U.S. Department of the Interior
Bureau of Land Management

Lava Ridge Wind Project

Final Environmental Impact Statement

June 2024

VOLUME 5a

Appendix 14. Summary of Public Comments on the Draft Environmental Impact Statement - Part 1

Prepared by:

U.S. Department of the Interior
Bureau of Land Management

In Cooperation with:

National Park Service
U.S. Army Corps of Engineers
U.S. Fish and Wildlife Service
State of Idaho
Jerome County
Lincoln County
Minidoka County

Mission

The Bureau of Land Management's mission is to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations.

1 DRAFT ENVIRONMENTAL IMPACT STATEMENT PUBLIC INVOLVEMENT PROCESS

Public involvement is an integral part of the National Environmental Policy Act (NEPA) process and is required in the preparation and implementation of agencies' NEPA procedures. The Bureau of Land Management (BLM) published a notice of availability (NOA) for the draft environmental impact statement (EIS) for the Lava Ridge Wind Project (the project) in the *Federal Register* on January 20, 2023 (BLM 2023a). Advertisement of the NOA is detailed in Appendix B. This notice began a 60-day public comment period, which was extended to 90 days and ended on April 20, 2023. The BLM held public meetings on the draft EIS in February and March 2023 (Table 1-1). Meetings were held virtually and in person in Shoshone and Twin Falls, Idaho; Portland, Oregon; and Mercer Island, Washington. Advertisement and details of the public comment period, public comment period extension, and public comment closing are detailed in Appendix C.

Details concerning dates, times, and locations of the meetings were announced through local news media, newspapers, email, mail, and the BLM project website. The initial notification at the beginning of the comment period included 2,567 direct emails and 255 hard copy mailers sent via the U.S. Postal Service. See Appendix C for the full hard copy mailers. Comments on the draft EIS were received by email and by mail, through the BLM project website, and at public meetings. A transcriptionist was present at meetings to document verbal comments for the project record.

Table 1-1. Public Meeting Dates and Locations

Meeting	Date	Location
Public orientation meeting	February 1, 2023	Virtual
Public open house meeting #1	February 22, 2023	Shoshone, Idaho
Public open house meeting #2	February 23, 2023	Twin Falls, Idaho
Public open house meeting #3	February 24, 2023	Virtual
Public open house meeting #4	March 1, 2023	Portland, Oregon
Public open house meeting #5	March 2, 2023	Mercer Island, Washington

The virtual meeting was recorded and made available on the BLM project website: https://eplanning.blm.gov/eplanning-ui/project/2013782/570. The virtual meeting presentation slides were used to create posters displayed during the open house meetings. Appendix D details all materials provided during the open house meetings. Appendix E details virtual and open house meeting presentation slides. Appendix F provides hard copies of the posters displayed during the open house meetings. Appendix G provides sign-in-sheets and attendee reports of the virtual and open house meetings. A summary of the project's prior public involvement efforts is in the scoping report (SWCA Environmental Consultants 2021), which is also available on the BLM project website: https://eplanning.blm.gov/public_projects/2013782/200493266/20052044/250058227/LavaRidgeWindEIS_ScopingReport.pdf.

2 PUBLIC COMMENT OVERVIEW

The BLM received a total of 11,194 submissions during the public comment period (Table 2-1)[1]. The BLM reviewed and responded to public comment submissions via revisions to the EIS. The counts of unique submissions within this report were accurate at the time the report was produced (May 2024).

Table 2-1. Submittals by Type

Submittal Type*	Number of Submittals	Percentage of Total Submittals
Form copy	6,536	58%
Unique	3,489	31%
Form plus	887	8%
Duplicate	282	3%
Total	**11,194**	**100%**

* *Unique* letters are submittals with unique content. *Form* letters are submittals from multiple entities or individuals containing identical or similar content; *form copy* letters are submittals that have the same text as a form letter, and *form plus* letters are submittals that have additional unique content in addition to the form letter content. *Duplicate* submittals are duplicates of a unique letter.

2.1 Respondent Affiliations

In all, 119 submissions came from commenters who indicated they were representing an organization, business, Tribal Nation or Tribal entity, or government agency. All other submissions came from unaffiliated individuals. Note: individuals who provided their business title or employer information in their letter or testimony but did not state that they were an official representative were counted as unaffiliated individuals. Several organizations provided submissions with comments or signatures from their members. These are included in the submissions count discussed above.

The Tribal Nations/Tribal entities, businesses, organizations, and governmental agencies that submitted comments are shown in Table 2-2.

2.2 Comment Categories

Within each submission, individual comments (i.e., stand-alone comments that relate to a single issue, idea, or conclusion) were identified and grouped into one or more of the following categories listed in Table 2-3. Comment categories were either defined by individual resources that may be affected by the project, individual elements of the project, or specific phases and aspects of the EIS or NEPA process (see Table 2-3). Categories are intended to describe the main topic or resource that is discussed in the comment, regardless of whether the comment is expressing opposition or support for the project as it relates to that topic. Any comments identified in form letters were categorized only once and counted as a single comment no matter how many form letters with that same comment were submitted.

Table 2-3. Comment Categories

Category	Topics	
Issue or resource topics	Air quality	Minidoka War Relocation Center and Minidoka National Historic Site
	Avian and bat species, including greater sage-grouse and eagles	Noise
	Climate and greenhouse gases	Paleontological resources
	Cultural resources and Native American concerns	Pollinators and insects, including BLM special-status bumble bees, St. Anthony sand dune tiger beetle, and monarch butterfly
	Environmental justice and socioeconomics	Recreation
	Fire and fuels management	Soils
	Geology and mineral resources	Transportation
	Hazardous materials and solid waste	Vegetation
	Human health and safety	Visual resources
	Issues analyzed in brief	Water and wetland resources
	Land use and realty, including aviation	Wildlife, including big game, pygmy rabbit, amphibians, general wildlife, and special-status species
	Livestock grazing	
Project element topics	Mitigation or minimization	Plan of development – Appendix 1
	Applicant's interests and objectives	
EIS/NEPA process topics	Alternatives	Decision process for the National Park Service
	Consultation and coordination	Legal or policy compliance
	Cumulative effects	Public and stakeholder involvement
	Decision process	Purpose and need

The BLM reviewed and responded to public comments via revisions to the EIS. See Appendix A for all substantive public comments received and the BLM's comment responses. To-date, 3,288 total individual substantive (further defined below) comments were identified from the various submissions and were categorized, as shown in Table 2-4. Two thirds of all comments (66%) fell into the following top 11

categories: concerns about the project affecting the Minidoka War Relocation Center (WRC) or Minidoka National Historic Site (NHS), potential impacts to wells and the aquifer, mitigation or minimization, environmental justice, socioeconomics, the plan of development, avian and bat impacts, legal or policy compliance, requests for extension of the public comment period or public involvement, alternatives, general wildlife, and comments out of scope of this project's evaluation.

Table 2-4. Substantive Comments Received by Comment Category

Comment Category	No. Comments Received	% Total Comments
Minidoka WRC and Minidoka NHS	468	14%
Water and wetland resources	260	8%
Out of scope	213	6%
Avian and bat species	201	6%
Mitigation or minimization	199	6%
Plan of development – Appendix 1	187	6%

3 SUBSTANTIVE COMMENT SUMMARIES

3.1 Identification of Substantive Comments

The BLM considered comments within each submitted letter and determined if comments were substantive or non-substantive. In performing this analysis, the BLM relied on Section 6.9.2 (Comments) in the BLM NEPA Handbook H-1790-1 (BLM 2008) to determine what constituted a substantive comment. All substantive comments are responded to in this report.

Substantive comments do one or more of the following:

- Question, with reasonable basis, the accuracy of information in the EIS.
- Question, with reasonable basis, the adequacy of, methodology for, or assumptions used for the environmental analysis.
- Present new information relevant to the analysis.
- Present reasonable alternatives other than those analyzed in the EIS.
- Cause changes or revisions in one or more of the alternatives.

Additionally, the BLM NEPA Handbook (BLM 2008) identifies the following types of substantive comments:

- Comments on the adequacy of the analysis: Comments that express a professional disagreement with the conclusions of the analysis or assert that the analysis is inadequate are considered substantive; they may or may not lead to changes in the final EIS. Interpretations of analyses should be based on professional expertise. Where there is disagreement within a professional discipline, a careful review of the various interpretations is warranted. In some cases, public comments may necessitate a reevaluation of analytical conclusions. If, after reevaluation, the BLM Authorized Officer responsible for preparing the EIS does not think that a change is warranted, the response should provide the rationale for that conclusion.
- Comments that identify new impacts, alternatives, or mitigation measures: Public comments on a draft EIS that identify impacts, alternatives, or mitigation measures that the draft did not address are considered substantive. This type of comment requires the BLM Authorized Officer to determine if it warrants further consideration; if so, he or she must determine if the new impacts, new alternatives, or new mitigation measures should be analyzed in the final EIS, in a supplement to the draft EIS, or in a completely revised and recirculated draft EIS.
- Disagreements with significance determinations: Comments that directly or indirectly question, with a reasonable basis, determinations on the severity of impacts are considered substantive. A reevaluation of these determinations may be warranted and may lead to changes in the final EIS. If, after reevaluation, the BLM Authorized Officer does not think that a change is warranted, the BLM's response should provide the rationale for that conclusion.

Comments that are not considered substantive include the following:

- Comments in favor of or against the Proposed Action or alternatives without reasoning that meets the criteria listed above, such as "we disagree with Alternative B and believe the BLM should select Alternative A."

- Comments that only agree or disagree with BLM policy or resource decisions without justification or supporting data that meet the criteria listed above, such as "more grazing should be permitted."
- Comments that do not pertain to the project area or the project, such as "the government should eliminate all dams" when the project is about a grazing permit.
- Comments that take the form of vague, open-ended questions.

In response to substantive comments, the BLM could do the following:

- Modify alternatives, including the Proposed Action.
- Develop and evaluate alternatives not previously given detailed consideration by the agency.
- Supplement, improve, or modify its analyses.
- Make factual corrections.
- Explain why the comments do not warrant further agency response, citing appropriate sources or authorities.

Within each submission, there could be substantive comments and non-substantive comments. Comments that merely expressed an opinion for or against the project were not identified as requiring a response because they meet the BLM NEPA Handbook (BLM 2008) definition for a non-substantive comment. Though not substantive, there were 1,910 comments in opposition to the project and 976 in support of the project. Many comments received throughout the comment analysis process expressed personal opinions or preferences, did not provide relevance to the adequacy or accuracy of the draft EIS, or represented commentary on management actions that are outside the scope of the EIS. These comments did not provide specific information to assist the BLM in making a change to the existing action alternatives, did not suggest new alternatives, and did not take issue with methods used in the draft EIS; the BLM did not address these comments further in this document.

The BLM read, analyzed, and considered all comments of a personal or philosophical nature and all opinions, feelings, and preferences for one element or one alternative over another. Because such comments were not substantive, the BLM did not respond to them. It is also important to note that although the BLM reviewed and considered all comments, none were counted as votes. The NEPA public comment period is neither an election nor does it result in a representative sampling of the population. Therefore, public comments are not appropriate to be used as a democratic decision-making tool or as a scientific sampling mechanism.

From the 3,489 unique and 887 form plus submissions, 3,288 substantive comments were identified. Sections 3.2 through 3.4 provide a summary of the substantive comments received by comment category. The information in these sections represents a brief summary of the comments from the perspective of the commentors. The information provided does not provide an in-depth review and assessment of the facts and context for the comments. The information in these sections is only intended to provide the reader with an understanding of the information that was included in the comments, and it should not be considered as a factual conclusion of the information provided in the draft EIS.

Appendix A includes all substantive comments with a BLM response for each substantive comment. The responses were informed by subject matter expert review; recommended additional studies, data, or scientific literature; and changes to the EIS made between draft and final.

3.2 Issue or Resource Topics

3.2.1 Air Quality

Comments on air quality centered around the adequacy of the construction emissions analysis. Commenters proposed adding additional information to improve the accuracy of the construction emissions impacts analysis; reanalyzing emissions using different methods; disclosing levels of avoided emissions; verifying the validity of the data used to calculate sulfur oxide emissions; disclosing potential impacts of sulfur oxides, dust, and other pollutants on nearby communities (such as human health impacts or visibility along roads); and verifying compliance with the BLM Visual Resource Management Class II airshed and the Craters of the Moon National Monument and Preserve Prevention of Significant Deterioration Class I area. One commenter suggested using a dust and emissions control plan with sufficient level of detail to implement proposed mitigation measures in the *Air Quality Technical Report for the Lava Ridge Wind Project* (SWCA Environmental Consultants 2022) to assure the public that the impacts to air quality would not be significant.

3.2.2 Avian and Bat Species

3.2.2.1 BATS

3.2.2.1.1 Lack of Baseline Data/Need for More Data

Commenters expressed concern that the draft EIS did not include enough references and baseline data to complete a rigorous analysis of bat impacts for a project the size and scale of the Lava Ridge Wind Project. Many commenters indicated the draft EIS underestimated bat mortality as well as potential impacts due to data quality issues. They noted the data were of poor quality and often outdated, and biased, making it very difficult to estimate impacts including potential mortality from turbines. For example, comments noted that during the first year of acoustic bat surveys, the detectors were placed on towers 5 feet above ground level, rather than at the typical 10-foot height; although this was corrected during the second year of monitoring, commenters interpreted it as a way to reduce potential impacts as calls are muffled by vegetation on the ground and bats often fly at higher elevation, which reduced the number of bat detections. Comments also criticized baseline bat datasets and expressed concern that they minimized bat impacts. Commenters recommended conducting additional baseline studies of species use and migration patterns prior to project approval rather than following the results of postconstruction monitoring, as currently stated in the draft EIS. Commenters also expressed concern that the mitigation and adaptive management measures are uncertain and nebulous and lack commitments for reducing impacts until postconstruction monitoring has been completed.

3.2.2.1.2 Townsend's Big-Eared Bat

Commenters noted the Townsend's big-eared bat should be given a more in-depth impact review in the draft EIS because it is a BLM sensitive species and the most commonly recorded species within the BLM Shoshone Field Office (SFO) planning area (64% of bat calls identified in the siting corridors were Townsend's big-eared bats) and Craters of the Moon National Monument and Preserve. Commenters noted that these bats forage widely in the Snake River Plain; use lava tubes, vents, craters, and caves like those found in the siting corridors as roosting habitat; and have a known maternity colony near the siting corridors as well. Commenters expressed concern that the analysis of potential impacts to the Townsend's big-eared bat was grossly insufficient because it was not even included in the detailed analysis, and commenters suggested the BLM rethink this exclusion and complete a detailed analysis for the species for inclusion in the final EIS.

3.2.2.1.3 Cumulative Impacts

Comments expressed concern about the analysis of cumulative bat population impacts from the proposed Taurus Wind and Salmon Falls Wind Projects in combination with the project and white nose syndrome (WNS) and the potential impacts of the project when considered in conjunction with WNS. Commenters expressed concern that there may be additional population-level impacts to bat populations from numerous wind facilities with high bat morality rates (the Taurus Wind and Salmon Falls Wind Projects are similar in size to the project) given the Snake River Plain is home to a multitude of bat species, many of them declining potentially due to the proliferation of wind energy developments in the West. Similarly, commenters did not agree with the analysis of WNS impacts and argued that WNS is a serious threat to bats and likely to affect bats in Idaho soon. Commenters criticized the BLM's conclusions, specifically that the BLM is unsure about how bat mortality may be impacted by the project and the role that WNS plays with respect to bat impacts. Comments suggested that it is the BLM's responsibility to look at the project in conjunction with WNS when calculating impacts and not to simply claim there is too much uncertainty to predict impacts.

3.2.2.1.4 Lack of Coordination with Local Bat Experts

Commenters raised a concern that neither the BLM nor MVE collaborated with local bat experts at Minidoka National Wildlife Refuge, Craters of the Moon National Monument and Preserve, and other Idaho bat working groups to better understand local roosts and hibernacula as well as ongoing bat research projects. Comments suggested local knowledge of how bats use habitats on the Snake River Plain would be integral to micrositing turbines and other project components, as well as applying protection measures such as buffers around roosting site and hibernacula if they are known.

3.2.2.1.5 Inaccurate/Misinterpreted Data and Overstatement of Fatality Risk

Comments included corrections to draft EIS text about bats that was viewed as inaccurate, misstated, or misinterpreted by the BLM; these corrections would avoid further misinterpretation and faulty conclusions. Comments stated the BLM's bat analysis seemed to be based on incomplete data, incorrect understanding of references, and overstatements of risk to bats using the siting corridors. They suggested correcting these flaws will improve the bat analysis by making it consistent with current scientific literature and actual bat use of the siting corridors, which the commenters stated lack hibernacula, surface water, and foraging opportunities. The comments noted that there is little mention of the environmental protection measures MVE has committed to, which include blade feathering, 1,000-foot setbacks for turbines from canals, avoiding riparian areas, and minimizing outdoor lighting. The commenters emphasized the bat fatality estimates do not take those measures into account.

3.2.2.2 BIRDS

Comments regarding birds expressed concerns related to underestimated take of birds in the draft EIS, species-specific analyses (or lack thereof), and cumulative impacts from regional wind projects on bird populations. There were many comments or questions about the impact analysis to birds, particularly about the accuracy of the data (i.e., 2-year avian studies, modeling, and comparison to other wind projects) and missing information (e.g., seasonal variations in bird populations, migration routes and flyways, population-level impacts, direct impacts from noise and light). Many commenters requested the final EIS adjust species-specific analyses or requested specific species be analyzed in detail. Finally, many comments expressed that the cumulative analysis of impacts to birds is inadequate and fails to consider many avian species, habitat fragmentation/loss, and regional wind project impacts on bird populations. Additionally, some comments provided new information to add to the final EIS, suggested revisions in the draft EIS, or suggested mitigation measures (e.g., facility siting, painting turbine blades,

fully analyzing impacts on birds in a supplemental EIS, preconstruction surveys for all species). Conversely, some commenters noted the applicant-committed measures would avoid and minimize population-level impacts to some species analyzed in detail and recommended that these species be analyzed in brief.

3.2.2.3 EAGLES

Comments received about eagles were primarily opposed to eagle take resulting from the project and indicated the analysis in the draft EIS underestimates the impacts to eagles. Commenters expressed concern that the analysis in the draft EIS did not adequately analyze indirect reduction of progeny from eagle take; indirect impacts related to eagle relocation into other critical raptor habitats (thereby increasing competition); indirect impacts related to an increase in farm pests, like voles; and cumulative impacts from existing and future wind projects in the region. Other commenters expressed disagreement or confusion with the terms and conditions of the incidental take permit; lamented being unable to see eagles in the future; or proposed avoidance, minimization, or mitigation measures to include in the final EIS.

3.2.2.4 GREATER SAGE-GROUSE

3.2.2.4.1 Lek and Population Data

Comments regarding leks and greater sage-grouse population estimates addressed the lack of baseline data and the inadequacy of surveys for a project the size, scale, and duration of the Lava Ridge Wind Project. Commenters criticized the reliance upon the desktop habitat assessment conducted by MVE and on aerial and ground surveys, which focused on known lek locations that had been recently active. They noted this survey method would miss any new leks in other areas of the project because it did not survey any areas distant from known leks. More specifically, commenters raised concern that the draft EIS identifies eight leks within 6.8 miles of the siting corridors that have "undetermined" management status. Commenters noted the BLM must apply the required protective lek buffers identified in the 2015 *Idaho and Southern Montana Grater Sage-Grouse Approved Resource Management Plan Amendment* (ARMPA) (BLM 2015) to all leks, including the eight undetermined leks. Comments stated that leaving a lek as undetermined makes buffer application impossible because lek designations per the ARMPA are active, inactive, occupied, unoccupied; therefore, the BLM cannot cite ARMPA compliance with undetermined leks because it is inconsistent with the ARMPA itself. Commenters cited the results of *Center for Biological Diversity* [CBD], *Western Watersheds Project, and Wildearth Guardians vs. United States Bureau of Land Management* 2023 (CBD et al. vs. BLM 2023), which determined that insufficient information, by definition, is not a valid reason for not designating the lek occupancy. Finally, commenters noted that nearly all leks with "undetermined" status are near the siting corridors, which puts them at risk of severe impacts from noise, dust, predation, habitat loss, etc. Commenters suggested this is a violation of the ARMPA, which requires NEPA to address all applicable management direction, including the application of appropriate lek buffers.

3.2.2.4.2 Noise Impacts

Comments focused on the inadequate analysis of noise impacts on greater sage-grouse due to increased road use, noting that the draft EIS estimates over 2 million vehicle trips associated with construction, operation and maintenance, and decommissioning. Commenters noted the BLM offers little to no analysis of the impacts a massive network of heavily trafficked roads (both new and existing) will have on greater sage-grouse outside the lek buffer. They expressed that the BLM does not offer any analysis as to what these impacts would be beyond generalized observations and quantification of functional habitat loss for greater sage-grouse. Commenters recommended the BLM add analysis of how roads impact population,

especially in the Desert Important Habitat Management Areas, Priority Habitat Management Areas/Sagebrush Focal Areas where population triggers were hit in 2018 and 2019. Additionally, commenters noted the BLM did not fully analyze the impacts of chronic widespread noise from construction at the population level. Comments stated that population-level impacts from noise could cause both lower female attendance at leks because they cannot hear males and avoidance of leks by males in areas where noise levels are high; population declines and regional extinctions could result and exacerbate already steeply declining populations of greater sage-grouse.

3.2.2.4.3 Seasonal Habitat Impacts

Commenters focused on the fact that the BLM does not adequately analyze population-level impacts to seasonal habitat, specifically summer (late-brood rearing) and winter habitat. They noted lek buffers and mitigation are only addressed for spring (breeding/early brood rearing) habitat and are lacking for summer/winter habitat. Commenters stated that spring habitats being impacted by the project are already fragmented and plagued by connectivity issues and expressed concerns that further fragmentation and disturbance within summer and winter habitat will likely eliminate whatever greater sage-grouse habitat remains.

3.2.2.4.4 Implications of CBD et al. vs. BLM

Commenters focused on the outcome of CBD et al. vs. BLM (2023), which ruled that the BLM approval of the Caldwell Canyon Phosphate Mine failed to adequately address impacts to greater sage-grouse, greater sage-grouse habitat, and habitat connectivity. Based on the outcome of the case, the comments suggested that impacts on sage-grouse habitat and populations were not included in the draft EIS, including functional habitat loss, risk of extirpation, connectivity between sage-grouse populations, and cumulative impacts.

3.2.2.4.5 Compensatory Mitigation

Commenters expressed concern about the lack of information included in the draft EIS about compensatory mitigation to offset unavoidable (residual) impacts on greater sage-grouse such as wildfire, climate change, mitigation plan failures, timing delays, durability, and the additive nature of projects.

3.2.3 Climate and Greenhouse Gases

Comments received about climate and greenhouse gas (GHG) emissions centered on the adequacy of the emissions analysis and suggestions to refine the analysis. Commenters noted that draft EIS failed to analyze sulfur hexafluoride and water vapor emissions, emissions from the manufacture of wind turbine components and infrastructure, transport of materials (from cradle-to-grave), and emissions associated with decommissioning and disposal (including any emissions from retired infrastructure). Commenters also expressed that the draft EIS underestimates emissions from construction (such as personnel travel and equipment) as well as the potential impacts to carbon sequestration in the landscape. Some commenters were concerned the draft EIS did not adequately analyze impacts to micro-climates from wind turbines (especially on rangeland productivity and local airsheds), loss of energy production during energy transmission and from turbines being taken offline for maintenance, or a premature facility shut-down scenario. Finally, some commenters noted the Social Cost of Greenhouse Gas data in Table 3.4-5 and 3.4-6 of the draft EIS do not include information for all alternatives, and the data are "unquantified and uncertain."

Commenters also noted issues with the AVoided Emissions and geneRation Tool (AVERT) dataset (i.e., an error in the decommissioning emission model) and requested clarity on the Intergovernmental Panel on

Climate Change (IPCC) model used in the draft EIS to calculate GHG avoidance costs and benefits. Commenters suggested adding in the new Council on Environmental Quality interim NEPA guidance for the consideration of GHG emissions and climate change and data from the IPCC's March 2023 *Synthesis Report of the IPCC Sixth Assessment Report* (IPCC 2023).

Commenters were interested in comparing emissions from the project with other types of energy projects such as hydropower, wind, and natural gas. They wanted to know what power source the project is replacing, the associated avoided emissions, and the initial carbon investment of the project and its long-term avoided emissions compared to the No Action alternative. Some commenters also expressed that the cumulative impact analysis needs to include other renewable projects and risks to project infrastructure from climate change, such as risks from extreme weather events and impacts to the electrical grid and turbines.

Commenters expressed concern about the "greenness" of the project given that wind turbine parts are made with fossil fuels, transported across the globe with fossil fuels, and operated and maintained with them as well.

3.2.4 Cultural Resources and Native American Concerns

Comments expressed that the BLM did not adequately consult with local Tribes, Japanese Alaskans, Japanese Americans, and Alaska Native groups; identified revisions or resources to be analyzed in the final EIS; or expressed concern with the draft programmatic agreement (PA) and mitigation measures.

Regarding consultation with Tribes and the Japanese American community, commenters specifically noted the BLM failed to adequately engage Tribes and Japanese Alaskans; noted that only 17% of the area of potential effects was surveyed; and expressed concerns related to potential treaty violations, irreversible damages or loss of cultural resources, viewshed impacts to Minidoka WRC (referred to as the Hunt Relocation Center during World War II) and Minidoka NHS, presence of traditional cultural properties (TCPs), and inclusion of traditional ecological knowledge.

Commenters suggested revisions and additions to the final EIS, including revisions to the analysis of impacts to Wilson Butte Cave and Minidoka NHS, expanded information about TCPs (e.g., Minidoka WRC), and conformance with the BLM SFO's 1986 *Monument Resource Management Plan*, as amended (BLM 1986). Comments also identified several resources that were not analyzed in the draft EIS, such as the Milner-Gooding Canal, Milner Ruts, the Kelton Freight Line Trail, the Oregon Trail, historic sheep trails (e.g., Wendell trail system), communities (e.g., Owinza), National Park Service (NPS) properties, and Indian Sacred Sites (under Executive Order 13007).

Regarding the PA, commenters criticized the phased survey approach proposed in the PA and the lack of PA and historic properties management plan (HPMP) in the draft EIS. Comments suggested minor revisions to the PA, requested a final version of the PA and HPMP be included in the final EIS, and noted that the BLM failed to engage Tribes and Japanese Americans to identify appropriate mitigation and avoidance measures. Many commenters expressed interest in ethnographic interviews prior to the finalization of the final EIS rather than as a compensatory mitigation measure. Other proposed mitigation measures included on-site archaeological monitors during construction, agreements between MVE and Tribes and the Japanese American community, increased noise setbacks from 2.2 miles to 6.5 miles, and recognizing ancestral lands in the final EIS.

3.2.5 Environmental Justice, Socioeconomics, and Areas of Critical Environmental Concern

3.2.5.1 ENVIRONMENTAL JUSTICE

3.2.5.1.1 Community Outreach

Several commenters noted inadequate outreach to impacted communities (Japanese Americans, Native Americans, Alaska Natives, Hispanic, low-income populations) both early on and throughout the EIS process. Commenters raised concerns that the BLM did not make a good faith effort to reach these communities and engage in meaningful discussions on project impacts. Multiple comments referenced Executive Order 12898 (Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations) and Executive Order 13166 (Improving Access to Services for Persons with Limited English Proficiency). Several comments discussed a lack of EIS documents translated to Spanish and difficulty obtaining Spanish documents even though there are significant Spanish-speaking populations within the environmental justice analysis area.

3.2.5.1.2 Inadequate Analysis

Comments emphasized an overall inadequate environmental justice analysis and unacceptable impacts to environmental justice communities. Many commenters noted the draft EIS did not specifically address impacts to Alaska Natives or Japanese Alaskans, and that the BLM should conduct a health impact assessment on these communities and all members of the public. Three additional tools for assessing impacts to environmental justice communities were recommended by the U.S. Environmental Protection Agency (EPA) and other commenters: the EPA Environmental Justice Screening and Mapping Tool, EPA Promising Practices for Environmental Justice Methodologies in NEPA Reviews tool, and the BLM's Vulnerability Model. One commenter specifically referenced several deficiencies in the draft EIS's Existing and Future Trends and Actions section relating to the Japanese American community as a dispersed environmental justice community under Executive Order 13985 (Advancing Racial Equity and Support for Underserved Communities Through the Federal Government). Several commenters questioned the cultural competency of the BLM and consultants and their ability to meaningfully engage with environmental justice communities, especially Japanese Americans. Additionally, commenters stated that the cumulative effects analysis did not consider COVID-related hate crimes on the Japanese American community.

3.2.5.1.3 Minidoka National Historic Site

Most of the comments regarding Minidoka NHS emphasized the irreversible impacts to the site and the disproportionately high and adverse impacts to the Japanese American community and questioned the BLM's preferred alternatives in light of these impacts. Many commenters wrote in support of the proposed Greater Minidoka Area of Critical Environmental Concern and the additional protections it would give to the culturally important landscape surrounding Minidoka NHS. Many commenters questioned the visual methodology and analysis in the draft EIS. Several commenters referenced the Indigenous Sacred Sites memorandum of understanding from Secretary Haaland (U.S. Department of the Interior et al. 2021), and one commenter referenced the BLM's Instruction Memorandum IM 2022-59. See also Section 3.2.13, Minidoka War Relocation Center and Minidoka National Historic Site.

3.2.5.2 SOCIOECONOMICS

Comments centered on a lack of benefits to local communities while other states and investors benefit. Commenters wanted to see a cost-benefit analysis of the entire project in relation to local economies over

the life of the project. Many commenters noted an inadequate analysis in the draft EIS of potential adverse impacts to property values, the livestock grazing economy, agriculture, the local supply chain for construction materials, local employment rates, and local airports. Regarding property values and the livestock grazing economy, multiple commenters questioned why mitigation measures or compensation were not included in the draft EIS for decreased home values and loss of animal unit months due to the project. Several comments focused on the potential adverse impacts to schools, roads, emergency services, the housing market, and local communities from temporary workers associated with the construction and decommissioning of the project. A few commenters expressed concern about the reliability of the electrical grid and increases in energy costs.

One commenter cited benefits to the local community. Another commenter suggested the EIS analyze benefits to the local and state economies if MVE were to hire locally and in-state rather than assuming out-of-state workers.

3.2.5.3 AREAS OF CRITICAL ENVIRONMENTAL CONCERN

Commenters suggested designating the greater Minidoka area and Minidoka WRC and Minidoka NHS as an Area of Critical Environmental Concern to preserve the cultural and historical values of the land surrounding the Minidoka NHS. Commenters also stated studies and reports have identified Minidoka WRC as a TCP and as being eligible for the National Register of Historic Places, and that this TCP would be part of the Greater Minidoka Area of Critical Environmental Concern nomination process.

3.2.6 Fire and Fuels Management

Most comments on this topic expressed concern that the wind turbines would adversely affect aerial firefighting operations. Commenters were also concerned about the possibility of turbines self-igniting; the difficulty of suppressing turbine fires; increased risk of wildfire from turbines, traffic, or overgrown vegetation; and how the costs associated with wildfire resulting from the project would be paid. Additionally, a few commenters expressed doubts about the adequacy of the fire plan and the width of fire breaks.

3.2.7 Geology and Minerals

Many comments focused on potential blasting impacts to the integrity of the lava bed and lava tubes, paleontological features, and the Wilson Butte Cave. Concerns were raised about blasting triggering seismic activity and whether the turbines could withstand either naturally occurring or induced earthquakes. Many comments also questioned the effects of turbine vibration, vibration and weight of construction vehicles, and weight of concrete turbine bases on the lava bed.

3.2.8 Hazardous Materials and Solid Waste

3.2.8.1 DISPOSAL AND RECYCLING OF WIND TURBINE PARTS

Commenters expressed concern about the quantity of waste generated by the project and whether local landfills would be able to accommodate it. Additionally, commenters shared concerns about the decommissioning process, including whether turbines parts could be recycled, how they would be disposed of (particularly wind turbine blades), and the potential for leaching of chemicals or heavy metals from hazardous materials used to construct the turbines into the soil and aquifer.

3.2.8.2 LEAKS, SPILLS, AND EMISSIONS

Comments expressed concern about the potential for leaks and spills of hazardous chemicals, including oil, into the soil, aquifer, and lava beds.

3.2.9 Human Health and Safety

Comments regarding human health and safety recommended looking at existing wind projects to adequately analyze human health and safety impacts on residents living near turbines. Specific impacts of concern included long-term exposure to vibrations, electromagnetic frequencies (EMFs), noise, shadow flicker, emissions, and chemicals from eroded wind turbines, as well as physical threats such as increased potential for traffic accidents, ice shedding, turbine collapse, stray voltage, disruptions in the power grid, electromagnetic interference, and general safety concerns related to energy transmission projects. Other comments noted that the draft EIS fails to consider significant impacts to public safety facilities, law enforcement, highway safety, and search and rescue providers. Commenters also recommended analyzing impacts to construction workers from blasting activities and to residents who work the night shift during construction activities (because their daytime rest may be affected by the construction noise).

3.2.10 Issues Analyzed in Brief – EIS Appendix 3

At least half of the comments indicated concern about the impact of the turbines on local weather patterns. Specifically, commenters requested analysis of the impact of changed weather on agriculture, vegetation, and wildlife as turbines alter wind speed, local directional flow, temperature, and moisture patterns. Commenters also expressed concern about the impact of the turbines on farming equipment, specifically interference with global positioning systems in farm equipment and the turbines disrupting needed "lines of sight" for equipment. Finally, commenters suggested the BLM consider how vandalism and damage to infrastructure (e.g., due to shooting sports) within the siting corridors would be addressed, and expressed concern that if vandalism becomes an issue, it might necessitate closing public ground to recreation. On a related note, commenters also raised concerns about the potential for an attack on project infrastructure and the need to consider security for the siting corridors via coordination with state and local officials.

3.2.11 Land Use and Realty, including Aviation

Several comments indicated concern for the functionality of the local communication network (including global positioning systems) due to potential electromagnetic interference created by the wind turbines. Commenters also expressed dislike of leasing public land for private business and noted confusion over lease agreements and Idaho state rights. Additionally, comments expressed concern about potential adverse impacts on farmland, loss of soil moisture, and reduction of animal unit months (AUMs).

3.2.11.1 AVIATION

3.2.11.1.1 Economic Impact to Local Airports

Comments noted that if aviation routes were impacted or if pilots decided to reroute based on safety concerns, local airports may experience decreased business, resulting in an adverse economic impact to the surrounding communities.

3.2.11.1.2 Emergency Medical Response

A few comments included that if flight time was added to emergency medical flights (LifeFlight) due to navigating around the siting corridors, it may escalate medical emergencies and increase health risks to patients.

3.2.11.1.3 Firefighting and Agricultural Uses

Many comments questioned if aerial firefighting operations could be successful in the siting corridors due to reduced maneuverability around turbines. Commenters also questioned if crop-dusting operations could be fulfilled because crop-dusting planes must fly at lower elevation for successful product application. A few commenters noted that they use low-flying aircraft to manage and protect livestock herds and are concerned they will not be able to continue this practice.

3.2.11.1.4 Safety Hazards

Comments expressed strong concerns about hazards the turbines would present to aviation: collision with towers, reduction of navigable airspace and challenges to climb gradients, added difficulty in emergency landings and maneuvers, and the possibility of pilot vertigo due to flashing lights. Commenters were also concerned about wind wakes generated by turbines, which could create a roll hazard to light-wing aircraft and helicopters. Additionally, commenters expressed concern that electromagnetic interference may occur with radar and navigation systems and create issues with instrument landings. Comments also included that the Federal Aviation Administration approval has not been obtained, and noted the Federal Aviation Administration had previously concluded the turbines would have an adverse impact on safe aviation.

3.2.12 Livestock Grazing

Many commenters on this topic expressed concerns related to grazing restrictions within allotments, inadequate analysis of grazing impacts, and lack of mitigation measures. Grazing restriction concerns included the permanence and legality of such activities; socioeconomic impacts to displaced permittees and industry; increased risk of wildfire; clarifications related to AUM reductions in the draft EIS; and permanently creating pastures, which would increase forage. Commenters recommended the final EIS should fully analyze potential impacts to livestock (cattle, sheep, etc.) from EMFs, vibrations, blasting and noise, stray voltage, shadow flickering, micro-climate changes, displacement, reduced airplane predator control, forage availability, increased chances of theft along new roads, increased risk of livestock collisions with traffic, impacts to historic sheep trailing, noxious weed invasion, potential long-term impacts after reclamation, and cattle clustering at turbines. Commenters had questions regarding mitigation measures included in the draft EIS and recommended additional mitigation measures, including cattle guards, alternative feed sources, making pastures permanent, information on compensation plans, specifications about troughs and fencing, full data disclosure, compliance and mitigation enforcement and maintenance, incorporating better grazing practices, specifications for grazing rotation timing, and reactivating suspended use AUMs.

3.2.13 Minidoka War Relocation Center and Minidoka National Historic Site

Most of the public comments related to Minidoka WRC and Minidoka NHS focused on the potential adverse impacts the project would have on the overall experience of the Minidoka WRC. Commenters explained that seeing and hearing operational wind turbines would detract from the experience, making it difficult to become fully immersed in the environment that is fundamental to the character of the site. Commenters noted that the impact of isolation and loneliness is essential to the historical and educational

values of the site, and the project would undermine these values. Comments emphasized that those impacted by wrongful incarceration at Minidoka WRC deserve to honor their histories at the site as it was, with landscape and viewshed preservation to maintain the site's integrity. Additionally, commenters noted that Minidoka NHS has become a pilgrimage site where healing and community building occur, and the visual and auditory intrusion of the project would destroy the solemnity of the site and hinder the ability to reflect and remember.

Commenters expressed that analyzing Minidoka NHS primarily as a site visited by tourists and recreationists is insensitive and minimizes the cultural significance of the site. Comments stated that Minidoka survivors and descendants of survivors should not be categorized as tourists and asked that this be corrected.

Commenters expressed concern that the "moderate" visual impacts to Minidoka were underestimated and questioned the accuracy of the visual simulations. Several letters included concern for visual impacts specifically from the location of the Honor Roll. Commenters highlighted that the turbines would be visible and audible from the Honor Roll, would be more significant than portrayed, and would dishonor Japanese Americans who served in the U.S. Army during World War II. Additionally, commenters raised concern that the turbines would create a distraction during somber commemorative events.

3.2.13.1 PROJECT OPPOSITION BECAUSE OF MINIDOKA WAR RELOCATION CENTER AND MINIDOKA NATIONAL HISTORIC SITE

Many letters from the public conveyed general opposition to the project based on impacts to Minidoka WRC or Minidoka NHS (see Tables A-1 and A-2 in Appendix A). These comments expressed that the sites serve as a reminder of American history that should not be repeated, and the project would be disrespectful to Minidoka WRC survivors, descendants and relatives of survivors, and the Japanese American and Minidoka-connected communities. Many commenters stated that impacts to the viewshed would ruin the sense of isolation, detract from the immersion experience at the site, and make it more difficult to feel connected to their ancestors who were incarcerated there.

Commenters also explained that the alteration to the Minidoka WRC viewshed would show disregard for the sanctity of the site. Many people who commented included that they themselves, or their relatives or friends, were incarcerated at Minidoka WRC or other "Relocation Centers," and feel that by considering this project, the U.S. Government is adding insult to injury. Commenters expressed concern that a federal agency choosing to inflict adverse impacts on Minidoka WRC and Minidoka NHS would be a conscious erasure of Japanese American history and would be unethical and immoral. Commenters also stated that the project proposal comes at a time when racism and discrimination against Asian Americans and Pacific Islanders has greatly increased, and consideration of impacting a site that is so important to the Japanese American community feels as if they are not being supported.

Several comments questioned whether such a project would be considered if there were impacts to a different national historic site or national park. Some commenters noted that they support renewable energy but suggested that the project be moved further away from Minidoka WRC to ensure there is no impact to the site.

3.2.14 Noise

Commenters raised concerns about the long-term effects of noise pollution generated by the turbines, and that the draft EIS does not include thorough analysis of these effects. Commenters raised questions about how long-term effects would disturb and create stress in humans, wildlife, and livestock, with possible economic impacts resulting from stressed livestock (such as decreased milk production). Comments also

discussed the effects noise pollution can have on human health, such as hearing loss, disruption of sleep patterns, and physical effects to organs.

Commenters recommended including a thorough analysis of different frequencies emitted by turbines (infrasound, ultrasound, extreme low frequency) and an analysis of possible effects to wildlife, livestock, and humans from exposure to these frequencies.

Several comments expressed concern at the way noise impacts were analyzed. Noise impacts were not analyzed at ground level or blade level and did not include noise traveling through solid materials such as concrete turbine bases and lava rock. Some commenters also raised concerns that the decibel ratings were inaccurate because the values came from a model, rather than direct measurements.

A small number of comments questioned how daily blasting during construction would affect residents and animals and raised a concern that, in general, the project would exceed noise regulations.

3.2.15 Paleontological Resources

Two comments were received regarding paleontological resources. One comment expressed concerns with potential impacts to undiscovered paleontological resources during construction and the lack of mitigation measures. The other comment requested clarification of the analysis area.

3.2.16 Pollinators and Insects

3.2.16.1 INSECT AND POLLINATOR MORTALITY

Public comments focused on mortality of a large number of insects and pollinators (approximately 40 million) from wind farms. Commenters expressed concern that, despite the acknowledged large-scale impacts to insect and pollinator species, no surveys were conducted, and no compensatory mitigation was proposed in the draft EIS. Commenters also repeatedly pointed out the link between pollinator populations and successful agricultural operations; if populations decrease, there could be wide-ranging adverse impacts on crop productivity and subsequently, economics, which have state and regional implications.

3.2.16.2 NOISE AND VIBRATION IMPACTS

Commenters expressed concern about the potential impact of noise, vibrations, and EMF on terrestrial invertebrates including insects (fleas, ticks, and mites), bees, and earthworms.

3.2.16.3 MONARCH BUTTERFLY

Commenters noted that the draft EIS does not include enough information about planned conservation efforts and methods for the monarch butterfly given the potential adverse impacts to the butterfly's habitat and population.

3.2.16.4 ST. ANTHONY SAND DUNE TIGER BEETLE

Comments provided corrections about how information about the species is presented and the conclusions. Suggested revisions were included to make the draft EIS more accurate and help avoid misinterpretation.

3.2.17 Recreation

Commenters expressed that the draft EIS did not adequately analyze impacts to recreation. Commenters recommended updates and further analysis related to the inventory of existing recreation resources, potential restrictions to access and user conflicts, and increased or decreased recreation opportunities as a result of the project. Commenters expressed interest in a greater analysis of impacts to recreation resources, including indirect effects from other resources such as visual resources and big game displacement. Without knowing the turbine locations and proposed road network, some commenters were concerned that the draft EIS did not adequately account for potential increased public access or potential dust impacts on recreation users.

3.2.18 Soils

Most comments related to soils were concerned with impacts to topsoil, fragile soils, and hydric soils; direct and indirect impacts related to wind erosion and dust; cumulative impacts to soils from grazing and wildfires; and potential mitigation measures. Comments regarding mitigation included clarification for the criteria of restoration success of fragile soils, suggested retiring grazing to reduce cumulative impacts to soils, and suggested a soil health analysis and soil carbon audit to quantify the impacts to topsoil and grassland carbon sequestration abilities. One comment critiqued that the draft EIS soil mitigation relies too heavily on assumptions. There was one comment requesting clarification on the long-term impacts of magnesium chloride (if used for project dust suppression) in the soil.

3.2.19 Transportation

Comments regarding transportation raised concern that the draft EIS did not adequately consider impacts to existing road infrastructure or requested information be added or changed in the final EIS to address these concerns. Commenters primarily expressed concerns with the unknown road designs; adequacy of local roads and highways to handle additional traffic; and accuracy of traffic estimates, timing, and intensity of impacts. Commenters also expressed concerns with impacts related to existing and future public use on new road networks; impacts to BLM travel management rules; and indirect effects such as dust, habitat fragmentation and loss, and cultural impacts. Some comments also expressed concern that the proposed traffic management strategies are too vague or unreliable.

3.2.20 Vegetation

Most comments on vegetation expressed concern that surface disturbance from the project may allow invasive species and non-native species to dominate vegetative communities. Commenters also stated that the mitigation measures for weed control and revegetation were inadequate and needed to provide more detail on plans for preventing, monitoring, and controlling invasive species. Commenters also deemed measures for revegetating with native species unrealistic due to documented difficulties with such plans. Additionally, commenters raised concerns with the use of herbicides including longevity of chemicals in the environment and dangers to grazing animals.

3.2.21 Visual Resources

3.2.21.1 MINIDOKA NATIONAL HISTORIC SITE

There were many comments about the importance of protecting the Minidoka NHS viewshed. Comments expressed that impacts to the viewshed would dishonor the Japanese American community, demonstrate a lack of respect, and detract from the ability to experience the feeling of isolation endured by the people

incarcerated at the site. Additionally, several comments argued that the Minidoka NHS Sensitivity Level Rating should be high instead of moderate.

3.2.21.2 KEY OBSERVATION POINTS PORTRAYAL

Many commenters expressed that the key observation point (KOP) portrayals were a misleading or inaccurate portrayal of the project. Commenters noted the KOPs did not show transmission lines or towers, minimized the size of turbines, or did not use the correct size turbine in the visualization. Commenters expressed a lack of trust in the visual impact analysis due to perceived errors in the KOPs, and several comments included photographs of other turbine projects to demonstrate the difference in appearance between reality and the KOP portrayal.

3.2.21.3 DISLIKE OF TURBINE AESTHETICS

Many comments expressed general dislike of turbine aesthetics and expressed concern that the pristine views of the area would be ruined by their presence. A few comments noted that despite efforts to mitigate the visual appearance of the turbines (such as color), there is no way to successfully lessen the visual impact of the turbines on the landscape.

3.2.21.4 METHODOLOGY

Several commenters disagreed with the methodology used to assess visual impacts and believed the analysis underestimated the true impact. Commenters recommended using the Argonne model and using visual distance zones for 500-kilovolt transmission lines. Additionally, commenters noted that the BLM's *Monument Resource Management Plan* (BLM 1986) did not establish Visual Resource Management (VRM) classes, creating a loophole and allowing the area to be designated VRM IV. They indicated interim VRMs should have been created prior to the assessment.

3.2.21.5 NIGHT SKIES

Several comments expressed concern that the flashing red lights at the top of the turbines would create light pollution and ruin the dark skies of the area. Commenters expressed concern that the Craters of the Moon National Monument and Preserve designation as an International Dark Sky Park may be threatened and that the lights may impact camping experiences along the Oregon Trail.

3.2.22 Water and Wetland Resources

3.2.22.1 BLASTING, DRILLING, AND PHYSICAL INTEGRITY OF AQUIFER

Commenters questioned the impacts of significant blasting and drilling on the integrity of the Eastern Snake River Plain Aquifer (ESPA). Specifically, comments noted the draft EIS includes very little information about the potential impacts of blasting and drilling to install foundations to the underlying hydrogeology (including aquifer structure, percolation, porosity, and connection between aquifers) because no studies have been done to assess blasting at this scale. Comments addressed how water quantity and quality could be impacted during construction and operation and maintenance by contamination from concrete leaching, chemicals, oil spills, diesel fuel, herbicides, and dynamite byproducts including ammonium nitrate. Comments emphasized that the ESPA is the lifeblood of southern Idaho because it provides drinking water, water for agriculture and ranching, and water for industrial uses. Additionally, comments noted there is no compensatory mitigation proposed for aquifer impacts; the only mitigation outlined is in measure bbb, which states that MVE will gain a clear understanding of the local hydrogeology and then closely monitor blasting and excavation to reduce the

potential for contamination of said aquifer. Commenters recommended including evaluation of the potential environmental impacts and emphasized that the proposed mitigation must be effective in addressing those environmental consequences.

Finally, commenters raised questions about whether there will be impacts to the aquifer from the weight of the turbines once they are constructed—specifically, whether the basalt geology and lava tubes could support the weight of 400 turbines following the stress from over 500 days of blasting two times daily.

3.2.22.2 BLASTING AND IMPACTS TO WELLS AND CANALS

Comments focused on the impacts of significant blasting on domestic wells in the siting corridors. Commenters noted that well damage may occur, and there is potential for contamination, which occurred after the 2007 Twin Falls Canal Company blasting project near Kimberly, Idaho, which caused contamination by coliform bacteria to all domestic wells within 0.75 mile of the blast site. If contamination occurs, commenters wanted to know who will pay to clean it up and how the damage will be repaired. Comments noted there is no mitigation proposed and suggested MVE put up a bond to assure landowners that any impacts to domestic wells will be mitigated.

Comments also focused on impacts to the canal system (North Side Main and Milner-Gooding) from blasting and how it could disrupt irrigation to over 150,000 irrigated acres. Commenters raised concerns that blasting near canals could change underground rock structure, open up sink holes in the canals where none previously existed, and drain off much-needed irrigation water. Commenters noted that neither canals nor impacts to them are mentioned in the draft EIS and should be included.

3.2.22.3 IMPACTS TO AQUIFER RECHARGE

Comments focused on the use of aquifer recharge areas (such as the recharge site on the Milner-Gooding Canal, at Milepost 31, and at Wilson Canyon) to replenish the aquifer and the potential for blasting and drilling to impact the potential for recharge if there are changes to underlying lava rock and basalt geology and percolation rates. Commenters noted that different locations in the lava beds take different amounts of water and serve as filters for bacteria-laden waters. Commenters raised concerns that if the underground structure changes, changing porosity and percolation rates, the water may not be slowly filtered through the lava rock and instead travel very rapidly with pollutants in it.

3.2.22.4 SNAKE RIVER WATER RIGHTS

Commenters noted that MVE requires a lot of water for construction, operation, and maintenance of the project. Commenters emphasized the draft EIS woefully underestimates the water needed over 34 years of operations by many magnitudes. Comments questioned where this quantity of water will come from and noted the draft EIS indicates the withdrawals from the aquifer will be insignificant. Commenters noted the Snake River is already over appropriated and 1) there is a moratorium on new groundwater and surface water consumptive water rights, 2) there is already not enough water for existing water right holders, and 3) reliance on leasing or acquiring water rights via the Idaho Water Bank is not likely given they already do not have enough water and would be put in the queue behind senior water right holders seeking to lease water. Commenters raised concerns about MVE's plans to drill six wells as part of the project and noted MVE does not have water rights for this water and their proposed use is too great for an exemption. Commenters wanted to know how MVE will legally acquire the vast quantities of water needed for construction, operation and maintenance, dust control, and other uses.

3.2.22.5 WETLAND IMPACTS

Comments noted that the draft EIS tallies up the impacts to wetlands and water courses (acreages and mileage) but does not include a discussion of the role of these wetlands and water courses in the ecosystem and the environmental impacts expected as a result of the project. Commenters stated that there is no discussion of impacts to wetland species, including those that use seasonal wetlands such as playas. Finally, commenters focused on the fact that the draft EIS says wetlands will be avoided to the extent practicable, but no site-specific wetlands surveys have been completed and would not be until an alternative is selected and the turbines are sited. Commenters raised concerns that this precludes the BLM from taking a "hard look" at impacts to wetlands and surface waters by thoroughly reviewing impacts, demonstrating how water quality targets will be met, and evaluating the effectiveness of proposed best management practices.

3.2.23 Wildlife, including Big Game

Commenters were concerned that the draft EIS did not adequately address impacts to or provide mitigation for wildlife species. Wildlife of concern included migratory wildlife (e.g., mule deer, pronghorn, and elk) and their summer/wintering ranges, ground-dwelling wildlife (e.g., reptiles, rodents, and in particular, the pygmy rabbit), amphibians, fish, and state-listed species. Commenters expressed that the final EIS should fully analyze the impacts related to habitat fragmentation, disruptions in wildlife corridors, displacement, population connectivity, and genetic isolation. Commenters noted the draft EIS failed to analyze direct and indirect effects from noise, vibrations, EMF, blasting, ground current, and exposure to pesticides during noxious weed management. Some commenters requested the final EIS analyze cumulative impacts from wildfires and cumulative effects on grizzly bear and wolves from delisting under the Endangered Species Act. Finally, some commenters suggested refining the analysis with more studies, including new data or information in the final EIS; adjusting mitigation measures to be more realistic, or expressed concern that the data included in the draft EIS had false assumptions. Several commenters lamented wildlife being displaced and asked when wildlife would return to the site.

3.2.23.1 INADEQUATE MITIGATION

Commenters disliked the proposed mitigation because they expressed concern that it did not address or resolve impacts. Comments raised concerns that the BLM violated the mitigation hierarchy (Instruction Memorandum 2021-046 Reinstating the BLM Manual Section (MS-1794) and Handbook (H-1794-1) on Mitigation) that requires avoidance, minimization, and mitigation in that order; instead, the comments described that the BLM seemed to skip avoid and minimize and then use mitigation ineffectively by including vague language.

3.2.23.2 BIG GAME

3.2.23.2.1 Owinza-Gooding Pronghorn Migration

Comments noted the Owinza pronghorn herd uses the wildlife analysis area as part of their winter range and for stopovers during migration. Commenters raised concern that the project would fragment the migration corridor, and thus siting the project in the migration corridor violates U.S. Department of the Interior Secretarial Order 3362, which requires the BLM to conserve big game habitat and migration corridors. Commenters focused on pronghorn behavioral changes that could result from the project, including changes in migration routes, quicker migration, less time at stopover sites (less forage and less high-quality forage for energy), and reduced use of migration corridors. Comments expressed that it is essential to conserve migration corridors because they connect big game seasonal habitats. Comments also suggested that pronghorn may not acclimate to disturbance very easily or very quickly and either

avoid turbines or are displaced by them, which may reduce the functional value of migration in the long term. Comments stated that population-level impacts could result from reduced animal health and fitness, including mortality and a reduction in reproductive success.

3.2.23.2.2 Fencing and Road Impacts

Commenters expressed concern about the number of miles (between 222 and 395 miles) of temporary livestock fencing required for construction and decommissioning. Comments noted that even wildlife-friendly fencing can cause entanglement, death, injuries, habitat fragmentation, and barriers to movement. Comments indicated that pronghorn have fidelity to known crossing sites, and there is concern about impacts to pronghorn. Commenters asked for clarification as to what is meant by "temporary" fencing, i.e., will it be removed after construction is complete and then could be reinstalled during decommissioning, only to be removed again once that is complete? Commenters noted that fencing can alter migration routes, reduce seasonal habitat, and displace big game onto roads where vehicle strikes/collisions could occur. Similar comments were submitted regarding the number of vehicle trips (approximately 2.4 million) and new roads (between 270 and 486 miles) and how these will impact migration corridors and push big game onto roads (leading to collisions/mortality) and into areas where they are not wanted (e.g., into agricultural areas, leading to depredation).

3.2.23.2.3 Lack of Data or the Need for Updated Data

Commenters indicated that the draft EIS did not include adequate data or information about the current conditions and obstacles faced by big game species in the wildlife analysis area, including wildlife-unfriendly fencing, cheatgrass invasion, increasing traffic and development, climate change (including drought), and wildfires. Moreover, commenters expressed distrust in the analysis of big game impacts in the draft EIS because the BLM admits that it is difficult to estimate the type and severity of behavioral impacts of the project on big game when they do not know how big game, specifically mule deer, pronghorn, and elk, will respond. Comments expressed concern that the analysis was inadequate.

Additionally, commenters encouraged the use of updated data, including mule deer migration corridor data as well as population and density data, and the inclusion of a more detailed analysis of project impacts to elk and bighorn sheep. Commenters noted the draft EIS mentions elk hunting but does not discuss impacts to elk migration routes given elk are particularly sensitive to human interference. Comments also stated that the draft EIS does not include any analysis of impacts to bighorn sheep.

3.3 Project Element Topics

3.3.1 Applicant's Interests and Objectives

Commenters expressed concerns that the threat of eminent domain is being used as an intimidation tactic toward private landowners and brought forth historical efforts (other than the proposed project) of the applicant wishing to build within or alongside Minidoka NHS. Comments noted that in the past, MVE has been prevented from building alongside Minidoka NHS. One commenter also suggested that the applicant conduct a feasibility study to acquire a power purchase agreement.

Commenters also inquired who the energy produced by the project would be contracted to and expressed concerns of national security should the project be sold to foreign adversaries. Comments conveyed frustration that the applicant has not disclosed the total cost of the project and power being distributed to other states (for example, California or Nevada), or the total amount of tax credits or incentives received from the government.

Commenters also stated that is it the responsibility of the applicant to fund independent studies to address specific resource issues, and that it is concerning that the applicant has not made an effort to connect with local road departments, highway districts, and other governmental agencies and offices within the community.

3.3.2 Mitigation – EIS Appendix 4

3.3.2.1 ADDITIONAL MITIGATION MEASURES

Comments suggested the inclusion or revision of many of the mitigation measures in the draft EIS. Commenters suggested mitigation measures for wildlife, including those for birds and bats such as painting turbine blades; curtailment strategies; and suggestions for postconstruction fatality monitoring protocols, including timing. Additional wildlife mitigation measures suggested by commenters included those for big game (road maintenance during winter), eagles and raptors (non-toxic lead shot and roadkill removal), and sage-grouse (breeding season timing restrictions for blasting). Other comments suggested mitigation for impacts to the aquifer and wells (compensation if private wells are impacted), lighting (to protect dark skies), restoration/reclamation (utilization of a bond), cultural resources, Treaty Rights, environmental justice communities (additional mitigation needed for permanent impacts), and livestock grazing (compensation for lost grazing, including rangeland improvements).

3.3.2.2 GENERAL MITIGATION CONCERNS

Commenters criticized the inclusion of mitigation measures that indicated that the mitigation would be completed at a later date or time (e.g., the paleontological resources treatment plan will be developed [it is not developed yet] and will mitigate for impacts to paleontological resources from the project). Commenters were adamant that all plans that would be developed to mitigate impacts should be developed before the project is approved to be sure the plans are thoroughly reviewed and deemed adequate. Similarly, comments stated the use of "loose" terminology such as "to the extent practicable, the extent feasible, or if economically feasible" in many of the mitigation measures is vague and non-committal and is a "loophole" for avoiding mitigation altogether. Commenters repeatedly asked how mitigation would be monitored, who would check if mitigation was being done, who will determine when mitigation should be done and if the proposed mitigation fully offsets the impacts, and who determines the criteria for measuring success.

3.3.2.3 MITIGATION IS INADEQUATE

Commenters expressed concern that there was inadequate mitigation proposed for big game, migratory birds, eagles, raptors, sage-grouse, bats, cultural resources, environmental justice communities, and socioeconomics. Overall, commenters viewed the mitigation measures not as clear commitments to offset impacts given the lack of specificity, but instead viewed mitigation as the "let us build it and then we'll see what happens" approach, citing the lack of detailed analysis and baseline resource data in the draft EIS as reinforcing this perspective. Commenters suggested that the studies specific to the siting corridors limited impact analyses in the draft EIS because they resulted in a lack of baseline data. Comments then said it was difficult to formulate effective compensatory mitigation because the impacts are not understood well enough. Finally, commenters noted that the mitigation measures included in the draft EIS often did not offset impacts. For example, commenters asked how proposing an ethnographic study and report for Minidoka NHS offset impacts to the sense of place, viewshed, and historical importance of the site to Japanese Americans from the project? They noted those impacts would be permanent, and the mitigation measure suggested does not offset those impacts. Another example noted in the comments was bat mortality and the proposed mitigation measure to survey abandoned mines and install bat-friendly

gates if in use. Commenters questioned how this survey and the bat-friendly gates would remedy potential population-scale impacts to bats that are already plagued by WNS.

3.3.2.4 OVERLAP OF APPLICANT-COMMITTED AND PROJECT-SPECIFIC MITIGATION

Comments suggested revisions to the proposed mitigation measures and the EIS identified when applicant-committed measures overlap with project-specific mitigation measures that may be required for a specific resource. Specifically, comments suggested changes to measures addressing potential impacts to air quality and dust mitigation; bats (including the bird and bat conservation strategy); co-location of infrastructure within existing energy corridors or in previously disturbed area; sage-grouse; migratory birds, including raptors and burrowing owls (including the bird and bat conservation strategy); big game; insects and pollinators (including bees, worms, and St. Anthony sand dune tiger beetle); EMF; fuel storage; paleontological resources; pesticides (insects and pollinators) and herbicide use (including for noxious weeds); aviation; waters and wetlands; Minidoka NHS and Shoshone-Bannock and Shoshone-Paiute Tribes; elements included in the plan of development (MVE 2022[2]) (e.g., lighting and roads); and vegetation.

3.3.3 Plan of Development – EIS Appendix 1

Comments related to the plan of development (MVE 2022[3]) expressed concerns, questions, or made recommendations related to the project's design, funding, operation, and decommissioning phases. In regard to project design, commenters discussed tower height options, efficiency, back-up power sources, seasonal issues, associated costs, and foundational depths. In regard to the construction phase, commenters requested the final EIS include clear timelines, sources of materials and labor, dust abatement and weed control measures, blasting plan and non-blasting options, stormwater pollution prevention plan details, and associated mitigation impacts. For operations, commenters were concerned about where power will be sold and used, safety (i.e., vandalism, wildfire, law enforcement, and emergency response), erosion and microplastic pollution, compliance enforcement, and dispute resolution. For decommissioning, commenters had concerns related to disposal, compliance enforcement, and reclamation plan details. Many commenters raised concerns surrounding the recyclability of turbine blades and batteries, and the capacity of local infrastructure to accommodate such waste throughout the life of the project.

3.4 NEPA Process Category Topics

3.4.1 Alternatives

3.4.1.1 NEW ALTERNATIVES FOR INCLUSION IN THE DRAFT EIS

The following new alternatives were suggested by commenters:

- Wildlife-friendly alternative: An alternative that would avoid migratory corridors and big game wintering areas (with focus on pronghorn) and greater sage-grouse habitat. Commenters noted there is a narrow band of land within Alternative C where turbines could be sited to avoid impacts to big game and greater sage-grouse.

[2] Since the release of the draft EIS, the POD has been updated. The most current version of the POD is from December 2023. This is provided as final EIS Appendix 1.

[3] See footnote 1.

- Reduced project size, layout, and turbine style alternative: An alternative (or alternatives) that would encompass a smaller siting corridors footprint, include fewer turbines, and use turbines that are shorter to reduce impacts. Commenters suggested the turbines not be sited in mile-long strings and instead be spread out to facilitate micrositing. Comments suggested different turbine types could be used in different parts of the siting corridors to further reduce impacts.
- Operational alternative: An alternative that is not just a variation in the size and location of the siting corridors but instead includes operational differences (e.g., different restrictions for cut-in speeds).
- Disturbance alternative: An alternative that sites the project in already disturbed habitat or in brownfields.
- Phased development alternative: An alternative that phases project development over time while monitoring impacts.

3.4.1.2 INADEQUACIES OF ALTERNATIVES INCLUDED IN THE DRAFT EIS

Commenters noted the following inadequacies with the alternatives included in the draft EIS:

- Commenters suggested that alternatives presented in the draft EIS do not represent a reasonable range of alternatives. They expressed that alternatives should have considered varying turbine heights and turbine designs as well as operational differences; the alternatives are just slight variations of the scale of the project (number of turbines) and the location of the siting corridor.
- Comments stated the analysis comparing alternatives is too simplistic and lacks rigor; a table comparing alternatives should be included (that includes the No Action alternative as well) and to the extent possible, actual turbine locations should be used to compare impacts to resources from each alternative to provide specificity. Comments emphasized the comparison between alternatives in the draft EIS is too general for the hard look required by NEPA.
- Commenters stated that there is no analysis of the No Action alternative (Alternative A) included in the draft EIS. They expressed concern that this makes comparison of the alternatives difficult and not very meaningful; tables that compare the alternatives should include the No Action alternative as well.
- Commenters disagreed with the BLM's decision to not include Alternative H as a viable alternative and suggested that they reconsider the elimination of that alternative, which avoids visual impacts at Minidoka NHS, Minidoka WRC, and Wilson Butte Cave. This alternative was included in the draft EIS at the request of the public and then eliminated. Commenters disagreed with why the BLM eliminated this alternative (they believe the wind speed is adequate given turbine placement and stated that no specific wind studies were done and there is access to transmission). Comments suggested that smaller turbines (reduced height) could be used near Minidoka NHS to avoid visual impacts and ensure the site retains its intended sense of place.
- Comments expressed concern that none of the alternatives include a comprehensive approach to mitigation, particularly as it relates to reducing impacts to environmental resources (e.g., wildlife) and cultural resources (e.g., Minidoka NHS).
- Commenters stated that none of the alternatives reduce environmental impacts to acceptable levels, and that significant impacts are predicted to occur, but those impacts are not minimized with required avoidance, minimization, and mitigation measures in the draft EIS.
- Comments stated the alternatives analysis seems biased toward the Proposed Action. Nearly 10 pages are spent analyzing the impacts of the Proposed Action on each resource, whereas each

alternative may receive a page or less of analysis of impacts per resource. A meaningful comparison between alternatives would require the same level of effort when identifying the impacts of each alternative on various resources.

3.4.1.3 OTHER POTENTIAL WIND TECHNOLOGIES

Commenters provided a list of other wind technologies that could be used in lieu of traditional wind turbines. The list includes vertical windmills, wind panels, air foils, vertical-induced vibration-resonant wind generators, low-profile turbines, and tulip-style turbines.

3.4.1.4 RELOCATION OF THE LAVA RIDGE WIND PROJECT

Comments focused on the relocation of the project closer to the states (Nevada, California) that would use, and benefit from, the power that would be generated. Commenters also suggested the project be built on private lands and viewed the BLM's potential approval of the project as a misuse of public lands. They suggested building in California via repowering turbines that have been abandoned, and in Wyoming.

3.4.2 Consultation and Coordination

Commenters focused on needed coordination with entities, including Tribes, e.g., U.S. Department of Defense, Southern Idaho Regional Communications Center, Shoshone-Paiute Tribes, Indigenous People of Alaska. Additionally, comments focused on Section 106 consultation and the associated PA, including additional requests to be a consulting parties and the need for more information about how the concerns of the Shoshone-Bannock and Shoshone-Paiute Tribes are being (or not being) incorporated into the PA. Commenters also requested the inclusion in the draft EIS of general information about coordination with the U.S. Fish and Wildlife Service and Section 7 consultation. Finally, comments expressed concern about coordination between local (counties), state (legislators, Idaho officials including governor, attorney general) governments, and the BLM with respect to project opposition.

3.4.3 Cumulative Effects

One commenter suggested the BLM should develop a plan that land managers can use to site projects appropriately and minimize impacts on land use, wildlife, housing, transportation, and equity. Commenters also stated the BLM's cumulative impact analyses is inadequate for the scope of the project and expressed concerns over cumulative effects analysis of the aforementioned resources in addition to Minidoka NHS, Alaska Natives, climate change and GHGs, cultural resources, big game winter range, mapped migration and stopover routes, population impacts from golden eagle fatalities, and impediment of fire suppression.

One commenter suggested that archeologists conduct field inventories of cultural resources and provide a full analysis of cumulative impacts for each alternative, taking into account foreseeable energy projects based on pending renewable energy applications such as the Gateway West transmission lines, two West-wide Energy Corridor transmission lines, and Southwest Intertie Project North. Numerous commenters also suggested considering all projects of a similar scope in the cumulative effects analysis.

Commenters stated the cumulative effects analysis for the project does not meet the legal requirements of NEPA, that the BLM should follow the Council on Environmental Quality regulation-based terminology for a more cohesive document and cumulative effects section, and the BLM did not comply with guidance in Instruction Memorandum 2023-013, which states the BLM must conduct inventories and monitoring to identify trends and emerging issues during plan evaluations.

3.4.4 Decision Process

Commenters suggested rigorous decision-making processes (including engagement with local communities, proactively identifying locations that are best suited for renewable energy development) and asked BLM to do its due diligence when making an informed decision. Specifically, comments suggested requiring a longer time period for studies related to resource impacts and not relying on desktop analysis for impacts analysis because this does not adequately support informed decision making.

Commenters also requested the BLM set a clear expiration date for the right-of-way grant, acknowledging the assumed 30-year project limit and that this should include a provision for 2 additional years dedicated to decommissioning and removal. Commenters suggested that if the BLM is unwilling to enforce the 30-year assumption, transparency is necessary regarding the project's potential adverse effects extending beyond 30 years.

3.4.5 Decision Process for the National Park Service

Commenters compared the NPS Organic Act of 1916 and the Federal Land Policy and Management Act (FLPMA) of 1976, stating that in contrast to "BLM's multiple use mandate under FLPMA, the NPS-managed resources at Minidoka NHS are managed and protected under a separate statutory requirement, which is the conservation mandate of the NPS Organic Act of 1916 and subsequent amendments." Commenters also noted that the Secretary of the Interior shall fulfill the mandate of the Organic Act of 1916, conserving Minidoka NHS and the natural scenery and historic objects. Commenters stated that the Minidoka NHS foundation document (NPS 2016) is relevant to the project and should be used in the decision-making process. Commenters recommended the EIS include a standalone section that identifies impacts to Minidoka NHS for each action alternative, to clearly identify impacts to the NPS's ability to carry out its legislated mission at Minidoka NHS.

3.4.6 Legal or Policy Compliance

Commenters stated the draft EIS does not assess, or comply with, the following:

- Applicable land use planning
- Issues raised through scoping and consultation and coordination
- Issues raised through coordination with permittees
- That the U.S. Department of the Interior and the BLM have not followed federal law or fulfilled the responsibilities of 43 United States Code 1712(c)(9)
- FLPMA
- NEPA
- National Historic Preservation Act
- The BLM's Wind Energy Development Program
- Public Law 109-441 (Preservation of Japanese American Confinement Sites)
- Public Law 100-383 (Civil Liberties Act of 1988)
- Organic Act

Commenters also requested the BLM suspend the project and ongoing NEPA and Section 106 consultation to amend the BLM SFO's 1986 *Monument Resource Management Plan*, as amended (BLM

1986), and also suspend the project to await decision on the proposed rule "Conservation and Landscape Health" (BLM 2023b) prior to making a decision on the project.

Commenters also raised concerns regarding compliance with other federal, state, county, and local laws (including zoning laws); connected actions not evaluated in the draft EIS; and concerns regarding the BLM's dominant management culture and its adverse effects on the quality, objectivity, and thoroughness of the NEPA analysis. Commenters also stated approval of the project would be contrary to the BLM's land use management obligation (as the project is "inefficient" and "wasteful") and mission statement, that the draft EIS fails to adequately analyze the wind potential rationale as recommended by the U.S. Department of Energy's Wind Energy Technology Office, and that approval of the project does not consider the BLM's pending Idaho Renewable Energy Strategy.

Lastly, commenters also stated that the BLM should have previously and proactively evaluated the eligibility of the entire WRC for listing on the National Register of Historic Places in accordance with "The Secretary of the Interior's Standards and Guidelines for Federal Agency Historic Preservation Programs Pursuant to the National Historic Preservation Act" (NPS 1998), and that the BLM has violated treaty rights of the Shoshone-Bannock Tribes.

3.4.7 Public and Stakeholder Involvement

Commenters requested 30-, 60-, and 90-day extensions of the public comment period, expressed frustration accessing the draft EIS and in providing comments, and stated that some members of the public are intimidated by the NEPA process. They raised concerns that the legal system and court reporters create more mistrust of the NEPA process, that public outreach efforts to engage Idaho citizens throughout the draft EIS process were insufficient, and that the project is an example of regulatory overreach and circumvents public involvement. Commenters stated that poorly executed public meetings did not allow for adequate and meaningful public comment. Comments also suggested that structured questions be presented at the public meetings and that approval of the project should be subject to a "yes" or "no" vote from the affected communities.

Commenters voiced concerns that it is the BLM's responsibility to assure documents be made available in other languages (such as Basque, Japanese, Portuguese, Spanish, Native American languages, and others) and be provided in alternative formats such as hard copies and audible copies, due to disabilities, limited internet, and lack of computers that support the size and type of the electronic versions of the draft EIS.

Commenters stated that the BLM purposely withheld information regarding Alternative A (No Action) because there was no information adequately represented during the public meetings, and that many members of the public are unaware of this alternative.

Comments also expressed great disappointment in the lack of meaningful engagement and cultural competency from the BLM toward Japanese Americans, stated BLM staff were insensitive to images of imprisoned children in Minidoka WRC, and suggested that cultural competency training within the BLM is warranted for meaningful engagement.

Lastly, commenters brought forth that the BLM failed to notify the affected population in Idaho and the United States (including Japanese Americans) of the project before publication of the NOA, and that the public meeting in Mercer Island, Washington, was held at an inconvenient time and location when there were several historic Japanese American location options in the surrounding area. Commenters also expressed disappointment that BLM staff did not introduce themselves to those reviewing visuals and expressed concern that LS Power employees were not wearing identification badges and also traveling, lodging, and dining with BLM staff.

3.4.8 Purpose and Need

Commenters raised the issue of Idaho's renewable energy deficit, stating that the project will not wholly reduce Idaho's energy deficit, and asked who the money and energy from the project would benefit.

Commenters also expressed concerns that the purpose and need includes no mention of the need to conserve resources and values within the siting corridors and cited sections of FLPMA related to conservation (Section 102 (a)(80 of FLPMA) to support this statement. Commenters also provided suggested iterations of the purpose and need and asked that the BLM revise the purpose and need statement to not only reflect FLPMA's multiple-use mandate, but to also reflect its conservation mandate, which requires the BLM to protect the quality of scenic and historical values (such as Minidoka NHS and WRC). It was also stated that the purpose and need statement should be rewritten to recognize a need to protect the cultural landscapes and scenic viewsheds protected by adjacent NPS land and should include congressional direction related to Minidoka NHS and WRC.

Commenters suggested the BLM provide an explanation in the purpose and need statement for the public to understand how the BLM seeks to balance its renewable energy and project-specific goals against its other codified duties, including the protection and promotion of historically significant properties like Minidoka NHS.

Lastly, commenters also stated that the final EIS should include how much energy is being produced and permitted to reach the goals of Executive Order 14008 as well as policy expressed in 43 United States Code 3004(b), and that the current purpose and need of the project is to combat climate change, offering no evidence in the draft EIS that the project will have a beneficial effect toward climate change.

3.5 Other Topics

3.5.1 Attention

Comments coded to this category included comments specifically asking the BLM to reach out to the commenter, requests to be added to the project mailing list, requests for studies or data used in the draft EIS, and requests for hard copies of the draft EIS.

3.5.2 Editorial

Editorial comments included comments related to technical development of the draft EIS such as grammar, punctuation, spelling, definition, abbreviation, and heading errors.

3.5.3 Out of Scope

Numerous comments received were identified as out of the project scope. The BLM does not provide an issue statement or discussion of consideration during the NEPA process for out-of-scope comments. Out-of-scope comments included the following:

- Other forms of energy such as solar, nuclear, natural gas, and coal
- Relocation of the project to California, Nevada, or other states
- Revise resource management plans across Nevada and other states with full public input, before reviewing and consider approving, renewable energy developers' applications via resource management plan amendments.

4 SUBSTANTIVE COMMENTS AND BUREAU OF LAND MANAGEMENT RESPONSES

As described in Section 3.1, the BLM provides, in Appendix A, responses to substantive comments. In response to substantive comments, the BLM has identified a preferred alternative (described and analyzed in the final EIS); supplemented, improved, or modified the analysis within the EIS, including adding additional issues analyzed in detail; made corrections; or explained why the comments do not warrant EIS revisions.

As stated in Section 3.2.13, commentors submitted numerous comments on the draft EIS regarding Minidoka WRC and Minidoka NHS, and many of the comments included personal accounts and related concerns from descendants of former incarcerees, or former incarcerees themselves (see Section 3.2.13.1). The BLM respectfully acknowledges the additional detail regarding Minidoka WRC and personal experiences related to this important site, and records the information provided for the project. In an effort to most thoughtfully and respectfully respond to the magnitude of comments containing similar statements, concerns, or concepts, and synthesize this information for ease of commentor and public reference, the BLM has compiled a table of recurring themes (see Table A-1 in Appendix A). The BLM provides a response to each theme in Table A-1. A table listing all comments that these themes address is included as Table A-2 in Appendix A.

Responses to other substantive comments, briefly summarized above in Sections 3.2, 3.3, and 3.4, are provided in Tables A-3a through A-3ll in Appendix A.

APPENDIX A

Substantive Comments and Responses

INTRODUCTION

The Bureau of Land Management (BLM) provides responses to substantive comments in Tables A-1 and A-3; these responses are organized by the comment categories described in Section 2.2 of the *Summary of Public Comments on the Draft Environmental Impact Statement* (comment summary report) and summarized in Section 3 of the comment summary report. Comment categories are intended to describe the main topic or resource that is discussed in the comment. As described in the Agency and Public Involvement section in Appendix 10 of the Lava Ridge Wind Project (project) environmental impact statement (EIS), the BLM revised the EIS in response to public comments. Following preparation of the responses provided below in Tables A-1 and A-3, the BLM continued revising the final EIS; it is possible not all of the final EIS revisions are comprehensively reflected in Tables A-1 and A-3.

As stated in Section 3.2.13 of the comment summary report, commentors submitted numerous comments on the draft EIS regarding Minidoka War Relocation Center (WRC) and Minidoka National Historic Site (NHS), and many of the comments included personal accounts and related concerns from descendants of former incarcerees, or former incarcerees themselves (see Section 3.2.13.1 of the comment summary report). The BLM respectfully acknowledges the additional detail regarding Minidoka WRC and personal experiences related to this important site, and records the information provided for the project. In an effort to most thoughtfully and respectfully respond to the magnitude of comments containing similar statements, concerns, or concepts, and synthesize this information for ease of commentor and public reference, the BLM has compiled these recurring themes in Table A-1. The BLM provides a response to each theme in Table A-1. Table A-2 lists all comments categorized as opposing the project because of the Minidoka WRC and Minidoka NHS.

Unless provided at the end of each response to comment (in Tables A-1 and Table A-3), literature cited in the responses to comments can be found in EIS Appendix 3 (Issues Analyzed in Brief), EIS Appendix 4 (Mitigation), or EIS Appendix 10 (EIS Literature Cited). Abbreviations used in this appendix are listed and defined in the EIS Contents section.

Minidoka War Relocation Center and Minidoka National Historic Site

Table A-1. Recurring Themes and Responses for Comments Opposing the Project Because of Minidoka War Relocation Center and Minidoka National Historic Site

Comment Theme	Comment Example / Comment ID	Response to Comment Theme
Why site the Project adjacent to the Minidoka NHS or within the Minidoka WRC?	"So why is this being considered near the Minidoka National Historic site and on Shoshone Bannock ancestral lands?" (Comment 1395-1) "It's just not right to choose that location." (Comment 5625-10) "It is disconcerting that this site has been selected to place a 400 wind turbine energy farm with the knowledge that a National Historic Site was already in place." (Comment 6906-1) "[T]he site at Minidoka is NOT the place for a wind farm." (Comment 9325-3) "If it's inappropriate to choose Arlington National Cemetery, the 9/11 Memorial, the FDR Racist Library or the Holocaust Museum as a site to erect wind or solar farms, so is it to desecrate the Minidoka National Historic Site in this manner. It would be an insensitive display of governmental apathy if the Lava Ridge project would be allowed to go forward." (Comment 9408-1) "Though I recognize the importance of expanding renewable energy sources like wind farms, I'm also concerned that the same government that put my ancestors in concentration camps, is now seeking to erase that history by selecting this particular space." (Comment 10436-1) "Why would the BLM permit a monstrous wind farm to pollute the sky and disrupt the quietude so near to this special place to those of us of Japanese descent who worked to bring life to this land?" (Comment 12261-1) (See also comments 3644-1, 7299-1, 7355-1, 8825-1, 9033-1, 9129-1, 9219-1, 9371-1, 9509-1, 9598-1, 9657-3, 10434-1, 10435-1, 10503-1, 11306-1, 12195-2)	The purpose and need for the BLM's action is to respond to the ROW application consistent with the requirements of FLPMA, including the requirement to manage public lands for multiple use and sustained yield. The project is proposed on BLM public lands. Although the project would be adjacent to Minidoka NHS, it is consistent with the applicable land use plan (BLM 1986, as amended). FLPMA authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V), as stated in the Purpose and Need section of the EIS. MVE has applied for a ROW on BLM public lands where the BLM's FLPMA requirements and authority apply. Under the regulations implementing Title V, the BLM's objective in reviewing applications is to grant ROWs consistent with the direction in 43 CFR 2801.2. However, the BLM retains broad discretion in determining whether to approve, approve with modifications, or deny ROW applications. Here, the BLM is reviewing the application together with MVE's POD (MVE 2023) and evaluating the potential impacts of the project consistent with applicable federal laws and requirements, including NEPA (pursuant to which the EIS was prepared) and the NHPA (under which the Section 106 process is completed); see also EIS Appendix 2 (Potential Major Agency Authorities and Actions and Other Applicable Federal Laws, Regulations, and Policies). The BLM has not yet decided and would decide in a project ROD whether to approve, approve with modifications, or deny the application. The BLM has analyzed a reasonable range of action alternatives in the EIS for developing the project that consider various siting or layouts from which the BLM has arrived at its Preferred Alternative in the final EIS. The BLM has also considered a No Action alternative. The analyses of alternatives throughout the EIS include assessments of the cumulative impacts of the project in relation to other reasonably foreseeable actions in the analysis areas evaluated, including other proposed wind energy developments. The BLM has included and provided opportunities for public input on the project since providing notice in the *Federal Register* (BLM 2021) and has since provided specific outreach to Japanese American communities. BLM. 2021. Notice of Intent To Prepare an Environmental Impact Statement for the Proposed Lava Ridge Wind Project in Jerome, Lincoln, and Minidoka Counties, Idaho. August 20, 2021. *Federal Register* 86(159):46867–46870.
Choose the No Action alternative and/or do not go forward with the Project, either as proposed or at all.	"Please do not allow the wind farm." (Comment 3750-1) "We oppose the Lava Ridge Wind Energy Project as it will disrupt an important historical U.S. site that must be preserved" and "We respectfully ask that the BLM choose Alternative A, the No Action alternative." (Comment 6380-1) "The Lava Ridge Wind Project is environmental injustice after we have experienced social and racial injustice. Only the NO ACTION alternative is acceptable and the right thing to do." (Comment 6870-1) "To locate the huge wind farm near the Minidoka Historical Site is another shameful action against all Japanese-American citizens in particular against survivors and families of Minidoka. This site is not just a museum. It is the place where my lifelong friend was born; it is where his grandmother committed suicide overcome by depression; it is where so many innocent children, elders, adults, all prisoners/internees fought anger, injustice, undeserved shame, and depression caused by loss of freedom, homes, businesses, livelihood...normal lives. BLM, leave the site at peace. A wind farm nearby will change the sacredness of the area. With the vastness of the high desert regions, please consider alternative sites." (Comment 9219-1) "Let's not let the Minidoka historical site be denigrated or diminished in importance by a wind farm. Let the site remain unchanged as is as a stark and harsh reminder of the injustices imposed by our government against innocent people." (Comment 10480-1)	The No Action alternative for the project is Alternative A in the EIS. The BLM is considering a no action alternative for the project by which it compares the potential impacts of the action alternative analyses in the EIS. The BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project, and will not make a decision on these matters until after the PA (see EIS Appendix 8) is signed and a project ROD is released. The BLM decision on the project will be stated in the ROD.

Comment Theme	Comment Example / Comment ID	Response to Comment Theme
	"The no build option is the only option. Mitigations cannot address the harm that has, is, and will be dispensed from this project." (Comment 10494-2) "I am very much in favor of wind turbines as a better method of producing power and reducing greenhouse gases, but not at the cost of our historic heritage and memorials. Please find another location for these turbines, one that does not impact the Minidoka memorial." (Comment 10497-1) "I support Alternative A-No Action Alternative because it is the only alternative that protects the integrity of the fundamental resource values associated with the Minidoka National Historic Site and its historic footprint. This includes the site's environmental setting, historic and cultural values, and scenic resources and viewshed, including its immersive setting which allows camp survivors and descendants to better understand and connect to the lives of the people incarcerated at Minidoka and the hardships they endured." (Comment 11315-5) "In conclusion, while we support renewable energy and wind power, we feel strongly that any option other than Alternative A-No Action will fail to protect the integrity of the Minidoka National Historic Site. More importantly, the survivors of the incarceration, their families and descendants, and all Americans deserve to have this historic land preserved for learning and repair of spirit." (Comment 11384-1) "The proposed alternatives, other than Alternative A - No Action, fail to sufficiently protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience." (Comment 11572-1) (See also comments 5-1, 1052-1, 5322-1, 8626-16, 8665-1, 8825-1, 8868-1, 9080-14, 9080-60, 9082-1, 9129-1, 9154-1, 9237-1, 9285-1, 9325-3, 9371-1, 9401-1, 9408-1, 9483-1, 9523-1, 9598-1, 9657-3, 9908-1, 10424-1, 10434-1, 10435-1, 10436-1, 10457-1, 10475-1, 10481-1, 10483-1, 10485-1, 10486-1, 10491-1, 10503-1, 10523-1, 10566-1, 11199-2, 11218-1, 11235-1, 11236-1, 11241-1, 11242-1, 11251-1, 11253-1, 11257-1, 11255-1, 11248-1, 11325-1, 11382-1, 11383-1, 11593-1, 12981-1, and other general opposition comments)	
Construction at Minidoka	"Minidoka War Relocation Center. To build in and around this historic landmark would be an affront to our local Japanese ancestry population and other families now relocated from the area." (Comment 5896-3) "I would like to express my strong opposition to the Lava Ridge Wind Project being considered on the historic footprint of the former Minidoka War Relocation Center in southern Idaho." (Comment 10499-1 "My understanding is that the Lava Ridge project would complete[ly] do away with the memorial center that has since been built at the site of the former Minidoka camp." (Comment 10523-1) (See also Comment 11800-1)	At no point would Minidoka NHS be within the project construction area, regardless of alternative. The BLM's Preferred Alternative would further exclude wind turbine development from the greater Minidoka WRC area. Although lessened by turbine setback from Minidoka NHS, visual impacts would remain under any action alternative, including—as presented in the EIS—those that could affect the experience and sense of place; see Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). Impacts would be mitigated, as stated in EIS Section 3.5; although, this mitigation would not remove the impacts that remain after all measures to avoid and minimize impacts are applied. Mitigation efforts for the remaining impacts are designed to retain and preserve resource values in alternate ways or to return value through other means, such as retaining documentation of the impacted resource for future knowledge and interpreting and educating on historic properties and area history such as at Minidoka NHS. One goal of mitigation would be to preserve information and convey knowledge of Minidoka NHS and the surrounding Minidoka WRC and enhance awareness of its history and the history of the Japanese American community.
Designating Minidoka as an Area of Critical Environmental Concern (ACEC)	"[I]t is vitally important that BLM engage in the process to establish the Minidoka National Historic Site as an Area of Critical Environmental Concern due to the special cultural value that the Minidoka holds for the Japanese American community." (Comment 11577-1) "Preserving Minidoka as sacred ground by beginning the ACEC process is critical to help advance racial justice, healing and equity." (Comment 11622-10) "I encourage BLM to adopt the No Action Alternative and begin a public planning process for the ACEC. I look forward to working with the BLM to protect Minidokas sacred values for current and future generations." (Comment 11551-4) "I do support the proposed Greater Minidoka Area of Critical Environmental Concern (ACEC) to protect Minidoka NHS's viewshed, along with other cultural sites, recreational access, migration corridors, wildlife, pollinators, and other values." (Comment 11774-1) (See also Comments 11381-1, 12159-3, 12046-1, 12528-1)	FLPMA requires the BLM to "give priority to the designation and protection of areas of critical environmental concern [ACEC]" in the development and revision of land use plans (43 USC 1712(c)(3)). However, because the BLM is not currently conducting a land use plan amendment, an ACEC cannot be designated through this final EIS. The BLM received a proposal for the "Greater Minidoka" ACEC from Friends of Minidoka. In accordance with the BLM ACEC Manual (BLM 1988), the BLM has conducted preliminary evaluations of two potential ACECs: the proposed Greater Minidoka area and also the Minidoka WRC boundary. See EIS Appendix 13 for these preliminary evaluations. The BLM preliminarily evaluated these two areas for relevance and importance criteria required for ACEC designation (BLM 1988) and to identify whether interim management is warranted to protect values contributing to the relevance and importance criteria. A full evaluation of a proposed ACEC is outside the scope of the project's NEPA process, the purpose and need of which is to respond to MVE's application (EIS Section 1.2). Nevertheless, and notwithstanding the fact that the Greater Minidoka and Minidoka WRC areas are not currently designated as ACECs, the final EIS analysis preliminarily discloses impacts to resources that are described in the Friends of Minidoka ACEC proposal, such as visual resources, cultural resources, and natural resources, as reflected in EIS Appendix 13. Analysis of impacts to the potential ACEC for Minidoka WRC and the BLM's interim management for this area have been added to EIS Section 3.8 (Land Use and Realty).
Evaluating Minidoka as a Traditional Cultural Property or Place (TCP)	"In December 2022, Algonquin Consultants, Inc. completed a TCP study titled 'A Landscape of Isolation: A Traditional Cultural Property Study of the Minidoka Concentration Camp and its Viewsheds' that was submitted to BLM on behalf of the Friends of Minidoka. Whereas Minidoka WRC comprises approximately 33,000 acres of the Project area, the TCP proposal described in the study would be considerably larger than the just the footprint of the WRC" and "BLM should revise its description of the proposed TCP in the DEIS so it accurately reflects the actual size of the TCP proposal as submitted." (Comment 9080-14) "We support the findings in the Minidoka Traditional Cultural Property (TCP) Report that the TCP is "… significant because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community." (Comment #11622-11) "We encourage the BLM to consider the impacts of the Lava Ridge project on the Minidoka Traditional Cultural Property (TCP), which has connections to Japanese Alaskan/Alaska Native families wrongfully incarcerated at Minidoka. The Minidoka TCP is connected to the cultural practices or beliefs of the living Japanese Alaskan community. It is rooted in our community's history and important in maintaining our continuing cultural identity. We agree with the TCP Report's findings Minidoka's 'viewshed is an integral part of the visitor experience. Therefore, significant changes to this expansive, largely unobstructed viewshed would have negative consequences and adverse impacts to the integrity of the TCP.'" (Comment 11661-5)	The Idaho SHPO received a draft TCP report for a proposed Minidoka TCP from Friends of Minidoka and provided its response on February 20, 2023. The SHPO has concurred with the recommended finding that there is an eligible TCP associated with the site that is significant under NRHP Criterion A. However, SHPO's comments indicate that more information would be needed to support significance under Criteria B and D and that SHPO did not agree with the proposed boundary as defined in the study. A copy of this draft TCP report was separately provided to the BLM by Friends of Minidoka on January 3, 2023, and the BLM received a copy of the February 20, 2023, SHPO response letter. For reference, the draft EIS was finalized in early December 2022, before Friends of Minidoka's draft TCP report was received. The draft EIS was then released for public comments on January 17, 2023. Subsequently, on December 15, 2023, Friends of Minidoka had prepared and then provided to the BLM an addendum to their proposed TCP boundary, which reemphasized a Minidoka TCP boundary proposal encompassing large areas beyond Minidoka WRC, with which SHPO was in disagreement. Therefore, because there has yet to be a defined TCP boundary, the BLM analyzes impacts to the current historic property boundary (Minidoka NHS) in the final EIS, and in that analysis, the BLM continues to consider potential impacts to Minidoka WRC and to the setting of Minidoka NHS as it may extend to the Minidoka WRC and the surrounding area beyond. Section 106 consultation will also include the BLM identifying adequate avoidance, minimization, and mitigation measures for adversely affected historic properties, including Minidoka NHS, pursuant to the PA for the project (see EIS Appendix 8). The PA preparation process, including development of appropriate mitigation measures, is ongoing.

Comment Theme	Comment Example / Comment ID	Response to Comment Theme
	(See also Comments 9080-13, 9080-43, 11546-5, 11672-4, 13006-1 (see in Table A-3g, Cultural Resources and Native American Concerns).)	
Minidoka as a Site of Conscience	“Because the site commemorates the more than 9,000 Japanese Americans who were imprisoned at the Minidoka War Relocation Center (WRC) during the Second World War, Minidoka NHS is recognized as an International Site of Conscience. However, despite the historical significance of the site, we are very concerned that BLM has proposed authorizing the development of a massive wind farm within the footprint of the WRC and immediately adjacent to Minidoka NHS.” (Comment 9080-2) “I consider this a site of conscience. This is a physical reminder of what our country did when people let fear and prejudice guide their decisions rather than the rule of law. Our civil rights were grossly violated and we must never forget that our government policies ruined people's lives and cost millions of dollars because of racism." (Comment 11305-1) “It goes without saying that even today, in 2023, we continue to see racially motivated attacks and provocations. Our nation has become polarized; it is unfathomable that racially motivated harassment and attacks have become normalized. Even with the recent COVID pandemic and the associated violence against Asian Americans, we as a nation continue to face racial challenges. That is why it is critically important to preserve monuments such as Minidoka as an International Site of Conscience, and continue to provide education and visibility on the unconstitutional removal of so many Japanese Americans from their homes and uprooting their lives. The proposal by the DEIS to use land surrounding Minidoka for wind farms shows a total lack of respect for this significant landmark.” (Comment 11337-1) “On behalf of the Japanese American Museum of Oregon, we write in support of Alternative A- No action. The Minidoka National Historic Site is a unique site for education, memory, and healing. The other Alternatives allow an incursion into the viewshed that significantly disrupts the experience of this site of conscience.” (Comment 11384-1) “The proposed alternatives, other than Alternative A - No Action, fail to sufficiently protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience.” (Comment 11572-1) “We must also remind the BLM how important this site of conscience is to ALL American people. In order for reckoning and healing to occur for the United States as a whole, all Americans must know about the mistakes made by our country and the courage it took to offer apology, reparations, designate parks and memorials, and make significant funding investments to preserve and interpret Minidoka and other sites. This is the sign of a great nation. Minidoka and the important lesson it shares must not be impeded.” (Comment 11622-5) “This is a site of "conscience," not a tourist destination.” (Comment 12950-1) (See also Comments 9657-1 and F1-1)	The BLM recognizes Minidoka NHS as a site of conscience, moral reflection, and community healing. Minidoka NHS is an International Site of Conscience, as noted in EIS Section 3.5 (Cultural Resources). Subsection 3.6.1.1.2 in EIS Appendix 9 provides information on Minidoka NHS as a site of conscience under the Japanese American and Minidoka-Connected Communities heading. Minidoka NHS is recognized as a member of the International Coalition of Sites of Conscience, which defines a site of conscience as “a place of memory – such as a historic site, place-based museum or memorial – that prevents this erasure from happening, to ensure a more just and humane future. Not only do sites of conscience provide safe spaces to remember and preserve even the most traumatic memories, but they enable their visitors to make connections between the past and related contemporary human rights issues” (International Coalition of Sites of Conscience 2022b). The BLM considered this value in the analysis of impacts. In particular, values of Minidoka NHS as a site of conscience and related analysis of impacts are expressed in the assessment of the Minidoka National Historic Site Interpretive Purpose in Section 3.19. The interpretive themes considered for Minidoka NHS at Section 3.19.1 (Affected Environment) and impacts to the Minidoka NHS interpretive purpose at Section 3.19.2 (Impacts) encompass the values of Minidoka NHS as a site of conscience. Mitigation is addressed at Section 3.19.4 (Compensatory Mitigation) and in the Mitigation Framework for Key Resources and Values Associated with Minidoka National Historic Site section in EIS Appendix 4.
Consideration of presidential Executive Orders and commitments to Environmental Justice	“The DEIS: Does not reflect nor address cultural competency as mandated in President Biden's Executive Order on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders.” (Comment 7358-1) “[D]efenders of Minidoka are in a position of having to justify the cultural importance of a site where Americans were unlawfully imprisoned, with this importance being trivialized as for tourists. This is not acceptable, and is not in keeping with President Bidens recent EO on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders.” (Comment 9119-1) “President Biden signed an executive order that addresses equity for Asian Americans and how this site is treated now is an excellent example of applying those pledges with deeds.” (Comment 9371-1) “In two recent executive orders, President Biden pledged to ‘deliver equity and environmental justice,’ and ‘advance racial equity and support for underserved communities.’” (Comment 11520-1) “[T]he Lava Ridge Windmill project should NOT be approved. It will significantly impact a site of historical significance for Americans. It goes against our own national mandate of Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders.” (Comment 12559-2) (See also Comments 3749-1, 7632-1, 11618-5, 12859-8, 12877-2)	EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) includes EO 14031 on *Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders*. Impacts related to the survivors and descendants of those incarcerated at Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed in EIS Section 3.6.1 (Environmental Justice Communities). The EIS has been revised to correctly represent the Japanese American community and Japanese or Alaska Natives. The BLM apologizes for indicating in any manner that the Japanese American communities and Native Americans are within the sensitive viewer group of “tourists and recreationists,” and the EIS is revised to not indicate or imply this. Because of the sensitive character of resources or landscape features assessed in the EIS from certain KOPs, and their strong connections to these, the BLM understands and respects that the Japanese American communities or Native Americans or Alaska Natives should not be referred to as “tourists” in any manner in relation. For consistency with the Minidoka NHS Foundation Document (NPS 2016), the terms “visitors and survivors” were used to characterize Japanese American community members within the Environmental Justice and Cultural Resource sections of the draft EIS (EIS Sections 3.5 and 3.6.1). In EIS revisions, the group formerly referred to under Visual Resources (EIS Section 3.16) as "tourists and recreationists" has been replaced with “visitors” and as "survivors and descendants of the incarcerated," or similar, within the Environmental Justice Communities and Cultural Resource sections of the EIS.
Adequacy of BLM review of impacts and protections at Minidoka in the EIS and under the law	“The National Environmental Policy Act (NEPA) requires a full appraisal of all historical, cultural and religious impacts of this industrial siting decision. There are many negative ones. I do not see them all fully evaluated in the documents. Just one component is the extreme size and height of the MVE's machines -- their mass and sightline appearance is significant, even when viewed at four or five miles distance.” (Comment 4801-1) “If BLM had instituted an effective ‘preservation program to identify, evaluate, nominate, and protect historic properties that are eligible for the National Register' as required un Section 110(a)(2), BLM would have known the WRC (not just the NHS) is potentially historically significant; and proactively determined whether it is eligible for listing on the NRHP. Depending upon that determination, BLM could or should have taken appropriate steps to manage and protect the WRC from the impacts of major development (e.g., through setbacks or exclusions zones) well before MVE submitted its current Project proposal. In our view, BLM’s failure to proactively address its Section 110 responsibilities is the root cause for the current situation.” (Comment 9080- “BLM has not complied with FLPMA’s requirement to inventory resources on public lands. Section 201 of FLPMA requires BLM to ‘maintain on a continuing basis an inventory of all public lands and their resource and other values (including but not limited to outdoor recreation and scenic values)’” (See also Comments 7355-1, 11672-1, 12982-19)	The final EIS analyzes the impacts of the project and the alternatives on the known historic and cultural properties. The current EIS and Section 106 review and analysis of the project represent steps that the BLM is taking under applicable laws (such as NEPA and NHPA) to protect the historic properties associated with Minidoka WRC and Minidoka NHS. The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, FLPMA, and other laws, regulations, and federal requirements in advance of the proposed project decision. The BLM will continue to plan for the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS, under a PA, completing the Section 106 process in consultation with consulting parties. The BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project, and will not make a decision on these matters until after the PA (see EIS Appendix 8) is signed and a project ROD is released. The BLM decision on the project will be stated in the ROD.

Comment Theme	Comment Example / Comment ID	Response to Comment Theme
BLM engagement of the Japanese American/Alaskan Communities	“Consultation with Alaska Native tribes and organizations on the historic and cultural impacts of the project is essential to complying with the National Historic Preservation Act, Government-to-Government consultation requirements, American Indian Religious Freedom Act, EO 1307 (May 1996, Indian Sacred Sites), Memorandum of Understanding Regarding Indigenous Sacred Sites (2021), and Indigenous Knowledge Guidance (CEQ, November 2022).” (Comment 11315-1) “I was shocked and angered when I found out about the Notice of Intent for the project well after it was posted. It was clear there was not an earnest and authentic effort to engage the Japanese American Minidoka community in the earliest stages of this project. So many people of the Minidoka community had no idea what was happening after the Notice of Intent was posted on 8-20-2021. I was devastated. My family was devastated. Community members were devastated. At least the BLM heard our voices amongst the Southern Idaho community and granted an extension on the comments deadline.” (Comment 11991-2) (See also Comments 7358-1, 10493-1, 12130-4, 12177-1 (see in Table A-3g, Cultural Resources and Native American Concerns), 12398-7)	The BLM’s scoping and consultation efforts are summarized in EIS Appendix 10 (under Consultation and Coordination) and in the scoping report prepared for the project and posted on the BLM’s project website (https://eplanning.blm.gov/eplanning-ui/project/2013782/510). The DOI Office of Collaborative Action and Dispute Resolution further conducted outreach efforts to the Japanese American communities in Idaho and throughout the United States with connections to Minidoka NHS to identify and consult on community interests and concerns and receive input on the project and produced a summary report on these efforts, as cited in the EIS, and also available on the BLM’s project website. The BLM understands that Alaska Natives, including Alaska Native spouses and mixed Alaska Native and Nikkei children, were among the Nikkei population incarcerated at Minidoka WRC. The NHPA Section 106 consulting parties representing the Minidoka-connected community include those with direct ties to Alaska, such as the Alaska Chapter of the Japanese American Citizens League (JACL) and those from Alaska territory. The BLM is consulting with Native American Tribes with ancestral ties to the project area (see EIS Appendix 10, Section 106 Consultation and Government-to-Government Tribal Consultation). Alaska Native Tribes were not directly among interested parties or stakeholders identified during the initial project scoping or through the NHPA Section 106 consultation process. Please see response to comment 11661-6 regarding the DOI’s trust responsibilities, specific treaties that relate to federally recognized Tribes with ancestral ties to the project area, and regarding the EIS’s full consideration of impacts to resources that may be associated with tribal rights or interests.
Additional detail regarding Minidoka NHS and personal experiences related to this important site	“My mother- and father-in-law are American heroes. They deserve a fitting memorial to commemorate their significant contributions to this country while at the same time suffering illegal incarceration, not to mention continuing racism.” (Comment 11323-1) “My parents, grandparents, and great-grandparents all were incarcerated during World War II in relocation camps - first in Camp Harmony in Puyallup, Washington, and then subsequently moved to Minidoka, Idaho.” (Comment 11337-1) “My parents, sister, and maternal grandparents were incarcerated in Camp Minidoka (Camp) for nearly three years (1942-45). My mother was carrying a fetus during the mass evacuation and lost her daughter in Camp a few days after her birth. I was born a prisoner of War in Minidoka in September 1944.” (Comment 11379-1) “My parents and relatives were incarcerated during World War 2 within these so called 'Relocation Camps'. They were forced to live in these crude concentration camps, behind barbed wire and patrolled by armed sentrys. They endured the dusty hot conditions of Summer, the freezing wintry weather of winter, with food supplies that were poor. communal showers and open toilets. They lost their homes, belongings, businesses and years of their lives. They felt alien, untrusted and un-American. They lost their pride and their sense of purpose.” (Comment 11382-1) “My grandmother, Asano Kanzaki was incarcerated at Minidoka. She had four American born sons who served in the US armed forces. Her oldest son, Akira never returned. Displayed in the window of her barracks were three silver stars and one gold star. Every mother, father, brother, sister at Minidoka had stories of hardships, sacrifices, loses and injustice.” (Comment 11455-1) “I am a fourth generation Japanese American descended from the Sakura family who was incarcerated at the Minidoka concentration camp during World War II - Family #35860, Barracks 17-F-S. This historic site holds deep and profound meaning for myself and my family as a representation of the deep wounds and intergenerational trauma that we live with to this day. It is critical to ensure the stories are not lost, diminished, or overpowered.” (Comment 11510-1) “The Pilgrimages official inception came on the heels of the designation of Minidoka as a National Monument, wherein the site became a place of honor and healing, and not only of oppression and grim memorial. We seek to honor the courage and sacrifices of Japanese American veterans, Gold Star families and resistors, who spoke out against the unjust incarceration. As noted in our scoping letter submitted by survivors and descendants: Annually, many of us are drawn to the Minidoka Pilgrimage to remember, to heal and ally ourselves with those who confront injustice. Desolation creeps into our minds and bodies when we walk along the burning sandy paths. At the ceremonial conclusion of our pilgrimage, we bow our heads to honor the soldiers who made the ultimate sacrifice in defense of our freedoms. We can hear the wind flapping against the American flag as their names are read.” (Comment 11622-1) “During World War II, my grandparents and their families were torn away from their homes, businesses, and lives in Seattle and were imprisoned in Camp Minidoka. They lost everything. After the war, it took them decades to rebuild and restart their lives, but still, three generations later, our family has not healed from the trauma from being violated and forcibly incarcerated against their will by the State.” (Comment 12139-1) “I am yonsei, a fourth generation American with Japanese heritage. Both of my paternal grandparents and their families were incarcerated at Minidoka. My grandpa left Minidoka to fight in the 442nd combat unit and came home with two Purple Hearts, a Bronze Star, a Presidential Unit Citation, a Combat Infantry Recognition Award and an Army Good Conduct Medal.” (Comment 12195-2) “I am a survivor of 2-1/2 years behind barbed wire fences at Minidoka. It’s a solemn place - a reminder of war hysteria, prejudice and hardship suffered by my family because my immigrant grandparents were born in Japan. Leaving home on Bainbridge Island, WA, and transplanted to southern Idaho we faced a desolate land - treeless, dusty and void of all but packed earth and rows of tar papered barracks. Return trips as an adult remind me that this is a unique place in our Country’s history. The quiet, open spaces, dotted by a few restored buildings under open skies, allow for reflection and tears.” (Comment 12261-1) “I am a 90 year old survivor of Minidoka, taken from my home in Juneau, Alaska when I was a child of nine. I remained there with my family without my father who was detained in a justice department camp in Santa Fe, New Mexico until the war ended and I was almost thirteen. Minidoka was a barren, dusty landscape so foreign to me who longed for the beautiful coastal mountains of Alaska. For many of the years following, I wanted to block out the experience of Minidoka from my psyche as it was a painful memory of captivity.” (Comment 12308-1)	The BLM respectfully accepts and appreciates the additional detail pertinent to Minidoka NHS and personal experiences related to this important site, and the BLM records this information for the project with the comments and responses provided in this document. The EIS is updated at Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), 3.16 (Visual Resources), and Section 3.6.1 in EIS Appendix 9 to not solely rely on technical categorizations for analysis but to also further address the unique sensitivities of the Japanese American and Minidoka-connected communities provided in comments and consultation. Within the issues analyzed, the sensitivities, perceptions, and concerns of the Japanese American community are therefore further specifically addressed in the Visual Resources, Cultural Resources, and Environmental Justice Communities sections of the EIS. These revisions included quotes taken directly during the public comment period to show perceptions of impacts in peoples' own words. The Cultural Resources section includes a stand-alone subsection (Section 3.5.2) for Minidoka WRC and Minidoka NHS, which incorporates information from BLM consultation with the Japanese American community, their concerns, and interests. The DOI Office of Collaborative Action and Dispute Resolution conducted outreach efforts specifically to the Japanese American communities connected to Minidoka in order to identify and consult on community interests and concerns and receive input on the project, and they produced a summary report on these efforts, as cited in the EIS (BLM 2022). Although sites of visual importance to one’s home, social, business, and recreation environment are considered in the Visual Resources section of the EIS (Section 3.16), the range of cultural resources that include sacred ground, memorials (including as to veterans and victims of racial prejudice), cemeteries, places of healing and commemoration, TCPs, and sites of religious significance are a consideration of EIS Section 3.5 (Cultural Resources), and impacts to the communities to who these resources are important are addressed in EIS Section 3.6.1 (Environmental Justice Communities).

Comment Theme	Comment Example / Comment ID	Response to Comment Theme
	"My father, Kazuo Murakami, was a true American patriot who was interned at Tule Lake and Minidoka despite being an active member of the Army Air Corp stationed in Arizona. Apparently, he was not East enough to avoid internment, and was reclassified as an enemy alien and sent to internment in his American Aircorp uniform. Until the day he passed away, he expressed how it was one of the saddest days of his life." (Comment 12343-1) "My mother, father, aunts and uncles and grandparents were forcibly removed from Seattle and the Portland area in 1942 and placed in the Minidoka concentration camp. This was an extremely traumatic and life-altering event for our family." (Comment 3749-1) (See also Comments 5382-1, 11325-1, 11593-1, 11772-2, 12193-1, 12241-1, 12299-2, 12323-1, 12369-1, 12538-2, 12559-1, 12671-1, 12859-22, 12877-1)	
Additional analyses of impacts at Minidoka	"The extent and severity of potential adverse effects to the landscape setting of Minidoka NHS (park) and the WRC is particularly concerning. The setting provides critical context to help visitors understand the purpose of the park and the experiences of the Japanese Americans who were unjustly incarcerated there. As described in the 2016 NPS Foundation Document for the site: The purpose of Minidoka NHS is to provide opportunities for public education and interpretation of the exclusion and unjust incarceration of Nikkei Japanese American citizens and legal residents of Japanese ancestry in the United States during World War II. Minidoka NHS protects and collaboratively manages resources related to the Minidoka War Relocation Center in Idaho and the Bainbridge Island Japanese American Exclusion Memorial in Washington State. Also described in the Foundation Document is that [f]undamental resources and values are those features, systems, processes, experiences, stories, scenes, sounds, smells, or other attributes determined to merit primary consideration during planning and management processes because they are essential to achieving the purpose of the park and maintaining its significance. Most notably, Minidoka's environmental setting is identified as a Fundamental Resource and Value because: Minidoka's remote location in the high desert of Idaho provides an immersive setting that is fundamental to the visitor experience. Views of open fields and distant mountains create a sense of isolation on a vast landscape where Minidoka once stood. Extreme changes in temperature, the arid environment, and high winds that the people at Minidoka experienced are part of the environmental setting that are felt today. Experiencing this environmental setting allows visitors to better understand and connect to the daily lives at Minidoka. Because the site commemorates the more than 9,000 Japanese Americans who were imprisoned at the Minidoka War Relocation Center (WRC) during the Second World War, Minidoka NHS is recognized as an International Site of Conscience. However, despite the historical significance of the site, we are very concerned that BLM has proposed authorizing the development of a massive wind farm within the footprint of the WRC and immediately adjacent to Minidoka NHS." (Comment 9080-2) (See also Comments 3749-1, 6380-1, 11623-1)	The final EIS includes a new section, Section 3.19 (Minidoka NHS Interpretive Purpose), where impacts identified within the EIS in Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources) are assessed in terms of how these would impact the interpretive purpose of Minidoka NHS under the supporting concepts (Civil and Constitutional Rights, People, Place, and WWII) through the four interpretive themes established through Public Law 110-229: 1. The story of the relocation of Japanese Americans during WWII to the Minidoka WRC and other centers across the United States 2. The living conditions of the relocation centers 3. The work performed by those incarcerated at the relocation centers 4. The contributions of the United States military made by Japanese Americans who had been incarcerated
Consideration of visual and auditory (noise) impacts at Minidoka and to its setting and feeling, including as relates to the Japanese American/Alaskan communities and ability to experience the NHS, and such as would result from project structures and lighting	"Through esoteric legalistic maneuvers Minidoka could be surrounded by windmills and become nothing more than a soulless power station of 400 feet tall windmills. The Minidoka historic site would be lost in the shadows of Lava Ridge turning blades of profit." (Comment 1052-1) "What will this project do to the Minidoka National Monument?" (Comment 11297-6) "The indirect and direct effects of the Project on the historic footprint of the Minidoka Relocation Center and the Minidoka National Historic Site (MNHS) would be pervasive, destructive, and permanent." (Comment 11315-5)	Impacts to the survivors and descendants of those incarcerated at Minidoka WRC and other communities in terms of environmental justice (and associated mitigation, including compensatory mitigation) are addressed in EIS Section 3.6.1 (Environmental Justice Communities). The BLM has found that the project would have long-term visual effects to Minidoka NHS (see EIS Section 3.5 [Cultural Resources]) that would diminish its historic integrity, including as experienced by the Japanese American community and others. The visual impacts at Minidoka NHS are further discussed in EIS Sections 3.5 and 3.16, including daytime turbine visibility and nighttime lighting effects from the project. At no point would Minidoka NHS be within the literal shadows or shadow flicker zone of wind turbine generators from the project (see EIS Section 3.16 [Visual Resources]). Use of an ADLS would minimize the amount of time that red turbine lighting would be lit at night, only turning on when an aircraft is detected by the system. The BLM Preferred Alternative would additionally eliminate project infrastructure from being placed within the greater Minidoka WRC. The BLM has found only the Proposed Action (Alternative B) to have the potential for long-term auditory impacts at Minidoka NHS; the other action alternatives (Alternatives C through E) would not. None of the action alternatives would have long-term atmospheric impacts at Minidoka NHS, such as from dust. See EIS Section 3.5 (Cultural Resources). Action alternatives considered beyond the applicant's Proposed Action (Alternative B) would all work to further set back turbines from Minidoka NHS, and Alternatives C and E and the BLM Preferred Alternative would remove turbines from Minidoka WRC. Under no alternative would turbines surround the Minidoka NHS. Although lessened, visual impacts would remain under any action alternative, including—as presented in the EIS—those that could affect the experience and sense of place; see Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources). However, impacts would be mitigated, as stated in EIS Section 3.5; although, this mitigation would not remove the impacts that remain after all measures to avoid and minimize impacts are applied. The PA for the project (EIS Appendix 8) would further address the resolution of adverse effects to historic properties at Minidoka WRC and Minidoka NHS.
Mitigation of impacts	"My position is that: I support the NO windmill option (Option One) because there is no feasible way to mitigate the impact of the project as well as the fact that this project functions as a 21ST century version of identity hijacking and identity theft." (Comment 1052-1) "Because of their nature and scope, the effects cannot be adequately mitigated at the proposed site." (Comment 11315-5)	Impacts would be mitigated, as stated in EIS Section 3.5; although, this mitigation would not remove the impacts that remain after all measures to avoid and minimize impacts are applied. Mitigation efforts for the remaining impacts are meant to retain and preserve resource values in alternate forms or to return value through other means, such as retaining documentation of the impacted resource for future knowledge and interpreting and educating on historic properties and area history such as at Minidoka. The PA (see EIS Appendix 8) would further be implemented to resolve adverse effects to historic properties, including at Minidoka WRC and Minidoka NHS.

As stated in Section 3.2.13 of the comment summary report, commentors submitted numerous comments on the draft EIS regarding Minidoka WRC and Minidoka NHS, and many of the comments included personal accounts and related concerns from descendants of former incarcerees, or former incarcerees themselves (see Section 3.2.13.1 of the comment summary report). The BLM respectfully acknowledges the additional detail regarding Minidoka WRC and personal experiences related to this important site, and records the information provided for the project. In an effort to most thoughtfully and respectfully respond to the magnitude of comments containing similar statements, concerns, or concepts, and synthesize this information for ease of commentor and public reference, the BLM has compiled these recurring themes in Table A-1. The BLM provides a response to each theme in Table A-1. Table A-2 lists all comments categorized as opposing the project because of the Minidoka WRC and Minidoka NHS.

Table A-2. All Comments Opposing the Project Because of Minidoka War Relocation Center and Minidoka National Historic Site

Comment ID	Sender	Public Comment
2831-1	Ann Shintam	My grandfather was interned at Minidoka. We never thought to go visit as it held forgettable memories. However, as an adult, I believe that the site is a sacred reminder of injustices that have happened and hope to prevent in the future. As Japanese Americans, many in our communities make visits to family and pay respects to family gravestones. Now, we make pilgrimages to historic internment sites, places where our families and communities were displaced. I wish that the respect and solemnity, the barrenness be kept at Minidoka. I believe it will be a powerful and emotional experience, and wind turbines would reduce that solemnity and weight of this site. Thank you.
2832-1	Kelly Campbell	Please listen to the concerns of the Japanese American community about the negative impacts of siting this wind farm near minidoka - affected communities concerns must be addressed to achieve environmental justice.
2833-1	Kamil Khan	Guided by our mission and value statement, the Oregon PSR is here to show solidarity with Japanese-American communities in Oregon. The Minidoka National Historic site is an important marker of the injustices faced by Japanese Americans and any construction contiguous to it, irrespective of project, must have the input of Japanese-American communities and preserve the experience, integrity, and storytelling of the past so history isn't repeated.
2941-1	Brian Ito	It was an American Concentration Camp. It is a cemetery of souls whose lives were forever changed. Where the lives of people like you and me were broken apart by order of the United States Government. Minidoka does not stand alone. Along with 9 other Sites of Shame across America, it bears witness to an arc of Anti Asian racism that started many years earlier. I plead with you of the Bureau of Land Management to let your hearts and minds see Minidoka as we do, a testament to a pain that lives on to today; as well as a symbol of the undying spirit of our fathers and mothers, grandfathers and grandmothers, aunts and uncles who persevered despite adversity to make a better life for all of us, including you. I plead with you to stop the Lava Ridge Wind Farm. In search of cheaper electricity it will desecrate this sacred site of Minidoka.
3232-2	Carol Reitz and Karen Matsumoto; Bainbridge Island Japanese American Community	In keeping with the government's commitment to the Japanese American community, we request that the BLM choose Alternative A, the No Action alternative. Although Alternative E minimizes some impacts to the Minidoka NHS, it does not avoid adverse impacts to important Native American cultural sites, other significant historic and natural areas, local farmers and ranchers, and wildlife. We cannot knowingly support a project that will negatively affect our neighbors and the legacy of our elders. BIJAC would like to voice our strong opposition to the Lava Ridge Wind project, support of the No Action alternative, and request that our comments be included in the public record.
3521-1	Renee Myers	This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding. Dear BLM Lava Ridge Committee, The Lava Ridge Project presents a big problem for a national historic site, I feel they need to keep this area sacred. Also I an familiar with wind turbines being sold off to companies outside the US to run once they get the tax breaks. These are built to help Americans with clean energy, not for outside interests to take them over. We need to be very careful how we approve anything like this, please judge what to do on how you would feel if you were of Asian descent and had family at the camps at one time, and if you still feel this is right for the area make sure it keeps helping Americans and doest go to outside interests through some future deal. BEST WISHES, Renee Myers
3575-3	Sue Page	Disrespecting the Japanese Americans who were imprisoned, died and to those who survived this government because they were Japanese is once again on the verge of being disrespected. 400 - 740ft tall wind turbines casting shadows, disrupting silence by their whooshing sounds and the blinking lights in the night along with tall aircraft warning towers will break the silence of the Minidoka National Historic Site. The government cannot be allowed to disrespect this site. Destroy the wildlife that call this home or the natural monuments created by Mother Nature such as Wilson_Butte_Cave. As stated this historical site cannot be moved but this wind project can. No to building Lava Ridge in any form presented.
3602-5	Sue Page	Minidoka National Historic Site will be disrespected by the looming towers, blinking lights and the constant whooshing sound created.
3622-1	Claudia Taylor Walsworth	To Whom It May Concern: Please find my comments below for the Lava Ridge Windmill project proposed by Magic Valley Energy, LLC. My name is Claudia Walsworth, I am a self-employed archaeologist with my own small proprietorship in Idaho. I meet the Secretary of the Interior's qualifications and have specialized in cultural resource management for over 30+ years. My clients range from the private sector, federal, state, and local governments to non-profit organizations. In the early 1980's, I was an archaeologist for the Shoshone Field Office BLM. During extensive field work, I learned firsthand about the area's valuable, fragile, and irreplaceable cultural resources including those in the project area. My work focuses on projects requiring Section 106 compliance; therefore, I understand what constitutes an adverse effect on historic properties during a proposed action within an Area of Potential Effect (APE) from the standpoint of the Federal and State governments. I also have a good understanding about what constitutes an adverse effect in terms of environmental justice communities such as Japanese Americans and Native Americans with long standing ties to the project area. These groups have identified areas where Traditional Cultural Properties (TCPs) are present under the Section 106 consultation process According to the EIS Volume I Executive Summary, the physical APE measures 84,375 acres in size or 132 square miles that takes in the 9,111 acres or 14 square miles of proposed ground disturbance. I also understand that the non-physical APE measures at a much greater spatial footprint at 2,050,486 acres or 3,204 square miles. There are approximately 5,096 previously recorded cultural resource properties within the non-physical APE. For the physical APE, there are 199 cultural resource properties. A mere17% of the physical APE has been previously surveyed for archaeological and historic sites. The types of sites located in both the physical and non-physical APE are varied and portray a 16,000 year old human landscape. Prehistoric sites in the APE, both physical and non-physical include lithic scatters, tool scatters, campsites, and rock features consisting of cairns, stone circles, alignments, and hunting blinds. In addition, there are sacred geography and cultural landscapes important to Native American stakeholders, including rock shelters, lava tubes, lava blisters, caves, and buttes. Historic resources include trash scatters/dumps, farmsteads, homesteads, houses, buildings, rock habitation structures, campsites, bridges, and linear features. Historic linear features prevalent throughout the study area and APE are railroads, trails/roads, transmission lines, and irrigation-related features such as canals, ditches, and reservoirs that are part of the large Minidoka Project and Reclamation Era agricultural landscape. Currently, there are 13 historic districts in the study area that are listed with the National Register of Historic Places (NRHP): * The Bonneville Power Administration (BPA) Unity Substation Historic District * The BPA Heyburn Substation Historic District * The North Side Pumping Division District * The Shoshone Historic District and Boundary Increase for the Shoshone Historic District

Comment ID	Sender	Public Comment

* Rupert Town Square Historic District and Boundary Increase for the District

* Twin Falls Downtown Historic District

* Twin Falls Original Townsite Historic District

* Twin Falls City Park Historic District

* Twin Falls Historic Warehouse Historic District

* Lava Rock Structures Thematic Group

* Historic Agricultural Resources of Twin Falls County, Idaho 1860-1970 (new NRHP listing since EIS published)

In addition to these historic places there are also several linear features that are part of a larger district or individually eligible for listing in the NRHP:

* The Oregon Trail, North Alternate and the Shoshone Falls to Starrh's Ferry Wagon Road

* The Oregon Short Line/Union Pacific Railroad

* Extensive Reclamation-Era Irrigation networks including the Milner-Gooding Canal, the North Side Canal, and dozens of other interrelated buildings and features such as pump houses, canals and canal roads, drains, ponds, reservoirs, dams, and other water transportation equipment

There are several Traditional Cultural Properties (TCPs) that fall within the study area and most likely many more that have yet to be identified. Although these have not been formally documented with the National Park Service as TCPs, the following properties are acknowledged in the Lava Ridge Wind Project EIS documents that contain areas of cultural, religious, or spiritual importance. These areas may be visible or non-visible and include sacred places or sensitive use areas for plants, wildlife, water, minerals, and other highly revered natural resources.

* Wilson Butte Cave

* The Minidoka National Historic Site/War Relocation Center (Minidoka Site) as Site of Conscience

* The Oregon Trail Ruts at Milner

* Other areas containing artifacts or features with human remains, funerary objects and sacred places important to the Native American community

* Other sacred pilgrimage areas containing cultural landscape features important to the Japanese American community

During all phases of the proposed project, there is the potential for the discovery of thousands more cultural resources or TCPs in the physical and non-physical APE. The impact duration for physical effects of the project on cultural resources and TCPs is permanent because cultural resources are non-renewable resources. The impact duration for non-physical impacts from the project are expected to last 34 years from the start of construction to decommissioning the wind turbines and transmission lines from operation. This is 1/3 of a century that will have lasting adverse visual, audible, and atmospheric effects for the land, people, animals, plants, water, air, and other essential resources.

According to my analysis of the EIS concerning cultural resources and environmental justice groups, I am writing to tell you that my preference to the Lava Ridge proposal is a firm vote for ALTERNATE A NO ACTION.

The reason I am for ALTERNATE A NO ACTION is based on the following reasons:

* Throughout the EIS documents, the Japanese American community, Native Americans with Treaty Rights, and Low Income communities should be regarded as stakeholders, not tourists or recreationists.

* The project under Alternates B-E will have long term, adverse effects to the visual, auditory, and atmospheric conditions at Wilson Butte Cave

* According to the EIS, the Shoshone-Bannock Tribes believe that the presence of the project is severely impactful on TCP's

* According to the EIS, the Northwest Band of the Shoshone Nation state the project will have adverse impacts on wildlife and vegetation, which are spiritually and culturally significant to their community

* The project under Alternates B-E will have long term, adverse effects to the visual, auditory, and atmospheric conditions at the Minidoka Site

* The project under Alternates B-E will diminish the Japanese American Community (Nikkei) a place to remember and reflect the atrocities that occurred at this site to themselves, their families, and friends

* The Minidoka Site and surrounding area is a Site of Conscience. This sacred landscape is important to the Nikkei and is a place of remembrance. Turbines will alter the character of the expansive views of this isolated agrarian landscape and the noise and lighting as well as dust during construction and other necessary operations will diminish the experience of people visiting the site and will negatively affect the property's intrinsic value

* The project presents long term, adverse effects to wildlife habitat and population

* The project presents long term, adverse effects to the Snake River Plain aquifer

* The project presents an eyesore to the pristine beauty of the rolling lava hills and agricultural landscape

* Physical impacts would be permanent. The impacts duration for non-physical visual impacts from project infrastructure is the 34-year life of the project, from the start of construction through decommissioning, and the impact duration for non-physical audible impacts (from turbines and transmission lines) is the 30-year operation phase.

Comment ID	Sender	Public Comment
		Although there is a Programmatic Agreement in place that addresses responsibilities for Section 106 and mitigation plans to minimize the adverse effects of the project on cultural resources and spiritual places of importance to the Nikkei and Native American communities, these proposed efforts may not be enough to maintain and protect the values of these properties. I hope you will consider my comments and join me in voting for ALTERNATE A NO ACTION. Sincerely, Claudia Walsworth
3644-1	Colleen Vadheim	Haven't we done enough to the Japanese Americans? Please honor their sacred ground and look elsewhere to place your wind turbines. Thank you. Margaret Vadheim
3703-2	Julie Erickson Simonds	And, within the proposed Lava Ridge development is the Minidoka National Historic Site. I feel it is so disrespectful to impact this area that has been designated as a memorial to the Japanese-Americans who suffered here.
3725-2	Jerry Ball	The project diminishes my experience of The Minidoka National Site that is also enjoyed by many others because of the giant wind turbines that will be a giant eyesore on the landscape. Reconstruction of the Site is both historically and culturally of a great importance to the Japanese Community. Disturbing the viewscape, soundscape and viewable landscape should be unacceptable.
3750-1	Marylyn Feaver	I was a 7 years old sansei when Japan bombed Pearl Harbor. I was living then on the Big Island of Hawaii and could not fully comprehend how that aggression would change the lives of many Japanese-Americans in the US. However, it was hard to ignore. In Hawaii we called these "concentration camps". Throughout my growing up and formal education years, the experiences of those who were forceably moved to isolated barbed enclaves seemed less disastrous than the genocide occurring in Europe. As I grew older, and moved to SW Georgia during the Civil Rights struggle to help with voter registration, the implications of what happened to Japanese-Americans took on a more personal connection. I could not separate myself or my history from what happened during those years, and vowed that one day I would visit these sites. Having read accounts, I am hoping to try to imagine what it was like for an 8 year old, which I would have been, had I been sent with my nissei parents and my issei grandmother to one of these camps. The sparseness of the geography, the winds blowing and the feeling of isolation, I expect might help me to connect. Being that these are government lands, and I am grateful for the EIS process so ordinary citizens like me can comment, the historical value of a site must include the ambiance. My children also carry European lineages, but my grandchildren have either Japanese or Hawaiian first names. I would wish that these national commemorative places be there as historically accurate experience so they, too, can imagine that this Executive Order was questionable. Monuments as these, like The Little Big Horn Battleground in Montana, are reminders that our uniqueness as a nation is our diversity and willingness to remember when we have strayed from the pledge of one nation ... "with liberty and justice for all". I am grateful that the national government has pledged to restore and recreate lasting monuments for certain of these camps, but in this case, I hope that the experience, not just the site, will be considered. As someone who has changed our lifestyle to conform to more sustainable ways, I support the move toward government support of alternative energy. But, the sense of who we are as a people, are also important, too. Please do not allow the wind farm.
4031-1	No Name Provided	Survivors and descendants of Minidoka incarceration oppose Lava Ridge (magicvalley.com) <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fmagicvalley.com%2Fnews%2Flocal%2Fsurvivors-and-descendants-of-minidoka-incarceration-oppose-lava-ridge%2Farticle_b90c4c3e-b47a-11ed-be3d-7b6c6f1f8187.html%3Futm_source%3Dmagicvalley.com%26utm_campaign%3D%252Fnewsletter-templates%252Fnews-alert%26utm_medium%3DPostUp%26lctg%3D5646104%26tn_email_eh1%3D58f7b15e3b93e624e23ae3451d2ff44d181ebfa9&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C0ba9be85a98643b9ee5508db18e767db%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638131154374383130%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=PMKAKvZElox73iFp5CurAb6FT7%2BO1G6Z9T4NF0Lb52c%3D&reserved=0> During World War II, President Franklin D. Roosevelt issued Executive Order 9066, allowing the War Relocation Authority to forcibly move 120,000 Americans of Japanese descent from their West Coast homes to inland internment camps. Minidoka National Historic Site, north of Eden, is one such camp, which confined 13,000 Japanese Americans, primarily from Washington, Oregon and Alaska. Karen Hirai Olen was born at the internment camp; her family was released when she was 18 months old. Her father had gotten a job as a farm hand near Curry, so the family stayed in the Magic Valley. Hirai Olen said that, growing up, she never knew exactly what had taken place. It wasn't something her family discussed. My parents never talked about Minidoka, really, she told the Times-News. When my mother's friends would come to visit they all spoke amongst themselves in Japanese. So we knew it wasn't something good, but we had no idea what happened. Many descendants of survivors of the incarceration have said the same thing: It wasn't something that was discussed. The pain was too raw. The forced removal of Japanese Americans from their communities devastated their lives and erased livelihoods. Many lost all their possessions that didn't fit in a suitcase. The effects are still felt in the community, several generations later. I would ask my mom different things and she would just kind of give me non-answers, Hirai Olen said. I really didn't understand what it was all about until we started going on the pilgrimages. The first Minidoka Pilgrimage for survivors and descendants took place in 2003, and have taken place regularly ever since. The pilgrimages have been described as an act of healing, giving survivors and descendants a space to recognize and overcome the wrongs of the past. It was on one such pilgrimage in 2007 that Hirai Olen said she finally heard her mother discuss her experiences of incarceration at Minidoka. It was a tremendous act of healing, she said. When you see 300 or more people at Minidoka, the sense of healing is so strong and the sense of cohesion within our community. We can come together about this 60, 70, 80 years later, I think that's something that needs to be valued. The land was the prison' To many survivors, Minidoka is sacred ground. The nonprofit Friends of Minidoka's mission is to preserve, protect, and educate. Executive Director Robyn Achilles told the Times-News that the group wants to make sure the story of incarceration is recognized and treated in an honorable and somber manner. You can imagine, for the Japanese-American community, incarceration is an incredibly painful and important part of our history, Achilles said. It really defined who we are, sadly, and how we were raised, and what we experienced after incarceration. The Japanese-American community adamantly opposes an application to place up to 400 wind turbines on Bureau of Land Management ground north of the Minidoka Historic Site. When LS Power and Magic Valley Energy applied for a right-of-way permit from the BLM for the sprawling wind farm, many in the Japanese American community felt the progress made in the last 80 years toward acknowledgement of the violations of civil liberties would be a step backwards. When we found out about this proposal, we were shocked, and it was so painful because it felt like another attack on the Japanese-American community, Achilles said. We feel like the proposed project minimizes the trauma, the loss, and the humiliation that was suffered by American citizens based solely on their ancestry. The sense of isolation the incarcerated community experienced was amplified by the remote landscape, with vast, sweeping views, surrounded by emptiness. The possibility of a visual wall of spinning wind turbines interrupting the viewshed would alter that key feature, she said.

		One of the fundamental values of the park is the remote setting and immersive experience, Achilles said. Eighty years ago there was barbed wire, but so many of the survivors said the reality was they weren't going to escape because the land was so remote and desolate, where would they go? The land was the prison. Alternatives shaped by public comment During the scoping period in 2021, a majority of public comments submitted expressed concern from the Japanese-American community about the impact the wind project would have on Minidoka. The draft Environmental Impact Statement <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Feplanning.blm.gov%2Feplanning-ui%2Fproject%2F2013782%2F510&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C0ba9be85a98643b9ee5508db18e767db%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638131154374539358%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=%2FberRef0HJnFtdNayHCnvlCQ3LrpRxFs1kg6oYVUGpM%3D&reserved=0> for the project was released in January and is now in the public comment period, which has been granted a 30-day extension <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fmagicvalley.com%2Ftncms%2Fasset%2Feditorial%2Fdbda8dac-b3ad-11ed-b522-8fb3a8c75742&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C0ba9be85a98643b9ee5508db18e767db%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638131154374539358%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=fT8LZhp91lDbjAuNX9Xv03lQ3rLaMji%2BG3E%2FTtOEMko%3D&reserved=0> and will close on April 20. Driven by the volume of comments concerned about the impact to Minidoka, the draft EIS evaluated three scaled-back alternatives that would reduce the visual impacts to Minidoka, in addition to evaluating the project as proposed by the applicant. In Alternative B in the draft EIS, the nearest wind turbine would be sited approximately 1.7 miles from the Minidoka National Historic Site's visitor's center. Alternatives C, D and E all have a reduced footprint, with wind turbines sited farther away from the historic site. Alternative D would put the turbines the farthest from the site — less than 6 miles from the visitors center. Under all alternatives, windmills would be visible from the site. Broad community opposition Janet Keegan is on the Friends of Minidoka board, and is active in the Stop Lava Ridge Committee. Keegan, a lifelong resident of the Magic Valley, is not only opposed to the project based on its impact to the historic site, but also because of the likely impacts the project would have on people who hunt game, people who graze cattle and people who farm. I feel like if the government were to approve it in any form, it would be another transgression such as incarceration was, Keegan said. It would take away livelihoods and way of life for the people in the Magic Valley who live and depend on that land. Keegan said she feels good about the ability of a community effort to halt the project. Hundreds of people showed up to two open houses the BLM held for the project in Shoshone and Twin Falls. The amount of community participation is encouraging, Keegan said. I'm totally optimistic, I think that this thing could be squashed, Keegan said. Idaho has enjoyed years and years of just being able to recreate and enjoy our open spaces. And now we're confronted with this threat. And we have to take care of it. We have to face it. To facilitate participation from the Japanese American community, the BLM is hosting open houses in Portland, Oregon, and Mercer Island, Washington. State and national partners like the Japanese American Civil League and the Japanese American Museum of Oregon are helping to spread awareness, and encouraging members of the community who are outside of the Magic Valley to participate. Heather Tiel-Nelson Twin Falls District BLM Public Affairs Specialist
4161-1	Brian Ito	Dear Bureau of Land Management, Minidoka was not a summer camp. It was an American Concentration Camp. It is a cemetery of souls whose lives were forever changed. Where the lives of people like you and me were broken apart by order of the United States Government. Minidoka does not stand alone. Along with 9 other Sites of Shame across America, it bears witness to an arc of Anti Asian racism that started many years earlier. I plead with you of the Bureau of Land Management to let your hearts and minds see Minidoka as we do, a testament to a pain that lives on to today; as well as a symbol of the undying spirit of our fathers and mothers, grandfathers and grandmothers, aunts and uncles who persevered despite adversity to make a better life for all of us, including you. I plead with you to stop the Lava Ridge Wind Farm. In search of cheaper electricity it will desecrate this sacred site of Minidoka. Respectfully yours, Brian Ito
4220-8	Sue Page	They can liter the ground with dead birds around this site and the whole area. These beasts with flashing lights will dishonor those Japanese Americans who were displaced from their homes and treated with disrespect. To belittle this site by placing these beast here is shameful.
5281-1	Dan Handa	Renewable "Green Power" for Southern California, but at what cost? My grandparents, father, uncle and aunt were incarcerated at Minidoka during WWII. So were many, many other Japanese American friends and relatives of mine. I visited Minidoka in June 2016 and while there isn't much left of the camp remaining from the war I was moved by the location, its remoteness, the quiet, and the stark beauty of the dry Idaho countryside. It was not difficult for me to understand why the War Relocation Authority picked this remote windswept location to intern Japanese Americans. Giant wind turbines as a high as a 75 story building which will be visible for tens of miles as well as occupy an tens of square miles? All three affected Idaho counties have voiced their opposition to the project. Wind turbines of this scale and numbering in the hundreds should not be allowed to desecrate Idaho or frankly any other part of our country. My primary concern is the desecration of the Minidoka National Historic Site, however even if the historic site was not there I would still support the Idaho area residents. It is hard for me to fathom how this huge project has progressed as far as it has under the radar. I only recently found out about this project from the local news media in the Seattle area. I believe there are many others like myself who reside outside of Idaho who are not yet aware of this project who would wish to comment in opposition to a project.
5382-1	Wanda Yamagata	My family was not incarcerated in the Minidoka Hunt Camp but were fortunate to have been long time residents of Jerome County and were able to purchase a farm which just happened to be in the future camp area. Many of our family friends were people who decided to remain in this area after the camp closed. It is an affront to those people to have this project built so close to the area that holds so much significance to them and to the remembrance of such an embarrassing time in the history of our country. A time which should not be forgotten.
5625-1	Michael Klein	Just speaking from the heart, as a Seattle local and business owner. I really hope you're able to find a new location that doesn't disrupt the hearts of those who care so much for preserving the old internment camp location. The Japanese are incredibly kind and symbolic people. It's just not right to choose that location.

Comment ID	Sender	Public Comment
5896-3	Mike Tylka	Minidoka War Relocation Center. To build in and around this historic landmark would be an affront to our local Japanese ancestry population and other families now relocated from the area. One of my next door neighbors had immediate family members illegally detained at the camp by the hateful racist democratic party of the time.
5921-1	Claudia Taylor Walsworth	* Throughout the EIS documents, the Japanese American community, Native Americans with Treaty Rights, and Low Income communities should be regarded as stakeholders, not tourists or recreationists. [...] * The project under Alternates B-E will have long term, adverse effects to the visual, auditory, and atmospheric conditions at the Minidoka Site * The project under Alternates B-E will diminish the Japanese American Community (Nikkei) a place to remember and reflect the atrocities that occurred at this site to themselves, their families, and friends * The Minidoka Site and surrounding area is a Site of Conscience. This sacred landscape is important to the Nikkei and is a place of remembrance. Turbines will alter the character of the expansive views of this isolated agrarian landscape and the noise and lighting as well as dust during construction and other necessary operations will diminish the experience of people visiting the site and will negatively affect the property's intrinsic value
6356-5	Gayle Michelucci	WE SHOULD NOT DESIGRATE THE MEMORY OF THE JAPANESE. THAT AREA SHOULD BE REMOVED FROM THE PROJECT, UNLESS SOLAR IS USED AS COVERING GOR THE PUBLIC THAT VISITS.
6380-1	Eileen Miyao, Stanley Miyao	We oppose the Lava Ridge Wind Energy Project as it will disrupt an important historical U.S. site that must be preserved. In 1942, 20,000 residents of Japanese descent living on the west coast were exiled to one of 10 concentration camps located in desolate areas of the US. Minidoka was one of such camps. Most of those exiled to the concentration camps were US citizens. The living conditions were inhumane as families were cramped together in makeshift, tar-papered barracks. Barbed wire fences contained them in the camp. Guard towers were manned with armed soldiers; rifles pointed inwards towards the Japanese prisoners ensuring they did not try to escape. We grew up in California during the 1950-1970's and there was no mention of the incarceration of the Japanese Americans in school curriculum nor did we have classroom discussions on this topic. Our education did cover historical material on the German death camps and black slavery in the US. But Japanese Americans incarcerated in concentration camp in America? It was like it never happened! In early January 2023, President Biden signed a new bill that will help memorialize the history of the U.S. government's incarceration of Japanese Americans during World War II. The legislation would reauthorize funds that help preserve the sites in which tens of thousands of Japanese Americans were detained. The act will not only renew funding for the 2006 Japanese American Confinement Sites Program, but also designate $10 million for grants to understand the "use and abuse of power," and promote awareness around this dark period in American history. of every American," said co- Today, the existence of camps such as Minidoka, in an untouched state, allows Japanese Americans and all visitors (especially those who are unfamiliar with the Japanese American experience during World War II) to see and mentally experience what the Japanese Americans lived through during World War II. We went to one of the few remaining camps and could not believe that our parents, grandparents, aunts, uncles, and cousins had to live there. We had heard their stories about camp life but did not realize how bad it was to have to live there; until we saw it first-hand. We wanted to return to our home after a few hours on the camp site. How could America treat its citizens like that? Unbelievable!! Current Americans need to know what happened here so that history does not repeat itself. Who would believe it today? We need to preserve Minidoka in its current state as a reminder that this happened in the United States in 1942-1945 solely because of "racial prejudice, war hysteria, and a lack of political leadership." And it can happen again to anyone! We oppose the proposed Lava Ridge Wind Energy Project and ask, "How does the addition of wind turbines at Minidoka National Historic Site preserve the site as proposed by the new bill recently signed by President Biden?" The Wind Project will change the entire environment at Minidoka by destroying the peace and tranquility in the area. Visitors will be turned off by the sights and sounds of the turbines and eventually the site will no longer be frequented by visitors, leading to its future closure. How does eliminating one more of the 10 concentration campsites promote awareness about the dark period in American history? We respectfully ask that the BLM choose Alternative A, the No Action alternative.
6403-1	Satsuki Ina	Minidoka War Relocation Authority unconstitutionally held over 13,000 Japanese Americans depriving them of life, liberty, and the pursuit of happiness. It is a site of shame and as such a site that must be preserved for the healing of survivors and for all Americans to learn from the mistakes of those in power who fell victims to racism, wartime hysteria, and the failure of political leadership. Most of us want an environmentally sound alternative form of energy and would support such plans, but NOT ON A CULTURALLY AND HISTORICALLY SIGNIFICANT site. We who go to pilgrimage at Minidoka are not "tourists" and "recreationalists" as stated in the report! We are SURVIVORS AND DESCENDANTS who seek healing and learning by preserving and honoring a site where people can be reminded to never allow such a failure of humanity to occur again.
6830-1	Erika Jennings	Being of Japanese American heritage, with relatives that were incarcerated at what is now the Minidoka National Historical site, there is a large potential impact on how I am able to experience the area if this proposed development is allowed. Visiting the site holds a very emotional connection for me and my family. I visited with my husband and daughters several years ago and we were all shocked and unsettled by the barren, exposed and desolate feeling of being in a place with little vegetation and civilization surrounding it. Trying to imagine the desolation and isolation that my grandma and grandpa, aunts and uncles must have felt as we looked across dusty land with nothing as a landmark or comfort of the Willamette Valley that they had been forced from, we were overcome by emotion. The eerie silence and stillness in the air were both oppressive and haunting. The addition of transmission lines, turbines, battery stations and other developments that are included in this proposal will vastly change the feeling of the historical site if they are visible, audible or felt leading up to and at the site itself. Those developments would alter the stillness and exposure that overshadow that historical site, which is integral to the experience and learning that happen there. With all the division and hate within our society today, we run the risk of repeating mistakes like incarcerating US citizens that were never shown to be a national security risk, if we don't preserve the character and integrity of historical sites like Minidoka. Please don't make the mistake of denigrating a historical site that has so much potential to impact how we behave as members of the human race.
6844-1	Lenore Chinn	Please protect Minidoka National Historic Site from a massive wind farm project that would only serve to benefit corporate entities and desecrate a sacred site where more than 13,000 Japanese Americans were unjustly imprisoned at Minidoka during WWII. This area has tremendous cultural and historic significance which must be preserved as a reminder that unlawful detentions motivated by wartime hysteria not be repeated. I urge you to take a leadership role in recognizing this legacy in the interests of advancing environmental justice. A sustainable, greener future must center impacted communities, and not further harm them. Minidoka must be protected as a place for healing and learning for future generations of all Americans.
6870-1	Name Not Provided	As a descendant of Japanese American survivors from Minidoka, the Lava Ridge Wind Project makes me seethe with disgust and feel heartbroken. How can the government betray our community by first apologizing for the injustice of the incarceration, then designating Minidoka National Historic Site to learn about the injustice, and then commit yet another injustice against the Japanese American community. The Lava Ridge Wind Project is environmental injustice after we have experienced social and racial injustice. Only the NO ACTION alternative is acceptable and the right thing to do. Even though the BLM is trying to "minimize" the impacts to Minidoka with Alternatives C and E, both alternatives have the negative impacts of hurting our community and further tarnishing the reputation of the Department of the Interior. I am shocked and appalled that Secretary Haaland and National Park Service Director Sams would allow the project to move forward. It is unconscionable for indigenous leaders who espouse caring about equity and environmental justice to support this project. Any of the action alternatives for the Lava Ridge Wind Project would desecrate a place that holds so much historical trauma to the Japanese American community. We are not tourists and recreationists; we are survivors and descendants still healing from the injustice inflicted by the government and Department of Interior on our community. No mitigation is acceptable to me. If the Lava Ridge Wind Project is developed and the wind turbines are spinning across the Minidoka skyline, I will forever feel betrayed. I doubt if I could ever go there again. The Minidoka Pilgrimage will be severely negatively impacted if people like me no longer feel a connection to Minidoka as a place of healing, and rather think of it as a site of betrayal. No money or project could make up for this impairment and unacceptable impact to Minidoka, a place that

Comment ID	Sender	Public Comment
		scarred my family and community during World War II and now is a place for education, healing, commemoration, and upholding the dignity of the nation. Who ever makes this final decision should know that any alternative, except the no action, will be a major blow to the Japanese American community, and a huge step back in the progress of our nation in healing historical wounds and righting wrongs.
6874-1	Name Not Provided, Robert Barr	I feel a part of history as important as this must not be disturbed. Too often these days misinformation is provided to us and it's places like this where you can come and share tangible evidence of our horrible past. We must know that we too are not above committing acts of systemic racism for the benefit of security. We must be ever vigilant to hold ourselves and our government responsible. This Hallowed ground must remain a symbol of the sacrifice forced upon our own that should never have occurred. So many of them had sons who still fought in the European theater out of honor, for a country who showed them no respect. Therefore we must now and forever respect this place.
6876-4	Jonathan Jarvis	Having worked closely with the Japanese American community for the preservation, interpretation and restoration of these sites, I can attest to their value and importance as places for healing and learning. American citizens, many born in this country, were rounded up and forced into these lonely landscapes for no other reason than their ethnicity. Obviously, this was an act of the federal government, enforcing President Franklin D. Roosevelt's Executive Order 9066. It is through the preservation of these sites that we as a nation can recognize and hopefully prevent actions that violate basic constitutional rights, even during times of war.
6876-5	Jonathan Jarvis	Preserving sites of conscience alongside sites of commemoration is a uniquely American practice, valuing these hallowed grounds for the messages they deliver to successive generations that we are willing to learn from our mistakes. Once again, it is the federal government who can decide on the fate of these historic sites. When one travels to Minidoka, Manzanar, Tule Lake or other confinement sites, the desolate isolation is evident and essential to the experience. Ironically, the War Relocation Authority which was established to manage the ten confinement camps was an agency of the Department of the Interior under the thoughtful stewardship of Sec. Harold Ickes. Today, the BLM and the NPS, both agencies of the same DOI, wrestle with this legacy and the conflict created by energy projects like Lava Ridge.
6879-1	Katherine Laubscher	The greatest experience of my life to date has been going on a pilgrimage to a Japanese-American incarceration site where my great-aunt was held. Part of what made this experience so special was the way the landscape had been preserved. Each incarceration site was, by definition, selected because it was situated on land where no one else wanted to settle (with the exception of the Colorado River and Gila River camps, which were established against the will of the American Indians who by rights possessed the land). So each "camp" is characterized by its own version of desolation and wide open space. That vast emptiness is a core characteristic of these camps; the scale and openness of the land is the underlying theme that connects the camps across climate and state. The simulations provided by the BLM are all too convincing: the proposed turbines would irrevocably disrupt and ruin the quality and the sanctity of the space that Minidoka holds for thousands of Americans. The simulations show a nightmarish future prospect, an alternate reality that I sincerely pray never comes to pass. A visit to Minidoka is more akin to a sacred pilgrimage than a tourist visit. It is a living site that still holds memories for those who are here to recall them, and one that holds real, visceral energy for anyone who has a connection to the camps. Please know that the Shinto religion also places a great importance on the sanctity that a certain location can hold. Minidoka is one of those locations. The grounds of Minidoka played host to the fullest of human experience, from suffering, to perseverance, to even great art in the face of oppression, as in the case of the famous woodworker and artist George Nakashima. These camps must be preserved as the historic sites they are. Enclosing them with massive structures and disrupting their skylines threatens to reduce them to soulless markers. The incarceration campsites embody the Japanese-American incarceration on a spiritual and literal level. Damaging them damages our collective history, and threatens our future. I believe this project would only serve to make it more difficult to preserve the Minidoka site the way it ought to be preserved, both on a historical and humanitarian level. The Lava Ridge project would be detrimental to countless generations to come and cause irreparable damage to the Minidoka historic site.
6882-1	Will (No Last Name Provided)	It is shameful and racist to continue with the Lava Ridge Wind Project. How dare the Bureau of Land Management auction off the remaining shreds of integrity to LS Power so blatantly. Completely dismissing the concerns of Japanese American concentration camp survivors as "tourists" is cruel and heartless.
6906-1	Karen Lucas; Twin Cities Japanese American Citizens League	It is disconcerting that this site has been selected to place a 400 wind turbine energy farm with the knowledge that a National Historic Site was already in place. In the large state of Idaho, there are other sites without National Historic Site designation. The message of discounting and disrespect was apparent from the start of planning. It was disregard and outright hostility which created the site back in a supposedly less enlightened time 80 years ago, a violation against Americans of Japanese ancestry deprived of due process. After the concentration camp was closed in 1945, property was open to homesteading but restricted to whites. The lessons of a threatened constitution and civil liberties are fundamental to preserving a democracy under constant siege. There is no better visceral impact than the physical experience of that offense, the immersion in the stark, barren, forsaken reality of the landscape which would now be altered by the intrusion of wind turbines.
6906-3	Karen Lucas; Twin Cities Japanese American Citizens League	As a third generation Japanese American, I personally feel the denigration this project casts on my community. Both of my parents' families were imprisoned for 3 years on a desert in Arizona after having lost everything due to their forced removal from California farms. My father at the time was a US Army soldier who ended up serving with the Military Intelligence Service in the South Pacific as well as in Occupied Japan. He retired a major after a 20 year US Army career and prided himself on being a patriot his entire life. Japanese Americans are all too familiar with this process. This National Historic Site which is managed by the National Park Service, with its profound message, is currently underfunded relative to similar National Historic Sites established around the same time with no more compelling interests than this one. Perhaps it is time for the tone to be reset to one of equal consideration, fairness and justice for all Americans, and curbing the one sided powerful and monied interests over the people who suffer the consequences.
7299-1	Virginia Hand	I learned of this proposed development from the Minidoka Pilgrimage group. They are opposed to the disruption of what, to them, is sacred ground. I have followed their activities for years and know that these annual visits are a deeply moving and emotional tribute to their history and ancestors. For the BLM to describe Minidoka as simply a tourist and recreational site is insulting and dismissive. The US government made a cruel decision when all citizens of Japanese ancestry were originally sent to internment camps. The Minidoka Camp has been declared a national historic site, a step toward healing and acknowledging the damage done to those people. Please respect that history. To build a disruptive wind project adjacent to that site is a step backwards. Do not reopen the wounds from this ugly chapter of US history. Find another site for the Lava Ridge project.
7318-3	Linda (No Last Name Provided)	Negative impact on the Minidoka National Historic Monument which "now stands as a memorial to the nearly 10,000 Japanese Americans forced to relocate here during World War II." It would be disgraceful to spoil the land on which this historical monument stands. It is sacred and a reminder to us all about the evil of oppression. The Lava Ridge project and the plans to place others close by will greatly affect the sanctity of this area.
7331-1	Carol Clapp	It would be virtually impossible to convey what it was like to be interned at a place of such desolation if it is no longer desolate as is proposed. The historic value of this site and what sets it apart from other arid swaths of land is what happened here and how it must have been experienced; the proposal changes that experience.
7340-1	Rich Iwasaki	My issei (first generation) grandparents and my nisei (second generation) mother were incarcerated at Minidoka during World War II. As a sansei (third generation) Japanese American citizen, I'm very concerned that the number and size of the proposed wind turbines will dramatically affect visitors who come to remember and honor all those who were unjustly incarcerated at Minidoka during World War II. For many Japanese Americans, the Minidoka site is a sacred place of reflection and healing for the survivors and their descendants. The traumatic experience of Minidoka affected thousands of issei and nisei, and the site is a stark reminder of lives drastically altered and changed forever. The stories of the unfair imprisonment of Japanese Americans must be told to educate those who remain unaware of the unjust loss of civil liberties that befell innocent US citizens. A forest of wind turbines will greatly diminish the profound impact of the Minidoka experience on descendants and others who come to learn and commemorate the time of inequality and race prejudice. It is vitally important that every visitor viscerally experience and understand what happened during this dark chapter in American history. While I and many others are not against alternative energy sources, all of the proposed wind turbine alternatives near the Minidoka site will have a negative impact on the integrity of this sacred and historic site.
7355-1	Name Not Provided	Use of Minidoka for BLM's purposes is a further insult to the Japanese American (JA) community who's civil liberties were already totally disregarded by our nation's government via incarceration of an targeted ethnic group. The wrongs of this act/EO9066 have been acknowledged by our government via reparations to the JA community whom were incarcerated. Through your proposal to develop Minidoka for general use other than the preservation of a historical site, BLM will be falling short of its mandate from Congress to ensure natural, cultural, and historic resources are maintained for present and future use. Use another piece of land.

Comment ID	Sender	Public Comment
7357-1	Name Not Provided	Please do not move forward with the Lava Ridge Wind Project. The proposal has not taken into consideration the effect of the project on the Japanese-American community, who use Minidoka National Historic Site as a place of remembrance and healing. Completely altering the landscape of this site will erode the sacredness of this place for a community who has already been mistreated time and time again by public authorities in the United States. The needs of the Japanese-American community are just as important as any other cultural group's needs, and should not be treated in this way. Please listen to the community.
7358-1	John Okada	Let me start by stating that I am the son of incarcerated parents that were held at a relocation "camp." Although, my parents were incarcerated in Tule Lake, not Minidoka, I can say without a doubt that the land is sacred. You don't really get the feeling of how large these camps were without visiting and truly visualizing the enormity of the camp which held approximately 10,000 people unjustly and unconstitutionally held behind barbed wire fences with guard towers all around. Because of this and the reasons below, I would object to the Lava Ridge project. The DEIS fails to adequately protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience. The DEIS inappropriately identifies Minidoka NHS as for "Tourists and Recreationists" which reflects ignorance of the history of the location and its impacts. As stated above, this is a place of reflection and healing for survivors and descendants, as well as an educational benefit to make sure something like the incarceration never happens again. The DEIS fails to recognize the importance of the cultural landscape and preserve the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its immersive educational experience. The DEIS fails to protect the view-shed. A "moderate" degree of visual change as stated fails to protect the integrity of Minidoka NHS. The only option that comes close is Option E. The BLM failed to notify the impacted population in Idaho and throughout the US before the Notice of Intent was posted on August 20, 2021. The BLM has shown a lack of deep knowledge of the history of the cultural properties of the site, that after WWII, the incarcerees were dispersed throughout the country. The DEIS: o Failed to include the importance of the education about the negative psychological effects of incarceration at Minidoka. See Donna Nagata's study here: https://psycnet.apa.org/record/2021-05763-007. o Failed to include the preservation of "immersive feeling of isolation" and somberness that, like protected at other National Parks such as the site of the Battle of Saratoga, Saratoga National Park, instill reflection and education on the historical event of the unjust incarceration at Minidoka. o Does not reflect nor address cultural competency as mandated in President Biden's Executive Order on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders. o Does not include potential cumulative effects as other projects are being planned in the area.
7367-1	Lynn Yarne	I am a descendant of Minidoka survivors. My aunties, uncles, grandparents, and their parents were incarcerated at Minidoka. It is a wound. The Lava Ridge project gives me concern because disrupting this sacred site is a disruption to the healing of thousands of descendants who have been impacted. To place historic significance upon sites such as Minidoka is to speak to the importance of our past wrongdoings and commitment to a more equitable future. To treat Minidoka as simply a tourist site is to again silence the experience of our community and minimize the impact of our society's wrongdoings.
7379-1	Michele Fritzler	Please come up with a better solution and don't violate the sacred Minidoka land. Imagine going to Dachau or Twin Towers or any other memorial site meant to remember atrocities that should never happen again, and meant to remember the victims of the atrocities; and instead of a memorial, finding wind farms. As if to say, we found something more relevant to do with this land. That the land use is more important than remembering and solemnly committing to not diminishing the horrors done, in this case, the Japanese Americans being interned into camps Americans on American soil, by Americans!
8396-1	D. Handa	My grandparents, mother, father, aunts and uncles were all incarcerated here. In June 2016 I visited the Minidoka Historic Site and I was moved by what remains of the camp, its stark scenery, the remoteness, and the desolate dry surrounding countryside. The Minidoka National Historical Site is considered one of the most endangered in the country.
8610-2	Jaime Thietten	The World War II Japanese-American incarceration camp is NOT a place where “tourists and recreationists visit” as LS Power’s EIS refers to the visitors who come to this site. They are mourners, family members, and survivors coming to honor those who died or were incarcerated here. Belittling these visitors shows LS Power’s selfishness and lack of concern for not only our lands but the people who live and visit here. This misrepresentation is like calling our Veterans and their family members who visit the Vietnam Memorial “recreationalist and tourist”.
8624-7	Public Comments via Remote Video	The draft environmental impact statement process neglects to comprehensively account for the emotional impact on the internees, and especially on their children during their internment. The emotional effects of the internment, as those created by my reoccurring nightmare, illustrates that it has not been adequately addressed by the DEIS. Furthermore, the emotional impact has not been accounted for in the BLM's analysis of the impact of the proposed wind farm on the setting, emotion, and feelings associated with this historic site. The DEIS doesn't adequately include a framework and baseline for an emotional impact statement for the Japanese Americans interned at Minidoka. Finally, the bibliography supporting the BLM's analysis of the emotional impact of the Lava Ridge Farm on the Japanese American community is totally inadequate.
8626-14	Public Comment Mercer Island Community and Event Center	Having been to the site, I just feel like if the windfarm thing goes through, it's just going to totally ruin the -- I guess the emotions and the feelings, because it's going to make it so -- if that technology is coming in, all those things are coming in, and the sacredness of the site is going to be ruined. And I believe, you know, people say, well, it's a tourist spot. This is not a tourist spot. It can be, but for many of us who go there, it's much deeper than that. It's a place where we need to remember and not forget that this is part of U.S. history, not just Japanese American history, and it's so vital that we keep the -- I guess the environment the way it was.
8626-16	Public Comment Mercer Island Community and Event Center	I'm Erin Shigaki, and I'm a descendant on both sides of my family of the Minidoka concentration camp. And I support Alternative A, No Action, in regard to the Lava Ridge Wind Farm Project. That's it.
8626-24	Public Comment Mercer Island Community and Event Center	I just wanted to add on the record it was a little disappointing that some of the BLM staff like head of Public Affairs and a couple of others whose names I didn't catch were looking at photos of survivors and talking about how cute they were. I think it was pretty demeaning, and I just think, you know, they brought photos of them at the incarceration site that showcased that they were, you know, child prisoners, and then they just were told about how cute they were. So I just wanted to provide that comment just as a point of feedback, as a wish that, you know, we continue taking these conversations seriously and acknowledging that, you know, these were children prisoners. So, yeah, thank you.
8665-1	Ken Mochizuki	My comments regarding the proposed project are presented in this letter. My parents, grandparents and aunts—all were forced to spend some time, or the entire time, at the Minidoka War Relocation Center from 1942-1945. I had an uncle who was already serving in the U.S. Army before the outbreak of World War II—his name is listed on the Military Honor Roll monument at the entrance to the now Minidoka National Historic Site. Those family members never, or hardly ever, talked about when they were confined at Minidoka, or ever expressed any interest in visiting the site of their wartime incarceration. When asked about their time in “camp,” they answered with general or vague responses, indicating that that time in their lives was to be left in the past and was too impractical to be remembered and revisited. Or was there another reason? Michi Nishiura Weglyn, author of Years of Infamy, her book which was the first to expose the actual policies and actions of the U.S. government to establish and operate the “relocation centers,” said: “Many Japanese Americans have been quiet about the internment for all these years because it’s still painful to talk about what happened to us.” Was that, or part of, the real reason why my family members never openly talked about their time at Minidoka? Those in my family who were confined at the Minidoka camp are now gone. Other Japanese American families were more fortunate with learning about their pasts. A daughter of a Minidoka camp survivor talked about when she and her father attended the annual Minidoka Pilgrimage:

Comment ID	Sender	Public Comment
		"… Basically, my dad had always shut down every time we tried to get him to talk about his experiences at Minidoka. Finally, when he was around 82, I asked him why he didn't ever want to talk about it. My dad said that he still got really angry about that time in his life and couldn't really articulate much more than that anger. In fact, he got visibly angry as he was explaining this to me. "We finally convinced him to come on a pilgrimage because it was good timing for most of our family to go, with mom, my aunt and uncle, and four of the five kids with some of the grandkids, too. As we arrived in Boise, and drove to Minidoka, my dad made a lot of comments like, 'I haven't been back here since I was 12 years old' (the year he was when he was incarcerated) and other observations about how the place has changed or stayed the same (it was very hot!). So, I think he was already beginning to look at the camp experience in a different light, actually being at the site of the camps. There were also other former incarcerees at the pilgrimage that he knew, so that helped him to become more comfortable as well, I think. "It wasn't until the third day, after we had had a couple of workshop sessions, toured the old barrack, and seen the canal and the entry of the camp when we had the small group discussion where my dad was invited to speak because he was one of only two former incarcerees in our group of a dozen or so. My son and I were fortunate to be in the group with him. My dad mostly talked about what camp was like in terms of the physical grounds, and a bit about having some sports to do, and also school (which he admitted that he sometimes didn't go to). But he also talked about how he was often by himself or had to look for his friends because the family was split up (his own dad worked elsewhere in the camp, his older brother was with his friends and then found a job in camp, and his sister eventually moved out of camp because an influential friend's family was able to hire her as a housekeeper back in Renton). He talked about not having his mom because she had died a few years before the war from illness. "He seemed really comfortable telling all this to complete strangers, as if he realized that there weren't many left to pass on this information, so he was concentrating on communicating well with the group. When he was done talking for a few minutes, one man thanked him because his father had never told him anything about the camp experience and had since passed, and others thanked him as well. My son and I were pretty surprised that dad spoke about so much, with much detail and so long, as this was the first time he had opened up to us and he usually didn't talk very much. Also, after the pilgrimage, he let me videotape him talking about more of his memories of camp and his childhood. "… [H]e was reluctant at first, but then being actually at the site somehow made it important for him to speak out, or maybe he felt relieved that he was able to come back to the site of such trauma and be okay." As the daughter said, her father was not there as a "tourist," but was healing from trauma in his past. This is why the land within seeing and hearing distance around the Minidoka site is essential to be left the way it presently is. Those who were confined at Minidoka need to see what they saw around them back then. This daughter's story illustrates why the descendants of the Minidoka camp survivors consider the Minidoka National Historic Site as a sacred and revered place to revisit and learn. The Lava Ridge Wind Project would have more to gain if it showed a simple act of respect by not erecting the wind turbines there.
8788-3	Sue Page	It disrespects the Japanese Americans interned at Minidoka National Historic Site. It dishonors the Native American Tribes which hold the surrounding lands scared. This beautiful land must not be disfigured by 400 740ft tall wind turbines, football field sized blades and blinking lights that will destroy our night skies.
8825-1	Paul Murakami	My name is Paul Murakami. I am 73 years old. My parents and grandparents were incarcerated in Minidoka, block 26, after being forcefully removed from their home/business in Seattle, WA. Their only 'crime' was being of Japanese descent. They did not talk a lot of their incarceration with myself or my 3 siblings while we were young. Now that I am older, and my parents and grandparents have all passed, I reflect back and think they didn't want to burden us with the hardships of the past. There is a Japanese word, 'Gaman', which means enduring the seemingly unbearable with patience and dignity. I believe they applied this philosophy during this oppressive period in their life. My father volunteered and enlisted in the U.S. Army in Minidoka. I was told my grandmother sent my father's older sister to the recruitment office to nullify his application. However, she was unsuccessful since he was 18 years of age. I, too, had a difficult time understanding how my father could volunteer for a country that has treated his family so unjustly. His answer was always… "I am an American". He proudly served his time in the army with the all Japanese American 442nd Infantry, I Co.. These are the images in my mind when I visit the Minidoka National Historic Site and imagine the hardships my family and those of others faced during this unjust time. I strongly ask that you consider moving the Wind Project which will not interfere audio/visually with this site.
8829-1	George Snyder	I am writing to you in regard to the proposed Lave Ridge wind farm project that will affect the Minidoka Japanese internment historic site. I believe that it would be a disservice to not only the Japanese members of our communities but also to all people to have a historic site such as this be lessened by this project.
8868-1	Gerald Kita	Lava Ridge Wind Project EIS and the Minidoka National Historic Site The Bureau of Land Management, Department Of The Interior, constructed the Minidoka mass internment camp that housed Japanese Americans during WW II. Minidoka has been declared a national historic site. Recently, a company, LS Power, proposes that the Bureau approve location of a wind turbine farm to generate electrical power adjacent to Minidoka. It is a conflict of purpose for the Bureau to degrade a national historic site Minidoka, on land of which the Bureau is in charge, to locate a wind turbine farm adjacent to a national historic site. Please consider denial of the Lava Ridge Wind Project EIS to avoid degradation of the Minidoka National Historic Site I am a former internee of the Heart Mountain Wyoming internment camp during WW II.
8875-1	Andres Tangalin	Thank you for the opportunity to make my personal comment. The Lava Ridge project will compromise the Minidoka National Historical Site as an honorable and grim reminder of our nation's incarceration of Japanese Americans. The dignity to reflect on the physical, emotional, mental, and economical harm to Japanese Americans are the most important features of this Site to preserve. The Lava Ridge project would violate the sanctity of the visitation experience, directly marginalizing the suffering that the community of survivors and descendent's pay homage to. The preservation of an aura of personal contemplative space and privacy respects the visitor's remembrance as well as the national intent of validating the legacy of our nation's missteps in violating the civil liberties of Americans based on ancestry.
9006-1	Carol Suehiro	With a major in Geography from the University of Washington, I am well aware of the relationship between people, the environment and the purposeful use of natural resources. In my travels, both nationally and internationally, I often photograph these large modern windmills that harness wind power for human use. I find them fascinating and give credit to science and technology in their development. I see little analysis of the human toll and ramifications of the construction of the massive Lava Ridge Wind Project on the Minidoka National Historic Site. Would we allow France to place such structures next to the Epinal American Cemetery and Memorial? This cemetery is a tragic part of American history. We will not forget that Japanese American soldiers were killed fighting in Europe during WWII while their families were incarcerated in camps like Minidoka. Most Japanese American families asked that their family member's body be returned to America to be buried. Go to Bruyeres, France and see young people who are still grateful to the Japanese American soldiers that saved and liberated their town from Germany while their own families were not free. This respect and appreciation by the townspeople of Bruyeres have been passed through the generations by historical memories. Future generations should never be left with the impressions that whatever sacrifices and sufferings were made by any portion of American Society has no meaning or purpose. These sites and pilgrimages are reminders of the horrors of war whether nationally or internationally. The Minidoka National Historic Site should never be camouflaged, dismissed and sidetracked by these huge hypnotizing rotating turbine windmills. What happened at Minidoka is part of American history. The integrity of American history is not disposable, but the Lava Ridge Wind Project erodes our past.
9033-1	John Mellana	The currently proposal by a private corporation for four hundred wind turbines to be sited both within and adjacent to the Minidoka NHS comes far too close to being a desecration of hallowed ground. Merely substitute the name Minidoka" with locations such as Gettysburg, Little Bighorn, Angel Island and Manzanar, and the inappropriate essence of the site selection for the Lava Ridge project is clear. Please find a better place for what is otherwise the commendable and much-needed development of cleaner energy sources.

