Historic Site), I think that a phased project could be best. Perhaps the BLM could approve the right of way for alternatives B or C but construction would begin only on the footprint of alternative E and could not proceed to the expanded footprint until 80% or so of construction is done on footprint E. This could allow use to continue in its current state at the footprints of alternatives B and C that are not included in E until the project is nearly complete, which could potentially limit friction between the project and local stakeholders. Thanks for all of your work on this project so far.	The BLM considers each alternative when evaluating the project purpose and need. Information about project construction and site plans are included in MVE (2023). The EIS provides information on the alternatives and alternative development in Chapter 2 (Proposed Action and Alternatives). See response to comment 11455-2 (see in Table A-3ee, Alternatives) regarding the impacts to Minidoka NHS.
3990-3	Diana Nielson	4. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance. 5. Place infrastructure in already disturbed locations where the habitat has not been fully restored. 6. Co-locate linear facilities within one mile of existing linear facilities.	Information regarding construction and development are provided in MVE (2023) and include details about electrical infrastructure and transmission system interconnection. The EIS includes information about project components in Appendix 11 (Project Elements Common to All Action Alternatives).
4057-1	Dean Dimond	I am opposed to Lava Ridge In reviewing the DEIS It is clear that the Alternate A option was never developed? Every project should have a pro and con list for all options. Were is that list for any of the options in the DEIS?	See response to comment 9275-5 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
		Part of the BLMs job is to protect the land for future generations. Why didn't you analyze what the shape the wildlife, land, aquifer, etc…. will be in 5, 10, 20, 30,40 and even 50 years for each option? Were is any analyzation for alt A? While the DEIS is a long a complicated document their has been a lot of "copy and paste" used. and again you totally skipped Alt. A. The BLM needs to go back and analyze what shape the ground is in now and identify what measure could be taken in the future to IMPOVE the area and how the proposed windmills would conflict with any future uses. Their are a lot of pro's to Alt. A. The BLM must consider them. Please complete this study	
4220-5	Sue Page	You want suggestions? Let California create their own energy. Put turbines in the Mojave Desert, around Eagle Mountain, Mono and Crowley Lakes. (Pictures attached)	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
4220-6	Sue Page	Or better yet join the Alnshultz Wind Farm project in Wyoming. It's all on private property.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
5978-1	Jeff Roper	It is unfortunate that the BLM planners didn't understand that preserving the view from the Minidoka National Historical Site was important—perhaps the project can be altered to move the windmills at least 10 miles away.	See response to comment 11455-2 (see in Table A-3ee, Alternatives).
6350-1	Linda Olson	Wind turbines over 84,000 acres that will be 700 feet tall for California power should be in California. There are thousands of desert land there where nothing would be disrupted.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
6849-3	Name Not Provided	California has ample public land, let them sacrifice their own land, for this project	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
7356-2	Elaine French	But I greatly favor installing the fewest number of wind turbines of the lowest effective height on a smaller amount of land. I would like the project to impact as little as possible the view shed and wildlife habitat and corridors in the area.	See response to comment 1042-2 (see in Table A-3ee, Alternatives). Table 2.4-1 provides information on the alternatives considered and the project components of each alternative. the information includes details regarding the number and type of wind turbine and various information about the project area (e.g., total area, ground disturbance, siting corridors). Visual and wildlife resource impact information for each alternative is provided in the Affected Environment and Impacts sections in Sections 3.16 (Visual Resources) and 3.18 (Wildlife).
8324-1	Curtis Wolthuis	I understand from the Executive Summary and other News reports that the BLM is actually looking to find alternative wind turbines or products that are much less intrusive to the visual sight lines and ambiance of the area in which the project could be potentially located. I am aware of low profile smaller wind turbines that should be considered as an alternative for this project.	See response to comment 1042-2 (see in Table A-3ee, Alternatives).
8338-1	Kim Hanks	I hope the wind project will consider the "tulip" style turbines that are non lethal to wildlife	See response to comment 1042-2 (see in Table A-3ee, Alternatives).
8420-2	Sue Page	Let this project be built were the end user has better accessible. There is plenty of open land in both Nevada and California to be used.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
8435-2	Gary Smith	If the goal is truly to increase Clean Reusable Energy for the West Coast Power Grid, then BLM and all parties concerned should be to reuse all the wind turbines that have been abandoned. In my opinion it makes more sense to reuse the land and infrastructure in California wind farms. There are estimates of over 10,000 abandoned wind turbines and the wind farms in Southern California.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
8458-8	Sue Page	Put turbines in the Mojave Desert, around Eagle Mountain, Mono and Crowley Lakes.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
8458-10	Sue Page	Or better yet join the Alnshultz Wind Farm project in Wyoming. It's all on private property.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
8829-2	George Snyder	Also, there is talk of the power going to other more power hungry states. I can't speak to the available lands in in many other states, but I do know about California. From the Navada and California border going north on interstate 15 there is hundreds of square miles of land that isn't used for anything that could be used for such a project.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
9080-35	The Coalition to Protect America's National Parks	A. Section 2.1 Alternatives Development Process (p. 2-1) – As described in the DEIS, "[a] range of alternatives was developed and alternatives were carried forward for detailed analysis if they: 1) met the BLM's purpose and need, 2) were technically and economically feasible, 3) addressed the substantive issues identified in scoping, 4) reduced potential adverse environmental effects or addressed resource conflicts when compared with the proponent's project, and 5) were consistent with management objectives outlined in BLM (1986), as amended." Our concern with the range of action alternatives considered is that none would successfully avoid substantial adverse effects to visual resources as seen from the perspective of Minidoka NHS, the WRC, and Native American cultural sites such as Wilson Butte Cave, regardless of whatever "mitigation measures" BLM proposes to try to lessen the relative severity of those impacts. In our scoping comments, we had recommended that BLM consider at least one action alternative in a location with adequate wind energy potential but outside of the current Project area in order to avoid conflicts with the sites mentioned above. However, it appears that BLM has not fully considered such an alternative.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). As discussed in EIS Section 2.3 (Project Elements Common to All Action Alternatives), action alternatives have been developed with the intent to avoid and minimize potential impacts to Wilson Butte Cave, Minidoka NHS, and the communities that have connections to these places, as well as accounting for other resource concerns (see Table ES-2 for a comparison of potential impacts from each action alternative).
9080-40	The Coalition to Protect America's National Parks	F. Section 2.8.4 Alternative H (pp. 2-16 and 2-17) – As described under Alternatives Considered but Eliminated, "Alternative H was considered in order to examine an alternative that eliminates potential impacts to the visual landscape surrounding the Minidoka NHS. Alternative H considered a project layout that would only include turbine siting corridors not potentially visible from the Minidoka NHS (see Figure 2.8-1)." (Emphasis added) However, BLM dismissed this alternative from further consideration because "[t]wo of the core siting requirements, wind resource quality and access to suitable transmission, reduce the feasibility of	See response to comments 11455-2 and 12859-18 (see in Table A-3ee, Alternatives).

Comment ID	Commenter	Public Comment	Response to Comment
		Alternative H compared to the Proposed Action and other action alternatives." BLM's decision to limit ALL of the action alternatives to the same location within close proximity of Minidoka NHS, the WRC, and Wilson Butte Cave has created an irreconcilable conflict between managing for appropriate energy development under FLMPA and conserving scenic and cultural resources and values, which is also mandated by FLMPA. As a result, the range of action alternatives presented in the DEIS is merely a list of relatively bad options that vary in the level of adverse effects they would cause. Alternative A (No Action) is the only alternative considered that would actually avoid substantial adverse effects to the cultural landscape surrounding and encompassing these sites.	
9275-2	AJ Whitecotton	In reviewing the Lava Ridge Wind Project Draft Environmental Impact Statement, I noticed that you only offered the public options B, C, D and E. Yet Option A, which is to do nothing at all was missing from your charts. I believe that this was misleading to the public and it needs to be corrected and a new comment review period with better explanation that the public could have picked or selected Option A for the BLM to do nothing and deny the project.	See response to comment 9275-5 (see in Table A-3ee, Alternatives).
9275-5	AJ Whitecotton	Lastly, I find only B, C, and D, in your proposal, where is option A that no wind tower's be built in this area.	Alternative A (No Action) is addressed in the EIS. Chapter 2 (Proposed Action and Alternatives) provides details on alternative development and describes the No Action Alternative in Section 2.2. Details about how the alternatives were developed is provided in Section 2.1 (Alternatives Development Process). The impacts of Alternative A are explored in each section of Chapter 3 (Affected Environment and Impacts). Table ES-2 summarizes and compares the impacts of action alternatives on the issues analyzed in the EIS. Also see response to comment 11535-7 (see in Table A-3ee, Alternatives).
9657-6	Saiyare Refaei	I ask that you reconsider an alternative location for this project because as it stands the leading Alternatives C and E still will impose on the immersive feeling and impact of the ambiance of the Minidoka National Historic Site that is critical in the educational aspect of the experience.	See response to comment 11455-2 (see in Table A-3ee, Alternatives). The BLM also added EIS Section 3.19 evaluating potential project impacts to the NPS interpretive purpose at Minidoka NHS.

Consultation and Coordination

Table A-3ff. Consultation and Coordination

Comment ID	Commenter	Public Comment	Response to Comment
11535-99	Steven Andersen	The GPS interference caused by industrial wind turbines is also a threat to national security. As a result, the Department of Defense ("DOD") Siting Clearinghouse works with developers to address risks to national security during development. However, there is no discussion or mention that MVE ever consulted with the DOD, received feedback on national security risks, evaluated any potential mitigation measures, let alone received a green light.	See MVE (2023) Section 5.2.1 (Aviation and/or Military Considerations).: "The FAA/Department of Defense Preliminary Screening tool was used to determine potential FAA permitting processes for the Project area. The Long Range Radar screening tool indicates the Target Area is in a green zone, which signifies there are no anticipated impacts to Air Defense and Homeland Security radars… The preliminary review of the Military Operations screening tool did not return any likely impacts to military airspace. MVE will continue coordinating with the agencies listed above to ensure they are informed as design of the Project is refined." Entities seeking to develop a wind energy project on BLM public lands, in conjunction with BLM Washington Office and Field Office staff, shall consult with the U.S. Department of Defense regarding the location of wind power projects and turbine siting as early in the planning process as appropriate. This consultation shall occur concurrently at both the installation/field level and the Pentagon/BLM Washington Office level. An interagency protocol agreement is being developed to establish a consultation process and to identify the scope of issues for consultation (BLM 2012). Bureau of Land Management (BLM). 2012. Appendix C: BLM Wind Energy Development Program Policies and BMPs. In *Searchlight Wind Energy Project FEIS*. Available at: https://www.energy.gov/sites/default/files/EIS-0413-FEIS_Appendix%20C_BLM%20Wind%20Energy%20BMPs.pdf. Accessed December 28, 2023.
11535-104	Steven Andersen	The Executive Director of the Southern Idaho Regional Communications Center (SIRCOMM) submitted scoping expressing serious concerns regarding risk that the Project could interfere with radio transmission and reception pathways near Nietrich Butte; interference with transmission and reception pathways between Dietrich, Hansen and Gooding Tower Sites; interference with the transmission and reception pathways between Dietrich Butte and Skeleton Butte; and interference with the transmission and reception pathways caused by equipment utilized for construction and interfere with a comprehensive upgrade to the telecommunication system in the area.323 As such SIRCOMM asked for continued updates and involvement,324 which never happened.	See EIS Section 3.8.1.1.4 (Land Use and Realty, Communication Sites). This section of the draft EIS states that "additional details concerning existing communication systems in the analysis area were identified through scoping" and summarizes these concerns related to radio transmission and reception pathways. This section additionally states that "MVE's coordination with communication providers and operators is ongoing to identify specific sites and pathways of concern in the analysis area," and provides assessment of the impact of wind turbines on communication sites. Results of this assessment indicate that the impact of wind turbines on communication services is consistently low and the frequency of the operation for these services would allow the signal to propagate through the wind turbines. "Per MVE's applicant-committed measures 27 and 28, MVE would design the project to minimize interference with communication systems and work with system users to resolve any issues; measures to reduce interference may include the use of Comsearch's recommended setbacks from land mobile fixed-base stations (254 feet) or other design modifications such as attaching communications equipment to project infrastructure or to existing communications structures in the analysis area. Signal studies were provided in April 2021 to all communication site authorization holders who had submitted responses to the BLM following notification provided in July 2020. Prior to final design and siting of project infrastructure, MVE would complete a line-of-sight interference study to further identify communication

Comment ID	Commenter	Public Comment	Response to Comment
			pathways potentially blocked by the project's proposed infrastructure and to determine where potential impacts to existing communication towers can either be avoided through micro-siting of infrastructure or mitigated. Coordination with local communication providers and operators is considered ongoing."
11585-4	Preservation Idaho	Both the Shoshone-Bannock and the Shoshone-Paiute Tribes have voiced their significant concerns about the loss of artifacts and history. Disturbance and destruction of these lands and the history and sites that they contain is nothing short of disrespectful and negligent. Federal policy such as the 1966 National Historic Preservation Act requires and allows consideration of these concerns and mandates that preservation of this heritage is in the public interest.	Native American concerns are addressed in Section 3.5 (Cultural Resources). See response to comment 6900-1 (see in Table A-3ff, Consultation and Coordination) regarding the BLM's consideration of input received throughout the NEPA and NHPA Section 106 processes, (including from government-to-government consultation with Tribes) in their alternatives development and decision-making processes.
11640-4	Amber Madsen	How many animals, endangered or otherwise, have to die? Not even one is acceptable. An individual citizen would be imprisoned, why is it acceptable for a corporation to injure or kill any?	See EIS Sections 3.3 (Avian and Bat Species), 3.11 (Pollinators), and 3.18 (Wildlife), which summarize project impacts to animals; and EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), Consultation and Coordination, Cooperating Agencies, U.S. Fish and Wildlife Service section. The USFWS section of EIS Appendix 10 discusses the statutory responsibility of the USFWS related to MBTA, ESA, and BGEPA implementation, and states that each of these statutes applies to MVE's permit request. The USFWS provided input regarding 1) the risk of incidental take of eagles from turbine operations; 2) avoidance and minimization measures, compensatory mitigation, and fatality monitoring related to incidental eagle take from turbine operations; and 3) project impacts to migratory birds, bats, endangered species, and critical habitat, and options for addressing those impacts. The USFWS intends to use this information in decision-making for a BGEPA eagle take permit application submitted by MVE on July 28, 2021, and in meeting other USFWS statutory obligations. Coordination with the USFWS on the above matters is ongoing. Per EIS Appendix 10, Mitigation Framework, Types of Mitigation section, the USFWS will issue their own NEPA document to facilitate their decision regarding the project's BGEPA eagle take permit application submitted by MVE on July 28, 2021. This document may include additional mitigations should USFWS find they are warranted after completing their own NEPA analysis.
11862-1	Suzanne K. Ishii-Regan	Given the significant relationship of the Indigenous People of Alaska to the WWII Japanese Internment, and its cultural impact, I respectfully urge that the Alaska Native tribes and corporations be included in the discussion of the proposed Lava Ridge Wind Farm Project.	See response to comment 11315-3 (see in Table A-3gg, Cumulative Effects).
11886-4	Sandra Eto	Consultation to Inform Identification The Draft PA indicates BLM will identify properties to which Japanese Americans attach cultural significance, pursuant to 36 Code of Federal Regulations (CFR) 800.2(c)(5). Given the expertise and jurisdiction of the NPS over properties within the non-physical APE and/or that may be affected by the proposed project, the NPS needs to be included in any discussion regarding the handling of these types of properties. The entire 34,000-acre WRC site is an area within which the activities occurring between 1942 and 1945 have made a significant contribution to the lives of 120,000 Japanese Americans and their descendants, and the culture of the Japanese American community since World War II, as well as the history of the US as a Nation.	The NPS is a consulting party on the project under NHPA Section 106 and will continue to be consulted by BLM on the identification of historic properties and potential effects to them as the Section 106 process is completed under a final PA.
11991-13	Julie Abo	NEPA is not a collaborative process. The consulting parties' and the public's role is simply reacting to a a very complex plan that is difficult for people who are not familiar with archeology, geology, preservation, conservation and other terms and concepts that are needed to understand the scoping comments and the DEIS and participate in meetings that are difficult to attend during the day. We (the Japanese American community) haven't been part of shaping the plan. As stated in the DEIS: "However, the BLM will continue to solicit input from environmental justice populations regarding potential mitigation measures for adverse effects to facilitate collaborative decision-making throughout this EIS process." It is disingenuous to characterize this process as "collaborative."	See response to comment 6900-1 (see in Table A-3ff, Consultation and Coordination). The BLM also prepared the *Lava Ridge Wind Project Stakeholder Assessment and Engagement Report* to conduct a situation assessment that focused on the Japanese American communities with connection to the Minidoka NHS. The situation assessment was designed to gather information and recommend approaches for a public involvement strategy and identify what characteristics of the NHS are most important to these stakeholders (BLM 2022).
11991-21	Julie Abo	It is noted in the DEIS: "Tribes have noted they would consider the presence of the project on the landscape severely impactful. The Shoshone-Bannock Tribes specifically voiced concerns that the project would impact traditional Tribal resources relating to hunting, gathering, and other practices. The Shoshone-Bannock Tribes voiced concerns about severe cultural and spiritual impacts on their members, dark skies concerns related to turbine lighting that would present severe effects to Tribal practices in the area, and concerns for the diminishment of their exercise of Treaty Rights in the area." (page 3-208) This should be high on the list of concerns for the BLM and the Department of the Interior.	See response to comment 11585-4 (see in Table A-3ff, Consultation and Coordination).
12398-22	Environmental Protection Agency	Potential Impacts to Biological Resources EPA recommends that the FEIS include information on working with the U.S. Fish and Wildlife Service, and as appropriate, with the Idaho Department of Fish and Game, including recommended measures to reduce risks and protect biota and habitat during implementation of the proposed project. In addition, include in the FEIS information on the outcomes of Section 7 of the ESA consultations with the Service and coordination with other agencies. The DEIS indicates the project may impact federally and state protected species occurring on the analysis area or vicinity, including many bird and bat species, bald and golden eagles, sage-grouse, pygmy rabbit, and yellow-billed cuckoo. The impacts will be related to the anticipated suitable habitat degradation, fragmentation, alteration, and loss; higher than optimal noise levels especially during project construction activities; air quality from smoke and fugitive dust, as well as mortality due to collision with turbines and vehicles. As a result of	Consultation and coordination with USFWS, IDFG, and other agencies is summarized in the Consultation and Coordination Section of EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers). This section notes the role each agency played in the development of measures to minimize or avoid impacts to biological resources. BLM has continued to coordinate with USFWS during the development of the FEIS and is currently preparing a BA for Section 7 Consultation. Although the BA and Section 7 Consultation will not be completed prior to the publication of the FEIS, these will be completed prior to, and the outcome will be summarized in, the ROD. EIS Appendix 3 (Issues Analyzed Brief) includes preliminary effects determinations for all species included in the official species list for the project. As stated in EIS Appendix 3, the project would have no effect on any ESA-listed plant species because none are present in the siting corridors (see AIB-43 in Table App3-1). The project would have no effect on Canada lynx, grizzly bear (Greater Yellowstone ecosystem and Selkirk-Cabinet populations), northern Idaho ground squirrel, wolverine, bull trout, Banbury Springs limpet, Bliss Rapids snail,

Comment ID	Commenter	Public Comment	Response to Comment
		collision with turbines alone, the DEIS indicates that up to more than 15,000 bats could die each year the project will operate.	Bruneau hot springsnail, or Snake River physa because these species do not occur in the general project area (see Tables App3-4 and App3-5). The yellow-billed cuckoo (western distinct population segment) may migrate through the siting corridors but riparian habitats for foraging and breeding cuckoos are not present. The monarch butterfly, which is a candidate for ESA listing, is discussed in EIS Section 3.11.3 (Monarch Butterfly).
12469-4	Mike Telford	Coordination The DEIS states on the front page that Minidoka, Jerome, and Lincoln counties, along with the State of Idaho are cooperating agencies. Its is my understanding (see NEPA) that The BLM is required to work with and consider input from the counties, state and local governments. Those three counties have all passed resolutions against Lava Ridge and urge Alternative A. In addition, a historic joint resolution in opposition was sign by all 7 magic valley counties. This historic event took place April 6 2023 at the Historic Japanese internment camp location in Jerome County. Both houses of the State legislator have passed unanimous resolutions in opposition to Lava Ridge. Additionally, the Idaho Governor, Lt Governor, and the Attorney General have joined Idaho's national Delegation of Senators and Congressmen in declaring opposition to Lava Ridge.	The seven cooperating agencies for the project are the NPS, the USACE, the USFWS, the State of Idaho, Jerome County, Lincoln County, and Minidoka County. As noted in the Cooperating Agencies section of draft EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), the BLM solicited input from cooperating agencies during the planning, scoping, and EIS analysis phases, and will continue to solicit input from cooperating agencies throughout the EIS process. Any new input received has been addressed in the final EIS. This section of EIS Appendix 10 provides a list of cooperating agencies and their authority/expertise (Table App10-2) and summarizes how input received from cooperating agencies has been incorporated into the EIS analysis. For a summary of the role of cooperating agencies in the NEPA process, please refer to 43 CFR Subsection 46.230 (https://www.law.cornell.edu/cfr/text/43/46.230): In accordance with 40 CFR 1501.6, throughout the development of an environmental document, the lead bureau will collaborate, to the fullest extent possible, with all cooperating agencies concerning those issues relating to their jurisdiction and special expertise. Cooperating agencies may, by agreement with the lead bureau, help to do the following: (a) identify issues to be addressed; (b) arrange for the collection and/or assembly of necessary resource, environmental, social, economic, and institutional data; (c) analyze data; (d) develop alternatives; (e) evaluate alternatives and estimate the effects of implementing each alternative; and (f) carry out any other task necessary for the development of the environmental analysis and documentation.
13008-13	Scott Hauser	Secondly, the use of the phrase "other Shoshone-Paiute groups" is vague and leaves potential for many Native American groups to be left out of this discussion. The Shoshone and Paiute people were very nomadic and traveled extensively throughout their home range, which included everything from southern Utah and Northern California to Canada and from Wyoming and Montana to the Pacific Coast. USRT feels there should be much more effort in reaching out to all Shoshone and Paiute tribes, people, and communities, as well as other Native American groups and communities that historically inhabited this area.	The Section 106 Consultation and Government-to-Government Tribal Consultation sections of draft EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers) summarize the BLM's outreach and consultation efforts with regard to Native American Tribes with ties to the project area. The BLM contacted the following Native American Tribes to provide information on the project and the Section 106 process and to inquire about engaging in future consultations: the Shoshone-Paiute Tribes of the Duck Valley Indian Reservation (Shoshone-Paiute Tribes), the Shoshone-Bannock Tribes of the Fort Hall Indian Reservation (Shoshone-Bannock Tribes), the Northwestern Band of the Shoshone Nation (Northwestern Band), the Nez Perce Tribe of Idaho, the Te-Moak Tribe of Western Shoshone including the Battle Mountain Band, the Elko Band, the South Fork Band, the Wells Band, and the Confederated Tribes of the Goshute Reservation. In summary, the BLM did reach out to additional Native American Tribes and not simply the Shoshone-Paiute in general. As noted within this context, the Shoshone-Paiute Tribes specifically refer to the Shoshone-Paiute Tribes of the Duck Valley Indian Reservation. Per EIS Appendix 10, the Shoshone-Paiute Tribes, the Shoshone-Bannock Tribes, and the Northwestern Band of the Shoshone Nation have chosen to consult with the BLM and participate in the Section 106 process, including development of the PA.
2826-1	Kelly Campbell	Oregon Physicians for Social Responsibility (PSR) requests to be a Consulting Party for section 106 compliance on the issue of the siting of Magic Valley Energy's Lava Ridge Wind Project. Guided by the values and expertise of healthcare and public health, Oregon PSR works to protect human life from the gravest threats to health and survival by striving to protect our climate, end the nuclear threat, promote peace, and advance justice. As the local affiliate of the International Physicians for the Prevention of Nuclear War and the International Campaign to Abolish Nuclear Weapons, Oregon PSR was honored to share in both the 1985 and 2017 Nobel Peace Prize for our work to educate about the dangers of nuclear weapons and nuclear war. As part of our educational work to prevent nuclear war, Oregon PSR works closely with the Japanese and Japanese-American communities in Oregon as well as other community partners to organize the annual commemoration of the bombing of Hiroshima and Nagasaki every year at the Japanese-American Historical Plaza in Portland, Oregon, drawing hundreds of participants. Our partners at the Portland Japanese American Citizens League and Japanese American Museum of Oregon have alerted us to their opposition to the siting of Magic Valley Energy's "Lava Ridge Wind Project" on the historic footprint of the Minidoka National Historic Site and where almost all 400 turbines would be visible to visitors. The Minidoka National Historic Site is where thousands of Oregon residents of Japanese ancestry were unjustly imprisoned during World War II, and the preservation of this historic site is important for all visitors to help us understand the chilling injustice, critical civil rights lessons, and to lift up the stories of the individuals forcibly removed and incarcerated there from 1942 to 1945. Part of the significance of the location that visitors still witness today is its remote and desolate location. We question whether the siting such a massive wind project where it is highly visible and detracting from the experience of this National Historic Site is appropriate. Oregon PSR is an organization that strongly supports a just transition to 100% clean energy, and has worked on many campaigns to do just that. We know that our clean energy future will necessarily include a significant commitment to wind power. However, key to this just transition is ensuring that historically marginalized communities have a say over where and how clean energy projects are sited, so as to not replicate the injustices of the past. We are writing to express our	The Cultural Resources section (Section 3.5) of the draft EIS, Section 3.5.2, provides background on the Minidoka WRC and Minidoka NHS, an assessment of project-related impacts under each action alternative, and a summary of Japanese American community concerns associated with the project. In the context of environmental justice, the interests and concerns of Japanese Americans within the analysis area are further described in EIS Section 3.6.1 (Environmental Justice Communities) and Section 3.6.1 of Appendix 9. The BLM and the Office of Collaborative Action and Dispute Resolution have implemented proactive approaches to solicit input on the EIS from members of the Japanese American community. These parties have also been included in Section 106 consultation, as described in the Section 106 Consultation section of EIS Appendix 10. See also EIS Section 3.5 and Section 3.6.1 (Environmental Justice Communities) for EIS analyses regarding potential project impacts to cultural resources and environmental justice communities. The BLM will consider the request of the PSR for consulting party status under Section 106 of the NHPA.

Comment ID	Commenter	Public Comment	Response to Comment
		concern that the siting of this project where it will detract from the experience of visitors to the Minidoka National Historic Site is not appropriate, and that instead, other sites where it will not have such a negative cultural and historical impact should be sought out. We urge you to listen to the comments of individuals and organizations connected to those who were incarcerated at Minidoka as you decide where to site this project. We appreciate the opportunity to submit comments on this project and look forward to being informed about next steps as a Consulting Party.	
3302-7	Susan Canham	Who decides that this project is "unlikely to cause, or contribute to, a trend toward listing under the ESA" for bees, beetles, etc., and what happens if it does?	The Pollinators and Insects section of the EIS (Section 3.11) provides analysis of project effects to pollinators (Section 3.11.1); the St. Anthony Sand Dune Tiger Beetle (Section 3.11.2), monarch butterfly (Section 3.11.3), and BLM special-status bumble bees (Section 3.11.4). The statement made regarding a trend toward listing under the ESA is made with regard to the St. Anthony sand dune tiger beetle, specifically (see Section 3.11.2 [St. Anthony Sand Dune Tiger Beetle]), and is based on the analysis of the results of the desktop assessment and field survey of potential habitat for St. Anthony sand dune tiger beetle in the analysis area. With applicant-committed measures and additional mitigation applicable to the St. Anthony sand dune tiger beetle (summarized in EIS Appendix 4), impacts to the St. Anthony sand dune tiger beetle would be largely minimized or avoided; if it is determined that complete avoidance is not feasible, compensatory mitigation measures (see Table App4-5 in EIS Appendix 4) may be required. With this minimization and avoidance in mind, in consideration of whether project effects on individual St. Anthony sand dune tiger beetles and suitable habitats would be irretrievable and irreversible, the draft EIS analysis indicates that although irretrievable, the effects would not be irreversible because the majority of existing tiger beetle habitat would be unaffected by the project, and because the small number of individuals that may be killed would not likely result in a trend toward federal listing under the ESA or a loss of population viability. As stated above, if it is determined that complete avoidance is not feasible, compensatory mitigation measures may be required. BLM considered the information presented in the baseline reports and developed appropriate mitigation measures (including pre-construction field verification surveys, complete avoidance of occupied habitat, minimization of effects in potential habitat and dispersal areas, and compensatory mitigation for residual impacts) that, when implemented, would ensure that no alternative results in a trend toward ESA-listing or loss of population viability.
3527-1	Diana Nielson	For some reason the BLM has failed many times to mention Option A. The Maps, RAC meetings, Sub RAC meetings and presentations I have been to have failed to show the Option A, No Build Option on their maps. This Opton A is only mentioned in our comment periods. The Friends of Minidoka, Shoshone Bannock Tribes and the grassroots group Stop Lava Ridge has recently brought this to the BLM's attention. As Part of the NEPA process the BLM has to work with the communities and Local Governments. So far the Commissioners of Jerome, Minidoka, Lincoln, Gooding, Twin Falls, and Camas Counties have signed Resolutions against Lava Ridge Wind Turbine Project. We have approached Blaine County Commissioners to also sign a resolution against Lava Ridge Wind Turbine Project. We need our State Government to stand up against Lava Ridge. We do not want our States Endowment Lands in Lava Ridge. The gentrification of Rural Idaho and its underserved populations is a violation of our way of life. I LOVE MY STATE OF IDAHO. KEEP IT WILD AND FREE. DO NOT SELL US OUT TO CAISO AND INVESTMENT CORPORATIONS!	See responses to comments 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement) and 9275-5 (see in Table A-3ee, Alternatives). See Consultation and Coordination in Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers) regarding parties involved in project consultation and coordination.
6900-1	Name Not Provided	The Section 106 consultations are not worth the effort of any person opposing the project. The Section 106 PA does not allow for consulting parties to oppose the project, have their dissent matter, and are virtually powerless in the decision-making process. Consulting parties should have been told up front that if they don't want the project, then their time is wasted in participating in numerous consultation meetings when the end result is going to be a selection of one of the action alternatives.	The regulations guiding the Section 106 process under the NHPA state that federal agencies are required to take into account the effects of their undertakings on historic properties and afford the ACHP a reasonable opportunity to comment on such undertakings. The procedures under the Section 106 regulations define how federal agencies meet these statutory responsibilities. The Section 106 process seeks to accommodate historic preservation concerns with the needs of federal undertakings through consultation among the agency official and other parties with an interest in the effects of the undertaking on historic properties, commencing at the early stages of project planning. The goal of consultation is to identify historic properties potentially affected by the undertaking, to assess its effects, and to seek ways to avoid, minimize, or mitigate any adverse effects on historic properties (see 36 CFR 800.1 [Purposes]). Pursuant to regulation, 36 CFR 800.2(c)(5), certain individuals and organizations with a demonstrated interest in the undertaking may participate as consulting parties due to the nature of their legal or economic relation to the undertaking or affected properties or their concern with the undertaking's effects on historic properties. Consulting party status entitles you to share your views, receive and review pertinent information, offer ideas, and consider possible solutions together with the federal agency and other consulting parties. It is not a forum for project opposition. See ACHP (2021). Failure to Resolve Adverse Effects (or "termination of consultation") under Section 106 does not constitute automatic cancellation of an undertaking/project or an inherent requirement to avoid adverse effects to historic properties. Throughout the NEPA process, the BLM is considering and addressing in the EIS, input received from cooperating agencies, consulting parties, government-to-government consultation with Tribes, Japanese American and Minidoka-connected communities, and the public. This input is considered in the BLM's alternatives development and decision-making (see the project scoping report available on the BLM project website: https://eplanning.blm.gov/eplanning-ui/project/2013782/510 [SWCA 2021]) and the BLM's

Comment ID	Commenter	Public Comment	Response to Comment
			consultation and coordination documentation in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers). Please note that the BLM's scoping and identification of a preferred alternative does not indicate that the BLM would authorize the project. The BLM's decision on the project would be reflected in their ROD. The BLM also contemplates public input received on the EIS, and during Section 106 review, the PA. If consulting parties or the public have concerns regarding an undertaking, its effects on historic properties, or associated analyses, they are encouraged to make these known by submitting them in writing to the lead agency for review and consideration. It is not uncommon for PAs to reflect views from consulting parties or the public who have expressed such concerns. The BLM timed revisions to the draft PA (EIS Appendix 8) to occur after the public comment period on the draft EIS ended, so that any public comments or consulting party comments received concerning cultural resources could be addressed as appropriate. Advisory Council on Historic Preservation (ACHP). 2021. *Protecting Historic Properties: A Citizen's Guide to Section 106 Review*. Available at: https://www.achp.gov/sites/default/files/documents/2021-01/CitizenGuide2021_011321.pdf. Accessed December 28, 2023.
9657-7	Saiyare Refaei	If there is not proper consultation and full approval from neighbors, local tribes and culturally significant sites that have been deemed historically significant then construction should not progress.	See responses to comments 6900-1 (see in Table A-3ff, Consultation and Coordination) and 12469-4 (see in Table A-3ff, Consultation and Coordination).

Cumulative Effects

Table A-3gg. Cumulative Effects

Comment ID	Commenter	Public Comment	Response to Comment
1042-7	WildLands Defense	There are MET towers now peppering BLM land areas north of Salmon Falls Dam, and another immense wind project very foreseeably looms there – with potential for a huge additional amount of killing migratory birds, bats, Golden Eagles and other wildlife over a whole other landscape, and killing large numbers of individuals as another big blow to local, regional and range-wide populations. How large does BLM estimate that project will be and with how many turbines? An equal or greater number – as Idaho is turned into a desolate energy exploitation zone to perpetuate Las Vegas sprawl.	The Salmon Falls Wind project was included in the RFFAs (Section 3.1.1 [Existing and Future Trends and Actions]) evaluated in the cumulative effects analysis.
10557-1	Robert Penney	Finally, although this is a stand-alone proposal it is only one of several similar projects being studied for the local area. As such, its approval would set a precedent for approval of the rest. While impact of any one proposal might not be tragic or permanent, approval of numerous similar local projects cannot help but change the future of local wildlife permanently and for the worse.	The cumulative effects of the project in combination with other RFFAs are described in Section 3.18.1.2.7 (Wildlife Movement [non-game mammals and reptiles], Cumulative Impacts) and Section 3.18.2.2.7 (Big Game Habitats and Populations, Cumulative Impacts).
11315-3	Karen Atkinson	Description of Impacts: Each of the Impacts descriptions for the Action Alternatives (B, C, D, and E) in Sections 3.6.2.2.2-5 and Cumulative Impacts Section (3.6.2.2.6) and associated tables do not describe the impacts on Alaska Natives.	Alaska Natives are part of the larger "Japanese American and Minidoka-Connected" dispersed environmental justice community. Section 3.6.1.1 (Dispersed Environmental Justice Populations) and Section 3.6.1 in EIS Appendix 9 has been revised to clarify that Alaska Natives are part of the larger Minidoka-connected community due to their connections with Minidoka NHS and WRC.
11326-1	Filip Camacho, Tasha Sorensen	Responsible energy development includes proper site selection and taking a hard look at the scale of proposed projects. The BLM needs to consider scale at the level of maximum impact. In the DEIS, the scale of multiple proposed renewable energy projects in this area should be included in a cumulative effects analysis. As the U.S. ramps up domestic production of energy resources, our land management agencies must think and act differently if we are to avoid the same mistakes of the past. For example, we are still cleaning up abandoned hard rock mines from over a century ago and struggling to just identify all the orphan and abandoned oil and gas wells across the U.S.—let alone plug and reclaim them. The Lava Ridge project is massive with proposed development upwards of over 300 square miles for this one project. In the DEIS, the BLM fails to address cumulative impacts of this project. Notably, the BLM should be required to address cumulative impacts from Tauraus Wind Project (and other proposed projects in the vicinity totaling over 200,000 acres in developments), located immediately northwest of the Lava Ridge Wind Project, and a project that would be similar in size and scale to the Lava Ridge Wind Project. The BLM must use the best available science and improved mapping technology to identify areas with minimal resource conflict and already disturbed areas that may be suitable for renewable energy development. Our remaining, intact public lands should not be carved up before exhausting all other options. Without fully analyzing all related activity and development, the BLM risks overlooking the direct, indirect, and cumulative impacts to fish and wildlife habitat, nearby communities, farms, ranches and cultural and Tribal resources.	Taurus Wind is included in the RFFAs evaluated in the EIS (Section 3.1.1 [Existing and Future Trends and Actions]).
11327-21	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	There is little that is currently in place that requires projects to avoid development in big game migration routes, winter range, and stopover areas. Even if the BLM chooses to select Alternative A, or "No Action," for Lava Ridge, there are very few mechanisms in place today that prevent the next proposal to come in behind it on the same landscape. There are many unique challenges and issues to Lava Ridge, but these issues are likely to	The BLM has developed mitigation specific to big game migration. This was added to final EIS Appendix 4 (Mitigation) and Section 3.18.2 (Big Game Habitats and Populations).

Comment ID	Commenter	Public Comment	Response to Comment
		spill over into other proposed renewable energy projects in our state. This is especially concerning as the BLM is currently working through applications for 11 solar, wind, and geothermal projects in the Twin Falls District alone. The DEIS notes that three solar energy facilities (by Invenergy and Longroad) and another another wind facility (Taurus Wind Project) are already proposed in the analysis area adjacent to the proposed Lava Ridge Wind Project. Many of the proposed project footprints overlap with big game winter range, mapped migration routes and stopover areas for pronghorn and mule deer, and important raptor and eagle habitat.	
11327-23	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	ii) Potential Continental-Scale Consequences The Draft EA fails to recognize that Golden Eagle fatalities in Idaho could have broader continental-scale population impacts. Given the value of the state for supporting breeding, wintering and migrating individuals, eagle fatalities at Lava Ridge could have far-reaching consequences. For an international example that holds powerful similarities to Golden Eagles in Idaho, researchers in Spain - which is the world's third largest wind-power producer after the United States and Germany - examined the population response of Egyptian vultures (a long-lived raptor that had the bulk of its breeding population in Spain) to wind farms35. They found that even "very low" reductions in survival associated with wind-farms strongly impacted the species' population viability. The authors note the extension of this research in the management of other imperiled, long-lived species, notably Golden Eagles. Numerous researchers have documented the effects of renewable energy projects extending far beyond the location of energy production to impact bird populations in distant regions across continental migration networks. In 2017, this was demonstrated with Golden Eagles killed at the Altamont Pass Wind Resource Area in California. Researchers used genetic and stable isotope data to show that the effects of local-scale wind-energy associated fatalities can have continental- scale consequences36. In the Conkling et al. (2022) research, eagle mortalities originated from both local and non-local subpopulations and vulnerability population-level effects occurred to both. Additionally, Domenech reported to the Wyoming Golden Eagle Working Group of results of his work to determine natal origins of eagles killed at Wyoming wind energy facilities37. Based on feather samples from 33 juvenile (n=11) and immature (n=22) Golden Eagles killed on five wind farms in Converse and Carbon Counties from 2017-2019, he found that 67% had natal origins significantly north of where they were recovered in Wyoming, indicating that the majority killed and collected were possibly migrants or long-distance dispersers. Additional work is being conducted by Dr. Katzner at the U.S. Geological Survey, who is working with a team of researchers to determine the range-wide demographic consequences of fatalities of Golden Eagles. Effective management of energy production is improved by an understanding of its consequences, locally, nationally, and globally. Given the loss of approximately 3 billion birds in North America since 197038 and the ecological/economic value of avian species, understanding and mitigating the many threats to bird populations is critical to make renewable-energy industry truly sustainable. Conkling et al. (2022) note in the closing paragraph of their publication, "In the case of renewable energy, decisions about facility siting, investment and development, as well as management and mitigation actions, will be most effective if they consider both local and non- local impacts to focal species, and if their demographic frame of reference extends to breeding, wintering or stopover habitat far from where the facility is located." We strongly encourage the BLM to explore the population-level consequences of the proposed project and all the potential mechanisms to minimize, mitigate, and reduce negative consequences of this project on broader populations as a whole. For this reason, we applaud these two options in Applicant-committed measureNumber 157, "Providing physical samples for the U.S. Geological Survey or other agencies interested in analyzing such samples" and "Providing funding for research or conservation efforts to be implemented for the benefit of impacted species", as both will advance collective knowledge and improve future management efforts.	See response to comment 10442-7 (see in Table A-3d, Eagles).
11353-2	Don Wind, Dave Price; Oregon-California Trails Association	Page 3-1, Section 3.1.1, Existing and Future Trends and Actions Page 3-3, Figure 3.1-1, Existing and future trends and actions near the siting corridors Page 3-186, Section 3.5.6.2.6, Cumulative Impacts Cumulative impacts to the Oregon Trail in Idaho and the California Trail in Nevada are multiplied by transmission lines and other infrastructure needed to deliver power generated by the Lava Ridge Wind Project (LRWP). The project causing the greatest adverse effects to these Trails is the Southwest Intertie Project – North (SWIP-North). This 500 KV transmission line crosses the Oregon Trail near Twin Falls, and also crosses the California Trail, the Pony Express Trail, and Hastings Cutoff in Nevada, ruining the viewshed in those pristine areas and having potentially significant physical impacts to the Trails themselves. SWIP-North has been proposed as the primary transmission line project for the delivery of LRWP electricity to Ely and markets in southern California. The LRWP is dependent on the SWIP-North transmission line to deliver generated power to proposed customers. This EIS lacks a thorough explanation of cumulative impacts caused by separate projects, but projects that are dependent on each other for their value and purpose. OCTA finds that treatment of the cumulative impacts of SWIP-North as necessary ancillary infrastructure is sorely lacking in this draft EIS and needs to be addressed in a more thorough and detailed way. Unfortunately, other energy projects proposed for south-central Idaho will also have additional cumulative effects on the Oregon and California Trails in Idaho. Other projects contributing cumulative impacts to the Trails include the Taurus Wind Project, the Salmon Falls Wind Project, and the Gateway West Transmission Line. While the EIS lists these projects as contributing to additional impacts to cultural resources in the area, it lacks a thorough explanation of cumulative impacts to the Oregon and California Trails in Idaho. The BLM should place a greater emphasis in this EIS on the impacts of cumulative effects of the multiple energy and energy infrastructure projects proposed for this area. To focus on each project individually, while ignoring the cumulative effects of at least five energy and energy infrastructure projects in relatively close proximity to one another, will produce adverse impacts in the field never recognized with each new proposed project. This EIS lacks the specificity of cumulative effects and what is to be done to address these effects. This EIS does not address how the cumulative adverse effects are going to be avoided	The projects listed by the commenter are evaluated in the cumulative effects analyses of the EIS. The SWIP-North project has already been authorized and although the Lava Ridge Wind project could tie into SWIP-North, SWIP-North is not a "connected action" because the Lava Ridge Wind project could also tie into the Midpoint substation. Impacts to the Oregon Trail and its various components (e.g., Milner Ruts) are specifically analyzed between each action alternative in EIS Section 3.5 (Cultural Resources). This includes consideration of cumulative impacts. Where project action alternatives would have visual impacts on the Oregon Trail, per the EIS, then cumulative impacts from the project would occur in combination with the visual impacts of other existing and reasonably foreseeable projects (e.g., the Salmon Falls Wind Project in relation to Milner Ruts). Please note that Milner Ruts were the location where KOP 4 was placed to help consider the visual impacts to the Oregon Trail; however, as stated in the EIS (Section 3.5), Oregon Trail analyses rely on the field-verified trail segments within the project viewshed in the non-physical APE for each action alternative.

Comment ID	Commenter	Public Comment	Response to Comment
		or minimized. This EIS does not address how the cumulative effects of multiple projects will affect the decision-making process for the LRWP.	
11491-3	Dean Dimond, Jennie Bateman	The Purpose and Need for this Wind Project is treated as stand-alone with no measurable impact to meet unidentified energy shortfalls from existing projects. In other words, to add a ROW of this size to BLM lands, we must be aware of what role this additional electric generating project will play in meeting the needs of the Nation's power grid and other energy needs to address cumulative effects and the actual environmental effects pursuant to the NEPA.	See response to comment 12307-2 (see in Table A-3ll. Purpose and Need).
11491-6	Dean Dimond, Jennie Bateman	No information generated in this document indicates a full interdisciplinary analysis of even the separate areas of concern identified as to their cumulative impacts to the project area and upon the people living in the immediate area and to the American people.	As per 40 CFR 1502.2, EISs shall not be encyclopedic. The RFFAs in the project area for which information is publicly available are described in Section 3.1.1 (Existing and Future Trends and Actions) and evaluated in the cumulative impacts analysis for the resources analyzed in detail in the EIS.
11491-24	Dean Dimond, Jennie Bateman	28. A full disclosure of impacts of other wind projects in the USA as to bat, insect, bird and other fatality and injury numbers,	See responses to comments 11808-4, 12982-17, and 11534-22 (see all in Table A-3gg, Cumulative Effects). Cumulative impacts to pollinators and other insects are disclosed in EIS Section 3.11 (Pollinators and Insects).
11514-2	Judy Ruprecht	Cumulative impacts are those that result from the collective effects of multiple projects across the landscape. Each project has an individual impact on the environment, but the cumulative effects of multiple projects have the potential to be greater than the sum of the individual projects alone. Very little is known about the cumulative effects of multiple large scale projects. We cannot ignore the accelerated rate at which renewable projects are being proposed across the state.	See response to comment 12982-17 (see in Table A-3gg, Cumulative Effects).
11518-3	Karen Steenhof	Furthermore, Lava Ridge is not the only wind project planned for the immediate area. It is essential that BLM evaluate the cumulative effects of all proposed projects before any individual projects are authorized.	The RFFAs in the project area for which information is publicly available are described in Section 3.1.1 (Existing and Future Trends and Actions) and evaluated in the cumulative impacts analysis for the resources analyzed in detail in the EIS.
11523-1	Janice Simpkin	* There is no statewide/regional plan to assess cumulative effects of land uses. Developing a comprehensive plan would provide a tool for land managers to site projects appropriately to minimize damage. Such a plan should consider, in part, the following: o impacts on wildlife (especially birds, bats, and migratory mammals) o Community impacts that include housing, transportation, and equity o Equitable electricity distribution to local communities	The BLM is preparing a programmatic EIS for wind and solar energy that will address the issues mentioned in the comment. Although it will not be ready before publication of the Lava Ridge Wind EIS, the Lava Ridge project is being considered in the programmatic EIS.
11534-21	Matt Arnold, William Eubanks	Arbitrary Analytical Limits Render the DEIS's Cumulative Impact Analyses Useless for Informing the Public and Decisionmakers In conducting an analysis of the Project's environmental "effects," NEPA obligates BLM to evaluate "cumulative effects," which the Act's implementing regulations define as "effects on the environment that result from the incremental effects of the action when added to the effects of other past, present, and reasonably foreseeable actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions." 40 C.F.R. §§ 1508.1(g)(3), 1502.16(a)(2). As indicated above, "[a] proper consideration of the cumulative impacts of a project requires 'some quantified or detailed information; . . . [g]eneral statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided.'" Klamath–Siskiyou Wildlands Ctr. v. Bureau of Land Mgmt., 387 F.3d 989, 993-94 (9th Cir. 2004) (quoting Ocean Advocates, 361 F.3d at 1128). This analysis "must be more than perfunctory; it must provide a useful analysis of the cumulative impacts of past, present, and future projects." Id. at 994. The DEIS's cumulative impact analyses do not pass muster under this test. As a threshold issue, BLM inexplicably limits the scope of its cumulative impacts analyses to other anticipated wind-energy projects; in other words, BLM ignores the effects of other built or planned projects in the analysis areas. Compare DEIS at 3-55–56 (Project's cumulative effects on bats), and id. at 3-100 (eagles), with id. at 3-115 ("Three solar energy facilities . . . are proposed in the analysis area adjacent to the Lava Ridge Wind Project."). However, BLM never explains why it excluded from its analysis other fatality sources that presently or will occur in the area. This is a troubling oversight since these alternative kinds of energy projects also entail significant sources of mortality for bird and bat species. See, e.g., K. Shawn Smallwood, Utility-scale Solar Impacts to Volant Wildlife, J. WILDLIFE MGMT., May 2022, at 1-2 (finding that fatalities/MW/year "averaged 11.61 birds and 0.06 bats at [photovoltaic panel] projects and 64.61 birds and 5.49 bats at solar thermal projects," totals which "consistently exceeded those reported").17 BLM's failure to analyze the expected impact of these projects alongside its current proposal, therefore, arbitrarily understates the full extent of the Project's impacts. This must be corrected in order to satisfy the agency's NEPA obligations.	The EIS accounts for past and present projects and trends in the Affected Environment sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how RFFAs and trends would exacerbate or compound the effects of the project on the environmental baseline. EIS Section 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts) and EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts), provide a quantitative analysis of both mortality from existing wind facilities within the analysis area, as well as reasonably foreseeable future wind projects. Other sources of mortality are discussed qualitatively because there is insufficient data to quantify all possible cumulative sources of mortality for birds and bats within the analysis area, and because the issue evaluated in the EIS is specific to the effect that turbines would have on avian and bat populations. Even if other sources of mortality could be precisely quantified, there is insufficient data on the current population sizes and trends to perform a quantitative analysis for most avian and bat species. Both EIS Section 3.3.1.2.7 and 3.3.2.2.7 disclose the potential for the cumulative effects to result in the decline of some populations of birds and bats. As noted in these sections, fatalities from turbine collisions represent a relatively small proportion of overall avian fatalities from anthropogenic sources and are not a major threat to most avian species, while for bats, turbine collisions are a major source of mortality for many species (especially migratory tree bats) and their populations may be threatened by the continued development of wind energy if sufficient measures are not implemented to minimize or avoid these fatalities. Since the project's contribution to cumulative effects to avian and bat species is proportionate to the generation capacity of each alternative, the cumulative effects analyses for avian and bat species use the percentage increase in existing wind generation capacity within their respective analysis areas as quantitative estimate of each alternative's relative contribution to cumulative effects from fatalities due to turbine collisions. The RFFAs described for greater sage-grouse (at draft EIS 3-115) in EIS Section 3.3.4.1.4 (Greater Sage-Grouse, Existing and Future Trends and Actions) differs from those presented for bats (at draft EIS 3-55) in EIS Section 3.3.1.1.3 (Bat Populations and Roosting Habitat, Existing and Future Trends and Actions) and eagles (at draft EIS 3-100) in EIS Section 3.3.3.1.1 (Eagles, Existing and Future Trends and Actions) because each of these resources has a different analysis area specific to that impact analysis.
11534-22	Matt Arnold, William Eubanks	the DEIS's limited discussion of wind-project-driven cumulative impacts is insufficient. With respect to bats, for instance, the DEIS concludes that "the cumulative impacts of numerous facilities with high fatality rates across the landscape could compound the impacts on bat populations." DEIS at 3-43; see also id. at 3-56 (explaining that the Project "would contribute to additional turbine collisions that could lead to declines in bat populations in the analysis area over the next 30 years," even "if fatality rates were relatively low"). According to BLM, a more fulsome analysis "is impossible" because it "would depend on several site-specific variables at each project location, the number and size of turbines that would be used, and the implementation and effectiveness of mitigation measures to reduce impacts to bats." Id. at 3-43. The problem with BLM's claimed inability to assess	See responses to comments 11808-4 and 12982-17 (see both in Table A-3gg, Cumulative Effects). For birds and bats, wind projects are a substantial source of mortality, and the EIS discloses that wind projects alone could result in significant effects to bird and bat populations. Section 3.3.1.2.7 (Cumulative Impacts) discloses that impacts of the project in combination with the RFFAs would be significant.

Comment ID	Commenter	Public Comment	Response to Comment
		the impacts of other proposed wind- energy facilities is that the same limitations ostensibly apply to its analysis of this Project. Indeed, the same "site-specific variables"—such as the number and size of the turbines that will be used, and the implementation and effectiveness of mitigation measures—remain undefined for this Project in the DEIS. See DEIS at 3-8 ("[T]he exact location of project components is not yet known . . ."); id. at 2-2 ("The project's final design and engineering would be completed after the BLM has issued a record of decision (ROD) and would be informed by applicant-committed measures and other mitigation requirements established in the ROD."); id. at 3-57 ("Final residual impacts and compensatory mitigation will be described in the final EIS after public comments are considered."). BLM, however, never explains why the guesswork that supports its DEIS analysis for this Project cannot be used to examine the cumulative impact of these forthcoming projects. Instead, it merely regurgitates the conclusions of its alternatives analysis by listing which alternatives may contribute the most impacts relative to one another. See DEIS at 3-56 (ordering Alternatives C–E according to their "proportional contribution to wind capacity in the analysis area"). Of course, this restatement does not provide "a useful analysis of the cumulative impacts of past, present, and future projects" because it fails to inform the public whether the "total impact from [these] actions [are] greater than the sum of the[ir] parts." Klamath–Siskiyou Wildlands Ctr., 387 F.3d at 994. For these reasons, the DEIS's cumulative impacts analysis is deficient and must be corrected before this Project moves forward.18	
11534-23	Matt Arnold, William Eubanks	The DEIS does, however, use "federal and state renewable energy mandates" to downplay the reduced cumulative effects that would be associated with approving a smaller version of the Project. See DEIS at 3-87 ("[A]lternatives that substantially reduce the generation capacity of the Lava Ridge Wind Project may result in additional wind energy projects being constructed elsewhere within [the avian analysis area] in order to meet federal and state renewable energy mandates, which could result in a similar level of cumulative impacts across all the action alternatives."); see also id. (reasoning that smaller versions of the Project might actually "result in greater impacts to avian populations").	The draft EIS discloses that additional wind projects could be constructed, and Section 3.1.1 (Existing and Future Trends and Actions) discloses that specific projects have already begun the planning and permitting stage.
11535-153	Steven Andersen	Multiple wind farms are in development in south Idaho. The EIS should display maps showing the wind farms (both on private and public lands) along with the Lava Ridge proposal to show the separate and cumulative adverse visual impacts upon historic properties, sites, and districts listed or eligible for listing in the National Register or Historic Places. This is particularly important when considering the potential impacts of pending renewable energy applications in the area as depicted in the BLM's map below:	Figure 3.1.1 and Figure 3.16.3 provide the locations of the RFFAs analyzed in the EIS, including other wind projects.
11535-154	Steven Andersen	The cumulative effects analysis in the DEIS is inadequate and fails to account for necessary past, present and future foreseeable projects and how this project will incrementally contribute to impacts in the area. Given the sensitivity of the area combined with the inundation of recent and foreseeable projects, the cumulative effects analysis should have been robust. The proposed project will interact with many others to affect lands and wildlife in the project area and throughout the west – including avian and bat populations, aquatic systems, human perturbations, including irrigated agriculture, wildfires, livestock grazing, road networks, native species and ecosystem function --- this all must be thoughtfully analyzed.	The EIS accounts for past and present projects and trends in the Affected Environment sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how RFFAs and trends would exacerbate or compound the effects of the project on the environmental baseline.
11535-155	Steven Andersen	Additionally, given the area of the proposed project, the agency must look carefully at the cumulative impacts to cultural resources including archaeological and cultural resources. The area has tribal and historical significance, including the Minidoka National Historic Site. A comprehensive study of cumulative impacts, including a field inventory of the area to be subjected to inundation and surface disturbance should have been undertaken by a qualified archaeologist, and a full analysis of cumulative impacts presented for each alternative, taking into account: foreseeable energy projects based on pending renewable energy applications; the Gateway West transmission lines (running east to west north and south of Lava Ridge); the two WEC transmission lines (running east west and north south); and SWIP North.	Cumulative impacts to the cultural resources are specifically analyzed between each action alternative in EIS Section 3.5 (Cultural Resources). This includes consideration of reasonably foreseeable projects including other wind generation and transmission line projects. As stated in the Introduction, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision-making. As such, the EIS provides sufficient information to understand the basis for that decision-making and is not intended to provide extensive or exhaustive detail, or to include additional new studies such as intensive field survey. The BLM is developing a PA to complete the Section 106 process, which would include additional cultural resources identification efforts (e.g., field survey) prior to construction beginning on the project and the also would require the resolution of adverse effects to historic properties (including cumulative adverse effects) under HPMPs. For more detail, refer to the draft PA (EIS Appendix 8 [Cultural Resources Programmatic Agreement]), which is a working document subject to revisions deemed necessary to address public concerns per public and consulting party comments.
11535-156	Steven Andersen	In the Final Environmental Assessments and Proposed Land Use Plan Amendments for Idaho sections of Gateway West, it was specifically contemplated that "construction … could lead to the establishment of a corridor in which other lines may be installed in the future. There is a potential that cumulative impacts to the visual settings for some cultural resources would occur due to the establishment of a corridor and the subsequent construction of additional transmission lines." As aptly noted in the B2H final EIS and Proposed LUP Amendments, "The B2H Project, in combination with proposed wind facilities and the B2H Project would result in relatively high cumulative impacts." The DEIS should be analyzed in conjunction with pending projects and known transmission lines in the area to evaluate certain key cumulative effects. There is no thoughtful analysis in the DEIS or discussion of how the proposed project would combine with these past, present and reasonably foreseeable future actions to contribute to cumulative impacts on a broad range of environmental resources including historic cultural resources, including critical viewsheds, and effects on EJ populations, wildfires, socioeconomics, habitat, air and the ecosystem. There are only brief references to other alternative energy projects in the area and alignment with existing transmission lines. The FEIS fails to enumerate the environmental effects of other projects or consider the interaction of multiple activities, which is required under a cumulative effects analysis.	The EIS accounts for past and present projects and trends in the Affected Environment sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how RFFAs and trends would exacerbate or compound the effects of the project on the environmental baseline.

Comment ID	Commenter	Public Comment	Response to Comment
11598-32	Idaho Conservation League	Lessons learned from existing projects There are a myriad of existing wind and solar projects on private properties in Idaho. The lessons learned from these projects can help inform the location and design of Lava Ridge and other projects. The BLM and our State partners should be taking a comprehensive look at the issues related to these projects, particularly to see if they functioned as intended and if the impacts were as anticipated.	In preparation of the EIS, the BLM reviewed the U.S. Wind Turbine database (Hoen et. al. 2018; updated as recently as May 2023), including summarizing in Section 3.1 (Introduction and Methodology) the number of turbines within 30 miles of the project. The avian and bat cumulative analyses additionally evaluated numbers of turbines within bird conservation Region 9 and for bats the North American Desert Level 1 ecoregion. Where data were available/applicable for both avian and bat species from other facilities in the United States and Idaho, these were used within those EIS analyses to estimate fatalities from the project. Scoping, public comments on the draft EIS, and prior wind projects were used to inform the issues analyzed in detail and in brief within this EIS. Where information was publicly available or provided by MVE or cooperating agencies, the BLM evaluated these information in the EIS.
11603-2	Sheri Freemuth	ollowing my review of this particularly complex document, I submit that the BLM neglected to perform an adequate cumulative impact analysis. In particular, I did not find a clear presentation of past, present and reasonably foreseeable actions. Specifically the following actions are not adequately described or are missing: references to infrastructure related programs, local airport improvements/plans, the CAFE program and other agricultural endeavors, updated comprehensive and local transportation plans, modifications to urban and rural development patterns (past, present and future), within a broad area. Furthermore, the analysis of cumulative impacts is segmented by resource, when in fact the intent is to consider the impacts holistically, across disciplines. In this geographic area a variety of agencies, jurisdictions, and private entities and industries coexist; were their future plans adequately considered? The Minidoka NHS has already been challenged once by a proposed adjacent Confined Animal Feeding Operation on adjacent private land; what would be the cumulative impact to the visitor experience of a nationally significant resource, and visitor attraction, if a CAFO (routinely permitted in Jerome County) were to occur in combination with Lava Ridge? In short, did the EIS preparers include the use of trends information, interagency plans, and private development potential within the region to determine the combined effects of past, present, and future actions across the full and spectrum of NEPA resources?	The EIS accounts for past and present projects and trends in the Affected Environment sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how RFFAs and trends would exacerbate or compound the effects of the project on the environmental baseline. RFFAs are defined and described in Section 3.1.1 (Existing and Future Trends and Actions). All of the RFFAs that meet this definition and for which information is publicly available are described in this section and considered in the analysis. No CAROs are reasonably foreseeable.
11618-1	Bif Brigman	Why are you not addressing issues of the cumulative impacts from this and other projects? Why do you allow this shady and biased business of these billion dollar for profit companies not having to address any of the TOTAL impacts from their projects like they aren't connected to each other?	The EIS accounts for past and present projects and trends in the Affected Environment sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how RFFAs and trends would exacerbate or compound the effects of the project on the environmental baseline.
11667-9	Alisa Bowman	Concern: Damage to the ecology The land would be disturbed by hundreds of miles of roads, dust pollution, and the cumulative destructive activity for the construction of these machines.	The effects of roads and dust on various biological resources are described in Sections 3.3 (Avian and Bat), 3.11.1 (Pollinators), 3.13.1 (Soils), 3.15.1 (Native Upland Vegetation Communities), 3.17 (Water and Wetland Resources), and 3.18 (Wildlife). Cumulative effects are described in the Cumulative Impacts sections of those resource chapters.
11687-2	Robert Nielson, Diana Nielson	How many 500KV lines can fit on the ROW across BLM land and Private lands? What about the Minidoka National Historical Sites view? And Private land owners that do not want 3 transmission lines across their property? If all 3 will fit they will open the door wider for more Green Energy Projects on private and public land due to the electric transmission lines in Idaho are deregulated. If a transmission line has the capacity for more Electricity than it is carrying, it can not refuse the of wheeling of power from other providers. The public lands are to be multi use, not for abuse and destruction of open spaces necessary for the sustainability of wildlife, recreation and protein source production from grazing and hunting.	Transmission lines and electrical infrastructure are sited to minimize impacts and thus are typically required to first use areas that are already impacted rather than develop land without any disturbance. Thus, multiple lines may run in the same corridor. See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
11740-4	Logan Dimond	negative effects that need to be considered and addressed. These may include impacts on wildlife, visual and noise impacts on local communities, potential impacts on human health, changes to local economies and communities, and concerns about manufacturing and disposal processes. It is essential to carefully plan and manage wind energy projects, taking into account their negative effects. Additionally, ongoing research and monitoring are needed to better understand the negative impacts of windmills.	The effects of the project on wildlife are described in Section 3.18 (Wildlife), on visual resources in Section 3.16 (Visual Resources), on noise in the various resource sections where there would be sensitive receptors, on human health in EIS Appendix 3 (Issues Analyzed in Brief), and on local economies in Sections 3.6.2 (Community Services, Employment, and Housing Availability), 3.6.3 (Local and Regional Economy), and 3.9.1 (Grazing Allotments and Range Socioeconomics). Waste is addressed in EIS Appendix 3.
11808-4	Jon Ochi	One of the requirements of the National Environmental Policy Act (NEPA) is the requirement to consider the cumulative impacts of a proposed action the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non- Federal) or person undertakes such other actions (40 CFR ~ 1508.7). An obvious cumulative effect would be other similar projects in the vicinity of the project being studied. Here are projects in the immediate (with 30 miles) vicinity of LRWP: Other Wind Projects: 1. Taurus Wind: 1500 MW, located immediately west of LRWP 2. Salmon Falls Wind: 800 MW, located 30 miles south of LRWP Other Solar Projects: 1. Invenergy Gem Vale Facility: 500 MW (guesstimate based on 3,500 acre footprint, located east of US 93, just north of the Midpoint Substation and south of Shoshone, Idaho 2. Two Longroad Energy Facilities: 1000 MW combined produced by the two facilities, located east of US 93 just south of the Midpoint Substation and north of Twin Falls [...] It is possible that losses of bats from LRWP may not trigger Endangered Species Act (ESA) protections. But under the doctrine of cumulative effects, the ESA protections would be much more likely to be triggered if there are three wind projects and three solar projects all within 30 miles proximity. Maximum avian mortalities from three wind projects are projected to be 30,000 to 51,000 mortalities per year. The additional deaths from the three solar projects cannot be determined with currently available	The wind and solar projects referenced in the comment are described in EIS Section 3.1.1 (Existing and Future Trends and Actions) and analyzed in the Cumulative Impacts sections in EIS Chapter 3 (Affected Environment and Impacts) as appropriate. There are no ESA-listed bats or other ESA-listed species that occur in the siting corridors. Section 7 consultation would be required if any bats (other species occurring in the siting corridors) become listed in the future. NEPA documents must disclose cumulative effects, but there is no requirement that similar but independent projects be grouped together in a single NEPA document.

Comment ID	Commenter	Public Comment	Response to Comment
		studies. In a similar fashion, more damage to ecosystems will occur with the addition of three more wind projects and three more solar projects as being “reasonably foreseeable future actions.” According to NEPA law, it is unacceptable to treat each project as a discrete, unconnected event. The doctrine of cumulative effects was intended to counteract case by case actions. In NEPA law one must consider that cutting one tree at a time still results in the loss of the forest.	
11978-4	Magic Valley Energy, LLC	Section 3.1.1 – Existing and Future Trends and Actions 5. MVE Comment: As stated in the DEIS: “the existing and future trends and actions should include reasonably foreseeably actions that have existing decisions, funding, formal proposals, or are highly probable.” To this extent, the FEIS should include in the analysis the potential for reasonably foreseeable private land actions in the analysis area that could have cumulative impacts. This notion should be applied globally throughout the ‘existing and future trends and actions’ sections of the FEIS. For instance, Section 3.8.1.1.6 (Land Use and Realty) should include foreseeable actions of adjacent landowners tying into electrical infrastructure through privately owned wind turbines. Similarly, Section 3.16 (Visual Resources) includes subsections, such as shadow flicker in Section 3.16.3.2.6, where the cumulative impacts should evaluate the possibility of private landowners tying into electrical infrastructure if landowners desire to do so. The current language in Section 3.16.3.2.6 could be read as contradictory to this possibility.	Information about private land actions are typically not publicly available. This was clarified in EIS Section 3.1.1 (Existing and Future Trends and Actions).
11978-5	Magic Valley Energy, LLC	Chapter 3 Section 3.1.1 – Existing and Future Trends and Actions ... MVE Comment: The FEIS should follow the Council on Environmental Quality (CEQ) regulation- based terminology for a more cohesive document. For example, the DEIS introduces the notion of “trends” where that word is not used in the regulatory definition of effects or impacts. Further, Section 3.1 states impacts are “reasonable changes to the affected environment” where it should say “reasonably foreseeable changes to the affected environment” to be consistent with the definition of impacts in CEQ’s regulations (40 C.F.R. § 1608.1(g)).	Assumed the commenter was referring to the 40 CFR 1508.1(g)(3) definition for cumulative effects. In the current and proposed CEQ NEPA Implementing Regulations (as of July 2023), 40 CFR 1502.15(a) and (b) require evaluation of “reasonably foreseeable environmental trends and planned actions in the area”; this EIS follows these regulations. Also see response to comment 12976-15 (see in Table A-3gg, Cumulative Effects).
11979-1	Louisa Gauger	One last thing, we are aware that there are 3 other projects waiting in the wings to be presented if this one is approved. Personally speaking, I do not want to live in a forest of wind farms, that will destroy not only our land, it detrimentally affects human health as well.	Reasonably foreseeable wind and solar projects in the area are listed in Section 3.1.1 (Existing and Future Trends and Actions) and analyzed in the EIS.
12307-3	Dean Dimond	No information generated in this document indicates a full interdisciplinary analysis of even the separate areas of concern identified as to their cumulative impacts to the project area and upon the people living in the immediate area and to the American people. This is a deficiency that only a Supplemental draft EIS can possibly address.	See response to comment 11491-6 (see in Table A-3gg, Cumulative Effects).
12307-7	Dean Dimond	- In February of 2023, the BLM sent out letters to counties and others in five states regarding the expansion of the Western Solar Plan. This programmatic EIS will expand their Solar Plan in those five additional western states. With the obvious lack of cumulative impact analysis of existing energy resource development and the addition of solar projects, this Lava Ridge DEIS is premature. The Western Solar Plan will require a cumulative effects analysis of both solar and wind projects on federal BLM lands. Without this Programmatic EIS completed for solar and with only 2 more years before a new programmatic EIS is required for BLM Wind Development Planning (per this Lava Ridge DEIS), the Lava Ridge Project Supplemental EIS will need to be tabled until the Western Solar Plan NEPA is completed. The information contained in the BLM Wind Plan is not current and expires in 2025. The “NO ACTION” alternative for the Lava Ridge Wind Project must be chosen until the BLM can coordinate their planning efforts for their Western Solar Plan with the Wind Plan for both effective and efficient transparent planning, public involvement, county, state and tribal and NEPA on federal lands.	The BLM is preparing a programmatic EIS for wind and solar energy that will address cumulative impacts. Although it will not be ready before publication of the Lava Ridge Wind Project EIS, the project is being considered in the programmatic EIS.
12455-2	Diana Nielson	The easements for SWIP Line North have not been completed at this time. The approval of Lava Ridge would be putting the cart before the horse without the means for the power to be delivered to California Independent System Operator aka CAISO. If Lava Ridge is to be approved and not able to start construction, they will need to stockpile supplies needed to qualify by the deadline for the Tax Incentives that have been increased and dates extended. One of the issues is not all of the ROW easements are approved across private land. Another issue is the transmission line from Cedar Hill to Midpoint is part of the Gateway West Segment. Who has been approved for this BLM easement shared with Idaho Power? Is CAISO aware of this? If push comes to shove who will be dominate over the ROW. Today I watched a presentation from Idaho Power, Rocky Mountain Power and PacifiCorp in a Jerome County Planners Meeting. How many 500KV lines can fit on the ROW across BLM land and Private lands? What about the Minidoka National Historical Sites view? And Private land owners that do not want 3 transmission lines across their property? If all 3 will fit they will open the door wider for more Green Energy Projects on private and public land due to the electric transmission lines in Idaho are deregulated. If a transmission line has the capacity for more Electricity than it is carrying, it can not refuse the of wheeling of power from other providers.	See response to comment 11687-2 (see in Table A-3gg, Cumulative Effects). See Section 3.16 (Visual Resources) for disclosure of potential visual resources impacts from the project.
12476-2	Rebecca Kenison	In addition, other projects are being planned in the vicinity of Minidoka. DEIS does not address the cumulative effects of those other planned projects. There are other options for placement of the Lava Ridge project. The need for this project in this location has not been established	Other reasonably foreseeable projects in the project area for which information is publicly available are described in Section 3.1.1 (Existing and Future Trends and Actions), and evaluated throughout the EIS in the Cumulative Impacts sections. BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM’s purpose and need for action arises from the BLM’s responsibility under FLPMA to respond to a ROW application requesting authorized use

Comment ID	Commenter	Public Comment	Response to Comment
			of public lands for a specific type of renewable energy development. Technical and economic feasibility of wind energy projects require meeting the correct combination of core siting requirements.
12859-46	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Failure to conduct inventory and monitoring. BLM did not comply with its own guidance to conduct inventories and monitoring to identify trends and emerging issues during plan evaluations that are supposed to occur every five years.273 As noted in the BLM Instruction Memorandum 2023-013: BLM state offices should ensure that inventories used to obtain information and data on the relevance and importance of values, resources, systems or processes, and natural hazards (MS- 1613.21(B)) are kept current consistent with section 201(a) of FLPMA “so as to reflect changes in conditions and to identify new and emerging resource and other values” (43 USC 1711(a)). Inventories and subsequent monitoring should be performed and updated on intervals appropriate to the resource value sensitivity to ensure data are available to identify trends and emerging issues during the plan evaluations that occur every 5 years (43 CFR 1610.4-9; MS-1613.63; Handbook- 1601-1, Land Use Planning, rel. 1-1693)	The BLM is responding to an application for a wind generation facility. Since March 2022, the BLM Idaho has been systematically completing LUP evaluations by district. LUP evaluations for the Twin Falls District are currently underway in accordance with 43 CFR 1610.4-9, with expected completion in the first quarter of 2024. Additional information about Idaho BLM LUP status can be obtained here: https://www.blm.gov/programs/planning-and-nepa/plans-in-development/idaho.
12934-6	Rob Thornberry; Theodore Roosevelt Conservation Partnership	Consider cumulative effects to private land owners. Although the DEIS outlines the project’s clear threat of habitat fragmentation to the long-term viability of pronghorn in analysis area, it does not consider the potential effects of displacing pronghorn to the private ground of nearby agricultural producers. Idaho political officials have a history of solving depredation concerns by forcing IDFG to thin pronghorn populations, and the TRCP is concerned that habitat loss in the area, combined with unfriendly depredation politics, could further damage the area’s pronghorn population. The TRCP encourages the BLM to consider the ramifications of wind power development moving pronghorn from finite winter habitat and pushing them on nearby private ground.	See response to comment 13006-18 (see in Table A-3aa, Wildlife, including Big Game).
12976-15	James Komadina	E. Direct and Indirect Effects As discussed in Section IV(A), agencies generally should quantify all reasonably foreseeable emissions associated with a proposed action and reasonable alternatives (as well as the no-action alternative). Quantification should include the reasonably foreseeable direct and indirect GHG emissions of their proposed actions. Agencies also should disclose the information and any assumptions used in the analysis and explain any uncertainty. In assessing a proposed action's, and reasonable alternatives', reasonably foreseeable direct and indirect GHG emissions, the agency should use the best available information. As with any NEPA review, the rule of reason should guide the agency's analysis and the level of effort can be proportionate to the scale of the net GHG effects and whether net effects are positive or negative, with actions resulting in very few or an overall reduction in GHG emissions generally requiring less detailed analysis than actions with large emissions." b. Throughout the DEIS, numerous other renewable energy projects are described. Specifically on page 3-6 these are: i. "The BLM Twin Falls District Office has received additional ROW applications for other wind and solar development projects. One of the proposed projects, Taurus Wind, would be immediately west of Lava Ridge (potentially within 1 mile) and be of a similar size and scale (1,500 MW). Another proposed wind project, Salmon Falls Wind (800 MW), would be located approximately 30 miles south of Lava Ridge. Three solar facilities are also proposed adjacent to the siting corridors. The Invenergy Gem Vale facility would cover approximately 3,500 acres on the east side of U.S. 93, just north of the Midpoint Substation. Two Longroad Energy facilities would cover a total of 6,800 acres (producing roughly a combined 1,000 MW)just east ofU.S. 93 and south of(connecting to) the Midpoint Substation." 11. The spatial relationship of several projects to this DEIS are depicted in Figure 3.5-2. 111. The socio-economic study, Black, G., and S. Peterson. 2020. Econonuc and Fiscal Impacts Report: Two Proposed Southern Idaho Wind/arms and the SWIP-North Transnussion Line in Southern Idaho and Eastern Nevada, discloses numerous projects to be constructed in Idaho and Nevada linked with the Lava Ridge Project. 1v. The DEIS concludes the following in 3.16.1.2.6: "A project like this, where the project elements being introduced are not currently found in the existing landscape would set the stage for similar types of proiects and development to occur within the area." (Emphasis added). v. 40 CFR 1508.1 (g) and 40 CFR 1508.1 (g)(l) provide the following definitions applicable to this DEIS: 1. (g) Effects or impacts means changes to the human environment from the proposed action or alternatives that are reasonably foreseeable and have a reasonably close causal relationship to the proposed action or alternatives, including those effects that occur at the same time and place as the proposed action or alternatives and may include effects that are later in time or farther removed in distance from the proposed action or alternatives. 2. (1) Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic (such as the effects on employment), social, or health effects. Effects may also include those resulting from actions that may have both beneficial and detrimental effects, even if on balance the agency believes that the effect will be beneficial. v1. Other recent NEPA compliant EIS reviews have addressed the Cumulative Effects aspect of a proposed action: Resolution Copper final EIS I Resolution Copper Project and Land Exchange Environmental Impact Statement (resolutionmineeis.us) Resolution Copper's EIS, Chapter 4 Cumulative Effects notes: "CEQ regulations in effect for this FEIS define a cumulative impact as one that 'results from the incremental impact of the action when added to other past, present, and reasonably foreseeable actions, regardless of what agency (Federal or non Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time' (40 CFR 1508.7). Cumulative impacts are the combination of impacts from • the proposed action or alternatives • other past or present actions • reasonably foreseeable future actions." vn. COMMENT: This DEIS and POD are silent on the matters of Cumulative Effects which are reasonably foreseeable and for which, public Open Houses have been held in the greater Twin Falls area. The impacts of the future projects must be included in this DEIS to advise the public fully of impacts of President Biden's EO	The EIS introduces past, present, and reasonably foreseeable trends and actions in Section 3.1 (Introduction and Methodology). Then each section accounts for these trends and actions in the Affected Environment and No Action Alternative sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how reasonably foreseeable trends and actions would exacerbate, compound, or offset the effects of the project on the environmental baseline. See also analysis in EIS Section 3.4 (Climate and Greenhouse Gases) and response to comment 11978-5 (see in Table A-3gg, Cumulative Effects).

Comment ID	Commenter	Public Comment	Response to Comment
		14008 decree which "set a renewable energy goal to provide 25 gigawatts (GW) of onshore renewable energy on DOI lands by 2025."	
12982-17	Jerry Taylor	The scope and frequency of these types of wind projects have increased considerably in recent years, and to meet the current administration's stated green energy goals will have to increase exponentially in a very short time. Consequently, the cumulative environmental impacts from these projects will increase at, or exceed, the rate of construction. The DEIS must analyze this loss of habitat and the direct impacts of species "take" and cumulative impacts in a much broader context, in order to understand and disclose to the decision makers and the public how significant this particular loss really is. How many wind projects are in operation within sage brush ecosystems in the Inter Mountain West, within Idaho, the Great Basin, the Columbia basin, and the Snake River Basin now? What are the kill rates of each, for federally protected avian species and others? How much habitat has been lost or is threatened? How much is expected to be lost overall? What are the cumulative impacts, considering all that has been done and what is planned?	Impacts to avian habitat are disclosed in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1. The potential for cumulative impacts to avian and bat species from multiple wind energy facilities across the landscape was specifically considered when determining the appropriate analysis area for bat populations (EPA North American Deserts Level I ecoregion; see EIS Section 3.3.1 [Bat Populations and Roosting Habitat]) and avian populations (BCR 9; see EIS Section 3.3.2 [Avian Populations]). Both the avian and bat population analyses examined fatality rates at multiple spatial scales and recognized that the vulnerability of specific avian and bat species to wind energy development is due to the cumulative nature of fatalities from numerous individual wind energy facilities throughout these species' ranges. Thus, even though none of the action alternatives are likely to have significant impacts on the population of any avian or bat species, a robust mitigation framework for avian and bat species has been developed in acknowledgement of the fact that each individual wind energy facility will have to reduce its overall contribution to cumulative impacts on avian and bat populations to prevent the declines of the most vulnerable species. Specifically, a TAC will be created (additional measure mm) that will be responsible for evaluating the data gathered during postconstruction avian and bat fatality monitoring (applicant-committed measure 150; additional measure u) and, if thresholds for adaptive management are triggered, recommending appropriate adaptive management measures including curtailment (applicant-committed measure 158; additional measures w and y) to reduce fatalities. Additional monitoring would be required to assess the effectiveness of these adaptive management measures and determine whether compensatory mitigation measure are warranted. See EIS Appendix 4 (Mitigation) for a complete list of required mitigation measures.
12988-8	Melody Asher	DEIS 3.3.2.1.3 EXISTING AND FUTURE TRENDS AND ACTIONS Your DEIS says "Existing and future trends and actions have influenced and will continue to influence bird populations in the analysis area through habitat disturbance, introduction of invasive species, or conversion of open space to agriculture or rural residential, particularly where those actions occur in suitable habitats (shrublands, rangelands, agricultural areas, and rocky outcrops) for bird species and their prey." This is just another cumulative impact to our ecosystem and the birds/mammals. This says to me that we need a state/region wide plan to decide where/how much cumulative effect from these proposed wind power/solar power developments that the environment and all the flora/fauna can handle and still have any semblance of any normal ecosystems.	See the cumulative impact analyses within each of the Chapter 3 biological sections. Potential cumulative impacts were evaluated in this EIS from existing and future trends and actions, and when combined with the project, must overlap temporally and spatially. For this reason, each Chapter 3 biological section defines an analysis area within which project and cumulative impacts are evaluated. Also see response to comment 3256-1 (see in Table A-3gg, Cumulative Effects).
13006-17	Leon Smith	8) Recommend consider cumulative impacts from additional proposed wind, solar, and battery projects in the region.	Reasonably foreseeable wind and solar projects in the area are listed in Section 3.1.1 (Existing and Future Trends and Actions) and analyzed in the EIS Cumulative Impacts sections.
2930-3	Regina Smith	400 wind turbines will certainly change fire suppression tactics in this area. I did not see a cumulative impact discussion on this topic but multiplied by other projects of a similar scope and size could impede large areas during fire suppression. I have seen the results of some 8000 homes destroyed in the Santa Rosa area (California).	Section 3.7.1.2.7 (Cumulative Impacts) describes the cumulative impacts of the project and other RFFAs and trends on fire and fuels management.
3256-1	Regina Smith	If one operation is constructed where will the limit be for cumulative impacts?	The EIS explains in Section 3.1 (Introduction and Methodology) the RFFAs evaluated within this EIS. The BLM is also preparing a programmatic EIS for solar energy that will evaluate cumulative impacts for the region, although it will not be completed before publication of the final EIS.
3256-5	Regina Smith	More study on cumulative impacts needs to be put into this analysis before we start an irreversible trend.	See response to comment 3256-1 (see in Table A-3gg, Cumulative Effects).
3256-6	Regina Smith	All in all The impacts anticipated;·existing and future trends, cumulative impacts and compensatory mitigation sections are glossed over.	The EIS accounts for past and present projects and trends in the Affected Environment sections since these actions and trends are currently affecting resources and contribute to the environmental baseline. The Cumulative Impacts sections describe how RFFAs and trends would exacerbate or compound the effects of the project on the environmental baseline.
4768-1	Regina Smith	I am trying to review and make comments on this draft EIS. On page 3-6 there are multiple ROW applications for similar wind and solar projects mentioned. I would like to know if there is one map showing the projects listed. I have not seen much about the Cumulative Impacts of all these projects together. For instance the Taurus wind project is adjacent to the Lava Ridge project. What are the cumulative impacts of multiple projects of similar size and scope? Twin Falls may be outside of the Lava Ridge project area but may be surrounded by multiple projects. There's no analysis of the impacts to Twin Falls or other surrounding communities. In addition sage grouse habitat may be affected by the Lava Ridge project but what will the impacts from numerous projects? If the disturbance during construction causes the wildlife to move out of the immediate area where will they move to? This will affect the hunting resources, recreational resources, cultural resources, OHV and visual resources. I understand that we are mainly analyzing the Lava Ridge project however if this is approved that will set a precedent for other projects. The long-term effects could be extremely overreaching.	Figure 3.1.1 (Existing and future trends and actions near the siting corridors) provides the locations of the RFFAs analyzed in the EIS including other wind projects. The cumulative effects of these RFFAs combined with the project are described in the Cumulative Impacts sections throughout EIS Chapter 3.
6913-11	Public Comments Canyon Crest Events Center	They also know nothing about the line, the transmission line that's going to go to Las Vegas, Nevada. I'm not sure the exact mileage, but it's probably at least an eight-hour drive from here, maybe more, a long way, and that power line is not even part of this study. It probably doesn't kill eagles but it impacts lots of acreage all the way to Vegas. Then from Vegas, a big hub for electricity, part of the national network, it's going to be shipped to California from there.	Reasonably foreseeable future projects in the area are listed in Section 3.1.1 (Existing and Future Trends and Actions) and evaluated in the Cumulative Impacts sections of Chapter 3.

Comment ID	Commenter	Public Comment	Response to Comment
7338-1	Matt F.	Please accept my comment regarding the Lava Ridge Wind Project EIS as it relates to the cumulative environmental impact from this project and others currently in the approval process pipeline. It is clear that BLM's long term planning vision involves multiple wind and solar projects blanketing southern Idaho. BLM needs to begin taking into account the concept of cumulative effect. Stated simply: while the impact in a particular area of one project may be minimal, the total impact across all projects in all areas could, and likely will be, devastating to the environment, people, property and businesses. BLM should develop some type of impound account which all projects must contribute funds to such that when the negative impacts become so large, the funds can be used to mitigate damage or to pay out injured parties. Further, if BLM ascertains that the cumulative effect of the entirety of planned projects would lead to negative impacts so great that a project would be denied, it should begin the denials in the beginning with the first project, not at the end after the damage has already been done. This would stop the damage from happening in the first place, rather than waiting until irreversible damage has been done to the region. For example: one project might not result in substantial declines in the Greater Sage Grouse population. However, if all of the projects were to be approved, they could reasonably be assumed to have a devastating effect on the GRSG population. It would be irresponsible for BLM to approve the projects knowing full well what would happen. So rather than wait until the end, after the damage has been done, the projects should be denied from the beginning such that the cumulative effect never comes to be. This reasoning could be applied to impacts on human systems as well, such as when ascertaining the cumulative negative impacts to airports and fire fighting ability.	MVE would be required to have a reclamation bond and would be held to BLM-approved reclamation success criteria. The BLM is preparing a programmatic EIS for wind and solar energy that will address cumulative impacts for the region. Though it will not be ready before publication of the EIS, the Lava Ridge Wind Project is being considered in the programmatic EIS. Cumulative impacts to sage-grouse are described in Section 3.3.4.2.7.
8068-2	Richard Dinges	Chapter 3.11 discusses the effect of the wind turbines on the population of pollinators and insects. In 3.11.1.2.2 under "Displacement, Injury, or Mortality" heading and third paragraph the following is stated: "Decline of insect populations may also diminish their ecosystem function, such as pollination. Declines in pollinators can thus reduce the ability for plants to reproduce and maintain native vegetation community components." Although it is recognized that a diminished insect population will diminish their ecosystem function, the full extent of what that entails is not addressed. Reference to maintaining native vegetation community components could vaguely refer to providing food for wildlife in the project area. It does not address the effect on cow-calf cattle grazing in the project area. The project is sited on many traditional grazing allotments. What remains of these allotments would be impacted by this expected loss of pollinators in that a loss of or degradation of the native vegetation means less pounds gained by the calves, loss of body score on the mother cows and more cows not breeding back. This will result in an economic loss for the cattlemen compared to the situation pre project. Also,the Lava Ridge project abuts and partially encompasses private property, the majority being irrigated farm land. A wide variety of crops are grown on these properties. Some of these crops require pollination to produce a yield. This aspect of the "ecosystem function" has not been addressed in this Chapter. If the crop is not fully pollinated, yield is reduced and the grower suffers a lower than expected return. He suffers an economic loss. The tv ads that have been aired by the developers of this project have touted the great economic benefit that this project will bring to the Magic Valley. Explain this to the cattleman and crop grower.	Although all action alternatives would impact pollinators to some degree, there is currently no evidence that direct mortality from wind turbine collisions poses a major threat to insect populations (Arcadis Belgium 2020). Approximately half of all existing wind energy turbines are located in cultivated cropland (Harrison-Atlas et al. 2022); concerns have been raised that continued conversion of farmland to wind energy development can reduce overall agricultural output (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017), but in none of these cases has a reduction in crop productivity or yields due to pollinator declines been documented. Given the prevalence of wind energy turbines in agricultural lands and the lack of documented declines in crop productivity in the vicinity of these turbines, it is unlikely that that direct mortality of pollinators and other insects from collisions with operational wind turbines would have negative economic consequences for the local agricultural economy. Arcadis Belgium. 2020. Business and nature working together: action by the energy sector to protect wild pollinators. 8074-4	Richard Dinges	Chapter 3.3.2 in the Lava Ridge Environmental Impact Statement (EIS) discusses the probable number of birds that will be killed by collisions with the turbine blades. One aspect of the mortality of the birds that is not discussed, is how these deaths affect the overall ecosystem. It is a given fact that the bird's main diet are insects. When the bird population decreases, the insect population will increase. The Lava Ridge project abuts and in some cases partially encloses private property. In some cases this ground is irrigated crop land, and many different crops are grown on it. There are insects which can damage some of these crops. With a decreased bird population, it can be expected to see the detrimental insect population increase. The grower of the crop then is faced with a reduced yield or must apply chemical sprays to control the insects to achieve his yield goal. In both cases, the net result is less income from either a lower yield or increased input costs due to purchased chemicals. The TV ads being run to tout this project exclaim how this wind farm is going to bring economic benefits to the whole Magic Valley. Explain that to the grower who experiences a lower net profit. I believe that a more comprehensive review of the effects this project will have on the bird population and its effect on the ecosystem must be made.	Approximately half of all existing wind energy turbines are located in cultivated cropland (Harrison-Atlas et al. 2022); concerns have been raised that continued conversion of farmland to wind energy development can reduce overall agricultural output (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017), but in none of these cases has a reduction in crop productivity or yields due to pollinator declines been documented. 8624-3	Public Comments via Remote Video	The question is, is this the right place to do that? We have failed to consider the cumulative impacts from having projects at Salmon Falls, Lava Ridge, Arco, Idaho, as well as solar projects, and the cumulative damage to wildlife and the overall Idaho experience that many of us value very highly.	Reasonably foreseeable wind and solar projects in the area are listed in Section 3.1.1 (Existing and Future Trends and Actions) and analyzed in the Cumulative Impacts sections of Chapter 3. The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. Technical and economic feasibility of wind energy projects require meeting the correct combination of core siting requirements.

Decision Process

Comment ID	Commenter	Public Comment	Response to Comment
11204-11	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The DEIS did not adequately address these issues. The DEIS continues to preclude the formulation of substantive site-specific comments when it makes admissions like: • “the exact location of infrastructure and activities within the siting corridors is unknown at this time” (DEIS, pgs. ES-vi and 2-2); • the “project’s final design and engineering would be completed after the BLM has issued a record of decision” (DEIS, pgs. ES-vi and 2-2); • the Project’s “final design would identify the specific location for all infrastructure and project activities and would be approved by the BLM Authorized Officer” (DEIS, pg. 2-2); • because “the exact location of project components is not yet known, beyond being located within the siting corridors, the acreage of work area and infrastructure disturbances are proportionally applied to the siting corridors” (DEIS, pg. 3-8); • the “exact location of overhead collector lines undetermined” (DEIS, pg. 3-117); and, • “the exact location of the groundwater wells would be determined during final design” (see DEIS, pg. 3-440). The lack of site-specific information within the DEIS regarding the exact location (and related timing) of infrastructure and activities within the siting corridors is problematic when many of the issues being analyzed (such as visual changes, the generation of noise, the potential for shadow flicker, and impacts to grazing practices) are highly dependent upon the exact location and engineering of the infrastructure and the timing of its installation and use. The request for site-specific concerns regarding potential impacts from the proposed Project is an impractical task when site-specific information is not yet available regarding the location and design of Project components and regarding the timing of their planning, construction, operation, and decommissioning. In fact, the ability for the Permittees to actually comment to the DEIS is effectively negated by such lack of location and timing specifics. This is because, absent such specifics, the Permittees cannot reasonably know the impacts upon their livestock operations during each of the four (4) different phases, i.e., construction, rehabilitation, operation, and decommissioning, and based thereon, know if it is even reasonably possible to maintain and sustain their current livestock operations during each of the phases. The lack of	As described in the EIS, turbines and associated project elements could be sited anywhere within the siting corridors. The Chapter 3 analysis assumes project siting (including for turbines) could occur anywhere within the corridors, and the EIS discloses potential impacts to the issues evaluated. In accordance with NEPA and the BLM NEPA Handbook, the analysis presented in the EIS provides a reasonable comparison of project alternatives. Additional site-specific coordination between the BLM, MVE, and grazing permittees would occur preconstruction, through construction, and during project operation and decommissioning. See also MVE (2023) and EIS Appendix 11 (Project Elements Common to All Action Alternatives) for additional project details.

Comment ID	Commenter	Public Comment	Response to Comment
		specifics as to location and timing unreasonably prejudices this entire process as against the Permittees and for the applicant, i.e., MVE, i.e., Wind Company.	
11491-34	Dean Dimond, Jennie Bateman	24. Need new info the on the ground scale —- the computer modeling level does not appear to be verified on the ground	MVE conducted a number of baseline resources to verify the results of desktop investigations and collect site-specific information necessary to inform the analysis in the EIS, as described throughout EIS Chapter 3 (Affected Environment and Impacts).
11534-5	Matt Arnold, William Eubanks	According to the DEIS, "BLM's purpose is to respond to MVE's application for a ROW grant to construct, operate and maintain, and decommission a wind energy facility on public lands in compliance with FLPMA, BLM ROW regulations, and other applicable federal laws and policies"; the "need" is defined as "aris[ing] from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy." DEIS at 1-1. In deciding whether to grant the ROW, BLM explains that it "will also consider a number of federal policies, including . . . [t]he policy expressed in 43 USC [§] 3004(b)," which "seek[s] to issue permits that, in total, authorize production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects by not later than 2025, through management of public lands and administration of Federal laws." Id. Apart from this single reference in its purpose-and-need statement, BLM fails to explain its purported consideration of and motivation by the nationwide policy codified at 43 U.S.C. § 3004(b). ... Given this Project's potential to permanently impair the Minidoka National Historic Site, "a nationally significant [historical] site . . . related to civil rights and liberties," DEIS at 3-155, 3-166, the population-level impacts to certain wildlife species, and the other significant impacts to affected resources, it is incumbent on BLM to explain in the FEIS how much nationwide progress has been made towards achieving the renewable-energy goal identified at 43 U.S.C. § 3004(b), and why this Project, specifically, is necessary to achieve that goal (compared, for example, to other BLM-administered lands where wind-energy infrastructure would threaten far less risk to affected resources). Such an explanation is critical for the public's understanding of how BLM seeks to balance its renewable-energy and Project-specific goals against its other codified duties, including the protection and promotion of historically significant properties like Minidoka, see, e.g., 54 U.S.C. § 300101 (espousing a national policy of prioritizing historical preservation of significant sites), and the conservation of migratory birds and other species of concern that reside in the Project area, see, e.g., 16 U.S.C. §§ 703-712 (prohibiting anyone from killing or otherwise "taking" migratory birds).	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-N. The BLM follows applicable laws, regulations, and policies that guide the preparation of the EIS and inform the evaluation of proposals like the project. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. Within the EIS, the BLM fully considers impacts to resources such as Minidoka NHS and migratory birds to understand how the potential impacts relate to laws, regulations, and policies. See also response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
11556-1	Mark Menlove; The Nature Conservancy	The Conservancy urges the Bureau of Land Management to invest in rigorous decision-making processes, including engagement with local communities, and to proactively identify places that are best suited for renewable energy development. These actions could help us minimize negative impacts to nature and people and avoid local conflict, which has surrounded the project.	The BLM follows the laws, regulations, and policies to guide the preparation of the EIS and inform the evaluation of proposals like the Lave Ridge Wind Project. Throughout the perpetration of the EIS the BLM has used the mitigation hierarchy to identify measures and alternatives that would avoid and minimize potential impacts. The development of measures and alternatives have been informed by the robust suite of outreach efforts that the BLM facilitated throughout the preparation of the EIS. The BLM provided opportunities for input early on through coordination with stakeholders and cooperating agencies and incorporated input from the public throughout the preparation of the EIS. These outreach efforts have resulted in considering elements that have the potential to minimize adverse impacts.
12453-3	Alexia Deetz	The SWCA Environmental Consultants chosen by BLM to research and create this report are people invested in "climate change"remediation. Go and look at their website and see some of the Board of Directors and their "twitter" posts. SWCA utilizes desk surveys to back up statements they make. Most of the literature cited in Appendix 2 App 2-5 and Appendix 3 App 3-58 – App 3-65 is outdated and hearkens back as far as 1999. I only saw one that referenced Idaho. Based on outdated desk survey data and research not performed in southern Idaho this report states whether impacts to the BLM land are significant or not and what mitigation efforts would be needed. This is fraudulent, in my opinion, because there hasn't been any "real" local impact study. The "real information" to consider is the information provided by the people who live and work here. They have "real local expertise". In addition, there are no "studies" cited for the impact caused by either the size of the windmills planned for this project or the number of windmills to be built. I am not interested in putting our public land, aquifer and people at risk for an experiment. Furthermore, desk surveys are based on data gleaned from the internet. The data is analyzed and yields information for decision making. Data can be secondary or primary. Secondary data is most often available to researchers and is often produced by other researchers. The " Impact Statement" referenced above is primarily based on secondary data collection and analysis. The problems with secondary data are many. Such as reliability of the data, it is often difficult to ascertain whether the data has been tampered with, altered or is even truthful. There are restrictions for using secondary data. Secondary data does not always represent a continuous time interval of interest to researchers or may be missing some factual aspects and has scattered sources which makes them incomparable, or they may not be labeled adequately. Data may be outdated. There are technical challenges for data acquisition, not every researcher has the skill set for efficient acquisition of data from websites and data processing. Secondary data often requires long processing before relevant information can be extracted. Secondary data collection can be biased. I do not find "desk survey" research to support informed decision making, particularly the important decision to be made about the Lava Ridge Wind Project or any other projects on the horizon.	The BLM follows applicable laws, regulations, and policies that guide the preparation of the EIS and inform the evaluation of proposals like the Lava Ridge Wind Project. This includes making use of reliable existing data and resources to describe the existing conditions and inform the analysis of potential impacts. Throughout the preparation of the EIS, the BLM has obtained the relevant data and information needed to prepare the EIS. This information has come from project-specific surveys, publications and analytical documents prepared by cooperating agencies and other reliable resources, and from information supplied by individuals and stakeholder groups.
3230-5	Gary Carney	Among the few that I mentioned, there are many others. However, the overall theme is that there has been an extreme lack of diligence brought forward to make an informed decision. There are many other clean energy options that can be brought to light to help the delivery of electricity to those who will benefit, but this decision may have sever adverse effects on millions of citizens. This is an extremely large project and deserves proper due diligence that would require years to satisfy and cannot be underestimated. The Bureau of Land	The BLM is responding to MVE's application for a wind generation facility that connects to the Midpoint Substation or SWIP-N. The BLM follows applicable laws, regulations, and policies that guide the preparation of the EIS and inform the evaluation of proposals like the project. This includes making use of reliable existing data and resources to describe the existing conditions and inform the analysis of potential impacts. Throughout the preparation of the EIS, the BLM has obtained the relevant data and information needed to prepare the EIS.

		Management should require more inspections done that require a longer time period than what was given. The BLM should require non-bias 3rd Party ecologists, biologists, geologists, and other field professionals to study the project. These hires take much more time than what the BLM has granted. The timeframe given to us as locals was just enough to scratch the surface, and has brought the attention to those who have reached out to field experts in order to write letters like mine.	This information has come from project-specific surveys, publications and analytical documents prepared by cooperating agencies and other reliable resources, and information supplied by individuals and stakeholder groups.

Decision Process for National Park Service

Table A-3ii. Decision Process for National Park Service

Comment ID	Commenter	Public Comment	Response to Comment
11782-4	Ken Fitch	There are competing obligations and jurisdictions here, some of them legal and jurisdictional. NPS under the Organic Act has obligation to “conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.” In terms of NPS evaluation, the adjacent actions would constitute an impairment, As a Cultural Resource Manager at a NPS unit once told me, “We are required to protect the items in our care not just for the next five years, but the next 500 years” and beyond.	See responses to comments 9080-51 (see in Table A-3ii, Decision Process for National Park Service), 11598-26 (see in Table A-3jj, Legal or Policy Compliance), and 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11886-2	Sandra Eto	This land has gone through significant processes to acknowledge and protect the importance of the Minidoka NHS as part of the history of the US’ struggle as a democratic nation, one that is still little known to the Nation at large. The Foundation Document, prepared by the NPS, has identified the basis upon which planning and management of the Minidoka NHS has occurred. The NPS is the jurisdictional entity for managing the Minidoka NHS. It is current and relevant to the Lava Ridge proposed project, unlike the Monument RMP (1986). The Foundation Document must be recognized as the basis upon which impacts from the proposed project on the Minidoka NHS are evaluated. And NPS must be the agency at the table to speak for decisions being made that affect the Minidoka NHS (and the Oregon Trail), such as the non-physical APE. The NPS must be a concurring party to the PA and be included in any decision-making or discussions involving or affecting the Minidoka NHS.	The project is being proposed on public lands managed by the BLM. The location of project infrastructure would be located in areas adjacent to Minidoka NHS, a site managed by the NPS, but no portion of the project would be located on lands within the jurisdiction of the NPS. The NPS is a cooperating agency, and the BLM has worked with them closely to ensure the EIS evaluates potential impacts to the NPS units and associated resources. The NPS is also participating as a consulting party within the Section 106 process and has actively participated in the preparation of the PA that would stipulate the process necessary to comply with Section 106 obligations. The BLM has considered information in the Foundation Document (NPS 2016) prepared for Minidoka NHS; however, the Monument RMP (BLM 1986), as amended is the guiding land use plan for uses occurring on public lands managed by the BLM. The BLM has coordinated and taken into consideration extensive input from the NPS and has used that information to inform the analysis of potential impacts within the EIS. The line officers for the NPS units adjacent to the project area are not delegated the authority for decision related to the project and cannot legally make determinations or enter into agreements regarding the project and the associated PA.
12338-1	National Park Service	Topic #1 – Standalone Summary of Impacts to Minidoka NHS Global comment The NPS recommends that the Environmental Impact Statement (EIS) include a standalone section that summarizes the identified impacts on Minidoka National Historic Site (NHS) for each action alternative, in order to clearly identify impacts to the NPS ability to carry out its mission at Minidoka NHS. The draft EIS currently fragments the analysis of effects to the park in different sections of Chapter 3. Impacts to the Japanese American community and to the former Minidoka War Relocation Center are identified, without a clear indication of which effects accrue to Minidoka NHS. A stand-alone section would help the reader understand the totality of the project’s impacts to the park’s mission. The NPS also recommends the analysis include impacts to the park’s purposes, stated in legislation as interpreting “the story of the relocation of Japanese Americans during World War II to the Minidoka Relocation Center and other centers across the United States; the living conditions of the relocation centers; the work performed by the internees at the relocation centers; and the contributions to the United States military made by Japanese Americans who had been interned” (PL 110-229, Section 313). Minidoka NHS legislative purposes are implemented through planning documents, including its General Management Plan (GMP), a Foundation Document, and an Interpretive Plan. These documents all address interpretation and commemoration. The GMP and Foundation documents mention reflection and healing to different degrees. The statutorily required GMP, a publicly developed document, references that some commentors on the GMP believe that Minidoka NHS is a place of healing for former incarcerees and their descendants. The Foundation Document, an internally developed document, identifies healing and commemoration as fundamental values. The NPS can provide the park’s GMP, Foundation Document, and other planning and operational documents and, if requested, can assist in providing context for this section. The NPS makes this recommendation to ensure that the impacts of visible wind turbines to Minidoka NHS legislative interpretive mission are fully considered.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
9080-51	The Coalition to Protect America’s National Parks	B. National Park Service Organic Act of 1916, as amended58 – In contrast to the BLM’s “multiple use mandate” under FLPMA, the NPS-managed resources at Minidoka NHS are managed and protected under a separate statutory requirement, which is the “conservation mandate” of the NPS Organic Act of 1916 and	The project is proposed on public lands managed by the BLM. The location of project infrastructure would be located in areas adjacent to Minidoka NHS, a site managed by the NPS, but no portion of the project would be located on lands within the jurisdiction of the NPS. The NPS is a cooperating agency, and the BLM has

Comment ID	Commenter	Public Comment	Response to Comment
		subsequent amendments. The Organic Act established the fundamental purpose of units of the National Park System, which is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations (54 USC § 100101(a)). Courts have consistently interpreted the Organic Act as giving conservation priority over use such that "when there is a conflict between conserving resources and values and providing for enjoyment of them, conservation is to be predominant" (NPS Management Policies 2006 §1.4.3). In addition, as described under General Comment 10 above, under the NPS Organic Act, as amended, the Secretary of the Interior "has an absolute duty, which is not to be compromised, to fulfill the mandate of the 1916 Act to take whatever actions and seek whatever relief as will safeguard the units of the national park system."	coordinated with the NPS to ensure the EIS evaluates potential impacts to the NPS units and associated resources. The NPS is also participating as a consulting party within the Section 106 process and has actively participated in the preparation of the PA that would specify the process necessary to comply with Section 106 obligations. The BLM additionally prepared Section 3.19 (Minidoka National Historic Site Interpretive Purpose) to disclose potential impacts to this NPS-managed property's legislated purpose.