9080-1	The Coalition to Protect America's National Parks	I am writing on behalf of the Coalition to Protect America's National Parks, which represents over 2,400 current, former, and retired employees and volunteers of the National Park Service. Collectively, our membership represents over 45,000 years of national park management and stewardship experience. Our membership includes former National Park Service directors, deputy directors, regional directors, and park superintendents. Recognized as the Voices of Experience, the Coalition educates, speaks, and acts for the preservation and protection of the National Park System, and mission-related programs of the National Park Service. As a national parks advocacy group, we are quite concerned that the proposed Lava Ridge Wind Project would be constructed immediately adjacent to Minidoka National Historic Site (NHS)1 in south central Idaho. We offer the following comments about the January 2023 Draft Environmental Impact Statement (DEIS) for the project. INTRODUCTION As described in the Federal Register Notice,2 Magic Valley Energy, LLC (MVE) has applied for a right-of-way (ROW) grant to construct, operate, maintain, and decommission the Lava Ridge Wind Project (LRWP or Project), a wind energy facility and ancillary facilities primarily on BLM-administered public lands in Jerome, Lincoln, and Minidoka counties, Idaho. The Project would consist of up to 400 wind turbines and associated infrastructure, including new and improved roads, powerlines for collection and transmission of electricity, substations, operation and maintenance facilities, and a battery storage facility. The Project area spans 197,474 acres and all project components would be sited within a series of corridors. These corridors are approximately one-half mile wide and cover approximately 84,385 acres, of which 75,760 acres are located on public lands managed by the BLM, 2,910 acres are on State lands managed by the Idaho Department of Lands, 5,417 acres are on private lands, and 288 acres are on lands managed by the Bureau of Reclamation. All wind turbines, powerlines, and associated infrastructure would be located on lands managed by the BLM and the Idaho Department of Lands. However, less well described in the Federal Register Notice is the fact that the entire Project Area is located immediately adjacent to Minidoka NHS,3 a unit of the National Park System managed by the National Park Service (NPS), and the larger 33,000-acre footprint of the Minidoka War Relocation Center (WRC), which is located primarily on public lands managed by the BLM. As a result of its proximity to these historically and culturally significant sites, the Project poses significant risk of adverse effects to historic and cultural resources in the Project area and as a result is generating significant controversy.
9080-60	The Coalition to Protect America's National Parks	CLOSING COMMENTS As described in this letter, we have multiple concerns about the proposed development of the Lava Ridge Wind Project in close proximity to Minidoka NHS and the larger Minidoka War Relocation Center (WRC). We and others believe the WRC and portions of the surrounding landscape to be eligible for listing on the National Register of Historic Places. The proposed Project, if approved, would cause significant adverse effects to visual resources that are essential components of the landscape setting for these Register-eligible properties. For the many reasons summarized in this letter, we urge BLM and the Secretary of the Interior to select Alternative A (No Action) and deny MVE's ROW grant application.
9082-1	Scott Miller	I am a 67 year old white male living in Seattle, Washington and I am writing to support Option A: No Action. Just one month ago, I had an opportunity to visit the Minidoka National Historic Site, which would be desecrated by the proposed Lava Ridge wind project. My wife's father and his family were among the hundreds of Japanese-American citizens who were imprisoned here for no other reason than their heritage. It is a bleak chapter in our history; one it is imperative that we remember so it never happens again. What struck me most about my recent visit to Minidoka was the sense of isolation one feels when walking the grounds that were once encircled by fences and guard towers. It is important to my wife, and many other former prisoners and their descendants, to visit this site once a year in recognition of the sacrifice that previous generations made right here in Minidoka. Imagine being uprooted from communities where you were active and contributing members and being sent to such a remote place. The loneliness, the isolation, the sheer distance from these unfamiliar horizons to the place you call home. It is a powerful experience, properly called a pilgrimage. Yet the BLM's EIS classifies my wife and other descendants who regularly make this journey of remembrance as "tourists". This reveals a complete lack of understanding of the reasons Minidoka was designated as a National Historic Site. It is to keep alive painful lessons of the past. Why does this misclassification matter? Because it illustrates the BLM's complete lack of understanding of why Minidoka matters. How can the other judgements about impact elsewhere in the EIS carry any credibility when the agency gets what is at stake so completely wrong. It is frankly shocking that an administration that has made social justice a priority could make such a mistake. The reasons for supporting Option A: No Action extend beyond this insulting mischaracterization of pilgrims to the Minidoka site. Of the 400 wind turbines planned for Lava Ridge, each taller than the Space Needle, more than 300 will be visible from Minidoka. The sense of isolation experienced by those imprisoned here will be forever altered. That is simply unacceptable for those of us, of all races and backgrounds, who believe it is important for us to own our history so we don't make the same mistakes again. Protecting Minidoka as a National Historic Site was an important step in that direction. Why would BLM and the Biden Administration turn around and allow the desecration of a place so worthy of protection?
9119-1	John Okura	I consider myself an interested stakeholder in this discussion; over 80 years ago, my grandmother was incarcerated at Minidoka for the crime of being Japanese American. Unfortunately, this may not count as much to a corporation or even to some in the government, despite the national historic status Minidoka has. The Draft Environmental Impact Statement (DEIS) does not reflect a culturally sensitive understanding of the site and its' impact and identity in American history. The development of the Lava Ridge Wind Farm (Lava Ridge) will result in irreparable impairment of resources, affecting the land surrounding a place that should maintain the character of the time when American citizens were imprisoned within barbed wire fences onsite. The integrity of the site and its' viewshed would be greatly diminished when visited with a backdrop of a wind farm. Studies have concluded that the audio impacts alone will be significant, affecting the ability of survivors and their families to come and consider what was lost and those lessons that affect current events. As an International Site of Conscience, the installation of Lava Ridge would be a slap in the face of all seeking healing and reflection at this site. The unfortunate characterization of the Minidoka site as for tourists and recreationalists reflects an astonishing lack of sensitivity and recognition for the injustice that was inflicted upon Americans both at Minidoka and elsewhere. Would it be acceptable for a DEIS to characterize one of the Spanish missions or the Evers home in Jackson, MS as sites for tourists and recreationists? Yet, defenders of Minidoka are in a position of having to justify the cultural importance of a site where Americans were unlawfully imprisoned, with this importance being trivialized as for tourists. This is not acceptable, and is not in keeping with President Biden's recent EO on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders. It is my greatest hope that the Shoshone BLM, like their namesake would have a deep appreciate for the lands under their jurisdiction, and deny the Lava Ridge project.
9129-1	Bruce Rutledge	I am writing in protest of the plan to build a large wind farm near Minidoka, a place of profound cultural importance. This is a place of contemplation and reflection for many Americans, especially the Japanese Americans whose families were incarcerated here. But it is also a place of reflection for all Americans who rue the decision to imprison our fellow citizens during wartime hysteria. The large wind farm being planned will overwhelm the landscape. There are certainly better options for this farm. Please reconsider the location of this project.
9145-1	Margaret Gotchy	I am writing to urge you to stop the Lava Ridge Wind Project, in which 400 wind turbines would be erected near the original Minidoka concentration camp in Idaho. Such a development would be a national travesty. Both my brothers and I are immediate descendants of my entire family—paternal and maternal grandparents, numerous aunts, uncles, and cousins—who were unconstitutionally incarcerated at the Minidoka War Relocation Center in 1942. This incarceration was a traumatic event that left entire generations of families with deep emotional scars. In July, 2017, my husband and I participated in a pilgrimage to Minidoka on the 75th anniversary of this injustice. It was only through this visit that we were able to learn the true history of this incarceration since my parents and grandparents were too traumatized to ever talk about their experience, and the subject was never really addressed in school. It was here that we learned how common this ignorance about this act of racism really was. One participant in the program recounted how her niece at her college in the mid-West had received a failing grade on her final term paper when she had written about the American concentration camps during WWII. The reason for the failing grade? Her professor insisted that she had not written about a factual historical event!

Comment ID	Sender	Public Comment
		It is for this reason that the Minidoka National Historic Site must be protected as a place to educate the public about the unjust incarceration of 13,000 Americans of Japanese ancestry during WWII, as well as to hold lessons to help Americans understand the roots of racism in our society.
9154-1	Kelis Giswold	My great grandmother hung herself at the Minidoka internment camp while her sons where fighting in the 442nd battalion during WW2 for the United States. My uncle was born behind the barbed wire of Minidoka. My grandma could barely tell me about that horrible time it was so traumatic for her. When I visited many years ago it was barely a pile of rocks in a barren feeling landscape. I couldn't imagine what it must have been like for my family to be dislodged from their lives and moved to that place. The landscape seemed inhospitable. My grandmother told me there were little piles of sand that would pile up day after day inside her barracks from the incessant winds. The weather and remote landscape is much of what that experience was for her- and what needs to be remembered. Please do not go forward with the Lava Ridge wind turbine project. It will detract from the visual impact of the Minidoka National Historic site, once again disrespecting the Japanese-Americans and their history. And stealing the truest experience of what lessons, memories and healing that place has to offer to current and future generations. One day I will take my now 6-year old daughter there and I hope that she can experience as accurately as possible what her great grandmother, cherished great uncle and family experienced. Large wind turbines in the horizon would most definitely detract from her feeling the remoteness of Minidoka. I'm happy to hear that the history is being captured by the NPS and teaching what happened so that it never happens again. Please do not allow the Lava Ridge wind turbine project to progress.
9166-1	Mary Gleysteen	I oppose the proposed LavaRidge project due to its potential detrimental effects on the Minidoka National Historic Site which I have visited and which I hope will be further developed and enhanced so that others can learn about this largely ignored shameful chapter in US history. The construction and operation of a wind farm so close to the Historic Site which honors the people wrongfully incarcerated there will certainly have an adverse impact on not only the descendants of people affected by the racist relocation of their forebearers, but also people like me who are seeking to become more aware, responsible and better citizens of the United States. People visit the Minidoka National Historic Site to learn their history and to honor those imprisoned there, not as tourists or recreationalists. Our understanding of the significance of what happened at the site should not be obscured or minimized by proximity to an immense wind farm which will overshadow and dominate the view of this location whose very desolation is a significant part of its history. What I have read of the Lava Ridge DEIS does not seem to address my concerns about damage to this site as a shrine to the powerful effects of the isolation and unjust and racist incarceration experienced there as well as the need for all of us to understand what it represents in order to prevent its happening again.
9219-1	Pamela Ching-Bunge	To locate the huge wind farm near the Minidoka Historical Site is another shameful action against all Japanese-American citizens in particular against survivors and families of Minidoka. This site is not just a museum. It is the place where my lifelong friend was born; it is where his grandmother committed suicide overcome by depression; it is where so many innocent children, elders, adults, all prisoners/internees fought anger, injustice, undeserved shame, and depression caused by loss of freedom, homes, businesses, livelihood...normal lives. BLM, leave the site at peace. A wind farm nearby will change the sacredness of the area. With the vastness of the high desert regions, please consider alternative sites.
9237-1	Diane Feller	I am writing in reference to the Lava Ridge Wind Project being considered for Bureau of Land Management (BLM) managed lands near the Minidoka Internment Camp National Historic Site. Bottom Line: Wind Generating Turbines should not be built within easy view of the Minidoka Internment Camp. While there is no question greener power generation is needed for the long term survival of the Planet Earth, there are millions of acres available for building wind projects. But it is also very important to preserve the record of past mistakes on the part of governments, a large one being the internment of Japanese-Americans during World War II. Minidoka helps hold in place a solemn reminder that we must all keep on watch as those who are free today may tomorrow find themselves as the targeted group. Keeping wind turbines from view maintains visitors of the solemnity, the loneliness, and the abandonment of people who were just ordinary US Citizens, contributing to our overall society. Placing turbines in view has an implication that this National Historic Site does not memorialize something important, but would instead help relegate it to just something that happens to be on land generating power. Thank you for your consideration and Thank you for not allowing the Lava Ridge Wind Project to continue.
9239-1	Steve Feller	I am writing in reference to the Lava Ridge Wind Project being considered for Bureau of Land Management (BLM) managed lands near the Minidoka Internment Camp National Historic Site. Bottom Line: Wind Generating Turbines should not be built within easy view of the Minidoka Internment Camp. While there is no question greener power generation is needed for the long term survival of the Planet Earth, there are millions of acres available for building wind projects. But it is also very important to preserve the record of past mistakes on the part of governments, a large one being the internment of Japanese-Americans during World War II. Minidoka helps hold in place a solemn reminder that we must all keep on watch as those who are free today may tomorrow find themselves as the targeted group. Keeping wind turbines from view maintains visitors of the solemnity, the loneliness, and the abandonment of people who were just ordinary US Citizens, contributing to our overall society. Placing turbines in view has an implication that this National Historic Site does not memorialize something important, but would instead help relegate it to just something that happens to be on land generating power. Thank you for your consideration and Thank you for not allowing the Lava Ridge Wind Project to continue.
9285-1	Polly Aird	Stop the Lava Ridge Wind Project! I am not of Japanese descent, and my family was not incarcerated, but I have been to Minidoka National Historic Site as well as to the Japanese-American Exclusion Memorial on Bainbridge Island from where those of Japanese descent were rounded up and shipped off, most of them ending up in Minidoka. This is a critical piece of our American history that we must never forget. If you live on Puget Sound, as I do, you are aware of the world those incarcerated came from—a world surrounded by water. To be taken to Minidoka meant not only being imprisoned, but without any connection to the sea they loved. Minidoka is a lonely, windswept place where one can imagine the desolate feelings of those so unjustly kept behind barbed wire. As Americans, we need to be aware of our history, especially parts like slavery and incarceration, that are blots on our values. As a nation, we need healing from the times when we failed to live up to our ideals and resolve to never repeat them. Minidoka is one place where one can visualize the cruelty we imposed on others simply because of their race. The lesson that this must never happen again is critical to what Minidoka is all about. The DEIS fails to protect the significance of the land surrounding Minidoka NHS land that helps those visiting the site to appreciate what happened here—its isolation, its cold and windswept nature in winter, its burning, shade-less heat in summer, and its cruelty. It is a place where those who descend from the incarcerated can reflect and hopefully find healing. It must not have a for-profit enterprise with hundreds of wind turbines on its adjacent land, desecrating the importance of this place in national history. The DEIS claims that Minidoka NHS is for Tourists and Recreationalists. Nothing could be farther from the truth. It is where people can come to reckon with a national sin. The DEIS thus ignores a critical piece of our American history. The DEIS fails to preserve the feelings of isolation and oppressiveness that places like Gettysburg National Military Park have done so well. Do not permit the development of the Lava Ridge Wind Project!
9325-3	Saya Moriyasu	My name is Saya Moriyasu and I am a United States citizen - an American. As an American, our raw and true history is important to me. I want all the people I know to visit Minidoka and the other American concentration camps. It's a hard part of our history that needs more light upon it. The past is relevant today to marginalized groups and everyone living in the USA.

Comment ID	Sender	Public Comment
		I am eco-conscious in my life. I drive a Prius, have solar panels, and eat a vegetarian diet. However, the site at Minidoka is NOT the place for a wind farm. The site's importance is huge and needs to be shown the respect that was not shown to those families incarcerated. The survivors are not tourists, and as survivors, they deserve extra respect for this history that they did not choose. When I drive across Washington State, I see wind turbines and hope they are creating a green solution to energy. I applaud wind energy in the right place. Last summer, I took a trip that included 3 of the concentration camps. Of those three (Santa Fe, New Mexico, Topaz in Utah, and Minidoka in Idaho) Minidoka is by far the best site to experience what the survivors endured. Going to the sites is an important way to learn about history. I'm forever changed by visiting those sites. Even though I've listened to, read, and watched stories and documentaries about the camps, it can never be replaced by visiting them. The isolation of the Minidoka site and the views of the surrounding area is part of the experience. Driving up to Minidoka, you experience the site of a guard tower and the guard station. It's a feeling of leaving the present and entering history. The walking tour and signage helped me to internalize the experience of arriving at such a desolate place. So very far from my home in Seattle, it's a scary and jarring feeling. Seeing the buildings that have been put back on the site. And the enormous root cellar that was made by the Japanese Americans is uniquely impressive. The very act of generosity in feeding themselves and others during the war. Thinking of the humiliation that they must have felt. In addition sons and husbands going to fight in the most decorated unit, the 442. Proving their valor, fidelity, and patriotism. President Biden has promised to "advance equity and environmental justice." Minidoka needs to be protected as a place for healing and education. The 73,000 acres on BLM lands are public lands and should serve the greatest good for our citizens. Having 400 large turbines surrounding Minidoka is NOT acceptable. The attached size comparison really brings it home that the wind project needs to go somewhere else. I urge you to choose Alternative A.
9371-1	Catherine Norton	Please do not build the Lava Ridge Wind Project near the Minidoka National Historic Site. To do so would dishonor this monument to the memory of the terrible injustice that Japanese Americans suffered during World War II. These people and their descendants deserve to have a serene location to honor their families and others who were incarcerated there. As a 68 yo native of the Puget Sound, I wasn't taught about Minidoka and other internment camps in school and they didn't become common knowledge until 30-40 years ago. I am ashamed about that part of US history. The least our country can do now is cooperate with the affected US citizens and those who want to visit it by preserving this site as it is. President Biden signed an executive order that addresses equity for Asian Americans and how this site is treated now is an excellent example of applying those pledges with deeds.
9401-1	Nancy A Loizeaux	I encourage the Bureau of Land Management to value the history of the Tribes, the Japanese American interment and the EIS noted negative impacts on these people and the native wildlife. There is not an economic benefit that can usurp the historical damage as a result of this project. Please deny the application for the Lava Ridge Wind Project.
9408-1	Gary Heyamoto	I am an immediate descendant of two Japanese Americans, both Nisei's born in this country as US citizens, both unjustly incarcerated at the Minidoka War Relocation Center solely due to their race, both denied their constitutional inalienable right to liberty, dignity and privacy and both willing, postwar, to integrate back into society but not necessarily willing to forgive or forget the atrocities of the US Government. Imagine being wet, cold, hungry and injured hunkered down in a foxhole with bullets flying overhead. Now imagine fighting overseas in an all Japanese, (yes, segregated) unit (the 442nd) defending freedom in Europe while your own families are illegally incarcerated back home by your own government. My father didn't have to imagine it. He lived it. He came home with two Purple Hearts, a Bronze Star, a Presidential Unit Citation, a Combat Infantry Recognition Award and an Army Good Conduct Medal. He also came home to discrimination, racism, disrespect and prejudice. On top of that, in the years following the war, our families had to endure governmental inequities in job opportunities and in housing discrimination (See Race Map Seattle/King County 1960). As a child I had my lunches stolen, my homework taken, was forced to walk home in ditches, called names and had rocks thrown at me. I was not allowed to play Little League on my grade school team because the local Elks Club sponsor would not allow it. This was nothing compared to what my parents went through, but it was discrimination and racism just the same. Now, the government wants to go after our pursuit of happiness. If it's inappropriate to choose Arlington National Cemetery, the 911 Memorial, the FDR Racist Library or the Holocaust Museum as a site to erect wind or solar farms, so is it to desecrate the Minidoka National Historic Site in this manner. It would be an insensitive display of governmental apathy if the Lava Ridge project would be allowed to go forward. Minidoka is a sacred place for many. A place and time where an entire generation came together to support each other and survive the harsh prison conditions. Rationed food, cold showers, barbed wire fencing and armed tower guards imprisoned entire families whose only "crime" was being of Japanese ancestry. Minidoka has become a place of pilgrimage, a place for us to remember lost dreams/opportunities, to pray and most of all, to pay homage to those who died as prisoners there. It has become a sacred place. For many, it is hallowed ground. We did not ask to be there, did not deserve to be there. And now, they want the National Historic site to serve their needs. How insensitive, unjust and inhumane can that be? Is it not enough to have erased this egregious act of racism from school textbooks? It's unimaginable our government can be so disrespectful and so uncaring to allow desecration of the very site they selected to commit their homeland war crime; their homeland hate crime. But, as history has shown, the US Government is racist. History has documented they've used their narrow-focused wants and needs over other's rights (see Native American history) conveniently justifying their actions as "eminent domain" or unsubstantiated "public safety". So, I wouldn't be surprised if Idaho unsympathetically allows destruction of a sacred National Memorial site in the name of the "greater good". After all, Coeur d'Alene had the white supremacist Aryan Nations headquarters at Hayden Lake for decades for their "white-only homeland" in the Pacific Northwest. As of 2021, the Southern Poverty Law Center lists six hate groups (Proud Boys, Patriot Front, G416 Patriots, Lordship Church, Independent History and Research and The Brother Nathanael Foundation) in Idaho. Hate crimes are also on the rise (Fifty-four hate crimes in Idaho were reported to police in 2020) with 19 targeting racial groups. Yet, Coeur d'Alene's mayor Tim Hammond is proud to claim, "We are a culture of love and kindness." We don't live in the "land of the free" and there is no "justice and liberty for all". So, go ahead and desecrate the sanctity of Minidoka. It's just another act of injustice apathetically perpetrated by our government. Justice for all. It's all a myth the US Government would like us to believe in. A myth, not unlike the tooth fairy. Gary E. Heyamoto, DDS REFERENCES: https://www.seattletimes.com/opinion/dont-desecrate-minidoka-memorial-to-japanese-american-incarceration/ https://www.seattletimes.com/nation-world/coeur-dalene-hate-group-arrests-extend-north-idahos-long-history-with-extremism/
9483-1	Susan Tripp	The Minidoka community of survivors and descendants deserve the respect and acknowledgement of this gross historical violation of civil liberties by our nation's government through the preservation of the site. The Minidoka story must be recognized and treated in an honorable and somber manner as other painful events in our nation's history. The proposed Lava Ridge project minimizes the trauma, loss, and humiliation suffered by Japanese Americans based solely on their ancestry. My parents, aunts, uncles, and grandmothers were incarcerated at Minidoka. In their memory, Minidoka must be preserved. Do not allow this project to continue. What seems minimal to you is a major insult to those who were forced to live there.
9503-1	Caroline Parker	I am writing to ask that you pursue the Bureau of Land Management's goals in a way that does not desecrate the Minidoka National Historic Site. As someone with a longtime friend whose family was tragically incarcerated at this site, I believe that it is crucial that we honor and protect this historically significant site so that families who suffered the injustice of incarceration may continue to make pilgrimages to this hallowed place for continued reflection and healing. While harvesting the power of the wind is an important goal, there are larger issues at stake here. Failure to protect land at the Minidoka National Historic Site will only bring further shame on the U.S. government for this tragic historical event.
9509-1	Lisa Wareham	I was pleasantly surprised when I came upon Minidoka. Embarrassed, I had never heard of it. What an important part of our history to acknowledge and teach to each coming generation! Please appreciate that and find another location for wind turbines.
9523-1	Bev Ikeda	Please keep the Minidoka National Historic site, near Minidoka Idaho, free from the physical and visual impacts of the wind farm proposals. The Lava Ridge project will desecrate the landscape surrounding the historical significant land where thousands of Japanese Americans were incarcerated during World War II, due to racism. The site needs to be preserved with its surroundings untouched.

Comment ID	Sender	Public Comment
		We as a nation, need to preserve historical and environmental areas, without visual pollution or enroachments of commercial enterprises. Wind turbines are large visual distractions and interrupt the desert/open landscape. Similarly, you would not build wind turbines near Arlington National cemetery, Old Faithful at Yellowstone National Park, or near the Statue of Liberty. Please honor this land and stop the building of the Lava Ridge Wind turbine farm.
9598-1	Ryan Anderson	My grandparents were at Minidoka, and this proposed wind farm would destroy the historical relevancy of the site. Instead of using this camp as a reminder of history, the wind farm would turn it into an opportunity for money. There's plenty of other areas to put a wind farm in Idaho, the state is huge. I had the opportunity to visit Minidoka 2 years ago, and the absolute vastness of the site were both eye opening and sorrow-filled. This part of the state is very flat, and putting a wind farm in would diminish the impact that the site has on people visiting, as well as the people who were kept there. Please do not let this wind farm happen. The last thing we need as a nation, is for a reminder of a "black-eye" of American history to be further erased and forgotten because of money.
9657-3	Saiyare Refaei	I ask that you reconsider an alternative location for this project because as it stands the leading Alternatives C and E still will impose on the immersive feeling and impact of the ambiance of the Minidoka National Historic Site that is critical in the educational aspect of the experience. I support better energy alternatives but after talking to community members and hearing an overwhelming sense of no consent to any of these alternatives this project should not come to fruition. If there is not proper consultation and full approval from neighbors, local tribes and culturally significant sites that have been deemed historically significant then construction should not progress.
9729-1	Charles Young	I vigorously oppose any use of the land which detracts from the historical value of the detention camp site and what it represents with respect to discrimination as a political weapon in our country.
9770-1	Glenn Murakami	Ogden, Utah was home to my mother and her family in small part of the city. In the year 2000, my wife and I visited that area to see what remnants we could find of their existence and life thru some difficult times. We were shocked to find that the entire section where they lived and prospered was leveled and no sign of the Japan Town was left. It is now a Marriotts hotel complex. The address of their home and business is still there on a large utility box. My grandparents owned a noodle restaurant there. Later I found out there existed another Japanese-American community in Salt Lake City. It was razed to make way for the Salt Palace. We also visited Tule Lake relocation center. The only thing left is the officer's club which serves as a convenient store for the area. A trip to Camp Amache was also disappointing. All traces of their existence has been eradicated. Members of my family served in WW2 (442 RCT), Korean War (1st Cavalry) and I served in the Vietnam War. Is this a historical genocide to cleanse the consciousness of Americas many mistakes of non-whites and non-christians?
9899-1	Doreen Alexander	I am writing to comment on effects to the actual experience of the Minidoka National Historic Site location itself would have to be surrounded by Windmills so unnatural to the environment. When I moved to Idaho 21 years ago I was and still am very intrigued by the Minidoka site and the experience of walking the grounds. I am very interested in history and was so excited to research this area. We have made this site a family field trip for years and have spent much time researching the history of what happened here. This is a very sacred spot and one to be preserved for a life time. The actual thought of seeing windmills near the site completely degrades the importance of history itself and what this site means to our country. I have seen many mock up drawings of what this could possibly look like at various proposed variations and none of them provide any relief from the degradation of the site with the Wind Mills towering within eyesight. Please do not destroy the experience that we are blessed to have in out small town in Idaho.
9908-1	Ruth Tokumaru	I am writing to request that No development be allowed to infringe upon the Minidoka Concentration Camp historical site.
10424-1	Paige Blumenthal	I oppose the Lava Ridge wind project. It completely disregards important cultural aspects in Idaho's history and present. The DEIS fails to adequately protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience. We need green energy, but in implementing it, need to consider the crossroads of other important aspects such as cultural significance.
10433-1	David Cook	The Minidoka community of survivors and descendants deserve the respect and acknowledgement of this gross historical violation of civil liberties by our nation's government through the preservation of the site. The Minidoka story must be recognized and treated in an honorable and somber manner as other painful events in our nation's history. The proposed Lava Ridge project minimizes the trauma, loss, and humiliation suffered by Japanese Americans based solely on their ancestry. Please reconsider the approval of this project.
10434-1	Yahm Levin	Please take into consideration the importance of the Minidoka National Historic Site. Japanese internment during and after WWII is part of this country's history and in order to ensure we do not repeat it, we must keep historical sites and memorials accessible. A wind farm so close to this historical site will overshadow its importance. A wind farm (which is incredibly important to build!) can be moved to an area without historical significance. Please take this into consideration. Thank you.
10435-1	M Chapman	Minidoka is a national treasure for many people. We must keep this as it was as a reminder so it doesn't happen again. [...] Do not build these (important) windmills close or within eyesight of a national monument to our past with our eyes toward keeping our country moving forward.
10436-1	J Yamada	I'd like to voice opposition to the proposed wind farm project. As someone who has family and friends incarcerated there during WWII, it is important to keep the space as a reminder of what happened there. Though I recognize the importance of expanding renewable energy sources like wind farms, I'm also concerned that the same government that put my ancestors in concentration camps, is now seeking to erase that history by selecting this particular space. It is alarming to see the scale of each turbine and how it will impact the space.
10457-1	Gary Bohlen	Wind energy is only a temporary fix. Meantime, it's ruins the area I grew up on. Our homestead was 12 miles from the Minidoka Camp. Money can't be the only reason to do or not to do something. Stop the madness.
10459-1	Ryan Anderson	My grandparents were at Minidoka, and this proposed wind farm would destroy the historical relevancy of the site. Instead of using this camp as a reminder of history, the wind farm would turn it into an opportunity for money. There's plenty of other areas to put a wind farm in Idaho, the state is huge. I had the opportunity to visit Minidoka 2 years ago, and the absolute vastness of the site were both eye opening and sorrow-filled. This part of the state is very flat, and putting a wind farm in would diminish the impact that the site has on people visiting, as well as the people who were kept there. Please do not let this wind farm happen. The last thing we need as a nation, is for a reminder of a "black-eye" of American history to be further erased and forgotten because of mone
10474-1	Maddie Tawa	Eighty years ago, my grandmother was incarcerated in the Minidoka War Relocation Center during World War II because the United States government decided that she was the "enemy" on the basis of her ethnicity. These incarceration camps continue to exist today as a testament to what the Japanese American people have endured and evidence of one the worst mass incarceration events in our country's history. The Minidoka National Historic Site has become a place of remembrance and healing for the survivors of the mass incarceration event and their families, hence why annual pilgrimages are organized and executed consistently by prominent Japanese American organizations. It is a place of mourning, healing, and remembrance, not a destination for "Tourists and Recreationists" as the Lava Ridge Draft Environmental Impact Statement has called it. The construction proposed by the Lava Ridge project is described to have a "moderate" degree of visual change. 740 ft. tall wind turbines are not a "moderate" degree of visual change. They actively obstruct Minidoka's view shed and disrupt the history preserved by this open space. To add these turbines would be to erode Japanese American space and memory. Renewable energy is an important cause, to be sure, but when such projects begin with the occupation of spaces that are critically important to marginalized people's identities and histories, it is no longer "repurposing". It is colonization.
10475-1	Bobby Toda	I support Alternative A-No Action. Minidoka Historical site should be preserved as a reminder to future generations that your rights as a US citizen can be taken away by a stroke of a president. There is not much left of Tule Lake internment camp where many were imprisoned before being moved to Minidoka. Yes, it was a horrible and unjust time, but don't make it worse by erasing historic landmarks.

Comment ID	Sender	Public Comment
10480-1	Lori Takahashi	am strongly opposed to the building of the Lava Ridge wind farm due to it's proximity to the Minidoka incarceration site. My family was jailed at Minidoka; my grandparents on both sides, my parents and cousins and friends. This imprisonment had a life-long impact on the incarcerated as well as influenced the upbringing of their offspring. To build a wind farm near the historic Minidoka incarceration center disregards the importance of the action of our government. The Japanese people affected were illegally imprisoned. Many of these people were Japanese-Americans - meaning they were American citizens and had done nothing improper or illegal to deserve such treatment. History should not be forgotten as there are good lessons to be learned. Ignorance allows repetition of past sins. Let's not let the Minidoka historical site be denigrated or diminished in importance by a wind farm. Let the site remain unchanged as is as a stark and harsh reminder of the injustices imposed by our government against innocent people.
10481-1	Millie Takizawa	My comments regarding the proposed project are presented in this letter. The Lava Ridge Wind Project Environmental Impact Statement ("EIS") fails to adequately protect the significance of the land surrounding Minidoka National Historic Site ("Minidoka") as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience. Furthermore, it is inappropriate to identify Minidoka's Sensitive Viewer Group as for "Tourists and Recreationists." The Japanese American community is at the forefront of protecting, honoring, and preserving Minidoka and its surrounding land. The EIS further fails to not only recognize the importance of the cultural landscape, but to also preserve the historic nature of the land, including the integrity of the site, the feeling and association of historic events, and its immersive educational experience. The integrity and viewshed of Minidoka will also not be protected with the "Moderate" degree of visual change proposed by the EIS. All of the above culminate in the emotional impacts of the proposed Lava Ridge project. The Minidoka community of survivors and descendants deserve the respect and acknowledgement of this gross historical violation of civil liberties by our nation's government through the preservation of the site. The Minidoka story must be recognized and treated in an honorable and somber manner as other painful events in our nation's history. The proposed Lava Ridge project minimizes the trauma, loss, and humiliation suffered by Japanese Americans based solely on their ancestry. In conclusion, the "No action alternative" should be the only choice for this project.
10483-1	Myra Hudson	Executive Order 9066 cruelly isolated and stigmatized my fellow Americans: mothers, fathers and children of Japanese descent. To allow construction of a wind turbine project on the hallowed grounds of the Minidoka internment camp would be a debasement of their pain and suffering. Even today so many years later, I understand the anguish that site still causes. Placing wind turbines there is repugnant, a cold act of denial. Please do not deny what happened at Minidoka. Allow it to remain a place of reflection and rememberance.
10485-1	Richard Osborn	Many people of Japanese ancestry in the Seattle area, where I live, have a direct connection to the Minidoka "camp", but rarely talk about it. They will talk about it if you bring it up but do not initiate anything about the "camps". Clearly, this subject is very painful. To continue the Lava Ridge Wind Project would add insult to injury, 80 years later. Surely there are less sensitive and less sacrilegious sites for this project. Please do not go on with this project in it's present form.
10486-1	Janna DeLange	I am strongly opposed to the project for the following reasons. The impact of the Lava Ridge Wind Project on Minidoka National Historic Site cannot be overstated. Most of these huge wind towers, as tall as 740 feet, would be visible from the new Visitors Center and would be extremely detrimental to the visitor experience and disrespectful to the survivors of Minidoka and their descendants. Minidoka National Historic Site is intended to be a place of reflection and healing for those who were unjustly incarcerated there, and a place of immersive education for those who come to learn about what happened to these American citizens during World War II. The EIS does not recognize the importance of the unimpeded landscape to the integrity of the site. For visitors like me, experiencing the complete unobstructed desolation and empty silence of the Minidoka landscape is crucial to our understanding of the unconstitutional removal of Japanese-Americans from their homes and livelihoods. I urge you to preserve this historic landscape for future generations, as both a memorial to those who suffered injustice and as an educational experience to help ensure that such things do not happen again. Please do not approve the Lava Ridge Wind Project.
10491-1	Robin (No Last Name Provided)	Do not destroy a legacy for a community that suffered under American government misguided and disturbing conduct. Don't even consider Alternative C.
10493-1	Name Not Provided	Lava Ridge Wind Project is impairment to Minidoka National Historic Site. The EIS is correct in stating that the impacts to the Japanese Americans environmental justice community are disproportionately high and adverse. Federal tax credits should not be used to subsidize the Lava Ridge Wind Project that has disproportionately high and adverse environmental justice impacts. This is absolutely contrary to the dignity of the nation and the Biden administration's commitment to environmental justice. To give federal tax credits (paid for by the American people) is yet another form of environmental injustice upon the Japanese American community. The Biden administration made a commitment to protect and preserve places associated with the incarceration of Japanese Americans in the Presidential Proclamation for the Day of Remembrance on the 80th Anniversary of E.O. 9066 on February 19, 2022. Now, to use the federal government's money to support a project that is exacerbating generational trauma and disproportionately impacting Japanese Americans yet again is hypocritical. The analysis in the EIS should describe the facts above, so that all Americans can read and understand why the Lava Ridge Wind Farm Project is in direct conflict with the Biden administration's supposed commitment to environmental justice and to the Department of the Interior's own responsibilities to "protect, preserve, and interpret the resources associated with the Minidoka Relocation Center" as stated in the enabling legislation for Minidoka National Historic Site.
10494-2	Name Not Provided	his project should have never gotten to this point, and the near unanimous opposition in Idaho and by the Japanese American community and historic preservation communities is evidence that DOI and BLM did not do adequate site analysis. You let Magic Valley Energy propose this project without considering the level of impacts to myriad resources, especially Minidoka National Historic Site. Your oversight has caused immeasurable grief and trauma to me, my Japanese American family and Japanese American community. The BLM should be ashamed of itself. The consultants who are hired for this project should know they too have caused harm to the Japanese American community. By working for and taking money from LS Power, the consultants are complicit in the environmental injustice to the Japanese American community. Using words like "visitors" and "recreationists" for those individuals and descendants who are associated with Minidoka is repugnant. Japanese Americans have for decades tried to undo the shame associated with the incarceration and heal from these wounds caused by the federal government and larger American public at the time. Instead of our community organizations focusing on public education and healing, we have had to galvanize our energy, money, and time to fight for the protection of Minidoka, which we now consider a sacred site. You should include this in the EIS as further evidence of injustice to our community. All I've seen in weak leaders who have not stood up to take a moral stand against this project because of the impacts to the Japanese American community and legal responsibilities to protect Minidoka and its resources. I'm so severely disappointed in the Secretary of the Interior, Director of Bureau of Land Management, and Director of the National Park Service who care more about their political careers rather than the people and resources of the United States. I know the conflict of green energy and environmental justice playing out in this project, and to see how cowardly these appointed leaders are related to this project is disgusting. [...] The no build option is the only option. Mitigations cannot address the harm that has, is, and will be dispensed from this project. The BLM should select Alternative A based on the impact analysis, dignity of the nation, and as representative of the people who care enough to write comments which are overwhelmingly against this project.
10497-1	Rachel Nathanson	am opposed to the impact from the wind generator proposal on the views and legacy of the Minidoka Memorial. I am a member of the Board of Directors of the Holocaust Center for Humanity in Seattle. We use the lessons of the Holocaust to teach greater understanding of each other, promote caring and reduce hate and bigotry. The lessons of our history are here to teach us how to be better citizens and neighbors. This is what the Minidoka Memorial does. Do not reduce the impact of this important remembrance. I am very much in favor of wind turbines as a better method of producing power and reducing green house gases, but not at the cost of our historic heritage and memorials. Please find another location for these turbines, one that does not impact the Minidoka memorial.
10498-1	Name Not Provided	This is a terrible thing to foist upon a the American citizens, denied their Constitutional rights and put in a concentration camp. Now the memorial is going to be degraded by noisy, unsightly wind turbines, disturbing the peace of this almost sacred site.
10499-1	Karen Yoshitomi	I would like to express my strong opposition to the Lava Ridge Wind Project being considered on the historic footprint of the former Minidoka War Relocation Center in southern Idaho. A massive wind farm of nearly 400 turbines stretching across 40 miles will negatively impact the barely acknowledged tragic historical significance of the area. The wind project drastically changes the landscape and takes away from the historical value of Minidoka. In order to adequately portray the landscape as it

Comment ID	Sender	Public Comment
		was when Minidoka was in operation, the turbines do not preserve the Minidoka experience as it was during the war. In 1942, more than 120,000 people of Japanese descent (2/3 American citizens) were mass incarcerated in concentration camps throughout the United States. Minidoka held more than 13,000 people before the war's end. This camp, like all the rest, was purposely built in a desolate location: deserted, uninhabited, and empty. History also states that many men and women volunteered out of these camps to serve in the United States military. The all-Japanese American 442nd Regimental Combat Team was the most decorated unit for its size and length of service in the entire history of the U.S. military. About 18,000 people served, earning over 4,000 Purple Hearts, 21 Medals of Honor, and an unprecedented seven Presidential Unit Citations. Of the ten camps, the highest number came from Minidoka: more than 900 incarcerees served the U.S. during WWII. The Minidoka site is a sacred site for the dwindling number of survivors and their descendants. The Minidoka site as it is, holds the full story, both historically and geographically, of an embarrassing part of American history. Never forget. Do not let it ever happen again.
10503-1	Amy Myoraku	For way too many years I was ashamed to say I was born in Minidoka because then I would have to explain "camp" and even though we left when I was a year and a half I internalized the shame of being Japanese. Our family and friends rarely talked about our experience except in very general terms. It was only in the last 20 years or so when Minidoka became a National Historic Site that I embraced my heritage. We need our government to acknowledge the importance of Minidoka not just to Japanese-Americans but so everyone will know that by remembering a past injustice it will not happen again. The Lava Wind Wind Project will overshadow Minidoka and minimize its importance. I implore you to consider another site.
10523-1	Cammie Hall	I don't have a long prepared statement but I hope that you will understand my experience. During WWII my family was "relocated" to the Minidoka camp. It's where my grandparents met and were married, and where my mother was born. We have history and a deep connection to that place. As a child we visited the site of the camp - which at the time had only a marker. When asking for directions almost no locals we met knew anything about the camp, which I find both sad and frustrating. My understanding is that the Lava Ridge project would complete do away with the memorial center that has since been built at the site of the former Minidoka camp. Given the nature of the project there needs to be a way to both honor this nation's history and provide renewable energy - there must be a middle ground somewhere. This country has a deep pattern of erasing exactly those parts of our history that need to be remembered and honored, so that they don't happen again. Please don't be a party to the ongoing trauma to our communities and this country.
10545-1	Traci Wood	I am not for Lava Ridge Wind farm. This will disturb the Minidoka Memorial Site. The view will not be honorable to the relatives and survivors of this Site. This will desecrate this memorial site and will not be what pleasant to those who come to the Memorial for healing and history. 400 wind turbines aren't healing or peaceful. They will be an abomination!
10566-1	Ron Nakatani	My name is Ron Nakatani, my mom Jessie Hirai was interned in Minidoka. To have the "Lava Ridge Wind Project" constructed close to the Minidoka camp site will disrupt the solitude of Minidoka. "Lava Ridge wind project will mar the site, to what end? Power generated goes to California, workers come from out of state and Idaho is not benefiting from this project. Please consider rejecting this proposal. This proposal will do harm to ecology of the area, such as migration routes of birds, deer & elk, why put up this wind farm? Makes no sense. Please stop this project.
10573-1	Peter Altmann	I am writing out of concern for the sanctity of the Minidoka incarceration center. The center was the end result of a travesty of the life and property of American citizens of Japanese decent. Minidoka is a shrine and remembrance of this grievous error. Its location was selected because of its desolation. Part of its meaning and beauty is this desolation. I am concerned that the imposing of tall wind machines upon the landscape would affect the isolation that was part of the camps selection. It was the shear isolation of our citizens imprisonment that is part of the shrine. The wind machines would remove some of the desolation that our citizens were condemned to.
11184-1	Darryl Ford, Sheila Ford	Wind turbines are unreliable, and expensive. They can only operate within a limited range of wind speed, and must be managed to stay within range. Weather, as we have seen in Texas affects their operation and when relied on too heavily, can cause blackouts. Many of the materials used in their manufacture come exclusively from China where mining is not environmentally regulated. Those materials are not easily disposed of when the machinery becomes worn out. Construction requires much fuel from whatever source to transport the enormous parts to construction site. Were they transported on electric vehicles (most are not) electricity relies on substantial amounts of oil for its production. Transmitting the power produced will require use of enormous amounts of land and materials for transmission towers and lines. The aquifer affected extends nearly across the entire State, quite possibly endangering the well water that serves us here in Western Idaho with the blasting required to establish foundations for the hundreds of turbines proposed. Lava Ridge project's proposed consumption of 118 square miles of farmland is wasteful. People knowledgeable about the Minidoka Memorial express outrage that the project will interfere with the educational value and operations of the facility which is vital to maintaining true and accurate history of our nation. It dishonors those who were incarcerated, some of whom are our family. Consuming this much land in the vicinity is also detrimental to First Nations Communities. For all these reasons, this is not a wise or efficient use of land; therefore, we are adamantly opposed to construction of any extensive wind turbine facility such as Lava Ridge
11187-1	Lynn Takeoka Spence	I had a chance to visit the Minidoka National Historic Site last month. It was my first visit to the incarnation site of my parents and their families. Driving through the area my husband commented that it is desolate place. There were a lot of power lines and some farmhouses visible from the incarceration site which detracted from the visual image of placing people in a desert area that was cut off from society. My parents remember it as being out in nowhere. They had no idea which way a town might be or how far away it was. When they were moved there, the camp was not complete and basic services like water and sewer were not functioning yet. As we walked around, I thought that it would be a detraction to have a wind farm within view of this historic site. It was clear to me that the site is being developed so people can come and get an idea and feel of what our country did to a select group of Americans and legal immigrants. As our country continues to deal with racial discrimination, I believe it is important to use these historic sites as teaching opportunities for the nation. Part of that means recreating an environment that makes that possible to imagine. Since the Minidoka Historic site is being developed for visitors to see and learn about the experience of Japanese Americans and legal Japanese immigrants who had lived on the west coast, I believe a wind farm would take away from that learning opportunity
11192-1	Name Not Provided	The DEIS fails to recognize that the visual impacts from Alternatives B, C, D, and E to Minidoka National Historic Site would constitute major impacts. The Department of Interior is legally responsible to protect Minidoka National Historic Site pursuant to Minidoka's enabling legislation "to protect, preserve, and interpret the resources associated with the Minidoka Relocation Center," the Organic Act, and numerous other laws and executive orders. The Department of the Interior is failing and will ultimately fail in maintaining the trust of the Japanese American community if it does not select Alternative A or an alternative that does not impact Minidoka NHS. Selecting any of the action alternatives will be a blight on the Biden administration, federal government, DOI, BLM, and NPS. It would mean undoing decades of federal laws and executive orders that have worked to demonstrate the fundamental injustice of the incarceration of Japanese Americans during WWII and the protection and preservation of the incarceration sites dedicated to public education and the integrity of the nation. Would the government desecrate other sacred or nationally significant sites for renewable energy? Would it place such wind turbines near Yosemite Valley, Mount Rushmore, or Flight 93? The fact that the DOI seems to be OK with desecrating Minidoka NHS is a clear demonstration that the DOI leadership and the Biden administration are not fulfilling their promises, executive orders, statements, and regulations to ensure environmental justice for minority and disadvantaged communities. There is no mitigation that is acceptable. If an alternative that impacts Minidoka and the Japanese American community is selected, it will go down in history with the names of the leaders (Biden, Haaland, Estenoz, Stone-Manning, Sams, etc.) who approved it as a continued failure of political leadership. Some places and histories are sacred and cannot be compromised, negotiated, or "balanced" with other competing agendas. Don't desecrate Minidoka in the name of renewable energy. The stakes are too high; the benefits of gigawatts do not outweigh the destruction, distrust, and injustice the project would cause.
11194-1	Kimberly Drake	Please do not put this project so close to the historical site.
11195-4	Sandra Callen	The Japanese Internment camp would be desecrated with these turbines.
11197-1	Maria Lorcher	Idaho will continue to loose their identity if historical sites like Minidoka are lost to development. There is plenty of land to swap in and around this project so that the wind farm can co-exist but NOT on the historical site. Manzanar in California has done a great job in creating an auto tour, recreated the bunk houses & entry to the camp and a building to hold artifacts and stories of this historic time in America. Japanese Americans regularly host events at this site and it is important for all Americans to remember this time in history even if it is uncomfortable. Manzanar has the distinction of being part of the US National Park service. As a Federal Agency (BLM), it would benefit the State of Idaho and the citizens of the United States if Minidoka can share the same distinction to be saved for generations to come. Please say "NO" to the Lava Ridge Wind Project on this land.

Comment ID	Sender	Public Comment
11198-3	Lori Wright	I am a third generation Idahoan. My father who is 86 remembers watching trains pass with Japanese people going to Minidoka to be interned. If Lava Ridge Wind Project goes through, the view shed from Minidoka would be altered and therefore our perception of the past. The feeling of isolation that the Japanese encountered is an educational opportunity to learn from our historical mistakes. This opportunity would be removed with Windmills, roads, and dust encroaching and changing the perspective thus eliminating the preservation of impact of Minidoka for future generations to experience and learn from.
11199-2	J Yamamoto, B Yamamoto, D. Miller, S Okamura, T. Robison, M Woods, M. Yamamoto-Howland, R Yamamoto, K Waters, G Watanabe, J Nakanishi, D. Nakanishi, J Naito, P Okamura Sr., W. Nakanishi, N Yamamoto, S. Yamamoto, T Hadway, T. Waters, K Hadway, K Yamamoto, C. Waters, B. Farner, R Yamamoto-Farner, D. Yamamoto	I OPPOSE the Lava Ridge Wind Project and SUPPORT NO ACTION ALTERNATIVE A. I do not see a short term or long term benefit to Idaho as a whole, the area's historical monuments like MINIDOKA, and surrounding habitat and recreation. Idaho is becoming a dumping ground for Energy resources that do not benefit Idahoans. There is an ALREADY ESTABLISHED Turbine Farm in the same area as well as Solar Panels. The view of enormous turbines around MINIDOKA interment camp DISRUPTS visitors sensibilities to an unjust time, forcibly inflicted upon a targeted group of specific ancestry. The extraneous structures DIMINISH the recognition of hardship and injustice FORCED upon Japanese-American Citizens during WWII by removing the personal journey of experiencing the desolate, harsh environment & poor living conditions experienced by those incarcerated. The sight of 740ft Turbines (largest on US soil) would certainly distract visitors and potentially disrupt the immersive experience by becoming a focal point of conversation and attention; dishonoring the painful memories/stories of discrimination, loss and hardship endured by internees.
11203-1	Joan Darby	Lava Ridge should move far away from the Minidoka memorial project. It is the least we can do to respect the American citizens who were placed in detention without warning or reason. They deserve a quiet place of remembrance. Our American government made a whopping big mistake when they incarcerated Japanese American families during WW II. While in Minidoka they improved the land around them, and built as good a life as possible. I admire what they accomplished there in spite of the trauma of expulsion from their homes. Please respect the Japanese Americans by NOT placing a huge windfarm in their back yard.
11209-2	Linda Ando	My name is Linda Ando, Japanese American community member and I am writing in response to the proposed Lave Ridge Wind Project and the impact to the Minidoka National Historic Site. After reviewing the proposed site plans of the 400 wind towers and 14 towers located on the Minidoka Historic Site where the annual Minidoka pilgrimage occurs and sacred grounds of our ancestors and family were incarcerated poses great concern. My concerns relate to the encroachment of the massive wind towers to the Minidoka Historic site where families, community (local, nationally and internationally) and Students gather to learn, share, heal and understand past injustices and walk on sacred sites where the Japanese Americans were detained in desolate environments and conditions. The preservation of the history, actual incarceration sites like Minidoka and to experience the physical site (land carries memory) where trauma of injustices occurred in American history is critical to the healing of the nation. Preserving an unobstructed Minidoka Historic Site is an ethical and historic consideration.
11218-1	Friend of Minidoka	No Action alternative requested. Honor the areas near Minidoka and keep them sacred. In doing so we remind ourselves to avoid repeating past mistakes and making new ones. The First People took care of the land and the land took care of them. Incarcerated Japanese Americans labored over the wasteland and brought forth edible crops and sustained life. Scarring the landscape to harness electricity is going against the grain.
11235-1	Amanda Vail	I oppose this project, although I support clean energy. The Minidoka site is an important part of American history that should be maintained as it currently is. I support the Japanese-Americans who are opposed to this project, as it infringes upon an important part of their history.
11236-1	Michele Thompson	As a Japanese American I strongly oppose this project. Although my mother was born in Japan in 1930 she immigrated and became a citizen after the war. She always felt and passed on to me that to be a citizen you must always acknowledge the errors made by our government and to learn from them. The Minidoka site serves to remind everyone of this horrendous episode when US citizens were imprisoned by their own government and this could happen again. We visit this site to remember this group of brave citizens who endured much, and we hope all citizens, no matter what their race or ethnicity can learn these lessons. Erecting these very intrusive windmills so close seems to trivialize this site, as if our government is once again saying "you don't matter". Please find another site for this project.
11241-1	Ellen Ito	As my family members who were incarcerated at Minidoka age and pass from their earthly life, I feel even more acutely the need for physical, tangible space to keep their legacy and stories alive. I implore you to consider the compounded existing pain, alongside the new harm and loss you will create for the children, grandchildren and great-grandchildren of those incarcerated by erasing this important history. Like incarceration, this action will not exclusively impact the Japanese American community: Everyone suffers when the lives of others are erased. The same optimism that informs the pursuit of cleaner energy sources should also inform the path we take in pursuit of a better future.The site is a symbol of hope that we may all learn from the gross errors of the past, a crucial reminder to everyone that we should never repeat these traumas, This turbine project perpetuates the very action that the site stands in testament and opposition to. Please consider option A, no action.
11242-1	Christine Shigaki	Please do not continue this project that affects the integrity of the Minidoka National Memorial. It is important part of history for all Americans to continue to recognize and learn from our past. Incarceration of innocent Americans should not have happened and we, at this pivoting point, are responsible for protecting this sacred land to memorialize the past and educate current and future generations. Continuing this for profit venture not only perpetuates inequalities that continue to happen, but also supports future inequities. It is important for my (our collective American) children, their generation and future generations to not continue the generational harm. Allowing this project supports and continues the harm that we can collectively arrest. Considering this project, not only will destroy a national landmark, but also erases part of an important past history for all Americans. Especially, for our future generations that can learn from past atrocities by remembering--to not let history repeat itself.
11248-1	Kit Y	Please stop this windmill project as it will destroy a national landmark that is important to preserve as part of US History. Its purpose is to honor and remember our past American ancestors who experienced incarceration wrongfully and had endured so much pain and disruption. These stories need to be passed on to future generations so that we don't forget the scar it has left on generations of Americans.This tangible historical landmark educates and reminds current and future generation of Americans to not repeat the past atrocities. Please do not erase this tragic history!
11250-1	DJ YU	For all Americans, but especially Asian Americans this act to effectively erase the history of interment here at this location is searingly painful. A wrong happened here in American history and to rid the site of this evidence allows a further repeat. For those families affected and all Americans who feel the shame, it is imperative that this site remain for only this action fends off any further revisitation of this horrible history. It is a heritage which should remain forever remain to bear testament as we all need to move forward to acknowledge that this happened. It is still the heaviest burden of intimate cutting pain that many Asian American feel and to leave off or rid this site would constitute further grievance onto a very painful past. Please consider how important this site is to all Americans who need to bear witness to the devastating consequences of internment here at this site forever. Thank you for keeping history alive.
11251-1	Glenda Owen	Please stop plans to allow wind turbines on this historical site.
11253-1	Hugh Kim	This windmill project must be stopped in favor of preserving the Japanese Incarceration camp landmark. We must conserve the site as a reminder to never repeat such an injustice to any group of citizens living peacefully in our beloved country. The site is a significant, living reminder that even in a freedom loving country as the U.S., how misguided, and racist decisions could be made at the highest levels of the offices. As we have witnessed during the pandemic, hatred against Asian Americans is still a reality that we must face. The consequence of erasing such an important, shameful chapter of the U.S. history is to further cement how little Asian Americans are regarded.

Comment ID	Sender	Public Comment
11255-1	Gilbert Hirabayashi	I am absolutely against this project! My grandparents and parents as well other relatives and friends were incarcerated at the Minidoka concentration camp. The site should not be compromised because it is a memorial to the grave injustice suffered by Japanese Americans during an extremely dark period in our history. This site, as well as others like this, must continue to remind us that loyal Americans, regardless of skin color, ethnicity, or culture, must not be corralled and imprisoned without trial or because they looked like the enemy. This site, instead, should be enhanced and expanded to provide more information and transparency about the injustice that happened then and insure it will not happen again. Our children and their children and all others must know what happened to protect themselves and their future. As a retired US Department of Justice employee I am fully aware how the federal government often does business and makes decisions. I appreciate the opportunity to voice my concern and opinion. I also am aware our government can make great strides considering all sources of input and feelings. Sometimes economics, ecology, business, or politics are not the only or best interests for us. What is in our hearts and souls are is what is essential to us all. This small piece of land and history is essential to all Americans.
11257-1	Kalman Fortoloczki	The Minidoka National Historic site is both a memorial and a teaching facility. It is my understanding that the proposed project will significantly impact the Minidoka National Historic site in a number of ways. I have personally visited the site and have a direct connection to those who were incarcerated there and their families. First and foremost any impingement, visual or otherwise, on the site is a defilement, minimizing and trivializing the suffering and trauma experienced by Japanese American resulting from the unjust violation of their civil rights by the US Government. Secondly, the impact of a visit is grounded in experiencing the vastness of the original camp. The magnitude of the crime perpetrated by the US Government cannot be fully appreciated until one stands within the grounds, imagining the empty landscape filled with blocks of barracks housing 15,000 to 20,000 people, each one of which was unlawfully removed from their homes and communities. This impact is critical to the educational mission of the camp which illuminates the effects of racial prejudice and illegal government overreach. For the visitor, the physical space contextualizes the magnitude of the dangers of a government out of control. I would ask that the project managers reconsider their proposal, and respect the social, moral and educational dynamics of the Minidoka National Historic site as it exists today.
11260-1	Hannah (No Last Name Provided)	Please rethink this project and the placement of it. My grandfather and great aunt were one of the many individuals incarcerated in the Minidoka incarceration camp just two miles south of where this project is proposed to be placed. My grandfather had the chance to take a pilgrimage to it in 2019. He passed away in 2020. I have yet to visit the camp because facing my history has been difficult, yet I deeply desire to visit for I want to connect with my grandfather and my community by experiencing it in the way that they did. Placing this project 2 miles north of the sacred site of the Minidoka National Historic Site would destroy the site, and ruin the experience of many elders and members of the Japanese American community for the site and sound of windmills would destroy from the desolate nature of the desert. This desolate aspect was a part of the terrible experience, and what contributed to the emotions and feelings of these individuals being betrayed by their government. It is important for us now to reflect and connect with this space as it was back then, so that we do not forget this dark mark in American history. Installing the project and the windmills in this location would also be a dark mark upon American history for it is an incredibly shameful act upon the Japanese American community by destroying the quiet desolate desert. Disregarding the input of the community would show the lack of respect for the Japanese American community and the desire to preserve a historic heritage site. Do not place this project near the Minidoka National Historic Site. Help us preserve the site so that many generations can come to see the beauty and horror the space, so that many people like me can visit to connect with our community and our relatives.
11263-1	Rae K.	The Lava Ridge Wind Farm should not be sited as currently proposed. The Minidoka site is considered sacred to people of Japanese heritage like me as a memorial to a time when thousands of Japanese Americans were incarcerated because if their race. This includes my father and aunt, both of whom were born here in the US. As much as I support alternative power sources, given the huge expanse of land in the area, creating these wind towers so close to the Minidoka site will destroy the memorial site's silence, desolation and remoteness that was part of my ancestors' experience while there. Incarceration of any Americans based on race alone should never happen again but if we don't preserve these memorials as they were, these seemingly "small" violations into these memorials create a risk that we minimize and potentially rewrite the violation of law and the impact the Japanese incarceration had during that sad time and n history.
11277-1	Jane Slickers	I am opposed to the Lavaridge wind project because of Questionable effect on our aquifer and our water supply Noise from the Blasting The sheer scale of the project and size of the windmills The effect on our wildlife Compromising the Minidoka memorial site
11279-1	Name Not Provided	I hope that this project will be reconsidered. When I was in high school, I asked my father about Minidoka, and his response was, "We just don't want it to happen to you guys (the kids)." The man of few words tried to drive us out there on a family trip many years ago, but was not successful in finding the exact site. He wanted to share with us, but perhaps it was too painful or difficult to do verbally. I know that our family is not alone in this experience---many of the Nisei pressed on with their lives without processing the trauma. I would like myself, my child, and generations to come, to be able to go to Minidoka and get a sense of what it was like to be sent out there as American citizens, to connect with our family and community's history, and to process the injustice...without the presence of large wind turbines! My hope is that a compromise can be worked out. We owe it to these great Americans.
11281-1	Daniel Hwang	The United States government, our government, finally issued a formal apology by then President Ronald Reagan for the wrongful internment of hardworking Japanese-Americans. This national landmark remembering both the formal apology and the wrongful Executive Order 9066 by President Franklin Roosevelt should be preserved. The purpose is to honor and remember the wrongful incarceration a dark chapter in American history. We can do better in America despite the past. We must pass on this story to future generations. This landmark is there to educate current and future generations in hopes of stopping future generations from repeating past atrocities.
11286-1	Robert Spreen	It is bad enough that our country made decisions that made Minidoka necessary. Desecrating this site now makes a statement that it is time to forget, another appalling statement.
11287-1	Katharine Christian	Wind turbines need to be kept outside the footprint of the concentration camp. Ideally there would also be one side that would have unobstructed views so that visitor could better grasp the isolation of those interned there.
11289-1	Midge Carstensen	I am writing in protest to the building of the wind farm near and on the area of the memorial to the Japanese internment camp in Idaho. We have memorials in this country and on this earth for very important reasons - to remember those who died for an important cause, i.e. defending democracy, freedom, etc, and for those who were treated unfairly, unjustly and persecuted by our citizens and our government. That second reason can be a tough one to admit but it's mandatory for preserving history and for healing. I, and many others, ask that this wind farm NOT be built near or on the grounds of this memorial site. Thank you. Sincerely- Midge Carstensen Redmond, WA
11292-1	Name Not Provided	The current DEIS fails to adequately weigh the impacts on the Japanese American community. This desecration of the Minidoka Historical Site and its surrounding should be seen as an unacceptable price to pay for this project. The language BLM uses, describing incarcerees and their descendants as "tourists" shows the racist bias of BLM and lack of community engagement. Alternative A: No Action is the only way forward.
11294-1	Michael Higashi	STOP the Lava Ridge Wind Project The Camp Minidoka grounds and expansive neighboring landscape needs to be preserved for future generations to see and experience. The isolation and bleakness that our ancestors were forced to endure is not to be trivialized or forgotten. A shameful action of our government created this place and Americans suffered.
11296-1	Kellie Wright	I support the "no action alternative" and I feel that it should be the only choice for the Lava Ridge Wind Project.

Comment ID	Sender	Public Comment
		First of call, the Minidoka Historic National Site and other potentially significant historic and cultural sites, including many that have not been properly surveyed, are in the path of the project. I strongly feel that the work has not been done and lacks the appropriate surveys leaving many historical sites vulnerable to destruction without documentation or identification. This project also fails to recognize the importance of the cultural landscape and the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its immersive educational experience.
11300-1	Michael Kataoka	I would like to formally state my objection to the proposed Lava Ridge wind farm project on the site of the federally protected World War II Minidoka incarceration camp. While I am a strong proponent of clean energy alternatives, including wind turbines, and in fact am an anti-fossil fuel activist aligned with the Climate Reality Project and the GreenFaith organization, I do not believe Minidoka is an appropriate location for Lava Ridge. I am also the son of two Japanese Americans who were unjustly incarcerated in a camp just like Minidoka, in Rowher, Arkansas. The proposed wind farm would severely block views of the National Historical Park with 400 proposed towers and disturb the solemnity, seclusion and sacred setting of Minidoka that has been preserved for some 80 years. I urge you to protect the Minidoka landscape from intrusive, unnecessary industrialization.
11319-1	Priscilla Wegars	Although I am not of Japanese American ancestry, I am opposed to the Lava Ridge project if any wind turbines can be visible from the Minidoka National Historic Site. This place is an important pilgrimage site for Japanese Americans and others, who deserve to have the viewshed remain as it was when it served as a concentration camp for American citizens of Japanese ancestry and their non-citizen relatives and friends. Calling current-day Japanese American visitors "tourists" rather than survivors or descendants of survivors denigrates their unconstitutional detention.
11320-1	Judy Todd	As a life-long Oregon Resident (minus 4 years in WA) I am well aware of the difficult and onerous treatment our Japanese Citizens and in some cases, early immigrants, received in the 20th Century, mostly due to World War Two. The documented racist , colonial-privileged heavy, and unfair actions, laws and decisions made individually and collectively were misplaced and in retrospect, damagingly inappropriate. This plan at Minidoka continues that egregious tradition by some uninformed or ignorant people in positions of power, unfortunately. Instead, I ask that Option A, No Action, be chosen. Why? Because: The plans for BLM going forward fails to adequately protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience. It also inappropriately identifies Minidoka NHS as for "Tourists and Recreationists." This is a slur and an incredibly ignorant and misleading description. (It sounds a lot like the 'playground' at Hanford Nuclear Site that is also currently up for green-washing/white-washing.) Finally, going forward in the BLM plans also fails to recognize the importance of the cultural landscape and preserve the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its immersive educational experience. Thank you for your attention. May the right course be taken, at last, as an example for the reparations in the 21st Century we desperately require.
11328-1	Mark Takiguchi	I am writing in support of Alternative A- No action. The Minidoka National Historic Site is a unique site for education, memory, and healing. I feel strongly that preserving the viewshed is necessary to maintain the site as close to its feel in 1942 when over 13,000 people were incarcerated there, most for multiple years. My own family was incarcerated in Poston, Arizona. I have numerous photographs of my maternal great grandfather, Kametaro, the family patriarch. The shots of him before the war show a vibrant, confident man and community leader while the images of him after the family resettled in Chicago show a broken person, ravaged by stroke and requiring support from his tiny wife to move around. He was removed from our family and subjected to questioning by the FBI and my family said he was never the same after that. I have heard numerous, similar stories from friends and colleagues about the multi-generational trauma of this shameful chapter in our history. Many of us are still coming to terms with the multiple ways this removal of our families from their homes, livelihoods and communities still plays out. This is why I am fighting so hard against the other Alternatives and their disruption of a historical site of conscience. The DEIS is thorough, but what is unintentionally missing is how language and the framing of choices signal a default set of values. For instance, the identification of the Minidoka National Historical Site as for "Tourists and Recreationists" minimizes its main role as a place of healing, reflection, and restoration. Similar to a religious pilgrimage, people undertake these visits to understand and process powerful emotions and moral choices. I also question who gets to decide what is a "moderate" degree of visual change? Would a tiny swastika symbol erected near a Jewish Temple qualify as "moderate" disruption or should the group most harmed by that incursion get to decide the impact of that change? I understand that balancing many different constituencies and competing needs is very hard, but I would hope that human groups that have experienced historical harm would be given additional consideration. When our needs and perspectives are not heard though these processes, it reopens old wounds and undermines our faith in these institutions. Please protect this unique site and honor the pain of those incarcerated and the impact on their descendants. And respect the decades-long efforts that led to the designation of this site as a National Historic Site and its current partnership between NPS and many others. Sincerely Mark Takiguchi Fourth Generation Japanese American
11335-1	Jan Ronald Boles	April 18, 2023 In Re: Proposed Lava Ridge Wind Project I am a member, an ally, of the Friends of Minidoka. I have resided and worked in Idaho more than 60 years, all that time a friend and colleague of Japanese Americans whose lives were directly impacted by Executive Order 9066. I have come to feel a deep emotional bond with those dear people in my life. As a member/ally of FOM, I endorse and second their position in opposition to the proposed Lava Ridge Wind Project: "No action." As an American who supports the drive for alternative sources of energy, including hydro, solar, and wind, I say "No action" to the proposed Lava Ridge Wind Project. As a professional photographer/visual artist who has been documenting the Minidoka NHS since the early 2000s, when I visit the site (my wife and I were last there on April 15, 2023) I visit a shrine. I visit a hallowed memorial to the more than 9,000 Japanese Americans incarcerated there during World War II. Today I visualize those 340 proposed wind towers that were diagrammed in the BLM DEIS, clearly delineated on 114 degrees of arc, nearly one third of the horizon, juxtaposed behind key components of the NHS. Those proposed towers would dishonor the purpose and spirit of the Minidoka National Historic Site. For these reasons I say please, take "No action." Jan Ronald Boles Sunny Slope, Idaho
11338-1	Stephanie Ikeda	I am writing in criticism of the Lava Ridge DEIS and requesting the No Action option. This proposal ignores the extreme impairment of resources that the National Park Service have invested in the Minidoka National Historic Site and the significance to the taxpaying citizens who regularly utilize its historic resources. Furthermore, the DEIS inappropriately identifies Minidoka NHS as a site for tourism and recreation which reflects ignorance of the history of the location and its impacts. The DEIS also fails to recognize the importance of the cultural landscape and preserve the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its educational experience. The size and scope of the project impinges on the viewshed of the site which is a crucial component of the historic preservation component of Minidoka NHS. The Bureau of Land Management also failed to notify the impacted population in Idaho and throughout the United States before the Notice of Intent was posted on August 20, 2021. The Bureau has shown a lack of knowledge or refusal to adequately address the cultural properties of the National Historic Site and that the proposed changes will negatively impact citizens not only in Idaho but across the country, as people formerly incarcerated at the National Historic Site and their descendants have since dispersed throughout the country.

Comment ID	Sender	Public Comment
11348-1	Karen Maeda Allman	I am writing to register my objection to the proposed alterations to Lava Ridge and the Minidoka site. I have visited the Minidoka Historic Site and believe that the proposed wind farm and other structural changes will permanently harm a vital historic site. We should be building on the understanding of the experiences of those wrongly incarcerated during World War II, not destroying this history and placing this disruptive project on the historic site, discouraging visitors to what many people nationally consider an important, sacred site.
11364-1	Bille Arellano	To: Bureau of Land Management Officials. Hello, my name is Billie Arellano and I was moved to contact you to ask you to reconsider permitting a privately owned company based in New York to develop the Lava Ridge Wind Project in Southern Idaho. This project would forever change the landscape that is the site of the Minidoka War Relocation Center that Japanese Americans and Alaskan Americans were unjustly sent to in 1942. This site is located in remote, isolated area that experienced extreme climate temperatures that those human beings had to endure. There is still much wildlife in that area and I am concerned about the negative impact building the 400 foot wind turbines and the roads would impact those creatures on the ground, in ponds and the birds. Growing up in Southern California and having lived in the Pacific Northwest for 33 yrs I have known several people who had grandparents, parents, aunts/uncles, cousins who were incarcerated in that camp as well as one of the camps in California. When they trusted me enough to share these facts and their stories there was an intense feeling of shame, anger, hurt, loss. There was also a strong feeling of anger and loss over being ripped away from their homes, neighbors, friends and having to literally walk away from businesses that those people built and developed from the ground up. In our contemporary life this is called Post-Traumatic Stress Disorder. I have not yet been able to visit this sacred space but I am planning on making that site a pilgrimage. I liken it to my trip to Dachau,Germany concentration camp I took summer of 1969 when I graduated. As we pulled up in the bus I could "feel" a chill run through me and still feel that when I recall that moment. As I stood inside the camp I felt such a deep sense of sadness and grief. I felt the solemness and sacredness of that place and me standing there. Minidoka is one of those place and I ask you:PLEASE DO NOT PERMIT THE WIND TURBINES at MINIDOKA. Thank you.
11365-1	Alexandra Arai-Cauley	Hello, I would like to respectfully lodge my opposition to this project as it is currently designated. Its proximity to the Minidoka Historical Site and former site of incarceration of Japanese-Americans causes very great concern for me. I believe the impact of the turbines and related infrastructure, while intended to promote environmental sustainability, will instead aid in the destruction of a site that is incredibly important to the Japanese-American community. These sites of incarceration are not merely museums or places to visit; they are physical markers and "proof" of the suffering endured there that continues to affect our community. The fact that other sites have been similarly destroyed or erased by similar projects deemed for the public good makes it very painful for survivors and their descendants. Are we not members of the public? It is hard for me to accept that there is no other place for these turbines to go. If they are being placed in a remote area to avoid disturbing local communities, please consider that the Minidoka site is not empty; it is filled with the pain of our community and has also become a site of healing for those who return and maintain it. I strongly urge you to reconsider this project. Please do not forget us again.
11374-1	Tara Fisher	We are requesting no action be taken on behalf of Friends of Minidoka. This action would cause further harm to communities the United States has historically and is attempting to currently marginalize. The land is and site is meant for remembrance, let us not forget the actions we (the United States government and therefore its people) took towards Japanese Americans and this project would cause disruption to that memory and the site itself.
11376-1	M Fisher	I strongly believe the Lava Ridge DEIS V1 should not come to fruition. I think the land where and around Menodoka sits, needs to remain unscathed, as a tribute to the Japanese who were unfairly forced to live there during World War 2. We need to honor their wishes to not desecrate this area with windmills.
11377-1	Roy Wesley	I object to the Lava Ridge wind farm development on Minidoka Land, a designated National Monument. I am a survivor of incarceration at Minidoka (1942-1944) and deem the designated land to be historic and should be left for visitors to contemplate the actions and lives that suffered there in silence and with a sense of the original landscape. The presence of the wind farm is jarring and disturbing to this type of contemplation. The Wind Farm may continue its expansive set up beyond the visual borders of Minidoka. There appears to be plenty of space for it. Thank you for your consideration, Roy Wesley (born Uyesugi) named changed by my Japanese American Father, 1944.
11378-1	Susan Shinoda	My father, uncle, grandmother, and great grandmother were interned at Minidoka and my great grandmother died her first winter there, unaccustomed to the harsh conditions. Family of my generation have all made the pilgrimage to learn and better understand our heritage and circumstances from the past. The Lava Ridge Wind Project adjacent to the Minidoka National Historic site would be a tragedy as the wind farm would tower over the site. Experiencing the feeling of isolation in a barren desert would be lost. Please take No Action to not allow the Lava Ridge Wind Project adjacent to the Minidoka National Historic site.
11381-1	Thomas Koto; Boise Valley Japanese American Citizens League (JACL)	To Whom It May Concern: My name is Tom Koto, a descendant of a Japanese and Japanese American family incarcerated at Minidoka during WWII. I am a third generation Idahoan, born in Jerome, lived in Shoshone and moved to Twin Falls, Idaho when I was 2. My Mother's side of the family were taken from their farm in Salem Oregon and transported to Tule Lake, CA and eventually to Minidoka where they spent the rest of their time imprisoned, in the desolate desert of SE Idaho. I am opposed to the proposed Lava Ridge wind project for many reasons, mainly the direct impact on the view shed of Minidoka. This would have a negative impact on the historical site. As an educational facility, the desolate effect would be lost on the visual of hundreds of wind turbines. I also oppose for the direct and indirect impact of the project to land users, aviation and migratory birds and animals. When I went on the BLM tour last Summer, at the final stop, a BLM Biologist presented and stated there is an acceptable mortality rate for migratory birds and when asked what happens if the number breaches the maximum threshold, he stated LS Power would be "fined." LS power has consistently stated they do not have any contracts in place yet. They wouldn't be spending so much time and money if they didn't already have customers. Which we understand to be Las Vegas and S. CA. Magic Valley Power representative stated in an Idaho Senate committee hearing "this project would be good for Idaho and Idahoans." I do not see how that can be a true statement, with power shipped out-of-state, labor primarily CA union workers, and profits going to the East coast, will not benefit Idahoans or Idaho, as was stated. This project is not supported by our Governor, Lt. Governor, Federal Delegation, State Government (Both House and Senate), local government, and many thousands of Idahoans in the Magic Valley. Therefore, I support Alternative A, "No Action," and support the proposed Greater Minidoka Area of Critical Environmental Concern (ACEC).
11385-1	Ron Abramovich	Thanks for the opportunity to comment. We all support renewable energy projects; however, the size of the proposed windmills and magnitude of the Lava Ridge Wind Project is too large in this fragile high desert environment in south central Idaho. A few items to address follow: 1. Any impacts to the Snake River Plain Aquifer that flows beneath this unique area. The aquifer is very complex with rivers flowing underground from the Lost River basins to the Snake River. Any changes in the hydraulics would be challenging to determine but should be addressed before tons of concrete is used in the fragile volcanic area. 2. Another item are wolves that use this area. March 2016 I was traveling in this area and saw three wolves coming down the drainage to drink water from the canal. I was driving along the canal from the Minadoka National Historical Site to Mile Post 31 Recharge Site. They saw me and I saw them. The wolves took a quick drink, turned and headed back north. I was not able to get a picture. 3. The Minadoka National Historical Site is also a special area for so many people and their families and should not be impacted visually by these huge windmills, sound from them or greater dust levels from disturbed areas. 4. Best practices should be used to reduce raptor impacts. February 2023 along Highway 20, I saw one of the biggest Golden Eagles I have ever seen. I'm sure raptors use the Lava Ridge area too. Thank you for the opportunity to comment. If you need anything else, feel free to contact me. Ron Abramovich Retired Idaho Water Supply Specialist 208-908-8280

11388-1	Michael Tanaka	I am writing to express my strong opposition to the Lava Ridge Energy wind project and endorse Alternative A. While I understand the importance of renewable energy, this project poses a significant threat to culturally sensitive sites that must be protected. Renewable energy projects should be sited at areas that don't pose these problems. The Lava Ridge project should be delayed in order to allow careful consideration of other, potential options. Of particular concern is the impact of the project on the Minidoka National Historic Site. This site is of immense cultural significance to Japanese Americans who were unjustly interned there during World War II. The site serves as a poignant reminder of a dark period in our history, and it is essential that it be protected for future generations. My father and his family were incarcerated at Minidoka, making the present site especially meaningful to me. Even though diminished, Alternatives C and E identify potential auditory and visual impacts from the project. They will desecrate the almost sacred communion one experiences at Minidoka. The proposed mitigation measures fall short of ensuring that the essential character of the Minidoka site remains undiminished. In addition, the project would also have a significant impact on culturally sensitive Native American sites in the area. It is imperative that we respect the sovereignty and cultural heritage of Native American communities and work to protect these sites from development that could cause irreparable damage. I urge BLM to fulfill its important role in managing and protecting public lands to deny approval for this project given its detrimental impact on the Minidoka site. Thank you for your consideration. Michael Tanaka
11395-1	Gordon Sakaue	I would like to submit a comment as an interested member of the public. My mother was confined in Colorado, my father in Arkansas, and one of my pursuits after retiring from a math classroom has been to visit the sites of incarceration from 1942-45. I have been fortunate to visit Minidoka twice -- once on my own and walking the path with informative signposts, and once as part of a pilgrimage, with speakers, panels, and -- that particular year -- the dedication of its National Park Service visitor center. At some of the sites, the terrain remains stark and windblown: Topaz in Utah and Amache in Colorado. (A former original barracks and a replica exist at the latter). Manzanar has a refurbished social hall, now the visitor center, and multiple barracks replicas. Heart Mountain has a barracks replica serving as a meeting place, and cultivated fields on the acreage of the actual camp footprint; in Arkansas, private owners are cultivating fields where the Rohwer and Jerome camps were located. I have not visited the Gila River site on reservation land; at the three Poston camps (on on the Colorado River reservation), there has been some infrastructure development, such as a modern elementary school. The fate of the Tule Lake site is under discussion: uniquely, part of the camp footprint lies on the local airfield. At none of these other former WRA incarceration sites is there such a dominating and literally overshadowing presence as would emerge at Lava Ridge. It wasn't easy for me to visualize such a tower, but this proved useful: somewhere between the Statue of Liberty (300 feet) and Washington Monument (500 before if tapers). And there could be as many as 400 of these wind towers! Projected images give us a sense of what might be within view while walking the grounds of Minidoka -- a wall or forest of wind turbines. With towers filling the fields of view, it would be difficult to try to walk in the footsteps of those confinees, experiencing some of the mental outlook shaped by bleak vistas, isolation, and weather extremes. Reading some of the coverage in southern Idaho, there are ecosystem and environmental impacts and consequences as well -- habitat and watersheds drastically altered, with an potential recovery lasting years beyond the expected life span of the generation of power. Even more discouragingly, it's not as if local residents would receive any benefits -- the recipients of the power are residents of Nevada and California. Finally, it seems inconceivable that government by the people and for the people could approve use of public lands in Idaho -- with such wide-ranging and large scale consequences -- for other communities hundreds of miles removed. If a picture is worth a thousand words, what might the value be of a sweeping landscape immersing us in the long ago yet not so distant past? The remains of an original root cellar (let us hope soon to be restored) silently punctuates "Never Again
11397-1	Mary Jussel	Thank you for taking my comment. I am quite concerned about this location diminishing the somber, reflective and interactive nature of the Minidoka Site. Please do not put it here. There must be better options.
11398-1	John Pelonio	I suggest "no project" due to potential impacts on nearby cultural sites.
11401-1	Name Not Provided	The proposed Lava Ridge project will be visually and emotionally disruptive to experiences at Minidoka National Historic Site. The land must be protected so that we remember this shameful part of our American history. I request the "No Action" alternative.
11409-1	Paula Fujiwara	I am writing concerning the Lava Ridge Wind Energy Project. I am a third-generation Japanese American (JA) whose grandparents, parents, aunts, uncles, and family friends were incarcerated in several of the WRA concentration camps (Tule Lake, Amache, Rohswer/Jerome, Gila River). I had the privilege of visiting the Minidoka Concentration Camp site in the summer of 2021, even though the country was in the middle of the COVID-19 pandemic. A fellow Japanese American childhood friend and I have embarked on pilgrimages to incarceration sites to honor our families and mourn, reflect and attempt to heal personal and collective trauma. When we arrived at Minidoka, we visualized how the inmates stepped off the bus with only what they could carry. The day was hot, windy and shade less - was it the same for them? Walking the land that day, with the sun beating on our heads, we felt the desolation of the landscape, so remote and isolated, and now so sacred to our history. The Lava Ridge Wind Energy Project will involve construction of wind turbines within the sightline of the Minidoka Historic Site. The expansive panorama of the night skies would be affected by the light sources of the project. To plant these turbines in such close proximity to, and within the day and night view shed of the Minidoka Historic Site would severely affect the immersive experience of today's visitors as they attempt to truly "feel" the lived reality of the inmates. In summary, this is not just a story for and of Japanese Americans; it is a shameful piece of history that all Americans need to learn about and experience without the disruptive presence of the wind turbines on the visual integrity of this land. This project should not be built in the visible proximity of the Minidoka Historic Site.
11412-1	Sam Zalutsky	I am vehemently opposed to the desecration of a sacred place to Japanese-Americans and all Americans, a spot which is essential to protect as it shines a light on the history of this country. The wind farms proposed should be placed elsewhere and this site should be protected from all development. A historical monument to Japanese-American internment should not be forced to compete with our essential action on climate change. It's disrespectful and harmful. Thank you
11416-1	Maggie Tokuda-Hall, Marilyn Tokuda, Wendy Tokuda, Ann Fujii-Lindwall, Ryan Chin, Mikka Tokuda-Hall	I am writing on behalf of my family to support the "No Action" option for the proposed Lava Ridge Project. Ten members of my family including my parents, my brother, four grandparents, aunts and uncles were incarcerated at the Minidoka Internment Camp during WWII. Both sides of my family lost everything they had. Except for my grandparents, the rest were American citizens. For that reason, Minidoka is hallowed ground for me. Their imprisonment there shaped not only their lives, but all of my siblings and myself who were to come after. I visit Minidoka as a pilgrimage not as a tourist destination. There's a reason Minidoka was constructed in the remote desert. It was to isolate the Japanese and prevent us from spying. The desolation and dusty winds were an integral part of this prison experience. To build rows and rows of wind towers taller than the Seattle Space Needle as the backdrop to Minidoka would minimize the impact of the memorial and it's significant. To me, this feels like an insult. Consider these towering windmills, the sheer numbers of them and then imagine our historical site in front of them. The whole experience of Minidoka would be destroyed. The view of the towers and the extensive land they would take would turn our monument into a postage stamp. it would turn our history into a small spot next to a wind farm. Wind farm first, monument second, if that... The unconstitutional nature of the evacuation based solely on race was so egregious that the laws permitting it were overturned, and the U.S. Government eventually apologized and paid survivors redress. That makes this site a historically significant national monument. It is important that it be preserved as it was, so we will never repeat this mistake. I am an environmentalist, but I feel the Interior Dept should find another location. It's not just the view. It's history.
11417-1	J Pray	The porposed Lava Ridge project will impact quite negatively on the history and meaning of Minidoka. The poposed wind farm can--and should--be relocated to avoid dmaging this important and sacred site.
11429-4	Felicia Poteet	Another consideration is preserving the Minidoka National Historic Site (aka Camp Hunt). This is a site of deep local and national historical significance that I have taken my own kids to visit and learn the lessons of the Japanese-American internment. Please say NO to Lava Ridge!
11430-1	Trisha Copeland	By placing the wind farm at the proposed site is erasing US History. No one should forget that Americans were imprisoned because of their heritage.

Comment ID	Sender	Public Comment
11432-1	Alison (No Last Name Provided)	I am a high school photography teacher in Hawaii and I am urgently requesting that there be NO ACTION taken in developing the lands adjoining Minidoka Historic Site for the Lava Ridge Wind Project. The extensive alteration of the natural landscape and the desecration of the view from Minidoka would add more hurt on top of an already painful chapter of our past. My mother and her extended family were all incarcerated at Minidoka. As a young adult, I learned about how their constitutional rights were violated as well as the extreme hardships they faced (familial, social, physical, financial, emotional) for not only the three years they were in the camp, but for many years and even generations after the war. I applied for a sabbatical from teaching three years ago and one of my goals is to continue working on a series of photographic books about my family's story in Minidoka. Although my project was twice delayed due to Covid, I now have a flight booked in July of this year to see Minidoka for the first time. My aunt, uncle and cousins are joining me to also experience the camps we've heard bits and pieces about from family members. Unfortunately, my mother who was born while her family was in the assembly center at Puyallup and then lived in Minidoka for the first three years of her life is not healthy enough to travel with us to see the camp. Though this is a big disappointment, the goal of photographing Minidoka and researching my family history has given me purpose as an artist, a teacher and a descendent. Although I've always been interested in seeing Minidoka, it wasn't until I met NY based photographer Stan Honda, who has photographed many of the country's incarceration camps, and later Hanako Wakatsuki-Chong, the former chief of interpretation and education at Minidoka, that I realized how much I needed to see the site for myself. Stan's majestic photos of Minidoka would not be the same with rows and rows of wind turbines visible on the horizon. Now that we have a better perspective of this historical tragedy, it is distressing to the Japanese American community that the BLM is considering allowing unrelated, yet highly visible structures to be built in this sacred area. The BLM impact statement referred to visitors as 'tourists and recreationalists,' which is insensitive and insulting to the Japanese American community and its allies. I believe that most people who visit Minidoka are traveling thousands of miles out of their way to honor their ancestors and connect to their past. A trip to Minidoka is well off the beaten path and requires money and planning. Most surviving Sansei (third generation Japanese Americans) like my mother, are in their 80's and are definitely not casual tourists. Now there are fourth, fifth and sixth generation Japanese Americans who are continuing to learn about their heritage. Thanks to the wealth of information now available on sites like Densho and Friends of Minidoka, we can find photos, documents and stories since the majority of survivors are very old or deceased. We can connect to a much bigger nationwide community and share our histories with each other. That being said, in our post-Covid world, more survivors and descendants will be making pilgrimages to Minidoka and other incarceration sites in person rather than relying solely on online resources. As a photographic artist, documenting this historical place and finding the beauty in sadness and desolation is my goal and I am looking forward to my trip in July. Still, I can't help but worry that if these enormous wind turbines are built, my children and my grandchildren will not be able to experience the camp the same way that I will. My grandmother used to talk about the wind blowing dust everywhere, including through the cracks in the barracks walls and floors. It would be dismaying and ironic to see that very wind harnessed now, when the National Park Service has done so much to reclaim the Minidoka Historic Site, building a visitor center, reconstructing barracks, preserving the guard tower and root cellar and helping visitors to really feel what it was like. Whether the visitor is a descendant with deep personal connections or someone who was unaware of the severity of the situation and can learn from this country's mistakes, everyone who comes to Minidoka deserves to see it in this preserved state that allows for reflection. Please honor those who were unjustly incarcerated, their descendants and those who want to learn more about it by not proceeding with any construction of the proposed Lava Ridge Wind Project. Thank you for your consideration.
11437-1	Bill Tashima	As a third generation Japanese American, and more importantly, as an American citizen who loves our country and values the struggles and lessons that our country endures as we strive to be a more perfect union, I request that the Bureau of Land Management adopt a "no action"" alternative to the current Lava Ridge Project proposals. I am a progressive citizen. I believe in sustainable energy. In general, wind farms offer a eco-friendly source of energy. Equally, I am an American who values our treasured monuments and National Park areas as priceless legacies that need to be preserved and passed down to future generations. I have been to Minidoka at least eight times since 2002. I go to Minidoka as I would to my parents cemetery. I view each visit to Minidoka as a way to honor my parents and grandparents who were incarcerated in this WWII camps, having lost their homes, property, freedom, liberties, and personal dignity. I view each visit as a reaffirmation of the work and efforts needed to protect the fragility of American civil liberties in times of racism, hysteria, and lack of government leadership. I am insulted to have my visit to these sacred sites views as a "tourist site." Tourist to Minidoka? These are the places where dreams were destroyed. Where people were born and where people died. In spite of all that America did to betray Japanese Americans, more Japanese Americans volunteered to service in the American military than from any other camps. Minidoka, as well as all places of confinement for Americans citizens due to race in WWII, is a sacred place. Hallowed ground, consecrated by the blood, tears, and bodies of American citizens of Japanese ancestry. I am appalled and again insulted that huge wind towers, taller than the Space Needle, will abut Minidoka. Where is cultural sensitivity in making these decision. Where is common decency and common sense? Would BLM permit wind turbines at Gettysburg or Arlington? Has BLM marginalized Japanese American history so much that BLM will sacrifice that many to be one of the biggest shameful moments in American history. I believe there are alternatives. I believe we can have sustainable energy and still honor Japanese American confinement sites. For these reasons, I call for no action on current proposals for Lava Ridge.
11448-1	Nicole Lichtenberg	The unlawful incarceration of Japanese American citizens at Minidoka during WWII is one of the most shameful parts of Idaho history, and it is a part too often skimmed over or skipped entirely. The indignity and desolation the incarcerees faced, as well as the resilience they showed in enduring this terrible injustice, can be difficult to imagine. Only by preserving this history in a manner that visibly demonstrates the isolation and hardship faced by the Americans who were illegally held at Minidoka can we carry this history forward so as to never repeat it again. Any construction project, no matter the type or purpose, that interrupted the landscape and impeded the visual experience would have a detrimental impact on the site's ability to teach the public about the experiences of the incarcerees. Approving or recommending or even failing to oppose a construction project that impacts the sightlines of Minidoka is an unconscionable choice to facilitate the erasure of this difficult, painful, and integral part of our state and our nation's history.
11449-1	C. Kanako Kashima; Minidoka Pilgrimage Planning Committee	The Bureau of Land Management MUST NOT allow Lava Ridge Wind Project to commence within the viewshed of the National Park Service Minidoka Historical Site. The ONLY alternative is A - no action! The development, infrastructure, noise and lights that would be caused by these wind turbines would grossly minimize and - defile this sacred, hallowed ground of those unjustly incarcerated and their descendants. The site is a monument for those who were forced to live there and their descendants. The US government chose to imprison these innocent people in a desert setting, forcing their removal from their homes and businesses with very little notification. This site is to be preserved as is - no development within the viewshed. I am a descendant of Minidoka incarcerees. The first time I visited the site in 2011, I felt the presence of those who were forced to live in the barren, desolate area. The trauma inflicted on my grandfather was so severe, he refused to talk about it with anyone. He started to open up about it with my husband, who helped him get his records from the National Archives. Even then, he never talked about what he went through emotionally. Looking over the records we received, I can only imagine what he went through. I never understood the trauma my grandfather went through at Minidoka, until I took a course at the University of Washington. It was eye-opening, and made me want to learn more about what happened, as this was part of a dark chapter in American history. It was at this point I realized that very little was being taught about the Japanese American incarceration. Although I was born after the war, the stories I have heard from several pilgrimages are carried in my heart. Reading my grandfather's records, I could only imagine what had transpired during the lonely years without his family. Some were funny stories, others were painful. The Minidoka Site is a testament to the desolate conditions that those who were incarcerated had to endure. The BLM must not and cannot minimize the historical importance of Minidoka. In my opinion, it is a slap in the face for everyone, if these wind project gets underway at this site. You cannot put these wind turbines on such sacred ground. I have gone on the Minidoka Pilgrimage every year since 2011 until the pandemic hit. Every year, I shed tears of sadness for what our ancestors went through. Listening to the survivors talk about their harsh living conditions was very heart wrenching. Those who were young, made the most of it, as did the adults under those harsh conditions. The Minidoka Historical Site is also an educational site. To preserve the integrity and sacredness is paramount to educate all people - many who never knew about the incarceration of the Japanese Americans. The educational opportunity is to help bring the pilgrimage experience to another level of focused awareness, healing, heart and reflection. It is of vital importance of sharing and carrying on the legacy of the many stories that are shared from one generation to another so that what has happened will not be forgotten. This is who we are and what we have become - due to the sacrifice of our parents, grandparents and other family members who went through this experience of being put into a concentration camp during WWII. Stories of happiness, sadness, bitter sweetness, pain, and suffering - all make up the experience of our parents, grandparents and even great-grandparents. The importance of keeping the site alive and undeveloped for future generations is vital so that such injustices will not occur again.

Comment ID	Sender	Public Comment
		Putting up the Lava Ridge Wind Project here grossly minimizes historical importance of this place. For many, the intergenerational trauma that has been passed on, will finally feel a weight lift off of their shoulder just by attending the pilgrimage - that this was the place where Japanese Americans were unjustly incarcerated so many years ago, that there might be some closure, a feeling of release and finally some peace. I urge you to please consider the educational, emotional and historical value of preserving Minidoka as is, and not let the Lava Ridge Wind Project to commence.
11450-1	Esther Poirier	I am writing in strong opposition to the Lava Ridge Wind Project. The simple fact that land so close to the Minidoka National Historic Site is even being considered for such a project shows how incredibly important it is for this project not to move forward. So many people today have no idea of the heartbreaking injustice suffered by Japanese Americans and their families from 1942-1945. They have no idea of the lasting impact of this travesty. The site is a powerful witness to history that must not be forgotten. Following Executive Order 9066, over 120,000 individuals were forcibly removed from their homes and incarcerated around the country in what were euphemistically called "camps" or "relocation centers." I can easily imagine, given the wording in the draft Environmental Impact Statement that refers to those who visit Minidoka as "tourists and recreationalists", that the people who drew up this plan had no idea of the depth of meaning that comes to those who are able to visit this historical site and commemorate all whose lives were forever changed by the unjust hardship, indignity and loss they (and future generations) suffered. Recently, I was blessed to join in a pilgrimage to Israel and Palestine where one of the most profound experiences was simply sitting in silence in the Judean desert wilderness. I have also just returned from a Lenten border pilgrimage in the Tucson sector of the Sonoran Desert. It's inconceivable that a wind farm would be built adjacent to the Saguaro National Park, as everyone would understand how it would detract from the uniqueness of the land and the experience of being there. It should be even more inconceivable that such a wind farm could be built near the Minidoka National Historic Site. Government leaders speak of a commitment to environmental justice and a desire to advance racial equity. It is time to take a stand, not against renewable energy which is essential, but against placing such private infrastructure where the impact is one of dishonor and devastation on those who already experience racism and a history of oppression. The Minidoka National Historic Site is sacred land. I hope one day to participate in a pilgrimage there, and I am certain that the Lava Ridge Wind Project on adjacent land would feel like a desecration. To be in that space, standing in the expanse and isolation of field and mountain view, gives opportunity for a holy connection to all who were forced to live there. The site serves as motivation to fight current racism and injustices - a motivation that is vitally important to our country today. It also serves as a place of healing and education - both of which are important values to me as an Episcopal priest and a former middle school teacher in the Pacific Northwest. I participated in a "virtual on-line pilgrimage" to Minidoka during the summer of 2020, which included a National Park Service project where we received seeds and grew native grasses which we mailed back to be planted at Minidoka. It was a personal and meaningful way to honor dear friends of mine who were incarcerated there. It was a way to care for the site. To have hundreds of wind turbines within the viewshed of this area would totally ruin the experience that so many of us desire to respect and commemorate this site. Please say no to this project. Thank you.
11451-1	Melna Skillingstead	I am Japanese American. I was not in the Minidoka Concentration Camp but I have read various accounts about the hardships my Dad and his extended family experienced in there. I have visited the area twice where my grandma, 62, shared a tarpapered room with my dad, 41, and my uncle, 39. In adjacent buildings were eight aunts, four uncles and nine cousins ages 0-9 years old. (one was two months old and another was born there). I feel sad that my cousin felt ashamed until he was 70 years old that he was born in prison - he turned 80 this year). Why the US government felt threatened by children ages 0-9 is a mystery to me. I think the government committed a crime by imprisoning all of them but especially the children. They suffered the bitter cold, the scorching sun, the lack of privacy and the harsh weather in outdoor mess hall lines just to eat their meals. Some of my school aged cousins had to repeat a grade from inadequate schooling while in 'camp'. My heart hurts for my cousin's experiences. My cousins who are now in their 80's still remember Minidoka. They have shared their stories in elementary to college classrooms on the east and west coasts. They've appeared in films, books, TV news stories, photos (National Archives), a survivor panel webinar (Friends of Minidoka), a museum (Washington State Historical Museum and more to educate future generations about this sad time in Japanese American history. Our extended family will continue to know about our relative's experiences in Minidoka from the stories contained in our two family books. Our descendants may visit Minidoka where it all happened. In 2020 I was in Jerome, ID which is about 15 miles from the site. It was April but the temperature that morning was 29 degrees and the 19 mph wind was a bone chilling. I was cold in my down jacket just going to get something from the car. The wind was so strong the door blew closed. Once I was back in the hotel room I realized that my family had suffered through similar weather with inadequate clothing. I imagined them standing outside in a wind such as that waiting to go into the mess hall for their breakfast. It still brings tears. I was struck by the emptiness and isolation of the area during my two visits to the site in 2008 and 2016. When future generations visit the site I hope they are able to see and experience the same desolate, lonely place where their ancestors spent 2-3 years of their lives behind barbed wire. Minidoka is a symbol of injustice. It is also sacred ground which honors our family and all the people of Japanese descent who were incarcerated there. Please respect their memory. Please do not locate the Lava Ridge wind farm in its backyard or visually impact the experience of future visitors to the Minidoka National Historic Site. Thank you.
11452-1	Name Not Provided	The Lava Ridge project while intended to move more renewable energy sources forward does so while carelessly trampling on the Japanese American and indigenous American history. To move ahead as planned would be to destroy a critical American memory for the sake of speed and lack of due diligence to marginalized communities. No on this location.
11453-1	Christian Chesley, Margaret A Chesley	Please honor the lives disrupted during the unconstitutional incarceration of Japanese Americans during World War II by keeping the boundaries of the Minidoka, Idaho camp intact with no installation of windmills.
11454-1	Andrew Abo	My mother was incarcerated at Minidoka during World War II. It had a traumatic effect on her and her family long after the war. The Minidoka National Historic Monument has become a place of healing and community for my mother. The establishment of the National Historic Monument by the National Park Service is a meaningful and appreciated recognition of the wrongs that were made and a show of commitment to avoiding similar wrongs in the future. The proposed Lava Ridge Wind Project has caused my mother much distress. First, there's the visual impact of the turbines and transmission lines that diminish the experience of returning to Minidoka. Second, there's a sense of disrespect that is painful. For these reasons, Alternative A: No action is the only acceptable choice to my mother. I hope the BLM can take into account the re-injury this project will cause to those who were incarcerated at Minidoka.
11456-1	Chad Yoneda	My family and I visited Minidoka National Historic Site on June 6, 2021. We visited the visitor center, talked with the park rangers, and walked the grounds of this important site, a legacy of racial incarceration and concentration camps for Americans of Japanese descent. It is a haunting place, filled with memories of exclusion, loss, and betrayal of mostly American citizens who just happened to look like what was at the time the enemy. As a Japanese American, it is a painful history to know that so many of us were forcibly detained and excluded here. Yet it is absolutely necessary to remember and honor this racist past, with the fervent hope that this will never happen again. For this reason, I find it absolutely appalling that an enormous wind farm is proposed within sight of Minidoka National Historic Site. It would forever blight and destroy the character of Minidoka. Much has already been lost. Extensive sections of land and buildings that were part of Minidoka racial incarceration camp have already been sold off and severed from the historic site. It is enormously disrespectful for Minidoka National Historic Site to put a wind farm on Lava Ridge with wind turbines that are 740 feet tall. The turbines would be more than twice the height of the Statue of Liberty, and nearly 200 feet taller than the Washington Monument!

Comment ID	Sender	Public Comment
		Such 740-foot turbines would forever mar the skyline of Minidoka, and detract from the solemn reflection and consideration that Minidoka deserves for its remote rural location. No National Historic Site deserves such desecration and Minidoka should be no exception. The Japanese American incarcerees at Minidoka were betrayed by their own government, not for any cause or action they had done. To allow huge 740-foot wind turbines in proximity and sight of Minidoka would be the equivalent of betraying those Japanese Americans again by signaling that their wartime betrayal by the U.S. and loss are not being remembered nor respected. I strongly urge the rejection of Lava Ridge Wind Farm and any future attempt to place wind turbines within sight of Minidoka National Historic Site. Please support the sacred memory and respect for Minidoka National Historic Site.
11459-1	Joel Kikuchi	It is with utmost sincerity that I must express outrage and sadness that a for profit corporate entity could set up a windfarm on a sacred place for myself and my community. The disregard for my heritage and ancestors by this proposed project is insulting. I demand that this unwarranted, desecrating maneuver be stopped.
11460-1	Elissa Dingus	I am writing to express my strong opposition to the proposed Lava Ridge Wind Project by Magic Valley Energy and encourage the selection of Alternative A - No Action. The project would install up to 400 wind turbines on Bureau of Land Management property adjacent to Minidoka National Historic Site, including the potential for several turbines to be on the historic footprint of the camp. This would have a major negative environmental and cultural impact on the area, as well as a direct threat to the historical, natural, and cultural resources of Minidoka National Historic Site and the surrounding area. The proposed project would involve a significant number of new installations, including up to seven new substations, 381 miles of access roads, 47 miles of temporary crane walk paths, and more. The turbines may also have a maximum height of up to 740 feet, which would be a significant visual intrusion on the landscape and detract from the beauty of the area. The footprint of the project would expand across a space larger than the city limits of Seattle, Washington - it's incomprehensibly massive. The power generated would also not even be for Idaho residents and would be shipped to California. The wind turbines would be visible from the WWII Japanese American incarceration site, disrupting the sense of isolation and vast landscape that is fundamental to the visitor experience. Minidoka's remote location in the desert of southern Idaho provides an immersive setting that is essential to providing insight into the desolation and loneliness of WWII incarcerees. The vast expanse of open landscape on the horizon creates a sense of isolation on a vast landscape where Minidoka once stood. The extreme changes in temperature, the arid environment, and high winds that the people at Minidoka experienced are part of the environmental setting that can be still felt today. Experiencing this environmental setting allows visitors to better understand and connect to the daily lives at Minidoka. [...] This project would also harm local farmers and ranchers, as the construction of the wind turbines and associated infrastructure would impact their land use and reduce their ability to utilize their property for agriculture and grazing. Not to mention the inevitable consequences for birds, bats, and migratory wildlife in the area. I urge the Bureau of Land Management to carefully consider the potential negative impacts of the Lava Ridge Wind Project on Minidoka National Historic Site and the surrounding area. I also urge the agency to explore alternative, less destructive forms of renewable energy that would not have such a negative impact on the area's natural and cultural resources.
11473-1	Name Not Provided	No action!!!! Do not take more from those who have already endured so much pain and loss!! This project is taking advantage of minorities and their history. Trying to erase the site won't change how bad history is! As a Japanese American I feel strongly about minidokas mission to bring awareness to our cultures history and shed light on the abominations of this country in hopes to change the future generations. No lava ridge project
11476-1	Name Not Provided	No action on this project!! Shut it down. Do not again make Japanese Americans suffer under the US government o
11477-1	Suzu Kawamoto	I am adding my name and voice and heart to the call to stop any further action on the proposed Lava Ridge Wind Project. This project will completely bury any remaining evidence of the atrocities of the incarceration of the Japanese American citizens at Minidoka. In fact, I was disheartened, but not surprised, to not even see Minidoka mentioned in the proposal. Minidoka is a Landmark; an important part of American history that must remain and not erased. In the name of my Grandparents, aunts, and uncle, and all the Japanese American citizens who were unfairly incarcerated in Minidoka; losing their possessions, dignity, and years of their lives, I implore you to choose the "No Action" alternative.
11478-3	Sandra Thompson	We further believe that our wildlife and bird populations will be destroyed. We must also respect our historical national monuments and the people associated with them. This is not an appropriate location for a project like this.
11479-1	Suzu Kawamoto	I am adding my name and voice and heart to the call to stop any further action on the proposed Lava Ridge Wind Project. This project will completely bury any remaining evidence of the atrocities of the incarceration of the Japanese American citizens at Minidoka. In fact, I was disheartened, but not surprised, to not even see Minidoka mentioned in the proposal. Minidoka is a Landmark; an important part of American history that must remain, and not be erased. In the name of my Grandparents, aunts, and uncle, and all the Japanese American citizens who were unfairly incarcerated in Minidoka; losing their possessions, dignity, and years of their lives, I implore you to choose the "No Action" alternative.
11486-1	Lisa J. Ponder	Mourners. Mourners and Historians. Mourners, Historians, and Survivors. Not tourists. Locate the turbines in the field of Gettysburg. Site them at 9-11 Ground Zero. Put the turbines in Arlington Cemetery. Any of those places would cause less trauma. Choose the “No Action” plan. Otherwise, in the dark of night, the red lights of each turbine would shine with a silent and ominous message… the government can do it again. Immigrants came to America because they preferred the US to the place they left. They settled. They obeyed the laws. They honored the American dream. They worked hard for achieving and acquiring an American life.

Comment ID	Sender	Public Comment
		How could living in barracks at Minidoka be considered cruel? Other people lived nearby in towns, in the same climate, so why would anyone consider it cruel to be housed in Minidoka's concentration camp (FDR's chosen term for the imprisonment site)? In Jerome, the "other" people had homes with insulation, homes that could withstand the heat, the cold, the dust, the wind; homes that had space for each person, with indoor water and toilets; The others had family photos and heirlooms still intact, allowed, and unconfiscated; The others had the "fruits of their labor" intact and available to use and to pass to descendants. Crucially, the "others" in Jerome chose to be there, prepared to be there, had autonomy there. They had not been forced to be there, kidnapped at gunpoint and with their home lives stolen… unlike Japanese Americans, even citizens, who had everything in their lives ripped away swiftly. The Japanese Americans and Japanese immigrants there were imprisoned without crimes and sentences to serve. The US government used its military power to incarcerate toddlers, working men & women, elderly and infirm grandparents, youth who had wanted to enlist, recent college graduates ready to enter the workforce, and pregnant women thus deprived of the medical care that could save their infants' lives and their own. In the past decades, Japanese American communities have worked HARD to heal and rebuild… and, the US as a whole has officially recognized and acknowledged the wrong of imprisoning people because their grandparents had been born in Japan. Putting Minidoka into the somber shadow of the turbines would create an ongoing psychological threat; It would undo decades of healing and would create new psychic harm; It would harm the deep solemnity of the very place where people "come to terms" with the generational impacts and cultural genocide perpetrated by temporary misuse of power. Siting the turbines in view of Minidoka would send a message way beyond mere disrespect; It would indicate an utter disregard for important American lives. It would also run counter to Congress's proclamation that the imprisonments were unjustified, and the reasons for forced removals were unfounded. President Roosevelt knew this; he'd received that documented information, yet authorized removal anyway. Congress has since publicly determined and said the causes of incarcerations were "war hysteria" and racism. Congress has decreed America must have more education about the incarcerations' unjustness— and, Congress continues to fund education about the incarcerations. Congress made Minidoka a National Historic Site Park. Protecting the integrity of the site/s is a key part of the education that Congress funds. The history site needs to convey more than "facts and data". The imprisonment site education must also convey the desolation and despair and devastation of personal lives the incarcerations created: havoc and ruin. Minidoka's ruinous impacts did not end with the camp closure: After "release", former incarcerees could not resume former lives and jobs, nor were they allowed to return home directly. Furthermore, the camp-caused impaired quality of life continued to impair whole families—for years and for generations—through camp-related illnesses and ill-health deaths. Additionally, the government pressured people to "disperse" and for their own safety many Japanese Americans from then on lived isolated from other Japanese Americans—whether in Montana or Chicago—to the point that their children grew up without learning family history or language and to the point that a very high percentage married non-Japanese; It seemed safer. Looming turbines, along with their sounds and monster red-lights at night, would do more than distract us from the history of the site. They would minimize and begin to erase the history. The very feel of the place is a core part of the place. Choose the "No Action" option: doing so would say and show—loud and clear—that Japanese American lives and histories do matter, and ARE American history. I say all this because data and facts are not the full story. The impact of the site and of your decision go far beyond data details and power points. I am a white woman, with no Japanese or Asian relatives or ancestors. My family came to the US in the 1600's and 1700's and I am a member of the DAR. I need to have Minidoka preserved in its feel as well as fact. It is important. Choose the "No Action" option.
11497-1	Name Not Provided	I am the son of a Minidoka incarceree. My father was a student at the University of Washington when he was arrested and sent to the Minidoka War Relocation Center. When he was released, he joined the Army and served this country for over 20 years through both the Korean and Vietnam Wars before retiring. He never returned to college to finish getting a degree. Like most incarcerees of his generation, he didn't talk much about his time at Minidoka. As we get older, we tend to reminisce about the past. So in 2018, over 20 years after his passing, I decided to see for myself what it would have been like to live in the place where he was detained. This trip was not a vacation. I was not a "tourist" but a descendant going on a pilgrimmage to experience a place that had a strong impact to my father's future. One of the things I remember most about that visit was the vast remote feeling of being in the middle of nowhere. Having lived in the Seattle area for over 40 years, I couldn't help but notice that quiet and isolated feeling of seeing the horizon in all directions. At Minidoka, there's a plaque next to the former site of a swimming area. This plaque has a picture of the lifeguards that watched over the swimmers. My father was a lifeguard and is in that picture. Seeing large wind turbines behind this area where children played to try to escape their isolation takes away from the true historic and educational experience of what it was like to live there. As I said, after my dad had passed, it took me over 20 years to realize I needed to make the trek to Minidoka. Had I made that trip and saw the structures proposed by the Lava Ridge Wind Farm project looming over the countryside, I would not have been able to experience the true landscape of the camp surroundings as my father would have seen it. To ensure future generations continue to have those same experiences, we need Alternative A: No Action
11501-1	Tara Rowe	I write today in opposition to the Lava Ridge Wind Project proposed by Magic Valley Energy, LLC. As an Idaho historian and a resident of Twin Falls, I have a vested interest in the outcome(s) of this proposal. Let me begin by stating emphatically that there is no outcome aside from this project ceasing to go forward that accomplishes what is needed here which is the protection, preservation and continued accessibility of the Minidoka Historic Site--the incarceration center for Japanese Americans once known as the Hunt Camp. This is a sacred site with a history unique and important to the people who once were incarcerated there, the people who make the trek back there each summer and the people in the agricultural community whose livelihoods continue to benefit from the impact of Japanese American laborers throughout the twentieth century. It would be an absolute travesty to lose any portion of this land, whether that be the footprint of the original camp, the current footprint of the historic site administered by the National Park Service or the view from the site over the surrounding area (a view that would be marred by wind turbines). On a personal note: In 2001, as a high school junior, I went with a history group to the site where some 13,000 Japanese Americans were incarcerated during WWII. At that time, Congress was in the process of designating the area a national historic site. Unfortunately, the space was in disrepair. Most of the barracks buildings had been hauled off to various farms, the warehouse and surrounding spaces were crumbling, and there was very little to represent not only the people who had once been incarcerated there, but also their impact on the area during their incarceration and in the decades after. Had Congress not designated the site and the Park Service taken administration duties, I'm afraid the sacred space would have been unrecognizable as anything but farm land. It is only because of the Park Service, congressional monies and the hard work of volunteers like Friends of Minidoka that the site has been restored to what it is today. If we allow business, like Magic Valley Energy, to encroach on the site, the long-term project of presenting the site's history to younger generations will suffer. I have now had the privilege of writing on the historic nature of the land in question. I am attaching both columns from the Idaho Capital Sun on this topic. I urge the Bureau to respect the history of this space, the lives of those who were taken against their will and incarcerated there, and the many, many Idahoans who desire to know that history by having continued access to the unobstructed site.
11508-4	Justin Gott, Daniel Gott, Josie Gott	4. The Minidoka Japanese Internment is located in the area also. It has a rich history which is being conserved for the public to come out and see so we don't forget this history of our Japanese ancestors.
11509-1	Leah Nguyen	he Minidoka National Historic Site is of critical importance to understanding our nation's history and the impacts of the violation of the civil liberties of Japanese Americans. It is important to treat this site and the community with respect. This site is not open and barren, it holds the pain, trauma, loss, and betrayal of the community that was imprisoned there. Maintaining the integrity of the site as a historical monument allows this history to be acknowledged and opens opportunities for healing and integration.

Comment ID	Sender	Public Comment
11511-2	Elizabeth (No Last Name Provided)	I recently visited the Minidoka Internment Camp Historical Monument. Certainly, the quiet location for this important reminder of the past for current and future generations would forever be altered by the nearby presence of massive, disruptive wind towers with increased noise, construction and traffic. To place these towers adjacent to this monument shows disrespect for all people who have been wronged by the government.
11515-1	Charlotte Marie Okuma Johnston	Almost a year ago on Earth Day, April 22, President Joe Biden stated that "we've put environmental justice at the center of what we do, addressing the disproportionate health, environmental, and economic impacts that have been borne primarily by communities of color -- places too often left behind." It was in this sentence that President Biden emphasized the importance of listening to the voices of the marginalized and the role that the White House Environmental Justice Advisory Council has in creating policies that fulfill his and Vice President Harris's commitment to confronting long standing environmental injustices and to ensuring that marginalized, underserved, and overburdened communities have greater input on federal policies and decisions (whitehouse.gov). We are now at a pivotal moment in history in which the environmental justice decisions are in conflict with the voices of marginalized communities of color. And you, Kasey, and the fellow staff at the Bureau of Land Management are at the center of this conflict. Minidoka National Historic Site holds the legacy of the 13,000 imprisoned Japanese Americans from 1942-1945 (81 years from the singing of EO 9066).This means that the number of children, grandchildren, friends, historians, National Park Staff who would be negatively impacted by the Lava Ridge Wind Project would easily exceed the population of Boise, Idaho (250,000). The legacy of Minidoka was desolate. The legacy of Minidoka was unwanted land. The legacy of Minidoka was the spirit, patience, and strength of the incarcerees through farming, gardening, and landscaping that made this land desirable and auctionable to white veterans post-WWII. There are countless stories of feeling isolated, looking out into the empty horizon and watching the birds fly freely in the sky. When descendents make pilgrimages to the land to reconnect with their ancestors, they look at the horizon and see the vast emptiness that their ancestors once saw. It is the current feeling of isolation that strongly reflects the loneliness and imprisonment felt by the incarcerees. We are now at a point where the Lava Ridge Wind Project has already caused irreparable harm against the voices of the marginalized- those vowed to be protected by the Environmental Justice Advisory Council. The Environmental Impact Statement has already miscategorized the descendents and survivors of Minidoka as "tourists and recreationalists." The different options on the maps showcase how Wind Turbines would sit on the former Minidoka Internment Camp. Option A was not presented at the Mercer Island Open House until requested by attendees of the Open House. Staff members attending the Open House pointed at photos of survivors as child prisoners and called them "adorable" and "cute." I am not a descendent of the Japanese American Incarceration. I am a first generation Japanese American, born overseas as both a U.S. and Japanese Citizen and moved to Washington State at a young age. I am a granddaughter of a white-American WWII Lieutenant Colonel in the Air Force. I also hold love for both Eastern Washington and Northern Idaho as the majority of my U.S. family members live in both areas. Much like yourself and the BLM staff, I learned about the American Injustice of the Incarceration through school and the voices of the Japanese American Community. I am one of many examples of how it is possible to not have a direct relation to the Minidoka history and still understand the significance of the land, the horizon, and the great injustice that the placement of the Wind Farm would have on U.S. history. There is no consideration outside of Option A- the action of no action. Looking back throughout U.S. history, we hear stories of injustices- the trail of tears, slavery, segregation, the Chinese Exclusion Act, the Japanese Incarceration, and more. As President Biden stated on February 19, 2023, the incarceration was a shameful day of history where the Japanese American community "[lost] liberty, security, and the fundamental freedoms that rightfully belonged to them." My question to you and the staff at the Bureau of Land Management- what side of the history books do you want to be on? Will you be known as the Program Manager who represents a government entity that once again takes from the Japanese American Community?
11517-1	Daniel Kittaka	A critical part of my understanding of my personal identity and family heritage is the incarceration without due process of my paternal grandmother and her family at what is now the Minidoka National Historic Site. Accepting and acknowledging this heritage has helped me understand and change my relationships with others and discover how I can serve our society. Visiting the site with my father, whose mother had been incarcerated there, was a memory which I will never forget. As I walked the sight, I imagined my grandmother looking out over the desolate land and holding anger at her unjust incarceration and awe of the natural beauty at the same time like me in that moment. I shared some thoughts with my father and some I kept with myself. For me it was important to visit the site to open the book of processing the intergenerational impact of my ancestors' incarceration. The quiet, serene landscape felt comforting at that moment. The proposed Lava Ridge Project would disrupt those moments for future generations as it would cause a visual distraction from the emotional and spiritual work to be done by descendants of incarcerated people like myself and my father. I recommend considering a different site or alternative proposals C or D to minimize the impact to the Minidoka National Historic Site for the well-being of future generations.
11520-1	Shirley Louis (Nikki Nojima)	retired professor of creative writing and Asian American Studies at the University of New Mexico. I'm better known as Nikki Nojima Louis, my professional name as a writer and theater artist. I reside in Albuquerque, New Mexico, where I'm represented by Senators Martin Heinrich and Ben Ray Lujan and Representative Melanie Ann Stansbury. I and my mother are survivors of Camp Minidoka. I am also the daughter of a father incarcerated in Lordsburg and Santa Fe DOJ camps in New Mexico. On December 7, 1941, the FBI removed my father from our home in Seattle, Washington. It was my fourth birthday, and we never lived together as a family again. In 1985, I began a journey of discovery and recovery that continues today. This journey has taken me from the Pacific Northwest--where I was first drawn to the stories of camp survivors of Bainbridge Island and Seattle--to the Southwest, where I became immersed in the stories of the DOJ and Army-operated "enemy alien" camps of New Mexico and Texas. I established a readers theater touring group and forged a partnership with CLOE: "Confinement in the Land of Enchantment," an outreach project on the DOJ prison camps of New Mexico. Since 2014, we have brought "living history" plays on the Japanese American experience to diverse and underserved audiences throughout New Mexico Thirty-eight years ago, when I began researching, teaching, and presenting plays on the Japanese American experience, my focus and that of my colleagues was on bringing to light the injustices of Japanese American incarceration. In the intervening years, a plethora of sociological and historical traumas has brought us to a keen awareness of injustices and systemic racism. As a seven-year-old returning to society in 1945 after incarceration in a desert concentration camp and reaching maturity in the turbulent '60s, I had little interest in Japanese American civil rights. The causes that engaged my interest then were the solidity of the African American, anti-war, and women's movements. Denial, shame, guilt, and silence--i.e., internalized racism--were at the forefront of the community trauma that affected my long disinterest in my own experience of displacement. I cite these personal details because they are echoed in the conversations, oral histories, and documentation of countless Japanese Americans who experienced this community trauma. MNHS and other National Park incarceration sites are meeting grounds for the sharing of memories, reflection, healing, and knowledge. For the DEIS to identify them as tourist and recreational sites is short-sighted and insensitive. I wish to state my support of the No Action Alternative (Alternative A) as it promises to protect the integrity of the Minidoka National Historic Site. I advocate for MNHS to be viewed as Traditional Cultural Property and listed on the National Registry of Historic Places. In two recent executive orders, President Biden pledged to "deliver equity and environmental justice," and "advance racial equity and support for underserved communities." I ask that these promises be fulfilled by delivering environmental justice to MNHS and supporting a Japanese American community that has been historically underserved and racially targeted since the early days of its immigration. I ask that the Minidoka National Historic Site's "immersive feeling of isolation" that is honored by other National Parks be preserved for camp survivors, their descendants, and present as well as future seekers of knowledge, history, and legacy.
11525-5	Erin Schmith	In any case, I agree with the Japanese American community that any change to the Minidoka NHS, the larger WRC footprint, or the surrounding environment as proposed under this Draft Environmental Impact Statement, fails to protect the integrity of Minidoka NHS. I support Alternative A - No Action.
11526-1	Mikka Tokuda-Hall, Wendy Tokuda, Marilyn Tokuda, Maggie Tokuda-Hall	10 members of my family were incarcerated at the Minidoka Internment Center. My parents met there and my oldest brother was born there. My parents lost everything they had, including my father's drugstore. So Minidoka is a sacred place for me. When I go there, I can feel the spirits of my grandparents, parents, aunts and uncles and my brother. That is why I am against The wind towers are taller than the Space Needle in Seattle, where I was raised. I know how the needle dominates the view of that city. The thought of dozens of these huge wind towers as the backdrop of the Minidoka National Monument is upsetting. The towers would overwhelm Minidoka. Instead of a pilgrimage to this historic site, it would be more like- hey, look at all these wind towers. Part of the experience of visiting this historic site is to feel the desolate nature of the location. Japanese were carted away to this remote spot in the desert for a reason- to prevent them from spying. This is part of the educational aspect of the Minidoka monument, and for descendants like me, the feel of the location strikes deep at my soul. I can feel my parents there. I can feel what they went through. it is a soulful experience that would be destroyed by the view of dozens of wind towers, taller than the Seattle Space Needle. Frankly, for me, it feels like an insult. I am an environmentalist. I have solar panels and I drive a plug in hybrid car. I compost and have an organic garden. I am all for wind power, just not in this location. let all of America experience Minidoka as it truly was in 1942- a prison set in the remote desert, not a historic site overpowere by a windfarm.
11529-1	Erika Katayama	s a member of the Japanese American community, and a direct descendant of incarcerated individuals of the WWII American concentration camps, I vehemently oppose the construction of a wind farm near Minidoka. I experience Minidoka National Historic Site as a product of generational trauma, but also as a person that wants the location preserved as an important reminder of the horrible effects of racism and xenophobia. My grandma and additional family members bear the scars of the

Comment ID	Sender	Public Comment
		unjust imprisonment, I see Minidoka as a distinct reminder of the hateful treatment that Japanese Americans and Asian Americans experience still today. Education and awareness is critical in the efforts to eradicate hateful treatment of others, and Minidoka must be preserved in order to continue this education.
11530-1	Nicole Iwamasa	As a descendant of Japanese Americans who were interned during World War II, I think this project is incredibly disrespectful towards the communities that the US government has previously decimated. There are always alternatives to support renewable energy projects that do not harm communities of color, and should you choose to disregard pleas on the half of the Japanese American community to find another site you will not only be perpetuating a legacy of Western Supremacy, but also degrading historical remnants of past injustices. You should move to take no action. I and many other people would hope to continue visiting historical areas, but this project would impede my ability to do so.
11537-1	Chisao Hata	My name is Chisao Hata and I am a third generation Japanese American and both of my parents were held at one of the incarceration sites. I am writing to adamantly oppose the project to build wind tunnels at Minidoka. This effort is not only an affront to the years of organizing for Redress, the passage of the Civil Liberties Act in 1988, the efforts to gain educational and interpretive centers at the incarceration sites and our generational trauma from one of the most racist acts in American history. This is a time to acknowledge, rectify and honor the histories of people of color in America. The act of building these towers ignores the decades of work so many of us have done to protect these sites of conscience so our American history is inclusive, honest and correct. DO NOT INVADE THE SITE OF MINIDOKA. DO NOT IGNORE OUR HISTORY. DO NOT MOVE FORWARD ON THE LAVA RIDGE PROJECT.
11538-1	Francis Sumida Palk; Japanese Ancestral Society	WE AT IKoi no Kai would much prefer "NO" towers at Minidoka!" I was one of the evacuees at the camp and remember, how "upsetting" it was to be in the "rehabilitation" camp. My whole family wants to have it remembered. Dad could not stay with us as he was forced to work at the Anderson Dam, so we missed him. My other relatives were sent to Nyssa and Ontario to do hard labor on the farm to raise sugar beets. PLEASE, we do not want our newer relatives to forget! SO MINIDOKA needs to be remembered WHOLE.
11539-1	Karen Hardesty	While my father was not a resident of Minidoka, he was a forced resident of Manzanar and Tule Lake Concentration Camps in California. I haven't had a chance to visit those camps, but my husband and I were able to visit Minidoka. The experience was sobering, as I thought about my father (he was around 11 years old at the time) and his family having to live in these conditions. I understand the need for clean energy, but having these wind turbines so close to the Minidoka Historical Site will ruin the experience when visiting the site. These camps were established in remote areas of the US for a reason, and when visiting the camp, you can feel how remote and isolated you really are. These wind turbines will minimize that experience.
11544-1	James Rodgers	I have visited the Minidoka National Park on several occasions and worked directly with survivors and their descendants for a number of years. They speak of trauma, racism, and being scapegoated as villains by the U.S. government and their own neighbors. To call this place a "tourist attraction" is an insult to those 12,000 people incarcerated there during WWII. Minidoka is a concentration camp that needs to be memorialized as it existed from 1942 - 1946 as a reminder of how fragile democracy is. Part of that memorialization needs to be respecting the desolate viewshed and the feeling of unbearable hopelessness that view inflicts. Those people of Japanese descent forcibly removed from their homes on PNW farms and forests had nothing to look at but endless planes of desert sand and sagebrush. To mar this view with hundreds of windmills will only cause further damage to the Nikkei community. Please respect this history and don't compound any more pain and trauma. The only answer for this development is Option A - No change.
11546-1	Dan Sakura	Thank you for the opportunity to submit comments to the BLM regarding the Lava Ridge wind project. I'm a descendant of three genera□ons of Minidoka survivors on my father's side. I'm proud of my grandfather Chester's military service during World War II, my grandmother Agnes for raising three boys by herself in a U.S. Government prison camp and my 87-year old father, David Sakura, for his work to tell the story of Minidoka to young people throughout New England. [photos] Chester Y. Sakura, 442nd/MIS (le□), Agnes Sakura, David, Gerry & Chet David Sakura, Minidoka Survivor I'm also proud of the work of the Japanese American community and the National Park Service to turn a place of trauma into a place for healing. I'm proud of the hard work and cultural sensitives of the National Park Service leadership, interpreters and resource stewards from 2000 to the present. They demonstrate the highest level of public service. In close partnership with the Japanese American community and many partners, they have worked tirelessly to preserve Minidoka's sacred ground, tell the whole story of America, honor Japanese American veterans and convey the hardships and courage of Japanese American and Alaska Native survivors and descendants during and after World War II. For over 22 years, star□ng in late 2000, I've worked to designate, expand and protect Minidoka, in a variety of roles, including serving at the White House (Council on Environmental Quality) during the Clinton Administra□on. I was grateful for President Clinton's decision to designate the Monument and the bipartisan leadership from the Idaho and Washington State Congressional delegations to expand and redesignate Minidoka in 2008. Representatives Mike Simpson, Jay Inslee and Senators Larry Craig, Mike Crapo, Maria Cantwell and Paty Murray worked across the aisle to advance our country on its road to healing. I appreciated the opportunity to support the National Park Service's acquisition of the Farm-in-a-Day and Military Police proper□es through legislative and minor boundary expansions. In 2009, through the leadership of Secretary Ken Salazar, the NPS and BLM worked together to relocate the Southwest Inter□e Project – North (SWIP) project away from the park. The Department of the Interior's commitment to the Japanese American community dates back over 75 years to Sec. Harold Ickes who worked to improve conditions for incarcerees. I've atended two Pilgrimages and brought my family to Minidoka. As an advisor to the Minidoka Pilgrimage Planning Commitee, I look forward to the 2023 pilgrimage in July. I've worked to designate Tule Lake and Honouliuli National Monuments, acquire land at Topaz and the Bainbridge Island-Eagledale Ferry Dock (Pritchard Park), and pass bipartisan legisla□on in 2022 to establish the Amache National Historic Sites in Colorado. Partnering with the BLM. During my career, I've worked in close partnership with the BLM to acquire private land in Idaho, Montana, Arizona, New Mexico, Wyoming, California (with Ed Hastey), Colorado and Washington State to protect National Conservation Lands and advance BLM's land tenure goals through the LWCF, FLTFA and land exchange programs. I respect the important – and challenging -- work that the Bureau does to find the right balance between multiple competing uses of the land and its important role in the fight against climate change.
11549-1	Carmen Tsuboi Chan	My name is Carmen Tsuboi Chan. I am a sansei and have visited the Minidoka site with my father who was incarcerated @ Minidoka, along with his parents and 5 siblings. I am writing to you to demand "No Action" on the Lava Ridge project which would dishonor this sacred site. We were not "tourists and recreationalists" as sited in your report. My father was a man of few words, especially about the incarceration ~ but when we were there with so many other survivors, he immediately opened up and talked about the pain and injustices that eliminated their family grocery store, home, schooling, and lifestyle. This was a scar on democracy that needs to be preserved to continue educating future generations and the benefits I and others have been able to enjoy because of their sacrifices. Let the spirit of healing continue unadulterated through preserving this site. Though Japanese Americans are looked upon as the model minority ~ you need to know we will not sit silently again for this racist action!
11551-4	Erin Shigaki	Thank you for the opportunity to submit public comments regarding the proposed Lava Ridge Wind Project. As a descendant of Minidoka, I strongly oppose the proposed Lava Ridge Wind Project and support Alternative A–the No Action alternative. [...]

Comment ID	Sender	Public Comment
		In addition to flaws in the DEIS, I wish to express our concerns about BLM's failure to follow Biden Administration policies in which he has committed to simultaneously "deliver equity and environmental justice" (E.O. 140574) and "advance racial equity and support for underserved communities." (E.O. 139855) The Federal government must honor these assurances by protecting the Minidoka National Historic Site. I support renewable energy and a green future but not at the expense of our community or other local communities who oppose the Lava Ridge project. Please do not install the Lava Ridge Wind Project or any wind farm project at or near our sacred Minidoka National Historic Site. I strongly believe that this Wind Project would mark a step backward in the U.S. government's acknowledgment that the World War II mass incarceration of my family and community was wrong. I unequivocally support the work of the National Park Service to preserve Minidoka's fundamental resources and values unimpaired for the benefit of future generations. I encourage BLM to adopt the No Action Alternative and begin a public planning process for the ACEC. I look forward to working with the BLM to protect Minidoka's sacred values for current and future generations.
11554-6	Raul Labrador; Idaho Attorney General's Office	Fourth, the Project will dishonor the Minidoka National Historical Site—a memorial to the injustice of Japanese American internment camps that serves as a powerful reminder of the perils of acquiescing to government overreach in times of crisis. By placing 400-foot-tall wind turbines around the Minidoka Site, the Lava Ridge Wind Farm will strip the site of its historical authenticity and lessen its impact.
11559-1	Maddy Lim	The Minidoka National Historic Site is an incredibly significant place for not only the Japanese American community but for the entire world, it offers an opportunity to reflect on the complicated history of the United States while contributing to the to the continued efforts of never allowing such an event to occur again in this country. Allowing the completion of this project to impact the visual and emotional experience of visitors to this site would be yet another instance of Asian American history being overwritten by large corporations. Marginalized groups like the Asian American community are expected to validate their rights to visit and exist in sites that are directly tied to them and their descendants. To build near this historical site would be to disparage the sacrifice and incarceration these families were forced to endure during World War II, along with their descendants who wish to visit the site today. To visit and reflect at this site is not a privilege, but a right held by every single Japanese American and every other individual who wishes to experience the impacts of legalized racism during wartime.
11562-1	K Komorita; Tsuru For Solidarity / Friends of Minidoka	As a descendant of Minidoka camp survivors and a staunch environmentalist, I ask you to please move forward with the "No Action" alternative. Japanese Incarceration was not that long ago. These are deep, deep wounds that will take generations to heal and it's absolutely unreasonable to ask us to taint that opportunity to heal with this project. BIPOC + POC communities are continually demanded to shoulder the burden of climate change - both the burden of its costs but also its solutions and this plan continues to play into that pattern. My Dad, brothers, and cousins have been wanting to make the trip out to the Minidoka site in order to honor our Grandfather and also learn a little more about him. My Grandfather was only a teenager when he, his family, and his cousins were all incarcerated at Camp Minidoka. The trauma of camp cut deep in our family, so we've needed time to process and tend to those wounds and we have finally reached a point where is possible. (It only took us 34 years.) I can't help but think of our elders who are only now going into therapy because it's finally becoming more socially acceptable and are probably in similar situations. To finally arrive, look out at the site, and see AND hear a farm of Space Needles would be a heartbreaking and frustrating reminder of State intrusion in our communities. The change you're asking for is not just visually altering the site's landscape, but altering the atmosphere. Silence literally gives our brains room to process and mental/emotional processing is a key to healing. There are still camp survivors who are now our elders and at the very least, they deserve the chance to heal from a traumatic life-changing experience without disturbance. Please move forward with the "No Action" alternative. Thank you.
11565-1	Norie Sato	I am writing to voice concern for the proposed Lava Ridge Wind Farm and its impact on the Minidoka National Historic Site. I am a first generation Japanese American, born in Japan. Our family did not arrive in the United States until after the war. Though we were not personally impacted by the incaceration of Japanese Americans during the war, the history of this action has impacted my life in the United States and how I have been identified since my arrival in 1954. I visited the Minidoka National Historic Site in 2019 for the first time and was moved by the suffering and the conditions under which the incarcerated were housed and the difficulties they endured. The site makes this action taken by the American government clear about its cruelty and unjust nature of the incarceration, but is educational not only from a fact-based perspective but also from an emotional one. The extent of the camps, the remote nature of its location and the rather desolate nature of the site is quite striking and one cannot help but gain a deeper understanding of the egregiousness of such an action. The DEIS fails to include the importance of education about the negative psychological effects of incarceration at such a site, which is enhanced by visiting this site. It would be a travesty to allow a commercial enterprise such as the wind farm to interrupt the solemn sense of pilgrimage, commemoration and reflection of the site. The scope and visibility of the turbines would break the importance of the site in its context. The DEIS does not seem to understand that the feeling of isolation is an important part of the viewshed which would be damaged by the existence of the Lava Ridge Wind Farm. This is not only a site for education, however, it is also a site to honor the memory of those lost and who suffered here, a site for pilgrimage and a sacred site. I demand Option A: No Action be taken.
11569-1	Name Not Provided; Marley Haller	I choose "no action" because Minidoka should be preserved as a historic site.
11570-1	Joy Shigaki	I am writing to demand Option A: No Action on the Lava Ridge Wind Project. It is unjust and wrong. It's clear the DEIS failed on many fronts to protect the sacredness of this site. I am a descendant of the thousands Japanese Americans that were imprisoned during World War II in Minidoka. My great grandparents, grandparents, and many uncles and aunts were forced to live in these inhumane conditions for years. Additionally, my father was born on a brutally cold, snowy day in January 1944 by a horse doctor. I can only imagine the fear my grandmother felt and the danger she was in delivering my father in this way. At the same time, I grieve for the many women who's babies (or themselves) died during childbirth. This entire experience has carried incredible pain, loss, harm, and humiliation for my family and those in my community for generations. I am absolutely incensed and disgusted that this wind project has been considered near this National Historic Site. Minidoka is sacred place for pilgrimage and healing for survivors and descendants. It has been an important place to remember and retell the painful history while elevating the joy and resilience of so many despite the inhumane conditions. Also, it serves as an immersive and visceral reminder for visitors of what occurred on this land. By deepening one's understanding of the historic events and allowing a quiet, sober surrounding, it provides the public a powerful experience. It is very clear the DEIS failed to protect the significance of the land surrounding Minidoka to serve as a place of healing and reflection. Additionally, the DEIS grossly and insensitively identified NHS as for "Tourists and Recreationalists." It's disgusting. It's unconscionable that 400 wind turbines might be erected near Minidoka. Given the height and scale of the wind farm, it will desecrate the site and be an impairment of resources. The viewshed will be ruined after finally making this place a site of conscience and part of the National Park Service. As an environmentalist, I support renewable energy. Yet, allowing this wind farm near this National Historic Site is perpetuating the harm, violence, and erasure of my family's history and of so many others in this country where our past has been continually ignored, covered up or erased. I implore you to stop the Lava Ridge Wind Project NOW.
11572-2	Elissa Dingus	As such, I stand with the Japanese American community in supporting Alternative A - No Action. Any change to the Minidoka NHS, the larger WRC footprint, or the surrounding environment as proposed under this Draft Environmental Impact Statement would fail to protect the integrity of Minidoka NHS.
11575-1	Jeff Matsumoto; Portland Japanese American Citizens League	On a recent trip to visit family in California, I drove along Highway 580 towards Livermore, CA through Altamont Pass Wind Farm. I thought how much the area had changed in 40 years. What started as a few wind turbines dotted along the pass has now become a wave of turbines countless to the eye to behold. Whether it is a maximum of 269 wind turbines or 400 depending upon proposal, the thought and i mage of one is one too many. The Minidoka National Historic Site is a sacred place to the families unjustly incarcerated there during World War ll and serves as a lesson to remind us how prejudice and racial animosity can supersede our civil rights. The Minidoka National Historic Site also serves as a healing place. It is a place for us to remember and recognize the courageous acts of the Issei and Nisei (First and Second) generation whose lives were up ended with incarceration. It is a place

Comment ID	Sender	Public Comment
		for our own healing as we try and understand what happened. All of this is diminished with the placement of wind turbines and the Lava Ridge Wind Project and for this reason I strongly urge support of Alternative A: No Action, in which the BLM would not authorize construction, operation and maintenance, and decommissioning of the project. Thank you for your consideration and opportunity to share our comments.
11577-2	David Inoue; Japanese American Citizens League	On behalf of the Japanese American Citizens League please accept our comments in response to the Draft Environmental Impact Statement (DEIS) for the proposed Lava Ridge wind Project. This project proposes the construction of a massive wind farm sited on Bureau of Land Management land within clear view of the Minidoka National Historic Site, where thousands of Japanese and Japanese Americans were incarcerated during WWII. The JACL was founded in 1929 to combat the increasing racism against our community in the form of numerous laws specifically targeting Japanese Americans, Asian Americans, and other communities of color. The anti-Japanese racism exploded in the wake of hostilities between Imperial Japan and the United States leading to the incarceration of 120,000 people of Japanese ancestry at sites such as Minidoka under the false reason of national security. Sites such as Minidoka were selected for their remote and largely desolate locations. Since the end of the war, and subsequent diaspora of survivors throughout the country, the incarceration sites have taken on special meaning in the Japanese American community through the development of pilgrimages of survivors to return to the sites of their incarceration to promote healing and reconciliation. The government, and particularly the National Park Service have affirmed the vital importance of sites such as Minidoka establishing national historic site designations and the establishment of interpretive centers to educate the public about the incarceration experience, the desolation being a very important component of educating visitors to Minidoka about the feelings of those who were incarcerated. As such we implore upon the Bureau of Land Management to preserve this component of the Minidoka visitor's experience. We urge the Bureau of Land Management to adopt option A, or no action. The DEIS notes specifically that alternatives C and E would have negative impact upon the value of the Minidoka site to the Japanese American community. We urge you to acknowledge this damage not just in word of the DEIS, but in the action of taking no action on this project at this time. [...] We acknowledge the vital interest of expanding renewable energy such as wind power, but believe that this goal can be accomplished without infringing upon the historic value of the Minidoka site. We recognize the goal of the Department of the Interior to make land available for renewable energy projects such as the proposed Lava Ridge project. However, we remind BLM and Interior of the commitment of this administration and Congress to preservation of our nation's cultural and historic heritage. The very establishment in 2001 as the Minidoka Internment National Monument and later expansion and restating as the National Historic Site are in itself indicators of our country's desire to protect and preserve the historic value of the site. more recently, Congress passed the Japanese American Confinement Education Act which allocated an additional $42 million to the Japanese American Confinement Sites Grant Program administered by the National Park Service "to identify, research, evaluate, interpret, protect, restore, repair, and acquire historic incarceration sites in order that present and future generations may learn and gain inspiration from these sites and that these sites will demonstrate the nation's commitment to equal justice under the law." As the BLM reviews comments regarding the Draft Environmental Impact Study, we urge you to take special note of the remarks submitted by the Friends of Minidoka with which we concur and lift up as the most comprehensive response on behalf of the Japanese American community. While the Friends of Minidoka might provide the most comprehensive comments, the comments of survivors and their descendants are of even greater value. At nearly 750 feet in height and in numbers that would overwhelm the historic site, this project would be in direct contravention of the effort to preserve the site and be a failure in demonstrating our nation's commitment to equal justice under the law. We urge you to adopt option A, that of no action...
11579-1	Karen Kawaguchi	As a Japanese American whose family was incarcerated at Minidoka, I strongly object to the Lava Ridge project. This would desecrate an important historical site which preserves Japanese American history. Find another site for this project -- on white people's land.
11580-1	Name Not Provided	I'm concerned and appalled that the Laval Ridge Project failed to protect the significance of the land surrounding Minidoka as a place of reflection and healing for current survivors who were unconstitutionally incarcerated during WWII and their family and friends. As a Japanese American who's grandparents and family were part of the incarceration, this project has taken an insensitive approach, neglecting the cultural significance of the site and the preservation of historic land. The government who once failed to protect American citizens, should do whatever they can to continue to do right by their history and stories. Please consider a better alternative that will not impact the integrity of the site, so future generations of Japanese Americans can learn about their own history and other Americans can observe and reflect.
11581-1	Barbara Hall	strongly disagree with any of the proposals to pollute our land with miles of huge unsightly windmills. They will completely ruin the reflective experience at Minidonka National Historic Site. This site is sacred land to many descendants of Japanese Take a drive through Washington and Oregon and you can see how they have ruined the landscape and what was once beautiful landscapes. I wish I had more time to cite some of the information I've learned about wind power, but it is not by far the most efficient or environmentally friendly method to generate power. I highly recommend that you do not approve this big east coast company to come into our state and ruin it, simp Thansk Barb Hly to send power to California.
11582-1	Donna Branch-Gilby	Given the historical and cultural importance of the memorial to Japanese American incarceration at Minidoka, I believe the Lava Ridge Wind Project should be sited on property that preserves the memorial. Given that 13,000 Americans of Japanese ancestry were incarcerated there, solely because of their ancestry, the memorial has significant value to be preserved. It is a lesson to we contemporary Americans of the persistence of racist thinking and its periodic eruption into action as with the Japanese incarceration. President Ronald Reagan acknowledged this devastating act of racism when he authorized reparations to thousands of Japanese Americans. I urge the Bureau of Reclamation to honor the memory of those incarcerated at Minidoka by leaving it untouched for future generations. Revise the Lava Ridge Project to leave the Minidoka Memorial to to honor those Americans incarcerated at that site.
11587-1	T. Pulkka	This proposal fails to adequately protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit this International Site of Conscience.
11592-1	Randall Meehl	I am the grandson of Japanese Americans that were ripped away from their homes and sent to camps such as this, and what this project proposes is nothing short of an attempt to erase this tragic legacy of American history to corporate "greenwashing". There is an dire need now more than ever to preserve this site and the many other concentration camps the United States ran, to preserve the history of when we as a people failed at our central principles so we do not repeat these atrocities again. This site is not just some plot of land, people lived and died here, all while under the barrel of US soldiers and trapped behind barbed wire for simply being Japanese, but their story of perseverance shows us the true spirit of this nation. It is so convenient for a government bureaucracy to just so happen to select this specific place, a historical monument of the horrors this country is capable of, and schedule it to be erased, all the while patting themselves on the back for how "progressive" they look. It is readily apparent this was not researched or even looked into, and the callousness of putting a wind farm the size of Seattle over this site where people like me were imprisoned at this time is beyond the pale. This proposal needs to be ignored, passed on and instead talk with the people who had families that went through these events to help create a preservation minded plan, rather than hand land over to a corporation to do what it pleases regardless of what damage it does to the people of this nation. Do nothing to advance this plan, reject this demolition of American history.
11595-1	Maya Abo Dominguez	I request that Alternative A - no action is selected and I would like to comment on the notion that Alternatives C - E are repeatedly referenced throughout the DEIS as having "reduced visual and auditory impacts as seen from susceptible cultural resources, such as Minidoka NHS, Minidoka WRC..." as compared to Alternative B as seen in Table ES-2. Although these alternatives aim to reduce the footprint of the project site and visual and auditory footprint, they do not eliminate the harm caused. Going forward with this project in any capacity creates irreversible harm on the survivors who were incarcerated at Minidoka, Japanese American Community, and all Americans. We return to Minidoka to remember what happened to us, to our ancestors, to our friends, family members, neighbors, and community members. To build this project is to contribute to the erasure of the Incarceration by desecrating the site and viewshed. This erasure is not without precedent, with the land that constituted Minidoka WRC being sold to white-only WWII Veterans and the barracks being sold to homesteaders after the dissolution of the camp, not to mention that the Incarceration continues to be reduced to little more than a footnote in WWII education. Although alternatives C - E attempt to "reduce" the impacts on the Japanese American community, they still contribute to the harm caused by the Incarceration on survivors and their descendents. The generational trauma imposed on the Japanese American community in the lead-up to, during, and the aftermath of the incarceration will not be "reduced" by having the wind turbines built so they are generally more in the "middleground" rather than the "foreground", as put forth in Table

Comment ID	Sender	Public Comment
		3.16-5. Although this DEIS attempts to describe quantitatively a smaller viewshed and site footprint, this is not sufficient to describe how having the entire horizon filled with wind turbines (no matter how small they appear) negatively affects the integrity of the experience of returning survivors, descendents and other visitors.
11603-3	Sheri Freemuth	Finally, I am confident that you will receive many comments regarding the untenable negative impacts of the proposed action to the Minidoka NHS. I have enclosed a blog post that I wrote in 2011 at a pilgrimage and unveiling of a triptych at the site. It speaks to the quiet, honor and beauty of this place. In this context though, this short essay demonstrates that the NHS has been positively evolving over the years with careful collaboration between the NPS and the Friends of Minidoka. In addition to the federal dollars committed to the improvement of the site for the PUBLIC's benefit, thousands of dollars of private donations have been invested to enhance this site so that the full story may be shared with the American public (a story that is even more valuable in our present age of intolerance). I recommend the no-action alternative.
11604-1	Name Not Provided	The Department of Interior and BLM should formally apologize to the Japanese American community for accepting this permit request, conducting this EIS, and putting survivors and descendants through yet more generational trauma. The BLM and DOI should be ashamed of themselves for pushing this forward given the history of DOI bureaus (BOR, BLM, War Relocation Authority) and their treatment of Japanese Americans during WWII. The Lava Ridge project is fundamentally flawed and causes impairment to Minidoka National Historic Site. The EIS should be terminated [...]
11606-1	Michael Wissenbach	I am very concerned about the potential adverse effects of the proposed Lava Ridge Wind Project on south central Idaho in general and on the Minidoka National Historic Site in particular. The adverse effects of this massive project would be felt over a huge area, and these impacts would be most detrimental to the cultural integrity and the cultural experience of the Minidoka National Historic Site (Minidoka). My association with Minidoka began in 2001, when I was hired by the National Park Service as a Natural Resource Specialist. Through my work, I became well acquainted with the site and its resources, both natural and cultural. The most important discovery I made regarding Minidoka was the importance of that site to the large Minidoka community - the survivors of incarceration and their many diverse family members whose lives were changed forever by that experience and that site. My experiences at Minidoka are dominated by the understanding of the pain and sense of despair that these people suffered. Minidoka is truly sacred ground to these people, this community, and our country and should be protected as such. In addition, to experience Minidoka is to become aware or be reminded of the civil liberties we enjoy as citizens of the United States and how they must be protected for all peoples. The National Historic site provides this experience to all who visit there. The intrusion of and visual effects of the proposed Lava Ridge project would dramatically and adversely impact Minidoka's cultural setting. The presence of giant wind turbines and electric transmission lines is not compatible with Minidoka's feeling and association with the historic wartime incarceration and loss of liberties suffered by the Americans of Japanese descent who were held there against their will. Furthermore, none of the action alternatives examined in the DEIS minimize these impacts to an acceptable level. The only viable alternative is the No-Action Alternative. Please select the No-Action Alternative and deny the application for this proposed project.
11608-1	Alison Yasuoka	#StopLavaRidge In support of the Friends of Minidoka, in solidarity and in honor of my great grandfather, Giichi Tamura, who was a wrongfully incarcerated Issei, at SFIC, Santa Fe Incarceration Center, I, Alison Yasuoka, am against the Lava Ridge Wind Project. I am instead in staunch support of the preservation of Minidoka National Historic Site. I support the words of the Japanese American National Museums President and CEO, Ann Burroughs: "We support our colleagues at the Friends of Minidoka. The community must speak out to ensure that their voices are heard and to prevent the desecration of this historic site. Minidoka National Historic Site must be preserved for future generations as a sacred place of reflection. Another site must be found for the wind project to prevent the erasure of this painful chapter of American history." Some may wonder, why would family members want to preserve the site where injustices against Issei, Nisei, and Sansei occurred? All of the Japanese Incarceration Sites are reminders of the courage, the strength, resilience, leadership, and creative capacities of our family members to endure and persevere against the injustices they faced. We refuse to silently allow the Lava Ridge Wind Project to move forward and erase our stories. The trauma experienced from the wrongful incarceration of Issei--first generation Japanese immigrants, and Japanese American Nisei (second generation) and sansei (third generation) is on-going and it is imperative that our voices continue to be heard, and our stories told. Integral to the sharing of stories, is the ability of present and future generations to have opportunities to visit sites like the Minidoka National Historic Site without it being overshadowed by these ginormous, 740 feet wind turbine structures. In reading the stories of those who were incarcerated, the guard towers were often mentioned as constant reminders of being overpowered by discrimination, racism, and injustices that our families faced. Another foreign object dominating the landscape is the last reminder needed of how some make decisions without regard for the truth, and really without understanding what it is like face hate in such a tangible way.
11610-2	Lisa Shiosaki Olsen; Intermountain District Council-Japanese American Citizens League	On behalf of the Idaho Falls Chapter of the Japanese American Citizens League, I am reissuing this letter to express my grave concern regarding the proposed Lava Wind Ridge Project and its significant negative effects on the Minidoka National Historic Site, a unit of the National Park System. The current recommendations to build windmills in this area will cause irreparable damage to this community. Minidoka National Historic Site is a sacred place for my family. My grandfather, Kiichi Shiozaki, immigrated to America from Japan to build a better life for his family. He worked for the Oregon Shoreline Railroad as a foreman in Blackfoot, Idaho, until Pearl Harbor was bombed in WWII. This was a devastating time for my family who suffered racial persecution and lost everything: home, salary, job, pension, friends, and graduation honors. Despite this, my Grandfather encouraged my dad and two uncles to fight with the 442nd Regiment. He told his sons: " you are an American, and you will fight for America. If you have to die for America, then so be it. I would rather you came home in a body bag than to dishonor this country or your family." By joining the military and serving with distinction, my father and uncles fulfilled my grandfather's request and were honored with Congressional Gold Medals and many other service medals. My sons have continued to honor this request by serving in the Army and Navy. I am proud of my family's military service and the service of thousands of other Japanese Americans during World War II, despite the fact that their families were incarcerated at Minidoka and other sites. My Uncle Hero (Hiro) Shiosaki fought for America but believed that the Japanese American Incarceration story needed to be preserved. He began work in the 1970s to see Minidoka recognized on the National Register of Historic Places and as a commemorative site to mark Idaho's Centennial in 1990. He worked hard to ensure that the site would be preserved for future generations. I remember visiting Minidoka with my parents and uncle during meetings with representatives and senators. The area's dry heat and barren dirt still contained rusted salt and pepper shaker lids and the shed skins of rattlesnakes. The loneliness and heartbreak seemed to blow around the area with the dust. Minidoka was designated as a National Monument in 2001, and my Uncle Hero was part of this process. I am grateful that the National Park Service has built on my uncle's stewardship over this important part of history by preserving this area and allowing individuals to visit this sacred site to learn and to heal. My uncle persevered for many years to tell this sad story of courage of JA Incarceration and the 442nd Regiment. He carried education booklets from the Japanese American Citizens League with him and spoke in numerous states to students, groups, and colleges. Sadly, he and my father are no longer here to tell this story, but it is a story that is dear to my heart and is a crucial part of Idaho and American history. I am glad that the National Park Service is honoring his legacy of service and commitment by working to preserve Minidoka unimpaired for the benefit of current and future generations. I was pleased that the Idaho Congressional delegation worked to pass bipartisan legislation in 2008 to expand and redesignate Minidoka as a National Historic Site. I also appreciate the Idaho Delegation's support for legislation in 2009 to relocate LS Power's proposed Southwest Intertie Project (SWIP) power line away from the entrance of Minidoka. Thankfully, the Department of the Interior and Congress protected Minidoka from the power line that would have been located over Minidoka's Honor Roll. I also appreciate Congress's support for the Japanese American Confinement Sites Act (Public Law 109-441) and annual appropriations for the JACS grants. Federal funding from Congress has enabled the Friends of Minidoka to rebuild a guard tower at the entrance to the park and support NPS's mission at the Park. The Friends of Minidoka and Minidoka Pilgrimage Committee have also worked in close partnership with NPS to advance the park's mission. I am especially proud of the Honor Roll at the entrance to Minidoka that honors the World War II military service of about 1,000 men from Minidoka including 73 men who made the ultimate sacrifice during World War II.

Comment ID	Sender	Public Comment
		I am also grateful to Congress for authorizing the Congressional Gold Medal to recognize Japanese Americans who served in the 442nd RCT and other units. My uncle Hero was able to receive the medal in 2012, before his passing in 2017. It was a highlight for him and my family and is a testament to our nation's commitment to acknowledge Japanese American patriotism and ability to overcome racial prejudice. In addition to federal preservation efforts and the acknowledgment that the incarceration was wrong, I am grateful to the State of Idaho and the leadership of Governor Little and previous Governors in commemorating the annual Day of Remembrance every February. [...] Thanks to the tireless work of my late Uncle Hero and other local partners in Idaho, Minidoka's fundamental resources and values include serving as a place "… for engagement, reflection, and healing. These sites provoke connections to individuals affected by the World War II exclusion, forced removal, and unjust incarceration, and serve to commemorate those who survived this difficult chapter of American history." I have now taken up the mantle from my uncle and have served as a Teacher Ranger Teacher at the Minidoka National Historic Site where I created lessons for other teachers to tell this story through primary resources. I have also worked with the Idaho Falls chapter of JACL to hold teacher workshops that train teachers who can then educate their students and honor the legacy of Minidoka. As noted by NPS, I believe that Minidoka should support Public Understanding, Education, and Involvement as an FRV: "Educating and engaging the public in understanding the history of the incarceration of Japanese Americans during World War II, the fragile nature of civil rights, and the need to protect civil and constitutional rights in the United States is essential...At Minidoka, special events such as the pilgrimage and the civil liberties symposium connect the public to the history that occurred here and its significance today." This is why the placement of the wind turbines will be detrimental to the sacred story of incarceration, loss and the military service of those who gave their lives to defend our freedoms. The desolation will be replaced with a view of and noise from hundreds of extremely large wind turbines. The sacred way of honoring ancestors will be disturbed when JA individuals return to Minidoka on pilgrimage to honor their lost loved ones. It will also be heartbreaking for those incarcerees who are still alive and visit Minidoka. Their sacrifices and painful loss during WWII will no longer be honored. It will instead be interrupted by the disturbance of wind turbines that are larger than any in the state of Idaho. I ask that you, please, reconsider the location of this project. I realize that there is a need for renewable energy, but the placement of this project conflicts with the Congressional mandates of the National Parks to preserve the heritage of this sacred site. If you would not place four hundred giant wind turbines next to other National Parks and nationally-significant historic sites like Mount Vernon, then please, do not place it next to our historic site of healing. Thank you for considering my views.
11611-1	Teri Price	I am a resident of Boise Idaho but have read about the treatment of Japanese Americans during WWII and been aware of camps like Minidoka when we lived in Seattle WA and Oregon. After all that our country put the generations of our own citizens through during that time and in the decades since, to desecrate the spot that is now sacred to generations of those affected is horrible. This project would completely alter the historical site. It would change the future for those who want to learn from the history and those who share in that history. I urge you to reject this proposal and allow this Historial Site that is of National importance to be allowed to remain undisturbed. I join with other Idahoans to ask you to choose Alternative A and save this historic land for future generations to experience.
11612-1	David Monsees	urge you to adopt Alternative A (No Action) for this DEIS. Minidoka is an internationally known memorial for Japanese American community and Native American tribes who come seeking peace and solace in response to the unconstitutional incarceration of the many thousands of Japanese American citizens whose lives were destroyed and deaths were caused by this and other concentration camps supported by our government. The many huge wind turbines proposed by BLM's preferred Alternatives C and E would disrupt the search for closure of the many individuals come here. Not only would the viewscape created by these turbines be a violation of what the Japanese Americans desire, but also of the Native American tribes who also consider this land sacred (as well as stolen). This quiet memorial must be preserved so that this injustice which was continued after WW II, will never be repeated again for any other group of peaceful citizens. The annual pilgrimage to this site is witness to the multigenerational damage caused by such acts.
11617-4	Stephen Kitajo	Thank you for the opportunity to submit public comments regarding the proposed Lava Ridge Wind Project. My name is Stephen Kitajo, and I am a co-chair of the Minidoka Pilgrimage Planning Committee. I strongly oppose the Lava Ridge Wind Project and support Alternative A - No Action, with regards to alternatives presented in the associated DEIS. My maternal grandparents, along with many members of my extended family, were removed from their homes in Seattle and imprisoned in Minidoka, where my uncle was later born. I did not get to know my grandparents very well while growing up. My grandmother passed away before I was born, and my grandfather had an array of medical conditions that made it difficult to converse with him. He passed away when I was 8 years old. I never got to hear the story of their lives from them, so I turned to my mother for their story when I was older. It was then that I realized that she did not know the whole story of their lives either, particularly their lives in Minidoka, because they did not speak about it. While my grandparents chose to not share their Minidoka story, I could feel the importance and the weight of their story because of how much they avoided it. I first joined the Minidoka Pilgrimage in 2012 through their youth scholarship program. I joined with the hope of finding out more information about my grandparents, perhaps through a survivor who remembered them and would share some fond memories, or some documents that had survived from that era. While I did not find the memories and documents I was looking for, I did hear countless stories from other survivors about their time in Minidoka that helped me feel connected with my grandparents for the first time. I could imagine the similar stories and feelings that my grandparents would have had through the stories of their peers, and I was able to finally feel as if I could begin to know them as I stood on the site where they too may have once stood. I could look out across the landscape and see how empty it felt, imagining how they must have felt when they arrived as a newlywed couple facing an uncertain future ahead of them. My first Minidoka Pilgrimage began a process of healing and connectivity that continues to this day. I would not have been able to begin this process without the experience of the pilgrimage and the ability to travel to the site and be there surrounded by others on the same journey. The emotions that are felt as you walk around the site are evoked by the setting that surrounds you. The emptiness and isolation, the size and scope of the site's historical footprint, and the environmental conditions all play a role in the immense impact that Minidoka has. Completion of the Lava Ridge project would take all of that away. Minidoka serves many purposes beyond being a site of healing and remembrance for the Japanese American community. For the rest of America, Minidoka serves as a clear reminder of the dangers of prejudice, discrimination, and oppression that are possible when civil liberties are stripped from the people. To those from around the world, it is a chance to show how America is ready to confront its dark past to learn and move forward for a brighter future. Completion of the Lava Ridge project would not just take that away but would also be a clear demonstration that our nation has not learned from the past because it chooses to continue inflicting needless pain on communities that have already suffered enough. I support renewable energy initiatives, but I do not support them when they threaten sites of historical and cultural significance, like Minidoka. The Biden Administration, and many other previous administrations, have made commitments to the perpetual preservation of Minidoka for its cultural and historical significance. I expect these commitments to be honored. This does not need to be a showdown between renewable energy and preserving Minidoka. The proposed location for the Lava Ridge Wind Project is not the only location that a wind farm can be built at, but this is the only location that Minidoka can exist at. Wind projects can be built elsewhere; a site like Minidoka cannot, and should not, ever be built anywhere else. The BLM's preferred alternatives C and E are found to have "disproportionately high and adverse impacts" to the Japanese American community in the DEIS. Knowing these impacts, the BLM has still opted to mark these alternatives as preferred. Based on this, I question the BLM's priorities and their understanding of what Minidoka means to the Japanese American community. [...] I strongly oppose the Lava Ridge Wind Project and only support the No Action -Alternative A. I look forward to working with the BLM towards ensuring that Minidoka is protected for generations to come.
11618-5	Bif Brigman	Thank you for the opportunity to go on the record because I have a list of questions that remain unanswered since literally day one of this process. I have tried to reach out repeatedly with my questions and concerns. I have offered assistance and no responses. I'm sorry BLM staff don't like, or doesn't know how to respond - that doesn't make my questions any less valid or important for your Agency to address for this EIS process.it may actually make them more important since you are actively not recording or answering them. Why are you not addressing issues of the cumulative impacts from this and other projects? Why do you allow this shady and biased business of these billion dollar for profit companies not having to address any of the TOTAL impacts from their projects like they aren't connected to each other? Some of my most important questions relate to the cultural competency of Bureau of Land Management - staff, consultants and managers and their subsequent actions, decisions and priorities impacting the Minidoka National Historic site and Japanese American stakeholders. To date, everyone has appeared to be white. Everyone. The BLM track record on this EIS is a clear disaster on engaging the vast Japanese American community who have profound ties to Magic Valley. It really speaks volumes on the inability for BLM to successfully understand or engage this historically marginalized community with any depth. You are convinced you understand - but your actions and words tell me and others otherwise.