Legal or Policy Compliance

Table A-3jj. Legal or Policy Compliance

Comment ID	Commenter	Public Comment	Response to Comment
11188-1	Clare Josaitis	Neither in the MVE's Plan of Development or in the DEIS, are the identities of MVE's participants disclosed. Per FLMPA 1976 (as amended), the BLM "shall require the applicant to disclose the identity of the participants in the entity." Who are the partners and shareholders involved in MVE?	FLPMA does provide the Secretary with the authority to require applicants to disclose the identity of the participants in the entity (partnership, corporation, association, or other business entity) when it is deemed necessary to a determination of whether or not a ROW grant shall be issued. This authority is provided to allow for the effective adjudication of MVE's legal authority to hold a ROW grant and is not provided in the EIS, as it is not relevant to the BLM's analysis and review of potential impacts that may result from the Proposed Action.
11188-2	Clare Josaitis	FLPMA states that "The Congress declares that it is the policy of the United States that - ... public lands not previously designated for any specific use and all existing classifications of public lands that were effected by executive action or statute before October 21, 1976, be reviewed in accordance with the provisions of this Act...". All the land within the project area has already in fact been designated for livestock grazing use through existing permitted allotments. Additionally, numerous other consumptive and non-consumptive uses currently take place in the project area. Implementation of the proposed action or any other identified action alternatives would directly and drastically usurp the existing designated allotments and associated grazing permits that have been in use by local cattle and sheep ranchers for decades. Congress has not exercised its constitutional authority to withdraw the lands in the project area from livestock use. Implementation of any of the action alternatives would effectively cause the termination of existing permitted livestock use. This is in conflict with the letter and spirit of FLPMA.	See responses to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 11326-9 (see in Table A-3jj, Legal or Policy Compliance). The BLM considers the potential impacts to other valid existing uses on public lands, including permitted livestock grazing, in the EIS. See Section 3.8.1 (Land Use Authorizations), Section 3.9.1 (Grazing Allotments and Range Socioeconomic), and EIS Appendix 12 (Historical Livestock Actual Use and Utilization). If the project were to be authorized, other uses of public lands would not be precluded.
11188-4	Clare Josaitis	The 1986 Monument Resource Management Plan cited in the DEIS is antiquated and does not have any discussion of wind energy. So, to truly be in conformance with the management plan for the Monument Resource Area, the proposed project should not be authorized.	See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance).
11188-5	Clare Josaitis	According to the BLM's Final Programmatic Environmental Impact Statement for Wind Energy Development on BLM-Administered Lands in the Western United States (BLM 2005a), to which this DEIS tiers, the wind resource potential was measured by the DOE's National Renewable Energy Laboratory (NREL). According to the maps in Wind Energy EIS, the wind resource potential measured in the proposed project areas is "low". EPA.gov states that wind turbines are 20% to 40% efficient at converting wind into energy. Given the low wind resource rating and the inefficiency of wind turbines for producing energy, how can there be any justification in building these pseudo-green turbines?	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. MVE completed siting analysis and used the latest computer modeling to assist in their selection of the project area as a viable wind energy facility. MVE has also established meteorological stations to gather additional information on the wind resources within the project area.
11204-5	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	DEIS did not consider or assess the applicable land use planning.	EIS Appendix 2 provided a description of the project's conformance with the land use plan.
11204-8	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	II. Land Use Plan violation: The applicable Land Use Plan (the 1986 Monument Resource Management Plan) was not amended by the 2005 ROD-Wind and does not authorize wind projects as amended. See 2021 Comments, pgs. 7-8. Summary: The DEIS needs to be revised to explain how the proposed Project can be authorized despite the fact that the 1986 Monument RMP was not amended by the 2005 ROD-Wind and the 1986 Monument RMP, as amended, does not authorize wind projects. The 2021 Comments stated that the applicable land use plan is the 1986 Monument RMP, as amended, by the following documents: • the Record of Decision dated August 20, 2003, relating to Land Tenure Adjustment and Areas of Critical Environmental Concern ("2003 ROD-Land Tenure"); • the Record of Decision and Approved Resource Management Plan Amendments for the Great Basin Region (including the Greater Sage-Grouse Sub-Regions of Idaho and S.W. Montana, Nevada and N.E. California, Oregon, and Utah) dated September 15, 2015 ("2015 ROD- ARMPA"); • Attachment I to the 2015 ROD-ARMPA dated September 15, 2015, relating to the Idaho and S.W. Montana	See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		Greater Sage-Grouse Resource Management Plan Amendment ("2015 Idaho ROD-ARMPA"); and • the Idaho Greater Sage-Grouse Record of Decision and Approved Resource Management Plan Amendment dated March 14, 2019 ("2019 Idaho ROD-ARMPA"), as reaffirmed by the Idaho Record of Decision for the Greater Sage-Grouse Supplemental Environmental Impact Statement dated December 30, 2020 ("2020 Idaho ROD-SEIS"). See 2021 Comments, pgs. 7-8. The 2021 Comments noted that, while there is some uncertainty whether the 2019 Idaho ROD-ARMPA is currently an applicable land use plan amendment because the 2019 Idaho ROD- ARMPA was enjoined from implementation by W. Watersheds Project v. Schneider, 417 F. Supp. 3d 1319 (D. Idaho 2019), "such court decision was issued before issuance of the 2020 Idaho ROD-SEIS." 2021 Comments, pg. 8. The 2021 Comments go on to note that even if the 2015 Idaho ROD-ARMPA and/or the 2019 Idaho ROD-ARMPA, as reaffirmed by the 2020 Idaho ROD-SEIS, are currently the applicable land use plan amendments, then the Permittees still don't find any explicit management direction for wind energy in the 1986 Monument RMP. See 2021 Comments, pg. 8. The 2021 Comments noted that the applicable Land Use Plan ("LUP"), i.e., the 1986 Monument Resource Management Plan, does not authorize wind projects. 2021 Comments, pg. 7. The 2021 Comments also noted that the 1986 Monument RMP was not amended by the 2005 ROD-Wind that resulted from the 2005 PEIS-Wind. 2021 Comments, pg. 8. The DEIS did not adequately address these issues. Under the heading "Conformance with Land Use Plans," the DEIS states that the applicable land use plan is the 1986 Monument RMP (BLM 1986), as amended, including the 2015 Idaho and Southern Montana Grater Sage-Grouse Approved Resource Management Plan Amendment (BLM 2015)." See DEIS, pgs. ES-v and 1-2. The DEIS admits that the 1986 Monument RMP was not amended by the 2005 ROD-Wind at pages 1-7 and 3-7 which report that "BLM (1986),[4] as amended, was excluded from being amended by BLM (2005b)."5 The DEIS attempts to excuse the fact that the 2005 ROD-Wind did not amend the 1986 Monument RMP by explaining that the exclusion of the 1986 Monument RMP from the LUPs that were amended by the 2005 ROD- Wind "could have been for a variety reasons, including that developable wind resources were not deemed present in the area managed by the SFO at that time, or that BLM (1986) was expected to be amended in the near term (and thus analysis [from the 2005 ROD-Wind] would be incorporated into BLM [1986])." The DEIS therefore concludes that even though the 1986 Monument RMP was not amended by the 2005 ROD-Wind, its associated Best Management Practices (BMPs) and 2005 PEIS-Wind analyses are "relevant for the Lava Ridge Wind EIS." However, such rationalization does not change the fact that the 1986 Monument RMP does not authorize wind projects and was not amended by the 2005 ROD-Wind. Given the lack of wind resource and development in the 1986 Monument RMP, the 1986 Monument RMP must be revised as per 43 C.F.R. § 1610.5-6, or alternatively, a land use plan amendment must be developed as per 43 C.F.R. § 1610.5-3(c), as a condition precedent to any consideration of the proposed Wind Project. While, as explained below in the next Section, the Permittees will acknowledge that the 2015 Idaho ROD-ARMPA and/ the 2019 Idaho ROD-ARMPA, as reaffirmed by the 2020 Idaho ROD-SEIS, considered and assessed wind development, such consideration and assessment was limited as specifically related to sage-grouse management, not as related to the consideration and assessment of all of the public lands and public land resources, including the multiple-uses, upon the public lands. Neither the 2015 Idaho ROD-ARMPA nor the 2019 Idaho ROD-ARMPA provide the factual or legal land use planning direction under 43 C.F.R. § 1610.5-3 to support the proposal and wind development generally upon the public lands.	
11274-1	Karen Schumacher	It seems the BLM has not followed federal law for Coordination, specifically 43 USE 1712(c)(9). This law states, "(9) to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located, assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans, and shall provide for meaningful public involvement of State and local government officials, both elected and appointed, in the development of land use programs, land use regulations, and land use decisions for public lands, including early public notice of proposed decisions which may have a significant impact on non-Federal lands. Land use plans of the Secretary under this section shall be consistent with State and local plans to the maximum extent he finds consistent with Federal law and the purposes of this Act." The BLM is required to follow Coordination laws in the Lava Ridge project as it is required to by both FLPMA and NEPA rules. Coordination is found in both of these laws, (42 U.S.C. 4331(b)), NEPA (42 U.S.C. 4331(b)), FLPMA (43 U.S. Code SS 1712(9)), and both state "shall" as mandates for Coordination. Until the BLM engages in Coordination and ensures consistency with local land use plans with ALL counties involved in this project, it cannot move forward and a No Action alternative must be the decision. In the 2005 BLM Wind Energy Development Program Record of Decision, there are protections for the cattle industry. On page A-2 it states, "wind energy projects shall be developed in a manner that will not prevent other land uses, including...livestock grazing, recreational use, and other ROW uses". It also states, "Additional areas of land may be excluded from wind energy development on the basis of findings of resource impacts that cannot be mitigated and/or conflict with existing and planned multiple-use activities or land use plans." Since the BLM has failed to initiate its responsibility for Coordination with local counties, and consistency with land use plans has not be determined, this project cannot move forward. The construction of the project conflicts with resource impacts for multiple use and grazing rights, as well as for up to 34 years, with reduction of allotments after that time. This violates the BLM's own policies. In addition, according to its Policies and Best Management Practices (BMPS), BLM wind energy projects "shall be developed in a manner that will not prevent other land uses, including...livestock grazing, recreational use, and other ROW uses (1-1)." During construction the Grazing Plan calls for the removal of allotments and AUMs which violates these	Coordination occurred as described in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers) and included Jerome, Lincoln, and Minidoka Counties as cooperating agencies. Coordination with permittees began early in the evaluation of the project and incorporated permittees feedback. The draft EIS evaluates potential impacts to livestock grazing within Section 3.9 of the draft EIS, and the approval of the Proposed Action or other action alternatives would maintain other compatible uses, such as livestock grazing.

Comment ID	Commenter	Public Comment	Response to Comment
		policies by preventing land use, along with recreational use, for years with eventual permanent loss of use. Based on this the BLM must select Alternative A, No Action. 43 USC 315b states holders of grazing permits "are entitled to participate in the use of the range". With this project, those entitlements are being taken away, a violation of the law. With this project land will not be available for grazing, a clear violation of federal law 43 CFR SS 4130.2(e)(1) The ongoing destruction of the land with temporary fencing that is then removed for fencing in another area causes a cumulative overall significant impact which violates 40 CFR 1508.27(b)(7). According to this law, breaking up these small areas does not diminish the significance of the cumulative damage. It also violates 40 CFR 1508.7 43 U.S. Code SS 1701 requires that the land will be managed in a manner that will provide food and habitat for domestic animals. The destruction of this land violates this law. 43 CFR SS 4130.2(e)(1) states that grazing permits that have been issued remain available for livestock grazing. This right to grazing is being removed by the project, another law violation. In the BLM Mitigation Handbook it states "wind energy projects shall be developed in a manner that will not prevent other land uses, including...livestock grazing..." This whole project violates the BLM's own Mitigation Handbook directives. Because of so many federal law violations, the BLM has no other choice than to pick Alternative A, NO ACTION.	
11326-9	Filip Camacho, Tasha Sorensen	The Idaho BLM Field Offices should also be proponents for being included in any programmatic efforts for wind and solar.3 Additionally, we support full-plan revisions and amending resource management plans in Idaho to address renewable energy developments more comprehensively including biodiversity and connectivity of intact landscapes. In this area, the Monument Resource Management Plan (RMP 1986)4 is outdated and pre-dates industrial-scale development of public lands. The RMP also does not include wildlife migrations or reference the significant avian populations in this region. Of note, the Monument RMP was omitted in the 2005 Wind Energy Development PEIS, which amended 52 BLM land use plans in Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.	The December 2005 *Record of Decision for the Implementation of a Wind Energy Development Program and Associated Land Use Plan Amendments* states, "The decision is hereby made to implement a comprehensive Wind Energy Development Program to administer the development of wind energy resources on BLM-administered public lands in 11 western states: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. The decision establishes policies and best management practices (BMPs) for the administration of wind energy development activities and establishes minimum requirements for mitigation measures. The policies and BMPs were evaluated in the Final Wind Energy PEIS (BLM 2005a) and are included in Attachment A. With the decision to implement the Wind Energy Development Program, the BLM Interim Wind Energy Policy (BLM 2002) will be replaced by a new policy that incorporates the programmatic policies and BMPs evaluated in the PEIS. Elements of the Interim Policy addressing applications, authorizations, competitive interests, and due diligence will not be changed by the new program requirements. (emphasis added)" (BLM 2005b). In processing the application for the Lava Ridge Wind Energy Project the BLM follows the elements and the BMPs established by the December 2005 ROD and analyzed in the PEIS. The BLM recognizes that the use of these program elements and BMPs are not a requirement established by an amended land use plan but considers them as established guidance through policy. The BLM routinely reviews its land use plans and updates them, as necessary. Since the *Monument Resource Management Plan* (BLM 1986), as amended, was approved, it has been amended multiple times to provide direction on management actions and allocations related to the management of sage-grouse, designations of ROW corridors, analysis of geothermal leasing, designation of Areas of Critical Environmental Concern, fire and vegetation management, and identification of parcels available for land tenure adjustments. The action alternatives described in this EIS are in conformance with BLM (1986), as amended, including BLM (2015). The action alternatives fall within an area designated as moderate use, which is described as follows: "Moderate use areas are generally suitable for a wide range of existing and potential uses and will be managed for production and use of their forage, timber, minerals and energy, recreation, or other values. Where conflicts occur with resources or uses, full consideration of all benefits and costs will be taken into account in resolving such conflicts. Sensitive and significant values will always be protected consistent with Federal and State law. Public lands in a moderate use area will be retained in Federal ownership (BLM 1986:4). No special limitations or restrictions on the type or intensity of resource use will be applied in this area. Valid uses will be allowed subject to environmental review and stipulations or special conditions to protect resources (BLM 1986:6)." In addition, because the siting corridors are in a General HMA for greater sage-grouse, the area is designated as open to wind energy development per BLM (2015).
11327-19	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	In Idaho, the majority of Resource Management Plans (RMPs) are outdated and in need of full plan revisions. The Monument Resource Management Plan is no exception- it is severely outdated and includes no reference to wildlife migrations or renewable energy development. The Monument Resource Management Plan was also omitted in the 2005 Wind Energy Development PEIS, which amended 52 BLM land use plans in Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.56 The absence of plan revisions has left the BLM to largely rely on the 2015 Greater Sage-Grouse Resource Management Plan Amendments to respond to renewable energy projects on public lands. While these amendments require measures that avoid, minimize, and mitigate impacts to Greater sage-grouse and their habitat, they are only looked at through the lens of that one species. This has resulted in negative impacts to other resources and will continue to do so if the BLM does not adopt more comprehensive strategies to guide renewable energy development – regarding siting, operation, and decommissioning. Simply put, southern Idaho will suffer from a piecemeal approach to wind and solar energy development if the BLM continues to analyze projects in the same manner that they are today.	See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance).
11491-1	Dean Dimond, Jennie Bateman	- My first concern for this draft EIS is that it has not been developed strictly according to the Congressionally mandated criteria of the National Environmental Policy Act, as amended. It includes two Executive Orders (EOs) written to address Environmental Justice (President Clinton 1994) and another regarding Climate Change (President Biden 2021). Although the power of an EO is effective in steering our Nation in effective ways toward addressing issues of great concern, I must point out that the criteria for the NEPA analysis of a	See EIS Section 3.4.1.2.2 (Alternative B [Proposed Action]) Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) for estimates of the direct and indirect GHG emissions as well as EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) in Section 3.4.2.2.2 (Alternative B [Proposed Action]). In addition, EIS Appendix 4 (Mitigation) includes a list of

Comment ID	Commenter	Public Comment	Response to Comment
		project must include the actual conditions on the ground and the interdisciplinary effects of a project on federal lands. I share the content on the most recent EO and must challenge the far-reaching and barricade to true NEPA analysis that it represents in this draft EIS. Without sounding disrespectful, this EO breeches the authority of the BLM to change the criteria for analysis of environmental impacts of this wind project by removing the existing contributions and of the loss of production of other energy sources within BLM authorities. Without the impact of the loss of other energy production included in this DEIS, the American people cannot assess the need, capacity and or the impact of this wind development project to meeting the domestic energy needs of the American people, the energy grid security and other aspects covered in this EO. To illustrate my comment, an excerpt from EO 14008 signed January 27, 2021 by President Biden follows: "Sec. 207. Renewable Energy on Public Lands and in Offshore Waters. The Secretary of the Interior shall review siting and permitting processes on public lands and in offshore waters to identify to the Task Force steps that can be taken, consistent with applicable law, to increase renewable energy production on those lands and in those waters, with the goal of doubling offshore wind by 2030 while ensuring robust protection for our lands, waters, and biodiversity and creating good jobs. In conducting this review, the Secretary of the Interior shall consult, as appropriate, with the heads of relevant agencies, including the Secretary of Defense, the Secretary of Agriculture, the Secretary of Commerce, through the Administrator of the National Oceanic and Atmospheric Administration, the Secretary of Energy, the Chair of the Council on Environmental Quality, State and Tribal authorities, project developers, and other interested parties. The Secretary of the Interior shall engage with Tribal authorities regarding the development and management of renewable and conventional energy resources on Tribal lands. Sec. 208. Oil and Natural Gas Development on Public Lands and in Offshore Waters. To the extent consistent with applicable law, the Secretary of the Interior shall pause new oil and natural gas leases on public lands or in offshore waters pending completion of a comprehensive review and recon- sideration of Federal oil and gas permitting and leasing practices in light of the Secretary of the Interior's broad stewardship responsibilities over the public lands and in offshore waters, including potential climate and other impacts associated with oil and gas activities on public lands or in offshore waters. The Secretary of the Interior shall complete that review in consultation with the Secretary of Agriculture, the Secretary of Commerce, through the National Oceanic and Atmospheric Administration, and the Secretary of Energy. In conducting this analysis, and to the extent consistent with applicable law, the Secretary of the Interior shall consider whether to adjust royalties associated with coal, oil, and gas resources extracted from public lands and offshore waters, or take other appropriate action, to account for corresponding climate costs. Sec. 209. Fossil Fuel Subsidies. The heads of agencies shall identify for the Director of the Office of Management and Budget and the National Climate Advisor any fossil fuel subsidies provided by their respective agencies, and then take steps to ensure that, to the extent consistent with applicable law, Federal funding is not directly subsidizing fossil fuels. The Director of the Office of Management and Budget shall seek, in coordination with the heads of agencies and the National Climate Advisor, to eliminate fossil fuel subsidies from the budget request for Fiscal Year 2022 and thereafter. Sec. 210. Clean Energy in Financial Management. The heads of agencies shall identify opportunities for Federal funding to spur innovation, commercialization, and deployment of clean energy technologies and infrastructure for the Director of the Office of Management and Budget and the National Climate Advisor, and then take steps to ensure that, to the extent consistent with applicable law, Federal funding is used to spur innovation, commercialization, and deployment of clean energy technologies and infrastructure. The Director of the Office of Management and Budget, in coordination with agency heads and the National Climate Advisor, shall seek to prioritize such investments in the President's budget request for Fiscal Year 2022 and thereafter." I contend that the measurements of climate impacts of existing energy production have not been analyzed to address the true environmental impacts (positive and adverse) of the addition of this wind project. This alone creates a fatal flaw in this DEIS for the Lava Ridge wind project.	the applicant-committed measures to encourage carpooling among construction workers and minimize excessive exhaust emissions from construction equipment. In addition, Section 3.4.2.2.2 quantifies the estimated avoided emissions and the social cost of carbon for Alternative B.
11491-5	Dean Dimond, Jennie Bateman	- My second comment will certainly be unpopular with the Department of Interior and BLM, however, NEPA is required on federal lands and the interdisciplinary analysis of the impacts of any proposed program or project must be determined transparently by the Agency of authority. Glaringly absent is the identification of the BLM interdisciplinary team of resource professionals assigned to this important task. It appears that the Climate Change Task Force created in EO 14008 is directing the use of computer modeling and broad-brush generalities as to impacts of the project. Based on this requirement for BLM to convene their own ID Team, I contend that this draft EIS does not meet BLM's fiduciary requirements for production of federal agency interdisciplinary NEPA documentation. I also question the use of this Task Force as a politically driven group of Presidential appointees that are acting in deference to the Federal Advisory Committee Act (FACA) in a vacuum to meet objectives outside of the federal NEPA statutory requirements. No information generated in this document indicates a full interdisciplinary analysis of even the separate areas of concern identified as to their cumulative impacts to the project area and upon the people living in the immediate area and to the American people. This is a deficiency that only a Supplemental draft EIS can possibly address.	EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers) Table App10-3 provides a list of individuals on the interdisciplinary team from the BLM and the third-party contractor team responsible for preparing this EIS.
11534-2	Matt Arnold, William Eubanks	At its most basic level, FLPMA endeavors to strike a balance between competing uses of federal public lands. Norton v. S. Utah Wilderness All., 542 U.S. 55, 58 (2004). BLM ostensibly achieves that balance through the resource management planning process, which results in the publication of a governing RMP. Id. FLPMA makes clear that a crucial aspect of this process is public involvement. Klamath Siskiyou Wildlands Ctr. v. Boody, 468 F.3d 549, 557 (9th Cir. 2006) (discussing "FLPMA's requirement that BLM ensure the 'views of the general public' and 'third-party participation' are adequately incorporated into the land planning process" (citing 43 U.S.C. § 1701(a)(5); 43 C.F.R. § 1610.2)). Any subsequent authorizations, like authorizing a ROW for a	The BLM SFO's *Monument Resource Management Plan*, as amended, guides decision-making for the public lands affected by the project (BLM 1986). The plan has been amended over the years to address critical resources, including sensitive species such as sage-grouse. Also see responses to comments 1022-3 (see in Table A-3ee, Alternatives) and 11326-9 (see in Table A-3jj, Legal or Policy Compliance). If the project were to be authorized, other uses of public lands would not be precluded.

Comment ID	Commenter	Public Comment	Response to Comment
		major wind facility, must be consistent with the governing RMP. Norton, 542 U.S. at 69 ("The statutory directive that BLM manage 'in accordance with' land use plans, and the regulatory requirement that authorizations and actions 'conform to' those plans, prevent BLM from taking actions inconsistent with the provisions of a land use plan."). "Unless and until the [RMP] is amended, [inconsistent] actions can be set aside as contrary to law pursuant to 5 U.S.C. § 706(2)." Id. BLM's Shoshone Field Office manages public lands under its jurisdiction according to the 1986 Monument RMP. DEIS at 1-1. That RMP categorized "[a]ll public land in the Monument Planning Area" into four areas, including: "limited use," "moderate use," and "intensive use/development areas." BLM, Monument Resource Management Plan at 4 (Jan. 1986) [hereinafter "Monument RMP"]. According to BLM, the Project will occupy lands "within an area designated as moderate use," DEIS at 1-2, which the Monument RMP describes as: [G]enerally suitable for a wide range of existing and potential uses and will be managed for production and use of their forage, timber, minerals and energy, recreation, or other values. Where conflicts occur with resources or uses, full consideration of all benefits and costs will be taken into account in resolving such conflicts. Sensitive and significant values will always be protected consistent with Federal and State law. Monument RMP at 4; see also id. at 6 (explaining that "[n]o special limitations or restrictions on the type or intensity of resource use will be applied in this area," and "[v]alid uses will be allowed subject to environmental review and stipulations or special conditions to protect resources"). By contrast, "Intensive Use/Development Areas" are those that "will generally be managed for a major or large-scale intensive use/development such as a major campground, off- road vehicle (ORV) area, mine, or public utility installation," but "[n]o intensive use/development areas were established in the Monument RMP." Id. at 4 (emphases added). By acknowledging that "no projects of this size have been constructed before," DEIS at 3-86, the DEIS demonstrates that this Project is precisely the kind of "major or large-scale intensive use/development" that belongs in an "Intensive Use/Development Area," as envisioned by the agency's own land-planning process, see Monument RMP at 4. That no "Intensive Use/Development Areas" were designated in the Monument RMP (or evaluated as part of any concomitant environmental review) clearly indicates that a large-scale wind facility like this one is not "clearly consistent with the terms, conditions, and decisions of the approved [Monument RMP]." 43 C.F.R. § 1601.0-5. Moreover, although the Monument RMP generically envisions in moderate-use areas "a wide range of existing and potential uses," including the vague category of "energy," id., industrial wind-energy facilities were not economically viable, and thus were not even contemplated, sources of energy development on public lands (or elsewhere) at the time the Monument RMP was developed. In fact, as of 1986, only three relatively small wind-energy facilities were in operation. See The U.S. Wind Turbine Database, U.S. GEOLOGICAL SURV., https://bit.ly/418vSWA (last visited April 12, 2023).1 Consequently, the Monument RMP's management prescription for energy development does not even mention potential wind-energy developments; instead, the RMP considers potential "energy leases" alongside "geology" and "minerals" management, indicating that BLM (and the public) only expected and/or considered the kind of fossil fuel developments then in existence on BLM lands. Those traditional energy developments, of course, come with an entirely different set of environmental and related consequences than those resulting from hundreds of 700-foot turbines across thousands of acres of the surface estate administered by BLM. In short, authorizing this Project would plainly change the "scope of resource uses" under the Monument RMP. 43 C.F.R. § 1610.5-5 ("An amendment shall be initiated by . . . a change in the scope of resource uses" of the RMP). And, it would be arbitrary and capricious for BLM to interpret the scope of the Monument RMP's language regarding a "wide range of existing and potential uses" as encompassing energy sources that were not viable or contemplated at the time of its promulgation. See, e.g., Boody, 468 F.3d at 557 ("[D]esigning a management plan that 'contemplates' a wide swath of future changes" to avoid "plan amendments" is unlawful because it "would render nugatory the provisions of FLPMA requiring BLM to act in accordance with established resource management plans.").	
11534-3	Matt Arnold, William Eubanks	The patent inconsistency between the Monument RMP and the Project is further underscored by the fact that in 2005 BLM undertook a programmatic review with the express purpose of amending 52 specific "BLM land use plans to address wind energy development"— but BLM explicitly excluded the Monument RMP from that programmatic review. See BLM, Final Programmatic Environmental Impact Statement on Wind Energy Development on BLM- Administered Lands in the Western United States at 1-2, 2-26–2-27 (June 2005) [hereinafter "Wind Energy PEIS"]; see also BLM, Record of Decision: Implementation of a Wind Energy Development Program and Associated Land Use Plan Amendments (Dec. 2005) [hereinafter "ROD"]. For those RMPs that the agency excluded from its programmatic decision (such as the Monument RMP), BLM explained that it "expected" wind energy projects to be addressed "through ongoing and future land use planning efforts." See ROD at 6 ("The amendment of 52 BLM land use plans to adopt the program ensures that the program will have a maximum effect. Additional land use plan amendments and revisions are expected to follow the issuance of this ROD in those remaining areas with potentially developable wind energy resources through ongoing and future land use planning efforts."). In the DEIS for this Project, BLM attempts to sidestep the ROD's commitment to future RMP amendments by implying that the reason for the Monument RMP's exclusion from the agency's previous programmatic review is a mystery. See DEIS at 1-7 (The "[ROD] states that this exclusion could have been for a variety reasons, including that developable wind resources were not deemed present in the area managed by the [Shoshone Field Office] at that time, or that [the Monument RMP] was expected to be amended in the near term (and thus analysis would be incorporated into [that RMP])."). But the reason the Monument RMP was excluded is no secret; the 37-year-old Monument RMP is long overdue for revision, and has been scheduled to be replaced imminently. BLM itself acknowledged as much in 2014 when reevaluating the RMP for the abutting Jarbidge Field Office. See, e.g., BLM, Jarbidge	See response to comment 11534-2 (Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		Proposed RMP/final EIS at 4-102 (May 2014) (noting that the Shoshone Field Office and others nearby "are scheduled to prepare RMPs for their respective planning areas in the near future." (emphasis added)). In other words, it is clear that the Monument RMP was excluded from the 2005 ROD either because BLM anticipated that it would be formally amended before any industrial wind energy facilities were authorized, or because BLM, in 2005, did not deem the public lands governed by the Monument RMP to contain developable wind resources. Either rationale only further reinforces that BLM's 1986 Monument RMP (developed nearly two decades before the agency's 2005 programmatic wind-energy review that itself excluded these public lands) in no way contemplated, or even could have contemplated, the possibility of massive commercial- scale industrial wind-energy turbines and infrastructure on these public lands. Put simply, BLM cannot have it both ways—having already acknowledged in the PEIS that BLM had to amend 52 RMPs prior to BLM authorizing specific wind-energy projects under those RMPs, BLM must likewise amend the Monument RMP prior to authorizing wind-energy projects under this RMP. Balancing wind-energy production as a new addition to the "multiple uses" permitted by the Shoshone Field Office now is also imperative because "wind energy generation in [the Twin Falls District Office] is expected to increase substantially over the next 30 years. At least two other large wind energy facilities are proposed near the Lava Ridge Wind Project." DEIS at 3-85. But, as explained, BLM has not considered in the DEIS or elsewhere how this new, major energy source—which is fundamentally different from other energy sources in terms of its impacts on public lands and the many users of those lands—fits within the Monument RMP's existing energy-production mix, nor how that overall mix balances with non-energy uses on BLM lands in the Shoshone Field Office. Until and unless BLM completes a formal amendment to the Monument RMP that adequately addresses these concerns, BLM must halt the DEIS process to avoid unlawfully placing the cart (Project-specific DEIS) before the horse (RMP amendment). Only once an RMP amendment process is complete may BLM restart its DEIS process, and any new Project-specific EIS process must rely upon and be "clearly consistent with the terms, conditions, and decisions of the approved [amendment to the Monument RMP]." 43 C.F.R. § 1601.0-5. In the absence of an amended RMP prior to approval of this Project, BLM will stand in flagrant violation of FLPMA, NEPA, and those statutes' implementing regulations.	
11534-4	Matt Arnold, William Eubanks	BLM Must Specify Which Version of NEPA's Implementing Regulations the Agency is Relying on to Analyze the Project As a threshold matter, the DEIS does not disclose which version of NEPA's implementing regulations BLM is applying to analyze the Project. In 1978, CEQ promulgated regulations implementing NEPA, 43 Fed. Reg. 55978 (Nov. 29, 1978), as well as a minor substantive amendment to those regulations in 1986, see 51 Fed. Reg. 15618 (Apr. 25, 1986). In 2020, however, CEQ published a new rule, effective September 14, 2020, further revising the 1978 regulations. 85 Fed. Reg. 43,304-43,376 (July 16, 2020). Shortly after the new rule was published, CEQ announced that it had "begun a review of the 2020 Rule to, among other things, determine if the rule may adversely affect environmental justice communities, climate change or environmental quality." Sec'y of Interior, Secretarial Order No. 3399, Department-Wide Approach to the Climate Crisis and Restoring Transparency and Integrity to the Decision-Making Process § 3 (Apr. 16, 2021) [hereinafter "NEPA Order"]. In recognition of that review, Secretary of the Interior Deb Haaland directed agencies within the Department of Interior—including BLM—to "not apply the 2020 Rule in a manner that would change the application or level of NEPA that would have been applied to a proposed action before the 2020 Rule went into effect on September 14, 2020." Id. § 5(a). The DEIS dos not identify which version of NEPA's implementing regulations BLM applied to analyze the Project and its effects on the environment. Given the present uncertainty surrounding NEPA's implementing regulations, clarification is necessary; that is, BLM should specify whether it is relying on the 2020 NEPA regulations, or those that were in effect when BLM issued the 2005 Wind Energy PEIS. If the former, BLM must also explain why it has decided to ignore the Secretary's NEPA Order, what authority it retains to do so, and how it has rectified any incongruities between the analytical bases for the DEIS and the document to which it tiers. Such explanation is important for assuring the public that BLM has not used the current ambiguity surrounding NEPA's regulations to sidestep any environmental analyses for this commercial-scale Project with its significant impacts.	The BLM uses the direction and guidance provided in the most recent laws, regulations, and policies.
11534-6	Matt Arnold, William Eubanks	The DEIS purports to "tier" several important effects analyses to the 2005 Wind Energy PEIS. DEIS at 1-7; see also id. at 1-5 (explaining that "issues analyzed in other NEPA documents and tiered to in the [DEIS] . . . were analyzed in brief" in Appendix 3). The abbreviated discussion of impacts based on tiering includes, for example, how Project lighting affects bat foraging; how dust from Project roads affect vegetation, wildlife, and invertebrates; and the collision and electrocution risks posed to raptors by overhead powerlines, among others.3 BLM's decision to rely on the PEIS to escape its "hard look" duty under NEPA is arbitrary for multiple reasons. First, the 2005 Wind Energy PEIS is already stale and cannot, therefore, be used to support the Project authorization sought here. See Western Org. of Res. Councils v. Zinke, 892 F.3d 1234, 1244-45 (D.C. Cir. 2018) (BLM "admits that any deficiencies in the PEIS," including that it is "too outdated," "may affect the ability of BLM to 'tier' to that document when making individual leasing decisions."). The PEIS here was prepared in 2005, when wind projects existed in only three areas on BLM-administered lands. Even then, the collective generating capacity of those projects is likely smaller that this single Project alone. Compare PEIS at 2-28–2-29 (identifying projects with a combined generating capacity of 1,558 MW), with DEIS at 2-4 (considering installation of "349 6-MW turbines," or 2,094 MW total). Since the PEIS was published, wind energy projects (and the best way to mitigate the impacts thereof) have evolved significantly, including important technological advances that allow them to be installed in an increasing number of environments. This is evident from the fact that the Shoshone Field Office's Monument RMP was excluded from those amended by the PEIS because "developable wind resources were not deemed present in the area managed	The December 2005 *Record of Decision for the Implementation of a Wind Energy Development Program and Associated Land Use Plan Amendments* states, "The decision is hereby made to implement a comprehensive Wind Energy Development Program to administer the development of wind energy resources on BLM-administered public lands in 11 western states: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. The decision establishes policies and best management practices (BMPs) for the administration of wind energy development activities and establishes minimum requirements for mitigation measures. The policies and BMPs were evaluated in the Final Wind Energy PEIS (BLM 2005a) and are included in Attachment A. With the decision to implement the Wind Energy Development Program, the BLM Interim Wind Energy Policy (BLM 2002) will be replaced by a new policy that incorporates the programmatic policies and BMPs evaluated in the PEIS. Elements of the Interim Policy addressing applications, authorizations, competitive interests, and due diligence will not be changed by the new program requirements" (emphasis added) (BLM 2005b). In processing the application for the Lava Ridge Wind Project, the BLM follows the elements and the BMPs established by the December 2005 ROD (BLM 2005b) and analyzed in the PEIS. The BLM recognizes that the use of these program elements and BMPs are not a requirement established by an amended land use plan but considers them as established guidance through policy.

Comment ID	Commenter	Public Comment	Response to Comment
		by the SFO [i.e., Shoshone Field Office] at that time." DEIS at 1-7. The PEIS itself implicitly acknowledges that such advancements limited its utility in future authorizations. The "Maximum Potential Development Scenario" ("MPDS"), for instance, is limited to 20 years (i.e., until 2025). PEIS at 2-2–2-3 (explaining that the MPDS "identifies the spatial distribution of the maximum possible extent of future wind energy development activities that may occur on BLM- administered lands over the next 20 years (i.e., 2005 through 2025)," and was "evaluated . . . as representing an upper bound of potential impacts and showing where the potential development may occur."). The Project here is slated to operate until 2055 at least, and in an area outside those considered by the MPDS. DEIS at 2-3 ("The EIS analysis assumes an approximate project schedule consisting of three phases: 2 years of construction, up to 30 years of operation and maintenance, and 2 years of decommissioning."). On its face, therefore, the PEIS is an inappropriate basis for tiering in the DEIS, both because the analysis contained in the PEIS is severely outdated and, in any event, was never intended to apply to wind-energy projects on these public lands or operating three decades into the future after the conclusion of the PEIS's own stated window of analysis. Even setting aside the age and geographical limitations of the PEIS, it is also an improper basis for tiering due to its cursory (or, in some cases, non-existent) analysis of certain issues. ... BLM's decision to tier to the PEIS also undermines other sections of the DEIS, rendering those "analyses" insufficient under NEPA and Ninth Circuit precedent. See DEIS at App'x 3-2, (deferring to the PEIS for examinations of Project effects in a broad array of areas, including "avian habitat," "noise and human activity from project construction and operation," "collision and electrocution risks" to raptors from overhead powerlines, and groundwater contamination, among other things). Because these tiered analyses fail to provide "some quantified or detailed information" concerning the actual effect this Project will have on the resource, "neither the courts nor the public . . . can be assured that [BLM] provided the hard look that it is required to provide" under NEPA. Neighbors of Cuddy Mtn. v. U.S. Forest Serv., 137 F.3d 1372, 1379-80 (9th Cir. 1998).	See EIS Section 3.1.2.2. The BLM has evaluated the information provided in the PEIS for its applicability to the project and uses the analysis as support for the use of BMPs. The draft and final EIS provide an in depth review of specific impacts that could occur if the Proposed Action or alternatives are selected. The information provided in the PEIS and the EIS together provide the information needed to support a "hard look" as the BLM considers the decision on the proposal.
11535-2	Steven Andersen	We also reiterate our strong objection that the BLM is processing this application before the completion of the NEPA process for the Programmatic Environmental Impact Statement ("PEIS") and correlating Resource Management Plan amendments for western states, which is being expanded to BLM-administered lands in Oregon, Washington, Montana, Wyoming and Idaho. According to the Notice of Intent and Planning Criteria, the PEIS is specifically being completed to appropriately account for protection and management of cultural and historic resources in response to the development of utility-scale renewable energy development projects like Lava Ridge. The DEIS states that the current PEIS for Wind Energy Development in the Western United States (BLM 2005) did not amend the Monument RMP but is relevant for the Lava Ridge Wind EIS and goes so far as to indicate that the EIS tiers to the BLM's 2005 Final Programmatic Environmental Impact Statement for Wind Energy Development on BLM Administered Lands in the Western United States, even though the 2005 Programmatic EIS only applied to BLM administered lands in Arizona, California, Colorado, Nevada, New Mexico and Utah – not Idaho. Tiering this EIS to the inapplicable 2005 Programmatic EIS is inappropriate; however, the PEIS and correlating RMP amendments for western states will extend to Idaho: To accelerate the processing of the Lava Ridge application ahead of the PEIS and necessary RMP amendments is contrary to the mandate of Executive Order 14008 and the BLM's obligations under FLPMA.	The ongoing planning effort supported by the programmatic EIS is focused on renewable solar energy projects not wind projects. The BLM SFO is working with the BLM State and Headquarter offices so that the planning action and actions (if any) authorized at on a project level are not conflicting. See response to comment 11534-6 (see in Table A-3jj, Legal or Policy Compliance).
11535-3	Steven Andersen	Additionally, processing of this application should await a decision on Proposed Federal Rule Doc. 2023-06310 in response to Executive Order 14072. The proposed rule is intended to "promote the use of conservation to ensure ecosystem resilience, and in so doing the proposed rule would clarify conservation as a use within the BLM's multiple use framework, including in the decision making, authorization and planning processes."2 Given the complexity of the proposed project and its multi-faceted impacts on public lands, and the clear disturbance of the ecosystem, awaiting the finalization of the rule would provide clarity to defining key terms like disturbance, direct and indirect effects, important, scarce and sensitive resource, as well as "Indigenous Knowledge" and "intact landscape" as well as "mitigation" and "permittee" when identifying the responsibility of parties in the context of mitigation. Id. All of this is directly related to the Lava Ridge proposal and will be impactful to analysis of the application and evaluation of associated environmental impacts.	The BLM's is processing this application consistent with all applicable laws, regulations, and policies. The BLM has coordinated with Native American Tribes throughout the evaluation of the project, considering their input and feedback on processes and potential impacts. The information obtained through coordination with Native American Tribes and other stakeholders and communities play a significant role in shaping the information in the EIS and the BLM's decision.
11535-5	Steven Andersen	This action is closely related to and should be discussed in the same NEPA document as proposed actions for the entire Southwest Intertie Project northern portion, known as SWIP North (SWIP Phase III).3 These actions are part of a singular, connected system and are so functionally interdependent as to constitute a single federal action. Both actions are aspects of a broader proposal and a single NEPA document is necessary to fully and adequately evaluate the cumulative impacts contemplated by the system. LS Power strategically sited Lava Ridge to feed into SWIP, as shown in LS Power's own materials: In fact, MVE's Development Plan and the alternatives discussed in the DEIS repeatedly address suitable access for interconnection with SWIP-North. There is no independent utility in Lava Ridge without SWIP North, and analysis of the environmental impacts of the two projects should not be segmented to avoid a broader and more accurate analysis of those impacts. In fact, although the financial capability of MVE was glossed over in MVE's Plan of Development, MVE's financing for Lava Ridge is dependent upon completion of and interconnection to SWIP North and securing Power Purchase Agreements (as well as Federal financing). Currently, SWIP North is undergoing cultural inventories, sage grouse analysis and ethnographic studies. However, failure to consider the projects together fails to account for key impacts like habitat fragmentation and consideration of broader alternatives to meet national "clean" energy objectives. By considering the actions piecemeal, the agency and public cannot understand the true scope and impact of the activities that should be under consideration. MVE's attempt to	Within the draft EIS Section 3.1 (Introduction and Methodology), the SWIP-North transmission line is described as an authorized use contributing to cumulative impacts. The combined impacts of the existing and future trends and actions and the project are discussed for each resource in the analysis of potential impacts.

Comment ID	Commenter	Public Comment	Response to Comment
		divide up this project for separate consideration under NEPA is inappropriate and the agency's consideration of the projects separately is arbitrary and capricious.	
11535-15	Steven Andersen	The project fragments large, continuous tracts of sage-grouse habitat, and does not focus the wind energy development on lands already altered or cultivated and away from areas of intact and healthy native habitats. 35 This is contrary to policy. Wind energy development located in areas with high levels of conflict and sensitive resources present the public and land management agencies with a corresponding risk or adverse consequences. Development should be directed away from areas of high conflict resources and towards areas of low conflict, such as previously disturbed sites, areas adjacent to previously disturbed sites, and locations that minimize construction of new roads and transmission lines.36 Broad EPA and BLM policies express a preference for directing renewable energy development towards low conflict areas. These policies aim to promote renewable energy development on disturbed or degraded lands, and also establish screening and prioritization processes designed to direct development away from lands with high conflict or sensitive resource values and towards low conflict areas.37 None of this was properly considered in the DEIS. The Audubon Society has designated lands within the boundary of the INL, generally throughout the proposed project area, as a global "Important Bird Area," with a concentration of species that inhabit largely undisturbed sagebrush steppe habitats, i.e., sage-grouse.	The steps MVE took as they considered project locations are described in the Alternatives Considered by MVE (Appendix C in MVE [2023]). The descriptions of these steps support that the BLM and other agencies worked with MVE to direct projects away from high conflict resources, such as priority habitat management areas for sage-grouse. Sections 3.7 (Fire and Fuels Management) and 3.15 (Vegetation) describe the project area as having high levels of disturbance from wildfire and having significant areas of non-native plant communities. Additionally, within Section 3.8 (Land Use and Realty), the draft EIS describes the development of high voltage transmission lines that are authorized and in place within the project area. Other areas of public lands outside of the project area have much less development, have seen less impacts from wildfires, and continue to have intact native plant communities offering higher quality wildlife habitat. The BLM recognizes that there continues to be important resources within the project area and fully considers potential impacts within the draft and final EIS with the intent of making an informed decision considering all laws, regulations, and policies.
11535-170	Steven Andersen	The DEIS selects the site alternatives without adequate consideration of suitability. It appears the sites presented in the DEIS were considered as suitable in large part due to insufficient and outdated land management plans. By avoiding "red tape" found in updated and comprehensive land management plans and areas with VRM Class ratings, the site is not more suitable. Rather, the agency has a duty to assess the same factors that should be considered in such updated plans, including visual resource management concerns. It has been widely reported that there is relatively low wind energy potential in the proposed project area. This is why the area was not included in the BLM's Final Programmatic EIS for Wind Energy Development on BLM-Administered Lands in the Western United States (BLM 2005a). See Record of Decision, December 15, 2005 (and associated wind study). In reality, MVE wanted proximity to SWIP North, with very little red tape.	See responses to comments 11326-9 (see in Table A-3jj, Legal or Policy Compliance), 11534-2 (see in Table A-3jj, Legal or Policy Compliance), 11535-15 (see in Table A-3jj, Legal or Policy Compliance), and 11535-149 (see in Table A-3y, Visual Resources).
11535-172	Steven Andersen	Further, breaking up this NEPA analysis from the SWIP North analysis eliminates an evaluation and understanding of MVE's interconnection requirements and a cohesive analysis of the location suitability.	See response to comment 11535-5 (see in Table A-3jj, Legal or Policy Compliance).
11546-2	Dan Sakura	Doe Run Solicitor's Opinion. The DEIS does not adequately describe the Secretary's responsibilities to manage units of the National Park System pursuant to NPS statutory authorities, in conjunction with FLPMA and other authorities outlined in the Friends of Minidoka comment letter. The relationship between the Secretary's requirement to manage parks unimpaired for future generations pursuant to the Organic and Redwoods Acts and actvities on lands outside the boundaries of National Parks is described in the 1998 Solicitor's Opinion relating to permits requested by the Doe Run mining company. Redwoods Act. The Redwoods Act of 1978 states that "Congress further reaffirms, declares, and directs that the promo□on and regulation of the various areas of the National Park System, as defined in section 2 of this Act, shall be consistent with and founded in the purpose established by the first sec□on of the Act of August 25, 1916, to the common benefit of all the people of the United States." According to Molly Ross, the Doe Run opinion concludes that the Secretary "bears responsibility both for determining whether the ac□vi□es of other DOI bureaus threaten park resources and values and—as implied in the solicitor's description of the secretary's options—for protecting them, as long as the statutes governing those non-NPS activities provide the secretary sufficient discretion." Because the Organic Act (as amended by the Redwoods Act) does not expressly limit "authorization of activities" to areas within park boundaries, the Solicitor found that "the text of the 1978 [Redwoods Act] Amendment and the other legal considerations discussed in this sec□on support the conclusion that the Organic Act as amended in 1978 does have application to the Secretary's exercise of his authorities over ac□vi□es taking place outside the boundaries of park units."3 The Congressional guidance in Minidoka's authorizing legislation directs the Secretary to preserve and interpret the Minidoka Relocation Center, which extends well beyond the boundaries of the Minidoka National Historic Site's authorized boundary.	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. See also response to comment 9080-46 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11546-6	Dan Sakura	Secretary's authority outside park boundaries. As a general mater, the Solicitor's opinion cites an article no□ng the Secretary's "general lack of regulatory authority over ac□vi□es arising outside the parks." Robert B. Keiter, On Protec□ng the National Parks from the External Threats Dilemma, 20 Land & Water L. Rev. 355 (1985).4 However, in the case of Lava Ridge, the Secretary has the authority under FLPMA to deny Magic Valley Energy's application for a BLM ROW permit. Derogation of park purposes is not directly and specifically authorized. According to the Solicitor, the Redwoods Act requires that "`authorization of activities' shall not be exercised 'in derogation of the values and purposes for which these various areas have been established,' except as 'directly and specifically provided by Congress.'"	See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS. See also response to comment 9080-46 (see in Table A-3cc. Mitigation – EIS Appendix 4).
11546-7	Dan Sakura	As noted in the Friends of Minidoka letter, FLPMA by itself directs the Secretary to preserve Minidoka's cultural resources by beginning a planning process to consider the Greater Minidoka ACEC. In conjunction with park specific authorizing legislation, there is clear Congressional authority to protect Minidoka. Moreover, FLPMA does not "directly and specifically" authorize the Secretary to derogate Minidoka's values and purposes. Also, the Energy Policy Act does not include direct or specific authority relating to Minidoka NHS: it directs the Secretary to seek to permit at least 25 gigawatts (GW) of electricity from wind, solar, and geothermal projects by 2025, a nationwide goal. Redwoods Act and Minidoka NHS. The Solicitor found that "[t]he more the threat is	See responses to comments 9080-51 (see in Table A-3ii, Decision Process for National Park Service) and 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		direct, specific, and credible, and the more it relates to a fundamental value or purpose of the park in ques□on, the more clearly the 1978 Amendment comes into play."6 As noted by the Friends of Minidoka DEIS comment letter, the proposed Lava Ridge project poses a direct, specific and credible threat to Minidoka's viewshed and associated park purposes and fundamental values to interpret the lives of incarcerees and support commemora□ve ac□vi□es and healing. The FEIS should consider the Solicitor's Opinion in its analysis of BLM's legal authorities.	
11554-12	Raul Labrador; Idaho Attorney General's Office	MVE is an out-of-state energy company that wants to take public lands and use them for private gain. The Project's unprecedented scope has raised significant concerns across the public-interest spectrum. And for good reason. Bulldozing across nearly 200,000 acres of public land to import 400 steel turbines that rise up 740 feet and crank 230-foot blades all day is going to cause unalterable damage and have serious collateral consequences. If the Project is approved, Idaho's people, resources, and interests will bear these harms so MVE can sell power to California. These concerns are reflected by the Idaho Legislature's joint resolution—unanimously passed—opposing the Project. See Idaho House Concurrent Resolution 4, (2023). Indeed, the agency must steward these lands for the benefit of the public and ensure that any use is consistent with the land's public nature. See 43 U.S.C. § 1701(8). The agency must also ensure that uses do not violate protected interests, such as State, environmental, and tribal interests. But MVE's proposal and the agency's preferred alternatives are legally indefensible. The agency's Draft Environmental Impact Statement acknowledges as much, repeatedly noting the "irreversible and irretrievable" consequences posed by the Project. It is well recognized in our federal system that Idaho retains sovereign interests in its water, air, wildlife and the well-being of its people. See Massachusetts v. E.P.A., 549 U.S. 497, 518–19 (2007). MVE's Project would infringe on each of these interests. And the BLM's draft EIS fails to account for these harms in its proposed alternatives. [...] CONCLUSION [...] It's no surprise that the agency's failure here has catalyzed Idahoans from across the political spectrum to unite in opposition to the Project.12 The agency should listen to these voices and reject MVE's attempt to capitalize personally at the expense of the public. The harms are overwhelming and are too great to ignore.	The BLM recognizes the State of Idaho's interest and the potential of uses on public lands to result in impacts to air, water, and wildlife. Early in the evaluation of the project, the BLM coordinated with the State of Idaho agencies and incorporated them as cooperating agencies in the preparation of the EIS. The BLM has coordinated with State agencies extensively and used information pertaining to the State's jurisdiction by law and the agencies' expertise to prepare the EIS and provide a hard look at these issues. The potential impacts to water, air, and wildlife have been described in the EIS.
11554-13	Raul Labrador; Idaho Attorney General's Office	MVE's Project cannot be justified under the law. It represents a disregard for the environment and other vital interests entrusted to the agency's safekeeping. The Project cannot be squared with Congress's mandate in the FLPMA that the agency must manage all public lands to "protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archaeological values." 43 U.S.C. § 1701(8). The agency's draft EIS fails to take a hard look at the numerous sweeping environmental impacts the Project will cause. Ctr. for Biological Diversity v. Dep't of Interior, 623 F.3d at 641 (9th Cir. 2010). It also fails to account for numerous other relevant interests. And the Project would significantly intrude on Idaho's "residual and inviolable" sovereignty, disrupting the critical federal-state balance that underlies our constitutional system of "dual sovereignty." Printz, 528 U.S. at 918–19. On the other side of the balance sheet, only one private company will profit.	BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. Within the EIS the BLM fully considers impacts to resources and considers the potential impacts and how they relate to laws, regulations, and policies. The BLM recognizes the State of Idaho's interest and the potential of uses on public lands to result in impacts. Early in the evaluation of the project, the BLM coordinated with the State of Idaho agencies and incorporated them as cooperating agencies in the preparation of the EIS. The BLM has coordinated with State agencies extensively and used information pertaining to the State's jurisdiction by law and the agencies' expertise to prepare the EIS providing a hard look at a comprehensive set of issues.
11554-14	Raul Labrador; Idaho Attorney General's Office	Idaho has a special interest in preserving the wildlife within its borders. See Kleppe v. New Mexico, 426 U.S. 529, 545 (1976) ("Unquestionably the States have broad trustee and police powers over wild animals within their jurisdictions."); Baldwin v. Fish and Game Comm'n of Montana, 436 U.S. 371, 391 (1978) ("Protection of the wild life of the State is peculiarly within the police power, and the State has great latitude in determining what means are appropriate for its protection.") (cleaned up). Indeed, "the protection of wildlife and other natural resources of a state are some of the state's most important interests." Conservation Force, Inc. v. Manning, 301 F.3d 985, 996 (9th Cir. 2002) (cleaned up). To protect this critical interest, Idaho law declares "[a]ll wildlife ... within the state of Idaho . . . to be the property of the state of Idaho" and requires the state to "preserve, protect, perpetuate, its wildlife" and "provide continued supplies of such wildlife for hunting, fishing and trapping." Idaho Code § 36-103(a). The Project will undermine Idaho's rights over its wildlife. And no amount of compensatory mitigation will adequately address the Project's deep harms.	The BLM recognizes the State authorities and responsibilities for managing wildlife. The BLM regularly coordinates on broader policies and principles for ensuring the sustainability of wildlife and their habitats located on public lands. Additionally, the BLM has coordinated with the State of Idaho through our evaluation of the project to ensure that important issues and potential impacts are considered. With the information and expertise that the State of Idaho has provided, the BLM has prepared an EIS that will provide what is needed to take a hard look that considers potential impacts to wildlife and the State of Idaho's interests in the project.
11563-6	Idaho Cattle Association	The Biden administration and Department of Interior leadership have made clear their priority to encourage and facilitate renewable energy development on federal lands. The Lava Ridge project is certainly an outgrowth of that. Despite the administration's goals for expanded renewable energy, adequate review and planning for such massive infrastructure has not occurred. The BLM's Resource Management Plan (RMP) for this area dates back to 1986 and lacks sufficient direction for managing energy development. At the local and state level, there should be an effort undertaken to first develop comprehensive energy development planning and then update plans RMPs accordingly, with the input of the locally affected communities at every step of the way. This project should be put on hold until the RMP is updated and the BLM, in concert with the state, has more robust plans for energy development across the state.	See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance).
11598-3	Idaho Conservation League	If the BLM still decides to move forward with some form of an action alternative for this project, we recommend that the BLM not proceed directly towards a Final Environmental Impact Statement and Record of Decision but instead initiate a Supplemental Draft Environmental Impact Statement. We note that Federal Agencies can take this step when it becomes clear that additional information or additional alternatives are needed. The BLM can use the SDEIS process to conduct additional baseline monitoring on wildlife and cultural resources, further the analysis in response to public comments about the project, and develop one or more additional alternatives that better avoids, minimizes and mitigates impacts. We believe that it is possible to address the wildlife issues detailed below through a robust Supplemental draft EIS process, a programmatic approach on BLM lands	The BLM has prepared a full and detailed analysis with robust public participation with the NEPA process supporting requirements for a hard look in BLM decision-making. After the public comment period for the draft EIS, the BLM responded to comments by • modifying alternatives as supported by analysis or comments; • improving or modifying analysis after considering information from comments; • making factual corrections; and • adding detail or adjustments to mitigation measures supported by analysis or comments.

Comment ID	Commenter	Public Comment	Response to Comment
		across southern Idaho, and a willingness of the project proponent to adjust the proposal to better fit the landscape.	The BLM's NEPA policy that a supplemental analysis is not warranted unless the BLM • makes substantial changes to the Proposed Action that are relevant to environmental concerns; • adds a new alternative that is outside the spectrum of alternatives already analyzed; or • there are significant new circumstances or information relevant to environmental concerns and bearing on the Proposed Action or its effects. In our review of comments and preparing the final EIS, the BLM did not make any of these adjustments warranting supplementation.
11598-24	Idaho Conservation League	Comments on NEPA Procedure ICL appreciates how future micro-siting might be used to further avoid and minimize impacts, but we are concerned about the BLM not taking the required hard look as required by NEPA: Although the exact location of infrastructure and activities within the siting corridors is unknown at this time, evaluating the entirety of the siting corridors for potential impacts provides flexibility to site the project components where necessary (from both resources and engineering perspectives) within the siting corridors. The project's final design and engineering would be completed after the BLM has issued a record of decision (ROD) and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. Lava Ridge DEIS, ES-vi. and Although the exact location of infrastructure and activities within the siting corridors is unknown at this time, evaluating the entirety of the siting corridors for potential impacts provides flexibility to site the project components where necessary (from both resources and engineering perspectives) within the siting corridors. The project's final design and engineering would be completed after the BLM has issued a record of decision (ROD) and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. The project's final design would identify the specific location for all infrastructure and project activities and would be approved by the BLM Authorized Officer. This EIS identifies and considers effects to resources present within the siting corridors, allowing for identification of areas with fewer impacts or specific resource trade-offs. This identification of resource constraints within the siting corridors provides flexibility for the project design to adjust through site-specific engineering for the final layout. EIS 2-2. In order to address these and other NEPA deficiencies, we recommend that the BLM complete a Supplemental Draft Environmental Impact Statement (SDEIS). The BLM can use that opportunity to conduct additional baseline monitoring on wildlife and cultural resources, further the analysis in response to public comments about the project, and develop one or more additional alternatives that actually avoid impacts (see Figure 1 below). We note that the BLM has utilized a SDEIS for the Jonah Infill Drilling Project, Willow Master Development Plan, Arctic National Wildlife Refuge Coastal Plain Oil and Gas Leasing Program. The Forest Service has utilized the Supplemental process for the Stibnite Gold DEIS and the CuMo Mine Exploration Project EA, both also in Idaho. The SDEIS should also include alternatives for the permanent administrative protections of those areas deemed incompatible with infrastructure development, including Areas of Critical Environmental Concern, as mentioned below.	The BLM's NEPA policy recognizes the level of detail used to describe a proposed action will vary by nature and stage of the project and the level of detail will influence the specificity of the analysis and assumptions made in analyzing the potential impacts. Utilizing siting corridors in the Proposed Action and alternatives to describe the location of proposed infrastructure provides the required amount of detail to fully analyze the potential impacts. The details provided in the description of the siting corridors, the proposed infrastructure, and the actions associated with construction and operation has provided the information needed to have • focused and meaningful public input and internal discussions, • completely identify issues, • develop a range of reasonable alternatives, • prepare a sound and focused analysis of effects, • have a focused consideration of mitigation measures, and • supports a hard look for BLM decision-making. See response to comment 11598-3 (see in Table A-3jj, Legal or Policy Compliance).
11598-26	Idaho Conservation League	As noted in our scoping comments, the Monument RMP calls for more detailed management plans or activity plans when the need arises. As part of mitigation for this project, the BLM should complete an activity plan focused on protecting the values of the adjacent Minidoka National Historic Site: Detailed Management Plans The RMP provides general guidance for the resource area. More detailed management plans, called activity plans, will be prepared to deal with areas where a greater level of detail is required. Activity plans will indicate specific management practices, improvements, allocations, and other information for a particular site or area. They will be prepared for most major BLM programs such as range (allotment management plans), recreation (recreation area management plans), wildlife (habitat management plans), and cultural resources (cultural resources activity plans.). Where two or more activities have activity plan needs in the same general area, a single consolidated activity plan may be prepared. Coordination, consultation, and public involvement are integral parts in the formulation of activity plans. -Monument RMP, p. 26.	The action alternatives are not proposed on Minidoka NHS; the NPS manages Minidoka NHS under the *Minidoka Internment National Monument: General Management Plan* (NPS 2006). The BLM is adding an EIS section evaluating potential project impacts to the NPS interpretive purpose at Minidoka NHS. Also see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11598-31	Idaho Conservation League	Decision Space The BLM should be clearer about the decision space it has for this project and if the No Action Alternative is feasible. In the event the BLM selects the No Action Alternative for the Lava Ridge Project, the BLM should also inform the public if there is anything in the Resource Management Plan (RMP) or BLM policy that would prevent another renewable energy project from being proposed in the same location.	The BLM's decision space is described in Section 1.3 (Decision to be Made) of the EIS. The decisions made by the BLM on the project or any subsequent renewable energy proposal are made after considering the relevant information and based the information specific to the project.
11598-34	Idaho Conservation League	A programmatic approach needed to select appropriate areas for renewable energy development. Many members of the public are concerned that Lava Ridge is just the first of a series of projects that would fully develop the Snake River Plain with renewable energy projects. State and federal agencies need to be clear that to meet Idaho's clean energy goals and the Administration's renewable energy goals, it will not be necessary to develop all potential lands in southern Idaho with solar, wind or geothermal energy projects. While we do not believe this full development would occur in the foreseeable future, we are concerned that less suitable sites with conflicting public values may be developed. At this point, there is nothing in the BLM or State direction that would specifically preclude such overdevelopment or protect existing uses. While Lava Ridge would appear to be a suitable location based on avoidance of important areas such as Sage-grouse Priority and Important Habitat Management Areas, Wilderness Study Areas, Areas of Critical Environmental Concern and known habitat for threatened and endangered species, there are still significant issues with the proposed location based on other values. It may be the case that some form of energy project in the Lava Ridge location is indeed the best place in the Snake River Plain for a development project, but without an additional programmatic analysis, we will not know for sure. A transparent, public process is the best way to build confidence in renewable energy projects and to prevent renewable energy projects from being developed	The BLM's purpose and need for the project is specific to responding to MVE's application for a ROW grant to construct, operate, maintain, and decommission a wind energy facility on public lands. Additionally, the BLM has determined that the proposed action and range of reasonable alternatives needed to meet the purpose and need are in conformance with the *Monument Resource Management Plan* (BLM 1986), as amended. Therefore the preparation of a programmatic analysis for the purpose of supporting a land use plan amendment for renewable energy is outside the scope of the EIS. See response to comment 11534-6 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		in sensitive areas such as wildlife and viewsheds where renewable energy projects should not be allowed. We recommend that the BLM take a programmatic approach across all Resource Management Plans in southern Idaho and see which areas have the greatest renewable energy potential with the fewest natural resource and community impacts. Once the BLM has gone through this process and identified a discrete number of sites and acreages suitable for energy development, the BLM should apply its Prioritization Criteria for these sites and facilitate the permitting of projects that are "smart from the start." We propose that the Idaho BLM undertake a series of Resource Management Plan amendments, similar to the Greater sage-grouse RMPA (Resource Management Plan Amendments) process. The Monument RMP is one of the oldest RMPs in the country and many of the other RMPs are also significantly outdated and insufficient to provide adequate guidance on renewable energy development. Without a consistent approach to this issue, we are concerned that public lands are going to be developed in an uncoordinated and patchwork manner with projects receiving different levels of scrutiny, varying levels of protections, inconsistent design features, insufficient mitigation measures and suboptimal coordination for efficient energy development. Just as the Greater sage-grouse RMPA focused on management issues that may affect Greater sage-grouse, this Renewable Energy RMPA would update RMPs to examine resource energy potential and energy transmission and the effects that these projects might have on cultural resources, wildlife habitat, recreation and other community values. For areas that are identified through this RMPA process as being incompatible with renewable energy development, the RMPs should be amended to preclude such development and safeguard these resources. For areas that are deemed not suitable for renewable energy development, this determination should be codified in the RMP amendments. Temporary segregation or withdrawal for renewable energy projects, similar to an administrative mineral withdrawal, could be another option. Even if the BLM selects the No Action Alternative for the Lava Ridge project because of cultural or wildlife values or other issues, there is currently nothing in the current RMP that would prevent another project from being proposed in the very same area. If there is always the possibility of such a proposal being developed in an area with conflicting and unresolvable issues, it will be difficult for the BLM and partners to optimize the other values in this area such as restoring habitat for wildlife or additional interpretation of cultural values. If wildlife habitat is determined to be of critical importance, as has been expressed for certain areas of Lava Ridge, then the RMP should be amended to state that these areas are to be managed instead for wildlife habitat conservation and restoration. Likewise, areas with fewer resource conflicts could be optimized for renewable energy development but the RMPA would allow for more strategic and expanded mitigation opportunities. Renewable Energy Conservation Plan The California Desert Renewable Energy Conservation Plan was a public process involving the BLM, the state of California and counties. The plan started out with approximately 20 million acres under review for potential projects and was then narrowed down to some 11 million acres of public lands. Lands not deemed appropriate for energy development were safeguarded with conservation measures to protect local values, while lands that were deemed appropriate for development included mitigation measures and setbacks for wildlife and cultural resource issues. Counties received support to engage in this process. Although this particular process took 8 years, the lessons learned from this process could be applied more strategically and help federal, state and local governments in Idaho address this issue.	
11598-35	Idaho Conservation League	Update and tier to the BLM's Wind and Solar Programmatic EIS The BLM could work with the state, county, Tribal governments, and members of the public to update the BLM's Wind and Solar Programmatic Environmental Impacts Statements for southern Idaho to provide more specific direction similar to the BLM's Solar Energy Development programmatic EIS for western states including CA, NV, NM, AZ, UT, and CO. The BLM could tier to the PEISs and provide a more specific analysis to all RMPs in southern Idaho with an updated review process. Protecting cultural values for Shoshone-Bannock and Shoshone-Paiute Tribal members, as well as for members of the Japanese-American community, will be a critical component to this process.	See responses to comments 11598-34 and 11534-6 (see both in Table A-3jj, Legal or Policy Compliance).
11620-2	Simone Griffin; BlueRibbon Coalition	The Bureau of Land Management is required to show a broad range of alternatives when undertaking a NEPA process. In order to adequately comply with NEPA the BLM must have alternatives that explore a range of alternatives. Closure is not management. These areas provide a purpose and need for outdoor access that improves physical and mental health for public land users.	The BLM analyzed a full range of reasonable alternatives and describes additional alternatives that were considered within the draft EIS and the final EIS. The description of the Alternatives is located within EIS Chapter 2 and the analysis of potential impacts is located within Chapter 3.
11672-2	Teiko Saito	• BLM's Monument Resource Management Plan (RMP) is 38 years old and horribly out of date, as demonstrated by the fact that it fails to (ironically, given the name of the RMP) recognize Minidoka's initial status as a designated National Monument under the Antiquities Act, let alone Minidoka' s subsequent Congressional designation as a National Historic Site that is part of the National Park System. It will be arbitrary and capricious for BLM to make a major land use management decision of the magnitude of Lava Ridge Project based upon such an out-of-date RMP. Accordingly, BLM should logically pause further work on the Lava Ridge Project and first update the Monument RMP, so it accurately reflects the current land use designations, uses and resource values within the RMP planning area.	See responses to comments 11326-9 and 11598-26 (see both in Table A-3jj, Legal or Policy Compliance).
11674-1	Marilyn Broek	The proposed Lava Ridge wind turbine project is to be constructed on Federal public lands. It must be obligated to meet the requirements of this long standing law protecting migratory birds between the United States and Canada, Mexico, Japan, and Russia The proposed Lava Ridge wind turbines draft EIS states up to 11,799 birds will be killed by the turbines every year. It is beyond comprehension that this project can even be considered as acceptable on public lands in our United States. Our federal agencies are required to live within the rules of this Act. So must any private business thinking they can construct and operate on our public lands.	The EIS describes potential impacts to migratory birds and compliance with the MBTA within Section 3.3.2.

Comment ID	Commenter	Public Comment	Response to Comment
		As a project engineer working on large construction projects located on public and private lands in Idaho for the last 40 years I have delt with this Migratory Bird Treaty Act many times. The scope of the bird kills along with the stated mitigation efforts anticipated for Lava Ridge is a slap in the face to Idaho, the United States, Canada, Mexico, Japan, and Russia. And it is a death warrant for our beloved birds.	
11821-10	Laura Cunningham, Kevin Emmerich, WildLands Defense	Many BLM Resource Management Plans (RMPs) are decades old and in need of revision. As BLM considers the lands that it manages for renewable energy development, BLM cannot rely on outdated information from existing RMPs. Instead, there must be an updated robust environmental analysis at the local level with full public and stakeholder participation. [...] The plans were made before BLM had developed the VRM Class policy. By default, any unevaluated Visual Classes for BLM resource areas are managed as VRM Class IV which encourages development. A fair evaluation of these lands may determine they qualify for VRM Class II or VRM Class III which are more restrictive to energy development.	See responses to comments 11326-9, 11534-2 (see both in Table A-3jj, Legal or Policy Compliance), and 11535-149 (see in Table A-3y, Visual Resources).
11860-12	Shauna Robinson	Monument Resource Management Plan • Even though the Greater Sage Grouse Resource Management Plan from 2015 was used as an update to the 1986 Monument Resource Management Plan, it seems inadequate in addressing the impacts caused by renewable energy projects on public lands, i.e., Lave Ridge. It states that lands rated as General Habitat Management Areas are open to a host of uses, wind energy projects included. The “moderate use” areas are deemed “generally suitable for a wide range of existing and potential uses with no special limitations or restrictions on the type of intensity of resource use,” and “because the siting corridors are in a General Habitat Management Area (GHMA) for Greater Sage Grouse…the area is designated as open to wind-energy development per BLM (2015).”(ES-v, Monument RMP, p.4, p.6) I feel this is inadequate because it does not take into consideration resources other than Greater Sage Grouse in determining locations for wind energy projects. Endemic species of insects, vegetation, or amphibians could inhabit some of those GHMA sections. Perhaps such an area would be part of a flyway used by migrating birds, and, certainly, with the extensive history of human habitation in areas like the Lava Ridge project area, surface and sub-surface artifacts may be there. Consider, too, unique geologic features that can be found in a volcanic plain or features like playas. So, just opening the land to huge energy projects because the habitat may not support Sage Grouse is a mistake. A comprehensive strategy for energy projects is needed that considers all resources.	Also see response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance). The SFO has a history of updating management direction within management plans when a need has been established. Within the EIS the BLM considers impacts to multiple resources and species to understand how the potential impacts relate to laws, regulations, and policies.
11869-5	Raul Labrador, Josh Turner; Idaho Attorney General’s Office	And by failing to account for Idaho’s sovereign interest in its water, the draft EIS also falls short of the requirements of NEPA and the FLPMA. See Ctr. for Biological Diversity v. Dep’t of Interior, 623 F.3d 633, 641 (9th Cir. 2010) (NEPA requires agencies to take “a ‘hard look’ at the environmental consequences of its proposed actions”); see also 43 U.S.C. § 1701(a)(8) (requiring the Bureau to manage public lands in a manner that “will protect the quality of [its] water resource”	The BLM recognizes the State authorities pertaining to the allocation of water resources. The BLM regularly coordinates on broader policies and principles for ensuring the sustainability of water uses on public lands and ensuring these uses comply with state laws. Additionally, the BLM has coordinated with the State of Idaho through our evaluation of the project to ensure that important issues and potential impacts are considered. With the information and expertise that the State of Idaho has provided, the EIS will provide the BLM with what is needed to take a hard look that considers potential impacts to State of Idaho’s interests in our decision on this project. See response to comment 11554-13 (see in Table A-3jj, Legal or Policy Compliance).
11869-6	Raul Labrador, Josh Turner; Idaho Attorney General’s Office	Our Constitution creates a system of “dual sovereignty.” Printz v. United States, 521 U.S. 898, 918 (cleaned up). When the States entered the Union, they “retained a residuary and inviolable sovereignty.” Id. at 919 (quoting The Federalist No. 39 (J. Madison)). One of the states’ retained powers is the right to hold title over all non-navigable waters. United States v. Utah, 283 U.S. 64, 75 (1931). The States have had a “traditional and primary power over . . . water use.” Solid Waste Agency of Northern Cook Cnty. v. United States Army Corps of Engineers, 531 U.S. 159, 174 (2001) (SWANCC); see also 33 U.S.C. § 1251(b) (“It is the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States to . . . plan the development and use (including restoration, preservation, and enhancement) of land and water resources”). So the law has long recognized a state’s ownership of its waters as “an essential attribute of [its] sovereignty.” Idaho v. Coeur d’Alene Tribe of Idaho, 521 U.S. 261, 283 (1997). The draft EIS acknowledges that “all action alternatives” will have “long-term irretrievable impacts on” Idaho’s wetlands and surface waters. DEIS at 3-447. Ground disturbance from building and operating the wind farm will “remove or alter wetlands, change their function, change the rate and quantity of runoff from the fill footprint, compact soils, and alter flow patterns.” DEIS 3-444. The Project could also pollute Idaho groundwater and surface water through inadvertent spills of hazardous materials, soil disruption. DEIS at 3-442, id. at Appendix 3-17–18. The draft EIS irresponsibly entrusts MVE to mitigate these impacts while at the same time conceding that even perfect compliance with these mitigation measures “would reduce but not eliminate potential impacts to wetlands and waters.” DEIS at 3-445. The draft EIS also fails to analyze how these impacts will affect Idaho’s sovereign interests over its waters or even acknowledge that Idaho has such an interest.5	See responses to comments 11869-5 and 11554-13 (see both in Table A-3jj, Legal or Policy Compliance).
11869-7	Raul Labrador, Josh Turner; Idaho Attorney General’s Office	Idaho also has a sovereign interest “in all the air within its domain.” Massachusetts v. EPA, 549 U.S. at 518–19 (cleaned up). The Project appropriates Idaho’s wind for private profit. In doing so, it deprives Idaho of the ability to use state-owned land in the Magic Valley to harvest wind for energy. Wind in Idaho is a resource that belongs to Idaho, and MVE’s use diminishes it for use by Idaho and its people. The draft EIS fails to consider Idaho’s interest in harvesting energy from its own wind.	The BLM recognizes the State of Idaho’s interest and the potential uses of public lands to result in impacts to air. Early in the evaluation of the project the BLM coordinated with the State of Idaho agencies and incorporated them as cooperating agencies in the preparation of the EIS. The BLM has coordinated with State agencies extensively and used information pertaining to the State’s jurisdiction by law and the agencies’ expertise to prepare the EIS and provide a hard look at these issues. The potential impacts to air have been described in the EIS. The BLM recognizes the State authorities and responsibilities for approving land uses including those to harvest wind on state-owned lands. The BLM regularly coordinated with the Idaho Department of Lands on broader policies and principles for ensuring compatible land uses. Additionally, the BLM has coordinated with the State of Idaho through our evaluation of the project to ensure that important issues and potential impacts are considered. With the information and expertise that the State of Idaho has

Comment ID	Commenter	Public Comment	Response to Comment
			provided, the BLM has prepared an EIS that will provide what is needed to take a hard look that considers potential impacts and the State of Idaho's interests in our decision on this project.
11869-21	Raul Labrador, Josh Turner; Idaho Attorney General's Office	The agency's recommended alternatives do not mitigate the harm. They also would "have irreversible impacts on mule deer and pronghorn from human activities (e.g., vehicle use, construction equipment, maintenance activities), wind turbine operation (e.g. noise, vibration, shadow flicker caused by moving blades) and ground disturbance that would remove or alter habitat." DEIS at 3-485. As noted above, Idaho maintains the right and responsibility to "preserve, protect, and perpetuate" its wild game populations and to "provide continued supplies of such wildlife for hunting, fishing and trapping." Idaho Code § 36-103(a). MVE's devastation to Idaho wild game is a clear invasion of Idaho's legal rights.	See responses to comments 11554-13 (see in Table A-3jj, Legal or Policy Compliance) and 11554-14 (see in Table A-3jj, Legal or Policy Compliance).
11869-23	Raul Labrador, Josh Turner; Idaho Attorney General's Office	Similarly, Idaho has designated several birds as SCGNs that the agency also recognizes will be severely and "irretrievably" harmed by the Project. See, e.g., DEIS at 3-126 (all action alternatives will have irretrievable harm on sage grouse); id. 3-68, 3-78 (ferruginous hawks are "vulnerable to population-level effects from wind energy development). As trustee over its wildlife, Idaho has a special interest in preserving these populations. The draft EIS's failure to account for, or even mention, Idaho's interest in SGCNs is a clear violation of federal law.	See responses to comments 11554-13 (see in Table A-3jj, Legal or Policy Compliance) and 11554-14 (see in Table A-3jj, Legal or Policy Compliance).
11871-9	WildLands Defense	This thwarts a meaningful hard look direct, indirect and cumulative impacts analysis under NEPA. NEPA-compliant hard look systematic science-based comparisons cannot be made unless the full range of pre-decisional biological, cultural and other information is gathered.	See response to comment 11871-14 (see in Table A-3jj, Legal or Policy Compliance).
11871-14	WildLands Defense	Reliance on post-decisional surveys for sensitive and other species and various other values of public land violates NEPA, FLPMA and the Migratory Bird Treaty Act. It violates the Monument RMP protections for sensitive values, the BLM sensitive species policy, BGEPA, the MBTA, the ARMPA, numerous BLM IMs, MOUs and policies. It is impossible to adequately assess the direct, indirect, cumulative and synergistic effects unless the specific project facility/infrastructure locations and other specific data - including for all biota of concern are identified pre-decisionally. Surveys must be conducted pre-decisionally and new analysis provided in a Supplemental EIS for public review and comment prior to any alternatives being developed.	Prior to the preparation of the draft EIS, multiple surveys were completed to gather information fully supporting the BLM's analysis of potential impacts and inform the BLM's decision. Measures described within the EIS identify additional surveys that would be required prior to construction if an authorization is granted to inform the implementation of an approved action in accordance with the required measures and design features.
11871-22	WildLands Defense	https://esajournals.onlinelibrary.wiley.com/doi/abs/10.1002/fee.2456 CEQ Corridors and New Connectivity Guidance A hard look assessment of Lava Ridge's direct, indirect and cumulative impacts on all wildlife seasonal ranges and movement corridor habitats must be assessed in a SEIS. This must also include migration corridors for volant species – but first, of course, a solid baseline of studies and analysis must be conducted. These habitats must be identified across the landscape. See: https://www.whitehouse.gov/wp-content/uploads/2023/03/230318-Corridors-connectivity-guidance-memo-final-draft-formatted.pdf "Connectivity is the degree to which landscapes, waterscapes, and seascapes allow species to move freely and ecological processes to function unimpeded. Corridors are distinct components of a landscape, waterscape, or seascape that provide connectivity. Corridors have policy relevance because they facilitate movement of species between blocks of intact habitat, notably during seasonal migrations or in response to changing conditions… Increasing connectivity is one of the most frequently recommended climate adaptation strategies for biodiversity management." "To the maximum extent practicable, Federal agencies are expected to advance the objectives of this guidance by developing policies, through regulations, guidance, or other means, to consider how to conserve, enhance, protect, and restore corridors and connectivity during planning and decision-making, and to encourage collaborative processes across management and ownership boundaries. Any existing corridor and connectivity policies or related policies should be updated as needed to align with the objectives in this guidance. Federal agencies should have new or updated policies ready to implement by the first quarter of 2024 and make their policies publicly available. Federal agencies should also actively identify and prioritize actions that advance the objectives set forth in this guidance." "Federal agencies should not limit engagement in restoration activities only to circumstances when restoration serves as a mitigation strategy to compensate for adverse impacts from projects or actions. Instead, Federal agencies should consider where there are opportunities in their programs and policies to carry out restoration with the objective of promoting greater connectivity."	Within the EIS, the BLM fully considers impacts to resources such as wildlife and migratory corridors and considers all applicable laws, regulations, and policies.
11873-2	Mary Schwartz, Frank Schwartz	1. The BLM obviously does not realize the NEPA regulations changed a few years back. This BLM NEPA product for this windfarm proposal is typical old-school NEPA, not adhering to page limits, including analysis in appendices that should be in the body of the document, containing much repetitive and extraneous information, and not acknowledging or analyzing quite a number of environmental impacts to some resource areas. The purpose of the NEPA analysis in an environmental impact statement is to inform decision makers and the public of reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. Agencies should focus on significant environmental issues and alternatives and shall reduce paperwork and the accumulation of extraneous background data. Statements shall be concise, clear and to the point and shall be supported by evidence that the agency has made the necessary environmental analyses. The text of final environmental impact statements {paragraphs {a)(4) through (6) of 1502.10) shall be 150 pages or fewer, and for proposals of unusual scope or complexity, shall be 300 pages or fewer unless a senior agency official of the lead agency approves in writing a statement to exceed 300 pages and establishes a new page limit. This DEIS, for 40 CFR 1502.10 {a)(4) through (6), is 508 pages, includes much repetition and extraneous information, and does not include some important analyses that should be included. The appendices to this DEIS are also excessively long, repetitive, contain extraneous information	The BLM follows applicable laws, regulations, and policies that guide the preparation of the EIS and inform the evaluation of proposals like the Lave Ridge Wind Project. This includes making use of reliable existing data and resources to describe the existing conditions and inform the analysis of potential impacts. Throughout the preparation of the EIS the BLM has obtained the relevant data and information needed to prepare the EIS. This information has come from project-specific surveys, publications and analytical documents prepared by cooperating agencies and other reliable resources, and from information supplied by individuals and stakeholder groups.

Comment ID	Commenter	Public Comment	Response to Comment
		and omit some important information. The company hired to do this NEPA analysis obviously used a recycle approach from other NEPA analyses that they have done in years past, including the same omissions, repetition and extraneous information, which is likely a part the reason this document does not meet the current NEPA regulations and does not address some analyses that are important to informing the decision maker and public. See 40 CFR 1502.	
11886-1	Sandra Eto	I could find no copy of the Monument Resource Management Plan (RMP) on the internet other than that in the Lava Ridge DEIS Literature Cited.2 There was no decision or location map provided with this citation. Therefore, it is difficult to address land use decisions made in the RMP that require the map. Nor is any explanation provided as to why revisions or amendments have not been made since 1986, except for minor fish and wildlife activities related to Greater Sage Grouse habitat.3 Albeit small in acreage, significant changes in land use and transfer areas have occurred within the Monument RMP since 1986: listing of the former Minidoka WRC on the National Register of Historic Places (NRHP) in 1979; Presidential Proclamation 7395 dated January 17, 2001, establishing the National Monument as the 385th unit of the National Park System; Public Law 110-229 dated May 8, 2008, which enlarged the National Monument (and added the Bainbridge Island Japanese American Exclusion Memorial), and changed the designation to the Minidoka NHS. Included in these actions, where appropriate, was the transfer of jurisdiction from the Bureau of Land Management (BLM) to NPS. Most notably there is no recognition in the Monument RMP that there has been a transfer of jurisdiction from BLM to NPS of the 388-acre NHS which—adequately or not—currently represents the original approximately 34,000-acre Minidoka WRC.	The BLM Twin Falls District RMPs are posted on the BLM's ePlanning NEPA Register (https://eplanning.blm.gov) with links to applicable amendments on the RMP ePlanning sites; direct links to the RMP ePlanning sites are available on the BLM website: https://www.blm.gov/programs/planning-and-nepa/plans-in-development/idaho. See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance) and also 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
11991-14	Julie Abo	If the Monument Resource Management Plan is from 1986 and doesn't include visual resource management, this should be revised. Craters of the Moon's Resource Management Plan is from 2007 and includes evaluation of scenic quality. "The SFO Monument Resource Management Plan (BLM 1986b) does not establish Visual Resource Management (VRM) classes or associated management objectives for BLM public lands in the siting corridors; for this reason, conformance with BLM VRM (page 3-396)	Within the EIS the BLM considers impacts to visual resources to understand how the potential impacts relate to laws, regulations, and policies. Also see responses to comments 11326-9 (see in Table A-3jj, Legal or Policy Compliance) and 11535-149 (see in Table A-3y, Visual Resources).
12054-1	Kevin Emmerich	The DEIS is being evaluated based on an outdated Resource Management Plan: The BLM is basing the NEPA review on a very old and outdated Resource Management Plan (RMP) called the Monument Resource Management Plan that was completed in 1986! The plan is so old, it is a scan of a typewritten document and pre-dates modern technology. The plan also neglects to even discuss Visual Resource Management Classes. The Federal Land Policy and Management Act (FLPMA) requires the BLM to maintain on a continuing basis an inventory of all public lands and their resources and other values (Inventories, Section 201). Planning, per FLPMA Section 202 instructs that the Secretary of the Interior shall, with public involvement and consistent with the terms and conditions of the Act, develop, maintain, and, when appropriate, revise land use plans which provide tracts or areas for the use of the public lands. The purpose of a Resource Management Plan (RMP) is to: 1. Allocate resources and determine appropriate multiple uses for the public lands; 2. Provide a strategy to manage and protect resources; 3. Establish systems to monitor and evaluate the health of resources and effectiveness of practices. RMPs are like a public lands version of municipal zoning. Examples of situations that may require new or changed land-use plan decisions include: The Bureau of Land Management evaluates and amends or revises its land-use plans in response to changing conditions and demands on the public lands, or when new components are added to the National Conservation Lands that it manages. Keeping a plan up-to-date helps ensure that the BLM manages the public lands in ways that meet the multiple-use and sustained yield goals that Congress has set for these lands. Examples of situations that may require new or changed land-use plan decisions include: The Monument RMP is 36 years old and in that timeframe, values, visitation and use of the area have changed. The Minidoka National Historic Site was established in 2001, 18 years after the Monument RMP was released. The Minidoka National Historic commemorates the more than 9,000 Japanese Americans who were imprisoned at the Minidoka War Relocation Center during the Second World War. Cultural landscapes, viewsheds, historic structures and archeological sites are all identified as fundamental resources and values by the National Park Service for the Minidoka National Historic Site. The National Park Service defines a cultural landscape as a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person, or exhibiting other cultural or aesthetic values. Equally, the visitation statistics for the Craters of the Moon National Monument have changed. We learned from personal communication with the National Park Service that visitation has nearly doubled since 1986 with annual visitation that year at 178.332 compared to 2021 annual visitation at 270,829. This is a significant increase since 1986.	See responses to comments 11991-14 (see in Table A-3jj, Legal or Policy Compliance) and 11535-149 (see in Table A-3y, Visual Resources).
12054-3	Kevin Emmerich	Two New Significant Land Use Plans must be Considered for Purpose and Need and Alternatives: The BLM is reviewing a new western renewable energy plan that emphasizes "exclusion criteria" based on resource conflicts. The 2023 update to the solar programmatic environmental impact statement is reviewing the 2012 Western Solar Plan which created Solar Energy Zones, Variance Lands and Exclusion Zones. The BLM is considering adding wind energy to this review. When the updated plan is approved, it could require a Plan Amendment to the Monument RMP. This would be a potential opportunity to create a Renewable Energy Exclusion Zone.1 As the BLM states: "The identification of exclusion areas allows the BLM to support the highest and best use of public lands by avoiding potential resource conflicts and reserving for other uses public lands that are not well suited for utility-scale solar energy development. Because of the size and scale of utility-scale solar energy development (typically involving a single use of public lands), the BLM has excluded a broader set of categories from utility-scale solar energy development than would be identified in a land use	See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		plan for other types of ROWs."2 This of course can also apply to wind energy. The point is that a land use plan amendment can be used to protect the local resources.	
12054-10	Kevin Emmerich	There are two ways to change an RMP: Plan revisions: Plan revisions involve a complete or near-complete rewrite of an existing land- use plan. A plan revision always requires a full Environmental Impact Statement. Plan amendments: Plan amendments modify one or more parts of an existing land-use plan, for example, allowing the development of wind energy resources where they had not previously been considered. Depending on how wide-ranging the effects of an amendment would be, the BLM will prepare either an Environmental Assessment or a full EIS to accompany a plan amendment. The BLM moved forward with the review of the Lava Ridge Project and before the Monument Resource Management Plan was revised. Approving the Lava Ridge Project without any kind of RMP update is a form of BLM streamlining and is irresponsible because it limits the opportunity of the public to oppose the project.	See response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance). The BLM has not limited opportunities for public involvement in the NEPA process for the project.
12130-3	Brenda Pace	While most project components would be located on BLM public lands, several privately owned, State of Idaho–owned, and Bureau of Reclamation-owned parcels are also present in the Lava Ridge Wind project area. The DEIS suggests that these would "provide opportunities to locate additional wind turbines, collector and transmission lines, and potentially other ancillary components" (DEIS pg. 2-1 and pg. 3-262). The likelihood of additional development on non-BLM lands inside the project area should have been discussed in the DEIS, as part of Chapter 3, "Affected Environment and Impacts," but I have not been able to identify this discussion in the DEIS. I am particularly concerned that there will be no environmental review or mitigation for Lava Ridge Wind project developments on State and private lands. For cultural resources, this likelihood is stated clearly "Where federal permitting and law do not apply (e.g., on state or private lands), cultural resources identification efforts might not occur, and impacts might go unmitigated" (DEIS 3-165). Since Lava Ridge Wind project developments on non-BLM lands would be linked to the federal action evaluation in the DEIS, I believe that they must be subject to the same level of environmental review and mitigation. I request that BLM confirm that Lava Ridge project developments on non-BLM land are included in the NEPA analysis and all of the mitigations contained within and provide justification if they are not.	The EIS analysis describes impacts associated with all components of the project including those that would occur off of public lands. The location of the project components was discussed in Section 2.3.1 of the draft EIS.
12307-1	Dean Dimond	I share the content on the most recent EO and must challenge the far-reaching and barricade to true NEPA analysis that it represents in this draft EIS. Without sounding disrespectful, this EO breeches the authority of the BLM to change the criteria for analysis of environmental impacts of this wind project by removing the existing contributions and of the loss of production of other energy sources within BLM authorities. Without the impact of the loss of other energy production included in this DEIS, the American people cannot assess the need, capacity and or the impact of this wind development project to meeting the domestic energy needs of the American people, the energy grid security and other aspects covered in this EO. To illustrate my comment, an excerpt from EO 14008 signed January 27, 2021 by President Biden follows: "Sec. 207. Renewable Energy on Public Lands and in Offshore Waters. The Secretary of the Interior shall review siting and permitting processes on public lands and in offshore waters to identify to the Task Force steps that can be taken, consistent with applicable law, to increase renewable energy production on those lands and in those waters, with the goal of doubling offshore wind by 2030 while ensuring robust protection for our lands, waters, and biodiversity and creating good jobs. In conducting this review, the Secretary of the Interior shall consult, as appropriate, with the heads of relevant agencies, including the Secretary of Defense, the Secretary of Agriculture, the Secretary of Commerce, through the Administrator of the National Oceanic and Atmospheric Administration, the Secretary of Energy, the Chair of the Council on Environmental Quality, State and Tribal authorities, project developers, and other interested parties. The Secretary of the Interior shall engage with Tribal authorities regarding the development and management of renewable and conventional energy resources on Tribal lands. Sec. 208. Oil and Natural Gas Development on Public Lands and in Offshore Waters. To the extent consistent with applicable law, the Secretary of the Interior shall pause new oil and natural gas leases on public lands or in offshore waters pending completion of a comprehensive review and recon- sideration of Federal oil and gas permitting and leasing practices in light of the Secretary of the Interior's broad stewardship responsibilities over the public lands and in offshore waters, including potential climate and other impacts associated with oil and gas activities on public lands or in offshore waters. The Secretary of the Interior shall complete that review in consultation with the Secretary of Agriculture, the Secretary of Commerce, through the National Oceanic and Atmospheric Administration, and the Secretary of Energy. In conducting this analysis, and to the extent consistent with applicable law, the Secretary of the Interior shall consider whether to adjust royalties associated with coal, oil, and gas resources extracted from public lands and offshore waters, or take other appropriate action, to account for corresponding climate costs. Sec. 209. Fossil Fuel Subsidies. The heads of agencies shall identify for the Director of the Office of Management and Budget and the National Climate Advisor any fossil fuel subsidies provided by their respective agencies, and then take steps to ensure that, to the extent consistent with applicable law, Federal funding is not directly subsidizing fossil fuels. The Director of the Office of Management and Budget shall seek, in coordination with the heads of agencies and the National Climate Advisor, to eliminate fossil fuel subsidies from the budget request for Fiscal Year 2022 and thereafter. Sec. 210. Clean Energy in Financial Management. The heads of agencies shall identify opportunities for Federal funding to spur innovation, commercialization, and deployment of clean energy technologies and infrastructure for the Director of the Office of Management and Budget and the National Climate Advisor, and then take steps to ensure that, to the extent consistent with applicable law, Federal funding is used to spur innovation, commercialization, and deployment of clean energy technologies and infrastructure. The Director of the Office of Management and	Climate impacts of all existing energy production is outside the scope of the project and EIS. See response to comment 11491-1 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		Budget, in coordination with agency heads and the National Climate Advisor, shall seek to prioritize such investments in the President's budget request for Fiscal Year 2022 and thereafter." I contend that the measurements of climate impacts of existing energy production have not been analyzed to address the true environmental impacts (positive and adverse) of the addition of this wind project. This alone creates a fatal flaw in this DEIS for the Lava Ridge wind project.	
12307-9	Dean Dimond	My first concern for this draft EIS is that it has not been developed strictly according to the Congressionally mandated criteria of the National Environmental Policy Act, as amended. It includes two Executive Orders (EOs) written to address Environmental Justice (President Clinton 1994) and another regarding Climate Change (President Biden 2021). Although the power of an EO is effective in steering our Nation in effective ways toward addressing issues of great concern, I must point out that the criteria for the NEPA analysis of a project must include the actual conditions on the ground and the interdisciplinary effects of a project on federal lands.	The EIS was prepared considering project-specific issues and project-specific impacts in accordance to the applicable laws and policies, including NEPA.
1231-1	Carolyn Dimond	We have discovered that: The zoning for this area of BLM ground in all three counties (Jerome, Minidoka, Lincoln) is A1- Agriculture. In order for windmills to be built in A1 zone it requires a special use permit from each county. Realizing that BLM is exempt from local zoning laws, LS power is a private company and is not exempt but subject to all local zoning laws. The Federal Land Policy Management Act confirms this. LS power has not included or even applied for this required special use permit that must be included in the DEIS. Along with that requirement, there are other state owned lands managed by the state in conjunction with the BLM, known as school sections, checkered board across the proposed area that clearly require all local zoning laws be followed. (see permit application for state lands) These permits have not been obtained and LS Power cannot be permitted to continue with this project.	The system of public lands managed by the BLM are not under the jurisdiction of county planning and zoning laws and regulations. The BLM uses land use plans to establish what actions and protections are appropriate for public lands within the planning area. The BLM considers State and local plans in the preparation of land use plans to ensure there is consistency to the maximum extent as allowable under other laws and fulling the purpose of FLPMA. This, however, does not mean that an applicant requesting the use of public lands is required to obtain a permit from the county as there is no development proposed on private property within the jurisdiction of the local government. MVE has applied for or will be required to apply for the use of the State sections, managed by the Idaho Department of Lands, that are incorporated within the project proposal. These State lands are not within BLM's jurisdiction and although the EIS considers impacts on these lands as part of the larger project the BLM is not delegated authority to approve or deny the use of the State lands.
12371-4	Alan Hansten; Northside Canal Company	NSCC would note that the Idaho Legislature recently passed House Concurrent Resolution No. 4 where the House and Senate unanimously voted to support a "no-build" option for the Lava Ridge Project. Alternative A or the "no action" alternative is the only alternative that would fall in line with the Legislature's position. In addition, Jerome County and several other local counties have all opposed the project as negatively impacting area citizens. HCR 4 identifies concerns to Idaho's agriculture and citizens which would include NSCC's shareholders as well. NSCC requests that the BLM strongly consider the Idaho Legislature's statement and the local county commissioners' positions on this issue in formulating the final EIS.	The counties and state agencies have participated in the preparation of the EIS as cooperating agencies and the BLM has received and considered all stakeholder feedback in the preparation of the EIS.
12398-23	US Environmental Protection Agency	Permits and Authorizations The EPA is aware that project construction will be contingent upon completion of the environmental planning and review process under NEPA and regulatory approvals that may be outstanding or subject to modification at the end of the NEPA process. These include CWA Sections 401 and 404 authorizations, Historic Properties Management Plan, an Eagle Conservation Plan, an Air Quality Permits, a Stormwater Pollution Prevention Plan, among others. EPA therefore recommends that the FEIS include information on all authorizations (federal, state, local government, etc…) that will be necessary for the project and highlight any changes to significance determinations or additional conditions. In a consolidated fashion (as a narrative or table in the FEIS), present the status of all permits or approvals needed by the project to help the public and responsible agencies better understand the scope of work and assist with construction planning and scheduling, as well as measures to reduce risks to environmental resources.	Other federal, state, and local permit requirements are described in Section 1.5 of MVE (2023).
12398-25	US Environmental Protection Agency	The DEIS identifies underserved communities that face disproportionate impacts within the project area, including the Japanese American community, Native Americans, and low income and minority populations. The proposed project has the potential to have significant disproportionate impacts to these identified communities, including cultural impacts to historically important sites. In reviewing the EJ analysis of the DEIS, EPA utilized several key documents and policies for considering and addressing EJ concerns within NEPA analyses, which are further described in the following. Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations2, requires "each Federal agency… make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effect of its programs, policies, and activities on minority populations and low- income populations in the United States… " As noted in the Guidance from CEQ on Environmental Justice and the National Environmental Policy Act3 (CEQ EJ Guidance): "NEPA's fundamental policy is to "encourage productive and enjoyable harmony between man and his environment" . . .The following goals, set forth in NEPA, make clear that attainment of environmental justice is wholly consistent with the purposes and policies of NEPA . . . to assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings". . . and "preserve important historic, cultural, and natural aspects of our natural heritage, and maintain, wherever possible, an environment which supports diversity and variety of individual choice" The CEQ EJ Guidance goes on to state "Agencies should recognize that the question of whether agency action raises environmental justice issues is highly sensitive to the history or circumstances of a particular community or population, the particular type of environmental or human health impact, and the nature of the proposed action itself" and provides six principles as general guidance for identifying and addressing environmental justice. These principles include: • "Agencies should recognize the interrelated cultural, social, occupational, historical, or economic factors that may amplify the natural and physical environmental effect of the proposed agency action. These factors should include the physical sensitivity of the community or population to particular impacts; the effect of any disruption on the community structure associated with the proposed action; and the nature and degree of the impact on the physical and	The BLM considers laws, regulations, and policies related to evaluating potential impacts to environmental justice communities. The potential impacts to these communities are described in the EIS in Section 3.6.

Comment ID	Commenter	Public Comment	Response to Comment
		social structure of the community." • "Agencies should assure meaningful community representation in the process. Agencies should be aware of the diverse constituencies within any particular community when they seek community representation and should endeavor to have complete representation of the community as a whole." The CEQ EJ Guidance identifies four important ways to consider EJ under NEPA, including: • "Mitigation measures identified as part of . . .an environmental impact statement (EIS), or a record of decision (ROD), should, whenever feasible, address significant and adverse environmental effects of proposed federal actions on minority populations, low-income populations, and Indian tribes." • "Each Federal agency must provide opportunities for effective community participation in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving the accessibility of public meetings, crucial documents, and notices." • "Review of NEPA compliance (such as EPA's review under § 309 of the Clean Air Act) must ensure that the lead agency preparing NEPA analyses and documentation has appropriately analyzed environmental effects on minority populations, low-income populations, or Indian tribes, including human health, social and economic effects."4 Finally, the CEQ EJ Guidance specifies that: • "When the agency has identified a disproportionately high and adverse human health or environmental effect on low-income populations, minority populations, or Indian tribes from either the proposed action or alternatives, the distribution as well as the magnitude of the disproportionate impacts in these communities should be a factor in determining the environmentally preferable alternative. In weighing this factor, the agency should consider the views it has received from the affected communities, and the magnitude of environmental impacts associated with alternatives that have a less disproportionate and adverse effect on low- income populations, minority populations, or Indian tribes." • "Under NEPA, the identification of a disproportionately high and adverse human health or environmental effect on a low-income population, minority population, or Indian tribe does not preclude a proposed agency action from going forward, nor does it necessarily compel a conclusion that a proposed action is environmental unsatisfactory. Rather, the identification of such an effect should heighten agency attention to alternatives (including alternative sites), mitigation strategies, monitoring needs, and preferences expressed by the affected community or population."	
12469-5	Mike Telford	The DEIS in 3.8.1 talks about land use authorities. It sites 1986 land use documents. Those are out dated and are in the process of being rewritten. New ordinances are being drafted to oppose these large scale wind projects All this alone should compel BLM to decide Alternative A is the only answer.	See responses to comments 12371-4 (see in Table A-3jj, Legal or Policy Compliance) and 11326-9 (see in Table A-3jj, Legal or Policy Compliance).
12859-10	Kristen Brengel, Robyn Achilles; Friends of Minidoka	The Department of the Interior via the BLM has a duty to protect Minidoka The Federal Land Policy and Management Act (FLPMA) requires the Interior Department and BLM to: • "Protect public land values including air and atmospheric, water resource, ecological, environmental, and scenic values," and to preserve and protect "certain public lands in their natural condition," and "food and habitat for fish and wildlife,"104 • Account for "the long-term needs of future generations;"105 • Prevent "permanent impairment of the productivity of the land and quality of the environment;"106 and • Shall "take any action necessary to prevent unnecessary or undue degradation of the lands."107 While these substantive obligations have existed since the passage of FLPMA in 1976, BLM has not properly applied these land and resource management requirements in the Monument RMP or the Lava Ridge DEIS. Instead, the BLM chooses preferred alternatives that would run counter to FLPMA's requirements, Minidoka specific statutes, laws of general applicability and environmental justice.	See responses to comments 11554-13 and 11598-26 (see both in Table A-3jj, Legal or Policy Compliance).
12859-11	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Among FLPMA's requirements, BLM must adhere to 43 USC §1701(a)(8) which provides for protection of scenic and historical values: [Regs quoted and citations included in full pdf letter, pages 23-26] Furthermore, FLPMA's definition of "multiple use" in 43 USC 1702(c) includes scenic and historical values: [Regs quoted and citations included in full pdf letter, pages 23-26] Additionally, when considering multiple renewable energy projects, BLM regulations require it to apply screening criteria to prioritize wind energy development applications with a goal to reduce resource conflicts.108 Low-priority applications, which may not be feasible to authorize, include those for projects sited on land "near or adjacent to lands designated by Congress, the President, or the Secretary for the protection of sensitive viewsheds, resources, and values (e.g., units of the National Park System, Fish and Wildlife Service Refuge System, some National Forest System units, and the BLM National Landscape Conservation System), which may be adversely affected by development."109 Here, the proposed project meets the criteria for a "low-priority" designation because it is sited on land "near or adjacent to … units of the National Park System." As stated in an 2022 Instruction Memorandum relating to initial screening and prioritization for solar and wind energy applications, "BLM's objective is to facilitate solar and wind projects with the greatest technical and financial feasibility and the least anticipated natural and cultural resource conflicts on BLM-administered lands."111 BLM has incorporated the prioritization principles in its new Idaho Renewable Energy Strategy, which it adopted in early 2023, after beginning the Lava Ridge wind project NEPA process.112 In addition, BLM's Best Management Practices (BMPs) include siting wind projects outside of sensitive viewsheds, or as far as possible from sensitive viewing locations, including units of the National Park System: [Regs quoted and citations included in full pdf letter, pages 23-26] Incomplete list of authorities. In our comments in support of the ACEC designation (above) and regarding the relationship to statutes, regulations and other NEPA Documents (below), we demonstrate requirements for BLM to protect Minidoka's cultural resources through BLM's authorities and congressional direction that Minidoka and other incarceration sites should be protected and interpreted as part of a comprehensive network to tell the whole story of America. BLM's current list of authorities in the Purpose and Need section of the DEIS and Appendix 2	BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS is a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyze impacts, and inform the BLM's decision. The project is being proposed on public lands managed by the BLM. The location of project infrastructure would be located in areas adjacent to Minidoka NHS, a site managed by the NPS, but no portion of the project would be located on lands within the jurisdiction of the NPS. The NPS is a cooperating agency, and the BLM has worked with them closely to ensure the EIS evaluates potential impacts to the NPS units and associated resources. The NPS is also participating as a consulting party within the Section 106 process and has actively participated in the preparation of the PA that would stipulate the process necessary to comply with Section 106 obligations. Also see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		"Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations and Policies" is incomplete and does not include relevant statutory and Executive Branch authorities. While the DEIS lists only partial authorities relating to Minidoka and Japanese American incarceration sites, BLM lists one industry-backed legislative rider in an appropriations bill that establishes a nationwide goal for renewable energy.114 Congressional intent and "Better fitting statutes." The Property Clause of the U.S. Constitution vests Congress with the power to manage public lands.115 Congress has directed that Minidoka and other Japanese American incarceration sites, including the Bainbridge Island Japanese American Exclusion Memorial, Amache, Manzanar, Tule Lake, and Honouliuli, be managed unimpaired for the benefit of current and future generations, as required by the NPS Organic Act, the Redwoods Act and other statutes. [Regs quoted and citations included in full pdf letter, pages 23-26] In the absence of direct and specific Congressional authority to derogate Minidoka's "values and purposes," as required by the Redwoods Act of 1978, BLM lacks the authority to impair Minidoka's fundamental resources and values.122 BLM lacks authority to issue a permit that damages Minidoka NHS. FLPMA's permitting provisions also preclude BLM from issuing permits which "damage federal property."123 The NPS has highlighted the Lava Ridge proposal's significant negative impacts on federal lands it manages as part of the National Park System.124 Based on federal law relating to deference to agency interpretation of its own statutory authority, determination of what constitutes protection under the NPS Organic Act, NHPA and other NPS statutes is best made by NPS.125 BLM must choose an alternative that does not allow development within the viewshed of Minidoka National Historic Site. It is well within BLM's authority to make decisions regarding land use authorizations that protect National Park System units and resources.126 Development adjacent to NPS units can result in significant impacts to park resources and values, as well as the ability for current and future visitors to experience parks "unimpaired," as intended by the 1916 National Park Service Organic Act. [Regs quoted and citations included in full pdf letter, pages 23-26]	
12859-13	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Japanese American Confinement Sites Act. In 2006, Congress passed bipartisan legislation "to provide for the preservation of the historic confinement sites where Japanese Americans were detained during World War II."143 Known as the Japanese American Confinement Sites Act (JACS), the Act directed the Secretary of the Interior to: … create a program within the National Park Service to encourage, support, recognize, and work in partnership with citizens, Federal agencies, State, local, and tribal governments, other public entities, educational institutions, and private nonprofit organizations for the purpose of identifying, researching, evaluating, interpreting, protecting, restoring, repairing, and acquiring historic confinement sites in order that present and future generations may learn and gain inspiration from these sites and that these sites will demonstrate the Nation's commitment to equal justice under the law."144 Because the law defines historic confinement sites to include the Minidoka Relocation Center, which includes approximately 33,000 acres as depicted in Figure 9.2 from the NPS's Confinement and Ethnicity publication, we ask that BLM list this statute in its list of applicable laws and consider the intent of Congress.145 In 2022, Congress reauthorized and expanded the Japanese American Confinement Sites Act via the Norman Y. Mineta Japanese American Confinement Education (JACE) Act.	Public Law 109-441 Japanese American Confinement Sites Act, as amended by Sec 644 of the Consolidated Appropriations Act of 2023, titled the Norman Y. Mineta Japanese American Confinement Education Grants was added to the list of Federal Regulations in EIS Appendix 2. The project is being proposed on public lands managed by the BLM. The location of project infrastructure would be located in areas adjacent to Minidoka NHS, a site managed by the NPS, but no portion of the project would be located on lands within the jurisdiction of the NPS. The NPS is a cooperating agency, and the BLM has worked with them closely to ensure the EIS evaluates potential impacts to the NPS units and associated resources. The BLM considered impacts associated with Minidoka NHS in EIS Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities). See also response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19.
12934-8	Rob Thornberry, Theodore Roosevelt Conservation Partnership	Programmatic EIS encouraged. The TRCP encourages the BLM to undertake a programmatic environmental impact study for all wind projects in Idaho. The Lava Ridge proposal is the first of many to be considered by Idaho BLM in the coming years, and it will set expectations for other applicants in the future. Still, we believe taking a statewide look at wind development issues will lead to less confusion about this and future projects; potentially fewer criticisms, and ultimately better project proposals that adequately consider historic uses of public lands, which include hunting and other types of recreation.	See response to comment 11598-34 (see in Table A-3jj, Legal or Policy Compliance).
12968-1	Charles Brockway	The Federal Land Policy Management Act does not require that the BLM consider this application. FLPMA certainly requires that public land be managed for multiple uses but does not require consideration of any particular application for generation of electric energy. BLM has made the decision to consider the application in the face of widespread public opposition.	See response to comment 12968-5 (see in Table A-3jj, Legal or Policy Compliance).
12968-5	Charles Brockway	No consideration was made of the land-use efficiency of wind farms as opposed to other established power generation technologies. Wind farms normally have total land requirements ranging from 40 to 80 acres per installed megawatt capacity, as opposed to coal, natural gas, and nuclear facilities at 12 to 13 acres per megawatt. But the proposed action has an incredible land use of 160 acres per megawatt or about 2.7 times the average for wind farms and 13 times the typical coal or nuclear plant land use requirement. If a similar calculation is made over the total life of the wind farm, the intermittent nature of wind makes the project even less viable: the land area per total megawatt-hour generated increases to about 20 times that of coal, natural gas, and nuclear. The BLM is charged with managing public lands in an optimal manner for multiple public uses. The proposed wind project should be rejected on its face as a grossly inefficient and wasteful use of public land resources. Approval of the proposed action would be contrary to the agency's legal obligation. The alternatives evaluated in the EIS are not actual alternatives - they are just slight variations on the same land-intensive, inefficient technology.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS is a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyze impacts, and inform the BLM's decision. Within the EIS, the BLM fully considers impacts to resources and considers the potential impacts and how they relate to laws, regulations, and policies. See response to comment 11188-5 (see in Table A-3jj, Legal or Policy Compliance).
12968-6	Charles Brockway	Wind has an extremely low generating efficiency. Typical wind-to-wire efficiency is 20 to 40%, on par with solar farms. Modern coal-fired plants have efficiencies of 45 to 55%, and combined-cycle gasification facilities can reach 55 to 60%. Hydroelectric plants have typical water-to-wire efficiencies of 60 to 75%. Allowing such an inefficient and wasteful technology on public land is contrary to the BLM's land use management obligation.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS is a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyze impacts, and inform the