Comment ID	Sender	Public Comment
		I don't see how can you possibly think you understand and realistically or adequately can assess the impacts on these communities you don't belong to? And yet some continue to drive a process when you clearly do not understand the communities you are impacting, at all, nor the harm you are visiting on them. This proposal, at this location, is actively inflicting harm and you are only in the planning stage. It is shameful that you are visiting harm and trauma on a community that the Department of Interior originally harmed and traumatized in 1942. I shudder to think how the tribes are being managed in this process. They too deserve much better. My apologies to them. As you check your boxes in your biased process, What y'all are missing is what about the harm that cannot be mitigated? What about the things that compensatory mitigation can't address for the harm that is being inflicted or the thing being taken? You expect people to comment on mitigation when no amount of money can replace what is being proposed here. We know you don't want us to see your grandma. But if we did, how much would you want? Your process is flawed and has been flawed since the beginning. Why did BLM say no to an area south of Twin Falls because of Sage grouse but thought it is just fine to impact the resources of one of the rare National Landmarks for Japanese Americans in the whole nation. And the only one in the state of Idaho. It's disturbing and shocking. Why won't you answer questions about what sorts of training Blm staffers have had when it comes to cultural competency? Why do you not require that from your consultants? Why can't you answer any questions about diversity equity and inclusion requirements for the Bureau of land management or policies that you are currently following as it relates to the subjects? Why is it not reflected in the EIS? Having y'all deciding what is and isn't Environmental justice is a total farce. Y'all need to do better. Much better. Why won't BLM address the numerous presidential proclamations and executive orders that specifically address issues of environmental justice and not impacting historically, marginalized, ethnic communities? Why? Why were no materials produced in Japanese language for non-English speakers who are associated with the Minidoka national historic landmark why were no ethnic newspapers, or other media engaged in the outreach efforts of BLM? Why was there no Spanish language translations of materials and notices? Spanish is the next most spoken language and NOTHING, Again massive failure of cultural competency and BLM. I also would like to know what formal process BLM has for addressing formal complaints against your biased EIS and especially the open house process and "outreach" - including signage, biased and selective posted options, location, timing and , the overly chummy relationship between the energy company proposing this project and your staff people? https://youtu.be/14MdgztuaP0 Alternative A is the only just and right decision.
11619-1	Gwynne McElhinney	As a lifelong resident of this state, I oppose the plan to build the Lava Ridge wind farm on the public lands that have been selected. As you well know, the proposed project would put up to 400 wind turbines on about 118 square miles, making it Idaho's largest wind farm to date. The recommended site includes land near the concentration camp where more than 9,000 Japanese Americans were imprisoned during W.W. II. With good reason, people say this development endangers the Minidoka National Historic Site, which commemorates the thousands of people with Japanese ancestry who were ordered by the U.S. government into prison camps around the country starting in 1942. Pre-pandemic, my husband and I joined dozens of other interested citizens from Treasure Valley and took a field trip to the Minidoka National Historic Site. This educational tour was sponsored by The Osher Lifelong Learning Institute at Boise State University. Given the gravity of the experience, I remember being overwhelmed by emotion and crying on the bus trip home. Tonight, my husband and I joined a large crowd of concerned Idahoans at BSU's Albertsons Library. We attended an excellent, eye-opening presentation, one in a month-long series of lectures associated with the exhibit from of the Holocaust Memorial Museum which traveling across the nation to only 50 selected university libraries. Tonight's program was described as a Screening and Panel Discussion of the 2022 film Betrayed: Surviving an American Concentration Camp. Told through the voices of survivors of Minidoka, this 60-minute documentary explores the suspension of civil liberties during W.W. II, the long-lasting impact incarceration has on the Japanese American community, and the rise of Japanese American activism in defense of the rights of others. During the second hour, Kurt Ikeda, Director of Interpretation and Education at Minidoka, and Minidoka Camp survivors Mary (Tanaka) Abo and Karen Hirai Olen, shared their personal insights, especially about the relevance of this story today. Each of them agreed that Minidoka should become an international Site of Conscience. In case you are unfamiliar with this concept, a Site of Conscience is a place of memory - such as a historic site, place-based museum or memorial - that prevents this erasure from happening in order to foster more just and humane societies today. Not only do Sites of Conscience provide safe spaces to remember and preserve even the most traumatic memories, but they enable their visitors to make connections between the past and related contemporary human rights issues. There is only one Minidoka National Historic Site. There are hundreds of thousands of acres of public lands in Idaho. Please go back to the drawing board and relocate the wind farm so that this sacred space can be preserved forever. There really can be no other outcome that is acceptable. As Elie Wiesel said we must remember the lesson taught by the Holocaust: never again. And that applies to incarcerating innocent American citizens under any political pretext.
11622-2	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	We support the Biden Administration's commitment to environmental and racial justice, the Department of the Interior's goal to tell the whole story of America, including the wrongful incarceration of Japanese Americans and Alaska Natives at the Minidoka concentration camp, and Minidoka's Congressionally-directed purpose: The Secretary shall interpret— (I) the story of the relocation of Japanese Americans during World War II to the Minidoka Relocation Center and other centers across the United States; (II) the living conditions of the relocation centers; (III) the work performed by the internees at the relocation centers; and (IV) the contributions to the United States military made by Japanese Americans who had been interned. We support President Biden's leadership to acknowledge the painful chapters in our nation's history, such as the Tulsa Race Massacre. His remarks at the 100th anniversary of the massacre resonate with Minidoka survivors and our community's experiences: For much too long, the history of what took place here was told in silence, cloaked in darkness. But just because history is silent, it doesn't mean that it did not take place. And while darkness can hide much, it erases nothing. It erases nothing. Some injustices are so heinous, so horrific, so grievous they can't be buried, no matter how hard people try … only with truth can come healing and justice and repair.
11623-1	Monica Lundberg	I work at South Seattle College, and have attended the annual pilgrimage to the Minidoka National Historic Site three times. Each year on our campus, we recall the injustices of Executive Order 9066, by inviting speakers to talk about the historic site and encourage our students to visit. Having personally met survivors of Minidoka and their family members at pilgrimages, I can understand how this project would completely diminish the experience at Minidoka National Historic Site in numerous ways. The DEIS needs to adequately protect the significance of the land surrounding Minidoka NHS as a place of reflection and healing for the survivors who were unconstitutionally incarcerated, their descendants, and all who visit. The DEIS needs to recognize the importance of the cultural landscape and preserve the historic nature of the land, including the integrity of the site, feeling and association of historic events, and its immersive educational experience. The Japanese American community has worked hard to heal from this trauma and reclaiming Minidoka is part of that journey. This project would completely distract from the historic nature. After having experienced gross violations of civil liberties, our country especially needs to listen to the voices of the Japanese American community. Don't pour salt into the wounds!
11624-1	K.C. Potter de Haan	The Minidoka community of survivors and descendants deserve the respect and acknowledgement of this gross historical violation of civil liberties by our nation's government through the preservation of the site. The Minidoka story must be recognized and treated in an honorable and somber manner as other painful events in our nation's history. The proposed Lava Ridge project minimizes the trauma, loss, and humiliation suffered by Japanese Americans based solely on their ancestry. I request No Action.
11628-2	Margaret Sekijima	I am a US citizen, 3rd generation Seattle resident, 72 year old woman, retired nurse practitioner, proponent of green energy and Sansei third generation Japanese American. I write in protest of the proposed Lava Ridge Wind Project which deeply disrespects Minidoka and the intended legal protection conferred by its designation as a National Historic Site. Both my parents were high school juniors when they and most of their respective families were incarcerated at Minidoka in 1942. Their public school education, the integrity of their families and community were destroyed by Executive Order 9066. My grandfather has his business permanently confiscated, the civil rights of Japanese Americans were violated, as was their personal self esteem and trust in the America they valued so highly. Ironically, my father was drafted into the US Army in

Comment ID	Sender	Public Comment
		1944, and was assigned to the Military Intelligence Service which is credited with ending the war more quickly than it would have been otherwise. My family dutifully carried on with their lives after the war and accomplished much. However, all carried unseen psychological scars for the remainder of their lives, and to continue the process of healing intergenerational trauma (https://psycnet.apa.org/record/2021-05763-007). When I return with the Japanese American community to Minidoka on our annual pilgrimage, it's to honor the memory of those who suffered the indignity of incarceration, and to gather strength to speak out for others who have had their rights wrongfully violated, or who are currently experiencing some form of that injustice. I am deeply offended by the authors of the proposed BLM EIS who categorized the survivors and descendants of incarcerated Japanese Americans as tourists or recreationalists, dismissing out of hand the effect of these wind turbines on our pilgrimage. They will intrude physically and psychologically like so many towers of armed guards who peered down on the incarcerated. The BLM authors reveal a willful ignorance of well-documented history, culture and our community work of healing and educating. Likewise, to give the same designation to Native American peoples of Idaho and surrounds is unconscionable. Members of Shoshone Nation and other Peopnle will not be on tour or vacation as they pay respects to their rightful homelands, sacred sites and centuries of ancestral injury. People with much less power than the BLM would not think or articulate such disrespect. I understand the stated mission of the BLM is to enhance the quality of life for all citizens by the wise stewardship of our country's public lands and resources. Thus I urge you make decisions with the knowledge that culture, history and the whole health of people also constitute a significant part of our national resources. Do reject the Lava Ridge project proposed by New York developers. Do put BLM resources to work to relocate this project away from protected historical, archeological and cultural sites. Do act to establish your credibility as a culturally sensitive Department of the US. Do not allow construction of any project which intrudes on any portion of the viewshed of the Minidoka NHS or the White Buffalo Cave cultural site. Do not pit the Japanese American or Native American communities against sustainable energy. I fully support that effort, but not the current Lava Ridge proposal when other With respect and thanks for considering these comments. sites exist, albeit perhaps at loss in profit to the New York investors. With respect and thanks for considering these comments.
11630-1	Cooper Brossy	Dear BLM, I am concerned about visual impacts to Minidoka NHS from all the proposed alternatives that involve construction of wind turbines. Any additional visual impacts to the Minidoka NHS further desecrate this important piece of American History. We all need Minidoka NHS to remain a place where we can reflect upon our past and teach our children about injustice, prejudice, and racism by maintaining the desolate and remote feeling of the place. Adding tens or hundreds of symbols of modern technology to the horizon or looming over the site alters the feeling of the place in a way that I cannot support. I support Alternative A (No Action). Thank you for your consideration.
11632-1	Karen Ko	o not permit the development of the Lava Ridge Wind Farm. It would desecrate the site. There are places that deserve to be preserved as close to their original form as possible. They can teach us in ways nothing else can about injustice. Minidoka is such a site. My father and his parents were there and in their names I have to officially register my deep dismay that once again, the Japanese Americans who were incarcerated at Minidoka are treated as less than.
11644-1	Page Bridges	I know how much this threat to their remembrance and annual pilgrimage site is upsetting the Japanese camp survivors and their families. I am dear friends with some of them and I am asking you to respect their dignity and what they went through. I am a witness to
11652-1	Natasha Varner	As an organization dedicated to preserving Japanese American World War II incarceration history, we at Densho urge you to select “Option A, No Action” in regards to the proposed construction of the Lava Ridge wind farm adjacent to the Minidoka National Historic Site. We share the concerns of many WWII incarceration survivors and descendants in our community surrounding the disruptive impact of the Lava Ridge project, as currently proposed, on the Minidoka historic site. We’ve outlined below a few of our key concerns: ● Minidoka is one of the few federally recognized sites of Asian American history in the United States and it is essential that it be protected as a place for learning and healing for future generations. The proposed wind farm would gravely jeopardize the viewshed and solemn nature of the site. To illustrate this point, we ask that you consider the prospect of a project like Lava Ridge adjacent to 9/11’s Ground Zero, or to the Arlington Cemetery. Even if these sites were located in rural areas, it would be unthinkable to desecrate them with a project that is the size and scope of Lava Ridge. To survivors of WWII incarceration and their descendents, Minidoka holds the same somber significance that Ground Zero and the Arlington Cemetery hold for some members of American society. We demand that it be respected accordingly.
11661-1	Sam Kito Jr.	The Kito family supports Alternative A, the no action alternative, [...] Background: In the early 1900s, my father, Saburo Kito, (Sam, Sr.) settled in Petersburg, where he met my mother, Amelia (Okegawa). Her mother was Tlingit and father was Japanese. Along with the Kito and Okegawa families, Petersburg was home to the Kawashima, Ozawa, Kaino, Komatsubara, Ohashi and Oyama families. Following the attack on Pearl Harbor, when I was five, my dad, his brother Tom, and my Grandfather Iwataro (Harry) Okegawa were taken from our family and incarcerated in Lordsburg, New Mexico. We didn’t see my father for over two years. My mother was left in Petersburg with myself (age 5), my sister Barbara (age 3), my brother John (age 1). Since my mom was without her father or husband we traveled by boat to Seattle and later to Puyallup Fairground. My brother Harry was born in a hospital in Tacoma, while we were incarcerated at Camp Harmony. At Minidoka, we lived in Block 24, with other families from Alaska. After the war, we lived at the Anderson Dam construction site, near Mountain Home, where my father worked. Later, my brother, Harry, and I served in a Cold War electronics training program for Alaska Natives and participated in a White House ceremony with President Kennedy, Sec. Stuart Udall and Sen. Ernest Gruening, Senator for All Alaska. Harry later joined the Marines and was killed while serving in Vietnam. The Kito family is proud of his service to our nation and grateful that the Alaska legislature named a bridge near Petersburg as a fitting tribute to honor his life and service to our country. The Minidoka National Historic Site is sacred ground to our family, because of its connections to my brother, my mom and dad, and Japanese Alaskans from Southeast and across the state. Speaking as a Marine Corps Veteran, I can say that siting the Lava Ridge wind project against the backdrop of the Honor Roll will dishonor the military service and sacrifice of the 73 men from Minidoka, who gave their lives to defend our nation’s freedom during World War II, and Minidoka’s 73 Gold Star families. In addition to honoring the military service of Japanese Americans who fought during World War II, Minidoka is a place to honor the service of my brother Harry and other Minidoka survivors and descendants.
11667-7	Alisa Bowman	Concern: Historical Sites

Comment ID	Sender	Public Comment
		Minidoka National Historic Site would be impacted by this project and not in a positive way. Please honor the history of this are and the residents that lived here by preserving the area. Do not allow LS Power to desecrate this site by the visual impact that would be imposed by the towering structures.
11672-1	Teiko Saito	I am one of the few remaining survivors from the World War II Minidoka Japanese American War Relocation Camp. Not only was I born in the camp in April of 1943, but my mother, an American citizen, died in the camp when I was only 1 year old. Because of the racial injustice inflicted upon Japanese American citizens along the West Coast during World War II, I never had a chance to grow up with and know my mother. And because Minidoka was the place where she spent the last two years of her life, I consider ALL of the historic footprint of Minidoka to be sacred and hallowed ground. My personal connection to Minidoka runs deep and is multifaceted. Not only have I participated in two past pilgrimages to Minidoka, attended by internment survivors and family descendants, I also intend to go to other Minidoka pilgrimages in the years to come and have my nieces and nephews accompany me so they too can learn about this unjust treatment of Japanese Americans during World War II. I should note that it was during my second pilgrimage to Minidoka that I was finally able to connect with my mother and find peace with her death. In addition to the annual pilgrimages, I have made yearly charitable donations to the Friends of Minidoka and have that non-profit organization in my will. In addition, I have donated to the National Park Service at Minidoka National Historic Site a primitive doll that my mother made for me out of the scarce resources she could collect in the camp. Finally, I have made a number of significant charitable donations to the Friends of Minidoka to assist in the campaign against the proposed Lava Ridge Wind Project. After reviewing the various alternatives that BLM laid out in its Draft EIS for the proposed Lava Ridge Wind Project, I am submitting the following comments on the Draft EIS on behalf of myself and 11 other members of my family, including my brother, who is also a survivor from Minidoka, and two generations of his descendants: [...] • Given the Secretary ofInterior's statutory obligations to protect units of the National Park System from harm and to leave them unimpaired for the benefit of future generations, it is our view that the BLM must exercise its discretionary authority under the Federal Land Policy Management Act (FLPMA) in such a manner as to shield the Minidoka National Historic Site and its viewshed from adverse environmental effects and degradation. Unfortunately, the best identified Alternative in the DEIS that accomplished that statutory obligation (Alternative A) was rejected by BLM in the DEIS, a decision which I believe is contrary to the Secretary's statutory obligations for the National Park System. I would, therefore, urge BLM to go back and reconsider this decision and adopt Alternative A in its Final EIS and Record of Decision. [...] Regarding the various project Alternatives set out in the DEIS, again I endorse and incorporate by reference the Alternative analysis set out in the comments submitted by Friends of Minidoka and NPCA among others. I am particularly disappointed that BLM dismissed Alternative A outright as a non-starter. The Friends of Minidoka and NPCA comments and analysis lay out cogent reasons why this should not be the case. And while Alternative Eis significantly better than Alternatives B, C or D, it still falls short of avoiding adverse impacts and harm to Minidoka and its viewshed, as should be the case for a unit of the National Park System and an area that is eligible for inclusion in the National Register of Historic Places. Thus, Alternative A, the No Action Alternative, is the only one that I can recommend BLM to adopt in its final Record of Decision.
11681-1	Glenn Glass	The proposal to build the wind farm at Lava Ridge diminishes my experience at Minidoka Historic Site in this way: At the time of incarceration of American citizens, the area was barren with light agricultural activities and with industrial scale structures nearby, it will be very hard to imagine what the prisoners experienced and why it should never be allowed to happen again.
11696-1	Rebecca Morgan	Please do not put up windmills at Minidoka! We have friends whose relatives were incarcerated at Minidoka during World War II. This is not just a tourist site! People who were American citizens, who had committed no crimes, were incarcerated here, and their lives were forever changed. We need to respect this, and the people who visit this site. This is a place for meditation and reflection, not windmills! Please put the windmills somewhere else, where they are not visible from this site. Would we be putting windmills up by any other serious American historical site?
11738-1	Rita Takahashi	I am responding to the U.S. Department of Interior, Bureau of Land Management's January 2023 statement titled "Lava Ridge Wind Project: Draft Environmental Impact Statement." For reasons I stated in my prior letter to you and BLM, I am opposed to the construction and maintenance of wind turbines in and around the areas that were once the Minidoka War Relocation Authority camp. The area is of great historical significance, and those affected by the U.S. Government's exclusion and incarceration orders are opposed to developments (including wind turbines) that infringe upon and alter the original grounds. I ask that BLM take the right course by respecting and honoring what the area represents to so many. I urge the adoption of Alternative A, as specified in BLM's impact statement: "Alternative A – No Action, in which the BLM would not authorize construction, operation and maintenance, and decommissioning of the project." Your affirmative action in adopting Alternative A will be valued and appreciated.
11741-2	S. J. Arima	I select Alternative A. Take NO ACTION. No Wind Farm on or near The Minidoka National Historical Site. My American born Mother and her then five siblings (initially the oldest was but years old, and the two youngest could not yet walk)were incarcerated at Minidoka, after being confined at the Puyallup Assembly Center. As a Descendant and as a Survivor, I have participated in five organized pilgrimages to Minidoka. In doing so, I reflected on the mental and physical hardships imposed on my Family by Our Government. In remembrance of the injustice imposed, I feel closer to my Family and seek healing for them and myself. There exists trauma from the forced relocation, confinement, and denial of rights as native born citizens. Minidoka Pilgrimages help reduce the passing of trauma to following generations. My Father was the publisher and editor of a bilingual newspaper, with circulation throughout the Northwest. He was physically arrested on December 7, 1941 as an enemy alien. Having immigrated as a teenager, he was a US resident for over 20 years. Fatheralong with all others of Japanese ancestry, was not eligible to seek US Citizenship. He was separated from his wife and children. Bank accounts were frozen, and his publishing business was forced to close by Our Government. The loss of freedom and the mental stress of not being able to care for his Family was worse than the loss of assets. Only until August 1944 did Our Government reunite my Parents and Siblings. They were incarcerated at an Enemy Alien family facility in Crystal City, Texas. Our Government had more selectively incarcerated Germans and Italians for incarceration there. South Americans of Japanese ancestry were forcibly removed from their countries of residence and held captive at Crystal City as well. I am the product of my Parents' Crystal City reunion. After the incarceration, my Father remained largely stoic and did not talk of his treatment , or of the loss of his business. He worked long hard hours with only my Mother's companionship and assistance. Their earnings were little, but he had regained his freedom and did not have to take orders from others. He raised his children to be educated loyal Americans. Two of his sons volunteered for military service (I am a Vietnam veteran.) and a third son was medically rejected and had a civilian career with the Department of the Navy. Whenever I inquired my Mother about her life in Minidoka, her response was succinctly : " I was the old woman in the shoe, who didn't know what to do ". Almost daily she by hand laundereddiapers and clothing, often under extreme temperatures and dust conditions. She cared for her children without any of her relatives nearby to assist her. When I go to Minidoka, I find it a safe place to reflect on what affect Our Government's actions had on my Family and myself. In turn I reflect on the impact on others then, now, and in the future. Such an injustice should not be allowed to be repeated. We must not forget. We must educate others. We need a safe place to remember, a safe place to seek healing, and safe place to share. Minidoka should be a place for all to gain strength to prevent the unjust treatment of others. The Minidoka Historical Site is just a very small piece of what made up the wartime facility. It has taken effort and fundraising to assemble what is the current site. This site should not be surrounded by a visual pollution of noisy turbines that are taller than Seattle's Space Needle. People's thoughts should not be interrupted by the activity of wind farm construction, operations, maintenance, and repairs. The push by others to infringe on the Minidoka Historical Site is an added hurt to Survivors and their Descendants. A grave injustice was placed on those of Japanese Ancestry during World War II so that others could gain economically. One might

Comment ID	Sender	Public Comment
		consider the wind farm proposal an effort for history to repeat itself. A huge feedlot had been proposed. Minidoka would have been down wind from the feedlot and be subjected to fowl smells. It took much effort to have the feedlot location rejected. When groups gather near the Honor Wall and Guard Station, the peaceful dignity is often interrupted by vehicles and farm vehicles passing by on the entrance road. I had been hoping that sometime in the future that the road could be relocated to the other side of the canal. A wind farm would be a huge distraction. [...] Do Nothing - No Lava Ridge Wind Farm.
11748-1	Robert Peshkin	The Minidoka National Historic Site will be impacted and it's significance will be diminished as the context of it's isolation will be destroyed. This site is of vital importance to the lessons of American and human history. The wind turbines will also be visible from Craters of the Moon National Monument and Preserve and the adjacent designated wilderness area thus destroying the visual resources which are an important part of those sites.
11750-1	Eugene Tagawa	My name is Eugene Minoru Tagawa. I am 80 years old. I am the son of an immigrant Japanese father and an American-born Japanese mother. I was born in June 1942 while my parents and two infant sisters along with my maternal grandparents were confined at the Puyallup Detention Center near Seattle. From there, in August of that year, we were taken to the Minidoka WRA camp in southern Idaho. There we spent the next three years along with 13,000 other people of Japanese ancestry. I speak also as a member, since 2009, of the Minidoka Pilgrimage Planning Committee. We are an all-volunteer group that has been organizing an annual pilgrimage to the Minidoka National Historic Site since 2003. Begin- ning with my first Pilgrimage in 2008, I have seen and felt how important it is for visitors to be able to walk the dusty ground and feel and breathe the air of this place where thousands of innocent, mostly American citizens were incarcerated. While we are immersed in this landscape, we can feel the remoteness and isolation of this place so different and distant from our homes. We can better imagine what it was like for our families, our predecessors, who were confined here not knowing how long they would have to stay. The experience of being at this place changes and enriches the lives of so many who travel here to reflect and connect and to become more appreciative and empathetic of those who suffered, endured and survived. It is a sacred place for all to learn and heal. The Lava Ridge Wind Project would have a significantly negative effect on the unique ambience of the Minido- ka National Historic Site. Hundreds of 700-foot wind towers with rotating blades spread across a wide swath of the view would be visible to visitors seeking view the horizon as Minidoka incarcerees saw it. To connect with the past. For our ancestors, for present day visitors, for future generations - please protect this culturally important place. I urge you to consider Alternative A, No Action Thank you.
11753-5	Mary Rios	Another issue I have with the location of this wind project is that it will be placed on the Minidoka National Historic site that includes the Minidoka War Relocation Center. On page 226 of the EIS statement, it states "The project could adversely affect Minidoka NHS's ability to convey its association with 1) the Japanese American incarceration experience and 2) the site's contribution to southern Idaho's agricultural history and development. The openness and undeveloped landscape are vital to the historic character and purpose of Minidoka NHS. These defining characteristics—expansiveness, remoteness, high desert, and agrarian terrain—convey the government's site criteria and the long-lasting effects of that intentional decision making process." The Japanese Americans have raised many concerns about this project. Putting a bunch of metal wind turbines on this land would not be honoring them. On page 228 it states "The Japanese American community has expressed that no mitigation of project impacts could protect the site from the intrusion and desecration of, what to the community is considered, a sacred site. The Japanese American community would like to see the project located at other sites that would not impact Minidoka NHS rather than in the currently proposed area (BLM 2022). The NPS has recommended that measures to avoid, minimize, or mitigate adverse effects to Minidoka NHS consider the visitor and survivor experience in relation to the historic integrity of the site (NPS 2021). Although project infrastructure was set back from Minidoka NHS during project design, and action alternatives were developed with the intent to further minimize non-physical impacts to Minidoka NHS (MVE 2022:C-3.2.2; Section 2.4), non-physical impacts would not be fully avoidable." For these reasons, The BLM needs to choose the no build option A.
11760-1	Joanne Egashira-Kitajo	Imagine being over 20 years old and knowing your parents and family, but not knowing ABOUT them- their life, their experiences that shaped their lives and their opinions. My parents did not share much about their lives after they were married; everything I knew was in bits and pieces. I knew my mother grew up on a dairy farm in Skagit Valley, Washington, and my father lived near what is now Beacon Hill and went to Franklin High School. When I was in my 20s, I was concluding my education at Seattle Central Community College (SCCC). 1981 was a pivotal year for me, because in the SCCC auditorium, an array of speakers on the subject of redress shared their experiences of being relocated. This was my first in depth look at the events that I believe shaped my parents. The economic losses, families torn apart, questions of loyalty, questioning their own government and their so-called rights. I went to every opportunity over the course of 3 days to hear the stories of these speakers. They shared experiences, and impact not only for the Japanese Americans, but the Japanese Peruvians and Aleuts, and those related by marriage. What?? I knew a little about the relocation and camps, but not the Peruvians or Aleuts. Who were they, and why were they relocated? I certainly didn't remember learning about this in school. My interest in these experiences grew, and I read and learned all I could about those times. My parents still didn't say much about it. That summer, I went on a pilgrimage to Tule Lake with my cousin, where we experienced some of what these people must've felt, seen in our own eyes some of what they saw, and explore Japanese American culture with others. Almost forty years later, my husband Scott and I have two wonderful children. Like many parents, we tried to raise them understanding where they came from- their families, their culture, their history. From infancy, this meant we went to Bon Odori where we shared food, music, dance, taiko, and good times. We shared what we knew about relocation and concentration camps, and how experiences shaped us. They gifted us with an experience to the Minidoka Pilgrimage. They knew it was something I always wanted to do, and Scott was also wanting to learn more about the concentration camps. This was the first time for us to visit Minidoka- where my eldest brother was born, where my parents spent their first years of marriage, where I hoped to gain a better understanding of my parents. I couldn't go to them with my questions, my mother passed away in 1981, and my father and I didn't talk much. Nothing could have prepared me for the long drive. I can't imagine living or traveling in the heat of the summer or the freezing cold of fall and winter. Going over the terrain with closed windows, not only to not know where exactly where you were going, but how you got there. No maps here, just the clanking of the rail tracks as they traveled through the night, and during the day with the shades pulled down. The vastness of the land was a visual not obtained in a picture in a textbook. It seemed as though there was nothing for endless miles. Can you imagine going to a place like this? Basically little but rock and dirt. The terrain was nothing. except the guard towers. Those were the only landmarks in the horizon. Was that really necessary? How would/could anyone escape from here with no place to hide? These people could not have posed much of a threat. Looking up from the ground, the guard towers may not have been very high, but very intimidating. There was, however, a spiritual closeness that allowed me to understand a little more about my parents, what they must have experienced, what shaped them, my roots, and the teaching of future generations.

Comment ID	Sender	Public Comment
		Building the Lava Ridge Wind Farm near the Minidoka site should not be allowed. Please do not build it here. My family and countless other citizens were wrongfully imprisoned here during World War II. This sacred land should be preserved as a reminder of the grave injustice done to the community, and citizens of the United States. This site will allow the teaching of future generations of the harm when civil liberties are violated. Please choose Alternative A- No Action, while working to find alternative solutions to preserve the nature of this land while promoting renewable energy alternatives. Future generations, and I thank you for your attention to this matter.
11761-2	Carolyn Firth	For the reasons I have stated above, I urge you to choose Alternative A. I appreciate any consideration you may give to my concerns.
11762-1	Kristine de Leon	As a concerned citizen, I wanted to voice my concern and opposition to the construction of the Lava Ridge Wind Farm at the Minidoka National Historic Site. Minidoka is historically significant because it was where Japanese Americans were unlawfully incarcerated during World War II. Please protect this important site, honor our nation's history, and do not permit this project to proceed by choosing Alternative A - No Action from the Draft Environmental Impact Study.
11764-1	Blaine Campbell; City of Eden	3. This area has significant historical value as home to the Minidoka internment camp which is a part of our collective heritage that should remain unmarred and as a memorial for all people to remember the tragedy that happened here. When people visit the internment camp and the visitor's center there is almost a sacred feeling about the place. When people visit here they like the quite solitude to reflect up on this place and what happened here.
11766-1	Robert Malae	As a stakeholder in this project site, I oppose the proposed Lava Ridge Wind Project primarily because of the adverse environmental impact it has on the neighboring site where the Federal Minidoka Incarceration Site ("Minidoka") is located. As the draft Environmental Impact Statement ("EIS") indicates, the scope, scale and physical footprint of the project are enormous and expansive: 197k acres; up to 400 wind turbines; and almost a mile wide. The Minidoka site is important to me. Minidoka has significant historical, physical, cultural and human significance to Japanese Americans and individuals of Japanese ancestry. This proposed Lava Ridge Wind Project ("Project") will adversely impact and adversely affect the physical, cultural, human and wildlife environments of the landscape. Mitigation of the Project's impact is not adequate. The physical presence of the turbines and associated infrastructures will cause irreparable harm to the aesthetics and peace because of the sight, presence and noise levels of the project. Additionally, the alternative plans C and E do not appropriately mitigate the irreparable harms in aesthetics and noise levels that will adversely impact Minidoka. The findings under Public Law 100-383 acknowledge the injustice of the incarceration (see The Congressional Commission on Wartime Relocation and Internment of Civilians and National Archives). This Commission determined that EO 9066 and all of the government actions that stemmed from it were based on lies. Additionally, the Commission noted that EO 9066 and related actions were caused by racism, wartime hysteria and failure of political leadership. See Public Law 100-383. (See also the attached statement from President Joseph Biden.) While life stories of Minidoka include the incarceration of over 9,000+ individuals and their families, Minidoka also encapsulates the collective trauma from the wrongful incarceration of over 120,000+ individuals—men, women and children of Japanese ancestry—in multiple incarceration sites across the western, continental United States. This is not only significant to Japanese Americans but all Americans. These lived experiences and intergenerational trauma at Minidoka continue today. Pilgrimages to this site—as well as other historic incarceration sites—continue today and for future generations of Americans. I plan to make a pilgrimage to Minidoka and wish to preserve the environment near Minidoka for all Americans to experience—in its undisturbed state— to remember, heal, and inspire future generations of Americans to uphold civil rights. This is a key opportunity for the Federal government and its executive agencies to get this right. This EIS should properly document the adverse impacts on America's significant cultural and historic landmarks, and the grave responsibility of federal agencies like the BLM to steward the land—and its stories—including natural resources both properly and reverently.
11767-1	Rita Alcantara	Please protect Minidoka National Historic site as it is a part of American History with lessons our country and world still, sadly, need to learn. Land on which my uncle was born and where people even died after being unjustly incarcerated should be preserved so we do not repeat this treatment of Americans ever again. I was hoping to bring my children there to learn about this important part of our history and urge you to protect it for generations to come.
11768-1	Polly Shigaki	My name is Pauline (Otani) Shigaki, direct descendant of Minidoka incarcerees, also married to a 79 year old survivor. I hope my comments will convey deeply held emotions and careful discernment in total opposition to the draft Environmental Impact Statement (DEIS) for the proposed Lava Ridge Wine Project in Jerome, Lincoln, and Minidoka Counties, Idaho. I wish for BLM to record that I am in favor of Option A – No Action. My parents were among the more than 13,000+ Japanese/Japanese Americans forcibly-removed and unconstitutionally imprisoned at Minidoka American Concentration Camp for approximately 2 ½ years. My mother, Mitsuko Murakami Otani (prison # 12188E) entered with her Issei (first generation) parents and 10 siblings, 3 of whom were married with infants and toddlers. My grandparents remained incarcerated until Minidoka closed and returned to Auburn, WA. My father, Seigo Otani (prison #11122A), lived in Block 30 with other single men. They entered as unmarried adults, were introduced and married in April 1944. As Dad was helped to secure employment as a baker, they bravely relocated to Cleveland, OH, where I was born in July 1945, before returning to Seattle in 1949. With the timing of Commission on Redress hearings, 3 Yonsei (4th generation) teenage granddaughters began deep probing/questioning in interviews to gather family history and stories. Neither grandparent had spoken negatively of their hardships, assumed postures of cultural Shikata ga nai – "it can't be helped" and Gaman – "bearing the unbearable with dignity." They clearly experienced anti-Japanese incidents -sentiments, but in attempting to be seen as 110%+ American citizens as I grew up, they silently endured and persevered with cheerful stoicism and resiliency of Spirit. The now well-researched concept and effects of generational trauma being transferred to subsequent generations was yet unknown. I am still learning about the negative psychological effects of incarceration embedded in my DNA from Donna Nagata's 2021 "Forever Foreigners" study, and earlier Sansei Study. Approaching age 78, while very proud to be an American of Japanese Ancestry, I still grapple with self-loathing, being viewed as a 2nd class citizen, and I still fear "looking like the enemy" in our hate-filled climate of anti-Asian, anti-BIPOC and anti-LGBTQIA+ violence. It was only after retirement that I had the opportunity to make my first Pilgrimage in 2014. Since then, I have been on Pilgrimage four times with family members and others to the sacred 70 acres (of original 33,000 acres) at Minidoka National Historic Site. However, my soul holds all the overwhelming emotions and flood of remembrances of that first visit, coming as a living witness among survivors, descendants and fellow seekers. I felt the Spirits and Legacy of my Issei grandparents, parents, and relatives, recalling the trauma and humiliations suffered and endured – whispering in the hot wind and swirling dusty air. This once desolate, isolated site intentionally chosen to imprison my community, is now an important place of solace and quietude, where peace and deep healing occurs as pilgrims gather and reunite. It is imperative to protect and preserve the viewshed and cultural landscape of Minidoka's hallowed grounds from desecration by the overwhelming project scale that fails to protect the integrity and sanctity of the Minidoka site. An important aspect of my post-retirement ministry as an ordained Vocational Episcopal Deacon now assigned to historically Japanese American St Peter's Episcopal Parish (Seattle, WA) has been to annually preach about the effects of EO 9066 on St Peter's - her entire community forcibly exiled like the Israelites into Egypt and her doors closed for more than 3 years; regularly educate through personal stories of our few living survivors and descendants; and continually provide information about the increasingly vast repository of incarceration resources. Since 2017, I have also invited and accompanied new Pilgrim Allies as they experience Minidoka Pilgrimage firsthand – including my former Bishop/wife, my Rector Rev. Edmund Harris, parishioners, Deacon colleagues, Priests and friends. These

Comment ID	Sender	Public Comment
		new co-conspirators are almost all Caucasian, having moved to Seattle-West Coast for jobs and college. Unless they had family directly affected by EO9066 and heard difficult stories about the incarceration, the majority were never exposed to or learned anything beyond the sanitized, cursory 1-2 sentences in our History textbooks. The experience of walking the sacred ground as pilgrims together while simultaneously listening to the personal stories of Minidoka survivors has very powerfully impacted and educated many Allies. As they have all become woven into the threads of the Minidoka Story - our American Story – they help me to widen the circle of witnesses to honor the cultural resilience and perseverance of Japanese Americans by bringing more hidden stories into the light. The following is the powerful refrain repeated during St Peter's "Prayers of the People" for our annual Remembrance of the signing of EO 9066 February 19,1942 – Help us to Remember, Help us to Listen, Keep us from Forgetting.
11774-1	Caroline Morris	My comments about the proposed project follow. I am an Idaho resident who regularly visits Minidoka National Historic Site (Minidoka NHS). This former Japanese American incarceration center has profound social justice and spiritual implications for me and many other visitors and supporters, most importantly the former incarcerees and their families. The visual and emotional impact of Minidoka NHS's potent visitor center in its quiet rural setting would be destroyed by constructing the Lava Ridge Wind Project (Lava Ridge), which proposes installing 400 wind turbines each 740' tall. These massive towers would have significant negative social and environmental impact, by both creating unwelcome atmospheric noise and destroying the Minidoka NHS rural view shed that would ruin the current peacefulness. The remote Minidoka NHS surrounding area should not be industrialized and diminished culturally for the benefit of LS Power. Locating an industrial wind project in this location is socially and environmentally irresponsible. I favor the No Action Alternative for Lava Ridge. I do support the proposed Greater Minidoka Area of Critical Environmental Concern (ACEC) to protect Minidoka NHS's viewshed, along with other cultural sites, recreational access, migration corridors, wildlife, pollinators, and other values. However, I have experienced BLM's unwillingness to devote adequate resources for monitoring other ACECs.
11782-1	Ken Fitch	The location of this major project adjacent to Minidoka National Historic Site raises a wide range of issues, in addition to the other impacts of such a massive project. Re Minidoka NHS, some of the accounts of the forced removal and placement at this location are marked by hostility and racism endured by those who were taken to this place and these strong feelings and wounds are reopened when further actions of disrespect occur. The recognition of Minidoka as a National Monument and a National Historic Site, in addition to official actions such as the Civil Liberties Act of 1988, and statements by at least 7 of the most recent Presidents of the United States of America have brought acknowledgment, apology and reordering of perceptions that take a path toward healing. This historic location has also become a place of healing for former residents, but also current visitors and citizens with a rededication to eliminate such attitudes and actions that took extreme form here. If one has seen the Minidoka National Historic Site film, it is very difficult to accept and any further disrespect to this community. In this regard, there is great sensitivity about any action that diminishes this ongoing sense of healing and rededication with any action that diminishes this in any way. And certainly, a bold action such as this galvanizing major attention to an intrusive infrastructural presence would also seem to divert attention from the history here. The application of such a project may bring a sense of some awkwardness, given the purpose in the current global crisis to reduce the threat of global warming and climate change, but of equal importance and concern, when interconnecting cultural experience is a factor, is that at this special historic location we learn the essential lesson that racism and target of others, is a particularly insidious thread of harmful activity now in the world. It might conjectured that the story here is primarily of interest to those culturally connected to the site, but the reality, of course, is that the internment/incarceration of American citizens remains an action in American history that must not be repeated, and consistently invoked as such. In fact, the human story here continues to proliferate with the highly read and viewed Farewell to Manzanar and many other books and media presentations, including the musical, Allegiance on its journey to Broadway and beyond. Here, diagonally across the continent, there are at least six books in our local library with connection to Minidoka, including teen novels and easy reader books popular on the Children's section, bringing the specific stories of Minidoka and lives of its people to succeeding generations as part of the stories with which they grow. As a remote site with a little-known story, it takes its place in the larger American culture, with the historic site eventually joining others as a place of pilgrimage. How many of us have wanted to visit these sites familiar from our childhood stories and media. This is where it happened, the actual place. And this is where a character in stories that we have come to know and understand lived. When this place of historic and cultural significance, with deep emotional connection to survivors and descendants is faced with major impact, it creates a major disruptive cultural wound. It is an unfortunate reality that there is a history of major infrastructural projects being located adjacent, near, or through areas of especial cultural significance with power plants, highways, etc. The list goes on. The news now often highlights these occurrences. The prevalence of these situations spurred the need for Environmental Justice considerations in NEPA reviews (most often focused on health and safety), but sometimes on equally impactful cultural impacts, sometimes invisible and severe (but significantly noted in this review). The emergence of the issue here further intensifies the situation with its Environmental Justice aspect. A place with a powerful story would be replaced by another contemporary story and major issues with its location and existence in a remote windblown area. When that story transfer occurs, the historic cultural story easily recedes, as thoughts gravitate not to the historic wilderness beyond the historic site but instead to the largest wind turbine project of its kind in the country (!!!). The displacement becomes most uneasy, and the operational activity associated with it further intensifies awareness of the intrusion. The fact that the structures on the horizon are turbines in mobilization further disrupts with a visual energy that alters a landscape viewshed.
11782-2	Ken Fitch	The project would constitute a major conflicting presence for the NHS in its impact on the purpose of the Park, and especially in its alteration of the environment itself that is a primary experiential, value of the National Historic Site, and thus present an impairment.
11782-8	Ken Fitch	Indeed, the site speaks to us as an International Site of Conscience, even though perhaps we do not need that designation to tell us that, although we invoke it in this official assessment and determination. One visits a place to experience the place, and it is the experience of this place that is at risk. The experience of place is so essential that any diminishment becomes heightening in its negative impact.

Comment ID	Sender	Public Comment
		In our history, we should continue to seek a path of healing. Unhealing should not occur.
11782-9	Ken Fitch	One of the central aspects of the experience of Minidoka often cited by residents is the character of the place to which they had been sent in the middle of nowhere, all we could see was a sea of sagebrush, and a place God forgot. and certainly, the area beyond the barracks areas powerfully intensified their sense of isolation, both in the emptiness and relentless exposure to natural elements of cold, heat, wind, snow, mud, all of it in extremes. This landscape and environment are central to the historic experience here and would now be altered by a distinctive multi –mobile presence with its ultra modern architecturally monumental spinning turbines and busy land traffic, with an endless venture into impersonality, diminishing the natural and stressed human experience that distinguished the site that now would be diminished forever, thus altering and eliminating the experience of this place for all who would venture here to honor and commemorate a human experience of continuing relevance for moral and cultural understanding and reconciliation, a reconciliation that has illumined our lives in ways that have spurred a more positive commitment to the diversity of the human community.
11797-2	John Shigaki	Minidoka invites connections to engage in this critical journey of learning and reflecting through personal stories, connections, and critical education in and around this sacred site. I can't believe there could be 400 wind turbines that would nearly cover half the size of the City of Seattle. It's beyond insulting. It will desecrate it and be an impairment of resources. The view sheds will be completely ruined when you're there adding to the hurt, insult, and injustice of my entire family and 120,000 other Japanese Americans. I support renewable energy but pitting this wind farm against this National Historic Site, this site of conscience, is outrageous. It is time to shut down the Lava Ridge Wind Project near Minidoka.
11800-1	Bridget Keaveney, Kim Hirose, Janet Nuzum, Janice Faden, Ryosuke Shibuya, Noriko Sanefuji, John Tobe, Julie Abo, Linda Adams, Michael Tanaka	We appreciate this opportunity to provide public comment on the DEIS for the proposed Lava Ridge Wind Energy Project in Southern Idaho. We are the Washington DC Chapter of the Japanese American Citizens League. Our members live in the Washington DC, Northern Virginia and Maryland Metro area. Some of our members are survivors and descendants of survivors of the Minidoka confinement site. Our main concern is that the proposed project would negatively impact the viewshed of the Minidoka National Historic Site which would degrade the immersive feeling, educational experience and healing at the visitor's center and the grounds. The recent Traditional Cultural Properties designation includes and protects this viewshed. Therefore we support Alternative A: No Action. The Lava Ridge Wind Energy Project proposal disregards the Congressional requirement that the Secretary stated to "protect [and] preserve . . . the resources associated with the former Minidoka Relocation Center." See: P.L. 110-229, Sec. 313(c)(2)(A), 122 STAT. 771 (May 2, 2008) (codified at 54 U.S.C. §§ 320101. Congress directed the Secretary to protect and preserve the entire historic 33,000-acre "Minidoka War Relocation Center," which extends beyond the legislative boundary of the Minidoka NHS. In addition, the Biden Administration's Proclamation on the Day of Remembrance of Japanese American Incarceration During World War II. February 18, 2022 states: "Today, the National Park Service helps preserve several Japanese American incarceration camps. These tangible reminders of our history provide important spaces for reflection and learning about the injustices born of prejudice. Preserving incarceration sites as national parks and historic landmarks is proof of our Nation's commitment to facing the wrongs of our past, to healing the pain still felt by survivors and their descendants, and to ensuring that we always remember why it matters that we never stop fighting for equality and justice for all. My Administration is committed to maintaining these national parks and landmarks for future generations and to combating xenophobia, hate, and intolerance — including through the reestablished White House Initiative on Asian Americans, Native Hawaiians, and Pacific Islanders. One of our most pressing needs today, sustainable energy, should not have to come at the cost of the Native Americans, low income communities, and the Japanese American community. Let's learn from our past mistakes. Let's work together for sustainable energy sites of least conflict that make sense. We have the capability and the resources to find these sites around the country. Please choose Alternative A: No Action.
11806-1	Leslie Morishita	The proposed wind turbines will destroy the Minidoka NHS viewshed that is integral and essential for the immersive experience of the place. If allowed to happen, beyond the physical desecration, the turbines will stand as a gigantic, symbolic fuck you, to my family and community. The blatant disregard for the sacred meaning and importance of the place will make a mockery of the educational intent and cultural value and messages of the site. Please do not pile this injustice on top of the injustice of the existence of an American concentration camp in the first place.
11811-1	Joy Shigaki	It's unconscionable that 400 wind turbines might be erected near Minidoka. Given the height and scale of the wind farm, it will desecrate the site and be an impairment of resources. The viewshed will be ruined after finally making this place a site of conscience and part of the National Park Service. As an environmentalist, I support renewable energy. Yet, allowing this wind farm near this National Historic Site is perpetuating the harm, violence, and erasure of my family's history and of so many others in this country where our past has been continually ignored, covered up or erased. I implore you to stop the Lava Ridge Wind Project NOW.
11815-2	Liz Phillips	I am not against wind turbine energy. I am not against the Lava Ridge Project. I am against anything that would decrease the purpose of the Minidoka Historical Site. Historical sites are memorials to help us reflect, remember and learn. The isolation of the Minidoka camp is a huge part of the ability of individuals to reflect on the injustice that happened there. I believe a reasonable alternative is to move the Lava Ridge Project at least 30-35 miles away from the Minidoka Historical Site.
11817-2	Satsuki Ina	I support sustainable energy and applaud President Biden's commitment to supporting and encouraging sustainable energy projects, however, these projects should not come at the cost of communities of color, in particular, Indigenous Americans who have suffered centuries of dislocation and cultural erasure as recognized in this DEIS as a "environmental justice community." Secretary Haaland stated in her "Federal Indian Boarding School Initiative" that "only by acknowledging the past can we work toward a future that we're all proud to embrace." I ask the Secretary to not repeat the mistakes of the Department of the Interior during WWKK and protect the preservation of the MInidoka Historic Site and its viewshed now and for future generations.
11819-1	Stephen Okawa	History is important in each of our lives. It plays an essential part in the shaping of it. The sense of place in that history is of equal importance. Since I was born in Minidoka in mid-1943, I have no recollection of the place. I and my family have only a sense of Minidoka as it is now. But at least we could imagine that this bleak and desolate land was once home to my family and almost 10,000 other unconstitutionally incarcerated Japanese Americans. The desecration of this National Historic Site and surrounding area would be a further disgrace to not only those who suffered at Minidoka, but it would surly be another unconscionable act. We urge you to do the right thing and not allow the tragedy of allowing windmills to be built in or anywhere near this sacred site . . . a place of so much meaning and history not only for my family, but to so many others now and in the future.
11823-1	Amy-Aiko Hovland	The site has a nice visitor center, which helps those wanting to know more and experience more about the camp itself. The site has visitors who come to experience the history here, and we must keep it preserved. The BLM has considered this site as a viable place for renewable energy options, but it comes at the expense of American minority people connecting with our history. We must not build wind power in such away that does not inhibit this historic site. We must be allowed to grieve without turbines interrupting the process. If this project goes forth as proposed, we will lose an incredibly powerful experiential opportunity of what the Japanese Americans endured. It will be obscured by this proposal's radical changing of the visual and emotional landscape. We must preserve both the positive and negative parts of our history, and we must not remove or significantly diminish the impact of historical sites where cultural minority tragedies are memorialized. We must retain this landscape so that my child and the generations to come can continue to understand and experience our history with the stark visual impression and the emotional impact that we have preserved.
11828-1	Susan Kunimatsu	The Lava Ridge Plan of Development issued by Magic Valley Energy, LLC in June 2021 contains only a vague explanation of how the project site was selected: The proposed Project location was selected based on the quality of the wind resource in the area, the power markets accessible by existing and planned transmission lines, the availability of suitable land, and the absence of land use constraints, critical environmental concern[s],…and other restrictive land use designations (page 3). Impact on historic resources is not listed as a siting consideration. Later, the same report says that MVE, its contractors and all project personnel must comply with federal and state laws and regulations including…Section 106 of the National Historic

Comment ID	Sender	Public Comment
		Preservation Act (page 57). In the Draft EIS issued in January 2023, the Stakeholder Assessment and Engagement Report contains a long list of recommendations for community input on the impact of the project on the Minidoka National Historic Site. All of this input was gathered AFTER THE PROJECT SITE WAS SELECTED. Visual simulations prepared as part of the DEIS show that the project will dominate the skyline visible from the Minidoka NHS. It seems none of this was taken into consideration as no alternative sites were considered in the DEIS. I am a Sansei (third generation) Japanese American living in Seattle WA. My mother, grandmother, and several of my aunts and uncles were imprisoned at the Minidoka concentration camp during World War II. That history is a powerful and emotional chapter in the history of the Japanese American community in Seattle and the nation. The BLM and MVE failed to comply with federal regulations in siting the Lava Ridge Wind Project without considering its impact on the Minidoka NHS. Other locations should be considered in the final EIS, or the project should be scrapped.
11834-2	Lynn Fuchigami	Established as a National Monument by President Clinton in 2001 and re-designated as a National Historic Site under President George W. Bush in 2008, the Minidoka National Historic Site exists as a reminder of the fragility of our freedom and how we must be vigilant to protect civil liberties, civil rights, due process and the principles on which our country was founded. It is a testament to the enduring spirit and resilience of the people that were incarcerated there. Furthermore, the Japanese American Museum of Oregon interprets the Japanese American WWII incarceration story through the Minidoka site and experience. This site and the principles that are embodied there must be protected and preserved. Fundamental Resources and Values are clearly identified in the Foundation Document of the Minidoka National Historic Site. Environmental Setting, Commemoration and Healing, Public Understanding, Education, and Involvement are paramount. The NPS/DOI document states, “Fundamental resources and values help focus planning and management efforts on what is truly significant about the park. One of the most important responsibilities of NPS managers is to ensure the conservation and public enjoyment of those qualities that are essential (fundamental) to achieving the purpose of the park and maintaining its significance. If fundamental resources and values are allowed to deteriorate, the park purpose and/or significance could be jeopardized.” This proposed wind project jeopardizes and/or will destroy the very fundamental resources identified in the Foundation Document of the Minidoka National Historic Site. Any decision other than Alternative A appears to contradict the Department of the Interior and National Park Service’s purpose and goals for the site. In closing, the DEIS recognizes and identifies many of the potential adverse impacts and effects that the Lava Ridge Wind Project will have on this culturally and historically significant site. It also acknowledges the concerns expressed by the Japanese American community, so anything other than No Action silences the voices and concerns of important stakeholders, and shows that once again, government is willing to turn its back on the Japanese American community.
11842-3	Erin Nishijima	I request that you think deeply about the consequences of your actions with Lava Ridge Wind Farm. Listen to their stories of the communities you are interrupting and educate yourselves on the history and significance of Minidoka National Historic Site.
11843-1	Harriet Fukushima, Tamiko Nimura, Stan Shikuma, Hiroshi Shimizu, Satsuki Ina, Barbara Takei, Ken Nomiyama	Like the Minidoka Historic Site, the Tule Lake National Monument is managed by the NPS. Both sites are recognized as National Historic Landmarks, the highest designation granted to America’s places of historic significance. Both sites were also recognized as Traditional Cultural Properties, places that have deep meaning and significance to the Japanese American community — places that our government has a responsibility to protect, not desecrate. In February 2022, President Joseph Biden promised to help heal the pain of Japanese American survivors of incarceration and descendants, and pledged to preserve and protect these carceral sites. He stated: Preserving incarceration sites as national parks and historic landmarks is proof of our Nation’s commitment to facing the wrongs of our past, to healing the pain still felt by survivors and their descendants, and to ensuring that we always remember why it matters that we never stop fighting for equality and justice for all. My Administration is committed to maintaining these national parks and landmarks for future generations. President Biden’s Day of Remembrance Proclamation, February 18, 2022 The Lava Ridge wind farm project does the opposite of preserving and protecting Minidoka, threatening the work of NPS and multiple Administrations that have worked to preserve this American civil rights site. Tule Lake Committee DEIS Lava Ridge Wind Farm Page 2 The only Option that is truly consistent with President Biden’s Proclamation, that ensures the preservation of the Minidoka site is Option A, the “no action” option. Option A is the only choice that does not create a negative impact on Minidoka’s view shed, a choice that prioritizes protection of the archeological, historic, cultural and environmental resources of the Minidoka National Historic Site. Options B, C, and D examine a range of minimal and maximum impacts created by the wind turbines. However, the various configurations, whether low, moderate or severe impacts, all share the unacceptable feature of creating a visual blight. Introduction of a massive wind farm infrastructure within the view shed of the Minidoka concentration camp will destroy the setting, feeling and association so important to the integrity of this American concentration camp. The sense of isolation and abandonment — so much a part of the incarceration experience — will be erased by the line of wind turbines encroaching the horizon. The Bureau of Land Management is in a position to protect a significant national civil rights site. Option A is the only option that honors the social justice story the Minidoka National Historic Site was created to tell.
11853-1	Ryan Kozu	I strongly object to the Lava Ridge Wind Project and demand that Alternative A: No Action! be chosen. As a descendent of Minidoka survivors, this land holds great cultural and historical significance to my family and community and the DEIS fails to adequately protect this. The Minidoka National Historic Site is also sacred ground to my family as my great grandfather also died at Minidoka. As an organizing member of the Minidoka Pilgrimage Planning Committee, we bring survivors, their descendants and other allies back to Minidoka National Historic Site each year for reflection, education, healing and closure. We do not come to Minidoka NHS as tourists or recreationalists as the DEIS states. We come back as part of the healing process of our intergenerational trauma. Minidoka National Historic Site holds as much cultural and historical significance as the Gettysburg National Military Park, the Pearl Harbor National Memorial or Saratoga National Park and preservation of the immersive feeling of isolation and soberness is just as critical at Minidoka as the other sites. Please do not allow the Lava Ridge Wind Project to continue to proceed at or near our sacred Minidoka National Historic Site. Alternative A: No Action is the only option in order to preserve this sacred ground.
11860-10	Shauna Robinson	The visual protections for the Minidoka National Historic Site are very inadequate and play a role in the National Trust for Historic Preservations listing of the Minidoka NHS as one of the eleven most endangered historic places in America . For the 13,000 Japanese Americans who were unjustly held in this remote camp during World War II, the views were constant reminders of their isolation and unwarranted imprisonment. The survivors of Minidoka and their descendants today consider this location sacred, with many making annual pilgrimages to Minidoka to honor the sacrifices and resolve of their family members. The expansive views are an integral part of the camp’s history, contributing to its unique setting, feeling, and sacred attributes. For placement of wind turbines just two miles away and continuing to the north/ northeast, it would absolutely impose adverse effects on Minidoka. Disruption of the meaningful views is an inexcusable intrusion on the setting and feeling of the incarceration camp.
11862-2	Suzanne K. Ishii-Regan	The Minidoka Internment Camp site is sacred to those whose lives and families were impacted by the WWII incarceration/internment. The shame and fear that the incarcerated/interned Japanese and Japanese Americans felt as a result of the 1^71^711 Internment is well-documented. And because of the shame and fear, most did not discuss the experience with their children, grandchildren and great-grandchildren. So, for many, it is only through personal research. proiects such as ours. and pilgrimages to the internment camp sites, that they are able to learn about what occurred during the WWII Japanese Internment and the impact on their ancestors and their families. The museum at Minidoka is a living museum. Its location, geography, topography, and climate are as much a part of the experience as the information contained in and/or represented by the structures on it. Having a windmill farm visible from the Minidoka Internment Camp site will negatively impact the experience for all visitors to the site/museum, distracting from the bleak landscape which the internees faced. There is an old saying that "seeing is believing." Dotting the landscape with manmade modem technology will serve as a distraction and alteration of the backdrop, thereby changing the experience of visiting Minidoka. I am therefore, submitting this letter in support of No Action Alternative A. We are aware that Karen Atkinson, who had family members incarcerated at Minidoka, has personally submitted a letter in response to the proposed Wind Farm. And I am incorporating her comments by reference herein.
11874-1	Brittany Arita	Minidoka is a National Historic Site, and for good reason. It is a significant, even sacred, site for the Japanese American Community.

Comment ID	Sender	Public Comment
		In 1942, this site held almost 13,000 people of Japanese ancestry. Among them was my grandfather. He was first incarcerated at Manzanar War Relocation Center (another National Historic Site, which also had to fight against the building of a large-scale solar farm) before being transferred and incarcerated at Minidoka. This site is historical. This site is critical to the preservation and education of the Japanese American experience during WWII. This site is meaningful. This site is also a place of healing. Every year, many gather for the Minidoka Pilgrimage, to honor and heal and learn from ancestor's experiences. I hope to join them soon. And I hope that the site will continue to be honored and preserved, as it is, for generations to come. Reckoning with history is imperative to healing. The proposed Wind Project would disrupt this historical site. This project also continues a pattern evidenced throughout the history of this country of the seizing, displacement, and desecration of marginalized communities' lands and sacred sites. While the importance of clean energy and a sustainable future are imperative, so is the preservation of such historical sites like Minidoka. Such clean energy efforts should no longer be at the expense of marginalized communities, their lands, and their histories. These massive, 740 ft tall wind turbines would surround the landscape of Minidoka, in a way which is both disruptive and disrespectful. The landscape is it's own character in the story of the forced relocation and incarceration of the Japanese American community. And one that needs to be protected & preserved. I urge the Bureau of Land Management to thoughtfully reconsider this project and opt for Alternative A: No Action. Please help the Japanese American community continue to protect and honor this historical site for generations to come.
11928-1	David Sakura	One of the first things a visitor sees when entering the Minidoka National Historic Site is the Honor Roll that displays the names of hundreds of the men and women from Minidoka who fought in WW II. My father, Chester Y. Sakura was among the first from Minidoka to volunteer for military service. He later discovered that his three brothers had also enlisted, including his youngest brother who was a father of a six-month old son. My father (as a 2nd generation Japanese American, or Nisei) felt that as an Army enlistee, the US government had finally recognized him as a full-fledged US citizen rather than as a potential threat to the country. In May 1943, my father left Minidoka for training with the 442nd Regimental Combat Team (RCT) See photo below . I was 7year old at the time. Before he left, my father gave me the following instructions: "You are now the man of the house and take care of your mother and three brothers". Desperate upon his leaving, my mother begged my father not to leave her with the three boys. She said: "Chester, you're 38 years old with three boys. You don't have to go!" In retrospect 30 years later, my father recognized that "the intervening time after leaving for service until the end of the war was a hard struggle for Aggie (my mother)". The unsung heroes (wives, elderly parents, children) of the Minidoka story are those who struggled against loneliness, uncertainty, isolation, heat, and dust, while their loved ones were away fighting and dying in the war. As one who is 87 years old and a survivor of Minidoka, I consider this ground (the Minidoka National Historic Site, and my childhood home for 2 years) to be sacred and that the memories of these unsung heroes should be preserved as such. The proposed Lava Ridge Wind Project would forever change the character of the Minidoka National Historic Site. If a permit were granted by the BLM and if I were to visit Minidoka, perhaps for the last time, I would be saddened to see a vast array of giant wind towers, some standing within a short distance from my former barracks (Block 15-Building 8-Room E). It would no longer be a place of remembrance and meditation for me and for generations to come. In a letter signed by President G.H. W. Bush that was sent to me and each of the surviving internees, along with a redress payment of $20,000, he stated: "We can never fully right the wrongs of the past. But we can take a clear stand for justice, and recognize that serious injustices were done to Japanese Americans during World War II." Will the U.S. government, and the BLM go back on its promise, by once again committing yet another in its long line of injustices towards Asian Americans by approving the Lava Ridge Wind Project? I urge the BLM to seriously consider the promise made by President Bush to the survivors of Minidoka and take a strong stand for justice by denying the siting of wind turbines within sight of the Minidoka National Historic Site. I strongly support Option A in the DEIS, along with encouraging the BLM to take future action in order to protect permanently the lands surrounding the Minidoka National Historic Site.
11932-1	Sharon Sakamoto	My name is Sharon Sakamoto. I was born in Camp Minidoka. I am an American citizen. My parents, Roy and Josephine Sakamoto, both natural born American citizens, were imprisoned in Camp Minidoka. In 1942, they along with my older siblings, Eileen (6 yrs), Kent (5 yrs), Dennis (3 yrs.) and Joy (2 yrs.), lived in the desolate area called Camp Minidoka far from their robust and thriving community in Seattle. My family's entire Camp Minidoka incarceration experience left indelible scars and dark memories in my famly's collective psyche. My parents could hardly speak about it. The Lava Ridge Wind Project would so greatly alter and destroy the landscape at the Camp Minidoka site as to obliterate the experience and erase an important memory of our collective American mind. The sense of desolation, destitution, devastation and annihilation experienced by the Japanese American community upon arrival at the Minidoka Camp will be lost forever with the Lava Ridge Wind Project. The Project would concretely demoralize and totally disregard our community once again. All Americans become better citizens when we remember our country's past. I urge the Bureau of Land Management and you, Kasey Prestwich, to be leaders today and not repeat the failure of leadership of 1942. I urge you to lead our country forward by not sucumbing to the economic benefits of a few, by not destroying the evidence at Camp Minidoka, by not again extinguishing the Minidoka Japanese American community and legacy and by not repeating history. All Americans must remember the Japanese American experience at Minidoka. The Bureau of Land Management has a moral and American obligation to remember fully and memorialize the Japanese American experience at Minidoka in respect of our citizens who lived it and so our country will not act in the same manner ever, ever again. I ask you and my congressional senators and representatives to stop the Lava Ridge Wind Project which desecrates the Camp Minidoka memory of all who lived, died and were born there.
11935-1	Alexandra Delis-Abrams	I would be opposed to this project, and, although we need wind power, and I support wind power, the turbines must be refined to not harm birds, and not be located near a revered, and respected and honored Memorial site.
11936-1	Wendy Tokuda	My parents met in the Minidoka Internment Center, and my brother was born there. Altogether, ten members of my family were incarcerated there, many of them for the entire duration of the war. My parents lost everything they had. The imprisonment would affect them and me and my siblings for the rest of our lives. So, Minidoka is sacred to me. Even though I was not born there, Minidoka is in my bones. The proposed wind towers are taller than the Seattle Space Needle. Seattle is my hometown, and I know how that single structure- the space needle- impacts the view and the feel of the city. I think dozens, hundreds of these huge wind turbines would dominate the entire experience of visiting Minidoka. The sheer size of the project would reduce Minidoka to a tiny postage stamp. It would diminish the impact of an historic site that changed the lives of my family forever. Minidoka was located far from the coast in a remote spot for a reason- so that the Japanese locked up there would not be able to spy. The feel of the location is important for that reason- a desolate spot, hot and dry. It's part of the history. When I go there, I can feel my parents. The Lava Ridge Project would destroy that feeling. The wind towers would dominate the experience. It is hurtful to me. Frankly, it feels like an insult. That's why I'm against it in total. No wind towers. I am an environmentalist. I have solar panel, a plug in hybrid car, and an organic garden. I compost and save water. I volunteer doing environmental restoration work regularly, almost daily- I'm not kidding. I am all for wind power, just in a different location. Because to put it adjacent to, or close enough to impact the backdrop of the Minidoka National Monument will diminish the importance of the history of that location. It was in a desolate spot in the desert for a reason. Because we weren't considered to be real Americans. Please help us preserve the importance of this fact so that our history is preserved.
11942-1	Richard Ito	Damage to the Nature and Character of a National Historic Site: It should be abundantly apparent to any informed unbiased reader of the draft EIS that the proposed project impacts the historic Minidoka Confinement Site. Yes, evaluating and quantifying such impact is a poorly developed field. Yet not adequately addressing the impact, especially when the impact is showing itself to be adverse, brings negligence to the process. The overriding issue of social impact is of much the same character as if the Lava Ridge Project was proposed to be located at a similar distance to Arlington National Cemetery.
11942-3	Richard Ito	Lastly, it seems proper that the producers of the EIS make a review of the project pushing bias that seems to arise in many other EIS reports, intended or unintended. For example, the attempt to create a future scenario from Minidoka looking towards the windmills is deceiving without accounting for the fact that the human eye is highly perceptive to motion, in this case the many constantly spinning blades. Perhaps, uncomfortably revealing of bias, hopefully not intentional, is the description of people arrving as "tourists and recreationalists". This EIS is not about affect on an amusement park.
11949-3	Victor Yamada	I'm a Japanese American who had a grandmother and uncles removed from Seattle, Washington under Executive Order 9066 and sent to the Minidoka War Relocation Center in Idaho. One of my uncles joined the US Army's 442nd Infantry Regiment from the Minidoka Camp. He fought in the European Campaign, was injured, and received a Purple Heart for his service during World War II.

Comment ID	Sender	Public Comment
		My extended family member wrote No-No Boy, a fictionized account of Japanese American incarceration during World War II. Part of the setting in the novel includes the Minidoka War Relocation Center. My family and I have visited the larger Minidoka War Relocation Center Site and Minidoka National Historic Site from the time the location was nearly bare to its being designated a historic site by the National Park Service. We remembered and honored family members and other thousands of Japanese Americans who were wrongly and unjustly incarcerated at this site. We were gratified that the general public is being properly educated on the Japanese American experience during World War II. On behalf of my family, I am submitting comments on the Lava Ridge Wind Project Draft Environmental Impact Statement. I am for renewable energy development done in a responsible manner. However, the proposed project and its discussed alternatives would cause significant impacts to the Minidoka National Historical Site. I am addressing significant impacts under 3 topics – Visual Resources, Cultural Resources, and Environmental Justice. Project Components – The wind structures (including the towers and extended vanes) would be up to 700 feet high. For comparison, these heights are similar to the Seattle Space Needle or a 70-story building. Visual Resources – The wind towers would be clearly visible at locations on the Minidoka National Historic Site. An unobstructed view of the sweeping vistas and desolate environment is essential to the immersive experience and practice of commemorating those who were incarcerated at the Site. [...] Environmental Justice – The proposed project and associated visual changes would have significant and adverse effects on the setting, feeling and experience at Minidoka National Historic Site. The Site is an acknowledgement of the injustice that happened to thousands of Japanese Americans. It notes the distinct population who suffered unique experiences before, during, and after incarceration associated with World War II. [...]
11959-1	Karen Yoneda	I am deeply concerned about the placement of numerous turbines close to Minidoka National Historic Park. Historically the wildlife and the Native Americans have resided. The Japanese American citizens were forcibly interned in World War II due to discrimination. This is a sacred place. We need to honor Minidoka to our past, present and future!! Other events/developments seem to target the Asian community. Seattle Sound Transit have considered dividing up Chinatown for the new development recently.. Chinese were evicted from Tacoma in 1885. In all respect, please consider Minidoka sacred. Please do not place the turbines in Minidoka. Why was Minidoka considered? Why was other national parks or other areas not considered? Find another solution!!
11963-1	Jeff Fujioka	I am definitely against Alternative B which puts the wind turbines in clear and obtrusive view of the Minidoka site.
11965-2	Matt Bridges	Also, section 3.5.3 states Today, Minidoka National Historic Site conveys feelings of isolation and abandonment, expressing a sense of the desolation experienced by Japanese Americans during the incarceration period. The feeling of the site evokes the victimization, injustice, and racism that are important aspects of the site's history. [If] the wind project is built, visitors to the historic site may no longer experience the feelings of wide-open spaces devoid of large-scale development characteristic of the incarceration period and agricultural and reclamation projects of the twentieth century. In this way, the presence of turbines, transmission towers, collection lines, battery storage facilities, maintenance facilities, and substations could impact the feeling of the site. Japanese American concerns: Disproportionally impacting historic sites associated with their community Siting the project in proximity to the nationally significant Minidoka NHS given Japanese American community concerns and sensitivities associated with impacts related to development in the surrounding area Honoring the place of Japanese Americans in national history Maintaining the wide-open vistas of the landscape as would have been experienced at the time of Minidoka WRC incarceration Prominent project structures and their lighting visually impacting Minidoka NHS All these concerns will be real if this project goes through in any capacity other than Alternative A, the No Build option. I view the Minidoka National Historic Site as a remembrance of an incarceration facility. This is a true reminder to the atrocities bestowed on the Japanese Americans under the direction of the U.S. Government. To build a wind project near this facility and over the sacred grounds of Native American Tribes, thus degrading, obscuring, and obliterating cultural resources, appears to be a cover up of the atrocities of the Government meted out on her people. Burying the past and building a project will restrict the citizenry from learning about these atrocities, and enjoying the learning experience of visiting our public lands. The BLM must meet their mission statement to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations. For this reason, please select Alternative A, the No Build Option.
11968-3	Cheryl Sandy	We have the Minedoka Set aside grounds honoring the Internment Camps endured by our Japanese Imigrants. This meaningful land would be disturbed.
11970-3	Janet Keegan	When the Monument Resource Management Plan (RMP) was written in 1985, the remnants of the entrance to the Minidoka War Relocation were clearly visible. In 1979, a six acre parcel of the former site was listed on the National Registry of Historic Places. In 2022, the Friends of Minidoka submitted a Traditional Cultural Property study to the Idaho State Historic Office (SHPO) to determine eligibility of the historic footprint and view shed of MNHS for the national registry. The SHPO determined it is eligible in November 2022. Minidoka | Densho Encyclopedia Mitigation: Volume 3, App4-34 XIV and XV: Existing transmission lines are a visual pollution on the current landscape. Adding more to the pollution of the view shed is not acceptable. Mitigation would not ease the emotional impact and pain that was created by forced, unconstitutional removal from homes, farms, businesses, friends and neighborhoods in 1942 by the United States government. Descendants and survivors experience need healing and they need to know that MNHS remains a sacred place of healing, remembrance and the historical value of such a site is not destroyed. Attending a pilgrimage at MNHS and seeing hundreds of wind turbines and miles of transmission lines in the near and far distance would decimate the visual impact and immersive experience of descendants and survivors of the concentration camp. The prisoners of the WRC were not only imprisoned by barb wire and armed guards, they were held in place by the vast, wild and uninhabitable landscape that surrounded them.
11977-1	Mike Ishii	In my lifetime I have become a master healer using my training in East Asian medicine to help those suffering with trauma. With time I have come to understand how hurtful and damaging the experience of being imprisoned at Minidoka was for my entire family and the JA community. Our people have endured inordinate rates of chronic disease related to stress. We have experienced high rates of addiction and mental health issues. We have exhibited many of the classic forms of post-traumatic stress syndrome and adaptive survival behavior that is common for people subjected to severe violence and trauma. This is true across generations of Japanese American camp survivors and their descendants. One specific harm my people are still healing from is emotional trauma due to forced removal, and loss of home and place. Displaced, incarcerated children suffer impacts to their developing brains and psyches that last a lifetime presenting as depression, anxiety, panic disorders, pain syndromes and compulsive disorders. This is what I witnessed in my mother and her siblings. It is what I know was passed down to my generation as well. As a human rights worker and healer, I have come to understand that collective and individualized trauma often become deeply connected to place. Minidoka is central to my community as place. In recognizing this I implore you to understand that Minidoka should be prioritized as a site of national conscience and healing that supersedes other considerations. For this site, like others of its kind

Comment ID	Sender	Public Comment
		around the world, are necessary as haunting reminders so that we do not repeat our violent history. Such places should be set aside as special sites to honor human life, human resilience and to foster efforts to heal violence and trauma in humans and to heal desecration to the land. As a site of conscience there is necessary healing of place that needs to be supported at Minidoka. The proposed wind farm exhibits a tremendous lack of regard or sensitivity and is dismissive of the experience of every person who lived and died in captivity there. It also demonstrates a callous lack of respect for this land that was truly desecrated. The proposed project will not only change the viewshed but negatively impact the site as a place of worldwide cultural significance, its importance as a place of healing and reflection and undermine attempts to heal the suffering of this place and of the people imprisoned there. Even a moderate change to the viewshed would still impact the integrity of the Minidoka site. I can't imagine the outcry that would resound were a wind farm to be proposed surrounding Dachau, or the ruins of Hiroshima or at Wounded Knee. Why then would so little regard be offered for this site or the impacted people who are connected to it? To categorize Japanese Americans connected to Minidoka as "tourists and recreationalists" is not only deeply hurtful but further exhibits blindness to a cultural understanding of repair and healing of the U.S. incarceration of Japanese Americans. The level of arrogance required to proceed forward with this proposal when impacted people who paid dearly with their bodies and spirits have spoken out and requested preservation over development, is absolutely sickening. It is often the way of U.S. society to whitewash over the racist violence of its past in order to erase history and to recycle places where great harm to communities of color and immigrants occurred. This continues a pattern of white supremacy. We have seen this in the intersectional history of forced removals, forced displacements, mass incarcerations, and separation of families - all carried out by U.S. governmental agencies. We see it in the paved over graves of enslaved Africans at Wall Street; the desecrated graves and bones of Native Hawaiians on Maui paved over in outdoor shopping malls; in the use of Fort Bliss, a former Japanese American incarceration site now re-purposed to mass incarcerate unaccompanied migrant children; or at the Tanforan racetrack shopping mall parking lot, once a Japanese American incarceration site. And now we see the erasure of the sanctity of Minidoka and its surroundings in the proposed Lava Ridge Wind Project. Further compounding this violent legacy is the Department of Interior management's historical relationship to Indigenous and Japanese American communities. The use of reservation lands to imprison Japanese Americans and the very desecration of stolen Indigenous lands used for any of the wartime incarceration sites, all encompass an agenda of white racism and genocide. That legacy is not disconnected from this particular proposal. This proposal stings for its lack of regard for our outcries, for the erasure of our humanity, our experience and of the sacred and historical importance of this place. In the stewardship of these places, we reveal our true inner nature and, ultimately, how we as a country treat human beings and the sacred lands where they reside. The land where you would like to build the Lava Ridge Wind Project has deep consequential impact on my people's future. The impairment of resources will affect permanently our ability to heal the trauma experienced by the more than 13,000 people who suffered in that place. I implore you to reject the Lava Ridge Wind Project. In the spirit of healing,
11977-2	Mike Ishii	I would like to comment on the detrimental impact of the proposed Lava Ridge Wind Project upon the continued repair and healing for the Japanese American community in relation to the site of the former Minidoka War Relocation Center. This proposal has created great anguish in my community. I am deeply troubled that we have arrived at a moment when survivors of the Minidoka concentration camp, people deeply impacted by the violence experienced at the site, are forced to campaign to stop this construction of the Lava Ridge Wind Project. The proposal affirms a historical pattern that has also played out regarding other Japanese American confinement sites like Fort Bliss, Fort Sill, or Pomona- a historic pattern of utter disregard and dehumanization of communities of color most impacted on these sites who decry further violations and have been ignored.
11983-1	John Ruff	I can't imagine the BLM approving a wind farm that would intrude upon the viewshed of Arlington National Cemetery, or one near Gettysburg, or Monticello or Mount Vernon; I can't imagine our federal government not fighting such a project at Normandy where it could be seen from the cemetery were American soldiers lie buried. BLM documents describe people who would go to Minidoka as "tourists and recreationalists." I have gone on two pilgrimages to Minidoka, and I head for my third this summer. All were carefully organized by volunteers in Seattle and Portland who have family who were born there, lived there, even died there. To go on a pilgrimage implies you are going to a holy place, to be blessed, to be healed, to honor those who came before you, who survived (or did not survive) a horrible ordeal there. Minidoka was situated in a remote desert area, a reclamation area which Japanese and Japanese American farmers did reclaim; they did make the desert bloom, even as they helped to save the Idaho beet crop. But Minidoka like the other camps was situated so this crime against humanity would be largely out of site and out of mind for the rest of America. After the war, the barracks were sold and carted off, the much improved land put in a lottery or auctioned off. It became a desert again with only the so-called "Reception Center" made of basalt and the concrete foundations under the water towers remained as permanent scars from the ordeal...To put that wind farm there would be a desecration; we don't need to industrialize a holy site.
11983-2	John Ruff	A vast wind farm would have plenty of wind, I get that. But it also domesticates what was a barren, hostile area, and people who go there to educated, to get some sense and feeliing for what the place was like, can't have the viewshed tamed or domesticated. Idaho is huge place and largely unpopulated There has to be another area that is has not the associations for the Japanese American that this one has.
11984-1	Nomu Desu	As a writer for the Discover Nikkei website [...] So much Japanese Canadian history has been lost here too. It really concerns me that human rights crimes like the internment of Japanese Americans and Japanese Canadians is being 'erased' by our respective societies. Having important sites like Minidoka preserved for future generations is critically important if we are not going to repeat the mistakes of the past.
11985-2	Val Tollefson; Bainbridge Island Japanese American Exclusion Memorial Association	The Bainbridge Island Japanese American Exclusion Memorial honors the memory of the 277 Bainbridge Islanders of Japanese descent who were forced from their homes in 1942 as a result of Executive Order 9066. Most of those people spent the duration of World War II incarcerated at Minidoka. The majority of them returned to the Island after the war, resuming their lives as valued members of a tight-knit community. Our Memorial is an administrative unit of the Minidoka National Historic Site. We have a stake in any decision the Bureau of Land Management makes on the Lava Ridge Wind Project Environmental Impact Statement. We ask that this project not be approved. Accordingly, we ask that you adopt Alternative A of the Draft EIS. Alternative A is the "no action" alternative. "No action" would preserve Minidoka as the sacred site for Japanese Americans that it is today. The adoption of any alternative other than "no action" would ignore the essence that makes Minidoka such an important monument. To understand that fact, one needs to know why Minidoka came into being, and what role it plays today. In 1942, a colossal wrong was perpetrated under the cover of government authority. The rights of citizens of Japanese ancestry were ignored and they were imprisoned. Wartime hysteria and racism combined to support this injustice. In later years, the government came to acknowledge this wrong, and to apologize. The creation of the Minidoka National Historic Site was part of this restorative process. With the Lava Ridge project on its docket, the BLM appears ready to administratively nullify that apology.
11991-1	Julie Abo	I am providing comment on the draft Environmental Impact Statement because of my close connection to Minidoka National Historic Site. The proposed project is in the viewshed of this sacred educational site. The day after Pearl Harbor was bombed in 1941, the FBI came to the Tanaka home in Juneau, Alaska and took away my mother's father, Shonosuke Tanaka. My mother, her mother and her siblings didn't see him again for a year and weren't reunited until two years later. In the spring of 1941, my mother, Mary (Tanaka) Abo and the rest of her family along with some 200 other Japanese American and Tlingits were forcibly removed from their homes in Juneau, Alaska and were incarcerated at Minidoka War Relocation Authority Camp in Southern Idaho from 1942 to 1945. (881 Unangax̂ peoples were incarcerated in Alaska.) This has indelibly impacted all of our lives. I'll never forget walking on the Minidoka site with my own daughters, feeling the hot sun beating down and looking off into the expansive distance, feeling as though my ancestors were with me. My aunt, who was nine when they were incarcerated there, was recalling some of her memories walking on that same spot many decades before. Listening and sharing in community with the other 300 participants was a very spiritual experience and a kind of acknowledgement that this did happen, it was wrong and that we can move on. Today, I also think about the Shoshone Bannock and other indigenous peoples who were here centuries before who were forcibly removed from this land, not a place they consider their property, but a place they still consider to be part of their creation story and identity. Just over 80 years ago, President Franklin D. Roosevelt signed E.O. 9066 that enabled the forced removal and incarceration of over 125,000 Japanese Americans in 75 detention centers and incarceration sites such as Minidoka and is recognized today by the US government as a decision based on war hysteria, racism and a failure of political leadership. There were some 13,000 Japanese American and Tlingit people who were incarcerated at Minidoka. The Japanese American incarceration was a violation of constitutional rights that resulted in the separation of families, the loss of generational wealth and the continuation of widespread multigenerational trauma that still exists today.

Comment ID	Sender	Public Comment
		Today, for my family and me, and the Japanese Americans and indigenous Tlingit who were incarcerated there and their descendants, friends and allies, Minidoka is sacred and hallowed ground, a place for commemoration, reconciliation and healing. Today, Minidoka is a National Historic Site maintained by the National Park Service overseen by the Department of the Interior, the same governmental agency that administered the incarceration in 1942 through the War Relocation Authority. The preservation of the site is proof that the US government recognizes the wrongs of the past and its efforts to make it right and has lessons for all who pass through the site. Recently, my mother and I have attended presentations by Dr. Satsuki Ina, a 2020 American Psychological Association Presidential Citation recipient psychotherapist and University of Michigan psychologist Dr. Donna Nagata and we have learned about how the incarceration was a psychologically traumatic experience, particularly for the children such as my mother, Mary (Tanaka) Abo that caused shame and silence that was passed down to my generation. My mother and I have participated in multigenerational discussions at Pilgrimages for the Minidoka community and allies which have had a healing effect. (See Dr. Satsuki Ina's PBS documentary Children of the Camps.) Magic Valley Energy's Proposed Lava Ridge Wind Energy Project proposal would irreversibly degrade Minidoka National Historic Site's immersive experience for survivors, descendants and visitors. The construction of this site would effectively undo the years of reconciliation and education outlined in the bipartisan Civil Liberties Act of 1988 that clearly states that the incarceration was wrong and to preserve its lessons through preservation of the historical site, public educational programs and pilgrimages. This apology was recently repeated in President Biden's February 19, 2023 Statement from President Joseph R. Biden, Jr. on the Day of Remembrance of Japanese American Incarceration: The incarceration of Japanese Americans reminds us what happens when racism, fear, and xenophobia go unchecked. As we battle for the soul of our nation, we continue to combat the corrosive effects of hate on our democracy and the intergenerational trauma resulting from it. We reaffirm the Federal Government's formal apology to Japanese Americans for the suffering inflicted by these policies. And we commit to Nidoto Nai Yoni – to "Let It Not Happen Again." Furthermore, the Department of the Interior would be repeating the mistakes of 1942 and it would send a negative message to the local and national community.
12019-1	Suzu Kawamoto	I am adding my name and voice and heart to the call to stop any further action on the proposed Lava Ridge Wind Project. This project will completely bury any remaining evidence of the atrocities of the incarceration of the Japanese American citizens at Minidoka. In fact, I was disheartened, but not surprised, to not even see Minidoka mentioned in the proposal. Minidoka is a Landmark; an important part of American history that must remain and not erased. In the name of my Grandparents, aunts, and uncle, and all the Japanese American citizens who were unfairly incarcerated in Minidoka; losing their possessions, dignity, and years of their lives, I implore you to choose the "No Action" alternative.
12046-1	Mary Abo	I am an 81 year old Minidoka Survivor. My family was ordered from Juneau, Alaska, along with all the Japanese as well aany Native children born of Japanese fathers. They were scattered throughout Alaska. My mother who could hardly understand English and my siblings were sent to Minidoka while my father was sent to a different camp in Santa Fe, New Mexico. Consequently, she was thrown into a constant state of anxiety, even hoarding toast under her cot from the mess hall because she thought we might starve. I have often returned for Minidoka Pilgrimages with my family. Being there has made it easier for my daughter and my granddaughter to understand what it was like. They could imagine being prisoners in the vast desert, the tarpaper barracks, the mess hall, the fire station. The wind whipped up the sand into our eyes, the tumbleweed rolled on the dunes, the hot sun beat down on us as we walked the trails Being there bonded us together as a family. We could talk about the trauma of camp and commit ourselves to work for justice. When I heard that Minidoka was threatened with a giant wind turbine farm, I felt like we had no chance to fight it. But after attending the many BLM Section 106 zoom meetings, open houses, Friends of Minidoka meetings, writing scoping letters, comment letters, examining the DEIS and the Draft Programmatic Agreement, I realized many different environmental agencies and towns people were upset. They were concerned with the environment , grazing rights, water rights, , farming, ranching, fishing and hunting, and sympathized with the Natives and the Japanese Americans concern over their sacred sites. I began to feel there was a chance we could discourage the project, I appreciate BLM Lava Ridge Subcommittee Final Report which concluded with their decision for Alternative A, no action. Many common concerns were itemized covering historic properties, bird kills, wildlife crossings, grazing and water rights. There were many questions that have not been adequately addressed in the DEIS. I appreciate the extensive space allotted to Minidoka in the DEIS. I am sure such consideration was due to the many comment letters from the Japanese American community and the Langsdon Group interviews that were commissioned to interview Minidoka survivors such as myself. Unfortunately, in the early stages of the Lava Ridge public meetings, I believe the only historic entity consulted was the Jerome Historical Society whose only connection to Minidoka are a few artifacts. As a result the National JACL and the Japanese American Confinement Site Consortium (made of members of the10 incarceration camps) publicized the project and articles appeared in all the major Japanese American press in California, Washington and Oregon. Although many Minidoka survivors live outside Idaho, they will often return because The Minidoka National Historic Site remains an indelible memory. They, as well as the general public, learn and relearn a valuable American History lesson every time they visit the site. Minidoka is an American Concentration Camp and must be acknowledged. When the Lava Ridge Project was announced, It seemed Idaho was wide open for the picking for big industry to swoop in because there were inadequate guard rails. For that reason, we are hopeful that BIM will establish Areas of Critical Environmental Concerns to provide permanent protections as new proposals come up. I believe the Lava Ridge Project awakened BLM and prospective enterprises to thoroughly engage their local communities to make sure their project will be welcomed.on public lands. At one meeting, it was suggested there be a Monument Resource Plan in place to protect whatever resource Idaho want protected. Another person agreed because otherwise they will have to go through the same ordeal over and over again whenever an energy project is proposed. If for some reason, the Lava Ridge Project is allowed to be built in some form, I am hopeful that the provisions described in the Programmatic Agreement in regards to adverse affects will adequately protect Minidoka and the Shoshone-Bannock tribes and all the key cultural sites listed within. If Alternative A is chosen, the headache of managing and monitering rhe giant wind project will disappear, My only choice for the Lava Ridge Project is Alternative A , no action.
12057-6	A. Ben Crouch	16. The windmills will be unsightly, and will ruin and disrupt views, sights, and lines of vision. The environmental impact on our lands far exceeds any potential gains and infringes on the Minidoka National Historic Site. It is bad enough what happened to the Japanese Americans and others when they were unconstitutionally imprisoned at the Minidoka Encampment – but to intentionally encroach so closely to the historic site and ignore cries to not futher insult or desecrate their memories would be irresponsible and tragic.
12059-4	Martin Bender	The final reason I am opposed to the Lava Ridge Wind Project is that if it goes ahead, it could impact a local historical site. One of the proposed areas for wind turbines is around the Minidoka Hunt Camp National Historic Site. Hunt Camp was established in 1942, to house Japanese Americans disinterred from their homes due to fears that they would support a Japanese occupation of the US, and while such fears never came to pass, the camp is nonetheless an important historical reminder of the persecution of an ethnic group in the United States for perceptions that they would give aid to an enemy and something that we should endeavor to make sure doesn't happen again. The fact that a means of generating renewable energy is proposed within the borders of that camp, to me, is disgraceful to the significance of the site and implies that such a historical site is ultimately only useful if the government or a private company can profit from it.
12062-2	Michelle Kumata	I was able to visit Minidoka in 1991 and also last fall. Both times were very impactful, to drive out to the site and walk where our ancestors were unjustly held for years. In 1991, there wasn't much left from the site, but I visited with former incacerees and saw the root cellar and the location of the former camp cemetery. When I visited last October, I read each of the walking tour interpretive panels which included photos, text and quotes that further enhanced and personalized the experience. The barracks and baseball field also helped me imagine the incarcerees daily lives. The Military Honor Roll Wall honors the Japanese Americans that served valiantly in the U.S. military while their families were held behind barbed wire. It was incredibly moving to be able to look out at the vast land and imagine how our people were held in such a massive, barren and isolated site. I felt like I was walking in my ancestors' footsteps. Minidoka is sacred to our Japanese American community and must be treated as such. This is a place where survivors and descendants can go to reflect and heal, honor our ancestors' strength and resilience, and build pride in what they endured. This is a place where everyone can go to experience a hidden chapter of U.S. history and connect the Japanese American incarceration to current social justice issues. The Lava Ridge Wind Project involves 400 wind towers, 340 of which would be visible from the Minidoka NHS Visitors Center. It covers 76,000+ acres, creating a visual wall of towers filling 114 degrees of the Park's 360 degree viewshed. Over a dozen wind towers, as tall as 740 feet, would be located on the historic footprint within two miles of the Visitors Center. The wind towers would be visible from the Visitors Center, behind the Honor Roll wall, the baseball field, and the barracks. I oppose the Lava Ridge Wind Project Project Draft EIS on behalf of my great grandparents, grandparents, parents, siblings, and current and future generations of the Japanese American community. This proposed development will have a detrimental impact on a critical, yet almost invisible part of U.S. history – the unconstitutional incarceration of 125,000 people of Japanese descent. ...

Comment ID	Sender	Public Comment
		I plan to visit Minidoka this summer with my mother, who has not returned to the site since her family left in 1945. She's turning 80 years old later this year. I'm glad she'll be able to experience the site with the historic feel of the land intact, without wind towers crowding the horizon. I am all for renewable energy, but I implore you to consider another site for the Lava Ridge Wind Project that won't destroy this sacred place of healing for our community, and an immersive, educational site for everyone. Preserving and protecting the integrity of the Minidoka site and making it accessible for all visitors is crucial to preserving and protecting U.S. history.
12070-1	Donna Zuck	3.5.3 Minidoka War Relocation Center and Minidoka National Historic Site The Lava Ridge Wind Project would have detrimental effects on the Minidoka National Historic Site and the Minidoka War Relocation Center through the invasion of physical, visual, and auditory pollution from construction and operation of the wind turbines. On page 3-155 the DEIS states "Minidoka NHS is a nationally significant site (listed under NRHP Criterion A) related to civil rights and liberties and American history(NPS 2021:1)." It is important to leave this area as close to how it was in WWII when American citizens of Japanese ancestry from the West Coast lost their rights as Constitutionally described because of their race. Visitors to this site must be able to see, hear, and feel how it was experienced by our fellow citizens. Please protect this site and choose Alternative A - no build.
12079-1	Shawn (Itoi/Nagashima) Brinsfield	On my first arrival to Minidoka, with no one else on site, I was standing alone; softly gazing in the distance. In the quiet, undisturbed moment I felt reverential and a connection. I could 'see' my Nisei mom and her brother strolling not far away as they might have done seventy years before. The silence and the 'pure' surroundings were important in invoking that state of mind; an impactful and emotional experience for me. All my family stories and their memories of Minidoka became real to me at that moment. I walked away with a deeper felt meaning of the family and community history. Since then I have made donations of time and money to support public awareness of the World War Two massive confinement event in Japanese American history; and to memorialize the first and second generations of Japanese Americans who overcame very tough conditions and forces larger than them to have a successful immigrant experience in a land which has given them wonderful opportunities. I support keeping the Minidoka National Historic Site area and view scape a meditative place which supports reflection, contemplation and a unique experience. I do not support a wind turbine farm in that general area. The Minidoka site is sacred. And I can not imagine building a wind turbine complex next to Mt. Rushmore or near the Statue of Liberty.
12080-2	Zoe Barker-Aderem	It is our responsibility to preserve similar opportunities for the families forever altered at Minidoka; as well as to all of us and the potential of the world we might build if we choose to remember.
12084-1	Greg Davidson	I feel the Lava Ridge project as written is a detriment to the visual environment of the Minidoka Containment Historic site. This project is of a size that it will significantly affect the viewshed of this entire region. As we build for our future energy needs we must not make the same mistakes as we have in the past and destroy significant cultural, historic, & scenic resources of this country. I ask the current Proposal be adjusted to remove the sites that fall within the viewshed of the Minidoka site. We have wronged enough American citizens by letting our fear rule our decisions, lets not make a similar mistake by disrespecting them again.
12090-3	Chris Bender	6. This will negatively impact the Hunt Camp WWII Memorial. The Minidoka Mational Historic Site is in the area that will be affected by this project. If you are unfamiliar with it, this is where many Japanese Americans were relocated to Southern Idaho during WWII. This is a heartbreaking part of our nation's history that needs to be preserved, out of respect to those persecuted before us and as a caution that it should never happen again. The thought that this is even being contemplated to be placed here is extraordinarily tasteless, disgraceful, and appalling.
12097-1	Shannon Reagan	I am writing to submit my opposition to the Lava Ridge Wind Project as proposed by Magic Valley Energy, LLC. I urge the Bureau of Land Management to take No Action on the proposal. My concerns are primarily centered around preserving and maintaining Minidoka National Historic Site and its viewshed. While my views align with most, if not all, of Minidoka survivors and descendants, I would like to share a slightly different reasoning for my strong opposition to Lava Ridge. I am not of Japanese American descent. I am a fourth generation Idahoan. I learned of my German roots, French-Canadian ancestry, and pioneer forefathers from a family history compiled by my maternal grandmother, which she painstakingly researched in the late 1980s before the days of easily accessible online ancestry records. She also included first-person recollections of her own experiences as a young woman growing up in Burley during World War II. A short passage in this family history alludes to the incarceration of American citizens at Minidoka: "There was also a camp built…for Japanese American displaced persons from the coast. They were not exactly prisoners, but were not allowed to travel freely. It seemed like a strange situation, but we were assured it was for their own safety." I find this short paragraph chilling. It underscores how little the public knew at the time about the incarceration of their fellow Americans. Yet even today, we still do very little to educate ourselves about this history. That is why it has become my personal mission to educate and inform others about Minidoka's past and present. While I am not personally affected by the generational trauma that Minidoka's survivors and their descendants carry, the drive I feel to share and amplify Minidoka's history cannot be overstated. Over the past several years, I have mentored a group of high school students studying the history of the camp and advised the Friends of Minidoka's first group of high school summer interns. Based on this work, one of those students is currently writing a full-length musical based on life at camp and the reparations movement of the 1980s. I have also educated my own family about the Japanese American incarceration of World War II and taken them to visit both Minidoka and the Topaz Concentration Camp in Utah. I consider this work to be one small way that I can help younger generations understand the fundamental injustice of incarcerating Japanese Americans during WWII. Over the past two decades, it has heartened me to see Minidoka transform from a windblown patch of land amongst the farm fields of Magic Valley into a protected national historic site. But I am disturbed to think of this region surrounded by spinning turbines. Key Observation Point imagery confirms my opinion that Minidoka's viewshed is at risk if the Lava Ridge project is allowed to move forward as proposed. As you are aware, the Idaho State Historic Preservation Office has determined that public land near Minidoka National Historic Site is eligible for listing on the National Register of Historic Places. Additionally, approving any of MVE's existing proposals would directly contradict the BLM's own Environmental Justice Implementation Instruction Memorandum. Furthermore, I am deeply concerned by the development of public land for private gain. To permit wind energy development of any kind within Minidoka's viewshed undermines the dignity of the site, and negatively detracts from the deeply moving experience of visiting Minidoka in person. Minidoka National Historic Site must be preserved and protected from the interests of private energy developers who see the land as little more than an opportunity to turn windpower into profit. In closing, I would like to share an anecdote about my visit to the site last spring when the Friends of Minidoka high school interns and I took a tour with Kurt Ikeda, Director of Interpretation and Education. As we stood in the visitor center breezeway next to the bronze map of Minidoka's original footprint, Kurt asked each of us why we were there to visit. When it was my turn to answer, I looked out across the skyline towards Burley, Idaho, where my grandmother spent her adolescence. I thought of her arriving home from an afternoon matinee to hear the radio blaring news about the bombing of Pearl Harbor. I remembered her recollection of the "strange situation" that was Minidoka. A gust of wind came up, and I thought about what it might be like to look towards my grandmother's hometown from the same place in a few years, with a skyline marred by spinning turbines. I tried to choke back the emotion in my voice as I replied, "My grandmother grew up here, and she didn't understand what was happening just a few miles from her home. I'm here to learn the things she never did." Kurt nodded quietly, directed our attention to the Frank Kitamoto quote above the visitor center door, and asked us to read it aloud together: "This is not just a Japanese American story but an American story with implications for the world." That was a key moment in my personal experience of Minidoka. It validated my resolve to learn and share all I can about its history, while advocating for its future preservation. I cannot imagine that moment unfolding in the same way, or impacting me as deeply as it did, if I had looked towards my grandmother's hometown to see dozens of turbines crowding the skyline. Approving the development of Lava Ridge would be a devastating footnote to the story Minidoka teaches us about American injustice, racial prejudice, and resilience. Wind energy development in and around the site would negatively impact my personal experience and connection to Minidoka National Historic Site, and that of the students I educate. For these reasons, I urge the BLM to take No Action on Magic Valley Energy's proposal.
12107-1	Linda Bosserman	As a third-generation member of the Japanese American community whose parents, grandparents, aunts, uncles, cousins, family members, and friends were incarcerated in the Minidoka Concentration Camp during World War II, even though they were US Citizens, this proposal is an affront to our sensibilities! This proposal to build the 76,000-acre Lava Ridge Wind Farm project near the Minidoka historic site should not be favorably considered by anyone, especially the BLM.

Comment ID	Sender	Public Comment
		Instead, your agency should be communicating with another agency in your family, namely the National Park Service, which included Minidoka in the National Register of Historic Places on July 10, 1979, to preserve the rich history of this important site! We should be making this site easily accessible to citizens, visitors, historians, and students to learn and be educated about this period of time in US history. The decisions stripped away the constitutional rights of US citizens and their immigrant parents, who were legally denied even the possibility of citizenship. This makes the legacy of those decisions that created Minidoka still relevant today! Members of our community, as American Citizens, worked hard to get Minidoka established as a National Historic Site to safeguard it for future generations to learn from this shameful time in American history. If we don't preserve these historic sites and teach future generations about our mistakes, we will be doomed to repeat them again and again. The legacy of what the Japanese Americans who were incarcerated endured is to teach our Nation how to value those that look different. The incarcerated Japanese Americans made the deserts bloom. From behind barbed wire, they sent their sons to join the Army's 442nd Regimental Combat Team of WWII, which became the most highly decorated unit for its size in the history of the US Army — so much so they were nicknamed the Purple Heart Brigade and became Congressional Gold Medal winners in 2011. All this while their families were incarcerated and their rights and livelihoods destroyed. Erasing the desolate landscape surrounding Minidoka that was key to its selection as an internment camp location, as exemplified by the mantra used by realtors …. location, location, location ... contributes to erasing its memory and explicitly the experience of being there, in the middle of nowhere. A 76,000-acre Wind Farm that will not benefit society as much as preserving Minidoka with its visual and experiential effect will! The BLM has a vast inventory of acres of land that it can select from for placement of this Wind Farm … near Minidoka where it will change the landscape is not one of them! I urge you to reject the proposed Lava Ridge Wind Farm project! The wind farm construction would be a disrespectful slap in the face to Japanese Americans and their descendants. It would send the message that the government does not care about the inhumane conditions, pain, and suffering that 13,000 innocent men, women, and children endured for four (4) years at Minidoka. The project would devastate the aura of the Minidoka Internment Camp, one of our Nation's National Historic Sites. The turbines would be visible from the camp. Moreover, the noise and vibration would disrupt the peace and tranquility of this site — a sacred place of memory and healing for Japanese Americans and their families. Instead, it is a place to learn from our mistakes and build a more just and equitable society.
12127-1	Tom Yaguchi	They did this while their families were incarcerated at home behind barbed wire in camps like the Minidoka Camp. The Minidoka Camp, and what is left of the other internment camps are a reminder of what should never happen again in this country. The Minidoka Camp is a National Historic Site, to be honored and respected. The BLM Lava Ridge Wind Farm Project does the exact opposite: it desecrates, it dishonors and it disrespects all of what the 100th Battalion/442nd Regimental Combat Team/MIS fought for while their families were held prisoner behind barbed wire in camps such as the Minidoka Camp. NO TO BLM LAVA RIDGE PROJECT! OPTION A - TAKE NO ACTION!
12136-5	Diane Honda	I urge you to recommend/select DEIS Alternative A and to reject the installation of wind towers in this area based on their impact on the Minidoka NHS, camp survivors/descendants, Native Americans, local residents, and area wildlife. I hope my children, future grandchildren and I can visit the Minidoka historic site and take in the healing experience it provides, today, tomorrow and in perpetuity.
12139-2	Jonathan Narita	It is not the place. Move the project elsewhere.
12143-1	David Brown	I want to voice my opposition to the wind farm proposal on the Minidoka site. I am married to a woman who is 25% Japanese and I have been introduced to the injustices to our Japanese American citizens in the Second World War. I also know people who were incarcerated in Minidoka's concentration camp. I have visited the site on three different occasions and feel that a wind farm would desecrate this memorial to an American tragedy. I voice my opposition to the Minidoka wind farm as proposed.
12146-1	Linda Tamura	Hello. I'm a Sansei, 3rd generation Japanese American. My mother, Chizuna Noji Tamura and her family from Hood River, Oregon - as well as other relatives and friends - were incarcerated at Minidoka after their transfer from Tule Lake during World War II. My father, Harry Tamura, volunteered to serve in our country's armed forces seven days after Pearl Harbor was bombed. I have visited Minidoka a number of times – most memorably with my sister and family from California and have presented and participated in several pilgrimages and programs. Those visits to Minidoka have special meaning for our family because the pilgrimages were times when Nisei and their descendants began openly sharing their horrid past. It has taken years for many Japanese Americans to even acknowledge how they were mistreated by their neighbors, former friends and even by our own government. Psychologists even equate their responses with PTSD (post-traumatic stress disorder). So now learning that the proposed Lava Ridge project would be placed nearby seems to blatantly minimize the impact of this historic site. While I support wind turbines and efforts to provide alternate energy sources, these huge towers will produce noise and visibly detract from the memorial experience of the Minidoka National Historic Site. Our own government admitted in its formal apology in 1988 (Civil Liberties Act of 1988) that the incarceration of Japanese Americans was a grave injustice, motivated by racial prejudice, war hysteria and a failure of political leadership. Placing the Lava Ridge Wind Project nearby denigrates that apology and the memorial to our past. Please discontinue this project and find a reasonable alternative.
12159-3	Marie Matsuno, Dan Sakura	My mom and dad met before World War II. My dad was Japanese American and born in Hawaii. My mom was Aleut. She was born in a village in western Alaska. Before the War, my parents lived in the native village of Ugashik on Bristol Bay. When the government came to take my dad away after Pearl Harbor, my mom decided to go with him, rather than living alone in the village. I was born in Minidoka. There were other Alaska Native people in Minidoka, such as Sam Kito's mother and her family. During the war, my dad, Fred Rock Matsuno, joined the Japanese American 442nd Regimental Combat Team, the most decorated unit of any kind during World War II. I am proud of his military service and hundreds of others like him who joined the military. After we left when I was two, we were able to return to Ugashik, our home village. While we were in camp, our home was taken by others, and to this day I do not know which house that was. After returning to the village, my mom and dad started to rebuild their lives. My parents rarely talked about being incarcerated. For many years, I felt uncomfortable as though I had done something wrong, but perhaps it was that people did not know how to treat us after our home and belongings were taken during the War. Our parents hardly talked about the experience, and we did not know enough to ask questions. Because our village did not have a school, my parents sent my brother (age 12) and me when I was nine to boarding school in Haines, Alaska, which was 1,000 miles away. While we were very homesick for 9 months of year, we were happy to go home in the summer to fish. In 1988, I was grateful that my former boss, Senator Ted Stevens, invited me to attend the bill signing of the Civil Liberties Act in the Department of the Interior auditorium. Senator Stevens was a great man. He had a strong sense of justice. He cared deeply about the experience of the Japanese Americans in Alaska and the relocation of the Aleut people to Southeast Alaska during the war. I am very pleased that the government has recognized the importance of both the Japanese American and Aleut relocations. We are a great nation. And a great nation acknowledges its mistakes. Many years after the bill signing, a longtime friend in Washington state knew about my birth in Minidoka. She offered to drive me to the Pilgrimage. She had an interest because of a family connection. I was happy we went because I wanted to see it for myself. It was an opportunity to meet other people and to hear what camp was like for them. It was wonderful to meet one lady who had been born in camp like I was. The Pilgrimages mean a great deal to people like me since I saw and heard firsthand what life was like for our families at Minidoka. The Pilgrimages are so helpful that I try to make a donation to support seniors who wish to visit. I was also very proud to see our dad's name on the Minidoka Honor Roll. Growing up, I don't recall seeing his Purple Heart or other medals nor did he discuss them or his time in the Army. And even later, I attended the Congressional Gold Medal program in Washington, D.C. and accepted a replica on his behalf. I strongly support the work of the National Park Service to preserve Minidoka's fundamental resources and values unimpaired for the benefit of future generations. I encourage BLM to adopt the No Action Alternative and begin a public planning process for the ACEC.

Comment ID	Sender	Public Comment
12176-2	Julie Boraks	I am totally against the Lava Ridge Windmill project.
12183-1	Russell Davis	Her family was not incarcerated in the Minidoka Hunt Camp but were fortunate to have been long time residents of Jerome County and were able to purchase a farm which just happened to be in the future camp area. Many of her family's friends were people who decided to remain in this area after the camp closed. It is an affront to those people to have this project built so close to the area that holds so much significance to them and to the remembrance of such an embarrassing time in the history of our country. A time which should not be forgotten.
12185-1	Wanda Yamagata	My family was not incarcerated in the Minidoka Hunt Camp but were fortunate to have been long time residents of Jerome County and were able to purchase a farm which just happened to be in the future camp area. Many of our family friends were people who decided to remain in this area after the camp closed. It is an affront to those people to have this project built so close to the area that holds so much significance to them and to the remembrance of such an embarrassing time in the history of our country. A time which should not be forgotten.
12192-1	Terri and James Walker	Secondly, but even more important is the destruction of a valuable piece of history. The internment of the Japanese is a blemish to the US Government. Keeping these monuments alive will help to remind future Americans the grave injustice that was done and hopefully not be done again.
12241-2	Joe Abo	I believe alternative A, no action, is the best plan to maintain as much of the 1942 viewshed as possible.
12287-1	Aura Sunada Newlin	As a member of the Japanese American Confinement Sites Consortium, the Heart Mountain Wyoming Foundation is joining the supporters of the Minidoka National Historic Site in Idaho to call for the selection of Alternative A: No Action in the case of the proposed Lava Ridge Wind Project in Southern Idaho. Our foundation represents former incarcerees at the Heart Mountain concentration camp for Japanese Americans during World War II. We operate a museum and educational organization that teaches Americans about the historic wrong perpetrated against 125,000 people of Japanese descent, two-thirds of them U.S. citizens, during World War II. Part of the experience for visitors at Heart Mountain is to take in the remoteness and isolation of being incarcerated in locations away from the West Coast. That is a key part of the experience for visitors to the Minidoka National Historic Site, and that experience will be endangered by the approval of the Lava Ridge Wind Project. The location of hundreds of industrial wind turbines around the Minidoka site will destroy the area's viewshed and the immersive feeling of isolation that is critical to depicting the incarceration experience at Minidoka. That is why we join the Friends of Minidoka, the Minidoka National Historic Site and the Minidoka Pilgrimage Planning Committee in calling for Alternative A: No Action.
12357-1	Jan Boles	I am a member, an ally, of the Friends of Minidoka. I have resided and worked in Idaho more than 60 years, all that time a friend and colleague of Japanese Americans whose lives were directly impacted by Executive Order 9066. I have come to feel a deep emotional bond with those dear people in my life. As a member/ally of FOM, I endorse and second their position in opposition to the proposed Lava Ridge Wind Project: "No action." As a professional photographer/visual artist who has been documenting the Minidoka NHS since the early 2000s, when I visit the site (my wife and I were last there on April 15, 2023) I visit a shrine. I visit a hallowed memorial to the more than 9,000 Japanese Americans incarcerated there during World War II. Today I visualize those 340 proposed wind towers that were diagrammed in the BLM DEIS, clearly delineated on 114 degrees of arc, nearly one third of the horizon, juxtaposed behind key components of the NHS. Those proposed towers would dishonor the purpose and spirit of the Minidoka National Historic Site. For these reasons I say please, take "No action."
12374-1	Douglas Wilson	Please recognize the vital importance of their concern for the Minidoka Historical site and discontinue all actions you intend to approve placing the wind farm that will cause Japanese Americans to again feel that their government that incarcerated them is still determined to treat them as nothing but a bunch of tourists and again being in the way of a for-profit enterprise. My friendsI have taught me a lesson in compassion and empathy. Please join me in stopping this discretion of the Minidoka Historical site.
12420-1	Sheila Omoto	My mother, an American born citizen, spent her teen years at the Minidoka Concentration Camp. We MUST keep the land a sacred and somber place to honor those that lived through this unjust incarceration for future generations (for ALL people, not just Japanese Americans) to learn, reflect and act justly against discrimination. Minidoka Historic Site is NOT a tourist destination for my family and others like me. It is not a tourist destination for all visitors. When we walk this land it is profoundly moving and to have a wind farm adjacent to it would ruin the experience. BLM has not taken this into consideration in the environmental impact study - it is more than the environment but it is a human impact.
12434-1	Gloria Kawabori	I am a Japanese American who was born in a Japanese Concentration Camp, called Topaz, in the state of Utah. My mother was an American citizen like two thirds of the approximately 120,000 people sent to these ten internment camps which were situated in desolate desert areas across our country. My best friend, Teiko, was born in the Minidoka Camp. Her mother was an American citizen as well, and died in this camp when my friend was only one year old. Teiko visited Minidoka as an adult and went on several pilgrimage trips to the place of her birth. Each time she went to Minidoka, it was an emotional experience allowing her to think deeply about the injustice of the incarceration and the death of her mother. She knew her mother might have lived if she received good medical care and medicines which were not available in the camp. Her pilgrimages to Minidoka helped her to think, heal, and reflect. After her last trip to Minidoka, my best friend was distraught to learn about the Lava Ridge Wind Project which would place wind turbines near this place which has become sacred to her. It is incredible to think that many wind powered generators, taller than our Seattle Space Needle, would be imposed on and/or near this historic site. I strongly urge you NOT to build the wind farm at or near the Minidoka National Historic Site. Minidoka is a reminder not only of a place to heal and reflect, but also to remind us that racism and injustice acts toward any of our citizens is not to be tolerated in our country.

12438-1	Beth Kawahara	This is to register a plea for a "No Action" decision on the Lava Ridge Wind Project proposed near the Minidoka National Historic site. As much as I support renewable energy the location of this proposal is critically important as well. I lived in the barracks of Minidoka from 1942 to 1945. My family and I survived the extreme hardships of the entire ordeal---the discrimination, the upheaval of the move from Seattle to Puyallup to Minidoka, finding a safe place to store our household goods with hopes that they wouldn't be plundered and stolen. We survived the harsh conditions of camp, with the meager rations, with the lack of privacy, with the brutal winters, with the dust penetrating through the misaligned windows and doors, the walks to the mess hall three times a day on the shoe-sucking, mud pathways as the rain turned the dirt into mud. I remember the numerous conversations, sometimes with tears, but always with a worried look, my parents had as each new crisis came up in the camp. I remember when my dad was buried in effigy, complete with a cross on his grave, when a proposal he was supporting was very unpopular with a segment of the camp parents. So yes, life was very difficult in camp. I have attended two pilgrimages back to Minidoka, and yes, after the initial reality of the experience after seeing the barrack, the one room that five of us lived in for three years, I found it very healing to be back there, reminisce where the schools were, the medical center, canal, the swimming hole, and to listen to the various speakers, to share with others who were also in camp, and to realize that we all survived this horrible upheaval. By installing this huge project on the grounds that bear so much history, and has brought healing to me and many of my generation who had to live through this terrible injustice, it would be a continuation of the original assault.
12442-1	Isamu Kawabori	I am a Japanese American who was interned at the age of two, not in Minidoka but in another internment camp, also located in a God-forsaken desert in the middle of nowhere, Poston, Arizona. The choice of these locations was purposeful by the United States Government. I believe that it is important to preserve the isolation of Minidoka NHS so Americans of any ethnicity who may visit can also feel the impact of the isolation, the dry desolate terrain, and the mountains in the distance. We must preserve this site, and the sight lines, intact. Why? Because we must not repeat our mistakes in the future. We must learn from our past mistakes. Leave the Minidoka NHS and its surrounds natural as a historical site and also respect the Native American grounds as well. This is not the only place a wind power facility can be built. Wind powered generators seven stories tall imposing themselves on and/or near a historic site where the internees felt the isolation and saw desert as far as the eye can see, and the proposal is to put hundreds of wind generators as far as the eye can see? Racism was a part of the reason for internment. For the sake of renewable energy we are considering trashing the Minidoka NHS and disrespecting the cultural sites of Native Americans? I believe we are better than this. This wind farm should not be built here.
12451-1	Ron Sakura	I visited the site back in 2016 and it was quite a solemn experience. It was quiet with a slight breeze and somewhat peaceful. It would have been hard to imagine what my father's family experienced if there were a bunch of oversized wind turbines humming in the background and visible to the horizon. My father was the oldest son of 10 siblings and the entire family and associated members spent most of the war behind barb-wire at Minidoka. My dad and his three brothers were the first Japanese Americans to volunteer for military service on the mainland. Against much sentiment against the violation of their rights of due process as Americans and Anti-Japanese feelings across the entire nation. Two of my uncles served in the Military Intelligence Service (MIS) during the war with their wives and children also at Minidoka. My dad "Kenny" died in 1989 just a year after the Redress Act was passed in congress, which awarded survivors of internment an apology and twenty thousand dollars as compensation. He was one of the older Nisei at Minidoka and was in his 40's at the time. Many Nisei (2nd Generation) people that survived the war did not really care about the money but they did care about the apology that the US government bestowed them 40 something years later. Redress was pushed through congress not by Nisei but by Sansei (3rd Gen) my generation. Those were hard years for most Japanese Americans and it took a very great toll on their emotions and psyche. It took my father around 40 years to come to terms with what happened and Redress was the final chapter, putting an end to his anguish. World War II was hard for all Americans. Imagine if a corporation wanted to put a wind farm next to the cemetery of your fallen relatives. I think you would think this is quite disrespectful of the dead who sacrificed for this country. Minidoka National Historic Site is a symbol and tribute to those who were forced to sacrifice their freedom, self esteem and did their patriotic duty serving in uniform and behind barbed wire. I hope you sincerely consider this fact when deciding to put a wind farm in the backdrop of a national historic site. If you consider this okay you may as well put one on the rim of the Grand Canyon or any other national park or monument.
12454-1	John MacMillan, Kathy MacMillan	We are vehemently opposed to this because it negatively impacts the Minidoka National Historic Site. This has been identified by the National Park Service as an important and critical area to preserve and protect for its historical significance to the country, Idaho and specifically to all Japanese Americans. We personally have had a close friendship with a Hunt Internment Camp survivor. We have always celebrated her strength and fortitude despite this childhood experience. Other survivors and future generations should not see the Minidoka National Historic Site suffer an additional insult and disgrace to themselves as individuals and a culture within the United States.
12456-1	Karena Youtz	This project should not be built. Please choose "NO ACTION." The proximity of Minidoka historical site requires that the land remain as close to its state during the time of the camp. If this project were pursued, it would dishonor history and loss. There is nothing that could mitigate the wind project's impacts in this location. Please have them choose another area in the vast Idaho desert lands. I am interested in this because a person very close to me was incarcerated there. To me, even proposing the wind project is disrespectful and cold, without basic humanity.
12464-1	Rita Takahashi	I am opposed to the construction and maintenance of wind turbines in and around the areas that were once the Minidoka War Relocation Authority camp. The area is of great historical significance, and those affected by the U.S. Government's exclusion and incarceration orders are opposed to developments (including wind turbines) that infringe upon and alter the original grounds. I ask that BLM take the right course by respecting and honoring what the area represents to so many. I urge the adoption of Alternative A, as specified in BLM's impact statement: "Alternative A – No Action, in which the BLM would not authorize construction, operation and maintenance, and decommissioning of the project." Your affirmative action in adopting Alternative A will be valued and appreciated.
12467-1	Charlotte Garrido; Robert Gelder, Edward Wolfe, Dana Daniels; Kitsap County Board of Commissioners	NOW THEREFORE, THE BOARD OF COMMISSIONERS, KITSAP COUNTY, WASHINGTON DOES RESOLVE AS FOLLOWS: Section 1. Kitsap County supports the Department of the Interior's funding increase for Minidoka in the Department's budget request to Congress and supports the reauthorization and renewed funding of the JACS grant program. Section 2. Kitsap County supports the work of the National Park Service to protect Minidoka's integrity, fundamental resources and values for the benefit of future generations. Section 3. Kitsap County also encourages the BLM to engage with members of the Bainbridge Island community during the compliance process for the National Environmental Policy Act and Section 106 of the National Historic Preservation Act. Section 4. Kitsap County respectfully requests Washington State's Congressional leaders to work with their colleagues in Congress and with the U.S. Department of the Interior to permanently protect Minidoka National Historic Site from activities on nearby BLM lands that would impair the fundamental resources and values of the park. Section 5. Kitsap County will transmit this resolution to its Congressional Delegation for their use and transmittal to appropriate federal agencies.
12473-1	Tilman Smith	Over the past ten years, I have had the deep privilege of attending the annual Minidoka National Historic Site Pilgrimage many times. As a white American who grew up just after World War II, these experiences have been invaluable to my understanding of American, and especially Pacific Northwest history and culture. What a treasure to all of us to have a living museum that captures and honors the real-life stories of unjustly incarcerated Japanese Americans, as well as the generational impact of the incarceration their families and communities. I am asking you to please prioritize protecting this history for all of us and do NOT move forward with the Lava Ridge Wind Project. One of the most powerful and educational experiences of being on the grounds of Minidoka is actually feeling the isolation of the site. The expansive and desolate landscape brings home the reality of how far away these families were from everything they knew, and how much resilience it took for them to survive such a horrifying ordeal. Please don't erase this history by undermining the integrity of this site and destroying the viewshed that helps us understand the experiences of those incarcerated.

Comment ID	Sender	Public Comment
		I am deeply concerned that by surrounding this sacred site with huge wind towers, along with the immense foot and vehicle traffic that goes with them, that Minidoka will be reduced to a small entertainment park, when in fact it needs to be held as a revered monument to the lessons that we must learn as a country. Not only do we owe it to those incarcerated and their families to maintain this site as it has always stood, but we owe it to all of us to protect this site as the national museum that it is. I am imploring you to enact the NO ACTION alternative; to protect the Minidoka National Historic Park and find an alternate location for the Lava Ridge Wind Project. We must protect this most precious of national monuments for all the generations to come who deserve to fully experience and embrace this critical part of United States history!
12476-3	Rebecca Kenison	I grew up on Bainbridge Island in the 1960s. All of the American citizens of Japanese descent who lived on the Island were incarcerated in Minidoka during WWII. Actually, all of them except the young Japanese-American men who served the United States in our military. I knew many Bainbridge Islanders of Japanese descent who were incarcerated. They lost their homes; they lost their businesses; their lives were upended, never to totally return to normal. The Minidoka National Historic Site has deep historical significance for all of us but particularly for American citizens of Japanese descent. Minidoka provides those who were incarcerated there and their children and grandchildren a place for reflection and healing. The Department's Environmental Impact Statement does not adequately protect the importance of Minidoka and the land surrounding it. American citizens were sent to the middle of nowhere; to construct their own living quarters, their own school, to provide for themselves. They were isolated. That overwhelming sense of isolation and somberness at Minidoka should remain since it is an important aspect of this historic site. DEIS fails to consider that the intense somberness associated with Minidoka is an important part of place, of the history of U.S. citizens incarcerated without trial. [...] To maintain the integrity of the site of Minidoka, its viewshed should not be impacted. Even a "moderate" amount of visual change is significant. Locating turbines on the lands surrounding the Minidoka would amount to an irrevocable and harmful change. [...] I trust respect will be shown to our American citizens of Japanese descent by allowing the Minidoka National Historic Site and land surrounding it to be preserved as a place of reflection and healing without the distraction of turbines in its site lines. And, for the rest of us, that we can learn our history lessons and feel the history of Minidoka deeply without the distraction of turbines in its site lines.
12508-1	Geraldine Shu	When 32 members of our family went on the Minidoka pilgrimage nearly 14 years ago, my aunts & uncles who had been incarcerated there were visiting for the first time in 60 years. It was only vaguely recognizable to them because it was much more lush than they remembered due to subsequent plantings & added irrigation. Recent reconstruction of former structures has been helpful in recreating a more representative version of what Minidoka was like back then. However, future addition of numerous wind turbines to the nearby landscape would be a misconception of the original starkness & desolation that they had endured, giving future visitors & pilgrims the impression that their imprisonment was much more agreeable than it actually was. I do appreciate the need for alternate energy resources but please consider the impact of your choice on Minidoka's historical role in the obstruction of civil liberties. No action or Plan E options in regards to the Lava Ridge project would be preferred.
12528-1	Fred Sakura	I have visited the Minidoka site many times since in 1971 and attended what I believe may have been the first Minidoka Pilgrimage. Minidoka has a very special spiritual meaning to me. Before the war my parents lived in the Eatonville Lumber Company's housing near Mount Rainier in Washington State where my father worked as a dry kiln foreman. His three brothers also worked at the mill. In addition to the spouse and children of my dad's older brother, his younger sister and his widowed mother also lived there. It was a happy vibrant Nikkei community as many of the several hundred workers were Japanese American. Soon after the President signed Executive Order 9066 in February 1942, the owner of the mill was forced to sell his company to a competitor because half of his workforce and their families were forcibly removed and incarcerated in the Assembly Center at the Western Washington Fairgrounds in Puyallup, Washington, then later to Minidoka in Idaho or Tule Lake near Newell California. My parents sold or gave away their new car, dog and belongings and were removed to a barbed wire enclosed temporary prison. There they were assigned to live in a horse stall near the men's toilet under the grandstand. After stuffing a sack with straw for her mattress my mother was terribly sick from the stress, smell, bad food and unsanitary conditions. Since there were no doctors, one had to be found in the local community. When the Doctor finally arrived and told my mother that her "illness" was she was pregnant with me, her only words were, "OH NO!" My parents would never tell us anything about the forced removal from their home and their experiences in Puyallup and the Minidoka concentration camp. Only later in my adult life as we did research for a family history book did we find that my paternal grandmother stood up to an angry crowd that was against Military recruitment in the "camps." Soon after, her four sons volunteered to serve in the military unbeknownst to each other, fulfilling their deceased father's instructions to join the American Army if there was ever a war with Japan. Minidoka life was difficult for the grandparents. Jobs were available for a few dollars a day if you were a citizen which none of the elders were. Family structure broke down. Children ate with their friends and many men went to work outside the camp in the Idaho sugar beet fields and then later left for the Army and the war. My father and uncles were in the Army with the MIS and the 442nd RCT in Europe with one uncle held as a prisoner of war by the Germans. There were rumors that some inmates might be sent to Japan in a prisoner exchange. With much uncertainty for her future my mother's mother who did not want to return to Japan hung herself using my diapers as a noose. She was so distraught she thought death was a better place than living in a tar paper shack in the middle of nowhere while being held a prisoner in a concentration camp when her only crime was looking like the enemy. Even to this day I know nothing about my grandmother who died so alone in Minidoka. None of her children would speak of her or what happened even after we found out where how she died. Her last surviving child still will not talk about her and only will say when asked, "it was so sad" and won't say anything more. When my mother and her father were allowed to leave Minidoka, they returned to the family farm in Woodinville, Washington where "friends" had been allowed to live. After the "friends" were finally convinced to leave the house, my mother said she shoveled trash out the windows because the house was so full of it. Family friends, Floyd Schmoe of the American Friends Service Committee and students from the University of Washington helped grandpa prepare the fields to plant crop seeds before his sons came home from the war. Rev. Emery Andrews, pastor of the Japanese Baptist Church would drive grandpa's truck laden with lettuce to sell at the "wholesale house" in Seattle because if grandpa drove his truck Dave Beck and his Teamsters would not allow the produce of the "Japs" to be unloaded and sold. Now that I'm an Octogenarian, I have tried to leave all the unfortunate anti Japanese and racist rhetoric behind me. But when I see that the Lava Ridge project intends to place a giant Windmill in the footprint of my birthplace, the Minidoka National Historical Site, I wonder if it is another example of an effort to minimize the history and experience of the Japanese American community. Is it another of many efforts by some to minimize the contributions of the Native, minority and immigrant communities in America? The Lava Ridge project would completely destroy the character and change the ecosystem of the site and surrounding area. It would seriously degrade the experience of anyone visiting the Minidoka Historical Site and probably depress the number of visitors learning about the unfortunate decisions to remove and incarcerate nearly 130,000 innocent American citizens and their parents during WWII costing the taxpayers billions of dollars because of racial hysteria promoted by some for political advantage and by others to sell more newspapers. Minidoka is hallowed and sad spiritual place to me. When I visit Minidoka as I often do and walk along the barbed wire fence, examine the old barracks and gaze at the view from the visitor center I cannot help to wistfully think of my grandmother who was so distraught with her situation in life as a prisoner in Minidoka that she decided to end it. When I bring my young grandson to Minidoka for the first time to visit his great grandmother's sprit, what will he experience at the place I spent the first three years of my life? The place where my mother and grandmother washed my dirty diapers by hand in (often) cold water, trudged a long distance in deep mud in winter and swirling dust in summer to take a shower and use the toilet with no privacy. Where they had to haul coal (when it was available) in a bucket to try to keep our barracks warm in the sub freezing winters. Will he notice the dry scrub volcanic high desert BLM land reclaimed into idlic farmlands next to an irrigation canal? Or will his experience be spoiled by a giant spinning, noisy and bird killing wind turbine in his face and hundreds of them stretching as far as he can see? Because of the cumulative effects of this and other wind projects in the vicinity the only option for the Lava Ridge project is No Action (Alternative A) and to support the proposed Minidoka Area of Critical Environmental concern.
12538-1	Clarke Kido	Let me begin by saying that I strongly oppose the proposed Lava Ridge Wind Farm because it would drastically alter the visitor cultural experience and remoteness of the Minidoka National Historic Site. · The general public might not be aware that the Minidoka Site is sacred land to the persons of Japanese Ancestry who were incarcerated during WWII. · My parents, grandparents and over 20 family members endured 3 years of substandard living conditions at the Minidoka War Relocation Center.

Comment ID	Sender	Public Comment
		· My father was allowed to leave Minidoka to serve in the U.S. Army 442 Regimental Combat Team. His name is listed on the Minidoka Honor Roll. · I have visited the Minidoka National Historic Site many times and attended several Pilgrimages and public presentations. I have exchanged family stories with survivors and descendants from Minidoka and other incarceration sites. · On the basis of these experiences and related research, I submitted my opposition comments on October 19, 2021 and June 30, 2022. I participated during the public comment period of the zoom meeting held on August 22, 2022
12559-2	Tammy Duncan	the Lava Ridge Windmill project should NOT be approved. It will significantly impact a site of historial signifigance for Americans. It goes against our own national mandate of Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders.
12574-1	Jan Yamaguchi	In this age of growing movements to attempt to erase the ugly rascist chapters in our nation's history, please don't let the Minidoka National Historic Site be a casualty of that effort! As we all should know, we must continue to learn from our past mistakes, or we will be doomed to repeat them in the future. And to dismiss those who have made the pilgrimage to the site for healing and reflection as "tourists and recreationalists" is insensitive and wrong. The site is a distinct symbol and reminder of how thousands of Japanese Americans during WWII were cruelly uprooted from their homes and businesses, families broken apart in many instances, that we must never forget...
12645-1	Tika Bean	The impingement of the Lava Ridge Wind Farm Project on the Minidoka National Historic Site is yet another insult to Japanese Americans (living and dead). The Minidoka National Historic Site holds special meaning for many incarcerees who are still alive The construction of a wind farm on this important historical site is belittling, insulting, and betrays the significance of the Japanese American story. It also diminishes the struggle to find solutions and answers to the racism, violence, incarceration, and hate that still exists today in America.. The noise and the presence of grotesquely tall, untested, 400 wind turbines would seriously impinge and diminish the important work, both cultural and historical, from being successfully executed by the educational staff at the Minidoka National Historic Site.
12652-1	Peregrin Spielholz	I disagree with the Lava Ridge wind project proposal and Draft Environmental Impact Statement. The impact does not identify that this project would cause a degradation of resources and is at best culturally incompetent, and at worst is racist. Members of my community continue the healing process each day from the incarceration of Americans at Minidoka. My friends who visit are not tourists and are not there for recreation. They are there to heal. Impacting the greater site by placing wind turbines or placing them within the visual field of the site would significantly damage this critical place. It is important to our greater community and country that this place is preserved in its current state as a place of remembrance so that we can continue to learn, heal and make sure that this never happens again.
12657-1	Tony Mazzella	Revisit this project's footprint to insulate the commemorative legacy of illegal and immortal incarceration of our fellow Americans.
12671-2	Sarah Suzuki	In conclusion, the Lava Ridge Wind Project, as currently proposed, would have significant adverse effects on the Minidoka National Historic Site and its visitors. I urge the BLM to carefully consider the points raised in this letter and work towards a solution that respects the site's importance for the Japanese American community, the survivors, and the broader public in understanding and learning from this dark chapter of our nation's history.
12676-1	Steve Justus	In my opinion, Wind Turbines in and near the Minidoka National Historic site would in so many ways be an insult to the suffering of the thousands that were held prisoner there and their descendants. The site should be maintained as it was when it was operational.
12684-1	Monique Jong	The impingement of the Lava Ridge Wind Farm Project on the Minidoka National Historic Site is yet another insult to Japanese Americans (living and dead). To have been exiled from our homes and imprisoned in concentration camps was horror enough. Now that we have been allowed to return to attend pilgrimages at Minidoka, many have begun an unexpected process of healing through memory, tears, and quiet reflection. The Minidoka National Historic Site holds special meaning for many incarcerees who are still alive in my family: I, who was born in the Minidoka hospital in 1944; my relatives who held Buddhist funeral rites for my second cousin, Sgt. Frank Hachiya; the children of my brother, Paul Hiroaki Morita who was drafted into the army from Minidoka, my brothers, Mototsusgu Morita Jr, and Claude Goro Morita, who went to school in Minidoka, and my brother, Claude, who delivered telegrams to sorrowful mothers in Minidoka. The construction of a wind farm on this important historical site is belittling, insulting, and betrays the significance of the Japanese American story. It also diminishes our struggle to find solutions and answers to the racism, violence, incarceration, and hate that still exists today in America.. The noise and the presence of grotesquely tall, untested, 400 wind turbines would seriously impinge and diminish the important work, both cultural and historical, from being successfully executed by the educational staff at the Minidoka National Historic Site. The presence of ugly wind turbines on this site would surely evoke deep resentment where it is not intended. The Lava Ridge Project, if implemented, will become a permanent reminder of the persecution and the will of the government to further pervert our lives by allowing LS Power to scar the land where we once toiled, cried, and shared memories and stories.
12692-1	Juliane Shibata	I ask you to consider the historical significance of Minidoka National Historic Site and be respectful of those who were relocated there, as well as their descendants. I strongly feel that the Minidoka site should be preserved. Talks with individuals and allies in the Japanese American community should continue to work out a solution.
12812-1	Steve Evans	As regards the proposed Lava Ridge project, I am very concerned about its negative impact upon the Minidoka Historic Site and the surrounding important historical lands. Should these areas be overtaken by this massive commercial enterprise, they will never be retaken. Also, the land itself is an important part of our state's native landscape, and it will be irreparably harmed by this project. For these reasons, I am opposed to the granting of permission for this project to be constructed.
12824-1	Janice Abe	Our first visit to Minidoka was in the early 1990's with our 3 young children. We wanted to experience with our kids the place that severely impacted our grandparents and parents We almost didn't find the site as there were no signs or markers anywhere. We stopped to talk with several Twin Falls residents who had little or no knowledge of Minidoka. After driving through a dry, deserted and very remote area, we spotted a small sign indicating the location of the internment camp. All that was present at that time were remnants of what we guessed was the entrance guard house, lots of tumbleweeds and the creek that swiftly ran through the area. That experience impressed upon us how solemn, lonely and desolate the area was that was home to tens of thousands Japanese-Americans during WWII. The next time we visited the site was in 2017 when we attended a Minidoka pilgrimage. We were glad to learn that the site was currently being maintained by the U.S.National Park Service and that it was designated as a National Historic Site. As we toured the camp, its ominous guard tower, the restored buildings and structures, the Minidoka Honor Roll and the historical captions, it was apparent how important it is to protect and preserve this site and its surrounding land. Visiting Minidoka is an educational and immersive experience which makes clear the devastating and harmful effects of prejudice, racism and injustice. Minidoka in its present state is a place of healing and refection for all who were interned and their descendants. The presence of huge wind turbines will negate those feelings of somberness, isolation and loneliness that enhance one's experience and understanding of the Japanese-American Internment. It is critical that one experience the physical remoteness and emotional distance from all that is normal to truly acknowledge the extreme courage and perseverance of our ancestors. In the future, we hope to take several members of our extended family back to the Minidoka site so they too can personally contemplate and reflect on what life was like for their ancestors during their internment. Please do not destroy or detract from that experience for future generations.
12826-1	Clarence Moriwaki: Bainbridge Island City Council	NOW THEREFORE, THE CITY COUNCIL OF THE CITY OF BAINBRIDGE ISLAND DOES RESOLVE AS FOLLOWS: Section 1. The City of Bainbridge Island supports the Department of the Interior's implementation of President Biden's day one executive order to advance racial justice by including a funding increase for Minidoka in the Department's budget request to Congress and supports the reauthorization and renewed funding of the JACS grant program.

Comment ID	Sender	Public Comment
		Section 2. The City of Bainbridge Island supports the work of the National Park Service to protect Minidoka's integrity and fundamental resources and values unimpaired for the benefit of future generations. The City supports protective measures on nearby BLM land to protect the park's immersive setting, views of distant mountains and sense of remoteness, feeling and association. Section 3. The City also encourages the BLM to engage with members of the Bainbridge Island community during the compliance process for the National Environmental Policy Act and Section 106 of the National Historic Preservation Act. Section 4. The City of Bainbridge Island respectfully requests the support of its elected officials in Congress to work to ensure that the Department of the Interior does not approve the Lava Ridge Wind Project in any way that will negatively affect the integrity and fundamental resources and values of Minidoka.
12852-1	Robert Hirai	The historical significance of Minidoka to my family is tremendous. It is a site of one of the most egregious acts enacted by the federal government -- a culmination of a long history of racist and discriminatory treatment of Asians and their descendents. The Minidoka National Historic Site and Visitors Center is vital to the education and awareness of generations to come. It is a place that promotes the connecting of generations, the healing of emotional wounds, and the learning of an important piece of Idaho/US history. It is the site of an injustice that should never happen again. This is sacred ground. One thousand young men from Minidoka volunteered to fight for the very country that imprisoned their families. Some were part of the famed 442nd regimental combat team - the most highly decorated unit of its size in military history. Seventy three of these men never came home. One hundred ninety three people died at Minidoka during their incarceration -- far away from their homes, their friends, their neighbors, their American dream. The building of a wind farm in such close proximity would dishonor the sacrifices made by my mother and all those who were incarcerated at Minidoka. I urge the Bureau of Land Management to consider an alternative site for this project. The protection of all historical sites is of significant importance to future generations. One question: Would this project even be considered if the property in question were Gettysburg or Mount Vernon? I think not. "No Action" on the Lava Ridge Wind Project
12877-3	Emily Yoshioka	Given my and my community's concerns regarding the Lava Ridge wind project, I support Alternative A (No action). I believe this is the only choice that protects, preserves, and respects the Minidoka National Historic site for current and future generations.
12878-1	Karen Kawaguchi	As a Japanese American whose family was incarcerated at Minidoka during WW2, I strongly object to the Lava Ridge Wind Project, a commercial-scale wind energy facility of up to 400 turbines proposed to be constructed on approximately 84,000 acres of Federal, State and private land about 25 miles northeast of Twin Falls in south-central Idaho. This project would desecrate Minidoka and the memory of Japanese Americans who were incarcerated there. Find another location for this project.
12885-1	Chuck Roehrich	Regarding the proposal to put a wind farm on land on and around land where the Minidoka Japanese internment site - just don't do it. This is history. Would the Government consider desecrating the little bighorn battle site, or Bull run? No. The land, the scenery, the remoteness, the vegetation, the very debris on the ground are all part of the history. The places chosen for these internment camps were all out of the way, isolated locations and were purposely chosen to hide them from general public knowledge and sight because the government knew it was wrong. How could anyone think that entire families with children, grandmothers, careers, and some with generations of living here were somehow dangerous? No, people knew. And yet it was done. People who make the journey to visit these sites can walk around, see, hear, feel, contemplate, and in a small way know what it was like. The presence of the windmill towers would irreparably interfere with the experience. The ground itself makes it real. People can learn the history more directly than in any other way and decide that we should guard ourselves as a nation from ever doing anything like this again. There is immense value to this. Don't do it.
12928-1	Lois Saito	There is tremendous significance to the proposed site, Minidoka prison. My father's entire family was incarcerated at Minidoka. All of his siblings, including himself, were US citizens. The proposed wind farm site would be an insult to the Japanese Americans incarcerated there. The wind farm would be a visual eyesore for all who go to the Minidoka Visitors Center. It would detract from the feeling of being desolate, isolated, & a feeling of despair Minidoka is a National Historic Site. This shows the significance of this sacred site. I am not opposed to the wind farm project but it should be relocated to an alternative area. If the BLM's families had been imprisoned at Minidoka they too would be opposed to the wind farm location. There is always an environmental impact statement but consider the personal impact statement of the significance of Minidoka where 10,000, most of which, were US citizens were in prisoned. Please take into consideration the meaning of this sacred proposed site.
12960-1	Karen Hirai Olen	I am writing to oppose the Lava Ridge Wind Project. I urge you to select Alternative A. Three generations of my family were incarcerated at Minidoka National Historic Site. I was born in Minidoka and I am neither a visitor nor a tourist to the site. The construction and operation of the massive turbines will destroy the historic nature of solitude and serenity of a Site of Conscience and will further denigrate the 13,000 incarcarees and their descendants. The massive towers, the transmission towers, the overhead transmission lines, the shadow flicker, the noise destroy the viewshed and the solemnity of the site. These intrusions on the traditional sanctity of the site are an affront to the honor, the dignity and the suffering of all incarcerees and their descendants. Minidoka must be preserved as a traditional Historic property. The Lava Ridge project will cause irreversible and irretrievable damage to the Minidoka National Historic Site. It is my understanding that the proposed 740' tall, 3MW or 6MW turbines have not been built. This makes the data on the impact of the project speculative and/or extrapolated from other sites. The project area of 200K+ acres and an APE of 1.8 million+ acres must be developed and implemented with hard data. I have the following concerns: • The true effects of the construction phase • The true effects on the aquifer when the wells are drilled. • The true effect on all the other wells in the area • The true effect on the viewshed of the Minidoka National Historic Site. • The true effect on the current migration patterns of the wildlife, avian species, pollinators, bats • The true effect on the habitats of sage grouse, owls, raptors, pollinators. • The real death rates of the bald eagles, golden eagles, bats, pollinators. • The true noise levels and the effect on all wildlife, cattle, area residents and their pets. • The true effect of light flicker on all wildlife, cattle, crops, area residents and their pets. • The effects of the project on the four adjacent counties. • The true effect on prehistoric sites in the area.

Comment ID	Sender	Public Comment
		I think that this vast project has too many unknowns to be approved. I strongly urge you to select Alternative A as the only appropriate choice.
12961-1	Janet Baba	During World War II, I was imprisoned with over 120,000 people of Japanese heritage. My family of five lived at Minidoka and in Tule Lake, for a total of about 3 years. I"m asking for the Lava Ridge Wind Project be located elsewhere - than near the Minidoka National Historic Site. Please find another site for the Lava Ridge Wind Project, as I am deeply concerned about our environment. Please preserve our Minidoka Camp Site, away from an area of deep painful year for my family, and find another location for the Lava Ridge Wind Project. • Save Minidoka Camp Site • Build Lava Ridge Wind Project elsewhere – away from Minidoka camp site
12963-1	Larry Watson	consider myself a native Idahoan as I was born in and have lived in Idaho for eighty-one years. I have enjoyed and tried to be a good steward of our public lands. While the forested, federal lands of central and northern Idaho are beautiful and special, so are the public high desert lands of southern Idaho where the Lava Ridge Wind Project is proposed. I am totally opposed (100 percent) to the project for the following reasons: 1) the visual scape would be transformed forever; 2) the possible damage to the aquifer that we depend on for human and economic needs is too fragile; 3) the fragile ecosystem would transform to the point-of-no-return; and 4) the project would show disrespect the Japanese-Americans who were illegally interned there during World War II. Their history and painful legacy must be protected at all costs. For these reasons I do not support the Lava Ridge Wind Project.
12980-1	Kyoko Oda	I am writing today to express our concern regarding the proposed wind project in Minidoka, Idaho. As an organization that seeks to preserve historical sites, we strongly believe that this project be stopped immediately. There are several reasons why we are advocating for the cessation of this project: First of all, it will negatively impact the wildlife population in the area. There are · several endangered species that inhabit the region, and the construction of a wind farm would pose a serious threat to their habitats. Secondly, the wind project would also have a significant impact on tourism and local businesses. Many individuals visit this area for its historic area, and remember their ancestors living in one of America's Concentration Camp located in Minidoka, Idaho. The peaceful and natural surroundings would be greatly disturbed by the large wind turbines and would not only detract from its inherent beauty as a place once lived on by their ancestors, but also disturb descendants and visitors of Minidoka's historical home to a large population of Japanese Americans whose parents and grandparents suffered and survived in Minidoka. Their stories belong to the future generations who will visit their ancestors' home during WWII. Many of America's Concentration Camps have been given historic status. Recognition of such sites will serve as opportunities to educate future generations about the importance of protecting everyone's rights and freedom, especially in times of national crisis.
12981-1	Kayo Hayashida Ong	I am a survivor of 2-1/2 years behind barbed wire fences at Minidoka. It's a solemn place - a reminder of war hysteria, prejudice and hardship suffered by my family because my immigrant grandparents were born in Japan. Leaving home on Bainbridge Island, WA, and transplanted to southern Idaho we faced a desolate land - treeless, dusty and void of all but packed earth and rows of tar papered barracks. Return trips as an adult remind me that this is a unique place in our Country's history. The quiet, open spaces, dotted by a few restored buildings under open skies, allow for reflection and tears. Why? Why? Why would the BLM permit a monstrous wind farm to pollute the sky and disrupt the quietude so near to this special place to those of us of Japanese descent who worked to bring life to this land? Are we less worthy of our rights as in 1942? Why? Why would the BLM allow the constant 'whoop' 'whoop' noise of the turning arms pollute the quiet? Why choose this flat land when the wind would be more efficient on higher ground? Would a massive wind farm be considered for the Black Hills? for Yellowstone? or other place set aside for future generation to reflect on the history and import of these places? You are charged to consider the impact and lasting importance of your decision. There are several alternatives balancing economics and conservation away from this historic site. The Minidoka National Historic Site needs your decision to preserve this area as a solemn, reflective place for future generations.
F1-4		Construction of a wind project in this location could compromise Minidoka's ability to convey the setting in which Japanese Americans were imprisoned and degrade the park's ability to heal and ensure that this does not happen again. The federal government should not compound the damage it has already inflicted upon the Japanese American community at this site.
F5-1		Please stop this windmill project as it will destroy a national landmark that is important to preserve. We must preserve its purpose of honoring and remembering our past American ancestors that experienced incarceration wrongfully. We must also pass our story along to future generations. And this landmark is there to educate current and future generations in hopes of stopping future generations from repeating past atrocities.
F5-2		Please stop this windmill project as it will destroy a national landmark that is important to preserve. We must preserve its purpose of honoring and remembering our past American ancestors that experienced incarceration wrongfully. We must also pass our story along to future generations. And this landmark is there to educate current and future generations in hopes of stopping future generations from repeating past atrocities.

Air Quality

Table A-3a. Air Quality

Comment ID	Commenter	Public Comment	Response to Comment
11488-1	Lari Perron, Teresa Perron	One of the many problems with Lava Ridge is the amount of dust the miles and miles of new roads are going to create. If the ground is not covered with vegetation the wind blows the dust into the air something terrible. Will they be watering these roads often enough with the 40,000 truck loads of cement and numerous other vehicles that will be passing over them to keep the dust from the air? The 2023 Air Quality Report of the American Lung Association shows Idaho's air quality is harmful to health. This project will add to the overall problem and will be a huge impact to the health of the people in a large radius. Dust can travel many miles. What written guarantees are in place to make sure this problem is addressed and also what recourse is available if the construction companies are not abiding by the requirements? Will they be replanting along side the roads and towers to replenish the vegetation as quickly as possible? This is not only a problem during construction but the ground will continue to be blown around for years afterward because these dirt/gravel roads will need to be maintained.	See EIS Section 3.2.1.2.2 (Alternative B [Proposed Action], Alternative B with Additional Measures) and Section 2 (Project Construction and Emissions) of the project air quality technical report (SWCA 2022) for a list of mitigation measures to control fugitive dust emissions. MVE would finalize the project Dust and Emissions Control Plan, which would have to be approved by the BLM prior to construction. The draft Dust and Emissions and Control Plan is MVE (2023) Appendix O. The BLM would be responsible for enforcing the terms and conditions of the ROW authorization (throughout the life of the project), including mitigation measures for dust. The BLM would require MVE to do this, keep a log, and submit to the BLM on a regular basis. The log should also note any instance when watering was not conducted with an explanation.
11491-32	Dean Dimond, Jennie Bateman	21. Need State DEQ air quality, water quality and safety issues in construction and ongoing,	See EIS Section 3.2 (Air Quality) for the EIS air quality analysis. Impacts to surface water quality are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-49. Health and safety issues are also discussed in Table App3-1; see AIB-10 through AIB-14.
11508-5	Justin Gott, Daniel Gott, Josie Gott	I understand there will be over 400 miles of service roads built. If they are gravel roads it will cause a lot of dust to be stirred up in the area affecting wildlife. Also to keep the dust down a dust abatement could be applied which could leak into the aquifer.	See response to comment 3811-4 (in Table A-3v, Soils) regarding impacts from application of dust palliatives. EIS Section 3.2.1.2.2 (Alternative B [Proposed Action], Alternative B with Additional Measures) and Section 2 (Project Construction and Emissions) of the project air quality technical report list mitigation measures to control fugitive dust emissions. MVE would finalize the project Dust and Emissions Control Plan, which would have to be approved by the BLM prior to construction. The draft Dust and Emissions and Control Plan is MVE (2023) Appendix O.
11535-45	Steven Andersen	The Monument RMP provides that the lands are classified as Class II under the Clean Air Act. The DEIS has no evaluation of whether its operations will comply with this standard. 40 CFR 93.150-160 requires an approved implementation plan. MVE is required to apply the General Conformity Regulations to its action. The DEIS should have clearly indicated project emissions in the construction and decommissioning years and whether it would exceed General Conformity de minimis thresholds, and if so, establish a plan for developing the air quality conformity analysis, addressing plans for satisfying General Conformity, and describe plans for releasing a draft general conformity determination and Final Determination.	EIS Section 3.2.1.1.1 (Regulatory Background) discusses Class II areas and general conformity. As stated in this section, because Jerome, Lincoln, and Minidoka Counties are in attainment for all criteria pollutants, the General Conformity Rule does not apply. At the request of the NPS, an additional Class II area was evaluated against Class I thresholds. EIS Section 3.2.1.2.2 (Alternative B [Proposed Action]) discusses the results of the VISCREEN Level-1 visibility screening analysis that demonstrated that project construction would not cause a visible plume that would cause any visibility impairment inside Class I or Class II special consideration areas. The same section also discusses the preliminary screening analysis using the EPA's AERSCREEN model, which demonstrated the modeled NO_2 (1-hour and annual) and PM_{10} (24-hour) emissions to be below their respective NAAQS at the boundaries of the Class I area and the Class II special consideration area. This is discussed in additional detail in the air quality technical report (SWCA 2022) (see Section 5.1 and 5.2).
11535-46	Steven Andersen	The fugitive dust analysis in the DEIS is inadequate and assumes a 2-year construction period, which is unrealistically short given the magnitude of what is being proposed. Because the engineering for the project has not even occurred, the DEIS is underestimating the construction time-frame. Further, the dust source control is limited to application of water but fails to specify exactly when, how, where, with what regularity such application would occur. Moreover, there is no indication of committed efforts to limit earth-moving equipment.	See response to comment 11488-1 (see in Table A-3a, Air Quality).
11598-23	Idaho Conservation League	Air Quality The Air Quality Technical Report for the Lava Ridge Wind Project (AQTR)20 provides the foundation for which the BLM analyzed the air quality impacts of the project in the DEIS. In particular, the AQTR and DEIS highlight the issue of fugitive dust generation as the driving source behind particulate matter (PM) impacts. Specifically, the AQTR states, "Applicant-committed measures to control fugitive dust emissions include routine watering and installation of base coarse and gravel on access roads. In addition, and as discussed in the POD, a dust and emissions control plan (DECP) would be prepared prior to construction. The AQTR then proceeds to list multiple specific monitoring and control requirements that MVE has committed to.21 Beyond this, the AQTR goes on to further highlight even more additional fugitive dust control measures that MVE has committed to employ.22 The Measures and Additional Measures described provide prudent initial guidance on fugitive dust control. One significant example is Measure 111: Where necessary, water may be used as a dust control method during construction and would be applied on unpaved roads, material stockpiles, and other surfaces that can create airborne dust. Roads would be watered at intervals sufficient to control dust. Water spray would be controlled so that pooling would be avoided to the extent possible. 20 Prepared for BLM and MVE by SWCA Environmental Consultants, revised October 2022 21 AQTR, Measure 110 through 116, page 2. 22ATQR, Additional Measure a through i, page 3. While the Measure offers some specificity, phrases such as "where necessary" and "intervals sufficient to control dust" are ambiguous and assumedly left to be discussed in future DECP. A thorough review of the EPA's AP-42 Chapter 13.2.2 Unpaved Roads emission factors and guidance will impart the importance of the technical science and web of variables that influence fugitive dust generation and control. Figure 13.2.2-5 of Chapter 13.2.2 specifically identifies how the quantity and frequency of water spray significantly affects their control efficiencies. Among other critical fugitive dust generation and control variables are examples such as road silt content, mean vehicle weight, surface material moisture content, and mean	MVE would finalize the project Dust and Emissions Control Plan (in accordance with the Idaho Department of Environmental Quality guidance, which would have to be approved by the BLM prior to project construction. The draft Dust and Emissions and Control Plan is MVE (2023) Appendix O. Details such as those requested in the comment would have to be approved by the BLM prior to notice to proceed with project construction.

Comment ID	Commenter	Public Comment	Response to Comment
		vehicle speed. Considering this, ICL stresses the importance of MVE developing, and BLM approving, a DECP that is sufficiently detailed, specific, and comprehensive. While the values for the critical variables that went into estimating project fugitive dust emissions are not publicized in the AQTR or the DEIS, a well developed DECP is essential to ensuring the project is constructed and operating in such a manner that is consistent with those assumed variable values. The unspecified phrases highlighted in Measure 111 above, may be appropriate for the AQTR and DEIS, but the DECP must include a much deeper dive into specific details. A substantive DECP must address the following: How will the level of fugitive dust emissions be monitored? Will the EPA's Visible Emissions Field Manual EPA Methods 9 and 22 (December 1993) be used? Will onsite monitoring equipment be employed? How much water will be applied? How often will it be applied? Will application frequency be evaluated qualitatively or will it be tied to EPA Method 9 or 22 observations? Without a DECP that adds the sufficient level of detail needed to successfully implement Measure 111 and many of the AQTR listed Measures and Additional Measures, the public cannot be confidently assured that the project will not have significant air quality impacts.	
11978-7	Magic Valley Energy, LLC	Table 3.2-5 – Air Quality for Alternative B 8. MVE Comment: MVE would like to confirm that the sulfur oxides (SOX) numbers in table 3.2-5 reflect the use of ultra-low sulfur diesel (ULSD) in equipment. ULSD contains 97% less sulfur than low-sulfur diesel, which was commonly used prior to 20071. If the DEIS used outdated data from low-sulfur diesel in the calculation, a correction to ULSD would be warranted to show accurate SO2 emissions (i.e., 0.30 tons of SO2 per year for off-road construction equipment).	Yes, the values in EIS Table 3.2-6 use the EPA's MOVES emission factors, which incorporate the latest ultra-low-sulfur diesel standards (EPA 2022d).
11978-8	Magic Valley Energy, LLC	Table 3.2-5 and Table 3.2-6 – Air Quality for Alternative B during Construction and Operation 9. MVE Comment: The percentage of estimated total construction emissions per county given in each of the tables is not representative of the amount of emissions the Project would have in each of those counties. The DEIS currently calculates each county emissions using 100% of the Project's emissions. Given that there are three counties, this would equate to 300% of the Project's emissions. A simple, yet more accurate method, is for the FEIS to pro-rate emissions to each county based on disturbance acreage within each county and then calculate percentages accordingly.	The text has been revised to include apportioned emission comparisons.
11978-9	Magic Valley Energy, LLC	Section 3.2.2.2– Air Quality Operational Impacts 11. MVE Comment: The DEIS lists estimates of air pollutant emissions due to operation of the Project but excludes air pollutants that will be avoided due to operation of the Project. The DEIS provides estimates of avoided emissions in Section 3.4 (Climate and Greenhouse Gases); see Table 3.4-4 (Alternative B), Table 3.4-7 (Alternative C), Table 3.4-8 (Alternative D), and Table 3.4-9 (Alternative E). As shown in these tables, the avoided air emissions due to the Project's wind energy generation will be significant and are relevant to the Project's operating phase annual emission rates. To ensure that the FEIS provides the available information and adequately discloses the anticipated effects of the Project, these avoided emissions need to be incorporated into the annual operation phase emission estimates disclosed in the Air Quality section in Table 3.2-6 (Alternative B). Additionally, the operating phase avoided emissions for each alternative should be documented in Section 3.2.2.2.3 (Alternative C), Section 3.2.2.2.4 (Alternative D), and Section 3.2.2.2.5 (Alternative E).	The text has been revised to include the avoided emissions and add the avoided emissions to EIS Table 3.2-9 and in EIS Sections 3.2.2.2.3 through 3.2.2.2.6.
11991-7	Julie Abo	If the project goes forward, will there be a measurement of air quality effects to see that this projection is correct? (page 3-23)	See response to comment 11488-1 (see in Table A-3a, Air Quality). MVE would finalize the project Dust and Emissions Control Plan, which would detail how dust emissions would be controlled. No, a measurement device would not be set up and operated for the duration of the project. The draft Dust and Emissions and Control Plan is MVE (2023) Appendix O.
12338-7	National Park Service	Section: 3.2.1 Air Quality Page: 3-10 The NPS recommends revising the following statement from the draft EIS on page 3-10: "Because of the nature of air pollutants, which become more spread out as they travel away from a source of pollution, the air quality analysis area for both issues extends approximately 31 miles (50 kilometers) in all directions beyond the siting corridors (Figure 3.2-1). A 31-mile (50 kilometers) radius was chosen to be consistent with minimum air quality analysis required for major source air quality permitting." The draft EIS appropriately discusses the Federal Land Manager's Air Quality-Related Values Work Group (FLAG) visibility modeling recommendations for near-field assessments on page 3-14. However, the statement on page 3-10 is inconsistent with FLAG recommendations for far-field air quality related value impacts. Far-field impacts and analyses are often conducted for sources well beyond the 50-km radius described in the analysis.	The text has been revised.
12338-8	National Park Service	Section: 3.2.1.2.2 Air Quality Page: 3-18 & 3-19 The NPS recommends removing the comparison of construction-related criteria air pollutant emissions as a percentage of county level emissions and propose that it be replaced with the emissions calculations and nearfield modeling analyses of anticipated downwind concentrations to draw conclusions regarding potential project-related ambient air quality and Air Quality Related Value (AQRV) impacts. These results specifically address the predicted impact of the project in the local area and provide more meaningful context for project-related emissions.	Comparison to the county emission inventory helps to add context in terms of the level of emissions. EIS Section 3.2.1.2.2 (Alternative B [Proposed Action]) and the air quality technical report (SWCA 2022) discuss the VISCREEN and AERSCREEN screening analyses conducted for compliance with the NAAQS.
12398-12	US Environmental Protection Agency	Potential Impacts to Air Quality Because the project may result in impacts to air quality, EPA recommends the FEIS include: • Updated information on expected air quality permits, including types, from IDEQ and conditions to protect air quality. • Predicted project construction, maintenance, and decommissioning emissions and a determination of whether emissions will exceed National Ambient Air Quality Standards (NAAQS). The DEIS indicates that, "pollutants generated by the project construction were not modeled". The document includes a conclusion without justification that, "it is unlikely that project construction emissions added to background concentrations would violate the NAAQS and the analysis area would remain in attainment for all criteria pollutants."14 While this may be true, data are needed to show it will be the case. This is important because the project will involve more than 1.5 million vehicle trips per	See response to comment 11598-23 (see in Table A-3a, Air Quality). The text has been revised to include additional permit discussion. Furthermore, the text has been revised to remove the statement, "it is unlikely that project construction emissions added to background concentrations would violate the NAAQS" because modeling was conducted to confirm this (see air quality technical report). EIS Section 3.2.1.2.2 (Alternative B [Proposed Action]) and the air quality technical report (SWCA 2022) discuss the VISCREEN and AERSCREEN screening analyses conducted for compliance with the NAAQS.