Comment ID	Commenter	Public Comment	Response to Comment
			BLM's decision. Within the EIS the BLM fully considers impacts to resources and considers the potential impacts and how they relate to laws, regulations, and policies. See response to comment 11188-5 (see in Table A-3jj, Legal or Policy Compliance).
12982-2	Jerry Taylor	The Draft Lava Ridge Wind Project EIS (DEIS) is long on volume, short on analysis, and is premature. Critical steps were skipped and vital data were not collected or analyzed. The DEIS is insufficient and BLM should suspend the EIS process, until such time as critical data is collected, properly analyzed and the impacts are disclosed in full. ... The DEIS relies too much on future studies (like "Geo Technical studies"), which should be conducted upfront to properly inform the impacts section of the DEIS. It relies too much on future mitigation (involving future inventory, analysis, agreements, plans and "mitigation compensation"), at the expense of cumulative impact analysis upfront. It arbitrarily dismisses potentially significant impacts without substantive data, analysis or reasonable justification. It relegates these potentially significant impacts to "Issues Analyzed in Brief' (Appendix 3) and/or future "Mitigation" (Appendix 4). It relies heavily on future inventory, plans and agreements to address potentially significant impacts. This approach is flawed, as disclosure of reasonably foreseeable significant impacts on the human environment are not available upfront to inform the public and the decision maker. The BLM should compel MVE to collect the required data up front, so it can be analyzed and the impacts can be described and disclosed. The lack of needed information or data is not a sound rationale for arbitrarily dismissing potentially significant impacts, or deferring to future actions promised, in lieu of analysis upfront. Impact analysis, particularly cumulative impact analysis, and the disclosure of such analysis to the decision maker and to the public is dependent on the agencies' due diligence upfront. What is presented in the DEIS is a piecemeal approach to planning, which I believe you will find has been rejected by the courts in other cases. The BLM must do its due diligence upfront. Gather sorely needed data, analyze it and fully disclose the impacts (individual and cumulative) before moving forward.	Prior to the preparation of the draft EIS multiple surveys were completed to gather information fully supporting the BLM's analysis of potential impacts and inform the BLM's decision. Measures described within the EIS identify additional surveys that would be required prior to construction if an authorization is granted to inform the implementation of an approved action in accordance with the required measures and design features. NEPA as amended guides the agencies on information source by identifying that agencies may make use of any reliable data sources and clearly stating that it is not required to undertake new scientific or technical research unless the new scientific or technical research is essential to a reasoned choice among alternatives. Additionally, if agencies are requiring new scientific or technical research, they should consider if the overall costs and time frame for obtaining it are reasonable.
12982-3	Jerry Taylor	The Code of Federal Regulations (40 CFR 1500 Chapter V) lays out the Purpose, Policy, and Mandate for NEPA regulations. It provides direction to Federal agencies on what they "must do" to comply with NEPA. For example: "NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail." Furthermore, "Environmental Impact Statements shall be concise, clear, and to the point, and shall be supported by evidence that agencies have made the necessary environmental analyses." The draft EIS fails to comply with the regulations, in its current state. Sufficient information currently does not exist to describe and analyze potentially significant impacts and declare them in the DEIS.	See response to comment 12982-2 (see in Table A-3jj, Legal or Policy Compliance).
12982-4	Jerry Taylor	In preparing an EIS, BLMs own NEPA Handbook (H-1790-1) instructs that: "Early in the process, the lead office should begin to identify information and data needs and availability. Generally this will involve: reviewing and organizing existing information and data; determining what additional information or data are needed, including the level of detail; obtaining additional information and data; and determining if there is any incomplete or unavailable information." In addition, the NEPA Handbook says, in part, "Information needs are primarily determined by the extent to which the proposed action and alternatives are likely to affect the quality of the human environment ... 11 It also says, in part, that "Enough information about the proposed action and alternatives and environmental setting must be available to analyze potential impacts." The draft EIS fails to comply with BLMs NEPA Handbook. Enough information is not available on the environmental setting, the proposed action or alternatives to analyze potentially significant impacts. The Federal Land Policy and Management Act of October 21, 1976, Title 2, Section 201(a) states, in part, " ... the Secretary shall prepare and maintain on a continuing basis an inventory of all public lands and their resource and other values ... ". The BLM doesn't have the inventory base it needs to go forward with the EIS process, at this time.	See response to comment 12982-2 (see in Table A-3jj,Legal or Policy Compliance).
13006-31	Leon Smith	4) Recommend that the conformance section be rewritten to find that the proposal does not conform with the Monument RMP because of the plan's requirement to protect sensitive values, including Minidoka Traditional Cultural Property (TCP).	The EIS addresses conformance with the land use plan in EIS Appendix 2.
13006-33	Leon Smith	7) Recommend that BLM adopt protective measures for the cultural landscape and heritage of wise multiple use. 8) Recommend BLM begin a public process to amend the Monument RMP to designate protective measures around Minidoka and other wise multiple uses, subject to valid existing rights.	The BLM's decision space is described in Section 1.3 (Decision to be Made) of the EIS. The decisions made by the BLM on the project or any subsequent renewable energy proposal are made after considering the relevant information and based the information specific to the project. The BLM's purpose and need for the project is specific to responding to MVE's application for a ROW grant to construct, operate, maintain, and decommission a wind energy facility on public lands. Additionally, the BLM has determined that the Proposed Action and range of reasonable alternatives needed to meet the purpose and need are in conformance with the *Monument Resource Management Plan* (BLM1986), as amended. Therefore the preparation of a land use plan amendment to designate protective measures around Minidoka NHS is outside the scope of the EIS. See response to comment 11598-26 (see in Table A-3jj, Legal or Policy Compliance).
1605-2	Dean Dimond	The Zoning for this area of BLM ground in all three counties (Jerome , Lincoln, Minidoka) is A1 Agriculture. In order for a windmill to be built in A1 zone it requires a special use permit from each county. While we realize the BLM is exempt from local zoning laws LS power is NOT the BLM. LS power is a Private company thus they are subject to all Local laws. The FLPMA confirms this. LS power has failed to obtain the REQUIRED or even	The system of public lands managed by the BLM are not under the jurisdiction of County Planning and Zoning laws and regulations. The BLM considers State and local plans in the preparation of land use plans to ensure there is consistency to the maximum extent as allowable under other laws and fulling the purpose of FLPMA. This, however, does not mean that an applicant requesting the use of public lands is required to obtain a

Comment ID	Commenter	Public Comment	Response to Comment
		apply for the required special use permit. LS Power must obtain the required special use permits to be included in the DEIS. There are also many sections of state owned land, known as school sections, checkered board across the proposed area. These lands are managed by the state in conjunction with the BLM. These lands also clearly require that all local zoning laws be followed. (See permit application for state lands)	permit from the county as there is no development proposed on private property within the jurisdiction of the local government. The county commissioners from Lincoln, Jerome, and Minidoka Counties have been coordinated with as a cooperating agency throughout preparation of the EIS. As a local agency with jurisdiction by law over adjacent private lands and memorandum of understanding was entered into outlining the counties responsibilities for adjudicating the Proposed Action and alternatives with local planning and zoning ordinances. During reviews of the administrative draft EIS the counties did not identify an action that would require MVE to obtain a special use permit from the county. See response to comment 1231-1 (see in Table A-3jj, Legal or Policy Compliance).
1968-2	Dean Dimond	In reviewing the DEIS I can not find were they have addressed or made any agreement with the permit holders to run cows on the affected properties. My farm shares common boarder with the BLM. Through the years I have developed a crop rotation that helps midigate problems that arise to the fields that boarder the desert. For example: it is a fact that grazing the desert help control fires and Voles. On years when I know that they are not going to graze the desert or they have a late season turn out .I avoid planting small Grain in these fields. This helps reduce the risk of fire coming of the desert onto my place The opposite is also true. On these years I try to plant a green crop next to BLM. I also know that the risk of fires go way up with the more people you have on the desert. Is LS power prepared to pay for damages they cause to my place? The same for the voles, deer, elk and other wildlife as they disrupt the habitat. Is LS power going to pay me for those damages? It is going to affect ground miles away from the windmill area. I have heard that LS power is considering purchasing AMUs to offer the cattlemen as mitigation. The BLM allowing LS power to purchase/rent AMUs is wrong on so many levels. but we cannot even speculate on the problems this will cause because it isn't in the DEIS. In addition I count on my crop residue in the fall the feed my cattle. With the increased actively on the desert and the destruction of the wildlife habitat the wildlife is going to find its way to my farm. The DEIS is missing information on all of this.	The draft EIS and subsequently the final EIS, as warranted, describes potential impacts associated with these issues and other issues identified by stakeholders during the scoping period and public comment period. For a full discussion on potential impacts and a description of the Proposed Action and alternatives, please refer to Chapters 2 and 3 of the EIS, specifically Section 3.9 (Livestock Grazing).
2565-1	WildLands Defense	Courtney said he was not aware of any findings that would shut down all renewable projects in the area, but that a process did exist to amend resource management plans to create exclusion areas=94. Here's what CAN be done. And what we believe what needs to be done - given the terrible Eagle death toll, the intrusion on homes and quality of life, how ancient the Land Use Plans are, and the great public opposition to this monstrosity. Please prepare a Supplemental DEIS with an alternative that amends the affected Land Use Plans to makes land UNAVAILABLE to industrial wind farms and other industrial energy.	The BLM has prepared a full and detailed analysis with robust public participation with the NEPA process supporting requirements for a hard look in BLM decision-making. After the public comment period for the draft EIS the BLM responded to comments by • modifying alternatives as supported by analysis or comments; • improving or modifying analysis after considering information from comments; • making factual corrections; and • adding detail or adjustments to mitigation measures supported by analysis or comments. The BLM's NEPA policy that a supplemental analysis is not warranted unless the BLM • makes substantial changes to the Proposed Action that are relevant to environmental concerns; • adds a new alternative that is outside the spectrum of alternatives already analyzed; or • there are significant new circumstances or information relevant to environmental concerns and bearing on the Proposed Action or its effects. In our review of comments and preparing the final EIS, the BLM did not make any of these adjustments warranting supplementation. The BLM's decision space is described in Section 1.3 (Decision to be Made) of the EIS. The decisions made by the BLM on the project or any subsequent renewable energy proposal are made after considering the relevant information and based the information specific to the project. The BLM's purpose and need for the project is specific to responding to MVE's application for a ROW grant to construct, operate, maintain, and decommission a wind energy facility on public lands. Additionally, the BLM has determined that the Proposed Action and range of reasonable alternatives needed to meet the purpose and need are in conformance with the *Monument Resource Management Plan* (BLM1986), as amended. Therefore, the preparation of a land use plan amendment to designate lands as unavailable to wind energy projects is outside the scope of the EIS.
2939-6	George Solverson	I believe the scope and detail of the LRWP cumulative effects analysis does not meet the legal requirement under the National Environmental Policy Act (NEPA) based on the following: • The Shoshone Field Office was specifically excluded for tiering to the 2005 USDI BLM Wind Energy Programmatic EIS (PEIS). • The LRWP EIS attempt to incorporate by reference to the PEIS fails the NEPA compliance test given the following: PEIS stated 20-year effects analysis horizon is near the end; referenced studies, research, and data in the PEIS is outdated, and the PEIS did not evaluate the cumulative effects based on the accelerated scale of proposed DOI activities (25 gigawatt by 2025).	See EIS Section 3.1.2.2 (Tiering to the 2005 Programmatic Wind Environmental Impact Statement). Although SFO land management planning was not amended by BLM (2005b), the BLM (2005a) analysis includes the area managed by the SFO, and therefore some of the analysis (BLM 2005a) and the BLM (2005b) BMPs are relevant for the Lava Ridge Wind EIS. As appropriate, this EIS uses conclusions and BMPs from BLM (2005a) and BLM (2005b). These are referenced in the issues analyzed in detail (Chapter 3) and in EIS Appendix 3 (Issues Analyzed in Brief). Potential site-specific impacts and impacts not disclosed in detail in BLM (2005a) are discussed in this EIS. See response to comment 11534-6 (see in Table A-3jj, Legal or Policy Compliance).
3780-1	Stephanie Novacek, Ron Novacek	It is very interesting to read BLM's purpose statement "The Bureau of Land Management's mission is to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations." To date, the local BLM has pretty much adhered to their proclaimed mission statement; however, I fail to understand how passing approval of the Lava Ridge proposed site, or any future green energy proposals, meets this declaration. How does an 80 year disruption of land, ranching, historical sites, Native	The BLM's decision space is described in Section 1.3 (Decision to be Made) of the EIS. The decisions made by the BLM on the project or any subsequent renewable energy proposal are made after considering the relevant information and based the information specific to the project. The BLM's purpose and need for the project is specific to responding to MVE's application for a ROW grant to construct, operate, maintain, and decommission a wind energy facility on public lands.

Comment ID	Commenter	Public Comment	Response to Comment
		American religious sites, wildlife(both winged and furred) and the complete destruction of Magic Valley viewsheads comply with your mission statement?	
3812-1	Jan Hanks, Butch Hanks	I oppose the proposed Wind Turbine Project. I believe it violates your mission to “sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations.” The negative impact of this project to Idaho is greater than the benefits. It will destroy the “use and enjoyment of present and future generations” part of your mission. This is a conflict with the Biden-Harris administration. You work for us not the Biden-Harris administration. Our local voice should be your priority. Please do not destroy Idaho with wind turbines.	See response to comment 3780-1 (see in Table A-3jj Legal or Policy Compliance).
3858-1	Stephanie Novacek	The BLM’s mission statement says to "sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations". How does a proposed wind site of 170,000+ acres, with a total area-affected timespan of 80 years accomplish this? The only honest, conscientous and appropriate choice is Alternative A.	See response to comment 3780-1 (see in Table A-3jj Legal or Policy Compliance).
5054-1	Sue Page	As outlined under Idaho Title 36 Fish and Game, Chapter 1, Sections 36 - 103 Universal citation: ID Code section 36-103 (2020) 36-103 WILDLIFE PROPERTY OF STATE - PRESERVATION States all wildlife within our state is declared property of Idaho. As government officials you should know this and rather than me lecturing you, I am simply asking you to uphold the laws of our state. Protect our state from outside forces from destroying our state for the benefit of others.	The BLM recognizes the State authorities and responsibilities for managing wildlife. The BLM regularly coordinate on broader policies and principles for ensuring the sustainability of wildlife and their habitats located on public lands. Additionally, the BLM has coordinated with the State of Idaho through our evaluation of the project to ensure that important issues and potential impacts are considered. With the information and expertise that the State of Idaho has provided, the BLM has prepared an EIS that will provide what is needed to take a hard look that considers potential impacts to wildlife and the State of Idaho’s interests in our decision on this project.
6882-2	Will (No Last Name Provided)	I am not convinced that this project can continue without violating the treaty rights of Shoshone-Bannock Tribes.	See EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), regarding the BLM’s government-to-government consultation with Native American Tribes, which considers treaty rights. Tribal Treaty Rights are further discussed in the Cultural Resources, Native American Resources EIS Section 3.5.1. The EIS notes that Tribal Treaty Rights span a variety of subjects, including rights reserved by Tribes in relation to natural resources (i.e., the right to hunt, fish, and gather on land ceded by or land retained by Tribes). Tribal Treaty Rights are considered in the agency decision-making process, consistent with the federal government’s trust responsibility to federally recognized Tribes.
6899-2	Japanese American Community	Impairment is not allowed under the National Park Service's Organic Act. It is the responsibility of the Secretary of the Interior to not allow impairment of NPS sites and resources. This project is in violation of the Organic Act. NPS Management Policies describe unacceptable impacts as "inconsistent with a park's purposes or values"; "diminish opportunities for current and future generations to enjoy, learn about, or be inspired by park resources and values;" and "unreasonably interfere with park programs, an appropriate use, or the atmosphere of peace and tranquility, or the national soundscape maintained in wilderness and natural, historic, and commemorative locations with the park" page 12. Management Policies states that "an impact would be more likely to constitute impairment to the extent that it affects a resource or value whose conservation is: necessary to fulfilling specific purposes identified in the establishing legislation or proclamation of the park, or key to the natural or cultural integrity of the park or to opportunities for enjoyment of the park, or identified in the park's general management plan or other relevant NPS planning documents as being of significance" page 11. Management Policies goes on to describe what park resources and values are subject to the non-impairment standard. The resources and values for Minidoka that are subject to the non-impairment standard include: the park's scenery, scenic features, natural visibility, both daytime and at night, cultural landscapes, ethnographic resources, appropriate opportunities to experience enjoyment of the above resources, and "the park's role in contribute to the national dignity, the high public value and integrity, and the superlative environmental quality of the national park system, and the benefit and inspiration provided to the American people by the national park's system." Furthermore, Management Policies states "Impairment may also result from sources or activities outside the park" page 11. The Lava Ridge Project surely meets the description of unacceptable impacts and impairment of Minidoka NHS. While NPS Management Policies do not apply to the BLM, the impairment of resources does apply to the Secretary of the Interior. There is no doubt about the impacts and that they constitute impairment and conflict with the Organic Act.	See responses to comments 12859-11 and 11598-26 (see both in Table A-3jj, Legal or Policy Compliance).
7346-1	Matt F.	This CFR section spells out liability for public lands permit grantees: https://www.ecfr.gov/current/title-43/subtitle-B/chapter-II/subchapter-B/part-2800/subpart-2807/section-2807.12 This says that grantees are liable for any damages caused to the United States or to third parties. This is a good start, but it should go farther. The applicant should be required to carry some type of bond or insurance, the funds of which are kept in an impound account for when the inevitable claims must be paid. This mechanism is already practiced, and is mentioned in the EIS with regard to "Reclamation bonds", which are money set aside for decommissioning. However, there are no mentions of such bonds for the operations phase of the project. BLM should require such for this project if any alternative other than A, no build, is chosen. With that in mind, another question that arises is: what is the process for people to report negative impacts, and how responsive should they expect BLM and the applicants to be? Will there be a 24-hour hotline they can call? Will it go to a live operator, or will they have to just leave a message and hope someone gets back to them in a timely manner? Is there a	The BLM’s regulations under 43 CFR 2805.20 allow the BLM to require a ROW grant holder provide a performance bond and reclamation bond prior to receiving a notice to proceed with construction and operation activates. The reclamation bond will be based on a reclamation cost estimated and the bond amount will be regularly re-evaluated throughout the term of the authorization.

Comment ID	Commenter	Public Comment	Response to Comment
		requirement that they be responded to within a certain amount of time? There needs to be some type of complaint hotline/process for rectification of these negative impacts. Last, BLM should devise some type of process that is more akin to arbitration, rather than a court proceeding. The reason is that when individuals are eventually and inevitably harmed by these projects, they shouldn't have to spend a decade in court fighting a multi billion dollar global corporation just to be compensated for their loss. Rather, BLM should devise a simplified process which is focused on getting the payments out to injured parties as fast as possible. Should the payments rise faster than anticipated, or the damages continue to mount, BLM should reserve the right and the authority to shut down the project during the operations phase. Such a caveat could and should be included in the permit approval language. Without a mandated bond, a special contact hotline, and a mechanism for dispute resolution, residents and businesses in the area are likely to suffer severe loss of property and life without any established way for them to be compensated.	
8420-3	Sue Page	The mission of the BLM is to protect the land and its resources now and for future generations. It is not suppose to allow any sole source, use that will infringe on the land, environment or impact the enjoyment by all.	See response to comment 3780-1 (see in Table A-3jj Legal or Policy Compliance).
8699-1	Heidi Olson	Simple question, why is a private company allowed to start a business on public land? If so, I would like to start my next business on BLM ground as well. I am at least a citizen of idaho	The BLM considers uses on public lands that are consistent with laws, regulations, and policies. The uses proposed by MVE are consistent with allowable uses on public lands as provided for within 43 CFR 2800.
8788-2	Sue Page	The BLM has a duty first and foremost to protect public lands set aside, OUR LAND. To sustain the health, diversity and productivity of public lands for the people, the wildlife and the habitats for present and future generations. Lava Ridge Wind Project does not conform to any of the duties required by the BLM for the People's Land.	See response to comment 3780-1 (see in Table A-3jj Legal or Policy Compliance).
9001-1	Karen Schumacher	In the 2005 BLM Wind Energy Development Program <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwindeis.anl.gov%2Feis%2Findex.cfm&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Ccc059dc6765c400e76d708db3b990496%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638169300617810839%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=Tw9hybHYI3wlLLJvPOGVzZS9lmff%2FoyKD1osEdJ2ky8%3D&reserved=0> Record of Decision, there are protections for the cattle industry. On page A-2 it states, "wind energy projects shall be developed in a manner that will not prevent other land uses, including…livestock grazing, recreational use, and other ROW uses". It also states, "Additional areas of land may be excluded from wind energy development on the basis of findings of resource impacts that cannot be mitigated and/or conflict with existing and planned multiple-use activities or land use plans." Since the BLM has failed to initiate its responsibility for Coordination with local counties, and consistency with land use plans has not be determined, this project cannot move forward. The construction of the project conflicts with resource impacts for multiple use and grazing rights, as well as for up to 34 years, with reduction of allotments after that time. This violates the BLM's own policies.	In the EIS, the BLM provides a description of potential impacts to livestock grazing and will consider these potential impacts as a decision on the project is prepared. The county commissioners from Lincoln, Jerome, and Minidoka Counties have been coordinated with as a Cooperating Agency throughout preparation of the EIS. As a local agency with jurisdiction by law over adjacent private lands and memorandum of understanding was entered into outlining the counties' responsibilities for adjudicating the Proposed Action and alternatives with local planning and zoning ordinances. During reviews of the administrative draft EIS, the counties did not provide information regarding specific issues. See response to comment 11188-2 (see in Table A-3jj, Legal or Policy Compliance).
9001-2	Karen Schumacher	In addition, according to its Policies <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwindeis.anl.gov%2Fdocuments%2Fdocs%2FIM2009-043_att1.pdf&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Ccc059dc6765c400e76d708db3b990496%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638169300617810839%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=nIF0a7kkwr%2Bt09fwziCcdA7Fto6gPE%2FtqvMlspFvIFU%3D&reserved=0> and Best Management Practices (BMPS), BLM wind energy projects "shall be developed in a manner that will not prevent other land uses, including...livestock grazing, recreational use, and other ROW uses (1-1)." During construction the Grazing Plan calls for the removal of allotments and AUMs which violates these policies by preventing land use, along with recreational use, for years with eventual permanent loss of use.	See response to comment 9001-1 (see in Table A-3jj Legal or Policy Compliance).
9010-1	Karen Schumacher	It seems the BLM has not followed federal law for Coordination, specifically 43 USE 1712(c)(9) <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.law.cornell.edu%2Fuscode%2Ftext%2F43%2F1712&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C0b66af63b7fc4fdbc71108db3b966dc4%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638169289500739389%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=Dd690I3G%2FL3MsxtXEdkA%2FKHGNgNMDwZBe9Vq2n%2FbcUE%3D&reserved=0> . This law states, "(9) to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located, assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans, and shall provide for meaningful public involvement of State and local government officials, both elected and appointed, in the development of land use programs, land use regulations, and land use decisions for public lands, including early public notice of proposed decisions which may have a significant impact on non-Federal lands. Land use plans of the Secretary under this section shall be consistent with State and local plans to the maximum extent he finds consistent with Federal law and the purposes of this Act." The BLM is required to follow Coordination laws in the Lava Ridge project as it is required to by both FLPMA and NEPA rules. Coordination	The county commissioners from Lincoln, Jerome, and Minidoka Counties have been coordinated with as a Cooperating Agency throughout preparation of the EIS. As a local agency with jurisdiction by law over adjacent private lands and memorandum of understanding was entered into outlining the counties responsibilities for adjudicating the Proposed Action and alternatives with local planning and zoning ordinances. During reviews of the administrative draft EIS, the counties did not provide information regarding specific issues. The BLM recognizes the State of Idaho's interest and the potential uses of public lands. Early in the evaluation of the project the BLM coordinated with the State of Idaho agencies and incorporated them as cooperating agencies in the preparation of the EIS. The BLM has coordinated with State agencies extensively and used information pertaining to the State's jurisdiction by law and the agencies' expertise to prepare the EIS and provide a hard look.

Until the BLM engages in Coordination and ensures consistency with local land use plans with ALL counties involved in this project, it cannot move forward and a No Action alternative must be the decision.	
9080-24	The Coalition to Protect America's National Parks	5. Multiple credible information sources indicate the wind resources in the Project area fall BELOW the U.S. Department of Energy (DOE) recommended threshold for wind energy development. However, the DEIS fails to adequately explain or analyze the "wind potential" rationale underlying the proposed siting of the Project – As background, the DOE Wind Energy Technologies Office states that "[a]reas with annual average wind speeds around 6.5 meters per second and greater at 80-m height are generally considered to have a resource suitable for wind development."35 However, the National Renewable Energy Laboratory (NREL) wind resource map for Idaho indicates that the average wind speed in the vicinity of the Lava Ridge project site just north of Twin Falls is less than the recommended 6.5 meters per second threshold. See map below. [map] As further evidence of the concern about the adequacy of wind energy potential at the site, see DEIS section 3.1.2.2 (p. 3-7) on "Tiering to the 2005 Programmatic Wind Environmental Impact Statement (PEIS)."36 As described, the 1986 Monument RMP for the SFO was NOT amended by the Record of Decision for the PEIS "for a variety reasons (BLM 2005b:B-2), including that developable wind resources were not deemed present in the area managed by the SFO at that time, or that BLM (1986) was expected to be amended in the near term (and thus analysis would be incorporated into BLM [1986])." (Emphasis added) In addition, a review of Appendix B, p. B-70, of the PEIS indicates the wind energy potential for the SFO is "Low." See the following map at PEIS Appendix B, p. B-70. [map] This begs the question – why is BLM entertaining a massive wind energy project at a location with "low" wind energy potential, so low, in fact, that the Monument RMP was NOT amended by the 2005 Wind Energy PEIS? When considering the current proposed Project area, to what extent did MVE or BLM consider the Project's obvious, significant, and unmitigable adverse effects on resources and values of Minidoka NHS, a unit of the National Park System before proceeding with Project planning at the proposed location? And why did BLM not suggest or discourage MVE from applying for this site because of the direct conflicts with the conservation of Minidoka's resources and values? Based on the POD information cited above, it sounds like BLM's primary feedback to MVE related to the avoidance of conflicts with sage grouse habitat. As a result, MVE was unaware or unconcerned about potential visual resource impacts in the vicinity of Minidoka. These questions/concerns have not been adequately addressed in the DEIS, which is sorely lacking in information or analysis regarding the rationale for siting the Project in a low wind energy potential area immediately adjacent to Minidoka NHS.	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. MVE completed sitting analysis and the latest computer modeling to assist in their selection of the project area as a viable wind energy facility. MVE has also established meteorological stations to gather additional information on the wind resources within the project area. MVE outlines their consideration for siting the project in the general area and earlier efforts to develop the project in other locations. This information can be in found in MVE (2023) and in Alternatives Considered by MVE (Appendix C in MVE [2023]). Within the EIS, the BLM fully considers impacts to resources such as Minidoka NHS to understand how the potential impacts relate to laws, regulations, and policies. See response to comment 11598-26 (see in Table A-3jj, Legal or Policy Compliance).
9080-25	The Coalition to Protect America's National Parks	6. The completion of SWIP Phase III (AKA SWIP-North) in Idaho and the LRWP appear be "connected actions" under NEPA; however, they are not identified or evaluated as such in the DEIS – We previously raised this concern in our scoping comments. Although the Record of Decision (ROD) for SWIP was issued in 1994, SWIP Phase III (AKA SWIP-North) has never been constructed. As proposed, SWIP-North would provide a 275-mile 500 kV transmission line between Midpoint Sub-station near Shoshone, Idaho and Robinson Summit in Nevada. Because the NEPA review for SWIP-North was conducted nearly 30 years ago, it is surely outdated as environmental conditions in the project area have changed significantly since 1994 (e.g., impacts of climate change; changes in sage grouse conservation). In December 2020, LS Power reported37 that SWIP-North is "permitted but seeking cost recovery" (i.e., construction funding) and that the "project is nearly construction ready and could be online as early as June 2024." The same report also indicated that SWIP-North would provide a link to "Idaho Power Company's interconnection queue; primarily wind, including a 1050 MW Lava Ridge wind project, being developed by [an] LS Power affiliate that is scheduled to be online in 2024." (Emphasis added.) Based on this statement, SWIP-North is clearly "connected" to the Lava Ridge Wind Project. The long delayed completion of SWIP-North, first approved in 1994 but never constructed, and the	See response to comment 11535-5 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		proposed LRWP are both planned for completion in 2024; both are being developed by LS Power or an "affiliate" of LS Power; and either project would be impractical without the other. In fact, the map below contained in LS Power's December 2020 report geographically illustrates the dependency of one project's existence upon the completion of the other, and vice versa. [map] Last but not least, the most recent (July 2021) U.S. Geological Survey (USGS) interactive "wind turbine database" map38 for Idaho shows there are no existing wind turbines in the immediate vicinity of the Twin Falls-Midpoint Substation-Shoshone area. Completing the Idaho leg of an interstate high voltage transmission line that terminates in rural Idaho nearly three decades after it was approved makes no sense unless and until there will be a major energy generation facility near the same terminus. As a result, SWIP-North and the LRWP clearly appear to be "connected actions" under NEPA. As described in BLM Permanent Instruction Memorandum (IM) No. 2018-023:39	
9080-26	The Coalition to Protect America's National Parks	Connected actions are those proposed Federal actions that are "closely related" and "should be discussed" in the same NEPA document (40 CFR 1508.25 (a)(1)). Proposed actions are connected if they automatically trigger other actions that may require an environmental impact statement; cannot or will not proceed unless other actions are taken previously or simultaneously; or if the actions are interdependent parts of a larger action and depend upon the larger action for their justification (40 CFR 1508.25 (a)(1)). (Emphasis added.) If the connected action is also a proposed BLM action, we recommend that you include both actions as aspects of a broader "proposal" (40 CFR 1508.23), analyzed in a single NEPA document. You may either construct an integrated purpose and need statement for both your proposed action and the connected action, or you may present separate purpose and need statements for your proposed action and the connected action. Regardless of the structure of the purpose and need statement(s), you must develop alternatives and mitigation measures for both actions (40 CFR 1508.25(b)), and analyze the direct, indirect, and cumulative effects of both actions (40 CFR 1508.25(c)). (Emphasis added) In other words, if either action "cannot or will not proceed without the other," then they are "connected" under NEPA and should be evaluated accordingly in the same NEPA document. As a result, we urge BLM to defer any further planning for the LRWP until BLM has prepared a supplemental EIS that properly analyzes both SWIP-North (Phase III) and Lava Ridge as "connected actions" under NEPA.	See response to comment 11535-5 (see in Table A-3jj, Legal or Policy Compliance).
9080-27	The Coalition to Protect America's National Parks	7. The DEIS does not consider the Area of Critical Environmental Concern (ACEC) nomination submitted for the 237,000-acre area surrounding the Minidoka WRC. Any decision on the Project should be deferred until after BLM makes a determination on the ACEC nomination – FLPMA requires BLM to "give priority to the designation and protection of areas of critical environmental concern," or ACECs, in the development and revision of land-use plans (43 U.S.C. § 1712(c)). The statute defines an Area of Critical Environmental Concern (ACEC) as follows: Areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards [43 U.S.C. § 1702(a)]. (Emphasis added) Page 55 of the TCP study prepared by Algonquin Consultants, Inc. (see General Comment 2 above) states that: Algonquin also completed an ACEC Study report and nomination concurrent with this TCP Study that was submitted to the BLM, Twin Falls District Office. The ACEC nomination found that the BLM should establish the approximately 237,000-acre area surrounding the Minidoka Relocation Center as an Area of Critical Environmental Concern (ACEC). Minidoka and its vicinity represent a sensitive and culturally important site for the Minidoka descendant community. The landscape surrounding and incorporating Minidoka is also of significant national and historic importance, commemorating the experiences of incarcerated Japanese Americans during WWII. (Emphasis added) Given that FLPMA requires BLM to "give priority to the designation and protection of ACECs," it is incumbent upon BLM to fully evaluate the ACEC nomination before proceeding with further planning or approval of the ROW application for the Project.	The BLM's decision space is described in Section 1.3 (Decision to be Made) of the EIS. The decisions made by the BLM on the project or any subsequent renewable energy proposal are made after considering the relevant information and based the information specific to the project. The BLM's purpose and need for the project is specific to responding to MVE's application for a ROW grant to construct, operate, maintain, and decommission a wind energy facility on public lands. Additionally, the BLM has determined that the Proposed Action and range of reasonable alternatives needed to meet the purpose and need are in conformance with the *Monument Resource Management Plan* (BLM 1986), as amended. Therefore, the preparation of an analysis for the purpose of a nomination of an ACEC and land use plan amendment is outside the scope of the EIS. Within the EIS, the BLM considers the potential impacts to the resources that contribute to the resource values described in the ACEC nomination. However, the action to establish an ACEC will require evaluation on its own merits within a land use planning revision or amendment process. See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
9080-28	The Coalition to Protect America's National Parks	8. The DEIS does not consider BLM's pending Idaho Renewable Energy Strategy (Strategy).40 Any decision about the LRWP should be deferred until after the Strategy is finalized, so that BLM can apply the Strategy's screening criteria to the Project before BLM makes a final decision whether to approve MVE's ROW application or not – BLM has recently announced that it is undertaking a review of its Renewable Energy Strategy (Strategy) in Idaho. Note: We submitted separate comments on the proposed Strategy and will not repeat them here. First, we commend BLM Idaho for reviewing its Strategy by taking a holistic look at its current approach to managing renewable energy projects. In our view, the current policy, if there is one, sorely lacks effective screening criteria for evaluating renewable energy proposals in Idaho. As an effective model for renewable energy project screening criteria, we call your attention to the 2012 Western Solar Plan (Plan).41 The Plan identifies "priority development zones" with high energy development potential and low potential for conflict with the protection of other resources and uses. It also identifies numerous "exclusion areas" where utility scale energy development would NOT be allowed in order to "to support the highest and best use of public lands by avoiding potential resource conflicts and reserving for other uses public lands that are not well suited for utility-scale solar energy development." Had a proper project screening process been in place in Idaho that identified priority wind energy development zones and exclusion areas, we suspect BLM would have denied or redirected the LRWP to another location when it was first proposed. This is due to the relatively low wind energy potential in the Project area and the relatively high potential for conflict of the Project with the protection of nearby historic and cultural sites. In the absence of an effective screening process, MVE, BLM, and many stakeholders have now invested considerable time, energy, and expense in a complicated and lengthy planning process. It is inevitable that whatever BLM decides to do with the Project after such a	The BLM Idaho renewable energy strategy as described in Instruction Memorandum IM-2023-09 outlines a pre-NEPA process that will help applicants, the BLM, and stakeholders have the information needed to effectively proceed with the NEPA process once the BLM proceeds with evaluating a project. The policy is not intended to replace the NEPA process for informing the BLM's decisions.

Comment ID	Commenter	Public Comment	Response to Comment
		process, some party or parties will be extremely disappointed with the decision. BLM Idaho has stated that the summary document for the Idaho Renewable Energy Strategy will be available by May 1, 2023,42 which means BLM will complete the Strategy well before it issues a final EIS or Record of Decision (ROD) on the LRWP. Once the Strategy is completed, we recommend that BLM apply it to the Project to help inform its decision about whether to approve the Project or not.	
1022-3-29	The Coalition to Protect America's National Parks	9. The proposed action violates the letter and intent of P.L. 109-441, an Act to Provide for the Preservation of Japanese American Confinement Sites43 – The Act requires the Secretary to establish a program "for the purpose of identifying, researching, evaluating, interpreting, protecting, restoring, repairing, and acquiring "historic confinement sites in order that present and future generations may learn and gain inspiration from these sites and that these sites will demonstrate the Nation's commitment to equal justice under the law." (Emphasis added.) As described in the law, this is an "all of the above" mandate, not a discretionary or "one or none of the above" decision option for Interior agencies. The proposed action, a massive wind farm development with up to 400 wind turbines with a maximum height of up to 740 feet, will be highly visible, dominate the landscape, and overwhelm the scenic vistas immediately north and northeast of Minidoka National Historic Site (NHS). In addition, the proposed action would "overlap 4,818 acres (8 square miles) of Minidoka WRC." (DEIS p. 168) Moving forward with the proposed action, as described, would be the antithesis of the Act's mandate to right the injustice of Nikkei incarcerations and demonstrate the "Nation's commitment to equal justice under the law." Although portions of the DEIS acknowledge the history of Japanese American incarceration at Minidoka WRC, the fact remains that all proposed action alternatives would cause substantial adverse effects to the site. As a result, BLM's planning process continues to seem indifferent to the unjust treatment suffered by and the amazing resiliency demonstrated by the Nikkei community at Minidoka WRC44 during one of the gravest American civil rights injustices of the 20th century. Moving forward, consistent with P.L. 109- 441, BLM should carefully re-consider the historical and cultural context of the Minidoka landscape that BLM's proposed action would irreparably harm.	See responses to comments 9080-51 (see in Table A-3ii, Decision Process for National Park Service), 11598-26 (see in Table A-3jj. Legal or Policy Compliance), and 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
9080-30	The Coalition to Protect America's National Parks	10. Notwithstanding FLPMA's "multiple use" mandate, the Secretary of the Interior has an "absolute duty" under the NPS Organic Act, as amended,45 to protect the resources and values of Minidoka NHS from unacceptable impacts – As the chief executive of the U.S. Department of the Interior, the Secretary is responsible for ensuring the Department and its bureaus comply with a variety of agency-specific legal mandates. For example, as stated in the DEIS (p. 1-1), FLPMA "requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V)." While FLPMA emphasizes managing public lands for multiple uses, at its core it is a conservation law. Section 102 (a)(8) of the Act states, in part: "the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values[.] (Emphasis added.) In contrast to the BLM's "multiple use mandate" under FLPMA, the NPS-managed resources at Minidoka NHS are protected under the "conservation mandate" of the NPS Organic Act of 1916 and subsequent amendments. The Organic Act established the fundamental purpose of units of the National Park System, which is: to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. (54 USC § 100101(a))	See responses to comments 9080-51 (see in Table A-3ii, Decision Process for National Park Service), 11598-26 (see in Table A-3jj, Legal or Policy Compliance), 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics), and 12859-11 (see in Table A-3jj, Legal or Policy Compliance).
9080-31	The Coalition to Protect America's National Parks	Congress supplemented and clarified the NPS Organic Act's 1916 provisions through enactment of the General Authorities Act in 1970, and again through enactment of a 1978 amendment commonly referred as the "Redwood amendment" because it was included in a bill expanding Redwood National Park. Key language from these amendments includes the following: Congress further reaffirms, declares, and directs that the promotion and regulation of the various areas of the National Park System… shall be consistent with and founded in the purpose established by section 1 of this title [the Organic Act provision quoted above], to the common benefit of all the people of the United States. The authorization of activities shall be construed and the protection, management, and administration of these areas shall be conducted in light of the high public value and integrity of the National Park System and shall not be exercised in derogation of the values and purposes for which these various areas have been established, except as may have been or shall be directly and specifically provided by Congress. (16 USC 1a-1) (Emphasis added) Congress intended the language of the Redwood Amendment to the General Authorities Act to reinforce the provisions of the Organic Act, not create a substantively different management standard. As stated in the Senate committee report:46 The Secretary is to afford the highest standard of protection and care to the natural resources within . . . the National Park System. No decision shall compromise these resource values except as Congress may have specifically provided. The Secretary has an absolute duty, which is not to be compromised, to fulfill the mandate of the 1916 Act to take whatever actions and seek whatever relief as will safeguard the units of the national park system. (Emphasis added) Similarly, the House committee report described the Redwood amendment as a "declaration by Congress" that the promotion and regulation of the National Park System are to be consistent with the Organic Act. The House report47 stated: The Secretary is to afford the highest duty of protection and care [to parklands]. (Emphasis added) In other words, while FLPMA Title V may "authorize the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric public lands," the Secretary of the Interior has overarching responsibility over all bureaus of the Department. The Secretary's responsibility includes "an absolute duty, which is not to be compromised,…to take whatever actions and seek	See responses to comments 9080-51 (see in Table A-3ii, Decision Process for National Park Service), 11598-26 (see in Table A-3jj, Legal or Policy Compliance), 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics), and 12859-11 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		whatever relief as will safeguard the units of the national park system," including Minidoka NHS. We urge Secretary Haaland to fulfill this absolute duty by denying MVE's problematic ROW grant application.	
9080-33	The Coalition to Protect America's National Parks	Section 1.4 Conformance with Land Use Plans (p. 1-2) – This section of the DEIS states the following: The Proposed Action and alternatives described in this EIS are in conformance with the [1986 Monument Resources Management Plan (RMP)], as amended, including the 2015 Idaho and Southern Montana Grater Sage-Grouse Approved Resource Management Plan Amendment (BLM 2015). (Emphasis added) The Proposed Action and alternatives fall within an area designated as "moderate use", which is described as follows: Moderate use areas are generally suitable for a wide range of existing and potential uses and will be managed for production and use of their forage, timber, minerals and energy, recreation, or other values. Where conflicts occur with resources or uses, full consideration of all benefits and costs will be taken into account in resolving such conflicts. Sensitive and significant values will always be protected consistent with Federal and State law. Public lands in a moderate use area will be retained in Federal ownership. (BLM 1986:4) (Emphasis added) No special limitations or restrictions on the type or intensity of resource use will be applied in this area. Valid uses will be allowed subject to environmental review and stipulations or special conditions to protect resources. (BLM 1986:6) (Emphasis added) We believe the BLM has mischaracterized the proposed LRWP as a "moderate use." An energy generation facility is defined as a "public utility" under applicable Idaho statutes; and a "public utility installation" is an "intensive use/development" that is explicitly precluded in the 1986 Monument RMP, see p. 4, which states: Intensive Use/Development Areas – These areas will generally be managed for a major or large- scale intensive use/development such as a major campground, off-road vehicle (ORV) area, mine, or public utility installation. No intensive use/development areas were established in the Monument RMP. (Emphasis added)	The BLM discusses conformance with the *Monument Resource Management Plan* (BLM 1986), as amended, in EIS Appendix 2. Also see response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance).
9080-34	The Coalition to Protect America's National Parks	First, under Title 61 of the Idaho Statutes, §61-11848, LRWP meets the definition of an "electric plant": The term "electric plant" when used in this act includes all real estate, fixtures and personal property owned, controlled, operated or managed in connection with or to facilitate the production, generation, transmission, delivery or furnishing of electricity for light, heat or power, and all conduits, ducts or other devices, materials, apparatus or property for containing, holding or carrying conductors used or to be used for the transmission of electricity for light, heat or power. (Emphasis added) Second, under § 61-12949 of the statute, LWRP meets the definition of a "public utility": The term "public utility"…includes every common carrier, pipeline corporation, gas corporation, electrical corporation, telephone corporation and water corporation … and each thereof is hereby declared to be a public utility and to be subject to the jurisdiction, control and regulation of the commission and to the provisions of this act. The term "public utility" as used in this act shall cover cases: (1) Where the service is performed and the commodity delivered directly to the public or some portion thereof, and where the service is performed or the commodity delivered to any corporation or corporations, or any person or persons, who in turn, either directly or indirectly or mediately or immediately, performs the services or delivers such commodity to or for the public or some portion thereof[.] (Emphasis added) In other words, LWRP, if approved, will be considered a "public utility" under applicable Idaho statutes; "public utility installations" are explicitly identified as an "intensive use/development" under the Monument RMP; and no "intensive use/development areas" were established in the RMP. Therefore the Project is not in conformance with the Monument RMP. We ask that BLM revise the DEIS to accurately reflect the nonconformance. In addition to the legal definitions described above, we also question in common sense terms how the BLM could view the LRWP as only a "moderate use" of the area. As described in the FR Notice, "[t]he Project area spans 197,474 acres and all project components would be sited within a series of corridors. These corridors are approximately one-half mile wide and cover approximately 84,385 acres." (Emphasis added) In mathematical terms, 84,385 acres or 43% of the Project area would be heavily developed with concentrated corridors of as many as 400 wind turbines up to 740 feet tall. While there may be "open space" between the numerous corridors, the visual adverse effects of such concentrated development over such a large area would resonate across the Project area and beyond. If one compares the size of the Project area with the size of the proposed ACEC described in General Comment 7 above, the Project area of 197,474 acres would constitute 83% of the proposed 237,000-acre ACEC. This hardly seems like "moderate use" to us.	See responses to comments 9080-33 (see in Table A-3jj Legal or Policy Compliance) and 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
9080-41	The Coalition to Protect America's National Parks	A. Section 3.1.1 Existing and Future Trends and Actions – This comment is specifically about the SWIP-North project mentioned on DEIS p. 3-5. See General Comment 6 above. In December 2020, LS Power reported51 that SWIP-North, approved in 1994, is "permitted but seeking cost recovery" (i.e., construction funding) and that the "project is nearly construction ready and could be online as early as June 2024." The same report also indicated that SWIP North would provide a link to "Idaho Power Company's interconnection queue; primarily wind, including a 1050 MW Lava Ridge wind project, being developed by [an] LS Power affiliate that is scheduled to be online in 2024." (Emphasis added.) The 1994 NEPA compliance for SWIP-North is undoubtedly outdated, as environmental conditions in the project area have changed significantly over the past three decades (e.g., impacts of climate change; changes in sage grouse conservation, etc.). It is clear from LS Power's 2020 report that the primary reason the company is moving forward with that project now, with a target completion date of 2024, is because the LRWP is also anticipated to be completed by 2024. As a result, BLM should follow its guidance in Permanent Instruction Memorandum (IM) No. 2018- 023:52 Connected actions are those proposed Federal actions that are "closely related" and "should be discussed" in the same NEPA document (40 CFR 1508.25 (a)(1)). Proposed actions are connected if they… cannot or will not proceed unless other actions are taken previously or simultaneously (40 CFR 1508.25 (a)(1))… If the connected action is also a proposed BLM action, we recommend that you include both actions as aspects of a broader	See response to comment 11535-5 (see in Table A-3jj, Legal or Policy Compliance).

Comment ID	Commenter	Public Comment	Response to Comment
		"proposal" (40 CFR 1508.23), analyzed in a single NEPA document. (Emphasis added) We urge the BLM to defer any further planning on LRWP until it has prepared a supplemental EIS that properly evaluates the Lava Ridge Wind Project and SWIP-North as "connected actions," which they clearly are.	
9080-42	The Coalition to Protect America's National Parks	B. Section 3.1.2.2 Tiering to the 2005 Programmatic Wind Environmental Impact Statement (PEIS) (p. 3-7) – See General Comment 5 and Chapter 1, Section 1.7 comment above. As described previously, BLM did NOT amend/incorporate provisions of the 2005 PEIS into the Monument RMP due to the lack of wind energy potential in the SFO. Yet BLM proposes to "adopt" just the best management practices (BMPs) from the 2005 plan while disregarding the more recent BMPs for "Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands,"53 published in 2013. For example, the 2013 BMPs recommend: "Site [alternative energy] facilities and ROWs outside of sensitive viewsheds or as far as possible from sensitive viewing locations." (Emphasis added) However, the proposed action for the LRWP is located only 0.5 miles from the boundary of Minidoka NHS, which is the antithesis of "outside of sensitive viewsheds or as far as possible from sensitive viewing locations." In general, BLM has not explained its rationale for adopting just the BMPs from a plan/PEIS that it did not otherwise amend or incorporate into the Monument RMP, while disregarding more recent BMPs that are specifically related to reducing visual impacts of renewable energy facilities on BLM-administered land. We recommend that BLM adopt the 2013 BMPs instead.	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. Throughout the preparation of the EIS, the BLM has used the mitigation hierarchy to identify measures and alternatives that would avoid and minimize potential impacts. The development of measures and alternatives have been informed by the robust suite of outreach efforts that the BLM facilitated throughout the preparation of the EIS. The BLM provides opportunities for input early on through coordination with stakeholders and cooperating agencies and incorporated input from the public throughout the preparation of the EIS. These outreach efforts have resulted in considering elements that have the potential to minimize adverse impacts. Through completion of the BLM's evaluation of the project consistent with NEPA, a decision will be based on an analysis of the full range of potential impacts with consideration for the use of appropriate BMPs. See response to comment 11534-6 (see in Table A-3jj, Legal or Policy Compliance).
9080-49	The Coalition to Protect America's National Parks	4. APPENDIX 2. Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies – The appendix fails to include numerous significant federal statutes and guidelines that are directly applicable to the Project. The following authorities provide important context for this issue and should be included in the listing: [see comment letter for full list, too much to fit in one comment]	Table App2-1 lists the major relevant agency actions and authorities that must be obtained or considered for the project. Other federal, state, and local authorities that may require actions and authorities applicable to this EIS are listed after the table. The relevant actions and authorities provided in this appendix are not meant to be comprehensive.
9080-53	The Coalition to Protect America's National Parks	G. The Civil Liberties Act of 1988 (Public Law 100-383)66 – The Act granted limited reparations to Japanese Americans who had been incarcerated by the United States government during World War II. The limits of these reparations reinforce the importance of preserving Minidoka WRC and the remembrance of its history and the people connected to it. H. P.L. 109-441, An Act to Provide for the Preservation of Japanese American Confinement Sites67 – Section 1(a) of the Act provides that The Secretary shall create a program within the National Park Service to encourage, support, recognize, and work in partnership with citizens, Federal agencies, State, local, and tribal governments, other public entities, educational institutions, and private nonprofit organizations for the purpose of identifying, researching, evaluating, interpreting, protecting, restoring, repairing, and acquiring historic confinement sites in order that present and future generations may learn and gain inspiration from these sites and that these sites will demonstrate the Nation's commitment to equal justice under the law. (Emphasis added.) In other words, it was the expressed intent of Congress that the Secretary of the Interior shall, among other things, identify, protect, and restore Japanese American confinement sites to "demonstrate the Nation's commitment to equal justice under the law." Implicit within this statement is Congress's recognition that the Nikkei were unjustly incarcerated at sites like Minidoka; and preservation of these sites by the Department of the Interior is necessary to demonstrate the Nation's commitment to righting that that injustice.	See responses to comments 9080-51 (see in Table A-3ii, Decision Process for National Park Service), 11598-26 (see in Table A-3jj, Legal or Policy Compliance), and 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
9080-55	The Coalition to Protect America's National Parks	K. 43 CFR Part 280070 – Section 501 (a)(4) of FLPMA authorizes the Secretary of the Interior "to grant, issue, or renew rights-of-way . . . for generation, transmission, and distribution of electric energy." The Secretary has delegated that authority to the BLM; and the Bureau has promulgated regulations at 43 CFR Part 2800 governing the granting such rights-of-way. Section 2804.35 describes how BLM will prioritize solar and wind applications. Specifically, § 2804.35(c) states: (c) Low-priority applications may not be feasible to authorize. These applications may include lands that meet the following criteria: (1) Lands near or adjacent to lands designated by Congress, the President, or the Secretary for the protection of sensitive viewsheds, resources, and values (e.g., units of the National Park System, Fish and Wildlife Service Refuge System, some National Forest System units, and the BLM National Landscape Conservation System), which may be adversely affected by development (Emphasis added) In other words, under applicable BLM regulations, because of its location the LRWP is considered a "low-priority" project that "may not be feasible to authorize" in order to protect "sensitive viewsheds, resources and values" of a unit of the National Park System. BLM should follow its own regulations and deny MVE's ROW application.	This pre-NEPA processing step described in the regulations is intended to help applicants, the BLM, and stakeholders have the information needed to effectively proceed with the NEPA process once the BLM proceeds with evaluating a project. The policy is not intended to replace the NEPA process for informing the BLM's decisions.
F1-3		I respectfully request that BLM immediately suspend its review of the Lava Ridge project including the ongoing NEPA and Section 106 processes and commence a holistic public process to update the Monument Resource Management Plan, which has not been updated in more than 37 years. This will allow the BLM to examine the cultural, historic, and resource values of the public lands in and around the Minidoka National Historic Site in a holistic way, providing meaningful protection for cultural resources, scenery, wildlife, and recreation, when evaluating potential renewable energy projects.	Also see response to comment 11326-9 (see in Table A-3jj, Legal or Policy Compliance). The BLM's decision space is described in Section 1.3 (Decision to be Made) of the EIS. The decisions made by the BLM on the project or any subsequent renewable energy proposal are made after considering the relevant information and based on information specific to the project. The BLM's purpose and need for the project is specific to responding to MVE's application for a ROW grant to construct, operate, maintain, and decommission a wind energy facility on public lands. Additionally, the BLM has determined that the Proposed Action and range of reasonable alternatives needed to meet the purpose and need are in conformance with the *Monument Resource Management Plan* (BLM 1986), as amended. Therefore, the preparation of an EIS for a land use plan amendment or revision is outside the scope of the EIS. The blm analyzes a full range of reasonable alternatives and describes additional alternatives that were considered within the EIS. The description of the alternatives is in EIS Chapter 2 and the analysis of potential

Comment ID	Commenter	Public Comment	Response to Comment
			impacts is in Chapter 3. This analysis provides the BLM an opportunity to evaluate the project with the information needed to take a hard look prior to a making an informed decision.

Public and Stakeholder Involvement

Table A-3kk. Public and Stakeholder Involvement

Comment ID	Commenter	Public Comment	Response to Comment
10450-1	Eric Bush	What I would like to see is Fact based information so a thinking person can judge the pros and cons.	The EIS was prepared using best-available information and clarifies impacts analysis rationale throughout Chapter 3 (Affected Environment and Impacts) and within EIS Appendix 3 (Issues Analyzed in Brief).
10531-2	Steph Olmstead	I urge BLM to extend the comment period at least 30 more days to give all citizens a chance to review the very large document concerning the Lava Ridge wind project.	The BLM initially provided a 60-day review period for the draft EIS (January 20 to March 20 of 2023). In response to requests to extend the public comment period on the draft EIS, the BLM provided an additional 30 days, leaving the comment period open through April 20, 2023.
11297-3	Steven Upton, Linda Upton	Another group impacted will be the low income and minority groups. Materials for Lava Ridge Project have not been provided in alternative formats in order for these groups to make public comments. Has LS Power, aka Magic Valley Energy and the BLM purposely excluded non-English speaking communities? [] What about our farmers and ranchers? Please do not ignore our communities and work with us to address all concerns.	See response to comment 11629-1 (see in table A-3kk, Public and Stakeholder Involvement). The affected grazing permittees are in coordination with BLM and MVE; MVE developed the Grazing Coordination Plan (Appendix S in MVE [2023]) through coordination with the grazing permittees.
11372-1	Jamie Kohtz	62,000 AUM's and nearly 42 ranchers, my family included, will be impacted by the project. Factoring in their employees, hundreds of families will be impacted in some way due to the inaccessible AUM's. The employees that live and work on these local farms and ranches are primarily migrant and Spanish speaking. I do not feel that enough has been done to reach out to these people, gather their input, and educate them on the project.	See response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
11436-2	Tim Ekeberg	In addition you have had Idaho's Senator's requesting additional time for the public to view and fully understand the EIR and ALL of the Alternative choices available to them. With this error it is clear either the BLM extend the comment period or face legal challenges for years to come costing tax payers millions to fight litigation that might be avoided by extending the comment period.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1145-1	Sue Williams	After attending the Lava Ridge meeting in Jerome and recognizing the level of detail contained in the draft EIS, I respectfully request that the deadline for comments be extended a minimum of 30 days. This extension would give more time to thoroughly understand the impacts noted in the document and provide time for the public to involve their own experts to analyze and provide substantive objections to this project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
11491-8	Dean Dimond, Jennie Bateman	Counties have not been given tangible impacts of this wind project. [...] This is an example of regulatory overreach of federal overreach as well as circumvents true public involvement. Counties have been disregarded in this deficient draft EIS.	As listed in EIS Appendix 10, Table App10-2, the three counties in which the project is located are participating in the project NEPA process as cooperating agencies. See also comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement) regarding the draft EIS public comment period extension.
11535-1	Steven Andersen	As a preliminary matter, we express our continued objection to the denial of our firm's previous requests for an extension to the public comment period beyond April 20, 2023. The DEIS describes a proposal for massive turbines never constructed or tested, without any specificity on siting, or engineering for the proposed project, with huge gaps in necessary analysis. The DEIS acknowledges a lack of engineering and site specifics but tries to brush it off as a positive that allows "flexibility". In reality, this is key information necessary for an informed analysis of environmental impacts. The agency should have allowed itself more time for an adequate DEIS based on necessary information and likewise, permitted the public adequate time to review and participate. Not only is this an extremely complicated topic with multi-faceted implications (many not addressed in the DEIS), but the impacted public – specifically, many impacted minority and low-income rural communities – remained, by and large, uninformed, and unable to meaningfully participate on this expedited track relative to the complexity of the project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement) and EIS Appendix 10 for all public involvement opportunities provided. Also, Section 3.6.1.1.1 (Low-Income, Minority, and Tribal Populations) and 3.6.1.2 (Impacts) of the EIS provide an evaluation of potential project impacts to low-Income and minority communities.
11551-2	Erin Shigaki	Regarding the March 2, 2023 Open House Event Because the BLM failed to notify impacted populations in Idaho and throughout the US (including Japanese Americans) before the Notice of Intent was posted on August 20, 2021, I was glad to see that there would be "open house" events in certain locations. During the "open house" event on Mercer Island, WA on March 2, 2023, I was present for the full four hour long event along with several other members of the Minidoka Pilgrimage Planning Committee. Please explain why the event was held at an inconvenient suburban location when there are several historic Japanese American locations in Seattle proper. Who did you reach out to to decide where this event should take place? Why was it held during the work week, and in the middle of rush hour traffic? Please explain why not one BLM employee introduced themselves to me, even as I interacted with our survivors and other community members, as well as reviewed your visuals. Please explain why the LS Power employees who were present were not wearing identification badges. I also ask for an explanation as to why LS Power employees were traveling with your group at all, and–as I understand it–staying at the same hotels and dining with BLM staff. Please explain why	In support of the BLM, NPS staff suggested the Portland and Seattle meeting times and locations. LS Power attended the meetings because they were open to the public. LS Power was not attending on behalf of BLM. No BLM staff dined with LS Power. BLM staff attempted to approach all members of the public attending the meetings. At public meetings, BLM staff visited with all members of the public who approached BLM staff for questions or clarifications. The No Action Alternative is evaluated in the EIS and is the background to all maps within the EIS. This was printed and included at meetings in response to public requests to do so.

Comment ID	Commenter	Public Comment	Response to Comment
		the Alternative A: No Action option was not printed on your many materials at the event, instead only on a hastily taped up piece of cardboard as an afterthought?	
11573-1	Jaimee Orton	However, my frustration with this project goes beyond its potential environmental impacts. I am also extremely frustrated by the difficulty of actually being able to submit public comment on this issue. As someone who cares deeply about our community and the environment, I want to have a say in this decision-making process. But the process for submitting public comment has been extremely confusing and frustrating, making it difficult for me and many others to participate. In order to submit public comment, I had to navigate a confusing online system. Even after I successfully submitted my comment, I received no confirmation or acknowledgment that my comment had been received. This lack of feedback left me feeling disengaged from the process and unsure if my voice had been heard. I am not alone in my frustration. Many of my friends and neighbors have also expressed difficulty in navigating the comment submission process. This lack of accessibility and transparency in the public comment process is deeply concerning and could result in the voices of concerned citizens like myself being ignored. I urge you to reconsider the process for submitting public comment on this issue. The community deserves a clear and accessible way to have their voices heard in this important decision-making process.	The BLM provided several open houses in late February (in Shoshone and Twin Falls, as well as a virtual online meeting) and early March (in Portland and Seattle) for submittal of in-person (or virtual) public comments, including comment transcription by a court reporter. Comments were also received via hardcopy mail to the SFO, via the project email address, and through online comment submissions on the project website (https://eplanning.blm.gov/eplanning-ui/project/2013782/570). Also see response to comment 10531-2 (see in table A-3kk, Public and Stakeholder Involvement).
11618-2	Bif Brigman	Some of my most important questions relate to the cultural competency of Bureau of Land Management - staff, consultants and managers and their subsequent actions, decisions and priorities impacting the Minidoka National Historic site and Japanese American stakeholders. To date, everyone has appeared to be white. Everyone. The BLM track record on this EIS is a clear disaster on engaging the vast Japanese American community who have profound ties to Magic Valley. It really speaks volumes on the inability for BLM to successfully understand or engage this historically marginalized community with any depth. You are convinced you understand - but your actions and words tell me and others otherwise. I don't see how can you possibly think you understand and realistically or adequately can assess the impacts on these communities you don't belong to? And yet some continue to drive a process when you clearly do not understand the communities you are impacting, at all, nor the harm you are visiting on them. This proposal, at this location, is actively inflicting harm and you are only in the planning stage. It is shameful that you are visiting harm and trauma on a community that the Department of Interior originally harmed and traumatized in 1942. [...] Why won't you answer questions about what sorts of training Blm staffers have had when it comes to cultural competency? Why do you not require that from your consultants? Why can't you answer any questions about diversity equity and inclusion requirements for the Bureau of land management or policies that you are currently following as it relates to the subjects? Why is it not reflected in the EIS? [...] Why were no materials produced in Japanese language for non-English speakers who are associated with the Minidoka national historic landmark why were no ethnic newspapers, or other media engaged in the outreach efforts of BLM? Why was there no Spanish language translations of materials and notices? Spanish is the next most spoken language and NOTHING, Again massive failure of cultural competency and BLM. I also would like to know what formal process BLM has for addressing formal complaints against your biased EIS and especially the open house process and "outreach" - including signage, biased and selective posted options, location, timing and , the overly chummy relationship between the energy company proposing this project and your staff people? https://youtu.be/14MdgztuaP0	See EIS Appendix 10 for a list of Section 106 consulting parties involved in the Lava Ridge Wind Project NEPA process, including Japanese Americans and Tribes. Also see Tables A-1 and A-2 in this Public Comment Summary Report appendix. Also see response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement) regarding the translation of materials into Spanish.
11622-8	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	In addition to flaws in the DEIS, we wish to express our concerns about BLM's failure to follow DOI, BLM and Biden Administration policies regarding engaging with Environmental Justice Communities early in the planning process. While we appreciate BLM's outreach through Langdon Group/CADR program and the public meetings in Washington and Oregon, we felt that it was more of a "check the box" approach rather than a good-faith effort to engage with the Japanese American and Alaska Native community as required by Administration policies. This can be seen by BLM's disregard for some of the most important findings in the Lava Ridge Wind Project Stakeholder Assessment and Engagement Report that was produced by Langdon Group/Kearns & West for BLM in preparation for the DEIS process, such as the section that stated "appropriate meeting locations, dates and times should be coordinated with Local Japanese American community groups." In the Seattle area, a single public open house was held on Mercer Island to discuss the DEIS with the community. The location, date, and time were not discussed with local Japanese American community groups. The Langdon Group's report also found that increased "cultural competency training within BLM is warranted for meaningful engagement." Several members of the Minidoka Pilgrimage Planning Committee attended the open house and were greatly disappointed by the lack of meaningful engagement and cultural competency from BLM representatives. At various points during the open house, committee members were burdened with the responsibility of explaining concepts and history to BLM representatives that should have been known and taken into consideration from the beginning of the DEIS process. The committee also had to endure a BLM staff member calling images of children imprisoned in Minidoka "cute." We hope to see the lessons learned by BLM at the open house and in the Langdon Group's report reflected in the FEIS. We would welcome the opportunity to engage directly with the BLM and encourage it to work in meaningful ways with the Minidoka stakeholders located in Washington, Oregon, Alaska, California and throughout the United States, as well as Friends of Minidoka in Idaho to protect Minidoka's sacred values for current and future generations. The Lava Ridge project has clearly demonstrated that Minidoka has many lessons left to teach about avoiding repeating the wrongs of the past.	See responses to comments 11573-1 (see in Table A-3kk, Public and Stakeholder Involvement), 11551-2 (see in Table A-3kk, Public and Stakeholder Involvement), and 11618-2 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
11629-1	Ruth Harder	-Why is it available in English only? There are many citizens that would be directly effected by the Lava Ridge project that cannot read or respond to the proposal.	The draft EIS handout and scoping notice were prepared in Spanish. A Spanish-translated draft EIS Executive Summary was provided to those that specifically requested Spanish translation. For information on how to obtain project information documents in accessible formats and/or translated into different languages, contact: Kasey Prestwich, Project Manager. By email: BLM_ID_LavaRidge@blm.gov. By mail: BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352. Additional information on the BLM Accessibility Program is always available at https://www.blm.gov/programs/recreation/recreation-programs/accessibility.
11741-1	S J Arima	Recently, I attended an informational gathering on Mercer Island, Washington sponsored by the BLM. Unfortunately it was not informative as a whole. Alternative A was not initially presented. By name it was added by onto the bottom of one of the boards featuring other alternatives in detail. The fact that there are other energy sites being proposed in Idaho was not featured. Seemingly they would have much less impact on the Minidoka Historical Site. There was no information that the possible energy produced by the Lava Ridge wind farm could very well be sold outside of Idaho. I was given the impression that attendees were being purposely guided by information and the lack of disclosures to favor Alternative E. A more complete factual presentation would have supported Alternative A.	See response to comment 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
11772-7	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	The Langdon Group's report also found that increased "cultural competency training within BLM is warranted for meaningful engagement." Several members of the Minidoka Pilgrimage Planning Committee attended the open house and were greatly disappointed by the lack of meaningful engagement and cultural competency from BLM representatives. At various points during the open house, committee members were burdened with the responsibility of explaining concepts and history to BLM representatives that should have been known and taken into consideration from the beginning of the DEIS process. The committee also had to endure a BLM staff member calling images of children imprisoned in Minidoka "cute." We hope to see the lessons learned by BLM at the open house and in the Langdon Group's report reflected in the FEIS.	See response to comment 11618-2 (see in Table A-3kk, Public and Stakeholder Involvement).
11814-1	Jake Powell	I was extremely dismayed that the Alt A has never been presented at any of the scoping meetings I've attended. It seems like the decision is already made and the BLM is playing charades with the public and this scoping process.	See response to comment 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
11842-1	Erin Nishijima	Additionally, you have failed to notify the impacted population in Idaho and throughout the US before the Notice of Intent was posted on August 20, 2021.	The NOI was the BLM's first public announcement of the agency's intent to prepare an EIS. The NOI initiates the NEPA scoping process which defines issues for analysis in the EIS and informs the BLM's alternatives development process.
11873-21	Mary Schwartz, Frank Schwartz	23. A large part of the demographic in the area of the Lava Ridge project is Spanish-speaking. The BLM's communications approach for this DEIS did not appear to consider this. The local population needs to be fully informed of this proposal, and it is BLM's responsibility to assure that happens.	See response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
11912-2	Da'nell Cannon	[...] have adequate town-hall informative meetings been held to inform and gain the consent of Idahoans?	See responses to comments 11573-1 (see in Table A-3kk, Public and Stakeholder Involvement) and 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
11926-9	Name Not Provided, Susan Jesser	BLM withheld information from the public at Open Houses in not sharing about Alternative A-no action. Can BLM be trusted to honestly consider the comments? Is a neutral party monitoring this process?	See response to comment 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement). Also multiple agencies and interested parties are participating in the NEPA process as cooperating agencies and providing on the analysis in the EIS, although the BLM is the land management agency and will make the final decision when selecting an alternative in the ROD.
1202-1	Dawn Leiske	I am requesting that you grant us an extension on Lava Ridge Comment Period from March 21, 2023; for at least another 60 days. We are not skilled researchers or writers for this project. We will need more time to put together our comments. The BLM and LS Power has taken 3 years to put the EIS research and document together. It is to our disadvantage that we have such a short period of time to read this whole document and comment on it.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement). The BLM proactively reached out to stakeholders (identified through: scoping, meetings with cooperating agencies, public expressions of interest, and Section 106 consultation) in the months prior to public release of the draft EIS to alert them of the upcoming review timeframe.
12101-1	Dawn Leiske	We are still waited for a hard copy of a Spanish version of the Lava Ridge Wind Turbines EIS, which was not provided by the end of the public comment deadline of April 20, 2023. "Limited English proficiency individual versions", of the Lava Ridge Wind Turbines EIS should have been provided by BLM at the beginning of the public comment period. There are NO "limited English proficiency individual's versions" of the Lava Ridge Wind Turbines EIS for the English limited individuals in Idaho. English language Zip files were given out, but that technology is no longer relevant in today's technical world. The majority of individuals wanting to comment did not own a tablet or a computer. They own cell phones. So receiving a hard copy of the EIS all (4) volumes was critical. We were told by the BLM that they had limited resources; and that they were too costly and difficult getting the EIS printed. I only received a hard copy of the English 4th volume after weeks of trying to get a hard copy from the BLM. Very few copies of the full 4 volumes of the English version where even distributed. That was because BLM felt they were "unnecessary", for us to review due to the nature of content within the 4th volume. I noted on the cover of the 4th volume; Section 508 of the Rehabilitation Act of 1973 was printed on it. (Not printed on volumes 1, 2, and 3 below). There is no mention of any languages, "such as Spanish or Japanese", for the individuals whom may be directly affected by this project. A federal government agency such as the BLM directly involved in the EIS process should provide full hard copies, in "all languages" for everyone wanting to make a formal public comment to the Lava Ridge Wind Turbines EIS? We were told to	See responses to comments 10531-2 and 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
		write substantive comments with EIS references or it would not be considered as a public comment. Yet we were not able to obtain all necessary materials for all of the individuals wanting to make public comments. How are the limited English proficiency individuals going to write substantive comments without a these language appropriate EIS? The full English version of a hard copy was much too difficult to acquire.	
12305-1	Marcy (No Last Name Provided)	Why is the EIS only provided in English language? Reports are supposed to be available in the language common to the area. Spanish speaking residents of Jerome county make up 40% of the population. Native American tribes, Potuguese, and Japanese also make up a large potion of the population in the Magic Valley. And why are there not enough copies of the EIS for persons who are computer challenged and for those who do not have computers?	See responses to comments 11618-2 and 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12307-4	Dean Dimond	This is an example of regulatory overreach of federal overreach as well as circumvents true public involvement. Counties have been disregarded in this deficient draft EIS.	See responses to comments 10531-2 and 11491-8 (see in Table A-3kk, Public and Stakeholder Involvement).
12400-4	Elizabeth Lampert	I would respectfully request that the Public Comment Period be extended for at least another 6 months to allow more public comment.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
12402-1	Name Not Provided, Dawn Leiske	I understand that there is a Policy on adequate opportunity to provide input. These are the last couple of days until the deadline and this information should have been provided in the beginning of the comment period from what I read. I appreciate your time and effort on this matter but the issue has not been resolved for all people with limited English proficiency.	See responses to comments 10531-2 and 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12453-1	Alexia Deetz	I also, have some eyesight issues and find the time frame to respond to the enormous report extremely unrealistic. It is also of concern that there are no multi-lingual or audible copies of the Impact Statement and the only efficient access is online, using acrobat reader. How many people have resources, skills and abilities to access this way?	See responses to comments 10531-2, 11629-1, and 12555-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12555-1	Darrell and Jennifer Schutte	2. Why was the Lava Ridge EIS only available in English? This is not giving equal access to all. What about the 40% Hispanic population of Jerome County? What about people like our mother-in-law, who is legally blind? She has a right to know what is happening to her public lands, as well, and have the opportunity to have a say. What about those peoples who couldn't get a copy of the EIS because there were so few copies of the monstrosity of a document it was and could not access a digital copy?	See responses to comments 10531-2 and 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement). All documents provided via the project website (https://eplanning.blm.gov/eplanning-ui/project/2013782/570) were compliant with Section 508 accessibility requirements.
12556-1	Darrell and Jennifer Schutte	The Lava Ridge EIS and all materials distributed by LS Power / Magic Valley Energy and the BLM are 100% misleading. It is clearly evident that the only options offered to the public were Options B, C, D and E. What about Option A, which is to do nothing at all? Why is it missing from your charts? I believe that this was misleading to the public and it needs to be corrected. A new comment review period should take place with better explanation that the public does have, can have, and should have the option to pick or select Option A, for the BLM to do nothing and deny the project. We feel LS Power / Magic Valley Energy and the BLM failed to give full disclosure of ALL the facts and ALL possible options, including Option A. Again, the impact study should be redone so that the public understands that they infact had and have another option. All public meetings that used these misleading materials and charts will have to be repeated as well. I would ask that all who submitted comments on your web page or by other means and who commented on social media be notified as well, because it is proven that they have concern and deserve to be presented with all the options.	See responses to comments 10531-2 and 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12834-2	Sheree Bovey	The BLM has NOT mentioned to residents that there is an option A for this project. At no time have I seen and Option A presented in the maps. This would be the NO build option. This has been brought to the BLM's attention by several groups and they continue to not provide this.	See response to comment 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12846-1	Regina Smith	There have been requests for this document in Spanish. Hispanics, Basque, Portuguese and other minorities make up 40% of the population. They are not represented here. Requests for Spanish translations have been denied. It would not be unreasonable for MVE to foot the cost of a few copies for a large, local minority.	See response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12859-44	Kristen Brengel, Robyn Achilles; Friends of Minidoka	The Lava Ridge permit process began with little outreach to the Japanese American community. This directly contravenes the administration's Executive Orders and policies regarding stakeholder engagement while implementing its climate agenda. Climate Crisis Executive Order 14008. On January 27, 2021, President Biden issued Executive Order 14008, entitled "Tackling the Climate Crisis at Home and Abroad." The Climate Crisis E.O. states the goals of the Administration to reduce climate pollution and deliver environmental justice.271 The E.O. also states that: "[s]uccessfully meeting these challenges will require the Federal Government to pursue such a coordinated approach from planning to implementation, coupled with substantive engagement by stakeholders, including State, local, and Tribal governments." Secretarial Order 3399. To carry out this guidance from the President's Climate Crisis EO, Secretary Haaland issued Secretarial Order 3399, entitled a "Department-Wide Approach to the Climate Crisis and Restoring Transparency and Integrity to the Decision-Making Process." Section 5 (c)of the Secretary's Order clearly requires BLM to engage with stakeholders early in the planning process, before a decision to prepare an environmental impact statement: "Bureaus/Offices will proactively begin consultation with potentially impacted Tribes, both those currently in the proposed area and those with a historic presence, as well as engage potentially impacted environmental justice communities early in the project planning process. 'Early in the project planning process' includes when a Bureau/Office has enough information on a proposed action to determine that an environmental assessment or an environmental impact statement will be prepared." Emphases added.	See responses to comments 11618-2 (see in Table A-3kk, Public and Stakeholder Involvement) and 11842-1 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
12867-3	Steve Lampert	There are many more issues that I believe the EIS does not adequately address for the Project. For this reason, I would respectfully request that the Public Comment Period be extended for at least another 6 months to allow more public comment.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
12949-1	Ralph Kincheloe; Connie Kincheloe	We attended the public meeting in Twin Falls on February 24 hosted by the Bureau of Land Management and the Galileo Project, LLC. The display boards did not include Option A, No Build. This is a violation of NEPA. While the DEIS does include this option, most of the public was interested in the boards and did not sit down to read the DEIS. How many of the attending public were unaware, based on the visual display boards, that this was still a viable option. It is questionable that they may have been driven to choose between other alternatives because of this decision to leave out a board. The zoom presentation on the following day also did not include Option A.	See response to comment 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12955-1	Jose Torres	I have concerns about the project that there is no information in Spanish and considering that almost 48% of the population in Jerome County are Spanish-speaking and we are homeowners. I was scared I asked more about the environmental impact statement in my area.	See response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12968-2	Charles Brockway	The public involvement allowed for this application has been absurdly inadequate given the massive scope and impact of the proposed project. Public meetings have been highly constrained and limited in scope, allowing only token public comment. Input from local governing bodies such as county commissions and city councils has been insignificant. The two virtual public scoping meetings were poorly executed, and did not allow for adequate and meaningful public comment.	See responses to comments 10531-2, 11491-8, and 11573-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12972-1	Sheila West	The Environmental Impact Statement for the Lava Ridge Wind Project does not comply with Executive Orders EO12898 and EO13166 which requires federal agencies to provide meaningful access for people with limited English proficiency. The above document is only available in English and not all languages of people effected by the scope of the project. The BLM is ignoring the Law and the people the law protects. The Lava Ridge Wind Project needs to be available in Spanish, Portuguese, Basque and Hindi to name a few of the languages spoken in the Magic Valley.	See responses to comments 10531-2 and 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12978-1	Susan Jesser	4. Jerome County has large LEP (limited English proficiency population and the draft EIS was not translated into Spanish. A Hispanic friend told me the Jerome is nicknamed "Little Mexico." This concern should be investigated by the Federal Coordination and Compliance Section of LEP.gov	See response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12978-2	Susan Jesser	8. BLM withheld information from the public at Open Houses in not sharing about Alternative A-no action. How can BLM be trusted to honestly consider the comments? Is a neutral party monitoring this process?	See responses to comments 1022-3 (see in Table A-3ee, Alternatives) and 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12979-1	Susan Jesser	In August 2022, I was first introduced to the Lava Ridge Wind Project and the negative impact on the economy, wildlife, habitat, aquifer, etc. When I attended the open house in Shoshone, listened to ZOOM meetings, and started asking questions, my eyes were opened to new concerns and more questions about Lava Ridge Wind Project I would appreciate some understanding as to why Alternative A-no change was not placed on the display posters? I asked a presenter, "What is/Where is "A" at the Shoshone Open House? When I heard that "A" is no change and "mysteriously" missing from the posters, I was very disappointed and angry. r Was there hot ONE person from SWCA, Galileo Project, MVE, or BLM, etc. who recommend showing the truth and that there was an Alternative A? The posters had Alternatives B C D E listed with C and E labeled (preferred) but no "A". Was showing "A" on the posters even discussed at all of the meetings? Who made the final decision that Alternative A-No Change shouldn't be presented to the public? Keeping the citizens in the dark about "A" appears to be a lack of honesty and that no change was an option for the area. At the open house in Twin Falls there was a paper showing Alternative A on the table with the printed DEIS volumes but not in Shoshone. Not letting folks know "no change" was an option from the start was not honest or being government employees or consultants with integrity. Another aspect of not listing Alternative A for Lava Ridge and "hiding" information concerns a sweet friend. She lives in the Clover area where Salmon Falls Wind project is being considered. She was telling me about a wind monitoring station not far from her home. She thought the coming wind turbines were a done deal when we talked. More keeping information from the public and not being told about NO CHANGE OPTION.	See response to comment 9275-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12982-1	Jerry Taylor	The cumbersome format of the DEIS, the inordinate volume of the document, and the inherent difficulty in navigating electronic/online versions seriously detracts from the publics' ability to gain access to, focus on, or clearly understand what is being proposed or the impacts that would likely result. Pitiful few paper copies of the DEIS were made available for public review.	See response to comment 12555-1 (see in Table A-3kk, Public and Stakeholder Involvement).
13002-1	Jim Meeks	There are zero copies of the Lava Ridge wind project draft environmental impact statement printed in Spanish or any other language other than English. Idaho, proudly supports our significant percentage of Hispanic businesses and ag. land owners. Our Hispanic neighbors observe the opportunity to review the draft impacts in Spanish.	See response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
1377-1	Teiko Saito	I am writing to request that the Bureau of Land Management give the public an additional 30 days to comment on the DEIS for the proposed Lava Ridge wind project. The DEIS is very long, has multiple volumes and reading through it is a massive task for a personally	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
		affected citizen like myself. The likely impacts of the project are so sweeping and significant that it is taking me a long time to read through the DEIS, let alone draft my comments to send to you on this proposal. I don't believe that a 30 day comment period extension request is unreasonable, especially from the point of view of an elderly survivor from Minidoka. For that reason, I would deeply appreciate it if you and BLM would grant my request for a 30 day extension in the DEIS comment period for Lava Ridge	
1378-2	Brian Olmstead	One more small request: I am working hard every day to read, understand, and make respectful, thoughtful comments to each environmental issue in the DEIS. I cannot possibly finish this important process by March 21. This is a huge, unprecedented, project and this DEIS took a great many months to produce. Give myself and all citizens a fair chance to comment by extending the period by AT LEAST 30 additional days!	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1452-1	Bridget Keaveney	The Japanese American Citizens League, the nation's oldest and largest Asian American civil rights membership organization and representing over 8,000 members nationally, requests a 30 day extension to the comment period for the BLM's Draft Environmental Impact Statement from the currently scheduled March 21st, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1490-1	Sam Kito Jr	The DEIS is over 500 pages long and includes numerous attachments and supporting documents. Also, the BLM has not provided the public with hard copies of this document, making it more difficult for Minidoka survivors – all quite elderly Americans - to review. Because of the complexity of the project, additional time is needed to review and comment on the project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1578-1	The Coalition to Protect America's National Parks	I am writing to you on behalf of the Coalition to Protect America's National Parks (Coalition). Our membership is comprised of over 2,300 National Park Service (NPS) retirees, former and current employees, and NPS volunteers, who collectively represent more than 45,000 years of national park management and stewardship experience. We request that the Bureau of Land Management extend the public comment period for the Lava Ridge Wind Project by 30 days. This would give the public a total of 90 days to review and comment on the Draft Environmental Impact Statement (DEIS), a document that is well over 1,500 pages long including attachments.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1592-1	Stephanie Olmstead	I urge BLM to extend the comment period at least 30 more days to give all citizens a chance to review the very large document concerning the Lava Ridge wind project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1593-1	Eila Olmstead	I urge the BLM to extend the comment period so that my generation has a chance to educate ourselves on this project (right now I can tell you that many of my generation aren't even aware) and let our opinions be known for the preservation of Idaho public lands for generations to come.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1618-5	Brian Olmstead	I respectfully ask you again to extend the comment period, as studying and making important, knowledgeable comments takes a lot of time! 60 days is not a reasonable comment period for a gigantic project such as this!	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1691-2	Regina Smith	BLM extended the release date at least 3 times. To expect normal citizens to be able to study the DEIS and make effective comments in 60 days is unrealistic. Community members may have an the issue of even finding a professional to consult in 60 days. If we found a professional in this time period, and schedule an appointment, it could take 2 to 3 months to get in to see the professional. This 60 days comment(s) time limit is setting your community members up for failure. Please extend the comment period. I look forward to the news of the extension being released shortly.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1693-1	Brian Olmstead	First of all, I must ask for an extension of at least 30 days to the comment period for the draft EIS. I am reading it section by section and will be making comments on a great many of the draft findings. I want them to be personal, accurate, and pertinent to the subjects in the EIS. This will take research and there simply isn't time in the next 50 days to do all I need to do.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
1953-3	Allan Lloyd	Why not put this up for a vote for all of us to decide, instead of trying to ram it through with very little chance of all of Idaho having a voice?	See responses to comments 1022-3 (see in Table A-3ee, Alternatives) and 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2100-2	Office of Governor Brad Little, Office of Lieutenant Governor Scott Bedke, Office of US Senator Mike Crapo, Office of US Senator Jim Risch, Office of Congressman Mike Simpson	Our offices were informed that public outreach efforts have been insufficient to adequately engage Idaho citizens in the process. For these reasons we urge the BLM to reassess and refocus the process on working with the local communities to address the concerns outlined above. If all these concerns are not addressed, it is unlikely we will be able to support this project moving forward. Without community support, the BLM risks jeopardizing trust in government, which in turn makes future projects more challenging to accomplish.	See responses to comments 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement) and 11491-8 (see in Table A-3kk, Public and Stakeholder Involvement).
2193-1	Simone Griffin; BlueRibbon Coalition	As our members and others have continued to engage we believe an extension is warranted. There has been a high volume of interest in this project that should be accommodated. Because there has been such a high interest in public review of information we believe BLM should grant an extension to give adequate time for public comment. The comment period is imperative for the BLM to make these decisions, and if the public hasn't been given adequate time to review all information it compromises the integrity of the NEPA process. BRC would like to point out that the largest current wind farm in Idaho is more than ¼ the size of the proposed	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
		project. Therefore, a project of this size is new territory for residents and public land users. We hope BLM will strongly consider our recommendation to extend the comment period for another 30 days. This will provide adequate time for public comments to be made on accurate information. BRC would like to be considered an interested public for this project.	
2327-1	Toni McNeill	I am writing to request a 6 month extension to the public input on the EIS report. The report is extensive and time is needed for the public to address their concerns in the manner the BLM is requesting.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2336-1	Saundra Bell	It took 6 months for you all to come up with the EIS report you need to extend the time for us as citizens to respond with our input. Thank you for your consideration.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2364-1	Joe Alexander	I was writing in hopes that you could extend the time I have to respond to the lava ridge EIS it will take a long time to read.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2380-1	Doreen Alexander	I am writing to ask for an extension on the Lava Ridge comment due date. Because the letters are needing to be Substantive, they will take longer. Please consider extending this due date.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2554-1	Barbara Takei; Tule Lake Committee	As a grassroots non-profit organization composed of Japanese American survivors and descendants of the WWII incarceration, the Tule Lake Committee urges the BLM to grant an extension on the current March 21, 2023 deadline for public comment on the Lava Ridge draft EIS. Protection of archeological, historic, cultural and environmental resources is a complex conversation. The present 30-day comment period for the Lava Ridge draft EIS is not reasonable if the purpose of the comment period is to provide for a democratic process that includes, rather than discourages citizen participation. The present 30-day comment period for a 500-page technical and specialized report ensures the only participants in the process will be environmental professionals representing business and government, effectively excluding members of the general public. We urge the BLM to please consider extending the deadline another 30 days, or if possible, another 60-days. Such an extension would enable greater citizen participation on a matter of deep concern.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2821-1	Erin Shigaki	The Minidoka Pilgrimage Planning Committee (MPPC) is a volunteer-run 501(c)3 organization based in Seattle, WA. Our mission is to honor those who were incarcerated during World War II and educate the general public on this history. We organize an annual pilgrimage to the Minidoka National Historic Site in southern Idaho, where Japanese Americans from Seattle, Portland and Alaska were incarcerated. We serve incarceration survivors, descendants, and allies who care about this history. It follows that our community has a huge interest and stake in the forthcoming decisions to be made around the Lava Ridge Project. On behalf of the executive board of the Minidoka Pilgrimage Planning Committee, I write to urgently request a thirty day extension of the public comment period for the Lava Ridge Draft Environmental Impact Statement. This extension will provide the public with a 90 day comment period which provides a more fair and equitable period of time in which to digest and process the 578 pages of the DEIS.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2836-1	Brenda Ford	I would like the comments from the public to be extended 30 to 60 days.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2839-1	Susan Jesser	More time for this public comment is necessary to address this project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2841-1	Lowell Ihler	We respectfully request a 60-90 day extension of the comment period for the draft EIS report regarding the Lave Ridge Wind Farm. This is a huge project that will impact our state and valley for upwards of 100 plus years or more. The existing time frame for comments is not enough for the average citizen to study the DEIS and make informed decisions and educated comments. The LS Power has had a long time to put this all together, so a little longer for citizens to comment only seems fair. Many citizens are just now gaining access or even hearing about the project and all it entails, and because of the size of the draft EIS and the time involved to read it we ask you to, please, extend the comment period another 69-90 days.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2843-1	Lois Chapman	I want the comment period to be extended for 90 days so everyone has an opportunity to express their concerns.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2886-1	Diane Meeks	Please extend the community response time an additional 30 days, to April 30, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2887-1	Jose Martinez	Please extend the community response time another 30 days; to April 30, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2888-1	John Shaw	Please extend the community response to an additional 30 days; to April 30, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2889-1	Jim Meeks	Please allow for an additional 30 days for community response time...to April 30, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2890-1	Juan Martinez	Please allow another 30 days for community response time.. April 30, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2899-1	Matt Feemster	I am requesting a 60-day extension of the comment period for the draft EIS. The document is very long with substantial research for numerous environmental topics required by the [indecipherable]. An additional sixty (60) days would allow voters appropriate time to research all topics covered as well as read all appendices.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2900-1	Eric Hess	I am requesting an extension of time for review and comments on the Lava Ridge EIS due to complexity of the project for a period of 60-90 days.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
2902-1	Margerete Frigoyen	I am writing this note to ask you to give an extension of another 60 days so I can study the EIS/ There is a lot to read	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2904-1	Toni McNeill	I am writing to request an extension letter for responding to the environmental impact report. Extra time was given to produce the report & the report is very cumbersome. Responding in the manner you are requesting will take time, much more time for the lay person who does not work with these documents on a stable basis. I am requesting an extra 6 months for response letters.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2906-1	Heather Stroup	I would like to respectfully request an extension per the deadline for comments concerning the Lava Ridge wind project. Please allow an additional 30-60 days for members of our community to do their own research, and formulate responses to their findings.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2908-1	Gary Dixon	Please extend the comment period on the Lava Ridge wind turbine project. I am just becoming aware of this project and need more time to become informed. At least extend by 60 days.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2910-1	Alexia Decte	This letter is to request a 60-90 day extension on the March 21, 2023 comment period for the Lava Ridge wind project. Due to the extensive report there is to review and the public comment [indecipherable]. I need more time to prepare and submit my statement.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2913-1	Liz Niccum	I respectively request an extension for the March 21, 2023 deadline to submit written comments concerning the Lava Ridge draft EIS. This is an important concern for all citizens living in the magic valley and adequate time is needed to allow for there citizens to provide their written concerns about the impact of the Lava Ridge wind project will have on their lives and property.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2920-2	Regina Smith	The first one is simple I am requesting an extension to the comment period.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2921-1	Sheila West	Therefore, I respectfully request a 30 to 60 day extension on the Lava Ridge Project EIS comment period.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2924-1	Steven Andersen	In our firm's initial analysis of the DEIS, it is clear that the complexity of subjects addressed (and those omitted) paired with the gravity of the Proposed Action and Alternatives require an extended public comment period.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2935-1	Rob Norris	request that the BLM extend the comment period for a minimum 30 days, and 60 more days would be more reasonable.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2936-1	Kim Brackett, Chet Brackett	Due to the volume of the EIS and our age related inability to adequately maneuver the document on the computer, we need more time to be able to: 1. Secure a written copy of the EIS and 2. Review and study the document. The invasive and potentially irrevocable damage to sensitive environment - we feel that a comprehensive study time for this is very necessary- so we are respectfully asking for an adequate extension of time to review the EIS. At least 6 months.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
2943-1	Vern Eames	Please extend the comment period so that credible analysis and research can be included in public comments.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3052-1	Marsha Jones	Please extend the public comment period by at least 30 days so we have time to review the thousands of pages of the Lava Ridge disaster project for Idaho.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3054-1	Philip Gossi; Gooding-Lincoln County Farm Bureau	I would like to have the deadline for submitting comments on the Lava Ridge Wind Projected extended 30 to 60 days	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3055-1	Karen Matsumoto	Due to the length and complexity of the draft EIS, and the difficulty of interested parties to fully understand the process and provide meaningful comments in such a short time, the public comment period should be extended by 30 days to April 21, 20223.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3056-1	Scott Prow	I am requesting that you consider extending the public's comment period.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3163-2	Rick Aitchison	Bring about Structured Questions that all Parties involved can agree to. Questions that must be generated by communities and must be answered	See Section 1.4 of the document for the preliminary issues identified through public scoping and stakeholder involvement and the questions that were analyzed in brief (EIS Appendix 3) and analyzed in detail (Chapter 3).
3163-3	Rick Aitchison	let communities Vote Yeah or Neah for this Project.	See response to comment 1022-3 (see in Table A-3ee, Alternatives).
3262-2	Dawn Leiske	I am requesting that you grant us an extension on Lava Ridge Comment Period from March 21, 2023; for at least another 60 days. We are not skilled researchers or writers for this project. We will need more time to put together our comments. The BLM and LS Power has taken 3 years to put the EIS research and document together. It is to our disadvantage that we have such a short period of time to read this whole document and comment on it.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3701-1	Tony Cuciti	As a concerned resident of southern Idaho, I am writing to request that the Bureau of Land Management (BLM) extends the Lava Ridge Wind Project EIS public comment period. According to a Federal Register notice, dated 20 August, 2021, preparation of this EIS began, in earnest, with the January, 2021 Executive Order 14008. From that date, multiple full-time, fully-funded staffs, consisting of dedicated legal and other subject matter experts, required approximately two years, including delays, to prepare the EIS draft. Given that	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
		most members of the affected public, including myself, possesses neither resident subject matter expertise, ability to devote full-time effort, nor funding to obtain commensurate legal guidance, a 60-day public comment period does not afford concerned citizens a reasonable or equal opportunity to research and prepare substantive input to such a complex and lengthy document. Accordingly, I request you extend or encourage the extension of the public commenting period by a minimum of 180 days, allowing people to submit feedback that will not only enable decision makers to select the best course of action but will also foster public confidence in the decision making process itself. In the spirit of a government of the people, by the people, and for the people, the system and processes by which the BLM decides Lava Ridge Wind Project may prove to be even more important than the decision itself over the long-term. To remain credible, the government needs to work, to the maximum practical extent, for all stakeholders. This project may significantly affect the livelihoods, and quality of life, of families who have lived in southern Idaho for generations and will continue to do so indefinitely. We, as southern Idahoans, need to know that we receive the same consideration and voice as the individuals and entities who stand to gain from this project in the short-term yet have neither a long-term stake in this area nor will be subject to long-term accountability. At a time when public confidence in government could be higher, extending the comment period as requested, would be a crucial first step by which the BLM can demonstrate its commitment to a fair and objective decision making process, consistent with its mission to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations. Please feel free to contact me if you have any questions.	
3775-1	Nolan Nefzger	I´m from Sawtooth Elementary in the fourth grade. I was wondering if you and the BLM could give us a thirty day extension to read the EIS statement. I think it's only fair that you give us a thirty day extension. Thank you. 😃	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
3782-1	Dawn Leiske	RE: Comment on the Lava Ridge Wind Turbine EIS Draft My comments regarding the proposed Lava Ridge Wind Turbine Project are presented in this letter. The whole process to access the Lava Ridge Wind Turbine EIS Draft is so difficult for community members trying to write a comment. Censorship is the first thing that comes to mind when I think of how the comment EIS materials have been provided to us. Most people do not have computers. Phones limit the ability to read the documents, and the zip drives are useless for the only-phone-users. The on-line files are so overwhelming for a non-specialist. We have asked for hard copies so that people can read them and learn about the environmental studies in order to make our comments. We have been told it is too expensive to provide these to the general public. We have received a few zip drives that are being shared among hundreds of interested individuals. We are not specialists in this field, yet we are treated as if we are specialists; that should know how to go through these technical writings on a zip drive or through the confusing on-line documents. This is a very time consuming and overwhelming task; searching for topics and pages to reference our concerns? We received a 30 day extension which is very unfair due to the fact that this EIS draft took years to be perfected. This is difficult, to such a degree that many people will not respond. We are an extreme disadvantage to LS Power, and Magic Valley Energy. Magic Valley Energy has a website with an automated form that frequently regenerates a support letter for individuals to submit directly to BLM. http://www.supportlavaridge.com/http:/www.supportlavaridge.com/ <https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwww.supportlavaridge.com%2Fhttp%3A%2Fwww.supportlavaridge.com%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C0aa9f9dc153b4d0f7e6a08db1b277f85%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638133628675667074%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=qz2sOXrjFFa09aBlNp66Ay3CVMRtSlJUpvR8YYzVYQg%3D&reserved=0> I have made multiple calls and trips to BLM for zip drives and a hardcopy. But I have been told I can read the copies in the BLM office or check them out for a few hours. The BLM office has told us they have one or two hardcopies. I called to get a hardcopy and only received just 3 volumes after several weeks of asking for one. We were told they didn't give us the 4th volume because no one asks for it. All of this is time consuming, discouraging, and very difficult to accomplish. The EIS is a valuable reference, which we should have easy access to. This is a huge project that will greatly affect our lives and we have had the most difficult time obtaining the material to help us in the process. The Lava Ridge Wind Turbine EIS Draft comment period has proven to be discriminatory and appears to be a great way to shut us down or censor us with our concerns and comments. The PDF for Spanish speaking people doesn't even work. This has left us, the community members, at a great disadvantage. We are about to see a huge energy industrial project that will leave the door wide open for future projects of Wind Turbines and Solar Energy that is slated for Idaho that we can do little about as community members. We understand that the energy from this project is slated for consumers outside of the state of Idaho. I encourage you to select Alternative A – No Action, in which the BLM would not authorize construction, operation and maintenance, and decommissioning of the project. We are not equally supported in regard to being provided with the necessary documents to make our concerns and comments known on the Lava Ridge Wind Turbine EIS Draft project. Volume One, LAVA RIDGE WIND PROJECT DRAFT ENVIRONMENTAL IMPACT STATEMENT Page: 3,4,5, 6 Reference: United States Department of the Interior BUREAU OF LAND MANAGEMENT - Enclosed for your review and comment is the draft environmental impact statement (EIS) for the Lava Ridge Wind Project (project). In Conclusion: The "No Action Alternative" should be the only choice for this project.	See responses to comments 10531-2, 11629-1, and 12555-1 (see in Table A-3kk, Public and Stakeholder Involvement).
4055-4	Dawn Leiske	Concerning Lava Ridge Wind Turbine Project: The communities involved do not trust the this NEPA process. Our Facebook page has Magic Valley Energy infiltrating it with their Support Lava Ridge offsite link. The Magic Valley Energy has a webpage that guides them to fill out pre set form letters that Support Lava Ridge is	See response to comment 11573-1 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
		causing more mistrust. I myself am having spammers respond to my posts and other posts for Stop Lava Ridge members on FB with offsite webpage links. This increases our mistrust of this system and MVE. Having a person labeled Court Reporter is also intimidating by those who don't communicate well and are intimidated with this NEPA process and our Legal System.	
4109-1	Kiersten Vander Pol	I'm one of the students from sawtooth Elementary 4th grade you talked to us about the project.Me and my class are requesting that we have a extension to the time for the statement to be read so we can have a bit more time to do research and finalize our class assignment.I hope you consider my class's and the public's offer on for the time adjustment for the research of the E.I.S statement we would like just a small adjustment of a month .Thank you very much for reading the suggestion that me and my class and the public's suggestion. I hope once again you will consider our suggestion. Thank you.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4184-1	Hylee Bautista	Dear Kasey Presrwich, Hi I'm Hylee ,I'm in fourth grade at Sawtooth Elementary school. You came to talk to us about the Lava Ridge Wind Project. I would like a 30 day extension to read the EIS statement because it is about 527 pages.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4209-1	Olivia Jones	I'm in fourth grade at Sawtooth Elementary School. You came to talk us about the Lava Ridge project. I would like a 30 day extension for the Idaho people to read the EIS statement because it is about 527 pages. 🙏	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4215-1	Courtney Stevens	You visited our school, and I am requesting a 30 day extension for extra research. We need more time to read the EIS Statement, and more time to spread the word. Thank you.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4261-1	Lucas Dahle	Please give us more time to submit what we think. Maybe 'till sometime around May or June? -Luke D.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4266-1	Addison Bagley	I am in the class you presented to. My name is Addison. My class and I are hoping for some more time to look over the EIS statement. We are looking for about a 30 day extension.I hope you consider this.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4338-1	Logan Hawkins	This is about the Lava Ridge Wind project. I am asking for an extension for 30 days to read the EIS book. It has 527 pages.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4390-1	Lucas Dahle	Please give us more time to submit our answer or whatever it is. Maybe it could be due sometime around May or June? Thanks!	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4396-1	Dawson Peck	Please give us a 30 day extension, past March 21st, to read the EIS statement if you can.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4398-1	Tyler Christensen	I have so many concerns it will take some time to get them fully researched and written down, therefore an extension would be greatly needed and appreciated. I feel there is still such a large part of our community that has not been made aware of this project that could completely dismantle our aquifer. Also, there are not enough copies provided to the public and Jerome County's population is nearly 50% Hispanic and there is not a copy to provide them in Spanish. Please extend the deadline a minimum of 90 days in order to give our community enough time to	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4406-1	Cassie Christensen	Due to our limited time to currently reply, besides being available to the public in a hard copy they can take home, it should also be available in a more navigable format. The draft EIS has so many chapters on the BLM site to open, it makes it hard to use the search feature. A larger zip file would help to navigate this extensive document with more efficiency being it is nearly 2000 pages. Please strongly consider filing an extension for the maximum allotted time to help the people who care the most about this state.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4406-2	Cassie Christensen	Please take in consideration the limited amount of time that has been offered to the public for the comment period on the proposed Lava Ridge project. Our community is a working community and most people have to reply once they have returned home from their busy lives. The inability to navigate a physical copy is also limiting to many people because of their lack of internet or resources. LS Power should be responsible for providing the public copies of the draft EIS, in order for us to get our concerns out, as well as providing a copy in Spanish. Jerome County is 41.6% Hispanic according to the Census and between Minidoka, Cassia, Twin Falls, Jerome and Lincoln County there is an estimated to be over 36,300 Hispanics who reside in the area. This doesn't include the seasonal workers who come to the area in the summer to assist farmers. This is a huge discrimination against our local population.	See response to comment 10531-2, 11629-1, and 12555-1 (see in Table A-3kk, Public and Stakeholder Involvement).
4430-1	Miles Anderton	I want to ask you for an extension to read the EIS statement because it is more than 500 pages long. Please consider doing this thankyou!	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4441-1	Benson Willmore	Thank you for talking about the EIS project at Sawtooth Elementary School. We were wondering if you could give us a 30 day extension to read the EIS statement, past March 21. Thank you.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4462-1	Remington Coleman	I was wondering if you would give us a 30 day extension , past March 21str, to read the EIS statement.Thanks for the presentation.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4475-1	Chris Austin	I am humbly asking for a 90 day extension past the current March 21 deadline, for our comments on the Lava Ridge project. These substantive comments can take several of us quite a bit of time to research the subjects,	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).

Comment ID	Commenter	Public Comment	Response to Comment
		since many of us have little if any experience in any of these fields. And due to the complexity of the project, we want to make sure we present to the BLM information that will be beneficial.	
45-1	Sue Williams	After attending the Lava Ridge meeting in Jerome on 2/2, and recognizing the level of detail contained in the draft EIS, I respectfully request that the deadline for comments be extended a minimum of 30 days. This extension would give more time to thoroughly understand the impacts noted in the document and provide time for the public to involve their own experts to analyze and provide substantive objections to this project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4539-1	Kelly Lee	and many others would greatly appreciate extending the comment period on lava ridge windmill project. I.am not a skilled researcher and need more time than the 3-21-23 deadline.thank you for your consideration .	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4564-1	Julee Austin	I am humbly asking for a 90 day extension past the current March 21 deadline, for our comments on the Lava Ridge project. These substantive comments can take several of us quite a bit of time to research the subjects, since many of us have little if any experience in any of these fields. And due to the complexity of the project, we want to make sure we present to the BLM information that will be beneficial.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4618-1	Douglas Miller	I write to request an extension of the public comment period for the Lava Ridge draft EIS. The draft EIS documents, as downloaded from the BLM Lava Ridge ePlanning website total a whopping 2614 pages. The draft EIS covers a wide and disparate variety of subject matter, much of which requires a specialized technical background to understand. It is unreasonable to expect any lay person to read, let alone critically review, these 2614 pages in 60 days. Therefore I request that the public comment period for the Lava Ridge draft EIS be extended a minimum of 90 days.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4641-1	Gevin Bennett	I would like to express my hope that the “Public Comment Period” be extended for a period of at least 90 days. This will allow additional time for the citizens of Southern Idaho to study and comment on this very important issue.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4664-1	Charlotte Moffitt	All I am asking you is if you guys could possibly wait until later before you make your decision about the lava ridge wind project so we have more time to look over the EIS statement.Can you at least have a 30 day extension.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4665-1	Emma Klein	All we are asking you, is if you could possibly wait before you make a decision about Lava Ridge Wind Project so we could have more time to look into the EIS statement.Can you give the people of Idaho at least a 30 day Extension, past March 21st?	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4666-1	Amelia Moffitt	I believe you should give people more time to look over the EIS statement. Something like a 30 day extension or more, because some people won't be able to let their voice be heard by March 21. Please take this into consideration. Have a good day	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4753-1	Joan Hurlock	I respectfully request a 30-60 day extension of the comment period for the draft EIS report regarding the Lava Ridge Wind Project. The magnitude of this project, and size and scope of the report, will require much more time to read through and study, for the public to submit appropriate comments. This project will have an estimated 84-125 year impact on our public lands. A 30-60 day extension is a small amount of time in comparison.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4757-1	Brian Olmstead	this EIS took a couple of years to produce. 60 days is simply NOT enough time for thousands of folks lijke me to write careful, respectful, knowledgeable comments to the hundreds of incompletely researched issues in the DEIS.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4768-2	Regina Smith	In addition, I would request more comment time, please extend the comment period so that we can continue our review.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4770-2	Brinya Olmstead	Please allow us more time for the public to consider and comment on this project. We need more time than a meager 60 days to consider and comment on all the relevent aspects of this project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4792-1	Kyle Kinoshita	We are a partner organization of Friends of Minidoka, and we support its request for a 30-day extension of the time for public comment, which is currently set to end on March 21 of this year. As the document is extensive and complex, we believe that more time is needed to review and analyze the report. Please allow time for the public to give informed reaction to the study.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4892-1	Cameron Stauffer	lease extend the comment period for Lava Ridge Wind project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
4966-2	Brinya Olmstead	I will end this email here but ask that you Please allow us more time for the public to consider and comment on this project. We need more time than a meager 60 days to consider and comment on all the relevent aspects of this project.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
5183-3	Gary Smith	I am asking for Public Meetings to be held in locations around the Treasure Valley to allow all that could be impacted a chance to submit comments and ask questions of BLM and the applicant before you decide. The Snake River Plain Aquifer is a major part of the Idaho Eco-System and should be protected at all costs.	See responses to comments 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement) and 11573-1 (see in Table A-3kk, Public and Stakeholder Involvement). See also the EIS water impacts analysis in Section 3.17 (Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
5599-1	Jennifer Reinhardt-Tessmer	I am writing to renew our firm's previous request for an extension to the public comment period (submitted on February 23, 2023) to make public comments due June 19, 2023. This is a 60-day extension from the current deadline of April 20, 2023.	See response to comment 10531-2 (see in Table A-3kk, Public and Stakeholder Involvement).
7370-2	Tara Tatton	My mother made the trip to your Shoshone office to pick up printed copies of the EIS for herself, our family, and friends. There were no print copies available, only digital and online. This fact alone limits the number of people who can easily read and respond. What about those who do not have computers and the internet? How about people who's only connection is with a smartphone? The document is far too large to download. How about the elderly, or others, who find computers difficult to navigate, or would have extreme difficulty sitting in front of a screen for the DAYS it will take to read this document? These people are valuable members of our community, and the lack of inclusive information has made it nearly impossible for them to form an EIS based opinion, much less have the ability to share that opinion with the BLM! As this document is in English only, anyone whose English is a second language, or only speaks another language would have to find a translator to read over a thousand pages on a computer! Costly, impractical, and unlikely to happen. Surely all parties are aware that we have a large Spanish speaking population in the Magic Valley, so of course it needs to be provided in Spanish. Furthermore, the CSI Refugee Center is instrumental in assisting the relocation of people from around the globe here to our area. These people will be affected by this project as well. Based on information from the CSI Refugee Center' online information, since 2012 these are the likely languages that would need translation: Afghani, Congolese, Sudanese, Iranian, Iraqi, Bhutanese, Burmese, and Eritreans! Of course, this center goes back to 1982, adding an additional fifteen languages to the ones I have already listed.	See responses to comments 10531-2, 11629-1, and 12555-1 (see in Table A-3kk, Public and Stakeholder Involvement).
9275-1	AJ Whitecotton	Because I feel that BLM failed to give full disclosure of the facts and all possible options including Option A, this Impact study should be extended again so that the public understands they had another option. I would ask that all who submitted comments on your web page and who commented on social media be notified also. Public meetings that used this material and charts will have to be repeated too.	Alternative A is the No Action alternative discussed in EIS Section 2.2. As described in Section 1.3 (Decision to be Made), the BLM will decide whether to grant, grant with modification, or deny a ROW grant. EIS Section 2.2 explains the option for BLM to deny the application. This alternative would not include impacts from construction of the project. The No Action represents the existing and future condition without addition of the project. This is discussed in the analysis in Chapter 3 and represents the background datasets shown on all draft EIS map figures. Where the final EIS includes map figures displaying all alternatives, Alternative A (the existing condition) is now included as its own map figure.
9787-1	Dawn Leiske	Please Inform me as to why there is no Spanish Version of the Lava Ridge Wind Turbines EIS for our Spanish speaking individuals in Idaho? I finally received the English 4th volume after weeks of trying to get a copy of the full volume. I noted on the cover of this last "4" volume, it states that Section 508 of the Rehabilitation Act of 1973 requires that the information in federal documents be accessible to individuals with disabilities (Not noted on any of the other volumes). But there is no mention of any languages, such as Spanish or Japanese, from which they may be directly affected by this project. Is there anything in Idaho law that states material such as this EIS from a federal government agency does not have to provide us with this information? Even the full English version was difficult to acquire. The Spanish version of the Lava Ridge Wind Turbines EIS is non-existence. How are Spanish speaking people going to write comments without a copy in Spanish? As we see more and more Spanish speaking individuals arrive into Idaho, why are they not being included? We are bending the laws of immigration by voting on illegals residing in Idaho drivers license, regardless of their immigration status: yet we can't get a Spanish speaking legal citizen a copy of the Lava Ridge Wind Turbines EIS?	See responses to comments 12555-1 and 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).