Comment ID	Commenter	Public Comment	Response to Comment
		year and a disturbance of up to 9,114 acres that could result in significant fugitive dust emissions. • Plans to monitor air quality conditions on the analysis area and taking corrective actions to prevent local air quality deterioration. Monitoring strategies tailored to local conditions will ensure that localized air quality impacts do not exceed standards when area-wide and/or long- term monitoring data may show compliance with air quality regulatory requirements. This is especially important for the project due to its proximity the Craters of the Moon National Monument and Preserve, a Prevention of Significant Deterioration Class I area. Because of the project, there is also potential for significant local air emissions due to fugitive dust releases during ground disturbing activities, use of access dirt roads and cumulative effects from surrounding activities. • Plans to coordinate with IDEQ and other entities in the area, such as County Air Quality Boards, to ensure compliance with the NAAQS and related regulatory requirements throughout the 34- year project period.	The mitigation measures listed in EIS Appendix 4 (Mitigation) would reduce effects to the level that monitoring is not needed.
12398-13	US Environmental Protection Agency	The DEIS describes current air quality conditions within the analysis area and EPA appreciates information provided, especially on baseline emissions, general conformity rule applicability analysis, and Prevention of Significant Deterioration. Although affected counties are currently in “attainment” with all criteria pollutants and General Conformity is not applicable to the analysis area, local air quality may still be impacted due to cumulative impacts from surrounding activities such as road construction and site operations, traffic on unpaved roads, local traffic emissions, agriculture, fire, and air traffic. It is also possible that changes in climate could more likely lead to increased air pollution due to future wildfires.	Additional text was added to EIS Section 3.2.1.1.6 (Existing and Future Trends and Actions) and Section 3.2.1.2.7 (Cumulative Impacts) to address climate change and cumulative impacts where they may overlap with the project. Additional text was added regarding impact to local air quality. Regarding PSD, this is a NEPA analysis and not a PSD analysis. A PSD analysis is the responsibility of IDEQ.
13008-4	Scott Hauser	The DEIS (Appendix 0) provides little to no discussion of how dust will, or will not, be controlled on access roads. Given the amount of traffic during construction, dust may become a human hazard while driving.	See response to comment 11488-1 (see in Table A-3a, Air Quality).
2106-1	Jack S. Williams	I'm concerned about all the wind farms being constructed and the impacts on both the local environment and the broader area environmental impacts. Basically, if the energy is absorbed by the wind farms what impacts are there to the downwind environments? What study/modeling has been completed to define the impacts of these wind farms on our micro and macro environments?	Because turbines do not absorb or block wind, wind would still occur downwind of the turbines. Downstream impacts of the turbines in terms of climate change are discussed in EIS Section 3.4 (Climate and Greenhouse Gases), and any impacts would likely be offset by providing a renewable source of energy that reduces the need for fossil fuel combustion.
2932-1	Scott Prow	I would like to draw your attention to The Lava Ridge Wind Project Draft Environmental Impact Statement (EIS). On page 3-15, figure 3.2-2, titled "2021 Wind rose for Twin Falls Sun Valley Regional Airport, Idaho." There is not an airport, anywhere, with that title. Twin Falls, ID has Joslin Field/Magic Valley Regional Airport (KTWF), Hailey, ID has Friedman Memorial Airport (KSUN), and Bullhead City, AZ has Sun Valley Airport (A20).	These data were taken from the Midwest Regional Climate Center. Although the meteorological station is named TWIN FALLS SUN VLY RGNL AP, the location of the station (42.4819 / -114.4869) is that of the Magic Valley Regional Airport.
3141-1	Scott Prow	I would like to draw your attention to The Lava Ridge Wind Project Draft Environmental Impact Statement (EIS). On page 3-15, figure 3.2-2, titled "2021 Wind rose for Twin Falls Sun Valley Regional Airport, Idaho." There is not an airport, anywhere, with that title. Twin Falls, ID has Joslin Field/Magic Valley Regional Airport (KTWF), Hailey, ID has Friedman Memorial Airport (KSUN), and Bullhead City, AZ has Sun Valley Airport (A20).	See response to comment 2932-1 (see in Table A-3a, Air Quality).
3302-4	Susan Canham	How can between 1,800,000 to 2,500,000 vehicle trips be considered "minor air pollutant emissions"?	As discussed in EIS Section 3.2.1.2.2 (Alternative B [Proposed Action], Alternative B with Additional Measures) and in Section 2 (Project Construction and Emissions) of the air quality technical report (SWCA 2022), on-road emissions would be temporary and spread over large areas and would not be cumulatively concentrated in a small area.
3340-8	Sue Page	According to the air quality surveys in the EIS, there will be an increase in air pollution during the project’s construction. This will be from the estimated 2.2 MILLION vehicle trips per year on the newly constructed roads, the heavy machinery used to haul and construct the turbines, the excessive blasting, and the many diesel generators that will be in operation for the duration of the construction. One of the pollutants is Sulfur Dioxide. It is estimated that 64.76% of the SO2 and other sulfur oxides in the air in Jerome county will be attributed to the construction period of the LRWP. SOs can harm the human respiratory system, especially in people with asthma and in vulnerable children. SOs can harm plants and trees by damaging foliage and decreasing growth. But no worries…according to the EPA, the levels of sulfur oxides in the air will still fall within “safe” levels. This same EPA has also said the air was fine in Palestine, Ohio. I’m sure the residents of that community beg to differ. Will LS Power be held liable for the potential increase in respiratory ailments?	Impacts from the project, as well as the VISCREEN and AERSCREEN screening analyses conducted, are discussed in EIS Section 3.2.1.2.2 (Alternative B [Proposed Action]) and in the air quality technical report (SWCA 2022). It should also be noted that the NAAQS are set with a margin of safety to protect sensitive populations.
5896-6	Mike Tylka	ll of the alternatives present vehicle trips in the millions except Alternative A. Trips in the millions with vehicles powered by diesel or gasoline will spew billions of additional pollutants into the air, CO, Nox, Sox, and the like. Stationary equipment such as generators, cranes and other ancillary equipment running constantly will add to the mix. Any proposed “electric” vehicles are currently propelled by coal or natural gas burned somewhere else. Land disturbance created by using existing or newly built roads will create dust pollution that does not currently exist. Building 400 tower pads will add to this, especially due to the amount of basalt that will need to be blasted.	Impacts from the project as well as the VISCREEN and AERSCREEN screening analyses conducted discussed in EIS Section 3.2.1.2.2 (Alternative B [Proposed Action]) and in the air quality technical report (SWCA 2022).
5920-4	Kelly Varelmann	500+ days of construction and heavy equipment will surely degrade the surrounding highways and roads more than normal. Will the extra dust created by the multitude of heavy equipment, trucks, concrete trucks, etc traveling on the dirt roads exceed EPA standards?	See response to comment 6511-4 (see in Table A-3a, Air Quality).
6511-4	Kelly Varelmann	500+ days of construction and heavy equipment will surely degrade the surrounding highways and roads more than normal. Will the extra dust created by the multitude of heavy equipment, trucks, concrete trucks, etc traveling on the dirt roads exceed EPA standards?	As discussed in the air quality technical report (SWCA 2022), on-road emissions would be temporary and spread over large areas. Mitigation measures to control fugitive dust emissions are discussed in EIS Section 3.2.1.2.2 (Alternative B [Proposed Action], Alternative B with Additional Measures) and in the air qua64lity technical report. As mentioned in those sections, roads would be watered at intervals sufficient to control dust. Furthermore, MVE would finalize the project Dust and Emissions Control Plan, which would detail how dust emissions would be controlled. The draft Dust

10442-2	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Bats P. 3-43 In the DEIS it is stated, " The cumulative impacts of numerous facilities with high fatality rates across the landscape could compound the impacts on bat populations. The potential effects of the expansion of wind energy on the bat populations in the analysis area would depend on several site-specific variables at each project location, the number and size of turbines that would be used, and the implementation and effectiveness of mitigation measures to reduce impacts to bats." Comment: Bat population declines are problematic for a host of reasons. Bats provide ecosystem services including pollination and pest control . They are one of the most diverse groups of mammals but are not well understood, and recently have been placed at great risk from wind energy projects and from white-nose syndrome. Oregon State University-Cascades' Northwestern Bat Hub studies indicate that the hoary bat decline is consistent with the hypothesis that the longer projects exist and the more extensive they are, the greater the impacts are on species through collision and barotrauma. We are encouraging a further review of the immediate area and other potential sites.	The link between wind energy development and the decline in populations of migratory tree bats, including the hoary bat, is discussed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat). As part of MVE's bat acoustic monitoring surveys, WEST deployed several acoustic monitoring stations in the siting corridors and surrounding region to characterize seasonal variations in bat use and evaluate bat activity at potential roost sites and foraging areas. In addition to these project-specific monitoring stations, WEST obtained data from acoustic monitoring stations in the siting corridors and surrounding region that are part of the North American Bat (NABat) monitoring program, which is administered by the Oregon State University-Cascades' Northwestern Bat Hub. The description of hoary bat in the Affected Environment section for species analyzed in detail (EIS Section 3.3.1.1.2) discloses the evidence from the peer-reviewed literature that hoary bat populations have recently experienced large population declines, including the evidence presented in Rodhouse's et al. (2019) study of the Northwestern Bat Hub's NABat monitoring data. It is important to note that Rodhouse et al. (2019) made no conclusions as to the relationship between the size or operational duration of wind energy facilities and their relative impact on bat populations. The authors note that their conclusions must be considered provisional in nature due to the limitations of their study, and go on to say "Hoary bat migration patterns are still not well described, and it remains unclear where the hoary bats that occur in our study region during summer monitoring are being killed [by wind turbines] . . . seasonal hoary bat occurrence patterns . . . suggest [that] bats that occur in our region during summer could spend winters in and migrate through regions where turbine densities are much higher, offering a possible explanation for decline in the Northwestern United States. Although available evidence supports the working hypothesis that regional hoary bat decline is likely caused by elevated adult mortality from turbine collisions and barotrauma during fall migration, our results reflect net cumulative impacts, and a limitation of our study is the imprecision with which stressor impacts can be ascribed." Despite the uncertainty remaining in the relationship between wind energy development and bat populations, the EIS takes the precautionary approach of assuming that fatalities from collisions with operational turbines may result in significant impacts to the populations of certain bat species without the implementation of measures to minimize or avoid collision fatalities. The species analyzed in EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) also include those that are generally considered to have a low risk of colliding with turbines but whose populations may become increasingly sensitive to small sources of mortality due to the potential effects of the continued spread of WNS in the West. The potential for significant impacts to bats was considered early in the planning process and, in addition to MVE's baseline resource studies for bats and roosting habitat, the BLM conducted a thorough review of the publicly available scientific literature and coordinated with state and federal wildlife agencies to obtain additional data and expert input. As described in EIS Section 3.3.1.1 (Bat Populations and Roosting Habitat, Affected Environment), recently published summer bat occupancy maps produced by the NABat Monitoring Program clearly show that bat occupancy in the Snake River Plain is substantially lower than surrounding areas, which is consistent with the low bat activity observed during summer bat acoustic monitoring surveys. Where concentrated bat use has been observed in the siting corridors and vicinity (such as the irrigation canals and lava crater roost site), protective buffers have been incorporated to prevent turbine siting near these features (see applicant-committed measures 136 and 138 and additional measure n in EIS Appendix 4 [Mitigation]). Although many other measures have been incorporated to minimize or avoid impacts to bats, postconstruction bat fatality monitoring would be required and adaptive management measures would be implemented as needed if high fatality rates are observed. Together, these measures demonstrate that adequate consideration has been given to the siting of the facility and the potential impacts to bat populations. A detailed evaluation of alternative sites for the project is beyond the scope of analysis in this EIS because they would not address the BLM's purpose, which is to respond to MVE's ROW grant request.
11226-4	Clare Josaitis	The number of projected bat fatalities is breathtakingly obscene, even if underestimated. USGS.gov states "Dead bats are found beneath wind turbines all over the world. It's estimated that tens to hundreds of thousands die at wind turbines each year in North America alone" More literature on bats and bat fatalities should be referenced in the EIS than just the two cited to thoroughly research effects of the proposed Lava Ridge turbines on bats.	The analysis presented in the EIS is based on a thorough review of the available scientific literature, coordination and consultation with state and federal wildlife agencies, and the results of MVE's baseline resource surveys. A number of additional sources related to bat fatalities at U.S. wind energy facilities were reviewed and incorporated into the EIS analysis in response to comments received during the public scoping period, including journal articles that had been published subsequent to the initial literature review conducted for the draft EIS. For a complete list of data sources, see the Bat Populations and Roosting Habitat section of the Literature Cited list in EIS Appendix 10. Also see Section 9.0 (References) in the BBCS (Appendix M in MVE [2023:M-64 to M-73]).
11282-1	Karen Schumacher	According to the Data Quality Act, federal agencies are required to ensure and maximize the quality, objectivity, utility, and integrity of information (including statistical information) and data. In the DEIS the data provided on the effects of	The EIS has been updated to include a reference to EPRI (2020a), which examined 277 publicly available studies from 181 different wind energy facilities in the U.S. and Canada (1998 to 2018). The study found that bat fatalities

Comment ID	Commenter	Public Comment	Response to Comment
		wind turbines on the avian population is biased, inadequate, and the integrity of that information does not support the actual death rate or damage caused by wind turbines. The data used is also significantly outdated such as the 2005 BLM data on fatality rates of bats as being 1-2 per turbine (pg 3-44). While the DEIS does "suggest" that larger turbines has led to a higher fatality rate, however that is then negated with "uncertainty in the relationship between turbine characteristics and bat fatality rates remain" from a 2016 study. It also doesn't identify what "larger turbines" means, or identify the height of the turbine being referenced. In contrast to the referenced study on bat fatalities per megawatt from 2018 as being 3 with lower rates in Idaho, below is a link to a 2020 study that shows the bat fatality rate in Idaho is actually 9 per megawatt in 2014 (pg 17), and that is from your often referenced source of information in the DEIS, West. https://west-inc.com/wp-content/uploads/2021/07/WEST_2020_RenewWildlifeFatalitySummaries.pdf This is just one example of biased, outdated, and poor data being used that clearly justifies the decision for Alternative A, No Action on this project.	peaked at intermediate turbine sizes and decreased at larger turbine sizes but concluded that there was only a weak correlation between bat fatalities and turbine size or capacity. Although the EIS summarizes the information from the 2005 PEIS, including the estimated bat fatality rates, the estimated fatality rates presented in the EIS are based on more recent postconstruction monitoring studies at other wind facilities in the region as described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B). Page 17 of EPRI (2020a) indicates the highest bat fatality rate that has been observed in the Pacific Region is 9.3 bat fatalities/MW/year, which represents a single year of data from a single facility in Idaho. Other studies from the Pacific Region had lower bat fatality rates, which is consistent with the fatality estimates presented in the EIS.
11429-1	Felicia Poteet	The wind turbines are a huge disturbance to the ecosystem of Idaho, [...] One small example is the number of Idaho bats killed by wind turbines each year. There is a change in air pressure near the wind turbines that pops blood vessels around their lungs and kills them. Bats are an important part of our agricultural ecosystem, as they are natural predators to many agricultural pests.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), “Bat fatalities from barotrauma (due to rapid changes in air pressure near spinning turbine blades) have been documented, but there is little evidence to suggest that this is an important source of mortality at wind energy facilities (AWWI 2016).” Table 3.3-3, also in this section, summarizes estimated bat fatalities by action alternative (without the implementation of mitigation). EIS Section 3.3.1.2.2 also describes the mitigation measures that would be implemented to minimize or avoid impacts to bats; a complete list is provided in EIS Appendix 4 (Mitigation). As described in response to comment 11753-3 (see in Table A-3b, Bats), there have been no studies quantifying the impact of bat fatalities at wind energy facilities on local insect populations, but mortality of these insects would also increase as a result of collisions with operational turbines.
11484-1	Liz Niccum	I am concerned about the enormous adverse effects the proposed Lava Ridge Wind Turbine Project would have on the bat populations and roosting habitats in the Magic Valley. Because it is difficult to predict accurately how many bats would be killed by the Lava Ridge Wind Turbine Project, everything concerning bat fatality rates in the EIS is an educated guess: "Fatality estimates for the project are based on the fatality rates observed at other wind facilities in the EPA North American Deserts Level I Ecoregion, and the fatality rate for the project would fall within the range observed at other wind energy facilities in this region." (Page 3-29 of the Lava Ridge Environmental Impact Statement.) Since the planned Lava Ridge Wind Turbine Towers will be significantly higher at 740 feet, how can these statistics from other wind energy facilities with lower tower heights accurately predict bat fatality rates for the project? By introducing much taller wind turbines into areas where bat populations and migrations exist, the potential for bat fatalities increases because studies have shown that bats fly at high altitudes and are essential for farmers because of their consumption of crop-damaging insects that travel at high altitudes. https://www.batcon.org/article/bats-aloft-a-study-of-high-altitude-feeding/ "The rapid expansion of wind energy facilities across the United States is one of the greatest threats to the viability of many migratory bat species" (Page 3-55 of the Lava Ridge Environmental Impact Statement) If this trend continues, how long before many bat species will be listed as endangered? Bats are far too important to the survival of society through food production and the abatement of crop destroying pests to carelessly destroy them with the rapid expansion of wind energy project on public lands like Lava Ridge and other proposed projects in the west. In addition, White Nose Syndrome disease is wreaking havoc on bat populations in the west. How long before Idaho sees evidence of this disease as well as other states? We stand at a crossroads environmentally. Which is more important? Destructive to the environment, short term wind turbine projects fueled by tax incentives or real environmentalism that seeks to preserve and protect nature? Bats are too important to continue this destruction by constructing higher wind turbines in areas of bat migration and habitation.	Bat fatalities are presented on a per MW/per year basis rather than per turbine/per year basis to account for the larger size of turbines with higher generation capacities. EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations) presents information on bat foraging and migratory behavior, including site-specific data collected during bat acoustic monitoring surveys for the project. This section also describes the status of WNS in Idaho; additional details on WNS are provided in the cumulative effects analysis in EIS Section 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts). EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B) acknowledges the difficulty in accurately predicting bat fatality rates prior to construction and provides a range of potential fatality estimates to allow for a reasonable comparison of the magnitude of effects that could be expected for each action alternative. Mitigation measures implemented for bats include postconstruction fatality monitoring, which would provide an opportunity to assess bat fatality rates; adaptive management measures would be implemented as needed if high fatality rates are observed; see EIS Appendix 4 (Mitigation) and the BBCS (Appendix M in MVE [2023]). As described in response to comment 11753-3 (see in Table A-3b, Bats), there have been no studies quantifying the impact of bat fatalities at wind energy facilities on local insect populations, but mortality of these insects would also increase as a result of collisions with operational turbines.
11534-11	Matt Arnold, William Eubanks	The DEIS Does Not Adequately Explain Its Conclusions Concerning Irretrievable and Irreversible Commitments of Resources The plain language of NEPA makes clear that every EIS must include “a detailed statement by the responsible official on . . . any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.” 42 U.S.C § 4332(C)(v). This requirement is animated by NEPA’s core policy of informing both decisionmakers and the public about what is truly at stake in any given major federal action. Disclosure of these resources is crucial because they help define the pre-NEPA status quo and when the Act’s review must occur relative to project implementation. Forest Guardians v. U.S. Fish & Wildlife Serv., 611 F.3d 692, 714-15 (10th Cir. 2010) (“In order for us to conclude that an agency has engaged in predetermination, we must decide that the agency has irreversibly and irretrievably committed itself to a plan of action that is dependent upon the NEPA environmental analysis producing a certain outcome, before the agency has completed that environmental analysis.”); see also Metcalf v. Daley, 214 F.3d 1135, 1143 (9th Cir. 2000) (holding that an agency conducts NEPA analysis “too late in the decision-making process” when it does so “after making an irreversible and irretrievable commitment of resources”). For this reason, among others, accurately explaining and defining these resources is crucial to the NEPA process. Yet, the DEIS’s conclusions here about the Project’s irreversible and irretrievable commitments of resources are little more than non-sequiturs. Take, for example, its discussion of the Project’s impacts on bats. The DEIS concedes that “collision with wind energy turbines is one of the leading causes of bat fatalities in North America,” and “recent studies on the effect of turbine collisions on migratory bats indicate that population-level impacts could occur due to sustained mortalities from collisions with turbines during migratory movements.” DEIS at 3-44 (emphasis added); see also id. at 3-53 (discussing dramatic declines in populations of Little brown bats, a cave-dwelling species, and acknowledging that “even the relatively small number of fatalities that would occur under [the proposed alternative] could exacerbate the decline in their populations”). But when disclosing the Project’s “irreversible and irretrievable commitments” of resources, the DEIS suddenly changes tune, claiming that although “[a]ll action alternatives would irretrievably impact individual bats through fatalities caused by collision with turbines over the 30-	Irreversible and irretrievable effects are disclosed at the end of each resource analysis in EIS Chapter 3 (Affected Environment and Impacts). The Forest Guardians v. USFWS and Metcalf v. Daley cases cited in the comment are related to the timing of NEPA and the mandate that agencies not take actions that involve resource commitments until the NEPA process is completed, not the requirement at 40 CFR 1502.16(a)(4) that agencies disclose the irreversible and irretrievable commitment of resources that would result from implementing the Proposed Action. The BLM has not issued a ROD for the project yet, nor has any ROW or other permit or authorization been granted to MVE. Irretrievable commitments refer to impacts that would occur over the life of the project but that could be renewed or restored following the project, while irreversible commitments refer to those impacts that are permanent and cannot be restored; see EIS Section 3.1.2.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) for additional details. EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Summary of Alternative B and Alternative B with Additional Measures) intentionally uses the word “could” rather than “would” when describing the potential for project-related fatalities to impact bat populations because of the uncertainty in the current and future population sizes and trends due to the lack of empirical data and potentially confounding variables such as WNS, climate change, and the ongoing development of technologies to reduce bat collisions with wind turbines. The conclusion in EIS Section 3.3.1.3 (Bat Populations and Roosting Habitat, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) that impacts to individual bats would be irretrievable but that impacts to bats would not be irreversible is based on the best currently available scientific data and literature and the implementation of a robust mitigation plan for bats. EIS Section 3.3.1.2.2 describes how the facility has been sited to minimize the potential for high bat fatality rates and a number of other proactive measures that would be implemented to avoid impacts to bats, such as avoiding turbine placement within 0.25 mile of known bat roosts (additional measure n) and 1,000 feet of the irrigation canals (applicant-committed measure 138), and feathering turbine blades when wind speeds are below the manufacturer’s cut-in speed (applicant-committed measure 160). Because it is not possible to predict postconstruction bat fatality rates from the results of preconstruction acoustic monitoring, the

Comment ID	Commenter	Public Comment	Response to Comment
		year operation period, [] these effects would not be irreversible because they would be unlikely to result in a trend toward listing under the ESA or a loss of population viability." Id. at 3-57. This conclusion is problematic for a number of reasons. To begin with, the DEIS never explains why a population-level impact or "population viability" is the appropriate threshold for irreversibility under NEPA when tens of thousands of bats will be killed (presumably permanently) each year the Project operates. See id. at 3-46 (summarizing bat fatalities by alternative). Nor does the DEIS explain how "listing under the ESA" affects this conclusion. Id. at 3- 57. As the Greater sage-grouse demonstrates, large and important portions of a species' population can be eliminated without it being listed under the ESA. See 12-Month Findings for Petitions to List the Greater Sage-Grouse (Centrocercus urophasianus) as Threatened or Endangered, 75 Fed. Reg. 13,910, 13,988 (Mar. 23, 2010) (finding that petition to list western sub-species of Greater sage-grouse "is warranted but precluded" due to other bureaucratic priorities). And, a species may suffer irreversible and irretrievable losses to its population from federal projects long before an ESA listing is even contemplated. Regardless of the metric, the DEIS's discussion of bat impacts demonstrates that its conclusion about irreversible losses is internally incoherent or, at the very least, lacks a cogent but necessary explanation. How can it be possible that the Project will not "result in . . . a loss of population viability," DEIS at 3-57, when "population-level impacts could occur due to sustained mortalities from collisions with turbines during migratory movements," especially since wind projects are "one of the leading causes of bat fatalities in North America," id. at 3-44, and those fatalities "are likely to rapidly increase over the next 30 years with the rapid anticipated growth of wind energy" id. at 3-56? BLM never says.10 The final EIS must rectify these issues to satisfy NEPA.	mitigation plan for bats includes a minimum of 2 years of postconstruction bat fatality monitoring (applicant-committed measure 150) to assess actual bat fatality rates. The TAC would be responsible for evaluating the results of this postconstruction fatality monitoring and, if high fatality rates are observed, recommending appropriate adaptive management measures (including curtailment; see applicant-committed measure158 and additional measure y) to the BLM Authorized Officer who would make the final decision on which measures to implement. Additional monitoring would be required to assess the effectiveness of adaptive management measures (applicant-committed measure 159), and compensatory mitigation may be recommended by the TAC and implemented by the BLM Authorized Officer, if warranted. The TAC's recommendations will be based on the best available data, literature, and technology at that time. Additional details are provided in EIS Appendix 4 (Mitigation) and the BBCS (Appendix M in MVE [2023]). The estimated fatalities in Table 3.3-3 do not account for the implementation of mitigation measures, and actual bat fatalities are expected to be lower. Impacts to bats would be considered irreversible if they caused a loss of population viability or trend toward federal listing because the population may not recover, or may take many years to recover, after the impacts of the project cease, whereas impacts that do not cause a loss of population viability are not irreversible because the population would remain large and healthy enough to replace any bats killed as a result of the project. A "trend toward listing under the ESA" (not ESA listing itself) is considered synonymous with a loss of population viability because it indicates the species may need management intervention to prevent further declines.
11534-14	Matt Arnold, William Eubanks	The Project's Potential to Exacerbate Bat Population Losses Due to White-nose Syndrome Merits Additional Scrutiny In discussing the Project's impacts on bats, the DEIS forthrightly acknowledges the serious existential threat that White-nose Syndrome poses to bat populations. DEIS at 3-38 (Bat "species have recently experienced major population declines due to the spread of [WNS], a disease caused by the fungus Pseudogymnoascus destructans," and "even a small increase in fatalities could have population-level impacts for those species whose populations have already been significantly reduced by WNS."). The DEIS also explains that the fungus causing WNS has been detected on the Project's doorstep, representing a "moderate" to "high threat" for Big and Little brown bats in the Project area, respectively. DEIS at 3-43. When describing the additive mortality caused by the Project's operation, BLM provides no information about what the presence of WNS portends for these bat species. Instead, BLM claims that the "magnitude of this effect is difficult to determine given the lack of site-specific information on little brown bat populations and the uncertainty surrounding the impact that WNS will have on the little brown bat population in the analysis area over the 30-year operation period." DEIS at 3-50. Given that BLM estimates the Project may kill "several thousand" Little brown bats during the life of the facility, and that this "species is at a high risk of being extirpated" from areas where WNS has been detected, id., it is incumbent on BLM to do more than simply throw up its hands and ask, "who knows?" If, as seems likely, the Project will directly contribute to the extirpation of an entire species of bat, BLM has a duty to inform the public, including conducting "new scientific studies" about area-specific abundance in order "to fully and fairly analyze the impacts" of this Project. League of Wilderness Defenders, 752 F.3d at 763 (cleaned up). BLM should also explain what "uncertainty" surrounds the impact WNS will have on cave-dwelling bats, and why a complete analysis of WNS in conjunction with the Project is not feasible in the DEIS. DEIS at 3-50. As far as SLR is aware, WNS has been studied extensively by academics and the U.S. Fish and Wildlife Service, including detailed models about its spread. See Meredith L. McClure et al., Projecting the Compound Effects of Climate Change and White- nose Syndrome on North American Bat Species, CLIMATE CHANGE ECOLOGY, December 2021; see also Suzanne M. O'Regan et al., Multi-scale Model of Epidemic Fade-out: Will Local Extirpation Events Inhibit the Spread of White-nose Syndrome?, 25 ECOLOGICAL APPLICATIONS 621, 632 (2015) ("[O]ur analysis indicates that disease-associated mortality within counties will not inhibit large-scale spread of white-nose syndrome at the county level and that, at a minimum, over 80% of counties of the contiguous United States are likely to become infected before the current epidemic is over.").12 Thus, BLM is capable, especially with assistance from federal wildlife scientists from sister agencies, of evaluating the Project's anticipated impacts to bats, in combination with WNS, using well-established statistical models that account for various scenarios of decline due to WNS and other stressors. This is precisely what NEPA and its regulations require. See, e.g., 40 C.F.R. § 1502.21(b), (d) (directing agencies to "include information in the [EIS]" regarding reasonably foreseeable significant adverse effects if "the overall costs of obtaining it are not unreasonable," and this "includes impacts that have catastrophic consequences, even if their probability of occurrence is low, provided that the analysis of the impacts is supported by credible scientific evidence").	The potential for WNS to lead to future declines of cave-hibernating bat populations in the analysis area is disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat), and species-specific risk factors are discussed in greater detail for species analyzed in detail (i.e., big brown, little brown bat, and western small-footed bat populations). Other cave-hibernating species that occur in the analysis area were also evaluated for potential declines due to WNS, as described in Table App 3-2 in EIS Appendix 3 (Issues Analyzed in Brief). As described in Section 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts), "Because WNS is not yet widespread in the western United States and it is unknown how rapidly the fungus that causes the disease will spread or how differences in hibernacula between the eastern and western United States will affect disease transmission, it is difficult to assess the magnitude of WNS on bat populations over the 30-year operation period. However, if WNS has a similar impact on bats in the western United States, some species could experience significant declines from the cumulative impacts of the expansion of both WNS and wind energy development (including the project)." As described in Section 3.3.1.1.3 (Bat Populations and Roosting Habitat, Existing and Future Trends and Action), WNS and its impacts on bats are well studied in the northeastern U.S. where the disease first appeared, but there is greater uncertainty in how WNS will impact bats in the western U.S. because the *Pseudomonas destructans fungus* has only recently been detected in this area and has not yet led to widespread infections or mortality. To comply with 40 CFR 1502.2(b), the EIS summarizes the conclusions in the available literature rather than recounting the detailed discussion of individual factors contributing to this uncertainty. As described in the study by Cheng et al. (2021) discussed in this section, the threat posed to individual bat species by WNS varies due to a number of factors including winter roosting behavior and the types of hibernacula used. Neubam and Siemers (2021) found that bat swarming behavior during migratory periods may also affect WNS transmission in the western U.S. (the citation for this study was inadvertently omitted in Section 3.3.1 of the EIS but was correctly cited in EIS Appendix 3 [Issues Analyzed in Brief]). Despite early concerns raised about the potential spread of WNS to the western U.S., such as those in O'Regan et al. (2015) study referenced in the comment, the fungus has not spread as rapidly as predicted, as acknowledged in the McClure et al. (2022 [2021 used in the public comment is an incorrect date]) study referenced in the comment as well as the study by Neubam and Siemers (2021) referenced in the EIS. In addition to uncertainties in the rate of WNS spread, there is also uncertainty in how western bat species whose populations have only recently been exposed to *Pseudomonas destructans* will respond to the fungus because some species infected with the fungus never develop symptoms of WNS (such as the western small-footed bat , Mexican free-tailed bat, silver-haired bat, and Townsend's big-eared bat) and because the response in bat populations to WNS varies between species (see for example big brown bat and little brown bat in Section 3.3.1.1.2 [Affected Environment, Bat Populations]). The McClure et al. (2022) study adds further uncertainty to these impacts by providing evidence that warming from climate change will mediate the impact of WNS in the west because the *Pseudomonas destructans* fungus thrives in cooler temperatures. Given the uncertainty in the rate of WNS spread in the western U.S., the lack of information on transmission pathways, and the variability in impacts between species, any attempt to further quantify the risk WNS poses to western bat populations would be highly speculative. Despite these uncertainties, the analysis in the EIS takes the conservative approach of assuming that WNS will lead to large declines of some bat species in the analysis area over the life of the project, and discloses the potential that even a relatively small number of fatalities from turbine collisions could have significant impacts on these species. Postconstruction bat fatality monitoring would be implemented to determine the actual bat fatality rate and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatality rates; additional details are provided in the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation). McClure, L.M., C.R. Hranac, C.G. Haase, S. McGinnis, B.G. Dickson, D.T.S. Hayman, L.P. McGuire, C.L. Lausen, R.K. Plowright, N. Fuller, and S.H. Olson. 2022. Projecting the compound effects of climate change and white-nose syndrome on North American bat species. *Climate Change Ecology* 3(2022):1000047.

11535-25	Steven Andersen	The agency wholly fails in its responsibility to take a hard look at the irreparable impacts the proposed project will have on bat population generally. The agency relies on faulty data to form its inadequate baselines for fatality rates and roosting impacts, and underappreciates the magnitude of this project given its unprecedented size. The DEIS admits that the "high concentration of volcanic features, such as lava tubes, vents, craters, and caves that provide roosting habitat for a variety of bat species, throughout the SFO planning area and at CRMO, which is less than 10 miles northeast of the siting corridors[,]" was not even visited.81 This is especially concerning considering the fact that, as the DEIS admits, the "Townsend's big-eared bat (Corynorhinus townsendii) is the most commonly recorded species" at those locations, "and most (64%) known maternity roosts for the species in Idaho" are within that area.82 The Townsend's big-eared bat is an important species in Idaho, but barely considered in the DEIS.	The analysis presented in the EIS is based on a thorough review of the available scientific literature. A number of additional sources related to bat fatalities at U.S. wind energy facilities were reviewed and incorporated into the EIS analysis in response to comments received during the public scoping period, including journal articles that had been published subsequent to the initial literature review conducted for the draft EIS. The BLM also solicited input from IDFG, USFWS, NREL, NPS, and other relevant agencies during the development of the analysis in the EIS. As described in Table App3-2 in Appendix 3, the Townsend's big-eared bat was dismissed from detailed analysis in the EIS because it has never been recorded as a fatality at a wind energy facility.
11535-26	Steven Andersen	Even more, the DEIS used "patterns of bat fatalities observed at existing wind energy facilities … as the basis for determining the likelihood for collision," but those other facilities pale in comparison to the proposed size of the Lava Ridge project.83 The DEIS exposes its inadequacies further by stating that "[b]ecause wind energy facilities in the far western and southwestern United States, which constitute much of the analysis area, are underrepresented in the [utilized databases], there is uncertainty in the predicted fatality estimates and the consequences to bat populations."84 The flaws could not be more clear in the DEIS' attempts to analyze bat populations in and around the proposed project area (which is still largely unknown). Predicting bat mortality at wind facilities is notoriously uncertain, which is compounded in this case given the project's unprecedented magnitude and lack of specific locations for the turbines. As the agency states, "bats may cross the siting corridors multiple times each night when travelling between roost sites and foraging areas." 85 With the size of the proposed project, that means the potential for bat fatalities has been grossly underestimated and was based on improper baseline analysis not taking into account the unpredictable nature of this project. Even if preconstruction surveys indicate a certain level of bat presence and fatality rates, that may change after the facility is built.86 Further, the DEIS predicts, on the low-end for the life of the project, that 36,300–52,380 bats will die, and on the high-end, 266,400–464,880 bats will die; however, the agency does not even attempt to explain why this level of mortality is non-significant to bat populations at the regional or local levels.87 Shockingly, even those numbers are not an accurate prediction of the potential fatalities, as the DEIS goes even further by stating, "Alternative B [and necessarily, all other Alternatives,] could result in a higher bat fatality rate than would be expected based on generation capacity alone." The DEIS recognizes the need for additional surveying and analysis but proceeds in its biased advocation for moving forward with the project, nonetheless. Specifically, the agency states, "[a]lthough these results support the conclusion that the bat fatality rate increases with the number and size of turbines (and thus, the facility's generation capacity), they also reveal substantial geographic and temporal variation in fatality rates."89 It further states, "[t]his introduces uncertainty when attempting to quantitatively assess the project's potential bat fatality rate[,]" and "[d]ata are also lacking on how fatality rates at existing wind facilities change over time, and it is unknown whether initially high fatality rates may decline over time as bats adjust their behavior in response to the presence of the wind energy facility, as habitat is degraded or lost, or as the size of bat populations decline." 90 Thus, it is apparent there has been inadequate consideration of the irreparable impact on bat fatality.	See EIS Section 3.3.1 (Bat Populations and Roosting Habitat) for a description of the analysis assumptions for analyzing impacts to bat populations and roosting habitat, which states that "Fatality estimates for the project are based on the fatality rates observed at other wind facilities in the EPA North American Deserts Level I Ecoregion, and the fatality rate for the project would fall within the range observed at other wind energy facilities in this region. Fatality rates are not intended to be precise predictions but are presented to allow for a meaningful comparison between the alternatives. Although the project acoustic monitoring surveys (WEST 2021a, 2022a) help inform which species occur in and near the siting corridors and the timing of peak bat activity, preconstruction acoustic activity does not appear to be correlated with observed bat fatality rates following construction (Arnett et al. 2015; Solick et al. 2020). The risk of fatalities from turbine collisions also varies among species due to factors such as flight characteristics, foraging behavior, and habitat use (AWWI 2018). Thus, the species composition of fatalities observed at other United States wind facilities was considered when determining the magnitude of the effect on each species' population." EIS Section 3.3.1.1.2 (Bat Populations, Affected Environment) provides additional discussion of the factors influencing bat fatality rates at wind energy facilities and individually assess the risk that turbine collisions pose to each species of bat that may occur in the siting corridors; further details are provided in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). 40 CFR 1502.21 requires the BLM to disclose where there is incomplete or unavailable information when evaluating reasonably foreseeable significant adverse impacts; therefore, the EIS must describe the uncertainties involved in estimating bat fatality rates due the incomplete nature of the publicly available information on the response of bat populations to wind energy development. As previously stated, the fatality rates presented in the EIS are not intended to be precise predictions but are presented to allow for a meaningful comparison between alternatives. Precise estimates of bat fatality estimates are not essential to a reasoned choice among alternatives because there are currently no widely accepted estimates of bat population sizes or populations trends for most species that could be used to assess the potential effects to a population from specific fatality rates. While the comment provides no suggestion as to how the fatality estimates in the EIS could be improved, there are currently no widely accepted methods of estimating bat fatality rates from preconstruction data alone, so any other method of estimating fatalities would be no less speculative than the method employed in this EIS. Subsequent to the publication of the draft EIS, the BLM requested additional data from IDFG on postconstruction bat fatality monitoring studies at existing wind energy facilities in Idaho; the bat fatality rates observed at these facilities are consistent with the bat fatality estimates presented in the EIS and additional discussion has been added in EIS Section 3.3.1.2. (Bat Populations and Roosting Habitat, Impacts). The EIS makes no argument that the estimated bat fatality rates would not have significant impacts on bat populations; instead, Section 3.3.1.2 states that hoary bat and silver-haired are expected to account for the majority of these fatalities, and that this level of mortality could have substantial effects on their populations that warrant the implementation of mitigation measures to minimize or avoid these impacts. The EIS also discloses the potential for significant impacts to populations of bats that may experience future declines from WNS as it continues to spread in the western U.S., despite the lack of evidence that those species experience large number of fatalities from collisions with wind turbines. Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction bat fatality monitoring to assess bat fatality rates; adaptive management measures would be implemented as needed if high fatality rates are observed, and additional monitoring would be conducted to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), this approach is consistent with the *U.S. Fish and Wildlife Service Land-based Wind Energy Guidelines* (USFWS 2012).
11535-27	Steven Andersen	Today we know that fatality rates of bats can outnumber those of birds at most wind energy facilities.91 During operation, habitat loss or deterrence due to ultrasonic sounds might occur.92 Nevertheless, effects resulting from direct or indirect contact with moving turbine blades are the subject of main concern, causing lethal or sub-lethal injuries.93 There are proximate causes of bat fatality, implying direct collision and barotrauma.94 Collision can be explained by ultimate causes, comprising why bats approach moving turbine blades, including either random collision (presence of bats), coincidental collision (e.g., flight behavior), or collision as a result of attraction.95 Bats with visual injuries found dead or injured underneath turbines have been associated with physical contact with moving turbine blades, which is made more true by the fact that even by using echolocation, the rapidly moving turbine blades are still hard to detect in time and thus to avoid.96 Furthermore, bats being hit by moving blades continue flying in an altered direction, which means there are an unknown number of offsite deaths due to such sub-lethal injuries, leading to even higher fatality rates.97 The DEIS drastically underestimates and underappreciates these impacts by not surveying sufficient area in and around the proposed siting corridor, and by failing to consider the effect a project of	See response to comment 11535-26 (in Table A-3b, Bats) for a discussion of the analysis assumptions in the EIS; as described in this response, more precise estimates of bat fatality rates are not essential to a reasoned choice among alternatives, partly due to the lack of reliable estimates of bat population sizes and trends, but primarily because it is widely accepted that wind energy poses significant risks to some bat species, as disclosed in EIS Section 3.3.1 (Bat Populations and Roosting Habitats). As described in Section EIS 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), there is little evidence to suggest that barotrauma is an important source of mortality at wind energy facilities. Increased understanding of the causes of bat mortality at wind turbines may help improve mitigation strategies in the future, but regardless of the specific causes of mortality or the overall estimated fatality rate for each alternative, the relative impact of each alternative would still be directly correlated to the number of turbines installed. Therefore, additional discussion of the sources of bat mortality at wind energy facilities is not essential to a reasoned choice among alternatives. Impacts to bat roosting habitat are also analyzed in EIS Section 3.3.1; additional analysis is provided in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). The background literature review conducted

Comment ID	Commenter	Public Comment	Response to Comment
		this size will have on bat fatality rates based on the foregoing threats. The projected fatality rates for the project are based on unsupported baseline reports which rely on wholly unpredictable information. Again, the DEIS admits that "there is uncertainty in the predicted fatality estimates and the consequences to bat populations" of the project.98 Fatality rates in the DEIS were "calculated by applying the mean bat fatality for the EPA North American Deserts Level I Ecoregion of 1.5 bat fatalities per MW per year (WEST 2021c) to the estimated range of generation capacity under each alternative."99 These estimates grossly misrepresent the potential impact this project will have on bat populations because bat fatalities are the result of various causes, not just direct collision.100 Specifically, in some studies of fatalities, not all carcasses showed external injuries.101 Necropsy and histopathology results revealed internal injuries, indicating barotrauma.102 Barotrauma, which is caused by a sudden decrease in air pressure resulting in severe hemorrhaging, might cause up to 90% of fatalities.103 Even more, bone fractures, as a result of direct collision, might often remain undiscovered by visual inspection alone.104 The agency falls well short in its obligation to take a hard look at the potential fatality rates of bat population, as the Lava Ridge project would represent a new and additive source of fatality.	for the EIS provided no information to suggest that wind energy facilities generate ultrasonic sound that deters bat activity; such a conclusion would be contrary to the evidence of substantial bat fatalities from collisions with turbines. Instead, acoustic deterrent devices are being investigated as a means of reducing bat fatalities and are included as a potential adaptive management measure (applicant-committed measure 157).
11535-28	Steven Andersen	Further, the DEIS takes a national-view approach in its consideration (inadequate) of proposed impacts to bat population, taking the analysis out of local assessment, i.e., no loca focus. Importantly, inter alia, it provides only a cursory review of the Townsend's Big-eared bat (corynorhinus townsendii), seemingly disregarding this important bat altogether, failing to appreciate that the proposed actions could extirpate an important part of the population of the Townsend on the Snake Plane. The DEIS does not even cite to the Species Conservation Assessment and Conservation Strategy for the Townsend's Big-Eared Bat, which is a comprehensive summary of the status and conservation needs for Townsend's big-eared bats in the West, and specifically, in Idaho. 106 Further, there was not cooperation with local bat experts identified in the DEIS. Not only does this show the failure of the agency to consider local impact generally, it is also concerning given that the foregoing assessment discusses in detail issues such as foraging, which the DEIS failed to evaluate. Thus, the DEIS analysis of the impact to local bat population is grossly insufficient. With reference to the lack of consideration of local impact generally, and the serious impacts of the proposed project on species such as the Townsend's big-eared bat, we support and adopt the comments to those points submitted by Brenda R. Pace, Master-Naturalist.	As described in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations), wind energy development primarily threatens bat species that engage in long distance migrations and do not inhabit the siting corridors year-round. Therefore, a larger analysis area is needed to properly assess the potential cumulative impacts to bat populations from the expansion of wind energy across their ranges. This section also discloses the lack of detailed demographic data on bat populations, particularly at the local scale, and the reasons this data is difficult to obtain. Development of the EIS included a robust public involvement process, including the solicitation of comments and additional information for consideration in the EIS. The BLM also solicited input from IDFG, USFWS, NREL, NPS, and other relevant agencies during the development of the analysis in the EIS. As described in Table App3-2 in EIS Appendix 3 (Issues Analyzed in Brief), the Townsend's big-eared bat was dismissed from detailed analysis in the EIS because it has never been recorded as a fatality at a wind energy facility.
11557-3	Deanna Weigel, Andy Weigel	several other proposed mitigation measures have no proven efficacy and/or rely on technology and methods that do not even exist currently. Examples include: [...] Avian and Bat Species: no demonstrated replacement habitats nearby for bats, no actual remedy for white-noise syndrome, and insufficient plans for conservation strategy.	See EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) for a description of mitigation measures that would be implemented to minimize or avoid impacts to bat populations and an evaluation of the effectiveness of these mitigation measures; the conservation strategy for bats is described in the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation). Habitat for bats is generally lacking in the siting corridors and the effects of wind energy development on bats are primarily associated with turbine collisions that occur during fall migration rather than with impacts to bat habitat. Therefore, mitigation measures that create or restore habitat for bats are unlikely to reduce the impacts to bats associated with the action alternatives; however, improvement of riparian habitat for foraging bats is a type of mitigation action that would be considered (see Mitigation Framework for Birds and Bats in EIS Appendix 4). WNS has the potential to impact some of the same bat species that may experience fatalities from collisions with turbines, but otherwise has no relation to the implementation of the action alternatives (see Table App3-1 in EIS Appendix 3 [Issues Analyzed in Brief]). As described in EIS Section 3.3.1.1.3 (Bat Populations and Roosting Habitat, Existing and Future Trends and Actions), the fungus that causes WNS has recently been detected in southeastern Idaho, but there are no confirmed cases of WNS in Idaho. Given these factors, any mitigation measures targeted at reducing impacts of WNS would be unlikely to reduce the impacts to bats associated with the action alternatives; however, contributing funds to assist with research on WNS and vaccination against WNS are types of mitigation actions that would considered (see Mitigation Framework for Birds and Bats in EIS Appendix 4).
11598-19	Idaho Conservation League	Bats A wide variation in fatality rates at wind facilities are observed across N. America.16 A total of seven bat species inhabit the project area, split between tree bats and cave-hibernating bats. Both groups are likely affected by the project, for differing reasons. Tree bats, including the hoary and silver-haired would likely be attracted to project infrastructure and both are expected 16 American Wind Wildlife Institute (AWWI). 2018. AWWI Technical Report: A Summary of Bat Fatality Data in a Nationwide Database. Washington, DC. to suffer similar impacts. The hoary bat is also an ESA candidate and Idaho SGCN species due to rapid population declines and a slow growth rate. The big brown bat is a BLM special-status species for the SFO. The cave-dwelling little brown bat is also an ESA candidate and Idaho SGCN species due in part to North American populations being affected by White Nose Syndrome. Of note, Townsend's big-eared bats were omitted from an impact analysis in the DEIS. Diseased bats could be even more susceptible to population-level effects if turbines prove a significant cause of mortality in the project area. Direct and delayed mortality due to wind power facilities can be significant,17 as could stressor-induced mortality caused by disease. While a species-specific mortality and impact analysis would be desirable, these combined factors could relate to all bat species documented in the project area. Also important is that the DEIS cited documentation suggesting that bats may travel back and forth through project siting corridors several times per night. Blade speed is a significant variable in bat mortality associated with wind generation facilities. Current behavioral data also indicates that periods of seasonal and day-period movement of migratory bats have been identified in recent research. Distinct activity during fall migration season was also apparent in acoustic monitoring surveys of the area. Curtailment, based in part on this migration analysis, can reduce bat mortality by over 60%.18 ICL recommends using known and emerging research on efficacy of curtailment technologies to minimize those impacts. Effective practices should be implemented from the start of project operations. Additionally, the DEIS indicates that bat use in the project area and surrounding areas is largely unknown, but proposes no additional work to discover more about local bat populations and behavior. Nevertheless, five species known to be using the area were determined to have a moderate or high potential for population-level impacts. The Snake River plain encompasses very important bat habitat, including for	As described in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations), the potential for some bat species to experience large population declines due to the continued spread of WNS was considered when determining which species may experience population-level impacts from collisions with operational turbines under the action alternatives. The Townsend's big-eared bat is analyzed in Table App3-2 in EIS Appendix 3 (Issues Analyzed in Brief). Cumulative effects from other planned projects in the analysis area are discussed in EIS Section 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts). Proactive mitigation measures such as feathering turbine blades when wind speeds are below the cut-in speed for the turbine (applicant-committed measure 160). Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction bat fatality monitoring to assess bat fatality; adaptive management measures would be implemented as needed if high fatality rates are observed, and additional monitoring would be conducted to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), this approach is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). Detailed studies of migratory routes in the analysis area are beyond the scope of the EIS but are included as potential adaptive management or compensatory mitigation for avian and bat species; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details.

Comment ID	Commenter	Public Comment	Response to Comment
		hibernacula, north-south fall migration routes and maternity colonies. In addition to echo-location, bats also use visual cues to migrate and fly at low speeds, indicating a complex relationship to large physical structures on the landscape. Given that several more wind power-generation facilities are planned in the Snake River plain, ICL believes that the BLM should encourage more study work on bats in south-Central Idaho to assess: migration and other seasonally-driven behavior variables, food availability, weather 17 Steven M. Grodsky, Melissa J. Behr, Andrew Gendler, David Drake, Byron D. Dieterle, Robert J. Rudd, Nicole L. Walrath, Investigating the causes of death for wind turbine-associated bat fatalities, Journal of Mammalogy, Volume 92, Issue 5, 14 October 2011, Pages 917–925, https://doi.org/10.1644/10-MAMM-A-404.1 18 Adams EM, Gulka J, Williams KA (2021) A review of the effectiveness of operational curtailment for reducing bat fatalities at terrestrial wind farms in North America. PLoS ONE 16(11): e0256382. effects (Baerwald and Barclay 2011)19 and cumulative effects from wind power expansion in the area. Macro and micro-citing should be based on an accumulation of knowledge of the interplay between these factors. 19 Baerwald EF, Barclay RMR (2011) Patterns of activity and fatality of migratory bats at a wind energy facility in Alberta, Canada. J Wildl Manag 75(5):1103–1114. doi:10.1002/jwmg.147	
11598-29	Idaho Conservation League	Typos and corrections The DEIS contains the following typo: In Idaho, data are available for a single facility (Horse Butte Wind), which reported bat fatality rates of 7.80, 9.27, and 5.12 bat fatalities per MW per year across 3 years of study (WEST 2021c). The Horse Butte Wind energy facility is approximately 55 miles southwest southeast of the siting corridors in similar sagebrush steppe habitat but	This sentence ends with “but includes forested and riparian habitats that are lacking in the siting corridor.” No revisions are necessary.
11598-33	Idaho Conservation League	White-nose fungus White-nose fungus, which has had devastating impacts on bat populations, was recently seen in Idaho. The DEIS should factor white-nose fungus into the cumulative effects analysis and identify what strategies might be employed to avoid, minimize and mitigate impacts.	The potential for WNS to lead to future declines of cave-hibernating bat populations in the analysis area is disclosed in EIS Section 3.3.1.1 (Bat Populations and Roosting Habitat, Affected Environment). Although the big brown bat, little brown bat, and western small-footed bat have a low likelihood of colliding with operational turbines, these species were analyzed in detail in the EIS (see Section 3.3.1.1.2 [Bat Populations]) because of their potential to be heavily impacted by WNS in the future. Additional discussion is provided in EIS Section 3.3.1.1.3 (Bat Populations and Roosting Habitat, Existing and Future Trend and Actions) and EIS Section 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts).
11753-3	Mary Rios	Bats are very important to our ecosystem, which include our farms, since we are an agricultural state. The EIS statement claims that bats may be in danger due to the turbines, I think they need to change the word may to will. Here are several sentences that are stated on page 107 of the EIS statement-”Species with small, declining populations may be vulnerable to small increases in mortality as a result of collisions with turbines. Species with larger, more stable populations may also be vulnerable to population declines if very high fatality rates from turbine collisions are sustained over a long time period. Each of the bat species with the potential to occur in the siting corridors (see Table 3.3-1) was evaluated for its likelihood of colliding with turbines and the potential for those fatalities to lead to population-level effects (see Table App3-2 in EIS Appendix 3). Twelve of these species were determined to have a low likelihood of population-level effects. Though effects to these 12 species may occur (as analyzed and described in Table App3-2 in EIS Appendix 3),experience a readily detectable population decline in the analysis area.” This research was based on other wind farms. But those wind farms’ turbines were not as large as the wind turbines that will be put in, in the Magic Valley. My students and I did a lot of research on bats and how many insects they eat in one night. On most websites, it stated that a single bat can eat anywhere from 3,000 to 4,500 insects in one night. It will not be a good thing for our farmers in our state, if the bats’ populations are affected by this huge wind project. This project would definitely have a negative effect on their populations. On page 110 of the EIS statement it states: “Post Construction monitoring at existing U.S. wind facilities indicates that migratory tree bats account for most (72%) of the bat fatalities from collisions with turbines (AWWI 2018; Peters et al. 2020). The migratory behavior of these species (e.g., flight paths, flight height, migratory stopover habitat) are not well understood, which makes it difficult to determine the specific attributes that lead to the increased collision risk for these species (Hein and Schirmacher 2016; Peters et al. 2020). However, in general, it is expected that collision risk during migration to and from breeding grounds is higher for migratory tree bats because they must fly more frequently and over greater distances than cave-hibernating bats.” On page 111, it states- “Both the hoary bat and the silver-haired bat are BLM special-status species for the SFO and are Idaho Tier II SGCNs (see Table 3.3-1), which indicates management intervention will likely be necessary to prevent long-term declines in these species and to prevent a trend toward federal listing under the ESA.” So this means that the tax payers would have to pay for this intervention that will be needed by these bat populations so that they will not go extinct due to the wind turbines. This is an expense that we should not have to pay for. So for the bats’ populations in Idaho, the no build option is the only way to go. The BLM needs to vote for option A.	EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations and Roosting Habitats) describes bat species that have a moderate to high risk of experiencing population-level impacts from collisions with turbines; EIS Section 3.3.1.2.2 describes the mitigation measures that would be implemented to minimize or avoid impacts to bats. MVE would bear the cost of implementing all mitigation measures. While it is possible that insect populations could increase locally if predation by bats is reduced, operational turbines can also kill large numbers of insects. See EIS Section 3.11.1.2 (Pollinators, Impacts). However, it is not possible to further quantify the potential magnitude of this impact or the consequences to local agriculture due the lack of studies on this subject (Voigt 2021). Voigt, C.C. 2021. Insect fatalities at wind turbines as biodiversity sinks. *Conservation Science and Practice.* Available at: https://www.researchgate.net/publication/348790564_Insect_fatalities_at_wind_turbines_as_biodiversity_sinks. Accessed December 29, 2023.
11869-22	Raul Labrador, Josh Turner; Idaho Attorney General’s Office	Beyond wild game, the Project will devastate many other vulnerable animal populations in Idaho. The hundreds of sweeping blades slicing through the air, for example, are known to pulverize bat and bird populations.2 Increased mortality from wind farms has even pushed some bat species to the point of extinction.3 These devastating impacts will affect the rest of Idaho’s ecosystem. Bats maintain an equilibrium in the insect population and ensure that insects don’t overwhelm local crop output. And a reduction in the predatory bird population will lead to a corresponding increase in rodents that harm crops. The draft EIS proposes no adequate alternative to harmful effects on Idaho’s wildlife. While the draft EIS generally acknowledges the Project will harm Idaho wildlife, it still suggests preferred proposed alternatives that will cause “irreversible” damage to Idaho wildlife. Importantly, the Idaho Department of Fish and Game designates several bat species as “species of greatest conservation need” (SGCNs).4 The agency knows that the Project will very likely have a “population-level” effect on several of these SGCN bat species, but it disregards those consequences. DEIS 3-37, 3-41–42.	See EIS Section 3.1.2.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) for the definition of irreversible and irretrievable commitments, which are related to the duration of the impact rather than the severity or magnitude. Special-status avian and bat species, including those designated as SGCNs by IDFG, were individually assessed for their populations to be impacted by wind energy development, as described in EIS Section 3.3.1.1 (Bat Populations and Roosting Habitat, Affected Environment) and Section 3.3.2.1 (Avian Populations, Affected Environment). Those species with a moderate to high potential for impacts are analyzed in detail in Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) and Section 3.3.2.2 (Avian Populations, Impacts). Species with a low potential for impacts are analyzed in Table App3-2 and App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Due to the potential for significant impacts to special-status avian bat species, a number of avoidance, minimization, and mitigation measures would be implemented as described in the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation). As described in EIS Section 3.3.1.3 (Bat Populations and Roosting Habitats, Irreversible and Irretrievable Commitments and Short-term Uses Versus Long-Term Productivity) and

Comment ID	Commenter	Public Comment	Response to Comment
			Section 3.3.2.3 (Avian Populations, Irreversible and Irretrievable Commitments and Short-term Uses Versus Long-Term Productivity), irretrievable impacts to birds and bats would not be considered irreversible because they would be unlikely to result in a trend toward listing under the ESA or a loss of population viability. As described in response to comment 11753-3 (see in Table A-3b, Bats), there have been no studies quantifying the impact of bat fatalities at wind energy facilities on local insect populations, but mortality of these insects would also increase as a result of collisions with operational turbines.
11871-11	WildLands Defense	Recent research shows turbine bat and bird kills are likely drastically under-estimated. Studies used for comparison used flawed methods and did not rely on detection dogs and/ir frequent enough surveys. The SEIS states: The project's highest estimated bat fatality fate from collisions with turbines is: 1,800–3,141 (mean), 8,880–15,496 (maximum) bats per year. This may lead to population-level effects for some species of migratory tree bats and cave-hibernating bats whose populations are reduced by white nose syndrome. We stress that mortality is highly likely to be orders of magnitude greater – given flaws in many of the studies (including those of WEST and other industry consultants who deliver products massaged and wordsmithed to please industry). There is credible evidence that many of the past volant species mortality studies were done on the basis of survey methodologies that greatly under-estimated mortalities. In scientific retrospect, many studies were not done using search dogs and were not conducted frequently enough to provide an adequate representation.	Multiple sources of bat fatality estimates were considered in the EIS. Postconstruction bat fatality monitoring studies include adjustments for searcher efficiency and search interval. The TAC will determine the appropriate carcass search methods for postconstruction avian and bat fatality monitoring for the project based on the best available scientific literature and data. EIS Appendix 4 (Mitigation) has also been revised to include additional details on the TAC and their responsibilities (see additional measure mm), and to include the full Avian and Bat Postconstruction Monitoring Plan, which provides additional details on the bat fatality monitoring protocols.
11871-37	WildLands Defense	The presence of irrigated pastures in association with Spring Valley Wind in Nevada provided a critical resource for bats in migration. Is the same effect happening here? DEIS at 3-36 states: "During the second year of project acoustic monitoring surveys, much higher bat activity was recorded at the acoustic monitoring stations installed near the irrigation canals in the siting corridors than at monitoring stations installed near cave features (see Figure 3.3-2), confirming that concentrated foraging activity occurs along the canals (WEST 2022a). Data collected from NABat stations during the second year of acoustic monitoring surveys revealed that bat use and species diversity were higher at stations near rock features (which are likely to be used for roosting) and near stock ponds than at stations where these features were absent (WEST 2022a)". The DEIS the tries to discount the information – claiming lower bats in this area of the SRP from summer monitoring. But these areas may be crucial during migration – as was the case with Spring Valley wind.	As described in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations), "Characterizing the abundance of individual bat species in the siting corridors is not possible with acoustic monitoring data alone because individual bats may be recorded passing the same detector multiple times. Due to the general lack of detailed long-term studies on bats, it is also difficult to determine how bat abundance and use in the siting corridors compare to other locations within the analysis area. However, the recent publication of the first results of the North American Bat Monitoring Program have begun to shed some light on spatial variations in bat occupancy (Udell et al. 2022). Results are only available for five of the bat species listed in Table 3.3-2, but summer occupancy maps for all five of these species clearly show that bat occupancy in the Snake River Plain is substantially lower than surrounding areas. This is consistent with the low bat activity observed during summer acoustic monitoring surveys (WEST 2021a, 2022a). Winter abundance maps were not yet available at the time of this draft, and occupancy during migration is not included in the study. The pronounced peak in bat activity during the fall migratory season recorded during project acoustic monitoring surveys indicates that bats have the potential to pass through the siting corridors in large numbers, even if little bat use is occurring during the summer and winter (when bats would be hibernating)." Additional information on bat foraging and migration in the siting corridors is provided in EIS Section 3.3.1.1.2 and AIB-8 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief). New measures to protect ephemeral surface waters that may be used foraging bats have been added to the final EIS (see additional project-specific measure bb).
11871-44	WildLands Defense	There are extensive flaws in use of any comparative data such as this. See for example: https://www.mdpi.com/1424-2818/12/3/98 "Abstract: Wind turbine collision fatalities of bats have likely increased with the rapid expansion of installed wind energy capacity in the USA since the last national-level fatality estimates were generated in 2012. An assumed linear increase of fatalities with installed capacity would expand my estimate of bat fatalities across the USA from 0.89 million in 2012 to 1.11 million in 2014 and to 1.72 million in 2019. However, this assumed linear relationship could have been invalidated by shifts in turbine size, tower height, fatality search interval during monitoring, and regional variation in bat fatalities. I tested for effects of these factors in fatality monitoring reports through 2014. I found no significant relationship between bat fatality rates and wind turbine size. Bat fatality rates increased with increasing tower height, but this increase mirrored the increase in fatality rates with shortened fatality search intervals that accompanied the increase in tower heights. Regional weighting of mean project-level bat fatalities increased the national-level estimate 17% to 1.3 (95% CI: 0.15–3.0) million. After I restricted the estimate's basis to project-level fatality rates that were estimated from fatality search intervals <10 days, my estimate increased by another 71% to 2.22 (95% CI: 1.77–2.72) million bat fatalities in the USA's lower 48 states in 2014. Project-level fatality estimates based on search intervals <10 days were, on average, eight times higher than estimates based on longer search intervals. Shorter search intervals detected more small-bodied species, which contributed to a larger all-bat fatality estimate. "Fatality estimation can also be more accurate by using scent-detection dogs in place of human searchers. Where dogs were used at the same turbines concurrently searched by humans, and monitoring methods were otherwise the same, 71 bat fatalities were found, where humans found one . At another project previously monitored for three years by humans, fatality finds using dogs resulted in a bat fatality estimate that was 11 times higher than the estimate based on human searchers, despite the search interval and maximum search radius being equal [114]. Dogs can find trace evidence of bats that human searchers would unlikely find, and likewise they can find bats hidden in tall vegetation recent use of scent-detection dogs suggests that searcher detection rates likely biased fatality estimates to be low through 2014. Whereas fatality estimators are often compared for their accuracy [111 , 115 ,116], accuracy in fatality estimation is most substantially affected by the field methods used to inform the terms of the estimators. Accuracy in fatality estimation depends on detecting as many of the fatalities as possible and accurately adjusting the fatality count for the proportion undetected. Finding more of the fatalities diminishes the necessary adjustments along with the adjustments' error and biases. Accuracy in 'all bat' fatality estimation depends on detecting all of the species represented by fatalities. Unless the monitor is aware of which species could have been found but were not found, there is no suitable adjustment for increasing the accuracy of negative findings of a species". We are greatly concerned that the consultant knows who butters its bread, and uses questionable, out-dated and industry-slanted methodologies and mortality comparisons in its avian and bat studies and reports	The estimated bat fatality rates and analysis of impacts to bat populations presented in EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) are based on the best publicly available literature and data. Additional details on bat fatality rates at existing wind energy facilities in Idaho have been added to this section. As stated in the analysis assumptions in Section 3.3.1 (Bat Populations and Roosting Habitat), fatality rates are not intended to be precise predictions but are presented to allow for a meaningful comparison between the alternatives. Precise estimates of bat fatality rates are not essential to a reasoned choice among alternatives because there are currently no widely accepted estimates of bat population sizes or populations trends for most species that could be used to assess the potential effects to a population from specific fatality rates. Despite the lack of this information and the uncertainty in the magnitude of the impact of wind energy development on bat populations, the EIS concludes that, without mitigation, the action alternatives have the potential to result in significant impacts to several species of bats including migratory tree bats, which are known to collide with operational wind turbines in large numbers as well as several species of cave-hibernating bats that do not collide with operational turbines frequently but that may be susceptible to small increases in mortality if their populations decline due to WNS in the future. Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction bat fatality monitoring to assess bat fatality rate. The TAC will determine the appropriate carcass search methods for postconstruction avian and bat fatality monitoring for the project based on the best available scientific literature and data. Adaptive management measures would be implemented as needed if high fatality rates are observed, and additional monitoring would be conducted to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), this approach is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).

Comment ID	Commenter	Public Comment	Response to Comment
		associated with this EIS. The Lava Ridge project very likely greatly underestimates mortality – based on flawed and out-dated mortality detection estimates at other facilities.	
11871-45	WildLands Defense	WEST states: "The assessment of potential impacts to avian and bat species at the Project was informed by the Tier 1–3 studies conducted for the Project along with the most up-to-date publicly available information on impacts to wildlife from wind energy" This is not the case, as many recent studies highlighting harms caused by wind, are not included, and the EIS constantly minimizes environemntla concerns. Further, LS Power has not revealed the specifics of the turbine type to be used, and specific siting sufficiently. West at 6: "The AWWI has compiled publicly available data from 193 studies across 130 WEFs in the US and reported 281 species of birds as fatalities during surveys and an additional 13 species as incidental observations (AWWI 2019). Of the studies between 2002 and 2017, fatality estimates in the US ranged from approximately zero to 12.0 birds/MW/year, with a median value of 1.8 (AWWI 2019). The all bird fatality rate for 28 studies in the USFWS Pacific region appears to be approximately 2.0 birds/MW/year (see Section 2.2.1.3; AWWI 2019)". "Across all spatial scales examined in this report, fatality estimates ranged from zero to 9.15 fatalities/MW/year; median and mean estimates ranged from 2.28–2.66 (median) to 2.50–2.90 (mean) across all spatial scales (Table 2, WEST 2021). Fatality estimates from scales with low sample sizes (e.g., Idaho) should be interpreted with caution". Given the shocking increase in carcass detection when dogs are used to detect dead bats and birds, as detailed in Smallwood 2020, shouldn't all or nearly all of the mortality estimates be viewed as extreme underestimates of mortality??? The DEIS mortality estimates are deeply flawed, and reflect the use of out-dated deficient detection methods. As descried in the Smallwood 2020 article for bats above, similar deficiencies of detection, study design, human deservers vs. scent dogs, frequency of surveys, turbine type, etc. plague WEST's use of a mishmash of old avian wind mortality monitoring efforts. Smallwood 2020 concluded: "Summary, I estimated 2.22 million bat fatalities across the USA in 2014, but with a 95% CI of 1.77 million to 2.72 million bat fatalities. My estimate was made in the face of very substantial biases, potentially shifting the mean lower by a factor of three and higher by up to a factor of 11. The proportion of mortally injured bats leaving the search areas under their own volition, otherwise known as crippling bias [109], could also shift my USA-wide estimate higher [114]. Furthermore, since 2014, the installed capacity of wind energy has increased 52% to 100,025 MW, and bat fatalities likely increased proportionally with this increase in capacity, so long as the pool of vulnerable bats has not diminished. The decline of hoary bats in the Pacific Northwest [126] suggests that the pool of vulnerable bats might be diminishing. It is imperative, therefore, that methods of fatality monitoring improve to more accurately estimate bat fatalities. Future fatality monitoring could vastly improve the accuracy of fatality estimation, by replacing human searchers with scent-detection dogs. It is also imperative that the benefits of wind energy be weighed against the ecological costs [127 ,128]. Improved methods are also imperative for measuring the efficacy of mitigation measures [129], such as operational curtailment strategies [130–133] and deterrents [134]".	See response to comment 11871-44 (in Table A-3b, Bats) for a discussion of the bat fatality estimates presented in the EIS and postconstruction bat fatality monitoring. As also stated in that response, the estimated bat fatality rates and analysis of impacts to bat populations presented in EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) are based on the best publicly available literature and data; the WEST baseline resource reports were one of many sources evaluated. The BLM also coordinated with state and federal wildlife agencies to obtain additional data and expert input to help inform the analysis of impacts to bat populations. Subsequent to the publication of the draft EIS, the BLM requested additional data from IDFG on postconstruction bat fatality monitoring studies at existing wind energy facilities in Idaho; the bat fatality rates observed at these facilities are consistent with the bat fatality estimates presented in the EIS. A discussion of the data from the facilities has been added to EIS Section 3.3.1.2.2. Although it is not possible to precisely quantify the impacts to bat populations from mortality caused by collisions with operational wind turbines, the BLM's literature review and expert consultation provided sufficient evidence to conclude that the action alternatives could lead to significant impacts to some bat species (such as migratory tree bats and cave-hibernating bats vulnerable to the continued spread of WNS). Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction bat fatality monitoring to assess bat fatality rates. The TAC will determine the appropriate carcass search methods for postconstruction avian and bat fatality monitoring for the project based on the best available scientific literature and data. Adaptive management measures would be implemented as needed if high fatality rates are observed, and additional monitoring would be conducted to assess the effectiveness of adaptive management measures. The BBCS (Appendix M in MVE [2023]) provides additional details on the measures MVE would implement to minimize or avoid impacts to bat populations. EIS Appendix 4 (Mitigation) describes additional mitigation measures that BLM would require MVE to implement to further reduce impacts (see Table App4-4). If unresolved impacts to bat populations remain after the implementation of the measures, compensatory mitigation would be required (see Mitigation Framework for Birds and Bats in EIS Appendix 4). Together, the implementation of these mitigation measures will allow the BLM to more accurately assess the fatality rate for individual bat species and provide flexibility so that specific adaptive management measures can be targeted to reduce those fatalities as needed. Additional bat fatality monitoring would then be implemented to assess whether adaptive management has been successful at reducing fatalities or if additional adaptive management or compensatory mitigation measures are needed to address unresolved impacts. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012) and provides the best opportunity to address site-specific impacts while minimizing the impact to the facility's power generation.
11871-57	WildLands Defense	Report Table 6 species refers to tier species – but the info in the table does not seem to mesh with the Table footnote wording.	The tiers in this table correspond to the tiers in the table note as follows: Tier I = Tier 1, Tier II = Tier 2, and Tier III = Tier 3. This table is part of MVE's *Analysis of Avian and Bat Mortalities at Existing Wind Facilities* (WEST 2021c), which is one of many data sources evaluated for the analysis in EIS Section 3.3 (Avian and Bat Species). This section describes the current listing status of each species analyzed in detail in the EIS, the listing status of other special-status avian and bat species with the potential to occur in the siting corridors is provided in Table App3-2 and App3-3 in EIS Appendix 3 (Issues Analyzed in Brief).
11871-58	WildLands Defense	14 bat species have been detected here. The WEST consultant report attempts to minimize significance of area to bats and the number of species found here – claiming - a "moderate" number of species. This is major bat biodiversity for this region, Nearly all of these are BLM sensitive species where BLM is required to manage habitats and populations to prevent the need for ESA listing. Again, unbiased scientific analysis must be provided using new studies and a new EIS process.	See responses to comments 11871-44 (see in Table A-3b, Bats) and 11871-45 (see in Table A-3b, Bats) for a discussion of data sources evaluated in the EIS. As described in those responses, the WEST baseline resource reports were one of many sources evaluated. Table 3.3-2 in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations) describes the bat species that have the potential to occur in the analysis area; as shown in this table, 17 bat species may occur in the siting corridors, 11 of which are designated as a BLM special-status species. All 17 bat species were individually assessed for their potential to experience population-level impacts from collisions with operational turbines under the action alternatives; five of these species were determined to be at high risk and are analyzed in detail in Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts). The remaining 12 species were determined to be at low risk and are analyzed in brief in Table App3-2 in EIS Appendix 3 (Issues Analyzed in Brief). The impacts analysis in Section 3.3.1.2 discloses the potential for Alternative B to result in high fatality rates that would not be consistent with the BLM's obligations to manage special-status species. To ensure that the action alternatives do not contribute to a trend toward federal listing or loss of population viability for these species, the BLM has proposed additional mitigation measures that would be required under all action alternatives to further minimize impacts to bats (see response to comment 11871-45 [see in Table A-3b, Bats] for additional details).
11871-66	WildLands Defense	Craters of the Moon National Monument and Preserve that contains the nearest maternity colony of Townsend's big-eared bat. It is simply wrong to make this claim: "Impacts to this species are not expected based on the lack of fatalities in the US and its foraging behavior at low altitudes. The limited number of studies and facilities with publicly available data in Idaho adds uncertainty to the timing and magnitude of fatality predictions for bat species of concern in Idaho".	The conclusion that Townsend's big-eared bats have a low likelihood of colliding with turbines is based on the best available scientific data. As described in Section 3.3.1.2.2, postconstruction monitoring would be implemented to assess bat fatality; adaptive management measures would be implemented as needed if high fatality rates are observed.
11871-67	WildLands Defense	Lava Ridge Bird and Bat Conservation Strategy Is Minimal, and Deficient M-63 is chock full of uncertainty: "Additional on-site studies may be considered to further understand impacts before mitigation options are implemented, such as focused avian surveys, site evaluations of potential attractants (i.e., prey base, perching substrate), more intensive fatality monitoring studies, or other focused studies. Adaptive management options that MVE will consider, depending on the results of the postconstruction mortality monitoring and taking into account economic feasibility, include, but	Bat and avian use in the siting corridors, including migratory patterns, is described in EIS Appendix 9 in Section 3.3.1.1.2 (Bat Populations, Bat Use in the Siting Corridors) and Section 3.3.2.1.1 (Avian Use in the Siting Corridors), respectively. As described in EIS Section 3.3.1.2 (Bat Populations) and Section 3.3.2.2. (Avian Populations, Impacts), preconstruction bat and avian use is not correlated with postconstruction fatality rates; therefore, postconstruction

Comment ID	Commenter	Public Comment	Response to Comment
		are not limited to, the following: Addition or modification of anti-perching, anti-nesting, or electrocution protection devices on project facilities; Providing physical samples to the U.S. Geological Survey or other agencies interested in analyzing such samples; Providing funding for research or conservation efforts to be implemented for the benefit of impacted species; Installation of bat deterrents at selected turbines (such as those commercially available from NRG Systems, https://www.nrgsystems.com/products/bat-deterrent-systems) based on the most effective options available at the time of implementation; Development of a strategic curtailment program, with operational adjustments as further defined below; and, Any additional mitigation measures which may be required under the adaptive management framework implemented per the Eagle Take Permit conditions from USFWS. An operational curtailment strategy, which would involve feathering turbine blades within wind speed ranges defined based on species of concern, to be implemented during peak migratory periods at locations shown to significantly contribute to fatalities. Peak periods and locations would be identified based on postconstruction fatality monitoring results, acoustic monitoring data, and/or radar studies; The wind developer has WASTED several years inf failing to conduct studies necessary to determine species use and migration patterns. Solid pre-decisional data must be collected, and reliance on a rickety uncertain 'adaptive" plan after the project is built ca not rectify inadequate pre-decisional data and analysis needed to actuslly take a hard look under NEPA at alternatives. There are sophisticated radar and other technologies available. Detailed pre-decisional data on migration and migration paths must be collected and provided to the public in a SEIS.	monitoring would be implemented to assess bat and avian fatality; adaptive management measures will be implemented as needed if high fatality rates are observed.
11871-75	WildLands Defense	Bat Mortality from Collisions and Barotrauma The bat killed by wind turbine blades Bats that fly too close to wind turbines are killed by either direct impact or from major air pressure changes around the spinning rotors. While bats clearly are killed by direct collision with turbine blades, up to 50 percent of the dead bats around wind turbines are found with no visible sign of injury. The cause for this non-collision mortality is believed to be a type of decompression known as barotrauma, resulting from rapid air pressure reduction near moving turbine blades. Barotrauma kills bats near wind turbines by causing severe tissue damage to their lungs, which are large and pliable, thereby overly expanding when exposed to a sudden drop in pressure. By contrast, barotrauma does not affect birds because they have compact, rigid lungs that do not excessively expand.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), "Bat fatalities from barotrauma (due to rapid changes in air pressure near spinning turbine blades) have been documented, but there is little evidence to suggest that this is an important source of mortality at wind energy facilities (AWWI 2016)." The final EIS has been revised to include a discussion of Lawson et al. (2020) and Guest and Hein (2023), which support the conclusion that there is insufficient evidence to support the conclusion that barotrauma is a significant source of bat mortality at wind energy facilities. Guest and Hein (2023) noted that reducing bat interactions with operational wind turbines is the best solution for reducing either cause of mortality (i.e., collision vs. barotrauma).
11871-76	WildLands Defense	Bat Attraction to Wind Turbines Many species of bats appear to be significantly attracted to wind turbines for reasons that are still poorly understood. Possible reasons for high bat mortality: The more plausible hypotheses include the following: 1. Auditory Attraction Bats may be attracted to the audible "swishing" sound produced by wind turbines. Museum collectors seeking bat specimens have used long poles that were swung back and forth to attract bats and then knock them to the ground for collection. It is not known if these bats were attracted to the audible "swishing" sound, the movement of the pole, or both factors. 2. Electromagnetic Field Disorientation Wind turbines produce complex electromagnetic fields, which may cause bats in the general vicinity to become disoriented and continue flying close to the turbines. 3. Insect Attraction As flying insects may be attracted to wind turbines, perhaps due to their prominence in the landscape, white color, lighting sources, or heat emitted from the nacelles, bats would be attracted to concentrations of prey. 4. Heat Attraction Bats may be attracted to the heat produced by the nacelles of wind turbines because they are seeking warm roosting sites. 5. Roost Attraction Wind turbines may attract bats because they are perceived as potential roosting sites. 6. Lek Mating Migratory tree bats may be attracted to wind turbines because they are the highest structures in the landscape along migratory routes, possibly thereby serving as ren-dezvous points for mating. 7. Linear Corridor Wind farms constructed along forested ridge-tops create clearings with linear landscapes that may be attractive to bats. 8. Forest Edge Effect The clearings around wind turbines and access roads located within forested areas create forest edges. At forest edges, insect activity might well be higher, along with the ability of bats to capture the insects in flight. Resident bats as well as migrants making stopovers may be similarly attracted to these areas to feed, thus increasing their expo-sure to turbines and thus mortality from collision or barotrauma. 9. Thermal Inversion Thermal inversions create dense fog in cool valleys, thus concentrating both bats and their insect prey on ridge-tops. https://windmillskill.com/blog/why-bats-are-insanely-attracted-wind-turbines	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), "The potential effect to individual bat species and their populations is expected to vary based on how frequently they occur in the analysis area, their risk of colliding with operational turbines (based on their flight characteristics and the frequency of fatalities observed at other wind energy facilities in the United States), and the current status of their populations (i.e., whether or not the species is vulnerable or declining)." Since the patterns of fatalities observed at existing U.S. wind energy facilities were examined to determine each species' risk of turbine collisions, the fatality estimates provided in the EIS inherently account for variability in risk factors such as potential attraction to turbines. The TAC would recommend the best minimization strategies for the species occurring in the area, which would allow for the implementation of new technologies to reduce bat fatalities as the scientific understanding of factors influencing bat mortality at wind turbines progresses.
11871-87	WildLands Defense	The DEIS tries to discount bat mortality at wind farms claiming: "There are 11,774 existing wind turbines in Canada and the United States within the analysis area for bats with a combined capacity of 8,112 MW (Hoen et al. 2018; Natural Resources Canada 2022)". Why is the EIS relying on a 2018 document in 2023? What are the specific methodologies used at each wind farm considered in these compilations? How many used digs for detection? At what intervals were searches conducted?	The Hoen et al. (2018) database is regularly updated as new wind energy facilities are constructed; as noted in the full reference provided in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), the draft EIS used Version 5.2 of the database, which was updated in October 2022. The final EIS has been updated with information from Version 6.0 of the database, which was updated in May 2023. The Hoen et al. (2018) database and Natural Resources Canada (2022) database only provide basic information on the size, location, and operational date of wind turbines installed in the U.S. and Canada, these databases do not provide any information on bat or avian fatalities associated with these turbines. These databases were queried to determine the total installed capacity of existing wind energy facilities in the analysis area to inform the cumulative effects analysis in EIS Section 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts). See responses to comments 11871-44 and 11871-45 (see both in Table A-3b, Bats) for a discussion data sources evaluated in the analysis of impacts in EIS Section 3.3.1 (Bat Populations and Roosting Habitat). Both the WEST Renew database and AWWI database aggregate postconstruction bat fatality monitoring data from studies conducted at hundreds of existing wind energy facilities across the U.S. Postconstruction bat fatality monitoring studies typically follow well established methods for conducting carcass searches and adjusting the results to account for factors such as searcher efficiency, carcass persistence, and search area, interval, and period. For additional details on study methodology please refer to the *Analysis of Avian and Bat Mortalities at Existing Wind Facilities* (WEST 2021c) and the *2nd Edition: Summary of Bat Fatality Monitoring Data Contained in AWWIC* (Allison and Butryn 2020) in the project record.

Comment ID	Commenter	Public Comment	Response to Comment
11871-88	WildLands Defense	M-35 states: “Temporally, bat activity was highest during the fall migration period, which coincides with the period when the majority of fatalities have been reported from postconstruction monitoring studies at other wind energy projects in the region (typically August and September; Arnett et al. 2008, Arnett and Baerwald 2013). Fifteen species were identified in 2021 by Kaleidoscope automatic classification, and twelve species were confirmed through qualitative review The report appears to omit showing Anabat detector location sites.	The BBCS (Appendix M in MVE [2023]) briefly summarizes the results of the 2020 and 2021 bat acoustic monitoring surveys (WEST 2021a, 2022a). The location of acoustic monitors deployed for the surveys was redacted from the public version of the BBCS to conceal the location of sensitive biological resources. The locations of acoustic monitoring stations deployed for the project as well as the locations of NABat acoustic monitoring stations from which data were obtained are shown in Figure 3.3-2 in EIS Section 3.3.1 (Bat Populations and Roosting Habitat); the ID names/numbers for some acoustic monitoring stations were not included in this figure to conceal the location of sensitive biological resources. Additional information on acoustic monitoring stations is provided in the WEST bat acoustic monitoring survey reports (WEST 2021a, 2022a) in the project record.
11871-90	WildLands Defense	The Horse Butte facility bat mortalities were considered the highest in the nation. [How was the monitoring done? Who conducted it? Since the facility was smaller, was it more thoroughly monitored? Were the usual suspect industry consultants not involved?	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), Horse Butte was the only facility in Idaho for which data were available at the time the draft EIS was published. The bat fatality rates observed during the postconstruction fatality monitoring studies at Horse Butte (7.80, 9.27, and 5.12 bat fatalities per MW per year across 3 years of study) were the highest reported in the USFWS Pacific Region and the EPA North American Deserts Level I Ecoregion but are well below the bat fatality rates reported for wind energy facilities in the eastern U.S., which are as high as 50 bat fatalities per MW per year. Subsequent to the publication of the draft EIS, the BLM requested additional data from IDFG on postconstruction bat fatality monitoring studies at six other existing wind energy facilities in Idaho; the bat fatality rates observed at these facilities are consistent with the bat fatality estimates presented in the EIS. Additional details on these studies have been added to EIS Section 3.3.1.2.2. One of these studies reported a higher fatality rate than Horse Butte (approximately 15.8 bat fatalities per MW per year), but this study monitored a non-random sample of turbines that were in high quality habitats, with most fatalities occurring at two turbines near a large reservoir with extensive cliff habitat for roosting bats. This supports the conclusion that bat fatality rates can vary widely across a single wind energy facility and that siting turbines to avoid habitat features that concentrate bat activity can substantially decrease bat fatalities at wind energy facilities. See response to comment 11871-87 (see in Table A-3b, Bats) for a description of the study methodologies for data sources evaluated in the analysis of impacts to bat populations.
11871-91	WildLands Defense	The West Report jumps back and forth between using estimates from across the US to using regional information, and lumping the whole US together. Example; “According to the AWWI (2018), the percentage of fatalities from hoary bat (31.0%), eastern red bat (24.0%), silver-haired bat (16.1%), Mexican free-tailed bat (Tadarida brasiliensis; 10.0%), and four additional species (little brown myotis [Myotis lucifugus; 5.1%], big brown bat [Eptesicus fuscus; 5.0%], tri-colored bat [Perimyotis subflavus; 1.7%], and evening bat [Nycticeius humeralis; 1.6%]), collectively account for more than 95% of all recorded bat fatality incidents in the US ...”. Well, isn’t this in significant part because of the number of studies at wind facilities not located in the interior West?	See responses to comments 11871-44 and 11871-45 (see both in Table A-3b, Bats) for a discussion of data sources evaluated in the analysis of impacts in EIS Section 3.3.1 (Bat Populations and Roosting Habitat). As stated in those responses, the WEST baseline resource reports were one of many sources evaluated. See response to comment 11535-26 (in Table A-3b, Bats) for a discussion of uncertainty in fatality estimates; EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B) specifically discloses the uncertainty in fatality estimates resulting from the underrepresentation of existing wind energy facilities in the far western and southwestern U.S. in the available data on bat fatality rates. Despite this deficiency, both migratory tree bats and cave-hibernating bats are present in the eastern U.S. and the patterns of fatalities observed in that region are consistent with the conclusion that the majority of bat fatalities that occur as a result of collisions with operational turbines can be attributed to migratory tree bats. As also described in this section, data on bat fatality rates from WEST’s (2021c) *Analysis of Avian and Bat Mortalities at Existing Wind Facilities* and the *2nd Edition: Summary of Bat Fatality Monitoring Data Contained in AWWIC* (Allison and Butryn 2020) are presented at multiple spatial scales in the EIS to provide context and to identify geographic variation in bat fatality rates at wind energy facilities, which is necessary to assess whether the project has been appropriately sited and determine what mitigation measure may need to be implemented to address bat fatalities from collisions with operational turbines. Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction bat fatality monitoring to assess bat fatality rates and determine which adaptive management measures need to be implemented if high fatality rates are observed, as well as additional monitoring to assess the effectiveness of adaptive management measures. The BBCS (Appendix M in MVE [2023]) provides additional details on the measures MVE would implement to minimize or avoid impacts to bat populations. EIS Appendix 4 (Mitigation) describes additional mitigation measures that the BLM would require MVE to implement to further reduce impacts (see Table App4-4). Together, the implementation of these mitigation measures will allow the BLM to more accurately assess the fatality rate for individual bat species and provide flexibility so that specific adaptive management measures can be targeted to reduce those fatalities as needed. Additional bat fatality monitoring would then be implemented to assess whether adaptive management has been successful at reducing fatalities or if additional adaptive management or compensatory mitigation measures are needed to address unresolved impacts. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-based Wind Energy Guidelines* (USFWS 2012) and provides the best opportunity to address site-specific impacts while minimizing the impact to the facility’s power generation.
11871-92	WildLands Defense	Horse Butte wind facility reported bat fatality estimates of 7.80, 9.27, and 5.12 bat fatalities/MW/year across three years of study, the highest in the region (SWCA 2015). Cattle grazing, grassland/herbaceous and hay/pasture, as well as sagebrush-steppe habitat are prevalent at both Horse Butte and the Project, although Horse Butte also includes forested habitat and riparian areas, which are extremely limited within the Project. WHAT about the canals that may generate abundant insect food? Again, this appears to be an effort to downplay likely mortality? The Project area has open canal features, which can be functionally similar as foraging and drinking habitat; however, the absence of trees limits roosting sites near these feature WHAT about the Milner-Gooding canal? The info and mapping used here obscures the Milner-Gooding Canal. It ignores bats potentially coming from other areas and feeding over irrigated pasture and crop fields that surround the project – and being killed in overflights of the project area.	See response to comment 11871-90 (in Table A-3b, Bats) for a discussion of bat fatality rates at Horse Butte and other wind energy facilities in the region. EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations) discloses the high likelihood that the irrigation canals that transect the siting corridors (including the Milner-Gooding Canal) provide the highest quality and most consistent drinking and foraging resources in the siting corridors and that these water resources are important habitat components for bats. Due to the potential for concentrated bat activity near these canals, MVE has committed to avoiding turbine placement with 1,000 feet of irrigation canals and avoiding wetlands and other waters to the greatest extent practicable (applicant-committed measure 138); additional measures that the BLM would require would further limit development in proximity to wetlands and other waters; additional details are provided in EIS Appendix 4 (Mitigation). New measures to protect ephemeral surface waters that may be used by foraging bats have been added to the final EIS (see additional project-specific measure bb). The alternatives analysis in Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) also describes the potential for bats travelling between roost sites and foraging areas, such as the canals, to encounter turbines during these flights and

Comment ID	Commenter	Public Comment	Response to Comment
			qualitatively assesses how this may affect the magnitude of impacts for each alternative based on the number of turbine corridors that would be located between known roost sites and the irrigation canals.
11978-11	Magic Valley Energy, LLC	Section 3.3.1 - Bat Analysis In multiple instances within the DEIS bat section, analyses are based on incomplete data, incorrect understanding of referenced materials, and overstatements of risk associated with bat use in the Project area. These flaws in the DEIS analysis lead to an inaccurate, overstated portrayal of the Project's impacts to bats. This section of the comment letter demonstrates these aspects of the DEIS bat analysis and presents MVE's requested changes in the interest of improving the FEIS with an analysis that is more consistent with the current scientific literature and observed bat use at the Project site. 12. MVE Comment: The DEIS estimates bat fatalities for the Project by assuming the fatality range will fall between the EPA North American Deserts Level I Ecoregion's mean and maximum bat fatality estimates for wind projects. The DEIS attempts to support this concept by stating, "higher fatality rates at more recently constructed facilities suggest that the shift toward larger turbines is increasing the risk of collision for bats (Barclay et al. 2007; Hein and Schirmacher 2016), in part because larger turbines operate at lower wind speeds when bats are most active." However, the DEIS citations tend to show that projects with increased bat fatalities occur mainly in eastern states (i.e., West Virginia, Tennessee) and a more recent 2020 Electric Power Research Institute (EPRI) report3 refuted the reports of Barclay et al. and Hein and Schirmacher, showing in a meta-analysis focused on bat fatality rates and turbine size that there were no apparent correlations between hub height, rotor swept area, or capacity and bat fatality levels. The DEIS assumption for estimating bat fatality rates also ignores other important considerations for estimating fatalities: Project area generally lacks foraging opportunities, surface water, and hibernacula sites, which all suggest relatively low bat use and do not support fatality estimates in excess of the mean. Therefore, the assumption reflected in the DEIS that bat fatalities will fall between the mean and maximum estimates appears unsupported. Additionally, the DEIS itself states, "there is uncertainty in the predicted fatality estimates and the consequences to bat populations." Excluding the minimum range of bat fatalities observed at other wind facilities ignores the uncertainty and contradicts this statement because the BLM is otherwise leading the public to believe that fatalities would only fall between the mean and maximum fatality rates. MVE requests that the FEIS analysis include the minimum- to lower-range of bat fatalities from the EPA North American Deserts Level I Ecoregion (estimated to be 0.0 to 0.08 bat fatalities/MW/yr) and support this possibility contextually throughout the bat section. Using the 0.08 predicted bat fatalities/MW/yr for the 6-MW output under Alternative B, an annual fatality rate of up to 168 bat fatalities from turbine collisions would be projected. This amount is 91% fewer predicted fatalities than the mean estimated fatality rate (1,800) given in the DEIS. An example of the minimum fatality rate's inclusion in DEIS Table 3.3-2 is provided below. Table 1. Revised Version of DEIS Table 3.3-2 Showing Minimum Range Bat Fatalities [see table in PDF for easier reading, below waareformatted to capture intent of table better] Alternative B Estimated generation capacity in MW: 1,200–2,094 Estimated bat fatalities per year from turbine collisions: 96 - 168 (minimum); 1,800–3,141 (mean); 8,880–15,496 (maximum) Estimated bat fatalities for project life from turbine collisions: 2,880 - 5,026 (minimum); 54,000–94,230 (mean); 266,400–464,880 (maximum) Alternative C Estimated generation capacity in MW: 1,134–1,554 Estimated bat fatalities per year from turbine collisions: 91 - 125 (minimum); 1,733–2,331 (mean); 8,547–11,500 (maximum) Estimated bat fatalities for project life from turbine collisions: 2,722 - 3,730 (minimum); 51,990–69,930 (mean); 256,410–345,000 (maximum) Alternative D Estimated generation capacity in MW: 840–1,074 Estimated bat fatalities per year from turbine collisions: 68 - 86 (minimum); 1,256–1,611 (mean); 6,194–7,948 (maximum) Estimated bat fatalities for project life from turbine collisions: 2,016 - 2,578 (minimum); 37,680–48,330 (mean); 185,820–238,440 (maximum) Alternative E Estimated generation capacity in MW: 807–1,164 Estimated bat fatalities per year from turbine collisions: 65 - 94 (minimum); 1,210–1,746 (mean); 5,972–8,614 (maximum) Estimated bat fatalities for project life from turbine collisions: 1,937 - 2,794 (minimum); 36,300–52,380 (mean); 179,160–258,420 (maximum)	In addition to the difficulty in determining what would constitute an appropriate minimum estimated fatality rate, this information would not lead to a more informed analysis because the relative impact of each alternative would remain the same. Both the bat and avian population EIS sections clearly state that the estimated fatality rates presented in Tables 3.3-4 and 3.3-12 are not intended to be precise estimates and do not account for the implementation of mitigation measures, footnotes have been added to both tables to reiterate this point.
11978-12	Magic Valley Energy, LLC	Section 3.3.1 - Bat Analysis ... 13. MVE Comment: Additionally, showing the full range (minimum to maximum) of estimated bat fatalities is consistent with applicable precedent in numerous other NEPA analyses. Both avian and bat fatalities for wind energy facilities are typically estimated in terms of fatalities per turbine or (more commonly) fatalities per megawatt (MW). MVE reviewed the avian and bat fatality estimates from the NEPA documents for a dozen wind energy projects rated at 50 MW or higher and found that in every case where fatality rates were listed, avian and bat fatalities were expressed in one of the following three ways: a) Minimum, average, and maximum fatality rates, b) Minimum and maximum fatality rates, or c) Average fatality rate only. Thus, for consistency with well-established BLM precedent and in order to describe the reasonably anticipated impacts of the Project consistent with NEPA procedures, BLM's avian and bat fatality estimates would need to be expressed in terms as described in item a, b, or c above. If the estimated fatality rates are not reported in this manner, then the FEIS should include rationale explaining why it is reasonable not to base the analysis on the entire range of fatalities or the average of that range. For reference, the avian and bat fatality estimates for the other wind energy NEPA analyses reviewed by MVE are provided in Attachment 2 to this comment letter.	See response to comment 11978-11 (in Table A-3b, Bats).
11978-13	Magic Valley Energy, LLC	14. MVE Comment: The DEIS does not account for applicant-committed measures in the calculated bat fatality rates. Importantly, MVE has committed to feathering the turbine blades when wind speeds are below the manufacturer's recommended cut-in speed. This applicant-committed measure will be implemented from the beginning of operations and has been shown to reduce bat fatalities by an average of 42.5% (Good et al., 2022). MVE believes that including this quantifiable benefit of turbine feathering would result in more realistic estimates of bat fatalities. This could be demonstrated in a table similar to DEIS Table 3.3-2, as shown below. Additional applicant-proposed measures that are expected to reduce fatalities but that are not factored into the fatality estimate include minimizing outdoor lighting, avoiding riparian areas if possible, and implementing 1,000 ft. buffers from canals. Additional measures that may reduce fatalities throughout the lifetime of the Project include adaptive management techniques listed in MVE's Bird	See response to comment 11978-11 (in Table A-3b, Bats).

Comment ID	Commenter	Public Comment	Response to Comment
		and Bat Conservation Strategy (BBCS, POD Appendix M), such as selective curtailment and acoustic bat deterrents, which can provide meaningful benefits (where one research paper reports a 66.9% reduction in bat fatalities4). Table 2. Revised Version of DEIS Table 3.3-2 Incorporating Turbine Blade Feathering Benefits [see table in PDF for easier reading, below slightly reformatted to capture intent of table better] Alternative B Estimated generation capacity in MW: 1,200–2,094 Estimated bat fatalities per year from turbine collisions with 42.5% estimated reduction from turbine feathering: 56 - 97 (minimum); 1,035 - 1,807 (mean); 511 - 8,911 (maximum) Estimated bat fatalities for project life from turbine collisions collisions with 42.5% estimated reduction from turbine feathering: 1,656 - 2,890 (minimum); 3,105 - 54,183 (mean); 153,180 - 267,306 (maximum) Alternative C Estimated generation capacity in MW: 1,134–1,554 Estimated bat fatalities per year from turbine collisions with 42.5% estimated reduction from turbine feathering: 53 - 72 (minimum); 997 - 1,341 (mean); 4,915 - 6,613 (maximum) Estimated bat fatalities for project life from turbine collisions collisions with 42.5% estimated reduction from turbine feathering: 1,566 - 2,145 (minimum); 29,895 - 40,210 (mean); 147,436 - 19,838 (maximum) Alternative D Estimated generation capacity in MW: 840–1,074 Estimated bat fatalities per year from turbine collisions with 42.5% estimated reduction from turbine feathering: 40 - 50 (minimum); 723 - 927 (mean); 3,562 - 4,571 (maximum) Estimated bat fatalities for project life from turbine collisions collisions with 42.5% estimated reduction from turbine feathering: 1,160 - 1,483 (minimum); 21,666 - 27,790 (mean); 106,847 - 137,103 (maximum) Alternative E Estimated generation capacity in MW: 807–1,164 Estimated bat fatalities per year from turbine collisions with 42.5% estimated reduction from turbine feathering: 38 - 55 (minimum); 696 - 1,004 (mean); 3,434 - 4,954 (maximum) Estimated bat fatalities for project life from turbine collisions collisions with 42.5% estimated reduction from turbine feathering: 1,114 - 1,607 (minimum); 20,873 - 30,119 (mean); 103,017 - 148,592 (maximum)	
11978-14	Magic Valley Energy, LLC	15. The DEIS states: "… to comply with 40 CFR 1502.2(b), this EIS has only [a] brief discussion of other than significant issues" and focuses on species with a moderate to high likelihood of population- level effects from the project. The five species (big brown bat, little brown bat, western small- footed bat, hoary bat, and silver-haired bat) that were determined to have a moderate to high potential for population-level effects are described in detail below." a. MVE Comment: Although the DEIS does not provide details establishing what the effects thresholds would be for making a determination regarding population-level effects for the five bat species (big brown bats, little brown bats, western small-footed bats, hoary bats, and silver-haired bats) the current body of scientific literature does not indicate the potential for moderate to high population level effects from the Project as discussed below. The DEIS states that big brown bats and western-small footed bats appear to have stable populations, and also have a low collision rate with wind turbines (since they rarely fly within the rotor swept height of the Project-available turbines). Little brown bats also have a low collision rate with turbines, as only 647 total turbine-related bat fatalities were recorded in the U.S. between 2006 and 20165. Additional curtailment technologies are also beneficial to these species. These technologies can offer up to 94.4% fatality reductions to big brown bat fatalities6 and as much as 91.4% reduction for little brown bats7. Though data on curtailment effectiveness is limited for western small-footed bats, the call frequency range of this species is similar to the little brown bat therefore a similar fatality reduction rate would be expected for acoustic deterrents. While hoary bats and silver-haired bats do have higher collision rates, curtailment methodologies have shown that fatalities for both of these species can be reduced by 81.4% and 90.9%, respectively8. MVE suggests the FEIS reevaluate the impacts to these species based on the information above, which suggests that the Project would not have a moderate to high likelihood of population-level effects.	As described in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations), "even though there are substantial limitations to quantitatively assessing impacts to bat populations, given the sensitivity of bat populations to increased mortality and the large number of fatalities that have been observed at existing wind energy facilities, it is widely accepted that turbine collisions have the potential to cause major declines in the populations of some bat species." This conclusion is supported by multiple lines of evidence presented in the publicly available literature and the BLM's coordination and consultation with state and federal wildlife agencies as well as NREL. Migratory tree bats experience the greatest mortality at existing U.S. wind energy facilities and these species warrant close examination in the EIS and the development of a robust mitigation framework to ensure that the BLM's actions are consistent with its responsibilities to ensure that the selected alternative does not contribute to a trend toward federal listing or loss of population viability for these species. Though it is true that the cave-hibernating bat species analyzed in detail have not been recorded as fatalities in large numbers at existing U.S. wind energy facilities, there is insufficient data to conclude with certainty that these species will continue to experience low fatality rates from collisions with operational turbines as wind energy continues to expand in the western U.S. Many bat species in the west appear to have different migratory patterns and roosting behavior than their populations in the east, which may affect their risk of turbine collisions. For bat species like little brown bat that have already experienced major declines in the eastern U.S., the low number of fatalities observed at existing U.S. wind energy facilities may be due to the predominance of studies at existing wind energy facilities within the portion of their range that has already been severely impacted by WNS in the data sources evaluated for the EIS. However, as also described in EIS Section 3.3.1.1.2, even a small number of fatalities from collisions with operational turbines could have population-level impacts for cave-hibernating bat populations that have already experienced significant population declines from WNS. While WNS has only recently spread to the western U.S. and large population declines have not yet occurred, each bat species with the potential to occur in the siting corridors was individually assessed for its potential experience population-level effects from fatalities caused by collisions with operational turbines. Each species susceptibility to future population declines from the spread of WNS was considered in this assessment as it has a strong influence on future populations sizes and trends, and thus, strongly influences the potential for fatalities from collisions with operational turbines to result in population-level impacts. The BLM's review of the publicly available literature indicated that big brown bat and little brown bat are at a moderate to high risk of impacts from WNS. Less is known about the effects WNS will have on the western small-footed bat because it has only recently been detected in the species, but their similarity to other species that have been severely impacted by WNS indicates that there is a potential for large population declines to occur. The siting corridors are also located in the same region as the largest known hibernacula for the species. Therefore, the potential for significant impacts to these cave-hibernating bat species cannot be ruled out and detailed analysis in the EIS is warranted. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B) the publicly available literature reveals wide variability in the efficacy of mitigation measures for bats and Tier 4 studies would be necessary to estimate the actual bat fatality rate following construction and to evaluate the effectiveness of both preconstruction and postconstruction avoidance and minimization measures. The TAC would be responsible for evaluating the results of the Tier 4 studies and recommending which adaptive management measures need to be implemented if high bat fatality rates are observed (see EIS Appendix 4 [Mitigation] for additional details).
11978-15	Magic Valley Energy, LLC	16. MVE Comment: The DEIS states: "Data are also lacking on how fatality rates at existing wind facilities change over time, and it is unknown whether initially high fatality rates may decline over time as bats adjust their behavior in response to the presence of the wind energy facility, as habitat is degraded or lost, or as the size of bat populations decline." However, arguably all data shows that rates do not remain at the estimated maximum annual fatality rate throughout operation of a wind facility, as shown in the NWCC 20109 report, which shows multi-year postconstruction monitoring results for over 10 facilities. Further, as previously mentioned, adaptive management measures would prevent annual maximum fatality rates.	The BLM is unaware of any publicly available data on long-term fatality rates at existing U.S. wind energy facilities, most, if not all, studies included in National Wind Coordinating Collaborative (2010) and the databases evaluated when estimating potential fatality rates were conducted during the first 3 to 5 years of a facility's operations. Thus, there is insufficient information to determine how fatality rates may change over the proposed 30-year operation phase for the project. The EIS does not assume that fatality rates under any action alternative would initially be at the maximum estimated rates presented in Table 3.3-4 and specifically states that those estimates do not account for the implementation of mitigation measures. As described in the response to comment 11978-11 (in Table A-3b, Bats), a table note has been added to Table 3.3-4 to emphasize this. As described in the response to comment 11978-14 (in

Comment ID	Commenter	Public Comment	Response to Comment
			Table A-3b, Bats), Tier 4 studies would be necessary to estimate the actual bat fatality rate following construction and to evaluate the effectiveness of both preconstruction and postconstruction avoidance and minimization measures. The TAC would be responsible for evaluating the results of the Tier 4 studies and determining which adaptive management measures need to be implemented if high bat fatality rates are observed (see EIS Appendix 4 [Mitigation] for additional details).
11978-16	Magic Valley Energy, LLC	The DEIS states: “High bat use has been documented at the irrigation canals toward the western limits of the siting corridors and at presumed roosting features toward the far eastern limits of the siting corridors (WEST 2022a), which are separated by a distance of less than 15 miles, suggesting that bats may cross the siting corridors multiple times each night when travelling between roost sites and foraging areas.” It should be noted that there are likely foraging areas outside the analysis area that would not require passes through turbine strings. Of the species mentioned in Section 3.1.2.2 as being affected by the turbines, myotis species, including little brown bat and big brown bat, and silver-haired bats all have foraging distances less than 3.5 kilometers (2.17 miles) from roosts 10. Western-small footed bats have foraging distances of 6 to 24 km (3.7 to 14.9) miles11, and hoary bats have distances of up to 20 km (12.4 miles)12. All of these foraging distances are under the 15-mile route from the canal to the eastern siting corridor. This sentence should be removed from the analysis as it suffers from a faulty premise.	The potential foraging route between roosting features near the eastern siting corridors and the canals in the western siting corridors is just one example that illustrates the increased collision risk bats face when their roost sites are separated from foraging areas by multiple strings of turbines. Regardless of the availability of other foraging resources beyond the siting corridors, both years of acoustic monitoring surveys (WEST 2021a, 2022a) indicated higher bat activity near surface water features in the siting corridors and surrounding vicinity. While activity was highest near the irrigation canals, higher activity was also recorded near stock ponds, which are scattered throughout the siting corridors, and bats with shorter foraging routes may still encounter numerous turbine strings when travelling between these stock ponds and their roost sites. Ephemeral surface water features (i.e., playas and vernal pools) are also present in the siting corridors and may attract bats when inundated. Bat foraging flight distances reported in the publicly available literature are based on a limited number of studies that may have been influenced by site-specific habitat conditions. Bat foraging flight distances would be expected to vary based on the spatial distribution of foraging habitat and roosting features, and given the widely scattered nature of both high-quality foraging habitat and roosting features in the siting corridors and surrounding vicinity, the possibility that bats in this area engage in longer foraging flights than observed elsewhere cannot be ruled out. The proximity of known concentrated foraging areas and bat roosts to the siting corridors indicates that foraging flights are occurring within the siting corridors, even if some species or individuals do not traverse the entire width of the siting corridors during each foraging flight. Thus, the conclusion that alternatives with fewer siting corridors in close proximity to these features would likely result in less bat fatalities holds true.
11978-17	Magic Valley Energy, LLC	The Rotor Swept Height (RSH) in the DEIS is noted as 130 – 790 ft, which seems to be based on specifications of turbines that cannot be used by MVE for this Project. The RSH used in the DEIS should coincide with the RSH outlined in the MVE POD (MVE 2022), which is limited to 180 – 740 ft. This statement should be corrected throughout the FEIS and in the analysis as it could potentially impact the assessment of bat fatalities.	As described in EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts), estimated bat fatalities are based on the generation capacity of each alternative rather than the height of individual turbines due to a lack of information on the relationship between fatalities and turbine height. RSH is considered in the analysis of impacts to avian population is EIS Section 3.3.2 (Avian Populations) because information on the heights different bird species fly at is readily available allowing for a more direct assessment of the collision risk posed by turbines with varying RSHs. The RSH of 180 to 740 feet was used for consistency with the RSH’s presented in the year 1 avian use study (WEST 2021a). On February 4, 2022, the BLM submitted an RFI requesting that MVE reconcile the difference between the RSH reported in MVE (2023) and the year 1 avian use study (WEST 2021a) and recalculate the percentage of flights that occurred within the RSH accordingly. At that time, MVE (2023) indicated that the smallest turbines in consideration had an RSH of 130 to 390 feet, whereas the largest turbines in consideration had an RSH of 180 to 740 feet, resulting in a combined RSH of 130 to 740 feet. On February 17, 2022, MVE provided a technical memorandum in response to this RFI that provided updated versions of Table 4 and 7 from the year 1 avian use report with the RSH use adjusted to reflect the turbine specifications in MVE (2023); an RSH of 130 to 395 feet was used for the smallest turbine model and an RSH of 180 to 790 feet was used for the largest model, resulting in a combined RSH of 130 to 790 feet. The technical memorandum explained that 790 feet exceeds the maximum height of a turbine rotor tip presented in MVE (2023) but was conservatively used to be representative of the largest land-based turbine currently available, and because this RSH was also used in the Eagle Conservation Plan (Appendix T in MVE [2023]). Therefore, the RSH evaluated in the EIS is consistent with the information previously provided by MVE.
11978-18	Magic Valley Energy, LLC	The DEIS states: “Data collected from NABat stations during the second year of acoustic monitoring surveys revealed that bat use and species diversity were higher at stations near rock features (which are likely to be used for roosting) and near stock ponds than at stations where these features were absent (WEST 2022a).” The WEST 2022 report does not support this statement. Instead, the report shows that multiple stations were placed at rock features, and higher activity was only recorded at one, the lava crater. Other rock features did not have elevated activity. Therefore, the assumption that bat use and species diversity were higher at stations near rock features is unsupported when looked at collectively. Elsewhere, the DEIS similarly states “[bat] use was slightly higher at the canal stations as compared to the cave stations but was not higher at NABat stations near stock ponds.” Again in the WEST 2022 report, it is noted that use at canal stations was much higher than caves, which had the lowest activity among all stations. This statement should be removed in the FEIS and in the analysis as it could potentially impact the assessment of bat fatalities.	The draft EIS has been revised to state “Data collected from NABat stations during the second year of acoustic monitoring surveys revealed that bat use and species diversity were higher at stations near the lava crater (which is likely to be used for roosting) and near stock ponds than at stations where surface water and prominent rock features were absent (WEST 2022a).” This is consistent with the *Year 2 Bat Acoustic Monitoring Surveys for the Lava Ridge Wind Project,* which states, “These results indicate bats are attracted to prominent flat water and rock features within the project area” (WEST 2022a:iii).
11978-19	Magic Valley Energy, LLC	The DEIS uses a citation from Frick et al. 2010: This reference is used in the DEIS to cite a paper published in 2010 that estimated little brown bat population effects in 2026. While research supported the estimates at the time of publication in 2010, more recent and relevant research shows evidence that little brown bat populations are rebounding in the Eastern U.S., where white nose syndrome (WNS) began13. MVE is requesting that the analysis using Frick’s 2010 prediction, which is no longer supported by recent and relevant science, be updated to suggest populations may be rebounding in previous decline areas and the species seems to have developed resistance to the disease (Langwig et al, 2017).	Langwig et al. (2017) found evidence that the size of some colonies of little brown bats in New York have stabilized at 5% to 30% of their original size but did not conclude that the species was “rebounding” from WNS. Langwig et al. (2017) also did not conclude that the species as whole has developed resistance to the disease, but rather that the intensive selective pressure exerted by the initial population declines has led to the development of disease resistance in some populations, and that other populations of little brown bats could still be driven to extirpation by WNS. Most importantly, the study could not determine whether the resistance developed in the colonies that persisted is a heritable trait that could be passed on to future generations of bats. Even if the trait were heritable, it would be decades before the species could reach its pre-WNS abundance due to their low reproductive rate. Grimaudo et al. (2021) found evidence that WNS-resistance in little brown bats may be heritable to some degree, but also found that the temperature and humidity of hibernacula had a strong influence on disease severity. The authors concluded that “we should not expect to see all little brown bat populations across North America stabilise [sic] or rebound from declines, but rather the persistence of colonies with the correct combination of host traits and environmental

Comment ID	Commenter	Public Comment	Response to Comment
			conditions" (Grimaudo et al. 2021). Therefore, it is still reasonable to conclude that there is a risk that little brown bat populations in the analysis area could experience significant declines as a result of WNS during the analysis timeframe. Grimaudo, A.T., J.R. Hoyt, S.A. Yamada, C.J. Herzog, A.B. Bennett, and K.E. Langwig. 2021. Host traits and environment interact to determine persistence of bat populations impacted by white-nose syndrome. *Ecology Letters* 2022(25):483–497. Langwig, K., J.R. Hoyt. K. L. Parise, W.F. Frick, J.T. Foster, and A. Marm Kilpatrick. 2017. Resistance in persisting bat populations after white-nose syndrome invasion. Philosophical Transactions of the Royal Society B 272(1712). Available at: https://royalsocietypublishing.org/doi/10.1098/rstb.2016.0044. Accessed December 29, 2023.
11978-111	Magic Valley Energy, LLC	13. Section 3.3.1.1.2 Bat Populations, Table 3.3-1 Mexican free-tailed bat listed in the table From WEST 2020: The only species that does not have potential to occur in the Project is the Mexican free-tailed bat (Tadarida brasiliensis), as its occurrence is considered accidental or non- regular transient, with no public records within or near the Project counties (IDFG 2021). MVE requests that this bat be removed from analysis.	As described in Table App3-2 in EIS Appendix 3 (Issues Analyzed in Brief), the siting corridors are at the northern limits of the Mexican free-tailed bat's range, but there are records of the species from Idaho, including the Little Wood River Valley 22 miles west of the siting corridors. Therefore, while the species has a low potential to occur in the siting corridors, it is possible that the species may occur in the siting corridors occasionally and it would be inappropriate not to address the potential effects to this species.
11978-112	Magic Valley Energy, LLC	14. Section 3.03.1.1.2 Bat Populations "MVE would also implement curtailment measures to reduce bat fatalities by reducing turbine operations that pose the greatest threat to bat species (applicant- committed measure 158; see Table App4-2 in EIS Appendix 4)." Curtailment is taken into consideration if the need to further reduce fatalities exists based on post- construction monitoring. MVE requests changing the existing language to align with the POD: "If needed to further reduce fatalities based on the results of postconstruction monitoring, MVE would also implement curtailment measures to reduce bat fatalities by reducing turbine operations that pose the greatest threat to bat species (applicant-committed measure 158; see Table App4-2 in DEIS Appendix 4)."	This section has been revised to clarify that feathering turbine blades below the manufacturer's cut-in speed would be implemented throughout operations, and that curtailment (i.e., feathering above the manufacturer's cut-in speed) would not be required unless the TAC determines it is warranted as an adaptive management measure.
11978-113	Magic Valley Energy, LLC	15. Section 3.03.1.1.2 Bat Populations - Hoary Bats "This is likely due to improvements in the ability to differentiate Myotis calls to the species level during the second year (WEST 2022a), and the species likely accounts for most of the activity recorded during summer in the first year of surveys (which was predominantly unidentified Myotis species)." MVE requests removing this from the analysis, as the FEIS analysis should not be based on speculation of identifying species from unidentified call information.	As stated in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations), "The western small-footed bat was recorded during both years of acoustic monitoring surveys and was the most active species at the lava crater roost site (WEST 2021a, 2022a), which accounted for approximately 80% of western small-footed activity recorded in 2021. Although very few western small-footed bat passes were recorded during the first year of surveys, the species accounted for nearly 74% of the passes that could be identified to the species level during the second year. This is likely due to improvements in the ability to differentiate Myotis calls to the species level during the second year (WEST 2022a), and the species likely accounts for most of the activity recorded during summer in the first year of surveys (which was predominantly unidentified Myotis species)." It is important to disclose the reason for the large difference observed in western small-footed bat activity between the 2 years of acoustic monitoring, and this is the most plausible explanation. There are sufficient data to indicate western small-footed bats regularly use the siting corridors and removing this statement would not change the results of the analysis in EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts).
11978-116	Magic Valley Energy, LLC	18. Section 3.03.1.2.2 - Bat Populations "Although the hoary bat is one of the most widespread and numerous bat species in the United States, evidence shows that the population is beginning to decline rapidly and that the growth of wind farms is driving this decline (Allison 2018; Electric Power Research Institute 2020; Frick et asheepl. 2017; Rodhouse et al. 2019)." The statement that wind turbines are 'driving the decline' of hoary bat populations is not supported by the sources given in the DEIS. MVE requests that more suitable language could be: "… the growth of wind farms could be contributing to the decrease in hoary bat populations…"	Multiple lines of evidence are presented in these studies to support the conclusion that the expansion in wind energy facilities is one of the primary factors contributing to the observed declines in populations of migratory tree bats, including the hoary bat. EPRI (2020a) in particular states that "Hoary bat population declines of 50% or more were likely without fatality reduction regardless of initial abundance. Such declines may have already occurred." The probability of hoary bat extinction varied widely based on the initial population size (which is not well known), which introduces uncertainty as to the magnitude of the impact of wind energy on hoary bat populations. However, this does not affect the conclusion that wind energy development is one of the largest factors contributing to the declines of hoary bats and other migratory tree bats. Instead, the question that remains to be answered is to what degree fatalities need to be reduced through the implementation of curtailment and other mitigation strategies to prevent further population declines and a trend toward federal listing.
11978-117	Magic Valley Energy, LLC	19. Section 3.03.1.3 "Caves, lava tubes, and known roost sites would be avoided, and the effects to other roosting features (such as shrubs and trees)." Shrubs are not considered adequate roosting habitat for bat species. MVE requests this statement be modified to: "Caves, lava tubes, and known roost sites would be avoided, and the effects to other roosting features (such as trees)."	Shrubs are considered adequate roosting habitat for many species, especially in environments where trees are sparse, such as in the siting corridors. Therefore, no change was made.
11991-10	Julie Abo	Why were these tests being done in this area prior to the NOI publishing on August 20, 2021? To document seasonal, spatial, and temporal variation in bat activity and to evaluate species composition, WEST monitored bat activity in and near the analysis area at two long-term acoustic stations between April 13 and November 1, 2020 (737 detector nights) (page 3-34, 3.3.1.1.2) It is evident that the turbines "have the potential to cause major declines in the populations of some bat species." I am concerned that the data on bats could be highly inaccurate since "patterns of bat fatalities observed at existing wind energy facilities were used as the basis for determining the likelihood for collision" and the proposed project would include turbines that are larger in diameter than any that currently exist.	Baseline resource studies, such as the bat features assessment and acoustic monitoring surveys, were conducted to gather site-specific information to inform the development of alternatives and analysis in the EIS. These studies followed the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012), which recommend surveys across multiple seasons and years to identify temporal variations in bat use. These studies must be initiated prior to the publication of the NOI in order for the BLM to comply with 40 CFR 1501.10(b)(2), which requires the BLM to complete the EIS within 2 years of publishing the NOI. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "available data from existing wind farms . . . had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for the Lava Ridge Wind Project." While it is likely that newer, larger turbines are underrepresented in the available data on bat fatality rates at existing U.S. wind energy facilities, there is currently no established relationship between bat fatalities and turbine height. Due in part to the uncertainty in quantifying fatality rates prior to construction, mitigation measures for bats include postconstruction bat fatality monitoring to assess bat fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as

Comment ID	Commenter	Public Comment	Response to Comment
			well as additional monitoring to assess the effectiveness of adaptive management measures. The BBCS (Appendix M in MVE [2023]) provides additional details on the measures MVE would implement to minimize or avoid impacts to bat populations. EIS Appendix 4 (Mitigation) describes additional mitigation measures that the BLM would require MVE to implement to further reduce impacts (see Table App4-4). If unresolved impacts to bat populations remain after the implementation of the measures, compensatory mitigation would be required (see Mitigation Framework for Birds and Bats in EIS Appendix 4). Together, the implementation of these mitigation measures will allow the BLM to more accurately assess the fatality rate for individual bat species and provide flexibility so that specific adaptive management measures can be targeted to reduce those fatalities as needed.
12130-8	Brenda Pace	Absence of local background information. The DEIS includes little to no reference to consultation with local or regional bat experts involved in bat surveys and research in and around the Lava Ridge Wind project area or in similar settings on the Snake River Plain. Bats are not mentioned in Appendix 10 “Consultation and Coordination, Mitigation Framework, EIS Literature Cited, and Preparers” or in Section 1.6 “Agency Consultation” in the “Bird and Bat Conservation Strategy”. I believe that wildlife biologists at Craters of the Moon National Monument and Minidoka National Wildlife Refuge would have provided important local information in published and unpublished survey data (Barnett 2014, NW Bat Hub 2023, Stefanic and Rodhouse 2013), on local roost characteristics, and research needs. University personnel (Brigham Young University-Idaho, Idaho State University) and members of the Idaho Bat Working Group (Rita Dixon and Bill Doering, POCs) and the East Idaho Bat Collaborative (David Dressel, POC) would have provided unique knowledge and experience with ongoing bat monitoring and research on the Snake River Plain (Call et al. 2018, Weller et al. 2018, Whiting et al. 2018a, 2018b, 2021, 2022). As it is, only a few important local studies/reports are briefly acknowledged in the DEIS, even though many more are easily located in published literature. ... daho bat experts may have also provided valuable assistance for the assessment of roosting habitat and at lava tube caves, in particular, by providing suggestions that would have resulted in a more comprehensive assessment of the Lava Ridge Wind project area. As this roost assessment is critical for micro-siting of turbines and other project components, I recommend that these local experts be invited to review the roost feature assessment completed for the DEIS (Section 3.3.1.1.1) to provide recommendations on any additional investigations that might be necessary.	As described in the Scoping section in EIS Appendix 10 and in the project scoping report linked in this section, the BLM conducted a robust public scoping process that included distribution of electronic and paper scoping letters, publication of an NOI in the *Federal Register*, paid advertisements in the local newspaper, posting on the BLM project website, and two public scoping meetings. The BLM took similar measures to advertise the public comment period for the draft EIS. The BLM also consulted with IDFG, NPS, NREL, and USFWS during the development of the analysis in EIS Chapter 3; see EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers). The final EIS has been revised to include discussion of literature provided in public comments on the draft EIS and additional literature review conducted for the final EIS. The TAC would be responsible for continuously evaluating the latest scientific data, literature, and technologies when making recommendations on adaptive management and compensatory mitigation needs; the final EIS has been revised to include additional details on the TAC and their responsibilities (see additional measure mm).
12130-9	Brenda Pace	It is likely that these Idaho experts would have recommended that acoustic detectors deployed in 2020 at the two “long term acoustic stations” in the Lava Ridge project vicinity be placed at the regional standard of 10 ft above ground surface (NW Bat Hub 2022) rather than at the very low height of 5 ft above ground surface in the DEIS data. At this low level, echoes from the ground surface and vegetation can confound or mask clean, clear bat calls. I do appreciate that this deployment error was corrected during data collection in 2021, but stress that a full season of acoustic data collection for the DEIS was compromised.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), preconstruction bat use is not correlated with postconstruction fatality rates. Postconstruction monitoring would be implemented to assess bat and avian fatality; adaptive management measures would be implemented as needed if high fatality rates are observed.
12130-10	Brenda Pace	Based on my own experience participating in surveys of many lava tube caves and acoustic data collection for bats in Idaho, I recommend the BLM consider additional preconstruction acoustic data collection at the small caves investigated in 2021 to target Fall and Spring, when these features, however “small, narrow [and] muddy” (DEIS pg. 3-44) they may appear, might have been used for migratory stopovers and/or during Spring dispersal from hibernacula. Despite high human use of the main chamber at Kimama Cave, I also recommend additional preconstruction investigation to determine if there is more than one entrance to this lava tube system. Lastly, I also recommend additional preconstruction field investigations for other possible roosting areas (bridges, irrigation structures, craters, landscape features) located in the Lava Ridge Wind project area, since data collection in 2021 did reveal an unexpected roost site at a small crater inside the project area. Bridges and structures over or near canals located in the project area could prove to be especially sensitive and worthy of protective buffers larger than the 1000 ft buffer proposed for the canals, themselves. I believe this additional information may help to identify roosting habitat that must be considered in micro siting of turbines and other project components.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), preconstruction bat use is not correlated with postconstruction fatality rates. Postconstruction monitoring would be implemented to assess bat and avian fatality rates; adaptive management measures would be implemented as needed if high fatality rates are observed. The final EIS has been revised to describe how measures to minimize or avoid impacts to surface waters, including intermittent and ephemeral features as well as irrigation canals, will indirectly benefit bats.
12130-11	Brenda Pace	Exclusion of Townsend’s big-eared bat from detailed analysis. Based on my own experience and understanding, I request that BLM reconsider the decision to exclude Townsend’s big-eared bats from detailed analysis in the DEIS and complete a detailed assessment of this species for the final EIS. I also recommend that BLM also consult with local/regional bat experts on this decision. Townsend’s big-eared bats are classified as an Idaho Tier III Species of Greatest Conservation Need and a BLM special-status species, which indicates that proactive management intervention/conservation measures will likely be necessary to prevent long-term declines in the species and to slow trends toward federal listing under the Endangered Species Act. Research indicates that lava tube caves on the Snake River Plain, including Craters of the Moon National Monument and other lava tube cave-rich portions of the volcanic landscape in south-central Idaho, are of critical importance to Townsend’s big-eared bats for hibernation and raising young (Call et al. 2018, Frost et al 1996, Wackenhut 1990, Weller et al. 2018, Whiting et al. 2018). Under all alternatives, the Lava Ridge turbine arrays are well within the summertime foraging radius for these bats relative to these critically important longer-term roosting areas. Despite Townsend’s big-eared bats’ reliance on low intensity echolocation calls and the overall difficulty in detecting them in standard acoustic surveys (Kunz et al. 2007), these ‘whispering’ bats were recorded in the Lava Ridge Wind project area during acoustic surveys in both 2020 and 2021. Notably, the DEIS does not address the difficulties inherent in capturing acoustic records of these bats. Acoustic surveys conducted by the USFWS at Minidoka National Wildlife Refuge (Barnett 2014) and at NABat monitoring program grids (NW Bat Hub 2023) adjacent to the Lava Ridge Wind project area have also documented the presence of Townsend’s big-eared bats. These acoustic detections indicate that these bats are foraging widely on the Snake River Plain and in the absence of detailed research on the foraging behavior of these bats in this particular habitat, I believe there is risk in assuming that these nightly visits will always remain at low altitudes below the influence of the	Table App 3-2 in EIS Appendix 3 discloses the potential for Townsend’s big-eared bats to occur in the siting corridors based on observations during acoustic monitoring surveys and the proximity of the siting corridors to CRMO, as well as the concerns that have been raised about the potential effects of wind energy on the species in the future. Despite the proximity to known Townsend’s big-eared bat colonies at CRMO, the species accounted for very little of the bat use recorded in the siting corridors and vicinity during the first year of acoustic monitoring surveys and was not recorded during the second year of acoustic monitoring surveys (WEST 2021a, 2022b). As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), preconstruction bat use is not correlated with postconstruction fatality rates. Postconstruction monitoring would be implemented to assess bat and avian fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities.

Comment ID	Commenter	Public Comment	Response to Comment
		turbines proposed for installation at the Lava Ridge Wind project. I also believe that the assessment of bat roosting habitat completed for the DEIS was inadequate to fully evaluate Townsend's big-eared and other bats' Spring and Fall use of the Lava Ridge project area and as a result, the DEIS is based on incomplete information for bat roosting habitat. I understand that Townsend's big-eared bats have not been documented as fatalities in reports that are publicly available from a small sample of approximately 20 wind facilities operating in the USFWS Pacific Region (DEIS Section 3.3.1.2, Lava Ridge Avian and Bat Mortality Report). However, I respectfully submit that the DEIS does not demonstrate that any of these ~20 facilities are operating in proximity to such important habitat for Townsend's big-eared bats as that which is found on the Snake River Plain and Craters of the Moon National Monument. Furthermore, it is possible that fatalities could have been missed by searchers due to insufficient search effort, could have been found and unidentified or misidentified to species, or could have been scavenged before surveys were completed. There is simply too much uncertainty about Townsend's big-eared bats' use of the Lava Ridge project area to exclude them from detailed consideration in the DEIS. As acknowledged in the DEIS (Appendix 3, pg. 3-30), the scientists at NatureServe, which is an oft-cited source for information on the conservation status of many species, have concerns that mortality of Townsend's big-eared bats from turbine collisions may pose a threat to the species in the future as wind energy development expands further into their primary range (Cannings and Hammerson 2023). Indeed, the Snake River Plain includes the highest density of Townsend's big-eared bat hibernacula in the western U.S. (Call et al. 2018, Frost et al 1996, Wackenhut 1990, Weller et al. 2018, Whiting et al. 2018), including dense concentrations of this critical habitat in the Shoshone District BLM and Craters of the Moon National Monument. The Lava Ridge Wind project area may not include the highly sensitive hibernacula and maternity roosts of these adjoining lands, but it does provide foraging habitat for large numbers of bats that must leave the immediate area of these roosts to survive and thrive. Placement of turbines in the midst of the important patches in their habitat could result in significant, population level impacts through loss of genetic diversity and baseline population levels needed to sustain the species if fatalities are high among the multitude of small (< 20 individuals) hibernating and/or maternity colonies known to inhabit the area.	
12130-14	Brenda Pace	Applicant-Committed Measure #138 outlines siting practices to minimize impacts to birds and bats. It does not include 0.25 buffers around caves, or 0.25 buffers around bat roosts as mandated by "Additional Project-Specific Mitigation" measures outlined in DEIS Appendix 4 (Table 4-4). The BBCS must include these required buffers.	Measure n in Table App4-4 in EIS Appendix 4 (Mitigation) states that "Turbines would not be placed within 0.25 mile of known bat roosts. Other infrastructure within that buffer would be minimized." As described under Alternative B with Additional Measures in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), these additional measures are not included as part of MVE's Proposed Action but would be included in the terms and conditions for a ROW permit, if a ROW is granted and Alternative B is selected. These additional measures would also be required for Alternatives C–E and the Preferred Alternative.
12130-25	Brenda Pace	BBCS Sections 3.2.2 and 3.2.3 (and DEIS Section 3.3.1.1.1) describe preconstruction surveys for bat roosting and foraging habitat. These surveys did not adequately assess roosting habitat in the Lava Ridge Wind project area. Additional acoustic surveys and field investigations are necessary to assess Spring and Fall use of small lava tube caves and to investigate other potential roosts at bridges, irrigation structures, and lava features.	As described in Section EIS 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), preconstruction bat use is not correlated with postconstruction fatality rates. Postconstruction monitoring would be implemented to assess bat and avian fatality rates; adaptive management measures would be implemented as needed if high fatality rates are observed.
12130-26	Brenda Pace	BBCS Section 3.0 and Table 6 summarize preconstruction data collection for birds and bats in and around the Lava Ridge Wind project. I recommend that the observations made during these surveys be added to the IDFG Wildlife Observation System (https://idfg.idaho.gov/species/observations).	The Bird and Bat Conservation Strategy (Appendix M in MVE [2023]) protocols will be finalized in coordination with the TAC and could include reporting of bird and bat observations to the IDFG Wildlife Observation System (https://idfg.idaho.gov/species/observations). The TAC would include resource specialists from the BLM, OSC, USFWS, and IDFG.
12130-27	Brenda Pace	BBCS Section 4.3.2 briefly discusses indirect impacts to bats and impacts are also discussed in DEIS Section 3.3.1.2.2. I recommend that BLM consider whether a prolonged period of construction at night would cause additional impacts to bats in the Lava Ridge Wind project area and restrict nighttime operating hours as needed for protection. Near documented roosts, this might be necessary near dawn and dusk, when activity levels tend to peak.	As described in Section 2.5 of MVE (2023), construction would be predominantly during weekdays, but some weekend and evening work may be required during peak construction periods. Measure n in Table App4-4 in EIS Appendix 4 prohibits placement of turbines within 0.25 mile of known bat roosts and minimization of other infrastructure within this buffer. Therefore, additional measures to minimize impacts to bat roosts during construction are not warranted.
12130-28	Brenda Pace	BBCS Section 5.1.2 must be updated to include 0.25-mile protective buffers around caves and known bat roosts.	Measure n in Table App4-4 in EIS Appendix 4 (Mitigation) states that "Turbines would not be placed within 0.25 mile of known bat roosts. Other infrastructure within that buffer would be minimized." As described under Alternative B with Additional Measures in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), these additional measures are not included as part of MVE's Proposed Action but would be included in the terms and conditions for a ROW permit, if a ROW is granted and Alternative B is selected. These additional measures would also be required for Alternatives C–E and the Preferred Alternative.
12130-31	Brenda Pace	Section 7.0 describes how MVE will coordinate with the USFWS, BLM, IDFG, and Idaho Office of Species Conservation on adaptive management measures to address impacts based on the results of postconstruction bird and bat fatality monitoring. In keeping with my comments above, I strongly recommend that a" Technical Advisory Committee" be formed to support a collaborative effort for implementing adaptive management through the life of the Lava Ridge Wind project. These agency personnel and local experts can best determine if fatality levels have reached unacceptable levels to species of concern (thresholds for adaptive response) and recommend implementation of appropriate mitigation measures that may include operational curtailment strategies (adaptive management).	The BBCS (Appendix M in MVE [2023]) describes measures to minimize or avoid impacts to birds and bats that MVE has committed to; these measures are also presented in EIS Appendix 4 (Mitigation) in Tables App4-2a through App4-2o. Additional project-specific mitigation that would be required by the BLM are listed in Table App4-4; additional measure w requires consultation with the TAC to determine appropriate thresholds for an adaptive management response. Additional details on the TAC and adaptive management measures have been added to EIS Appendix 4 (Mitigation)
12130-32	Brenda Pace	I believe that the DEIS falls short in presenting adequate local background information to inform the design of survey strategies, fully characterize risk, and develop meaningful mitigations. This is particularly problematic for bats. Discussion is included in my specific comments in paragraphs to follow. USFWS Wind Energy Guidelines (2012) specifically state, "The Service recommends that the developer make contact with federal, state, tribal, and local agencies that have jurisdiction or management authority over the project or information about the potentially affected	As described in the Scoping section in EIS Appendix 10 and in the project scoping report linked in this section, the BLM conducted a robust public scoping process that included distribution of electronic and paper scoping letters, publication of an NOI in the *Federal Register*, paid advertisements in the local newspaper, posting on the BLM project website, and two public scoping meetings. The BLM took similar measures to advertise the public comment period for the draft EIS. The BLM also consulted with IDFG, NPS, NREL, and USFWS during the development of the analysis in

Comment ID	Commenter	Public Comment	Response to Comment
		resources. In addition, because key NGOs and relevant local groups are often valuable sources of relevant local environmental information, the Service recommends that developers contact key NGOs, even if confidentiality concerns preclude the developer from identifying specific project location information at this stage. These contacts also provide an opportunity to identify other potential issues and data not already identified by the developer." Similar instructions are also included in wind energy development guidelines from nearby states (WDFW 2009, WGFD 2021)	EIS Chapter 3; see EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers).
12130-35	Brenda Pace	The BBCS is a critically important summary and guide for the conservation measures that have been or will be taken to identify, avoid, minimize, and mitigate impacts resulting from the Lava Ridge Wind project. Despite being dated 2022, the BBCS does not accurately reflect the results of pre?construction bat surveys conducted in 2021 and does not include many of the prescribed mitigation measures for bats and birds that are included in the DEIS Appendix 4 or in DEIS Section 3 pg. 3-52-53.	The draft EIS provided the BBCS in draft format, as submitted by MVE in October 2022. The results of the 2021 bat acoustic monitoring surveys (WEST 2022a) were not available until November 2022 and thus were not included in the draft BBCS. However, the results of the 2021 surveys were summarized in the draft EIS in Section 3.3.1.1.2 (Affected Environment, Bat Populations) and the BBCS has since been updated to include a summary of the 2021 bat acoustic monitoring surveys. The BBCS is a document prepared by MVE; mitigation measures for birds and bats described in the BBCS are included in MVE's applicant-committed measures in Tables App4-2a through App4-2o in EIS Appendix 4 (Mitigation). The BLM has identified additional measures required by BLM policy (see Table App4-3) and additional project-specific measures (see Table App4-4) needed to further minimize or avoid impacts. The measures strengthen, add to, or supersede MVE's applicant-committed measures and would be included the terms and stipulations of the ROW grant, if issued.
12230-2	Elizabeth Lampert; BLM Shoshone Office	Stopping Lava Ridge will preserve our bats that pollinate our crops and eat the bad insects. They are also protected under Idaho Code as non-game species.	While there are species of nectar-feeding bats in the tropics that provide important pollination services for crops, there are no nectar-feeding bats in Idaho and none of the bat species with the potential to occur in the siting corridor are considered pollinators. See EIS Section 3.11 (Pollinators and Insects) for a discussion of impacts to pollinators. As described in response to comment 11753-3 (see in Table A-3b, Bats), there have been no studies quantifying the impact of bat fatalities at wind energy facilities on local insect populations, but mortality of these insects would also increase as a result of collisions with operational turbines. As stated in IAC 13.01.06 Section 300.02 "Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management . . . "
12230-3	Elizabeth Lampert; BLM Shoshone Office	Bats will be killed by Pulmonary Barotrauma - their lungs will explode in the low pressure zones created around the turbines.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), "Bat fatalities from barotrauma (due to rapid changes in air pressure near spinning turbine blades) have been documented, but there is little evidence to suggest that this is an important source of mortality at wind energy facilities (AWWI 2016)." The final EIS has been revised to include a discussion of Lawson et al. (2020) and Guest and Hein (2023), which support the conclusion that there is insufficient evidence to support the conclusion that barotrauma is a significant source of bat mortality at wind energy facilities. Guest and Hein (2023) noted that reducing bat interactions with operational wind turbines is the best solution for reducing either cause of mortality (i.e., collision vs. barotrauma).
12899-1	Rob Morris	In reading/perusing the Analysis of Avian and Bat Mortalities at Existing Wind Farms that was used in drafting the EIS for the Lava Ridge Wind Project, I see several errors and discrepancies. 2.2.1 and 2.2.1.1 (pg 6) of the Analysis of Avian and Bat Mortalities fails to extrapolate the data to the size of the LR project and fails to differentiate for possible mortality data per species: how can an estimate of bird/bat deaths be made when the Analysis itself admits it is incomplete? All these data were taken from several sites that are much smaller in size than the LV project; you are, extrapolating beyond existing data points. For the BLM to approve any such project that affects so many species that are BCC, BLMSS and SGCN is beyond understanding.	The analysis presented in the EIS is based on a thorough review of the available scientific literature. The BLM also solicited input from IDFG, USFWS, NREL, NPS, and other relevant agencies during the development of the analysis in the EIS. EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B) describes estimated fatality rates for each species analyzed in detail. Postconstruction monitoring would be implemented to assess bat and avian fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities.
12982-14	Jerry Taylor	Numerous bat species were apparently encountered in a brief inventory by the company. Only two were discussed in any detail, the others only as being present. The DEIS can't presume to mitigate future impacts below significance on bat species they know nothing about. Suspend the EIS process and set about gathering the necessary information upfront to inform proper impact analysis.	EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations) describes bat species with the potential occur in the siting corridors (see Table 3.3-2). In addition to the 13 species detected during MVE's acoustic monitoring surveys (WEST 2021a, 2022b), this section describes 4 other species that may occur in the siting corridors based on the BLM's review of the publicly available literature and coordination with IDFG, NPS, and USFWS. As described under the subheading "Species Analyzed in Detail," each of these species was individually evaluated for its likelihood of colliding with turbines and the potential for those fatalities to lead to population-level effects. Twelve of these species were determined to have a low likelihood of population-level effects. Though effects to these 12 species may occur (as analyzed and described in Table App3-2 in EIS Appendix 3 [Issues Analyzed in Brief]), none of these species would be expected to experience a readily detectable population decline in the analysis area. Thus, to comply with 40 CFR 1502.2(b), this EIS "has only [a] brief discussion of other than significant issues" and focuses on species with a moderate to high likelihood of population-level effects from the project. The five species (big brown bat, little brown bat, western small-footed bat, hoary bat, and silver-haired bat) that were determined to have a moderate to high potential for population-level effects are described in detail below. Cave-hibernating bats are addressed separately from migratory tree bats because the risk factors for each group are notably different. EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) discloses the potential for the action alternatives to result in significant effects to bat populations without the implementation of measures to minimize or avoid bat fatalities. As described in this section, MVE has committed to a number of measures that are expected to reduce bat fatalities associated with the action alternatives. After evaluating the potential effectiveness of these applicant-committed measures (see Tables App4-2a through App4-2o in EIS Appendix 4 [Mitigation]), the BLM developed additional required mitigation measures (see Table App4-4 in EIS Appendix 4) that would be implemented to reduce bat fatalities. These measures include postconstruction bat fatality monitoring to assess bat fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented. Additional monitoring would be conducted to assess the effectiveness of adaptive management measures. EIS Section 3.3.1.4 (Bat Populations and Roosting Habitat, Compensatory Mitigation) discloses the potential for residual impacts to bats after the implementation of mitigation, including adaptive management measures, and a Mitigation Framework for Birds and Bats is included in EIS Appendix 4 to address these remaining impacts.

Comment ID	Commenter	Public Comment	Response to Comment
12988-1	Melody Asher	Your DEIS says "At least two other wind energy facilities are planned near the Lava Ridge Wind Project: the Taurus Wind Project, which would be immediately northwest of the Lava Ridge Wind Project, and the Salmon Falls Wind Project, which would be approximately 30 miles south. The Taurus Wind Project would be similar in size and scale to the Lava Ridge Wind Project (estimated capacity of 1,500 MW), and the Salmon Falls Wind Project would be smaller (estimated capacity of 800 MW). Though it is impossible to accurately predict the bat fatality rate from these facilities, the cumulative impacts of numerous facilities with high fatality rates across the landscape could compound the impacts on bat populations. The potential effect of the expansion of wind energy on bat populations in the analysis area would depend on several site specific variables at each project location, the number and size of turbines that would be used, and the implementation and effectiveness of mitigation measures to reduce impacts to bats." I did not see any bats the other day when I was out in the area but wanted to let you know that bats are a concern. Many bat populations are in decline. They are at risk from wind energy projects and white-nose syndrome. We need them for pollination and pest control. I think more review of the bat population, roost sites and areas of use are needed since bat studies show that bat declines are larger the longer the project exists.	The analysis presented in the EIS is based on a thorough review of the available scientific literature. The BLM also solicited input from IDFG, USFWS, NREL, NPS, and other relevant agencies during the development of the analysis in the EIS. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), preconstruction bat use is not correlated with postconstruction fatality rates. Postconstruction monitoring would be implemented to assess bat and avian fatality rates; adaptive management measures would be implemented as needed if high fatality rates are observed.
13006-14	Leon Smith	5) Recommend the DEIS includes additional population viability/sustainability assessment on raptors and bats.	The analysis presented in the EIS is based on a thorough review of the available scientific literature. The BLM also solicited input from IDFG, USFWS, NREL, NPS, and other relevant agencies during the development of the analysis in the EIS.
13006-15	Leon Smith	6) Recommend the DEIS include a full analysis of the Townsend's big eared bat, not a cursory review.	The conclusion that Townsend's big-eared bats have a low likelihood of colliding with turbines is based on the best available scientific data. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), postconstruction monitoring would be implemented to assess bat fatality rates; adaptive management measures would be implemented as needed if high fatality rates are observed.
13006-22	Leon Smith	13) Recommend BLM consider how a potential listing of little brown bat might affect the DEIS.	EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) disclosed the potential effects of the action alternatives on the little brown bat. USFWS consultation would be required for project operations if the little brown bat or other bats that occur in the siting corridors are listed under the ESA in the future.
13008-11	Scott Hauser	The bat resources section is quite concerning. First, it has a typo, or what is assumed to be a typo. It states, "None of the 1 bat species are federally or state-listed, although the USFWS is currently conducting a Species Status Assessment for the little brown myotis (Myotis lucifugus), which is being considered for listing under the federal Endangered Species Act. Five of the 1 potentially…" We are assuming the 1 is intended to be 14. If this is not the case, we request further information on what this paragraph is intended to state.	This text does not appear in the EIS or the WEST reports referenced in EIS Section 3.3.1 (Bat Populations and Roosting Habitat). See Table 3.3-2 in EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations) for a list of bat species with the potential to occur in the siting corridors and their special-status designations; this section also describes the range-wide status review USFWS is currently conducting for the little brown bat and discloses the potential for this species to become listed under the ESA in the future.
13008-12	Scott Hauser	A more concerning issue is that the DEIS states, "The extent that bats use this potential habitat for roosting is largely unknown at the Project…" This is followed up with an explanation that bats are unlikely to use the project area. However, the use is largely unknown, and there is no explanation of how, or if, Lava Ridge intends to fill this knowledge gap. Bats are widely misunderstood and under studied, all while bat populations are decreasing nationwide. Thus, it is troubling that Lava Ridge seems to be ignoring the blaring issue of unknown effects. We highly encourage Lava Ridge to enhance their monitoring and research on the effects the project may have on bats and deepen the understanding of bat usage of the project area.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), preconstruction bat use is not correlated with postconstruction fatality rates. Postconstruction monitoring would be implemented to assess bat and avian fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities. Preconstruction acoustic monitoring data for bats was used to identify areas of concentrated use, such as canals and roost sites, and develop measures to limit development in close proximity to these features (see EIS Appendix 4 [Mitigation] for additional details). The final EIS has been revised to include additional measures to minimize or avoid impacts to surface waters, including intermittent and ephemeral features, which will indirectly benefit bats.
1396-1	No Name Provided	The Brown Bat of Idaho is slated to be added to the Federally endangered species list. Please review the article below as it supports the threat to the life of bats and their importance to our ecosystem killing insects that are hazardous to our crops.</p> Mechanical wind turbines are killers of this creature by the blades or the low pressure zones which cause their lungs to explode. How will turbines know the bat is in the area? How will the power company protect the bat?Will they be allowed to obtain a permit, such as the one created by the Obama administration, which allows the taking/killing of eagles?	EIS Section 3.3.1.1.2 (Affected Environment, Bat Populations) describes the range-wide status review USFWS is currently conducting for the little brown bat and discloses the potential for this species to become listed under the ESA in the future. The article provided in the comment is an interview with a researcher studying bats and COTM and does not present empirical evidence that can be used to support the analysis in the EIS. However, EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) discloses the potential for the action alternatives to result in significant effects to the populations of certain bat species, including the little brown bat, without the implementation of measures to minimize or avoid bat fatalities. As described in this section, MVE has committed to a number of measures that are expected to reduce bat fatalities associated with the action alternatives. After evaluating the potential effectiveness of these applicant-committed measures (see Tables App4-2a through App4-2o in EIS Appendix 4 [Mitigation]), the BLM developed additional required mitigation measures (see Table App4-4 in EIS Appendix 4) that would be implemented to reduce bat fatalities. These measures include postconstruction bat fatality monitoring to assess bat fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures. EIS Section 3.3.1.4 (Bat Populations and Roosting Habitat, Compensatory Mitigation) discloses the potential for residual impacts to bats after the implementation of mitigation, including adaptive management measures, and potential compensatory mitigation measures are described in EIS Appendix 4 (Compensatory Mitigation Actions in the Mitigation Framework for Birds and Bats). Additional discussion of mitigation measures is provided in the alternatives analysis in EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts); although there are currently no commercially available sensor-based curtailment systems that can be used to detect approaching bats and adjust turbine operations, these systems are under development and could be used as adaptive management in the future, if necessary. Unlike bald and golden eagles, there is currently no formal system in place to permit incidental take of non-ESA bat species resulting from the operation of a wind energy facility because there are currently no laws or regulations in place that prohibit incidental take of such bats. However, the measures to avoid or minimize impacts to bat species described in EIS Appendix 4 are designed to meet the BLM's obligation to ensure that the selected alternative does not contribute to a trend toward federal listing or loss of population viability for any BLM special-status bat species. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). As described in response to comment 11753-3 (see in

Comment ID	Commenter	Public Comment	Response to Comment
			Table A-3b, Bats), there have been no studies quantifying the impact of bat fatalities at wind energy facilities on local insect populations, but mortality of these insects would also increase as a result of collisions with operational turbines.
1531-1	Sue Page	You may or may not be aware, bats are a legally protected species in Idaho. Under Idaho Code they are classified as "Protected Nongame Species". It is illegal to harmed, harassed or killed. There are over 14 different species of bats that live in Idaho. It is also my understanding that the brown bat is being considered to be added to the endangered species list. Safe our wildlife. Vote no on Lava Ridge Wind Project	As stated in IAC 13.01.06 Section 300.02 “Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management.”
5896-11	Mike Tylka	Bats and birds. The desert ecosystem is very fragile. Bats and birds continue to be a significant part of this overall ecosystem and it is impossible to predict how many of these creatures will be killed due to the construction taking place and the turbine system after operation begins. Therefore, why risk sacrificing any of the identified or non-identified species?	Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction bat fatality monitoring to assess bat fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), this approach is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).
8458-5	Sue Page	Bats will be killed due to the low pressure zones these turbines create by pulmonary barotrauma - their lungs burst.	As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), “Bat fatalities from barotrauma (due to rapid changes in air pressure near spinning turbine blades) have been documented, but there is little evidence to suggest that this is an important source of mortality at wind energy facilities (AWWI 2016).” The final EIS has been revised to include a discussion of Lawson et al. (2020) and Guest and Hein (2023), which support the conclusion that there is insufficient evidence to support the conclusion that barotrauma is a significant source of bat mortality at wind energy facilities. Guest and Hein (2023) noted that reducing bat interactions with operational wind turbines is the best solution for reducing either cause of mortality (i.e., collision vs. barotrauma).

BIRDS

Table A-3c. Birds

Comment ID	Commenter	Public Comment	Response to Comment
1042-3	WildLands Defense	It is sickening to think of Golden Eagle, rare bat and migratory bird and bat kills this project will inflict. Full and detailed studies of avian and bat migration patterns across the Snake River Plain and region must be undertaken over multiple years and assessed in a SEIS. This will greatly expand increase the wind turbine wall of death migrating birds and bats face in attempting to fly north to nesting/breeding habitats. The full adverse indirect and cumulative effects of all the existing turbines – and foreseeable additional projects – on BLM, state and private lands in this region must be fully assessed in a SEIS hard look analysis. Detailed multi-year studies of avian and bat migration patterns must be undertaken now – across this landscape and all the Snake River plain, and the breeding bird site populations harmed. WLD requested such studies take place as part of the Gateway EIS, and Idaho BLM blindly ignored this – being content to kill unknown numbers and species of birds and bats. There is no proper way to estimate “take” unless pre-decisional studies of fall and spring migration patterns, routes and impacted populations are conducted. This is necessary to determine what percentage of an avian population uses which routes. This is an example of the huge amount of necessary baseline biological information that must be collected in order to properly evaluate a projects; amount of take, to understand foreseeable impacts on local, regional and range-wide species populations. This is especially critical given the grave concern over the loss in recent decades of billions of birds, See Rosenberg et al; 2019 for example. Further, the developer must research and develop models based on inversions, storm fronts, rainy weather, etc. that possibility of mass avian and/or bat deaths during spring and fall migrations. How might population viability be impacted? Again, it is impossible to make informed comparisons between alternatives until this is done.	As described in response to comment 1042-27 (see in Table A-3c, Birds), detailed studies of migratory routes in the analysis area are beyond the scope of the EIS but are included as potential adaptive management or compensatory mitigation for avian and bat species; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. In addition to the avian use surveys (which included more detailed evaluations of bald and golden eagle use), MVE conducted 2 years of raptor nest surveys, 2 years of greater sage-grouse surveys, 2 years of bat acoustic monitoring surveys, and a bat roosting features assessment. In addition to these project-specific surveys, the BLM conducted a review of the publicly available literature and coordinated with state and federal wildlife agencies to obtain additional information. This information is summarized in EIS Sections 3.3.1.1 (Bat Populations and Roosting Habitat, Affected Environment), 3.3.2.1 (Avian Populations, Affected Environment), 3.3.3.1 (Eagles, Affected Environment), and 3.3.4.1 (Greater Sage-Grouse, Affected Environment). Due in part to the uncertainty in quantifying fatality rates prior to construction, postconstruction bat fatality monitoring would be implemented to assess bat fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities. Additional monitoring would be conducted to assess the effectiveness of adaptive management measures; see the BBCS and EIS Appendix 4 for additional details. As described in EIS Section 3.3.1.2.2 (Bat Populations and Roosting Habitat, Alternative B), this approach is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). Indirect effects to bats are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-5 though AIB-8. Cumulative effects to bat and avian species are disclosed in EIS Sections 3.3.1.2.7 (Bat Populations and Roosting Habitat, Cumulative Impacts), 3.3.2.2.7 (Avian Populations, Cumulative Impacts), 3.3.3.2.7 (Eagles, Cumulative Impacts), and 3.3.4.2.7 (Greater Sage-Grouse, Cumulative Impacts). The cumulative effects analyses included the identification of existing wind turbines within the analysis area as well as a discussion of reasonably foreseeable wind energy development. As described in Section 3.3.2.2.7, the number of birds estimated to be killed by collisions with turbines is relatively small in comparison to estimates of fatalities from other anthropogenic sources such as collisions with vehicles, buildings, transmission lines, and communication towers; exposure to pesticides and other toxic chemicals; and predation by domestic and feral cats (AWWI 2016; Loss 2016; National Wind Coordinating Collaborative 2010). Given this, collisions with turbines and wind energy development alone do not appear to be a threat to most avian populations (AWWI 2016; Choi et al. 2020). Even so, as the number of wind facilities increases, collisions with turbines will represent an increasingly large proportion of all collisions with humanmade structures and will have correspondingly greater effects on bird populations (National Wind Coordinating Collaborative 2010). Although the expansion of wind energy may not be the primary driver for the decline of most avian species, fatalities from turbine collisions exacerbate other impacts that have led to these declines and are becoming an increasingly important source of avian mortality. For species that are already declining, and for species with low reproductive rates, even a relatively small increase in the fatality rates could have a significant impact on their populations in the analysis area. The BLM appreciates that Rosenberg et al. (2019) and many others have found evidence of widespread declines in North American avian populations; however, as described in EIS Section 3.3.2.1.2 (Affected Environment, Species

Comment ID	Commenter	Public Comment	Response to Comment
			Analyzed in Detail), “to comply with 40 CFR 1502.2(b) this EIS “has only [a] brief discussion of other than significant issues” and focuses on species with a moderate to high likelihood of population-level effects from wind energy development.” Thus, the EIS does not summarize the available literature on general avian population declines (which are primarily related to factors other than wind energy development, as described above) and focuses on those species at greatest risk of experiencing significant impacts from the action alternatives. Measures to minimize or avoid avian and bat fatalities from collision with operational turbines were developed in consideration of the factors that are known to influence fatality rates, such as implementing curtailment during the fall migratory period for bats (see EIS Section 3.3.1.2.2 [Bat Populations and Roosting Habitat, Alternative B]). Bird fatalities from turbine collisions, on the other hand, are not strongly influenced by migratory behavior (see EIS Section 3.3.2.1); therefore, mitigation for avian populations focus on measures that target species whose flight characteristics put them at greater risk of turbine collisions (i.e., large diurnal raptors). EIS Section 3.3.1.2.2 also discusses how curtailment strategies can be refined by incorporating variables such as temperature and barometric pressure. As stated in this section “using data collected during postconstruction monitoring, MVE would develop curtailment strategies in coordination with the BLM, USFWS, IDFG, and Idaho Governor’s Office of Species Conservation (OSC) (applicant-committed measure 157). The curtailment strategies would define standard operating procedures for operation during different seasons (i.e., migratory periods) and different times of the day. The standard operating procedures would describe how operations staff would monitor for the presence of bats (and raptors) around turbines, how the decision to curtail specific turbines would be made, and how the curtailment would be implemented. “ As described in EIS Sections 3.3.1.3 (Bat Populations and Roosting Habitat, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), 3.3.2.3 (Avian Populations, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), 3.3.3.3 (Eagles, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), and 3.3.4.3 (Greater Sage-Grouse, Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity), with the implementation the mitigation measures listed in EIS Appendix 4 (Mitigation) none of the action alternatives are expected to result in irreversible impacts because impacts are unlikely to lead to a loss of population viability or a trend toward listing under the ESA for any avian or bat species. Rosenberg, K.V., A.M. Dokter, P.J. Blancher, J.R. Sauer, A.C. Smith, P.A. Smith, J.C. Stanton, A Panjabi, L. Helft, M. Parr, and P.P Marra. 2019. Decline of the North American avifauna. *Science* 366(6461): 120–124. Available at: https://www.science.org/doi/10.1126/science.aaw1313. Accessed December 29, 2023.
1042-4	WildLands Defense	We are alarmed that the EIS is basing its avian estimates on one year of ‘studies”, and that BLM cares so little about numerous sensitive species that it just lets the EIS contractor bundle all those birds including numerous sensitive species into “21 smaller bird species”. Further, we simply do not believe there are so few Burrowing Owls and Long-Billed curlews here. [graphic showing Table 3.3-3] We also greatly question the accuracy of the inventories for avian species and sensitive species - as the consultant claims to have found only two Burrowing Owl nests. Further, we can find no legitimate basis for using a mere one mile from siting corridors for an analysis. [graphic showing Table 3.3-4] As WLD also commented in the Gateway EIS, all transmission lines are also likely to be lethal to avian species, and all must have avian flight diverters, too.	The results of the second year of avian use studies were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. The summary of the avian use surveys in Table 3.3-7 focuses on the data for species or groups discussed in the EIS. Detailed avian use data is presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study was included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. As disclosed in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail), burrowing owl use in the siting corridors is likely to be higher than reported because avian use surveys were not designed to detect the species. Therefore, mitigation measures for burrowing owls were modified and expanded in the final EIS; these include preconstruction surveys for burrowing owl nests and avoidance buffers for active nests (additional measure q) as well as the removal of loose rocks to avoid creating habitat for prey (additional measure s); see EIS Section 3.3.2.2.2 (Avian Populations, Alternative B with Additional Measures) and EIS Appendix 4 [Mitigation]). The description of long-billed curlew in EIS Section 3.3.2.1.1 discloses the potential that long-billed curlew use in the siting corridors could be higher in particularly wet years when playas and vernal pools are inundated and describes the importance of the breeding population in western Idaho to the overall population in BCR 9, and thus, concludes that even a relatively low fatality rate from collisions with operational turbines could possibly result in a decline in the BCR 9 population. The analysis area for avian populations is BCR 9, as described in 3.3.2 (Avian Populations); Table 3.3-10 summarizes raptor nests recorded within 1 mile of the siting corridors during the 2020 and 2021 raptor nest surveys (WEST 2020, 2021b); as described in the table notes, burrowing owl nests were not targeted during either year of raptor nest surveys and the burrowing owl nests described in the table were observed incidentally during other biological surveys. Section 3.3.2.1.1 in EIS Appendix 9 summarizes additional raptor nests detected beyond 1 mile of the siting corridors during the raptor nest surveys. Details on the raptor nest survey methods, including supporting rationale for the study areas selected, are provided in the 2020 Raptor Nest Survey Memo (WEST 2020) and 2021 Raptor Nest Survey Report (WEST 2021b). MVE has committed to constructing all overhead collector and transmission lines in compliance with APLIC standards (APLIC 2006, 2012), which include the use of line markers or flight diverters to reduce avian collisions (applicant-committed measure 30). Effects to raptors from collisions with or electrocution by overhead powerlines are described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-4. Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction avian fatality monitoring to assess the actual long-billed curlew and burrowing owl fatality rate; adaptive management measures would be implemented as needed to reduce fatalities, and additional monitoring would be conducted to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details.
1042-9	WildLands Defense	“Highest estimated avian fatality rate from collisions with turbines: 3,240–5,654 (mean), 10,200–17,799 (maximum) birds per year. Most avian species are unlikely to experience population-level effects, but some special- status species (e.g., ferruginous hawk, long- billed curlew, short-eared owl, and burrowing owl) could experience population	As stated in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), it is impossible to accurately predict the fatality rate for the project because preconstruction use is not correlated with postconstruction fatality rates (WEST 2011). For comparison among action alternatives, this EIS estimates bird fatalities that could occur based on the mean

Comment ID	Commenter	Public Comment	Response to Comment
		declines …". What are the current local, regional and range-wide populations and population trends of these species? What threats do all of these populations face? In skimming the EIS, we see absurd claims that try to minimize harms by saying small passerine birds have short life spans – and so we are to conclude that they will be proportionately less effected – and this is total nonsense. In essence, the wildlife and ecological analysis of this project is severely flawed, and a supplemental EIS with a range of protective alternatives must be prepared, based on systematic competent and scientifically credible on-the-ground surveys for all affected biota.	fatality rate for BCR 9 (2.7 birds per MW per year). This EIS also presents the number of fatalities that could occur based on the maximum fatality rate observed in BCR 9 (8.5 birds per MW per year) (Table 3.3-12). EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail) provides a summary of important life history traits, demographic information, and susceptibility to impacts from wind energy development for the four species analyzed in detail in the EIS (ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl). Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief) presents this information for the special-status avian species with the potential to occur in the siting corridors that were determined to have a low likelihood of population-level effects. Other threats to avian species are described in EIS Section 3.3.2.1.2 (Avian Populations, Existing and Future Trends and Actions). The EIS does not conclude that the shorter lifespan of small passerines reduces the potential for impacts to their populations from fatalities due to collisions with operational turbines. As described in EIS Section 3.3.2.1.1, unlike large, long-lived avian species with low reproductive rates (like those species analyzed in detail in the EIS), the smaller size and shorter lifespan of passerines is correlated with higher reproductive output as well as lower annual survivorship. Therefore, their populations are less sensitive to increased mortality. Most small passerines also have very large populations and turbine-related fatalities constitute a small percentage of their total population size (typically < 0.02%) (AWWI 2016; Erickson et al. 2014). Further, as described in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts), "Despite the trend toward increasing avian fatalities from wind energy, this source of mortality will remain relatively small when compared to other sources of avian mortality—such as collisions with vehicles, buildings, transmission lines, and communication towers; exposure to pesticides and other toxic chemicals; and predation by domestic and feral cats (AWWI 2016; Loss 2016; National Wind Coordinating Collaborative 2010)—and for most species, this source of mortality will be too small to have a notable effect on their populations (AWWI 2016; Choi et al. 2020)." This section also describes the higher avian fatality rates associated with other forms of energy generation and the potential that alternatives with lower generating capacities could result in greater impacts to avian populations if other types of energy generation are used to satisfy the demand for electricity that would have been generated under alternatives with higher generation capacities.
1042-27	WildLands Defense	Migratory birds such as ducks, geese and swans will travel through the area during migratory season, although according to studies, it is not a primary migration corridor. [This is completely unacceptable, and WLD believes it seriously under-estimates the "take" that will occur. What are these studies, how were the conducted and what birds were studied?	See EIS Section 3.3.2.1 (Avian Populations, Affected Environment) for a summary of MVE's avian use studies; the final EIS has been updated to include the results of the second year of study. Detailed studies of migratory routes in the analysis area are beyond the scope of the EIS but are included as potential adaptive management or compensatory mitigation for avian and bat species; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. However, patterns of seasonal use for waterfowl and other avian species can be inferred from the results of the surveys, as well as other publicly available data sources evaluated for the analysis of avian populations. This section also discloses the potential for ephemeral surface water features in the siting corridors (i.e., playas and vernal pools) to provide migratory stopover habitat for waterfowl and other avian species when inundated. Impacts to special-status waterfowl are disclosed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). The data sources evaluated for the EIS analysis indicate that waterfowl are rarely recorded as fatalities at existing U.S. wind energy facilities, and therefore, relatively few waterfowl, geese, or swan fatalities would be expected under any action alternative.
10442-3	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Special Status Avian (Ferruginous Hawk) P. 3-86 In the DEIS it is stated, "However, for some special- status avian species, when cumulative fatalities across BCR 9 are considered, there could be negative population-level effects that continue a downward trend. Thus, even though an individual wind energy facility on its own may not cause population-level effects, each facility constructed in BCR 9 over the next 30 years would further increase avian mortalities and the potential for declines in some avian populations. Thus, when evaluating the need for adaptive management measures, it is important to consider the mortality that is likely to occur at other existing and future wind energy facilities in BCR 9." Comment: The Ferruginous Hawk is a keystone species for the arid steppe environment. This buteo is a Tier 2 Greatest Conservation Need, Type 2 BLM Sensitive Species and has a wildlife classification as Protected Nongame. According to nest survival models, the daily survival rate (DSR) of ferruginous hawk nests decreased as the number of wind turbines within the home range buffer (32 km2) increased ($\hat{\beta}$ = -0.89, SE = 0.39, 85% CI = -1.47 to -0.30). (Kolar, Patrick Shea, 2013. "Impacts of Wind Energy Development on Breeding Buteo Hawks in the Columbia Plateau Ecoregion" . Prairie Falcon Audubon members participate in the East Cascades Audubon Society Winter Raptor Survey project and sightings of wintering Ferruginous Hawks have been detected in the Hunt area as well as a significant wintering roost east of Murtaugh Lake. With climate change, there is a strong possibility of more wintering birds between the snow line and sage-steppe and agricultural fields. Prairie Falcon Audubon is encouraging a further review and study of wind development on Ferruginous Hawk reproduction. With their special status and lack of fall/winter surveys, we encourage further review of the immediate area and other potential wind energy sites before any decision is made.	The results of the Kolar (2013) study referenced in the comment were published in the *Journal of Wildlife Management* (Kolar and Bechard 2015) and are summarized in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail), which also describes special-status designations, key life history traits, and demographic information for the ferruginous hawk. This includes a description of ferruginous hawk use from the first year of avian use studies (WEST 2021a), which were conducted over the course of an entire year. The results of the second full year of avian use studies (WEST 2023) have been incorporated into the final EIS. Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 provides additional details on diurnal raptor use in the siting corridors and a summary of ferruginous hawk nests recorded during both years of raptor nest surveys (WEST 2020, 2021b); see also Table 3.3-7 and Table 3.3-8. Although ferruginous hawk use was not observed in the siting corridors during winter in the first year of avian use studies (WEST 2021a), two ferruginous hawks were recorded in winter of the second year of avian use studies (WEST 2023). The EIS also discloses the presence of a small over-wintering population of ferruginous hawks in southern Idaho based on the information in IDFG's SWAP (IDFG 2017). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project." As stated in the analysis assumptions in EIS Section 3.3.2 (Avian Populations) "The analysis of effects to avian populations also assumes avian fatalities from turbine collisions would have the same magnitude of impact on avian populations in BCR 9 regardless of where those fatalities occur in BCR 9. Therefore, the project's effects on avian populations at the BCR 9 scale would be directly proportional to the estimated fatality rate for each alternative. This is an oversimplification for some species that have variations among their smaller, local populations within BCR 9. Each of these smaller populations may not have the same relative contribution to the overall size and trend of their population in BCR 9. However, quantifying the relative importance of local populations to the overall population of a species in BCR 9 is beyond the scope of this analysis. Further, data on local avian populations are not available for many species and are of limited value for species for which data are available due to the much smaller sample sizes. Where the literature indicates important differences between local populations of a species within BCR 9, additional qualitative discussion is provided in this EIS." Such a discussion is

Comment ID	Commenter	Public Comment	Response to Comment
			provided for ferruginous hawk in EIS Section 3.3.2.1.1. Despite the small size of the ferruginous hawk population in Idaho relative to the overall population in BCR 9 and the low incidence of ferruginous hawk fatalities, the EIS takes the conservative approach of assuming that collisions with operational turbines under all of the action alternatives could have significant impacts on ferruginous hawks in BCR 9 without the implementation of avoidance and minimization measures. The ferruginous hawk analysis in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) describes a number of measures that would be implemented to minimize or avoid impacts to ferruginous hawks (see also EIS Appendix 4 [Mitigation]), including targeted curtailment if postconstruction fatality monitoring indicates such measures are warranted. In addition to the applicant-committed measures described in this section, the BLM would also require MVE to implement Tier 5 studies (as per USFWS [2012]) to further assess the potential for population-level effects if ferruginous hawk fatalities are observed following construction. This could include annual raptor nest monitoring over the life of the facility so that turbines within 1 mile of those nests can be curtailed (applicant-committed measure 158) during the nesting season (additional measure q). As stated in IAC 13.01.06 Section 300.02 "Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management". A detailed evaluation of alternative sites for the project is beyond the scope of analysis in this EIS because they would not address the BLM's purpose, which is to respond to MVE's ROW grant request.
10442-4	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Special Status Avian (Long-billed Curlew) P. 3-79 In the DEIS it is stated, "Alternative B could result in more long-billed curlew fatalities than the other action alternatives because it would have the most bird fatalities overall. Although the available data suggest that few long-billed curlew fatalities would occur, few of the facilities studied are within the long-billed curlew's breeding range and, for this reason, more fatalities could occur than expected. Considering that Idaho supports as much as 31% of the long-billed curlew population in BCR 9 (American Bird Conservancy 2013) and that the species may use siting corridors during spring migration (when juveniles and subadults disperse to new territories), fatalities resulting from collision with operational turbines could adversely affect the long-billed curlew population in BCR 9. This would especially apply when the impact of numerous facilities across the landscape is considered (see Section 3.3.2.2.6 [Cumulative Impacts])." Comment: This bird is a Tier 2 Greatest Conservation Need, Type 2 BLM Sensitive Species and has a wildlife classification as Protected Nongame. Long-billed Curlews are federally protected in the U.S., Canada, and México under the Migratory Bird Treaty Act. U.S. Fish & Wildlife Service Status Assessment and Conservation Action Plan for the Long-billed Curlew describes the initial population declines were attributed to over-hunting and plowing of the native prairies for agriculture. Current threats include habitat loss and destruction due to urban development, grassland conversion for agricultural purposes, changes in the natural fire regime and the spread of exotic invasive species. Predation, grazing practices, energy development, diseases, and pesticides may also threaten Long- billed Curlew populations. Further assessment is needed in the area which would include population monitoring, breeding ground studies that identify local micro-habitat use and identification of migration areas.	As described in response to comment 10442-3 (see in Table A-3c, Birds), 2 years of avian use studies were conducted to identify seasonal and spatial variation in avian use in the siting corridors, and broader studies of avian populations, migratory behaviors, and habitat use are beyond the scope of this EIS. The description of long-billed curlew in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail) discloses the potential that long-billed curlew use in the siting corridors could be higher in particularly wet years when playas and vernal pools are inundated and describes the importance of the breeding population in western Idaho to the overall population in BCR 9, and thus, concludes that even a relatively low fatality rate from collisions with operational turbines could possibly result in a decline in the BCR 9 population. Due in part to the uncertainty in quantifying fatality rates prior to construction, these measures include postconstruction avian fatality monitoring to assess the actual long-billed curlew fatality rate and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tier 4 and 5). MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M of MVE [2022]) in accordance with the USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities." As stated in IAC 13.01.06 Section 300.02, "Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management . . . "
10442-5	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Special Status Avian (Short-eared Owl) P. 3-80 In the DEIS it is stated, "Alternative B could result in more short-eared owl fatalities than the other action alternatives because it would have the most bird fatalities overall. Although short-eared owl fatalities are relatively uncommon at existing U.S. wind energy facilities, breeding males may be susceptible to turbine collisions when engaging in mating displays. Given that project raptor nest and avian use surveys were not designed to assess short-eared owl use or nesting, the species is likely underrepresented in the project survey data, and short-eared owl use and nesting in the siting corridors may be higher than the data suggest; thus, more fatalities may occur than expected. Because the short-eared owl population in BCR 9 is small and declining, the possibility that fatalities from collision with operational turbines could adversely affect their population in BCR 9 cannot be ruled out." Comment: Fragmentation of our open areas by turbines and associated access roads could have very serious consequences beyond mortality for these populations. Short-eared Owls are irruptive breeders with low site fidelity, resulting in annual shifts in local breeding densities, often tied to fluctuations in prey density. It is therefore critical to implement monitoring at a scale needed to detect regional changes in distribution that likely occur annually.	See response to comment 10442-3 (see in Table A-3c, Birds) for a description of the avian use studies conducted for the project; long-term regional studies of temporal and spatial variation in short-eared owl use are beyond the scope of this EIS. Because preconstruction surveys did not target owls, mitigation measures for short-eared owls were modified and expanded in the final EIS; these include preconstruction surveys for short-eared owl nests and avoidance buffers for active nests (see additional measure r). Additionally, MVE would complete a minimum of 2 years of postconstruction monitoring (applicant-committed measure 150 in Appendix 4) to assess the actual short-eared owl fatality rate and, if high fatality rates are observed, to determine which adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce short-eared owl fatalities. Effects to avian habitat are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1.
10442-6	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Special Status Avian (Burrowing Owl) P. 3-80 In the DEIS it is stated, "Alternative B could result in more western burrowing owl fatalities than the other action alternatives because it would have the most bird fatalities overall. Although burrowing owl fatalities are relatively uncommon at most existing U.S. wind energy facilities, very high burrowing owl fatality rates were observed at one existing wind energy facility in California where a large population of breeding owls was present. Given that project raptor nest and avian use surveys were not designed to assess burrowing owl use or nesting, the species is likely underrepresented in the survey data, and burrowing owl use and nesting in the siting corridors may be higher than the data would suggest; thus, more fatalities may occur than expected. Given this, the possibility that fatalities resulting from collision with operational turbines could adversely affect the western burrowing owl population in BCR 9 cannot be ruled out. This would especially apply when the	The description of western burrowing owl in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail) summarizes the publicly available literature on the impacts of wind energy development on the species and discloses the potential for collisions with turbines to affect the species population in BCR 9. Direct and indirect effects to avian habitat are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1, AIB-2, and AIB-3. As disclosed in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail), burrowing owl use in the siting corridors is likely to be higher than reported because avian use surveys were not designed to detect the species. Therefore, mitigation measures for burrowing owls were modified and expanded in the final EIS; these include preconstruction surveys for burrowing owl nests and avoidance buffers for active nests (additional measure q) as well

Comment ID	Commenter	Public Comment	Response to Comment
		impact of numerous facilities across the landscape is considered (see Section 3.3.2.2.6 [Cumulative Impacts]).” Comment: The Burrowing Owl is a migratory species that can be found from Canada to Mexico. In the United States, it occupies grasslands, agricultural lands, deserts and low-rainfall areas that still support growth of perennial grasses or shrubs. However, the owl is considered an endangered species in Canada, a threatened species in Mexico and is on the U.S. Fish and Wildlife Service's list of species of conservation concern. Clint Boal, a professor in Texas Tech's Department of Natural Resources Management is concerned that the primary threat to the owl's habitat is development of land for agricultural and urban development. Part of that development in the United States is the increase in the number of wind turbine farms. But little is truly known of that impact. We request a further study of the burrowing owl within the siting corridors and how siting of the turbines could effect their habitat.	as the removal of loose rocks to avoid creating habitat for prey (additional measure s); see EIS Section 3.3.2.2.2 (Avian Populations, Alternative B with Additional Measures) and EIS Appendix 4 [Mitigation]).
10442-9	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	We strongly encourage a further review to establish metrics and mapping to include direct, indirect, and cumulative effects of renewable energy projects on habitat suitability, reproduction, and survivorship of birds. Bird mortality related to poorly sited wind energy infrastructure is growing. The annual loss of birds from wind turbines in the United States was estimated to be around 681,000 as of 2021; more than 1.4 million bird deaths are projected by 2030 or earlier if the U.S. meets its goal of producing 20 percent of electrical energy with wind. If that figure reaches 35 percent, as Department of Energy projections suggest, up to 5 million birds could be killed annually. (These estimates do not include birds that are killed by collisions with associated power lines and towers, which could be in the hundreds of thousands or even millions annually.) (American Bird Conservancy – Wind Energy)	EIS Section 3.3.2.1.2 (Avian Populations, Existing and Future Trends and Actions) describes existing and future impacts from wind energy development in the analysis area, including estimates of cumulative fatalities from existing wind energy facilities and the relative impact of other sources of avian mortality, including collisions with transmission lines. As described in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts), “Because collisions with wind turbines would still result in a relatively small proportion of the fatalities from all anthropogenic structures (National Wind Coordinating Collaborative 2010), this is unlikely to significantly impact the population of most avian species in BCR 9, though it would add to the overall impact to these species. As wind energy capacity continues to increase in BCR 9, collisions with turbines will represent an increasingly large proportion of the avian fatalities resulting from collisions with humanmade structures and will have an increasingly large effect on avian populations. Although ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl would likely represent a very small proportion of all avian fatalities from collisions with turbines at any wind energy facility, even this relatively small increase in fatalities may have significant impacts on their populations in BCR 9.” As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), “The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project.”
10512-1	S. (No Last Name Provided)	The EIS is a significant miss and has several blatant errors. The lands directly in the impact area of the wind projects have major significant impacts on many species of wildlife. If a casual observer were to waltz through the project area on a hot afternoon in August it would be easy to conclude this habitat has low wildlife usage and importance to very many species/populations. This area is a critical corridor for sizable migrating waterfowl populations. When the snow melts the runoff flows into many lava depressions forming many small lakes scattered through this area providing critical staging areas for diverse waterfowl populations by the thousands.	The importance of habitat in the siting corridors for a wide variety of wildlife species is described in the Affected Environment sections for biological resources in EIS Chapter 3. Waterfowl use in the siting corridors is described in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. This section also discloses the potential for ephemeral surface water features in the siting corridors (i.e., playas and vernal pools) to provide migratory stopover habitat for waterfowl and other avian species when inundated. Impacts to special-status waterfowl are disclosed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). The data sources evaluated for the EIS analysis indicate that waterfowl are rarely recorded as fatalities at existing U.S. wind energy facilities, and therefore, relatively few waterfowl fatalities would be expected under any action alternative. The final EIS has been updated to include additional measures to minimize or avoid impacts to surface waters, including ephemeral and intermittent features, that would indirectly benefit bats and avian species (see additional measure bb).
1053-1	Susan Page	Burrowing Owls live in the open desert areas which a critical for their existence. There has already been declines due to habitat loss. A study should be conducted to review how much more of their habitat will be loss from the infrastructure planned. Will corridors inhibit their ability to traverse safely?	See EIS Section 3.3.2.2 (Avian Populations, Impacts) for a detailed analysis of the potential impacts to western burrowing owls from collisions with operational turbines. This section also describes a number of measures that would be implemented to minimize or avoid impacts to western burrowing owls (see also EIS Appendix 4 [Mitigation]). Impacts to avian habitat are disclosed in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1.
1071-4	Don Campbell	4) wind farms should not be located in or near a migratory flyway. This area is located on both a north/south and an east/west flyway. If allowed, how does the BLM and the operators propose to mitigate and pay for losses of wildlife? What value is the BLM and federal government assinging to each of these animals/birds/eagles??	As described in EIS Section 3.3.2.1 (Avian Populations, Affected Environment), migratory movements in Idaho are primarily east to west and concentrated along the Snake River, Salmon River, and Pend Oreille River corridors. EIS Appendix 4 (Mitigation) describes mitigation measures, adaptive management measures, and potential compensatory mitigation measures.
11327-9	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	Wind Development – Negative Impacts to Golden Eagles and Ferruginous Hawks Deaths from wind development activities would be considered unlawful take under relevant federal laws, specifically the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act. There is increasing concern for both species due to current and future projections of mortality risk from anthropogenic sources, such as industrial scale wind development. Both species are believed to be declining.29 Numerous studies have documented these species' vulnerability to mortality from wind turbine collisions and localized population-level impacts. Squires et al. (2020) examined these two species in Wyoming and found that both are at risk from future habitat fragmentation30. In 2016, both species were identified as being at equally high risk of experiencing population declines from wind energy in the United States31. In a 2021 peer-reviewed publication by Diffendorfer et al., 14 raptor species were examined for level of vulnerability to current and anticipated installed wind capacity and in greatest need of management attention32. Golden Eagles and Ferruginous Hawks were among the top four species with the highest turbine- caused mortality rates. These two species were also among the top five species that showed larger estimated declines in population rate of change with increased levels of wind energy, thus had high potential for population-level impacts from wind turbine collisions. Additionally, Conkling et al. (2022) found that Golden Eagles were among the avian species found to be vulnerable to population-level effects from added fatalities caused by renewables and other sources33. In a publication that is under peer-review, long-time avian biologist and researcher Jim Watson notes that wind projects appear to expedite	Both the ferruginous hawk and the golden eagle are analyzed in detail in the EIS due to the potential for collisions with operational turbines to affect their populations in the analysis area; see EIS Section 3.3.2 (Avian Populations) and EIS Section 3.3.3 (Eagles), respectively. Impacts to avian habitat are disclosed in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), “Although turbine collisions are not considered to be a threat to the populations of most avian species (AWWI 2016; Choi et al. 2020), most avian species are afforded protection under the MBTA. The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tier 4 and 5). MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M in MVE [2023]) in accordance with the USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential for population-level effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities.”