Purpose and Need

Table A-3ll. Purpose and Need

Comment ID	Commenter	Public Comment	Response to Comment
11210-6	Sheldon Ramsay	This project cannot be justified if wind were a reliable source of energy. How can it be justified from wind source whose actual performance of the technology is much worse than the calculations made based on 100% efficiency. And this poor performance is for existing turbine models not unproven 740 foot high Chinese manufactured ones which performance will be worse and which will haunt our landscape, and when they fail, our landfills.	See response to comment 11491-3 (see in Table A-3gg, Cumulative Effects).
11970-6	Janet Keegan	1.2, 1-1,2 References Executive Order (EO) #14008 to "increase renewable energy production on [public] lands." I suggest that EO #14008 clearly states a goal of "doubling offshore wind by 2030", but it does not state a measurable goal for wind production on terrestrial public land. See page 6 of EO #14008. Even though, the EO is not clear on how much wind energy, President Biden would like to see on public land, the DEIS and the head of the BLM, Tracey Stone-Manning states that she is following the mandate of the President in her reply to Idaho Representative Mike Simpson in the recent House Appropriations budget hearing. See my references below: eo-14008-tackling-climate-crisis-home-abroad.pdf (energy.gov) Budget Hearing – Fiscal Year 2024 Budget Requests for the Bureau of Land Management, U.S. Fish and Wildlife Service, and National Park Service | House Committee on Appropriations - Republicans Before a ROW is allowed in any form for the Lava Ridge project, the Final Environmental Impact Statement (FEIS) must reveal how much energy is actually	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that considers alternatives, analyzes impacts, and informs the BLM's decision. If authorized, this project would contribute approximately 1,000 MW of onshore wind energy generation from

Comment ID	Commenter	Public Comment	Response to Comment
		being produced and/or permitted to reach these vague goals as well as the policy expressed in 43 USC 3004(b) as stated on page 1-2 of Chapter 1 of the DEIS. Concrete goals as mandated elsewhere in the myriad of government documents, must be revealed to substantiate the NEED for the project. It is possible, that a genuine need relative to EO 14008 and 43 USC are covered by other renewable energy sources on public land.	BLM public lands. Because this project is furthest along in its evaluation of an onshore wind project on BLM public lands, other onshore wind projects would not meet this aspect of the purpose and need.
11978-2	Magic Valley Energy, LLC	Section 1.2 – Purpose and Need 3. MVE Comment: The BLM NEPA Handbook requires BLM to conform the purpose and need statement to "existing decisions, policies, regulation or law". In order to construct a robust purpose and need statement and ensure that BLM's purpose and need statement in the FEIS provides appropriate context in terms of addressing the numerous federal decisions, policies, regulations, or laws encouraging renewable energy development on federal lands, MVE would encourage BLM to consider incorporating summaries of the following in its purpose and need statement in the FEIS: • May 16, 2001 – The U.S. House of Representatives Committee on Science published a Report of the National Energy Policy Development Group, which was established to "develop a national energy policy designed to help the private sector, and, as necessary and appropriate, State and local governments, promote dependable, affordable, and environmentally sound production and distribution of energy for the future." • May 18, 2001 – Executive Order (EO) 13212, Actions to Expedite Energy-Related Projects, was signed to "implement recommendations from the National Energy Policy Development Group to establish a policy that federal agencies should take appropriate actions, to the extent consistent with applicable law, to expedite projects to increase the production, transmission, or conservation of energy." • August 8, 2005 – Energy Policy Act of 2005 (Public Law [P.L.] 109-58) was signed into law on August 8, 2005 stating "It is the sense of the Congress that the Secretary of the Interior should, before the end of the 10-year period beginning on the date of enactment of this Act, seek to have approved non-hydropower renewable energy projects located on the public lands with a generation capacity of at least 10,000-MWs of electricity." • 2009 – Wind Energy Development Program Instruction Memorandum (IM) No. WO- 2009-043 established by the BLM to further support wind energy development on public lands. The BLM initiated preparation of a Programmatic EIS in October 2003 and published the Record of Decision (ROD) for Implementation of a Wind Energy Development Program and Associated Land Use Plan Amendments in 2005. • December 8, 2021 – Executive Order, E.O. 14057, was issued for "Catalyzing Clean Energy Industries and Jobs Through Federal Sustainability," which establishes a policy to "achieve a carbon pollution-free electricity sector by 2035 and net-zero emissions economy-wide by no later than 2050." The alignment of this goal with the need for clean energy infrastructure is detailed throughout the E.O., particularly in the following sections: o Section 101: "As the single largest land owner, energy consumer, and employer in the Nation, the Federal Government can catalyze private sector investment and expand the economy and American industry by transforming how we build, buy, and manage electricity, vehicles, buildings, and other operations to be clean and sustainable." o Section 102: "Leading the Nation on a firm path to net-zero emissions by 2050 and achieving the policy set forth in section 101 of this order will require bold action to transform Federal procurement and operations and secure a transition to clean, zero-emission technologies. Through a coordinated whole- of-government approach, the Federal Government shall use its scale and procurement power to achieve: (i) 100 percent carbon pollution-free electricity on a net annual basis by 2030, including 50 percent 24/7 carbon pollution-free electricity, as defined in section 603(a) of this order; …; and (vi) climate resilient infrastructure and operations." o Section 203: Addresses plans of transitioning to 100 percent carbon pollution- free electricity by stating that each agency shall "facilitate new carbon pollution-free electricity generation and energy storage capacity by authorizing use of their real property assets, such as rooftops, parking structures, and adjoining land, for the development of new carbon pollution-free electricity generation and energy storage through leases, grants, permits, or other mechanisms, to the extent permitted by law." • September 12, 2022 – "Executive Order on the Implementation of the Energy and Infrastructure Provisions of the Inflation Reduction Act of 2022" prioritizes "driving progress to achieve the climate goals of the United States to reduce greenhouse gas emissions 50-52 percent below 2005 levels in 2030, achieve a carbon pollution-free electricity sector by 2035, and achieve net-zero emissions by no later than 2050. . . . [and] promoting construction of clean energy generation, storage, and transmission, and enabling technologies through efficient, effective mechanisms that incorporate community engagement."	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. The additional detail recommended would not change the evaluation of the project and would contribute to an extraneous amount of information that may result in the key purpose and need becoming less clear.
12054-2	Kevin Emmerich	Purpose and Need Statement: The Purpose and Need Statement should emphasize conservation goals relating to all of the impacts identified in the DEIS. The project is very controversial on many levels. Had BLM considered an alternative that would establish an Area of Critical Environmental Concern, the statement could reflect long-term conservation goals. The Purpose and Need Statement should be rewritten to recognize a Need to protect the cultural landscapes and scenic viewsheds protected by adjacent National Park Service lands. If the project were paused so the Monument RMP can be updated, conservation goals could be easily obtainable. Equally, the statement could be crafted to incorporate better wildlife conservation goals for golden eagles, pronghorn, bats, sage grouse and pygmy rabbits. According to BLM's NEPA Handbook4: The "purpose" can be described as a goal or objective that we are trying to reach. Often, the "purpose" can be presented as the solution to the problem described in the "need" for the action. In this case, we see a "need" to place a moratorium on the Lava Ridge Project until a solution to these controversial land use conflicts can be resolved. We request that the Purpose and Need Statement prioritize conservation over approval of industrial wind energy in this location.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. The SFO has a long history of establishing special designations for the protection of important resource values. In 1983, the *Monument Resource Management Plan* (BLM 1986) created the 128-acre Blue Heart Spring/Box Canyon Sensitive ACEC and the 105-acre Vineyard Creek Natural Area ACEC, as well as recommending 87,902 acres of suitable WSAs (Raven's Eye and Sand Butte WSA). The Great Rift WSA (179,990 acres) was also recommended suitable in a previous study. Nine other WSAs have been recommended suitable in the Timmerman Hills/Bennett Hills MFP area. The 1983 Sun Valley Management Framework Plan (MFP) was amended in 1991 to designate the Big Beaver-Little Beaver (6,282 acres), Sun Peak (560 acres), and Elk Mountain (7,753 acres) ACECs in the northern part of the Field Office for the protection of big game wintering habitat and a unique relic plant community. In 2000, Presidential Proclamation 7373 designated BLM lands as part of the Craters of the Moon National Monument, expanding the existing NPS Monument to 737,700 co-managed acres and closing those lands to future

Comment ID	Commenter	Public Comment	Response to Comment
			development. In 2003, a Land Tenure Plan Amendment added three more ACECs: Tee-Maze (10,762 acres), McKinney Butte (3,764 acres), and King Hill Creek (2,500 acres). In 2015, the *Idaho and Southwestern Montana Greater Sage-Grouse Approved Resource Management Plan Amendment* (BLM 2015) amended all the SFO land use plans and established allocations and limit travel to existing roads and trails to protect sage-grouse habitat. In all, the SFO has approximately 947,883 acres of special designation lands currently closed to development. Within the EIS, the BLM considers the potential impacts to resources that contribute to conservation values have and the protection set with the land use plan, as amended.
12307-2	Dean Dimond	An EO that dismisses the existing value and adverse impacts of other energy resources skews the purpose and need for this project in the first place. The Lava Ridge DEIS is arbitrary and capricious in assuming that the prior NEPA for other energy resources can be ignored. The Purpose and Need for this Wind Project is treated as stand-alone with no measurable impact to meet unidentified energy shortfalls from existing projects. In other words, to add a ROW of this size to BLM lands, we must be aware of what role this additional electric generating project will play in meeting the needs of the Nation's power grid and other energy needs to address cumulative effects and the actual environmental effects pursuant to the NEPA. Currently, the Council on Environmental Quality, with full oversight of NEPA compliance on all federal lands and assets, has published an NOI to change federal lands and resources NEPA analysis to match these two EOs for Environmental Justice and Climate Change. They intend to issue an "administrative" Categorical Exclusion to justify doing away with the current NEPA requirements. This further highlights my first substantive comment about this DEIS for Lava Ridge: It is fatally flawed as arbitrary and capricious in not addressing transparently the Purpose and Need for this project on federal public lands with the current NEPA criteria including cumulative effects of other existing energy production projects.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. See response to comment 11518-3 (see in Table A-3gg, Cumulative Effects).
12398-14	US Environmental Protection Agency	Project Purpose and Need Regarding the proposed project purpose and need, EPA recommends that the FEIS include: • A description of criteria used to determine the minimum project size that will be considered feasible. The DEIS does not discuss this directly, but for cumulative impacts, it seems projects that are considered in the realm of equivalent are those that produce over 500 MW. It also appears that under section 3.3.1.1.3, there is a lengthy discussion of Future Trends and Actions for wind development in the context of this project impacts to bats. This discussion provides more context for this analysis but may need to be expanded to clarify the minimum project size that will be considered feasible.	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. Technical and economic feasibility of wind energy projects require meeting the correct combination of core siting requirements. Defining a minimum project size would incorporate an incomplete assumption for the use of determining project feasibility. All proposals and alternatives should be determined feasible based on their ability to meet core siting requirements and their ability to meet the purpose and need. The purpose and need in the EIS is a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision.
12859-14	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Chapter 1.2 Purpose and Need. We recommend replacing the current purpose and need section with the following: "In light of new information relating to the Minidoka Traditional Cultural Property (TCP) and the nomination for the Minidoka Area of Critical Environmental Concern (ACEC), the Bureau of Land Management is issuing a supplemental draft environmental impact statement regarding a plan amendment to the Monument Resource Management Plan (RMP) to designate an ACEC to protect the Minidoka National Historic Site, Minidoka Relocation Center, Minidoka TCP and important multiple uses and values including rangeland, cultural resources, scenery, wildlife and other values." The proposed new purpose and need section would align the Monument RMP land use inventory, planning and management activities, as required by FLPMA, with the listing of Minidoka on the National Register of Historic Places (1978), the National Monument designation (2001), the NPS General Management Plan (2006) and enactment of bipartisan Congressional legislation to expand, ratify and redesignate the Minidoka National Historic Site (2008).	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. Within the EIS, the BLM fully considers impacts to resources such as Minidoka NHS to understand how the potential impacts relate to laws, regulations, and policies. Within the EIS, the BLM considers the potential impacts to resources that contribute to conservation values have and the protection set with the land use plan, as amended. The evaluation of land use plan allocations or special designations would require evaluation under a land use planning action and is outside the scope of the BLM's project specific evaluation of the project. See responses to comments 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) and 11297-6 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site).
12859-15	Kristen Brengel, Robyn Achilles; Friends of Minidoka	At a minimum, the purpose and need section should include Congressional direction related to Minidoka.148 According to the D.C. Circuit, "[w]hen an agency is asked to sanction a specific plan, . . . the agency should take into account the needs and goals of the parties involved in the application [cites omitted]. Perhaps more importantly, an agency should always consider the views of Congress, expressed to the extent that the agency can determine them, in the agency's statutory authorization to act, as well as in other Congressional directives." The Purpose and Need Statement's should accurately reference Executive Order 14008, entitled "Tackling the Climate Crisis at Home and Abroad." The Climate Crisis E.O. states the goals of the Administration to reduce climate pollution and deliver environmental justice.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. Within the EIS, the BLM fully considers impacts to resources such as Minidoka NHS and migratory birds to understand how the potential impacts relate to laws, regulations, and policies. See responses to comments 11297-6 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12927-1	John Arkoosh	The DEIS states the need and purpose of the project is to combat climate change. The DEIS offers no evidence the project will in fact have a beneficial effect toward climate change. It appears to me that siting an energy project on 300 square miles, hundreds of miles from the point of energy use, with a power efficiency factor of around 35% and line loss of up to 10%, is not an environmentally friendly way to produce energy. Since this project will be sited entirely on public land and be funded in large part by tax credits, subsidies and grants. The EIS must address in depth the environmental and economic feasibility of the project. Including a	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated.

Comment ID	Commenter	Public Comment	Response to Comment
		transparent accounting of expected production, tax credits, grants and subsidies. The EIS must also conduct a thorough study of the environmental impact of the project in comparison to other methods of energy production. Just stating the climate change dogma that wind turbines will save the planet is not sufficient.	This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision.
13006-5	Leon Smith	Recommend replacing the current purpose and need with a purpose and need to preserve and protect the Minidoka National Historic and Relocation Center site, and additional federal land, to tell the whole story of their experience, as required by Congress. Support No Action Alternative A because of the significant negative impact on the Japanese American community and Minidoka National Historic Site.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. Within the EIS, the BLM fully considers impacts to resources such as Minidoka NHS to understand how the potential impacts relate to laws, regulations, and policies. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding addition of new Section 3.19. Also see response to comment 11306-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding potential impacts to Japanese American and other communities associated with Minidoka NHS as well as potential impacts to the natural and cultural landscape surrounding the site.
13006-30	Leon Smith	3) Recommend that the purpose and need statement address where the generated power is going and if the transmission line has the capacity to accept the power.	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. The purpose and need specifically states that the BLM may consider MVE's goals " . . . to generate renewable energy with wind turbines for delivery to power markets in the western United States, including those markets accessed via interconnection to the existing Midpoint Substation or to an alternative new substation constructed along the permitted, but not-yet-constructed, SWIP-North."
6032-2	Peter Richardson	A full build-out of the proposed Lava Ridge project will generate approximately 1,000 MW (megawatts). While accurate, the jargon used in the electric industry can be confusing. 1,000 MW of wind power does NOT equate to 1,000 MW of energy available for local consumption. The typical wind project in Southern Idaho has a 'capacity factor' of approximately 33%. 3 That means over the course of a typical year, the project will be expected to consistently generate about one-third of its nameplate capacity. So, Idaho's energy deficit will not be reduced by 1,000 MW if Lava Ridge is fully built out, rather Idaho's energy deficit will only be reduced by about 333 MWh.	Table 2.4-1 within the EIS describes the estimated name plate capacity and the estimated annual generation for all action alternatives.
9080-32	The Coalition to Protect America's National Parks	Section 1.2 Purpose and Need (p.1-1) – First, we appreciate that the Purpose and Need statement provides for the possibility that BLM might deny MVE's ROW (ROW) grant application. Because the proposed action as well as any of the other action alternatives would have significant, unavoidable adverse effects on visual resources surrounding Minidoka NHS, the WRC, and Native American cultural sites such as Wilson Butte Cave, we strongly support Alternative A (No Action). It is the only alternative that would adequately protect the landscape settings of Minidoka NHS, the WRC, and Wilson Butte Cave. In contrast, we are very concerned that the Purpose and Need statement includes no mention of the "need" to conserve resources and values within the Project area. As stated in the DEIS (p. 1-1),"[t]he need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V)." This limited statement creates the impression that BLM is legally required to err on the side of "use" rather than "conservation." Despite its emphasis on allowing multiple uses, at its core FLMPA is a conservation law. For example, Section 102 (a)(8) of the Act states that: the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use. (Emphasis added.) We ask that BLM revise the Purpose and Need statement to reflect not only FLMPA's "multiple use mandate." The statement should also acknowledge the Act's "conservation mandate," which requires BLM to "protect the quality of… scenic [and] historical… values" as well. Otherwise, it sounds as if BLM's "mandate" is primarily focused on "use" rather than "conservation," which clearly is not the intent of FLPMA.	The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The purpose and need in the EIS has been prepared to provide a brief and specific statement that provides clarity to the proposal being evaluated. This structure is in-line with requirements set within laws, regulations, and policies and facilitates the preparation of an EIS that effectively considers alternatives, analyzes impacts, and informs the BLM's decision. Within the EIS, the BLM considers the potential impacts to resources that contribute to conservation values have and the protection set with the land use plan, as amended.

APPENDIX B

Notice of Availability

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[BLM_ID_FRN_MO4500168247]

Notice of Availability of the Draft Environmental Impact Statement for the Proposed Lava Ridge Wind Project in Jerome, Lincoln, and Minidoka Counties, ID

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of availability.

SUMMARY: In compliance with the National Environmental Policy Act of 1969, as amended (NEPA), and the Federal Land Policy and Management Act of 1976, as amended (FLPMA), the Bureau of Land Management (BLM) announces the availability of the draft Environmental Impact Statement (EIS) for the proposed Lava Ridge Wind Project in Jerome, Lincoln, and Minidoka Counties, Idaho.

DATES: To afford the BLM the opportunity to consider comments in the final EIS, please ensure that the BLM receives your comments within 60 days following the date the Environmental Protection Agency (EPA) publishes its Notice of Availability (NOA) of the draft EIS in the **Federal Register**. The EPA usually publishes its NOAs on Fridays.

ADDRESSES: The draft EIS is available for review on the BLM ePlanning project website at *https://bit.ly/3uu3BuV.*

Written comments related to the Lava Ridge Wind Project may be submitted by any of the following methods:

- *ePlanning Website: https://bit.ly/3uu3BuV.*
- *Email: BLM_ID_LavaRidge@blm.gov.*
- *Mail:* Lava Ridge Wind Project EIS, BLM Shoshone Field Office, Attn: Kasey Prestwich, 400 West F Street, Shoshone, ID 83352.

Documents pertinent to this proposal may be examined online at: *https://bit.ly/3uu3BuV* and at the BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352.

FOR FURTHER INFORMATION CONTACT: Kasey Prestwich, project manager, telephone 208–732–7204; address BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352; email *kprestwich@blm.gov.* Individuals in the United States who are deaf, deafblind, hard of hearing, or have a speech disability may dial 711 (TTY, TDD, or TeleBraille) to access telecommunications relay services for contacting Mr. Prestwich. Individuals outside the United States should use the relay services offered within their country to make international calls to the point-of-contact in the United States.

SUPPLEMENTARY INFORMATION:

Purpose and Need

Magic Valley Energy, LLC (MVE) has applied for a right-of-way (ROW) grant to construct, operate, maintain, and decommission the Lava Ridge Wind Project (the project), a wind energy facility and ancillary facilities primarily on BLM-administered public lands in Jerome, Lincoln, and Minidoka counties, Idaho. The BLM's purpose is to respond to the ROW application submitted by MVE in compliance with the FLPMA, BLM ROW regulations, and other applicable Federal laws and policies. The need for the BLM's Proposed Action arises from Title V of the FLPMA, which establishes a multiple use mandate for management of Federal lands, including ''systems for generation, transmission, and distribution of electric energy'' (43 U.S.C 1761).

Proposed Action and Alternatives

The project, as described by the Proposed Action (Alternative B), would be located primarily on public lands administered by the BLM Shoshone Field Office, approximately 25 miles northeast of Twin Falls, Idaho. The project would consist of up to 400 wind turbines and associated infrastructure, including new and improved roads, powerlines for collection and transmission of electricity, substations, operation and maintenance facilities, and a battery storage facility. The project's 500-kilovolt generation intertie transmission line would interconnect at Idaho Power Company's existing Midpoint Substation or at a new substation within the ROW corridor of the northern portion of the Southwest Intertie Project. The project's estimated generation capacity is 1,000 megawatts or more.

The project area spans 197,474 acres and all project components would be sited within a series of corridors. These corridors are approximately one-half mile wide and cover approximately 84,385 acres, of which 75,760 acres are located on public lands managed by the BLM, 2,910 acres are on State lands managed by the Idaho Department of Lands, 5,417 acres are on private lands, and 288 acres are on lands managed by the Bureau of Reclamation. All wind turbines, powerlines, and associated infrastructure would be located on lands managed by the BLM and the Idaho Department of Lands. The Bureau of Reclamation and private lands would include the use of existing public access roads, but no other project related infrastructure. The project infrastructure proposed within the corridors is estimated to have a 2,374-acre footprint and a total disturbance area of 9,114 acres.

Under the No Action Alternative, the Lava Ridge Wind Project would not be authorized and would not be constructed.

The project area of Alternative C would span 146,389 acres and the maximum number of turbines would be 378. Alternative C removes some siting corridors in the southwestern and northern portions of the project area to avoid or minimize potential impacts to Wilson Butte Cave, the Minidoka National Historic Site, and associated impacts to the Native American and Japanese American communities. Alternative C also removes siting corridors in the northern portion of the project area to reduce the potential for fragmenting wildlife habitat.

The project area of Alternative D would be the smallest of all action alternatives at 110,315 acres and the maximum number of turbines would be 280. Alternative D builds on the proposed changes in Alternative C that avoid and minimize potential impacts to Wilson Butte Cave, the Minidoka National Historic Site, and wildlife habitat. Alternative D further reduces potential impacts within wildlife habitat by removing siting corridors located in the eastern portion of the project area that have higher sagebrush cover that provide functional Greater sage-grouse habitat. Also, Alternative D would have substantially fewer wind turbines and less infrastructure than Alternatives B and C. It therefore would reduce the potential for bat and avian mortality and potential conflicts with livestock grazing operations.

The project area of Alternative E would span 122,444 acres and the maximum number of turbines would be 269. Alternative E builds off the proposed changes in Alternative C that avoid or minimize potential impacts to Wilson Butte Cave, the Minidoka National Historic Site, and wildlife habitat. Alternative E would remove siting corridors that are directly east of the Minidoka National Historic Site, resulting in this alternative having the least amount of visual impacts to the historic site. Like Alternative D, the smaller footprint and lower number of turbines would also reduce the potential for bat and avian mortality and potential conflicts with livestock grazing operations.

The BLM has identified Alternatives C and E as the agency's preferred alternatives. In selecting preferred alternatives, the BLM aims to consider project elements that balance energy production with reducing the potential for adverse impacts. Identification of these as the agency's preferred alternatives does not imply that one of these will be selected as the BLM's final decision. Information acquired during the public comment period could identify an alternative that blends elements of the agency's preferred alternatives, incorporates elements of any of the alternatives, or selects any of the five alternatives as the proposed alternative in the final EIS.

Draft EIS Preparation Process

A Notice of Intent to prepare an EIS was published in the **Federal Register** on August 20, 2021, (86 FR 46867), announcing the beginning of the public scoping process. The scoping period closed on October 20, 2021, and 1,478 comment submissions were received; of those, 1,157 are unique. A scoping report was prepared and is available on the project's ePlanning website *https://bit.ly/3uu3BuV.*

The scoping process and subsequent feedback received from agency resource specialists, Native American Tribes, cooperating agencies, consulting parties, and interested parties identified a range of concerns to be included in the EIS analysis. Concerns included, but were not limited to the following:

- Potential impacts to the Minidoka National Historic Site and associated impacts to Japanese American communities;
- Potential impacts to Wilson Butte Cave and associated impacts to Native American Tribes;
- Potential impacts to cultural resources associated with Native American habitation and early European-American settlement;
- Potential impacts to the Shoshone-Bannock Tribes' treaty rights, including the rights to hunt and harvest foods, medicines, and materials from their homeland;
- Potential impacts to big game winter range and movement corridors, bats, raptors, and the Greater sage-grouse general habitat management area;
- Potential impacts to permitted livestock grazing operations;
- Potential impacts to transportation networks needed to access the project; and
- Potential socioeconomic impacts.

Lead and Cooperating Agencies

The BLM is the lead agency responsible for completing the EIS and deciding whether to approve, approve with conditions, or deny MVE's request for a ROW grant. Cooperating agencies involved in the development of the draft EIS include the National Park Service, the U.S. Fish and Wildlife Service, the U.S. Army Corps of Engineers, the State of Idaho, and the counties of Jerome, Lincoln, and Minidoka, Idaho.

Schedule for Decision Making Process

The final EIS is tentatively scheduled to be issued in summer 2023, with a Record of Decision in fall 2023.

Public Involvement Process

The BLM will hold virtual and in-person public meetings during the comment period. The date(s) and location(s) of meetings will be announced in advance through local media, email, mail, and the ePlanning project website *https://bit.ly/3uu3BuV.*

The purpose of public review of the draft EIS is to provide an opportunity for meaningful collaborative public engagement and for the public to provide substantive comments, such as identification of factual errors, data gaps, relevant methods, or scientific studies. You may submit comments at any time during the 60-day comment period by using one of the methods listed in the **ADDRESSES** section of this notice. The BLM will respond to substantive comments by making appropriate revisions to the EIS or explaining why a comment did not warrant a change.

The BLM will continue to consult with Indian Tribal Nations on a government-to-government basis in accordance with Executive Order 13175, BLM MS 1780, and other Departmental policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources, will be given due consideration.

The BLM will use the draft EIS review process to help fulfill the public involvement requirements under the National Historic Preservation Act (54 U.S.C. 306108), as provided in 36 CFR 800.2(d)(3). The information about historic and cultural resources within the area potentially affected by the Proposed Action will assist the BLM in identifying and evaluating impacts to such resources.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

(Authority: 40 CFR 1506.6, 40 CFR 1506.10)

Michael C. Courtney,

BLM Twin Falls District Manager.

DEPARTMENT OF THE INTERIOR

National Park Service

[NPS–WASO–NRNHL–DTS#–35116; PPWOCRADI0, PCU00RP14.R50000]

National Register of Historic Places; Notification of Pending Nominations and Related Actions

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: The National Park Service is soliciting electronic comments on the significance of properties nominated before January 7, 2023, for listing or related actions in the National Register of Historic Places.

DATES: Comments should be submitted electronically by February 6, 2023.

ADDRESSES: Comments are encouraged to be submitted electronically to *National_Register_Submissions@nps.gov* with the subject line ''Public Comment on <property or proposed district name, (County) State>.'' If you have no access to email, you may send them via U.S. Postal Service and all other carriers to the National Register of Historic Places, National Park Service, 1849 C Street NW, MS 7228, Washington, DC 20240.

FOR FURTHER INFORMATION CONTACT: Sherry A. Frear, Chief, National Register of Historic Places/National Historic Landmarks Program, 1849 C Street NW, MS 7228, Washington, DC 20240, *sherry_frear@nps.gov,* 202–913–3763.

SUPPLEMENTARY INFORMATION: The properties listed in this notice are being considered for listing or related actions in the National Register of Historic Places. Nominations for their consideration were received by the National Park Service before January 7, 2023. Pursuant to section 60.13 of 36 CFR part 60, comments are being accepted concerning the significance of the nominated properties under the National Register criteria for evaluation.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time.

APPENDIX C

Public Meeting Notices and Announcements

U.S. Department of the Interior | Bureau of Land Management

Lava Ridge Wind Project Draft EIS Public Comment Period

The Bureau of Land Management (BLM) Shoshone Field Office issued a notice of availability for the draft environmental impact statement (EIS) for the Lava Ridge Wind Project on January 20, 2023, in accordance with the National Environmental Policy Act. To comply with Section 106 of the National Historic Preservation Act, the BLM is preparing a Programmatic Agreement and has included the draft as Appendix 8 in the draft EIS.

The BLM is seeking public comment on the draft EIS and draft Programmatic Agreement during a 60-day public comment period that will close at 11:59 pm MDT on March 21, 2023.

Submitting Comments

The most effective comments provide detailed information with clear rationale for why changes to the draft EIS or draft Programmatic Agreement are desired.

You may submit comments on the draft EIS in the following ways:

- Visit the BLM's project website: https://bit.ly/3EirzxD. Click on the "Participate Now" button to the left of the document link. Enter your comment and information, then click "Submit."
- E-mail to: BLM_ID_LavaRidge@blm.gov
- Delivered by hand or by mail and labeled "Lava Ridge Wind Project EIS" to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352
- Provided in writing or verbally to a designated court reporter during public meetings

To be considered in the development of the final EIS, comments must be postmarked by **March 21, 2023**.

Submittal of comments is completely voluntary and any identifying information provided will become part of the public record, and as such, must be released to any individual upon request. Requests to withhold comments and associated personal identifying information from public review cannot be guaranteed.

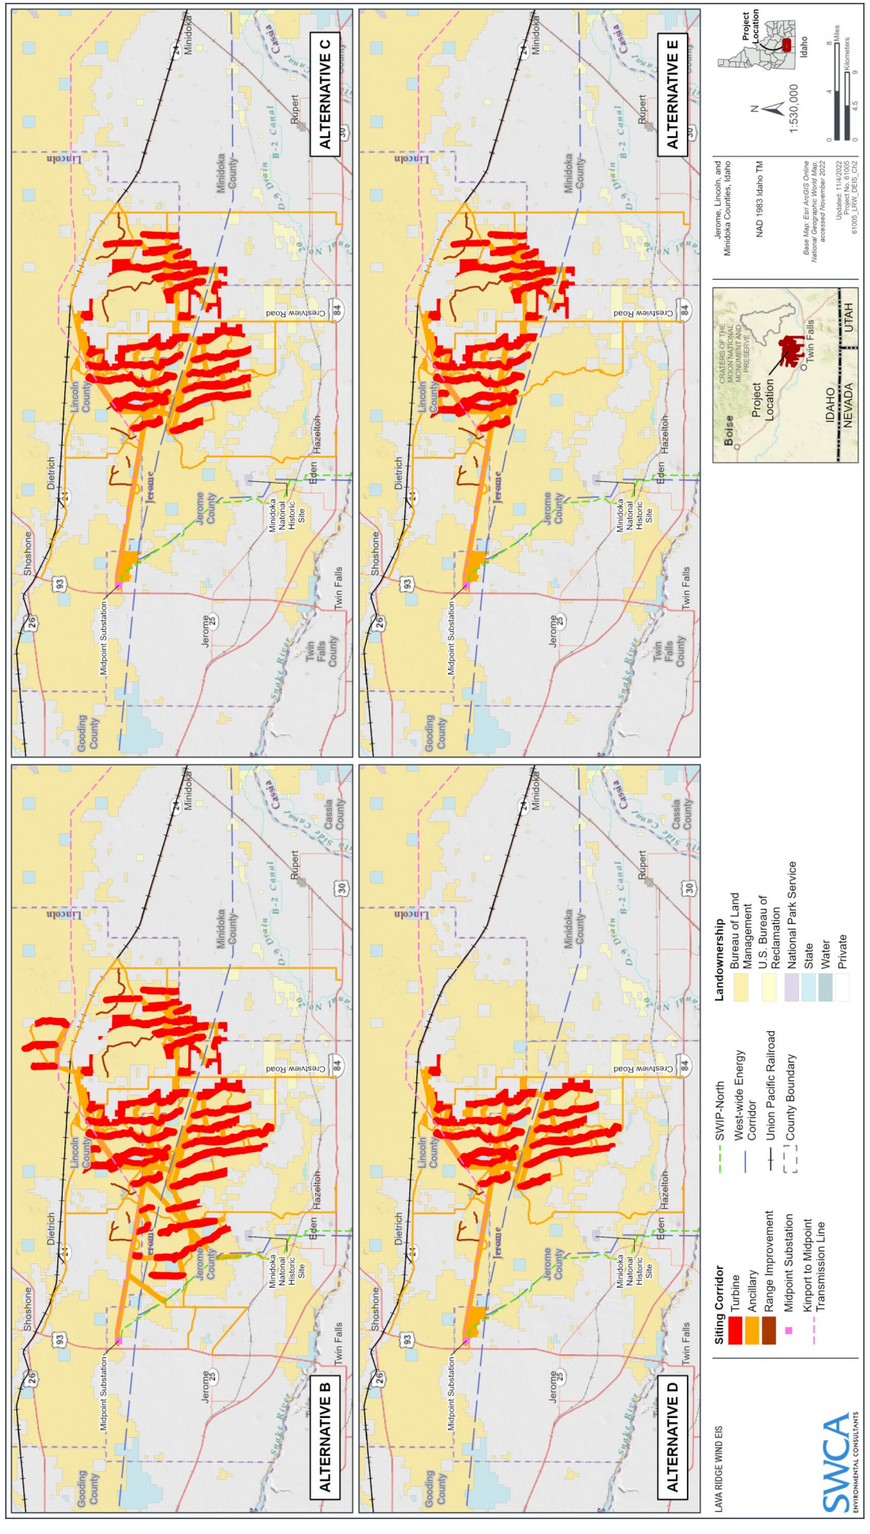
Lava Ridge Wind Project Draft Environmental Impact Statement
Map Comparison of Action Alternatives, January 2023



Lava Ridge Wind Project

Draft Environmental Impact Statement

January 2023

The Bureau of Land Management (BLM) Shoshone Field Office is seeking the public's review and comment on the draft environmental impact statement (EIS) and draft Programmatic Agreement for the proposed Lava Ridge Wind Project. The proposed project is a commercial-scale wind energy facility and would consist of up to 400 wind turbines and associated infrastructure, including new and improved roads, powerlines for collection and transmission of electricity, substations, operation and maintenance facilities, and a battery storage facility. The project would be located about 25 miles northeast of Twin Falls, Idaho. The project's 500-kilovolt generation intertie transmission line would interconnect at Idaho Power Company's existing Midpoint Substation or at a new substation within the right-of-way corridor of the northern portion of the Southwest Intertie Project.

Under the National Environmental Policy Act, the BLM developed the draft EIS using input provided by the public; from coordination with federal, state and local agencies; and through consultation with Native American Tribes. This input helped the BLM identify issues for analysis and develop alternatives to the Proposed Action. The draft EIS considers a range of alternatives that includes the Proposed Action, a no action alternative, and three additional action alternatives (see maps on page 4). The BLM has identified Alternatives C and E as the agency's preferred alternatives. In developing a decision, the BLM's Authorized Officer may select various components from each of the alternatives that best meet the purpose and need for the project.

To comply with Section 106 of the National Historic Preservation Act, the BLM is preparing a Programmatic Agreement. The Programmatic Agreement will provide detail for how historic properties that may be affected by the Lava Ridge Wind Project will be identified, evaluated, and assessed for effects. A draft Programmatic Agreement has been prepared in coordination with consulting parties and is included as Appendix 8 in the draft EIS.

The BLM looks forward to receiving comments on the draft EIS and draft Programmatic Agreement. We encourage all who are interested to stay informed about the project by signing up for the project mailing list at https://forms.office.com/r/NDsr6rhtbs and to access the documents on the project's web page at https://bit.ly/3EirzxD.

Codie Martin, Field Manager

Download the draft EIS: https://bit.ly/3EirzxD

Read the draft EIS in hardcopy at the following locations:

- BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352
- BLM Twin Falls District Office, 2878 Addison Avenue East, Twin Falls, ID 83301
- BLM Burley Field Office, 15 East 200 South, Burley, ID 83318
- BLM Idaho State Office, 1387 South Vinnell Way, Boise, ID 83709

See attached insert for additional hardcopy locations.

Kasey Prestwich, Project Manager
BLM Shoshone Field Office
400 West F Street, Shoshone, ID 83352

Phone: 208-732-7204 **Email:** kprestwich@blm.gov **Website:** https://bit.ly/3EirzxD

Public Comment Period

The BLM submitted the draft EIS to the Environmental Protection Agency on January 13, 2023. The Environmental Protection Agency's notice of availability for the draft EIS is expected to be published in the *Federal Register* on January 20, 2023 and will begin a 60-day public comment period. The public comment period provides an opportunity for stakeholders and interested parties to provide feedback to the BLM on the draft EIS analysis, data sources, analytical methods, action alternatives, and mitigation measures. The BLM will respond to substantive comments received during the comment period in the final EIS. The BLM is also seeking public input on the draft Programmatic Agreement and will use the comments received to help finalize the document.

How to Comment Effectively

The most effective comments provide detailed information with clear rationale for why changes to the EIS or changes to the Programmatic Agreement are desired. To make the best use of your input, consider the following:

- Keep your comments focused on the proposed project and what is being analyzed.
- Describe the significance of the potential impacts and how they affect you, others, places, and activities.
- Provide any new information that is relevant to the project (e.g., potential affected resources).
- Discuss modifications to existing alternatives or suggest other reasonable alternatives with justification.
- Remember to provide detailed information and references to back up your comment.
- List the reasons why you are either in favor of or opposed to the project or specific features of the project.
- Make sure you submit your comments within the timeframe announced. This ensures the BLM will have all concerns documented for use in preparing the final EIS.
- Comments are not counted as votes or as a part of a referendum on the BLM's decision.

To be considered in the development of the final EIS, comments must be postmarked by March 21, 2023.

How can I participate in the EIS process and stay informed?

- Attend the public meetings to learn more about the project and ask questions.
- Submit a written comment on the draft EIS. You can use one of three ways:
  - Visit the BLM's project website: https://bit.ly/3EirzxD. Click on the "Participate Now" button to the right of the document link. Enter your comment and information, then click "Submit."
  - E-mail to: BLM_ID_LavaRidge@blm.gov
  - Delivered by hand or by mail and labeled "Lava Ridge Wind Project EIS" to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352
- Sign up for the project mailing list to receive project updates: https://forms.office.com/r/NDsr6rhtbs

Public Meetings

Orientation Meeting

The BLM will hold a virtual meeting early in the comment period to provide information about accessing and reviewing the draft EIS, participating in the review, and submitting comments.

Wednesday, February 1, 2023
2:00—4:00 pm Mountain
Virtual/Zoom webinar
Pre-register here:
https://bit.ly/LavaRidgeDEISIntro

Open Houses

The BLM will also hold both in-person and virtual open houses as agency Covid-related policy allows, providing opportunities to learn more about the analysis, speak with resource specialists and agency managers and provide comments.

Wednesday, February 22, 2023
2:00—4:00 pm Mountain
Lincoln County Community Center
201 South Beverly Street
Shoshone, ID 83352

Thursday, February 23, 2023
5:00—7:00 pm Mountain
Canyon Crest Event Center
330 Canyon Crest Drive
Twin Falls, ID 83301

Friday, February 24, 2023
2:00—4:00 pm Mountain
Virtual/Zoom webinar
Pre-register here:
https://bit.ly/LavaRidgePublicMtg

Wednesday, March 1, 2023
3:00—7:00 pm Pacific
DoubleTree by Hilton - Portland*
1000 NE Multnomah Street
Portland, OR 97232
**complimentary garage parking*

Thursday, March 2, 2023
3:00—7:00 pm Pacific
Mercer Island Community and Event Center
8236 South East 24th Street
Mercer Island, WA 98040

Virtual meetings will be hosted using the Zoom webinar application. The Zoom app is free to download and use and can be accessed on your computer, smartphone or tablet. You can also access the Zoom meetings using your web browser. There will be a call-in number for those who want to listen to the meeting by phone. Virtual meetings will require pre-registration using the links provided and you can pre-register up until the end of the meeting.

If you need special accommodations, please contact Jo Render at jo.render@galileoaz.com or (612) 213-7543.

Bureau of Land Management
Lava Ridge Wind Project

BLM extends comment period for Lava Ridge Wind Project in response to stakeholder feedback

The Bureau of Land Management Twin Falls District will extend the public comment period for the Lava Ridge Wind Project draft environmental impact statement for an additional 30 days until April 20, 2023.

“The depth of the analysis in the impact statement has prompted many to request the public comment period be extended to allow more time for people to study the document,” said **BLM Twin Falls District Manager Mike Courtney**. “We are hopeful this extra time will alleviate concerns about being able to fully digest the document to allow for robust public feedback.”

The Lava Ridge Wind Project is a commercial-scale wind energy facility of up to 400 turbines proposed to be constructed on approximately 84,000 acres of Federal, State and private land about 25 miles northeast of Twin Falls in south-central Idaho. Magic Valley Energy, LLC, an affiliate of LS Power, is seeking authorization to construct the project in Jerome, Lincoln and Minidoka counties.

PUBLIC COMMENTS

Substantive comments that identify factual errors, data gaps, relevant methods or scientific studies are the most helpful. Comments can be submitted the following ways:

- The preferred way to comment is through the BLM’s ePlanning project site at **https://bit.ly/3uu3BuV**. Click on the “Participate Now” button to the left of the document link. Enter your comment and information, then click “Submit.”
- Through e-mail to **BLM_ID_LavaRidge@blm.gov**.

- Delivered by hand or U.S. mail enclosed in an envelope labeled “Lava Ridge Wind Project EIS,” to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352.

Those who provide comments should be aware that the entire comment–including personal identifying information like their address, phone number or e-mail address–may be made publicly available at any time. While commenters may ask to have their personal identifying information withheld from public review, the BLM cannot guarantee that they will be able to do so.

FOR MORE INFORMATION

If you have questions about the draft EIS or comment period, please contact Kasey Prestwich, Project Manager at kprestwich@blm.gov or (208) 732-7204.

Bureau of Land Management
Lava Ridge Wind Project

Lava Ridge Wind Project Draft EIS Public Comment Period ends April 20, 2023

On January 20, 2023, the Bureau of Land Management (BLM) issued a Notice of Availability for the draft environmental impact statement (EIS) for the Lava Ridge Wind Project, in accordance with the National Environmental Policy Act. To comply with Section 106 of the National Historic Preservation Act, the BLM is preparing a Programmatic Agreement and has included the draft as Appendix 8 in the draft EIS. The BLM is seeking public comment on the draft EIS and draft Programmatic Agreement during a 90-day public comment period that will close at 11:59 pm MDT on April 20, 2023.

To access the draft EIS and supporting materials please visit the BLM's ePlanning website at **https://bit.ly/3EirzxD**.

PUBLIC COMMENTS

You may submit a written comment on the draft EIS using one of three ways:

- Visit the BLM's project website: **https://bit.ly/3EirzxD**. Click on the "Participate Now" button to the left of the document link. Enter your comment and information, then click "Submit."
- E-mail to: BLM_ID_LavaRidge@blm.gov
- Delivered by hand or by mail and labeled "Lava Ridge Wind Project EIS" to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352

To be considered in the development of the final EIS, comments must be postmarked by **April 20, 2023**.

Submittal of comments is completely voluntary and any identifying information provided will become part of the public record, and as such, must be released to any individual upon request. Requests to withhold comments and associated personal identifying information from public review cannot be guaranteed.

FOR MORE INFORMATION

If you have questions about the draft EIS or comment period, please contact Kasey Prestwich, Project Manager at kprestwich@blm.gov or (208) 732-7204.

If you have questions about the draft EIS or comment period, please contact Kasey Prestwich, Project Manager at kprestwich@blm.gov or (208) 732-7204.

Oficina de Administración de Tierras

Proyecto eólico Lava Ridge

El borrador de la DIA del proyecto eólico de Lava Ridge finaliza el 20 de abril

El período de comentarios públicos para el borrador de la declaración de impacto ambiental (DIA) y el borrador del Acuerdo programático del Proyecto Eólico Lava Ridge se cerrará a las 11:59 p.m. MDT del 20 de abril de 2023.

El 20 de enero de 2023, la Oficina de Administración de Tierras (BLM) emitió un Aviso de disponibilidad para el borrador de la declaración de impacto ambiental (DIA) para el Proyecto eólico Lava Ridge (proyecto), de acuerdo con la Ley de política ambiental nacional. Para cumplir con la Sección 106 de la Ley Nacional de Preservación Histórica, la BLM está preparando un Acuerdo Programático y ha incluido el borrador como Apéndice 8 en el borrador de la DIA. La BLM está buscando comentarios públicos sobre el borrador de la DIA y el borrador del Acuerdo Programático.

Para acceder al borrador de la DIA y los materiales de apoyo, visite el sitio web de ePlanning de BLM en **https://bit.ly/3EirzxD**.

COMENTARIOS PÚBLICOS

Puede enviar un comentario por escrito sobre el borrador de la DIA utilizando una de las siguientes tres formas:

- Visite el sitio web del proyecto BLM: **https://bit.ly/3EirzxD**. Dé clic en el botón "Participar ahora" a la derecha del enlace del documento. Ingrese su comentario e información, después dé clic en "Enviar".
- Correo electrónico a: BLM_ID_LavaRidge@blm.gov
- Entregado en mano o por correo y etiquetado como "DIA de proyecto eólico de Lava Ridge" a Kasey Prestwich, Gerente de proyecto, oficina de campo Shoshone de BLM, 400 West F Street, Shoshone, ID 83352

Para ser considerado en el desarrollo de la DIA final, los comentarios deben tener matasellos antes del **20 de abril de 2023**.

El envío de comentarios es completamente voluntario y cualquier información de identificación proporcionada pasará a formar parte del registro público, y como tal, debe ser entregado a cualquier persona que lo solicite. No se pueden garantizar las solicitudes para retener comentarios y la información de identificación personal asociada de la revisión pública.

PARA MÁS INFORMACIÓN

Si tiene preguntas sobre el borrador de la DIA o el período de comentarios, comuníquese con Kasey Prestwich, gerente de proyectos en kprestwich@blm.gov o al (208) 732-7204.

APPENDIX D

Public Meeting Handout

U.S. Department of the Interior
Bureau of Land Management

Lava Ridge Wind Project

Draft Environmental Impact Statement

The Bureau of Land Management (BLM) Shoshone Field Office is seeking public comment on the draft environmental impact statement (EIS) for the Lava Ridge Wind Project, a commercial-scale wind energy facility of up to 400 wind turbines and associated infrastructure, including new and improved roads, powerlines, substations, operation and maintenance facilities, and a battery storage facility. The project would have a generation capacity of 1,000 megawatts or more.

Purpose & Need

The BLM's purpose is to respond to Magic Valley Energy's application for a right-of-way (ROW) grant to construct, operate and maintain, and decommission a wind energy facility on public lands in compliance with Federal Land Policy and Management Act (FLPMA), BLM ROW regulations, and other applicable federal laws and policies. The need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V).

Agency's Preferred Alternatives

The draft EIS analyzes five alternatives: the No Action (Alternative A), the Proposed Action (Alternative B) and three additional action alternatives (Alternatives C, D, and E). The BLM has identified Alternatives C and E as the agency's preferred alternatives. Information acquired during the public comment period could identify an alternative that blends elements of the agency's preferred alternatives, incorporates elements of any of the alternatives, or selects any of the five alternatives as the preferred alternative in the final EIS.

Project Schedule

August 20, 2021	—	BLM initiates public scoping
October 20, 2021	—	Scoping period ends
January 20, 2023	—	Draft EIS released for public review
		Public comment period opens
April 20, 2023	—	Public comment period ends
Summer 2023	—	Final EIS released
Fall 2023	—	Record of Decision (ROD)

The BLM issued a notice of availability for the draft EIS for the Lava Ridge Wind Project on January 20, 2023, in accordance with the National Environmental Policy Act. To comply with Section 106 of the National Historic Preservation Act, the BLM is preparing a Programmatic Agreement and has included the draft as Appendix 8 in the draft EIS. The BLM is seeking public comment on the draft EIS and draft Programmatic Agreement during a 90-day public comment period that will close at 11:59 pm MDT on April 20, 2023.

Accessing the draft EIS

Download the draft EIS: https://bit.ly/3EirzxD

Read the draft EIS in hardcopy at the following locations:

- BLM Shoshone Field Office*, 400 West F Street, Shoshone, ID 83352

- BLM Twin Falls District Office*, 2878 Addison Avenue East, Twin Falls, ID 83301
- BLM Burley Field Office*, 15 East 200 South, Burley, ID 83318
- BLM Idaho State Office*, 1387 South Vinnell Way, Boise, ID 83709
- Japanese American Museum of Oregon**, 411 NW Flanders St. STE 100, Portland, OR 97209
- Oregon Buddhist Temple**, 3720 SE 34th Ave, Portland, OR 97202
- Bainbridge Public Library**, 1270 Madison Ave N, Bainbridge Island, WA 98110
- Japanese Cultural and Community Center of Washington**, 1414 S Weller Street, Seattle, WA 98144

*Physical copies located at BLM offices are available for review during normal business hours beginning January 13, 2023.
**The BLM has also coordinated with non-BLM locations to make physical copies available outside the local project area at locations familiar to Japanese American communities. The availability of these copies at non-BLM locations are at the discretion of the location.

How to Comment

The most effective comments provide detailed information with clear rationale for why changes to the EIS or changes to the Programmatic Agreement are desired. To make the best use of your input, consider the following:

- Keep your comments focused on the proposed project and what is being analyzed.
- Describe the significance of the potential impacts and how they affect you, others, places, and activities.
- Provide any new information that is relevant to the project (e.g., potential affected resources).
- Discuss modifications to existing alternatives or suggest other reasonable alternatives with justification.
- Remember to provide detailed information and references to back up your comment.
- Make sure you submit your comments within the timeframe announced. This ensures the BLM will have all concerns documented for use in preparing the final EIS.
- Comments are not counted as votes or as a part of a referendum on the BLM's decision.

You may submit a written comment on the draft EIS in one of three ways:

- Visit the BLM's project website: https://bit.ly/3EirzxD. Click on the "Participate Now" button to the left of the document link. Enter your comment and information, then click "Submit."
- E-mail to: BLM_ID_LavaRidge@blm.gov
- Delivered by hand or by mail and labeled "Lava Ridge Wind Project EIS" to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352

To be considered in the development of the final EIS, comments must be postmarked by **April 20, 2023**.

Submittal of comments is completely voluntary and any identifying information provided will become part of the public record, and as such, must be released to any individual upon request. Requests to withhold comments and associated personal identifying information from public review cannot be guaranteed.

For More Information

For more information about the proposed Lava Ridge Wind Project and draft EIS, please contact:

Kasey Prestwich, Project Manager
BLM Shoshone Field Office
400 West F Street, Shoshone, ID 83352

Phone: 208-732-7204 **Email:** kprestwich@blm.gov **Website:** https://bit.ly/3EirzxD

Lava Ridge Wind Project

Draft Environmental Impact Statement

January 2023

The Bureau of Land Management (BLM) Shoshone Field Office is seeking the public's review and comment on the draft environmental impact statement (EIS) and draft Programmatic Agreement for the proposed Lava Ridge Wind Project. The proposed project is a commercial-scale wind energy facility and would consist of up to 400 wind turbines and associated infrastructure, including new and improved roads, powerlines for collection and transmission of electricity, substations, operation and maintenance facilities, and a battery storage facility. The project would be located about 25 miles northeast of Twin Falls, Idaho. The project's 500-kilovolt generation intertie transmission line would interconnect at Idaho Power Company's existing Midpoint Substation or at a new substation within the right-of-way corridor of the northern portion of the Southwest Intertie Project.