Comment ID	Commenter	Public Comment	Response to Comment
		changes in raptor guild structure, facilitating long- term, significant declines in local breeding populations of Ferruginous Hawks and Golden Eagles, in part due to subsidizing human-tolerant and detrimental species (ravens and great- horned owls). In our opinion, such effects – when applied to the proposed Lava Ridge Wind Project – could result in changes in guild structure and increase predation pressure likely to impact Golden Eagles at the local area population (LAP) scale.34 Conkling et al. (2022) also found that vulnerability varied by species and by taxonomic group. Most raptors also were vulnerable to increases in absolute numbers of fatalities, which is of concern as wind development interests increase in Idaho and across the West. Conkling et al. (2022) and others, as described in further detail below, further find that localized fatalities lead to broader continental-scale population impacts. In the closing paragraph of their publication, Diffendorfer et al. (2021) specified that their research highlighted "the conservation value of ongoing efforts to continue developing collision deterrent technologies (Mayet al. 2020, Stokke et al. 2020), to implement automated shutdowns when raptors are in close proximity to wind turbines (Tom´e et al. 2017, Hayes et al. 2019), and to site new turbines in locations that avoid raptors (de Lucas et al. 2012a, b, Hanssen et al. 2020." (Emphasis added). It is with this strong guidance that we frame our comments. Thus, with the strength of the arguments presented in this comment letter, adequate protections are necessary to ensure that renewable energy projects continue in a sustainable manner, especially not compromising the preservation standard required by U.S. Fish and Wildlife Service for Golden Eagles.	MVE is pursuing an ITP, which is being evaluated in a separate NEPA analysis being conducted by the USFWS (see Section 3.3.3 [Eagles]). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project." A number of additional mitigation measures would be implemented throughout the life of the project to further minimize or avoid impacts to ferruginous hawk, golden eagle, and other avian species; these include additional raptor nest surveys and avoidance buffers for active nests, and a minimum of 2 years of postconstruction fatality monitoring (applicant-committed measure 150 in EIS Appendix 4) to assess actual avian fatality rates and to determine whether Tier 5 studies (additional measure x) and adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce fatalities. These adaptive management measures include the use of detector-based curtailment systems (applicant-committed measure 158) and additional fatality monitoring would be required to assess the effectiveness of adaptive management measures. The USFWS will be responsible for making a decision on MVE's eagle ITP application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines. Cumulative effects from turbine collisions at other existing and planned wind energy facilities in the analysis areas and other sources of mortality are discussed in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts) and EIS Section 3.3.3.2.7 (Eagles, Cumulative Impacts). Painting the base of turbines or one turbine blade black, as recommended by May et al. (2020) and Stokke et al. (2020), is not possible due to FAA regulations (see EIS Section 2.9.5 [Alternative Components]). Stokke, B.; T. Nygård, U. Falkdalen, H. Pedersen, and R. May. 2020. Effect of tower base painting on willow ptarmigan collision rates with wind turbines. *Ecology and Evolution* 10(12):1–10. Available at: https://doi.org/10.1002/ece3.6307. Accessed December 19, 2023.
11327-15	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	c) Inadequate Analysis of Impacts to Ferruginous Hawks In Idaho, there are around 600 breeding individuals. The Ferruginous Hawk is threatened primarily by conversion of native grasslands into cultivated fields. According to the Idaho Fish and Game Department, almost 50% of Ferruginous Hawk habitat in southern Idaho has been lost, and local biologists are noticing a decrease in their numers.52 Ferruginous Hawks were among four "large bird species" (other than eagles) that were determined to be at risk, in the analyses presented in the DEIS, of population-level effect as a result of this project. The DEIS further states that Ferruginous Hawks are particularly sensitive to increased mortality and references the research of Beston et al (2016), who found that found that turbines have a relatively large contribution to overall mortality for this species, and that they are vulnerable to population-level effects from wind energy development. The document further notes that while the hawks would benefit from lont-term nest surveys and curtailment of turbines within 1 mile of their nests, mortality from collisions with turbines would still occur. Additionally, turbines may indirectly impact ferruginous hawk populations (through habitat loss or alteration and reduced habitat quality) by leading to reduced nest success and increased predation and starvation of juveniles. However, the DEIS fails to provide any mortality estimates beyond the group of all raptors together. The DEIS notes that "Alternative B could results in 156 to 607 raptor fatalities", but fails to break this down by species. Thus, BLM must provide an improved analysis of the impacts that this proposed wind farm, and the existing/proposed development, could have on this species of conservation concern. Analysis should include mortality/take estimates. Mortality and survival rates of adult raptors exert the strongest influence on direction and rate of population change relative to other population parameters53. Thus, meaningful measures should be taken to avoid and minimize mortality for these long-lived species. We do applaud Applicant-Committted Measure Number 157, which specifies that if Ferruginous Hawk fatalities are observed, MVE "would implement Tier 5 studies (as per the WEG [USFWS 2012]) to further assess the potential for population-level effects following construction. This could include annual raptor nest monitoring over the life of the facility so that turbines within 1 mile of those nests can be curtailed (applicant-committed measure 158) during the nesting season.	As described in the analysis assumptions in EIS Section 3.3.2 (Avian Populations), "Although the avian use surveys (WEST 2021a, 2023) were used to determine the species that may be present in the siting corridors and their seasons of use, the risk of fatalities from turbine collisions varies among species due to factors such as flight characteristics, type of prey, and habitat use. Thus, avian use observed prior to construction may not correlate directly to fatality rates after construction (WEST 2011)." The fatality rates presented in Table 3.3-12 are not intended to be precise estimates, they are presented to illustrate how generation capacity effects avian fatalities to allow for a reasoned choice among alternatives. Any attempt to further quantify the potential fatality rate for individual species such as the ferruginous hawk would be highly speculative and would not lead to a more informed decision. While ferruginous hawk use observed during the avian use studies accounted for a relatively small proportion of overall diurnal raptor and large bird use and ferruginous hawk fatalities are rarely recorded at existing U.S. wind energy facilities, the EIS describes evidence from the publicly available literature that ferruginous hawk populations may be susceptible to mortality from collisions with operational turbines as wind energy development continues to expand further west. This uncertainty in potential fatality rates was an important factor in the development of mitigation measures for the ferruginous hawk and other avian species, including additional measure q referenced in the comment (which is additional measure x in the final EIS).
11419-1	Joyce Flick	Lava Ridge and Salmon Falls wind projects do not take into consideration the effects it will have on wild life and birds. Lava Ridge is in the direct path of hundreds of seagulls and pelicans that fly twice a day, through the future path of the turbines, from the Snake River to the lakes and reservoirs to the north. They fly south in the A.M. and north in the P.M. They are just two species of birds that share this flight path. Hundreds will be killed if these projects are approved.	See Table App3-3 in EIS Appendix 3 for a description of potential impacts to gulls and pelicans.
11514-1	Judy Ruprecht	Without a comprehensive scientific plan, there can be many unknown and negative impacts on birds and other wildlife including bats, ferruginous hawks, long-billed curlews, short eared owls, burrowing owls, bald and golden eagles, greater sage grouse and many songbirds. Bird mortality related to poorly sited wind energy infrastructure is growing. The annual loss of birds from wind turbines in the United States was estimated to be around 681,000 as of 2021; more than 1.4 million bird deaths are projected by 2030 or earlier if the U.S. meets its goal of producing 20% of electrical energy with wind. If that figure reaches 35%, as Department of Energy projections suggest, up to 5 million birds could be killed annually. (These estimates do not include birds that are killed by collisions with associated power lines and towers, which could be in the hundreds of thousands or even millions annually.) (American Bird Conservancy--Wind Energy)	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "Although turbine collisions are not considered to be a threat to the populations of most avian species (AWWI 2016; Choi et al. 2020), most avian species are afforded protection under the MBTA. The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tier 4 and 5). MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M of MVE [2023]) in accordance with the USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring

Comment ID	Commenter	Public Comment	Response to Comment
			surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential for population-level effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities." EIS Section 3.3.2.1.2 (Avian Populations, Existing and Future Trends and Actions) describes existing and future impacts from wind energy development in the analysis area, including estimates of cumulative fatalities from existing wind energy facilities and the relative impact of other sources of avian mortality, including collisions with transmission lines. As described in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts), "Because collisions with wind turbines would still result in a relatively small proportion of the fatalities from all anthropogenic structures (National Wind Coordinating Collaborative 2010), this is unlikely to significantly impact the population of most avian species in BCR 9, though it would add to the overall impact to these species. As wind energy capacity continues to increase in BCR 9, collisions with turbines will represent an increasingly large proportion of the avian fatalities resulting from collisions with humanmade structures and will have an increasingly large effect on avian populations. Although ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl would likely represent a very small proportion of all avian fatalities from collisions with turbines at any wind energy facility, even this relatively small increase in fatalities may have significant impacts on their populations in BCR 9." As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project."
11523-2	Janice Simpkin	o As a volunteer for East Cascade Audubon, I have been conducting winter raptor surveys southwest of the proposed windfarm site(s) for about 10 years so I am quite familiar with the bird species in the area. It appears to provide good wintering habitat for several raptors in addition to the species already mentioned. For example, Rough-legged Hawks are common November-February, and I saw a Snowy Owl once. Even though these aren't breeding birds in this area, their winter habitat should be considered.	Two full years of avian use studies were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, including seasonal variation in diurnal raptor use. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and EIS Table 3.3-7. Detailed data from the first year of avian use studies are presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study was included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. The results of both years of raptor nest surveys were also summarized in this section (see also Table 3.3-10). Rough-legged hawk use in the siting corridors is described in the avian use survey reports (WEST 2021a; 2023), which showed that the species is the second most common diurnal raptor during the spring and fall but is generally absent during the winter and summer. However, many of the sources evaluated in the analysis of impacts to ferruginous hawks and other diurnal raptors (see EIS Section 3.3.2.2 [Avian Populations, Impacts]) also included discussion of potential impacts to rough-legged hawks. These studies demonstrated that rough-legged hawks are not as strongly affected by wind energy development as other diurnal raptors. Rough-legged hawks are not a special-status species, which is indicative of their relatively large and stable populations. Therefore, it is reasonable to conclude that rough-legged hawks have a low potential to experience population-level impacts from fatalities due to collisions with operational wind turbines. Therefore, the species does not meet the criteria for analysis in Section 3.3.2 (Avian Populations) or Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). The snowy owl was not included in Table App3-3 because of the lack of confirmed records within the siting corridors and immediate vicinity and because it does not carry a special-status designation in Idaho. Impacts to avian habitat are described in EIS Table App3-1 in EIS Appendix 3; see AIB-1.
11533-5	Rebecca Loomis	Not only will this wind farm destroy the terrain and impact animal life that live in the proposed areas but no one has done a thorough analysis on the negative impact on the massive number of birds to include endangered species that these wind turbines have on them.	Impacts to avian populations are disclosed in EIS Section 3.3.2 (Avian Populations). There are no ESA listed bird species that occur in the siting corridors (see Table App3-3 in EIS Appendix 3 [Issues Analyzed in Brief]).
11534-15	Matt Arnold, William Eubanks	The Analysis of Project Effects on Raptors Fails to Address Important BLM-Managed Habitat Located Adjacent to and Within the Project Area Section 3.3.2 of the DEIS evaluates the Project's effects on avian species, including raptors. These birds, which include hawks, eagles, owls, and falcons, are particularly susceptible to wind turbine mortality due to several factors, including behavior and the age structure of their populations. See Richard T. Watson et al., Raptor Interactions with Wind Energy: Case Studies from Around the World, 52 J. RAPTOR RES. 1, 2, 11 (2018) ("Wind-energy developments can be detrimental to birds of prey. Even low numbers of anthropogenic fatalities of certain species, especially raptors, can be additive with other causes of mortality and significant to their populations.").13 Idaho, in particular, contains a wealth of raptor species—31 in total (17 species of diurnal raptors (hawks, eagles, and falcons) and 14 species of nocturnal raptors (owls)). In fact, the state is home to the Morley Nelson Snake River Birds of Prey National Conservation Area ("NCA"), which, as BLM knows, "is home to the greatest concentration of nesting birds of prey in North America—and perhaps, the world." BLM, Morley Nelson Snake River Birds of Prey National Conservation Area Visitor Guide at 7 (2012), https://on.doi.gov/404HPLw; see also Act of Aug. 4, 1993, Pub. L. No. 103-64, § 1 (finding that "[t]he public lands managed by the Bureau of Land Management in the State of Idaho within the Snake River Birds of Prey Area contain one of the densest known nesting populations of eagles, falcons, owls, hawks, and other birds of prey (raptors) in North America"). The Project's proposed location is less than 90 miles East-Southeast of the Morley Nelson NCA—i.e., a nominal distance for far-ranging raptor species—along the major migration corridor in Idaho. See DEIS at 3-61 ("Migratory movements within Idaho are primarily east to west and concentrated along the Snake River."). Like most birds, raptors include "highly mobile species that migrate long	While small buttes, rock outcroppings, and other topographic features are present in the siting corridors, none of these features are large or consistent enough to be of significant importance to migrating raptors. Raptor use in the siting corridors was evaluated over 2 years of avian use and raptor nest studies, which are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. Temporal variation in raptor use indicates that some of these species migrate through the siting corridors, but the relatively low numbers of raptors observed would suggest that the siting corridors are not within an important migratory corridor for raptors. High raptor use at Morley Nelson Snake River Birds of Prey National Conservation Area is related to the presence of important habitat features such as large, steep cliffs that provide nesting habitat for raptors and create thermals used by migrating raptors. Unique soil and vegetation at this location also provides abundant habitat for important raptor prey resources such as ground squirrels and jackrabbits, as described in the visitor guide referenced in the comment. A brief description of the NCA has been added to EIS Section 3.3.2.1 (Avian Populations, Affected Environment). According to the American Bird Conservancy Wind Risk Assessment Map referenced in the comment, only the Alternative B siting corridors overlap with key habitat area for the greater sage-grouse; the siting corridors fall entirely with the bald eagle key habitat area. The greater sage-grouse is discussed in EIS Section 3.3.4 (Greater Sage-Grouse), which demonstrates the substantial considerations given to the species in the siting of the facility, the development of the action alternatives, and the identification of measures necessary to minimize or avoid impacts to the species. The key habitat area for bald eagle shown in Wind Risk Assessment Map spans a huge swath of North America and lacks the detail necessary to draw any meaningful conclusions as to the importance of habitat in the siting corridors for this

Comment ID	Commenter	Public Comment	Response to Comment
		distances," DEIS at 3-86, and many cover large areas in flight when searching for prey. But the DEIS fails to include any mention of the Morley Nelson NCA, what impacts the Project may have on its nationally significant abundance, especially when paired with the rapid rise of wind energy in this part of the state. In fact, the DEIS paints a very different (and arguably misleading) picture about the area's importance for raptors and other birds. According to the DEIS, "[t]here are no Important Bird Areas designated in the siting corridors, and with the exception of limited permanent water resources (namely canals), the siting corridors do not contain habitats that would concentrate migrating birds or mountain ridges that would provide updrafts for migrating raptors. DEIS at 3- 61. Elsewhere, however, the DEIS explains that the "[w]ind turbine siting corridors would be concentrated in the higher elevation lands associated with several buttes in the area, and on mid- elevation lands between the buttes." Id. at 2-2; see also id. at 3-62 ("The shrublands, rangelands, agricultural areas, and rocky outcrops in the siting corridors provide habitat, nesting and foraging areas, and migratory stopover areas for a variety of raptors and other migratory bird species."). Further, BLM's assessment about the Project-area's value to raptors is undermined by findings compiled by the American Bird Conservancy, which shows that this area is an "Area of High Importance" ("Key Habitat Area"), within which some wind development may be possible if key habitats "are avoided, and/or appropriate minimization and mitigation measures are incorporated." Wind Risk Assessment Map, AM. BIRD CONSERV., https://bit.ly/3GAU1gf (last visited Apr. 20, 2023).14	species. As noted in the description for this key habitat area, bald eagles are rarely detected away from large bodies of water, which are not present in the siting corridors. EIS Section 3.3.3.1 (Eagles, Affected Environment) also describes the general lack of habitat for bald eagles in the siting corridors and summarizes the results of both years of avian use (WEST 2021a, 2023) and raptor nest surveys (WEST 2020, 2021b), which indicate very low bald eagle use and no bald eagle nesting in the siting corridors. The Wind Risk Assessment Map also shows that the siting corridors are located outside of the intermountain raptor migration corridor, which supports the conclusion that raptor migratory movements are concentrated in the immediate vicinity of the Snake River, south of the siting corridors. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). A number of additional mitigation measures would be implemented throughout the life of the project to further minimize or avoid impacts to raptors, golden eagle, and other avian species; these include additional raptor nest surveys and avoidance buffers for active nests, and a minimum of 2 years of postconstruction fatality monitoring (applicant-committed measure 150 in EIS Appendix 4 [Mitigation]) to assess actual avian fatality rates and to determine whether Tier 5 studies (additional measure x) and adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce fatalities; additional fatality monitoring would be required to assess the effectiveness of adaptive management measures. The USFWS will be responsible for making a decision on MVE's eagle ITP application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines.
11535-29	Steven Andersen	The DEIS grossly underestimates the fatality rate of avian populations (both local and general). "There are no previous studies of wind energy facility [sic] of the size proposed, nor have there been any studies of facilities with turbines as large as those proposed for the Lava Ridge Wind Project, and it is unknown how these differences would affect avian fatalities during operation."107 "[D]ata on local avian populations are [sic] not available for many species and are of limited value for species for which data are available due to the much smaller sample sizes." 108 The DEIS could not be any clearer: it did not conduct a sufficient analysis of potential impacts based on the magnitude of the project. This 34-year proposed project has not been sufficiently supported by substantial research and surveys regarding impact to avian population. The magnitude of the project alone, acknowledged in the DEIS, requires significant more time and resources to determine what impact the project will have. Statements such as, "it is unknown" how the magnitude of the proposed project will affect avian populations is concerning, and is certainly evidence that the project should not move forward at this time.	Although the avian use surveys (WEST 2021a, 2023) were used to determine the species that may be present in the siting corridors and their seasons of use, the risk of fatalities from turbine collisions varies among species due to factors such as flight characteristics, type of prey, and habitat use. Thus, avian use observed prior to construction may not correlate directly to fatality rates after construction (WEST 2011). The fatality rates presented in Table 3.3-12 are not intended to be precise estimates, they are presented to illustrate how generation capacity effects avian fatalities to allow for a reasoned choice among alternatives. 40 CFR 1502.21 requires the BLM to disclose where there is incomplete or unavailable information when evaluating reasonably foreseeable significant adverse impacts; therefore, the EIS must describe the uncertainties involved in estimating bird fatality rates and the incomplete nature of the publicly available information on the response of avian populations to wind energy development. Despite these difficulties in quantifying impacts to avian populations, the EIS recognizes the potential for the action alternatives to adversely impact the BCR 9 populations of ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl without the implementation of mitigation measures. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-based Wind Energy Guidelines* (USFWS 2012).
11535-30	Steven Andersen	Mortality from wind energy could lead to localized population-level impacts, which the DEIS expressly acknowledged it did not consider. Again, the DEIS states, "data on local avian populations are [sic] not available for many species and are of limited value for species for which data are available due to the much smaller sample sizes."118 The cumulative result of wind energy with other anthropogenic sources of mortality may cause widespread declines in avian populations.119 All of these impacts require more consistent and rigorous monitoring. Obtaining, synthesizing, and communicating reliable information on mortality rates under different scenarios (e.g., geographical location, climate, topography, presence of species of conservation concern, etc.) is fundamental to identifying creative engineering and environmental solutions to minimize mortality.120 However, the literature reveals persistent concerns regarding the inconsistency, poor rigor, and lack of transparency of mortality studies at wind facilities worldwide.121 This is especially true in the DEIS which openly admits the impact is "unknown."	As stated in EIS Section 3.3.2 (Avian Populations), "The analysis area for avian populations is Bird Conservation Region (BCR) 9 (Figure 3.3-3), which is an ecologically distinct region with similar bird communities, habitats, and resource management issues (North American Bird Conservation Initiative 2021). BCRs provide an ecological approach to capturing regional variation in bird occupancy and useful spatial units over which to examine changes in population. Data on avian fatality rates and installed wind capacity are also available at the BCR level, which allows for a more informed estimation of the avian fatality rates that could be expected under the action alternatives, and the relative contribution of those fatalities to the overall impact on regional avian populations." and "the project's effects on avian populations at the BCR 9 scale would be directly proportional to the estimated fatality rate for each alternative. This is an oversimplification for some species that have variations among their smaller, local populations within BCR 9. Each of these smaller populations may not have the same relative contribution to the overall size and trend of their population in BCR 9. However, quantifying the relative importance of local populations to the overall population of a species in BCR 9 is beyond the scope of this analysis. Further, data on local avian populations are not available for many species and are of limited value for species for which data are available due to the much smaller sample sizes. Where the literature indicates important differences between local populations of a species within BCR 9, additional qualitative discussion is provided in this EIS."
11535-32	Steven Andersen	The purported data used from "BCR 9" is largely insufficient based on the DEIS admissions as to lack of research and analysis. More specifically, the analysis area is BCR 9, which runs from Canada to southern Nevada, and from the Cascade Mountains to the west slope of the Rocky Mountains. All of southern Idaho is included in BCR 9. Therefore, the area is absurdly large for use in estimating fatalities. BCR 9 certainly consists of vast differences in topography, geography, and general unique characteristics, which all play a major role in how mortality rates are determined. The improperly concludes, despite the express acknowledgment to the contrary, that the gigantic area that is BCR 9 is somehow useful for estimating avian fatalities for the subject project because it would be similar to wind factories in other parts of BCR 9. It is perplexing the DEIS jumps to this conclusion in the face of its statement that "[t]here are no previous studies of a wind facility [sic] of the size proposed,"124 but in any event, it is undisputed there are no wind farms or projects in BCR 9 that come close to the size in acreage or number and height of turbines.	See response to comment 11535-30 (see in Table A-3c, Birds) for the analysis area rationale. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), avian fatality rates for the USFWS Pacific Region and EPA North American Deserts Level I Ecoregion are similar to those reported for BCR 9. Therefore, the avian fatality estimates would be similar regardless of the spatial scale selected. Since the estimated fatality rates for each action alternative are directly proportional to generation capacity, the relative impact of each alternative is the same regardless of the fatality rate used for the estimate. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "available data from existing wind farms . . . had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for the Lava Ridge Wind Project." Although there are no existing U.S. wind energy facilities of the size proposed, the use of per-MW fatality rates is well established in the publicly available literature and allows for the fatality rates observed at existing facilities to be scaled up to the size proposed. The EIS discloses the uncertainty involved in this approach and the need for

Comment ID	Commenter	Public Comment	Response to Comment
			postconstruction monitoring to better quantify fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as described in the response to comment 11535-29 (see in Table A-3c, Birds). EIS Section 3.3.2.2.2 has been updated with additional postconstruction fatality monitoring data obtained from IDFG subsequent to the publication of the draft EIS; these studies showed that overall avian fatality rates at wind energy facilities Idaho are generally well below the regional mean (2.7 birds per MW per year) used in the avian fatality estimates presented in Table 3.3-12, despite the fact that all of the facilities for which IDFG provided data were located adjacent to large reservoirs, the Snake River, and other riparian areas and surface water. None of the studies could establish an estimated raptor fatality rate because too few carcasses (< 5) were found. Considering the project is much further from significant riparian habitat, large surface waters, and rocky cliff habitat present in the vicinity of other facilities studied in Idaho, it is possible that the fatality rates observed at the project would be well below the mean estimate and fatality rates exceeding the maximum estimates presented in Table 3.3-12 would be highly unlikely.
11535-33	Steven Andersen	Even more, the DEIS states, "[t]he analysis of effects to avian populations also assumes avian fatalities from turbine collisions would have the same magnitude of impact on avian populations in BCR 9 regardless of where those fatalities occur in BCR 9." This, of course, is intentionally misleading based on the fact that the location and circumstances of fatalities absolutely matter. The potential effect to local avian populations is more strongly influenced by their local population size, than by continental population size.126 The BCR 9 data therefore overgeneralizes and underestimates the local impact.	The EIS examines both continental and regional (BCR-level) population data. As stated in Section 3.3.2, "The analysis of effects to avian populations also assumes avian fatalities from turbine collisions would have the same magnitude of impact on avian populations in BCR 9 regardless of where those fatalities occur in BCR 9. Therefore, the project's effects on avian populations at the BCR 9 scale would be directly proportional to the estimated fatality rate for each alternative. This is an oversimplification for some species that have variations among their smaller, local populations within BCR 9. Each of these smaller populations may not have the same relative contribution to the overall size and trend of their population in BCR 9. However, quantifying the relative importance of local populations to the overall population of a species in BCR 9 is beyond the scope of this analysis. Further, data on local avian populations are not available for many species and are of limited value for species for which data are available due to the much smaller sample sizes. Where the literature indicates important differences between local populations of a species within BCR 9, additional qualitative discussion is provided in this EIS."
11535-34	Steven Andersen	The DEIS understates the negative irreparable impact the project will have on the avian population habitat. As the DEIS acknowledges, the siting corridor is used for "breeding, nesting, foraging, hunting, roosting, and sheltering. The shrublands, rangelands, agricultural areas, and rocky outcrops in the siting corridors provide habitat, nesting and foraging areas, and migratory stopover areas for a variety of raptors and other migratory bird species."127 The DEIS recorded a total of 72 species during surveys (surveys which are substantially inadequate in time-spent).128 The impact to such a vast number of avian species cannot be so easily overlooked as the DEIS has done, nor can the surveys and research be so scant as they have been. The most important type of impact is likely indirect, which the DEIS fails to adequately consider. Habitat loss is the leading cause of species extinction and other negative impacts on biodiversity but has received relatively little attention in the energy development literature.129 Wind energy requires almost twice the footprint of oil and gas per unit energy produced, and given the unprecedented magnitude of this project, it is likely to be even more, which means the habitat loss will be exacerbated. 130 More specifically, wind may require less infrastructure, but it results in higher levels of habitat fragmentation because impacts are geographically scattered rather than concentrated.131 Of note, in the U.S., the Federal Endangered Species Act currently protects over 1300 species and another, 250 species are under consideration for protection.132 The majority of these species list habitat loss and fragmentation as the primary cause for federal protected status. For these and other species that require large unfragmented habitat, improperly sited wind turbines may be incompatible with maintaining viable wild populations.134 The DEIS does not even consider which of the avian species requires a large unfragmented habitat in order to properly determine where the locate the turbines. If birds avoid the immediate vicinity of the project, the area may lose its attraction to birds on a long-term basis.135 Further, construction of a wind power facility means increased human activity in the area during and after the construction phase, and the disturbance caused by this may be significant.136 Such disturbance effects would appear during the early construction and continue with varying intensity during the project's lifetime.	Two full years of avian use studies were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, including seasonal variation in diurnal raptor use. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and in EIS Table 3.3-7. Detailed data from the first year of avian use studies is presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study is included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. The results of both years of raptor nest surveys were also summarized in this section (see also Table 3.3-10). Additional studies were conducted for greater sage-grouse, as summarized in EIS Section 3.3.4.1 (Greater Sage-Grouse). As described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief; see AIB-1), with the implementation of avoidance, minimization, and mitigation measures, effects to avian habitat would be the same as disclosed in BLM (2005:5-35 to 5-85).
11535-35	Steven Andersen	The DEIS fails to give due consideration to various aspects of habitat loss. For example, habitat loss from roads is substantial, often accounting for the largest proportion of land-use change.138 However, the only thing the DEIS does is provide an estimate of the total mileage of proposed roads, but fails to indicate how the differences in proposed mileage will impact the habitat of the avian population.	Disturbance from road construction and improvements is accounted for in the acreage of infrastructure for each action alternative as shown in Table 2.4-1 in EIS Section 2.4 (Alternative B). As described in the response to comment 11535-34 (see in Table A-3c, Birds), impacts to avian habitat are addressed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1.
11535-36	Steven Andersen	Further, noise and light pollution has a significant impact on habitat of avian population, but the DEIS only briefly (if at all) addresses this aspect of indirect impact. More specifically, noise and light pollution are widely acknowledged as sources of disturbance to avian species, contributing to habitat degradation and wildlife displacement, and masking auditory and visual life-history traits essential for survival and reproduction.	See response to comment 11535-34 (see in Table A-3c, Birds). Additional discussion of indirect effects to avian species is provided in AIB-2 through AIB-4.
11535-37	Steven Andersen	Finally, the DEIS has not sufficiently considered a large portion of the proposed siting corridor (let alone the specific location of the turbines because that has not yet been selected). Specifically, the DEIS admits that it has not covered "30% of the project area."140 Further, it appears surveys that took place only once per month for one year (second year unavailable, but presumably just as insufficient). Such a small sample size over a such a short period of time, given the magnitude of the project, is inadequate. This is even more true in light of the fact that certain avian populations are known to move their nests significantly over time.	Both years of avian use studies were conducted in accordance with standard survey methodology and the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). Due to changes in the siting corridors after the first year of avian use studies, that year of study does not provide the recommended 30% coverage but is acceptable for use in the EIS analysis because the point count locations that fall outside the current siting corridors are within a few miles of the siting corridors in similar habitats, as disclosed in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9.
11547-2	Lowell Ihler, Carol Ihler	2. The loss of wildlife, animals, birds and bats is a major concern. Again, we don't feel that this was fully addressed in the DEIS. The portions that were addressed shows how many birds, bats and wildlife could be damaged or lost due to this project. We have the World Center for Birds of Prey located in Idaho that has made a huge difference in the survival of many bird species including the eagles and falcons. If anyone shoots or kills one of the protected birds	See response to comment 11534-15 (see in Table A-3c, Birds) for a discussion of the Morley Nelson Snake River Birds of Prey National Conservation Area and impacts to raptors. The MBTA and BGEPA prohibit the intentional take of migratory birds and eagles but do not impose the same level of restrictions for incidental take of these species resulting from otherwise lawful actions. MVE is pursuing an ITP, which is being evaluated in a separate NEPA

Comment ID	Commenter	Public Comment	Response to Comment
		they are fined and punished. Why can a big corporation come in and have the "right" to kill these birds with a "take Permit" and only pay a fine for any over the allotted "take permit"? This is just a way of buying there way out and no amount of money can replace these birds and other wildlife.	analysis being conducted by the USFWS (see EIS Section 3.3.3 [Eagles]). The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tier 4 and 5). MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M in MVE [2023]) in accordance with the USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities." As stated in IAC 13.01.06 Section 300.02 "Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management . . . "
11554-18	Raul Labrador; Idaho Attorney General's Office	Beyond wild game, the Project will devastate many other vulnerable animal populations in Idaho. The hundreds of sweeping blades slicing through the air, for example, are known to pulverize bat and bird populations.2 Increased mortality from wind farms has even pushed some bat species to the point of extinction.3 These devastating impacts will affect the rest of Idaho's ecosystem. Bats maintain an equilibrium in the insect population and ensure that insects don't overwhelm local crop output. And a reduction in the predatory bird population will lead to a corresponding increase in rodents that harm crops. The draft EIS proposes no adequate alternative to harmful effects on Idaho's wildlife. While the draft EIS generally acknowledges the Project will harm Idaho wildlife, it still suggests preferred proposed alternatives that will cause "irreversible" damage to Idaho wildlife. Importantly, the Idaho Department of Fish and Game designates several bat species as "species of greatest conservation need" (SGCNs).4 The agency knows that the Project will very likely have a "population-level" effect on several of these SGCN bat species, but it disregards those consequences. DEIS 3-37, 3-41–42. Similarly, Idaho has designated several birds as SCGNs that the agency also recognizes will be severely and "irretrievably" harmed by the Project. See, e.g., DEIS at 3-126 (all action alternatives will have irretrievable harm on sage grouse); id. 3-68, 3-78 (ferruginous hawks are "vulnerable to population-level effects from wind energy development). As trustee over its wildlife, Idaho has a special interest in preserving these populations. The draft EIS's failure to account for, or even mention, Idaho's interest in SGCNs is a clear violation of federal law.	See EIS Section 3.1.2.4 (Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity) for the definition of irreversible and irretrievable commitments, which are related to the duration of the impact rather than the severity or magnitude. Special-status avian and bat species, including those designated as SGCNs by IDFG, were individually assessed for their potential to experience population-level impacts from the action alternatives, as described in EIS Section 3.3.1.1 (Bat Populations and Roosting Habitat, Affected Environment) and Section 3.3.2.1 (Avian Populations, Affected Environment). Those species with a moderate to high potential for population-level impacts are analyzed in detail in Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts) and Section 3.3.2.2 (Avian Populations, Impacts). Species at low risk of population-level impacts are analyzed in Table App3-2 and App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Due to the potential for significant impacts to special-status avian bat species, and number of avoidance, minimization, and mitigation measures would be implemented as described in the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation). As described in EIS Section 3.3.1.3 (Bat Populations and Roosting Habitats, Irreversible and Irretrievable Commitments and Short-term Uses Versus Long-Term Productivity) and Section 3.3.2.3 (Avian Populations, Irreversible and Irretrievable Commitments and Short-term Uses Versus Long-Term Productivity), irretrievable impacts to birds and bats would not be considered irreversible because they would be unlikely to result in a trend toward listing under the ESA or a loss of population viability. Table App3-4 was added to EIS Appendix 3 to provide the rationale for excluding other special-status species, including those designated as SGCNs by IDFG, from detailed analysis in the EIS.
11598-16	Idaho Conservation League	Birds ICL appreciates that wind projects have a smaller impact on avian mortality compared to many other anthropogenic effects and other forms of energy: Despite the trend toward increasing avian fatalities from wind energy, this source of mortality will remain relatively small when compared to other sources of avian mortality—such as collisions with vehicles, buildings, transmission lines, and communication towers; exposure to pesticides and other toxic chemicals; and predation by domestic and feral cats (AWWI 2016; Loss 2016; National Wind Coordinating Collaborative 2010)—and for most species, this source of mortality will be too small to have a notable effect on their populations (AWWI 2016; Choi et al. 2020). However, for some special status avian species, when cumulative fatalities across BCR 9 (Bird Conservation Region) are considered, there could be negative population-level effects that continue a downward trend. (DEIS 3-86). and It is also important to note that wind energy results in an estimated 0.269 avian fatality per gigawatt-hour (GWh) of energy produced, whereas nuclear power causes an estimated 0.416 avian fatality per GWh, and traditional fossil fuel energy causes 5.18 avian fatalities per GWh (Sovacool 2013). (DEIS 3-87). However, ICL is concerned about the lack of studies cited on the effects on avian mortality from projects of this size: There are no previous studies of a wind energy facility of the size proposed, nor have there been any studies of facilities with turbines as large as those proposed for the Lava Ridge Wind Project, and it is unknown how these differences would affect avian fatalities during operation. (DEIS 3-58). In addition, there may be declines in certain localized avian populations. 9 Idaho Department of Fish and Game, DRAFT State WIldlife Action Plan (2022). However, for some special status avian species, when cumulative fatalities across BCR 9 are considered, there could be negative population-level effects that continue a downward trend. Thus, even though an individual wind energy facility on its own may not cause population-level effects, each facility constructed in BCR 9 over the next 30 years would further increase avian mortalities and the potential for declines in some avian populations. (DEIS 3-86). The Lava Ridge project, located within Bird Conservation Region 9 includes over 70 bird species, representing a wide variety of life history characteristics. Among them the horned lark, western meadowlark and Brewer's sparrow are the predominant small/pasturing bird species. Large birds such as common ravens and waterfowl are also present, as well as many special-status birds that are Species of Greatest Conservation Need (SGCN) or BLM special-status species10 such as owls, buteos and eagles. Many protected birds in BCR 9, such as the ferruginous hawk are associated with low reproductive outputs and have been identified as having moderate risk of population-level effects from turbine mortality events. These significant risks will increase to breeding adults, fledglings and nesting success as more wind developments are constructed within ferruginous hawk habitat. (DEIS 3-68). The long-billed curlew is also a species with a low reproductive rate. While some populations in Idaho have apparently been increasing, rangewide declines indicate that current breeding success and localized distribution in BCR 9 needs to be preserved. Two SGCN owl species (short-eared and burrowing) have also been characterized in the DEIS (3-70) as being sensitive enough such that only small reductions in productivity could compromise populations in BCR 9. The DEIS then goes on to describe significant impacts that could result from the Lava Ridge project (ex. DEIS 3-80, 3-86). Based on the existing wind generation capacity in BCR 9 (8.5 GW), the potential combined capacity proposals of Lava Ridge, Salmon Falls, and Taurus would increase wind energy generation in Idaho by roughly 40%. While this is desirable from a renewable energy perspective, we are concerned that the potential to affect the population status of	EIS Section 3.3.2.2.2 (Avian Populations, Alternative B). As stated in this section, "The estimated avian fatality rate used in this EIS (and detailed below) was based on available data from existing wind farms, which had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for the project. Thus, the estimated avian fatality rates used in this EIS account for variability in the RSH." Although there are no existing U.S. wind energy facilities of the size proposed, the use of per-MW fatality rates is well established in the publicly available literature and allows for the fatality rates observed at existing facilities to be scaled up to the size proposed. The EIS discloses the uncertainty involved in this approach and the need for postconstruction monitoring to better quantify fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities. Two full years of avian use studies (WEST 2021a, 2023) were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, detailed studies of migratory routes are beyond the scope of this EIS. As described in the response to comment 11534-15 (see in Table A-3c, Birds), the siting corridors have been sited outside of known migratory routes in the area. Cumulative impacts to avian populations are disclosed in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts) and the future expansion of wind energy facilities within the analysis area was considered when determining the potential for each species to population-level impacts from collisions with operational turbines; see EIS Section 3.3.2.2 (Avian Populations, Impacts). Raptor nests, effects to breeding raptors, turbine siting considerations, and mitigation measures (including feathering and curtailment) are also discussed in the section; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. Effects to avian habitat and the effects of construction activities on avian species are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1 through AIB-5.

Comment ID	Commenter	Public Comment	Response to Comment
		avian communities through cumulative impacts in BCR 9 are significant given the known mortality 10 https://www.blm.gov/sites/blm.gov/files/docs/2022-04/Programs_FishandWildlife_BLMIdaho_Special_Status_Species_Animals_2022.pdf rates at operational facilities. The trajectory of wind energy development in the region over the next 30 years would magnify these cumulative effects exponentially. The DEIS also states that reductions in avian mortalities are unlikely to be realized with changes in turbine design (DEIS 3-86). New Lava Ridge alternatives that might be considered must take these realities into account when assessing not only mortality by direct collision, but other considerations as well, such as: ● displacement, barrier effects, species-specific life history needs, habitat change or loss (Drewitt and Langston 2006)11 ● consequences of construction activities, turbine placement and operations in differing habitat disturbance regimes ● postconstruction fatality monitoring ● raptor breeding sites, nest failure thresholds and fledgling behavior during parenting ● ongoing research on minimization techniques such as curtailment, blade feathering, etc. ● meaningful mitigation strategies that result in better outcomes for populations in other areas There are likely several flyways across the Snake River Plain. It is unclear if the Lava Ridge Project is within or outside these flyways. The BLM should analyze where the Lava Ridge project is relative to these flyways so that appropriate mitigation can be designed and provided. ICL is also cognizant that world-wide failure to rapidly increase renewable energy production and decrease fossil fuel generation will permanently destabilize the climate. The effects to biodiversity, ecosystem processes and human communities will be far more pervasive and disruptive than impacts from well-placed renewable energy projects.	
11803-1	Jon Christianson	It does not appear to the [Sawtooth Conservation and Recreation Alliance, Inc. (SCRA)] SCRA that the environmental impact to the ecosystem of the SNRA from the expected significant loss of migratory birds due to wind farm mortality has been investigated or mitigated at all in the proposal. The SCRA believes that such a project as the Wind Project should only be undertaken in this migratory corridor if there can be assurances backed up by adequate legal recourse that these wind farms will have no impact on the ecosystem of the SNRA.	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), the project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). A number of additional mitigation measures would be implemented throughout the life of the project to further minimize or avoid impacts to raptors, golden eagle, and other avian species; these include additional raptor nest surveys and avoidance buffers for active nests, and a minimum of 2 years of postconstruction fatality monitoring (applicant-committed measure 150 in EIS Appendix 4 [Mitigation]) to assess actual avian fatality rates and to determine whether Tier 5 studies (additional measure x) and adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce fatalities; additional fatality monitoring would be required to assess the effectiveness of adaptive management measures. With the implementation of these measures, none of the action alternatives would be expected to notably impact avian populations in the Sawtooth National Recreation Area and further analysis in the EIS is not warranted.
11833-3	Bob Hassoldt	Looking at section 3.3.2 in the DEIS, page 3-58, “Fatality estimates for the project are based on the fatality rates observed at other wind facilities in the western United States, and it is assumed that the fatality rate for the project would fall within the range observed at other wind facilities (on a per-MW basis). The problem is, as mentioned, that this facility is larger than any other in the United States. Any assumptions made are going to be educated guesses, not something with a high confidence interval. How can we be assured that avian and raptor fatalities won't be multiplicative rather than straight-line additive as you’ve indicated here?	See response to comment 11535-29 (see in Table A-3c, Birds).
11849-1	Charles Brockway	Studies of impacts on aviation populations descried in the EIS are inadequate and do not meet ordinary standards for scientific evaluations for a specific site and project. The area is home to horned lark, western meadowlark, Brewer's sparrow, common raven, mourning dove, grasshopper sparrow, brown-headed cowbird, barn swallow, sage thrasher, Swainson's hawk, and lark sparrow. As just one example of likely impact, on June l, 2022, a horned lark was clocked with range finder and found to be flying 107 m vertically, which aligns with the blade diameter of the wind turbines. The BLM did not conduct these types of necessary site specific evaluations but used simplifications and extrapolations from analogous projects that the EIS admits fail to match the scale of the Lava Ridge project.	EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail) provides a summary of important life history traits, demographic information, and susceptibility to impacts from wind energy development for the four species analyzed in detail in the EIS (ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl). Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief) presents this information for the special-status avian species with the potential to occur in the siting corridors that were determined to have a low likelihood of population-level effects. As described in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts), “Despite the trend toward increasing avian fatalities from wind energy, this source of mortality will remain relatively small when compared to other sources of avian mortality—such as collisions with vehicles, buildings, transmission lines, and communication towers; exposure to pesticides and other toxic chemicals; and predation by domestic and feral cats (AWWI 2016; Loss 2016; National Wind Coordinating Collaborative 2010)—and for most species, this source of mortality will be too small to have a notable effect on their populations (AWWI 2016; Choi et al. 2020).” This section also describes the higher avian fatality rates associated with other forms of energy generation and the potential that alternatives with lower generating capacities could result in greater impacts to avian populations if other types of energy generation are used to satisfy the demand for electricity that would have been generated under alternatives with higher generation capacities. The grasshopper sparrow and sage thrasher are discussed in Table App3-3; the other species referenced are not included in the EIS analysis because they do not carry a special-status designation in Idaho, and therefore, are assumed to have relatively large and stable populations.
11860-13	Shauna Robinson	The information included in the DEIS about the Western Burrowing Owl is extremely inadequate. A proper survey was conducted to provide accurate information about the unique and vulnerable species. The nest studies were termed as “incidentals” in a survey that was not “targeted” for Western Burrowing Owl nests in either 2020 or 2021 (3-66)! Surveyors reported observing only ten Western Burrowing Owls in their first year of surveying, noting they did not see any owls in the winter (3-70-71) Of course they did not see any in the winter because the owls migrate south to warmer areas like Mexico. Based on monitoring of Burrowing Owls my husband and I have done for about ten years of nests south of Twin Falls near Nat Soo Pah, the numbers of owls that return to an area are unpredictable. There can be numerous sightings one year, yet very few the following year. To establish a true accounting of the owls, observations must be conducted over multiple years, not just two as was completed for the DEIS. Also, the habitat	As disclosed in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail), burrowing owl use in the siting corridors is likely to be higher than reported because avian use surveys were not designed to detect the species. Therefore, mitigation measures for burrowing owls were modified and expanded in the final EIS; these include preconstruction surveys for burrowing owl nests and avoidance buffers for active nests (additional measure q) as well as the removal of loose rocks to avoid creating habitat for prey (additional measure s); see EIS Section 3.3.2.2.2 (Avian Populations, Alternative B with Additional Measures) and EIS Appendix 4 [Mitigation]).

Comment ID	Commenter	Public Comment	Response to Comment
		and available food supplies, i.e., rodents and insects, need to be monitored, in addition to other raptors / wildlife that might share the same area as the Burrowing Owls, like Swainson Hawks or badgers. Noting if grazing is near the burrow is important, too, as the cow dung is spread around the entrances to the burrows to attract insects that the Burrowing Owls eat. If the Lava Ridge project interrupts the grazing on numerous allotments, this, in turn, could affect the owls. Limited food sources can then affect the clutch size (2-12).	
11860-14	Shauna Robinson	The Short-Eared Owl also lacked a survey designed just for owls so accurate numbers could not be reported in the DEIS. As with the Burrowing Owls, multiple-year surveys are needed to monitor nesting areas, numbers, etc. There are Short-Eared Owls that stay in the area year-round. Also of note, at the first of April, when leaving the Minidoka NHS one evening around 7:00, the wildlife management area south of the camp was alive with Short-Eared Owls. We observed 6-10 owls flying, perched on fence posts, and sitting on the ground in that WMA, which is situated just a few miles from the planned corridors and turbines of Lava Ridge.	Because the avian use surveys (WEST 2021a, 2023) did not target owls, mitigation measures for short-eared owls were modified and expanded in the final EIS; these include preconstruction surveys for short-eared owl nests and avoidance buffers for active nests (additional measure r). Additionally, MVE would complete a minimum of 2 years of postconstruction monitoring (applicant-committed measure 150 in Appendix 4) to assess the actual short-eared owl fatality rate and, if high fatality rates are observed, to determine which adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce short-eared owl fatalities. Additional monitoring would be required to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).
11860-15	Shauna Robinson	The current DEIS report on migrating avians is totally inadequate. They are protected by the Migratory Bird Treaty as mentioned and deserve a more comprehensive study in light of a potential wind project that could very well impact their migration.	See Section 3.3.2.2.2 for a discussion of MBTA compliance.
11860-16	Shauna Robinson	One “large bird” species of interest in the Lava Ridge area is the Tundra Swan, a species that did not have adequate information about it in the DEIS. The DEIS remarks about “large bird” species One Saturday in early April, when driving just north of the recharge area on the Milner-Gooding Canal, my husband and I noticed the large recharge lake and quite a number of waterfowl, among them Tundra Swans. There were approximately forty swans on the north edge of the lake. We assumed, they were using the recharge lake as a stop-over place in their long migration to Canada and the tundra areas of the far north. The next week, we returned to the recharge area with the local Audubon chapter members for some birding across the Lava Ridge area. The lake was totally dry, but when all of us traveled north to the Star Lake vicinity, we saw twenty Tundra Swans on the south side of the lake. Our guess was some of the swans had moved to the next water source with Carey Lake to the north as the next stop. Such migration across the Lava Ridge could very well pose problems for the Tundra Swans or other migrating birds, lured by the seasonal water sources. Thousands of birds are expected to die from turbine collisions at Lava Ridge (3-71), and swans could very well be part of that number. Impacts ARE the impact!! More survey work of the specific migrating species is needed, along with documentation of their seasonal flyways, to enable responsible strategies and siting of turbines to minimize avian collisions in the event the wind project is built.	Two full years of avian use studies were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, including seasonal variation in diurnal raptor use. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and EIS Table 3.3-7. Detailed data from the first year of avian use studies is presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study is included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies (WEST 2023) were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. Detailed studies of migratory routes are beyond the scope of this EIS. Although tundra swans were recorded during the second year of avian use studies, the species does not meet the criteria for analysis in the EIS because it does not have a special-status designation in Idaho, and therefore, is considered to have a relatively large and stable population. There are also no records of fatalities of any swan species at existing U.S. wind energy facilities, indicating that the species is at low risk of colliding with operational turbines.
11871-2	WildLands Defense	Several alternative elements purposefully and unlawfully delay critical surveys for sensitive wildlife species including sensitive burrowing owls until post-decisionally. Many other wildlife species – including sensitive Long-Billed curlew and many other migratory birds, Idaho amphibians and mammals receive no systematic surveys of any kind.	See response to comment 11871-12 (see in Table A-3c, Birds).
11871-5	WildLands Defense	Critical data on project adverse impacts raptor prey species is absent.	See response to comment 11871-12 (see in Table A-3c, Birds).
11871-8	WildLands Defense	There is no assembled data on avian and bat migration routes in the local and regional area, despite available technology	As recommend by the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012), MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M in MVE [2023]), and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities.” As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), “The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project.” A number of other measures that would be implemented to minimize or avoid impacts to birds are described in EIS Section 3.3.2.2.2 and EIS Appendix 4 (Mitigation). Detailed studies of migratory routes are beyond the scope of this EIS but are included as potential adaptive management or compensatory mitigation for avian and bat species; see the BBCS and EIS Appendix 4 for additional details.
11871-12	WildLands Defense	Alternative comparisons are flawed “ Same as Alternative B, except additional preconstruction surveys would be implemented to better assess burrowing owl use in the siting corridors. Additional postconstruction monitoring requirements would also be implemented to better assess avian fatality rates and identify opportunities to minimize or avoid effects to species of concern (e.g., ferruginous hawk)”. These surveys need to be done at the start, in order to develop a reasonable range of alternatives and properly assess impacts. “These additional measures would minimize the potential for the project to cause, or contribute to, a trend toward federal listing for special- status avian species”. WHAT is the specific scientific basis for such claims? How severe will mortalities and habitat loss and displacement be for all species under all alternatives? What is the actual local and regional population of all impacted species, and what threats are these species facing? What is the rate of their population declines?	Table ES-2 in the Environmental Impacts section of the Executive Summary presents a brief summary of the impacts of each action alternative analyzed in the EIS. Reader should refer to EIS Section 3.3.2 (Avian Populations) for additional details. As described in that section, the studies conducted for the project to date and additional studies proposed both pre- and postconstruction have been, or will be, conducted in accordance with the tiered approach recommended in the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).

Comment ID	Commenter	Public Comment	Response to Comment
11871-40	WildLands Defense	Report Table 4. Avian species of concern with potential to occur at the Lava Ridge Wind Project in Lincoln, Jerome, and Minidoka counties, Idaho. The list omits Brewer's sparrow, LBCurlew. WERE the present where and when willets and others may be found? Or Rosy finches in winter using lava tubes??	See Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief) for a description of avian species not analyzed in detail Section 3.3.2.
11871-43	WildLands Defense	M-39 states: Fatality studies were screened to provide "comparable" information across WEFs by including annual fatality estimates that 1) were calculated from turbines greater than 0.5 megawatt (MW), 2) were calculated from the Huso, Shoenfeld, or GenEst estimators, 3) covered adequate sampling time for taxa of interest when most fatalities have been observed (i.e., two seasons for bats, three seasons for birds), and 4) were averaged for each WEF when multiple fatality studies were conducted at a facility. M-40 states: Forty-eight species of birds were documented in or near the Project across all avian studies at the Project, which account for approximately 18% of the 268 avian species that have been reported in Lincoln, Jerome, and Minidoka counties (eBird 2021), 11–12% of the 385–432 species reported in Idaho (eBird 2021, IDBRC 2020), and 10% of the 498 avian species reported in the Great Basin BCR (eBird 2021) over the last 10 years. Overall, the Project appears to contain a low number of avian species relative to these broader landscape scales, and the species typically observed were those commonly found throughout similar habitats in the region".20 2019). The closest operating WEF to the Project with public postconstruction fatality data is the Horse Butte wind facility, a 32-turbine facility located approximately 105 mi (169 km) northeast of the Project on the eastern edge of the Columbia Plateau and the western edge of the Middle Rocky Mountains in Idaho. All-bird fatality estimates from Horse Butte were 1.9 birds/MW/year in 2012, 2.6 birds/MW/year in 2013, and 3.5 birds/MW/ year in 2014 (SWCA 2015). These estimates are within the range of estimates from BCR 9 and larger spatial scales. We are very concerned that BLM does not provide sufficient detail on number of turbines, turbine height and type and details of facility activities, and the landscapes where the few facilities used as comparisons are located. Google searching reveals that Horse Butte contained only 32 turbines. There is no data on the specific fatality monitoring methods and whether there was use of detection dogs at all facilities used for comparison and in the various industry consultant databases. Mortality monitoring has relied on consultants paid by industry and studies developed primarily by industry. These efforts to downplay mortality and describe birds as 'common" are made much more alarming by the fact that there are not detailed analyses of avian migration patterns across Idaho. Why weren't avian migration studies conducted? Increasingly sophisticated technology allows significant amounts of information to be garnered.	The BBCS (Appendix M in MVE [2023]) briefly summarizes information on avian fatalities at multiple spatial scales. Studies were screened for their inclusion in the analysis based on the criteria cited in the comment, including study methodology. As described in the *Analysis of Avian and Bat Fatalities at Existing Wind Facilities* (WEST 2021c), these fatality rates are based on data from 530 studies across 341 existing U.S. wind energy facilities. A discussion of the fatality estimates presented in the *Analysis of Avian and Bat Fatalities at Existing Wind Facilities* (WEST 2021c), which are restated in the BBCS, as well as fatality estimates obtained from other sources, such as the AWWI database is provided in the Turbine Collisions section in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B). As stated in this section, "The estimated avian fatality rate used in this EIS (and detailed below) was based on available data from existing wind farms, which had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for the project. Thus, the estimated avian fatality rates used in this EIS account for variability in the RSH." Although there are no existing U.S. wind energy facilities of the size proposed, the use of per-MW fatality rates is well established in the publicly available literature and allows for the fatality rates observed at existing facilities to be scaled up to the size proposed. The EIS discloses the uncertainty involved in this approach and the need for postconstruction monitoring to better quantify fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities. Two full years of avian use studies (WEST 2021a, 2023) were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, detailed studies of migratory routes are beyond the scope of this EIS.
11871-46	WildLands Defense	WEST Avian Year 2 Study Concerns The report state: "The primary objectives of the two-year study were to estimate levels of use by avian species within the Project Area, with a focus on areas being considered for turbine development, and to characterize levels of potential risk that the proposed Project presents to eagles and other avian groups. Two years of observational surveys are recommended in the ECPG for characterizing levels of potential risk caused by a proposed wind project to eagles (USFWS 2012, 2016). In accordance with these guidelines, the Year 1 study collected data for all birds, while the second year of the study focused on eagles and other large birds. This report summarizes results from the second year of the study completed at the Project from April 1, 2021 to April 17, 2022". WHY were there not detailed year 2 studies for all avian species? Conditions can vary greatly from year to year (witness winter 2023) – ad given drought conditions, snow pack, weather patterns during migration when these lands may be a stopover site in proximity to the canals and other waters, irruptions of raptor prey species such as voles which may attract large numbers of raptors, etc. There simply have not been sufficient avian studies.	The results of the second year of avian studies were not available prior to the publication of the draft EIS. The final EIS includes a description of the results of the year 2 avian study (WEST 2023).
11871-47	WildLands Defense	Regarding Diurnal Raptors: "Raptors are known to be strongly affected by wind turbines, primarily through direct mortality (collisions) and secondarily through habitat alteration and loss (Watson et al. 2018). Most raptors and vultures are long-lived species that have high natural adult survival and low reproductive potential relative to short-lived species, increasing their potential for population-level impacts (Schaub 2012). Many raptor species known to collide with turbines are taxonomically related and share similar flight morphology and foraging habits (Herrera-Alsina et al. 2013) including buteos (e.g., red-tailed hawk, Buteo jamaicensis) and small falcons (e.g., American kestrel, Falco sparverius) in the US (Smallwood and Thelander 2008, ICF International 2015). The likelihood of collision is highly variable and dependent upon the interaction of site location, season, and species-specific behaviors (Marques et al. 2014)".	EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) describes the risk of population-level effects to diurnal raptors from turbine collisions and discusses the high degree of variation among species in the risk of population-level effects because of differences in each species' behaviors and habitat use. Population size and demographics must also be considered when assessing the potential for fatalities from turbine collisions to result in in population-level effects. This is also addressed in EIS Section 3.3.2.1.1, which states "Relatively large increases in mortality (as many as 5,000 additional deaths per year) do not appear to threaten the range-wide populations of raptors with larger, more stable populations such as red-tailed hawk and Swainson's hawk, and smaller, local populations (i.e., within a BCR) may not experience population-level effects from this level of mortality either (Conkling et al. 2022)." Red-tailed hawk and American kestrel have a relatively high risk of colliding with operational turbines but do not meet the criteria for inclusion in the EIS because they have relatively large stable populations, and the publicly available literature indicates that mortality at wind energy facilities does not pose a serious threat to the populations of either species.
11871-48	WildLands Defense	Regarding "Temporal Patterns of Fatalities: Temporal patterns at multiple spatial scales show peak bird fatalities during spring and/or fall migration seasons, particularly for small birds (Figure 2; WEST 2021) and are particularly evident at spatial scales with larger sample sizes (i.e., Great Basin BCR, USFWS Pacific region, North American Deserts, US). A closer examination of the species groups composing the fatalities reveals that passerines are the dominant species groups across all spatial scales (Figure 3). Fatality patterns from scales with low sample sizes (e.g., Idaho) should be interpreted with caution". The report states: "Species of concern that were found during postconstruction fatality monitoring at the Horse Butte wind facility in Idaho included Brewer's sparrow, black rosy-finch, Columbian sharp-tailed grouse (Tympanuchus phasianellus), and golden eagle (SWCA 2015). Two of these species (golden eagle and Brewer's sparrow) have been recorded at the Project". Where is the species list for all birds observed at the Horse Butte site? Table 8, M-42 provides no fatality estimates for raptors in Idaho. "Small Birds. Passerines are another group of concern because of impacts from WEF, although most small species (e.g., songbirds) appear less vulnerable to collisions with wind turbines on an individual level than raptors (Allison et al. 2019). Most songbirds are short-lived species and have low natural annual survival and high reproductive potential relative to long-lived species (e.g., raptors). This combination of life-history traits reduces their potential for population-level impacts from collisions with wind turbines or other forms of anthropogenic development (Stahl and	See response to comment 11871-43 (see in Table A-3b, Bats). The postconstruction fatality monitoring reports for Horse Butte Wind are included in the project record. The BBCS (Appendix M in MVE [2023]) briefly summarizes information on avian fatalities at multiple spatial scales; it is not possible to estimate a raptor fatality rate for Idaho alone because there have been too few recorded raptor fatalities at existing wind facilities in Idaho for which data are available. EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) has been updated with additional postconstruction fatality monitoring data obtained from IDFG subsequent to the publication of the draft EIS; these studies showed that overall avian fatality rates at wind energy facilities Idaho are generally well below the regional mean (2.7 birds per MW per year) used in the avian fatality estimates presented in Table 3.3-12, despite the fact that all of the facilities for which IDFG provided data were located adjacent to large reservoirs, the Snake River, and other riparian areas and surface water. None of the studies could establish an estimated raptor fatality rate because too few carcasses (< 5) were found. Considering the project is much further from significant riparian habitat, large surface waters, and rocky cliff habitat present in the vicinity of other facilities studied in Idaho, it is possible that the fatality rates observed at the project would be well below the mean estimate and fatality rates exceeding the maximum estimates presented in Table 3.3-12 would be highly unlikely. Special-status avian species were individually assessed for their potential to experience population-level effects from fatalities due to collisions with operational turbines as described in EIS

		Oli 2006)". This is another alarming effort to downplay the significance of mortality – as may songbird populations are in serious decline. See Rosenberg et al. 2019, The Decline of the North American Avifauna https://www.science.org/doi/10.1126/science.aaw1313 detailing the loss of 3 billion birds from North America. Since the Rosenberg et al paper, Avian flu is now decimating songbird, raptor, eagle and even mammal populations – witness the recently reported known deaths of four cougars in Wyoming. BLM must require fair unbiased consultants conduct studies and analyze data – and not wind industry biased environmental analysis. The Lava ridge environmental studies are a classic case of the fox guarding the hen house. "Small passerines, including both resident and nocturnal migrating songbirds, are the most abundant and diverse group of landbirds in the US, and most avian fatalities at wind projects in the US and Canada are passerines (Erickson et al. 2014, Allison et al. 2019, AWWI 2019). Passerines accounted for approximately 62.5% of the fatalities in 116 studies in the US and Canada, where 156 species of passerines totaling 3,110 fatalities were found (Erickson et al. 2014). It was estimated that approximately 134,000 to 230,000 fatalities occurred each year in the US and Canada combined, equaling a rate of 2.10 to 3.35 small birds/MW of installed capacity (Erickson et al. 2014). Fatalities were distributed among several species of passerines in the Erickson et al. (2014) analysis, such that impacts to individual species were a low (<0.1%) percentage of their respective estimated continental populations. Small passerines accounted for 56.5% of fatalities in the US and 51.3% in the Pacific Region (AWWI 2019"). HOW many of these studies/fatality monitoring efforts were conducted without use of carcass detection dogs and intensive site mortality detection surveys?	Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail); see also EIS Section 3.3.3 (Eagles), EIS Section 3.3.4 (Greater Sage-Grouse), and Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). As described in the list of data sources in EIS Section 3.3.2 (Avian Populations), the primary sources considered in determining past trends and the current status of avian populations are Partners in Flight (2022) and Sauer et al. (2019). Both of these databases use data collected by The North American Breeding Bird Survey program, which is a continent-wide program that has been collecting data on avian populations since 1966. As stated in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts) "Despite the trend toward increasing avian fatalities from wind energy, this source of mortality will remain relatively small when compared to other sources of avian mortality—such as collisions with vehicles, buildings, transmission lines, and communication towers; exposure to pesticides and other toxic chemicals; and predation by domestic and feral cats (AWWI 2016; Loss 2016; National Wind Coordinating Collaborative 2010)—and for most species, this source of mortality will be too small to have a notable effect on their populations (AWWI 2016; Choi et al. 2020). However, for some special-status avian species, when cumulative fatalities across BCR 9 are considered, there could be negative population-level effects that continue a downward trend. Thus, even though an individual wind energy facility on its own may not cause population-level effects, each facility constructed in BCR 9 over the next 30 years would further increase avian mortalities and the potential for declines in some avian populations. Thus, when evaluating the need for adaptive management measures, it is important to consider the mortality that is likely to occur at other existing and future wind energy facilities in BCR 9." Since wind energy development in BCR 9 has a relatively small contribution to the cumulative effects on most avian populations, reducing avian fatalities at wind energy facilities would do little to benefit those species. As described in the *Analysis of Avian and Bat Fatalities at Existing Wind Facilities* (WEST 2021c), these fatality rates are based on data from 530 studies across 341 existing U.S. wind energy facilities; therefore, it would be impractical to provide details on every wind energy facility and study included. A discussion of the fatality estimates presented in the *Analysis of Avian and Bat Fatalities at Existing Wind Facilities* (WEST 2021c) as well as fatality estimates obtained from other sources, such as the AWWI database (Allison and Butryn 2020) is provided in the Turbine Collisions section in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B). However, both WEST (2021c) and Allison and Butryn (2020) included only those studies that adhere to well established standards for postconstruction fatality monitoring and bias adjustments; thus, the fatality estimates presented in the EIS are based on the best publicly available data.
11871-49	WildLands Defense	Avian Report Year 1 – Additonal Concerns Please clarify what the report's use of the term "group" actually means. Is each sighting – of 1 or a flock of birds – considered a group – i.e. can there be a 'group" of one bird? The report states: "Mean use was the average number of birds observed per plot per survey for small or large birds. Small bird use (per 100-m radius plot per 10-min survey) and large bird use (per 800-m radius plot per 60-min survey) was calculated by: 1) summing birds per plot per visit, 2) averaging number of birds over plots within a visit, and 3) averaging number of birds across visits within a season. Overall mean use was calculated as a weighted average of seasonal values by the number of days in each season. Percent of use was calculated as the percentage of small or large bird use that was attributable to a particular bird type or species. Frequency of occurrence was calculated as the percent of surveys in which a particular bird type or species was observed. Mean use and frequency of occurrence describe different aspects of relative abundance, in that mean use is based on the number of birds (i.e., large groups can produce high estimates), whereas frequency of occurrence is based on the number of groups (i.e., it is not influenced by group size). Qualitative comparisons were made with these metrics among bird types, seasons, and survey points to help illustrate temporal and spatial avian use of the Project.	A "group" as used in the avian use studies (WEST 2021a, 2023) can consist of one or more individuals of the same species.
11871-51	WildLands Defense	Avian Report Year 2 Additional Concerns Avian Report year 2 discussion below describes our significant concerns in more detail. Avian Report Year 2 fatality numbers appear to be very low. For example, Golden eagle. The Report at 14-15 states: "Potential impacts to birds from power line operation include electrocution and collision risks, which depend on-line location, voltage, and configurations relative to area habitats and bird presence/use. For the Project, 34.5-kilovolt (kV) collector lines from the wind turbines to the Project's substation, these electric lines will be buried to the extent feasible; however, depth to rock is shallow across portions of the Project. In these areas, Magic Valley Energy (MVE) anticipates a portion of the collector lines will be aboveground. To minimize potential electrocution and/or collision risks to birds, the aboveground portion of the 34.5-kV collector lines will be designed to meet Avian Power Line Interaction Committee (APLIC) guidelines (APLIC 2006 [to be updated 2021] and 2012, respectively)". How many miles and where are the locations that lines will be above ground vs. below ground? This is critical information for estimating powerline collision mortality. It is also essential to understand how much blasting and other construction activity may take place. Note: "Avian collision risk with overhead lines is not uniform. Determining the relative risk or exposure to birds is generally governed by the type of electrical infrastructure in proximity to bird species potentially present and site-specific factors, such as habitat, line orientation to use areas, topography, weather, bird morphology, flight characteristics, and level of human influences. Proximity of power lines to locations where birds are landing or taking off is important in assessing the potential collision risk or exposure, particularly during daily movements and migration (APLIC 2012). A number of best management practices could be applied to the above ground collection lines to minimize fatalities. A review of 11 studies monitoring the effectiveness of bird flight diverters installed on power lines found a 78% reduction in avian fatalities (Barrientos et al. 2011), although effectiveness can vary widely with diverter types and spacing …".	Table 2.4-1 in EIS Section 2.4 (Alternative B [Proposed Action]) provides total miles of overhead and underground 34.5-kV collector lines for each of the action alternatives. As indicated in this table, all of the action alternatives would require two blasts per day during construction. EIS Appendix 11 (Project Elements Common to All Action Alternatives) provides additional details on collector lines and blasting. As stated in the Underground and Overhead 34.5-Kilovolt Collection System section of this appendix, "The specific location where lines would be buried would be determined after the geotechnical studies are complete. For the purposes of analysis, this EIS assumes a ground-disturbance footprint for all collector lines and assumes overhead lines for most of the route when assessing impacts to birds, bats, and visual resources." MVE has committed to constructing all overhead collector and transmission lines in compliance with APLIC standards (APLIC 2006, 2012), which include the use of line markers or flight diverters to reduce avian collisions (applicant-committed measure 30). Effects to raptors from collisions with or electrocution by overhead powerlines are described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-4. Several other mitigation measures would be implemented that limit development in the vicinity of important avian habitat features and known nest/lek locations for avian species of concern (e.g., applicant-committed measure 138); see EIS Appendix 4 (Mitigation) for a complete list.
11871-52	WildLands Defense	The avian studies do not provide sufficient information on many species – Long-Billed curlews, burrowing owl, etc. to allow this to be understood. The DEIS does not provide detail sufficient to determine this and to properly assess risk, harm and species "take'.	See response to comment 11871-100 (see in Table A-3c, Birds) and 11871-101 (see in Table A-3c, Birds).

Comment ID	Commenter	Public Comment	Response to Comment
11871-55	WildLands Defense	Report at 14-15: “Various potential indirect effects including the modification, fragmentation, and reduction of habitat; interference with behavioral activities; exposure to contaminants; noise; the introduction and spread of invasive vegetation; and destruction of individual biota (e.g., from clearing and grubbing activities or from vehicle collisions) were noted in BLM 2005 Wind Energy Final Programmatic EIS (2005 Programmatic EIS). The construction impacts of most concern with regard to ecological resources are those associated with the reduction, modification, and fragmentation of habitat (2005 Programmatic EIS). Displacement effects are the primary indirect impact at WEFs, and have been defined as “the displacement of birds from areas within and surrounding wind farms due to visual intrusion and disturbance that can amount effectively to habitat loss” (Drewitt and Langston 2006). Displacement may occur during both the construction and operation of a wind project, and may be caused by the presence of the turbines and/or ongoing site activities such as vehicle and personnel movements or site maintenance. The scale and degree of displacement effects varies according to site and species-specific factors. The scale of disturbance caused by wind projects varies greatly and is likely to depend on multiple factors including seasonal and daily patterns of use by birds, location to important habitats, availability of alternative habitats, and turbine and wind project specifications (Drewitt and Langston 2006, Lange et al. 2018). Similarly, the degree of the behavioral responses will vary among species and individuals, and may depend on factors such as life cycle stage (e.g., wintering, molting, and breeding), flock size, and degree of habituation. Recent research has indicated that indirect impacts of wind turbines on grassland nesting birds from displacement vary across years, species, sites, and distance from turbines (Erickson et al. 2004, Young et al. 2006, Shaffer and Johnson 2009, Hale et al. 2014, Hale 2016, Johnson 2016, Shaffer and Buhl 2016). AWWI (2020) has concluded that indirect impacts on birds from operating wind turbines due to displacement result in some species showing consistent decreases in abundance while other species show no effect”. Again, necessary detailed pre-decisional surveys and ecological studies have not been conducted to determine this.	Effects to avian habitat, including avoidance of habitats due to noise and human disturbance, are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1. As noted in the comment, displacement effects vary widely across space, time, and species due to a number of variables that are difficult or impossible to predict; thus, any attempt to quantify the potential impacts from habitat avoidance would be highly speculative. The project has been designed to avoid habitat for sensitive avian species such as greater sage-grouse and a number of mitigation measures would be implemented to further minimize or avoid impacts to habitat for avian species (see EIS Appendix 4 [Mitigation]).
11871-56	WildLands Defense	Report at 15 states: “Preconstruction studies at the Project identified 48 species of birds, 19 of which are species of concern. Diurnal raptor use was highest during summer and fall and was relatively consistent across survey points. No patterns of spatial or temporal use for small birds were noted. One ferruginous hawk and three burrowing owls nests were located in the Project. Three greater sage- grouse leks are present near the Project”. These studies were only conducted for one year for migratory songbirds and many other avian species., and e are very concerned they do not reflect the potential variation in seasonal and migration activity use by avian species here. Further the consultants neglected collecting and using avian migration data that is available on-line to study migration in the region. This must be done pre-decisionally and used in a SEIS.	MVE’s *Analysis of Avian and Bat Mortalities at Existing Wind Facilities* (WEST 2021c) is one of many sources evaluated in the analysis of impacts to avian populations presented in EIS Section 3.3.2 (Avian Populations). See response to comment 11871-43 (see in Table A-3b, Bats).
11871-59	WildLands Defense	Much More Rigorous and Extensive Baseline Data Must be Collected and Properly Assessed – Not Dismissively Minimized as the WEST Avian Reports Do Why is a much better avian and other wildlife species baseline is needed. It is critical that at least 2 additional years of year-round studies be conducted to determine avian use in the project area and across a significant block of the surrounding landscape. Indeed, given the huge additional wind energy ROW applications – Taurus/Arevia, Salmon Falls, Cat Creek.	See response to comment 11871-43 (see in Table A-3b, Bats), 11871-101 (see in Table A-3c, Birds), and 11871-105 (see in Table A-3c, Birds).
11871-60	WildLands Defense	Year 2 Avian Report The Year 2 Avian report states: The principal objectives of the two-year study were to estimate levels of use by avian species 16 within the Study Area and to characterize levels of potential risk that the proposed Project presents to eagles and other avian groups. Report at 27: Fifteen species of concern were recorded during the Year 2 study, thirteen of which were also recorded in Year 1. Bald eagle, Franklin’s gull, and white-faced ibis were recorded in Year 2 but not in Year 1. Two small bird species, sagebrush sparrow and green-tailed towhee, were recorded in Year 1 but not in Year 2. Four waterbird species considered as species of concern (California gull, Franklin’s gull, American white pelican, and white-faced ibis) were recorded in the Study Area. These were likely transient occurrences, as there are few water resources and no large waterbodies within the Study Area to provide habitat for waterbird species. Burrowing owl observations were recorded throughout the Study Area, with most observations recorded near he edge of the Project. The prevalence of observations near the Project 1 edge may be associated with agricultural areas, which burrowing owls have been shown to prefer due to increased prey availability (Moulton et al. 2006). Short-eared owl was only observed once during surveys. Ferruginous hawk observations were made throughout the Study Area; however, observations were concentrated near Point 75. These observations were likely associated with a nest that was occupied by ferruginous hawks in 2021 (McCormack and Harrison 2021). Common nighthawk, a species common to open habitats, were recorded throughout the Study Area. Long-billed curlew were observed throughout the Study Area, and were primarily observed during March and April when the species is in migration. Greater sage-grouse were observed in two groups, both of which were outside the Project Area within 3.1 miles of known lek locations (Appendix E)”. We are concerned at WEST’s dismissiveness is of several things in the above paragraph. First, the public lands here may provide an important source of grasshopper, Mormon cricket, vole or other food sources -depending on the year- that are eaten by Gulls. Second, White-faced ibis are present in southern Idaho in irrigated pastures and similar areas, and are also found at small wetlands near ag. at times.	See response to comment 11871-103 (see in Table A-3c, Birds).
11871-61	WildLands Defense	Several species that are present during migration (and some such as lark sparrow may best here) are: lazuli bunting , spotted towhee, lark sparrow, lesser goldfinch, Eurasian dove XXX. We also wonder about the lack of any sightings of Merlin, Rough-legged hawk, Lazuli Bunting in migration, Kingbirds,	These species did not meet the criteria for inclusion in the EIS analysis because they do not carry a special-status designation in Idaho and are thus considered to have relatively large and stable populations that have a low risk of population-level impacts from wind energy development.
11871-64	WildLands Defense	M-48 refers to displacement. This is a very serious concern – especially given that “displacement” would occur to sub-optimal habitats, and there are immense additional energy projects being proposed across the region – including the BLM Solar EIS actions. “Indirect Impacts. Construction of the Project could result in habitat impacts that may lead to	Appendix M in MVE (2023) is the project BBCS; impacts to avian habitat and nesting behavior, including disturbance and displacement, are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief) and tier to BLM (2005); see AIB-1 and AIB-2.

Comment ID	Commenter	Public Comment	Response to Comment
		displacement of local avian species. Displacement effects are one type of indirect impact to birds caused by the avoidance of turbines or other infrastructure at WEFs. Displacement effects are defined as “the displacement of birds from areas within and surrounding wind farms due to visual intrusion and disturbance that can amount effectively to habitat loss” (Drewitt and Langston 2006). Displacement may occur during both the construction and operation of a wind project, and maybe caused by the presence of the turbines and/or other disturbances such as vehicle and personnel movements, as well as noise disturbance created by blasting, equipment use, and other construction and maintenance activities. The scale and degree of displacement effects varies according to site and species-specific factors. The scale of disturbance caused by wind projects varies greatly and is likely to depend on multiple factors, including seasonal and daily patterns of use by birds, location to important habitats, availability of alternative habitats, and turbine and wind project specifications (Drewittand Langston 2006, Lange et al. 2018). Similarly, the degree of the behavioral responses will vary among species and individuals, and may depend on factors such as life cycle stage (e.g., wintering, molting, and breeding), flock size, and degree of habituation AWWI (2017). Research has indicated that indirect impacts of wind turbines on grassland nesting birds from displacement vary across years, species, sites, and distance from turbines (Leddy et al. 1999, Johnson et al. 2000, Erickson et al. 2004, Young et al. 2006, Shaffer and Johnson 2009, Hale et al. 2014, Hale et al.2016, Johnson 2016, Shaffer and Buhl 2016).	
11871-72	WildLands Defense	Comparisons among alternatives in Table ES-2 xvi are inadequate for Bats, avian species (nearly all lumped together), Golden Eagles, Sage-grouse and other sensitive species. Basically, under some alternatives, BLM appears to sacrifice some higher profile sensitive species that inhabit sagebrush, and sacrifice Long-Billed Curlew, Grasshopper Sparrow, Burrowing Owl - and potentially several other species habitats. Regrettably, the WEST reports and analyses fail to provide data on the “less sexy” sensitive species in a manner for the harmful; impacts of each alternative on avian species other than Sage-grouse can be systematically assessed and understood. BLM sensitive species policy does not say: It’s ok to sacrifice one sensitive species to “save” another”	Table ES-2 is part of the EIS Executive Summary and briefly summarizes the resource impacts described in detail in EIS Chapter 3 (Affected Environment and Impacts). The golden eagle is discussed in EIS Section 3.3.3 (Eagles), the western burrowing owl and long-billed curlew are discussed in EIS Section 3.3.2 (Avian Populations) and the grasshopper sparrow is discussed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). The WEST reports were one of numerous sources evaluated in the analysis of impacts to the species; see data sources in the introduction to each of these sections. A number of mitigation measures would be implemented to minimize, avoid, or offset impacts to BLM-sensitive species; a complete list of required mitigation measures is provided in EIS Appendix 4 (Mitigation).
11871-73	WildLands Defense	Avian Species - Alt. B states: “Highest estimated avian fatality rate from collisions with turbines: 3,240–5,654 (mean), 10,200–17,799 (maximum) birds per year. Most avian species are unlikely to experience population-level effects, but some special- status species (e.g., ferruginous hawk, long- billed curlew, short-eared owl, and burrowing owl) could experience population decline”. Note this would be based on the very likely large-scale under-estimates of mortality from deficient carcass searches used throughout the EIS. There is greatly inadequate data and lack of baseline analysis of the current status and condition of the local population of these species. Thus, it is impossible to make an informed analysis of differences between alternative actions. Table ES-2.	Table ES-2 in the Environmental Impacts section of the Executive Summary presents a brief summary of the impacts of each action alternative analyzed in the EIS. Readers should refer to EIS Section 3.3.2 (Avian Populations) for additional details. As described in this section, data from postconstruction fatality monitoring studies at existing U.S. wind energy facilities were used to inform the estimate of avian fatalities that would occur under each of the action alternatives, but each species was individually assessed for its potential to experience population-level impacts from collisions with operational turbines based on a number of species- and site-specific factors. The EIS does not assume that a low incidence of recorded fatalities at existing U.S. wind energy facilities is sufficient evidence to conclude that turbine collisions do not present a risk to a species. In fact, there are very few recorded fatalities at existing U.S. wind energy facilities for each of the four species analyzed in detail in the EIS. The EIS discusses the deficiencies in the available mortality data and discloses the potential for fatality rates to be higher than expected based on these observations. The EIS also discloses the potential for these species to experience significant effects from even a relatively small number of fatalities from collisions with operational turbines. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).
11871-80	WildLands Defense	The report’s Figure 1 map with turbine overlays – a viewer can’t see many biological indicators – Sage-grouse leks, raptors. Are burrowing owl sitings on here? Are burrowing owl nest sites assessed in these noise analyses? What are noise levels at all burrowing owl nests? Have thorough studies actually been conducted for this species? What is the population density and numbers of total burrow sites? If studies have not systematically inventories the whole site, this must be and proper noise estimates for this species too, and other sensitive species including passerines, and bats, must be undertaken. So too must studies for nocturnal owls – for example, Barn Owls do not even show up on the species list – despite the prominence of this species in road kills by I-84 and other areas of southcentral Idaho.	As described in the project noise technical report (SWCA 2022), background noise is assumed to be 19.3 dB at raptor nests. Noise impacts to bats and nesting birds are discussed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-8 and AIB-2, respectively. Migratory western burrowing owls typically select new burrows for nesting each year; therefore, including previously recording burrowing owl nests in the project noise technical report would not lead to a more informed analysis. As disclosed in EIS Section 3.3.2.1.1 (Affected Environment, Species Analyzed in Detail), burrowing owl use in the siting corridors is likely to be higher than reported because avian use surveys were not designed to detect the species. Therefore, mitigation measures for burrowing owls were modified and expanded in the final EIS; these include preconstruction surveys for burrowing owl nests and avoidance buffers for active nests (additional measure q) as well as the removal of loose rocks to avoid creating habitat for prey (additional measure s); see EIS Section 3.3.2.2.2 (Avian Populations, Alternative B with Additional Measures) and EIS Appendix 4 [Mitigation]). Barn owls are not addressed in the EIS because they do not carry a special-status designation in Idaho, and therefore, are considered to have a relatively large and stable population.
11871-85	WildLands Defense	And: “The Kieler Report (2007) observes that the flight patterns of some species, including geese, ducks, cranes, and gulls, tend to have wider radii of spatial avoidance around large WTs than around highways and local roads. Although their data suggest that the visual disturbance caused by WTs is likely the main reason for this finding, they also suggest that some birds, especially geese, are more sensitive to WTN than to noise originating on roads and railroads [64](p. 213). In addition to injuries and deaths from collisions, the report considers it highly probable that WTs have a combined audio-visual effect on birds. In conclusion, the Kieler Institute authors claim that data and knowledge about WTN and its effects on bird populations and habitats remain insufficient, while still contending that birds’ sensitivity to noise means that WTN should be minimized, without suggesting specific measures [64]. That said, the report notes that acoustic walls would be insufficient for minimizing the effects of WTN on birds, because they often fly higher that the walls”. https://www.sciencedirect.com/science/article/pii/S1364032122006852	Effects on noise on avian species as well as impacts to avian migration patterns are disclosed in Table App3-1 in EIS Appendix 4 (Issues Analyzed in Brief); see AIB-2 and AIB-5.

11871-93	WildLands Defense	Factors leading to high mortality wind facilities included: Projects located in a critical migratory pathway for songbirds; many raptor species are present; impacts habitat for declining grassland birds This wind energy project, on the Kenedy Ranch in southern Texas, is located inside the Gulf Coast and Lower Rio Grande bird migration corridors. Many sensitive grassland species, such as Sprague's Pipit, Savannah Sparrow, Horned Lark, Grasshopper Sparrow, and Long-billed Curlew, also use the area and could be harmed through collisions or displacement. Idaho BLM must stop treating the open space “grasslands” along the Snake River Plain and species like Long-Billed curlew as sacrifice zones and sacrifice species – which regrettably this DEIS and poor avian study reports and analysis does.	As described in EIS Section 3.3.2.1 (Avian Populations, Affected Environment), the siting corridors are not located in a major migratory flyway and habitat features that would concentrate migrating raptors are not present. A substantial proportion of the avian analysis in the EIS is focused on impacts to declining grassland birds such as the long-billed curlew (see Section 3.3.2 [Avian Populations]) and greater sage-grouse (see Section 3.3.4 [Greater Sage-Grouse]).
11871-95	WildLands Defense	“The industry has been saying for some time that bird mortality would be reduced with the new turbines compared to the older, lattice structures. According to this study, that does not appear to be the case,” Hutchins pointed out, since the study excluded data from wind developments using older designs.	The American Bird Conservancy news release referenced in the comment is an opinion piece and the quoted comment from Dr. Hutchins is a misrepresentation of the conclusions reached in the Loss et al. (2013) study being described. That study, which is referenced in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) (the citation was inadvertently left out of the draft EIS but has been corrected in the final EIS), was specifically intended to reassess cumulative avian fatality rates from wind energy facilities in light of the transition from older, lattice tower turbines to newer, monopole turbines and stated that “Our focus on [monopole turbines] could explain why our estimate is lower than the estimate of Smallwood (2013) that also includes data from lattice turbines. Lattice turbines can kill relatively large numbers of birds (Smallwood and Karas 2009), but they are largely being decommissioned in the U.S.” The study by Smallwood and Karas (2009), which is also referenced in EIS Section 3.3.2.2.2 found strong evidence that replacing lattice tower turbines with monopole turbines could significantly reduce fatalities of all birds, and Krigsveld et al. (2009) reached a similar conclusion. Smallwood, K.S. 2013. Comparing Bird and Bat Fatality-Rate Estimates Among North American Wind Energy Projects. *Wildlife Society Bulletin* 37(1):19–33. Available at: https://wildlife.onlinelibrary.wiley.com/doi/abs/10.1002/wsb.260. Accessed December 29, 2013.
11871-96	WildLands Defense	According to ABC, poorly sited and operated wind projects pose a serious threat to birds, especially birds of prey such as Bald Eagles, Golden Eagles, hawks, and owls; endangered and threatened species such as California Condors and Whooping Cranes; and species of special conservation concern such as the Bicknell’s Thrush, Cerulean Warbler, Tricolored Blackbird, Sprague’s Pipit, and Long-billed Curlew. One particularly interesting finding of the new study concerned the height of turbines. The scientists found that bird collision mortality increased significantly with increasing hub height. Across a range of turbine heights from 36 to 80 meters, the study predicts a staggering tenfold increase in bird mortality. This is especially important because the study identifies an apparent trend toward increased turbine height. Further, the study states: “This estimate (1.4 million) assumes that average wind turbine height will not increase. Installation of increasingly larger turbines could result in a greater amount of mortality.” Such an eventuality may be likely given that a Department of Energy report found that the average turbine hub height of U.S. wind turbines has increased …”.	Although Loss et al. (2013) found preliminary evidence that avian fatalities increase with hub height, other studies have reached contradictory conclusions and it remains unclear how hub height effects avian fatality rates. Loss et al. (2013) focused on fatalities per turbine rather than fatalities per MW, which obscures the fact that turbines with higher hubs also have a larger generation capacity; therefore, although more fatalities may occur at larger turbines, the relationship between fatalities and generation capacity remains relatively unchanged. Therefore, using a larger number of small turbines to generate a given amount of electricity would be expected to result in a similar number of avian fatalities as generating that electricity with a smaller number of large turbines.
11871-97	WildLands Defense	ABC also stated: “The report offered several additional key observations about wind energy and bird mortality: • The mortality rate at wind farms in California was dramatically higher than anywhere else. According to the study: “We estimate that 46.4% of total mortality at monopole wind turbines occurs in California, 23.1% occurs in the Great Plains, 18.8% occurs in the East, and 11.6% occurs in the West.	As Loss et al. (2013) noted, these percentages are a result of variation in both numbers of turbines and mortality rates and added that this variability could not be explained by differences in hub height. Loss et al. found that the per/MW fatality rate for the western U.S. was 2.83 birds per MW per year, which is consistent with the mean fatality rate analyzed in EIS Section 3.3.2.2 (Avian Populations, Impacts).
11871-98	WildLands Defense	• Failure to consider species-specific risks may result in relatively high rates of mortality for some bird species even if total mortality is relatively low.	Special-status avian species were individually assessed for their potential to experience population-level effects from fatalities due to collisions with operational turbines as described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail); see also EIS Section 3.3.3 (Eagles), EIS Section 3.3.4 (Greater Sage-Grouse), and Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief).
11871-99	WildLands Defense	Annual mortality estimates derived from a partial year of sampling may substantially underestimate mortality. Preconstruction studies should be conducted for at least one entire year prior to wind facility siting decisions.	Two full years of avian use studies were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, including seasonal variation in diurnal raptor use. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and in EIS Table 3.3-7. Detailed data from the first year of avian use studies are presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study is included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies (WEST 2023) were not available prior to the publication of the draft EIS but have been incorporated into the final EIS.
11871-100	WildLands Defense	Conclusions about collision rates and impacts of collisions on bird populations are tentative because most of the mortality data is in industry reports that are not subjected to peer review or available to the public. • Preconstruction assessment of collision risk at proposed wind facilities has been unreliable with no clear link documented between predicted risk levels and postconstruction mortality rates. “A key issue that was illustrated in this study, and one that we continue to have great concerns about, is data transparency and availability. While some companies may do the right thing and collect bird mortality data and make it available, others may not, especially if it is not in their economic interest,” Hutchins added”. https://www.wind-watch.org/news/2012/08/01/wildlife-kill-data-under-scrutiny/	Although the avian use surveys (WEST 2021a, 2023) were used to determine the species that may be present in the siting corridors and their seasons of use, the risk of fatalities from turbine collisions varies among species due to factors such as flight characteristics, type of prey, and habitat use. Thus, avian use observed prior to construction may not correlate directly to fatality rates after construction (WEST 2011). The fatality rates presented in Table 3.3-12 are not intended to be precise estimates, they are presented to illustrate how generation capacity effects avian fatalities to allow for a reasoned choice among alternatives. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).

11871-101	WildLands Defense	Long-Billed Curlew - Example of A Species Where DEIS an dConsultants Seriously Downplay Risks and Failed to Collect Sufficient Breeding Period Data Long-billed Curlews appear to begin breeding in early to mid-April throughout much of Idaho. Breeding atlas or lat-long locations: Long- billed Curlews breed at various locations throughout southern Idaho, including Camas Prairie Centennial Marsh, the Snake River Birds of Prey National Conservation Area, Magic Reservoir, Camas NW … https://digitalcommons.unl.edu/cgi/viewcontent.cgi?article=1464&context=usfwspubs Long-billed Curlew mortality: https://www.klickitatcounty.org/DocumentCenter/View/401/50-Avian-Bat-and-Habitat-Cumulative-Impacts---May-18-2011 TNC on Long-Billed Curlew https://www.nature.org/media/montana/wind-report.pdf Katzner et al. 2023 describe LBC poaching mortality in SW Idaho: file:///Users/katiefite/Downloads/KatznerEtalIllegalKillingNongameWildlife2020.pdf "In total, 33% of telemetered long-billed curlews (Numenius americanus) and 59% of other bird carcasses found with known cause of death (or 32% of total) were illegally shot. Analysis of spatial distributions of illegal and legal shooting is consistent with birds being shot illegally in the course of otherwise legal recreational shooting, but snakes being intentionally sought out and targeted elsewhere, in locations where they congregate. Preliminary public surveys indicate that most recreational shooters find abhorrent the practice of illegal killing of wildlife. Viewed through this lens, our data may imply only a small fraction of recreational shooters is responsible for this activity. This study highlights a poorly known conservation problem that could have broad implications for some species and populations of wildlife. "The NCA and the ACEC were established to aid in conservation of locally robust populations of raptors and curlews, respectively. It is, therefore, ironic that these species are among those we documented as illegally shot. Although curlews elsewhere are not thought to be targeted by shooters, raptors, globally, regularly are shot (Olson, 1999; Russell & Franson, 2014), in part because they are viewed as threats to livestock or game (Redpath et al., 2013). Snakes, and particularly rattlesnakes, also are killed because of the threat they are perceived to pose … Comparisons of data from recent and historical surveys for curlews in southwestern Idaho show severe population declines of >90%, from 2,000+ individuals in the late 1970s (Jenni, Redmond, & Bicak, 1981) to <200 in 2014 (Pollock, Miller, & Carlisle, 2014). This decline is ongoing through 2019 (Coates, Hayes, Clapsadle, Dougill, & Carlisle, 2019), and contrasts with a more stable range-wide population (Sauer et al., 2017). Illegal shooting of curlews has been a long-standing practice at the ACEC, with nine reported shot from 1977 to 1979 (Jenni et al., 1981). The ≥33% rate of shooting mortality we observed among 21 tracked adult curlews suggests a potential role for illegal shooting in the dramatic long-term declines observed for the local population of this long-lived and slowly reproducing species".	Two full years of avian use studies were conducted to evaluate temporal and spatial variation in avian use in the siting corridors. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and in EIS Table 3.3-7. Detailed data from the first year of avian use studies are presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study is included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies (WEST 2023) were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. The CEQ implementing regulations for NEPA at 40 CFR 1502.2 state that: "(a) EISs shall not be encyclopedic." Therefore, the description of long-billed curlew in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) presents a brief summary of the species' important life history traits, demographic information, and susceptibility to impacts from wind energy development. Although the EIS does not specifically discuss the effect that illegal shooting has had on the long-billed curlew, it provides adequate disclosure of the species' declining population range-wide and the importance of breeding populations in western Idaho to the overall population of long-billed curlews in BCR 9. Even though the very small number of long-billed curlew fatalities reported at existing U.S. wind energy facilities suggests this species has a low likelihood of colliding with operational turbines, the EIS conservatively assumes that even a small number of fatalities from collisions with operational turbines could be significant. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).
11871-102	WildLands Defense	WEST's claims about Long-Billed curlews being present in "migration" appear to be baloney - and instead birds are nesting here. This is the period when LBC commence nesting, and it is highly likely many of the birds observed were setting up territories and beginning to nest – and quieting down becoming less noticeable. If the WEST biologists were skilled observers, they would have skillfully observed the aerial flight "curlew, curlew, curlew' breeding displays of LBC. These flights would also put the curlews in danger of being killed by turbine blades. Plus, this species seems quite sensitive to overhead flight activity - and turbines and turbine shadows may be particularly problematic.	The avian use studies employed point-count surveys to generally characterize temporal and spatial variation in avian use in the siting corridors, observers did not record notes on avian behavior such as calls or mating displays. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and in EIS Table 3.3-7. Detailed data from the first year of avian use studies are presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study is included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. This included updating the long-billed curlew description in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) to indicate that the species was observed in the siting corridors during the second year of avian use studies. The analysis of impacts to long-billed curlew in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) has also been revised to clarify that "the species uses the siting corridors during spring migration and the summer breeding season."
11871-103	WildLands Defense	The consultants must provide maps for al sensitive species. p. 16. Shorebird use is highest in spring – consists mainly of Long-billed Curlew. Table 6 "frequency of occurrence" shows curlew abundance. Breaking results down by species is critical to establish a baseline and be able to gauge how much the wind project would harm, reduce, kill, or drive away each species of concern. Instead, WEST just lumps all birds in various "groups" categories together. Table 7 lists Shrikes, thrasher as "incidental".	Range maps for avian species are widely available and there would be no benefit to including these in the baseline resource reports or EIS. The avian use studies (WEST 2021a, 2023) employed point-count surveys to generally characterize temporal and spatial variation in avian use in the siting corridors and represent one of many sources considered in determining which species have the potential to occur in the siting corridors. Similarly, the results and conclusions presented in the avian use studies and other baseline resource reports were one on many sources considered when evaluating the potential for avian species to experience population-level impacts from collisions with operational turbines. Readers should refer to EIS Section 3.3.2 (Avian Populations) and Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief) for a full description of avian species that may occur in the siting corridors and the analysis of potential impacts to their populations. Both avian use studies (WEST 2021a, 2023) include appendices with the data broken out for individual species. Loggerhead shrike and sage thrasher were reported as incidental observations in the year 2 avian use study (WEST 2023) because the second year of studies focused on large birds and did not include point-count surveys for small birds. Detailed used data for these two species (and other small birds) are included in the year 1 avian use study (WEST 2021a).
11871-104	WildLands Defense	Table 9 lists LBC. Why is there no mention of Brewer's Sparrow here?	Table 9 in the year 2 avian use study (WEST 2023) summarizes observations of avian species of concern (i.e., special-status species). Although the year 1 avian use study (WEST 2021a) correctly identified Brewer's sparrow as a BLM special-status species, this species is not included in the most recent list of BLM special-status species for Idaho, which was published in 2022, after the year 1 avian use study had been completed. Since the Brewer's sparrow no longer carries a special-status designation, it is not included in Table 9 of the year 2 avian use study (WEST 2023).
11871-105	WildLands Defense	An example of a negative association between wind energy development and raptors exists from the Columbia Plateau Ecoregion. Nest success of ferruginous hawk, red-tailed hawk, and Swainson's hawk was studied in relation to wind turbine density within their home range (Kolar and Bechard 2016). Nest success for ferruginous hawk decreased in areas with greater turbine density whereas there was no effect for red-tailed hawk and Swainson's	The results of the Kolar and Bechard (2015) study are discussed in the ferruginous hawk description in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail), which describes the potential for effects to breeding ferruginous hawks to result in population-level impacts. Red-tailed hawk and Swainson's hawk do not carry special-status designations in Idaho and thus do not meet the criteria for analysis in the EIS because their populations in the

Comment ID	Commenter	Public Comment	Response to Comment
		hawk. Juvenile hawks of all three species from areas of greater turbine density were more likely to die from predation or starvation after fledging than those from areas with lower turbine density. Although the authors noted the cause of this negative association was unknown, they speculated it was some ..". Given there are no unoccupied habitats, this is a major concern also downplayed in the EIS, and the cumulative effects analysis is greatly deficient in identifying and assessing the full array of serious threats to species and populations.	analysis area are considered to be relatively large and stable. As noted in the comment, the Kolar and Bechard (2015) study found that red-tailed hawk and Swainson hawk nesting was less affected by wind turbine density than ferruginous hawk nesting. As described in EIS Section 3.3.2.1.1, other studies have also found these species to be at low risk of experiencing population declines from wind energy development (Conkling et al. 2022). EIS Section 3.3.2.1.2 describes the large increase in wind energy development that is expected to occur in the analysis area over the 30-year analysis period, including two other wind energy facilities proposed in close proximity to the project, and the increase in cumulative avian fatalities that is expected as a result. The analysis in EIS Section 3.3.2.2 (Avian Populations, Impacts) recognizes the inherently cumulative nature of avian fatalities from collisions with operational turbines and specifically discloses the potential for the species analyzed in detail to experience significant impacts from even a relatively small number of fatalities under the action alternatives when the impact of numerous facilities across the landscape is considered. Additional details are provided in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts).

Seasonal associations with light pollution trends for nocturnally migrating bird populations. 2022. Ecosphere. 2. La Sorte, F. A., M. Aronson, C. Lepczyk, K. G. Horton, Assessing the combined threats of artificial light at night and air pollution for the world's nocturnally migrating birds. 2022. Global Ecology and Biogeography. 3. Dezfuli, A., K. G. Horton, B. Zuckerburg, S. D. Schubert, M. G. Bosilovich. Continental patterns of bird migration linked to climate variability. 2022. Bulletin of the American Meteorological Society. This information is all necessary and should have been collected and presented	In addition to the 2 years of avian use surveys, MVE conducted 2 years of raptor nest surveys, and 2 years of greater sage-grouse lek surveys (WEST 2020 through 2023). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project." A number of other measures that would be implemented to minimize or avoid impacts to birds are described in EIS Section 3.3.2.2.2 and EIS Appendix 4 (Mitigation). This approach is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). Detailed studies of migratory routes in the analysis area are beyond the scope of the EIS. AIB-5 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief) has been revised in the final EIS to include a description of impacts to migrating birds from nighttime lighting.
11871-116	WildLands Defense	And: "Despite the dearth of studies concerning the effects of WTN on wildlife, they have generated some insights that could contribute to understanding the ecological impact of WTN. In general, it has been shown that noise pollution affects species demography (i.e., community composition, population density) and promotes habitat avoidance (e.g. Refs. [1,29], because noise alters animals' habitat selection. Several studies have demonstrated the impact of WT on demography and habitat avoidance, mostly in birds (e.g. Refs. [37,38], but also in other taxa such as mammals [39]. Very few studies have been able isolate and connect habitat avoidance specifically to WTN (e.g. Ref. [40], but Lehnardt et al. (in review) recently teased apart the effects of WTN on songbirds experimentally, by broadcasting the sound of a wind turbine in the field and showing that this significantly reduced the number of birds present. Furthermore, the existing literature implies that WTN alters birds' vocal communication, with possible implications for reproductive success [30,41,42]".	As described in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief), BLM (2005) discloses effects to habitat for avian species, including avoidance of habitats due to noise and human disturbance (see AIB-1). As described in EIS Section 3.3.2 (Avian Populations), most avian fatalities at existing U.S. wind energy facilities are small passerine species (i.e., songbirds), indicating that these species continue to use habitat at wind energy facilities despite noise from turbine operations.
11960-1	Roger and Liz Mandelkow	In response to a review of the EIS we would like to know how many endangered animals are you going to allow these wind turbines to injure or kill? In the EIS it specifically states that it will kill federally protected Bald Eagles that live in the area. If we injured or killed one Bald Eagle we would be held accountable. But yet LS Power / Magic Valley Energy will be held harmless? This is only the one species we are referencing from the EIS, but there are many more species of birds, eagles, and land-dwelling species that are going to be impacted and ultimately killed as well.	The MBTA and BGEPA prohibit the intentional take of migratory birds and eagles but do not impose the same level of restrictions for incidental take of these species resulting from otherwise lawful actions. MVE is pursuing an ITP, which is being evaluated in a separate NEPA analysis being conducted by the USFWS (see Section 3.3.3 [Eagles]). The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tier 4 and 5). MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M in MVE [2023]) in accordance with the USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential for population-level effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities." As stated in IAC 13.01.06 Section 300.02 "Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management . . . " Two full years of avian use studies (WEST 2021a, 2023) were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, detailed studies of migratory routes are beyond the scope of this EIS. The greater sage-grouse is not listed as threatened or endangered under the ESA, but BLM 2015 provides a broad, landscape-level, national greater sage-grouse conservation strategy for the species. Greater sage-grouse were considered in the development of alternatives analyzed in the EIS and a number of mitigation measures would be implemented to minimize or avoid impacts to the species, including compensatory mitigation, in accordance with the mitigation framework in BLM 2015; see EIS Section 3.3.4 (Greater Sage-Grouse) and EIS Appendix 4 (Mitigation) for additional details.
11970-5	Janet Keegan	3.3.3 Eagles: It is my personal, non-scientific belief that the DEIS did not take a "hard look" as required by NEPA into protecting bats, birds, pollinators and other creatures great and small in considering the scope of this proposed project. I have one suggestion that should be studied for AFFECTED ENVIRONMENT AND IMPACTS FEIS and a requirement in the ROD. This information can be found on the Peregrine Fund's World Center for Birds of Prey. The BLM managed Morley Nelson Snake River Birds of Prey National Conservation Area was not mentioned and data did	While small buttes, rock outcroppings, and other topographic features are present in the siting corridors, none of these features are large or consistent enough to be of significant importance to migrating raptors. Raptor use in the siting corridors was evaluated over 2 years of avian use and raptor nest studies, which are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. Temporal variation in raptor use indicates that some of these species migrate through the siting corridors, but the relatively low numbers of raptors observed would

Comment ID	Commenter	Public Comment	Response to Comment
		reach to that area in considering the Lava Ridge project. I feel that is a major oversight – as birds fly and migration can occur outside of nesting habitat. Automated monitoring for birds in flight: Proof of concept with eagles at a wind power facility - ScienceDirect	suggest that the siting corridors are not within an important migratory corridor for raptors. High raptor use at Morley Nelson Snake River Birds of Prey National Conservation Area is related to the presence of important habitat features such as large, steep cliffs that provide nesting habitat for raptors and create thermals used by migrating raptors. Unique soil and vegetation at this location also provides abundant habitat for important raptor prey resources such as ground squirrels and jackrabbits. A brief description of the NCA has been added to EIS Section 3.3.2.1 (Avian Populations, Affected Environment). Although raptors are capable of travelling the distance between the NCA and the siting corridors, the American Bird Conservancy's Wind Risk Assessment Map shows that the siting corridors are located outside of the intermountain raptor migration corridor, which supports the conclusion that raptor migratory movements are concentrated in the immediate vicinity of the Snake River, south of the siting corridors. The use of detector-based curtailment systems is discussed in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B).
11978-21	Magic Valley Energy, LLC	Section 3.3.2 – Avian Species Analysis ... 19. MVE Comment: The DEIS assumes that the annual avian fatality rate will be between the mean and maximum fatality rates within the BCR 9 Region. However, the DEIS also states that it "assumes avian fatalities from turbine collisions would have the same magnitude of impact on avian populations in BCR 9 regardless of where those fatalities occur in BCR 9." These two rationales are contradictory, as the DEIS cannot assume avian fatalities would have the same impact regardless of where they occur, and simultaneously eliminate the possibility of fatality rates being as low as other projects in BCR 9. An upward bias of estimated avian fatality rates is unwarranted since the Project area provides few avian use features and MVE's turbine siting practices avoid and minimize impacts, as stated in the DEIS: • There are no 'Important Bird Areas' designated in the siting corridors. • There are limited permanent water resources (namely canals, [which MVE has applicant- committed measures to avoid impacts to 1,000 feet of canals when possible]). • The siting corridors do not contain habitats that would concentrate migrating birds. • The siting corridors do not contain mountain ridges that would provide updrafts for migrating raptors. • Though in the Pacific Flyway, migratory routes in this flyway are concentrated along the Pacific coast and, to a lesser extent, the western slope of the Rocky Mountains. Migratory movements within Idaho are primarily east to west and concentrated along the Snake River, Salmon River, and Pend Oreille River corridors. • In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern. • Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). • Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project. The information provided above demonstrates that precluding the BCR 9 minimum estimated annual avian fatality rate as a possible outcome for the Project is unwarranted, and its inclusion should be added into the FEIS analysis. This inclusion of a minimum fatality rate would be in line with other FEIS documents from western states in the BCR 9 Region, which have projected minimum fatality estimates along with mean and maximum rates as part of their analyses (see Attachment 2 for examples). The minimum fatality estimate for BCR 9 is 0.24 birds/MW/yr and 0.01 raptor fatalities/MW/yr. Using these values as a basis, Table 3.3-5 could be updated to match the table below. [see table in PDF for easier reading, below slightly reformatted to capture intent of table better] Alternative B Bird fatalities from turbines (operation only) - - Minimum: All species: 288 - 492 birds per year - Minimum: Diurnal Raptors Only: 12 - 21 birds per year - Mean: All species: 3,240–5,654 birds per year - Mean: Diurnal raptors only: 156–272 birds per year - Maximum: All species: 10,200–17,799 birds per year - Maximum: Diurnal raptors only: 348–607 birds per year Bird fatality rate from turbines - - Minimum: All species: 0.24 birds per MW per year - Minimum: Diurnal raptors only: 0.01 diurnal raptors per MW per year - Mean: All species: 2.7 birds per MW per year - Mean: Diurnal raptors only: 0.13 diurnal raptors per MW per year - Maximum: All species: 8.5 birds per MW per year - Maximum: Diurnal raptors only: 0.29 diurnal raptors per MW per year Alternative C Bird fatalities from turbines (operation only) - - Minimum: All species: 273 - 373 birds per year - Minimum: Diurnal Raptors Only: 12 - 16 birds per year - Mean: All species: 3,062–4,196 birds per year - Mean: Diurnal raptors only: 147–202 birds per year - Maximum: All species: 9,639–13,209 birds per year - Maximum: Diurnal raptors only: 328–451 birds per year Bird fatality rate from turbines - - Same across action alternatives Alternative D Bird fatalities from turbines (operation only) - - Minimum: All species: 202 - 258 birds per year - Minimum: Diurnal Raptors Only: 9 - 11 birds per year - Mean: All species: 2,268–2,900 birds per year - Mean: Diurnal raptors only: 109–140 birds per year - Maximum: All species: 7,140–9,129 birds per year - Maximum: Diurnal raptors only: 244–311 birds per year Bird fatality rate from turbines - - Same across action alternatives Alternative E Bird fatalities from turbines (operation only) - - Minimum: All species: 194 - 280 birds per year - Minimum: Diurnal Raptors Only: 9 - 12 birds per year - Mean: All species: 2,179–3,143 birds per year - Mean: Diurnal raptors only: 105–151 birds per year - Maximum: All species: 6,860–9,894 birds per year - Maximum: Diurnal raptors only: 234–338 birds per year Bird fatality rate from turbines - - Same across action alternatives	See response to comment 11978-11 (in Table A-3b, Bats).
11978-164	Magic Valley Energy, LLC	20. MVE Comment: Four avian species (i.e., ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl) are analyzed in detail in Section 3.3 of the DEIS, as those species were perceived as potentially having a "moderate to high likelihood of population-level effects from the project." The DEIS sets forth three criteria, all of which must be met, to require a detailed analysis based on a moderate to high likelihood of population-level effects to the species due to the Project (referred to in this comment as "population-level effects concern criteria"); species not satisfying all three of these criteria were not analyzed further in the DEIS: "Therefore, the species analyzed in detail in this EIS meet all three of the following criteria: 1) The species has been observed in the siting corridors or has the potential to occur in the siting corridors because breeding, foraging, or migratory stopover habitat for the species is present and the species has been recorded in similar habitats within 4 miles of the siting corridors. 2) The species has a moderate to high potential of colliding with turbines based on if and how the species uses the RSH and the frequency with which the species been detected as fatalities at existing wind energy facilities. 3) The species has one or more demographic characteristics that make it susceptible to small increases in mortality; namely,	EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) describes how each of these species meet the criteria for detailed analysis.

Comment ID	Commenter	Public Comment	Response to Comment
		they have a small and declining population in BCR 9, are long- lived, have a low reproductive rate, and are dependent on high annual survivorship to sustain their population." However, each of the four avian species analyzed in detail do not satisfy at least one of the three population-level effects threshold criteria, all three of which would need to be satisfied to trigger a detailed review to determine the likelihood of moderate-to-high population-level effects.	
11978-165	Magic Valley Energy, LLC	The DEIS reports that ferruginous hawks account for only 13 wind energy fatalities in the entire U.S., comprising just 0.1% of all recorded fatalities. Based on this data, it is reasonable to ascertain that the species does not have a moderate to high potential for collision, which is one of the population-level effects concern criteria (#2 above) stated in the DEIS for an avian species to potentially have population-level effects. Regarding the very low fatality percentage (0.1% of all recorded fatalities) comprised by ferruginous hawk, the DEIS speculates that "[t]his low percentage may be in part due to the non- random nature of the facilities included in the database, which is heavily skewed toward facilities in the Midwest and eastern United States that are outside the range of the ferruginous hawk." However, the Analysis of Avian and Bat Mortalities at Existing Wind Facilities (WEST 2021c in the DEIS) removes the need for speculation by quantifying that, based on publicly available fatality data, only three recorded ferruginous hawk fatalities occurred in BCR Region 9, with none of those fatalities occurring in Idaho. As such, the available data do not indicate that ferruginous hawk has a moderate to high potential for colliding with wind turbines. Additionally regarding ferruginous hawk sensitivity, the DEIS cites a Beston et al. 2016 report to support a statement that "[m]odeling indicates that collisions with turbines have a relatively large contribution to overall mortality for ferruginous hawks, and that the species is vulnerable to population-level effects from wind energy development." MVE's review of the Beston et al. 2016 report found that the statement "modeling indicates that collisions with turbines have a relatively large contribution to overall mortality for ferruginous hawks" misinterprets the contents of the report since the wind turbine collision contribution to overall mortality of the species (parameter called "FT in the report") was actually a model input parameter instead of an output parameter. Potential problems with the FT input parameter include, but may not be limited to, the following: 1) The FT parameter, calculated as the number of estimated fatalities caused by wind turbines, divided by the total population size multiplied by the quantity one minus the adult survival rate, tends to skew high for long-lived species such as ferruginous hawk since they have high adult survival rates. 2) The report seems to indicate that the number of estimated fatalities caused by wind turbines may not actually be based on species-specific fatality data. As the report explains, "[o]ther data limitations may also affect the output of our prioritization approach. In particular, FT would be better estimated with species-specific fatality data." Regarding the DEIS statement that ferruginous hawk "is vulnerable to population-level effects from wind energy development" based on the Beston et al. 2016 report, the model attempted to prioritize bird species based on their risk of population-level impacts from wind energy development. The model outputs scored the ferruginous hawk as the 18th-ranked avian species in terms of population risk due to wind development. In addition to the data associated with the FT parameter discussed above, the model calculated risk metrics based on data including the percent of a species population living near wind turbines, the number of female offspring per female annually, age at first reproduction, and the number of habitats a species uses. None of these parameters take into account important characteristics related to turbine fatality risk for a given species around a given wind energy facility, such as flight height, the amount of time a particular species spends in the rotor-swept area, species behavior, habitat type, presence and type of prey/food resources, weather variables, etc. As such, the results of the modeling in the report provide little to no information about the risk presented to a particular avian species by a particular wind energy facility in a particular location. The report acknowledges this shortcoming to a degree, stating, "[b]y examining studies on bird avoidance of operating facilities, it may be possible to filter out species with a high Indirect Risk Index that actually tolerate wind turbines well." Additionally, the report admits that "fatality from wind turbines was usually vanishingly small compared to overall estimates of fatality." Finally, the modeled risk to ferruginous hawk due to wind energy seems inconsistent with observed trends in recent years. In a period when wind energy capacity is increasing significantly, the American Bird Conservancy reports that the North American population of ferruginous hawk is approximately 110,000, with an increasing trend in population size.14 Given the information above, the available data do not support the notion that the ferruginous hawk species has a moderate to high potential of colliding with turbines. As such, ferruginous hawk does not meet all three population-level effects concern criteria as outlined in the DEIS; thus, per the analytical framework in the DEIS, population-level effects are not expected. As such, a detailed impacts analysis for ferruginous hawk is not necessary and should be removed in the FEIS. Consequentially, the additional measures in the FEIS related to ferruginous hawk would also be removed since the Project does not have the potential for population-level effects on the species, and ferruginous hawk would continue to be protected by the applicant-committed measures and adaptive management procedures detailed in the BBCS (MVE's POD Appendix M).	The conclusions in WEST 2021c are based on a study from a single existing wind energy facility in Idaho and only 23 facilities in BCR 9, these sample sizes are insufficient to establish that the ferruginous hawk has a low risk of colliding with turbines, especially considering their frequent use of the RSH of the proposed turbines. Even if collision risk were low, ferruginous hawk populations could be impacted by relatively low fatality rates because the species has a low reproductive rate and depends on high juvenile and adult survivorship and because their populations are already declining in much of the analysis area (see EIS Section 3.3.2.1.1 [Avian Populations, Species Analyzed in Detail]). Beston et al. (2016) used fatality data from 53 existing U.S. wind energy fatalities to estimate FT, and also attributed much of the risk to ferruginous hawks to the percentage of the population living in the vicinity of turbines, the low reproductive rate for the species, and the indirect effects of disturbance, displacement, and habitat fragmentation and loss. Other studies summarized in the description of ferruginous hawks in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) (i.e., Kolar and Bechard 2015 and Ng et al. 2020) also found evidence that wind energy development negatively impacts breeding ferruginous hawks. While the BLM recognizes that MVE has committed to a number of measures to minimize or avoid impacts to the ferruginous, these measures may not be sufficient to prevent population-level impacts to the species. The ferruginous hawk is a BLM special-status species and the BLM must ensure that the actions it authorizes do not contribute to a trend toward federal listing or loss of population viability for the ferruginous hawk; the BLM has additional obligations to reduce impacts to species protected under the MBTA as provided in their 2010 MOU with the USFWS, which was renewed for 5 years in February 2022 (BLM and USFWS 2022). Therefore, the BLM has developed additional mitigation measures that would be implemented to comply with these requirements; see Alternative B with Additional Measures in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), EIS Section 3.3.2.4 (Compensatory Mitigation), and EIS Appendix 4 (Mitigation).
11978-166	Magic Valley Energy, LLC	Regarding long-billed curlew, the DEIS describes that only 16 long-billed curlews were recorded during the Project area surveys, which MVE notes could have included multiple observations of the same individual during the course of multiple survey days. These observations do not support the notion of the Project area hosting population levels high enough to be deemed important habitat needed for sustaining populations. The total North American population of the species is 123,500, of which the Great Basin population is estimated at 40,000 per IDFG 2017. Also per IDFG data described in the DEIS, the highest concentrations of curlews in Idaho occur to the west of the area managed by the BLM Shoshone Field Office in the administrative boundary of the BLM Four Rivers Field Office. Importantly, the DEIS states that the long-billed curlew population in BCR 9 appears to be increasing. Based on the information above, the species does not have a small and declining population in BCR 9 and therefore does not satisfy the third population-level effects concern criteria listed above in this comment. Additionally, the DEIS explains that all long-billed curlew flights recorded during Project avian use surveys occurred below the rotor-swept height. This is consistent with the DEIS species description, which noted the curlew as having a 0.1% rate of all recorded avian-turbine collision fatalities (only 10 fatalities nationwide). Accordingly, the available data supports a conclusion that the long-billed	The potential for significant impacts to long-billed curlew cannot be ruled out for the same reasons described for ferruginous hawk in the response to comment 11978-165 (see in Table A-3c, Birds); see EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) for additional details. The playas and vernal pools in the siting corridors were not inundated during the avian use surveys (WEST 2021a, 2023) and it is possible that long-billed curlew use could be higher during wet years. As described for ferruginous hawk, the BLM must develop additional mitigation measures to meet its special-status species management and MBTA obligations.

Comment ID	Commenter	Public Comment	Response to Comment
		curlew does not have a moderate to high potential for colliding with turbines. Since the species does not meet does not meet two of the three population-level effects concern criteria as outlined in the DEIS, per the analytical framework in the DEIS, population-level effects would not be expected, and a detailed impacts analysis for long-billed curlew is not necessary and should be removed in the FEIS. The species would continue to be protected by the applicant- committed measures and adaptive management procedures detailed in the BBCS (POD Appendix M).	
11978-167	Magic Valley Energy, LLC	Similarly, the short-eared owl and western burrowing owl have extremely low collision rates (0.2% and 0.1%, respectively, of all historical U.S. recorded fatalities at wind facilities) due to their low flight height, which is below the Project's RSH and the RSH of most other wind projects. The Altamont Pass Wind Project is one project where the RSH overlapped with the flight height of the two species, which correlates to the increased fatality rates recorded there. However, this data point is an outlier and should not be used in the DEIS analysis because the RSH at the Altamont Pass Wind Project is inapplicable to the model of wind turbines used today and is not bound to the design stipulations MVE has committed to for this Project. Thus, these species do not have a moderate to high potential of colliding with turbines, so the short-eared owl and western burrowing owl do not meet the population-level effects concern criteria #2. Accordingly, per the analytical framework in the DEIS, population-level effects to the species are not expected, and a detailed impacts analysis for short-eared owl and western burrowing owl is not necessary and should be removed in the FEIS. These species would continue to be protected by the applicant- committed measures and adaptive management procedures detailed in the BBCS (POD Appendix M).	Although frequent RSH use by short-eared owls and burrowing owls was not observed during the avian use surveys (WEST 2021a, 2023), these surveys were not designed to detect owls and may underestimate use of the siting corridors and use of the RSH by both species. As noted for short-eared owl, flights within the RSH have been recorded elsewhere and males are at particular risk when engaging in mating displays. The EIS also acknowledges that the older, lattice-tower turbines at Altamont Pass are the most likely explanation for higher fatality rates for burrowing owls observed at this facility, but the possibility that fatality rates may be higher where burrowing owls nest (such as the siting corridors) cannot be ruled out. Refer to EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) for additional details.
11978-168	Magic Valley Energy, LLC	Given the information presented above, all four species analyzed in detail in the DEIS do not meet the population-level effects concern criteria that would indicate the potential for population-level effects. Further, MVE has applicant-committed measures for avoiding and minimizing impacts (e.g., avoiding riparian areas where practical, siting turbines away from previously occupied raptor nests, removing carcasses within the Project area, and completing pre- and postconstruction surveys with applicable mitigation measures and potential adaptive management strategies) that would further reduce the impacts to all avian species. Ferruginous hawk, long-billed curlew, short- eared owl, and western burrowing owl should therefore be removed as species analyzed in detail in instead be added to Appendix 3 of the FEIS as Issues Analyzed In Brief.	A species' risk of experiencing population-level impacts is a function of 1) its demographic characteristics (e.g., population size, trend, and reproductive rate), and 2) its behavior (which determines its likelihood of colliding with operational turbines), which are factors independent of any avoidance or minimization measures that MVE or the BLM would implement. Rather, mitigation measures have been developed to address the potential impacts to species that are at risk of experiencing population-level impacts.
11991-9	Julie Abo	The avian fatalities seem very excessive for BLM-favored Alternatives C and E: "Alternative C 3,062-4,196 fatalities from collisions wth turbines. 9,639-13,209 (max) birds per year. Alternative E Avian populaations fatalities: 2, 268-2,900 to maximum 7, 140-9,129 birds per year (Page ESxv)" According to a study: Conkling TJ, et al.. 2022. Vulnerability of avian populations to renewable energy production. FigShare, avian surveys tend to focus on local groupings of birds. Were the avian surveys done only locally focused? If so, then as this research shows, does As the authors of this recent research show: "Our results illustrate that such locally focused surveys may poorly predict the cumulative impacts of fatalities. This study, therefore, emphasizes the importance of assessing the origins of wildlife affected when interpreting consequences to wildlife populations of these, or any, types of anthropogenic activities."	The draft EIS did not identify a BLM-preferred alternative. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) the estimated avian fatality rates in EIS Table 3.3-12 are not intended to be precise estimates but are presented to allow for a meaningful comparison between alternatives. The fatality rates presented in Table 3.3-12 also do not account for the implementation of mitigation measures (a table note has been added to this effect in the final EIS). As stated in EIS Section 3.3.2 (Avian Populations),"[BCR 9 (i.e., the analysis area)] is an ecologically distinct region with similar bird communities, habitats, and resource management issues (North American Bird Conservation Initiative 2021). BCRs provide an ecological approach to capturing regional variation in bird occupancy and useful spatial units over which to examine changes in population. Data on avian fatality rates and installed wind capacity are also available at the BCR level, which allows for a more informed estimation of the avian fatality rates that could be expected under the action alternatives, and the relative contribution of those fatalities to the overall impact on regional avian populations." As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), in accordance with the USFWS (2012) guidelines, MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M in MVE [2023]), and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities." While many species that may occur in the siting corridors likely travel beyond BCR 9 during migration, studies of the geographic origins of birds using the siting corridors are beyond the scope of this EIS but are included as potential adaptive management or compensatory mitigation for avian and bat species; see the BBCS and EIS Appendix 4 (Mitigation) for additional details.
12054-12	Kevin Emmerich	The noise from the turbines will impact eagles. The acoustic environment has a major influence in shaping animal behavior. A growing number of studies quantify the impact of nonlethal human disturbance on the behavior and reproductive success of animals. Most researchers agree that noise can effect an animal's physiology and behavior, and if it becomes a chronic stress, noise can be injurious to an animal's energy budget, reproductive success and long-term survival. In draft guidelines for human disturbance of breeding golden eagles, Hansen et al. (2017) state that ground disturbance and noise can be more significant than aerial noise to raptors: "In general, animals appear to be more responsive to louder sounds than to quieter ones (Bowles 1995). For example, Mexican spotted owls only flushed in response to helicopters and chainsaws when sound energy was above certain levels (chainsaws: 46 dBA, helicopters: 92 dBA; Delaney et al. 1999). Awbry and Bowles (1990:21 cited in USFWS 2006) stated that "what little published literature (on raptors) is available suggests that noise begins to disturb most birds at around 80–85 decibels (dB) sound levels and that the threshold for the flight response is around 95 dB." The Service (USFWS 2006) noted in its review of effects of human disturbance on northern spotted owls that raptors tend to be more sensitive to visual disturbances than to auditory ones. However, auditory and visual stimuli from human activities may often interact synergistically in their effects on wildlife (USFWS 2006). This synergistic effect could be responsible for findings that raptors are often more strongly affected by terrestrial activities than aerial activities (USFWS 2006; e.g., Fraser et al. 1985, Delaney et al. 1999, Grubb et al. 2010). The Service (USFWS 2006) recommended an injury threshold for northern spotted owls of 46 dBA for terrestrial activities due to the potential for stronger effects of ground-based activities than of aerial activities."	Impacts to eagles and other avian species from construction noise and turbine noise are disclosed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-2. Additional discussion is provided for eagles in EIS Section 3.3.3.2 (Eagles, Impacts).
12130-24	Brenda Pace	BBCS Section 3.1 (and DEIS Section 3.3.2.1.1) describes preconstruction surveys completed for birds. I am concerned that the raptor nest surveys completed were not designed to detect ground nesting raptors such as	As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), preconstruction avian use is not correlated with postconstruction fatality rates; therefore, conducting additional studies of current avian use in the siting corridors

Comment ID	Commenter	Public Comment	Response to Comment
		burrowing owls and short-eared owls. Additional preconstruction surveys should be conducted for ground nesting raptors.	would not lead to a more informed analysis. Postconstruction monitoring would be implemented to assess avian fatality rates and determine if adaptive management measures are needed to reduce fatalities.
12160-1	Richard Walsworth	The poor birds in the region will be massacred. According to the EIS approx. 15 golden eagles will be killed per year and before the 30 year lifetime of these windmills are over all the golden eagles in the region will be dead. If I killed even one golden eagle I would most likely get jail time and a large fine. How about the endangered sage hen, the tens of thousands of migrating birds and the large variety of birds of prey and songbirds that live on the Snake River Plain that will die each year. I think the flight patterns of these birds have not been adequately studied for the huge impact the windmills could have killing birds. I hunt doves in this area every year and know first hand many doves migrate through the project area.	The MBTA and BGEPA prohibit the intentional take of migratory birds and eagles but do not impose the same level of restrictions for incidental take of these species resulting from otherwise lawful actions. MVE is pursuing an ITP, which is being evaluated in a separate NEPA analysis being conducted by the USFWS (see Section 3.3.3 [Eagles]). The USFWS does not currently have a formal mechanism for permitting incidental take of migratory birds at wind energy facilities. However, the USFWS has developed land-based wind energy guidelines (USFWS 2012) to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). These guidelines recommend a tiered study approach, beginning with preliminary site evaluation (Tier 1) and site characterization (Tier 2), followed by preconstruction wildlife baseline studies (Tier 3), and where appropriate, postconstruction monitoring (Tier 4 and 5). MVE has conducted Tier 1–3 studies, has a draft BBCS (Appendix M in MVE [2023]) in accordance with the USFWS (2012) guidelines, and has committed to a minimum of 2 years of postconstruction monitoring surveys to meet the Tier 4 study requirements. Tier 4 studies would be used to determine if the fatality rates and potential for population-level effects predicted from the Tier 3 studies are accurate, and to provide a basis for determining if adaptive management measures need to be implemented to reduce avian fatalities." As stated in IAC 13.01.06 Section 300.02 "Protected nongame status is not intended to prevent unintentional take of these species, protection of personal health or safety, [or] limit property and building management . . ." Two full years of avian use studies (WEST 2021a, 2023) were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, detailed studies of migratory routes are beyond the scope of this EIS. The greater sage-grouse is not listed as threatened or endangered under the ESA, but BLM 2015 provides a broad, landscape-level, national greater sage-grouse conservation strategy for the species. Greater sage-grouse were considered in the development of alternatives analyzed in the EIS and a number of mitigation measures would be implemented to minimize or avoid impacts to the species, including compensatory mitigation, in accordance with the mitigation framework in BLM 2015; see EIS Section 3.3.4 (Greater Sage-Grouse) and EIS Appendix 4 (Mitigation) for additional details.
12469-9	Mike Telford	In our modern world we are surrounded by and governed by Models. Models are a way of predicting future events and numbers by using know facts and data and putting them into sometimes complicated equations. An algorithm is defined as " a process or set of rules to be followed in calculations or other problem solving operations, especially by a computer". Models are used from everything from future trading, to the weather. One profession modeler recently told me that " all models are wrong, but some are useful". All model's accuracy is mostly governed by the historical data and numbers put into them. They are all tested by then seeing what really happens and then comparing that real world result to what the model said was going to happen. Then the model uses those real result to attempt to fine tune the model to better predict outcomes... The DEIS has used models to try and predict Bird kills by the wind turbine. The DEIS is obvious that they have used very scarce data to model not only the impacts but the data if the birds numbers and location are all model created numbers. There is no complete study of the area of the bird population or the fact that in the last 50 years those population are declining. It is impossible in good faith to model anything with out good data... As the habitat is altered by all this destructive activity (the 380 plus miles of roads as just one) and food chain disruptions occur the modeling cannot be relied upon... The populations of water fowl changes dramatically depending on the winter precipitation that comes each year. In the wetter years as the spring thaw occurs, ponds both large and small occur. One of the largest noted on all the old BLM maps, is Senter lake, which is located on our farm. These Ponds last from a few weeks to a couple of months. They attract large numbers of water fowl. Many types of ducks, swans, snow geese, Canadian geese and occasionally pelicans. Experts could surely identify more detail. These are relatively lower flying. Therefore, more subject to windmill kills. The DEIS does not address this special influx population and the impacts The single most overwhelming factor is the project proposes 6MV wind turbines larger (740ft) than any constructed or in operation. Any impacts from something this large and untested, may be called a model but is only a guess or extrapolation. The is no running prototype to measure impacts and gathered data. In the DEIS Executive Summary there are 24 resource issues listed. None of them consider the lack of data concerning 6MV wind turbines and there impacts to everything. Fourteen of these resource issues are about living things. All these rely on modeling. Most of these have little or no real data and are subject to models, that as good as they maybe, can also be grossly inaccurate. Each creature, whether a humble insect or pollinator, a rodent, bat, or a predator is part of an ecosystem. All reliant in someway on the whole.	As described EIS Section 3.3.2. (Avian Populations), no widely accepted method exists for predicting postconstruction avian fatalities from preconstruction use data, and the avian fatality rates presented in Table 3.3-12 are not intended to be precise estimates but are provided to allow for a meaningful comparison between alternatives. The estimated fatality rates in this table also do not account for the implementation of mitigation measures, which are expected to substantially reduce fatalities. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "available data from existing wind farms . . . had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the Lava Ridge Wind Project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for the Lava Ridge Wind Project." While it is likely that newer, larger turbines are underrepresented in the available data on bat fatality rates at existing U.S. wind energy facilities, there is currently no established relationship between bat fatalities and turbine height or rotor-swept area. Due the variability in fatality rates between sites and species, the EIS individually assessed special-status avian species for their risk of experiencing population-level impacts from collisions with operational turbines under the action alternatives. Four species (ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl) were determined to have a moderate to high risk of population-level impacts and are analyzed in detail in EIS Section 3.3.2. Species that were determined to be at low risk of population-level effects, including the American white pelican and several waterfowl and shorebird species, are analyzed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). EIS Section 3.3.2.1 discloses the potential for waterfowl and shorebird use of the siting corridors to be higher in particularly wet years when playas and vernal pools are inundated. Pelicans and other waterfowl have rarely been recorded as fatalities at existing U.S. wind energy facilities and have a low risk of colliding with operational turbines; thus, few fatalities would be expected under any of the action alternatives; see Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Impacts to avian habitat are addressed in Table App3-1 in EIS Appendix 3; see AIB-1.
12988-2	Melody Asher	DEIS 3.3.2.1 AFFECTED ENVIRONMENT I don't think that the affected areas environment (& what species may be impacted) was looked at close enough. The Milner-Gooding Recharge Site, Star Lake and all the ephemeral ponds, playas and lakes are very important for waterfowl during migration and in late winter and spring and very important for shorebirds mainly in the spring migration. We saw 60 Tundra Swans, multiple waterfowl species, mountain bluebirds (our state bird I} and multiple songbirds in addition to eagles and hawks that are in the area most of the year. This happened when much of the water was already gone at the recharge site and I expect many more numbers and species would most likely have been there a little earlier in the spring when the lakes were larger.	Two full years of avian use studies were conducted to evaluate temporal and spatial variation in avian use in the siting corridors, including seasonal variation in diurnal raptor use. The results of the first year of avian use surveys are summarized in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9 and in EIS Table 3.3-7. Detailed data from the first year of avian use studies are presented in the Avian use study (WEST 2021a), which was made available on the BLM project website during the draft EIS comment period; a link to the study is included in Section 3.3.2.1.1 (Avian Use in the Siting Corridors) in EIS Appendix 9. The results of the second year of avian use studies were not available prior to the publication of the draft EIS but have been incorporated into the final EIS. The results of both years of raptor nest surveys were also summarized in this section (see also Table 3.3-10). Section 3.3.2.1 (Avian Populations, Affected Environment) also discloses the potential for ephemeral surface water features in the siting corridors (i.e., playas and vernal pools) to provide migratory stopover habitat for waterfowl and other avian species when inundated.
12988-3	Melody Asher	DEIS 3.3.2.1.1 AVIAN USE IN THE SITING CORRIDORS Your DEIS data showed - "48 bird species were recorded during project avian use	As described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail), to comply with 40 CFR 1502.2(b) this EIS "has only [a] brief discussion of other than significant issues" and focuses on species with a

Comment ID	Commenter	Public Comment	Response to Comment
		surveys (WEST 2021a); an additional 24 bird species have been identified within 4 miles of the siting corridors (IDFG 2020).' We saw over 50 species on JUST ONE DAY very recently and most of the migrating songbirds, shorebirds, and summer breeding birds have not migrated here yet. I think you need to study this more.	moderate to high likelihood of population-level effects from turbine collisions. While many other species occur in the siting corridors, they do not meet the criteria for detailed analysis in the EIS described in this section.
12988-4	Melody Asher	Your DEIS says "Large diurnal raptors are generally considered to be at the greatest risk of population-level effects from turbine collisions (AWWI 2016; Choi et al. 2020; Erickson et al. 2014; Watson et al. 2018)" Ferruginous Hawk Your DEIS says "No ferruginous hawks were recorded during the winter (WEST 2021a)." This needs to be looked at more closely. It is not far to a roost that I personally have seen 20 or more Ferruginous Hawks (FEHA) all at one time and they roost there regularly. We have more FEHA here in the winter than any other season. They are a long-lived species which makes them more vulnerable. More study on the FEHA use and on the impacts on Buteos (including FEHA) needs to be done. I don't want to see even less numbers of FEHA in Idaho.	Although ferruginous hawk use was not observed in the siting corridors during winter in the first year of avian use studies (WEST 2021a), two ferruginous hawks were recorded in winter of the second year of avian use studies (WEST 2023). EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) has been updated with the information form the second year of avian use studies. This section also discloses the presence of a small over-wintering population of ferruginous hawks in southern Idaho based on the information in IDFGs SWAP (IDFG 2017). The ferruginous hawk's long lifespan and low reproductive contributed to the decision to analyze this species in detail in the EIS and develop additional mitigation measures to ensure that the action alternatives do not adversely impact the species population in BCR 9; see EIS Section 3.3.2.2 (Avian Populations, Impacts) and EIS Appendix 4 (Mitigation).
12988-5	Melody Asher	Long-Billed Curlew Your DEIS says "Alternative B could result in more long-billed curlew fatalities than the other action alternatives because it would have the most bird fatalities overall. Although the available data suggest that few long-billed curlew fatalities would occur, few of the facilities studied are within the long-billed curlew's breeding range and, for this reason, more fatalities could occur than expected. Considering that Idaho supports as much as 31% of the long-billed curlew population in BCR 9 (American Bird Conservancy 2013) and that the species may use siting corridors during spring migration (when juveniles and subadults disperse to new territories), fatalities resulting from collision with operational turbines could adversely affect the long-billed curlew population in BCR 9. This would especially apply when the impact of numerous facilities across the landscape is considered (see Section 3.3.2.2.6 [Cumulative Impacts])." We saw almost 40 Long-Billed Curlew (LBCU) on this one day. They are definitely in the area and are a Tier 2 Greatest Conservation Need, Type 2 BLM Sensitive Species and they need protected and more loss of habitat would be detrimental.	See EIS Appendix 4 (Mitigation) for a description of mitigation measures; as described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), MVE would complete a minimum of 2 years of postconstruction monitoring (applicant-committed measure 150 in Appendix 4) to assess the actual long-billed curlew fatality rate and to determine which adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce long-billed curlew fatalities, if any.
12988-6	Melody Asher	Short-Eared Owl Your DEIS says "Alternative B could result in more short-eared owl fatalities than the other action alternatives because it would have the most bird fatalities overall. Although short-eared owl fatalities are relatively uncommon at existing U.S. wind energy facilities, breeding males may be susceptible to turbine collisions when engaging in mating displays. Given that project raptor nest and avian use surveys were not designed to assess short-eared owl use or nesting, the species is likely underrepresented in the project survey data, and short-eared owl use and nesting in the siting corridors may be higher than the data suggest; thus, more fatalities may occur than expected. Because the short-eared owl population in BCR 9 is small and declining, the possibility that fatalities from collision with operational turbines could adversely affect their population in BCR 9 cannot be ruled out. This would especially apply when the impact of numerous facilities across the landscape is considered (see Section 3.3.2.2.6 [Cumulative Impacts])." After looking around the other day and having done Short-Eared Owls (SEOW) surveys along Highway 24 in the area (and SEOW are present) I would encourage more study. I really would not like to see SEOW numbers go even lower in our area.	Because the avian use surveys (WEST 2021a, 2023) did not target owls, mitigation measures for short-eared owls were modified and expanded in the final EIS; these include preconstruction surveys for short-eared owl nests and avoidance buffers for active nests. Additionally, MVE would complete a minimum of 2 years of postconstruction monitoring (applicant-committed measure 150 in Appendix 4) to assess the actual short-eared owl fatality rate and, if high fatality rates are observed, to determine which adaptive management measures in the BBCS (applicant-committed measure 157) need to be implemented to reduce short-eared owl fatalities. Additional monitoring would be required to assess the effectiveness of adaptive management measures and determine whether there are unresolved or residual impacts that warrant compensatory mitigation; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the USFWS Land-based Wind Energy Guidelines (USFWS 2012).
12988-9	Melody Asher	DEIS Table 3.3-3 {page 3-66) Summary of Vear 1 Avian Use Studies I did not see a section on sagebrush obligates except this table (& maybe these species that I am listing are not totally sagebrush obligates but they are all very dependent on sagebrush steppe habitat). This loss of habitat (mainly will impact many sagebrush obligates: Sage Thrasher, Sagebrush Sparrow, Savannah Sparrow, & Brewer's Sparrow (an especially sensitive species). I am probably forgetting some species. There are other species that use sagebrush heavily: Loggerhead Shrike, Northern Shrike, Mountain Bluebirds, Long-Billed Curlew, Red-Tailed Hawk, Prairie Falcon, Gray Flycatcher, White-Crowned Sparrow, and Vesper Sparrow. As far as I could tell these bird species were not given much consideration in the DEIS. We (BLM) has spent money on prescribed fires that are for brewer's sparrows so I think that we should at least study the use for more than one year.	Impacts to avian habitat are analyzed in brief Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-1. See Table App3-3 in EIS Appendix 3 for avian species analyzed in brief.
13008-7	Scott Hauser	Section 2.3 of Appendix M, Aquatic Resources states, "There are no Important Bird Areas (IBA) within the Project area; however, Craters of the Moon National Monument and Preserve occurs in northern Lincoln and Minidoka counties, approximately nine miles from the Project area. This IBA is designated as globally important due to its high diversity of birds and high-quality migrating, breeding, and wintering habitat." This is a concerning statement for many reasons. First, many areas that are ideal for wind energy development are also ideal migratory corridors for bird migration. Wind power and bird migratory corridors both rely on wind. The suggestion that nine miles is adequate is concerning. Nine miles is an extremely small distance when considering that bird migration often covers thousands of miles. Though the project area is not listed as an important bird area, bird migration is considered extremely important and should be adequately addressed, especially when the construction of wind turbines has the potential to impact migratory species.	A description of the CRMO IBA had been added to EIS Section 3.3.2.1 (Avian Populations, Affected Environment). The analysis area for impacts to avian populations is BCR 9, which includes the CRMO IBA. Therefore, the effects described in Section 3.3.2.2 (Avian Populations, Impacts) account for effects to avian populations that use the CRMO IBA. Additional quantitative analysis of impacts to local avian populations is not possible due to the lack of publicly available scientific data.
13008-8	Scott Hauser	Table 7 in Appendix M is misleading. The numbers in this table are quite low. Lava Ridge has the potential of killing as many as 13,250 birds per year, though the average will likely be somewhere between 2,736 and 3,648. The table should reflect estimates for Lava Ridge rather than ratios that are misleading.	Table 7 of the BBCS (Appendix M in MVE [2023]) presents a summary of fatality rates observed at existing U.S. wind energy facilities in the Renew Database. Estimated avian fatality rates by alternative are presented in EIS Table 3.3-12.
13008-9	Scott Hauser	Additionally, pertaining to bird fatalities in section 6.3, the long-term monitoring states that a bird fatality rate will be established. However, it is unclear what the next steps are. There is considerable discussion on conservation of Eagles (Appendix T) and Greater Sage-grouse (Appendix U), but little consideration is given to bats and other bird	Section 6.3 of the BBCS (Appendix M in MVE [2023]) describes long-term monitoring, in the form of a Wildlife Incidental Reporting Strategy, that would be implemented in addition to the postconstruction fatality monitoring

Comment ID	Commenter	Public Comment	Response to Comment
		species that frequent that area. Can BLM provide details on what are the next steps if the project is determined to have a high bird fatality rate? There needs to be further discussion or consideration for other bird species and bats.	studies described in Section 6.1 of the BBCS. See EIS Appendix 4 (Mitigation) for a complete description of mitigation including postconstruction fatality monitoring and adaptive management measures.
13008-17	Scott Hauser	Further, construction operations lead to multiple impacts on birds and other wildlife. For instance, most birds are highly sensitive to noise and light pollution. Other species development, reproduction, and migrations can be altered by light pollution at night. It is highly concerning that these impacts are inadequately addressed in the DEIS.	Impacts to avian species from noise are analyzed in brief in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-2; impacts to avian species from project lighting are described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) and EIS Appendix 3; see AIB-5.
13011-2	Ron Yates	The EIS does not assign accountability to the Lessee in fines, (dollars) or an order mandating restoration for the death of birds of prey, that are residents to the area or those which may be migrating, migratory waterfowl or resident birds without hunting seasons. A 5-16-2013 news article relating to wind turbines in Converse County, Wyoming is attached. The article lists a number of birds known to be killed by wind turbines at the time. Today, 10 years later, where is the nationwide accountability? Habitat within the proposed Lava Ridge area presently has a balance of prey and birds of prey, any loss of eagles, hawks or owls will be difficult to replace. How will the BLM assess fines to the Lessee? How will the BLM require the Lessee to prevent the death of birds by their wind turbines?	See EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) for a discussion of mitigation measures that would be implemented to minimize or avoid impacts to avian species; potential compensatory mitigation measures are described in EIS Appendix 4 (Compensatory Mitigation Actions in the Mitigation Framework for Birds and Bats).
13012-8	Heather Saunders	My concerns regarding the actual operation of the turbines follow along the usual lines. Bird strikes is a big one, but only because we have so many raptors. I realize the claim is that wind turbines are usually hit by smaller birds flying in flocks. But I live less than 10 miles from the northern portion of that site and I can tell you for a fact that we have hundreds of raptors everywhere. I've seen as many as 50 hawks at a time hunting a field for mice. The hawks, falcons and eagles have raptor parties over my farm the second week of every September; we'll have as many as 30 birds in the air doing touch-n-go maneuvers in the trees. In the winter it's Great Horned Owls; they like to take over the hawk nest when the hawks aren't using it. And it's not just raptors. I spent the past few weeks also watching huge flocks of migrating swans flying over Richfield. And I happen to be aware of a seasonal pond located on Deadman's Curve (about mile marker 175 on US26/US93) very close to the northern end of the Lava Ridge area that attracts large flocks of migrating swans every spring. I already know what a turbine can do to a swan, but how big a bird hit does it take to damage a turbine?	As described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail), large diurnal raptors are generally considered to be at the greatest risk of collisions with operational turbines. The EIS individually assessed special-status avian species for their risk of experiencing population-level impacts from collisions with operational turbines under the action alternatives. Four species (ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl) were determined to have a moderate to high risk of population-level impacts and are analyzed in detail in EIS Section 3.3.2. Species that were determined to be at low risk of population-level effects, including the trumpeter swan and several other large waterfowl, are analyzed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Great horned owls are not addressed in the EIS because the species does not carry a special-status designation in Idaho, and thus, is considered to have a relatively large and stable population that is unlikely to be impacted by fatalities from collisions with operational turbines. See EIS Section 3.3.2.1 (Avian Populations, Affected Environment) for a summary of MVE's avian use studies (WEST 2021a, 2023); the final EIS has been updated to include the results of the second year of study. This section also describes the presence of surface waters that may be important to migrating birds in the vicinity of the siting corridors and discloses the potential for ephemeral surface water features in the siting corridors (i.e., playas and vernal pools) to provide migratory stopover habitat for waterfowl and other avian species when inundated. The final EIS has been revised to describe how measures to avoid or minimize impacts to surface waters, including intermittent and ephemeral features, would indirectly benefit avian species. Wind turbine failures are typically the result of operational error, structural damage, lightning damage, manufacturing, defects, and fires. While bird strikes can damage wind turbines, relatively few wind turbine failures are attributed surface damage, and most surface damage is caused by long-term wind and rain erosion (Mishnaevsky 2022). Mishnaevsky, L. 2022. Root causes and mechanisms of failure of wind turbine blades: overview. Materials 2022(15):2959–2987.
1618-4	Brian Olmstead	The EIS is severely deficient in impacts to ducks and geese. The Milner Gooding Canal has been one of my favorite duck hunting areas for over 50 years. Will they like the turbines, No! Will they be killed by the turbines, Yes. Do ducks and Geese fly in bad weather and at night, Yes! Will they respect the zones they should not fly through? No! Will the flashing lights confuse and disorient them? Yes! If the lights are turned off at night will the Geese see and avoid the killing blades? All these concerns also apply to hawks, owls, hummingbirds, swans, etc. As a member of the Idaho Water Resource Board I drive out to the Mile Post 31 and 29 recharge sites at least a couple of times each year. Beautiful managed lake/wetlands that Idaho built with great cooperation from you at BLM. I have personally seen and can send you pictures of hundreds of waterfowl including protected swans on those lakes. They also are not adequately addressed in the DEIS. In my opinion, all of these impacts to avian species are glossed over by all of the documents LS Power has submitted.	The analysis in EIS Section 3.3.2 (Avian Populations) focuses on those species with a demonstrated risk of significant effects from wind energy development in the region, as described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail). Additional species-specific analysis is provided in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief).
2097-1	Susan DeCamp	How are you adapting the wind turbines to avoid killing birds? To be sustainable - the project must mitigate bird losses by utilizing the latest radar and other technologies. The investment will be well worth it - with many endangered species relying on open land in Idaho, Montana and Washington. Bald eagles migrate through this area every year. Hundreds of thousands of birds are killed by wind turbines annually. It's time to make the turbines safe and sustainable for all God's creatures.	EIS Section 3.3.2.2.2 (Avian Populations, Alternative B) describes the measures that would be implemented to minimize or avoid impacts to avian populations from turbine collisions. A complete list of mitigation measures is provided in EIS Appendix 4 (Mitigation).
2314-3	Mike Tylka	Bats and birds. The desert ecosystem is very fragile. Bats and birds continue to be a significant part of this overall ecosystem and it is impossible to predict how many of these creatures will be killed due to the construction taking place and the turbine system after operation begins. Therefore, why risk sacrificing any of the identified or non-identified species? The mortality rate of avian species around existing wind turbines has historically proven to be very high. Especially endangered birds are raptors, which typically soar in that area.	As stated in the analysis assumptions in EIS Section 3.3.2 (Avian Populations), "Although the avian use surveys (WEST 2021a, 2023) were used to determine the species that may be present in the siting corridors and their seasons of use, the risk of fatalities from turbine collisions varies among species due to factors such as flight characteristics, type of prey, and habitat use. Thus, avian use observed prior to construction may not correlate directly to fatality rates after construction (WEST 2011). Given this, the species composition of fatalities observed at other western United States wind facilities was considered when determining collision likelihood and the magnitude of the effect on each species' population." Similar assumptions are described for bats in EIS Section 3.3.1 (Bat Populations and Roosting Habitat). As described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail), large diurnal raptors are generally considered to be at the greatest risk of collisions with operational turbines. The EIS individually assessed special-status avian species for their risk of experiencing population-level impacts from turbine collisions. Four species (ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl) were determined to have a moderate to high risk of population-level impacts and are analyzed in detail in EIS Section 3.3.2. Species that were determined to be at low risk of population-level effects are analyzed in Table App3-3 in EIS

Comment ID	Commenter	Public Comment	Response to Comment
			Appendix 3 (Issues Analyzed in Brief). Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian and bat fatality monitoring to assess fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).
2695-1	Jill Mckay	Did the EIS address the impact of project to local and migratory birds?? This must be addressed.	See EIS Section 3.3.2 (Avian Populations) for a discussion of potential impacts to avian populations, additional analysis is provided in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief); eagles are discussed in Section 3.3.3 (Eagles) and greater sage-grouse are discussed in Section 3.3.4 (Greater Sage-Grouse).
2915-2	Roger Twitchell	My primary criticism of the analysis of impacts to avian species is that the studies referenced cover a very short period of time, from about 2014 to 2022. The DEIS does not set a historic context for current populations/numbers. Large fluctuations in avian populations take place over long periods of time, several decades at least. These fluctuations, population booms and busts are probably normal. But if new threats such as wind turbines, maybe west-wide, are placed in nesting habitat, migration ways and seasonal gathering areas during low or "normal" population periods then one more barrier is placed on any population increase. Do so called normal, average or recently observed population levels depend on the periodic booms or apex numbers to sustain a species? Swainson's hawks periodically gather in the Mud Lake area, sometimes in large numbers. This is in relatively close proximity to the MVE project area. I see no treatment of the Swainson's hawk in the DEIS or appendices. Neither do I see any treatment of Prairie falcons or Arctic owls. If they have never been observed in or near the project area it should be so stated.	As described in the list of data sources in EIS Section 3.3.2 (Avian Populations), the primary sources considered in determining past trends and the current status of avian populations are Partners in Flight (2022) and Sauer et al. (2019). Both of these databases use data collected by The North American Breeding Bird Survey program, which is a continent-wide program that has been collecting data on avian populations since 1966. In addition to MVE's avian use studies (WEST 2021a, 2023), the BLM also reviewed data from IDFG and publicly reported observations on eBird (2024) to identify avian species with the potential to occur in the siting corridors. Swainson's hawk is briefly discussed in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) but did not meet the criteria for detailed analysis in EIS Section 3.3.2.2 (Avian Populations, Impacts) or abbreviated analysis in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief) because it does not carry a special-status designation in Idaho, and thus, is considered to have a relatively large and stable population that is unlikely to be impacted by fatalities from collisions with operational turbines. The prairie falcon is excluded from the EIS due its lack of a special-status designation in Idaho. The snowy owl was not included in Table App3-3 because of the lack of confirmed records within the siting corridors and immediate vicinity, this species has been added to Table App3-3 in the final EIS.
2926-1	Mark Southwick	SWAC Environmental Consultants did not include our property in their aviary study, but offer general research losses and impact from outside data sources. Are the Swainson's Hawks and Owls we enjoy being overlooked and a part of the acceptable losses put forth in the Environmental Impact Study?	See EIS Section 3.3.2.2 (Avian Populations, Impacts) for a discussion of potential impacts to the short-eared owl and western burrowing owl; avian species analyzed in brief, including the flammulated owl, can be found in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). As described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail)." Relatively large increases in mortality (as many as 5,000 additional deaths per year) do not appear to threaten the range-wide populations of raptors with larger, more stable populations such as red-tailed hawk and Swainson's hawk, and smaller, local populations (i.e., within a BCR) may not experience population-level effects from this level of mortality either (Conkling et al. 2022)."
2939-2	George Solverson	Furthermore, the dismissive conclusion that the estimated persistent death of bats and birds caused by this project will not be as bad as all other know anthropomorphic causes of decline is not a persuasive argument in support of adding to the problem.	As described in EIS Section 3.3.2.1.2 (Avian Populations, Existing and Future Trends and Actions), "Although the expansion of wind energy may not be the primary driver for the decline of most avian species, fatalities from turbine collisions exacerbate other impacts that have led to these declines and are becoming an increasingly important source of avian mortality. For species that are already declining, and for species with low reproductive rates, even a relatively small increase in the fatality rates could have a significant impact on their populations in the analysis area." Also see EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts), which states, "It is also important to note that wind energy results in an estimated 0.269 avian fatality per gigawatt-hour (GWh) of energy produced, whereas nuclear power causes an estimated 0.416 avian fatality per GWh, and traditional fossil fuel energy causes 5.18 avian fatalities per GWh (Sovacool 2013). Thus, alternatives with lower generation capacities could result in greater impacts to avian populations if other types of energy generation are used to satisfy the demand for electricity that would have been generated under alternatives with higher generation capacities."
3037-1	Cameron Stauffer	Evaluating the EIS for Lava Ridge Wind Project brings up concerns for local bird populations. The studies are dating back to 2016, and do not account for the increase of turbines up to the current time	As described in Section 3.3.2.2.2, "The estimated avian fatality rate used in this EIS (and detailed below) was based on available data from existing wind farms, which had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the Lava Ridge Wind Project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for the Lava Ridge Wind Project. Thus, the estimated avian fatality rates used in this EIS account for variability in the RSH."
3102-1	Patrick Cowan	The Erickson et.al. numbers are inappropriately used by proponents to bolster their claims that preconstruction avian surveys are an unnecessary expense.	In addition to the 2 years of avian use surveys, MVE conducted 2 years of raptor nest surveys, and 2 years of greater sage-grouse lek surveys (WEST 2020 through 2023). As described in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail), the Erickson et al. (2014) study supports the conclusion that most small passerine species are at low risk of experiencing population-level impacts from fatalities due to collisions with operational turbines; AWWI (2016) and Choi et al. (2020) reached similar conclusions. This section also discusses recent modeling indicating the potential for some small passerines to experience population-level impacts; however, none of the species Conkling et al. (2022) found to be vulnerable to fatalities at wind energy facilities occur in the siting corridors. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the USFWS Land-based Wind Energy Guidelines (USFWS 2012).
3230-1	Gary Carney	Each blade travels at speeds over 200 mph. This means any bird traveling through just one windmill footprint will face 3 blades traveling at death speeds every 3 seconds. It would be easier for a pedestrian to cross the track at the Daytona 500 than it would be for a bird to pass through just ONE windmill....and there are hundreds of windmills. This	Estimated avian fatality rates for each of the action alternatives, before the implementation of mitigation measures, are presented in Table 3.3-12 in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B). Additional species-specific discussion is provided in this section and in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). EIS Section

Comment ID	Commenter	Public Comment	Response to Comment
		is going to have severe effects on our migratory birds. Our area sees great patterns in migratory birds. Geese, ducks, sandhill cranes, pelicans, eagles, and other raptors will be decimated in this disaster. The Minidoka Wildlife Refuge There has been an extreme lack of due diligence on this issue and needs to be addressed through proper wildlife ecologists.	3.3.2.1 (Avian Populations, Affected Environment) describes habitat features important to migrating avian species in the siting corridors and surrounding vicinity; additional details on avian use in the siting corridors are provided in Section 3.3.2.1.1 (Avian Populations, Avian Use in the Siting Corridors) in EIS Appendix 9. Minidoka National Wildlife Refuge is more than 18 miles east of the nearest siting corridors and would not be directly impacted by any of the action alternatives. EIS Section 3.3.2.1 and Section 3.3.2.1 in EIS Appendix 9 describe the presence of surface waters that may be important to migrating birds in the vicinity of the siting corridors and discloses the potential for ephemeral surface water features in the siting corridors (i.e., playas and vernal pools) to provide migratory stopover habitat for waterfowl and other avian species when inundated. Therefore, additional discussion of Minidoka National Wildlife Refuge would not lead to a more informed analysis. AIB-1 in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief) has been revised to describe how measures to minimize or avoid impacts to surface waters, including intermittent and ephemeral features, would indirectly benefit avian species.
3405-1	Susan Laatsch	Has anyone thought of maybe Painting the Blades other than White ??? so Birds might see the blades & turn away. maybe a big red & yellow checker board ??? Can Birds See Colors??	As described in EIS Section 2.9.5 (Alternative Components), “BLM evaluated painting one turbine blade black on each turbine because this has been documented to reduce bird fatalities by 70% in Europe (May et al. 2020). However, this would not comply with FAA standards (FAA 2020).” See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures that would be implemented to minimize or avoid impacts to avian populations from turbine collisions.
3997-3	Angelee Eames	3. Any wind energy project that has existed has killed birds-towers of this size will kill 16.5 eagles and other large raptors per year. How will the population thrive if that many die every single year. 30 years of the deaths of these birds could lead to extinction? 10,200-17,799 of all birds per year for thirty years-how many will be killed by turbines?	See EIS Section 3.3.2 (Avian Populations) for a discussion of impacts to avian populations; estimated fatality rates for all avian species and diurnal raptors alone are provided for each alternative in Table 3.3-12. Eagles are discussed in EIS Section 3.3.3 (Eagles).
4220-3	Sue Page	Same as being told the bird migratory path was only reviewed for a few hours a day once a month? Really?! Bats and owls fly at night so they weren't even considered? No study was done on the hummingbirds we all get excited to see and feed as they move through the Magic Valley. No study!!? These little birds can fly as high as 500 feet and could get sucked into these turbines. Not acceptable Furthermore they will be allowed to kill eagles thanks to a permit created by the Obama administration in 2016. Don't kill our birds like what was done at the Alta Wind Energy Center in California. (This was the largest slaughtering of birds in the world because the time wasn't taken to review the migratory paths of flying creatures.)	In addition to the 2 years of avian use surveys, MVE conducted 2 years of raptor nest surveys, and 2 years of greater sage-grouse lek surveys (WEST 2020 through 2023). The calliope hummingbird is the only special-status hummingbird that occurs in the siting corridors and is addressed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Other hummingbird species may occur in the siting corridors but did not meet the criteria for inclusion in the EIS because they do not carry a special-status designation in Idaho, and thus, are assumed to have relatively large and stable populations. MVE is pursuing an eagle ITP in accordance with the Final Programmatic EIS for the Eagle Rule Revision (USFWS 2016a), which is being evaluated in a separate NEPA analysis being conducted by the USFWS (see Section 3.3.3 [Eagles]). In addition to the mitigation measures for eagles presented in the EIS (see EIS Section 3.3.3.2.2 [Eagles, Alternative B] and EIS Appendix 4 [Mitigation]), the USFWS would require eagle fatality monitoring and, possibly, compensatory mitigation if an eagle ITP is issued; see EIS Section 3.3.3.2.2 and 3.3.3.4 (Compensatory Mitigation). While the siting of the Altamont Pass wind facility likely contributed to the high avian fatality rates observed, the use of older, lattice-tower turbines was the primary reason for high avian fatality rates. The study by Smallwood and Karas (2009), which is also referenced in EIS Section 3.3.2.2.2 found strong evidence that replacing lattice tower turbines with monopole turbines could significantly reduce fatalities of all birds, and Krigsveld et al. (2009) reached a similar conclusion. s described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), “The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project.” A number of other measures that would be implemented to minimize or avoid impacts to birds are described in EIS Section 3.3.2.2.2 and EIS Appendix 4 (Mitigation).
4966-3	Brinya Olmstead	I also read in the draft eis that approximately 1 bald eagle and 13 golden eagles will be killed each year by these windmills. This should also include the immeasurable number of other birds that will die due to habitat loss.	See EIS Section 3.3.2 (Avian Populations) for a discussion of impacts to avian populations; estimated fatality rates for all avian species and diurnal raptors alone are provided for each alternative in Table 3.3-12.
5231-1	Jennifer Pfeil	It will destroy the complex ecosystem of birds of prey and insects negatively affecting the habitat. For more information regarding this harm, please review: Wind Energy’s Impact on Birds, Bats, and Insects | Wind Energy Impacts and Issues (wind-watch.org) <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.wind-watch.org%2Fdocuments%2Fwind-energys-impact-on-birds-bats-and-insects%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cf05dc59761184e04897b08db1f150093%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638137947281474076%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=bB2aGsMrdclfPOlVzOpeLquHvsRrxAv%2Fc83HPBlP2yU%3D&reserved=0>	Impacts to bats are described in EIS Section 3.3.1 (Bat Populations and Roosting Habitat); impacts to birds of prey and other avian species are described in EIS Section 3.3.2 (Avian Populations), EIS Section 3.3.3 (Eagles), and EIS Section 3.3.4 (Greater Sage-Grouse); impacts to pollinators and other insects are described in EIS Section 3.11 (Pollinators and Insects). The article referenced in the comment (McPherrin 2023) does not present any new data or information that has not already been considered in the EIS. McPherrin, J. 2023. Wind Energy’s Impact on Birds, Bats, and Insects. National Wind Watch. Available at: https://www.wind-watch.org/documents/wind-energys-impact-on-birds-bats-and-insects/. Accessed December 29, 2023.
5700-1	Gar and Mary Lorain	3-58. How could one determine the impacts to avian species on something that hasn’t happened and has never been studied like these new huge windmills? The EIS admits to that. They debunk their own statement that avian fatalities would be the same as other projects admitting they don't know. This proposed facility is in a major migratory corridor, the Snake River. It is very easy for any of these migratory birds, often in large flocks, to stray from the river to the impact area and it happens differently from year to year. One to two years of study is not near enough to assess this impact. 3-65 and 66. My experience with 11 years of raptor surveys shows that great horned owls move their nests significantly over time. I was very surprised at that so one to two seasons of nest surveys is not near enough to determine the total impact. This observation is from a lot of experience in similar habitats to the project area both in	As described EIS Section 3.3.2. (Avian Populations), no widely accepted method exists for predicting postconstruction avian fatalities from preconstruction use data, and the avian fatality rates presented in Table 3.3-12 are not intended to be precise estimates but are provided to allow for a meaningful comparison between alternatives. The estimated fatality rates in this table also do not account for the implementation of mitigation measures, which are expected to substantially reduce fatalities. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), “available data from existing wind farms . . . had turbines with a mean blade height of 557 feet; this falls between the minimum (545 feet) and maximum (740 feet) blade heights proposed for the Lava Ridge Wind Project. The largest turbines included in the available data had blade heights that were slightly taller than the largest turbines proposed for

Comment ID	Commenter	Public Comment	Response to Comment
		my official surveys and as an interested raptor observer for 50 years. [...] I know through personal observations in the desert south of Boise that ferruginous hawks do winter in Southern Idaho yet they are bareley mentioned. [...] Monitoring for only two years is drastically inadequate. This statement applies to all concerned species plus others not even mentioned which may not have been observed in a two-year window, but may come along at some point. Examples that come to mind are snowy owls and great gray owls which can pop up in unusual places in Idaho. [...] 3-65 to 68. I don't think rough legged hawks were even mentioned in the EIS and I think this is a big oversight as Idaho provides very important habitat for these species in the winter time. [...] Another species that was ignored in the EIS are swainsons hawks. I am sure they must occur in the project area as they have really increased in the Treasure Valley over the past five years. They seem to thrive in this agricultural and desert environment similar to the project area. [...] What about long and long eared owls, screech owls and barn Owls. Not much is mentioned of any of these species and I am sure all of them occur in the project area.	the Lava Ridge Wind Project." While it is likely that newer, larger turbines are underrepresented in the available data on bat fatality rates at existing U.S. wind energy facilities, there is currently no established relationship between bat fatalities and turbine height. Due to the variability in fatality rates between sites and species, the EIS individually assessed special-status avian species for their risk of experiencing population-level impacts from wind energy development. Four species (ferruginous hawk, long-billed curlew, short-eared owl, and western burrowing owl) were determined to have a moderate to high risk of population-level impacts from wind energy development and are analyzed in detail in EIS Section 3.3.2. Species that were determined to be at low risk of population-level effects are analyzed in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief). Although ferruginous hawk use was not observed in the siting corridors during winter in the first year of avian use studies (WEST 2021a), two ferruginous hawks were recorded in winter of the second year of avian use studies (WEST 2023). EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) has been updated with the information form the second year of avian use studies. This section also discloses the presence of a small over-wintering population of ferruginous hawks in southern Idaho based on the information in IDFGs SWAP (IDFG 2017). In addition to the avian use surveys, MVE conducted 2 years of raptor nest surveys (WEST 2020, 2021b), the results of which are summarized in Table 3.3-10. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project." A number of other measures that would be implemented to minimize or avoid impacts to birds are described in EIS Section 3.3.2.2.2 and EIS Appendix 4 (Mitigation). Swainson's hawk is briefly discussed in EIS Section 3.3.2.1.1 (Avian Populations, Species Analyzed in Detail) but did not meet the criteria for detailed analysis in EIS Section 3.3.2.2 (Avian Populations, Impacts) or abbreviated analysis in Table App3-3 in EIS Appendix 3 (Issues Analyzed in Brief) because it does not carry a special-status designation in Idaho, and thus, is considered to have a relatively large and stable population that is unlikely to be impacted by fatalities from collisions with operational turbines. The prairie falcon, barn owl, western-screech owl, and rough-legged hawk are also excluded from the EIS due their lack of a special-status designation in Idaho. The long-eared owl, great gray owl, and snowy owl were not included in Table App3-3 because of the lack of confirmed records within the siting corridors and immediate vicinity but have been added to Table App3-3 in the final EIS.
6081-1	Ceil Slauson	A recent study from the Norwegian Institute for Nature Research might offer a solution to fears of bird strikes. Researchers compared bird mortality rates over five years at a Norwegian wind farm and then randomly selected four out of the 68 turbines for a new paint job. They found that painting a single wind turbine blade black could reduce bird fatalities by 72%, and it was most effective at reducing collision deaths for birds of prey, such as white-tailed eagles (Haliaeetus albicilla).	As described in EIS Section 2.9.5 (Alternative Components), "BLM evaluated painting one turbine blade black on each turbine because this has been documented to reduce bird fatalities by 70% in Europe (May et al. 2020). However, this would not comply with FAA standards (FAA 2020)." See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures that would be implemented to minimize or avoid impacts to avian populations from turbine collisions.
6373-1	Sharon Pratt	Paint at least one arm black or a dark blue or brown to save the birds.	As described in EIS Section 2.9.5 (Alternative Components), "BLM evaluated painting one turbine blade black on each turbine because this has been documented to reduce bird fatalities by 70% in Europe (May et al. 2020). However, this would not comply with FAA standards (FAA 2020)." See EIS Appendix 4 (Mitigation) for a complete list of mitigation measures that would be implemented to minimize or avoid impacts to avian populations from turbine collisions.
6820-2	Chris Callen	The Windmills kill 1000's of birds especially Eagles and Hawks, why is it OK for these wind turbine projects to kill protected birds but if anyone else does it there are fines and possible jail time. I do not believe we should let these killers of our, Idahos Hawks and Eagles to be allowed to destroy and kill.	Compliance with the MBTA is discussed in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B). As described in EIS Section 3.3.3.4 (Eagles, Compensatory Mitigation), "The USFWS will be responsible for making a decision on MVE's eagle ITP application and determining any compensatory mitigation necessary to address incidental take arising from collisions with turbines."
6885-1	Louis Zamora; Twin Falls Canal Company	I have wildlife concerns with the EIS. With number of proposed projects in Southern Idaho (Lava Ridge, Salmon Falls, Taurus. and others) I believe the EIS should have encompassed the whole Southern Idaho Region. An eagle, hawk, goose, duck and other migrating birds could be at Salmon Dam one day off to Hagerman the next and maybe over to Idaho Falls the following. The Hagerman Valley has massive number of migratory birds flying in and out of it every day. The amount of bird kills with all the projects combined would be staggering and, in my opinion, would jeopardize wildlife populations.	The analysis area for avian populations and eagles both include southern Idaho; for additional details, see EIS Section 3.3.2 (Avian Populations) and EIS Section 3.3.3 (Eagles), respectively. Cumulative effects to avian populations and eagles, including other proposed wind energy projects are discussed in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts) and EIS Section 3.3.3.2.7 (Eagles, Cumulative Impacts), respectively.
7403-1	Jewel Vieu	This is to express my opposition to the Lava Ridge Project AND any future wind farms in Idaho. There are many negative impacts to address regarding this proposed wind farm, but I have been advised to stick to one issue. The fact that there needs to be an "acceptable" number of kills of Bald Eagles, (.56/year), to Golden Eagles, (13.3/year), to bats, (15,000/year), leads me to have a very negative opinion of the 740-foot-tall windmills. Why is a total avian kill of 17,791 considered acceptable? What is the "compensatory mitigation" that may be required if adaptive management measures are unsuccessful at reducing avian fatalities? If the birds are dead, they are dead. The fact is that Eagles and many bats are protected by law, how can any number be allowable much less acceptable? Post construction	As stated in EIS Section 3.3.1 (Bat Populations and Roosting Habitat) and EIS Section 3.3.2 (Avian Populations), the estimated avian and bat fatality rates presented in Table 3.3-4 and Table 3.3-12 are not intended to be precise predictions but are presented to allow for a meaningful comparison between the alternatives. These fatality estimates also do not account for the implementation of mitigation measures that would be implemented to minimize or avoid impacts to bats and birds; see EIS Section 3.3.1.2 (Bat Populations and Roosting Habitat, Impacts), EIS Section 3.3.2.2 (Avian Populations, Impacts), and EIS Appendix 4 (Mitigation). A bat fatality rate of 15,496 bat fatalities per year and avian fatality rate of 17,799 birds per year represents a worst-case scenario for the maximum generation

Comment ID	Commenter	Public Comment	Response to Comment
		monitoring would assess the actual avian fatality rate. A bit late, when the birds are dead, they are dead. Please do not approve the Lava Ridge Wind Project, or any other wind farm project in the Great State of Idaho.	capacity under Alternative B, which is the highest generation capacity under any action alternative. These fatality rates would only be expected if the facility had been very poorly sited and none of the mitigation measures listed in EIS Appendix 4 were implemented. These maximums are presented in the EIS to provide the context needed for a meaningful comparison between alternatives and the development of mitigation strategies. As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), "The project has been sited outside of major flyways for migratory birds; features that concentrate raptor migration (such as prominent ridgelines) are not present. In coordination with the BLM and USFWS, MVE has adjusted the siting corridors to avoid or minimize the placement of infrastructure in areas known to be occupied by avian species of concern (e.g., golden eagle [Section 3.3.3] and greater sage-grouse [Section 3.3.4]). . . . Turbines have been sited to reduce the risk of avian collisions (applicant-committed measures 136 and 138 to avoid occupied golden eagle and ferruginous hawk nests and to avoid riparian areas and wetlands to the extent practicable). Proper facility and turbine siting can lead to lower avian fatality rates, as would be expected for the Lava Ridge Wind Project." As described in EIS Section 3.3.1.1 (Bat Populations and Roosting Habitat), the siting corridors lack substantial roosting habitat for bats and are located in area of low summer bat occupancy. Though bat activity in the siting corridors is highest during the fall migratory period, the siting corridors lack forested and riparian habitats preferred by migrating bats and there is no indication that the siting corridors are located within a major bat migratory corridor. Thus, it is expected that fatality rates would be closer to the mean avian and bat fatality rates presented in Table 3.3-4 and Table 3.3-12 if adaptive management measures such as curtailment and acoustic deterrents were not implemented. Due in part to the uncertainty in quantifying fatality rates prior to construction, proposed mitigation measures include postconstruction avian and bat fatality monitoring to assess fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012) which were developed to provide wind developers with a system to evaluate potential impacts on species of concern and to avoid costly mitigation or potential criminal liabilities and fines (Rose 2015). MVE is pursuing an eagle ITP in accordance with the Final Programmatic EIS for the Eagle Rule Revision (USFWS 2016a), which is being evaluated in a separate NEPA analysis being conducted by the USFWS (see Section 3.3.3 [Eagles]). There is currently no formal system in place to permit incidental take of bat species resulting from the operation of a wind energy facility because there are currently no laws or regulations in place that prohibit incidental take of bats. Compensatory mitigation for bats and avian species is described in EIS Section 3.3.1.4 (Bat Populations and Roosting Habitat, Compensatory Mitigation), EIS Section 3.3.2.4 (Avian Populations, Compensatory Mitigation), EIS Section 3.3.3.4 (Eagles, Compensatory Mitigation), and EIS Section 3.3.4.4 (Greater Sage-Grouse, Compensatory Mitigation).
7546-2	Judith Ruprecht	My concern is for its impact on migratory songbirds. Migrating songbirds are vulnerable to collisions with the wind tower propellers. They often fly during the night and often at low elevations. We know that they collide with skyscrapers, under which dozens of bodies of birds are picked up from surrounding streets and sidewalks after nights of intense, concentrated migratory movement. Accurate modeling and predictions of mortality for songbirds are impossible, because there is no other wind project the size of Lava Ridge with which to compare, and if there were, it is nowhere near to Lava Ridge. There is no other similar artifact on Lava Ridge. It is quite possible that there would be no significant mortality for several years if the project were finished, and the BAM, at some later date, the migrating songbirds could take a horrible hit. The vagaries of wind, temperature, and weather patterns cause the birds to fly at unpredictable times and routes.	See EIS Section 3.3.2 (Avian Populations) for a discussion of impacts to migrating songbirds. As described in this section, migratory movements in the western U.S. typically occur at altitudes well above the RSH of the turbines proposed for the project, and mass fatalities of migrating songbirds at existing U.S. wind energy facilities are exceedingly rare. Despite the rapid increase in wind energy development in recent years and the likelihood this trend will continue in the future, direct mortality from collision with turbines at wind energy facilities is unlikely to pose a threat to most avian populations (AWWI 2016; Choi et al. 2020). Small passerine species account for 60% of fatalities at U.S. wind energy facilities but make up more than 90% of all land bird fatalities, and even for those species killed most frequently, turbine-related fatalities constitute a small percentage of their total population size (typically < 0.02%) (AWWI 2016; Erickson et al. 2014). Small passerine species are also at less risk of population-level effects because they are shorter lived and typically reproduce at a higher rate than other taxa (Erickson et al. 2014). EIS Section 3.3.2.2.7 discusses how mortality at wind energy facilities will remain a relatively small source of mortality for most avian species, particularly small passerines, and also notes that, on a per-MW basis, the avian fatalities associated with wind energy production are much lower than other forms of energy generation such as nuclear power and traditional fossil fuels.
7742-1	Julie DeWolfe	Lava Ridge Wind Turbine Complex and Owls. BLM DEIS does not appear to resolve the conflict between wind turbine lights and owls or met tower lights and owls. While I believe it must be common knowledge, for the sake of understanding I will address the ways one would deliberately go about getting rid of owls. Google search is awash in innumerable web articles which repeat similar steps to "get rid of owls". Here is one example: https://worldbirds.com/how-to-get-rid-of-owls/ <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fworldbirds.com%2Fhow-to-get-rid-of-owls%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cca13526f4c424d4354e208db2ee266de%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638155322139712101%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=I1yMovj88LFQL3WxZcd3DBld%2FUe%2Fb5NTL%2FtrUhu7WRY%3D&reserved=0> 12 Tips On How To Get Rid Of Owls Fast (2022) Updated on August 4, 2021 / By Garth C. Clifford 1. Stop attracting songbirds 2. Create high noises and sounds 3. Use strobe lights to scare owls away 12. Use night lights It is a given that birds will be disturbed and relocate outside of turbine areas, but the noise, sound, and strobe lights will remain a problem, specifically for owls. The BLM DEIS does address FFA and met (meteorological evaluation towers) lighting, and indicates that lighting can and will be used to scare birds away, or be shut off so as not to attract, but does not address the negative impacts of strobed lighting at night, and its impact on owls. [...] On the flip side of "getting rid of owls" people who don't want rodent infestations actually want to attract owls as rodent management, which is my concern as a person living on the edge of BLM. Owls are the most earth-friendly way of managing rodent pests. Green Blog states, " A family of five barn owls, including two adults and three young will feed on about 1,000 rodents during a season"	None of the action alternatives include the use of strobe lights, nor any intentional effort to discourage owls or other birds using the siting corridors. There is no indication that the FAA-standard blinking red aviation lights proposed for use on the turbines either attract or repel and bird species. An ADLS would also be used, and these lights would only be illuminated approximately 8% of the time. Therefore, it is unlikely that project-related would substantially impact owls under any of the action alternatives.

It is one of the few animals that will kill a skunk, and it may eat more than 4,000 mice per year.” https://www.dnr.state.mn.us/birds/greathornedowl.html <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.dnr.state.mn.us%2Fbirds%2Fgreathornedowl.html&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cca13526f4c424d4354e208db2ee266de%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638155322139712101%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=w1VfGuenp6y%2BtAJHwg9NzvTSEx04bwVgLiBoZp1NuWc%3D&reserved=0> If we drive away owls by strobed, blinking, pulsating, flashing, and flickering lights at night, even inadvertently, we contribute to catastrophic infestations of rodents which will harm everyone living in proximity of the wind turbine industrial complex. By the following year our ag industry will be negatively impacted, which will hurt our farmers and ranchers and the animals who depend upon ag for their livelihood and life. I hope you agree that we cannot destroy the fragile balance of nature in Idaho for a climate change agenda that environmentalists are now fleeing. Option A, to do nothing is the only reasonable decision. We must not allow our public lands to be turned into industry and our owls driven out of it by strobed lighting.	
8721-1	Doreen Alexander	I am writing in opposition to the Lave Ridge wind project. I also wanted to mention that a ‘No Build’ option should be available and accepted as a viable option to the BLM and those decision makers involved. I am a resident of Jerome County and have lived here 2 years. I moved here from California and Las Vegas and have finally found my true home. I had many reasons to escape NV and CA and I am sure you have heard them all. Idaho freedom and landscape were among the priority features on my list. I have almost 5 acres of land and the most special on that land are the variation of avian species. I have seen over 19 species of birds on my small property alone. It brings me great joy to provide an eco-system for them and their families. They in return provide a service of insect control as well as rodent management. Among so many other topics in the EIS that I am very concerned with, the 3.3.2 section entitled Avian Populations is especially important to myself. Studies from more than just the US have cited many devastating results that Wind farms have on all Wild life, especially Avian life. Even as far back as 2009 there was extensive data. Effects Of Wind Turbines On Wildlife, Livestock And Domestic Animals | Wind Turbine Property Loss <https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwindturbinepropertyloss.org%2Fsite%2Feffects-of-wind-turbines-on-wildlife-livestock-and-domestic-animals%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C20497e96e5f749f338e608db34441319%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638161239213029209%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=T4DDBEOxgB%2FA1TaeNmr1kLReieOMhUbZ7C3cAwuuMaY%3D&reserved=0> “Scientists have concluded that wind turbine developments placed near important wildlife areas have a long term, irreversible destructive effect upon these habitats. The effect is cumulative and increases the longer the wind turbines remain in place.” In a more recent study stating that this lost of birds from wind farms is hard to know exactly, they estimate 681,000 deaths per year which was cited in 2021. This is a horrendous amount of wild Life Avian death and one I feel is grossly understated at that. How Many Birds Are Killed by Wind Turbines? | ABC (abcbirds.org) <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fabcbirds.org%2Fblog21%2Fwind-turbine-mortality%2F&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C20497e96e5f749f338e608db34441319%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638161239213029209%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=uUqRf3NTwHlk0xclmlaRnMVGe0h%2FOCzvQULK%2B7dL%2Bdk%3D&reserved=0> “It's important to consider that wind energy capacity has grown considerably since then. The study by Loss and others reported that there were 44,577 turbines in operation in 2012, while the U.S. Wind Turbine Database <https://eerscmap.usgs.gov/uswtdb/> indicates that there are 65,548 today — an increase of 47 percent. Adjusting for this industry growth, we can project that approximately 538,000 wind turbine-caused bird deaths occur in the U.S. each year.” “However, projecting mortality based on energy produced is more frequently used because it accounts for the size of turbines in addition to their numbers. The American Wind Energy Association reports <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.awea.org%2Fwind-101%2Fbasics-of-wind-energy%2Fwind-facts-at-a-glance&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C20497e96e5f749f338e608db34441319%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638161239213029209%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=JT9wvwJsXpt%2B5jdLWZSEQuxwQTp8pTk94fTQmvPDd0I%3D&reserved=0> that there were 60,067 megawatts (MW) of wind energy capacity in the U.S. in 2012, versus 111,808 as of this writing in 2021 — an 86-percent increase. Taking this change into account, it can be projected that approximately 681,000 birds are currently killed by wind turbines in the U.S. each year.” With MANY studies available for estimates, these are only an estimate and do not give a true representation of losses that would be incurred in Idaho. Why are these acceptable terms for windmills? Birds are an essential component to the eco-system in rodent and insect management and when devastated by human factors, this balance can be upset. In section 3.58, the EIS compares projected avian death based on prior projects so they really have no idea what these numbers could possibly end up being. This is a different location and different flight	Under the No Action alternative, the project would not be developed; see EIS Section 2.2 (Alternative A [No Action]). Cumulative fatalities from existing U.S. wind energy facilities are disclosed in EIS Section 3.3.2.1.2 (Avian Populations, Existing and Future Trends and Actions) and the increased avian fatalities expected as wind energy development continues is disclosed in EIS Section 3.3.2.2.7 (Avian Populations, Cumulative Impacts). As described in EIS Section 3.3.2.2.2 (Avian Populations, Alternative B), avian fatality rates at recently constructed wind energy facilities in Idaho and the western U.S. are much lower than avian fatality rates at wind energy facilities in the U.S., upon which early cumulative avian fatality estimates were based. Even if fatality rates similar to those in the eastern U.S. were observed at new wind energy facilities in the western U.S., fatality from collisions with operational turbines will remain a relatively small source of mortality for most avian species (see EIS Section 3.3.2.2.7). As described in EIS Section 3.3.2.2.2, preconstruction use is not correlated with postconstruction fatality rates (WEST 2011); therefore, additional avian use studies are unlikely to lead to a more informed analysis. Due in part to the uncertainty in quantifying fatality rates prior to construction, these mitigation measures include postconstruction avian fatality monitoring to assess avian fatality rates and, if high fatality rates are observed, to determine which adaptive management measures need to be implemented to reduce fatalities, as well as additional monitoring to assess the effectiveness of adaptive management measures; see the BBCS (Appendix M in MVE [2023]) and EIS Appendix 4 (Mitigation) for additional details. This strategy is consistent with the *U.S. Fish and Wildlife Service Land-Based Wind Energy Guidelines* (USFWS 2012).

		pattern and no other project can properly prepare us for an accurate estimate of avian devastation. In Section 3.79, I am in question of using a two-year sample to adequately assess any complete volume nor quantified species accumulation. Two years would hardly be an accurate assessment of either based on changes in migratory fluctuations and weather changes. In my own yard of less than 5acres I witness a change every year on both categories. I am opposed to this wind project at any level and request a no vote to the Lava Ridge wind project.

1042-26	WildLands Defense	How will the project impact wildlife? Any wind energy project poses a risk of bird kills, and a project of this size is almost guaranteed to result in bird deaths. Magic Valley Energy must receive an Incidental Take Permit from U.S. Fish and Wildlife, which covers it in the almost certain event of bald and golden eagles killed by impacts with turbine blades or other infrastructure. The draft EIS for the project as proposed estimates an average of 3,240 to 5,654 bird fatalities per year, with a maximum of 10,200 to 17,799 fatalities per year. Specifically, an average 13 golden eagles are expected to die each year. Fewer bald eagles are present, and the draft EIS estimates that 16.5 bald eagles will be killed over the 30-year operating period.	Impacts to avian species are described in Section 3.3.2 (Avian Populations) and impacts to eagles are described in Section 3.3.3 (Eagles) of the draft EIS. The issuance of an ITP for eagles is governed solely by the USFWS. MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project's eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles.
10429-1	Toni McNeill	I am urging BLM to stop the project of Lava Ridge and specifically I am addressing the killing of the American Bald Eagle. This only takes into account one bird of prey and does not address the many other birds of prey that will be affected. It should not be allowed to give these companies a pass on killing X amount of Bald Eagles because it is for "wind energy". This project is fraught with discrepancies and favoritism towards a specific ideology. It will not supply the energy we need and will destroy our beautiful landscape, Bald Eagles, and many of wild animals that live in this area.	Impacts to non-eagle raptor species are described in Section 3.3.2 (Avian Populations) of the draft EIS. Pursuant to Section 504 (43 USC 1764) of FLPMA, the BLM must consider and process applications for ROWs. It requires the BLM to evaluate the proposed ROW application based on factors such as the public interest, environmental impacts, resource conservation, and compatibility with multiple land uses. An ITP issued by the USFWS allows for the limited take of eagles, including bald eagles and golden eagles, under certain circumstances. The ITP operates within the framework of the BGEPA and the regulations established under it. These laws provide provisions for the take of eagles, including incidental take, which refers to unintentional take that occurs during otherwise lawful activities. An ITP is issued with specific conditions that must be followed by the permittee to ensure compliance with the terms of the permit. These conditions may include limitations on the number of eagles that can be taken, reporting requirements, and adherence to specified mitigation measures. The permit has a set duration, typically ranging from a few years to several decades, depending on the nature of the project and its potential impacts. MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project's eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles.
10431-1	Richard Gailey	The possibility that so many birds of all species might die because of thye wind turbines concerns me, the eagles and the hawk population alone could cause and explosion of voles which are harmful to the farms in the area. The turbines could cause an imbalance in nature.	Impacts to avian populations are described in Section 3.3.2 and impacts to eagle populations are described in Section 3.3.3 of the draft EIS.
10442-7	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Eagles (Golden and Bald) P. 3-100 In the DEIS it is stated, " Alternative B would substantially contribute to the number of estimated fatalities and prey habitat effects in the LAP for both species, though to a much greater degree for golden eagle. When combined with other future renewable energy development, Alternative B may further reduce available prey habitat near known breeding areas, which would influence the distribution of prey across the landscape. If prey resources become scarce or are difficult to locate by nesting eagles due to habitat changes, lack of available prey would reduce eagle productivity. Alternative B has the highest maximum generation capacity and largest disturbance footprint of the action alternatives and thus is likely to contribute more to the cumulative eagle population and habitat effects than the other action alternatives. As wind energy capacity continues to increase in the LAPs, collisions with turbines are anticipated to contribute to an increasingly large proportion of eagle fatalities in the LAPs." Comment: We have significant concerns about the impact that this proposal, along with other potential projects, will have on Golden Eagles through collision risk, habitat loss, loss of prey, the potential for complete abandonment of a territory, and impact on roost sites. We believe that the assessment of such impacts through both construction and operation is incomplete. We do not want to see a terribly misguided decision to lock in bad practices for 30 years, which will result directly in an untold number of dead eagles rolling back years of conservation gains.	Additional project-specific impacts to eagle populations will be analyzed if USFWS considers an ITP for the project, which is a separate action from the BLM's decision on issuance of a ROW. When the USFWS considers impacts to eagles in an ITP, several factors are taken into account. The USFWS will conduct an assessment of the potential impacts that the proposed activity may have on eagles. This assessment includes factors such as habitat loss or alteration, disturbance, displacement, direct mortality, and indirect effects on eagle populations. The USFWS requires MVE to incorporate avoidance and minimization measures into their project design to reduce potential impacts on eagles. These measures may include modifying project locations, timing restrictions to avoid sensitive periods, implementing eagle-friendly infrastructure design, and adopting best management practices to mitigate potential risks. The USFWS may include requirements for adaptive management and monitoring in the ITP. This ensures that the project's impacts on eagles are continually assessed and monitored throughout the permit duration. If unexpected impacts occur or new information becomes available, adaptive management allows for adjustments to minimize harm and enhance conservation efforts.
11297-4	Steven Upton, Linda Upton	It is projected that 13.3 golden eagles will be killed per year. It is projected that 0.56 or half of a bald eagle every year. LS Power, aka Magic Valley Energy is allowed to kill X number of eagles per year, if they exceed that number, they merely pay a fine. Why is LS Power, aka Magic Valley Energy allowed to kill eagles but a normal citizen would go to prison?	An ITP issued by the USFWS allows for the limited take of eagles, including bald eagles and golden eagles, under certain circumstances. The ITP operates within the framework of the BGEPA and the regulations established under it. These laws provide provisions for the take of eagles, including incidental take, which refers to unintentional take that occurs during otherwise lawful activities. An ITP is issued with specific conditions that must be followed by the permittee to ensure compliance with the terms of the permit. These conditions may include limitations on the number of eagles that can be taken, reporting requirements, and adherence to specified mitigation measures. The permit has a set duration, typically ranging from a few years to several decades, depending on the nature of the project and its

Comment ID	Commenter	Public Comment	Response to Comment
			potential impacts. MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project's eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles.
11327-10	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	Surveys identified active Golden Eagle nests and active use throughout the Lava Ridge Wind Project's siting corridors. Additionally, Golden Eagle flight heights were recorded most frequently (52%) within the rotor-swept height (130-790 feet). Given this information, it is no surprise that the fatality estimates from turbine collisions (over the 30-year operation period) reported in the DEIS are incredibly high: 399.3 total Golden Eagles for Alternative B, 337.8 for Alternative C, 235.8 for Alternative D, and 229.8 for Alternative E. Taking into account indirect impacts, the impacts are likely much higher and extend beyond the Lava Ridge Wind Project.	Current trends for the Eagle Management Unit and Local Area Population are described in Section 3.3.3.1.1 (Existing and Future Trends and Actions) of the draft EIS, which describes the known permitted actions and indirect impacts to these eagle populations. Potential cumulative impacts to eagle populations are described in Section 3.3.3.2.7 (Cumulative Impacts) of the EIS, which considers known permitted actions and indirect impacts within these populations beyond the project. Section 3.3.3.4 (Compensatory Mitigation) of the EIS describes the potential compensatory mitigation that would be required should permitted take exceed the applicable eagle management unit take limits, if USFWS approves an ITP.
11327-11	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	iii) Fatality Monitoring Must be Robust and Transparent The DEIS states that the applicant would conduct a minimum of two years of intensive post- construction monitoring for eagles and that additional postconstruction monitoring would be conducted for all years of the permit. Clarification is needed where this latter monitoring would take place. Given how active turbines are expected to change the behavior and use areas of Golden Eagles over time, as well as potential for migrants traveling through the area. Also, fatality monitoring reports should be made available to the public and be considered, by the receiving agencies, in conjunction with those of adjacent operating wind projects. Additionally, given the increasing interest of wind development in Idaho, the BLM and USFWS should consider having feather samples from mortalities evaluated to determine natal origins. This information will better infer the consequences of Golden Eagle mortalities to range-wide population-level consequences, using a framework developed by Katzner et al. (2020)39. Conkling et al. (2022) also emphasize the importance of assessing the origins of wildlife affected when interpreting consequences to wildlife populations of these, or any, types of anthropogenic activities.	MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project's eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles.
11518-1	Karen Steenhof	The Snake River Plain provides key habitat for Golden Eagles. The final EIS should recognize that the area is home to not only nesting eagles but also to wintering eagles from throughout the continent. From 1978-1984, surveys indicated that the number of wintering Golden Eagles in the area was significantly higher than in the fall. Telemetry studies have tracked eagles from Washington, Canada, and Alaska using the Snake River Plain during winter. Thus, eagle mortalities caused by turbines will affect far more than the local resident population. Earlier surveys indicate that current Golden Eagle densities in the Lava Ridge area and throughout southern Idaho are lower than they were 30-40 years ago. If populations were to rebound to earlier levels, turbine-caused eagle deaths might exceed estimates reported in the DEIS.	Impacts to wintering eagles are discussed in Section 3.3.3.2 (Impacts) of the draft EIS. The USFWS will be responsible for making a decision on MVE's eagle ITP application, which will be analyzed in a separate NEPA document. USFWS will establish baseline data on eagle populations within the relevant geographic area, including information on nesting densities, breeding success, survival rates, and other key demographic factors. Existing survey data, research studies, and monitoring programs contribute to the understanding of population dynamics. The analysis incorporates a landscape-level perspective, considering the larger ecological context in which the project exists. This may involve examining regional population trends, connectivity between populations, and the availability and quality of suitable habitat across the landscape. Landscape-scale analyses help assess potential cumulative impacts and the long-term sustainability of eagle populations. An ITP often incorporates adaptive management principles, allowing for adjustments in response to new information and data. Population monitoring, postconstruction surveys, and ongoing data collection contribute to the evaluation of actual impacts and inform any necessary adaptive management actions. MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project's eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles.
11535-38	Steven Andersen	The negative, irreversible impacts to eagles (both bald and golden) are glaring, and the DEIS does not dispute as much. Instead, the BLM, in arguing the project should still move forward despite the irreparable harm to eagles, relies on only a few unavailing and unsupported proposed arguments, curtailment measures, as well as what the BLM deems "warranted" compensatory mitigation, which it fails to identify. All of these arguments and positions fail for several reasons and fall well short of meeting the threshold burden required.	Pursuant to Section 504 (43 USC 1764) of FLPMA, the BLM must consider and process applications for ROWs. It requires the BLM to evaluate the proposed ROW application based on factors such as the public interest, environmental impacts, resource conservation, and compatibility with multiple land uses. Additional project-specific impacts to eagle populations will be analyzed if USFWS considers an ITP for the project, which is a separate action from the BLM's decision on issuance of a ROW. When the USFWS considers impacts to eagles in an ITP, several factors are taken into account. The USFWS will conduct an assessment of the potential impacts that the proposed activity may have on eagles. This assessment includes factors such as habitat loss or alteration, disturbance, displacement, direct mortality, and indirect effects on eagle populations. The USFWS requires MVE to incorporate avoidance and minimization measures into their project design to reduce potential impacts on eagles. These measures may include modifying project locations, timing restrictions to avoid sensitive periods, implementing eagle-friendly infrastructure design, and adopting best management practices to mitigate potential risks. If unavoidable impacts to eagles are expected, the USFWS may require MVE to provide compensatory mitigation. This could involve offsetting the anticipated harm through the implementation of measures that benefit eagle populations or their habitats. Compensatory mitigation could include habitat restoration, habitat enhancement elsewhere, or funding for eagle conservation programs. The USFWS may include requirements for adaptive management and monitoring in the ITP. This ensures that the project's impacts on eagles are continually assessed and monitored throughout the permit duration. If unexpected impacts occur or new information becomes available, adaptive management allows for adjustments to minimize harm and enhance conservation efforts.

Comment ID	Commenter	Public Comment	Response to Comment
11535-39	Steven Andersen	The DEIS drastically understates the potential eagle take this project will have given its unprecedented magnitude. Anthropogenic factors (including collision with wind turbines) accounts for nearly 60% of all golden eagle mortality in the coterminous western United States. 142 Golden eagle electrocution on power poles is a global conservation problem and a leading anthropogenic cause of death for golden eagles, with an estimated 504 golden eagles (95% credible interval: 124–1,494) electrocuted annually in North America.143 These numbers are directly related to wind farms. Between the proposed action and alternatives, the BLM estimates that golden eagle fatalities from "turbine collisions" may range from 13.31 golden eagles per year (399.3 total over 30-year operation period) to 7.66 golden eagles per year (229.8 total over 30-year operation period).144 The BLM estimates that for bald eagles, the fatalities may range from .56 bald eagles per year (16.8 total over 30-year operation period) to .11 bald eagles per year (3.3 total over 30-year operation period).145 The BLM attempts to justify these numbers by estimating that the project LAP for eagles contains "approximately 997 golden eagles; the 1%, 5% and 10% benchmarks for this estimate are approximately 9.97, 49.87, and 99.75 golden eagle[deaths], respectively," and "approximately 123 bald eagles[; t]he 1%, 5% and 10% benchmarks of this estimate are approximately 1.23, 6.16, and 12.32 bald eagle[deaths], respectively."146 These estimates are pure conjecture because turbines of this size have never been constructed, maintained, or monitored—not to mention, the proposed accepted rates are simply unacceptable.	The LAP and fatality estimates were developed by the USFWS, documented in detail in EIS Appendix 6. Draft Eagle Local Area Population Analysis and Preliminary Eagle Fatality Model of the draft EIS, and represent the best available scientific information available to disclose potential impacts to eagle populations. An ITP, if approved by USFWS, would incorporate adaptive management principles, allowing for adjustments in response to new information and data. Population monitoring, postconstruction surveys, and ongoing data collection contribute to the evaluation of actual impacts and inform any necessary adaptive management actions. MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project's eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles. Additionally, collector lines would be installed underground, and any aboveground collector and transmission lines would be constructed in compliance with Avian Power Line Interaction Committee guidelines, which provide specific engineering standards to reduce risk of electrocution and collision (applicant-committed measures 29 and 30). MVE would also use tubular structures for collector lines, where practicable, to deter perching (applicant-committed measure 143). As required by the greater sage-grouse ARMPA (BLM 2015), MVE would be required to equip aboveground facilities (including buildings and other structures where birds could perch or nest) with structures or devices that discourage perching or nesting or raptors and ravens (BLM-required measure K). In consideration of these requirements, the potential for raptor electrocution would be no greater than that disclosed in BLM (2005:5-64–5-66).
11535-40	Steven Andersen	The DEIS recognizes that "authorized take greater than 5 percent of the LAP, or qualitative indicators that suggest that unauthorized take may exceed 10 percent of the LAP, or qualitative indicators of relatively high levels of take from one source, could trigger additional environmental analysis to determine whether issuance of the permit for a particular project is compatible with the preservation of eagles." 148 In arriving at the conclusion that the unauthorized take will not exceed the purported 10% threshold, the DEIS admits that avian surveys were only conducted for two years, and in one year, for only 1,080 hours (or 45 days).149 Eagle movement, and avian movement in general, fluctuates, and therefore, this compressed evaluation period is grossly inadequate, especially given the scope of the proposed project. A survey period of 45 days out of an entire year is not the "hard look" required by the National Environmental Policy Act. See, e.g., High Sierra Hikers Ass'n v. Blackwell, 390 F.3d 630, 639 (9th Cir.2004) (quoting Neighbors of Cuddy Mountain v. Alexander, 303 F.3d 1059, 1070 (9th Cir.2002)).	The surveys conducted for the draft EIS meet the survey requirements outlined in Section 22.80 of the Eagle Rule, as required for approval of an ITP by USFWS.
11535-42	Steven Andersen	Notwithstanding the unprecedented size of the proposed turbines, the lack of specific location of the turbines further exposes the inadequacy of the DEIS. Specifically, "the exact location of infrastructure and activities within the siting corridors is unknown at this time."152 Wind turbines present risk to birds when they are foraging, when they are on nesting grounds, or generally when they are in flight.153 The DEIS recognizes specifically that the siting corridors (the specific location is still not determined) are in proximity of nesting areas, flight paths, and importantly, "expansive areas for foraging."154 Accordingly, despite the BLM claimed curtailment efforts of "avoid[ing] construction activities within 0.5 miles of any occupied golden eagle nest[,]"155 and "turbines [are to be] sited at least 2 miles away [from nests,]"156 these efforts are nothing but speculation, and do not account for the escalated risks associated in areas of nesting, foraging, and flight patterns. Put another way, eagles are at greater risk during local movements, i.e., foraging, and the DEIS recognizes that foraging is "expansive" in the siting corridors given its undeveloped conditions.157 Even more concerning, since the specific placement of the turbines is currently undisclosed, there are concerns about the possibility that the turbines may be placed in wind corridors directly in the eagles' paths, or areas of heightened risk generally, leading to more deaths than are estimated (which is already understated). Eagles flying over summits, ridge-tops, cliffs and steep slopes, whether in active migration or moving locally, flew at altitudes that put them at risk from modern horizontal-axis industrial wind turbines. 158 However, without the specific location, the turbine development cannot be properly evaluated, which means the fatality rate cannot be (and has not been) properly considered or mitigated.	The BLM has specific requirements for issuing an NTP for construction on public lands. The BLM requires submission and approval of all necessary construction plans, including engineering designs, environmental management plans, and any required permits or authorizations. MVE must demonstrate adherence with ROW terms and stipulations, which includes siting turbines at specified distances from identified sensitive resources. Additional project-specific impacts to eagle populations will be analyzed if USFWS considers an ITP for the project, which is a separate action from the BLM's decision on issuance of a ROW. When the USFWS considers impacts to eagles in an ITP, several factors are taken into account. The USFWS will conduct an assessment of the potential impacts that the proposed activity may have on eagles. This assessment includes factors such as habitat loss or alteration, disturbance, displacement, direct mortality, and indirect effects on eagle populations. The USFWS requires MVE to incorporate avoidance and minimization measures into their project design to reduce potential impacts on eagles. These measures may include modifying project locations, timing restrictions to avoid sensitive periods, implementing eagle-friendly infrastructure design, and adopting best management practices to mitigate potential risks. The USFWS may include requirements for adaptive management and monitoring in the ITP. This ensures that the project's impacts on eagles are continually assessed and monitored throughout the permit duration. If unexpected impacts occur or new information becomes available, adaptive management allows for adjustments to minimize harm and enhance conservation efforts.
11598-18	Idaho Conservation League	Eagles We are encouraged that the effects analysis for bald and golden eagles took into consideration impacts at the population level (EMU) as well as cumulatively, between the four relevant Local Area Density Units. Proposals for wind power generation in this area are expected to significantly increase in the coming decades. Across this analysis area there are already a wide variety of anthropogenic sources associated with eagle mortality. Changes in habitat disturbance and fragmentation, human activity, and land use also alter prey distribution (DEIS 3-93), possibly contributing to additional mortality through stress, malnourishment and starvation and/or decreased fitness of juveniles. Additionally, widespread disturbance linked to industrial scale wind projects is not something that golden eagles have demonstrated an ability to adapt to (DEIS 3-94). Under-occupied, high-quality habitat, created either through displacement or location avoidance could be an unintended consequence of proliferation of large wind developments in this concentrated area of south-central Idaho. We are aware that, under Alternative B, impacts of operations of the Lava Ridge Wind Project have been modeled to contribute in excess of 1% mortality within the Local Area Population (LAP), which is the "concerning" threshold for permitted eagle take under the Bald and Golden Eagle Protection Act (DEIS 3-93). Compensatory mitigation proposals from MVE notwithstanding, cumulative impacts of other proposed industrial scale projects within the LAP could push this figure closer to the 5% or 10% benchmarks for take that would preclude permit issuance from USFWS. As noted in the DEIS, unauthorized take accounts for additional eagle fatalities in the LAP. Combined, anthropogenically-sourced mortalities would certainly be expected to increase over time in an ecologically significant area of the country at a time when golden eagle populations are known to be declining. We are not yet convinced, given the range of existing alternatives, that declines associated	The results of the second year of avian use surveys, refined and additional minimization measures, and mitigation are described and incorporated into the impact analysis in the final EIS. See response to comment 10442-7 (see in Table A-3d, Eagles) for a detailed discussion of USFWS's ITP process. The risk for eagle mortality from non-turbine related factors are discussed in Section 3.3.3.2 (Impacts) of the draft EIS. Due to the lack of an accepted fatality model, fatality estimates for non-turbine actions cannot be estimated; however, with the incorporation of minimization measures and adherence with APLIC design standards, non-turbine related fatalities are expected to be rare but not impossible. Collector lines would be installed underground, and any aboveground collector and transmission lines would be constructed in compliance with Avian Power Line Interaction Committee guidelines, which provide specific engineering standards to reduce risk of electrocution and collision (applicant-committed measures 29 and 30). MVE would also use tubular structures for collector lines, where practicable, to deter perching (applicant-committed measure 143). As required by the greater sage-grouse ARMPA (BLM 2015), MVE would be required to equip aboveground facilities (including buildings and other structures where birds could perch or nest) with structures or devices that discourage perching or nesting or raptors and ravens (BLM-required measure K). In consideration of these requirements, the potential for raptor electrocution would be no greater than that disclosed in BLM (2005:5-64–5-66)

Comment ID	Commenter	Public Comment	Response to Comment
		with the Lava Ridge project can be appropriately offset with the current set of compensatory mitigation strategies that are outlined in this DEIS. While we appreciate that MVE conducted avian surveys over a two year time period, only the first year of findings were included in the DEIS. We believe that decisions about avoidance, minimization and mitigation tactics for potential eagle impacts from the project should have been deferred until all eagle study results had been summarized. Understanding if and how observations within siting corridors may have changed between study years would have been helpful in trying to assess any emergent behavior trends or to identify specific flight patterns in the risk cylinder. This seems particularly important at such low densities of bald and golden eagles in the area of analysis. The DEIS notes that eagle prey species such as cottontail rabbits and black-tailed jackrabbits will likely be displaced due to project activity and disturbance. The conclusion that prey resources will be lost, potentially compromising eagle fitness in the area, is oddly juxtaposed to the minimization tactic that is also detailed in the eagle section which describes elimination of habitat features that could actually attract and retain prey species within the project area. This includes removal of natural material, such as rock piles, woody debris and tall vegetation. It may be preferable to restore native vegetation, attract and retain prey species outside of the project area where renewable energy projects are unlikely to occur. Because lead poisoning is a significant but preventable form of eagle mortality, another potential mitigation mechanism is supporting voluntary efforts to assist interested sportsmen transition from lead ammunition to copper ammunition. We also don't believe that burial of collector lines is a practicable minimization mechanism due to the difficult volcanic geology in the area. Other minimization techniques included in the DEIS, such as curtailment and detector-based camera systems, should be implemented from the start of operations, rather than waiting to see if "other adaptive management measures are insufficient to minimize fatalities." This is especially true given the high degree of behavioral variability in reaction to the presence of turbines on the landscape (DEIS 3-98). We believe that MVE should assume that only after all minimization methods have been fully implemented, it will be possible to conclude that the wide range of project-related impacts is adequately addressed. We would also advocate that eagle mortality due to project-related causes not associated with turbines, such as electrocution, transmission/guyline strikes and vehicles/roads also be included in the impacts analysis – especially for golden eagles.	
11723-3	David Robinson	legal killing of wildlife. And, what is this crap about being able to obtain a LEGAL EAGLE KILLING PERMIT.	See EIS Section 3.3.3 (Avian and Bat Species, Eagles), and EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers) for information regarding eagle take permitting. Section 3.3 (Avian and Bat Species) provides assessment of project impacts to avian and bat species, and Section 3.3.3 focuses on Eagles. Section 3.3 (Avian and Bat Species) additionally summarizes measures to be undertaken to reduce fatalities to these species. Per Section 3.3.3 (Eagles), the analysis of effects to eagles from potential fatality focuses on impacts at the population (eagle management unit [EMU]) and cumulative [LAP]) scale (Figure 3.3-5). EMUs for golden eagle are set at the BCR level (the golden eagle LAP is within the BCR 9 EMU). EMUs for bald eagle encompass geographically distinct breeding areas (the bald eagle LAP is within the Northern Rocky Mountains EMU). The USFWS analyzes permitted eagle take and determines its consistency with their preservation standard at these scales. Permitted (by the USFWS) eagle take at the EMU scale is governed by a take limit that is compatible with maintaining an equilibrium population size equal to or greater than the population objective, which is the estimated population size in 2009. Take limits at the EMU scale are intended to prevent local extirpation of eagles—both breeding and non-breeding. Per EIS Appendix 10, Consultation and Coordination, Cooperating Agencies, U.S. Fish and Wildlife Service section, the USFWS provided input regarding 1) the risk of incidental take of eagles from turbine operations; 2) avoidance and minimization measures, compensatory mitigation, and fatality monitoring related to incidental eagle take from turbine operations; and 3) project impacts to migratory birds, bats, endangered species, and critical habitat, and options for addressing those impacts. The USFWS intends to use this information in decision-making for a BGEPA eagle take permit application submitted by MVE on July 28, 2021, and in meeting other USFWS statutory obligations. Coordination with the USFWS on the above matters is ongoing. Per EIS Appendix 10, Mitigation Framework, Types of Mitigation section, the USFWS will issue their own NEPA document to facilitate their decision regarding the project's BGEPA eagle take permit application submitted by MVE on July 28, 2021. This document may include additional mitigations should USFWS find they are warranted after completing their own NEPA analysis.
11833-4	Bob Hassoldt	This project is going to kill golden eagles. It has an annual expected mortality of 13.31 eagles. The problem is as follows: In the scientific journal, Conservation Biology, Volume 31, No. 2, a research article titled "Golden Eagle fatalities and the continental-scale consequences of local wind-energy generation" by Todd E. Katzner and others, studied the golden eagle mortality that occurs at the Altamont Pass Wind Resource Area (APWRA). They were trying to determine if the deaths caused there by windmills are compensatory, meaning they replace natural mortality, or they were additive, meaning they were above and beyond natural mortality. What they found was that the stable population of golden eagles there is only sustained by immigration from other eagle populations across the distributional range west of the Mississippi river and that the mortality caused by collisions with a 200 mph windmill blade tip is additive. DNA analysis showed that the majority of those in- migration eagles are coming from Wyoming, Idaho, Oregon and the desert southwest. The analysis also points out: "One of the solutions to maintaining the population at the APWRA is to mitigate the killing of golden eagles elsewhere across the western U.S." The proposed mitigation for this project isn't going to increase or even maintain the western golden eagle population. Given this situation the project should not be approved.	See response to comment 10442-7 (see in Table A-3d, Eagles) for a detailed discussion of USFWS's ITP process.
11871-23	WildLands Defense	Wind Boom Threat to Wyoming and West-Wide Population of Golden Eagles A recent article on the industrial wind farm and Golden eagle killing situation in Wyoming describes: "Most of the [Wyoming wind energy] development is just going off like a rocket right now, and we already have eagles that are getting killed by wind turbines — a hell of a lot more than people really understand," Lockhart, a former U.S. Fish and Wildlife Service biologist, said. Lockhart,	See response to comment 10442-7 (see in Table A-3d, Eagles) for a detailed discussion of USFWS's ITP process.

Comment ID	Commenter	Public Comment	Response to Comment
		who now works as a consultant for private companies, surveys eagle populations in Wyoming — mostly around Medicine Bow and in the Shirley Basin. The region is the “heart and soul” of golden eagle habitat in North America, he claims. Experimental wind turbines here date back to the 1980s, and it’s the epicenter of existing and prospective development ambitions”. Also: “While some wind energy representatives say tools exist to reap energy from the wind while conserving species, Lockhart contends that level of development will require much more planning to consider cumulative impacts to eagles, raptors, songbirds and all other wildlife. Additionally, the FWS should reconsider its “incidental take” allowance for individual wind energy facilities, he said. “The Fish and Wildlife Service has provided an allowable take for those [individual] projects of 10 to 14 eagles per year,” Lockhart said. “You multiply that out by the 30-year project life — that’s a hell of a lot of eagles, and they can’t sustain that kind of impact.” https://wyofile.com/wind-energy-faces-bird-kill-and-other-habitat-challenges/ Eagles observed on Snake River Plain may have come from Denali, Alaska and other areas, and be killed by Lava Ridge. Basically after the local Eagles are killed off, Lava Ridge may continue killing juvenile and roving eagles from across the western US and Canada. https://www.nps.gov/articles/aps-v5-i1-c11.htm https://storymaps.arcgis.com/stories/c46dc6f9addd42a3a2d345df8e40f725 The above map shows: “Telemetry fixes of 571 Golden Eagles tracked in North America between 1992 and 2016. Lines indicate unobserved straight-line paths between consecutive telemetry fixes”.	
11871-24	WildLands Defense	“The Golden Eagle's high mobility and diversity of movement patterns carry individuals across multiple political, administrative, and ecological boundaries (Brodeur et al. 1996, McIntyre et al. 2008, Braham et al. 2015, Poessel et al. 2016). Variation in regulatory and land-management priorities among various administrative units may have consequences for Golden Eagles. For example, an administrative unit may be disproportionately used by eagles migrating from their breeding locations in another, possibly distant, unit. In contrast, a unit may contain the majority of movements by a resident population”. Thorough pre-decisional baseline studies must be done on both the local and migratory populations of eagles and other raptors susceptible to mortality from Lava Ridge, and analysis and estimates must be conducted on the mortality already taking place from al the private land wind farms that are in operation in this region, as well as the foreseeable impacts of Taurus wind development and Salmon Falls wind development too – and any other applications BLM may be aware of. https://adfg.alaska.gov/index.cfm?adfg=wildlifenews.view_article&articles_id=95 “Young eagles make their first southern migration in late September, leaving Denali without their parents or siblings. Most follow the Rocky Mountains south, and winter anywhere from Central Alberta down into Northern Mexico. “The highest mortality on eagles is during their first fall migration,” McIntyre said. Only about 20 to 35 percent of the golden eagles McIntyre has studied survive their first year, and only 10 to 15 percent live to reach sexual maturity at about five years of age. Most die from starvation, disease, predation, electrocution and illegal shooting. Golden eagles that survive may live 25 to 35 years in the wild”. How will the proliferation of wind facilities foreseeable in Idaho, and West-wide, impact the viability of populations of Golden Eagles? How will the loss of prey habitat due to industrial solar developments impact Eagle prey species? And of course, more industrial solar will mean more potentially lethal powerlines that kill volant species that collide with them or become electrocuted,	The surveys conducted for the draft EIS meet the survey requirements outlined in Section 22.80 of the Eagle Rule, as required for approval of an ITP by USFWS. See response to comment 10442-7 (see in Table A-3d, Eagles) for a detailed discussion of USFWS’s ITP process. Cumulative impacts to eagle populations, including other proposed renewable energy projects, are discussed in Section 3.3.3.2.7 (Cumulative Impacts) of the EIS.
11871-63	WildLands Defense	Isn’t there data available for radio-collared eagles – such as the National Guard in the Birds of Prey Are has used. This data shows birds from Alaska may fky to Idaho. BLM must conduct a review of existing radiotelemetry data to determine the breeding populations of Eagles and other species that may be harmed by being killed by Lava Ridge turbines in winter or other seasons.	Additional project-specific impacts to eagle populations will be analyzed if USFWS considers an ITP for the project, which is a separate action from the BLM’s decision on issuance of a ROW. The USFWS reviews available scientific literature, species status assessments, population surveys, and other relevant information to understand the biology, distribution, abundance, and conservation status of the species that may be affected by the proposed activities. See response to comment 10442-7 (see in Table A-3d, Eagles) for a detailed discussion of USFWS’s ITP process.
11871-86	WildLands Defense	There must be a thorough EIS analysis of Cumulative effects of threats or cross-influence of threats; Factors that influence population trends, especially the role of anthropogenic mortality; migratory connectivity; population-level effects of habitat loss and degradation, environmental contaminants, climate change threats, renewable and other energy sources of mortality. Now eagles and other avian and increasingly mammalian specie face mortality caused by Avian flu. Jessi L. Brown Author Affiliations + J. of Raptor Research, 51(3):197-215 (2017). https://doi.org/10.3356/JRR-16-72.1	Cumulative impacts to eagle populations are discussed in EIS Section 3.3.3.2.7 (Cumulative Impacts).
11871-94	WildLands Defense	The Full Killing and Displacement/habitat Fragmentation Footprint of Industrial Wind Must be Assessed – Both Across the Snake River plain, as well as Regionally Numerous wind facilities have had far larger mortality footprints, and/or have covered up species mortality. For example: “Fatalities Vastly Exceed Allowed” Take” https://www.nbcnews.com/news/us-news/wind-energy-company-pleads-guilty-least-150-eagles-killed-us-rcna23360 “A subsidiary of one of the largest U.S. providers of renewable energy pleaded guilty to criminal charges and was ordered to pay over $8 million in fines and restitution after at least 150 eagles were killed at its wind farms in eight states, federal prosecutors said. NextEra Energy subsidiary ESI Energy was also sentenced to five years probation after being charged with three counts of violating the Migratory Bird Treaty Act during a court appearance in Cheyenne, Wyoming. The charges arose from the deaths of nine eagles at three wind farms in Wyoming and New Mexico. In addition to those deaths, the company acknowledged the deaths of golden and bald eagles at 50 wind	The fatality estimates disclosed in the draft EIS were developed by the USFWS, documented in detail in EIS Appendix 6. Draft Eagle Local Area Population Analysis and Preliminary Eagle Fatality Model of the draft EIS, and represent the best available scientific information available to disclose potential impacts to eagle populations. The USFWS incorporates information on collision risk factors, population data, species-specific sensitivity, collision monitoring and reporting, mitigation measures, and scientific research into fatality models for eagles. This includes data on eagle collisions with structures or activities obtained from monitoring programs and studies. The fatality estimates are limited by the accuracy of the information available.

Comment ID	Commenter	Public Comment	Response to Comment
		farms affiliated with ESI and NextEra since 2012, prosecutors said. Birds were killed in eight states: Wyoming, California, New Mexico, North Dakota, Colorado, Michigan, Arizona and Illinois'.	
11871-115	WildLands Defense	Wind farms can have two broad potential adverse effects on birds via antagonistic processes: displacement from the vicinity of turbines (avoidance), or death through collision with rotating turbine blades. These effects may not be mutually exclusive. Using detailed data from 99 turbines at two wind farms in central Scotland and thousands of GPS-telemetry data from dispersing golden eagles, we tested three hypotheses. Before-and-after-operation analyses supported the hypothesis of avoidance: displacement was reduced at turbine locations in more preferred habitat and with more preferred habitat nearby. After-operation analyses (i.e. from the period when turbines were operational) showed that at higher wind speeds and in highly preferred habitat eagles were less wary of turbines with motionless blades: rejecting our second hypothesis. Our third hypothesis was supported, since at higher wind speeds eagles flew closer to operational turbines; especially–once more–turbines in more preferred habitat. After operation, eagles effectively abandoned inner turbine locations, and flight line records close to rotor blades were rare. While our study indicated that whole-wind farm functional habitat loss through avoidance was the substantial adverse impact, we make recommendations on future wind farm design to minimise collision risk further. These largely entail developers avoiding outer turbine locations which are in and surrounded by swathes of preferred habitat. Our study illustrates the insights which detailed case studies of large raptors at wind farms can bring and emphasises that the balance between avoidance and collision can have several influences. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8341499/	The provided study was reviewed and incorporated into Section 3.3.3.2 (Eagles, Impacts) of the final EIS.
11978-118	Magic Valley Energy, LLC	20. Section 3.03.3.1 - Affected Environment "During the Project's first year of avian surveys, 257 golden eagle minutes were recorded in 1,080 hours of survey." MVE requests a notation be added explaining that during the year one avian use survey, areas outside the current project were included that have since been removed in the interest of reduceing impacts to eagles and sage grouse.	This information was incorporated into the final EIS.
12054-14	Kevin Emmerich	For project construction, road traffic by trucks, water trucks, and heavy machinery can impact eagles. In wildlife considerations in planning and managing road corridors little attention has been given to the effects of disturbance by traffic on populations of breeding birds. Recent studies, however, show evidence of strongly reduced densities of many species of woodland and open habitat in broad zones adjacent to busy roads. The density reduction is related to a reduced habitat quality, and traffic noise is probably the most critical factor. Because density can underestimate the habitat quality, the effects on breeding populations are probably larger than have been established (Reijnen et al. 1997).	No proposed construction access roads would be located near known eagle nests. Mitigation measures 114 and 140 in EIS Appendix 4 Mitigation of the draft EIS provide additional restrictions on construction and maintenance activities in proximity to known eagle nests.
12054-15	Kevin Emmerich	Long-term disturbance could lead to declines in animal populations, including eagles. The proposed action would kill up to 14 golden eagles per year. At the project 30 year lifespan, that is 420 adult, breeding golden eagles. What kind of impact does removing that many raptors with a lower reproductive output from this region? Since golden eagles are naturally slow to mature and reproduce, their populations are sensitive to changes in adult and subadult survival rates. "Contextualizing the mortality of these eagles has important implications for understanding of the continental-scale population dynamics of many species of wildlife killed at wind-energy facilities in the United States (e.g., Hayes 2013; Loss et al. 2013; Pagel et al. 2013) and glob- ally (e.g., Desholm & Kahlert 2005; Drewitt & Langston 2006; Dahl et al. 2005). This is especially the case for long- lived species. Like eagles, bats are k selected (i.e., the stability of their populations depends on low adult mortality), and they may be killed in large numbers at wind- energy facilities. (Katzner et al. 2019)	Section 3.3.3.2 (Impacts) of the EIS discusses impacts from the project on eagle populations at regional and local population scales.
12469-10	Mike Telford	Hawes and Eagles are two important species that there is some good data for. I will review the information the DEIS has about them as probably the best case as most other rely on models to generate data for the models which compounds the possible problems. For this example we will use Alt E which should be the least impacts. First, the DEIS models show, on top of the existing fatalities, there would be up to 9,894 kills annually. I noted in the first of my comments that all these populations have been declining for the past 50 years of my personally observations. It defies reason that that is acceptable. Appendix 6 Draft Eagle Local Area Population Analysis and Preliminary Eagle Fatality Model Pages are not numbered so we numbered them for reference starting with the title page being 117. On page 121 the area of the LAP is 109-mile radius for golden eagles, and 86 miles for bald eagles. From the map it is apparent that the LAP includes the Birds of Prey national sanctuary. It is unreasonable to consider allowing kills that would impact this world-renowned site. It is the home of the International Peregrine Fund's World Center for Birds of Prey. The model attempts to use data from sparce counts and radio collared birds from a much larger area over a large span of year (2012 to 2021) to estimate kill rates. There is nothing about how the earlier years data and the later years shows any concerning trends. I would note that in the early years there were few turbines in Idaho. Now there are over 130 as noted in the DEIS. The very idea that there are authorized kills (called takes) would shock most citizens. An average citizen would go to jail for killing an Eagle. Just assume that the 6MV's that have no data kill, kills eagles at an exponential rate. You only have to tweak a model a little to swing the % of the LAP killed over the aleady unacceptable limits. The allowed reduction of 10 % of the LAP annually is seriously flawed and flies in the face of Birds of Prey recovery efforts and that Bald Eagles in Southern Idaho are rare. There is obviously a problem with electrocution (page 124) that needs to be addressed. It is not apparent if all the transmission lines are considered in the models or can be. I believe that the state of Idaho will have much to say about permits to kill Eagles in Idaho. On page 124, there is a modelers disclaimer of sorts. Table 2 footnote 1 "This is the minimum number of unpermitted eagle fatalities discovered and/or reported. Likely more fatalities were not discovered and /or reported." The model suggests under Atl E that 7.66 Golden eagles and only .11 Bald Eagles would be killed per year. Given the nature of Models in general and these very loose data and no data for 6MV, what if they are off by 3 or 4 times. The data is for the wind turbines themselves. Unlike the examples given, there is no going back to correct the model to real data as	The fatality estimates disclosed in the draft EIS were developed by the USFWS, documented in detail in EIS Appendix 6. Draft Eagle Local Area Population Analysis and Preliminary Eagle Fatality Model of the draft EIS, and represent the best available scientific information available to disclose potential impacts to eagle populations. The USFWS incorporates information on collision risk factors, population data, species-specific sensitivity, collision monitoring and reporting, mitigation measures, and scientific research into fatality models for eagles. The risk for eagle mortality from non-turbine related factors are discussed in Section 3.3.3.2 (Impacts) of the draft EIS. Due to the lack of an accepted fatality model, fatality estimates for non-turbine actions cannot be estimated; however, with the incorporation of minimization measures and adherence with APLIC design standards, non-turbine related fatalities are expected to be rare but not impossible. Collector lines would be installed underground, and any aboveground collector and transmission lines would be constructed in compliance with Avian Power Line Interaction Committee guidelines, which provide specific engineering standards to reduce risk of electrocution and collision (applicant-committed measures 29 and 30). MVE would also use tubular structures for collector lines, where practicable, to deter perching (applicant-committed measure 143). As required by the greater sage-grouse ARMPA (BLM 2015), MVE would be required to equip aboveground facilities (including buildings and other structures where birds could perch or nest) with structures or devices that discourage perching or nesting or raptors and ravens (BLM-required measure K). In consideration of these requirements, the potential for raptor electrocution would be no greater than that disclosed in BLM (2005:5-64–5-66). Potential cumulative impacts to eagle populations are described in Section 3.3.3.2.7 (Cumulative Impacts) of the EIS, which considers known permitted actions and indirect impacts within these populations beyond the project.

Comment ID	Commenter	Public Comment	Response to Comment
		the birds are dead. Only a model can kill .11 of a bald eagle annually. The models and the DEIS does not address the other kills that will occur from all the other disturbances to feed source and traffic etc. The accumulated impacts to Eagles would very likely eliminate them from this part of the LAP and permanently change forever the greater LAP. The DEIS also notes there is no analyze of the cumulative impacts of the other proposed wind project proposed in the area of the overlapping LAP. If each is permitted to kill some eagles, soon there are truly “irreversible” impacts Those cumulative impacts must be studied and modeled together.	
12698-2	David N Cook	Just how many endangered birds, like eagles and condors, will be slaughtered during its operation?	Impacts to avian species are described in Section 3.3.2 (Avian Populations) and impacts to eagles are described in Section 3.3.3 (Eagles) of the draft EIS. Condors do not occur in Idaho and would not be affected.
12855-1	Marilyn Broek	The Bald and Golden Eagle Protection Act, enacted in 1940, has since been amended numerous times. As late as November 2022, the proposed revisions include rules related to incidental takes for permitting wind energy. These new rules are intended to make it easier to apply for and receive take permits. However, the underlying standard of all permitting requirements is the goal of “maintaining stable or increasing breeding populations in all eagle management units and the persistence of local populations throughout the geographic range of each species (50 CFR 22.6).” The draft Lava Ridge wind turbine project EIS states that up to 13.31 Golden Eagle fatalities caused by turbine collisions are expected every year. In addition, 0.56 bald eagles fatalities are expected every year. This is unacceptable to the human local population here in Idaho and certainly unacceptable to our local Golden Eagles. No measure of mitigation will prevent our glorious eagles from being chopped by the huge blades on the proposed 400 wind turbines. We say the fatalities are not caused by eagles colliding with turbines, we say the turbines are colliding with our eagles. The bird experts who did the field study for the draft EIS had many eagle sightings during their time on the project location. These experts stated clearly in their report that the current “take” limit for Golden Eagles remains at zero unless offset with compensatory mitigation. Money cannot buy our Golden Eagles in the 304 square miles the project wants here in Idaho. Nor a 1.2 to 1 replacement to some theoretical bank for eagle replacements. Do not allow a private enterprise to use public lands to destroy our much loved eagles here in the Magic Valley of Idaho.	See response to comment 11297-4 (see in Table A-3d, Eagles) for a discussion of the legal process associated with USFWS’s issuance of an ITP for eagles.
12988-10	Melody Asher	3.3.3 Eagles Your DEIS says: "This section analyzes two eagle issues in detail. The following additional eagle issue is analyzed in brief in Appendix 3: • AIB-3: How would the increase in project-related traffic affect the risk of direct avian mortality? Issues Analyzed in Detail Issue 1: How would the project affect nesting and wintering eagles? Issue 2: How would the project affect populations of eagles?" When I was out in the Lava Ridge area I personally saw 2 golden-eagles (GOEA) (out in the Gooding/Milner Recharge Area) and 1 bald eagle (near Wilson Lake where I expect that the nest that is mentioned in the DEIS is). I don't want to go out and not see these birds in our desert anymore and there are few enough that the kind of kill numbers the DEIS mentions would probably wipe them out. Perhaps you models are not correct??? I think there needs to be more studies about eagles (& hawks). I am very concerned about this proposed project (plus many more proposed projects in our valley) will have significant cumulative effects for our eagles (especially GOEA but both species) because of habitat loss, risk of collision, loss of prey and perhaps total loss of any eagles in the area.	Impacts to eagle populations are described in Section 3.3.3 (Eagles) of the draft EIS. The surveys conducted for the draft EIS meet the survey requirements outlined in Section 22.80 of the Eagle Rule, as required for approval of an ITP by USFWS. See response to comment 10442-7 (see in Table A-3d, Eagles) for a detailed discussion of USFWS’s ITP process. Cumulative impacts to eagle populations, including other proposed renewable energy projects, are discussed in Section 3.3.3.2.7 (Cumulative Impacts) of the EIS.
1618-2	Brian Olmstead	I feel the DEIS is extremely deficient in the predicted impacts to bird populations. The killing of 13 magnificent Golden Eagles and 1 Bald Eagle per year is an absolute criminal act and cannot be permitted! How many more will starve, or simply relocate to other critical Raptor habitats that are also struggling?	The fatality estimates disclosed in the draft EIS were developed by the USFWS, documented in detail in EIS Appendix 6. Draft Eagle Local Area Population Analysis and Preliminary Eagle Fatality Model of the draft EIS, and represent the best available scientific information available to disclose potential impacts to eagle populations. Impacts to foraging resources are discussed in Section 3.3.3.2 (Impacts) of the draft EIS. See response to comment 11297-4 (see in Table A-3d, Eagles) for a discussion of the legal process associated with USFWS’s issuance of an ITP for eagles. MVE will coordinate with USFWS to implement compensatory mitigation for eagle take under the project’s Eagle ITP (50 CFR 22.26), should a permit be granted by USFWS. Compensatory mitigation requirements would be re-evaluated every 5 years by USFWS and could involve a number of options for the first 5-year permit administrative period (i.e., years 1 through 5).The eagle take permit process will follow the *Eagle Conservation Plan Guidance* (USFWS 2013), which provides specific in-depth guidance for conserving bald and golden eagles in the course of siting, constructing, and operating wind energy facilities. The BGEPA provides a regulatory framework for protecting eagles.
2943-2	Vern Eames	In the draft of the EIS, the eagle take as exhibited in Appendix 6, by the proposed windmills is extremely misleading. The Golden and Bald Eagle combined takes for all proposed Alternatives ranges from 8-14 per year. What the EIS does not include in this consideration is the loss in progeny - in addition to the existing population.	The fatality estimates disclosed in the EIS were developed by the USFWS, documented in detail in EIS Appendix 6 (Draft Eagle Local Area Population Analysis and Preliminary Eagle Fatality Model), and represent the best available scientific information available to disclose potential impacts to eagle populations. USFWS eagle fatality models do not consider the potential loss of breeding adults, though the potential for loss of breeding adults and impacts on productivity is discussed qualitatively in Section 3.3.3.2.2 (Eagles, Impacts, Alternative B) under Issue 2 of the EIS.
2943-3	Vern Eames	If the EIS is to be understood as written, there would only be 8 -14 eagles killed per year. A) It can be assumed the majority of the eagle take would happen in the spring when wind is most prevalent and chicks are still in the nest. This could indicate that for every eagle (either male or female, due to both being instrumental in raising the chicks) killed by windmills, there would be a loss of 1.5 chicks per year/ eagle killed. If the EIS predicts 8-14 adult eagles taken per year, the actual annual loss of life would calculate out to 20 - 30 per year. (8-14 adults plus 12-21 chicks.) B) If a breeding pair is expected to live 30 years and their breeding years are 20, the total cumulative loss of eagles over the 20- year life of the project would be: 8-14 breeding adults/ year. 1.5 chicks X 8 adults X 20 years of the project= 240 + (8 X 20) = 400 total. 1.5 chicks X 14 adults X 20 years of the project= 420 + (14 X 20) = 700 total. C) In the figure of the total loss of eagles over the 20 year life of the Lava Ridge Wind Project it comes out to 400 - 700 total eagles and their progeny lost. D) The above numbers only include the projected loss by the EIS and their progeny over the 20 year life of the project. If you compound the future loss of progeny from the direct loss of annual progeny the numbers become staggering. I will agree that after a number of years the population decline will reach a state of diminishing	See response to comment 2943-2 (see in Table A-3d, Eagles).

Comment ID	Commenter	Public Comment	Response to Comment
		returns because there will be no replacement eagles left to be killed by the windmills. The math isn't hard, but it is backed by studied eagle data at the World Center for Birds of Prey in Boise, Idaho over many years. The problem is the EIS does not want you to calculate the total numbers and see how staggering they actually are. Anyone with half a brain knows that you not only kill the 8 -14 adults per year, but there is a compounding effect when calculating genocide of a species, even if it is in a specified location.	
3340-11	Sue Page	Also according to the EIS, 13.31 golden eagles and 0.56 bald eagles will be Ginsu'd - that is, sliced and diced- per year. If you or I collected just a single feather from a bald eagle, we would face certain imprisonment in the federal pen. Not LS Power – they are able to obtain eagle kill permits from the US Fish & Wildlife Service. If they exceed the permitted eagle kills per year, they just pay a fine. --On a side note, if the surveys show that 0.56 of an eagle will be killed per year, what happened to the 0.44 portion of the eagle? Is it flying around out there somewhere? If you spot it, let me know. I could probably make a fortune selling tickets to see it at a circus side show. Anyways, do the avian and bat fatalities concern anyone? I know Mr. T, a gentleman who penned a moving piece titled "Meadowlark on a Windmill" cares. Is the death to eagles, a federally protected bird, the ONE thing that will show LS Power to the door?	See response to comment 11297-4 (see in Table A-3d, Eagles) for a discussion of the legal process associated with USFWS's issuance of an ITP for eagles. Fatality estimates are representative of the risk of collision over time. For example, in 1 year there would be no eagle fatalities and in the following year there may be one eagle fatality, which would average 0.5 eagle fatalities per year over 2 years. Fatality estimates are informed by site-specific avian use data collected during surveys and other baseline information related to collision risk and fatalities reported at other facilities.
5700-2	Gar and Mary Lorain	3-91. Two years of study is way too short as eagle populations tend to fluctuate dramatically over time. The same can be said for their nesting activities.	See response to comment 11535-40 (see in Table A-3d, Eagles).
6910-10	Public Comments Lincoln County Community Center	But what's concerning about this study -- and this is in appendix, what I'm referring to, this is in Volume 3, and it's Appendix 6, Draft Eagle Local Area Population Analysis. They talk about -- of course they don't have specific data for this area so they're extrapolating it from a lot of other places and a bunch of stuff from the Fish and Wildlife Service, which may or may not have good or accurate data for this area. But they talk about the unauthorized take that's happening out there already, or they're assuming that's going to happen in this area, because I don't think they know about this area. But they think that the nauthorized takes and their permitted takes would still be below 10%. But what that does is double the amount of birds that are lost already. They say in this -- in this, on page -- oh, the pages aren't in your numbered. But in the table, Table 2 in this particular section, it talks about 16 being shot -- 19 being shot, 16 being electrocuted. When they talk about collision with wind turbines, and it's quite low. There's nothing in here that compares cramming 400 of these wind turbines, some of them bigger than have ever been known to man before -- never been known, they don't even have them engineered yet -- what the effects would be on the mortality then when really what they should be doing is lowering the number of these unauthorized or unpermitted takes, which some of them were shot. I know our local electric company, Idaho Power, makes great efforts to keep putting things up to try to stop birds from getting electrocuted. It still happens some, but they put these roost things up high and they're trying to mitigate and trying to help them from being electrocuted. And that's the ones we see most of the time, is the ones that have been electrocuted, right at the base of poles, you know. Obviously, that's what's happened to them. So rather than doubling the number that's okay to kill out there -- if -- if any of us intentionally killed one of these, we'd go to jail. And they're talking about giving them a permit to kill 234 of them. And I can tell you there's not that many out there to start with. I've been here a long, long time and we see them, we know they're there, and it's always a wonderful thing when we get to see a bald eagle because they're seasonal. They're not there all the time in the summertime.	The USFWS estimates the permitted number of eagles that can be taken by considering population data, using mathematical modeling techniques, and establishing thresholds and guidelines based on conservation objectives. The estimation also takes into account the effectiveness of proposed conservation measures and aims to ensure that permitted take remains below population thresholds (identified in the *Final Programmatic Environmental Impact Statement for the Eagle Rule Revision* [USFWS 2016]) to maintain the long-term viability of eagle populations. Additionally, the USFWS considers the potential impacts of unauthorized take and incorporates an adaptive management approach to ensure population sustainability. Collector lines would be installed underground, and any aboveground collector and transmission lines would be constructed in compliance with Avian Power Line Interaction Committee guidelines, which provide specific engineering standards to reduce risk of electrocution and collision (applicant-committed measures 29 and 30). MVE would also use tubular structures for collector lines, where practicable, to deter perching (applicant-committed measure 143). As required by the greater sage-grouse ARMPA (BLM 2015), MVE would be required to equip aboveground facilities (including buildings and other structures where birds could perch or nest) with structures or devices that discourage perching or nesting or raptors and ravens (BLM-required measure K). In consideration of these requirements, the potential for raptor electrocution would be no greater than that disclosed in BLM (2005:5-64–5-66). See response to comment 11297-4 (see in Table A-3d, Eagles) for a discussion of the legal process associated with USFWS's issuance of an ITP for eagles.

GREATER SAGE-GROUSE

Table A-3e. Greater Sage-Grouse

Comment ID	Commenter	Public Comment	Response to Comment
1042-15	WildLands Defense	The biggest threat to sage grouse specified in the draft EIS is not from blade strikes, but from 807 acres of habitat loss. [There will be a MUCH GREATER LOSS OF HABITAT than 807 acres, for many sensitive and important species the loss will be the entire project area and a zone of at several miles surrounding it should be written off and mitigated for. The full disturbance footprint – noise, lights, etc. must be carefully assessed, admitted to, and mitigated for. Full and detailed analysis of the trajectory and trends of the local and regional population, and the degree and time-table of population declines, loss of leks, locations of leks, counts on all leks and lek routes for all periods of time, etc., must be provided. Haven't population triggers been tripped?].	As described in AIB-1 of EIS Appendix 3 (Issues Analyzed in Brief), applicant-committed measures to minimize lighting (measures 20–24 in EIS Appendix 4) would reduce effects of lighting on avian species, including sage-grouse. Both direct and indirect causes of mortality were considered, including avoidance of habitat due to proximity to infrastructure (indirect) as well as collisions with infrastructure (direct), and functional acres of habitat loss were calculated accordingly (IDFG 2022a). Only portions of the project area and siting corridors, rather than the entire project area, are on sage-grouse habitat. The amount of seasonal sage-grouse habitat in these areas is shown in Figure 3.3-7 (Greater sage-grouse seasonal use areas) and Table 3.3-10 (Mapped Greater Sage-Grouse Seasonal Use Areas in the Analysis Area and Siting Corridors). The analysis area considers the BLM designated Timmerman Hills and Craters of the Moon Habitat Assessment Framework (HAF) fine-scale habitat management areas because these cover the home range of the affected population. In the siting corridors, sagebrush habitat generally occurs in the north and east where it is interspersed with herbaceous communities (WEST 2020, 2021). The land surrounding the eastern, southern, and western portions of the siting corridors is mostly cultivated cropland. The effect of noise was analyzed in detail in Section 3.3.4.2 (Impacts) Issue 2: "How would project noise and human activity affect sage-grouse?" MVE would be required to avoid repeated or sustained noise that is 10 dBA greater than baseline levels at the lek from 6:00 p.m. to 9:00 a.m. within 2 miles (3.2 km) of leks during the lekking season (BLM-required mitigation measure A).

Comment ID	Commenter	Public Comment	Response to Comment
			The sage-grouse population trends both locally and regionally are described in EIS Section 3.3.4.1.2 (Sage-Grouse Population and Distribution). This section discloses the status of leks within 6.8 miles of the siting corridors, population trends, and adaptive management population triggers. This EIS analysis recognizes these triggers and evaluates impacts as the BLM has prescribed in their resource management plan for sage-grouse (BLM 2015a). As described in the "Sage-Grouse Population and Distribution" section, populations across Idaho have been consistently below the 2011 baseline in Idaho, and these declines tripped adaptive management population triggers in Important HMAs (since 2018) and Priority HMAs (since 2019) in the Desert mid-scale area that are currently operational (i.e., the populations have not increased to the 2011 baseline or above, and the triggers cannot yet be removed; State of Idaho 2022). The sage-grouse management requirements, including buffer distances required for different disturbances, are shown in EIS Table 3.3-23 (Greater Sage-Grouse Buffer Requirements). The summary of impacts by alternative, calculated in acres of disturbance to sage-grouse habitat, are shown in Table 3.3-25 (Summary of Impacts to Greater Sage-Grouse). Both direct and indirect impacts, including loss of habitat, were considered for each alternative. The project would affect Greater HMAs and not Priority HMAs or Important HMAs. The number of acres that would be mitigated are based on calculations from IDFG's Habitat Quantification Tool; the process is described in detail in IDFG's Idaho Habitat Quantification Tool Analysis of Potential Effects of the Lava Ridge Wind Energy Project on Greater Sage-Grouse (IDFG 2022a). According to the greater sage-grouse ARMPA (BLM 2015a:Idaho): "Designate and manage GHMA as open for wind and solar testing and development . . . subject to required design features and buffers."
10442-8	Jan Simpkin, Melody Asher, Randy Smith, Sarah Harris, Patricia Weber; Prairie Falcon Audubon	Greater Sage-Grouse P. 3-126 In the DEIS it is stated, " The trend for increased renewable energy development in the analysis area (see Section 3.3.4.1.4, Existing and Future Trends and Actions) and the potential additive or synergistic effects of other renewable energy projects (of similar size and scale) in combination with the Lava Ridge Wind Project would compound habitat loss and fragmentation on greater sage-grouse populations and their habitats. As more sage-grouse habitat is disturbed and converted, sage-grouse activity and lek attendance may decrease. Additional construction and operation of projects would lead to more anthropogenic noise sources and perching opportunities for sage-grouse predators. The potential effects of the expansion of wind energy on sage-grouse populations would depend on a number of site-specific variables at each project location, the number and size of infrastructure, and the implementation and effectiveness of mitigation measures to reduce impacts". Comment: The Greater Sage-Grouse is a conservation-reliant umbrella species! The Greater Sage-Grouse has a complex life history that includes seasonal migrations to meet its needs. Local disruption of any part of the annual cycle could result in long-term impacts over a wider portion of the species' range. There is a vast amount of peer-reviewed literature linking habitat loss to reductions in population abundance, species richness, genetic diversity, population growth, breeding success, predation, and foraging success. The smallest North American sparrow, the Brewer's Sparrow is considered an especially sensitive species. Reports show that the bird has been steadily declining over the last few decades despite once being among the most abundant birds in the large area known as the Intermountain West. Much like the sage-grouse, fragmentation and loss of sagebrush habitat is a key threat to this bird. Research shows that these sparrows are more abundant near large sage-grouse leks, suggesting that conservation of breeding habitat for sage-grouse could also benefit this sparrow.	The literature linking habitat loss to sage-grouse population declines across its range is described in EIS Sections 3.3.4.1.1 (Sage-grouse Habitat) and 3.3.4.2.2 (Alternative B [Proposed Action]), Issue 3. This EIS section summarizes literature related to the effects of habitat loss and development in sage-grouse habitat on population abundance, predation, breeding success, and seasonal use areas. Genetic diversity relates to connectivity within and among populations. If populations become isolated connectivity is reduced. Impacts to connectivity were identified for the action alternatives (as described in EIS Sections 3.3.4.2.2 through 3.3.4.2.6). Impacts to seasonal life stages for sage-grouse are analyzed for each alternative and summarized in Table 3.3-25 (Summary of Impacts to Greater Sage-Grouse). This EIS is focused on impacts to the sage-grouse population occupying the Timmerman Hills and Craters of the Moon BLM HAF units; impacts to the species' range outside of these areas is out of scope for this EIS. A summary of the historical and current national status of the species and the factors affecting its decline are reviewed in EIS Section 3.3.4.1.1 (Sage-Grouse Habitat) and Section 3.3.4.1.2 (Sage-Grouse Population and Distribution). If the BLM selects an action alternative and a ROW is granted, any action alternative would require compensatory mitigation that would result in a net conservation gain, as required by BLM (2015a).
10512-2	S. (No Last Name Provided)	I also have major concerns with the year round resident populations of sensitive species. Where did the support for sage grouse go? There are several populations present right now in the impact areas of Lava Ridge and introducing the wind turbines is a double negative for these magnificent birds. The loss of habitat, increased human traffic, and let a lone the birds strikes that will occur from the turbines will lead us down a path that will not allow a return of these periled avians.	The BLM's resource management plans outline sage-grouse management requirements (BLM 2015a), including avoidance and minimization measures. All of these requirements, including the buffer requirements summarized in Table 3.3-23 (Greater Sage-Grouse Buffer Requirements), would apply to the project. In addition, any action alternative would require compensatory mitigation that would result in a net conservation gain, as required in BLM (2015a).
11188-3	Clare Josaitis	The DEIS states that "In addition, because the siting corridors are in a General habitat management area (HMA) for greater sage-grouse (Centrocercus urophasianus), the area is designated as open to wind energy development per BLM (2015)." Stating that the area is "designated" as open to wind energy development is misleading at best. The project area is not specifically identified or ascribed as such.	The draft EIS shows the project is in a General HMA for sage-grouse. Table 2-1 of Attachment 1 of BLM (2015a) specifically stipulates General HMAs in Idaho are open to wind development.
11195-6	Sandra Callen	Several years ago the BLM spent years in the Rogerson area studying the Sage Grouse! Please do not disturb them!	See response to comment 10512-2 (see in Table A-3e, Greater Sage-Grouse).
11204-9	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	III. Land Use Plan violation: The 2021 Comments requested that the Permittees be provided with the most recent sage-grouse habitat maps (at pg. 9) and lek maps (at pg. 11) and noted that "MD RE 1 in the 2015 Idaho ROD-ARMPA requires conformance to the buffers and RDFs even in General Habitat Management Areas, like those that would appear to be within the Star Lake Allotment." See 2021 Comments, pg. 10. Summary: The DEIS inadequately considered and assessed the GHMA within the Star Lake Allotment, inclusive of leks. The DEIS is not grounded upon any on-the-ground monitoring of sage grouse within the Star Lake Allotment. Sage grouse exist in the Allotment. The 2021 Comments stated that, assuming the Star Lake Allotment is within a GHMA, the Permittees note several management directions associated with Wind Energy development within the 2015 Idaho ROD ARMPA which must be followed by any intended Project, as follows: • Section 2.1.1 -- Special-status species: Goal SSS 1, 2, 3, 4, 5; Objective SSS 1, 2, 3, 4, 5; MD SSS 27 (Anthropogenic Disturbance); and • Section 2.2.7 –Renewable Energy (Wind and Solar): MD RE 1 (wherein it is stated that "GHMA (Idaho): Designate and manage GHMA as open for wind and solar testing and development and nuclear and hydropower development subject to RDFs and buffers.") The Comments added that "[a]ny NEPA process should assess all applicable management direction relative to the intended Project as to the Star Lake Allotment, as well as ensure any authorization documents are in conformity with such management direction as per 43 C.F.R. § 1610.5-3(a)."	The BLM has added avoidance and minimization measures in Section 3.3.4.2 (Impacts) from Alternative B with Additional Measures: Prior to construction, MVE's compliance manager would consult with IDFG for technical assistance and would conduct lek surveys in previously un-surveyed areas identified by MVE as marginal habitat within 3.1 miles of the siting corridors. RDFs (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a).

Comment ID	Commenter	Public Comment	Response to Comment
		2021 Comments, pg. 10; see also 2021 Comments, pgs. 9-13. After submission of the 2021 Comments, Permittees were provided a copy of the recent sage-grouse habitat maps and lek map by the Idaho Office of Species Conservation (“OSC”). See Attachment #5. The map confirmed that the area within the Star Lake Allotment is currently classified as a “General Habitat Management Area” for greater sage-grouse and stated that there are no known “occupied” leks within the Allotment (although the 3.1 mile buffer around an occupied lek to the N of the Allotment boundary and another occupied lek to the E of the Allotment boundary slightly overlap into the Allotment). See Attachment #5; see also DEIS, pg. ES-v (wherein “because the siting corridors are in a General habitat management area (HMA) for greater sage-grouse (Centrocercus urophasianus), the area is designated as open to wind energy development per BLM (2015)”). The DEIS did not adequately address these issues. The DEIS recognizes that the 2015 Idaho ROD-ARMPA (referenced as BLM 2015 in the DEIS) “established required design features (RDFs) for certain activities in all sage-grouse habitats” including requirements “to avoid certain actions within a specified distance of occupied leks.” DEIS, pg. 3-114; see also DEIS, pgs. 3-107 to 3-115. DEIS, Table 3.3-13 at pg. 3-114 lists the applicable distance buffers required for occupied leks that were applied as sideboards for all action alternatives to conform with throughout the DEIS analyses. However, the lek data disclosed in the DEIS is inadequate so as to prescribe the applicable RDFs, inclusive of buffers. Specifically, the DEIS only reports a reliance upon “desktop habitat assessment (WEST 2020) and preliminary consultation with IDFG,” DEIS, pg. 3-112, as the means for conducting aerial and ground lek surveys to “check known lek locations and identify new lek locations,” DEIS, pgs. 3-112 to 3-113. In fact, as to the later, the DEIS reported that “Aerial surveys for new leks were conducted in areas considered potentially suitable sage-grouse habitat and where known leks had recently been active.” Emphasis added. In other words, the surveys the DEIS relied upon only searched for new (or previously undocumented) sage grouse leks near “known lek locations” which were recently active. If new or previously undocumented sage grouse leks are present within other portions of the proposed Project area the aerial surveys that were conducted could not have discovered them because these areas were not searched. Thus, the DEIS considered and assessed the application of RDFs and other sage-grouse related management directions only to previously “know leks” that “had recently been active” not because there are no other active leks within the proposed Project area, but because the survey methodology used to search for undocumented leks failed to survey areas that are distant from the know active leks. See Attachment Nos. 6, 7. This eliminated any consideration or assessment of GHMA within the Star Lake Allotment for any leks, whether new, occupied, active, unoccupied, or not previously documented. This skewed the analysis in the DEIS relative to assessing sage grouse habitat use within the project area and in prescribing applicable sage-grouse management direction within (at least) the Star Lake Allotment. This is particularly concerning given the fact that with respect to sage grouse (among many other resources) the “impacts duration is estimated to be a total of 84 years” (DEIS, pg. 3-102). The duration of the project itself warranted a broader consideration and assessment of the sage grouse habitat and lek locations, whether occupied, active, or unoccupied. Permittees have observed and documented sage grouse occupying and using habitat within the Star Lake Allotment. Attachment #8 contains photographs of sage grouse taken in the Star Lake Allotment in the fall of 2021 and 2022 and early winter of 2022. Additional sage grouse observations have been made by the Permittees year-round in areas just south of Star Lake and near 26 Mile Lake, including observations in the spring period. Because these observations include sightings made during the breeding season, it is reasonable to expect that undocumented lek(s) exist within the Star Lake Allotment.	
11211-2	Patrick Kelly; Western Watersheds Project	Greater Sage-Grouse: We appreciate that as currently planned, the Project site appears to conform to the Idaho BLM sage-grouse plans’ prohibition against wind energy development in Priority Habitat Management Areas (PHMAs). However, the Project has been sited in sage- grouse General Habitat Management Area (GHMA), which means that it will negatively impact sage-grouse, a species that continues to decline in abundance in Idaho and the West (Coates et al, 2021).1 The draft EIS contains several concerning elements that would pose serious threats to sage-grouse if the Project were approved: 1) Lack of adequate GRSG data: The gaps in knowledge and data regarding sage grouse in the analysis area, especially lek data, is woefully and unacceptably inadequate for a project of this size, scale, and duration. In the DEIS, BLM identifies eight leks "within 6.8 miles of the siting corridors" that have an “undetermined management status” (3-113).2 The BLM appears to group these “undetermined” leks into two sub-categories: Leks not “surveyed or documented as active in the last 5 years”, or leks with “insufficient survey information” (DEIS at 3-113).3 There are multiple problems that arise from this: • BLM must apply the 2015 Idaho Sage-Grouse ARMPA-required protective lek buffers to the eight undetermined leks. It appears from the limited information in the DEIS that these leks were designated as occupied, and that BLM lacks the five consecutive years of survey data to now designate them as unoccupied. The 2015 ARMPA provides that “[t]o be designated unoccupied, a lek must be inactive . . . for five consecutive breeding seasons.”(BLM, 2015). A lek is “inactive” where survey data show there “[w]as no strutting activity throughout a breeding season.”(BLM, 2015). Absent five consecutive years of survey data demonstrating that these leks were inactive in each year, BLM cannot lawfully treat these leks as unoccupied. Out of the eight “undetermined” leks listed in the DEIS, seven of them were last surveyed in 2018, falling far short of the required five consecutive years of surveys needed to establish occupancy status.4 The eighth lek (4L008) was surveyed in 2020 and 2022 (not in 2021), which likewise falls short of the 5 consecutive year requirement under the ARMPA.5 Additionally, the “undetermined” status is not one recognized by the governing 2015 Idaho Sage-Grouse ARMPA. The ARMPA contains only four possible lek status designations —active, inactive, occupied, and unoccupied. That the state has applied an “undetermined” status to these leks does not allow BLM to depart from the management definitions and protections in its own RMP. (See Ctr. for Biological Diversity v. United States Bureau of Land Mgmt., No. 4:21-CV-00182-BLW, 2023 WL 387609, at *1 (D. Idaho Jan. 24, 2023)). •	In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM’s independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG’s definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent

Comment ID	Commenter	Public Comment	Response to Comment
		Having insufficient survey information, by definition, cannot not allow for any conclusion to be reached as to the occupancy of the lek. Thus, BLM cannot write off any leks that lack data by simply claiming ARMPA compliance until they have definitively and appropriately established the occupancy status of the leks in question. Insufficient survey information does not legally or ecologically justify equating "undetermined" with "unoccupied", which is what BLM appears to be doing here. This is a pretty clear attempt to skirt the ARMPA buffer stipulations by not definitively establishing occupancy status. As already noted above, this is inconsistent with the 2015 Idaho Sage-Grouse ARMPA and is illegal. • As to these "undetermined" leks, it is also noteworthy and rather conspicuous that nearly all of them are much closer to the siting corridor than those listed as occupied, thus situating them to experience the most severe impacts from the Project (i.e. noise, dust, increased predation, habitat loss, etc). Undetermined leks 2J010-2J014, along with 2J017 and 2J021 are all extremely close to the siting corridor, with many of them listed as being "0 miles" away (DEIS, 3-113 and 3- 114). In other words, having insufficient survey information or otherwise not having confirmation of the occupancy status of these leks runs the risk of severely impacting any lekking grouse in these areas. BLM must gather the data and remedy this "insufficient survey information" in order to both follow the law and to avoid these potentially disastrous consequences.	change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to project construction, MVE's compliance manager would consult with IDFG for technical assistance and conduct lek surveys on previously un-surveyed areas identified by MVE as unsuitable habitat (WEST 2021) within 3.1 miles of the siting corridors. These areas would be surveyed by the compliance manager to search for leks that have not yet been identified (see Table App4-4). Required design features (RDFs) (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a).
11211-6	Patrick Kelly; Western Watersheds Project	2) BLM does not adequately account for impacts on sage-grouse resulting from exponential increase in use of roads and associated noise: • The DEIS estimates that under the proposed action there will be an astonishing 2,427,698 vehicle trips associated with the construction, operation, and decommissioning of the project (Table 2-5).6 The analysis of sage-grouse impacts offered in the DEIS for such an incredible increase in vehicle traffic is woefully inadequate. While focusing almost exclusively on road noise impacts to lek sites, BLM offers little to no analysis of the impacts a massive network of heavily trafficked roads (both new and existing) will have on sage-grouse outside of the lek buffer. This is especially problematic given that BLM fully acknowledges that impacts from roads will extend well beyond lek buffer zones (i.e. beyond Spring SUAs) (DEIS,3-118 & 3-116). Citing a study done on road impacts to sage grouse, BLM acknowledges that roads can affect sage-grouse by fragmenting and altering habitat, increasing human presence (resulting in disturbance and displacement of birds), increasing the risk of collision with vehicles, potentially reducing nest initiation rates of hens (Lyon and Anderson, 2003), or increasing the distance hens move to find nest sites (DEIS, 3-123). Additionally, BLM openly states that road usage would increase both predation rates and habitat fragmentation (DEIS, 3-123).Yet, despite this acknowledgment of road impacts, BLM does not offer any analysis as to what these impacts will look like beyond generalized observations and quantification of functional habitat loss (DEIS, . How will this massive increase in road usage impact sage-grouse the population numbers and breeding success in the project area and the broader sage-grouse HAF units (i.e. Craters of the Moon & Timmerman Hills) Is there any estimate as to how many birds will be lost, displaced, or otherwise eliminated from the region? What does this mean for the broader sage grouse population in the Desert IHMA/PHMA/SFA areas to the north, where hard population triggers were hit in 2018 and 2019 and remain operational?(DEIS, 3- 112).	EIS Section 3.3.4.2.2 (Alternative B [Proposed Action]) Issue 2 analyzes effects within the full extent of increased noise from the project, not just in lek areas. "Noise could be up to 29.3 dBA (10 dBA more than existing background noise levels for unoccupied open rangeland, which is 19.3 dBA) within 6.8 miles of the siting corridors (Figure D-1 of Appendix 4 in SWCA [2022]) and attenuate to background levels beyond 6.8 miles." "Estimated noise levels from construction traffic at the closest occupied lek (approximately 3.1 miles from access road) would be 25.2 dBA for a traffic level of 400 vehicles per hour (SWCA 2022), a 9.2-dBA increase over the assumed existing daytime noise level of 16 dBA". A review of studies evaluating the effects of roads on sage-grouse is presented under EIS Section 3.3.4.2.2 (Alternative B [Proposed Action]) Issue 3. Any action alternative would require compensatory mitigation that would result in a net conservation gain for sage-grouse, as required by BLM (2015a).
11211-7	Patrick Kelly; Western Watersheds Project	3). BLM does not properly or adequately assess the population level impacts that will result from inevitable loss and fragmentation of Summer and Winter SUAs • With its exclusive focus on leks and lek buffers, BLM effectively ignores and/or avoids any meaningful analysis of the impacts to sage grouse populations that disruption of both Summer SUAs (late brood-rearing), and Winter SUAs will have. Since BLM includes lekking, nesting, breeding, and early brood-rearing habitat under the Spring SUAs, the lek buffers and mitigation measures they require only address impacts to those areas (DEIS, 3-108). This becomes particularly concerning when we see that 40% of the acreage in the siting corridor for the proposed action (Alt. B) is not within Spring SUAs, and is instead comprised of Summer and Winter SUAs (DEIS, 3-111). BLM bluntly states that this will lead to fragmentation of sage-grouse habitat by "adding turbines, new roads, fences, overhead 34.5-kV collector lines, 230-kV transmission lines, and 500-kV transmission lines in sage- grouse habitat (General HMAs)."(DEIS, 3-118). As BLM makes clear, these areas are already suffering from serious fragmentation and connectivity issues due to 75% of the "linkage areas" that connect seasonal habitats being rated as "marginal" or "unsuitable" (DEIS, 3-111). The further fragmentation and destruction of Summer and Winter SUAs that will result from the project, which BLM acknowledges, will likely finish off whatever habitat remains and completely sever sage grouse connectivity with the surrounding regions (esp. those regions north of Highway 24) (DEIS, 3-111). This habitat, and the sage grouse populations that depend upon it, are being quietly sacrificed and no meaningful analysis is provided to quantify what this entails for the future of sage grouse in the broader area. BLM must properly account for this loss and make clear assessments and provide robust analyses that show what kind of population loss this will entail.	Impacts were analyzed to seasonal use areas by calculating number of acres of ground disturbance from direct or indirect impacts (see EIS Table 3.3-25 [Summary of Impacts to Greater Sage-Grouse]). As described in EIS Section 3.3.4.4 (Compensatory Mitigation), these were used in calculating functional acres of habitat lost, which determines HQT mitigation debits, or how much mitigation would be required. The habitat within the project area is heavily impacted by disturbance and in poor condition. Any action alternative would require compensatory mitigation that would result in a net conservation gain, as required by BLM (2015a).
11327-8	Michael Gibson, Daly Edmunds, Garret Visser; Idaho Wildlife Federation	IV. BLM must analyze Greater Sage-grouse population impacts based on new court decisions. Despite the proposed wind farm occuring within an area designated as open to wind energy development per BLM (2015), the current situation with Greater Sage-grouse (sage-grouse) is different. There is extensive new scientific information, there are continued declines of sage- grouse habitats and populations, and there are changes in the sagebrush landscape due to drought, fire and climate change. For these reasons, the BLM is pursuing revisions to the 2015 Plans. In regards to this proposed development, caution should be taken when pursuing actions that could cause further harm to Greater Sage-grouse. In March 2021, U.S. Geological Survey (USGS) researchers released a scientific report that provides one of the most comprehensive population trend modeling efforts ever undertaken for the species.24 The report describes an overall decline in the number of sage-grouse across the majority of their range, something previous studies have shown as well. Since 1965, sage-grouse populations have declined 80.7% range-wide (~3% decline per year), including areas where the decline has not been as severe. Since 2002, range-wide populations have declined 37%. Furthermore, 78% of leks have a greater than	Functional Habitat: The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. These habitat categories are used in the HQT process to determine debits (IDFG 2022a). Impacts were analyzed to seasonal use areas by calculating number of acres of ground disturbance from direct or indirect impacts (see EIS Table 3.3-25 [Summary of Impacts to Greater Sage-Grouse]). As described in EIS Section 3.3.4.4 (Compensatory Mitigation), these were used in calculating functional acres of habitat lost, which determines HQT mitigation debits, or how much mitigation would be required. The habitat within the project area is heavily impacted by disturbance and in poor condition. The project is proposed in General HMA, which has a lower breeding density of male sage-grouse. Even though all siting corridors are in a mapped General HMA, sagebrush cover is limited to a few portions of the project area. Any action alternative would require compensatory mitigation that would result in a net conservation gain, as required

Comment ID	Commenter	Public Comment	Response to Comment
		50% probability of extirpation in the next 56 years. Idaho is no exception in exhibiting declining grouse populations. The state continues to have a declining trajectory from peak counts in 2016, with 2019 appearing to be a nadir and stronger declines occurring north of the Snake River.25 We believe the BLM should analyze three impacts on sage-grouse habitat and populations that were not included in the DEIS: functional habitat loss, risk of extirpation, and connectivity between sage-grouse populations. These three points are highlighted in the recent decision in Center for Biological Diversity v. U.S. Bureau of Land Management (D. Idaho, 2023). In this case, a federal judge ruled that the BLM's approval of the Caldwell Canyon phosphate mine failed to adequately assess impacts to sage-grouse, sage-grouse habitat, and habitat connectivity. Judge Windmill concluded that the BLM did not discuss or analyze the impacts of the approved project on functional habitat in areas outside of identified leks, and only accounted for the footprint of the project area- not taking into account the impacts outside of the project footprints, such as in the buffer zones.26 The court also concluded that the BLM failed to adequately consider and analyze whether the project would put the local sage-grouse population at greater risk of extirpation, despite the BLM contending that the issue of extirpation is critically interrelated to the loss of functional habitat and that habitat loss is addressed in their analysis. Finally, the court determined that the BLM violated NEPA by failing to consider how the mine would impact connectivity between sage-grouse populations.27 We do not believe the BLM has analyzed how the project would impact connectivity between sage-grouse populations and relies upon habitat connectivity to make its determination. As stated in the Caldwell Canyon ruling, "Population connectivity is critical for maintaining the viability of the species because it allows for genetic interchange and movements between breeding populations. Loss of population connectivity can increase population isolation and result in the loss of genetic diversity and extirpation from stochastic events, such as drought or wildfire."28 This recent decision should be carefully considered by the BLM in how it analyzed impacts to sage-grouse in the Lava Ridge DEIS.	by BLM (2015a). Both direct and indirect effects were considered and included in the EIS (Sections 3.3.4.2.2 through 3.3.4.2.5, Alternatives B through E) and used in the HQT analysis (IDFG 2022a, which is also EIS Appendix 7). The final HQT calculations for the Preferred Alternative are summarized in EIS Greater Sage-Grouse, Compensatory Mitigation section. Information about broader population trends across the sage-grouse range, across the state of Idaho, and at a local and regional level has been added to the Sage-Grouse Population and Distribution section. Information regarding population connectivity has been added to the EIS in Section 3.3.4.2 (Impacts), Issue 3 and analyzed in each alternative.
11346-2	George Parker, John Arkoosh	The DEIS failed to do a thorough inventory of sage grouse in the project area. The permittees of the Star Lake allotment have documented through photographic evidence and GPS waypoints, as well as testimony of permittees that sage grouse are much more prevalent than has been represented in the DEIS. Permittees further believe there are unidentified LEKs in the project area. This warrants further investigation before any build alternative is permitted. In recent years much of the area has burned, but the Star Lake allotment had tremendous stands of sage brush before these fires and still does have areas of older sage brush to support grouse. The brush is reestablishing in many areas. The idea of squandering the habitat that we have for all the wildlife of this project area, and that being endorsed by the Department of Interior is a concept so foreign to me that I cant comprehend it!	In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM's independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG's definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to project construction, MVE's compliance manager would consult with IDFG for technical assistance and conduct lek surveys on previously un-surveyed areas identified by MVE as unsuitable habitat (WEST 2021) within 3.1 miles of the siting corridors. These areas would be surveyed by the compliance manager to search for leks that have not yet been identified (see Table App4-4). Required design features (RDFs) (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a). Even though all siting corridors are in mapped General HMA, sagebrush cover is limited to a few portions of the project area. The amount of seasonal sage-grouse habitat in these areas is shown in Figure 3.3-7 (Greater sage-grouse seasonal use areas) and Table 3.3-20 (Mapped Greater Sage-Grouse Seasonal Use Areas in the Analysis Area and Siting Corridors). Intact sagebrush habitat and known lek locations were important factors used to help guide project siting and avoidance and minimization measures (see Appendix U [GRSG Mitigation Plan] in MVE [2023]). With the exception of Alternative B, areas north of ID 24 were initially avoided because

Comment ID	Commenter	Public Comment	Response to Comment
			they connect intact sagebrush. All disturbance was sited 3.1 miles away from leks, and seasonal timing restrictions in General HMAs will be required."
11527-6	Richard Stover; State of Idaho	Wildfire is one of the primary threats to greater sage-grouse habitat. If approved, the Project must ensure neither fire nor loss of habitat compromises Idaho's Sage-grouse Management Objectives. The DEIS fails to analyze fire risks associated with malfunctioning turbines, which can act as an ignition source for wildfire.	See response to comment 2100-5 (see in Table A-3e, Greater Sage-Grouse).
11527-7	Richard Stover; State of Idaho	The State of Idaho manages sage-grouse in accordance with the following key guidance documents: (1) Executive Order 2022-03 "Adopting Idaho's 2021 Sage-Grouse Management Plan and Idaho Sage-Steppe Mitigation Process," (2) "Idaho 2021 Plan: Policy for Greater Sage-Grouse Management in Idaho," (3) "Idaho Sage-Steppe Mitigation Principles," and (4) State of Idaho- BLM 2019 sage-grouse memorandum of agreement (MOA) as implemented consistent with BLM Instruction Memorandum 2021-038 (https://gov.idaho.gov/wp-content/uploads/2022/03/Attachment3_BLMMOA-FINAL.pdf). Accordingly, the final EIS must analyze a range of potential mitigation measures that offset adverse Project effects to sage-grouse based on results of the HQT and Idaho's key sage-grouse guidance documents. Moreover, the BLM must coordinate with the Project applicant and State of Idaho to develop and incorporate in the final EIS and ROD a Mitigation Plan that specifies how compensatory mitigation will adequately and effectively offset unavoidable adverse effects on sage-grouse.	The GRSG Mitigation Plan (Appendix U in MVE [2023]) will be updated prior to the notice to proceed for project construction to include more details on compensatory mitigation options. See also the Mitigation Framework for Greater Sage-grouse in EIS Appendix 4. Preference will be to offset impacts close to where the project impacts would be, i.e., at the fine-scale HAFs, then the conservation area, followed by the other conservation areas in Idaho.
11527-16	Richard Stover; State of Idaho	Currently the DEIS and its associated appendices do not disclose how compensatory mitigation will be implemented for adverse Project effects on sage-grouse. The State recognizes that the BLM is analyzing how the Project would potentially affect sage-grouse and is considering a range of potential mitigation measures to avoid and minimize adverse effects. This is evident in the DEIS sections discussing Required Design Features (RDFs), avoidance and minimization measures such as buffers and seasonal restrictions, and the State's Habitat Quantification Tool (HQT) Results for each DEIS action alternative. However, none of these DEIS sections discuss options that the BLM is analyzing as compensatory mitigation to offset unavoidable (i.e., residual) adverse Project effects on sage-grouse.	See response to comment 11527-7 (see in Table A-3e, Greater Sage-Grouse).
11534-16	Matt Arnold, William Eubanks	The DEIS May Underestimate Greater Sage-grouse Populations Section 3.3.4 of the DEIS discusses potential Project effects on the Greater Sage-grouse, a species whose "populations in Idaho have shown an overall declining trend since 1965." DEIS at 3-112. This discussion is entirely predicated on the Project proponent's surveys of the analysis area. Id. at 3-112–113 ("Aerial surveys for new leks were conducted in areas considered potentially suitable sage-grouse habitat and where known leks had recently been active"; however, "[n]o new lek locations were identified during aerial surveys."). Based upon their review of the DEIS's surveys and their intimate knowledge of the Project area and the resources contained therein, SLR and its members maintain that BLM has not conducted adequate surveys for the Greater sage-grouse and its leks. In support, they have attached photographs taken by members that are geo-tagged to locations not included in the agency or Project proponent's surveys. See Attach. (Greater Sage-grouse Sightings within Project Analysis Area). SLR, therefore, requests that these sightings be investigated by BLM and its impact analyses amended accordingly.	The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to construction, MVE's compliance manager will consult with IDFG for technical assistance and will conduct lek surveys on previously un-surveyed areas identified by MVE as marginal habitat. These areas will be surveyed by the compliance manager to search for leks that have not yet been identified. RDFs (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a). In addition, the most current and available lek count and sage-grouse telemetry data from IDFG were used, as required.
11535-14	Steven Andersen	The DEIS fails to adequately address and mitigate the irreparable harm the project will cause to the greater sage-grouse.30 The research and analysis provided by the agency relies on unsupported assumptions, based on inadequate observations of sage-grouse, causing the baseline numbers for comparative analysis to be grossly inadequate. The proposed impact duration is estimated at an astounding 84 years, which includes 34 years for the life of the project, and an additional 50 years for final reclamation. 31 This duration is highly concerning on its own, but even worse, it is still an underrepresentation of the actual impact duration given the unprecedented magnitude of the project, and the agency must take a harder look at the impacts to sage-grouse.32 The DEIS does not adequately address and alleviate the severe, irreparable impact to the greater sage-grouse. Wind requires less infrastructure but results in higher levels of habitat fragmentation, because their impacts are geographically scattered rather than concentrated.33 Not only does the DEIS fail to identify the specific location of the many oversized turbines, but the vague siting corridor it does identify fails to restrict wind energy site testing and monitoring and wind energy development from occupied and suitable habitat for special-status species, including the greater sage-grouse, where their direct and indirect adverse effects cannot be mitigated. The project fails to address how it will manage vegetation to restore the resiliency of ecosystem structure and function and reduce fragmentation of habitat for sage-grouse and other native species. Importantly, energy development should be discouraged in breeding habitats, but the project does not do so.34 In short, the DEIS falls well below the required standard and does not rigorously evaluate the negative impacts to the greater sage-grouse.	BLM (2015a) outlines a hierarchy of mitigation priorities, where projects should be designed to avoid and minimize impacts to the extent possible (mainly through project siting and seasonal restrictions for specific activities), and any remaining residual impacts should be addressed through compensatory mitigation. This is described further in Section 3.3.4.4 (Compensatory Mitigation). Intact sagebrush habitat and known lek locations were important factors used to help guide project siting and avoidance and minimization measures (see Appendix U [GRSG Mitigation Plan] in MVE [2023]). With the exception of Alternative B, areas north of ID 24 were initially avoided because they connect intact sagebrush. All disturbance was sited 3.1 miles away from leks, and seasonal timing restrictions in General HMAs would be required. As described throughout the EIS and as required in BLM (2015a), the project was designed to avoid placing infrastructure within 3.1 miles of known, active leks (there are 3 within 6 miles of the siting corridors). The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. The project is proposed in General HMA, which has low breeding density of male sage-grouse. Even though all siting corridors are in a mapped General HMA, sagebrush cover is limited to a few portions of the project area. Knick et al. (2013) and Row et al. (2018) have documented the importance of landscape-scale sagebrush cover for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013) and more than 25% sagebrush cover within a 18.6-mile (or 30-km) radius (Row et al. 2018). Even with the implementation of applicant-committed measures and other mitigation described in EIS Appendix 4, impacts to sage-grouse would remain. Compensatory mitigation would be required, and more details are in the GRSG Mitigation Plan (Appendix U in MVE [2023]). MVE has a set of options to provide compensatory mitigation for unavoidable impacts to greater sage-grouse habitat on BLM public lands, which are described in the Mitigation Framework for Greater Sage-grouse section in EIS Appendix 4 (Mitigation).
11535-16	Steven Andersen	The DEIS relies on inadequate baseline data. Specifically, the agency purportedly relied on Idaho's Habitat Quantification Tool to estimate the number of sage-grouse and site scale. The functional acre debits are underestimated and fail to reflect mature sagebrush areas within the project areas, and fail to properly consider the degree to which the substantial impacts should affect debit calculations. There were no independent surveys conducted at proposed facility sites to determine impact on populations, and no meaningful cumulative impacts	Analysis of impacts to sage-grouse populations beyond the analysis area is out of scope for this EIS. However, information on population trends from Coates et al. (2021) range wide, within Idaho, and at local and regional levels relevant to the affected population were added in the Sage-Grouse Population and Distribution section of the EIS. The most current and available sage-grouse lek count and telemetry data from IDFG were used, as required by BLM (2015a). BLM (2015a), EIS Appendix 4, and EIS Section 3.3.4.1.3 (Sage-Grouse Management

Comment ID	Commenter	Public Comment	Response to Comment
		analysis discussing existing conditions. Even more, the DEIS does not provide for varying degrees of protection (protective measures), and it is conclusory as to whether the project will cause sage-grouse to be listed as a threatened or endangered species. The DEIS also fails to consider that the sage-grouse range covers multiple states and connectivity of habitat requires a large-scale analysis that transcends a single state.	Requirements) lay out development restrictions and extra protections that the project is required to implement to reduce impacts to this sage-grouse population. The project was designed so that no infrastructure would be placed within 3.1 miles of known, active leks (there are 3 within 6 miles of the siting corridors). The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. These habitat categories are used in the HQT process to determine debits (IDFG 2022a).The project is proposed in General HMA, which has a lower breeding density of male sage-grouse. Only a portion of the project occurs in sage-grouse habitat. Additional protective measures for greater sage-grouse were included in EIS Appendix 4 in the Applicant-Committed Measures, Mitigation Required, and Additional Project-Specific Mitigations sections. The final HQT calculations for the Preferred Alternative are summarized in EIS Greater Sage-Grouse, Compensatory Mitigation section.
11535-17	Steven Andersen	The DEIS has not adequately addressed the proper management of the greater sage-grouse, i.e., population management, general habitat management, breeding habitat management, habitat protection, habitat restoration, etc..39 The DEIS also provides inadequate buffer zones to occupied leks. Before making management decisions, agencies should cooperate to first identify lek locations and determine whether a population is migratory or nonmigratory.40 In the case of migratory populations, migration routes and seasonal habitats must be identified to allow for meaningful and correct management decisions—the DEIS fails to do so.	Appendix B of BLM (2015a) states “In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.” BLM used the most current available sage-grouse lek count and telemetry data from IDFG, as required, and field surveys completed for the project. The areas identified as sagebrush habitat and the known lek locations were important factors used to help guide project siting and minimization measures (EIS Appendix 4). Functional habitat loss has been calculated by the State of Idaho (2021a) and debits for this project have been determined. Compensatory mitigation would be required, and more details are in the GRSG Mitigation Plan (Appendix U in MVE [2023]). BLM (2015a) determined lek buffer distances, which are summarized in EIS Table 3.3-23 (Greater Sage-Grouse Buffer Requirements).
11535-18	Steven Andersen	Further, the DEIS indicates only a 3.1-mile buffer from occupied leks, which is inadequate.42 There should be a 5-mile buffer between leks and wind turbines, which is impossible to determine at this point because the DEIS does not identify specific locations for the turbines.43 These guidelines should be implemented over an entire seasonal range.	The greater sage-grouse ARMPA (BLM 2015a) based lek buffer distances on the best available science (Manier et al. 2014). These buffer distances are summarized in EIS Table 3.3-23 (Greater Sage-Grouse Buffer Requirements). All leks must be at least 3.1 miles from the edge of the siting corridor. The locations of all turbines would be within the siting corridors. Compensatory mitigation would be required, and more details are in the GRSG Mitigation Plan (Appendix U in MVE [2023]).
11535-19	Steven Andersen	Noise impacts have not been properly analyzed as to sage-grouse impacts. The DEIS expressly states, “the effects of noise from construction and ongoing wind farm operation on sage-grouse have not been specifically studied….” 45 Even less, for a project of this unprecedented magnitude. Ultimately, increased difficulty in finding leks or assessing males on the leks may lead to lower female attendance on noisy leks compared with quieter locations.46 Males may also avoid leks with high levels of noise if they perceive that their vocalizations are masked.47 Noise also causes stress to sage grouse.48 There is strong support “for an impact of noise playback on stress levels, with 16.7% higher mean FCM [fecal corticoids, an index of stress] levels in samples from noise leks compared with samples from paired control leks.”49 “Taken together with results from a previous study finding declines in male lek attendance in response to noise playbacks, these results suggest that chronic noise pollution can cause greater sage grouse to avoid otherwise suitable habitat, and can cause elevated stress levels in the birds who remain in noisy areas.”50 Noise at energy development sites is less seasonal and more widespread and may thus affect birds at all life stages, with a potentially greater impact on stress levels.51 Therefore, “[t]he cumulative impacts of noise on individuals can manifest at the population level in various ways that can potentially range from population declines up to regional extinction. If species already threatened or endangered due to habitat loss avoid noisy areas and abandon otherwise suitable habitat because of a particular sensitivity to noise, their status becomes even more critical.52 The DEIS fails to adequately consider these irreparable impacts.	The greater sage-grouse ARMPA (BLM 2015a) determined lek buffer distances, which are summarized in EIS Table 3.3-23 (Greater Sage-Grouse Buffer Requirements). All leks must be at least 3.1 miles from the edge of the siting corridor. The effect of noise on sage-grouse is analyzed in detail in EIS Section 3.3.4.2.2 (Alternative B) Issue 2. The greater sage-grouse ARMPA (BLM 2015a) requires that activities produce no repeated or sustained behavioral disturbance (e.g., visual, noise over 10 dbA at lek) to lekking greater sage-grouse from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season. This measure would apply to the project as described in EIS Appendix 4 (Mitigation). Compensatory mitigation would be required, and more details are in the GRSG Mitigation Plan (Appendix U in MVE [2023]).
11535-21	Steven Andersen	Functional Habitat Loss: The DEIS analysis reflects only areas that would be impacted by direct disturbance—and even then, not sufficiently. Indirect habitat loss was not adequately considered, i.e., that loss which will occur beyond the area impacted by direct disturbance. Such loss may include powerline, road, and railroad avoidance, and fragmentation.54 All of this is significant because such loss can be larger than the project’s physical footprint (which in our case is massive given the scope of the project).55 None, or very little, of agency’s analysis discusses avoidance of habitat fragmentation, or the functional habitat outside of the leks.56 General discussions are insufficient.57 The agency appears to have accounted only for the footprint of the proposed project area and did not take into account the impacts outside of the project’s footprints, such as in the buffer zones (and as stated, the DEIS does not even set the specific location for the turbines). 58 Sage-grouse avoid intact habitat near powerlines, roads, structures, and human noise, and that anthropogenic disturbance can fragment sagebrush habitat into disjointed patches that are unusable to the species.59 The area of influence of roads and powerlines is said to extend roughly 0.6 miles beyond the actual line feature, which the DEIS does not adequately take into account.	Both direct and indirect effects were considered and included in the EIS (Sections 3.3.4.2.2 through 3.3.4.2.5, Alternatives B through E) and used in the HQT analysis (IDFG [2022a], which is also EIS Appendix 7).
11535-23	Steven Andersen	Connectivity Between Populations and Genetic Interchange: The DEIS fails to provide a detailed analysis (or any analysis at all) of connectivity and genetic interchange, which must be discussed separately. 65 Indeed, the DEIS only generally mentions connectivity by making statements such as, “[p]atch connectivity was marginal,” “[w]ildfire has…limited the amount of seasonal habitat and connectivity in this area,” and [c]onnectivity between SUAs was marginal.”66 Such scant analysis is grossly insufficient, and the agency does not even mention genetic interchange.67 This is highly concerning given that “maintenance of connectivity and reduction of fragmentation of sagebrush habitats is key to the long-term welfare of all sagebrush associated species.”68 Even	A discussion of connectivity between populations and genetic interchange has been added to Section 3.3.4.2 (Impacts), Issue 3, and an analysis of impacts on connectivity has been added to each alternative (Sections 3.3.4.2.3 through 3.3.4.2.6).

Comment ID	Commenter	Public Comment	Response to Comment
		"small decreases in lek connectivity [can result] in large increases in the probability of lek abandonment,"69 which is more true given the unprecedented magnitude of the project. Connectivity between sage-grouse populations, or "population connectivity," refers to the ability of sage-grouse to intermingle with neighboring populations.70 "Genetic connectivity" means the extent to which separate populations of a species are able to share genes and thereby to maintain a healthy genetic diversity within each population.71 Connectivity is critical for maintaining the viability of the species because it allows for genetic interchange and movements between breeding populations.72 Loss of population connectivity can increase population isolation and result in the loss of genetic diversity and extirpation from stochastic events, such as drought or wildfire.73 The DEIS does not adequately address any of these important considerations. The agency must conduct a separate genetic connectivity analysis regarding separate sage grouse populations (concerning genetic interchange between otherwise separate sage grouse populations), which it did not do.	
11535-24	Steven Andersen	Cumulative Impact on Sage-Grouse: The cumulative impacts of the past, present, and reasonably foreseeable events and future projects on sage-grouse must be considered. However, the only substantive comment provided by the agency is, "[a]s more sage-grouse habitat is disturbed and converted [by other proposed renewable energy projects], sage-grouse activity and lek attendance may decrease."74 Such conclusory statement flies in the face of federal law. NEPA requires that an EIS consider the cumulative impact of the proposed action.75 "Cumulative impact is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions."76 General statements about possible effects and some risk, do not constitute a hard look.77 "The analysis must be more than perfunctory; it must provide a useful analysis of the cumulative impacts of past, present, and future projects in the area."78 Further, the "cumulative impacts analysis must do more than merely catalogue relevant projects in the area."79 Instead, the agency must discuss and analyze the impacts of the projects "in sufficient detail to assist 'the decisionmaker in deciding whether, or how, to alter the program to lessen cumulative impacts.'"	The Cumulative Impacts section of the Greater Sage-Grouse section of the EIS (3.3.4.2.7) provides qualitative and qualitative analyses using the most up-to-date information on existing and reasonably foreseeable future projects within the greater sage-grouse analysis area. As stated in the EIS, "Future projects on federal lands would be held to the mitigation standards (for residual impacts after avoidance and minimization have been considered) identified by the applicable land use plan. Currently, BLM (2015a) requires a net conservation gain standard, as discussed in Section 3.3.4.4 (Compensatory Mitigation). Net conservation gain would be determined by the BLM in coordination with the State of Idaho and informed by the Idaho HQT (State of Idaho 2021a). Projects on state lands would be held to the State of Idaho's no net loss standard; no mitigation would be required for private lands." The "Mitigation Framework for Greater Sage-grouse" in EIS Appendix 4 further describes the net conservation gain. The following text was added under "Connectivity" in Section 3.3.4.2.7 (Cumulative Impacts): "Connectivity between lek 4L160 and leks 4L152 and 4L159, as well as between lek 4L160 and the closest SUAs, would be reduced by the Lava Ridge Wind Project alone. With additional future projects in the region, connectivity with leks north and east of siting corridors, e.g., Big Desert and Craters of the Moon HAF fine-scale areas, is likely to be impacted. These areas have been identified as important areas in maintaining genetic connectivity locally and range-wide (Cross et al. 2018, 2023). With additional future projects in the region, connectivity to the south across the Snake River Plain would be reduced. Despite I-84, existing anthropogenic disturbance, and agriculture, there are still some low levels of genetic connectivity between the siting corridors and south across the Snake River Plain (Cross et al. 2023). The Lava Ridge Wind Project and additional future projects could decrease the remaining genetic connectivity across the Snake River Plain between the two contiguous landscapes and concentrations of genetic connectivity and importance for sage-grouse."
11598-17	Idaho Conservation League	Greater sage-grouse and the Habitat Quantification Tool Analysis ICL appreciates that LS Power ultimately dropped wind proposals for the Browns Bench/China Mountain area and for the Big Cedar Project west of Oakley because they were in Priority and Important Sage-grouse Habitat Management Areas, and because both projects had high potential for conflicts with sage-grouse. According to the Amended Resource Management Plans for Greater Sage-grouse, the Lava Ridge project proposal is located outside of priority and Important Sage-grouse Habitat Management Areas, but is instead located within General Habitat or entirely outside Sage Grouse Management. According to both the State of Idaho's Sage-grouse Management Plan and the BLM's Amended Resource Management Plans, general habitat remains open for renewable energy development, among other multiple uses. General sage-grouse habitat contains approximately one-third of the remaining sage-grouse habitat in the state but only 2.5% of male sage-grouse. Still, the BLM has to carefully consider impacts to sage-grouse populations in general habitat. We note that the recent Caldwell Canyon decision faulted the BLM for not considering population-level impacts from mining related activities and for not considering direct, indirect and cumulative effects on sage-grouse.12 The issues of cumulative impacts and population connectivity is particularly pertinent given the Taurus Project and others: Further, the "cumulative impacts analysis must do more than merely catalog relevant projects in the area." Indigenous Env. Network v. U.S. Dept. of State, 347 F. Supp. 3d 561, 578 (D. Mont. 2018). Instead, the agency must discuss and analyze the impacts of the projects "in sufficient detail to assist 'the decisionmaker in deciding whether, or how, to alter the program to lessen cumulative impacts.' " Id. (citing Great Basin Mine Watch v. Hankins, 456 F.3d 955, 971 (9th Cir. 2006)).13 The same case found that the BLM's Habitat Quantification Tool and compensatory mitigation measures were consistent with the Amended Resource Management Plan Amendments and achieved the required "net conservation gain" for greater sage-grouse. If the project proceeds, we recommend utilizing the Supplemental DEIS to describe the proposed mitigation measures in greater detail. Such measures need to account for mitigation project failures, time delays, durability, and additive nature of the projects, among other factors. While the ARMPA requires mitigation measures for sage-grouse, the DEIS notes that mitigation may be extended to other resources: and …[F]or resources without legal protections, the BLM would determine if compensatory mitigation is warranted. This would be based on the resource and its status (rarity, population trend, etc.), the type and intensity of residual effects, and the existing condition of the resource with relevancy to the siting corridors. The BLM can implement other mitigation standards, such as achieving net benefit, consistent with applicable law, when the BLM determines such standards are required to achieve resource objectives.14 We note that there are a number of resource objectives related to wildlife, vegetation and recreation that could be affected by the Lava Ridge Project that could meet this determination. While we are concerned about the effects of the Lava Ridge project on sage-grouse in and around the project area, a climate model by the Audubon Society15 shows that sage-grouse habitat across the entirety of southern Idaho is likely to be lost under	BLM (2015a) outlines a hierarchy of mitigation priorities, where projects should be designed to avoid and minimize impacts to the extent possible (mainly through project siting and seasonal restrictions for specific activities), and any remaining residual impacts should be addressed through compensatory mitigation. This is described further in Section 3.3.4.4 (Compensatory Mitigation). Restoration efforts for sagebrush habitat can require long time scales depending on the condition the site is in, particularly the resilience of an area to disturbance and resistance to invasive annual grasses (Pyke et al. 2015). The BLM would require compensatory mitigation as described in EIS Section 3.3.4.4 (Compensatory Mitigation) for any action alternative and would require compensatory mitigation to result in a net conservation gain, as stipulated by BLM (2015a). MVE has a set of options to provide compensatory mitigation for unavoidable impacts to greater sage-grouse habitat on BLM public lands, which are described in the Mitigation Framework for Greater Sage-grouse section in EIS Appendix 4 (Mitigation). Regardless of the mitigation mechanism selected, the BLM would use all the necessary mitigation mechanisms and hold all compensatory mitigation mechanisms to meet high and equivalent standards, including measurable mitigation outcomes and performance standards, a development plan, monitoring and maintenance, durability (biological, financial, and real estate), accounting, reporting, and adaptive management, as outlined in the BLM Mitigation Policy (BLM IM 2021-046; H-1794-1, Chapter 3.5 I.1 in BLM [2021c]). An analysis of population connectivity and genetic diversity has been added to Section 3.3.4.2.7 (Cumulative Impacts, Connectivity), and connectivity and genetic diversity are analyzed in Section 3.3.4.2 (Impacts), Issue 3. See also response to comment 11535-24 above. Regarding climate change and future suitability of greater sage-grouse habitat in southern Idaho, the EIS evaluates peer-reviewed studies (Homer et al. 2021; Rigge et al. 2021), which predict future reduction in suitable habitat for greater sage-grouse in the analysis area due to climate change.

Comment ID	Commenter	Public Comment	Response to Comment
		increasing climate temperatures. See figures 2-4 below. Figure 2. Modeled sage-grouse habitat under current climatic conditions. 15 https://www.audubon.org/field-guide/bird/greater-sage-grouse Figure 3. Modeled sage-grouse habitat range under 1.5 degree C warming. Figure 4. Modeled sage-grouse habitat range under 3 degree C warming. As such, it is important to understand that in order to protect and restore sage-grouse populations, we are going to have to find suitable areas - ideally outside of habitat for sage-grouse and other wildlife - to develop renewable energy sources at a utility scale.	
11871-41	WildLands Defense	Report at M-18 The report notes that "undocumented leks were observed during the aerial searches. Displaying males were recorded at two of the three leks (4L152 and 4L159) during ground and aerial surveys. Although no displaying males were recorded at lek 4L160 during surveys, IDFG reported that three males were observed by an IDFG biologist". The report included a review of GRSG telemetry data provided by IDFG, which indicate that the three leks within the Project area appear to be isolated from other GRSG breeding populations in the area, and insufficient data is available to determine whether there is movement between the three leks within the Project area. "Lek monitoring was conducted by WEST in 2021, and GRSG were observed at all three leks during the 2021 surveys. Lek 4L160 had a peak male count of 10 individuals, Lek 4L159 had a peak male count of 16, and Lek 4L152 had a peak male count of three (Figure 6). Lek records for 4L152 began in 2010. Counts at this lek have generally been on a downward trended, with males recorded in 2010, 18 in 2018, and eight in 2019. Trend data is unavailable for leks 4L159 and 4L160, which were discovered in 2018 and 2019, respectively". M-20. Detailed analysis of trends and loss of leks for all periods of time for Snake river plain leks must be provided, including detailed discussions of tripped triggers and what specifically BLM Has done in response. We have not observed any significant actions undertaken to protect populations and habitats. In fact, we have observed Idaho Falls BLM covering up the fact that triggers have been tripped when attempting to construct huge new livestock water pipelines (near Arco) or increase spring grazing on top of sage-grouse leks (Twin Buttes decision). Moreover, winter 2023 is likely to have taken a significant toll on remnant populations of Sage-grouse across the region with deep snow occurring in a landscape that has suffered large-scale loss of sage and other shrubs, and where BLM fire rehab remains focused on livestock forage seeding and herbicide use – to the detriment of sage recovery. Arkle et al. 201 describe how BLM livestock forage-centered fire rehabs are large-scale failures for sage-grouse and wildlife M-21 proceeds to treat the sage-grouse populations as a sacrifice to the wind industry, stating: "The results of the analysis indicated the Project will likely have some impact on the local GRSG populations and that these impacts are likely to be small at the level of the regional subpopulation, given the small local population and marginal habitat near the Project identified in the assessment. Placement of project infrastructure in areas with existing development and avoidance of placement in functional GRGS habitat to the extent possible has the potential to minimize the impact of new disturbance to the landscape by co-location. As such, the Project was modified to remove turbines from federal land within 3.1 mi of the three grouse leks in the Project area".	In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM's independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG's definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to project construction, MVE's compliance manager would consult with IDFG for technical assistance and conduct lek surveys on previously un-surveyed areas identified by MVE as unsuitable habitat (WEST 2021) within 3.1 miles of the siting corridors. These areas would be surveyed by the compliance manager to search for leks that have not yet been identified (see Table App4-4). Required design features (RDFs) (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a). The sage-grouse population trends both locally and regionally are described in EIS Section 3.3.4.1.2 (Sage-Grouse Population and Distribution). This section discloses the status of leks within 6.8 miles of the siting corridors, population trends, and adaptive management population triggers. This EIS analysis recognizes these triggers and evaluates impacts as BLM has prescribed in their resource management plan for sage-grouse (BLM 2015a). As described in "Sage-Grouse Distribution and Abundance", populations across Idaho have been consistently below the 2011 baseline in Idaho, and these declines tripped adaptive management population triggers in Important HMAs (since 2018) and Priority HMAs (since 2019) in the Desert mid-scale area that are currently operational (i.e., the populations have not increased to the 2011 baseline or above, and the triggers cannot yet be removed [State of Idaho 2022]). According to the greater sage-grouse ARMPA (2015a): Designate and manage General HMA as open for wind and solar testing … subject to RDFs and buffers. The BLM must analyze the effects of the project based on the current habitat data available. BLM (2015a) outlines a hierarchy of mitigation priorities, where projects should be designed to avoid and minimize impacts to the extent possible (mainly through project siting and seasonal restrictions for specific activities), and any remaining residual impacts should be addressed through compensatory mitigation. This is described further in Section 3.3.4.4 (Compensatory Mitigation). Intact sagebrush habitat and known lek locations were important factors used to help guide project siting and avoidance and minimization measures (see Appendix U [GRSG Mitigation Plan] in MVE [2023]). With the exception of Alternative B, areas north of ID 24 were initially avoided because they connect intact sagebrush. All disturbance was sited 3.1 miles away from leks (there are 3 within 6 miles of the siting corridors). The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. The project is proposed in General HMA, which has low breeding density of male sage-grouse. Even though all siting corridors

Comment ID	Commenter	Public Comment	Response to Comment
			are in a mapped General HMA, sagebrush cover is limited to a few portions of the project area. Seasonal timing restrictions in General HMAs will be required. The project is in an area heavily impacted by existing disturbance. Even with the implementation of applicant-committed measures and other mitigation described in EIS Appendix 4, impacts to sage-grouse will remain. Compensatory mitigation would be required, and more details are in the GRSG Mitigation Plan (Appendix U in MVE [2023]). MVE has a set of options to provide compensatory mitigation for unavoidable impacts to greater sage-grouse habitat on BLM public lands, which are described in the Mitigation Framework for Greater Sage-grouse section in EIS Appendix 4.
11871-54	WildLands Defense	We stress that flight diverters can fall off. We observed that with China Mountain wind MET tower guy wire diverters. This also happens all the time with BLM Sage-grouse fence diverters – they fall off, the reflective material falls off plastic, they are largely invisible in snow-scapes (Fite field observations in southern Idaho).	Compensatory mitigation details are in the GRSG Mitigation Plan (Appendix U in MVE [2023]). Mitigation will be added including maintenance on flight/fence diverters every 5 years (based on observations from BLM sage-grouse specialists in Idaho), and diverters must be replaced following a wildfire.
11871-70	WildLands Defense	Sage-grouse Adverse Impacts There is ever-growing scientific information on industrial energy and other threats to Sage-grouse. See for example: https://www.researchgate.net/publication/241908360_Greater_Sage-Grouse_Habitat_Use_and_Population_Demographics_at_the_Simpson_Ridge_Wind_Resource_Area_Carbon_County_Wyoming Johnson et al. 2012. Greater Sage-Grouse Habitat Use and Population Demographics at the Simpson Ridge Wind Resource Area, Carbon County, Wyoming. This was a WEST study, so is likely biased towards industry. It found that lek size decreased. This was a much larger population than at Lava Ridge– with 14 active leks, 37 birds mean lek size, 513 birds tallied. Lava ridge is highly likely to wipe out the leks.	The effects of wind energy projects on sage-grouse are detailed in Section 3.3.4.2.2 (Alternative B [Proposed Action]) Issue 3. The project is proposed in General HMA, which has a low breeding density of male sage-grouse. Even though all siting corridors are in a mapped General HMA, sagebrush cover is limited to a few portions of the project area. The presence of suitable habitat indicates that sage-grouse use is likely limited to the eastern and northern portions of the siting corridors (see Figure 3.3-7; Table 3.3-22). The area with sagebrush has low cover and is in an area impacted by existing disturbance, including croplands adjacent to the south and west of the project. Intact sagebrush habitat and known lek locations were important factors used to help guide project siting and avoidance and minimization measures (see Appendix U [GRSG Mitigation Plan] in MVE [2023]). With the exception of Alternative B, areas north of ID 24 were initially avoided because they connect intact sagebrush. All disturbance was sited 3.1 miles away from leks, and seasonal timing restrictions in General HMAs will be required. As described in EIS Section 3.3.4.2.2 (Alternative B [Proposed Action]), Smith et al. (2016) demonstrates the risk of leks disappearing with increased proportion of cropland on the landscape in Montana.
11871-71	WildLands Defense	Heterogeneity in the response of individuals and populations to wind-energy development is consistent with previous analyses of the effects of renewable energy on wildlife (Smith and Dwyer 2016, Coppes et al. 2020). It is also consistent with studies of how prairie grouse respond to other forms of infrastructure. For example, although roads, powerlines, and oil and gas development may have negative effects on survival and habitat use of prairie grouse (Hagen 2010, Hovick et al. 2014, Peterson et al. 2020), the magnitude of these effects and distance at which they are detectable is highly variable among species and locations (see also Northrup and Wittemyer 2013, Gregory and Beck LeBeau et al. (2014) reported that survival of greater sage-grouse nests and broods declined with proximity to a wind turbine (nest survival declined 7.1% with every 1-km increase in proximity to a turbine; brood survival declined 38.1% with every 1-km increase in proximity to a turbine).	The LeBeau et al. (2014) citation has been added to Section 3.3.4.2.2 (Alternative B [Proposed Action]).
11871-74	WildLands Defense	Three known leks within 6 miles of the siting corridors (4L160, 4L159, and 4L152) were checked in March and April 2020 and 2021, and birds were observed (either by WEST or by the BLM) at all three leks during each round of survey (WEST 2020, 2021). The results of the desktop habitat assessment and lek surveys indicate that sage-grouse habitat and use are likely limited to the eastern and northern portions of the siting corridors (see Figure 3.3-7; Table 3.3-12). The areas identified as sagebrush habitat and the known lek locations were important factors used to help guide project siting and minimization measures (Section 2.3.4, Avoidance and Minimization, and EIS Appendix 4, Mitigation). Eight leks within 6.8 miles of the siting corridors have an undetermined management status; these leks have not been surveyed or documented as active in the last 5 years, or they have insufficient survey information to be designated as unoccupied (Table 3.3-12). The lek buffers in BLM (2015a) only apply to occupied leks (as detailed in the section below and in BLM [2015a]).3-113, -114. WHY wasn't the status of these leks determined?? Where is data for all lek routes and counts at all leks for all periods of time known for – in the local and regional area. There have in reality been drastic declines in Sage-grouse in much of this area, with large gaps in opccurrence opening up as habitat has become lost and/or perforated.	According to the greater sage-grouse ARMPA (2015a, Idaho) the definitions for an unoccupied status are as follows: An unoccupied lek is one that has not been active for five consecutive years. To be designated unoccupied, a lek must be inactive (see above criteria) for five consecutive breeding seasons. Appendix B of BLM (2015a) states "In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency." The most recent counts for leks 4L152, 4L159, and 4L160 occurred in 2023, and for 4L008 in 2022. In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM's independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG's definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent

Comment ID	Commenter	Public Comment	Response to Comment
			change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. Intact sagebrush habitat and known lek locations were important factors used to help guide project siting and avoidance and minimization measures (see Appendix U [GRSG Mitigation Plan] in MVE [2023]). With the exception of Alternative B, areas north of ID 24 were initially avoided because they connect intact sagebrush. All disturbance was sited 3.1 miles away from leks, and seasonal timing restrictions in General Habitat Management Areas will be required.
11871-108	WildLands Defense	Kirol et al. 2020.Greater Sage-Grouse Response to the Physical Footprint of Energy Development Christopher P. Kirol, Kurt T. Smith, Nicholas E. Graf, Jonathan B. Dinkins, Chad W. Lebeau, Thomas L. Maechtle, Andrew L. Sutphin, Jeffrey L. Beck First published: 05 March 2020 https://doi.org/10.1002/jwmg.21854 This study Abstract states: Energy infrastructure and associated habitat loss can lead to reduced reproductive rates for a variety of species including the greater sage-grouse (Centrocercus urophasianus). Our goal was to refine our understanding of how the physical footprint of energy development relates to sage-grouse nest and brood survival. Our survival analyses were conditional upon the amount of surface disturbance female sage-grouse were exposed to during reproductive stages. We quantified levels of exposure and compared them to the surface disturbance levels of the surrounding area. From 2008–2014, we collected data in 6 study areas in Wyoming, USA, containing 4 primary types of renewable and nonrenewable energy development. Our research focused on press disturbance (i.e., disturbance sustained after initial disturbance and associated with existing energy infrastructure and human activity). Our results suggest exposure to press disturbance during nesting and brood-rearing was related to lower nest and brood survival, which manifested at different spatial scales. Our analysis of nest survival suggested that the likelihood of a successful nest was negatively associated with the amount of press disturbance within an 8-km² area. Broods exposed to any press disturbance within a 1-km2 area were less likely to survive compared to broods not exposed to press disturbance. Female sage-grouse consistently used habitat with lower disturbance levels during reproductive periods. Greater than 90% of nest and brood-rearing locations were in habitat with <3% press disturbance within a 2.7-km2 area. Our research links surface disturbance associated with press disturbance to reproductive costs incurred by sage-grouse exposed to diverse energy development. Our results demonstrate a pattern of female avoidance of areas where press disturbance was high during nesting and brood-rearing and survival of nests and broods were highest in areas that had the least amount of disturbance. Our findings underscore the importance of minimizing disturbance to maintain viable sage-grouse populations".	Issue 3 in EIS Section 3.3.4.2.2 (Alternative B [Proposed Action]) was updated to include this citation to support the effects of energy disturbance on nest and brood survival and hen avoidance that were already stated there.
11871-109	WildLands Defense	BLM must conserve, enhance and restore sage-grouse habitats and populations. Triggers have been tripped in the population The 2015 Idaho-SW MT ARMPA: https://eplanning.blm.gov/public_projects/lup/103344/143603/176718/2015_IDMT_ARMPA.pdfImplement the adaptive management plan, which allows for more restrictive land use allocations and management actions to be implemented if habitat or population hard triggers are met. MD SSS 6: The management area map and Biologically Significant Unit (BSU) baseline map will be re- evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re- evaluation can indicate the need to adjust PHMA, IHMA or GHMA or the habitat baseline. These adjustments can occur upon completion of the appropriate analysis and process (e.g., plan amendment) to review the allocation decisions based on the map. Results from the Wildfire and Invasive Species Assessments, such as identified focal or emphasis areas will also be used to help inform mapping adjustments during this evaluation. MD SSS 8: Idaho BLM will annually update the Key Habitat map, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Key habitat includes areas of generally intact sagebrush that provide sage-grouse habitat during some portion of the year. This map also identifies potential restoration areas (perennial grassland annual grasslands, conifer encroachment and recent burns). This map a broad scale current vegetation map that changes as habitat is lost or restored. The Key Habitat Map is not an allocation decision such as PHMA, IHMA, and GHMA. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that GRSG are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, GRSG Local Working Groups, or agency partners in GRSG conservation. Project-level evaluations of GRSG habitat during the NEPA process can also be used to inform the annual update. MD SSS 11: Idaho: Use hard and soft population and habitat triggers to determine an appropriate management response as described in MD SSS 16 to MD SSS 26. Hard and soft triggers responses are applied at the Conservation Area (MD SSS-1) scale (Appendix E). https://www.arcgis.com/apps/mapviewer/index.html?panel=gallery&layers=af37f0eb7ebb4883af1cfc6aefb7cc8a BLM mapping	As described in Section 3.3.4.1.2, populations across Idaho have been consistently below the 2011 baseline in Idaho, and these declines tripped adaptive management population triggers in Important HMAs (since 2018) and Priority HMAs (since 2019) in the Desert mid-scale area that are currently operational (i.e., the populations have not increased to the 2011 baseline or above, and the triggers cannot yet be removed [State of Idaho 2022]). This EIS analysis recognizes these triggers and evaluates impacts as BLM has prescribed in their resource management plan for sage-grouse (BLM 2015a). The BLM must analyze the effects of the project based on the current habitat data available.
11871-110	WildLands Defense	IDAHO 2006 GRSG Plan The above map shows the status of habitats a mere 17 years ago – and since this time BLM and the state have down-graded habitats, vast areas have been lost in fore, and invaded by weeds. The harmful Gateway West lines are being punched in spawning a huge amount of energy sprawl just like Lava Ridge	The Gateway West transmission line is described in EIS Section 3.1.1 (Existing and Future Trends and Actions). It was added specifically to EIS Section 3.3.4.2.7 (Cumulative Impacts).

11978-119	Magic Valley Energy, LLC	21. Section 3.03.4 Issues Analyzed in Detail “The following assumptions were used for analyzing impacts to avian populations:” ‘Avian populations’ is used, when this section is specific to sage-grouse. MVE requests specifying this language: “The following assumptions were used for analyzing impacts to sage-grouse:”	This particular sentence in the EIS has been edited to read “The following assumptions were used for analyzing impacts to sage-grouse:”
11991-11	Julie Abo	I heard that new federal guidance on Sage Grouse is imminent this summer. It should be a prerogative for the BLM and Department of the Interior to hear the new guidance before moving forward.	The greater sage-grouse ARMPA is currently under revision. It would be speculative for BLM to predict the outcome of the revisions, and BLM is required to respond to MVE’s ROW application for this project. Guidance documents applicable to the project include BLM SFO’s 1986 monument RMP (BLM 1986), as amended, and the greater-sage-grouse ARMPA (BLM 2015a). Bureau of Land Management (BLM). 1986. *Monument Resource Management Plan.* January. Shoshone District, Idaho. Available at: https://eplanning.blm.gov/public_projects/lup/36121/42518/45285/monumentRMP_ok.pdf. Accessed February 10, 2021.
12288-2	Susan Jesser	Who paid the bill for Fish and Game to collar and monitor sage-grouse, deer and pronghorn? From what I understand Magic Valley Energy didn't cover these costs. Clarification would be appreciated. Thank you.	IDFG data for grouse, deer, and pronghorn used in the EIS are from ongoing IDFG wildlife projects that cover a broad area, which is larger than but includes the project area. Many IDFG projects began before MVE’s ROW permit application was submitted. State wildlife agencies typically respond to research needs across a variety of land uses without receiving specific funding.
12934-7	Rob Thornberry, Theodore Roosevelt Conservation Partnership	Consider cumulative effects on sage grouse. The TRCP appreciates the applicant’s willingness to consider the ramifications of utility-scale wind power on sage grouse populations, and we are appreciative of the actions the applicant has already taken to avoid impacting the imperiled bird. Still, we recommend including more analysis and management actions to address the cumulative impacts of wind power in general sage grouse habitat.	Impacts on sage-grouse from energy development documented in peer-reviewed scientific literature are evaluated in EIS Section 3.3.4.2 (Impacts [to Greater Sage-grouse]). All known evidence-based management recommendations to reduce impacts to sage-grouse would be implemented, as described in EIS Appendix 4. A more detailed analysis of cumulative impacts is now included (Section 3.3.4.2.7).
12988-11	Melody Asher	DEIS 3.3.4.2.6 CUMULATIVE IMPACTS Your DEIS says "The trend for increased renewable energy development in the analysis area (see Section 3.3.4.1.4, Existing and Future Trends and Actions) and the potential additive or synergistic effects of other Lava Ridge Wind Project Draft Environmental Impact Statement 3.3 Avian and Bat Species 3-126 renewable energy projects (of similar size and scale) in combination with the Lava Ridge Wind Project would compound habitat loss and fragmentation on greater sage-grouse populations and their habitats. As more sage-grouse habitat is disturbed and converted, sage-grouse activity and lek attendance may decrease. Additional construction and operation of projects would lead to more anthropogenic noise sources and perching opportunities for sage-grouse predators. The potential effects of the expansion of wind energy on sage-grouse populations would depend on a number of site-specific variables at each project location, the number and size of infrastructure, and the implementation and effectiveness of mitigation measures t.o reduce impacts." Greater Sage Grouse are having a rough enough time already. I believe that Alternative E is the alternative that actually has more sagebrush as compared to much of the rest of the project area (most being more grass and weeds). This species could end up on the ESA list so I think losing this sagebrush is just another "straw on the back of the camel". I think sagebrush areas should not be developed. Habitat loss is the threat for this species.	See response to comment 8376-3 (see in Table A-3e, Greater Sage-Grouse).
12988-12	Melody Asher	DEIS 3.3.4.3 Irreversible and Irretrievable Commitments and Short-Term Uses Versus Long-Term Productivity Your DEIS says "All action alternatives would result in irretrievable impacts to individual sage-grouse from noise and increased human presence; direct mortality from vehicle strikes and collisions with project infrastructure; and the loss, fragmentation, and degradation of their habitat over the 34-year life of the project. A number of mitigation measures would be implemented to minimize the potential for these effects. Effects from noise, increased human presence, and direct mortality, as well as impacts to habitat quality from the presence of project infrastructure, would occur over the 34-year life of the project; however, these effects would not be considered irreversible because any residual habitat impacts would be offset through compensatory mitigation required by the SLM and thus would not result in a trend toward listing under the ESA or a loss of populationviability. The effects to greater sage-grouse from habitat loss and fragmentation could persist for an additional SO years following decommissioning (84 years total) but would not be considered irreversible because the SLM would require compensatory mitigation to offset these impacts and because much of the habitat would be restored and reclaimed in the long term." You sound highly optimistic. Is there anyplace in the United States where anyone has rehabbed sagebrush steppe for Greater Sage Grouse and they have returned??? I would have to disagree that the area would be recovered in 84 years. I believe once that much of the soil has been disturbed and the sagebrush and forbes gone and then you add in climate change the area has a very good chance of never recovering in several human lifetimes if ever. You can throw money at a project but if there is not enough precipitation over years it will fail anyway. I also have doubts that enough money can set aside (bonding) to pay for this rehabilitation that far in the future.	BLM (2015a) outlines a hierarchy of mitigation priorities, where projects should be designed to avoid and minimize impacts to the extent possible (mainly through project siting and seasonal restrictions for specific activities), and any remaining residual impacts should be addressed through compensatory mitigation. This is described further in Section 3.3.4.4 (Compensatory Mitigation). Referenced from the draft EIS 3-103. Restoration efforts for sagebrush habitat can require long time scales depending on the condition the site is in, particularly the resilience of an area to disturbance and resistance to invasive annual grasses (Pyke et al. 2015). The BLM would require compensatory mitigation as described in EIS Section 3.3.4.4 (Compensatory Mitigation) for any action alternative and would require compensatory mitigation to result in a net conservation gain, as stipulated by BLM (2015a). MVE has a set of options to provide compensatory mitigation for unavoidable impacts to greater sage-grouse habitat on BLM public lands, which are described in the Mitigation Framework for Greater Sage-grouse section in EIS Appendix 4.
13008-15	Scott Hauser	Lastly, 4) Are the locations of sage-grouse leks being accounted for when planning the route of the roads?	Yes, the project was designed so that no infrastructure, including roads, would be placed within 3.1 miles of known, active leks (there are 3 within 6 miles of the siting corridors).
13012-3	Heather Saunders	We are also concerned about the impact on the near threatened Greater Sage Grouse, a population for which the Department of the Interior is working to establish greater protections. We don't want our wildlife habitats destroyed and this particular habitat already n eds restoration. How long will construction of this facility delay that restoration?	BLM (2015a), EIS Appendix 4 (Mitigation), and EIS Section 3.3.4.1.3 (Sage-grouse Management Requirements) describes all mitigation measures the project is required to implement to reduce impacts to this sage-grouse population. The project was sited to avoid placement of infrastructure within 3.1 miles of known, active leks (there are 3 within 6 miles of the siting corridors). The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. The project is proposed in General HMA, which has low breeding density of male sage-grouse. Only a portion of the project occurs in sage-grouse habitat. There are three active leks within the study area. Intact sagebrush habitat and

Comment ID	Commenter	Public Comment	Response to Comment
			known lek locations were important factors used to help guide project siting and avoidance and minimization measures (see Appendix U [GRSG Mitigation Plan] in MVE [2023]). With the exception of Alternative B, areas north of ID 24 were initially avoided because it connects intact sagebrush. All disturbance was sited 3.1 miles away from leks, and seasonal timing restrictions in General Habitat Management Areas will be required. As described in EIS Appendix 4, Mitigation, MVE would undertake restoration actions as soon as possible after completion of ground-disturbing activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats. The BLM would require compensatory mitigation, as described in EIS Section 3.3.4.4 (Compensatory Mitigation), for any action alternative and would require compensatory mitigation to result in a net conservation gain, as stipulated by BLM (2015a). MVE has a set of options to provide compensatory mitigation for unavoidable impacts to greater sage-grouse habitat on BLM public lands, which are described in the Mitigation Framework for Greater Sage-grouse section in EIS Appendix 4.
2100-5	Office of Governor Brad Little, Office of Lieutenant Governor Scott Bedke, Office of US Senator Mike Crapo, Office of US Senator Jim Risch, Office of Congressman Mike Simpson	We question whether aerial fire suppression capabilities are compromised by hundreds of 600-feet-plus tall turbines in an area prone to wildfire. Fires are one of the primary threats to greater sage-grouse, and the BLM needs to ensure neither fire nor loss of habitat compromises Idaho's Sage-grouse Management Objectives. The BLM needs to ensure that pilots can effectively suppress wildfires within and adjacent to the proposed project area.	EIS Section 3.3.4.1.4 (Existing and Future Trends and Actions) describes how wildfire has changed and will continue to change habitat for sage-grouse. Additional text was added to EIS Section 3.7.1.2.2 (Alternative B [Proposed Action], Response and Suppression) regarding potential impacts to fire suppression from the project. Though the project would reduce aerial fire suppression options, it would increase surface access for engine and ground suppression crews. Therefore, the project is not anticipated to change total wildfire suppression.
3046-1	Cameron Stauffer	According to the EIS for the Lava Ridge project, "even with the implementation of applicant-committed measures and other mitigation described above (and in EIS Appendix 4), impacts to sage-grouse would remain." According to the BLM, "Greater sage grouse populations have been in decline for at least the last six years." If we are to reverse the loss of the Greater sage grouse and the sage brush sea habitat, there must be massive action. Action different than what has been proposed in this EIS. "If there is any hope to conserve greater sage grouse and the Sagebrush Sea ecosystem that supports hundreds of wildlife species, we need a bold paradigm shift in this next round of greater sage grouse plan revisions. Tweaking around the edges won't cut it,	As described in EIS Section 3.3.4.4 (Compensatory Mitigation), the BLM would require compensatory mitigation for any action alternative and would require compensatory mitigation to result in a net conservation gain, as stipulated by BLM (2015a).
3046-2	Cameron Stauffer	The current EIS is using plans and strategies that have not helped Greater sage grouse. Furthermore, the BLM under the Biden administration, was supposed to have a new plan in 2022 and is scheduled to be out in 2023. According to E&E news, "The bureau, which has reviewed more than 300 peer-reviewed studies that have been published since 2015, is considering major changes, including possibly redesignating some core sage grouse territory into "areas of critical environmental concern," which would add new restrictions on everything from energy development to recreational activities across potentially hundreds of thousands of acres." The timing of this EIS is inappropriate. According to the EIS there are at least eight Lek sites that are undetermined. There needs to be major changes in preserving the sage brush sea and this EIS is currently planning with inadequate information as it concerns to the Greater sage grouse and it's habitat.	Though the greater sage-grouse ARMPA is currently under revision, predicting the outcome of that revision and NEPA process would be speculative and pre-decisional. Therefore, the BLM is using the current management guidance regarding sage-grouse. In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM's independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG's definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to project construction, MVE's compliance manager would consult with IDFG for technical assistance and conduct lek surveys on previously un-surveyed areas identified by MVE as unsuitable habitat (WEST 2021) within 3.1 miles of the siting corridors. These areas would be surveyed by the compliance manager to search for leks that have not yet been identified (see Table App4-4). Required design features (RDFs) (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a).