Under the National Environmental Policy Act, the BLM developed the draft EIS using input provided by the public; from coordination with federal, state and local agencies; and through consultation with Native American Tribes. This input helped the BLM identify issues for analysis and develop alternatives to the Proposed Action. The draft EIS considers a range of alternatives that includes the Proposed Action, a no action alternative, and three additional action alternatives (see maps on page 4). The BLM has identified Alternatives C and E as the agency's preferred alternatives. In developing a decision, the BLM's Authorized Officer may select various components from each of the alternatives that best meet the purpose and need for the project.

To comply with Section 106 of the National Historic Preservation Act, the BLM is preparing a Programmatic Agreement. The Programmatic Agreement will provide detail for how historic properties that may be affected by the Lava Ridge Wind Project will be identified, evaluated, and assessed for effects. A draft Programmatic Agreement has been prepared in coordination with consulting parties and is included as Appendix 8 in the draft EIS.

The BLM looks forward to receiving comments on the draft EIS and draft Programmatic Agreement. We encourage all who are interested to stay informed about the project by signing up for the project mailing list at https://forms.office.com/r/NDsr6rhtbs and to access the documents on the project's web page at https://bit.ly/3EirzxD.

Codie Martin, Field Manager

Download the draft EIS: https://bit.ly/3EirzxD

Read the draft EIS in hardcopy at the following locations:

- BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352
- BLM Twin Falls District Office, 2878 Addison Avenue East, Twin Falls, ID 83301
- BLM Burley Field Office, 15 East 200 South, Burley, ID 83318
- BLM Idaho State Office, 1387 South Vinnell Way, Boise, ID 83709

See page 5 for additional hardcopy locations.

Kasey Prestwich, Project Manager
BLM Shoshone Field Office
400 West F Street, Shoshone, ID 83352

Phone: 208-732-7204 **Email:** kprestwich@blm.gov **Website:** https://bit.ly/3EirzxD

Public Comment Period

The BLM submitted the draft EIS to the Environmental Protection Agency on January 13, 2023. The Environmental Protection Agency's notice of availability for the draft EIS is expected to be published in the *Federal Register* on January 20, 2023 and will begin a 60-day public comment period. The public comment period provides an opportunity for stakeholders and interested parties to provide feedback to the BLM on the draft EIS analysis, data sources, analytical methods, action alternatives, and mitigation measures. The BLM will respond to substantive comments received during the comment period in the final EIS. The BLM is also seeking public input on the draft Programmatic Agreement and will use the comments received to help finalize the document.

How to Comment Effectively

The most effective comments provide detailed information with clear rationale for why changes to the EIS or changes to the Programmatic Agreement are desired. To make the best use of your input, consider the following:

- Keep your comments focused on the proposed project and what is being analyzed.
- Describe the significance of the potential impacts and how they affect you, others, places, and activities.
- Provide any new information that is relevant to the project (e.g., potential affected resources).
- Discuss modifications to existing alternatives or suggest other reasonable alternatives with justification.
- Remember to provide detailed information and references to back up your comment.
- List the reasons why you are either in favor of or opposed to the project or specific features of the project.
- Make sure you submit your comments within the timeframe announced. This ensures the BLM will have all concerns documented for use in preparing the final EIS.
- Comments are not counted as votes or as a part of a referendum on the BLM's decision.

To be considered in the development of the final EIS, comments must be postmarked by March 21, 2023.

How can I participate in the EIS process and stay informed?

- Attend the public meetings to learn more about the project and ask questions.
- Submit a written comment on the draft EIS. You can use one of three ways:
  - Visit the BLM's project website: https://bit.ly/3EirzxD. Click on the "Participate Now" button to the right of the document link. Enter your comment and information, then click "Submit."
  - E-mail to: BLM_ID_LavaRidge@blm.gov
  - Delivered by hand or by mail and labeled "Lava Ridge Wind Project EIS" to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352
- Sign up for the project mailing list to receive project updates: https://forms.office.com/r/NDsr6rhtbs

Public Meetings

Orientation Meeting

The BLM will hold a virtual meeting early in the comment period to provide information about accessing and reviewing the draft EIS, participating in the review, and submitting comments.

Wednesday, February 1, 2023
2:00—4:00 pm Mountain
Virtual/Zoom webinar
Pre-register here:
https://bit.ly/LavaRidgeDEISIntro

Open Houses

The BLM will also hold both in-person and virtual open houses as agency Covid-related policy allows, providing opportunities to learn more about the analysis, speak with resource specialists and agency managers and provide comments.

Wednesday, February 22, 2023
2:00—4:00 pm Mountain
Lincoln County Community Center
201 South Beverly Street
Shoshone, ID 83352

Thursday, February 23, 2023
5:00—7:00 pm Mountain
Canyon Crest Event Center
330 Canyon Crest Drive
Twin Falls, ID 83301

Friday, February 24, 2023
2:00—4:00 pm Mountain
Virtual/Zoom webinar
Pre-register here:
https://bit.ly/LavaRidgePublicMtg

Wednesday, March 1, 2023
3:00—7:00 pm Pacific
DoubleTree by Hilton - Portland*
1000 NE Multnomah Street
Portland, OR 97232
**complimentary garage parking*

Thursday, March 2, 2023
3:00—7:00 pm Pacific
Mercer Island Community and Event Center
8236 South East 24th Street
Mercer Island, WA 98040

Virtual meetings will be hosted using the Zoom webinar application. The Zoom app is free to download and use and can be accessed on your computer, smartphone or tablet. You can also access the Zoom meetings using your web browser. There will be a call-in number for those who want to listen to the meeting by phone. Virtual meetings will require pre-registration using the links provided and you can pre-register up until the end of the meeting.

If you need special accommodations, please contact Jo Render at jo.render@galileoaz.com or (612) 213-7543.

**The BLM has also coordinated with non-BLM locations to make physical copies available outside the local project area at locations familiar to Japanese American communities. Physical copies will be sent to these established locations prior to the beginning of the 60-day public comment period, to arrive on or around January 13, 2023. The availability of these copies at non-BLM locations are at the discretion of the location.

Electronic copies of the draft EIS are available for download at https://bit.ly/3EirzxD and additional physical copies can be made available if requested.

Proyecto Eólico Lava Ridge

Borrador de Declaración de Impacto Ambiental *Enero 2023*

La Oficina de Campo Shoshone de la Oficina de Administración de Tierras (BLM, por sus siglas en Inglés) busca la revisión y los comentarios del público sobre el borrador de la declaración de impacto ambiental (DIA) y el borrador del Acuerdo Programático para el Proyecto Eólico Lava Ridge propuesto. El proyecto propuesto es una instalación de energía eólica a escala comercial y constaría de hasta 400 turbinas eólicas e infraestructura asociada, incluyendo carreteras nuevas y mejoradas, líneas eléctricas para la recolección y transmisión de electricidad, subestaciones, instalaciones de operación y mantenimiento y una instalación de almacenamiento de baterías. El proyecto estaría ubicado aproximadamente a 25 millas al noreste de Twin Falls, Idaho. La línea de transmisión de interconexión de generación de 500 kilovoltios del proyecto se interconectaría a la Subestación Midpoint existente de Idaho Power Company o a una nueva subestación dentro del corredor de derecho de paso de la parte septentrional del Proyecto de Interconexión del Suroeste.

Bajo la Ley de Política Ambiental Nacional, la BLM desarrolló el borrador de la DIA utilizando los aportes proporcionados por el público; coordinación con agencias federales, estatales y locales; y a través de consultas con tribus nativas americanas. Estos aportes ayudaron a la BLM a identificar problemas en el análisis y a desarrollar alternativas a la Acción Propuesta. El borrador del DIA considera una gama de alternativas que incluye la Acción Propuesta, una alternativa de no acción y tres alternativas de acción adicionales (ver mapas en la página 4). La BLM ha identificado las Alternativas C y E como las alternativas preferidas de la agencia. Al desarrollar una decisión, el Oficial Autorizado de la BLM puede seleccionar varios componentes de cada una de las alternativas que mejor cumplan con el propósito y las necesidades del proyecto.

Para cumplir con la Sección 106 de la Ley Nacional de Preservación Histórica, la BLM está preparando un Acuerdo Programático. El Acuerdo Programático proporcionará detalles sobre cómo se identificarán, estimarán y evaluarán los efectos de las propiedades históricas que pueden verse afectadas por el Proyecto Eólico Lava Ridge. Se ha preparado un borrador de Acuerdo Programático en coordinación con las partes consultoras y se incluye como Apéndice 8 en el borrador de la DIA.

La BLM espera recibir comentarios sobre el borrador de la DIA y el borrador del Acuerdo Programático. Alentamos a todos los interesados a mantenerse informados sobre el proyecto registrándose en la lista de correo del proyecto en https://forms.office.com/r/NDsr6rhtbs y accediendo a los documentos en la página web del proyecto en https://bit.ly/3EirzxD.

Codie Martin, Gerente de Campo

Descargue el borrador de DIA: https://bit.ly/3EirzxD

Lea el borrador de la DIA en copia impresa en los siguientes lugares:

- Oficina local de BLM Shoshone, 400 West F Street, Shoshone, ID 83352
- Oficina de Distrito de Twin Falls de BLM, 2878 Addison Avenue East, Twin Falls, ID 83301
- Oficina local de BLM Burley, 15 East 200 South, Burley, ID 83318
- BLM Oficina Estatal de Idaho, 1387 South Vinnell Way, Boise, ID 83709

Consulte la página cinco para conocer las ubicaciones adicionales de las copias impresas.

Para obtener más información sobre el Proyecto Eólico Lava Ridge propuesto:

Kasey Prestwich, Gerente de Proyecto
Oficina local de BLM Shoshone
400 West F Street, Shoshone, ID 83352
Teléfono: 208-732-7204 **Correo electrónico:** kprestwich@blm.gov **Sitio web:** https://bit.ly/3EirzxD

Período de comentarios públicos

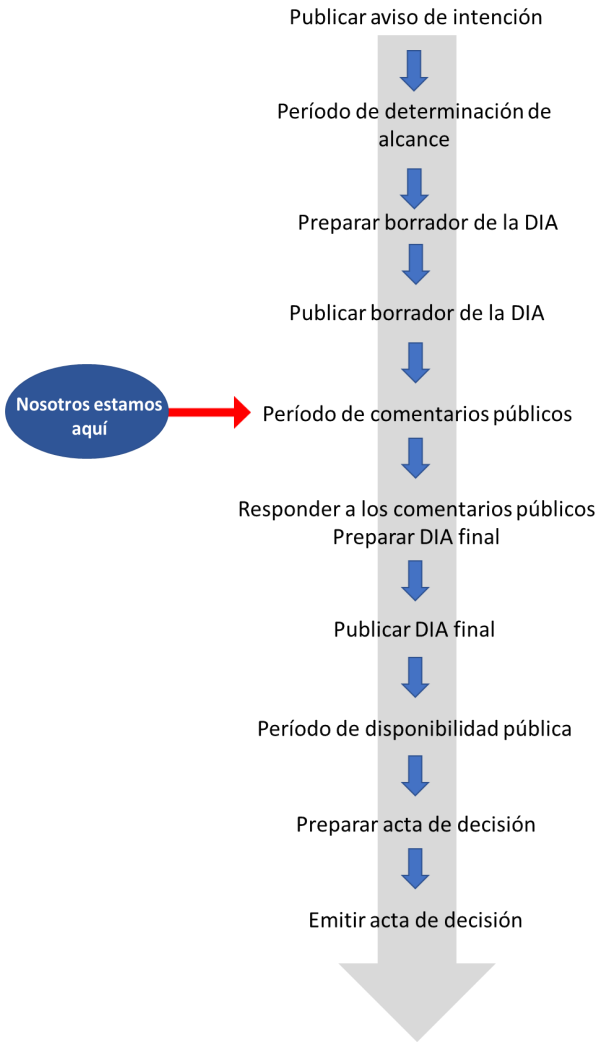
La BLM presentó el borrador de DIA a la Agencia de Protección Ambiental el 13 de enero de 2023. Se espera que el aviso de disponibilidad de la Agencia de Protección Ambiental para el borrador de la DIA se publique en el Registro Federal el 20 de enero de 2023 y comenzará un período de comentarios públicos de 60 días. El período de comentarios públicos brinda una oportunidad para que las partes interesadas proporcionen comentarios a la BLM sobre el borrador del análisis de la DIA, las fuentes de datos, los métodos analíticos, las alternativas de acción y las medidas de mitigación. La BLM responderá a los comentarios sustantivos recibidos durante el período de comentarios en la DIA final. La BLM también está buscando comentarios públicos sobre el borrador del Acuerdo Programático y utilizará los comentarios recibidos para ayudar a finalizar el documento.

¿Cómo comentar de manera efectiva?

Los comentarios más efectivos brindan información detallada con una justificación clara de por qué se desean cambios en la DIA o cambios en el Acuerdo Programático. Para poder hacer el mejor uso de sus comentarios, considere lo siguiente:

- Mantenga sus comentarios enfocados en el proyecto propuesto y lo que se está analizando.
- Describa la importancia de los impactos potenciales y cómo le afectan a usted, a otros, a los lugares y a las actividades.
- Proporcione cualquier información nueva que sea relevante para el proyecto (por ejemplo, los posibles recursos afectados).
- Discuta modificaciones a las alternativas existentes o proponga otras alternativas razonables con justificación.
- Recuerde proporcionar información detallada y referencias para respaldar su comentario.
- Enumere las razones por las que está a favor o en contra del proyecto o de las características específicas del proyecto.
- Asegúrese de enviar sus comentarios dentro del plazo anunciado. Esto asegura que la BLM tendrá todas las inquietudes documentadas para su uso en la preparación de la DIA final.
- Los comentarios no se cuentan como votos ni como parte de un referéndum sobre la decisión de la BLM.

Para ser considerado en el desarrollo de la DIA final, los comentarios deben contar con sello postal hasta el 21 de marzo de 2023.



¿Cómo puedo participar en el proceso de DIA y mantenerme informado?

- Asista a las reuniones públicas para obtener más información sobre el proyecto y hacer preguntas.
- Envíe un comentario por escrito sobre el borrador de la DIA. Puede usar una de estas tres formas:
  - Visite el sitio web del proyecto BLM: https://bit.ly/3EirzxD. Dé clic en el botón "Participar ahora" a la derecha del enlace del documento. Ingrese su comentario e información, después dé clic en "Enviar".
  - Correo electrónico a: BLM_ID_LavaRidge@blm.gov
  - Entregado en persona o por correo y etiquetado como "DIA de proyecto eólico de Lava Ridge" a Kasey Prestwich, Gerente de proyecto, oficina de campo Shoshone de BLM, 400 West F Street, Shoshone, ID 83352
- Regístrese en la lista de correo del proyecto para recibir actualizaciones del proyecto: https://forms.office.com/r/NDsr6rhtbs

Reuniones Públicas

Reunión de orientación

La BLM llevará a cabo una reunión virtual al principio del período de comentarios para proporcionar información sobre cómo acceder y revisar el borrador de DIA, participar en la revisión y enviar comentarios.

Miércoles, 1 de febrero de 2023
2:00—4:00 pm Horario de la montaña
Seminario web virtual/Zoom
Pre-registro aquí:
https://bit.ly/LavaRidgeDEISIntro

Puertas abiertas

La BLM también llevará a cabo jornadas de puertas abiertas tanto en persona como virtuales, conforme lo permita la política relacionada con Covid de la agencia, brindando oportunidades para obtener más información sobre el análisis, hablar con especialistas en recursos y gerentes de agencias y proporcionar comentarios.

Miércoles, 22 de febrero de 2023
2:00—4:00 pm Horario de la montaña
Centro Comunitario del Condado de Lincoln
201 South Beverly Street
Shoshone, ID 83352

Jueves, 23 de febrero de 2023

*A partir del 13 de enero de 2023, las copias físicas ubicadas en las oficinas del BLM estarán disponibles para su revisión durante el horario normal de oficina.

**El BLM también ha coordinado con lugares que no pertenecen al BLM para que copias físicas estén disponibles fuera del área local del proyecto, en lugares que sean familiares para las comunidades japonesas-americanas. Las copias físicas se enviarán a estos lugares establecidos antes del inicio del período de comentarios públicos de 60 días, para que lleguen alrededor del 13 de enero de 2023. La disponibilidad de estas copias en lugares que no pertenecen al BLM queda a discreción del lugar.

Se pueden descargar copias electrónicas del borrador de EIS en https://bit.ly/3EirzxD y copias físicas adicionales estarán disponibles bajo previa solicitud.

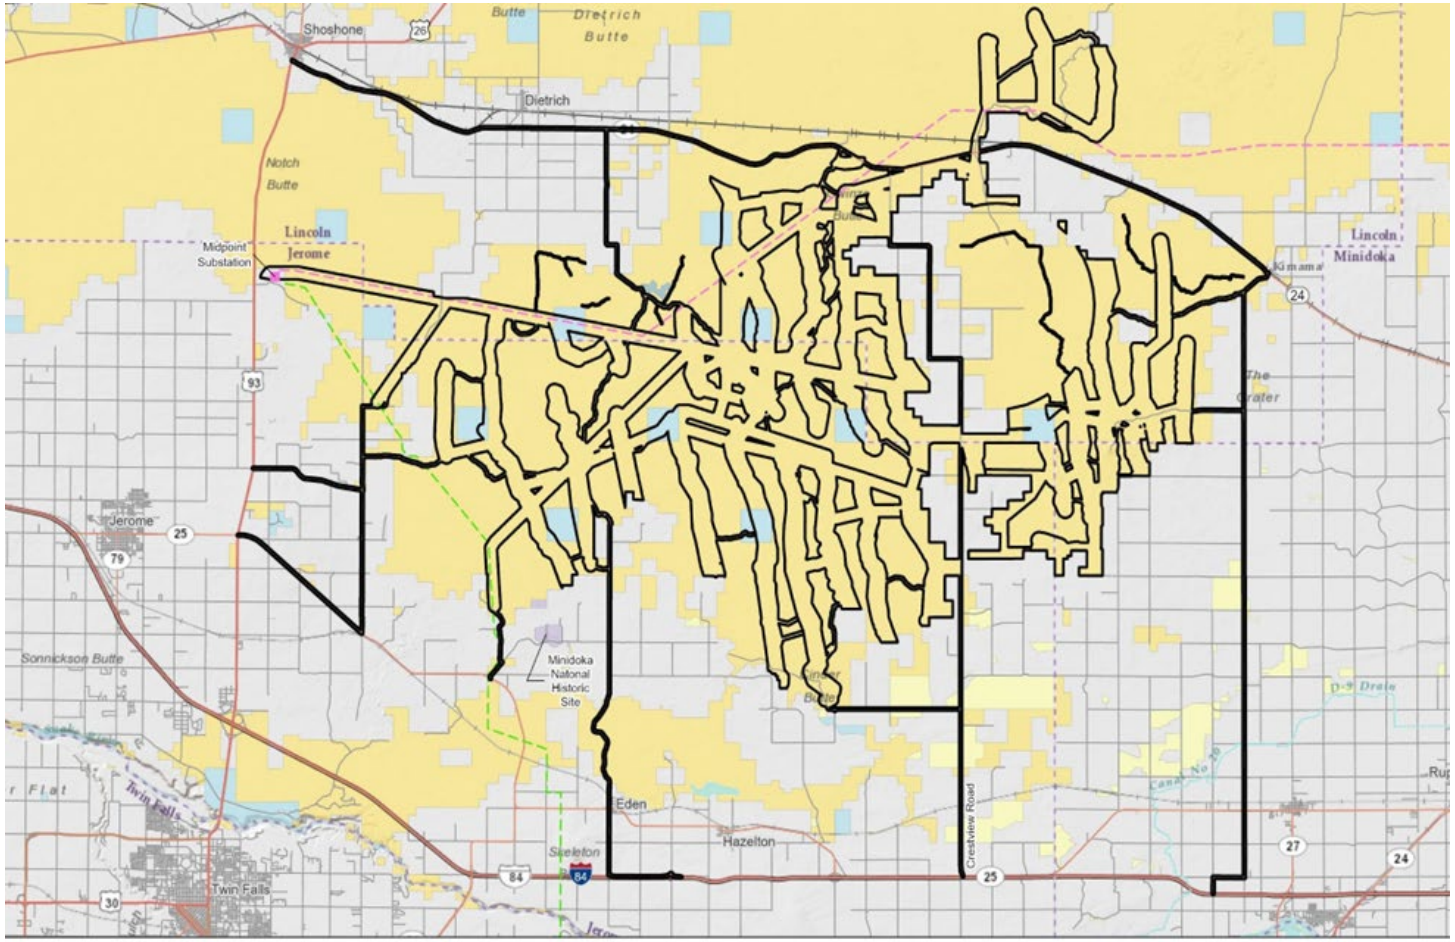
Meeting Objectives

This meeting will provide an overview of:

- National Environmental Policy Act (NEPA) process
- Where to access and download documents
- The draft Environmental Impact Statement (EIS)
- How to participate in the public comment period
- Upcoming open house meetings

Background



- Magic Valley Energy (MVE) applied for a right-of-way grant for a wind energy facility on public lands
- The BLM issued a Notice of Intent and held public scoping August – October 2021
- The BLM prepared a draft EIS to evaluate the proposed project and to respond to MVE's application

SWCA ENVIRONMENTAL CONSULTANTS

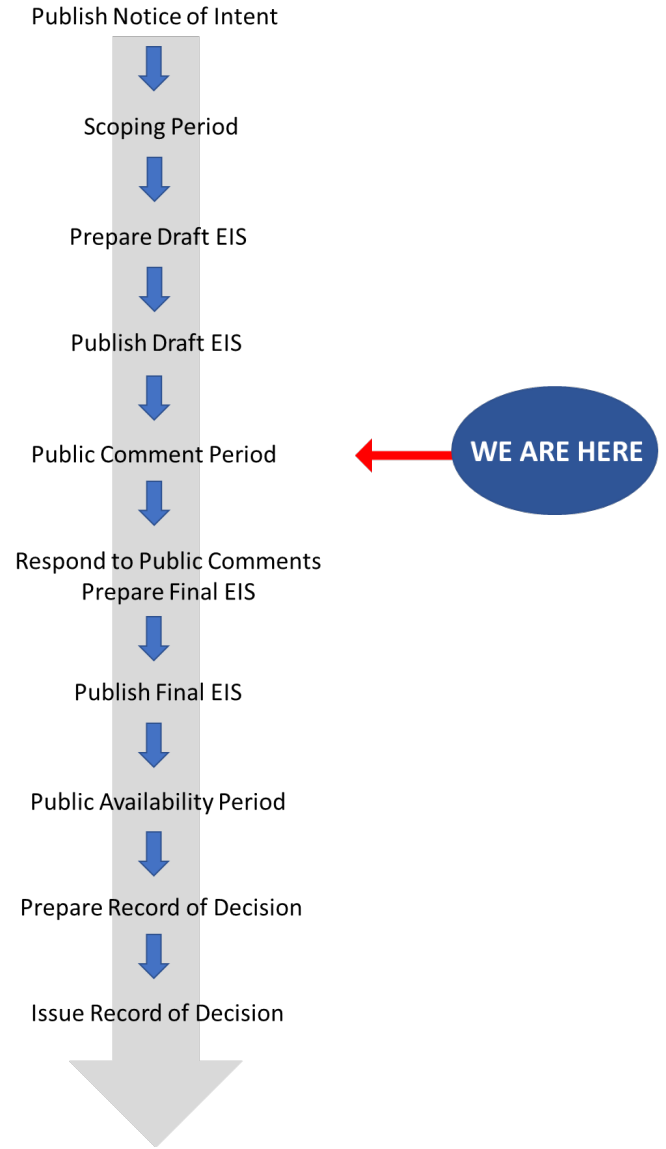
NEPA Process

What is an EIS?

An EIS is prepared to analyze and disclose effects of a proposed action on the natural and human environment, and to consider reasonable alternatives and mitigation measures.

How is the public involved?

The notice of availability for the draft EIS was published in the *Federal Register* on January 20, 2023, beginning a 60-day public comment period.



Purpose of the Public Comment Period

The purpose of the public comment period is to solicit comments from the public on:

- Draft Environmental Impact Statement analysis, data sources, analytical methods, action alternatives, and mitigation measures
- Draft Programmatic Agreement developed under Section 106 of the National Register of Historic Preservation Act

60-day public comment period: January 20 – March 21, 2023

U.S. Department of the Interior
Bureau of Land Management

Lava Ridge Wind Project

Project Information

NEPA Number:	DOI-BLM-ID-T030-2021-0015-EIS
Project Name:	Lava Ridge Wind Project
Project Type:	Environmental Impact Statement
Project Status:	In Progress - Analysis & Document Preparation
Lead Office:	Shoshone FO
Last Updated:	09/22/2022 10:19:34 MDT

Project Description

Magic Valley Energy, LLC (MVE) seeks authorization to use Federal lands to construct, operate, maintain, and decommission the Lava Ridge Wind Project. The proposed project is located primarily on public lands administered by the Bureau of Land Management (BLM) Shoshone Field Office, approximately 25 miles northeast of Twin Falls, Idaho, within Jerome, Lincoln, and Minidoka Counties. The project's planned 500 kilovolt (kV) transmission line may interconnect at the existing Idaho Power Midpoint substation approximately 7 miles south of Shoshone, or at an alternative location inside the right-of-way corridor for the not yet constructed, Southwest Intertie Project – Northern Portion (SWIP-North). The proposed project includes up to 400 wind turbines, up to seven new substations, approximately 198 miles of 34.5 kilovolt (kV) collector lines, 34 miles of 230 kV transmission lines, 18 miles of 500 kV transmission lines, 381 miles of access roads, 47 miles of temporary crane paths, a battery energy storage system, three operations and maintenance facilities, five permanent met towers and construction-related staging yards. The project proposal has identified a range of possible turbine sizes that would have a generating capacity of 2 to 6 megawatts (MW) per turbine and would

Overview of the Draft EIS

Volume 1

- Executive Summary
- Chapter 1. Introduction
- Chapter 2. Proposed Action and Alternatives
- Chapter 3. Affected Environment and Impacts

Volume 2

- Appendix 1. Plan of Development (Proposed Action) and related management plans

Volume 3

- Appendix 2 through Appendix 4 and Appendix 6 through Appendix 11

Volume 4

- Appendix 5. Select Visual Resources Simulations

Other Materials

Supporting materials can be accessed on the BLM's ePlanning website including:

- Analysis of Avian and Bat Mortalities at Existing Wind Facilities Report
- Year 1 Avian Use Study
- Bat Activity and North American Bat Surveys
- Year 2 Bat Acoustic Monitoring Surveys
- Vegetation Assessment Technical Memorandum
- Night Skies Analysis Report
- Wetlands and Waters Desktop Assessment
- Aquatic Resources Inventory Report
- Hydrogeologic Analysis Technical Memo
- Noise Technical Report
- Visual Resources Technical Report
- Stakeholder Assessment and Engagement Report

How to Participate

- Review the Draft EIS
  - On the BLM website: https://bit.ly/3EirzxD
  - Visit a hard copy location
- Attend public meetings
- Provide comments
- Sign up to be on the project mailing list: forms.office.com/r/NDsr6rhtbs
  - Please include your name and all relevant contact information when you complete the form.

Upcoming Public Open Houses

How to Submit Comments

- The preferred way to comment is through the BLM's ePlanning project site at https://bit.ly/3EirzxD. Click on the "Participate Now" button to the left of the document link. Enter your comment and information then click "Submit."
- Through e-mail to BLM_ID_LavaRidge@blm.gov
- Delivered by hand or U.S. mail enclosed in an envelope labeled "Lava Ridge Wind Project EIS," to Kasey Prestwich, project manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352
- Provide comment during the Open House public meetings

Make sure you submit your comments by the end of the comment period

March 21, 2023

Types of Effective Comments

- Provide detailed information with rationale for why changes to the EIS or changes to the draft Programmatic Agreement are desired
- Describe the significance of the potential impacts and how they affect you, others, places, and activities
- Provide any new information that is relevant to the project
- Discuss modifications to existing alternatives or suggest other reasonable alternatives with justification
- Explain why you are in favor of or opposition to the project or specific features of the project, with a reasoned basis related to the analysis

Submit comments by March 21, 2023

How to Participate

- Review the Draft EIS
  - On the BLM website: https://bit.ly/3EirzxD
  - Visit a hard copy location
- Attend public meetings
- Provide comments
- Sign up to be on the project mailing list: forms.office.com/r/NDsr6rhtbs
  - Please include your name and all relevant contact information when you complete the form.

Meeting Objectives

- Review the National Environmental Policy Act (NEPA) process and schedule
- Summarize elements and conclusions contained within the draft environmental impact statement (EIS) developed for the Lava Ridge Wind Project
- Respond to meeting participant questions about the NEPA process and draft EIS
- Provide participants with an opportunity for verbal comments
- Review how to provide written comments and continue participating in the NEPA process

What is an EIS?

An EIS is prepared to analyze and disclose effects of a proposed action on the environment, and to consider reasonable alternatives and mitigation measures.

August 20, 2021	BLM initiates public scoping
October 20, 2021	Scoping period ends
January 20, 2023	Draft EIS public comment period opens
March 21, 2023	Public comment period ends
Summer 2023	Final EIS released
Fall 2023	Record of Decision (ROD)

Lava Ridge Wind Project, February 2023

Purpose and Need

The BLM's purpose is to respond to Magic Valley Energy's application for a right-of-way (ROW) grant to construct, operate and maintain, and decommission a wind energy facility on public lands in compliance with the Federal Land Policy and Management Act (FLPMA), BLM ROW regulations, and other applicable federal laws and policies. The need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V).

Lava Ridge Wind Project, February 2023

BLM

Agency Participation

Cooperating Agencies have:

- Contributed staff to participate on the interdisciplinary team.
- Identified issues of concern regarding project impacts on the natural and human-made environment.
- Provided leadership, expertise, guidance, and review for the environmental analysis.

BLM

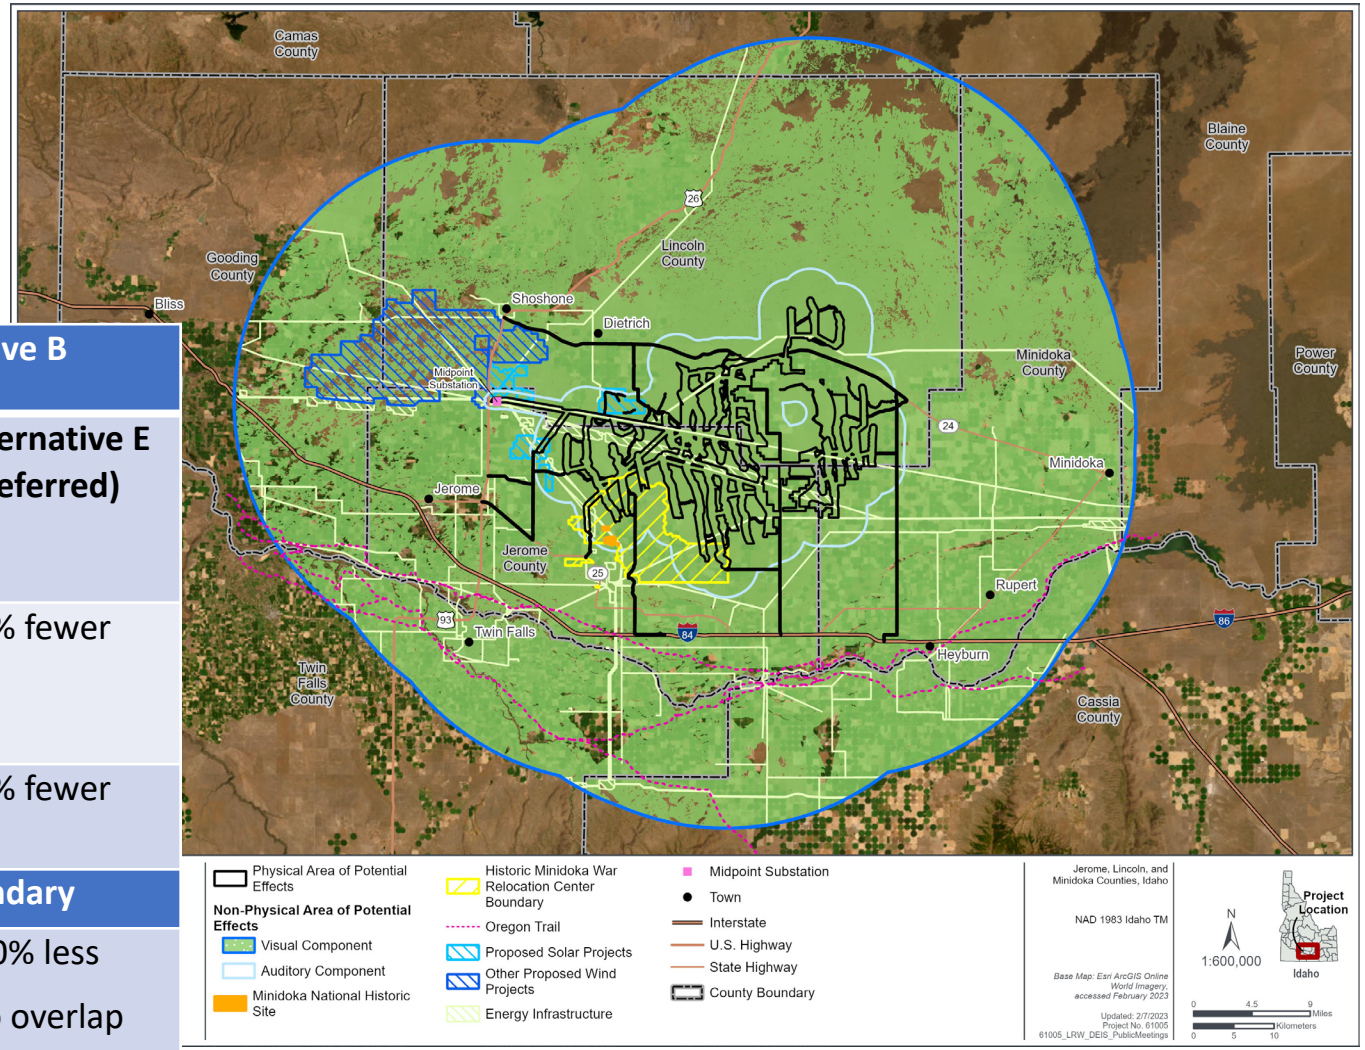
Visual or Auditory Impacts to Cultural Resources

Visual or auditory (non-physical) impacts to potentially susceptible cultural resources from turbines and 500-kV transmission lines would occur. Not all visual or auditory impacts can be avoided or minimized to avoid adverse effects. These impacts could affect setting, feeling, and association that may also result in disturbance of the resources' existing solitude and surroundings.

		Percent Difference from Alternative B		
	Alternative B	**Alternative C (Preferred)**	**Alternative D**	**Alternative E (Preferred)**
Visual Component	12,748 estimated resources	14% fewer	23% fewer	19% fewer
Auditory Component	361 estimated resources	29% fewer	47% fewer	40% fewer
Auditory Component Overlap of the Historic Minidoka WRC Boundary				
	41 square miles (also fully overlaps Minidoka NHS)	65% less (no overlap with NHS)	57% less (no overlap with NHS)	100% less (no overlap with NHS)



The majority of known cultural resources susceptible to visual impacts (approximately 80%) occur 10-20 miles from the project.

BLM

Physical Impacts to Cultural Resources

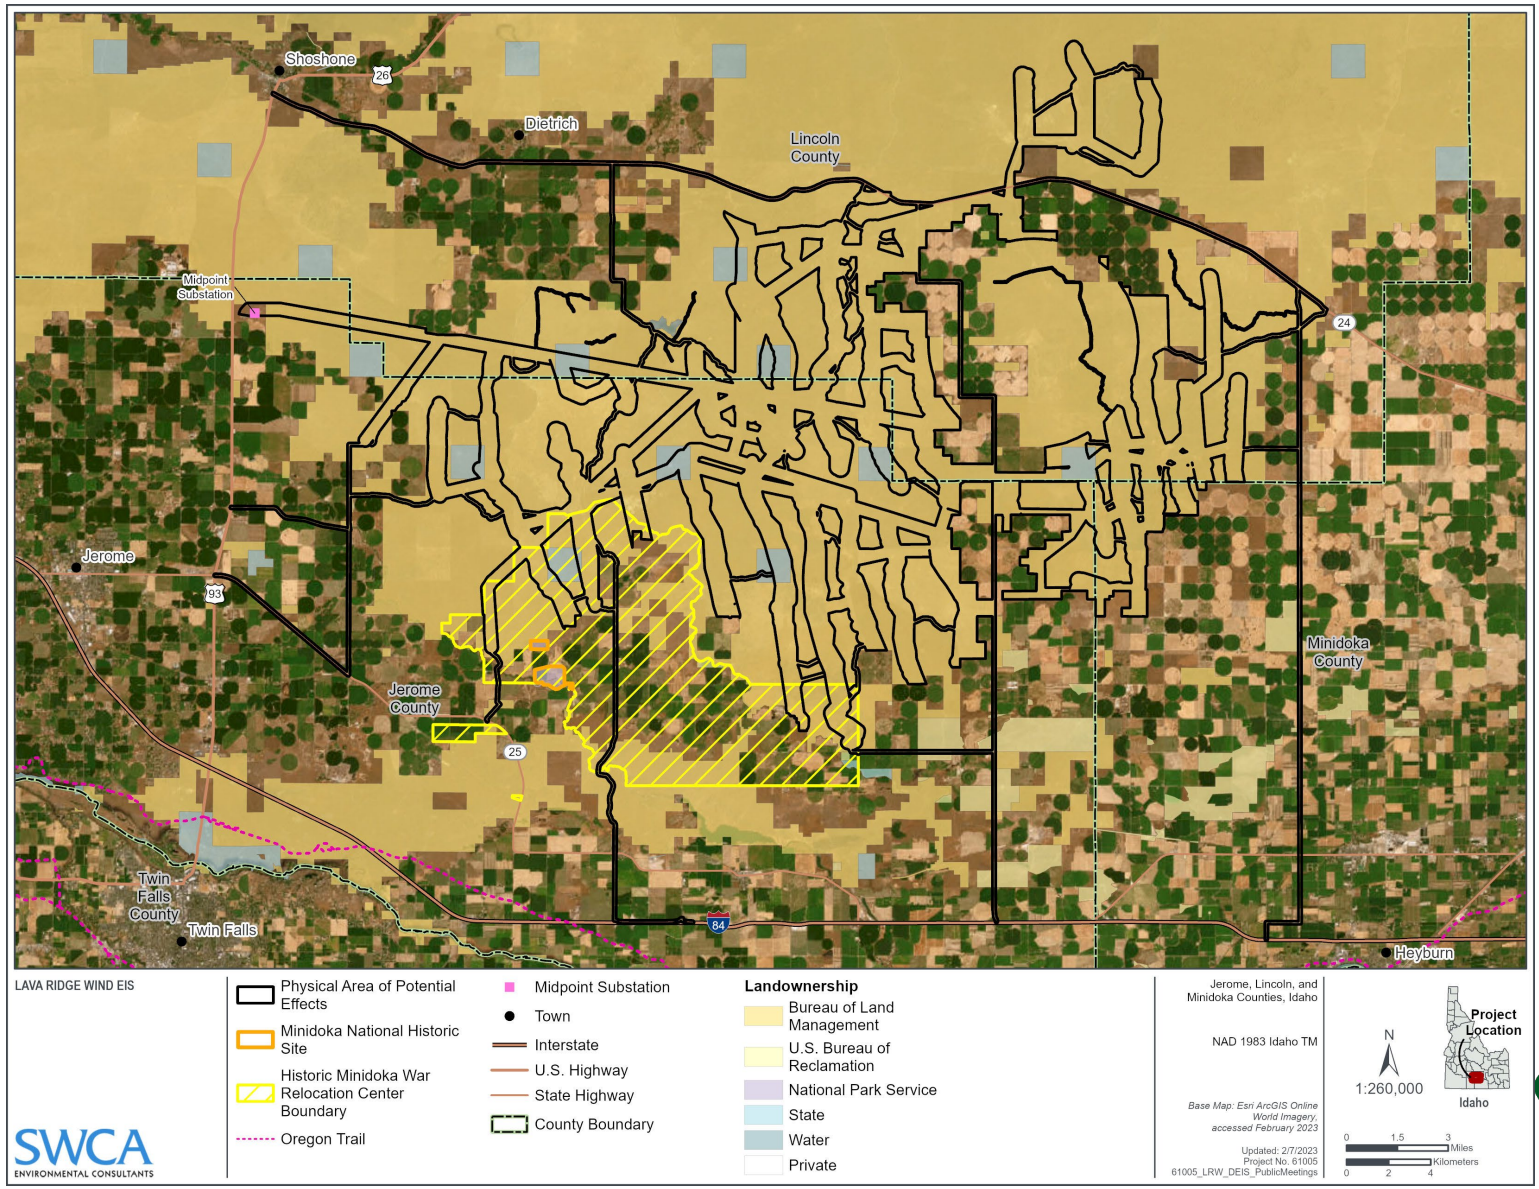
Ground disturbance has the potential to physically impact cultural resources in the project's physical area of potential effects (APE), including within the historic Minidoka War Relocation Center (WRC) boundary.

Alternative B
- 43 estimated resources in 14 square miles of ground disturbance
- 8 square miles of siting corridor overlap with Minidoka WRC

Alternative C
- 24% fewer estimated resources
- 86% less overlap with Minidoka WRC

Alternative D
- 47% fewer estimated resources
- 63% less overlap with Minidoka WRC

Alternative E
- 44% fewer estimated resources
- 97% less overlap with Minidoka WRC



BLM

Environmental Justice Communities

EO 12898 mandates consideration of environmental justice (EJ) issues: the fair treatment and meaningful involvement of all potentially affected people, regardless of race, color, national origin, or income.

Environmental justice populations: minority or low income, including geographically dispersed EJ populations who value this landscape for its viewshed and soundscape

Minority or Low Income:

- About half of all census tracts and block groups within the analysis area were identified as a low-income population, minority population, or both

Japanese American Community:

- the Minidoka National Historic Site is an international site of conscience; the historic Minidoka War Relocation Center has a larger 34k-acre historic boundary
- the landscape character and setting are key components of the visitor and survivor experience of remoteness, isolation, and abandonment, needed to engage in reflection, remembrance, and healing

Native American Tribes:

- the area is a cultural landscape supporting traditional uses and tribal treaty rights

Minidoka War Relocation Authority Center, 1942
Photo Credit: Francis Stewart

Engagement with Environmental Justice Communities

EO 12898 directs the BLM to evaluate how the project may affect environmental justice communities, including the places they live or locations they consider culturally-significant.

The BLM has worked to meaningfully engage with these environmental justice communities through in-person and virtual meetings, including National Historic Preservation Act Section 106 consultation meetings:

- Japanese American community
- the Shoshone-Bannock Tribes of the Fort Hall Indian Reservation (Shoshone-Bannock Tribes)
- the Shoshone-Paiute Tribes of the Duck Valley Indian Reservation (Shoshone-Paiute Tribes)

The Tribes and BLM have also been discussing the project in Government-to-Government meetings.

Minidoka National Historic Site Guard Tower
Photo Credit: National Park Service

Conclusion: Disproportionate high and adverse impacts to the Japanese American Community and Native American Tribes from changes to setting, feeling, and experience due to visual and noise impacts.

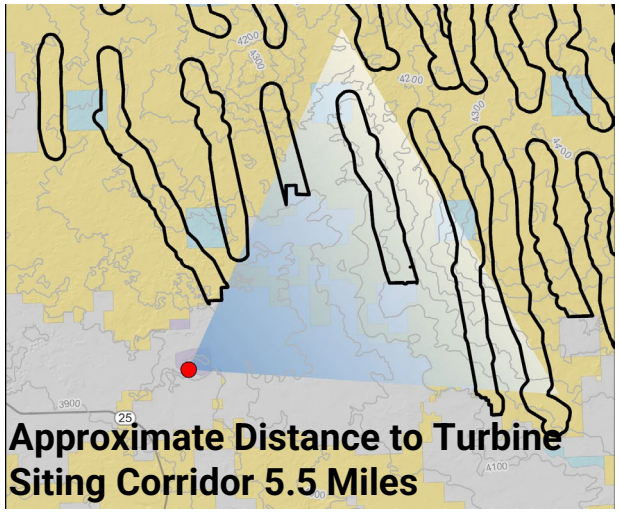
Cultural Resource Concerns of the Japanese American Community

The Minidoka NHS is a nationally significant historic site and provides stories of the individuals incarcerated there. The BLM is treating Minidoka WRC as a Traditional Cultural Property. These sites provide important civil rights lessons. The Japanese American community considers Minidoka NHS and War Relocation Center to be sacred and important places where learning and healing can be achieved through continued historic preservation.

Concerns include the following:

- honoring the place of Japanese Americans in national history;
- maintaining the wide open vistas, as would have been experienced during incarceration;
- prominent project structures and lighting visually impacting Minidoka NHS and WRC;
- siting the project in proximity to the Minidoka NHS and WRC, given Japanese American community sensitivities to development-related impacts in the surrounding area;
- disproportionate impacts to Japanese American historic sites.

Conclusion: The Japanese American community would consider the visual and emotional impact of the project on their experience of Minidoka NHS and WRC to be culturally and spiritually impactful.



Cultural Resource Concerns of Native American Tribes

Concerns include potential impacts to the following:

- a resource's setting, feeling, or association from a Tribal perspective;
- the views from Wilson Butte Cave (a nationally significant historic site) and other buttes and landforms;
- traditional resources for practices such as hunting and gathering;
- dark skies that support Tribal practices;
- vegetation and wildlife that Tribes hold spiritually and culturally significant, including wildlife habitats and corridors and migratory birds;
- Tribal treaty rights in the area;
- broader areas to which Tribes ascribe cultural significance.

Conclusion: Tribes would consider the presence of the project on the landscape to be culturally and spiritually impactful.

Draft Cultural Resources Programmatic Agreement (PA)

To comply with Section 106 of the National Historic Preservation Act (NHPA), the draft PA defines:

- the inventory and evaluation methods that will be implemented prior to project construction;
- further measures to avoid, minimize, or mitigate effects to cultural resources; with development of an Historic Properties Management Plan (HPMP) and Historic Properties Treatment Plans (HPTPs);
- development of a monitoring and discovery plan to address previously-unidentified cultural resources, if found during ground-disturbing activities.

The BLM is seeking your input and written comment on the draft PA developed to comply with Section 106 of the NHPA. The draft PA was prepared in coordination with consulting parties and is included as Appendix 8 in the draft EIS. You may provide written comments on the draft PA or cultural resources and historic properties potentially affected by the Lava Ridge Wind Project.

If you are interested in sharing information on these resources or have questions about the Section 106 process, please contact: **Shoshone Field Office,** email: BLM_ID_LavaRidge@blm.gov, phone: 208-732-7200.

BLM

Livestock Grazing and Affected Allotments

- Project vegetation disturbance, infrastructure, and temporary fencing would result in affected allotment acreage and reduced forage availability.
- All action alternatives would include measures that ensure coordination between MVE and permittees and would allow for livestock grazing to continue throughout the project phases.
- Range improvements, such as fencing, watering, and cattle guards, would be installed to disperse livestock away from project activities.

Maximum Percent Allotment Acreage Affected during Construction and Decommissioning

Allotment Name*	Alternative B Acres Unavailable (% Allotment)	Alternative C (Preferred) Acres Unavailable (% Allotment)	Alternative D Acres Unavailable (% Allotment)	Alternative E (Preferred) Acres Unavailable (% Allotment)
Camp I	271 (2.2%)	319 (2.7%)	319 (2.7%)	319 (2.7%)
North Milner	839 (3.0%)	80 (0.3%)	80 (0.3%)	67 (0.2%)
Sid Butte	15,548 (34.9%)	15,548 (34.9%)	1,579 (3.5%)	15,548 (34.9%)
Star Lake	4,916 (5.0%)	4,039 (4.1%)	4, 163 (4.2%)	2,479 (2.5%)
Wildhorse	452 (0.2%)	4 (< 0.1%)	0 (0%)	4 (< 0.1%)

* The maximum affected acreage in the Camp II, Flat Top, Hunt, and South Milner allotments is less than 15 acres per allotment.

The maximum percent allotment acreage affected during operation and final reclamation ranges from <0.1% to 1.3%, depending on the allotment and the alternative.

Mule Deer and Pronghorn Habitats and Populations

- The project is within winter range for mule deer and pronghorn.
- The Owinza migration route for pronghorn bisects the siting corridors; stopover areas have been identified in the southern portion of the project, as well as just north of the project.
- Wintering mule deer and pronghorn already experience high energy demands and increased mortality rates; development pressure in winter habitat could increase stress and avoidance behavior of areas of new development, indirectly reduce available habitat, and increase energy losses and mortality.
- IDFG studies to further refine mapped routes and stopover areas of mule deer and pronghorn and identify other currently unmapped routes and stopover areas are ongoing.
- MVE would be required to minimize disturbance in big game winter range (assumed to be the entirety of the siting corridors) during all project phases. This may include implementing a phased approach for construction, maintenance, and decommissioning to minimize intrusion on the winter and migration seasons.
- Adaptive management, such as supporting and using IDFG telemetry studies, would be implemented to reduce impacts and focus mitigation efforts as needed.

Conclusion: All alternatives may displace mule deer and pronghorn from important winter habitats. Alternatives C, D, and E would result in fewer affected mule deer and pronghorn habitats because there would be fewer siting corridors in observed winter range and migration routes.

BLM

Birds and Bats

- Bird and bat fatalities are expected due to collisions with turbines.

Indicator	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E (Preferred)
Estimated bird fatalities per year from turbine collisions (operation only, 30 years)	Mean: All species: 3,240–5,654 birds Diurnal raptors only: 156–272 birds Eagles only: 416 birds Maximum: All species: 10,200–17,799 birds Diurnal raptors only: 348–607 birds	Mean: All species: 3,062–4,196 birds Diurnal raptors only: 147–202 birds Eagles only: 341 birds Maximum: All species: 9,639–13,209 birds Diurnal raptors only: 328–451 birds	Mean: All species: 2,268–2,900 birds Diurnal raptors only: 109–140 birds Eagles only: 237 birds Maximum: All species: 7,140–9,129 birds Diurnal raptors only: 244–311 birds	Mean: All species: 2,179–3,143 birds Diurnal raptors only: 105–151 birds Eagles only: 233 birds Maximum: All species: 6,860–9,894 birds Diurnal raptors only: 234–338 birds

Diurnal: active during the day

BLM

Birds and Bats

- Adaptive management, including curtailment, would be implemented to reduce fatalities. Monitoring would evaluate the effectiveness of adaptive management and determine if compensatory mitigation is needed.
- See the Bird and Bat Conservation Strategy and the Eagle Conservation Plan in MVE's POD for more details.

Indicator	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E (Preferred)
Estimated bat fatalities per year from turbine collisions (operation only, 30 years)	Mean: 1,800–3,141 bats Maximum: 8,880–15,496 bats	Mean: 1,733–2,331 bats Maximum: 8,547–11,500 bats	Mean: 1,256–1,611 bats Maximum: 6,194–7,948 bats	Mean: 1,210–1,746 bats Maximum: 5,972–8,614 bats

BLM

Greater Sage-grouse and Sagebrush Habitat

The project would disturb greater sage-grouse habitat and add infrastructure that could change the way greater sage-grouse use those habitats.

Any action alternative would meet the BLM's required net conservation gain standard. This would be determined by the BLM in coordination with the IDFG and informed by the IDFG's habitat quantification tool (HQT).

Indicator	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E (Preferred)
Acres of ground disturbance in sagebrush habitat with > 10% cover†	940 acres work areas 331 acres infrastructure areas	724 acres work areas 255 acres infrastructure areas	298 acres work areas 90 acres infrastructure areas	625 acres work areas 235 acres infrastructure areas
Acres of ground disturbance in General Habitat Management Areas	6,145 acres work areas 2,161 acres infrastructure areas	4,611 acres work areas 1,621 acres infrastructure areas	3,386 acres work areas 1,026 acres infrastructure areas	3,306 acres work areas 1,240 acres infrastructure areas
Acres of functional habitat loss* from HQT analysis	806.8 acres	553.4 acres	75.3 acres	559.6 acres

†Data from Xian et al. (2015).

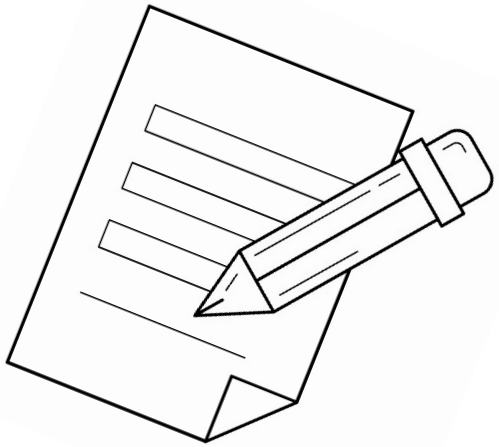
How to Submit Comments

Online: The preferred way to comment is through the BLM's ePlanning project site at https://bit.ly/3EirzxD. Click on the "Participate Now" button to the left of the document link. Enter your comment and information then click "Submit."

Email: BLM_ID_LavaRidge@blm.gov

Mail: Delivered by hand or U.S. mail enclosed in an envelope labeled "Lava Ridge Wind Project EIS," to Kasey Prestwich, Project Manager, BLM Shoshone Field Office, 400 West F Street, Shoshone, ID 83352

Public meetings: A court reporter will be available to record verbal comments during public meetings. Comment forms will also be available during in-person meetings.



Comments should be submitted by the end of the comment period March 21, 2023