Comment ID	Commenter	Public Comment	Response to Comment
			As described throughout the EIS and as required in BLM (2015a), the project was designed to avoid placing infrastructure within 3.1 miles of known, active leks (there are 3 within 6 miles of the siting corridors). According to the greater sage-grouse ARMPA (2015a, Idaho) the definitions for an unoccupied status are as follows: An unoccupied lek is one that has not been active for five consecutive years. To be designated unoccupied, a lek must be inactive (see above criteria) for five consecutive breeding seasons. The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. The project is proposed in General HMA, which has low breeding density of male sage-grouse. Even though all siting corridors are in a mapped General HMA, sagebrush cover is limited to a few portions of the project area. The presence of suitable habitat indicates that sage-grouse use is likely limited to the eastern and northern portions of the siting corridors (see Figure 3.3-7; Table 3.3-22). The area that contains sagebrush has low cover and to the south and west the project is adjacent to croplands. The project is in an area heavily impacted by existing disturbance.
3150-3	Cameron Stauffer	Secondly, sage grouse populations. As previously stated, the EIS has stated there will be adverse impacts on sage grouse during construction and during operation. There are at least 8 Lek sites that are not confirmed throughout the construction corridors as well as 4 others that are confirmed. When it comes to sage grouse populations, the status quo of management is not working. The EIS states there have been declining in Lek sites since 2011. Additionally, according to IDFG, there has been 6 years of population decline. This has been occurring with ZERO percent "green energy" projects on BLM lands in Idaho. The Biden administration has stated there will be a new sage grouse management plan scheduled for 2023(previously scheduled for 2022). According to E&E news, "the bureau, which has reviewed more than 300 peer-reviewed studies that have been published since 2015, is considering major changes, including possibly redesignating some core sage grouse territory into 'areas of critical environmental concern,' which would add new restrictions on everything from energy development to recreational activities across potentially hundreds of thousands of acres."	Though the greater sage-grouse ARMPA is currently under revision, predicting the outcome of that revision and NEPA process would be speculative and pre-decisional. Therefore, the BLM is using the current management guidance regarding sage-grouse. In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM's independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG's definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to project construction, MVE's compliance manager would consult with IDFG for technical assistance and conduct lek surveys on previously un-surveyed areas identified by MVE as unsuitable habitat (WEST 2021) within 3.1 miles of the siting corridors. These areas would be surveyed by the compliance manager to search for leks that have not yet been identified (see Table App4-4). Required design features (RDFs) (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a).
3990-2	Diana Nielson	I am not in Favor of the Lava Ridge Wind Project App4-3. Mitigation Required by BLM Policy Measure Measure Description Number 1. No repeated or sustained behavioral disturbance (e.g., visual, noise over 10 dbA at lek, etc.) to lekking greater sage-grouse from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season. 2. Avoid mechanized anthropogenic disturbance, in greater sage-grouse nesting habitat during the nesting season. Note: Figure 3.3-7 in Section 3.3.5 (Greater Sage- Grouse) depicts spring seasonal use areas, which includes nesting habitat. Spring is defined as March 1– June 30.* 3. Avoid mechanized anthropogenic disturbance during the winter (December 1 – February 29), in greater sage- grouse wintering areas. Note: Figure 3.3-7 in Section 3.3.5 (Greater Sage- Grouse) depicts winter seasonal use areas. The BLM may grant an exception for activities during the winter in patches of winter seasonal use areas only if MVE demonstrates that the area is devoid of sagebrush and unlikely to be used by sage-grouse.*	EIS Appendix 4, Table App4-3, describes Mitigation Required by BLM Policy, which includes all the measures mentioned in the comment.

Comment ID	Commenter	Public Comment	Response to Comment
3990-4	Diana Nielson	7. Locate staging areas outside the greater sage-grouse Priority Habitat Management Areas to the extent possible.	Only a portion of the project occurs in sage-grouse habitat, which is General HMAs, and has been sited to avoid Priority HMAs and Important HMAs.
3997-5	Angelee Eames	Sage Grouse have been thriving and will now lose 807 acres of habitat-where do they move? Salmon Falls?	See response to comment 8376-3 (see in Table A-3e, Greater Sage-Grouse).
4562-1	Stephanie Novacek	Greater Sage-Grouse: Study areas (pp 172): The various areas of impact studies such as ground disturbance doesn't seem to include studies on noise from the operation of the turbines themselves. Does the noise impact the Greater Sage-Grouse species? Also, what about shadow flicker, since the species is very adept at noticing movement? (pp 189): During operation, no occupied leks would experience increased noise from the project; six leks of undetermined status would experience increased noise This is the only mention of operation noise. This seems very shallow and underrepresented. The long range, low frequency noise from turbine operation should be studied in depth for its impact on the GSG. Wildlife is extremely sensitive to motion and sounds, especially when resting and feeding on the surface.	The impacts of noise on sage-grouse during both construction and operation are analyzed in detail in EIS Section 3.3.4.2.2 (Alternative B [Proposed Action]) Issue 2. The greater sage-grouse ARMPA (BLM 2015a) requires that MVE avoid repeated or sustained behavioral disturbance (visual disturbances, noise that is 10 dBA greater than baseline levels at lek, etc.) of lekking birds from 6:00 p.m. to 9:00 a.m. within 2 miles of leks during the lekking season (BLM-required mitigation measure A). The EIS does not analyze in detail the impacts of shadow flicker on sage-grouse, but BLM requires that no turbines be placed within 3.1 miles of leks. As described in EIS Section 3.16.3.2 (Impacts), shadow flicker intensity for receptor-to-turbine distances beyond 6,562 feet (1.24 miles) is very low and generally considered imperceptible.
6863-1	Mike Miller	Would like to comment on the negative impacts to Sage Grouse associated with the wind project. According to Idaho Fish and Game , the highest ranking threat to sage grouse includes (1) invasive species, (2) infrastructures as related to energy development, (3) wildfires. The panel also predicted that the range of the greater sage grouse would contract and fragment due to any habitat modification or loss (1). On the summary sheet ES-XVI of the EIS statement Alternative B , C ,D. and E , all have impacts loss or disturbance of habitat. With the Sage Grouse were close to being placed on the endangered species , but only because of conservation measures between multiple states and organizations , this has not been done yet.	See response to comment 8376-3 (see in Table A-3e, Greater Sage-Grouse).
8372-2	Douglas Miller	As the draft EIS notes, sage grouse populations are in steep decline. The decline has been so dramatic (98% from historic numbers; see https://tinyurl.com/2h34dcy5 <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Ftinyurl.com%2F2h34dcy5&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cdf8d0aca05b8403e6fad08db2a343671%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638150175964057121%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=Vuzyqi5Yl%2BGShCrwsq2iv0DwUqpxug0B5ZSe3OvEm5E%3D&reserved=0>) that the species has been proposed for listing as endangered multiple times. We know from a great body of independent, peer-reviewed scientific research that energy development is a significant contributor to the precipitous and accelerating decline of sage grouse. Chief among these detrimental and deleterious effects on sage grouse is nest and brood failure linked to the presence of wind turbines (e.g., LeBeau et al., 2014. Short-term impacts of wind energy development on greater sage-grouse fitness. Journal of Wildlife Management 78:522–530.) The presence of wind turbines decreases chick survival for grouse nesting in grasslands and sage steppe habitats by a whopping 50% (see Proett et al, 2022, Columbian sharp-tailed grouse brood success and chick survival in a wind-energy landscape. Journal of Wildlife Management 86:e22287. https://doi.org/10.1002/jwmg.22287 <https://doi.org/10.1002/jwmg.22287> .) Additionally, quantitative modeling shows that habitat disturbance from energy infrastructure decreases sage grouse brood survival by an eye-watering 61% (see Kirol et al, 2020. Greater Sage-Grouse Response to the Physical Footprint of Energy Development. The Journal of Wildlife Management 84:989–1001.) Sage grouse fatalities are magnified by collisions with fences, especially in flat to gently rolling terrain (see Stevens et al, 2012. Multi-Scale Assessment of Greater Sage-Grouse Fence Collision as a Function of Site and Broad Scale Factors. The Journal of Wildlife Management 76:1370–1380;) The hundreds of miles of new fencing required by each of the build alternatives will exacerbate the already imperious state of sage grouse in the project area. Power transmission lines like those required by each of the build alternatives will have a negative effect on greater sage grouse habitat selection and survival (see LeBeau et al., 2019.Greater Sage-Grouse Habitat Function Relative to 230-kV Transmission Lines. The Journal of Wildlife Management 83:1773–1786.) The science is clear: all of the build alternatives will destroy vital sage grouse habitat and cause sage grouse to become functionally extinct in the project area. Therefore, each of the build alternatives must be rejected. Further, all of the building alternatives will obviate the potential for sage grouse habitat restoration and concomitant sage grouse population revitalization in the project area. Each of the build alternatives will destroy hundreds of acres sage grouse habitat and is therefore clearly incompatible with the BLM's own sage grouse objectives (see https://www.blm.gov/programs/fish-and-wildlife/sage-grouse <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.blm.gov%2Fprograms%2Ffish-and-wildlife%2Fsage-grouse&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cdf8d0aca05b8403e6fad08db2a343671%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638150175964057121%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=78nsZHnATH6fVxb%2BpNtpK%2BYVuJ%2BlOwI2zpnPAUF8Oyw%3D&reserved=0>); namely: * "Safeguarding the most important habitat is essential to the long-term health of sage-grouse populations" * "the BLM continues to invest in treatments for sage-grouse habitat, to restore critical areas and make remaining habitat more resilient to various stressors and threats" (emphasis added) Permitting the Lava Ridge industrial wind factory is in direct conflict to sage grouse habitat restoration and making the remaining sage grouse habitat more resilient! Moreover, the draft EIS says nothing about how the status of the 8 sage grouse leks shown as "unknown" in Figure 3.3-7 will be determined, and if not found to be occupied, how these leks will be restored to	EIS Section 3.3.4.2 (Impacts) summarizes literature regarding impacts on sage-grouse from energy development, including the effects of turbines and transmission lines on nest, brood and hen survival. These studies were used in the analysis to calculate impacts to sage-grouse and their habitat for all alternatives. The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. General HMAs have more flexibility in land-use activities and energy development is allowed as long as appropriate measures are taken to avoid and minimize impacts. As described in EIS Section 3.3.4.1.2 (Sage-Grouse Population and Distribution), the primary threat to sage-grouse is habitat loss. Thus, impacts are quantified as number of acres affected, and compensatory mitigation debits are determined based on number of acres lost and weighted by the quality of the habitat in which it was lost (e.g., Priority HMA). This section also describes the sage-grouse population trends both locally and regionally. EIS Section 3.3.4.1.3 (Sage-Grouse Management Requirements) shows the required buffers where project activity would be restricted to protect leks in all HMAs. Applicable mitigation measures are described in the GRSG Mitigation Plan (Appendix U in MVE [2023]). Additionally, according to BLM (2015), "Designate and manage GHMA as open for wind and solar testing . . . subject to required design features and buffers." As stated in the GRSG Mitigation Plan, the construction of fences will be restricted to the minimum number and amount needed and sage-grouse safe fences would be required. Also temporary (e.g., drop down fencing) will be used where feasible and appropriate. In coordination with IDFG, seven of the eight previously undetermined leks identified in the draft EIS are now unoccupied and, therefore, do not warrant further consideration for BLM management. This conclusion is supported by additional lek count data from 2022 and 2023 and the following data: It has been approximately 70 years since sage-grouse were observed displaying in leks 2J010, 2J011, 2J012, 2J013, 2J014, 2J017, and 2J021. These same leks have had three to six repeated counts of zero since 2000; leks 2J012, 2J013, 2J014 also had a count of zero in 1972. In addition, these seven leks occur in a fragmented landscape with little remaining sagebrush cover, i.e., 9% to 19% sagebrush cover within a 3.1-mile (or 5-km) radius of these leks. Landscape-scale sagebrush cover is important for lek persistence. Occupied leks typically have more than 40% sagebrush cover within a 3.1-mile radius (Knick et al. 2013). The area around these seven leks is also dominated by high annual grass cover within 3.1-mile (or 5-km) radius around the leks, with 40-60% of the area having 20% or more annual grass cover. Because these seven leks have limited sagebrush across the landscape, have high annual grass cover, and are within a landscape further fragmented by agriculture and other land uses, and the leks have had numerous counts of zero over the past 20 plus years, BLM's independent determination of these seven leks is that they are unoccupied. This is also supported by IDFG definitions of five these leks as historical, i.e., no lekking activity in the last 20 years, and two leks (2J011, 2J017) no longer meeting IDFG's definition of a lek, i.e. the lek never had two counts of two or more males within a 10-year period. In summary, none of the previously undetermined leks are active/occupied and thus are not managed under BLM (2015a). One of the eight previously undetermined leks identified in the draft EIS (4L008) had four counts of zero between 2014 and 2022 and it has been over 40 years since it was occupied. However, lek 4L008 is within three and five miles of two occupied leks, 4L159 and 4L152, respectively, both with up to 20 birds, and the kernel density, similar to breeding bird density, is medium to high in this area, partly due to several occupied leks to the north and northeast. Habitat characteristics around lek 4L008 are similar to those around leks 4L152 and 4L159. All three of these leks have low landscape sagebrush cover (< 15%) and high annual grass cover (>40%) due to fires but are within 2 to 3 miles of larger contiguous patches of sagebrush cover. Furthermore, there are

Comment ID	Commenter	Public Comment	Response to Comment
		vitality. Because the draft EIS does not address the impact on the potential for improving and upgrading sage grouse habitat in the project area (making the draft EIS incomplete,) and without a revised draft EIS that does address this critical element, only Alternative A "No Build" can be considered acceptable. The draft EIS states that mitigation measures will be required to provide a "net conservation gain" (Section 3.3.4.4). But the "net conservation gain" described is only characterized in terms of acres. This approach tells us nothing about the loss of viable lek sites and actual sage grouse population decrease that will result from each of the build alternatives. Again, the draft EIS is incomplete in this regard, and so Alternative A must be recommended.	telemetry locations around leks 4L152 and 4L159 and to the north of 4L008. Due to the counts and recent change in lek definitions, IDFG no longer considers 4L008 a lek. However, BLM's independent determination is to consider lek 4L008 as occupied. Due to the proximity and similar characteristics of occupied leks 4L152 and 4L159, kernel density or breeding bird density, and telemetry locations in the area, there is insufficient information for BLM to consider lek 4L008 as unoccupied under BLM (2015a). Therefore, BLM would err on the side of caution for sage-grouse conservation and treat lek 4L008 as occupied. The BLM has added avoidance and minimization measures in "Alternative B (Proposed Action)", "Alternative B with Additional Measures": Prior to project construction, MVE's compliance manager would consult with IDFG for technical assistance and conduct lek surveys on previously un-surveyed areas identified by MVE as unsuitable habitat (WEST 2021) within 3.1 miles of the siting corridors. These areas would be surveyed by the compliance manager to search for leks that have not yet been identified (see Table App4-4). Required design features (RDFs) (see Table App4-3) and additional compensatory mitigation will be required if new occupied leks are found, in accordance with BLM (2015a).
8372-3	Douglas Miller	And, importantly, sage grouse are a foundational element of the cultural fabric in Idaho. Sage grouse are one of the few truly native Idaho keystone species. Sage grouse are an icon of the west (BLM National Greater Sage-Grouse Planning Strategy: https://tinyurl.com/2st56rym <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Ftinyurl.com%2F2st56rym&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cdf8d0aca05b8403e6fad08db2a343671%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638150175964057121%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=2G2gVbWin%2BOgYdOvg%2FCxUUiXqzA74HFsbZitwmPXg%2F8%3D&reserved=0>) All of the build alternatives are an order to extirpate sage grouse and a contemptuous malfeasance to destroy Idaho's priceless heritage. The draft EIS says nothing about the psychological harm and trauma that demise of sage grouse caused by each of the build alternatives will inflict on Idahoans whose most treasured memories and identities are rooted in sage grouse.	The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. General HMAs have more flexibility in land-use activities and energy development is allowed as long as appropriate measures are taken to avoid and minimize impacts. Numerous mitigation measures would be required to avoid, minimize, and compensate for impacts to sage-grouse. The BLM would require compensatory mitigation, as described in EIS Section 3.3.4.4 (Compensatory Mitigation), for any action alternative and would require compensatory mitigation to result in a net conservation gain.
8376-3	Rachel Espil	What of the effects upon the already sensitive species of sage-grouse? This habitat is already in need of protection and will be further compromised by this project.	As described throughout the EIS and as required in BLM (2015a), the project was designed to avoid placing infrastructure within 3.1 miles of known, active leks (there are 3 within 6 miles of the siting corridors). The BLM categorizes sage-grouse habitat into three categories (or habitat management areas or HMAs): Priority HMAs, Important HMAs, and General HMAs. Of these, Priority has the highest value, Important has moderate to high value, and General has a lower value. The project is proposed in General HMA, which has low breeding density of male sage-grouse. Only a portion of the project occurs in sage-grouse habitat. Even with the implementation of applicant-committed measures and other mitigation described in the GRSG Mitigation Plan (Appendix U in MVE [2023]), impacts to sage-grouse would remain. Compensatory mitigation would be required, and more details are in the GRSG Mitigation Plan. MVE has a set of options to provide compensatory mitigation for unavoidable impacts to sage-grouse habitat on BLM public lands, which are described in the Mitigation Framework for Greater Sage-grouse section in EIS Appendix 4.
9275-3	AJ Whitecotton	Sage Grouse habitat from your own files that I have read you are trying to build windmills, support roads, etc., right on top of sage grouse designated lands and yet some of the science says that is the worst thing you can do, remove ground cover etc., which now protects the birds from predator's. So you have done everything possible to protect them from grazing, etc., and yet now they are considered secondary? https://eplanning.blm.gov/public_projects/103344/200243182/20029799/250035998/Idaho_GRSG_FSEIS_2020%20COMPILED_508.pdf <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Feplanning.blm.gov%2Fpublic_projects%2F103344%2F200243182%2F20029799%2F250035998%2FIdaho_GRSG_FSEIS_2020%2520COMPILED_508.pdf&data=05%7C01%7Cblm_id_lavaridge%40blm.gov%7C9be8350ae5c34b0940fd08db39c43611%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638167287116841458%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C2000%7C%7C%7C&sdata=g1vPb4B39q2X22bLGkg96BwdKjmw%2FAgVG%2FNaNJvYZXs%3D&reserved=0>	See response to comment 8376-3 (see in Table A-3e, Greater Sage-Grouse).

Climate and Greenhouse Gas Emissions

Table A-3f. Climate and Greenhouse Gas Emissions

Comment ID	Commenter	Public Comment	Response to Comment
1042-10	WildLands Defense	This project is NOT in the public interest, and in no way, shape, or form can it be considered "green". The DEIS fails to accurately estimate the carbon greenhouse gas and combined energy and resource use footprint of the facility, and also the short life-span of turbine components. Mining for extraction of all elements used in manufacturing all parts of the turbines, lines, transformers, etc.; energy use in hauling the turbines, manufacturing them, etc.; energy use in replacing them after 1 or 2 decades - all must be fully assessed. Energy loss in transmission to Las Vegas or California must be assessed. There must also be an honest analysis of any "need" for this power, and where it will be used, must be undertaken	See EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) and EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) for estimates of the direct and indirect greenhouse emissions. In addition, EIS Appendix 4 includes a list of the applicant-committed measures to encourage carpooling among construction workers and minimize excessive exhaust emissions from construction equipment. Analysis of the origin of raw materials for the project or the ultimate destination for the power generated by the project are beyond the scope of analysis for this EIS.

11204-22	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The 2021 Comments state that the Permittees were "informed that wind farms reduce precipitation and raise ground temperatures in the immediate area of the project" and asked if this information would be true with respect to impacts from the proposed Project to the micro-environment within the Star Lake Allotment as this would potentially alter forage growth on the Allotment. 2021 Comments, pg.18. The DEIS did not address these concerns and questions at all. The DEIS and its associated Appendices use the word "precipitation" 14 times but never mention whether wind farm infrastructure has any impact on precipitation levels, timing, or patterns. The DEIS and its associated Appendices never use the words/phrases "ground temperature", "micro-environment", "micro environment", "micro-climate", or "micro climate."	The commenter is referred to AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief) regarding how vegetation and plant reproductive success could be affected by changes to ground-level temperatures and humidity levels from turbine operation. The presence of turbines could impact vegetation phenology because of changes in ground-level temperatures and humidity levels due to air mixing and turbulence from the turbines (Lee and Keith 2018; Roy et al. 2004). Lee, M.M., and D.W. Keith. 2018. Climatic impacts of wind power. Joule 2:2618–2632. Available at: https://doi.org/10.1016/j.joule.2018.09.009. Accessed July 10, 2023. Roy, S.B., S.W. Pacala, and R.L. Walko. 2004. Can large wind farms affect local meteorology. Jou*rnal of Geophysical Research* 109. doi:10.1029/2004JD004763.
11534-13	Matt Arnold, William Eubanks	The Full Extent of the Project's Greenhouse Gas Emissions Section 3.4 of the DEIS endeavors to quantify the greenhouse gas ("GHG") emissions that are expected to "be emitted from construction and decommissioning of the project," and how those "emissions contribute to climate change." DEIS at 3-126. Unsurprisingly, it concludes that regardless of any such emissions, the Project "would incrementally contribute toward achievement of national climate change goals" by generating energy from a renewable source, which "would result in significantly fewer emissions than if the same amount of energy were generated by fossil fuels." Id. at 3-140. The DEIS's evaluation, however, entirely omits the GHG emissions emitted by the manufacture and transport of the Project's critical infrastructure. See id. at 3-364 ("[S]pecific turbine component delivery routes are unknown (and would not be determined until closer to the start of construction) and would be determined by the turbine manufacturer . . ."). This information must be included to understand the full extent of the Project's GHG emissions, as an increasing number of turbines are manufactured in and imported from countries with far less restrictive climate controls. China's Increasingly Cheap Wind Turbines Could Open New Markets, S&P GLOBAL, https://bit.ly/3mqq7o1 (Sept. 26, 2022).11 Understanding where and by whom these turbines will be manufactured and transported also serves to inform the public and decisionmakers whether this Project is contributing to the Biden Administration's policy of encouraging domestic clean-energy jobs. Fact Sheet: Biden-Harris Administration Races to Deploy Clean Energy that Creates Jobs and Lowers Costs, WHITE HOUSE (Jan. 12, 2022), https://bit.ly/3UtZj2F. By omitting this information from the DEIS, BLM has not only failed to take a "hard look" at the Project's actual GHG effects, it has also arbitrarily skewed its analysis in favor of Project authorization.	EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) summarizes the direct and indirect greenhouse emissions, as does EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions). These emission estimates represent the project's direct and reasonably foreseeable indirect GHG emissions. The place of manufacture and transport of the wind turbine components is speculative and unknown at this time. The BLM is not able to analyze impacts that are beyond the scope of the project or make assumptions based on where and how the components will be manufactured and transported.
11535-118	Steven Andersen	The EIS fails to adequately consider the impacts on the environment versus productivity of the project. Harvard University studies quantified the generating capacity of 411 wind farms (using U.S. datasets) and concluded the average power density (the rate of energy generation divided by the encompassing area of the wind plant) was up to 100 times lower than previous estimates, including previous estimates from the Department of Energy and Intergovernmental Panel on Climate Change.346 Additionally, the study concluded that wind power causes climatic impacts such as warmer temperatures, which increase with the height of the turbines. 347 This intense study by Harvard University demonstrates negative climate impacts posed by wind farms. The warming is the effect of wind turbines actively mixing the atmosphere near the ground and aloft while simultaneously extracting from the atmosphere's motion.348 This study supports more than ten other studies that observed warming near operation US wind farms and is supported by satellite-based observational studies that found temperature increases.349 Importantly, the studies also note that the warming effect in the continental U.S. caused by wind turbines is actually larger than the effect of reduced emissions for the first century of its operation. This is because the warming effect is predominantly local to the wind farm, while greenhouse gas concentrations must be reduced globally before the benefits are realized.350 The DEIS grossly underestimates the construction period and the associated greenhouse gas emissions.	AIB-44 in EIS Appendix 3 (Issues Analyzed in Brief) addresses potential changes to ground-level temperatures from turbine operation. The referenced study (Lee and Keith 2018) was reviewed and added to AIB-44. Lee, M.M., and D.W. Keith. 2018. Climatic impacts of wind power. Joule 2:2618–2632. Available at: https://doi.org/10.1016/j.joule.2018.09.009. Accessed July 10, 2023.
11833-5	Bob Hassoldt	My final concern is that there is no financial analysis for this project. There is no cost-benefit analysis. How much will the climate be changed by this project? What reduction in the amount of CO2 will occur versus the same energy produced by a natural gas plant? If there is a CO2 reduction, how much will that reduction cool the planet and how much of a monetary benefit will that provide to the American citizenry?	Section 3.4.2.2.2 quantifies the estimated avoided emissions and the social cost of carbon for Alternative B. There is no method to quantify how anticipated CO_2 reductions from one project would impact global temperatures. Furthermore, due to the global nature of climate change and the scale of global CO_2 emissions, a single project will not have a discernable impact on temperature change.
11849-6	Charles Brockway	Modern electrical equipment makes use of sulfur hexafluoride for insulation and arc quenching. This compound is extremely stable with an estimated atmospheric life of 3,200 years. It is "the most potent greenhouse gas known to date," according to the EPA. The EIS fails to analyze the effect of its use and potential release in conjunction with the proposed project.	See EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) for the greenhouse gas emissions due to SF6 leaks.
11962-8	Cassie Christensen, Tyler Christensen	According to the report generated RRC Companies (Volume 2a-J-b-1) it is stated that there will be an estimate of 810,930 trips during the construction. In this assumption, it also states that it is believed that a number of workers will carpool to the job site, so the estimate could easily be 1.5% higher than stated, which brings it to 1,216,395 trips. Has a conversion been done on how much fuel will be burned in order to drive that many trips? Besides the amount of fossil fuels that will be burned just in the trips made (doesn't include the building, creation or any other type of CO2 that will be created in the construction of this project) the calculated trips don't include the construction of new public roadways in the area that will need replaced before and after construction. I assume that RRC has not physically seen the conditions of the roads that lead to the proposed site are in.	EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) and EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) provide estimates of the direct and indirect greenhouse emissions. In addition, EIS Appendix (Mitigation) lists the applicant-committed measures to encourage carpooling among construction workers and minimize excessive exhaust emissions from construction equipment (measures 39 and 118). Construction and maintenance of public roadways is not within the scope of this project nor within the authority of the BLM or the project operator. Project-specific road construction and the associated emissions, including from vehicle traffic, have been included in the referenced sections.
11978-26	Magic Valley Energy, LLC	Section 3.4.2.2.2 – Social Cost of Carbon (Alternative B) 22. MVE Comment: In Table 3.4-5, the DEIS lists the estimated Social Cost of GHG (SC-GHG) associated with Alternative B; however, SC-GHG values are not provided for the other alternatives under review. MVE requests that BLM provide estimates of SC-GHG for the	As discussed in EIS Sections 3.4.1.2.3 (Alternative C [Reduced Western Corridors]) through 3.4.1.2.5 (Alternative E [Reduced Southern Corridors]), the construction emissions of Alternatives C, D, and E are likely to be the same or less than the construction emissions generated by Alternative B. Similarly, the operations

Comment ID	Commenter	Public Comment	Response to Comment
		other alternatives, which is necessary to enable readers to calculate the net climate-related benefits of each alternative by subtracting the SC-GHG values for each alternative from the very large climate and health benefit values listed in Table 3.4-6.	emissions for Alternatives C, D, and E, discussed in EIS Sections 3.4.2.2.3 (Alternative C [Reduced Western Corridors]) through 3.4.2.2.5 (Alternative E [Reduced Southern Corridors]) are likely to be the same or less than the O&M emissions generated by Alternative B. Since SC-GHG values are based on these emissions, the SC-GHG values for Alternatives C, D, and E would likely be the same or less than the SC-GHG values calculated for Alternative B. Quantifying the estimated values would not contribute further to the analysis.
11978-27	Magic Valley Energy, LLC	Section 3.4.2.2.6 – Operational GHG Impacts: Cumulative 23. The DEIS states: "Future trends and actions would also increase GHG emissions through operation of new energy generation facilities to meet future power demands. Because the future planned actions are also renewable energy projects, their operation emissions would be fewer than those generated by fossil fuels (see section below for more details). The project would incrementally contribute toward achievement of national climate change goals. Without deep reductions in GHG emissions globally, a warming of 2°C is predicted to be exceeded during the twenty-first century, which is projected to increase climate change risk and have adverse consequences for human and ecological systems (IPCC 2021). The impacts to climate change from project operation would be minor. As described below, the project would generate energy from a renewable resource and would result in significantly fewer emissions than if the same amount of energy were generated by fossil fuels." a. MVE Comment: The recent CEQ guidance, National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change (the "2023 CEQ Guidance") states the following: "The agency generally should present annual GHG emissions increases or reductions, as well as net GHG emissions over the projected lifetime of the action, consistent with existing best practices. Agencies should be guided by a rule of reason and the concept of proportionality in undertaking this analysis, particularly for proposed actions with net beneficial climate effects, as described below."15 Consistent with the 2023 CEW Guidance, the cumulative impacts analysis should include additional analysis including a high-level assessment of the GHG benefits associated with the other proposed renewable energy projects in the analysis area.	Discussion of other renewable projects added to Cumulative Impacts section (3.4.2.2.7).
11978-28	Magic Valley Energy, LLC	Section 3.4.2.2.1 – Operational GHG Emissions Impacts: Alternative A (No Action) 24. MVE Comment: The 2023 CEQ Guidance specifies that "…development of a new wind energy project may result in short-term construction GHG emissions but overall long-term GHG benefits. Agencies should describe both short- and long-term effects in comparison to the no action alternative in NEPA reviews and clearly explain the net effect of their actions even if precision regarding the timing of short- and long-term effects is not possible." Thus, per the 2023 CEQ Guidance, Section 3.4.1.2.1 of the FEIS should be revised to compare the avoided GHG emissions estimated for the various alternatives versus the lack of avoided GHG emissions associated with the no action alternative.	EIS Section 3.4.2.2.1 (Alternative A [No Action]) has been revised to include a discussion of the lack of avoided GHG emissions associated with the No Action alternative.
11978-121	Magic Valley Energy, LLC	23. Section 3.04.1.2.2 Climate and Greenhouse Gases - Alternative B (Proposed Action) Table 3.4-2; Table 3.4-3 Table 3.4-2 has a footnote stating that calculations are only provided for Alternative B. An analysis for Alternatives C, D, and E would be beneficial to include in this table and related tables throughout this section. Contrary to the footnote, it would seem that the values of estimated annual project construction greenhouse gas emissions would likely change based on different sizes of the Project area, as vehicles would not need to travel as far. One would assume that GHG emissions would be close to the proportionality of the total area of surface disturbance for any given alternative.	As discussed in EIS Sections 3.4.1.2.3 (Alternative C [Reduced Western Corridors]) through 3.4.1.2.5 (Alternative E [Reduced Southern Corridors]), the construction emissions of Alternatives C, D, and E are likely to be the same or less than the construction emissions generated by Alternative B. Quantifying the estimated construction emissions for Alternatives C, D, and E would not contribute further to the analysis.
11991-8	Julie Abo	I would like to know what the "existing fossil fuel sources" are that would be replaced. This energy will not be used locally. How does this calculation work?	The estimated avoided emissions by generating electricity via the project instead of traditional fossil fuel–powered plants were calculated using the EPA's AVERT Excel Edition, Version 3.2 for the Northwest region based on EPA's 2019 regional data file. AVERT uses hourly "prepackaged" data from EPA's Air Markets Program Data (AMPD) and National Emissions Inventory to perform statistical analysis on actual behavior of past generation, given various regional demand levels.
11994-2	Danielle Gunn	The current state of this unaltered, minimally fragmented open space contained in these allotments also plays a significant role in carbon sequestration needed to manage climate change.	As described in EIS Section 3.15.1.1 (Native Upland Vegetation Communities, Affected Environment), the analysis area is composed mostly of sagebrush steppe and grassland vegetation; forests and woodlands that sequester more carbon, are not present. Impacts to native upland vegetation are summarized in EIS Table 3.15-3 (Summary of Impacts to Native Upland Vegetation Communities). EIS Appendix 4, Mitigation, lists mitigation measures that would be implemented to minimize or avoid impacts to native vegetation/loss of carbon sequestration and wildlife habitat.
11994-5	Danielle Gunn	Secondly, the DEIS needs to address the economics of wind power and how this power source compares to hydrologic and fossil fuel generated power.	Hydrologic and fossil fuel generated power are not alternatives analyzed in detail in the EIS and therefore the economics of those types of energy are not analyzed. Furthermore, hydrologic and fossil-fuel generated power are not evaluated in this EIS as part of the Proposed Action, nor does NEPA require analysis of alternatives that do not meet the purpose and need of the Proposed Action.
12398-16	US Environmental Protection Agency	Climate Change, Resilience and Adaptation Regarding impacts of climate change, EPA recommends the FEIS: • Broaden the discussion in section 3.4.1.1.1 to include existing and reasonably foreseeable environmental trends related to a changing climate of the analysis area. • Discuss reasonably foreseeable effects that a currently changing climate will have on the proposed project and the project area, including its infrastructure. This could help inform the development of measures to improve the climate resilience of the proposed project. If projected climate-related changes could notably stress the affected environment or exacerbate the environmental impacts of the project, these impacts should also be considered as part of the NEPA analysis. For example, adaptation strategies could include an extreme weather event analysis to minimize or prevent a disruption of power or loss of energy to consumers from natural disaster events. An increase in the magnitude or frequency of extreme events can severely challenge utility systems that are not designed to withstand intense events. Extreme event	EIS Section 3.4.1.1.1 (Existing and Future Trends and Actions) describes existing and reasonably foreseeable environmental trends related to a changing climate. Text was added to EIS Section 3.4.1.2.2 (Alternative B [Proposed Action]) regarding effects of a changing climate on the project. The Proposed Action is not anticipated to exacerbate climate change impacts in the area.

Comment ID	Commenter	Public Comment	Response to Comment
		analyses or modeling can help develop a better understanding of the risks and consequences associated with these types of events.	
12398-17	US Environmental Protection Agency	Indicate expected sulfur hexafluoride (SF6) emissions usually associated with gas-insulated switchgears on the WTGs and measures to be taken to minimize these emissions. One action that could be taken is for BLM to require adoption of SF6-free switchgears (“clean-air”) or other equipment. If SF6-free switchgears are determined to be technically infeasible, or are unavailable, the Applicant could also limit SF6 leaks to the extent practicable or required by state or federal regulations. SF6 is the most potent known greenhouse gas, with the potential to trap infrared radiation approximately 23,000 times more effectively than carbon dioxide. SF6 is also a very stable chemical, with an atmospheric lifetime of 3,200 years. Thus, a relatively small amount of SF6 can have a significant impact on global climate change.	See EIS Section 3.4.2.2.2 (Alternative B [Proposed Action]) for the sulfur hexafluoride emissions associated with circuit breakers and switchgears quantified as its CO2 equivalent.
12398-18	US Environmental Protection Agency	EPA recommends that the FEIS include information from the March 2023 Synthesis Report of the IPCC Sixth Assessment Report16 which states that the amount of current global climate adaptation measures, like the development of renewable energy infrastructure, are inadequate to prevent widespread adverse impacts and related losses and damages to nature and people. The Synthesis Report states with high confidence that for any given future warming level, many climate-related risks are higher than assessed in Fifth Assessment Report, and projected long-term impacts are up to multiple times higher than currently observed. The Synthesis Report states with high confidence that energy generation diversification (e.g., via wind) can increase energy reliability and reduce vulnerabilities to climate change.	This information has been added to EIS Section 3.4.1.1.1 (Existing and Future Trends and Actions).
12398-19	US Environmental Protection Agency	Highlight the climate change benefits/avoided greenhouse gas emissions. In our Scoping letter, EPA recommended that the DEIS include analysis of the existing and reasonably foreseeable environmental trends related to a changing climate and highlight the climate change benefits and avoided greenhouse gas emissions associated with this proposed project. EPA notes the DEIS explains the potential estimated avoided emissions for each action Alternative. Using EPA’s Greenhouse Gas Emissions Equivalency Calculator, we estimate that the minimum annual avoided emissions from the action alternatives is equivalent to removing about 500,000 gasoline-powered passenger vehicles driven for one year from the transportation system. These avoided emissions represent significant benefit to the environment. Concerning climate resilience and adaptation, EPA encourages the FEIS describe available mechanisms in the BLM licensing processes and other authorizations to cover the costs of safety measures and project operations and decommissioning including specific adaptive management plans to contend with changing climatic conditions that may affect this project operations.	Additional discussion regarding the GHG equivalencies for the potentially avoided emissions has been added to EIS Section 3.4.2.2.2 (Alternative B [Proposed Action]).
12469-2	Mike Telford	It is my understanding that the NEPA laws and regulations and other environment law’s purpose is to protect the environment. I do not find in the DEIS any detailed analyze of the carbon foot print of all inputs, construction, transportation, operation, and decommissioning and disposal, that would be created by Lava Ridge. This carbon foot print is very different than emission standards and analysis. Surly we must consider everything it takes. The raw materials mined or created down to the last gallon of fuel used. With geopolitical upheaval in the world, there must be consideration not only of carbon but where components are coming from, their standards, and who benefits. Wind power is proving to be relatively inefficient, and expensive. No one is opposed to “Green Energy” but we can not create more adverse impacts to the environment with more environmental damage than what it is suppose to replace. There is no way to assess the impact without a complete carbon foot print study of Lava Ridge. It makes no sense to destroy the environment to save it.	EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) and EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) estimate the direct and indirect greenhouse emissions. In addition, EIS Appendix 4 (Mitigation) lists the applicant-committed measures to encourage carpooling among construction workers and minimize excessive exhaust emissions from construction equipment. EIS Section 3.4.2.2.2 (Alternative B [Proposed Action]) quantifies the estimated avoided emissions and the social cost of carbon for Alternative B. NEPA does not require an analysis of impacts beyond the “Affected Environment” of the project. It is also speculative and beyond the scope of the Proposed Action to make assumptions of where raw materials may be derived from or where the components for the turbines would originate.
12969-2	Karen Brockway	In addition, on June 24, 2022, I sent you a letter explaining the impact of increased sulfur hexafluoride (SF6) that the switchgears for the turbines release. SF6 is 23,500 times more warming that carbon dioxide (CO2), and remains in the atmosphere for at least 3200 years. Because the turbines for the LS Power project have not been specified, neither LS Power nor BLM have addressed this major flaw of wind turbines, and the draft EIS statement completely neglected to investigate this valid environmental concern. Please refer to my previous letter with attached documentation for further information on the long environmental impact of SF6•	EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) lists the greenhouse gas emissions due to SF6 leaks. In addition, EIS Section 3.4.2.2.2 (Alternative B [Proposed Action]) quantifies the estimated avoided emissions and the social cost of carbon for Alternative B.
12976-4	James Komadina	2. Plan of Development a. Along with POD Appendix J, Section 3.14 of the following reports describe traffic patterns to/from the construction area: Transportation Assessment for the Lava Ridge Wind Project (Mott MacDonald 2021a), Review of-Trip Generation and Delivery Flow Plan -November 2021 Updates (Mott MacDonald 2021b) and Trip Generation Report for the Lava Ridge Wind Project (RRC 2022). b. POD Section 2.5 describes in general terms, the equipment necessary for construction of the Alternatives. Knowing the number of turbine structures, meteorological towers, power line alignments as well as ancillary facility locations as described in POD Section 1.3, along with industry productivity factors for the various mechanical and earthworks required, it is possible to develop a man-loaded equipment construction schedule from this coarse data. i. COMMENT - The level of accuracy from the Transportation Assessment data is inadequate for estimation of GHG emissions. A detailed man loaded activity schedule specifying the total individual annual equipment hours necessary to complete the project construction, operation and decommissioning is required to develop an estimate of total GHG emissions for the Alternatives under consideration.	Traffic estimates are detailed in MVE (2023) and in the EIS and are sufficient to allow analysis of effects and a reasoned comparison of alternatives. The emissions inventory prepared for the draft EIS estimated equipment emissions based on MVE (2023).
12976-10	James Komadina	4. Benefits/Valuation a. Reviewing the model inputs for Table 3.4-5, these are derived from Interagency Working Group on Social Cost of Greenhouse Gases (IWG). 2021. Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide. Interim Estimates under Executive Order 13990, and are incorporated into the model and compounded annually by 3% for the entire POD 30 year life. Text in 3.4.2.2.1 states "Significant uncertainty in the SC-GHG estimates exist." Further, "It is important to disclose that uncertainty is substantial	EIS Table 3.4-7 (Social Cost of Greenhouse Gases from Alternative B) has been updated to include emissions from the anticipated 2-year decommissioning. SCC estimates are provided for disclosure purposes. The BLM does not rely on a single paper or report to change how analyses are conducted.

Comment ID	Commenter	Public Comment	Response to Comment
		(IWG 2021)." (Emphasis added). i. There is wide precision in the estimate of SC-GHG, between $7/tCO2 to $125/tCO2, depending upon the confidence interval considered. Millstein, D., R. Wiser, M. Bolinger, and G. Barbose. 2017. "The climate and air-quality benefits of wind and solar power in the United States." Nature Energy, 2: 17134 explains this distribution as: "The range of estimates presented is driven both by the uncertainty in the underlying processes and also by differences in model characteristics; note, our analysis does not represent a full assessment of underlying uncertainties." 1. The accuracy of SC-GHG as set forth is not discussed and remains unquantified. 11. None of the foregoing input variables allow for human adaptation to changing environmental conditions which are described and supported by research contained in the Technological Forecasting & Social Change 156 (2020) paper Welfare in the 2JS' century: Increasing development, reducing inequality, the impact of climate change, and the cost of climate policies by Lomborg. 111. COMMENT-For financial purposes, the internal rate ofreturn ("IRR") is that rate by which investment cash flows must be discounted to the present to equal zero. This IRR represents the degree of risk, along with payback period, that an investor might consider prior to making the investment. Using assumptions from 2d(i) to (iii) above, the pre-tax IRR of Lava Ridge Alternative B is approximately 61%. As the SC-GHG model outputs indicate, compounding any gas emission cost by any factor less than the present value discount rate, leads to a future annual cost lower than the current value. Utilizing discount rates less than 5% provides a false sense of risk and accuracy when public investment analyses warrant a significantly higher discounting. Given the broad uncertainties inherent with the SC GHG estimates, Table 3.4-5 should be deleted from this DEIS document. 1v. COMMENT-For completeness, there is an error in the model as the final year of Decommissioning has been omitted.	
12976-11	James Komadina	b. Text in 3.4.2.2.1 notes that the "EPA's AVERT is not a long-term projection tool and is not intended to analyze avoided emissions for more than 5 years from baseline." The DEIS cites Land-Based Wind Market Report: 2022 Edition, authored by the DOE Office of Energy Efficiency and Renewable Energy, Figure 60, as the marginal health and climate benefits of $46/MWh used in Table 3.4-6 Climate and Health Benefits. i. Going to the DOE Figure 60 reference, Millstein, D., R. Wiser, M. Bolinger, and G. Barbose. 2017. "The climate and air-quality benefits of wind and solar power in the United States." Nature Energy, 2: 17134, the base data ends in 2015, outside of the AVERT guidance 5 year window. 11. The DOE study ends noting, "Both estimates of health and climate benefits are subject to uncertainty. Central estimates of these benefits are presented, though both estimates have a wide range of plausible values. More detail about this uncertainty is available in Millstein et al. (2017) and Fell and Johnson (2021)." (Emphasis added). m. COMMENT - It would appear that the underlying AVERT data is outside of the 5 year efficacy window and that the model outputs need to be updated for this DEIS. 1v. COMMENT - Millstein, D., R. Wiser, M. Bolinger, and G. Barbose. 2017. "The climate and air-quality benefits of wind and solar power in the United States.,, Nature Energy, 2: 17134 discusses that, "EPA states that greater than 90% of the per ton total monetary benefits are due to the reduced mortality rates." For the period 2007 - 2015, the premature mortalities avoided are cited as 3,000 to 12,700. The definition of premature mortalities must be clearly set forth. The control group for premature mortalities must be clearly set forth. The actual premature mortalities avoided must be documented and verified. v. COMMENT - While arithmetically correct, the 30-year estimate in Table 3.4-6 should be omitted as it falls well outside any predictive data available. v1. COMMENT - The net generation capacity utilized for the 6-MW Maximum Generation Case is not supported by the DOE study as these proposed turbines fall outside of industry practice at this time - they will be novel installations without actual production data. Therefore, this data should be omitted from the DEIS.	Table 3.4-8 has been revised and no longer estimates 30 years of avoided emissions. Instead, it presents the annual avoided SC-GHG based on annual avoided emissions estimated by AVERT. All data and discussion that used the DOE's Land-Based Wind Market Report: 2022 Edition have been deleted. The SC-GHG analysis and discussion are now entirely based on the IWG's *Technical Support Document: Social Cost of Carbon, Methane, Nitrous Oxides* and annual avoided emissions as estimated by the EPA's AVERT.
12976-12	James Komadina	c. Scope 1, 2 and 3 Inventory Guidance. Scope 1 emissions are direct greenhouse (GHG) emissions that occur from sources which are controlled or owned by an organization (e.g., emissions associated with fuel combustion in boilers, furnaces, vehicles). Scope 2 emissions are indirect GHG emissions associated with the purchase of electricity, steam, heat, or cooling. Although Scope 2 emissions physically occur at the facility where they are generated, they are accounted for in an organization's GHG inventory because they are a result of the organization's energy use. Scope 3 emission are all indirect emission, not included in Scope 2, that occur in the value chain of the reporting company, including both upstream and downstream emissions. Scope I and Scope 2 Inventory Guidance I US EPA. Directly applicable Scope 3 emissions, arising from the amount of rolling stock required to construct, operate and decommission the Lava Ridge facility are significant. The EPA notes in this guidance that, "Scope 3 emissions are the result of activities from assets not owned or controlled by the reporting organization, but that the organization indirectly affects in its value chain. Scope 3 emissions include all sources not within an organization's scope 1 and 2 boundary. The scope 3 emissions for one organization are the scope 1 and 2 emissions of another organization. Scope 3 emissions, also referred to as value chain emissions, often represent the majority of an organization's total greenhouse gas (GHG) emissions." i. COMMENT - MVE must account for all emissions generated by the rolling stock during construction, operation and decommissioning stages of the project as well as those associated with the manufacture of all capital elements utilized by this Project on a cradle to grave basis. MVE has not developed and clearly set forth this required data.	Neither NEPA nor CEQ guidance requires the estimation of Scope 3 emissions. Estimation of such emissions is speculative and beyond the scope of this EIS. See Section 3.4.1.2.2 (Alternative B [Proposed Action]) Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) of the EIS for estimates of the direct and indirect greenhouse emissions as well as Section 3.4.2.2.2 Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions). These emission estimates represent the Proposed Action's projected direct and reasonably foreseeable indirect GHG emissions.
12976-13	James Komadina	d. Further, on January 9, 2023, the CEQ issued interim guidance on GHG emission evaluation in NEPA documents for Agencies to immediately implement until such time as the final guidance, currently in public review, is completed. Federal Register:: National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions and Climate Change i. COMMENT- This section of the DEIS must be revised using the new CEQ interim guidance.	Additional discussion regarding the GHG equivalencies for the potentially avoided emissions has been added to Section 3.4.2.2.2 (Alternative B [Proposed Action]).

Comment ID	Commenter	Public Comment	Response to Comment
12976-14	James Komadina	e. Global warming has been deemed by some as an existential threat to humanity. Ocasio-Cortez: 'World will end in 12 years' if climate change not addressed I The Hill DEIS Section 3.4.1.1 acknowledges that "Water vapor is the most abundant GHG " i. COMMENT- Water emissions arising from activities covered under this DEIS have not been quantified nor have efforts to remove water vapor from the atmosphere have been addressed in this DEIS. The DEIS must describe all efforts being made to eliminate water emissions from occurring from these proposed actions. 11. The thoroughly referenced book Unsettled by Koonan (2021) notes that: 1. "In any event, it is impossible-for both practical and fundamental reasons-to tune the dozens of parameters so that the model matches the far more numerous observed properties of the climate system. Not only does this cast doubt on whether the conclusions of the model can be trusted, it makes it clear that we don't understand features of the climate to anywhere near the level of specificity required given the smallness of human influences." 2. "The uncertainties in modeling of both-climate change and the consequences of future greenhouse gas emission make it impossible today to provide reliable, quantitative statements about relative risks and consequences and benefits of rising greenhouse gases to the earth system as a whole, let alone to specific regions of the planet." 111. COMMENT - The IPCC utilizes over a dozen models in their work. The specific IPCC model which is utilized in this DEIS to justify GHG avoidance costs and benefits must be set forth. The untruncated model inputs utilized must also be set forth. Quantitative proofs of the precision and accuracy of the historic model results must be clearly summarized. The cumulative error of the estimate must be developed and presented.	Water vapor is not a GHG of concern for the Proposed Action and is not estimated in the draft EIS. Watering is necessary for dust suppression on roads and reclamation of disturbed areas. No IPCC model was used for the draft EIS to justify GHG avoidance costs and benefits. Furthermore, IPCC models that are used at global and regional scales are not designed for the project-specific analyses analyzed in the draft EIS. EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) and EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) give estimates of the direct and indirect greenhouse emissions. EIS Appendix 4 (Mitigation) lists the applicant-committed measures to encourage carpooling among construction workers and minimize excessive exhaust emissions from construction equipment. EIS Section 3.4.2.2.2 (Alternative B [Proposed Action]) quantifies the estimated avoided emissions and the social cost of carbon for Alternative B. The EIS has been updated to include information from the March 2023 Synthesis Report of the IPCC Sixth Assessment Report (IPCC 2023), which states that the amount of current global climate adaptation measures, like the development of renewable energy infrastructure, are inadequate to prevent widespread adverse impacts and related losses and damages to nature and people. The Synthesis Report states with high confidence that for any given future warming level, many climate-related risks are higher than assessed in Fifth Assessment Report, and projected long-term impacts are up to multiple times higher than currently observed. The Synthesis Report states with high confidence that energy generation diversification (e.g., via wind) can increase energy reliability and reduce vulnerabilities to climate change.
1311-1	David Mollineaux	Second, I heard that the cost to build one turbine with all the materials like concrete, metal and labor exceeds the power recovery over the life of the turbine. Is that true? Do you use up more energy in building the turbine than in the power it can provide? I would like to see a study showing the benefits.	The economic benefits of turbine manufacturing are outside the scope of the EIS analysis.
1697-1	Dean Dimond	Research shows that Wind farms can change the local weather patterns. It is going to be impossible to know the true effect of Lava Ridge as there are not any wind farms this large with this tall of towers. The DEIS fails to show this. What gives L.S power the right to change the weather pattern at my farm. When I have to water more because of it will LS POWER pay for it? Will the BLM be liable? were will I get the water? What will be the affect if other Wind projects are approved? How far will away will Lava Ridge affect the climate? What if Lava Ridge changes the weather pattern so the storms don't reach the mountains that supply our water? What will it do to Yellowstone Park? All of these questions and more SHOULD have been answered in the DEIS. Data from a meteorological field campaign show that such wind farms can significantly affect near-surface air temperatures. These effects result from enhanced vertical mixing due to turbulence generated by wind turbine rotors. https://www.nature.com/articles/s41598-021-02089-2	Approximately half of all existing wind energy turbines are located in cultivated cropland (Harrison-Atlas et al. 2022) and a reduction in crop productivity or yields has not been documented (Harrison-Atlas et al. 2022; Mills 2015; Morris and Blekkenhorst 2017). Given the prevalence of wind energy turbines in agricultural lands and the lack of documented declines in crop productivity in the vicinity of these turbines, it is unlikely that turbines would have negative economic consequences for the local agricultural economy. Harrison-Atlas, D., A. Lopez, and E. Lantz. 2022. Dynamic land use implications of rapidly expanding and evolving wind power deployment. *Environmental Research Letters* 17(4):17 044064. Accessed December 29, 2023.
5920-6	Kelly Varelmann	The environmental impact of these huge windmill projects are not just felt locally but also has a huge worldwide impact. The metals and hazardous materials needed to build wind turbines are mined in China where low environmental standards are the norm. The materials, parts and/or entire windmill blades are then shipped to the US using enormous amounts of fossil fuels. The blades are then trucked to the project sites using, yet again, enormous amounts of fossil fuels. It's my understanding that the industry has no solution for the disposal or recycling of these monsters once they are no longer functioning and at this time are merely being buried in the ground by heavy equipment that ironically uses fossil fuels. Currently the lifespan of a wind turbine is only approximately 20 to 25 years so at the rate they are currently being erected, we could be in for an environmental disaster in the near future, not to mention the current effects on the soil and ground water the decommissioned buried turbines are having right now.	See responses to comments 11873-7 and 11926-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
6017-1	Michael Siegle	My biggest question is the initial carbon footprint of manufacturing and transport and assembly, including any initial environmental and ecological impact. How long will it take to make up for these initial carbon investments?	EIS Table 3.4-6 estimates the annual and 5-year avoided emissions for the operation of the project. While it is true these emissions represent only a piece of the lifecycle GHG emissions of fossil fuel electricity generation, installed wind turbines harnessing the wind for electricity generation is also only a piece of the lifecycle wind power. The BLM has compared the emissions at the point of electricity generation rather than the entire lifecycle, since lifecycle emissions can vary greatly depending on project specifications. Guessing where turbines would be manufactured and their delivery route to the project site would be speculative and beyond the scope of reasonable analysis for this EIS.
7339-1	Matt F	Recent reporting suggests that as wind turbines get larger, they collapse more often. In addition to the danger of the collapses, such events will reduce the estimated power output of the project. This presents a problem because the EIS performs various calculations about the estimated emissions reductions that will result from the project. However, these calculations do not take into account turbine collapses and the subsequent reduction in power production caused by them. If the power output is reduced, then the emissions reduction benefits will also be reduced, thus possibly changing the determination of whether the project will be worth doing from an emissions reduction standpoint.	The EIS cannot speculate what turbines, if any, would have any type of mechanical or structural issues that would take them offline and temporarily reduce the overall capacity of the project. Turbines would be maintained to avoid mechanical or structural issues.

Comment ID	Commenter	Public Comment	Response to Comment
7341-1	Matt F	The EIS states on pp ES-xix that the operations phase will be 34 years. This is unrealistic because the machinery of the turbines degrades over time. This leads to a reduction in power output at a rate of about 1.6% per year, as can be seen in the discussion section of this paper which studied onshore turbines in the United Kingdom in 2013: https://pdf.sciencedirectassets.com/271431/1-s2.0-S0960148113X00138/1-s2.0-S0960148113005727/main.pdf?X-Amz-Security-Token=IQoJb3JpZ2luX2VjEJX%2F%2F%2F%2F%2F%2F%2F%2F%2F%2FwEaCXVzLWVhc3QtMSJHMEUCIHk%2BH%2FvXqkJWbdBxSPQpIeOWDBoNeZ5mm7TYm3h7hR5eAiEA%2BPNdVqQiFPwZ8GSdYaoNtzJQRi3M3wJaTpaAgnLJ4QYqswUITRAFGgwwNTkwMDM1NDY4NjUiDK3X7NuW%2F1wI35a1WCqQBeazecv0SAnRKBxrRGsxMzMae6YIXCwuhtyxshlnop2ggIfKA5aE%2FsQOvbNFcXjGMUrzsYw9uHjUJSPmpxqpP0sLB%2BI3y7TS8x%2FJyJiPFblvhyUJYQ9Bsg3PxRIiCXxhIrBeLfk15a3CvBX2uTExSaOxZLLHIY%2FZLNhdUf8oG3kDvexzceZiHYT029WpHX8gpSCXbNGc4Fp%2BJzwUoC7xSH39cH4IisTUnz4QdIydsaDZVTS8UADeNINoL3C4E6%2BE%2FMIIA2TrWEHyMZGDwRB16q6TpbWNTYtK6HEBlVQ1jC%2BkCBhbH8IFfByZZDASdKdR3xotrWNjDI498%2BeoZ0yAvMFo8cTY4bxXcq30caZ47tx7neScNOfNh9mfcQBDwi4OZj0gTD72PtoHbEW3rvW4aD5TgZIzSyPyqlh%2Ba0ANceZR6TrzCDCec4gwXaXZd7JCB%2FhIhtR3ZXtrYYgSD5yrohFXYNeVQRdgA1BeC%2BiDyqsNAlp%2F2k%2B0Axj6y7orqOHOSYxFnETvYB34aihhFhuoRqiyFx8pvs0ddTX5KTTLxnKkXk5WuQvw8N6c%2B0G92F4BeO2xBuqf66cKQNnZDM8ZNgyOK0TxZTmAxPBm%2BgLcqKDuikeV2nx7T5yY6%2BiFEvJ7c8pp%2B%2Frq2pNdr28HOgPZLN1wuVzem46garwmkzTVdc9k8ps4wmTniBLzKFpTQxnuzx00MwihDElKX0sFkFxoEhLQCksEUVvNJt10BeRQpNTnL7j49hSCsMSXy4Buw4%2FuxPbnvWUhrlHXg3ttYFQKLCGsJRpgB30u2ywpun%2FW8pLz0iGNofGNmGGpKqd%2BVbSpy08azvshO24QogYK4xG6%2BDeyHhHo8%2B4sRFoPb665e5RTML7bo6AGOrEBAlam5HL1HbQolEbM2EqjcTGDvwyy6xbOnx2ixoawGMBsK%2BjMmurMoZYM0zTXpTrlWB0mUALb52gdXSUXFE78Yx8%2BpY%2BR6pYNOGAV8iNnC0J%2BUupLOWgodRiSmi9plwHyQolT7c0AwICjBZdpXlX3UibHI8lwLorhZuKQ8Z0cyk5qV8CrkStaN8DRxSubtZzvoySJvMukpblHc%2FHH5%2F6kNoo%2BG4R%2B%2Bjrpbpzlwvf%2FXRt4&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Date=20230308T205939Z&X-Amz-SignedHeaders=host&X-Amz-Expires=300&X-Amz-Credential=ASIAQ3PHCVTYQ2KJ47PG%2F20230308%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Signature=c4aed47755c3eacde076d3bea24f5817d8d36403f6eab6f7fd62c8eea682b6e4&hash=9d44b29826b9326174ec0b117beb171afe779afe4208344ea3251bcf74889f75&host=68042c943591013ac2b2430a89b270f6af2c76d8dfd086a07176afe7c76c2c61&pii=S0960148113005727&tid=spdf-f77b6c55-4fd1-4f53-98fc-ee963bcfbdae&sid=19c93fa72deeb24a359846c2f9c834f9b8b5gxrqa&type=client&tsoh=d3d3LnNjaWVuY2VkaXJlY3QuY29t&ua=13105801500b5250035f&rr=7a4e00d19bae681a&cc=us The turbines have to be taken offline for maintenance more often as they degrade, thus leading to a decline in power output. Eventually, the output becomes so small and intermittent, that the project is no longer profitable to run. This will inevitably lead to a premature shutdown. This premature shutdown means the original emissions reduction calculations mentioned above would have been too optimistic. BLM needs to do much more due diligence when it comes to evaluating the claims of various project applicants regarding the lifespans of their proposed projects. For this specific project, the emissions reduction calculations need to be redone using a realistic assumption about the lifespan of the project, which is going to be much less than 34 years.	The EIS cannot speculate what turbines, if any, would have any type of mechanical or structural issues that would take them offline and temporarily reduce the overall capacity of the project. Turbines would be maintained to avoid mechanical or structural issues. Replacement of turbine components would likely be part of ongoing maintenance.
7342-1	Matt F	Part of the justification for developing wind and solar energy projects is that doing so will "save" emissions that would otherwise be emitted from fossil fuel based power sources. For example, this reasoning can be seen on pp 3-136 of the Lava Ridge Wind Project draft EIS under the Avoided Emissions section. It states that it uses the EPA's AVERT modeling tool to forecast the amount of avoided emissions. What is not clear is how many variables this tool takes into account. If BLM is to be honest about the avoided emissions, it needs to take *all* aspects of the project into account, and total how much they will all emit. Some elements to consider: 1) The production and installation of the wind turbines themselves. They involve the manufacture of many tons of concrete and steel, which are both very carbon intensive production processes. Steel accounts for between 7-11% of global C02 emissions: https://www.globalefficiencyintel.com/new-blog/2021/global-steel-industrys-ghg-emissions Are these production emissions taken into account? 2) Wind and solar are generally installed far from the population centers which use the energy they generate. This requires the construction of long distance power transmission lines. For example, the EIS states in the Introduction on pp ES-i: "The project would consist of up to 400 wind turbines and associated infrastructure and a 500-kilovolt (kV) generation intertie transmission line" Constructing such a line would again require many tons of concrete and steel. It is unclear whether the emissions from the manufacture and installation of the transmission line components were included in the AVERT model. Further, other forms of power such as natural gas fired power plants, are usually constructed closer to population centers, and thus need less transmission line construction. So for honest accounting, BLM should consider these differences in infrastructure emissions when comparing wind and solar to other forms of energy production. 3) Wind and solar are intermittent, so it is expected that they will be coupled with some kind of energy storage system in order for the energy they produce to be more predictable and reliable. For example, the EIS states on pp 3: "and a battery storage facility" And also on pp ES-ix: "the capacity of the battery energy storage system would be determined in the final design phase" Not only is the size of the battery not known at this point, the type is also not stated in the EIS. With these unknowns, it's unlikely that the AVERT model included the emissions from the battery production. Much like the comparison of transmission line distances above to other power sources, a comparison of battery production emissions to other power sources which do not need batteries should also be figured into the calculations. In addition to these, there are other construction elements listed on pp ES-ix of the EIS whose manufacture and installation will emit air pollutants. BLM should be both fully transparent and comprehensive in its analysis of avoided emissions.	EIS Table 3.4-6 estimates the annual and 5-year emissions that would be emitted if an equivalent amount of energy was generated via fossil-fuel combustion and are thus emissions that are avoided by implementation of the project. Transmission lines are required to transport the power generated by wind and solar; fossil fuel–generated power requires pipelines and trains/trucks in order to transport the coal to coal combustion facilities to transmission lines and natural gas from wells to storage to refineries to natural gas power plants to transmission lines. While it is true these emissions represent only a piece of the lifecycle GHG emissions of fossil fuel electricity generation, installed wind turbines harnessing the wind for electricity generation is also only a piece of the lifecycle wind power. The BLM has compared the emissions at the point of electricity generation rather than the entire lifecycle because lifecycle emissions can vary greatly depending on project specifications. Guessing where turbines or batteries would be manufactured and their delivery route to the project site would be speculative.

Comment ID	Commenter	Public Comment	Response to Comment
8-1	Patrick Williams	Secondly, if this project is being done to add to 'carbon neutrality' a better study is needed to prove this. Between manufacturing, blade degradation and disposal impacts, maintenance, and access impact to the land to build and sustain the wind farm is rarely, if ever, more beneficial to the overall environment.	EIS Table 3.4-6 estimates the annual and 5-year avoided emissions for the operation of the project. While it is true these emissions represent only a piece of the lifecycle GHG emissions of fossil fuel electricity generation, installed wind turbines harnessing the wind for electricity generation is also only a piece of the lifecycle wind power. The BLM has compared the emissions at the point of electricity generation rather than the entire lifecycle because lifecycle emissions can vary greatly depending on project specifications. Guessing where turbines would be manufactured and their delivery route to the project site would be speculative. Also see response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Text was added in Section 3.4.1.
878-2	Cathy Lee	The next question is how much fossil fuel is used to make and maintain these turbines? Are wind turbines really clean energy after everything is considered?	EIS Table 3.4-3 (Estimated Annual Project Construction Greenhouse Gas Emissions) and EIS Table 3.4-5 (Estimated Annual Project Operation and Maintenance Greenhouse Gas Emissions) estimate the direct and indirect greenhouse emissions. These emission estimates represent the project's direct and reasonably foreseeable indirect GHG emissions. Emissions resulting from the manufacture of the turbines are speculative and beyond the scope of this EIS.
967-1	Sue (No Last Name Provided)	Everything is connected! Wind energy has a HORRIBLE RECYCLE FEATURE and the discarded parts emit harmful gasses into our air quality.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Refer also to applicant-committed measure 84 "MVE would prioritize the re-use, recycling, or scrap value of decommissioned project components over direct disposal in approved landfill facilities. Recyclable materials would be recycled to the furthest extent practicable. Non-recyclable materials would be disposed of in accordance with state and federal law."

Cultural Resources and Native American Concerns

Table A-3g. Cultural Resources and Native American Concerns

Comment ID	Commenter	Public Comment	Response to Comment
10501-2	Kimi Ynigues	Minidoka should be formally designated a National Historic Landmark. Has it been assessed as a Traditional Cultural Property? If a Japanese American Ethnography has not been done the project should be halted until one has been completed. With adverse impacts to Native American (Indian) communities also taken into consideration	As noted in EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site), Minidoka NHS is a nationally significant site listed on the NRHP under Criterion A (historic event). Regarding a Minidoka TCP, see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics). See EIS Section 3.5.5.4 (Compensatory Mitigation) and measures VI and VII in Table App4-5 in EIS Appendix 4. Consideration of potential impacts to Japanese American and Native American communities are addressed at EIS Sections 3.5 (Cultural Resources), 3.6.1 (Environmental Justice Communities), and 3.16 (Visual Resources).
11198-2	Lori Wright	A historic and cultural survey has not been done. This leaves potential known and unknown sites vulnerable to destruction.	As noted under EIS Section 3.6 (Cultural Resources), the BLM has used previously existing cultural resource information in support of its consideration of the affected environment and for impact analyses, including information and data from prior historical and cultural resource surveys that have been conducted throughout the APE. At the time of this response, the BLM is developing a PA to complete the NHPA Section 106 process, which also includes cultural resources identification prior to construction beginning on the project and the resolution of adverse effects to historic properties under Historic Properties Management Plans. For more detail, refer to EIS Section 3.5 (Cultural Resources) and the draft PA (EIS Appendix 8).
11315-1	Karen Atkinson	The DEIS, Section 3.5 Cultural resources, does not address the significance of the Minidoka Relocation Center to Alaska Natives and the significant impacts the project would have on those tribal interests. Consultation with Alaska Native tribes and organizations on the historic and cultural impacts of the project is essential to complying with the National Historic Preservation Act, Government-to-Government consultation requirements, American Indian Religious Freedom Act, EO 1307 (May 1996, Indian Sacred Sites), Memorandum of Understanding Regarding Indigenous Sacred Sites (2021), and Indigenous Knowledge Guidance (CEQ, November 2022).	The BLM understands that Alaska Natives, including Alaska Native spouses and mixed Alaska Native and Nikkei children, were among the Nikkei population incarcerated at Minidoka WRC. The NHPA Section 106 consulting parties representing the Minidoka-connected community include those with direct ties to Alaska, such as the Alaska Chapter of the JACL, and those from Alaska territory. The BLM is consulting with Native American Tribes with ancestral ties to the project area (see EIS Appendix 10, Section 106 Consultation and Government-to-Government Tribal Consultation). Alaska Native Tribes were not directly among interested parties or stakeholders identified during initial project scoping or through the NHPA Section 106 consultation process. Also see response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding the DOI's trust responsibilities, specific Treaties that relate to federally recognized Tribes with ancestral ties to the project area, and the EIS's full consideration of impacts to resources that may be associated with tribal rights or interests.
11534-18	Matt Arnold, William Eubanks	The Project Threatens to Permanently Impair the Milner-Gooding Canal, an Historic Site Eligible for Federal Protection The DEIS makes clear that the Project will stand in the immediate vicinity of the Milner- Gooding Canal ("Canal"), a roughly 76-mile-long irrigation canal that connects the Milner Dam to the Big Wood River. DEIS at 3-6, 3-377. Built in conjunction with the Milner Dam in 1905, the Canal has "national significance in agricultural history" as an early example of the kind of public-private reclamation project that helped turn southern Idaho into the agricultural powerhouse that it is today. See, e.g., History of Milner Dam, TWIN FALLS CANAL CO., https://bit.ly/3mNLwYv (last visited Apr. 18, 2023); see also National Register of Historic Places Inventory Nomination Form: Milner Dam and the Twin Falls Main Canal (June 11, 1986), https://bit.ly/3MVb0xM Based on this, it is SLR's understanding that the Canal (including three separate camp sites used when constructing the Canal) is eligible for listing in the National Register of Historic Places, 36 CFR § 60.4, and protection under the National Historic Preservation Act, 54 U.S.C. § 3001 et seq. However, the DEIS does not discuss potential	Historic sites such as the Milner-Gooding Canal are addressed under EIS Section 3.5.4 and 3.5.5 and, accordingly, assessed throughout the Cultural Resources sections at Section 3.5. Appendix 9 (Cultural Resources Potentially Affected by the Action Alternatives) of EIS Appendix 8 summarizes cultural resources within the physical and non-physical APE for the project per action alternative and includes the Milner-Gooding Canal, and Milner Dam and Twin Falls Main Canal. Within Appendix 6 of EIS Appendix 8, the Milner-Gooding Canal is specifically considered regarding possible physical and non-physical effects to this historic property (see the row headed by Site Number(s) 53-17019/63-17895) and various other sites associated with the Milner Gooding Canal system are similarly assessed (see the very next row headed 53-17020). Appendix 6 of EIS Appendix 8 (see the row headed by Site Number(s) 53-17019/63-17895) specifically identifies that the Milner Gooding Canal would be subject to physical and non-physical impacts of the project. See also response to

Comment ID	Commenter	Public Comment	Response to Comment
		impacts to the historic nature of the Canal, or whether the Project will impede its inclusion in the National Register. This must be addressed before the Project moves forward.	comment 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding identification and assessment of effects to historic properties prior to project construction.
11535-54	Steven Andersen	The Analytical Framework provided for in the DEIS is flawed for numerous reasons. The physical analysis area for the APE (including physical impacts such as ground disturbance from construction, fugitive dust generation from traffic and construction) is based on conjecture, since admittedly, turbine sites and road locations have not yet been determined. The non-physical APE is also inadequate as the analysis fails to account for key impacts to sacred cultural and historic sites (see comments herein related to visual impacts and cumulative impacts). There should have been a comprehensive inventory conducted with the input and assistance of local Tribes, Japanese American and Alaska Native communities that accounted for what could be impacted by construction and the footprint of planned turbines (including burial sites, fossils and observance points) – or within the shadow of their noise and visual impacts. Rather, the DEIS relies on planned efforts to prepare a Programmatic Agreement and associated historic properties management plan. The Project area has a large number of cultural resources, and certain impacts to those resources will admittedly be significant and unable to be addressed through mitigation (see sound, environmental justice, visual impacts and cumulative impacts comments herein).	As described at EIS Section 3.5.4 (Physical Impacts), the physical APE allows for micro-siting of infrastructure to avoid physical impacts to cultural resources identified within the siting corridors. The physical and non-physical APE differ by action alternative. Action alternatives were developed with consideration for avoiding or minimizing Project impacts, including to cultural resources, and through incorporation of concerns identified through project scoping, Section 106 consultation with Native American Tribes and other consulting parties, per 36 CFR 800, the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. Previously recorded sites and the range of cultural resources potentially present in the project area of potential effects are addressed under EIS Section 3.5.4 and 3.5.5 and, accordingly, assessed throughout the Cultural Resources sections at Section 3.5. Appendix 9 (Cultural Resources Potentially Affected by the Action Alternatives) of EIS Appendix 8 summarizes previously recorded cultural resources within the physical and non-physical APE for the project per action alternative. As stated in the Introduction, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, or to include additional new studies such as intensive field survey. For additional cultural resources context, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. The BLM is developing a PA to complete the Section 106 process, which would include additional cultural resources identification efforts prior to construction beginning on the project and the also would require the resolution of adverse effects to historic properties under Historic Properties Management Plans. For more detail, refer to the draft PA (EIS Appendix 8), which is a working document subject to revisions deemed necessary to address public concerns per public and consulting party comments. The PA for the project would require a HPMP that is to include a monitoring and discovery plan for cultural resources, including planning for the discovery of burials). The HPMP is to include the finalization of protection measures and any monitoring areas, according to the PA. Per the stipulations of the PA, the BLM is to consult upon the HPMP with consulting parties before approving the final HPMP. The field surveys and monitoring under the PA can include trained tribal monitors or those from other affected communities, should Tribal Nations or those from the Japanese American community choose to directly participate in survey and monitoring as recommended within the comment.
11546-5	Dan Sakura	No Action. I encourage BLM to adopt Alternative A – No Ac□on. To protect Minidoka and provide renewable energy companies with helpful siting information (to avoid high conflict areas), I respectfully request that BLM work with the National Park Service -- Keeper of the Register to determine the Minidoka Traditional Cultural Property as eligible for listing on the National Register and begin a public process to designate the Greater Minidoka Area of Critical Environmental Concern.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11547-5	Lowell Ihler, Carol Ihler	5. The Hunt Relocation Center will be impacted by the turbines. This is a slap in the face to those whose families were "relocated" there during WW II. This is a National Historical Site and should be preserved. As a country we already took everything from innocent people and we do not need to do it to them again. Many descendants of the Japanese return to the "camp" each year to teach their children about what happened and to help heal the trauma. The same thing goes for the Native Tribes of indigenous people who have been treated so badly in the past and who depend on this land the wind turbines are to be located on as gathering places for certain plants for ceremonial use and also contains lands that are considered sacred by these people.	Impacts related to the survivors and descendants of those incarcerated at Minidoka WRC and to Native American Tribes in terms of environmental justice are addressed at EIS Sections 3.6.1 (Environmental Justice Communities). Impacts related to cultural resources, Native American resources, and Minidoka NHS and the surrounding Minidoka WRC are addressed at EIS Section 3.5 (Cultural Resources), specifically Section 3.5.1 (Native American Resources) and Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site). See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding a Minidoka TCP. Per EIS Appendix 8 (Cultural Resources Programmatic Agreement), minimization and mitigation measures for resolution of adverse effects to historic properties will be determined in consultation with signatories and with input from Tribes, consulting parties, including the Japanese American community, and the public, and finalized under HPMPs under the PA. In its regulatory review of the project, the BLM is weighing the concerns identified through project scoping and comment periods, Section 106 consultation with Native American Tribes and other consulting parties, the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding visual impacts and minimization or mitigation measures.
11557-4	Deanna Weigel, Andy Weigel	Avian and Bat Species: no demonstrated replacement habitats nearby for bats, no actual remedy for white-noise syndrome, and insufficient plans for conservation strategy.[...] Environmental justice, cultural resources: mitigation measures are entirely insufficient to make up for the lost cultural resources that impact not just members of tribes and Japanese American stakeholders, but to all the citizens of the region.	Mitigation measures related to cultural resources are addressed at Cultural Resources EIS Sections 3.5.4.2 and 3.5.5.2, as they relate to physical and non-physical impacts, respectively. Other measures for avoidance, minimization, and mitigation for resolving adverse effects to cultural resources are addressed in the PA (see EIS Appendix 8 and Section 3.5.3 [Programmatic Agreement]) and will be included in the HPMP and HPTPs and in the monitoring and discovery plan tiering to the PA. Such measures will be determined in consultation with signatories and with input from Tribes, consulting parties, and the public, and finalized prior to project construction.

Comment ID	Commenter	Public Comment	Response to Comment
			Mitigation measures related to environmental justice impacts are discussed in EIS Section 3.6.1.4.1; as explained in this section, the proposed compensatory mitigation measures would largely aim to compensate for impacts indirectly but would not directly reduce potential impacts to the setting and feeling of Minidoka NHS. Therefore, the BLM and the Office of Collaborative Action and Dispute Resolution continue to solicit input from members of the Japanese American and Minidoka-connected communities and additional mitigation measures will be considered for inclusion in the PA (draft provided as EIS Appendix 8) and in a compensatory mitigation plan for Minidoka NHS (Mitigation Framework provided in EIS Appendix 4). Note that not all cultural resources in the area of potential effects would be adversely affected. At historic properties that would be unavoidably adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (pursuant to NHPA Section 106 and as analyzed in Section 3.5). The BLM does seek first to avoid, then to minimize, and where necessary mitigate adverse effects to historic properties. The mitigation of adverse effects, following the EIS and pursuant to a PA, can be other than measures that would preserve, restore, or rehabilitate a historic property and follow the alteration of historic properties and the diminishment of the integrity that makes them eligible for NRHP listing. Compensatory mitigation measures VI and VII (see EIS Appendix 4, Table App4-5) could be applied to any action alternative if the BLM determines it is warranted. Compensatory mitigation measure VII includes a Mitigation Framework for Key Resources and Values Associated with Minidoka National Historic Site section that has been added to the final EIS (see EIS Appendix 4). See response to comment 11557-3 (see in Table A-3b, Bats) regarding avian and bat impacts.
11577-1	David Inoue; Japanese American Citizens League	As such, it is vitally important that BLM engage in the process to establish the Minidoka National Historic Site as an Area of Critical Environmental Concern due to the special cultural value that the Minidoka holds for the Japanese American community.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11585-1	Preservation Idaho	the lack of a complete survey in the area of impact will result in likely damage to cultural and historic sites. They cannot be protected if they are not surveyed and documented appropriately before any work is done. Over 80% of the impacted area has not been surveyed; the potential for damage to unknown resources of this scope is not acceptable by any industry standards. Disturbance of the ground, blasting, traffic, dust, and noise will all contribute to potential and permanent damage. The BLM's plan for a "phased identification, evaluation, and resolution of adverse effects..." (Programmatic Agreement, #10) is not adequate. A complete picture of cultural resources that will be impacted should be known ahead of any work done so that planning for the preservation of sites and artifacts can be properly managed.	See responses to comments 11198-2, 11557-4, and 12338-9 (see in Table A-3g, Cultural Resources and Native American Concerns), where the adequate analysis of impacts to cultural resources is previously addressed. The PA (see EIS Appendix 8) does adequately address and would complete phased identification, evaluation, and resolution of adverse effects in accordance with the regulations for the Section 106 process (at 36 CFR 800) and in compliance with the NHPA.
11598-10	Idaho Conservation League	Cultural Resources The proposed Lava Ridge Wind Project is located in a vast area of southern Idaho rich in cultural history dating from prehistoric times and continuing into the modern era. ICL is concerned that portions of this project area will either directly or indirectly impact cultural or historic areas worthy of preservation. Magic Valley Energy/LS Power and the BLM must comply with federal and state laws and regulations that are meant to protect these irreplaceable resources, including Section 106 of the National Historic Preservation Act and related Code of Federal Regulations; the Archaeological resources Protection Act of 1979; the Native American Graves Protection and Repatriation Act; Idaho Code title 67, Chapter 41; and Idaho Code title 27, Chapter 5 (Sections 27-502 through 27-504). Further, Native American resources (natural and cultural) may be protected under the American Indian Religious Freedom Act of 1978). The Crater of the Moon National Monument Resource Management Plan (Monument RMP) provides additional direction regarding cultural resources: Cultural Resources BLM will manage cultural resources so that representative samples of the full array of scientific and socio-cultural values are maintained or enhanced consistent with State and Federal laws. -Monument RMP, p. 26. and Economic and Social Considerations BLM will ensure that any management action undertaken in connection with this plan is cost-effective and takes into account local social and economic factors. -Monument RMP, p. 27. The DEIS indicates that within the 197,474-acre Alternative B project area, there are 199 documented historic properties within the siting corridors (Table ES-2). Further, there are a total of 1,788 recorded historic properties within the visual range of the non-physical Area of Potential Effect (APE). The DEIS also reports 42 recorded historic properties within the auditory APE. However, only 17% of the physical APE has been subjected to intensive Class III pedestrian survey (DEIS, p. 3-183). ICL is concerned that the DEIS does not accurately portray the full potential impacts and adverse effects to cultural resources for several reasons. First, the cited 17% of surveyed project area does not represent a quarter of the potential lands affected by Alternative B. If one were to project site density for the entire physical APE as described in Alternative B, using the assumption that site density remains at currently documented levels and raising the surveyed lands to 20%, then we can expect fully completed pedestrian surveys to result in roughly 1,000 historic properties, with 800 of those having yet to be identified and documented. The public cannot be expected to recommend an alternative with the least amount of adverse affects without knowing the full measure of the potential impacts to cultural resources. Second, site density likely will not exhibit as projected in the scenario above. In fact, historic properties may be clustered based on topography, available resources, or proximity to large and significant sites. The DEIS states that, “based on….previous surveys, cultural resource sites occurred at the approximate frequency of three sites per square mile in those previously surveyed areas of the physical APE. This would result in an estimated potential for 43 total cultural resource sites to be present in the 14 square miles of project disturbance” (p. 3-165). BLM would be remiss to rely on a model predicting three historic properties per square mile, especially the same Class I records search that reveals that 199 sites are located within the 17% of the physical APE subjected to previous surveys. If the statistics cited on page 3-165 are in fact a typographical or mathematical error, we	The BLM is proceeding with cultural resources management consistent with applicable state and federal laws. Cultural resources management is addressed under EIS Section 3.5 (Cultural Resources) and local social and economic factors under EIS Section 3.6.1 (Environmental Justice Communities). Impacts analyzed under the EIS are not limited to cultural resources or environmental justice communities, and extend to the fuller environment containing the project area. Should the BLM choose to approve the project, approve the project with modifications, or not approve the project, cultural resource and environmental justice impacts will be considered in relation to other environmental impacts and will not be the sole matter informing BLM decisions. As stated in the EIS Introduction, the EIS analyzes and discloses the potential environmental impacts of MVE’s project and alternatives for BLM decision making. The EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, including through additional new studies. EIS Section 3.5 analyzes the full range of impacts to known cultural resources and a range of impacts to estimated cultural resources in the areas of potential effects. EIS Section 3.5 (Cultural Resources) provides background on previous cultural resource identification efforts in the project area. Review of Idaho SHPO, NPS, and BLM cultural resource records finds that documented cultural resource field surveys cover approximately 17% of the area where physical effects from the project could result, such as within the project siting corridors. The EIS accurately represented that 59 of the 199 cultural resources identified by previous cultural resources in the project vicinity were identified in 17% of the project area of potential effects by projects of comparable size to the current endeavor. As stated in the EIS, surveys not comparable and outside of this 17% of the area (and 140 out-lying sites) were excluded from the calculation; therefore, the relative frequency or density of cultural resources sites is accurately stated for the intents and purposes given in the EIS. No correction is needed. The BLM understands that cultural resources may not be evenly distributed across the area of potential effects for the project; however, the BLM’s projection of potential cultural resource numbers across the project alternatives does not rely on cultural resources density but rather on the proportionality of cultural resource occurrence across different action alternatives to compare the relative potential for impacts (including cumulative impacts) between the alternatives—whether evenly distributed or not. The analysis is only comparative and does not claim to be predictive (as of real-world cultural resources locations or traits). The PA for the project would require a range of additional field inventories of cultural resources to fine-tune and manage actual historic property concerns, should the project proceed under any of the action alternatives prior to the project having notice to proceed with construction in those areas. However, the 83% of the project APE that has not yet received field surveys would not necessarily need field surveys and the EIS does not intend to imply that it would. Many of the alternatives to the Proposed Action would include much less extensive project siting corridors and infrastructure, including the BLM’s Preferred Alternative. Even within those corridors and

Comment ID	Commenter	Public Comment	Response to Comment
		recommend the BLM correct the error in a Supplemental DEIS. Fully completed surveys will reveal whether historic properties cluster in specific areas or if there are open spaces void of either prehistoric or historic cultural resources. These spatial patterns can help determine the most appropriate alternative that would least impact cultural resources in general, as well as specific historic properties of concern to Tribes. The BLM and Magic Valley Energy are obligated to complete surveys of all the potentially affected areas, and include those results in the resulting EIS. Since this has not been completed, we recommend that the BLM/Magic Valley Energy conduct Class III pedestrian surveys in the remaining 83% of Alternative B's physical APE that have yet to be surveyed and document the results of those investigations in a supplemental EIS. While current Section 106 compliance allows for the completion of phased resource identification and mitigation, pushing resource identification and evaluation out to an unknown future date strips the public of the ability to make informed recommendations and suggestions based on potential impacts to said resources. Further, the BLM and Idaho State Historic Preservation Office (SHPO) cannot make reasonable assessments regarding the project's cumulative impacts to cultural resources without knowing what resources are located within the physical APE, including potential transmission lines and roads. Archaeologists have identified numerous lava tubes and caves containing pre-and protohistoric cultural remains throughout the region, and it remains quite likely that investigators will discover previously unidentified cultural resources during pedestrian surveys within the physical APE. The BLM and Magic Valley Energy should avoid these resources whenever possible by relocating proposed roads, turbines, and associated infrastructure, and mitigate the impacts to these resources through excavation and data recovery efforts when necessary. Failure to avoid historic properties will result in permanent impacts, as is demonstrated in the DEIS, where the BLM states that, "If not avoided, the impact duration for physical effects to cultural resources is long term because cultural resources are non-renewable resources. Physical impacts would be permanent (emphasis added)," (DEIS, p. 3-146). ICL recommends that the BLM include an analysis describing how irreversible and irretrievable losses of cultural sites, Tribal treaty rights and TCPs will be mitigated. We believe that the compensatory mitigation section of the DEIS fails to offer or describe significant mitigation measures as related to historic properties and/or cultural resources. The DEIS states that, "any adverse effects would be resolved through treatment measures specified under the Historic Properties Management Plan (HPMP) and Historic Preservation Technical Procedures (HPTPs) as part of the P.A.," (p. 3-171 - 3-172). However, neither the HPMP nor the HPTP were included in the DEIS in whole or draft form. These documents must be completed with all mitigation measures, including compensatory mitigation, identified. True compensatory mitigation ideas may include land acquisition to replace impacted areas at a higher rate than affected parcels, including a potential timeframe and mechanisms for acquiring said parcels. We recommend that the BLM fulfill these NEPA and Section 106 obligations in a Supplemental DEIS. We further recommend that the HPMP include on-site cultural resource monitoring during construction in areas of identified sensitivity or high historic property density. The monitoring program should be incorporated with education workshops as identified in the draft programmatic agreement. Native American Resources According to the DEIS, Native American Resources within the proposed Lava Ridge project area refer to cultural and natural resources that are "spiritually and culturally significant to Tribes, including resources for which Tribes have treaty-protected rights," (p. 3-149). These resources are protected by the National Historic Preservation Act (NHPA), the Archeological Resources Protection Act (ARPA), and Native American Graves Protection and Repatriation Act (NAGPRA), as well as the American Indian Religious Freedom Act (AIRFA), Executive Order (EO) 13007 (meant to protect and preserve First Nation's religious practices) and Joint Secretarial Order (JSO) 3403 (which establishes how the Departments of Agriculture and Interior will fulfill their obligations to Federally recognized Indian Tribes). There are numerous natural resources and geographic locations within the cultural landscape that retain significant cultural and religious importance to the Shoshone-Bannock Tribe and other Tribes. Wilson Butte and the associated cave, Kimama Butte Cave, and Sid Butte are examples of geographic locations that retain cultural and spiritual importance to the Shoshone-Bannock Tribe. Further, Wilson Butte Cave yields significant paleontological and archaeological contents and data that inform the human occupation of the Snake River Plain. Cave contents have been dated to 13,000 years ago, including prehistoric camel faunal remains that show signs of consumption (Christina Cutler, Shoshone-Bannock Tribe, personal communication, February 13, 2023). There are also numerous rock art sites distributed across the vast landscape. Other resources of concern to Tribes likely found within the project area are traditional cultural properties (TCPs). As is noted in the DEIS, because TCPs are considered culturally sensitive "they often remain undocumented for confidentiality reasons…..and may not be identified in the Class I report" (DEIS, p. 3-153). Any alternative associated with the Lava Ridge project must take these resources into consideration and the BLM must do the proper level of due diligence to ensure these resources are not adversely affected by project development. We also recommend that significant cultural sites such as Wilson Butte Cave be protected as part of a larger ACEC. Programmatic Agreement ICL is disappointed that the DEIS does not include the Historic Property Management Plan (HPMP), in draft or final form. The DEIS states that the HPMP will provide resource identification and documentation processes, which are critical to understanding how cultural resources will be approached and adverse effects mitigated for the Lava Ridge project. Further, Clause 9, containing the number of identified historic properties within the Physical APE, number of NRHP-eligible sites, number of unevaluated resources, and number of sites ineligible for inclusion to the NRHP is incomplete, even though these numbers are known and reported in the DEIS. The draft PA should be as complete and comprehensive as possible in order for the public to evaluate the proposed process and submit significant and meaningful comments. ICL recommends that the BLM thoroughly review the PA and provide complete available information. Clause 10 states that the potentially affected historic properties "cannot be fully identified and the effects on historic properties cannot be fully determined prior to the approval of the project due to the large area potentially affected, and timing of the BLM Record of Decision including the	infrastructure planning areas, the focus of Class III survey under the PA would be on the footprint of potential project disturbance, which represents smaller areas within those corridors and areas where turbines, transmission lines, and other project elements siting are proposed. Additional identification efforts would also occur outside of the planned physical disturbance, largely in areas of the non-physical APE, for further mitigation and managing visual impacts. Surveys for historic properties susceptible to non-physical impacts, primarily buildings and structure sites, would also not be conducted for 100% of the area but would be focused mainly on historic properties where adverse effects could result from the project. Cultural resources identification efforts under the PA are intended to be completed prior to project construction. The PA (see EIS Appendix 8) would further include considerations of avoidance, minimization, and mitigation for the full range of cultural resources where the BLM would require these measures (e.g., at NRHP-eligible historic properties). Archaeological data recovery would be one mitigation measure available under the PA. Irreversible and irretrievable losses of cultural sites, including as associated with Tribal treaty rights and TCPs, would be mitigated pursuant to the PA and the required HPTP under the PA, in addition to the mitigation considerations described in the EIS. Compensatory mitigation for cultural resources, as described in EIS Section 3.5.5.4, would be addressed in ongoing consultation with consulting parties to the PA and with PA implementation and, like compensatory mitigation for other resources, does not require the fully detailed mitigation plans to be completed prior to the ROD. The SHPO, Tribes, NPS, organizations, individuals representative of the Japanese American parties, and other qualified parties under the NHPA Section 106 process (36 CFR 800.2) have joined the NHPA Section 106 consultation process as consulting parties and may decide to sign the PA as relates to their role as consulting party. BLM-recognized consulting parties, as long as they participate and regardless of deciding to sign-on to the PA, have opportunities to review and consult on PA documents such as reports and plans, including the HPMP and HPTPs that would detail the historic property management and treatment pursuant to the PA. The BLM would not release the ROD for the project until the PA is executed. However, as noted above, it is unnecessary to finalize all planning that would occur under the PA (such as the completion of the HPMP) prior to the ROD. The BLM will consider the mitigation measures suggested in these comments for cultural resources and future updates to the PA will reflect comment-based changes as appropriate. The PA already anticipates cultural resources monitoring for the project. The PA is proceeding in accordance with the regulations at 36 CFR 800. The project analysis relies on siting corridors to maximize the avoidance of project impacts to historic properties and other environmental resources, to the extent practicable. Wind turbines and other project structures and activity areas may be micro-sited within the survey corridors for this purpose. The identification and treatment measures for historic properties under the PA will proceed with continued BLM consultation of the SHPO, Tribes, and other consulting parties. The PA includes post-review discovery should unanticipated historic properties or impacts to historic properties occur with the project proceeding, including at unknown lava tubes or caves. The BLM has endeavored to avoid impacts to known caves and lava tubes in response to Tribal and archaeological concerns received during consultation to date. The BLM's EIS analyses under NEPA and preparation of the PA pursuant to NHPA Section 106 included incorporation of community knowledge and concerns—including on TCPs—identified through project scoping, Section 106 consultation with Native American Tribes and other consulting parties, per 36 CFR 800, the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. The BLM has accorded these consultation efforts with all due diligence and good faith. Regarding ACECs, please see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics). No supplemental EIS is required since these comments inform the BLM's preparation of a final EIS.

Comment ID	Commenter	Public Comment	Response to Comment
		authorized ROW area of the project," (Appendix 8, p. 2). However, Section C.1.b (Identification of Historic Properties, Identification within the Physical APE) states that the project proponent will, "fund a Class III-Intensive Field Survey within the Physical APE," determining the number, location, and condition of historic properties (Appendix 8, p. 9). The project proponent is clearly aware of its responsibilities under Section 106 of the NRHP and has committed to fulfilling this obligation. Therefore, stating that the properties cannot be identified and effects determined prior to project approval does not accurately represent a justifiable reason for postponing or delaying a Class III intensive survey of the Physical APE. The delay does align with an accelerated project timeline and the proponent's desire to fulfill the cultural resource mandate with a minimal expenditure of time and resources, focusing only on identifying historic properties within an approved Physical APE or alternative. However, the public cannot make meaningful decisions or recommendations without having a full complement of baseline data available for review. The project proponent must complete a full Class III inventory of the entire potential Physical APE in order to determine site locations and density and identify the least impactful alternative moving forward. Stipulation A.7.a provides assurance that methods and documentation standards on private lands will remain consistent with documentation and methodologies used on BLM-managed lands. However, when access to private lands is denied, Stipulation A.7.a states that the "[p]roponent shall ensure that additional measures are taken to identify and evaluate properties" (Appendix 8, p. 6), but those methods are not identified. Section B.6.b. outlines the minimum avoidance distance for ground disturbing activities and known historic property components to which Tribes attach religious or cultural significance. We recommend this distance be increased from the proposed 50 m to 100 m. ICL disagrees with the proposal as stated in Stipulation C.1.d, which outlines a phased Class III survey and resource identification. As we have stated earlier, these resources should be identified up front as part of the required baseline data necessary to make adequate environmental and cultural resource recommendations and determine the full potential adverse effects to historic properties. A phased mitigation or data recovery process is acceptable and is in fact the standard, or normal process for large projects such as Lava Ridge. However, full impacts cannot be determined without knowing the number, location, and condition of historic properties within the Physical APE. Stipulations G and H cover the process for developing the HPMP and HPTP for the Lava Ridge project. These critical components of the cultural resources section should have been developed and presented in the DEIS in draft form at the minimum. While we appreciate the BLM stating in the PA (Stipulation G.6.a.ii) that the agency will develop a plan for engaging the public in review and comment on the HPMP, we believe that the agency is missing an opportunity to engage the public regarding the HPMP during the DEIS review. And at the same time, by not having a draft HPMP or HPTP available for review, the BLM is creating additional demand for capacity and resources at a later time. We recommend that the BLM complete these documents and provide them to the public in a supplemental EIS. Finally, ICL notes that the National Park Service and/or stakeholders representing or associated with the Minidoka National Historic Site are not included as possible signatories to the Programmatic Agreement. We believe that this is an egregious oversight that should be corrected by including one or both parties as signatories to the PA.	
11615-6	Spencer Dixon	The EIS do not consider the geographic uniqueness of the area that is right next to craters of the moon national monument. Or the native american sites and other culturally important features such as the milner gooding canal. The canals are our valleys lifeblood and they were not considered in a cultural and historical context or what may happen to them if they are damaged by this project.	Native American [cultural] resources are addressed at EIS Section 3.5.1 (Native American Resources). These resources and historic sites such as the Milner-Gooding Canal are further addressed under EIS Sections 3.5.4 and 3.5.5 and, accordingly, assessed throughout the Cultural Resources sections at Section 3.5. Appendix 9 (Cultural Resources Potentially Affected by the Action Alternatives) of EIS Appendix 8 summarizes cultural resources within the physical and non-physical APE for the project per action alternative and includes the Milner-Gooding Canal, and previously recorded Native American resources. For additional cultural resources context, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. See response to comment 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding identification and assessment of effects to historic properties prior to project construction. Also, Appendix 6 of EIS Appendix 8 identifies all previously recorded in the project area of potential effect, including in the vicinity of Craters of the Moon National Monument and Preserve; although, the monument and preserve area are outside of the area of potential effects for cultural resources. EIS Section 3.16 (Visual Resources) further considers the Craters of the Moon National Monument and Preserve adjacent geography, including in relation to KOP information for that area.
11622-4	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	As the organizers of the annual Minidoka Pilgrimage, we understand the unique needs of survivors and descendants to be able to focus on the traumatic experiences of life at Minidoka, learn from other pilgrimage participants, and experience the sense of healing that the pilgrimage provides. We appreciate BLM adding KOP-16 (the view of the Honor Roll looking east). The views of the spinning turbine blades backlit by the morning light will dishonor those who served, those who did not come home and the sacrifices of Minidoka's 73 Gold Star families. One of the most important parts of the pilgrimage is the Closing Ceremony on the last day of the Pilgrimage at the Honor Roll, which is held in the morning to avoid the midday heat. At the closing ceremony, the audience faces the speakers and the reconstructed Honor Roll. It is a solemn occasion, similar to events honoring America's veterans at sites across the country. Along with a color guard and local veterans, we commemorate the military service of 1,000 Japanese Americans from Minidoka who served in the military. We clearly read the names of the 73 individuals who gave their lives to defend freedom while their families' freedom was taken away by their own government. This act unleashes a wash of visible and audible pain among the participants, as we create an opportunity to grieve together as a community both for the slain soldiers, and for our community as a whole. LS Power's deliberate decision to site the wind project in a location that serves as the visual backdrop of the Honor Roll reminds us of the Hood River incident in Oregon. In 1944, The American Legion removed 16 names of Japanese American soldiers from the county honor roll. After a national outcry, the	The BLM has identified action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape (see Cultural Resources EIS Section 3.5.5 [Non-Physical Impacts]). This includes action Alternative C, Alternative E, and the Preferred Action, which would each increase turbine setbacks from the Minidoka NHS and Honor Roll farther than would the MVE Proposed Action (Alternative B), as described in EIS Section 3.5. In the Proposed Action, MVE excluded development of project structures at Minidoka NHS, creating a minimum of 1-mile setback from the nearest project siting corridor to avoid physical impacts at Minidoka NHS facilities. However, as noted, the BLM is considering other action alternatives—including the BLM Preferred Alternative—that would yet further increase the distance between the nearest project turbines and Minidoka NHS. Under Alternatives C and D, the nearest project siting corridor (where turbines could be placed) would be 5.5 miles from Minidoka NHS Visitors Center and 6.4 miles from the Minidoka NHS Honor Roll. Under Alternative E, the nearest project siting corridor would be 8.5 miles from the Minidoka NHS Visitors Center and 9.0 miles from the Minidoka NHS Honor Roll. Under the BLM's Preferred Alternative, the nearest project siting corridor would be approximately 8.9 miles from the Minidoka NHS Visitors Center and 9.2 miles from the Minidoka NHS Honor Roll. Under all action alternatives, the majority of turbines would necessarily be farther from these historic properties

Comment ID	Commenter	Public Comment	Response to Comment
		American Legion restored the names to the Honor Roll in 1945.1 It also reminds us that LS Power previously sought to build the SWIP-N line on a ROW that would have towered over the Honor Roll and entrance to the park. We cannot help but find ourselves wondering how LS Power's next project will threaten the Honor Roll once more. The size and location of both Alternatives C & E would distract participants' attention from commemorative events, time with families and friends (both new and old), and healing painful emotional wounds. For example, a vital part of our Pilgrimage are the tours on the site which offer detailed interpretation of all of the buildings and and locations on the park site, including the foundation of the reception building, the recreated guard tower, the Honor Roll, the replica fence, the swimming hole, the fire station, the visitor center, the root cellar, the baseball field, and Block 22. In both site tour and Closing Ceremony instances, we are compelled to note a commonality. We acknowledge the creation of the KOPs, but these do not convey how the full experience of our ceremony and tours would be impacted by the visual distraction of multiple walls of wind turbines. Furthermore, if walls of wind turbines are built, each time they are on the site, survivors and descendants of the incarceration would be confronted with yet another piece of physical evidence as to how the United States government has dishonored their histories at this place. They would unfortunately also be reminded that Federal tax credits and tax dollars helped to fund and subsidize this project, and would have cause to once again question the United States' promises to right wrongs against us and offer us the dignity and justice we deserve.	than the nearest project siting corridor. The BLM's Preferred Alternative would have fewer turbines than any other action alterative (3 MW or up to 5 MW), as well as potentially shorter turbines than other action alternatives, reaching no greater than 600 feet tall at turbine tip with use of 5-MW turbines (in contrast to other action alternatives, which could use up to 6-MW turbines reaching 740 feet in height at blade tip). The EIS sufficiently analyzes the visual impacts of the 3-MW to 6-MW turbines that would be constructed for the current project, in consideration of the project's landscape setting and features, as related to cultural resources (Section 3.5) and visual resources (Section 3.16). The BLM will continue to consult on protection measures for historic properties, including those associated with Minidoka NHS. See EIS Section 3.16 and cited supporting documentation for the basis of KOP selection. Visual simulations and the KOP analysis are meant to be aspects of the visual impact analysis that help describe the present environment and the project as they would appear on that environment under the action alternatives. EIS Section 3.16 presents the basis of the full visual impacts analysis, including in relation to Minidoka NHS, and EIS Sections 3.5 further considers the adverse effects the project would have on Minidoka NHS and its surroundings as a historic property. KOPs for the project were chosen and agreed upon by the BLM and NPS for representation of Minidoka NHS and their analysis conforms to BLM standards for visual resources management as cited in EIS Section 3.16 (Visual Resources).
11622-10	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	We support Alternative A – the No Action Alternative – and respectfully request that the BLM seek public comment regarding the proposed Greater Minidoka Area of Critical Environmental Concern (ACEC) and work with the NPS and State of Idaho SHPO regarding the Minidoka Traditional Cultural Property (TCP) National Register eligibility determination...Preserving Minidoka as sacred ground by beginning the ACEC process is critical to help advance racial justice, healing and equity.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11622-11	Erin Shigaki,Stephen Kitajo; Minidoka Pilgrimage Planning Committee	Pilgrimage and Traditional Cultural Property We support the findings in the Minidoka Traditional Cultural Property (TCP) Report that the TCP is "… significant because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community. TCPs draw upon a community's traditions, defined as the …beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices." These practices include annual pilgrimages which we have organized both in-person and virtually (during COVID), annually.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11629-3	Ruth Harder	-There are so many unknown artifacts of prehistoric people in the area. Has this area been thoroughly investigated?	See response to comment 11535-54 (see in Table A-3g, Cultural Resources and Native American Concerns).
11634-4	Name Not Provided	The EIS is inadequate because of its failure to fully investigate impacts to Native American Communities. Scoping documents state that "The BLM invited the Shoshone-Bannock Tribes, Shoshone-Paiute Tribes, and the Northwestern Band of the Shoshone Nation to engage in government-to-government consultation regarding the project. Formal consultation has begun with the Shoshone-Paiute Tribes and the Shoshone-Bannock Tribes. The formal Tribal consultation process will continue throughout the NEPA analysis, and a summary of this process will be included in the EIS." No adequate summary of this process is included in the DEIS. Further, the Ft. Bridger Treaty of 1868 states that the Shoshone people "...shall have the right to hunt on the unoccupied lands of the United States so long as game may be found thereon, and so long as peace subsists among the whites and Indians on the borders of the hunting districts." The losses of game (elk, deer, antelope) noted for all alternatives investigated in the DEIS (except the no action alternative), represent a violation of this treaty agreement.	The BLM is consulting with Tribal Nations on the project, including regarding significant cultural resources under NHPA Section 106. Tribal consultation is a requirement of Section 106. The BLM continues to consult with Tribal Nations, including the Shoshone-Bannock. A description of consultation and a list of consulting parties may be found in EIS Appendix 10. Regarding the effects to treaty rights and game animals, see responses to comments 11808-3, 11860-3, and 11869-20 (see in Table A-3g, Cultural Resources and Native American Concerns).
11661-5	Sam Kito Jr	Traditional Cultural Property (TCP) description. We encourage the BLM to consider the impacts of the Lava Ridge project on the Minidoka Traditional Cultural Property (TCP), which has connections to Japanese Alaskan/Alaska Native families wrongfully incarcerated at Minidoka.4 The Minidoka TCP is connected to the cultural practices or beliefs of the living Japanese Alaskan community. It is rooted in our community's history and important in maintaining our continuing cultural identity. We agree with the TCP Report's findings Minidoka's "viewshed is an integral part of the visitor experience. Therefore, significant changes to this expansive, largely unobstructed viewshed would have negative consequences and adverse impacts to the integrity of the TCP."5	See responses to comments 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) and 11315-1 (see in Table A-3g, Cultural Resources and Native American Concerns). Physical impacts to Minidoka WRC and non-physical visual and auditory effects to Minidoka WRC and Minidoka NHS are addressed at EIS Section 3.5 (Cultural Resources).
11661-8	Sam Kito Jr	Indigenous Knowledge. The Biden Administration has issued guidance to federal agencies to consult with Indigenous people and incorporate Indigenous Knowledge in the federal land management decisions: "consultation and collaboration with Tribal Nations and Indigenous Peoples is critical to ensuring that Indigenous Knowledge is considered and applied in a manner that respects Tribal sovereignty and achieves mutually beneficial outcomes for Tribal and Indigenous communities." 9 Unfortunately, the BLM did not actively consult with Japanese Alaskans during the DEIS process. While the forced relocation of Japanese Alaskans has led to disconnections with traditional knowledge, we continue to have Indigenous Knowledge as it relates to our wrongful incarceration. Inadequate Description of Authorities Relating to Sacred Sites. The BLM's DEIS does not adequately describe the list of authorities relating to Tribal Sacred sites. For example, the DEIS does not list Executive Order 13007 – Indian Sacred Site which requires federal agencies to: "avoid adversely affecting the physical integrity of such sacred sites." Pilgrimages to Minidoka and other Japanese American incarceration sites are associated with a unique form of religious beliefs held by survivors and descendants: "Rituals play an important role in the preservation of memory as they involve the active bodily participation of all those who are present. Japanese American civil religion similarly involves rituals that bring a community together to remember	See responses to comments 12159-8, 12159-9, and 11661-5 (see all in Table A-3g, Cultural Resources and Native American Concerns). The BLM is consulting with Tribal Nations and the Japanese American community on resources of concern to each, including regarding significant cultural resources under NHPA Section 106. See also EIS Appendix 10 regarding BLM consultation on the project. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.

Comment ID	Commenter	Public Comment	Response to Comment
		the past for the sake of the present. These modern-day rituals, such as the annual pilgrimage to Manzanar that opens this article (and the Tule Lake Pilgrimage, which began in 1974), initially brought together Japanese Americans, mainly Sansei, who often lived in the shadow of their parents' and grandparents' silence, and helped them begin to recover a shattered past. As Joanne Doi explains: 'These [events] were attempts to search out the truth of the history bound up in the silence of the Nisei and the classroom. The magnitude of the silence of the Nisei helped form the voice of the Sansei; the Nisei's absence of outward emotional response mobilized the Sansei to begin to speak out.'48 In a significant sense, the annual pilgrimages and Days of Remembrance prepared the way for more intense struggles (the fight for redress) and extended projects (the Japanese American National Museum). 10 Today, the U.S. Government serves as an excellent steward of the Vietnam Memorial on the National Mall in Washington, D.C., where Harry Kito's name is inscribed. The Minidoka Honor roll serves as a similar purpose for our community. We encourage the BLM to listen to those directly impacted by the incarceration and preserve Minidoka as a place for learning, healing and honoring Japanese Alaskans who overcome prejudice to rebuild their lives and serve our country during war and peace.	
11667-8	Alisa Bowman	Concern: Archaeological/Anthropological Sites The area has one of the oldest-known sites that provides evidence of human presence on the Snake River Plain prior to 10,000 years ago. Please do your job and protect the area for future generations to enjoy and not those out for-profit and desecration of this land.	See responses to comments 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns), 11860-4 (see in Table A-3g, Cultural Resources and Native American Concerns), and 11915-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
11672-4	Teiko Saito	As was the case with all World War II Japanese American internment camps, Minidoka was selected as a site because of its isolation and the desolation of the surrounding landscape as far as the eye could see. This makes the viewshed from inside Minidoka (looking out) just as valuable an integral part of the National Historic Site as the actual designated acreage within Minidoka itself. Unfortunately, neither of BLM's preferred Alternatives adequately protects the viewshed of Minidoka from harm and will permanently mar and diminish the ability of visitors to Minidoka to personally experience that same sense of isolation felt by the incarcerated Japanese Americans within the internment camp.	See response to comment 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding action alternatives where turbines are set back from Minidoka NHS, thus reducing the appearance of the size of turbines on the landscape, and avoidance of physical project impacts at Minidoka NHS. Also see response to comment 11585-2 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding nearest turbine placement and the BLM's development of the Preferred Alternative. Also see response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
11753-4	Mary Rios	As a fourth grade teacher, that teaches Idaho History to my students and future leaders of our state, we study the Native American tribes that have inhabited our state. One of the tribes that we have studied is the Shoshone-Bannock tribe. On page 223 of the EIS statement, it states "The Shoshone-Bannock Tribes specifically voiced concerns that the project would impact traditional Tribal resources relating to hunting, gathering, and other practices. The Shoshone-Bannock Tribes voiced concerns about severe cultural and spiritual impacts on their members, dark skies concerns related to turbine lighting that would present severe effects to Tribal practices in the area, and concerns for the diminishment of their exercise of Treaty Rights in the area. The Northwestern Band of Shoshone Nation described their specific concerns relating to the impacts to wildlife, to wildlife habitats and corridors, and to migratory birds as they all apply to the rights and trust responsibilities defined in their treaties. Tribes have expressed that they hold wildlife spiritually and culturally significant and that includes everything about the wildlife's lifeways (habitat, migration tendencies, mating, etc.). Vegetation is another aspect of the natural environment Tribes hold spiritually and culturally significant, and wild plants continue to provide a primary source of subsistence for many Tribal members. These resources and associated practices in some cases involve places in which Tribes hold treaty rights, as well as broader areas to which they ascribe cultural significance." Why are we not listening to these tribal members, as they were given treaties that should protect these rights that they were granted by the government? The Native Americans from 7 different tribes migrated all over this state. I am sure there are many different burial grounds from the Shoshone and Bannock tribes specifically, as their tribes inhabited the Magic Valley area, and these grounds could very well be located in the spots that they want to blast so that they can put up these wind turbines. Please recognize that their voices need to be heard, and honored, therefore choose the no build option.	Tribal consultation is a requirement of Section 106 of the NHPA. The BLM continues to consult with Tribal Nations, including the Shoshone-Bannock. A description of consultation and a list of consulting parties may be found in EIS Appendix 10. Also see responses to comments 11808-3 (see in Table A-3g, Cultural Resources and Native American Concerns), 11860-3 (see in Table A-3g, Cultural Resources and Native American Concerns), and 11869-20 (see in Table A-3g, Cultural Resources and Native American Concerns).
11808-3	Jon Ochi	In 1868, the Treaty of Fort Bridger stated: ARTICLE 4. The Indians herein named agree, when the agency house and other buildings shall be constructed on their reservations named, they will make said reservations their permanent home, and they will make no permanent settlement elsewhere; but they shall have the right to hunt on the unoccupied lands of the United States so long as game may be found thereon, and so long as peace subsists among the whites and Indians on the borders of the hunting districts. Subtribes.com Peace has continued to subsists among the whites and Indians. That component of the treaty has been fulfilled. However, a violation of the treaty may occur if the LRWP is allowed to develop. If wildlife Is reduced or obliterated by the changes to the ecosystem such that animals cannot or will not survive or migrate through the area because of visual and/or audio impacts or loss of food sources, then the treaty will have been subtly breached. Yes, hunting by the Tribe is allowed, but there may be reduced amount of game to hunt. It will not be the first time that a treaty has been subtly violated. The Shoshoni-Bannock Tribes were "guaranteed the rights to hunt on unoccupied land of the United States so long as game may be found thereon." The issue is: Does granting development privileges to a private equity corporation during which hunting is compromised or destroyed constitute breach of treaty obligations? Having experienced breaching of rights of US citizenship, my father and his friends in California knew what it was to like to lose property not by direct taking, but by illegally incarcerating people such that they could not be present to pay their bills causing loss of their possessions and property. t The federal policy reads as follows: The requirements of EO 12898 to "make achieving environmental justice part of [the BLM"s] mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations"" DEIS, p.1-2	See response to comment 11860-3 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the effects of the project on game populations as may affect hunting under Tribal treaty rights. Specifically in regard to EO 12988, the Environmental Justice Communities section of the EIS (Section 3.6.1) further addresses the impacts of the project on tribal communities. The BLM will continue to work with Tribes regarding their resource concerns, including as relates to treaty rights and environmental justice.

Comment ID	Commenter	Public Comment	Response to Comment
11860-1	Shauna Robinson	• The lack of knowledge about a large percentage of the surface artifacts and features contained within Alternative B's fourteen square miles (9,114 acres) that will be vulnerable to "ground disturbance" is not acceptable. With only 17% of the project area surveyed (3-164), the cultural resources on 83% of the project land remain unknown and vulnerable to potential damage or destruction from the disturbance of the ground, blasting, traffic, dust, and noise. • The 199 previously documented cultural resources that are found within the planned corridors are "subject to physical impacts if not avoided by the project" (3-171). However, given that surveys have only covered 17% of the project area in an environment that has been used culturally for thousands of years, impacts would logically affect far more than 199 documented cultural resources, with some estimates of the presence of cultural resources being in the tens of thousands (3-177). The BLM's plan for a "phased identification, evaluation, and resolution of adverse effects…" (Programmatic Agreement, #10) is not adequate in planning for the known and/or the unknown. The BLM and the Proponent should know up-front the complete picture of cultural resources, to allow for responsible planning for the preservation of artifacts, pre- contact or historic. Additionally, number 1 in the "Qualifications and Standards" of the "Stipulations" document states, "The BLM shall ensure that appropriate cultural resource inventories/surveys…. are completed." A phased survey is not "appropriate" for such a critically important cultural area.	See response to comments 11198-2, 11557-4, 12338-9, and 11585-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
11860-2	Shauna Robinson	DEIS 3-149 states the "BLM SFO acknowledges all resource concerns expressed by the Tribes and will consider each concern as appropriate" based on the policies stated in various public laws, among them ARPA, the Archaeological Resources Protection Act, Public Law 96-95: 16. U.S.C. 470aa-mm. Under 16 U.S.C., Section 2, (a) "The Congress finds that--- (1) archaeological resources on public lands and Indian lands are an accessible and irreplaceable part of the Nation's heritage." It goes on to state "(b) The purpose of this chapter is to secure, for the present and future benefit of the American people, the protection of archaeological resources and sites which are on public lands and Indian lands," thus maintaining the valuable information such archaeological sites have in telling an area's heritage story. Also, the 1966 National Historic Preservation Act offers additional purpose for the preservation of artifacts in Section 1, b, 4, stating "the preservation of this irreplaceable heritage is in the public interest so that its vital legacy of cultural, educational, aesthetic, inspirational, economic, and energy benefits will be maintained and enriched for future generations of Americans." For a massive wind project to potentially "disturb" 9,114 acres of public land is not adequate.	The BLM has fully disclosed in the EIS (see Section 3.5) that the project is anticipated to have unavoidable visual adverse effects on historic properties due to the scale and nature of project elements The BLM has analyzed a reasonable range of alternatives, including alternatives that would avoid adverse effects (physical and non-physical) to some historic properties in the area of potential effects for the project. As described in the FEIS, not all historic properties in the area of potential effect would be adversely affected. At historic properties that would be adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (as analyzed in Section 3.5). The BLM does seek first to avoid, then to minimize, and where necessary mitigate adverse effects to historic properties, as would be further addressed under the PA for the project (see EIS Appendix 8) in compliance with Section 106 of the NHPA. Treatment of archaeological resources on BLM lands will be in accordance with ARPA. Under the PA, the project areas that would be disturbed by construction or other activities would receive further cultural resources identification efforts to refine the avoidance, minimization, or mitigation of adverse effects on historic properties. Under Section 106, historic properties on and off of BLM public land would be identified, effects assessed, and avoidance, minimization, and mitigation of adverse effects (physical through direct disturbance and non-physical as may result from visual or auditory impacts) would proceed pursuant to the PA for the project (see EIS Appendix 8).
11860-3	Shauna Robinson	Sufficient protection of Tribal Treaty Rights is undermined by a wind project that would destroy the vital landscapes and natural resources essential to wildlife. The provisions of the Fort Bridger Treaty of 1868 (3-153) granted the Shoshone-Bannock Tribes with hunting rights "off the reservation on 'unoccupied lands of the United States so long as game may be found theron' (Shoshone-Bannock Tribes 2021)". Shoshone-Bannock Tribal member, Chad Colter, voiced his concern about the Treaty Rights in the BLM RAC Subcommittee meeting on 22 September 2022, stating that those rights are being overlooked and that more emphasis is needed to maintain Tribal hunting and fishing rights on land that is "Tribal homeland.". He cited these traditional uses through the Fort Bridger Treaty 1868, and added how the Lava Ridge project would "whittle away" the land and resources. The BLM needs to protect the Treaty Rights and the resources utilized by the Tribes for hunting, gathering, and spiritual practices that depend on birds, other forms of wildlife, wild plants, and dark skies. It is inadequate for the BLM to allow the proposed wind turbine corridors that intrude on the migration routes of mule deer, elk, and pronghorn. They should be eliminated or moved outside migration routes to help preserve and strengthen Tribal Treaty Rights and the setting and feeling of the "Tribal homeland." (3-197)	In accordance with NEPA, the EIS fully considers impacts to natural and cultural resources from proposed long-term (up to 36-year plus the time it takes to reach successful reclamation following decommissioning) occupation of lands by the project, including such plant, animal, water, and mineral resources that may be associated with tribal rights or interests under the Fort Bridger Treaty of 1868 (see the referrals within Sections 3.5.4 and 3.5.5 to the analyses in Section 3.15 [Vegetation], Section 3.17 [Water and Wetland Resources], and Section 3.18 [Wildlife] for how these resource patterns or availability would be changed by the project). Dark skies are further addressed in Section 3.16.2 (Visual Resources, Night Skies) and, as cited in that section, *An Assessment of the Impact of Lighting at the Proposed project on the Night Skies of the Craters of the Moon National Monument and Preserve and the Minidoka National Historical Site*, which is available on the BLM website for the project (Dark Sky Partners, LLC 2022). EIS Section 3.5.1 (Native American Resources) connects these resources to tribal contexts, including as relates to treaties between the U.S. and Tribal Nations. Potential impacts of the project on mule deer and pronghorn are described in EIS Section 3.18.2 (Big Game Habitats and Populations). Elk are discussed in Table App3-1 in EIS Appendix 3 (Issues Analyzed in Brief); see AIB-62. The BLM identified an alternative to address concerns regarding impacts of the project on big game migration corridors, which is described in final EIS Section 2.8 (Preferred Alternative) and is analyzed in final EIS Section 3.18.2.2 (Big Game Habitats and Populations, Impacts). See also response to comment 11598-12 (see in Table A-3aa, Wildlife, including Big Game).
11860-4	Shauna Robinson	Protections of Wilson Butte Cave, a National Register site, are inadequate because of the planned siting of wind turbine corridors about a mile to the north. Wilson Butte Cave is one of the most significant archaeological sites in North America, with a history that documents Native American habitation for almost 15,000 years. Studies by Dr. Ruth Gruhn in excavations she conducted in the 1960s and 1980s, tell a story of a land that evolved from a cooler grassland dotted with ancient lakes to the desert it is today. Discoveries of bones from camel, early horse, bison, pronghorn, along with domestic and hunting tools, reveal how the indigenous people adapted to the changes of food sources and environments over the thousands of years. An important part of the site's historic integrity and setting are the viewscapes. Studies on the visual change from planned turbine sitings indicate the view would undergo major changes, no matter the alternative plan implemented (3-416). The presence of wind turbines would intrude on the unique setting, feeling, and sacred qualities of Wilson Butte Cave and, potentially, on the Wilson Butte itself, which is about a half mile to the east. Additionally, cumulative effects from other nearby energy projects also must be considered regarding impacts on the viewscapes (3-421).	See EIS Sections 3.5 (Cultural Resources) and 3.16 (Visual Resources for the BLM's disclosure of potential visual resources impacts and associated cumulative impacts from the project at the Wilson Butte Cave historic property and its surroundings. EIS Figure 3.5-3 illustrates the simulated condition for Alternatives B and E (with 6-MW wind turbines) as viewed 2.5 miles to the east from KOP 10 (Wilson Butte Cave), from the surface at Wilson Butte Cave; however, the nearest turbine siting corridor would be 1 mile from Wilson Butte Cave. For to-scale simulations and viewing information for visual resources KOPs, including for the BLM's Preferred Alternative from KOP 10, please refer to EIS Appendix 5 (Select Visual Resources Simulations) or the project visual resources technical report (SWCA 2024), available on the BLM project website (https://eplanning.blm.gov/eplanning-ui/project/2013782/510). The BLM is analyzing alternatives in the EIS that would maintain distance between project development and Wilson Butte Cave. Non-physical impacts (visual and audible impacts) to the Wilson Butte Cave site as a historic property are analyzed for all alternatives under EIS Section 3.5) and these analyses found that adverse effects could result to the Wilson Butte Cave historic property, to varying extents, under any action alternatives. Specifically, the integrity of setting and feeling of this historic property could be adversely affected; the project would avoid physical impacts to this historic property. The BLM is completing its finding of effects to historic properties under NHPA Section 106. Cumulative effects

Comment ID	Commenter	Public Comment	Response to Comment
			are addressed under the EIS, as at Section 3.5 (Cultural Resources) and for historic properties pursuant to the project PA (see EIS Appendix 8).
11860-8	Shauna Robinson	Additionally, the former community of Owinza at the railroad siding east of Dietrich, used to play an important role for sheep ranchers in the latter part of the 19th century and the 20th century. Sheep were often unloaded / loaded at Owinza to / from pasture areas. Lava Ridge would make this railroad location into a staging area for construction supplies and wind project operations. The early 20th century footprint and the surface evidence of the Owinza community and nearby homesteads will be severely damaged with the construction traffic and activities.	The Owinza Railroad Siding and Townsite is a previously documented historic property, identified in Appendix 6 of EIS Appendix 8 at 10LN0620 and indicated in state and BLM records to be eligible for the NRHP under Criteria A and D for its significance related to events in history and for its further research potential (as an archaeological site). EIS Section 3.5 (Cultural Resources) analyzes the effects of the project at historic properties within the area of potential effects for the project where physical (i.e., ground disturbance) and non-physical (i.e., visual or noise impacts) could occur. The analyses considers all project activities and areas where impacts could result to historic properties, including staging areas. The BLM would require measures to avoid, minimize, or mitigate adverse effects to historic properties, including at Owinza, as conditions of its approval of the project, should it decide to approve the project. In addition to conditions pursuant to the EIS review, the BLM is preparing a PA (see EIS Appendix 8) that would set measures for avoidance, minimization, and mitigation of adverse effects to historic properties, including Owinza, prior to any BLM approval of the project to proceed. The PA also includes unanticipated discovery planning measures to address post-review discoveries of and impacts to historic properties, should they inadvertently occur despite best planning efforts.
11869-20	Raul Labrador, Josh Turner; Idaho Attorney General's Office	Thus, the draft EIS concludes that hunting opportunities" will be significantly "diminished" due to the Project's "population-level" effects on mule deer and pronghorn. DEIS at EX-xxi; id. at 3-479–480. These "population-level effects" would be "irreversible," DEIS at 3-486, and would extend far beyond BLM land. Such effects will particularly burden tribal reserved rights in ways that will likely overtax Idaho lands and resources. Diminished wildlife habitats and tribal hunting grounds necessarily impact Idaho's right to manage its wildlife resources.	Potential impacts of the project on mule deer and pronghorn are described in EIS Section 3.18.2 (Big Game Habitats and Populations), based on the most recent scientific literature at the time of EIS preparation. The BLM is working closely with IDFG to compile and analyze the best available information to disclose impacts as accurately as is possible. In accordance with NEPA, the EIS fully considers impacts to natural and cultural resources from proposed long-term (up to 36-year plus the time it takes to reach successful reclamation following decommissioning) occupation of lands by the project, including such plant, animal, water, and mineral resources that may be associated with tribal rights or interests under the Fort Bridger Treaty of 1868. EIS Section 3.5.1 (Native American Resources) connects these resources to tribal contexts, including as relates to treaties between the U.S. and Tribal Nations.
11886-3	Sandra Eto	Non-physical Area of Potential Effect (APE) The description of treatment of non-physical APE or non-physical impacts in the DEIS is confusing and appears to not be consistent with, and is confusing when compared to, the same topic in the Draft Programmatic Agreement (PA). • The DEIS states (@ p. 3-173), "Cultural resources that are eligible only for their data potential (i.e., Criterion D) without such aboveground features or ties4 would not be considered susceptible to non-physical effects and not subject to further analysis for visual or auditory effects. • The Draft PA, Appendix 8 of the DEIS, states, under Stipulations, E. Assessment of Effect, 7.: As identified through consultation and agreement with SHPO, properties eligible only under Criterion D will be documented but not evaluated further for visual effects. (p. 13). The first explanation in the DEIS makes it clear that resources eligible for data potential that have aboveground features or ties would be considered susceptible to non-physical effects. The difference in these two explanations could lead some to interpret the wording in the Draft PA to mean any property eligible for listing (or listed) only under Criterion D of the National Register Bulletin 38 will not be evaluated further for visual effects in determining impact or mitigation.	The EIS language is changed to read that cultural resources that are eligible only for their data potential (i.e., Criterion D), without such aboveground features or ties (that would make them eligible for the NRHP under Criterion A, B, or C), would not be considered susceptible to non-physical effects and would not be subject to further analysis for visual or auditory effects.
11915-1	Kim Peyman	I would like to start by citing a few points from the ethic code of the BLM: Treat rock art, historic structures, and archaeological features with respect. Touching, chalking, or making rubbings or latex molds cause damage to rock art, gravestones, and fossil trackways. (May I assume that blasting holes would fit here too?) Take photographs or make a sketch instead. Report looting and vandalism to a BLM ranger or other local authority. I would like to file a preemptive damage report now. I would think that blasting holes into the earth near Wilson Butte Cave could potentially cause damage to its structure. Suppose that there is an unknown lava tube running under the cave which collapses due to explosive influences, thereby causing damage/collapse of Wilson Butte Cave? Our entire region is riddled with lava tubes. This cave is on the U.S. National Register of Historic Places as an archaeological site. Executive Order 11593, "Protection and Enhancement of the Cultural Environment," asserted that "the Federal Government shall provide leadership in preserving, restoring and maintaining the historical and cultural environment of the Nation."1 A potential collapse of Wilson Butte Cave is an unacceptable risk to take. The Nation has said we should preserve and treasure it. A 1959 excavation of Wilson Butte Cave was funded by Dr. J.O. Brew, Director of the Peabody Museum of Harvard University, and led by Ms. Ruth Gruhn, who was working on her doctoral dissertation. The Idaho State College Museum provided logistical support and guidance throughout this investigation.1 The excavation was conducted over a period of one year and the cave was found to include five layers of strata down to the bedrock. Radiocarbon samples were taken from these various strata and six conclusive dates were secured that ranged from 13,050 B.C. to 1525 A.D. The oldest stratum layer excavated yielded the bones of two extinct forms of camel, and one of a horse. Other layers yielded the bones of extinct camels, horses, possibly a sloth, the modern bison, and deer or antelope (undetermined). Various tools of stone and bone, along with stone projectiles, were uncovered in all stratum layers except the oldest one. Pottery was also discovered that could be directly associated with the Shoshonean culture. Some of the other cultural occupations of Wilson Butte Cave were identified as the Pre-Columbian Fremont People through the tools and projectiles that were found. The discovery of these artifacts provided unequivocal proof that Wilson Butte Cave was definitely occupied by humans for at least 12,000 years off and on due to climatic changes in the area. Our cave is one of only a handful of sites in North America that can offer indisputable proof of prehistoric occupation by humans. In fact, our cave held the oldest radiocarbon-dated evidence of human presence on the Snake River Plain, and is considered among the oldest evidence of mankind's existence in North America. This alone should disqualify the use of our BLM land for the wind farm	The BLM is committed to avoiding, minimizing, or mitigating adverse effects to important cultural resources, including caves and lava tubes that can be of tribal and archaeological significance, as at the Wilson Butte Cave historic property. The BLM is analyzing alternatives in the EIS that would maintain distance between project development, including blasting, and caves and buttes of cultural significance to Tribes and others (see EIS Section 3.5). Methods to avoid impacting resources during blasting are outlined in EIS Appendix 4, Table App4-2i. Per applicant-committed measure 86, a blasting geologist will be consulted prior to any blasting to avoid potential rockfall (rockslide/landslides). The PA for the project (see EIS Appendix 8) would further set avoidance, minimization, and mitigation measures for adverse effects from the project to historic properties, including Wilson Butte Cave. The PA includes unanticipated discovery planning measures to address post-review discoveries of and impacts to historic properties, should they inadvertently occur despite best planning efforts. Also, development of the project would not eliminate public access the BLM land within the project area, such as Wilson Butte.

Comment ID	Commenter	Public Comment	Response to Comment
		project, not to mention the National Historical Site recognition. We may not even be allowed to visit this peaceful place if the wind farm has towers there. What a loss this would be for us, as well as future generations.	
11949-1	Victor Yamada	Cultural Resources – The visual changes would significantly impact the setting, feeling, and association of Minidoka National Historic Site. The Site tells the stories of the forced incarceration of Japanese Americans and ensures they are honored and preserved for future generations. It is integral to the identify of the Japanese Americans taken from their homes, separated from their families, and imprisoned in a purposely isolated environment thousands of miles from home. Appendix 8, Cultural Resources Program Assessment, does not address these impacts.	The BLM is considering effects on cultural resources from the project undertaking through Section 106 consultation in addition to through impact analysis under the EIS. The PA is being prepared by the BLM in consultation with consulting parties under NHPA Section 106 and with the opportunity for public comment, including as presented in EIS Appendix 8. The BLM has been consulting with the NPS, the Japanese American community, and others on potential project impacts to Minidoka NHS pursuant to NHPA Section 106 and to inform EIS preparation. The BLM's EIS analyses under NEPA and preparation of the PA pursuant to NHPA Section 106 included incorporation of community knowledge and concerns identified through project scoping, Section 106 consultation with consulting parties (per 36 CFR 800), the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. The NPS, organizations and individuals representative of the Japanese American parties, and other qualified parties under the NHPA Section 106 process (36 CFR 800.2) have joined the NHPA Section 106 consultation process as consulting parties. BLM-recognized consulting parties have opportunities to review, consult, and contribute their knowledge on PA documents such as reports and plans, including the HPMP and HPTPs that would detail the address of historic property management and treatment pursuant to the PA. This includes consultation on the avoidance, minimization, and mitigation of adverse effects to historic properties, including Minidoka NHS. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the final EIS including a new section (Minidoka National Historic Site Interpretive Purpose).
11965-1	Matt Bridges	According to the Lava Ridge Wind Project DEIS, 3.5.2 Native American Resources, Native American resource concerns for the project in the NHPA Section 106 review pertain especially to a resource's integrity of setting, feeling, or association from a Tribal perspective, even if the project is not directly visible or audible from that resource of concern. Impacts to the NRHP-listed Wilson Butte Cave (10JE6) have specifically been identified by Native American Tribes and other consulting parties to be of heightened concern. Although a 1-mile setback was incorporated into the project design to avoid physical impacts to this significant cultural resource (MVE 2022:C-3.2.2), non-physical visual and auditory impacts would not be fully avoidable by the project. To build a wind project near this facility and over the sacred grounds of Native American Tribes, thus degrading, obscuring, and obliterating cultural resources, appears to be a cover up of the atrocities of the Government meted out on her people. Burying the past and building a project will restrict the citizenry from learning about these atrocities, and enjoying the learning experience of visiting our public lands. The BLM must meet their mission statement to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations.	The project would avoid direct physical effects at the Wilson Butte Cave historic property but would result in visual effects as stated in the EIS. As described in Section 3.5 (Cultural Resources) analyses, the BLM consideration of alternatives providing increased distances for project turbines from those historic properties that would be adversely affected by visual impacts would be effective in reducing visual adverse effects, including for the Wilson Butte Cave. Under the BLM's Preferred Alternative, the nearest project turbine siting corridor would be 4.4 miles from Wilson Butte Cave (KOP 10), as compared to 0.9 mile under the Proposed Action. For to-scale simulations and viewing information for visual resources KOPs, including for the BLM's Preferred Alternative from KOP 10, please refer to EIS Appendix 5 (Select Visual Resources Simulations) or the project visual resources technical report (SWCA 2024), available on the BLM project website [https://eplanning.blm.gov/eplanning-ui/project/2013782/510]). The avoidance, minimization, and mitigation of adverse effects to historic properties such as Wilson Butte Cave are further being addressed by the BLM through a PA and Historic Properties Management Plan as stated in the EIS, in consultation with Tribal Nations and consulting parties under NHPA Section 106. Mitigation efforts for adverse effects are intended to provide public value and may educate people on history, including the specific history of Native Americans in the project area. EIS Section 3.6.1 (Environmental Justice Communities) further considers the impacts of the project on Native American communities.
11978-29	Magic Valley Energy, LLC	Section 3.5.1 – Cultural Resources Analytical Framework 25. The DEIS states that "The auditory component of the non-physical APE, where noise from project operation could be perceptible, would extend up to approximately 2.2 miles from the turbine siting corridors and up to 0.5 mile from the 500-kV transmission line corridors (see Figure 3.5-2). Once the turbines and transmission lines are built, operational noise could persist throughout the 30- year project operation (see Section 3.6 regarding Noise; SWCA 2022a)." a. MVE Comment: The DEIS statement that "audible components extend up to approximately 2.2 miles from the turbine siting corridors and up to 0.5 mile from the 500-kV transmission line corridors" is not found in the SWCA 2022a reference. A suggested edit would be to reference this section in the SWCA 2022 Noise Tech R"port: "Estimated 1-hour Leq noise levels from the operation and maintenance traffic was estimated to be no more than 64.4 dBA at a distance of 5" feet."	Noise modeling estimated that turbine operational noise levels would be meaningly perceptible up to 2.2 miles (SWCA 2022: Figure D-2).
11985-1	Val Tollefson; Bainbridge Island Japanese American Exclusion Memorial Association	Alternative A is the No Action alternative. The No Action would preserve Minidoka as the sacred site for Japanese Americans that it is today. The adoption of any alternative other than the No Action would ignore the essence that makes Minidoka such an important monument. The creation of Minidoka NHS was part of this restorative process. With the Lava Ridge project on its docket, the BLM appears ready to administratively nullify that apology. Adoption of any alternative other than Alternative A would be wholly incompatible with the environmental, archaeological and cultural characteristics of the site. These characteristics have been carefully cataloged in the draft EIS, but the BLM-favored alternatives suggest that the BLM is prepared to ignore those characteristics. This must not happen. One standing on the ground at Minidoka, struck by the immensity of the sky, the distant horizon, and the silence has a similar visceral reaction to the site. The open space surrounding Minidoka is an essential element of the site. It is the very emptiness of the land to the distant horizon that conveys a sense of the enormity of the wrong perpetrated on these Americans, and the desolation that defined their lives for the war years;" "The remote setting of the Minidoka NHS now under threat is an irreplaceable part of the experience of each visit. While the need for renewable energy is undeniably important, the need for this project on this particular site is not. The BLM and other federal agencies control vast tracts of land in the western U.S. Picking this site for the project will perpetrate yet another injustice under cover of government authority. Find another site.	The current EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking under applicable laws (such as NEPA and NHPA) to protect the historic properties associated with Minidoka NHS. EIS Appendix 4 (Mitigation) specifically includes a Mitigation Framework for Key Resources and Values Associated with Minidoka National Historic Site. The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, FLPMA, and other laws, regulations, and federal requirements, in advance of the project decision. The BLM will continue to plan for the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS, under a PA (see EIS Appendix 8), completing the Section 106 process in consultation with consulting parties. The BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project, and will not make a decision on these matters until after the PA, is signed, and a project ROD is released. The BLM decision on the project will be stated in the ROD.

Comment ID	Commenter	Public Comment	Response to Comment
11991-2	Julie Abo	As a consulting party who has been participating in the Section 106 process, I do not consent to the Lava Ridge Project. I do not consent to the Section 106 current status nor the Programmatic Agreement. I have read the Draft Environmental Impact Statement and I support Alternative A: No Action for the reasons that follow. Cultural Competency and Non-physical Impacts I was shocked and angered when I found out about the Notice of Intent for the project well after it was posted. It was clear there was not an earnest and authentic effort to engage the Japanese American Minidoka community in the earliest stages of this project. So many people of the Minidoka community had no idea what was happening after the Notice of Intent was posted on 8-20-2021. I was devastated. My family was devastated. Community members were devastated. At least the BLM heard our voices amongst the Southern Idaho community and granted an extension on the comments deadline. Additionally, I find the transgression of the Tribes' rights as granted by treaty some of the most compelling reasons as to why this project should not move forward. (page 3-153) In the DEIS, Indigenous peoples and Japanese Americans should not be called "tourists and recreationists." This shows a lack of basic cultural competency on the part of the party who prepared the DEIS. It is disappointing to see that the BLM (SWCA) only has these three categories of people who frequent the parks. Japanese and Native Americans do not fit into these categories, another sign of a lack of cultural competency. (See page 3-403)	The BLM's scoping and consultation efforts are summarized in EIS Appendix 10, under Consultation and Coordination, and in the scoping report prepared for the project and posted on the BLM's project website, as cited (as SWCA 2021) in the Appendix 10 EIS Literature Cited section (for EIS Chapters 1 and 2). The DOI Office of Collaborative Action and Dispute Resolution further conducted outreach efforts to the Japanese American community in Idaho and throughout the United States to identify and consult on community interests and concerns and receive input on the project and produced a summary report on these efforts, as cited in the EIS. The BLM continues Government-to-Government consultation with Tribal Nations on the project. See response to comment 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding meaningful engagement with environmental justice communities. Also see response to comment 12859-35 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the BLM's apology and EIS revisions around correctly representing the Japanese American communities and Japanese and Alaska Natives.
11991-12	Julie Abo	Constructing and running a concrete batch plant would have a major impact on the surface ground and under the ground. The plan calls for three batch plants for all of the alternatives. Is it feasible that these batch plants could be constructed without disturbing the cultural resources, particularly for the Native American tribes? See DEIS: "Alternatives C and E: 3 batch plants" page 2-7 and page ES xvii Cultural Resources."	All project activity areas are considered in the EIS analyses, including analyses of impacts to cultural resources at EIS Section 3.5. The use of concrete batch plants is accounted for, in particular, as part of the consideration of physical impacts analyses for the project. Within the physical impact analyses for cultural resources, Native American resources are specifically included. The BLM seeks to avoid, minimize, and mitigate impacts to cultural resources, in that order of action, and would further stipulate measures for avoiding, minimizing, and mitigating adverse effects under NHPA Section 106 in the project PA (see EIS Appendix 8). To additionally support these avoidance, minimization, and mitigation efforts, Native American Tribes participating in Government-to-Government consultation for the project will be invited and encouraged to assist with cultural resources survey and monitoring of ground disturbing activities within the vicinity of resource components to which they attach religious or cultural significance.
12130-4	Brenda Pace	I am appreciative of the BLM's ongoing support of the interactive consultation that is at the heart of the NHPA Section 106 review process and am confident that adverse impacts to cultural resources in the Lava Ridge Wind project area will be avoided, minimized, and mitigated according to well-established standards, guidelines, and procedures. In reality, this will be no small task given the sensitive nature of cultural resources like the Minidoka National Historic Site, wide-ranging concerns of tribal communities, the presence of National Register properties like Wilson Butte Cave inside the project boundaries, and the large extent of the Lava Ridge Wind project footprint on the ground in in the visual realm. Section 3.5 of the DEIS and the draft Programmatic Agreement presented in DEIS Appendix 8 include information and stipulations that provide assurance that the preconstruction surveys, assessments, and mitigation that will be conducted prior to construction will be thorough. However, some of the information I believe is essential to evaluate the potential impact of the Lava Ridge Wind project, which will likely be part of the Historic Properties Management Plan, has not been included in the DEIS and this absence does prevent a full and timely review of impacts relative to the public comment period for the DEIS. I have a few examples: • The DEIS and PA do not include any definitions for basic cultural resource types, in particular the distinctions between "sites" and "isolates," and the National Register eligibility consequences of these basic divisions. These must be included in the final HPMP and PA.	Cultural resources are defined for the purposes of analysis under NEPA at the very beginning of EIS Section 3.5 (Cultural Resources). The range of cultural resources analyzed are summarized there and the variety of cultural resources documented in the area of potential effects is further listed in Appendix 6 of EIS Appendix 8, as well as having additional context provided in the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. The distinction of cultural resource site and cultural resource isolate is not necessary in the EIS analysis; however, this distinction would be included as applicable in the cultural resource documents and reports produced pursuant to the PA under NHPA Section 106.
12130-5	Brenda Pace	• It is also difficult to understand how National Register eligibility will be assessed for cultural resources in the project area in the absence of a basic research design and corresponding context statements for the cultural resources expected to occur. These important components must also be included in the final HPMP and PA.	As stated in the introduction of EIS Section 3.5 (Cultural Resources), NRHP eligibility is assessed in accordance with criteria of eligibility at 36 CFR 60.4. The BLM is further identifying, evaluating NRHP eligibility, and considering effects on cultural resources from the project undertaking through Section 106 consultation in addition to through impact analysis under the EIS. These efforts will be directed by the PA (see EIS Appendix 8) that the BLM is preparing in consultation with consulting parties, and would be further detailed as relevant in the HPMP and HPTPs that the address of historic property management and treatment pursuant to the PA. However, as stated in the EIS Introduction section, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, or to include additional new studies such as in development of historic contexts. For additional cultural resources context, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10.
12130-6	Brenda Pace	DEIS Section 3.5.5.1 presents a very simplified prediction for a density of three cultural resource sites per square mile in the unsurveyed portion of the Lava Ridge project area based on previous surveys completed in approximately 17% of the project area. This simple construct does provide a coarse tool to compare the potential impacts of the action alternatives in the DEIS, but has little use otherwise. If such predictions are to be of any use in the HPMP and PA, they must be based on a more detailed understanding of cultural resource distribution on the Snake River Plain, highlighting for example, the high archaeological sensitivity of playas (Henrikson et al. 1998). I realize that cultural resource surveys are delayed until a Record of Decision is reached in the NEPA process and a ROW is issued. One of the first steps in evaluating sensitive areas for avoidance in the Lava Ridge project area should be a cultural resource evaluation of the 46 playas that have been identified there.	See response to comment 12398-6 (see in Table A-3g, Cultural Resources and Native American Concerns). Additionally, all archaeologically sensitive locations within the field survey areas determined under the PA for the project would be further inventoried for cultural resources, including dry playa locations within those survey areas. However, it is not anticipated that all playas in the vicinity would be within the field survey areas or require evaluation for cultural resources where project impacts would not potentially occur.

Comment ID	Commenter	Public Comment	Response to Comment
12130-7	Brenda Pace	DEIS Section 3.5.5.2 and the PA include discussions of avoidance of physical impacts at identified cultural resources sites, including possible setbacks and buffers between sensitive resources and ground disturbing activities. These important avoidance measures must be included in the final HPMP and PA.	The EIS is contemplating action alternatives that would locate project turbines outside of sensitive cultural resources, including Minidoka NHS. Avoidance, minimization, and mitigation measures for adverse effects that would potentially result at these historic properties, including Minidoka NHS are contemplated in the EIS, such as at Section 3.5.5.4, and would be further pursued by the BLM under a PA completing the NHPA Section 106 process and associated HPMP and HPTPs, in consultation with consulting parties.
12159-8	Marie Matsuno, Dan Sakura	Indigenous Knowledge. The Biden Administration has issued guidance to federal agencies to consult with Indigenous people and incorporate Indigenous Knowledge in federal land management decisions: “consultation and collaboration with Tribal Nations and Indigenous Peoples is critical to ensuring that Indigenous Knowledge is considered and applied in a manner that respects Tribal sovereignty and achieves mutually beneficial outcomes for Tribal and Indigenous communities.” 8 Unfortunately, the BLM did not actively consult with Japanese Alaskans during the DEIS process. While the forced relocation of Japanese Alaskans has led to disconnections with traditional knowledge, I continue to have Indigenous Knowledge as it relates to our wrongful incarceration and efforts to heal the emotional scars.	The BLM is considering effects on cultural resources from the project undertaking through Section 106 consultation in addition to through impact analysis under the EIS. The PA is being prepared by the BLM in consultation with consulting parties under NHPA Section 106 and with the opportunity for public comment, including as presented in EIS Appendix 8. The BLM has identified Minidoka NHS as a historic property and has been consulting with the NPS, the Japanese American community, and others on potential project impacts to this historic property pursuant to NHPA Section 106 and to inform EIS preparation. The BLM’s EIS analyses under NEPA and preparation of the PA pursuant to NHPA Section 106 included incorporation of community knowledge and concerns identified through project scoping, Section 106 consultation with Native American Tribes and other consulting parties, per 36 CFR 800, the BLM’s Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. The BLM has accorded these consultation efforts with all due diligence and good faith. The BLM understands that Alaska Natives, including Alaska Native spouses and mixed Alaska Native and Nikkei children, were among the Nikkei population incarcerated at Minidoka WRC. The NPS, organizations and individuals representative of the Minidoka-connected community (including those with direct ties to Alaska), and other qualified parties under the NHPA Section 106 process (36 CFR 800.2) have joined the NHPA Section 106 consultation process as consulting parties. BLM-recognized consulting parties have opportunities to review, consult, and contribute their knowledge on PA documents such as reports and plans, including the HPMP and HPTPs that would detail the address of historic property management and treatment pursuant to the PA. This includes consultation on the avoidance, minimization, and mitigation of adverse effects to historic properties, including Minidoka NHS. The BLM is consulting with Native American Tribes with ancestral ties to the project area (see EIS Appendix 10, Section 106 Consultation and Government-to-Government Tribal Consultation). Alaska Native Tribes were not directly among interested parties or stakeholders identified during initial project scoping or through the NHPA Section 106 consultation process. Also see response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding the DOI’s trust responsibilities, specific Treaties that relate to federally recognized Tribes with ancestral ties to the project area, and the EIS’ full consideration of impacts to resources that may be associated with tribal rights or interests.
12159-9	Marie Matsuno, Dan Sakura	Inadequate Description of Authorities Relating to Sacred Sites. The BLM’s DEIS does not adequately describe the list of authorities relating to Tribal Sacred sites. For example, the DEIS does not list Executive Order 13007 – Indian Sacred Site which requires federal agencies to: “avoid adversely affecting the physical integrity of such sacred sites.” Pilgrimages to Minidoka and other incarceration sites are associated with a unique form of religious beliefs held by survivors and descendants: “Rituals play an important role in the preservation of memory as they involve the active bodily participation of all those who are present. Japanese American civil religion similarly involves rituals that bring a community together to remember the past for the sake of the present. These modern-day rituals, such as the annual pilgrimage to Manzanar that opens this article (and the Tule Lake Pilgrimage, which began in 1974), initially brought together Japanese Americans, mainly Sansei, who often lived in the shadow of their parents’ and grandparents’ silence, and helped them begin to recover a shattered past. As Joanne Doi explains: ‘These [events] were attempts to search out the truth of the history bound up in the silence of the Nisei and the classroom. The magnitude of the silence of the Nisei helped form the voice of the Sansei; the Nisei’s absence of outward emotional response mobilized the Sansei to begin to speak out.’ In a significant sense, the annual pilgrimages and Days of Remembrance prepared the way for more intense struggles (the fight for redress) and extended projects (the Japanese American National Museum).	The EIS references EO 13007 in multiple places in EIS Section 3.5 (Cultural Resources), including in the introduction of that section and also specifically in Section 3.5.1 (Native American Resources). EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) further considers the importance of Minidoka NHS and the surrounding area to the Minidoka-connected community, including survivors of incarceration and their descendants.
12177-1	Carol A. Overland	SITING WIND TURBINE NEAR HISTORIC SITE – NEEDS 6.5 MILE SETBACK The good news is that there is experience in siting the Big Bend Wind Project near an historic site in Minnesota, the settlement agreement1, ALJ’s Recommendation, and Commission Order offers suggestions on impacts, avoidance, and mitigation2 See attached Exhibits A, B, B-1, C. Discussion of impacts on the Mindoka National Historical Site are similar to those raised during the consideration of the Big Bend Wind Project3 in Minnesota near Pipestone National Monument and Jeffers Petrogylphs Historic Site. See attached Exhibit A, Planned Minnesota wind farm to be moved farther from Jeffers Petroglyphs site. State law requires consultation with the state Historic Preservation Office, and federal law requires consultation with tribal governments. Many tribal and local officials and residents raised questions about the impact of the wind project on the Jeffers Petroglyphs Historic Site, a site sacred to area native tribes. A look of issues raised and how addressed could/would help inform the record in this docket. The Jeffers Historical Site settlement specifics begin on page 58 of the ALJ’s recommendation. The bottom line is that turbines will now have at least a 6.5 mile set back from the Jeffers Historical Site. Additional historic resources were addressed in the proceeding, and recommendation addresses these sites beginning on p. 62 of the Recommendation. Exhibit C. The issues raised of impacts on the historical site and the settlement reached received broad attention4 and provides guidance on Lava Ridge siting. The essential part of reaching a mutually agreeable/not-all-happy agreement was participation of the parties with an interest. The BLM has experience with	At the advisement of the BLM, MVE revised their Proposed Action to exclude development of project structures at Minidoka WRC and Wilson Butte Cave, creating a minimum of 1-mile setback from the nearest project siting corridor to avoid physical impacts at Wilson Butte Cave area and at Minidoka NHS facilities. However, the BLM is considering other action alternatives—including the BLM Preferred Alternative—that would yet further increase the distance between the nearest project turbines and Wilson Butte Cave and Minidoka NHS. Under Alternatives C and D, the nearest project siting corridor (where turbines could be placed) would be 2.5 miles from Wilson Butte Cave and 5.5 miles from the Minidoka NHS Visitors Center. Under Alternative E, the nearest project siting corridor would be 3 miles from Wilson Butte Cave and 8.5 miles from the Minidoka NHS Visitors Center. Under the BLM’s Preferred Alternative, the nearest project siting corridor would be 4.4 miles from Wilson Butte Cave and 8.9 miles from the Minidoka NHS Visitors Center. Under all action alternatives, the majority of turbines would necessarily be farther from these historic properties than the nearest project siting corridor. The BLM’s Preferred Alternative would have fewer turbines than any other action alterative (3 MW or up to 5 MW), as well as potentially shorter turbines than other action alternatives, reaching no greater than 600 feet tall at turbine tip with use of 5-MW turbines (in contrast to other action alternatives that could use up to 6-MW turbines reaching 740 feet in height at blade tip). The EIS sufficiently analyzes the visual impacts of the 3-MW to 6-MW turbines that would be constructed for the current project, in consideration of the project’s landscape setting and features, as related to cultural resources (EIS Section 3.5) and visual resources (EIS Section 3.16).

Comment ID	Commenter	Public Comment	Response to Comment
		consultation, and in this case, what's needed is consultation with the Dept. of Interior/Historic Preservtion and all the parties weighing in.	Regardless, the BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project, and will not make a decision on these matters until after the PA (see EIS Appendix 8) is signed, and a project ROD is released. The BLM decision on the project will be stated in the ROD. Section 106 consultation (including with Native American Tribal Nations, NPS, Minidoka-connected community [inclusive of those with direct ties to Alaska] representatives, and others) will also include the BLM identifying adequate avoidance, minimization, and mitigation measures for adversely affected historic properties. As such, the BLM will continue to consult on protection measures for historic properties, including those associated with Wilson Butte Cave and Minidoka NHS, and will consider the additional setback distance provided in comment.
12177-4	Carol A. Overland	The DEIS, Section 3.5.9 addresses "Native American Resources" and addresses 1 mile and 2.5 mile setbacks, and states: Wilson Butte and Cave, Sid Butte, and other buttes and cultural resources of potential concern to Native American Tribes are within the up-to-2.2-mile operational noise zone where project-related noise would occur. P. 3-149. This 2.2 miles "noise zone" setback is NOT sufficient, and there is precedent of siting wind near Native sites with a 6.5 mile setback.	See response to comment 12177-1 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding setbacks.
12177-5	Carol A. Overland	Tribal Treaty Rights span a variety of subjects, including rights reserved by Tribes in relation to natural resources (i.e., the right to hunt, fish, and gather on land ceded by or land retained by Tribes) (ACHP 2021) (see also 36 CFI00.2(c)(2)(ii)(B)). Established treaties are binding federal law. Tribal Treaty Rights must be considered in the agency decision-making process, consistent with the federal government's trust responsibility to federally recognized Indian Tribes (ACHP 2021; ACHP et al. 2021). DEIS, p. 3-153. This siting proposal requires compliance with the U.S.' "trust responsibility," which goes further than the strict letter of the law, and requires heightened responsibility and respectful siting in light of the importance of these lands. See DEIS, first paragraph on page 3-153.	Tribal Treaty rights are addressed in the EIS; see Section 3.5.1.
12276-1	Dean Dimond	As part of the application process the BLM is supposed to study the Whole project area and identify anything that maybe eligible for the National historical registration. The DEIS does list the Wilson Butte Cave but fails to mention all others. Two that comes to mind are 1. The Milner/Gooding Canal and the three camp area that were used to build the canal system. There has been survey work done and the Canal and it has been determined that the canal system is eligible for the register. This eligible determination affords the canal the same protection as if it was listed on the register. 2, The historical sheep trails in the area. The one I am aware of is the Wendell Trail system. This trail system clearly meets the requirements of being listed on the register. The BLM must fully evaluate this and modify the EIS to accommodate this listing.	In addition to the Wilson Butte Cave historic property, cultural resources such as the Milner-Gooding Canal and associated sites are addressed under EIS Section 3.5.4 and 3.5.5 and, accordingly, assessed throughout the cultural resources sections at Section 3.5. Appendix 9 (Cultural Resources Potentially Affected by the Action Alternatives) of EIS Appendix 8 summarizes cultural resources within the physical and non-physical APE for the project per action alternative and includes the Milner-Gooding Canal, Milner Dam, and others, including historic trails in the area of potential effects. Appendix 6 of EIS Appendix 8 identifies the Milner Gooding Canal and the Wendell Trail Stock Driveway as NRHP-eligible historic properties. For additional cultural resources context, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. See response to comment 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding the further identification and assessment of effects to historic properties prior to project construction. See response to comment 11534-18 for further discussion of the Millner-Gooding Canal and similar or related historic properties.
12307-25	Dean Dimond	In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: Local access issues have not been considered and the impact on viewsheds at historical and culturally significant sites,	Regarding concerns related to access, please see the EIS Transportation section (3.14). The impact of the project on the viewshed and setting of historical and culturally significant sites is the subject matter of EIS Section 3.5. The BLM has fully disclosed in the EIS (see Section 3.5) that the project is anticipated The BLM has analyzed a reasonable range of alternatives, including alternatives that would avoid adverse effects (physical and non-physical) to some historic properties in the area of potential effects for the project. As described in the FEIS, not all historic properties in the area of potential effect would be adversely affected. At historic properties that would be adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (as analyzed in Section 3.5). As stated in the EIS Introduction section, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, including through additional new studies.
12338-4	National Park Service	Topic #3 – Possible Mitigation Topics Section: 3.5.6 Cultural Resources This section focuses on possible compensatory mitigation for impacts to Minidoka NHS. In terms of the potential forms of compensatory mitigation, the NPS would like to work with BLM to include a new or revised framework, beyond what is identified in Appendix 4, Table 4-5, for addressing compensatory mitigation, where warranted. For example, the framework may address without limitation: • Land protection measures to protect the Park Unit viewshed or associated resources. • Endowment to support interpretation, educational programs. • Support of special events, including events in support of commemoration and healing at Minidoka NHS. • Preservation and restoration of existing Park Unit assets including cultural landscapes and historic structures. • Administration, monitoring, operation, maintenance, enforcement, and replacement costs associated with compensatory mitigation. • Funding mechanisms and amounts; and • Timeframes for implementation.	In response to and in consultation with NPS, the BLM has added a Mitigation Framework for Key Resources and Values Associated with Minidoka National Historic Site to EIS Appendix 4 (Mitigation). The BLM has been consulting with the NPS, the Minidoka-connected community, and others on potential project impacts to Minidoka NHS and surrounding concerns pursuant to NHPA Section 106 and to inform EIS preparation and will continue to do so. The BLM will continue to consult with NPS and other consulting parties under NHPA Section 106 to determine mitigation measures in the PA and to inform the EIS analyses, including consideration of those measures proposed by NPS in comments here, funding mechanisms and amounts and timeframes for implementation.
12338-9	National Park Service	Section: 3.5.6 Cultural Resources Page: 3-172 to 3-189 The NPS recommends BLM complete the identification, assessment, and resolution phases for all non-physical effects to NPS properties prior to issuance of the Record of Decision, and to include such information in the final EIS and the Programmatic Agreement. The National Park Service and Advisory Council for Historic Preservation (ACHP) maintain it is important to resolve known adverse	EIS Section 3.5 analyzes the full range of cultural impacts in the area of potential effects for physical and non-physical impacts to cultural resources. For additional summary of existing literature on the range of cultural resources in the area of potential effects, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10.

Comment ID	Commenter	Public Comment	Response to Comment
		direct and indirect effects and that those effects be disclosed during the public process and prior to the issuance of the final EIS and Record Of Decision (NEPA_Section106_ 072922.pdf (achp.gov)).	As stated in the EIS Introduction section, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, including through additional new studies. The PA is being prepared by the BLM in consultation with NPS and other consulting parties, and with the opportunity for public comment, including as presented in EIS Appendix 8. The BLM's EIS analyses under NEPA and preparation of the PA pursuant to NHPA Section 106 included incorporation of community concerns identified through project scoping, Section 106 consultation with Native American Tribes and other consulting parties, per 36 CFR 800, the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. BLM-recognized consulting parties, as long as they participate and regardless of deciding to sign-on to the PA, have opportunities to review and consult on PA documents such as reports and plans, including the HPMP and HPTPs that would detail the address of historic property management and treatment pursuant to the PA. This includes consultation on the avoidance, minimization, and mitigation of adverse effects to historic properties, including Minidoka NHS.
12398-6	US Environmental Protection Agency	Potential Impacts to Cultural Resources and Coordination with Tribes Because of anticipated major adverse impacts to cultural resources from the project, EPA recommends that the FEIS: • Demonstrate that all impacts to cultural resources will be avoided, minimized, and/or mitigated. The DEIS indicates that only 17% of the project's area of potential effects (APE) has been surveyed for cultural resources and that surveys on the remaining 83% are still needed to determine impacts to cultural resources and measures to be taken to avoid, minimize, and mitigate the impacts.	EIS Section 3.5 (Cultural Resources) provides background on previous cultural resource identification efforts in the project area. Review of Idaho SHPO, NPS, and BLM cultural resource records finds that documented cultural resource field surveys cover approximately 17% of the area where physical effects from the project could result, such as within project siting corridors. The EIS does not say that that remaining 83% of the APE in those areas would require field surveys and does not intend to imply such. See Stipulation C of the PA (EIS Appendix 8) regarding Class III intensive field survey that would occur for the authorized ROW, should the project be approved. EIS Section 3.5 analyses the full range of cultural impacts in the area of potential effects for physical and non-physical impacts to cultural resources, not solely a subcomponent. For the full review of existing literature on the range of cultural resources in the area of potential effects, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022) cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. The EIS includes considerations of avoidance, minimization, and mitigation for the full range of cultural resources where the BLM would require these measures. See also comment 12398-7 regarding preparation of a PA to address additional cultural resources identification efforts, as through field survey and other methods, and regarding the avoidance, minimization, and mitigation of adverse effects. As stated in the EIS Introduction section, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, or to include additional new studies such as intensive field survey.
12398-7	US Environmental Protection Agency	• Include a copy of the final Programmatic Agreement (PA) designed to guide this project implementation, consistent with the National Historic Properties Act (NHPA) requirements. Specifically, EPA encourages BLM and the Applicant to: § Treat the MNHS as a cultural resource subject to protection of the NHPA and include this Site in the proposed project's APE. § Finalize the draft PA such that it provides for participation of groups with interest in the MNHS as signatories or non-signatories to the PA, if appropriate, and allow such groups to participate in an evaluation of whether the Lava Ridge Wind Project will impact historic and cultural resources like the MNHS. If the project has adverse effects, allow these groups to participate in the development and implementation of the contemplated Historic Properties Management Plan and the resource-specific Historic Properties Treatment Plan to avoid, minimize or mitigate adverse effects on cultural or historic resources in the project's APE. § Continue to consult with all affected Tribes and coordinate with other stakeholder groups, and consider their input when making decisions regarding the project.	The PA is being prepared by the BLM in consultation with consulting parties and with the opportunity for public comment, including as presented in EIS Appendix 8. The BLM has identified Minidoka NHS as a historic property and has been consulting with the NPS, the Japanese American community, and others on potential project impacts to this historic property pursuant to NHPA Section 106 and to inform EIS preparation. The BLM's EIS analyses under NEPA and preparation of the PA pursuant to NHPA Section 106 included incorporation of community concerns identified through the following: project scoping; Section 106 consultation with Native American Tribes and other consulting parties (per 36 CFR 800); the BLM's Government-to-Government consultation with Native American Tribes; and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American communities in Idaho and throughout the United States with connections to Minidoka NHS. The NPS, organizations and individuals representative of the Minidoka-connected community, and other qualified parties under the NHPA Section 106 process (36 CFR 800.2) have joined the NHPA Section 106 consultation process as consulting parties and may decide to sign the PA as relates to their role as consulting party. BLM-recognized consulting parties, as long as they participate and regardless of deciding to sign-on to the PA, have opportunities to review and consult on PA documents such as reports and plans, including the HPMP and HPTPs that would detail the address of historic property management and treatment pursuant to the PA. This includes consultation on the avoidance, minimization, and mitigation of adverse effects to historic properties, including Minidoka NHS.
12656-1	Regina Smith	In the Lava Ridge wind turbine DEIS; Seven field verified segments of the Oregon Trail are listed as eligible under criterion A, unevaluated and not eligible. Unevaluated segments must be considered eligible until they have been rated. Three segments are listed on the National Register in volume three, appendix 9; the Northside alternative, Oregon Trail/Kelton road and the Oregon Trail, California Trail. (Milner Ruts isn't listed in the appendix as such.) Of the seven aspects of integrity, the Oregon Trail would qualify for location, setting, feeling and association. The DEIS talks about the Milner Ruts 9.4 miles from the viewshed. I can see the flag at Flying J from before I cross the Perrin Bridge approximately 4 miles away. While I don't know the height of the flag, I'm sure it's not 740 feet. I can even see the flag's pattern in the colours. I have relatives on two branches of the family tree who followed immigrant trails to get out west. We in the west have fought many battles to preserve the integrity of setting along the immigrant California Oregon Trails. This project will infringe, reduce, and even destroy that feeling of space and time. The integrity of setting, and of feeling. Volume one of the DEIS page 3–178 discusses the viewshed as seen from the Oregon Trail at Milner Ruts, "the project would attract attention, but	KOPs are as described in EIS Section 3.16 (Visual Resources). The KOP representative of the Oregon Trail, where identified trail segments are relatively intact most proximate to the proposed project structures, is situated by the Milner Ruts. This is KOP 4, and visual simulations for KOP 4 of both 3-MW and 6-MW turbine examples are provided within Appendix C of the project visual resources technical report, which is available on the BLM website for the project as supporting information for the EIS (and is SWCA [2023] as cited in the EIS Section 3.16). As noted in the EIS, within Section 3.5, the nearest proposed turbines for the project could begin just under 10 miles from KOP 4, in relation to the Milner Ruts, at which distance the turbines would begin to fade into the middle ground, rather than be in the foreground from the Oregon Trail at that location. In the visual simulations for KOP 4 the simulated turbines are generally smaller and lower in appearance and blend with the horizon more than do electrical distribution lines or even juniper or other trees in the foreground. As the EIS analysis concludes in Section 3.5, the visual prominence of the turbines in relation to the Milner Ruts would be obvious and have sufficient size or contrast to compete with other landscape elements, but the turbines would have insufficient

Comment ID	Commenter	Public Comment	Response to Comment
		would not dominate the views." Continuing on with "the Oregon Trail near Milner Ruts (KOP 40) would experience a minor degree of visual change". This opinion is not supported since photograph simulations of wind turbines on the viewshed are not included in the DEIS. Immigrants coming across the nation did not encounter windmills of any size certainly not hundreds towering over the height of the Statue of Liberty or the Perrin Bridge (from the water level). Page, 3–188 " this would include related irreversible effects to significant cultural resources of the Japanese American community and the Native American tribes." The Oregon Trail isn't even mentioned. 34+ years is the equivalent of 1 1/2 generations. This means your grandchildren and great grandchildren and mine will never see it in its pristine condition. Since I am retired, you may even have children who will never experience the feeling of going back in time and seeing the trail as it looked during the immigrants travel. Or experience the endurance of these pioneers in our history. The DEIS blithely states that recreationists can go recreate elsewhere. If the Lava Ridge, Taurus, and Salmon Falls projects all go through, there will be no other elsewhere to experience the Trail in its historic setting.	visual contrast to strongly attract visual attention and insufficient size to occupy most of the observer's visual field. The action alternative analyses in EIS Section 3.5 (Cultural Resources) compare the differences in potential impacts to the Oregon Trail from each alternative, noting which would have comparable, greater, or lesser potential for visual impacts to the Oregon Trail at the Milner Ruts as well as in relation to other Oregon Trail segments in the project area of potential effects. The project would not have physical impacts to the Oregon Trail; any project effects on the Oregon Trail are anticipated to be visual. Cumulative impacts are also analyzed.
12859-12	Kristen Brengel, Robyn Achilles; Friends of Minidoka	BLM has not complied with FLPMA's requirement to inventory resources on public lands. Section 201 of FLPMA requires BLM to "maintain on a continuing basis an inventory of all public lands and their resource and other values (including but not limited to outdoor recreation and scenic values)."127 During World War II, the Minidoka Relocation Center was located on approximately 33,000 acres of federal land, which included approximately 950 acres of land for barracks and administration facilities. Following World War II, the U.S. government conveyed lands to returning veterans to develop farms. Over the past 30 years, the National Park Service, Presidents and Congress have clearly documented the importance of Minidoka and the Minidoka Relocation Center. As noted below, in 1992, Congress directed the Secretary of the Interior to study Minidoka as part of a National Historic Landmark Theme Study. To support the study, the National Park Service issued a comprehensive report in 1999, entitled Confinement and Ethnicity, which identified important historic resources at the Minidoka Relocation Center and other sites.128 In 2001, President Clinton designated the Minidoka Internment National Monument as a unit of the National Park System. As required by the Monument Proclamation and NPS planning regulations, NPS developed its general management plan (GMP) in consultation with the BLM.129 In 2006, the GMP recommended the administrative transfer of Minidoka's dump site from the BLM to the NPS.130 The 2008 Minidoka legislation authorized the transfer of 80 acres of BLM land to NPS, which has been completed. Also, the NPS identified Minidoka as nationally significant in the Japanese Americans in World War II Theme Study.131 Despite the significant amount of public information about the importance of Minidoka, BLM failed to update its inventory of historic resources on BLM lands. BLM also did not maintain the required visual resource inventories and prepare visual resource management classes or perform five-year plan reviews. While the Biden Administration has a nationwide goal of 25 gigawatts of renewable energy on public lands by 2025, there are clear statutory authorities that direct BLM to protect Minidoka and no direct authority relating to the location of the Lava Ridge Wind Project.	The BLM has added EIS Section 3.19, Minidoka National Historic Site Interpretive Purpose and has added a Mitigation Framework for Key Resources and Values Associated with Minidoka National Historic Site to Appendix 4 (Mitigation). Minidoka NHS is prominently identified in the EIS, and features and sites of the WRC landscape are identified within Appendix 6 of EIS Appendix 8. In addition to NEPA analysis within this EIS, the BLM is addressing Minidoka NHS and associated areas and resources under NHPA Section 106, as the EIS references. The Section 106 process at 36 CFR 800.4(c)(1) considers that the passage of time, changing perceptions of significance, or incomplete prior evaluations may require the agency official to reevaluate properties previously determined eligible or ineligible and that there is the potential for properties to be identified within a given area of potential effects that have not been previously evaluated for NRHP eligibility. The current EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking to protect Minidoka NHS and other historic properties. The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, and FLPMA in advance of the current project. The BLM will continue to plan for the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS, under a PA, completing the Section 106 process. The BLM conducted a project level visual resource inventory to identify visual values within the established analysis area for visual resources. The current resource management plan does not have visual resource management classes established and the BLM is evaluating an interim process to identify visual resource management classes for the project area. Since there were no established visual resource management objectives a 5-year plan review did not occur.
12859-35	Kristen Brengel, Robyn Achilles; Friends of Minidoka	3.16.1.1.2 Key Observation Points BLM's analysis of visual impacts is flawed based on an incomplete and inaccurate methodology of visual sensitivity for the Japanese American community. According to the project's consultant, "[v]isual sensitivity reflects attitudes and perceptions held by people regarding the landscape and, in general, reflects the public's level of sensitivity for noticeable change to the landscape."240 Sensitive user groups. The DEIS identified three key observation points (KOPs) associated with Minidoka, including the new visitor center (KOP 1), barrack block 22 (KOP 2) and the view looking east towards the Honor Roll from the park entrance (KOP 16).241 The DEIS defines tourist and recreational users as "local and seasonal residents engaged in recreational activities, and tourists and recreation users visiting from outside the local area."242 However, the DEIS wrongly categorizes members of the Japanese American community as "tourists and recreational users." In contrast to this mischaracterization, Lawrence Matsuda, a Minidoka survivor, states "I'm not a 'tourist.' I am a survivor."244 As a result, this list does not accurately reflect the connection between the Japanese American community and Minidoka, which is sacred ground. Minidoka is not a tourist attraction for the Japanese American and Alaska Native communities with family connections to Minidoka. It is a place of deep sacred connections to family members who are no longer with us, to Nihonmachis (Japantowns), farming communities, schools, friends, jobs, businesses, houses, pets and neighborhoods lost forever because of racism and prejudice. Minidoka is a place of deep spiritual resonance and connection. While the project consultant highlighted the unique sensitivities of the Japanese American community, the DEIS does not accurately describe or analyze the visual impact on the Japanese American community, including survivors, descendants and Japanese Alaskans.245 We recommend that BLM develop a new category of sensitive users, maybe entitled commemorative users,246 and develop a new methodology for assessing the impacts. We note that there might not be this type of analysis available because agencies generally respect sacred ground and avoid siting energy projects in areas that would impact national park units, such as the Manzanar National Historic Site247 and the Sand Creek Massacre National Historic Site. BLM's current methodology is flawed because it only lists limited types of sites that have "visual importance relative to one's home, social, business, and recreation environment."248 If BLM seeks to locate renewable energy sites in high conflict areas, BLM could consider adding "sacred ground, memorials to veterans and victims of racial prejudice, cemeteries, places of healing and commemoration, Traditional Cultural Property and sites of religious significance" to this list of types of sites.	KOPs for the project were chosen and agreed upon by the BLM and NPS for representation of Minidoka NHS, and their analysis conforms to BLM standards for visual resources management as cited in EIS Section 3.16 (Visual Resources). The selected KOPs are detailed in Section 3.16.1.1 (Key Observation Points) in EIS Appendix 9, and impacts to observers in those areas are detailed in Section 3.16.1.2 (Impacts). The EIS has been revised to correctly represent the Japanese American and Minidoka-connected community (including Japanese or Alaska Native). The BLM apologizes for indicating in any manner that the Japanese American and Minidoka-connected communities and Native American Tribes are within the sensitive viewer group of "tourists and recreationists," and the EIS is revised to not indicate or imply this. Because of the sensitive character of resources or landscape features assessed from certain KOPs, and their strong connections to these, the BLM understands and respects that the Japanese American and Minidoka-connected communities and Native American Tribes should not be referred to as "tourists" in any manner in relation. For consistency with the Minidoka NHS foundation document (NPS 2016), the terms "visitors and survivors" were used to characterize Japanese American community members within the Environmental Justice and Cultural Resource sections of the draft EIS (EIS Sections 3.5 and 3.6). In EIS revisions, the group formerly referred to under Visual Resources (EIS Section 3.16) as "tourists and recreationists" has been replaced with "visitors" and as "survivors and descendants of the incarcerated" within the Environmental Justice and Cultural Resource sections of the EIS. The commenter was correct that visual resource management categorizations included categories that did not fully reflect the connection of the Japanese American and Minidoka-connected communities to Minidoka NHS and surrounding area and caused offense, no matter how inadvertent. For this reason, the EIS has not solely relied on these categorizations but also considers the unique sensitivities of the Japanese American and Minidoka-connected communities, as the commentor has noted. Within the issues analyzed, the sensitivities, perceptions, and concerns of the Japanese American and Minidoka-connected communities are therefore specifically addressed in the Visual Resources, Cultural Resources, and Environmental Justice sections of the EIS. EIS Section 3.5.2 (Minidoka War Relocation Center and Minidoka National Historic Site) incorporates information from BLM consultation with the Japanese American community, their concerns, and interests. The DOI Office of Collaborative Action and Dispute Resolution further conducted outreach efforts to the Japanese American community in Idaho and throughout the United States to identify and consult on community interests and concerns and receive input on the project and produced a summary report on these efforts, as cited in the EIS. See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding recognition of Minidoka NHS as an important site of national conscience, moral reflection, and community healing. Although sites of visual importance to one's home, social, business, and recreation

Comment ID	Commenter	Public Comment	Response to Comment
			environment are considered in the Visual Resources section of the EIS, the range of cultural resources that include sacred ground, memorials (including as to veterans and victims of racial prejudice), cemeteries, places of healing and commemoration, TCPs, and sites of religious significance are a consideration of EIS Section 3.5 (Cultural Resources). The BLM has revised the visual sensitivity for Minidoka NHS and surrounding WRC to be high sensitivity, instead of moderate; see EIS Section 3.16 (Visual Resources). However, the degree of visual contrast for wind turbines will remain moderate based on visual resource management analyses in Section 3.16. See response to comment 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) regarding the addition of new Section 3.19 (Minidoka National Historic Site Interpretive Purpose) in the final EIS.
12968-10	Charles Brockway	The analysis in the EIS of effects on cultural resources, including aesthetic, visual impacts, and aural impacts, is inadequate. The EIS identifies major impacts on these resources and identifies no proposed mitigation efforts. The massive degradation of the landscape in terms of visual impact is hard to overstate. The EIS underestimates the radius within which the proposed turbines would be visible, based on line-of-sight analysis.	The BLM has fully disclosed in the EIS (see Section 3.5) that the project is anticipated to have unavoidable visual adverse effects on historic properties due to the scale and nature of project elements. The BLM has analyzed a reasonable range of alternatives, including alternatives that would avoid adverse effects (physical and non-physical) to some historic properties in the area of potential effects for the project. As described in the FEIS, not all historic properties in the area of potential effect would be adversely affected. At historic properties that would be adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (as analyzed in Section 3.5). The BLM does seek first to avoid, then to minimize, and where necessary mitigate adverse effects to historic properties. At historic properties that would be unavoidably adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (pursuant to NHPA Section 106, see EIS Appendix 8, and as analyzed in Section 3.5). The BLM's statements in the EIS Section 3.5 on these subjects as they relate to cultural resources remains correct. Regarding the distances at which turbines would be visible and visual impacts of the project on the landscape, see also EIS Section 3.16 (Visual Resources). Please further note that the area of potential effects for which cultural resources may be visually impacted in Section 3.5 (Cultural Resources) considers the distance at which adverse effects could occur at historic properties and not solely the ability of people to sight turbines within the range of human visual acuity. See also EIS Appendix 3 Table App3-1 at AIB-20 for further consideration of noise impacts on the landscape.
12982-19	Jerry Taylor	The cavalier and disingenuous approach to the history of this place disrespects the memory of those valued neighbors whose parents and/or grandparents were forced into internment camps and lost everything in the process. It disrespects those who settled this place and brought irrigation to a desert, not to mention the native peoples who have a much longer cultural history and memory. They should not be shoved aside based on cold and calculating processes or promises of future actions designed to appease or force unwanted change.	The BLM's current EIS and Section 106 review and analysis of the project represent appropriate steps that the BLM is taking for historic preservation and in relation to environmental justice communities, including as relates to Minidoka NHS and WRC and to Native American resources (see EIS Sections 3.5.1 and 3.5.2). The BLM is diligently proceeding with NEPA, NHPA, and other regulatory processes as relates to the project and is consulting in good faith. Although the process may be regulatory, the BLM's good faith consultation intends to be respectful to all parties and the public and their input. The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, and FLPMA, as well as other laws, in advance of the current project. The BLM will continue to plan for and consult on the avoidance, minimization, and mitigation of adverse effects to historic properties, including at Minidoka NHS and adversely affected Native American resources, under a PA, completing the Section 106 process. NEPA requires the consideration of alternatives to the Proposed Action when significant environmental impacts could result. The BLM reviewed a No Action alternative and developed action alternatives with consideration for avoiding or minimizing Project impacts, including to affected Japanese American and Minidoka-connected communities and Native American Tribes and the cultural resources of importance to those and other communities. The development of alternatives included incorporation of community concerns identified through project scoping, Section 106 consultation with Native American Tribes and other consulting parties, per 36 CFR 800, the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States.
12988-13	Melody Asher	DEIS 3.5.2 Native American Resources Your DEIS says "Native American resources, as the term is used in this EIS, refers to cultural resources or artifacts created by Native American Tribes or cultures and to places and landscape features of significance to Tribes, whether or not these resources are subject to the NHPA, ARPA, or NAGPRA, and to natural resources (such as plants, animals, and minerals, or geographic features like buttes and caves) that are spiritually and culturally significant to Tribes, including resources for which Tribes have treaty-protected rights. Impacts to these resources could diminish Tribes' treaty rights or other rights as recognized under the AIRFA and EO 13007 (May 1996: Indian Sacred Sites) and those addressed under Joint Secretarial Order (JSO) 3403 and the Memorandum of Understanding (MOU} Regarding Interagency Coordination and Collaboration for the Protection of Tribal Treaty Rights and Reserved Rights (ACHP et al. 2021}." When I was at Wilson Butte Cave recently and sat on top of the formation I was awed by the fact that I was sitting where many peoples from 10,000 to 15,000 years ago also sat. The quiet and the view were a very large part of that experience and if there are wind turbines surrounding the cave area that experience would not be anything like what it is now or what it was 10,000 to 15,000 years ago. I believe that you should choose Alternative A (No Action) until the time that the state and federal agencies, renewable energy industries, local communities, Native American Tribes and other interested parties get together and identify and prioritize areas of lowest environmental impact. We need to consider the cumulative effects of multiple wind turbine projects (along with multiple solar power projects) to our ecosystems and wildlife of all types.	Impacts to Wilson Butte Cave were specifically identified by Tribes and other consulting parties to be of heightened concern. Non-physical impacts (visual and audible impacts) to the Wilson Butte Cave site as a historic property are analyzed for all alternatives under EIS Section 3.5, and these analyses found that adverse effects could result to the Wilson Butte Cave historic property, to varying extents, under any of the action alternatives. Although a 1-mile setback was incorporated into the project design under the Proposed Action to avoid physical impacts to this significant cultural resource, non-physical visual and auditory impacts would not be fully avoidable. Specifically, the integrity of setting and feeling of this historic property could be adversely affected through non-physical project effects. The BLM is completing its finding of effects to historic properties under NHPA Section 106. Cumulative effects are addressed under the EIS, as at Section 3.5 (Cultural Resources) and for historic properties pursuant to the project PA (see EIS Appendix 8).
13000-2	Nathan Small	The Tribes would like the BLM to consider the following comments while making your recommendations for evaluation in the final EIS and particularly when drafting the Record of Decision for the project. • The project	As stated in the Introduction, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand

Comment ID	Commenter	Public Comment	Response to Comment
		lacks pertinent cultural resources information; including adequate ethnographic information and sufficient design progression to enumerate the actual impact of construction/operation activities.	the basis for that decision making and is not intended to provide extensive or exhaustive detail, or to include additional new studies such as ethnographic studies. For additional cultural resources context, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022), and the Class I cultural resources report for the BLM Twin Falls district (Far Western Anthropological Research Group, Inc. 2022), cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. For additional presentation on project design, informing the EIS analysis of impacts from construction and operations activities, see MVE (2023).
13000-4	Nathan Small	The project does not adequately address the massive net-loss in public lands for the Tribes' Treaty rights and interest, or the physical occupation of the land's surface for decades to come.	In accordance with NEPA, the EIS fully considers impacts to natural and cultural resources from proposed long-term (up to 36-year plus the time it takes to reach successful reclamation following decommissioning) occupation of lands by the project, including such plant, animal, water, and mineral resources that may be associated with tribal rights or interests under the Fort Bridger Treaty of 1868. EIS Section 3.5.1 (Native American Resources) connects these resources to tribal contexts, including as relates to treaties between the U.S. and Tribal Nations. See Table 2.4-1 (Project Components by Action Alternative). Additionally, as noted in Table 3.5-3 in Section 3.5.4 (Cultural Resources, Physical Impacts), the total ground disturbance under the Proposed Action would be 9,114 acres. Ground disturbance under Alternatives C, D, and E would each be lessened from that of Alternative B, and the BLM's Preferred Alternative would comparatively have 4,492 acres of ground disturbance (51% less than under Alternative B). Also, development of the project would not eliminate public access of the BLM public lands within the project area.
13000-7	Nathan Small	The DEIS does not present Treaty Rights, or cultural resources, accurately in the document and purports to 'mitigate' the project without consulting the Tribes.	The BLM clearly and accurately describes how cultural resources are considered in the EIS in Section 3.5 (Cultural Resources) in accordance with federal laws and regulations. This includes the consideration of Native American resources and treaties at Section 3.5.1. The BLM appreciates the Native American views and insights on cultural resources and on treaty rights presented by Tribal Nations in consultation under NEPA and NHPA Section 106, as well as received in comments and correspondence on the project from Tribal Nations. The BLM continues to consult with Tribal Nations on the project under NEPA and NHPA Section 106 including regarding the mitigation of project effects to tribal communities and resources of tribal concern as compiled in EIS Appendix 4 and as addressed under the PA at EIS Appendix 8. The BLM has not purported to mitigate the project. The BLM would not have project mitigation finally set or ultimately implemented until it makes a decision on the project following the completion of the NEPA and Section 106 processes with the signing of a ROD on the project.
13000-9	Nathan Small	Background The various bands of the Shoshone and Bannock people traditionally roamed extensively throughout the Great Basin and Intermountain region; with specific bands occupying the landscapes of the Snake River Plains and surrounding mountains from time immemorial. Prior to non-Indian settlers entry into the region, Indians utilized the rich natural resources, and enjoyed the cultural traditions and lifestyles unique to our people. The Tribes called their aboriginal territory, "bia sokoppe" the Shoshoni term referring to Mother Earth, or literally, "our big lands". The removal of our people to reservations remains a dark moment in our history, with generations carrying on stories of our homelands. In June 1867, an Executive Order established the Fort Hall Indian Reservation, as a collective place to consolidate the various bands of Shoshones and Bannocks, from their aboriginal lands, clearing the way for European-American settlements, such as ranchers and miners who desired rich resources present on aboriginal lands. The United States then signed a treaty, the Treaty with the Eastern Shoshone and Bannock Indians in 1868 (commonly referred to as the "Fort Bridger Treaty"), to protect our subsistence rights to harvest foods, medicine, and materials from our homelands. This document established a political entity we now refer to as the Shoshone Bannock Tribes (Tribes) who are the stewards of the unique culture, homelands, and practices of our people from time immemorial. The 1868 Fort Bridger Treaty (15 Stat 673) affirmed the reservation reserved by Executive Order in 1867 and reserved certain off-reservation use rights for the Tribes. Article IV states: The Indians herein named agree, when the agency-house and other buildings shall be constructed on their reservations named, they will make said reservations their permanent home, and they will make no permanent settlement elsewhere; but they shall have the right to hunt on the unoccupied lands of the United States so long as game may be found thereon, and so long as peace subsists among the whites and Indians on the borders of the hunting districts. In addition to the reserved rights to 'hunt' for our subsistence foods on the unoccupied lands of the United States, the Shoshone-Bannock Tribes specifically reserved land rights in the 'Camas Prairie' region of central Idaho. Due to a scribe's error, the Camas Prairie was never designated by the US government as a component of our reservation, the first of many broken Treaty promises across our lands. Our cultural connection has never been severed, and the region this project is located on is one of the richest cultural landscapes for our people that remains in the area. Statement of Policy for Management of the Snake River The Tribes stress the importance of initiating efforts to restore the Snake River system and affected unoccupied lands to a natural condition. The Tribes' Policy for Management of the Snake River Basin Resources states: The Shoshone Bannock Tribes (I'ribes) will pursue, promote, and where necessary, initiate efforts to restore the Snake River systems and affected unoccupied lands to a natural condition. This includes the restoration of component resources to conditions which most closely represents the ecological features associated with a natural riverine ecosystem. In addition, the Tribes will work to ensure the protection, preservation, and where appropriate-the enhancement of Rights reserved by the Tribes under the Fort Bridger Treaty of 1868 (I'reaty) and any inherent aboriginal rights. The proposed project has the potential to impact a large landscape that is currently home to a myriad of native assemblages of species. While our policy does recognize that anthropogenic modifications are the current paradigm, large-scale projects should not impact future generations of Tribal members' opportunities to enjoy the natural view shed, gather resources and	The additional detail regarding the Shoshone and Bannock people of the Fort Hall Reservation is acknowledged by the BLM and recorded for the project with the comment provided here and cited in conclusion to the Native American Resources subsection of the EIS (Section 3.5.1). Impacts related to Native American Tribes are included in EIS Section 3.6.1 (Environmental Justice Communities). Impacts related to visual resources, including those with natural landscapes, are described in EIS Section 3.16 (Visual Resources). Impacts related to natural and cultural resources of traditional importance to Tribes in Section 3.5 (Cultural Resources). The EIS overall intends to accurately disclose the environmental impacts of the project under the NEPA. Mitigation of impacts, including those effective of resources of tribal concern, is addressed in EIS Appendix 4 (Mitigation).

Comment ID	Commenter	Public Comment	Response to Comment
		continue traditional cultural practices. Each project must be objectively evaluated and those noted impacts must be mitigated equitably for the Tribes.	
13000-10	Nathan Small	Statement of Policy for Cultural Resources In the view of the Shoshone and Bannock people, cultural resources and heritage is broadly defined, through a holistic perspective that embraces plants, air, water, soil, animals, spirituality and humans, with the relationship existing between them. Cultural resources are highly significant because they directly contribute to the Shoshone and Bannock peoples' unique cultural heritage, for the past and into the future. Simply stated, a cultural resource is any resource of cultural character, including social institutions, Tribal identity, subsistence practices, beliefs, religious ceremonies and practices, sacred landscapes and objects, medicinal resources and practices, archaeological sites, natural resources and their use, view sheds, intellectual property, oral traditions, language, historical events, documents and structures, and secular and non-secular items. The Shoshone-Bannock Tribes' Policy for Cultural Resources states: The Tribes retain, assert, and exercise our inherent and ongoing rights as a sovereign government, pertaining to cultural resources and cultural properties. Where federal laws are non-existent or inconsistent, the Tribes will continue to exercise our inherent rights and unwritten traditional practices, in regards to the management of cultural properties and natural resources. It is the Tribes' right and responsibility to interpret and perpetuate cultural and heritage resources for future generations of Tribal members and the Tribal community. The Tribes continue to practice our unique subsistence lifestyle that maintains Tribal traditions and ceremonies, improves health, and utilizes ancestral territories. In addition, the Tribes will continue to work diligently to ensure the protection, preservation, and enhancement of our rights for future generations. The DEIS describes numerous physical and non-physical effects both irreversible and irretrievable to Tribal resources from all the Action Alternatives. With only 17% of the Area of Potential Effect having received previous cultural resource field surveys identifying 199 cultural resource sites. The Tribes believe the APE could potentially hold thousands of cultural sites that could potentially be lost forever and the DEIS suggests that these irreversible losses can receive compensatory mitigation in the form of an ethnographic study; a report that should have been used for analysis purposes. This is an unacceptable form of mitigation. Mitigation in the form of documentation is not equitable to the loss of the resource.	The BLM appreciates the Native American views and insights on cultural resources and on the project presented by Tribal Nations in consultation under NEPA and NHPA Section 106, as well as received in comments and correspondence on the project from Tribal Nations. The BLM has further sought the perspectives of Tribes through consultation on the project, as described in EIS Section 3.5.1 and EIS Appendix 10. EIS Section 3.5.1 summarizes the connections of Tribal Nations—the Shoshone and Bannock peoples specifically—to the project area and acknowledges the traditional cultural and religious—or sacred and spiritual—importance of resources in the area to these nations and peoples. This specifically includes consideration of natural resources (such as plants, animals, and minerals, or geographic features) that are spiritually and culturally significant to Tribes. In accordance with NEPA, the EIS fully considers impacts to natural and cultural resources from proposed long-term occupation of lands by the project, including such plant, animal, water, and mineral resources that may be associated with tribal rights and interests in the area. The policy statement of the Shoshone-Bannock, as quoted in the comment, are further placed in the record with this comment here. EIS Section 3.5 (Cultural Resources) calculates that the area of potential effects for the project could hold thousands of cultural resources potentially important to Tribal Nations and others. However, the BLM would implement measures to avoid, minimize, and mitigate adverse effect to cultural resources of traditional cultural or religious significance to Tribal Nations, pursuant to the EIS and a PA under NHPA Section 106. The BLM has analyzed a reasonable range of alternatives, including alternatives that would avoid adverse effects (physical and non-physical) to some historic properties in the area of potential effects for the project. As described in the FEIS, not all cultural resources in the area of potential effect would be adversely affected. At historic properties that would be unavoidably adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (pursuant to NHPA Section 106 and as analyzed in Section 3.5). The BLM does seek first to avoid, then to minimize, and where necessary mitigate adverse effects to historic properties. The mitigation of adverse effects, following the EIS and pursuant to a PA, can be other than only an ethnographic study. EIS Appendix 4 describes a variety of additional mitigation measures applicable to cultural resources. The BLM acknowledges the commenter's statement that Tribes do not consider ethnographic study to be an appropriate mitigation, in and of itself, and has accordingly updated final EIS Appendix 4 to no longer include ethnographic study as a pre-stated mitigation measure for Tribal resources. The BLM will continue soliciting input from the Shoshone-Bannock Tribes and Shoshone-Paiute Tribes to avoid, minimize, and mitigate project impacts to Tribes. As stated in the Introduction, the EIS analyzes and discloses the potential environmental impacts of MVE's project and alternatives for BLM decision making. As such, the EIS provides sufficient information to understand the basis for that decision making and is not intended to provide extensive or exhaustive detail, or to include additional new studies such as ethnographic studies. For additional cultural resources context, see the project's cultural resources Class I inventory report and report addendum (Power 2021, 2022), and the Class I cultural resources report for the BLM Twin Falls district (Far Western Anthropological Research Group, Inc. 2022), cited in EIS Section 3.5 (Cultural Resources) and referenced in EIS Appendix 10. For additional presentation on project design, informing the EIS analysis of impacts from construction and operations activities, see MVE (2023).
13000-12	Nathan Small	Cultural Resources The Snake River Plain is identified as a component of our ancestral lands and our people roamed these lands and waterways from time immemorial in a seasonal round that sustained our unique culture. The Tribes have identified significant physical cultural resources in the area that will be impacted as a result of the proposed wind project. The Tribes have also identified a high potential for burial sites in the area; the loss of those cultural resources is not acceptable for the Tribes. The relationship between the BLM and the Tribes is government-to-government, with the communications about the locations and potential impacts to physical sites, sacred sites, and traditional cultural properties being protected information. As such, our comments generally to the BLM is that the wealth of 'sites' identified already, as well as their cultural context/integrity, lends credence to the conclusion that the losses of' sites' does not justify the construction and operation of the project. Based on the nature and scale of impacts to our culture, history, and traditions, the Tribes cannot support an alternative for this project and fully recommend a complete re-evaluation of priorities to protect cultural resources from our federal trustees. Additional cultural resources consultations will be necessary throughout the EIS process, particularly because those impacts to cultural resources significant to the Tribes have remained relatively consistent throughout the project concept/planning process. The DEIS missed numerous opportunities to analyze the Tribes perspective which includes our inherent values associated with our seasonal rounds or spiritual and traditional cultural properties of the area. The Tribes requested a training specific for tribal cultural resource monitors to aid and assist the archaeologists performing their Class II survey inventories for the proposed project with the Tribal perspective in mind. This request by no way means the Tribes support the proposed wind project but are insuring cultural resources significant to the Tribes will be identified to the extent necessary for protection and to remain confidential. A land acknowledgement from the BLM should be considered as this land was the ancestral lands of the Shoshone and Bannock people before intrusion from the immigrants to our homelands. Our removal from these lands we considered our homelands was unjust and there is no recognition of these lands as being our ancestral lands.	The BLM appreciates the Native American views and insights on cultural resources and on the project presented by Tribal Nations in consultation under NEPA and NHPA Section 106, as well as received in comments and correspondence on the project from Tribal Nations. Consultation is summarized in EIS Appendix 10. EIS Section 3.5.1 summarizes area background on Native American resources, including those identified by Tribal Nations in consultation with the BLM and excluding any confidential information received from Tribal Nations. The BLM has further sought the perspectives of Tribes through consultation on the project, as described in EIS Section 3.5.1 and EIS Appendix 10. EIS Section 3.5.1 summarizes the connections of Tribal Nations to the project area and acknowledges the presence of traditional cultural and religious importance of resources in the area to these nations and peoples. The BLM continues to consult with Tribal Nations on the project under NEPA and NHPA Section 106 including regarding project effects to tribal communities and resources of tribal concerns and as addressed under the PA at EIS Appendix 8. The BLM, in the EIS, has determined that the project has the potential to result in adverse effects to important Native American resources. Efforts to minimize and mitigate impact to cultural resources are outlined in EIS Appendix 10. Additionally, measures to avoid, minimize, and mitigate adverse effect to historic properties of traditional cultural or religious significance to Tribal Nations would be implemented pursuant to a PA under NHPA Section 106, as referenced in EIS Section 3.5. The BLM has analyzed a reasonable range of alternatives, including alternatives that would avoid adverse effects (physical and non-physical) to some historic properties in the area of potential effects for the project. As described in the FEIS, not all historic properties in the area of potential effect would be adversely affected. At historic properties that would be unavoidably adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (as analyzed in Section 3.5). The BLM does seek first to avoid, then to minimize, and where necessary mitigate adverse effects to historic properties. The PA for the project would require a HPMP that is to include a monitoring and discovery plan for cultural resources, including planning for the discovery of burials (see EIS Appendix 8). The HPMP is to include the

Comment ID	Commenter	Public Comment	Response to Comment
			finalization of protection measures and any monitoring areas, according to the PA. Per the stipulations of the PA, the BLM is to consult upon the HPMP with Tribal Nations and consulting parties before approving the final HPMP. The field surveys and monitoring under the PA can include trained tribal monitors, should Tribal Nations choose to directly participate in monitoring as recommended. The EIS within Section 3.5.1 reaffirms that the project lands are the ancestral lands of the Shoshone-Bannock peoples, including as may relate to treaties between the United States and those peoples.
13006-1	Leon Smith	Tribal perspective/cultural resources and Minidoka National Historic Site/Japanese American community 1) Recommend the cultural resource sites need to be identified prior to ground disturbance, beginning with known highly sensitive areas. 2) Recommend that BLM add analysis to the DEIS on how irreversible, irretrievable losses of cultural sites, Tribal treaty rights, and Traditional Cultural Properties will be mitigated.	See responses to comments 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns), 11557-4 (see in Table A-3g, Cultural Resources and Native American Concerns), and 11535-54 (see in Table A-3g, Cultural Resources and Native American Concerns) regarding cultural resources identification before ground disturbance and 11557-4 regarding how adverse effects to cultural resources—including TCPs—would be mitigated, including those effects that might be irreversible with irretrievable losses of cultural resources or cultural resources values.
13006-3	Leon Smith	4) Recommend BLM follows policy regarding the identification and protection of cultural resource sites. Have archaeologists on site during construction to ensure sites are avoided. The Historic Properties Management Plan must include these details; sub-committee needs to see the HPMP because they can't evaluate the impacts without it. The Historic Context document would be helpful too; would like to see it as well.	The PA for the project would require a HPMP that is to include a monitoring and discovery plan for cultural resources (see EIS Appendix 8). The HPMP is to include the finalization of protection measures and any monitoring areas, according to the PA. Per the stipulations of the PA, the BLM is to consult upon the HPMP with consulting parties before approving the final HPMP. The PA requires that consultants retained for archaeological services meet the Secretary of the Interior's Professional Qualifications Standards for Archaeology.
13006-4	Leon Smith	Recommend BLM do an ethnographic study to guide the impact analysis and remove it from all the compensatory mitigation sections throughout the document.	The EIS is able to rely on existing information to inform impact analysis. The consideration of adverse impacts to Japanese American and Minidoka-connected communities and Native American Tribes is addressed at EIS Sections 3.6.1 (Environmental Justice Communities), 3.5 (Cultural Resources and Native American Concerns), and 3.16 (Visual Resources). Regarding ethnographic study, see responses to comments 13000-10 (see in Table A-3g, Cultural Resources and Native American Concerns) and 13008-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
13006-9	Leon Smith	11) If No Action Alternative A is not selected, recommend the DEIS not be finalized until MVE has an agreement in place with the Japanese Americans and Alaskan Natives.	The BLM is consulting with Tribal Nations and the Japanese American and Minidoka-connected communities on resources of concern to each, including regarding significant cultural resources under NHPA Section 106. The BLM is preparing a PA to address these resources under Section 106, with certain Tribal Nations and members of the Japanese American and Minidoka-connected communities participating as consulting parties. As consulting parties, Tribal Nations and organizations representing the Japanese American and Minidoka-connected communities have the opportunity to sign on to the PA as concurring parties. Please note the draft EIS was considered complete on its publication. The BLM has not yet determined whether it will approve the project, approve the project with modifications, or not approve the project, and will not make a decision on these matters until after the PA (see EIS Appendix 8) is signed, and a project ROD is released. The BLM decision on the project will be stated in the ROD. See response to comment 11315-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
13006-21	Leon Smith	12) Recommend BLM incorporates Tribal and cultural/spiritual perspectives into wildlife/cultural impact analysis.	EIS Section 3.5.1 summarizes the connections of Tribal Nations to the project area and acknowledges the traditional cultural and religious importance of resources in the area to these nations and peoples. This specifically includes consideration of natural resources (such as plants, animals, and minerals, or geographic features like buttes and caves) that are spiritually and culturally significant to Tribes. The BLM has further sought the perspectives of Tribes through consultation on the project, as described in EIS Section 3.5.1 and EIS Appendix 10. See the Wildlife (3.18), Vegetation (3.15), and Water and Wetland Resources (3.17) sections of this EIS for how these resource patterns or availability would be changed by the project.
13006-32	Leon Smith	6) Recommend additional information and analysis of the impacts of additional traffic in the area on Tribes and recognition of treaty rights is needed in the DEIS, including on Tribal gathering, fishing, hunting and trapping access.	Potential vehicle traffic related to the project is quantified in Table 2.4-3 and considered for impacts to Tribes and other Environmental Justice Communities as summarized in Table ES-2 (Summary of Project Impacts). Noise levels, as from project-related traffic, and potential noise impacts on environmental justice communities inclusive of Tribes and on cultural resources of importance to Tribes (Native American resources) are analyzed in Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities). See especially the Noise and Traffic sections in EIS Section 3.6.1, which notes that MVE would consult with local planning authorities regarding increased traffic during construction, and specific issues of concern would be identified and addressed in the Road Design, Traffic and Transportation Plan (Appendix J in MVE [2023]). This includes consideration of impacts on how peoples from these communities may use the project area, as under treaty rights and such as for project-local activities such as may include Tribal gathering, fishing, hunting, and trapping access.
13008-1	Scott Hauser	Cultural Impacts In section 5.1.5 the DEIS states, "Although no known Traditional Cultural Properties (TCPs) or traditional use areas occur in the Project study area, it is through this process that any potential Tribal concerns would be brought to light and addressed through the consultation process. It is possible that interested Tribes may include the Confederated Tribes of the Umatilla Indian Reservation (CTUIR), the Shoshone-Bannock Tribes of the Fort Hall Indian Reservation, and other Shoshone-Paiute groups." First, it is well established that the Shoshone and Paiute people frequented this area and have significant traditional ties to the land and its cultural, spiritual, and natural resources. Pursuant to a statement of policy from the Shoshone-Bannock for cultural resources, "[C]ultural resources and heritage is broadly defined, through a holistic perspective that embraces plants, air, water, soil, animals, spirituality and humans, with the relationship existing between them. Cultural resources are highly significant because they directly contribute to the Shoshone and Bannock peoples' unique cultural heritage, for the past and into the future. Simply stated, a cultural resource is any resource of cultural	EIS Section 3.5.1 summarizes the connections of Tribal Nations—the Shoshone and Paiute Peoples specifically—to the project area and acknowledges the traditional cultural and religious—or sacred—importance of resources in the area to these nations and peoples. The policy statement of the Shoshone-Bannock, as quoted in the comment, are further placed in the record with this comment here and are cited in conclusion to the EIS Subsection 3.5.1 (Native American Resources). The BLM, in the EIS, has determined that the project has the potential to result in adverse effects to important Native American resources and that this could include permanent and irreversible impacts. Efforts to minimize and mitigate impact to cultural resources are outlined in EIS Appendix 10; see also EIS Appendix 4 (Mitigation). Additionally, measures to avoid, minimize, and mitigate adverse effect to historic properties of traditional cultural or religious significance to Tribal Nations would be implemented pursuant to a PA under NHPA Section 106, as referenced in EIS Section 3.5. The BLM recognizes

Comment ID	Commenter	Public Comment	Response to Comment
		character, including social institutions, Tribal identity, subsistence practices, beliefs, religious ceremonies and practices, sacred landscapes and objects, medicinal resources and practices, archaeological sites, natural resources and their use, view sheds, intellectual property, oral traditions, language, historical events, documents and structures, and secular and non-secular items." Because this area is so culturally significant and sacred to USRT's member tribes, damage to this area from a significantly sized project like the Lava Ridge Wind Project would cause irreversible harm that no mitigation effort could repair.	that not all adverse effects would be avoidable or can be minimized or that mitigation would repair permanent and irreversible adverse effects.
13024-2	Keith Stone	The foundations will require blasting and equipment that will negatively impact the area's cultural resources, and potentially even our water. As recent as 1985, Baker Cave was discovered just north of Rupert. That discovery contained numerous untouched artifacts from native settlers. There are certainly other, yet undiscovered sites across the area proposed for the project. Allowing the project will impact, and possibly destroy sites.	See response to comment 11915-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
3768-1	Sue Page	The environmental impact studies each express concerns for impact to Wilson Butte Cave. Why?	See response to comment 12988-13 (see in Table A-3f, Climate and Greenhouse Gas Emissions).
3871-1	Jerry Ball	The archeological benefits from leaving this area as its present state outnumber the benefits of development. Is it historically and culturally important to the Shoshone-Bannock tribes? We know it is to the Minidoka National Historic Site. The visual (viewscape) and emotional impact of the proposed project will have an impact on the Historical Site. Visitors to the site will have the eyesore of a massive amount of turbines. Southern Idaho citizens should not have to give up our way of life for industrialization of the landscape on federal land around us. BLM is for the pleasure of the citizens, wildlife within its boundary, tourism and recreation for all not the industrialization for profit of a few. Thus, the site will no longer be what is once was or was intended to be when it was reconstructed to honor the Japanese Community.	EIS Section 3.5.1 identifies that natural and cultural resources of importance to the Shoshone-Bannock Tribes occur in the area of potential effects for the project and Section 3.5.2 provides background on the importance of the Minidoka area to the Japanese American and Minidoka-connected communities. Analysis of effects to Minidoka NHS and Native American resources as historic properties are considered variously throughout EIS Section 3.5. Efforts to minimize and mitigate impact to cultural resources are outlined in EIS Appendix 10; see also EIS Appendix 4 (Mitigation) and EIS Appendix 8 (Cultural Resources Programmatic Agreement). EIS Section 3.12 addresses effects to recreation, and EIS Section 3.18 addresses effects to wildlife.
3998-2	Sue Page	I cannot find any study on the effects to the lava fields, the underground tunes and the aquifer when foundation construction begins. It's my understanding there will be blasting twice a day for over 500 days. 500 days of mini earthquakes in Volcanic Geographical Axial sounds ridiculous. What do you think, that much earth disruption will have to Wilson Butte Cave? To the shifting soil? What about the artifacts still being gleaned from the Snake River Plain?	Methods to avoid impacting resources during blasting are outlined in EIS Appendix 4, Table App4-2i (Noise and Blasting), and blasting is further addressed in the Blasting Plan Methodology (Appendix I in MVE [2023]). The BLM received numerous comments on the draft EIS related to the aquifer, and impacts to the aquifer and groundwater quality are addressed in EIS Section 3.17 (Water and Wetland Resources) in the final EIS. See also AIB-30 (re: earthquakes), AIB-31 (re: surface geology and collapse/subsidence), and AIB-49 (re: aquifer) in EIS Appendix 3. EIS Section 3.13 (Soils) addresses project impacts to sensitive soils, soil health, and plant growth material quantity and quality in detail. As noted in EIS Section 3.5 (Cultural Resources), archaeological sites (which may be composed of cultural resource artifacts) may provide further information to researchers that could make these archaeological sites eligible for the NRHP if that information is able to further the understanding of history, including the history of the Snake River Plain. Typically, that information would importantly provide added insights on past human lifeways in the area. See response to comment 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns).
5332-2	Marilyn Broek	State Historical Preservation Office. Before any dirt can be turned on State of Idaho land our State Historical Preservation Office must do a study and report. They have the duty to prevent projects ruining forever our archeological treasures. I saw no report from this office included in the draft EIS. This office is dedicated and has teeth. Where is this study? If it has not yet been done, why not. A timely use of this requirement can change permitting requirements or completely eliminate the project plan. Where is the SHPO report?	The BLM is the lead federal agency reviewing the project on BLM public lands and is consulting with the State of Idaho on the project regarding state land concerns, and with the state historic preservation officer specifically on cultural resources concerns across the geographical analysis area of the project. This consultation is intended to conclude with the implementation of a PA pursuant to NHPA Section 106, to which SHPO is expected to be a signatory, which would include stipulation on how significant cultural resources such as NRHP-eligible archaeological sites would be identified, evaluated, and adverse effects to them avoided, minimized, or mitigated in continued BLM consultation with SHPO and other consulting parties. This PA and its stipulations are to be in place and to begin implementation prior to any project development proceeding. The BLM would have cultural resources identification reports prepared pursuant to the PA and prior to project construction, which would be submitted for SHPO review and concurrence. That reporting would inform the avoidance, minimization, and mitigation of adverse effects from the project on NRHP-eligible cultural resources.
5896-13	Mike Tylka	I and many others like me have discovered artifacts and locations unknown by official government entities that are cultural treasures and we may or may not choose to share that knowledge. This area probably contains more locations that are unknown and should continue to stay that way. A fire in the area around Mesa Verde National Monument several years ago in Colorado proved that to be true. The north side of the Snake River plain was also used by emigrants traveling to the west over a century ago and this area of forage for animals extended well beyond the canyon rim.	Regarding the identification of cultural resources in the geographic analysis area for the project, see response to comment 11198-2 (see in Table A-3g, Cultural Resources and Native American Concerns). Additionally, the PA being developed by the BLM pursuant to NHPA Section 106 addresses the treatment of unanticipated post-review discoveries of cultural resources.
6511-5	Kelly Varelmann	There are over 4,000 cultural resource sites within the proposed project area. Decimation of this area will undermine the sacred history and interests of both Native Americans and Japanese Americans.	Appendix 9 (Cultural Resources Potentially Affected by the Action Alternatives) of EIS Appendix 8 summarizes cultural resources within the physical and non-physical APE for the project per action alternative. The EIS analysis at Section 3.5 has concluded that action alternatives for the project would result in potential adverse effects to cultural resources, including those of importance to Native Americans and the Japanese American and Minidoka-connected communities. However, the BLM would take reasonable actions to avoid, minimize, and mitigate impacts should it approve any action alternative pursuant to this EIS and a PA under NHPA Section 106. The project would be located on public land and is subject to Section 106 of the NHPA and its implementing regulations (36 CFR 800). As the lead agency for the project, the BLM is required to consider effects on cultural resources from the project undertaking. These considerations include consultations, identification of cultural resources, assessment of impacts, and avoidance, minimization, or mitigation of adverse effects. The BLM is

Comment ID	Commenter	Public Comment	Response to Comment
			developing a PA to establish a mechanism to address cultural resource identification prior to the undertaking. For more detail, refer to EIS Section 3.5.
6818-1	Don Davies	When projects like Lava Ridge occur, though, they need to be sensitive to the areas where they are being sited, and they need to give back to the local community in a meaninful and durable way. To this end, I would like to make two suggestions: 1) Lava Ridge Towers should be located away from and out of site of the Minidoka National Historical Site. 2) An educational and outreach center that explains the project, it's contribution to fighting climate change, as well as helping to preserve and tell the historical story of the area would be suggested. A re-building of the Greenwood School at 2398 East 990 South, near Hazelton, ID could be a meaninful preservation of local history and heritage, and a unique opportunity for where such a center could be located.	The BLM is contemplating action alternatives that would locate project turbines outside of Minidoka NHS and anticipates that the BLM preferred alternative will locate all project turbines outside of the larger Minidoka WRC. Mitigation measures for adverse effects that would potentially result at Minidoka and that would return meaningful value to the public are contemplated in the EIS, such as at Section 3.5.5.4, and would be further pursued by the BLM under a PA completing the NHPA Section 106 process and associated HPMP and HPTPs. The BLM will contemplate the commentor's proposed mitigation measures, and whether to include them wholly or partially or not, in completing this process.
8256-2	Sue Page	4. Several Native American Tribes hold this area as spiritual with significant cultural resources all protected by the Tribes Treaty Rights. The Upper Snake River Tribes (USRT) Foundation is composed of four Indian tribes of the Upper Snake River region in Idaho, Nevada, and Oregon: the Burns Paiute Tribe, Fort McDermitt Paiute-Shoshone Tribe, Shoshone-Bannock Tribes of the Fort Hall Reservation, and Shoshone-Paiute Tribes of the Duck Valley Reservation.	As described in EIS Appendix 10 (Agency and Public Involvement, Consultation and Coordination, Environmental Impact Statement Literature Cited, and Preparers), the BLM has invited Tribal Nations with traditional connections to the project area to consult on the project, including on significant cultural resources under NHPA Section 106. This includes members of the Upper Snake River Tribes Foundations listed in the comment.
8639-2	Mark Southwick	What about, for example, the Kelton Freight Line Trail, as I understand it, it went through Lincoln County entering at or near Star Lake (Draft Horse watering site) and proceeded north between Dietrich Crater and Dietrich Butte, crossing the Little Wood River near Marley road and proceeding through the Cottonwood slough area. How many other roads, Native American sites, pioneer trails and historic areas are in the proposed area? During construction will the project identify, protect and properly deal with the discovery of such areas or simply hide or ignore them. Though not actively mapped, these sites do exist.	The Kelton Road is considered Site Number 10CA0966/10TF1830 in Appendix 6 of EIS Appendix 8, identified as a historic property that would potentially undergo visual impacts from the project placing turbines on landscape within view of, but away from, this cultural resource. Appendix 6 of EIS Appendix 8 provides a list of previously recorded cultural resources in the project area and its surroundings that could be physically or non-physically (e.g., visually) impacted by the project, per action alternative. The project would be located on public land and is subject to Section 106 of the NHPA and its implementing regulations (36 CFR 800). As the lead agency for the project, the BLM is required to consider effects on cultural resources from the project undertaking. These considerations include consultations, identification of cultural resources, assessment of impacts, and avoidance, minimization, or mitigation of adverse effects. The BLM is developing a PA to establish a mechanism to address cultural resource identification prior to the undertaking. For more detail, refer to EIS Section 3.5.
8790-8	James Ritchie	7. Without positively denoting the location of the turbines it is impossible to gauge the effect on the Wilson Butte Cave and other Native American sites as well as the Minidoka historic site.	EIS Section 3.5 (Cultural Resources) analyzes the effects of the project, including from turbines, on Wilson Butte Cave and other Native American sites, as well as Minidoka NHS and WRC. The analysis considers siting corridors where turbines may be placed under each action alternative and reasonable scenarios for physical and non-physical (e.g., visual, audible) impacts that could occur to cultural resources in relation to turbine and other project actions in these siting corridors.
9080-11	The Coalition to Protect America's National Parks	1. BLM Idaho has never fulfilled its responsibility under the National Historic Preservation Act (NHPA)10 to consider the eligibility of the 33,000-acre Minidoka War Relocation Center (WRC) for listing on the National Register of Historic Places (NRHP) – Federal agency responsibility for considering the eligibility of historic properties for listing on the NRHP is well established. As described in BLM National Training Center's "Brief and Selective Summary by Section"11 of the NHPA: Section 110(a)(2) of the NHPA directs each Federal agency to establish a preservation program to identify, evaluate, nominate, and protect historic properties that are eligible for the National Register. The agency shall ensure that such properties "as are listed or may be eligible for the National Register are managed and maintained in a way that considers the preservation of their historic, archeological, architectural, and cultural values in compliance with Section 106 of this Act. This section also directs that "preservation of properties not under the jurisdiction or control of the agency, but subject to be potentially affected by agency actions are given full consideration in planning. (Emphasis added) The provisions of Section 110 are proactive, not reactive, and are reinforced in the Secretary of the Interior's Standards for Federal Agency Historic Preservation Programs.12 Specifically, Standards 2 and 3 state the following (emphasis added to underlined sections): • Standard 2. An agency provides for the timely identification and evaluation of historic properties under agency jurisdiction or control and/or subject to effect by agency actions. (Sec. 110(a)(2)(A), and sec. 112) • Standard 3. An agency nominates historic properties under the agency's jurisdiction or control to the National Register of Historic Places. (Sec. 110(a)(2)(A)). These responsibilities are acknowledged in the 1986 Monument RMP (p. 41), which states: The Bureau of Land Management is required to identify, evaluate, and protect cultural resources on public lands under its jurisdiction and to ensure the Bureau-initiated or Bureau-authorized actions do not inadvertently harm or destroy non-federal cultural resources. These requirements are mandated by the Antiquities Act of 1906, the Reservoir Salvage Act of 1960 as amended by P.L. 933-191, the National Environmental Policy Act of 1969, Executive Order 11593 (1971), the Archaeological Resources Protection Act of 1979, and Section 202 of the Federal Land Policy and Management Act of 1976. (Emphasis added) Similarly, on a project-by-project basis, the Advisory Council on Historic Preservation (ACHP) guidance on "Meeting the 'Reasonable and Good Faith' Identification Standard in Section 106 Review" 13 states: The regulations implementing Section 106 of the National Historic Preservation Act ("Protection of Historic Properties," 36 CFR Part 800) require federal agencies to identify historic properties within the Area of Potential Effects (APE) that may be affected by their undertakings. Section 800.4(b)(1) of these regulations states that federal agency officials shall make a "reasonable and good faith effort" to identify historic properties. (Emphasis added)	The BLM is meeting all program and resource management planning requirements under the NHPA, NEPA, and FLPMA, as well as other laws, in advance of the current project. This includes Section 110 of the NHPA. The BLM has applied and continues to follow its preservation program pursuant to Section 110 and the guidance of BLM's established 8100 series manuals and handbooks for managing cultural resources. The BLM is diligently and in good faith proceeding with NEPA, NHPA, and other regulatory processes as relates to the project. The BLM's current NEPA and NHPA review and analysis of the project further represent appropriate steps that the BLM is taking for historic preservation, including as relates to Minidoka NHS and WRC (see EIS Section 3.5). The BLM will continue to plan for and consult on the avoidance, minimization, and mitigation of adverse effects to historic properties from the project, including at Minidoka NHS.
9080-12	The Coalition to Protect America's National Parks	However, it appears that BLM has never given consideration to the potential eligibility of the 33,000-acre Minidoka WRC as a whole for listing on the NRHP. The 1986 Monument RMP made no mention of the site. Most recently, Appendix 9 of the DEIS, titled "Cultural Resources Potentially Affected by the Action Alternatives,"	The Minidoka WRC is addressed variously throughout EIS Section 3.5 (Cultural Resources), especially within Section 3.5.2, as well as within EIS Section 3.19 (Minidoka National Historic Site Interpretive Purpose). See response to comment 90809-11, above, and see response to comment 12859-2 (see in Table A-3h,

Comment ID	Commenter	Public Comment	Response to Comment
		identifies over 5,600 individual “sites” that may or may not be eligible for listing on the NRHP. However, the WRC is notably missing from the appendix. In our experience, given the historical significance of the World War II era Minidoka WRC, the entire WRC is an obvious candidate for listing on the NRHP as either one or both of the following: • A “rural historic landscape,” which is described in National Register Bulletin 3014 as: The rural historic landscape is one of the categories of property qualifying for listing in the National Register as a historic site or district. For the purposes of the National Register, a rural historic landscape is defined as a geographical area that historically has been used by people, or shaped or modified by human activity, occupancy, or intervention, and that possesses a significant concentration, linkage, or continuity of areas of land use, vegetation, buildings and structures, roads and waterways, and natural features. Rural landscapes commonly reflect the day-to-day occupational activities of people engaged in traditional work such as mining, fishing, and various types of agriculture. Often, they have developed and evolved in response to both the forces of nature and the pragmatic need to make a living. Landscapes small in size and having no buildings or structures, such as an experimental orchard, are classified as sites. Most, however, being extensive in acreage and containing a number of buildings, sites, and structures--such as a ranch or farming community--are classified as historic districts. (Emphasis added) And/or as: • A “traditional cultural property,” which is described in National Register Bulletin 3815 as: The traditional cultural significance of a historic property [] is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. A traditional cultural property [] can be defined generally as one that is eligible for inclusion in the National Register because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community. (Emphasis added) Either of the above designations would be particularly appropriate for the Minidoka WRC in its entirety. The historical significance and potential eligibility of Minidoka WRC for listing on the NRHP has been known for decades. An initial 6-acre portion of the WRC was listed on the NRHP as long ago as 1979.16 The Nomination Form acknowledged that “[t]he property being nominated was only a small part of the Minidoka Relocation Center.” (Emphasis added) Over two decades later, on January 17, 2001, a larger 72.75 acres portion of Minidoka WRC was designated as Minidoka Internment National Monument making the site the 385th unit of the national park system. On May 8, 2008, the U.S. Congress expanded the park unit to 388 acres by passing Public Law 110-229, which changed the name to Minidoka National Historic Site and added the Bainbridge Island Japanese American Memorial in Washington State to the national park unit.	Environmental Justice and Socioeconomics) regarding BLM consideration of Minidoka WRC as a TCP and within an ACEC.
9080-13	The Coalition to Protect America’s National Parks	We understand that the Friends of Minidoka submitted a TCP study to BLM Idaho in December 2022 and BLM has acknowledged the proposal in the DEIS. However, our point is that it is an affirmative responsibility of the Bureau, not stakeholders, under Section 110 to “identify, evaluate, and protect cultural resources on public lands under its jurisdiction.” The fact remains that BLM Idaho has never considered the potential eligibility or submitted a nomination for the 33,000-acre WRC to be listed on the NRHP as required under Section 110 of the NHPA. That fact is confirmed by the notable absence of the 33,000-acre WRC in Appendix 9 of the DEIS. Instead, BLM is now entertaining a proposed action (Alternative B) in which “[t]he nearest wind turbine would be set back over 0.5 miles from the Minidoka NHS boundary and 1.7 miles from the Minidoka NHS Visitor Center (KOP 1) in the project layout design.” (DEIS p. 167) In addition, Alternative B’s “siting corridors would overlap 4,818 acres (8 square miles) of Minidoka WRC.” (DEIS p. 168) If BLM had instituted an effective “preservation program to identify, evaluate, nominate, and protect historic properties that are eligible for the National Register” as required un Section 110(a)(2), BLM would have known the WRC (not just the NHS) is potentially historically significant; and proactively determined whether it is eligible for listing on the NRHP. Depending upon that determination, BLM could or should have taken appropriate steps to manage and protect the WRC from the impacts of major development (e.g., through setbacks or exclusions zones) well before MVE submitted its current Project proposal. In our view, BLM’s failure to proactively address its Section 110 responsibilities is the root cause for the current situation.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) as well as to 9080-11 and 9080-12 above.
9080-14	The Coalition to Protect America’s National Parks	2. The DEIS description of the Traditional Cultural Property (TCP) proposed by Japanese- American groups is factually incorrect and any BLM decision based on that inaccuracy would have dire consequences for historic properties within the actual proposed TCP area – In December 2022, Algonquin Consultants, Inc. completed a TCP study titled “A Landscape of Isolation: A Traditional Cultural Property Study of the Minidoka Concentration Camp and its Viewsheds”19 that was submitted to BLM on behalf of the Friends of Minidoka.20 Whereas Minidoka WRC comprises approximately 33,000 acres of the Project area, the TCP proposal described in the study would be considerably larger than the just the footprint of the WRC. See Figure 25, page 40, in the study, which is shown below. [map] In contrast, p. 3-157 of the DEIS describes the TCP proposal as follows: Those Japanese Americans consulting on the project have asked that Minidoka WRC, inclusive of Minidoka NHS, be considered a TCP. As a result, the BLM is treating [only the] Minidoka WRC as a TCP, historically associated with the Japanese American communities. In accordance with National Register Bulletin 38 (NPS 1998), this Japanese American TCP would be NRHP-eligible because of its association with cultural practices and beliefs of a living community that a) are rooted in that community's history and b) are important in maintaining the continuing cultural identity of the community. Minidoka WRC retains the integrity of relationship between a property and the beliefs or practices that give it significance as a TCP. Minidoka WRC, as a TCP, retains its historical condition (e.g., setting, feeling, association), as expressed by the Japanese American communities and which could be impacted by the project. (Emphasis added) In brief, BLM’s description of the TCP proposal as being limited to the 33,000-acre footprint of the WRC is much smaller than what was actually indicated in the TCP study’s Figure 25 on page 40. As a result, BLM should revise its description of the proposed TCP in the DEIS so it accurately reflects the actual size of the TCP proposal as submitted. Any BLM decision about the	See responses to comments 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) and 11985-1 (see in Table A-3g, Cultural Resources and Native American Concerns), as well as 9080-11 above.

Comment ID	Commenter	Public Comment	Response to Comment
		Project or the TCP proposal itself should be based on the corrected description, not the faulty assumption that the proposed TCP would be limited to the footprint of the WRC. Lastly, the 1986 Monument Resources Management Plan (RMP)21 provides guidance to the SFO in the event that a project site is "determined to be of significant value; [or] eligible for or on the National Register of Historic Places." (Emphasis added) Specifically, p. 42 of the RMP states: Cultural resource values discovered in a proposed work area will be protected by adhering to the following methods: 1) Redesigning or relocating the project; 2) Salvaging, through scientific methods, the cultural resource values pursuant to the SHPO agreement; 3) Should the site be determined to be of significant value; eligible for or on the National Register of Historic Places; and/or the above mentioned methods are not considered adequate, the project will be abandoned." (Emphasis added) Given the likelihood that the proposed TCP is eligible for listing on the NRHP, BLM should "abandon the project" and deny MVE's ROW grant application.	
9080-17	The Coalition to Protect America's National Parks	As described in multiple places in the DEIS, BLM's primary "strategy" for protecting cultural resources, in general, is to focus on avoiding physical impacts to significant cultural sites by imposing a minimal "setback" (e.g., 0.5 miles from the boundary of Minidoka NHS or 1 mile from Wilson Butte Cave under Alternative B) for wind turbine installation. BLM's focus on avoiding primarily adverse physical effects to cultural sites in the Project area is ineffectual at protecting visual resources and related scenic values from the perspective of these important historical and cultural sites. The adverse effects to visual resources that are of concern are inherently non-physical effects, not physical. While minimal setbacks may prevent ground disturbance or other direct physical impacts in the immediate vicinity of (i.e., literally on top of) specific cultural resources, they offer little, if any, effective protection to the culturally significant landscape views as seen from Minidoka NHS, the WRC, or Wilson Butte Cave.	As described in Section 3.5 (Cultural Resources), the BLM consideration of alternatives providing increased distances for project turbines from those historic properties that would be adversely affected by visual impacts would be effective in reducing visual adverse effects, including for Minidoka NHS and Wilson Butte Cave. Additionally, see Cultural Resources section 3.5.5 (Non-physical Impacts) and Table App4-2 in EIS Appendix 4 regarding MVE's applicant-committed measures, required mitigation measures, and additional measures that would be implemented, supporting the avoidance and minimization of non-physical impacts to cultural resources. The avoidance, minimization, and mitigation of adverse effects to historic properties such as Minidoka NHS and Wilson Butte Cave are further being addressed by the BLM through a PA and Historic Properties Management Plan as stated in the EIS.
9080-43	The Coalition to Protect America's National Parks	C. Section 3.5.3 Minidoka War Relocation Center and Minidoka National Historic Site (pp. 3-154 thru 3-158) – See General Comment 2 above. By citing comments and concerns expressed by the Japanese American community and the National Park Service, this section of the DEIS contains a detailed description of the significance of Minidoka NHS and the importance of protecting not only its resources and values but also its isolated setting. However, p. 3-157 contains a factual inaccuracy related to the Japanese American community's request that the area be considered a Traditional Cultural Property (TCP) under the NHPA. The DEIS states that "[t]hose Japanese Americans consulting on the project have asked that Minidoka WRC, inclusive of Minidoka NHS, be considered a TCP. As a result, the BLM is treating Minidoka WRC as a TCP, historically associated with the Japanese American communities." (Emphasis added) The DEIS incorrectly states the proposed TCP would be limited to the footprint of the WRC, which comprises approximately 33,000 acres of the Project area. In reality, the proposed TCP would be considerably larger than the footprint of the WRC. See Figure 25, page 40, in the TCP study.54 As a result, we ask that BLM revise its description of the proposed TCP so that it accurately reflects the actual size of the TCP proposal as submitted. Any BLM decision about the project should be based on the corrected description, not the faulty assumption that the proposed TCP is limited to the footprint of the WRC.	See responses to comments 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) and 11985-1 (see in Table A-3g, Cultural Resources and Native American Concerns).
9080-44	The Coalition to Protect America's National Parks	D. Section 3.5.4 Programmatic Agreement (pp. 3-158 and 3-159) – Page 3-158, near the bottom, contains a misleading statement that "[t]he BLM will prioritize avoidance of adverse effects to historic properties." (Emphasis added) As described throughout the impact analyses in Section 3.5, it is clear that BLM will only seek to "avoid" adverse physical effects to cultural resources; but not the many adverse effects that are non-physical, such as visual resource and noise impacts. For example, see Section 3.5.5.2.2 (pp. 3-167 and 3-168) regarding the impacts of Alternative B, the Proposed Action, where the DEIS states: Alternative B was sited to avoid physical effects to Minidoka NHS and Wilson Butte Cave, which are NRHP-listed cultural resources. The nearest wind turbine would be set back over 0.5 mile from the Minidoka NHS boundary and 1.7 miles from the Minidoka NHS Visitor Center (KOP 1) in the project layout design… Alternative B siting corridors would overlap 4,818 acres (8 square miles) of Minidoka WRC, which would result in a greater potential for physical impacts to cultural resources within and associated with Minidoka WRC than Alternative C, D, or E. (Emphasis added) Stating the obvious, while a 0.5 mile setback of multiple 740-ft tall wind turbines from the Minidoka NHS boundary may prevent physical effects within the NHS boundary, it does not "avoid" (or prevent) all adverse effects to the NHS. The proposed action, and the other action alternatives to a lesser extent, would undoubtedly result in significant, albeit non-physical, visual impacts. We cite this information here as an example of how inaccurate BLM's statement is about "prioritizing avoidance of adverse effects to historic properties" such as Minidoka NHS. We therefor ask that BLM revise its statement so that it accurately reflects what BLM is actually proposing to do in the DEIS, which is to avoid (only) adverse physical effects to historic properties while addressing nonphysical adverse effects to a lesser degree through some other form or level of mitigation.	The BLM has fully disclosed in the EIS (see Section 3.5) that the project is anticipated to have unavoidable visual adverse effects on historic properties due to the scale and nature of project elements. The BLM has analyzed a reasonable range of alternatives, including alternatives that would avoid adverse effects (physical and non-physical) to some historic properties in the area of potential effects for the project. As described in the FEIS, not all historic properties in the area of potential effect would be adversely affected. At historic properties that would be adversely affected, the adverse effect may be minimized at the historic property and/or require further mitigation depending on the action alternative (as analyzed in Section 3.5). The BLM does seek first to avoid, then to minimize, and where necessary mitigate adverse effects to historic properties.
9080-59	The Coalition to Protect America's National Parks	6. APPENDIX 9. Cultural Resources Potentially Affected by the Action Alternatives – The appendix identifies over 5,600 individual cultural "sites" that may or may not be eligible for listing on the NRHP. However, the 33,000-acre Minidoka War Relocation Center (WRC) is notably missing from the appendix. Given the well-known history of the WRC, a small portion of which was listed on the NRHP as long ago as 1979, BLM should have previously and proactively evaluated the eligibility of the entire WRC for listing on the NRHP in accordance the Secretary of the Interior's Standards for Federal Agency Historic Preservation Programs,72 specifically Standards 2 and 3. which state the following: • Standard 2. An agency provides for the timely identification and evaluation of historic properties under agency jurisdiction or control and/or subject to effect by agency actions. (Sec. 110(a)(2)(A), and sec. 112) • Standard 3. An agency nominates historic properties under the agency's jurisdiction or control to the	See response to comment 11305-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) and related responses to comments 11622-4 (see in Table A-3g, Cultural Resources and Native American Concerns) and 1052-1 (see in Table A-3q, Minidoka War Relocation Center and Minidoka National Historic Site) cited there.

Comment ID	Commenter	Public Comment	Response to Comment
		National Register of Historic Places. . (Sec. 110(a)(2)(A)). (Emphasis added) In addition, under Section 106 of the NHPA BLM is required to "identify historic properties within the Area of Potential Effects (APE) that may be affected by their undertakings." In this case, the undertaking is the LRWP. Yet the WRC is not on the list of potentially eligible sites identified in Appendix 9, despite the fact that the 33,000-acre WRC appears to be eligible for listing as either a "rural historic landscape," as described in National Register Bulletin 3074; or as a "traditional cultural property," as described in National Register Bulletin 38.75 BLM should have conducted such an evaluation of the WRC as part of this planning process, if not before. See General Comment 1 above for additional information on this concern.	
9325-2	Saya Moriyasu	This area is a very important site for US history and respecting the Shoshone nation. President Biden has promised to "advance equity and environmental justice." Minidoka needs to be protected as a place for healing and education. The 73,000 acres on BLM lands are public lands and should serve the greatest good for our citizens. Having 400 large turbines surrounding Minidoka is NOT acceptable.	The importance of the area to the Shoshone peoples and Tribal Nations is recognized in EIS Section 3.5, particularly EIS Section 3.5.1 (Native American Resources). Section 3.5 also considers potential project impacts to the cultural resource values of Minidoka NHS–associated sites and landscapes and how those impacts would be treated. Please note that not all portions of the geographic analysis areas in the EIS are public or BLM public lands and not all places in the analyses areas, as described in the EIS, would have views of turbines in their surroundings.

Environmental Justice and Socioeconomics

Table A-3h. Environmental Justice and Socioeconomics

1042-16	WildLands Defense	[How much will it cost for the wind developer to buy out all homes and private property adversely impacted by the visual effects and/or noise of the turbines? This amount must be set aside in a bond for the project. Why isn't this major industrial intrusion into neighboring areas considered a "taking"].	See response to comment 13006-35 (see in Table A-3h, Environmental Justice and Socioeconomics).
1042-31	WildLands Defense	Magic Valley Energy's preliminary estimates from 2021 say that the construction phase will generate $80 million in tax revenue for the surrounding taxing districts and, once operational, revenues of nearly $4 million annually for schools, roads, cemeteries and fire districts in Jerome, Lincoln and Minidoka counties. [What is the economic value of all the NEGATIVE effects of the project? How much will home and property values be lowered, recreation opportunities lost? What will be the costs of dealing with health harms of industrial wind and turbine noise and other assaults on human mental and physical health?	Quantifying the monetary costs and benefits for all resource effects (e.g., negative health effects or effects on community services) is not feasible, nor is it required for NEPA. The BLM analyzes the impacts associated with the alternatives using the best available information and most appropriate impact indicators within the context of each resource chapter, which is typically not monetized estimates of benefits or costs. Additionally, CEQ NEPA regulations at 40 CFR 1502, Subpart 1502.22, specifically provide that BLM need not display the weighing of the merits and drawbacks of the various alternatives in a monetary cost-benefit analysis and should not do so when there are important qualitative considerations. In accordance with CEQ's NEPA regulations, the BLM analyzed the potential effects of the Proposed Action and alternatives on several different resource topics identified through internal and external scoping including but not limited to natural resources, cultural and historic sources, and socioeconomics. With respect to the economy, the BLM analyzed the potential economic effects of the project in EIS Section 3.6 (Environmental Justice and Socioeconomics). The BLM will make a reasoned choice among the alternatives based on the EIS analysis for all resources, and the BLM cannot determine significance for a proposed action based on economic effects alone.
10500-1	Nancy	This will not bring jobs to the area. People will come to install them and then will leave. This will not grow the economy.	See response to comment 11873-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
11204-16	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	C. The 2022 Comments discuss financial mitigation and related compensation values that MVE should pay to Permittees should: BLM consider, assess, and/or implement any decrease in the Permitted Use AUMs within the Star Lake Allotment during any phase of the wind project due in whole or part to the effects of the wind project; AUMs be lost or displaced during the construction phases of the proposed Project; AUMs be disrupted or eliminated during the postconstruction rehabilitation and/or operation phases of the proposed Project; and, any fire event occur due to Project-related activities during the construction and/or operation phases (including the rehabilitation phase). See 2022 Comments, pgs. 10-11. The DEIS does not address financial mitigation in terms of specific compensation values related to these issues. See also the sub-section above. Permittees stand by their 2022 Comments that should BLM consider, assess, and/or implement any decrease in the Permitted Use AUMs within the Star Lake Allotment during any phase of the Project due in whole or part to the effects of the Project, MVE should pay compensation to the Permittees in an amount that is 2.5 times the Full Market Value (FMV) of each decreased AUM upon implementation of any such decrease, with the FMV determined by mutual agreement between MVE and the Permittees, or in the alternative, by binding, arbitration, not subject to appeal / challenge by any party. See 2022 Comments, pg. 10. Permittees stand by their 2022 Comments that should their AUMs be temporarily lost or displaced, in whole or in	See response to comment 11204-38 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		part, during the construction phases of the proposed Project, MVE should pay compensation to the Permittees in an amount of $100 per AUM annually for each AUM temporarily lost or displaced during the construction phases. Likewise, should the Permittees' AUMs be permanently disrupted or eliminated during the postconstruction rehabilitation and/or operation phases of the proposed Project, MVE should pay compensation to the Permittees in an amount of $100 per AUM annually for each AUM that is permanently disrupted or eliminated due to Project-related activities. See 2022 Comments, pg.10. However, the compensation values discussed in the 2022 Comments and summarized above need to be subject to inflation adjustments for implementation in future years. U.S. inflation rates for the 10-year period from 2013 through 2022 averaged 2.63% with significantly higher inflation rates in recent years, i.e., 7% in 2021 and 6.5% in 2022 (see Attachment #9, Chart: United States Annual Inflation Rates (2013 to 2023)). Thus, the Permittees contend that it is necessary and reasonable to apply inflation adjustments to the 2022 compensation values discussed above based upon the actual annual inflation rates published at www.usinflationcalculator.com/inflation/current-inflation-rates for each year after 2022 (or in the alternative, based upon a projected average annual inflation rate of 4.5%). This inflation adjustment is particularly warranted given the timespan of this project could be 84 years, according to the DEIS at page 3-57. Finally, the Permittees stand by their 2022 Comments that should any fire event occur due to Project- related activities, MVE should pay compensation to the Permittees for any fire related losses incurred.9	
11204-35	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	X. Need to evaluate socio-economic losses due to impacts on local ranching operations. See 2021 Comments, pg. 16. The 2021 Comments expressed comments at pg. 16 that the proposed Project would result in socio-economic losses due to impacts on local ranching operations related to: (1) the gross annual income generated from the Permittees to support local, regional, and national economies; (2) the gross annual property taxes paid by the Permittees based upon their base properties and upon other private land; and (3) the workforce employed by the Permittees (at least 57 full-time and parttime employees annually).	See response to comment 11204-38 (see in Table A-3h, Environmental Justice and Socioeconomics).
11204-37	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	B. Socio-economic Damages Attributed to the Proposed Project Summary: The DEIS downplays or ignores potential socio-economic damages to the local economy from the proposed Project In contrast, the DEIS appears to trivialize and downplay the potential socio-economic damages that would result from the proposed Project by reporting nominally small percentage changes and by avoiding attaching any dollar values to the potential damages. For example, DEIS Table ES-2 (Summary of Project Impacts at pg. ES-xix) concludes that "AUM reductions for individual grazing allotments would range from 0% to 34.9% of the active AUMs" during construction, and "would range from 0% to 1.3% of the active AUMs" during operation. This summary goes on to conclude that since "some areas would not be reclaimed or have limited reclamation potential, an estimated 231 AUMs (0.4% of the active AUMs) would be permanently lost." DEIS, pg. ES-xix. These claims appear to be at odds with the DEIS reports elsewhere. The DEIS further trivializes the potential socio-economic damages with respect to the livestock grazing sector due to these AUM reductions by simply concluding: Reduced income, profitability, and economic stability for grazing permittees in nine grazing allotments due to temporary and long term animal unit month (AUM) reductions could affect the broader livestock grazing community. DEIS, Table ES-2, pg. ES-xix. The DEIS reports other potential negative socio-economic impacts in even more vague terms without attaching any numeric values whatsoever. For example, with respect to potential impacts of the proposed Project to property values, the DEIS concludes: Potential decrease in residential property value due to the proximity and visibility of wind turbines for residences in the immediate foreground (0–2 miles) and foreground (2–10 miles) of the siting corridors; however, the likelihood or degree to which this may occur cannot be predicted with any certainty. DEIS, Table ES-2, pg. ES-xix. Because the DEIS reports the purported socio-economic benefits of the Project in terms of the dollar values that such benefits are expected to generate, but fails to report the potential socio-economic damages in terms of dollar values lost, it is impossible to formulate an overall conclusion regarding the net socio-economic impact of any of the action alternatives in comparison to one another, or in comparison to the no action alternative. This deficiency in the DEIS needs to be corrected.	See response to comment 11204-38 (see in Table A-3h, Environmental Justice and Socioeconomics).
11204-38	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	C. Socio-economic Analysis Related to the Ranching/Farming Sector Permittees anticipated that the proposed Project would impact the socio-economic situation of the ranching/farming sector by changing: • the gross annual income generated from this sector to support local, regional, and national economies; • the gross annual property taxes paid by this sector based upon their base properties and upon other private land; and • the workforce employed by this sector. (2021 Comments, pg. 16). In contrast, the DEIS essentially only evaluates impacts to the socio-economic situation of the ranching / farming sector based upon the potential of the proposed Project to temporarily reduce or permanently eliminate livestock AUMs and thereby alter the annual income generated from this sector. The DEIS fails to attach a dollar value to such potential AUM reductions and permanent losses. The DEIS reports extensively upon the new tax revenues that are projected to be generated by the proposed Project, but fails to address any loss of tax revenues from other sectors that may be impacted by the Project. It seems unrealistic to assume that the Project will have no impact on tax revenues generated by other sectors, including the ranching/farming sector. Socio-economic Analysis Related to Property Values and Property Taxes The DEIS acknowledges that the proposed Project is likely to reduce property values in the surrounding areas, but fails to put any dollar value on these reductions (due to purported uncertainty). Similarly, the DEIS fails to project how such property value reductions might impact long-term property taxes in the region. To this end, what is damning as to each of these points is that, while acknowledging the likelihood of reductions in property values, the DEIS fails to consider and assess how it will require the applicant to mitigate such reductions and related losses. The	EIS Section 3.9 (Livestock) has been revised to include additional context and discussion regarding the anticipated AUM reductions for individual permittees and how they would affect those permittee's overall grazing operations in terms of available forage and anticipated changes to stocking rates and AUM active usage. The project-related effects to AUMs and forage availability are not expected to warrant any permit reductions, which are outside the scope of this NEPA analysis. As stated in Section 3.9.1.2.2, project-related effects to livestock grazing would be minimized and mitigated through various applicant-committed measures and mitigation required by BLM policy (see Tables App4-2 and App4-3 in EIS Appendix 4), as well as project-specific mitigation measures that the BLM would apply to the action alternatives related to invasive species control and prevention. The BLM is not required to incorporate compensatory mitigation measures (e.g., sch as payments to permittees) if other forms of mitigation can sufficiently bring impacts below the level of significance. Also see responses to comments 1042-31 and 11873-6 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		DEIS needs to provide mitigation to compensate the Permittees for any reductions to their property values that result from Project-related infrastructure and activities should the proposed Project be authorized and they sell such property thereafter. The DEIS also needs to provide mitigation that MVE will be required to compensate the Permittees upon such property sale(s) for any incremental costs for property appraisal(s) that are incurred to establish the reduction in property value attributable to authorization (and subsequent implementation) of the proposed Project compared to property values that would have been realized in the absence of the Project. Socio-economic Analysis Related to Workforce Employment With respect to workforce employment, the DEIS reports extensively upon new jobs that would be created during construction, operation, and decommissioning of the proposed Project, but fails to report upon jobs that would potentially be lost in other sectors due to the proposed Project. Instead, the DEIS implies that no such job losses in other sectors would occur, claiming that because the proposed Project requires "a relatively specialized construction workforce and to provide a conservative assessment of employment and related impacts, this analysis assumed all workers would be non-local, and unemployment in the analysis area would remain unchanged" (DEIS, pg. 3-220, bold emphasis added). DEIS Table 3.6-5 also concludes that "unemployment in the analysis area would remain unchanged" under each of the action alternatives (DEIS, pg. 3-221). To the extent the DEIS anticipates that there will be temporary AUM reductions and permanent AUM eliminations associated with each of the action alternatives for the proposed Project, it is reasonable to anticipate that there will be commensurate temporary reductions or permanent eliminations within the workforce employed to manage the livestock that utilize such AUMs. Thus, it is erroneous for the DEIS to conclude that "unemployment in the analysis area would remain unchanged" under the action alternatives evaluated for the Project. While such changes in workforce employment may not be extensive enough to change the regional unemployment rate, local unemployment within the analysis area would certainly change. The DEIS needs to be consider and assess the impacts to the socio-economic situation of the ranching / farming sector based not only upon the potential of the proposed Project to change the gross annual income generated from this sector (at local, regional, and national scales) due to AUM losses, but upon the potential to change the gross annual property taxes paid by this sector and the workforce employed by this sector.	
11204-39	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	D. Social and Cultural Impacts Related to the Ranching/Farming Sector The social implications of the proposed Project may be as serious or more serious to the socio-economic situation in the region than are the economic implications. The DEIS acknowledges that the ranching/farming sector is a vital component of the local and regional social and cultural fabric, stating: Livestock grazing plays an important economic and social role in southern Idaho. The livestock industry represents a core sector of commerce for the region and many families and communities depend on livestock grazing for their livelihoods (Lewin et al. 2019). These families and communities have strong ties to the livestock industry and have identified with the tradition, land use, and history of grazing in the area since the late 1860s. The livestock industry not only contributes to the region's economic stability but also the rural lifestyle for local residents and small community sense of place (Lewin et al. 2019). Moreover, the social networks of southern Idaho communities are often closely connected with grazing and agricultural life, and the economic well-being of the grazing community is of central importance to some rural southern Idaho towns. Rimbey et al. (1999) and Wulfhorst et. al. (2006) found that in southern Idaho communities, livestock grazing is an essential and stabilizing social and economic contributor, which allows community members to feel connected to the land, to each other, and to the ranching community. DEIS, pg. 3-230. While the DEIS statement quoted above recognizes that the ranching/farming community is not only a "core sector of commerce" in southern Idaho, but also plays a critical role in the region's tradition, rural lifestyle, small community sense of place, and social networks, the DEIS immediately thereafter focuses its socio-economic analysis regarding the livestock grazing sector on the temporary and long-term or permanent AUM reductions that the proposed Project would impose on the economic conditions associated with the nine grazing allotments which intersect the siting corridors of the proposed Project (DEIS, pg. 3-230). Once again, the DEIS conducts its subsequent socio-economic analysis in terms of magnitude (absolute number) or percentage of AUMs reduced and fails to put any dollar values on such reductions. The DIES utterly fails to address in its subsequent analyses the social/cultural impacts to the region's tradition, rural lifestyle, small community sense of place, and social networks associated with the ranching/farming sector that were identified as "essential and stabilizing social…" contributors by the DEIS at pg. 3-230. The DEIS needs to consider and assess the social / cultural impacts of the proposed Project to the region's tradition, rural lifestyle, small community sense of place, and social networks associated with the ranching / farming sector that were identified as "essential and stabilizing social" contributors by the DEIS at pg. 3-230.	EIS Section 3.9.1 (Grazing Allotments and Range Socioeconomics) includes discussion of how the existing landscape of the analysis area contributes to the livestock grazing communities' lifestyle and sense of place, and how the project would affect the landscape and sense of place.
11204-41	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey, Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	The DEIS utterly fails to address any of the social or cultural impacts that result from the Sheep AUM reductions associated with the proposed Project. As was documented in relation to the broader ranching / farming sector, the sheep herding sector plays a noteworthy role in the region's tradition, rural lifestyle, small community sense of place, and social networks. Evaluation of the social, cultural, and economic impacts associated with reductions to Sheep AUMs by implementation of the proposed Project is particularly important because they often alter the socio-economic climate of environmental justice communities (low-income and minority populations that immigrate to the United States as sheep herders). The DEIS needs to be consider and assess the negative impacts, including related mitigation, to the social and cultural setting for the environmental justice communities that would result from the sheep AUM reductions under the proposed Project.	EIS Sections 3.5 (Cultural Resources) and 3.6.1 (Environmental Justice Communities) have been revised to include additional details concerning existing and historic use of the analysis area by sheep herders, and potential effects of the project on sheep herding communities. Also see response to comment 11204-39 (see in Table A-3h, Environmental Justice and Socioeconomics).
11204-42	Livestock Permittees within the Star Lake Allotment: Barbara Oneida, David Oneida, James Ritchie, William Shaw, Karma Posey,	F. Socio-economic Concerns and Damages Reported by Other Commentors Many of the concerns and potential damages associated with the proposed Project reported by other commentors are substantially socio-economic factors or are closely related thereto. For example, comments regarding concerns and potential damages	The EIS analyzes potential effects to all of the resources mentioned by the commenter, including socioeconomics, air quality and climate, wildlife and habitat, recreation, land use, cultural resources, transportation, and visual resources. The comment does not identify any deficiencies in these EIS analyses.

Comment ID	Commenter	Public Comment	Response to Comment
	Justin Posey, Oralia Gergen, W. Alan Schroeder, William Arkoosh, Shawna McKay, Bryan McKay, Kevin Gergen	associated with: air quality (as it affects visibility); plant, animal, and wildlife populations and habitats (as they affect recreation, hunting, open space and solitude, scientific interests, commodity interests etc.); climate; cultural resources; environmental justice communities; fire and fuels management (as it affects multiple-use activities by every social sector); land use and realty; paleontological resources (as they affect recreational, commodity, and scientific interests); recreation; transportation (as it affects recreation, hunting, open space and solitude, scientific interests, commodity interests etc.); and, visual resources are largely expressed because they would potentially alter social or cultural values within the Project area and/or surrounding area significantly. Concerns and potential damages associated with the proposed Project reported by others include substantial socio-economic elements, including comments, news releases, and resolutions listed below: • Federal Aviation Administration, S.W. Region Office, Notice of Preliminary Findings, dated May 21, 2021, wherein "Initial findings of this [aeronautical] study indicate that the structure as described exceeds obstruction standards and/or would have an adverse physical or electromagnetic interference effect upon navigable airspace or air navigation facilities. Pending resolution of the issues described below, the structure is presumed to be a hazard to air navigation." Under information and belief, such findings were not resolved. See Footnote 27 herein. • Coalition to Protect America's National Parks, Scoping Comments on Lava Ridge Wind Project, DOI-BLM-ID-T030-2021-0015-EIS dated October 20, 2021. • Office of Governor Brad Little, Office of Lieutenant Governor Scott Bedke, Office of U.S. Senator Mike Crapo, Office of U.S. Senator Jim Risch, Office of Congressman Mike Simpson, Joint Letter to Idaho State Director Karen Kelleher dated February 6, 2023. • Capital Press, Idaho Leaders raise concerns about Lava Ridge wind project by Brad Carlson, dated February 10, 2023. • Idaho Statesman, Groups fighting 'invasive' wind farm project near Idaho incarceration camp site by Shaun Goodwin, dated February 20, 2023; and, • Idaho Statesman, Lava Ridge Wind Project doesn't uphold multiple-use values Opinion by John Arkoosh, dated February 27, 2023. • Idaho Transportation Department, Division of Aeronautics, dated March 23, 2023, wherein "The Division of Aeronautics has determined the windmills to be an aviation hazard contrary to public interest." • House Concurrent Resolution 4 regarding "LAVA RIDGE – States findings of the Legislature, expresses concern over the proposed Lava Ridge Project, and supports a no- build option", adopted by the House of Representatives, Legislature of the State of Idaho, on March 28, 2023, and Delivered to the Secretary of State on March 30, 2023. The DEIS needs to be consider and assess these negative impacts to the social and cultural setting and other potential impacts that would result from the proposed Project brought forth by other comments and news releases identified herein.	
11208-2	Mike Miller	On page 3-197 of the EIS, the BLM addresses the potential impacts to the low income and minority populations, Yet, I can not find any information where the EIS is available in Spanish, or any other language, other than English. The minority population should have a voice in this as well, because they will be impacted as well. Shame on you BLM for not making this readily accessible to the Hispanic community!	See response to comment 11982-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11315-2	Karen Atkinson	Environmental Justice: The DEIS, Section 3.6.2.12 Dispersed Environmental Justice Community, does not adequately describe the impact of the industrial scale wind project on Alaska Native survivors who were wrongfully incarcerated and their descendants. Please describe Alaska Natives as a distinct population because of their unique experiences before, during and after the incarceration. Table 3.6-2 Summary of Impacts to Dispersed Environmental Justice Communities does not list Alaska Natives or Japanese Alaskans.	The description of Minidoka NHS and WRC included in EIS Sections 3.5 and 3.6 has been revised to properly reflect the different types of communities that were incarcerated at the site. Although Alaska Natives were not directly among interested parties or stakeholders identified during initial project scoping or through the NHPA Section 106 consultation process, the BLM has received draft EIS comments regarding their inclusion as incarcerees at Minidoka and is assessing outreach efforts to these peoples.
11372-2	Jamie Kohtz	The Valley School District is 47% economically disadvantaged and 51% minority. The Dietrich School District is 58% economically disadvantaged and 25% minority. Shoshone School district is 73% economically disadvantaged and 50% minority. These families work on the local farms and ranches. The benefits have been discussed on the economical impact this will have in the area, but not for the people who live and work here. Many families will suffer, and jobs will be lost. The economically disadvantaged living in the surrounding areas from the project could face many unknown costs, and cannot afford lost wages. The EIS states there is a potential decrease in residential property value but the likelihood or degree cannot be predicted. Our family has owned homes and farms here for 70 years. We have turned sagebrush into valuable farmland and it is "uncertain" as to how this will affect our property value. The study mentioned in the EIS in England and Wales found a 6%-12% decrease in property value in view of turbines. My entire view from my porch will be wind turbines. I cannot afford a 6-12% decrease in my property value.	EIS Section 3.6 evaluates potential socioeconomic effects of the project on people living and working within the tri-county analysis area. This includes people who live in the immediate project area as well as those living further removed, but still within the tri-county analysis area. Also see response to comment 13006-35 (see in Table A-3h, Environmental Justice and Socioeconomics).
11411-3	Rayma Cates	Electricity generation requires large transmission lines. Large transmission lines cause problems for farmers. There is a lot of testimony from farmers, condemning the effect of transmission lines on GPS guidance systems. I have a farm in Power County. Myself and other Power County farmers and County Commissioners have been fighting the placement of the Gateway West Powerline for years. Land owners have no say in where transmission lines are placed. Idaho farmers will not be appropriately compensated for the transmission lines which will undoubtedly be placed on their farm fields.	See response to comment 6913-4 (see in Table A-3o. Land Use and Realty, including Aviation).
11433-1	Tom Zuiderveld	This also increases the cost of utilities to the people of Idaho as Idaho Power has to create new sources of reliable electricity for when the wind mills are not producing power, mandated by the federal government.	See response to comment 7344-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11442-3	Kalena Kendell, William Kendell	LS Power/Magic Valley Energy offers as a reason to move forward with this project the economic value this project will bring to the Magic Valley through job opportunities and economic stimulation. Idaho has one of the strongest economies in the nation. Idaho's economy ranks in the top five of all 50 states, and has been for years. Additional jobs is not an issue Idaho is currently struggling with. Currently, Idaho needs additional workers. Many	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		of the jobs Lava Ridge will create will be filled by workers from out of state, further exacerbating the housing shortage Idaho is experiencing in the Magic Valley.	
11481-5	Idaho Wool Growers Association	In the peripheral there are also concerns about how the project will impact the local communities and economies. With such a need for employees for the project this will either remove employees from the agricultural and agribusiness communities or it will create an intense need for housing and amenities in the area for new workers.	See responses to comments 1689-8 (see in Table A-3h, Environmental Justice and Socioeconomics) and 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
11491-20	Dean Dimond; Jennie Bateman	- In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: [...] 15. Need analysis of adverse economic impacts to counties, communities, tribes, and state, 16. Need up to date economic impact analysis with cost /benefit to taxpayer in federal PILT and other payments to counties, [...]	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
11491-31	Dean Dimond; Jennie Bateman	16. Need up to date economic impact analysis with cost /benefit to taxpayer in federal PILT and other payments to counties, 17. Overall liability and costs if developer fails to produce power or abandons the project to US Gov, 18. Need updated local workforce, ag and other business impacts, 19. Need detailed county law enforcement, search and rescue personnel review and analysis of viability.	Refer to EIS Sections 3.6.2 (Community Services, Employment, and Housing Availability), 3.6.3 (Local and Regional Economy), and 3.9.1 (Grazing Allotments and Range Socioeconomics) for a detailed discussion of tax revenues, impacts to the economy and workforce, and impacts to emergency services.
11495-1	Jennie Bateman	I am writing to express my concern about the lack of a cost-benefit analysis for community members in Minidoka and other affected counties in the DEIS regarding the Lava Ridge Wind Farm project. While wind farms may bring some benefits, such as energy and job opportunities, it is important to consider the potential costs and impacts on local communities. Studies from other wind farms have shown that community members can experience negative impacts, such as decreased property values, noise pollution, health concerns for humans and animals, obscured scenic views, and depleted county resources. It is crucial to conduct a cost-benefit analysis to assess these and other impacts and ensure that the benefits of the wind farm outweigh the costs for local residents. One study that highlights the importance of a cost-benefit analysis is the analysis of the Lompoc Wind Energy Project in California. This study found that while the wind farm created jobs and provided energy, it also had negative impacts on property values and scenic views. The study concluded that a comprehensive cost-benefit analysis was necessary to ensure that the benefits of the wind farm outweighed the costs for the community. Another study that underscores the need for a cost-benefit analysis is the analysis of the Blue Sky Green Field Wind Energy Center in Wisconsin. This study found that while the wind farm provided economic benefits to the community, such as tax revenues and job creation, it also had negative impacts on property values and noise levels. The study concluded that a comprehensive cost-benefit analysis was necessary to ensure that the community was adequately compensated for the negative impacts of the wind farm. Given these examples and the potential impacts of the Lava Ridge Wind Farm on Minidoka County, I urge you to conduct a comprehensive cost-benefit analysis to assess the potential costs and benefits for local residents. This analysis should include an evaluation of the impacts on property values, noise levels, human and animal health, scenic views, and the use of county resources as well as an assessment of the economic benefits and job opportunities created by the wind farm. Thank you for your consideration of this important issue.	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
11525-4	Erin Schmith	In the section of chapter 3.6 that talks about the Environmental Justice impacts of Alterative C, the report says that this alternative would "would minimize and avoid visual, noise, and traffic effects," but then goes on to say that they would not be eliminated altogether. This doesn't feel accurate, as it clearly says that the Alternative will not completely avoid these adverse effects to visitors of Minidoka. The proposed alternative may reduce some of the effects, but I do not agree with the characterization that it would minimize them.	The EIS uses the term *minimize* as directed in 40 CFR 1508.1(s)(2), which defines mitigation and states specifically that mitigation includes “minimizing impacts by limiting the degree or magnitude of the action and its implementation”.
11533-4	Rebecca Loomis	This proposal is premature to destroy a once protected area to advance the green energy climate change policies under this administration. The stated outcomes are mere speculation and can not be confirmed other than the number of wind turbines erected. There is no substantial data on energy produced and the true cost benefit analysis of any of these projects.	The analysis in the EIS is based on the best publicly available data. The energy that would be produced by the project under each action alternative is provided in Table 2.4-1 in EIS Section 2.4 (Alternative B [Proposed Action]). The impact analyses in EIS Chapter 3 (Affected Environment and Impacts) consider both beneficial and adverse effects from the project. Economic impacts of the project are analyzed in detail in EIS Section 3.6 (Environmental Justice and Socioeconomics).
11533-7	Rebecca Loomis	Why not conduct a thorough project that not only identifies the pros but also the cons. Only then can a reasonable decision be made rather than only doing part of a study and say it's good to go. An example has been the graveyards for the turbines. They are just now starting to investigate ways to handle the waste. There must be a cost benefit analysis to this project as well- how much does it cost to contract the manufacturing of these turbines (is China producing them? are supporting China not US manufacturing?), supporting structures and when is the cost recouped if at all. It can't be just that it is best for the environment, it must be backed by facts.	See response to comment 11533-4 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding analysis methodology and economic impacts and to response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) regarding turbine disposal.
11535-47	Steven Andersen	The DEIS fails to adequately analyze environmental justice impacts under the proposed action and alternatives. Title VI prohibits recipients of federal financial assistance from discriminating on the basis of race or national origin in their programs. The agency must ensure that all programs receiving Federal financial assistance that affect human health or the environment do not directly or through contractual or other arrangements, use criteria, methods or practices that discriminate on the basis or race, color or national origin. LS Power/MVE is a recipient of federal financing, and this project, should not be approved based on violation of Title VI alone. The agency's	See response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		analysis of environmental justice populations was wholly inadequate and inconsistent with a handbook drafted by the BLM's Environmental Justice Working Group and the BLM's Socioeconomics Team from identification of impacted populations to outreach and involvement to mitigation efforts.	
11535-48	Steven Andersen	Readily available demographic information on minority and low-income populations should have been analyzed in order to identify populations at risk (PAR) and the disproportionate risk to those PAR consistent with E.O. 12898 and federal direction to each agency to "analyze the environmental effects, including human health, economic and social effects, of Federal actions, including effects on minority and low-income communities, when such analysis is required by [NEPA]." Id.165 The DEIS provides a generalized recitation of census block groups and admittedly improperly based its poverty analysis on an incorrect threshold for federal poverty at 50% of what it should have been, because the agency ran out of time to redo it (see FN 14 of DEIS). The BLM's handbook states that the Census data can be out of date and there needs to be an in-depth and thoughtful analysis at a local level of the concentration of minority and low-income populations beyond what is simply reflected in census data. This never occurred. There should have been an effort to identify local and displaced environmental justice ("EJ") populations at the county and community level, consistent with BLM handbook direction. Id. at 10. Instead, in the DEIS, there is a list of what the BLM plans on doing in the future, including steps it plans to take to comply with NGPA and Section 106 Executive Order 12898. But Executive Order 12898 directed federal agencies to proactively identify and address disproportionately high and adverse human health and environmental effects of their actions on minority and low-income populations, to the greatest extent practicable and permitted by law, to develop a strategy for implementing environmental justice and to promote nondiscrimination in federal programs that affect human health and the environment, as well as provide minority and low-income communities access to public information and public participation.	See response to comment 12398-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11535-49	Steven Andersen	A special study into the environmental justice impacts of this project (including cumulative impacts) should have been conducted to inform scoping, facilitate public participation by marginalized communities and thoughtful analysis in the DEIS. Executive Order 14008 is intended to address climate change with "clean energy technologies" while delivering environmental justice in communities across America – not as some reactive box-checking exercise. Rather, Executive Order 14008 has a stated policy of securing environmental justice and economic opportunity for disadvantaged communities that have been historically marginalized and overburdened by pollution and underinvestment in housing, transportation, water and wastewater infrastructure, and health care. This proposal is a text-book example of a lucrative project intended to profit a private entity at the expense of local populations, which have been subject to historic marginalization. It is everything environmental justice initiatives are aimed at preventing. It proposes a project with a widespread footprint throughout rural Idaho (without due regard for a sacred National Historic Site) whose negative impacts will be borne by the nearby inhabitants, who are minorities, indigenous communities, persons of Japanese ancestry, and low-income communities - with little resources to defend against the external pressure being imposed by a goliath private developer from New York. They won't obtain any benefits from the alleged "green energy" provided by this project. It will be sold on the OEM to the highest bidder, which will in all likelihood, not be an Idaho utility. It will serve only to meet arbitrary federal initiatives and line the pockets of private developers, who are already reaping the benefits of federal incentives funded by taxpayers. This is eerily similar to scars in our country's history where disadvantaged communities were likewise pressured off their lands or otherwise displaced. In the post-colonial period, former colonies were used as dumping grounds for the North and for the trade in harmful and toxic products and African countries were used as sites for depositing harmful waste. We need not look any further than the very land the project intends to impede upon for a reminder of the government's failure to safeguard its citizens, thereby alienating them from the rights and territories linked to their identity and culture. This is contrary to the very principles of environmental justice, which the federal government has declared a "core priority" and part of the mission of every federal agency.	CEQ has not issued any guidance to explain how federal agencies should incorporate EO 13985, 14008, or 14096 into their NEPA analyses. Therefore, the BLM currently implements environmental justice analyses in accordance with EO 12898 and the BLM's environmental justice guidance document (IM 2022-059), which was issued in September 2022. Revisions have been made to EIS Section 3.6.1 (Environmental Justice Communities) to incorporate updated definitions of low-income and minority populations. With these revisions made, the EIS is in full compliance with EO 12898 and IM 2022-059. EO 14096 (Revitalizing Our Nation's Commitment to Environmental Justice for All) was enacted on April 21, 2023, to complement EO 12898. Until further guidance is issued on how to implement EO 14096, the BLM continues to implement EO 12898. Further, the BLM has closely reviewed the most recent EOs, and the EIS analysis is in compliance with the general themes and concepts presented in these EOs.
11535-50	Steven Andersen	Procedurally, there was little effort to make impacted minority communities even aware of the proposed project, let alone seek their meaningful participation in NEPA or account for the project's impacts in minority communities. The DEIS fails to demonstrate that real efforts were made to proactively locate, reach, and inform geographically dispersed environmental justice populations, like Alaska Natives and Japanese Americans. None of this occurred until late in the process, and efforts were weak, at best. With reference to the Hispanic population, a few preliminary handouts were in Spanish, evidencing the agency's knowledge of an impacted community that could only be reached in that language. Yet, very few hard copies of the DEIS were made available – and those made available were often incomplete (missing appendices). We are unaware of any hard copies or electronic copies of the DEIS made available in any language other than English despite the agency's apparent knowledge of the need for Spanish materials as well as Census data confirming large minority populations in the impacted region. The Federal government has recognized that failure to ensure that persons with limited English proficiency "can effectively participate in" such programs may violate Title VI found at 40 C.F.R. Part 7. 166 The BLM is advised, with reference to reaching minority populations in the NEPA process, as follows: • Language can pose a barrier. Identify needs early in the process and budget accordingly, including: translating outreach materials and providing an interpreter at public meetings.167 • Post notices (in the appropriate language) at facilities widely used by community members, such as churches, recreation centers, or bars. (Announcements made through mailing lists, English language newspapers, and BLM websites may not reach some EJ populations.) Id. • If you know or suspect that an EJ population could be affected by the BLM's actions, or if members of a minority or low-income community contact the BLM to tell us so, look into it further. Use your own and others' local knowledge to identify groups of minority or low income people who may not	The BLM performed meaningful outreach and engagement with environmental justice communities in accordance with EO 12898 and BLM's IM 2022-059. As described in EIS Appendix 10 in the Agency and Public Involvement section, public engagement efforts for the EIS have included a 60-day public scoping period, two virtual public scoping meetings, posting two newsletters (in Sept. and Dec. 2022) on the project website to keep stakeholders informed as the BLM developed the draft EIS, a 60-day public comment period, one virtual orientation meeting at the beginning of the draft EIS comment period, and seven open-house meetings during the draft EIS comment period (2 virtual and 5 in-person). In addition, to accommodate access and inclusion, hardcopies of the draft EIS were provided at eight locations or upon request, and notices for the public scoping and public comment periods were published in both English and Spanish (see response to comments 11982-1 in Table A-3h, Environmental Justice and Socioeconomics). As stated in EIS Appendix 10 in the Agency and Public Involvement section, due to the high proportion of scoping interest regarding the potential for impacts to Minidoka WRC and Minidoka NHS, the BLM and the Office of Collaborative Action and Dispute Resolution implemented proactive approaches to solicit input on the draft EIS from interested parties, including members of the Japanese American community. These parties are also included in Section 106 consultation, as described in the Consultation and Coordination section in EIS Appendix 10. Input received from Minidoka NHS and WRC–interested parties have been documented in a report and incorporated into the EIS analysis for environmental justice (Section 3.6) and cultural resources (Section 3.5). As described in Section 3.5 (Cultural Resources) and EIS Appendix 10 (Consultation and Coordination section), the BLM is engaging with Native American Tribal populations, individuals representative of the Japanese American parties, and other qualified parties under the NHPA Section 106 process (36 CFR 800.2). In addition, the BLM is engaging with Native American Tribal

		appear in the data or who don't live in the same place but could be affected by your project/plan. Id. at 10 (emphasis added). When our law firm heard of concerns from clients that copies of the DEIS were not being made available in other languages, we made the BLM Project Manager aware of our concerns, specifically articulating our concern that minority communities were not receiving copies in their language, and those minority communities remained, by and large, uninformed of the project. On that basis, we sought an extension. We didn't receive any follow up questions about our concerns that EJ populations affected by the BLM's actions were uninformed, and as far as we know, nobody looked into it further. We were denied our request, without explanation.168 The top six Idaho counties by total Hispanic population include Minidoka, Jerome and Twin Falls.169 Rupert, Burley and Jerome, are in the top four Idaho cities with the largest Idaho Hispanic population in 2023, and yet, it doesn't appear any meaningful efforts were made to inform and involve Spanish-speaking communities, including making a copy of the DEIS available in Spanish. In recent days, an article by the Associated Press discussed the lack of drafts in Spanish despite the large Spanish-speaking population in the area.170 In the article, one Idahoan is quoted as stating, "Idaho is not going to stand down and let their minorities be treated like second class citizens."	populations within the context of Government-to-Government Tribal consultation. Through these consultation processes, the BLM has, and would continue to, provide consulting parties with opportunities to review and consult on the project's PA and associated management plans and reports. The BLM's EIS analyses under NEPA and preparation of the PA pursuant to NHPA Section 106 included incorporation of community knowledge and concerns—including on TCPs—identified through project scoping, Section 106 consultation with Native American Tribes and other consulting parties, per 36 CFR 800, the BLM's Government-to-Government consultation with Native American Tribes, and DOI Office of Collaborative Action and Dispute Resolution outreach efforts to the Japanese American community in Idaho and throughout the United States. The BLM has accorded these consultation efforts with all due diligence and good faith. As stated in Section 3.6.1.4 (Compensatory Mitigation) of the environmental justice analysis, the BLM will continue to solicit input from environmental justice populations regarding potential mitigation measures for adverse effects to facilitate collaborative decision-making throughout this EIS process.
11535-51	Steven Andersen	On its face, the DEIS fails to adequately preserve and protect the Tribal treaty rights, historic resources and emotional impacts to Japanese Americans and Alaska Natives. It fails to analyze adverse effects on populations subject to environmental harm that have been historically subject to exploitation and disadvantaged, including the poor and minorities. An inadequate analysis was conducted of the history of the land and the communities impacted by this project.	See response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
11535-52	Steven Andersen	The DEIS failed to thoughtfully and effectively analyze the precise location of low-income and minority populations in relation to the specific turbines and how site operation would impact these populations. Again, the location for the turbines must precede any reliable analysis to the majority of impacts addressed in the DEIS. Without finite details on the location of the turbines and the location of roads, it is impossible to analyze the proximity to minority and low-income populations and tribal and cultural resources, and the related impacts – everything from electromagnetic exposure, microwave interference, impacts to farming operations (livelihoods), to visual impacts to shadow flicker to noise.	As described in EIS Section 2.3.1 (Project Location, Siting, Landownership, and Jurisdiction), the project's final design and engineering would be completed after the BLM has issued a ROD and would be informed by applicant-committed measures and other mitigation requirements established in the ROD. This approach provides flexibility for the project design to be adjusted in response to resource constraints through site-specific engineering for the final layout. The BLM's environmental justice analysis (EIS Section 3.6.1) is in full compliance with EO 12898 and IM 2022-059. Discrete turbine locations are not necessary for project related effects on environmental justice populations to be estimated within a reasonable range of certainty. The EIS analysis of potential effects to environmental justice populations conservatively assumed that the entire area within the siting corridors would represent a potential source of visual, noise, dust and traffic impacts for surrounding communities.
11535-55	Steven Andersen	The DEIS states that "the likelihood or degree to which property values may or may not be affected cannot be predicted with any certainty." However, it ultimately concludes that "property values in the analysis area would not likely be affected by the project." This conclusion cannot be supported by the data as the DEIS itself cites numerous experts who assert that property values are significantly impacted by the construction of wind turbines.175 To support its conclusions, the DEIS cites a number of sources with inherent biases in making studies and drawing conclusions. For example, the DEIS cites a 2009 study by Hoen et al., and a 2013 study also by Hoen, with slightly different supporting authors. Both studies were prepared for and funded by the Office of Energy Efficiency and renewable Energy Wind & Hydropower Technologies Program of the U.S. Department of Energy. The funding source draws into question the credibility of the ultimate conclusions of these sources. Moreover, experts have critiqued the Hoen et al. because the hedonic analysis it uses and its subsequent interpretation "tends to place heavy emphasis on the majority at the expense of the minority."176 Under such an analysis, "[p]articular neighbourhoods [sic] or social groups placed near turbines for example, that do indeed experience property value loss, may be drowned out in this aggregate analysis."177 Second, Hoen et al.'s study "tends to be based on distance zones, but rarely within less than half mile (805 m), [which] may not provide adequate spatial resolution."178 Finally, Hoen et al. and Lang et al. (2014) both fail to account for "homes that are not put on the market due for fear of net financial loss." Likewise, the DEIS fails to account for diminution of property loss due to individual preferences surrounding wind farm proximity to property. The studies cited in the DEIS do not account for homeowners' preferences, which is "particularly important as they ultimately decide final asking and selling prices."180 "Research from Australia found that 38% of respondents would pay 1–9% less for a property due to the presence of a local wind farm. In Ontario, work from Baxter et al. found that the majority of residents in both a control (69%) and a 'wind turbine' community (55%) reported concerns that turbines may lower property values." Additionally, Hinman (2010)182 provides evidence of a "location effect" which means that before a wind project is even approved, properties located near the eventual wind farm area were devalued in comparison to other like properties. This is a result from homeowners being concerned about "ancillary impacts including visual and acoustical disturbances, and…turbine-related health effect." 183 Hinman's results also suggest the existence of "wind farm anticipation stigma theory" where property values are diminished in anticipation of the development of a new wind farm.184 In their research, Walker et al. (2014) found that turbine-related real estate loss is perceived to already have occurred for some residents in both communities before the project was even completed.185 This overall perception is relevant because it affects asking and selling prices and overall mitigation of negative impacts. "If men define a situation as real, it is real in its consequences."186 The DEIS concludes that values cannot be predicted with any accuracy but has not attempted to examine property values before and after this project was announced. It shrugs off this issue by asserting that any possibility of change in property value is "either too small and/or too infrequent to result in any widespread and consistent statistically observable impact." This project will require an exorbitant amount of land, which means a greater number of property owners will be affected. "Wind power is naturally intermittent, and plants typically operate at about 25% of full capacity, compared to coal and natural gas plants operating at 90%."191 While	The BLM has reviewed the data sources provided. EIS Section 3.6.4 (Residential Property Values) has been revised to discuss additional factors affecting property values and to cite additional articles that provide further support for the range of conclusions which were already discussed in the analysis. The analysis conclusion has been revised to clarify that there is a potential for property values in the analysis area to be affected by the project. U.S. census data related to property values and asking prices are not available at the scale that would be needed to perform a more detailed and site-specific analysis of property value changes in relation to the project.

Comment ID	Commenter	Public Comment	Response to Comment
		larger wind turbines generate more energy, they also take up more land due to spacing requirements. “Land area requirements vary with turbine spacing and configuration, but are typically larger than required for almost all other forms of energy production, including solar facilities of similar power output.”192 Research from Harvard suggests that “that not only will wind farms require more land area to hit the proposed renewable energy targets but also, at such large scale, would become an active player in the climate system.” 193 In making this point, Clemente cites experts supporting the position that wind farms do, in fact, affect property values. Dr. James A. Chalmers, qualified as an expert witness in over 20 states, found that residential properties near transmission lines sold for 20-50% less than comparable residential properties.194 Michael McCann, of McCann Appraisal, LLC based in Chicago, concludes that: Residential property values are adversely and measurably impacted by close proximity of industrial-scale wind energy turbine projects to the residential properties up to 2 miles and a range of 25% to approximately 40% of value loss.195 John Leonard Goodwin, who has been a real estate broker for more than 10 years in Ontario, Canada, reports that wind turbines absolutely do impact property values: “Turbines complicate your property enjoyment, period. That alone spells depreciated value...they will also cause a significant loss of real estate value.”196 According to research in 2014 by the London School of Economics, wind farms can cut as much as 12% off the value of homes within a 2 kilometer radius, reducing property values as far as 14 kilometers away.197 In 2013, an Ontario Superior Court of Justice determined that landowners living near large wind farms do suffer from lower property values, with the court accepting a 22-55% reduction in overall value.	
11535-56	Steven Andersen	Furthermore, the DEIS focuses mostly on home values but does not adequately address how this project impacts the value of farms and crops. Takle (2018) discusses the negative effect that wind turbines may have on crops due to increased heat in the area.187 Mensching (2017) describes issues on farmers such as damaging fields during construction of wind turbines and drainage problems which may prevent farmers from planting in the first place.188 She also points out that wind turbines sometimes foreclose the use of crop dusters used by farmers to spray pesticides to protect their crops. The DEIS does not consider these concerns, which are specific to the properties being impacted by the proposed project. The value of the land is tied to the ability of farmers to make a livelihood, preserve the peace they obtain by living in a rural community. If they have drainage problems with fields, or their livestock have grazing issues, or their dairy cows’ milk production drops, or they can’t spray their fields, their land is of little value, and their livelihoods are in jeopardy.	The EIS analyzes potential effects on residential property values in EIS Section 3.6.4 (Residential Property Values). Although this analysis is focused on describing the potential effects of wind turbines on residential property values, some of the case studies cited in this analysis looked at rural residential properties within agricultural tracts and zoning designations. Therefore, the analysis in Section 3.6.4 applies to all types of residential properties, ranging from urban to rural/agricultural. Potential effects to farming-related land uses are further evaluated in Section 3.9.1 (Grazing Allotments and Range Socioeconomics), Section 3.8 (Land Use), and AIB-15 and AIB-16 (EIS Appendix 3). EIS Section 3.8 (Land Use and Realty) has been revised to discuss farming-related communication uses in the analysis area (see Section 3.8.1.1.4) and to analyze how they might be affected by the project (see Section 3.8.1.2).
11535-62	Steven Andersen	The DEIS also fails to account for the economic cost that a wildfire could have on the region. According to 2015 reports, “a fire incident at a turbine can cost up to $4.5 million.”209 When accounting for the fact that turbines have grown substantially in size and upfront cost, as well as accounting for inflation, this figure is likely to have increased dramatically. Additionally, this figure does not account for the economic damage that a wildfire could have on the surrounding community in the form of property values, insurance policies, and livestock.	EIS Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression) analyzes how the project would affect the risk of human-caused or natural-caused wildfire ignition and spread in the analysis area and wildfire response and suppression efforts. Under all action alternatives, there would be an increased risk of wildfire ignition and increased access for ground response coinciding with inhibited aerial response suppression activities. The degree of impacts under each of the action alternatives would generally be reduced as the project footprint goes down in size. Quantitative estimates of increased fire frequencies, intensities, or sizes are not provided in Section 3.7.1 and cannot be predicted for the life of the project with any certainty. Therefore, monetizing the economic impacts on local communities associated with increased wildfire risks would be too speculative. A brief qualitative discussion of potential effects on local fire districts has been added to Section 3.6.2 (Community Services, Employment, and Housing Availability) to connect the effects from Section 3.7.1 (Wildfire Ignition, Spread, Response, and Suppression) with the socioeconomic analysis. In addition, Section 3.7.1 has been revised to include additional discussion of project impacts to aerial wildfire suppression efficiency, including how wind turbine heights would impact water and retardant drop heights.
11535-64	Steven Andersen	With reference to environmental justice, the devastation of a wildfire can have wide ranging consequences, and research shows that low-income communities suffer disproportionately from such disasters.211 The impact of the proposed action on wildfires is a significant issue and it should have been analyzed in conjunction with impacts that are inextricably intertwined, including, but not limited to, environmental justice, socioeconomics, cultural sites, land and realty, endangered species and the environment.	See response to comment 11535-62 (see in Table A-3h, Environmental Justice and Socioeconomics).
11535-94	Steven Andersen	Additionally, the project would halt critical wildfire suppression in an area known for rapidly spreading wildfires (due to wind). Since 1980, 1,278 wildfires have occurred within a 20-mile radius of the project area. These wildfires have devastating impacts on operating farms, wildlife and low-income, rural communities. The BLM’s own Idaho aviation plan for fighting wildfires advises of the hazard of towers over 200 feet, which pales in comparison to the hazard of 500 towers over 600 feet high. Reducing navigable airspace to battle wildfires in an area known for large wildfires will not just reduce suppression activity, but threaten the wellbeing of nearby individuals, animals and wildlife. The DEIS simply states that FAA regulations do not limit the proximity of aircrafts to tall structures for fire suppression and engagement is at the pilot’s discretion. A pilot should not have to endanger himself to suppress a fire by flying, in smoky conditions, between large turbines.	See response to comment 11535-62 (see in Table A-3h, Environmental Justice and Socioeconomics).
11546-3	Dan Sakura	Health Impact Analysis. Because of the disproportionately high and adverse impacts on the Japanese American community and the connections between emotional and physical health, the BLM should conduct a Health Impact Assessment (HIA) on the health impacts on the Japanese American community, Alaska Natives and all members of the public. An HIA is a systematic process that uses an array of data sources and analytic methods and considers input from stakeholders to determine the potential effects of a proposed policy, plan, program, or project on the health of a population and the distribution of those effects within the population. Health impact assessment provides recommendations on monitoring and managing those effects.7 HIAs are tools to consider the health impacts of federal action in native villages in Alaska in association with proposed oil and gas	Potential physical effects to human health and safety are analyzed in the EIS in AIB-10 through AIB-14 (EIS Appendix 3), and potential psychological effects on the Minidoka community are discussed in Section 3.6.1 (Environmental Justice Communities). In addition, the EIS analyzes the potential project-related effects on several environmental factors that influence public health and safety including air quality (Section 3.2), groundwater quality (Section 3.17.3), noise (AIB-20 in EIS Appendix 3), and hazardous waste (AIB-45 through AIB-47 in EIS Appendix 3). The commenter has not identified any deficiencies in the existing EIS analysis that warrant or justify the completion of an HIA.

Comment ID	Commenter	Public Comment	Response to Comment
		development and in California in the San Francisco/Oakland area. Please consider this compilation of case studies related to local, state and federal projects in your analysis related to health impacts.	
11551-6	Erin Shigaki	In addition, I support the petition from the Friends of Minidoka to designate the Greater Minidoka Area of Critical of Environmental Concern.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11554-5	Raul Labrador; Idaho Attorney General's Office	Most importantly, Idaho has a critical sovereign interest in protecting "the health and well-being—both physical and economic—of its residents." Alfred L. Snapp & Son, Inc. v. Puerto Rico, 458 U.S. 592, 607 (1982). The Project harms the physical and economic well-being of Idahoans in several ways. First, an influx of temporary labor and federal dollars to construct the Project could cause a temporary housing shortage and lead to long-term increases in housing costs that price out Magic Valley residents. The rapid influx of short-term labor will strain local infrastructure and services like public schools and law enforcement. See draft EIS at ES-xix. Second, the Project will rapidly increase the number of roads and traffic in the Magic Valley Region. The Project will require the construction of more than 500 new roads. This influx in traffic will raise the risk of traffic-related injuries and fatalities and place more strain on existing roads and bridges. Third, a short-term influx of federal dollars threatens to create a boom-bust economic cycle in the Magic Valley region. The draft EIS projects that the Project will bring in $277 million during its two years of construction, but only $15 million per year during the Project's operation. draft EIS at ES-xix.	See responses to comments 11869-9 and 11869-11 (see in Table A-3h, Environmental Justice and Socioeconomics).
11598-2	Idaho Conservation League	The No Action Alternative would not permit the project but this is not a satisfactory outcome from our perspective. The No Action Alternative would not meaningfully respond to public concerns about the overall suitability of this location for industrial development. The No Action Alternative simply leaves the door open for another project that could also have alternatives incompatible with the current set of values. We believe that the BLM should instead take action to permanently protect the Pronghorn Migration Route, remaining areas with conservation value for sage-grouse, the viewshed around the Minidoka National Historic Site and original relocation center area, and Wilson Butte Cave and other cultural areas.	The commenter is suggesting a land use designation process that is outside the scope of this NEPA analysis; please also see response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding the BLM evaluating the proposed Greater Minidoka ACEC designation through a separate process outside of the project.
11598-6	Idaho Conservation League	Regardless of how the BLM proceeds with the Lava Ridge Project, we strongly recommend that the BLM continue the work started in its Renewable Energy Strategy and take the next step to initiate an RMP amendment process across southern Idaho, similar to the work the BLM and the State of Idaho conducted regarding sage-grouse. It may make the most sense to delay pursuing a development alternative for Lava Ridge until after this resource management plan amendment process is completed. Many of the unresolved questions regarding Lava Ridge could be addressed through this process. This process should be collaborative in nature and could be developed in partnership with Tribes, BLM, the BLM RAC, various public lands stakeholders, potentially affected Counties, and relevant State of Idaho agencies including the Idaho Office of Energy and Mineral Resources, the Idaho Dep't of Lands, the Idaho Dep't of Fish and Game, the Idaho Office of Species Conservation, and the Idaho Dep't of Water Resources.	The commenter is suggesting an RMP amendment, which is outside the scope of this NEPA analysis. In accordance with CEQ's NEPA regulations at 40 CFR 1502.16(a) and 40 CFR 1506.2(d), the BLM must only consider possible conflicts between the Proposed Action and approved land use plans and policies, including to BLM's RMP objectives. As stated in EIS Appendix 2, public lands in the analysis area are managed in accordance with BLM SFO's 1986 monument RMP (BLM 1986), as amended, and the 2015 greater sage-grouse ARMPA (BLM 2015). The Proposed Action and alternatives described in this EIS are in conformance with both of these plans.
11598-25	Idaho Conservation League	ACEC protections Under the 1985 Monument Management Framework Plan, large-scale energy development is allowed throughout the project area. Some sideboards, stipulations or special conditions are mentioned but they have not been applied in such a way that protects culturally sensitive resources: Moderate use areas are generally suitable for a wide range of existing and potential uses and will be managed for production and use of their forage, timber, minerals and energy, recreation, or other values. Where conflicts occur with resources or uses, full consideration of all benefits and costs will be taken into account in resolving such conflicts. Sensitive and significant values will always be protected consistent with Federal and State law. Public lands in a moderate use area will be retained in Federal ownership. (BLM 1986:4) No special limitations or restrictions on the type or intensity of resource use will be applied in this area. Valid uses will be allowed subject to environmental review and stipulations or special conditions to protect resources. (BLM 1986:6). EIS 1-2. For portions of the project area that the BLM concludes are not appropriate for turbine corridors, we recommend that the BLM amend the Management Framework Plan to designate these no-build areas as permanent no-build special areas and reclassify them from Moderate Use to a more protective designation such as an Area of Critical Environmental Concern that precludes similar types of development so that sensitive and significant values will truly be protected. Resource Management Plan amendments As mentioned in our June 22 letter to the BLM State Director following the Lava Ridge Tour, we propose that the Idaho BLM undertake a series of Resource Management Plan amendments, similar to the Greater sage-grouse RMPA (Resource Management Plan Amendments) process. The Monument RMP is one of the oldest RMPs in the country and many of the other RMPs are also significantly outdated and insufficient to provide adequate guidance on renewable energy development. Without a consistent approach to this issue, we are concerned that public lands are going to be developed in an uncoordinated and patchwork manner with projects receiving different levels of scrutiny, varying levels of protections, inconsistent design features, insufficient mitigation measures and suboptimal coordination for efficient energy development. Just as the Greater sage-grouse RMPA focused on management issues that may affect Greater sage-grouse, this Renewable Energy RMPA would update RMPs to examine resource energy potential and energy transmission and the effects that these projects might have on cultural resources, wildlife habitat, recreation and other community values. For areas that are identified through this RMPA process as being incompatible with renewable energy development, the RMPs should be amended to preclude such development and safeguard these resources. For areas that are deemed not suitable for renewable energy development, this determination should be codified in the RMP amendments. Temporary segregation or withdrawal for renewable energy projects, similar to an administrative mineral withdrawal, could be another option. Even if the BLM selects the No Action Alternative for the Lava Ridge project because of cultural or wildlife	See response to comment 11598-6 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		values or other issues, there is currently nothing in the current RMP that would prevent another project from being proposed in the very same area. If there is always the possibility of such a proposal being developed in an area with conflicting and unresolvable issues, it will be difficult for the BLM and partners to optimize the other values in this area such as restoring habitat for wildlife or additional interpretation of cultural values. If wildlife habitat is determined to be of critical importance, as has been expressed for certain areas of Lava Ridge, then the RMP should be amended to state that these areas are to be managed instead for wildlife habitat conservation and restoration. Likewise, areas with fewer resource conflicts could be optimized for renewable energy development but the RMPA would allow for more strategic and expanded mitigation opportunities.	
11598-37	Idaho Conservation League	We recommend that the BLM use the opportunity afforded by this NEPA process to designate areas around the Minidoka National Historic Site and Wilson Butte Cave as unavailable for future energy development and prioritize areas such as the Pronghorn Owinza migratory corridor for habitat restoration.	See response to comment 11598-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
11604-2	Name Not Provided	[...] the BLM should designate the entire viewshed from Minidoka as an Area of Critical Environmental Concern and Traditional Cultural Place.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11615-9	Spencer Dixon	The bat populations killed will likely lead to extinction of bats in the area and an increase in mosquitoes and other harmful insects. This in turn will affect farmers crop production	Potential effects to bat populations are analyzed in EIS Section 3.3.1 (Bat Populations and Roosting Habitat) and AIB-6 through AIB-8 (EIS Appendix 3). These EIS analyses do not predict any extinctions for bat populations.
11617-3	Stephen Kitajo	I request that the BLM move forward with seeking public comment regarding the currently proposed Greater Minidoka Area of Critical Environmental Concern and to work with the NPS, the Idaho State Historic Preservation Office, and other partners regarding the Minidoka Traditional Cultural Property National Register eligibility determination for more permanent protections for Minidoka.	See responses to comments 12859-2 and 11672-3 (see in Table A-3h, Environmental Justice and Socioeconomics).
11618-4	Bif Brigman	Having y'all deciding what is and isn't Environmental justice is a total farce. Y'all need to do better. Much better. Why won't BLM address the numerous presidential proclamations and executive orders that specifically address issues of environmental justice and not impacting historically, marginalized, ethnic communities? Why?	See response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics).
11620-10	Simone Griffin; BlueRibbon Coalition	Local communities rely on motorized recreation for economic opportunities. There has been a surge of use throughout the nation on public lands as well as in this area. Local groups have worked hard to put the area on the map so that they could reap the economic benefits. Closing roads or creating re-routes which are proposed, could hinder economic opportunity and needs to be thoroughly analyzed. According to the Bureau of Economic Analysis, outdoor recreation had a record breaking year in 2021. Outdoor recreation now accounts for $821 billion in economic activity. For reference, the oil and gas industry is $812 billion. Outdoor recreation is popular. It is an economic juggernaut. Yet, public land agencies act as if this nearly $1 trillion dollar industry is optional or an afterthought. Instead of building new roads, trails, campgrounds, and infrastructure to accommodate the new growth in outdoor recreation, land managers are relentlessly closing public lands for the public to use. A deeper dive into the numbers reveals that the engine driving this record-breaking growth is literally the millions of engines that find their way into the various forms of motorized recreation. Non-motorized forms of recreation account for $33 billion in economic value. Gear that is used in all forms of recreation accounts for $52 billion. Motorized forms of recreation account for a shocking $78 billion in economic value. BRC would like to point out that the largest current wind farm in Idaho is more than ¼ the size of the proposed project. The BLM did not fully analyze the effects of a project of this magnitude and how it will affect recreation opportunities.	The BLM analyzed potential effects of the project on various types of recreational uses, as follows: potential effects to hunting, trapping, and OHV uses are analyzed in Section 3.12 (Recreation) and potential effects to dispersed recreational opportunities, public motorized access, SRMAs, cave resources, and hunting spending are analyzed in brief in EIS Appendix 3 (see AIB-25 through AIB-29). Based on the results of these analyses, the magnitude of effects on recreational uses is not expected to cause meaningful changes to recreational spending in the regional analysis area.
11622-9	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	We have significant concerns about the BLM's proposed Lava Ridge wind project that would dishonor sacred ground for Minidoka survivors, descendants and the larger Japanese American community, including survivors and descendants with both Japanese and Alaska Native heritage. We support renewable energy and the Biden Administration's policy to combat climate change which is predicated on environmental justice principles. Because of BLM's findings that preferred Alternatives C and E would have "disproportionately high and adverse impacts" on the Japanese American and Indian Tribes, the proposed Lava Ridge project does not comport with the Administration's policy goals to fight climate change and advance environmental justice. Instead, the Lava Ridge project unnecessarily pits these two goals against each other.	See response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics).
11652-3	Natasha Varner	As we address the climate crisis, we cannot dismiss Minidoka's historical significance nor replicate the injustice wherein communities of color experience a disproportionate burden from our fossil fuel economy. Our sustainable, clean energy future must be intersectional in its approach and center those communities most impacted. The selection of a site in direct proximity to Minidoka is antithetical to the Bureau of Land Management's Environmental Justice Implementation Instruction Memorandum (https://www.blm.gov/policy/im2022-059). By listening to the community's opposition to the proposed site of Lava Ridge and deciding to not move forward with the Lava Ridge project as proposed, you have the opportunity to set a new standard for how we ethically approach clean energy production going forward.	See response to comment 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics).
11661-2	Sam Kito Jr	we encourage BLM to begin a public planning process in support of the Greater Minidoka Area of Critical Environmental Concern (ACEC). We also agree that the lands surrounding Minidoka are Traditional Cultural Property for both Japanese Americans and Alaska Natives with ongoing cultural connections to Minidoka.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11661-3	Sam Kito Jr	Based on the importance to Minidoka, we respectfully request your consideration of the following comments: Impacts Analysis: The DEIS fails to analyze the impacts of the project on Japanese Alaskans, including Tlingit, Haida, Tsimshian, Aleut, Inupiat and others, who were wrongfully incarcerated. Because of the unique	See response to comment 11315-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		circumstances of the Japanese Alaskans, many families were separated from their fathers, like our family, further compounding the harmful impact of the incarceration on Japanese Alaskans.	
11661-4	Sam Kito Jr	As noted by a multi-agency Memorandum of Understanding (MOU) signed by the Department of the Interior: … the relocation of many Indian Tribes, the Native Hawaiian Community, and Indigenous peoples from their original homelands has had traumatic impacts on those people collectively at the time, and has enduring negative impacts on the social, cultural, spiritual, mental, and physical wellbeing of Indian Tribes, the Native Hawaiian Community, and Indigenous peoples today.2 The Sacred Sites MOU states the that "Federal agencies, including those that approve or fund projects, are responsible for assessing and considering the potential impacts of their decisions on sacred sites and historic properties of traditional cultural and religious importance."3 We encourage BLM to accurately describe the baseline of the Japanese Alaskan community and the adverse impacts of the wind project on Japanese Alaskans and include relevant analysis of the project on Alaska Native survivors and descendants and include them as a separate category of "Dispersed Environmental Justice Community," throughout the FEIS.	See response to comment 11315-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11661-6	Sam Kito Jr	Federal Trust Responsibility. Please describe the Department of the Interior's trust responsibility to protect Alaska Native Tribal interests with regard to the Japanese Alaskan community, which is a dispersed environmental justice community. Please explain how BLM Alternatives C & E's disproportionately high and adverse impacts on Alaska Native sacred ground is consistent with this trust responsibility.	The DOI's trust responsibilities are described in EIS Section 3.5.1 (Native American Resources). This section identifies the specific Treaties that relate to federally recognized Tribes with ancestral ties to the project area. In accordance with NEPA, the EIS fully considers impacts to natural and cultural resources from proposed long-term occupation of lands by the project, including such plant, animal, water, and mineral resources that may be associated with tribal rights or interests. Section 3.6.1 (Environmental Justice Communities) of the EIS has been revised to include additional discussion of Tribal Treaty rights and trust resources. Alaska Native Tribes are not specifically identified in any of the relevant Treaties listed in Section 3.5.1. However, Alaska Natives are part of the "Japanese American and Minidoka-Connected communities", and therefore, their interests and concerns associated with the Minidoka NHS and greater WRC area are considered and analyzed in EIS Section 3.6.1 (Environmental Justice), as well as EIS Section 3.5.1 (Native American Resources).
11661-7	Sam Kito Jr	Area of Critical Environmental Concern: In announcing the Sacred Sites MOU, we appreciate Sec. Haaland's leadership to preserve sacred sites important to indigenous people and her support for actions to protect Indigenous Sacred Sites: "Since time immemorial, the Earth's lands and waters have been central to the social, cultural, spiritual, mental, and physical wellbeing of Indigenous peoples. It is essential that we do everything we can to honor sites that hold historical, spiritual or ceremonial significance …. The Interior Department is committed to protecting these sacred sites from desecration, while at the same time collaborating with Indigenous communities to increase access and ensure good stewardship of their lands."6 The MOU includes guidance to federal agencies to avoid actions that could damage sacred sites and to take pro-active measures to ensure good stewardship: "agencies should take a forward-thinking approach and not only seek to avoid adverse actions, but collaborate with Indian Tribes and Native Hawaiian organizations to ensure good stewardship of their lands and allow their rightful access and use to certain public lands …"7 The further MOU states that sacred sites include broader landscapes with cultural significance to indigenous people: "Participating Agencies acknowledge that sites sacred to Indian tribes and the Native Hawaiian Community often occur within a larger landform or are connected through physical features or ceremonies to other sites or a larger sacred landscape."8 The proposed Greater Minidoka ACEC is a sacred landscape for Alaska Natives along with the Japanese American community. We encourage the BLM to begin a public planning process to designate the Greater Minidoka ACEC, as required by the Sacred Sites MOU, the Federal Land and Policy Management Act, National Park Service Organic Act, Minidoka National Historic Site authorizing legislation and other relevant authorities.	See responses to comments 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics) and 11672-3 (see in Table A-3h, Environmental Justice and Socioeconomics).
11672-3	Teiko Saito	The Friends of Minidoka have submitted to BLM a proposal that the agency establish a 237,000 acre Greater Minidoka Area of Environmental Concern (ACEC) to preserve the cultural and historic values of the land surrounding Minidoka. The Friends have made a compelling argument as to why its proposal satisfies both the statutory and regulatory criteria for an ACEC. Given the fact that the horribly outdated Monument RMP fails to protect the historic footprint of the Minidoka War Relocation Center, as well as the surrounding viewshed of Minidoka, I strongly urge BLM to amend the Monument RMP and adopt the proposed Minidoka ACEC. I also urge BLM to develop an expedited process for satisfying the NEPA requirements for such an ACEC Monument RMP amendment.	The BLM is evaluating the proposed ACEC designation and TCP boundary for the Greater Minidoka area through a separate process that falls outside the scope of this NEPA analysis. In accordance with CEQ's NEPA regulations at 40 CFR 1502.16(a) and 40 CFR 1506.2(d), the BLM must only consider possible conflicts between the Proposed Action and approved land use plans and policies, including the BLM's RMP objectives. As stated in EIS Appendix 2, public lands in the analysis area are managed in accordance with BLM SFO's 1986 monument RMP (BLM 1986), as amended, and the 2015 greater sage-grouse ARMPA (BLM 2015). The Proposed Action and alternatives described in this EIS are in conformance with both of these plans.
11672-5	Teiko Saito	Let me just close by noting that I am no stranger to tough decision-making by Interior Department federal agencies, having spent 33 years ofmy career at Interior, including 31 of those years with the U.S. Fish and Wildlife Service where I became the first Asian American to reach Senior Executive Service status. Although most of my career with FWS involved international wildlife conservation, I did spend considerable time working in the Endangered Species Act program. I mention this because it is my understanding that the original proposed location of the Lava Ridge Project was shifted to its current site, in order to avoid destroying important sage grouse habitat. For the record, let me emphatically state that I am not only an ardent supporter of expanding renewable energy sources for this country, I am also an equally ardent supporter of the Endangered Species Act and sage grouse conservation. It is not lost on me that during the Obama Administration, BLM adopted and actively promoted its "Smart from the Start" renewable energy policy that was designed to steer renewable energy projects away from high conflict sites on public lands and to redirect them to low conflict sites, thereby facilitating their construction. Steering Lava Ridge away from sensitive sage grouse habitat was a classic example of "Smart From the Start." By contrast, however, redirecting that project to an alternative site that invades the historic footprint of Minidoka and destroys the viewshed of the National Historic Site is the very antithesis of a "Smart from the Start" decision-making process. Moreover, ifBLM approves the project in its	In accordance with CEQ's NEPA regulations, the BLM analyzed the potential effects of the Proposed Action and alternatives on several different resource topics identified through internal and external scoping including but not limited to natural resources, cultural and historic sources, and environmental justice. The BLM will make a reasoned choice among the alternatives based on the EIS analysis for all resources, and the BLM cannot determine significance for a proposed action based on environmental justice effects alone. Also see response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		current proposed location, the Biden Administration will be sending the message that it values sage grouse conservation more than it does protecting a unit of the National Park System that tells the story of one of the most shameful and racially discriminatory episodes in American history. If the mantra of "environmental justice" means anything to the Biden Administration and Secretary Haaland, it must mean rejecting Lava Ridge as it has been proposed, thereby telling the Japanese American community that our history of discrimination matters just as much as the conservation of sage grouse and other cultural/historical sites in the Park System. In 1942, the federal government encircled our camp with barbed wire. In 2023, BLM is being asked to encircle our sacred site with wind turbine towers and blades. Instead of being able to connect with the same lonely landscape that my mother had seen at the end of her life, I would now be distracted by massive twirling blades on an endless sea of turbines. There is no shortage of Presidential Executive Orders like Executive Order 13985 or Secretarial Orders like Secretarial Order 3399 for BLM to follow which promote racial and environmental justice. The only question that remains is whether with regards to Lava Ridge, the agency's final decision will embrace those Orders' spirit and intent? On behalf of not only myself but my brother's family as well, I urge you to protect the hallowed ground and viewshed of Minidoka for generations of Japanese Americans to come.	
11672-6	Teiko Saito	• The Minidoka Relocation Center and its viewshed have also been identified in a study and report commissioned by the Friends of Minidoka as qualifying as a Traditional Cultural Property (TCP) eligible for inclusion in the National Register of Historic Places. This TCP proposal has been endorsed by the Idaho State Historical Society and the State of Idaho Historic Preservation Officer has concurred in its eligibility for inclusion on the National Register. I urge you to consider the information in the TCP report as part of the Greater Minidoka ACEC nomination process and to give great weight to Minidoka's and its viewshed's National Register eligibility during your decision-making on the Lava Ridge Project.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
11724-2	Diana Nielson	I, the undersigned. object to too development of BLM and IDOL Public Lands for the use as a Large Scale Wind Turbine Project. There am many reasons. Some are listed below. 1. Rural gentrification & displacement by a wealthy out of state investor LS Power, to benefit another state [...] 4. Economic impacts to adjoining property owners. Generations of ranches will loose grazing and no documented mitigation plan for their losses has been offered. [...] 6. Excessive use of water during construction. Drilling 6 wells & they will need to find more water to buy. 7. Loss of Public Access 8. Loss of hunting units [...] 10. Large scale battery storage is hazardous. [...] 12. Noise pollution 13. Light pollution 14.Law Enforcement& Emergency Service communication disruption 15.heavy loads on rural county and state Highways will cause breakups. 16. loss of Civil Liberties the local population landowners 17. TRRAFIC: Wide & long loads holding up traffic 18. After construction only up to 20 jobs for 25 years the poor reclamation plan.	See response to comment 11204-38 (see in Table A-3h, Environmental Justice and Socioeconomics).
11772-1	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	We support Alternative A – the No Action Alternative – and respectfully request that the BLM seek public comment regarding the proposed Greater Minidoka Area of Critical Environmental Concern (ACEC) and work with the NPS and State of Idaho SHPO regarding the Minidoka Traditional Cultural Property (TCP) National Register eligibility determination.	See responses to comments 12859-2 and 11672-3 (see in Table A-3h, Environmental Justice and Socioeconomics).
11772-6	Erin Shigaki, Stephen Kitajo; Minidoka Pilgrimage Planning Committee	In addition to flaws in the DEIS, we wish to express our concerns about BLM's failure to follow DOI, BLM and Biden Administration policies regarding engaging with Environmental Justice Communities early in the planning process. While we appreciate BLM's outreach through Langdon Group/CADR program and the public meetings in Washington and Oregon, we felt that it was more of a "check the box" approach rather than a good-faith effort to engage with the Japanese American and Alaska Native community as required by Administration policies. This can be seen by BLM's disregard for some of the most important findings in the Lava Ridge Wind Project Stakeholder Assessment and Engagement Report that was produced by Langdon Group/Kearns & West for BLM in preparation for the DEIS process, such as the section that stated "appropriate meeting locations, dates and times should be coordinated with Local Japanese American community groups." In the Seattle area, a single public open house was held on Mercer Island to discuss the DEIS with the community. The location, date, and time were not discussed with local Japanese American community groups.	See response to comment 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics).
11775-2	Stephen Kitajo	The BLM's preferred alternatives C and E are found to have "disproportionately high and adverse impacts" to the Japanese American community in the DEIS. Knowing these impacts, the BLM has still opted to mark these alternatives as preferred. Based on this, I question the BLM's priorities and their understanding of what Minidoka means to the Japanese American community. The Lava Ridge Wind Project Stakeholder Assessment and Engagement Report was produced by Langdon Group/Keans & West for BLM in August of 2022, before the release of the DEIS. This report found that the BLM should try to engage with stakeholders for future meetings, saying that "appropriate meeting locations, dates and times should be coordinated with Local Japanese American community groups." When the BLM announced that a single public open house to discuss the DEIS would be held in the Seattle area in March 2023, the Japanese American community was surprised because no community groups were contacted to coordinate the open house. That report also found that increased "cultural competency training within BLM is warranted for meaningful engagement." When I attended the open house, I attempted to discuss with the BLM representatives how the Japanese American community in Seattle had a long history of being forced to live in certain areas of the city through redlining and racially restrictive housing covenants, and how Minidoka could be seen as a continuation of that injustice when looking at the community's history. Instead of a discussion, I found myself having to educate the representatives on this history. Based on the lack of cultural competency training and ability to meaningfully engage with the Japanese American community that I experienced at the open house, I do not believe the DEIS adequately incorporates the true	See response to comment 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		significance of Minidoka to the Japanese American community. It would be irresponsible of the BLM to move forward with any action until this is adequately understood.	
11775-4	Stephen Kitajo	This is why I request that the BLM move forward with seeking public comment regarding the currently proposed Greater Minidoka Area of Critical Environmental Concern and to work with the NPS, the Idaho State Historic Preservation Office, and other partners regarding the Minidoka Traditional Cultural Property National Register eligibility determination for more permanent protections for Minidoka.	See responses to comments 12859-2 and 11672-3 (see in Table A-3h, Environmental Justice and Socioeconomics).
11781-1	Gretchen Clelland	I am writing today to voice my opposition to the Lava Ridge Wind Energy project. The main reason for my objection is the financial numbers don't add up. According to Magic Valley Energy's website the construction of these windmills is going to employ 700 people and employ 20 people full time after completion. Do these workers have families, more specifically school age children. If Eighty percent of these workers have children that need to go to School that would be 560 families and if they have under the national average of 2.5 kids per family and only have 2 kids in need of public education that would be over 1000 kids added to these tiny districts. A few of these kids may go to Jerome or Minidoka schools but this is a huge problem because of the temporary need to educate these kids. The number of students in Lincoln County could be doubled. The schools would not want to build new facilities to house this influx because after a couple years these workers will have moved on and these districts would be left with buildings to maintain or temporary structures to dispose of when the work force is reduced to 20 from 700. The need to educate children is just one example of the short sidedness of this project. What other infrastructure improvements will need to be made to accommodate this temporary work force. Schools and infrastructure are just one of the reasons the BLM should not proceed with the Lava Ridge wind farm. There is a whole list of other reasons starting with the birds that will be killed or the total unsightly landscape that will be created I could go on for pages and pages but I will stop here and simply ask the Bureau of Land Management NOT to proceed with the Lava Ridge Wind Farm project.	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
11787-4	Representative Jack Nelsen	LS Power has also left unaddressed the effects of 700 workers descending on the small towns and communities surrounding the project. One of the big questions is where will all these people live, when housing is short for our local citizens right now? Rent prices are sure to soar, leaving many in our community possibly unable to afford to live here any more. Who will provide the services needed to meet the needs of these temporary workers? New businesses will sprout up for sure, but what happens to them when the 700 workers leave town when construction is complete. My fear is this project will leave behind broken communities, 20 permanent workers, and a desert environment completely and unalterably changed forever.	See responses to comments 11869-9 and 11869-11 (see in Table A-3h, Environmental Justice and Socioeconomics).
11788-3	Representative Jack Nelsen	3. The last of my major concerns is the lack of thought given to 700 workers dropping into the small towns surrounding the project. LS Power has determined there will be no problem finding 700 workers – my concern is where will these people find housing when it's next to impossible to find housing now, without adding 700 more folks to the rental pool. Not to mention the effect on the cost of rent, the availability of local services to meet the demands of this sudden large influx to our population, and finally……after the construction is complete and the 700 people leave town, what happens to all the businesses which were created to meet their needs at the time? My fear is we will be left with 20 full time workers, a devastated community, and a desert environment which is permanently and irreversibly changed.	See responses to comments 11869-9 and 11869-11 (see in Table A-3h, Environmental Justice and Socioeconomics).
11789-1	David Dillon; Laborers Local 155	The Laborers urge BLM to expand in its Scoping Document the full range of socioeconomic impacts related to the Lava Ridge Wind project, and to issue a finding that the proposed project will result in positive socioeconomic benefits to the surrounding communities and state of Idaho. Notably, because the applicant, LS Power and Magic Valley Energy, has laid out the large amount of economic benefit to numerous disadvantaged communities and employ hundreds of workers to complete this job. As a result, the proposed project will create thousands of high quality construction jobs over a multi-year period that pay family supporting wages and spur reinvestment in the host community and state of Idaho. Moreover, the creation of middle-class jobs for Idaho workers means the project will not increase demand on governmental services and subsistence resources, but in fact, generate additional governmental revenues and improve socioeconomic conditions. Lastly, high quality construction jobs promote equity because they offer a path to the middle class for workers who lack a college degree. This is especially salient in Idaho because the state has one of the lowest college attainment rates in the nation. Opportunities like partnering with LIUNA, assists in the rate of pay and the availability of affordable family health insurance for Lava Ridge construction workers which matters because projects that lack these benefits can result in an influx oflow-wage, and under- or uninsured workers who increase uncompensated care costs at hospitals, and rely on governmental subsidies in the host community. In this case, the potential of thousands of high quality jobs will support local healthcare institutions, and improve local socioeconomic conditions.	Project-related benefits to the local and regional economy (see EIS Section 3.6.3 [Local and Regional Economy]) were modelled using IMPLAN, which is a widely used economic impact analysis model. The BLM included an appropriate level of detail in the economic analysis that is based on the best available information and reasonable assumptions regarding employment and the costs of construction and operation. Including additional assumptions of potential wages or employment benefits would be speculative and unreliable.
11789-2	David Dillon; Laborers Local 155	In addition, by working on hiring local employers and workers from Idaho and surrounding communities, the workforce will be workers who live in Idaho and the surrounding community which will reduce housing and transportation burdens while ensuring workers' earnings are reinvested in the state and neighboring communities. Many projects analyzed by the Laborers before federal organizations claim to employ significant local workers, but typically import a majority out-of-state workforce. Moreover, economic models used by applicants assume 100% local employment despite actual low local employment. For example, developers typically rely on the IMPLAN model to quantify a project's cumulative local economic impacts, including induced impacts. IMPLAN's methodology assumes 100% local employment. In this case, by using these resources, local and state construction workers will benefit from job opportunities boosting the local and state economic effects of the project. Indeed, the employment oflocal and in-state labor matters because out-of-state workers typically limit	See response to comment 11789-1 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		their local spending to daily per diems for food and lodging while local workers spend 95% of their earnings locally.1 The Lava Ridge Wind project will also provide a much needed boost to Idaho's construction industry which generates the greatest share of unemployment claims in the state.	
11789-3	David Dillon; Laborers Local 155	In order to ascertain the full range of the socioeconomic benefits of the Lava Ridge Wind project, the Laborers identify the following issues for further study: 1. To what extent does a project that creates construction jobs that pay high wages impact the local and state community when compared to a project that lacks any livable wage commitment?	See response to comment 11789-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11789-4	David Dillon; Laborers Local 155	In order to ascertain the full range of the socioeconomic benefits of the Lava Ridge Wind project, the Laborers identify the following issues for further study: [...] 2. To what extent does a project that creates construction jobs that offer affordable family health insurance impact healthcare resources in the host community when compared to a project with high levels of under-insured or uninsured workers?	See response to comment 11789-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11789-5	David Dillon; Laborers Local 155	In order to ascertain the full range of the socioeconomic benefits of the Lava Ridge Wind project, the Laborers identify the following issues for further study: [...] 3. To what extent does the availability of high quality construction jobs promote equity in underserved communities?	See response to comment 11789-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11789-6	David Dillon; Laborers Local 155	In order to ascertain the full range of the socioeconomic benefits of the Lava Ridge Wind project, the Laborers identify the following issues for further study: [...] 4. To what extent does a project with greater rates of local and state worker employment impact local and state community resources when compared to a project with a low rate of local and state worker employment?	See response to comment 11789-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11869-9	Raul Labrador, Josh Turner; Idaho Attorney General's Office	The Project harms the physical and economic well-being of Idahoans in several ways. First, an influx of temporary labor and federal dollars to construct the Project could cause a temporary housing shortage and lead to long-term increases in housing costs that price out Magic Valley residents. The rapid influx of short-term labor will strain local infrastructure and services like public schools and law enforcement. See draft EIS at ES-xix.	EIS Section 3.6.2 (Community Services, Employment, and Housing Availability) has been revised to include additional details regarding the anticipated effects of non-local construction workers on community services and housing. The analysis has been revised to clarify assumptions regarding where non-local construction workers would reside within the regional analysis area, what type of housing accommodations would be available to them, and how many workers would realistically be expected to bring children and family members with them. EIS Section 3.6.2 (Community Services, Employment, and Housing Availability) has been revised to include more contextual information regarding current housing availability and housing affordability in the analysis area that allows for more detailed comparisons between existing conditions and the effects of the Proposed Action.
11869-11	Raul Labrador, Josh Turner; Idaho Attorney General's Office	[The draft EIS Ignores Idaho's Sovereign Interest in its People.] Third, a short-term influx of federal dollars threatens to create a boom-bust economic cycle in the Magic Valley region. The draft EIS projects that the Project will bring in $277 million during its two years of construction, but only $15 million per year during the Project's operation. draft EIS at ES-xix.	"Boom and bust" refers to a period of rapid economic growth that is abruptly followed by one of economic decline. The short-term and long-term economic effects of the Proposed Action and alternatives are presented in EIS Sections 3.6.3 (Local and Regional Economy) and 3.9.1 (Grazing Allotments and Range Socioeconomics). Section 3.6.3 describes how local and regional economies would experience economic benefits during construction and operation because of indirect and induced jobs and tax revenues. The economic benefits of the project would be distributed amongst non-local workers (i.e., construction jobs), local communities (i.e., spending on goods and services) and local or state governments (i.e., taxes). Although the short-term economic benefits of construction would outweigh the long-term benefits of operation, in terms of annual economic output and tax revenues, many of the short-term economic benefits would be distributed outside of the local economy (i.e., to state governments or non-local workers) and the project would continue to provide a net benefit to the local and regional economy over the long term, albeit to a lesser degree than during construction. For these reasons, the transition from construction to operation is not expected to cause any significant decline and de-stabilization of the local or regional economy.
11869-15	Raul Labrador, Josh Turner; Idaho Attorney General's Office	[The draft EIS Ignores Idaho's Sovereign Interest in its People.] Eighth, the Project will have a generation capacity of 1,000 megawatts or more. DEIS, Introduction. This could tax the energy grid and threaten the stability and predictability of Idaho's energy supply, but the draft EIS doesn't consider this, or even mention it.	See response to comment 7344-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11873-6	Mary Schwartz, Frank Schwartz	6. This project will have very little economic benefit to Idaho or its residents. While the DEIS Table 2.4-1 provides estimated ranges of construction personnel and operations personnel for each alternative, much of the construction labor work force would not be local labor, but instead semi-skilled laborers and contractors and equipment from outside of the area that specialize in wind farm installation. The operations staff is very minimal, and again, likely to be primarily imported rather than local residents. While there would be a few jobs available for local companies and laborers during the construction phase and possibly operations, the small number of local employees and contractors will have an insignificant benefit to the local area or Idaho as a whole. Any economic benefits to the Idaho economy from the transient workforce during construction are short-lived. Table ES-2 includes a section on socioeconomics, which also overstates the potential benefits from spending and tax revenues. It is normal for the majority of the wind farm components to be imported from overseas (China or other), so there is also little, if any, benefit to US manufacturers from this wind project. The DEIS portrayal of jobs and economic benefits associated with this wind farm proposal is not transparent and is very misleading.	Project-related benefits to the local and regional economy (see EIS Section 3.6.3 [Local and Regional Economy]) were modelled using IMPLAN, which is a widely used economic impact analysis model. Section 3.6.3 specifies that direct jobs and associated labor income would be distributed to non-local workers who would reside within the analysis area during construction, whereas much of the indirect and induced jobs would be distributed to locals because of spending on goods and services within the analysis area. Therefore, the relative distribution of economic benefits between locals and non-locals is correctly described in the EIS analysis.

Comment ID	Commenter	Public Comment	Response to Comment
11915-8	Kim Peyman	Furthermore, these same pro-wind farm people may be excited by the prospect that the wind farm will bring jobs and revenue to the area. Over the estimated four-year construction period, this proposal will create the largest wind farm in all of North America. I say, “No Thank You” again! I cannot dispute that revenue will likely increase with the influx of their workers, but as for the jobs, I am not sure how many local residents are skilled in erecting wind turbine towers. I am sure that some residents with particular skills will get hired, but not in the numbers we are led to believe. We see it all the time in Shoshone, the company pickups from other states heading up North to build someone’s new home or whatever it may be. I further question if the wind farm company would even want to train a new, small army of local workers when they already have employees that know the business. I say that they are using this as a selling point, a false promise, to entice our community into permitting this atrocity to take root in the most literal sense of the word.	See response to comment 1689-8 (see in Table A-3h, Environmental Justice and Socioeconomics).
11926-5	Name Not Provided, Susan Jesser	Jerome County has large LEP (limited English proficiency population and the draft EIS was not translated into Spanish. A Hispanic friend told me the Jerome area is nicknamed “Little Mexico.” This concern should be investigated by the Federal Coordination and Compliance Section of LEP.gov and Department of Interior.	See responses to comments 11982-1 and 12398-5 (see in Table A-3h, Environmental Justice and Socioeconomics) and see response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
11963-3	Jeff Fujioka	Projects like Lava Ridge windfarms may be a better alternative environmentally and funding via private for-profit enterprises perhaps is the only way the country can have environmentally responsible energy production given the present political situation. But it sounds like the electricity Lava Ridge will produce will provide little benefit to Idahoans, and the electricity will be sold to the highest bidder, probably to areas like Los Angeles, Phoenix maybe. The benefit would go to the for-profit investors of the Lava Ridge project. The State of Alaska has somehow negotiated with the oil companies a tax on the many barrels of oil pumped out of Alaska. This tax has certainly not hurt the profitability of these companies. If Idaho could somehow negotiate a tax on the kilowatts of electricity produced by Lava Ridge that is exported from the state, this tax could supplement state government operations currently funded by taxing individuals. It is my understanding that Idaho has a State income tax that could be reduced by taxes on exported wind energy. I would not recommend eliminating the State income tax, which Alaska has done, reduce the rate, but keep in place. Alaska has run into problems since oil revenue prices have reduced and the State has difficulty funding programs that were built with the State income tax before the oil started flowing.	The BLM’s purpose and need for action arises from the BLM’s responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. The commenter is suggesting state-wide policy changes related to energy production and export, which are outside the scope of this NEPA analysis and are also outside of the BLM’s jurisdiction by law as a federal agency. The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. In accordance with CEQ’s NEPA regulations, the BLM analyzed the potential effects of the Proposed Action and alternatives on several different resource topics identified through internal and external scoping including but not limited to natural resources, cultural and historic sources, and socioeconomics. With respect to the economy, the BLM analyzed the potential economic effects of the project in EIS Section 3.6 (Environmental Justice and Socioeconomics). The BLM will make a reasoned choice among the alternatives based on the EIS analysis for all resources, and the BLM cannot determine significance for a proposed action based on economic effects alone.
11968-2	Cheryl Sandy	Psychologically we are being pushed to comply with the "Green New Deal" Biden administration's blown out of proportion hysteria. Biden has shut down Part of our oil industry. We were energy independent and now we are dependent on the Middle East and other nations to supply our energy needs. There are far more effective and economical ways to meet our energy demands. The Windmills are not energy or financially effective. The Windmills require federal subsidies.	In accordance with CEQ’s NEPA regulations, the BLM analyzed the potential effects of the Proposed Action and alternatives on several different resource topics identified through internal and external scoping including but not limited to natural resources, cultural and historic sources, and socioeconomics. With respect to the economy, the BLM analyzed the potential economic effects of the project in EIS Section 3.6 (Environmental Justice and Socioeconomics). The BLM will make a reasoned choice among the alternatives based on the EIS analysis for all resources, and the BLM cannot determine significance for a proposed action based on economic effects alone.
11970-1	Janet Keegan	3.6.2.2.3: EO 12898 refers to Environmental Justice: The DEIS clearly disregards this Executive Order as the project will trample, decimate and destroy forever cultural resources, known and unknown, relative to the indigenous peoples that traveled, utilized and revered the project area for centuries. The descendants of these people residing on the Fort Hall Indian Reservation and Duck Valley Indian Reservation are considered “minority and low-income” as described in the EO. Summary of Executive Order 12898 - Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations | US EPA The large population of Hispanics that reside in Jerome, Lincoln and Minidoka Counties have not been considered whatsoever in the DEIS. The DEIS was not available in Spanish, the public meetings by the BLM did not provide for our large community of Spanish speaking residents. The descendants of the Minidoka War Relocation Center (MWRC) are recognized in the DEIS, however referring to this group as “visitors” is disingenuous. The BLM made a great effort to recognize the impact of the proposed project on the Japanese American (JA) community, but it was delayed reaction and an insult to the JA community. BLM and the developer was clearly aware of the MNHS and MRC and the adverse effects a project of this magnitude would have. The developer was entangled in a situation with a transmission line crossing through the MNHS in 2008. The issue was resolved legislatively in 2009. The JA community was notified of the Lava Ridge project in the middle of 2021.	See responses to comments 11535-50, 6340-1, and 11982-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
11978-32	Magic Valley Energy, LLC	Section 3.6.2.2.2 – Environmental Justice and Socioeconomics: Japanese American Community 28. The DEIS states: “Any adverse effects to Minidoka NHS and Minidoka WRC would also have the potential to cause psychological harm to members of the Japanese American community by perpetuating and reinforcing existing feelings of distrust and being dishonored within the community.” a. MVE Comment: MVE sympathizes with all those impacted by the wrongful incarceration of Japanese-Americans at the Minidoka Internment Camp, and we support those programs, groups, and services affiliated with the remembrance and education that surrounds the Minidoka War Relocation Center and the Minidoka National Historic Site. Although the DEIS evaluates impacts to Minidoka associated with the various action alternatives, regarding psychological impacts, the U.S. Supreme Court found that the NEPA process cannot properly assess psychological impacts from a Project; thus, the above-referenced language from the DEIS should be removed. This stems from the decision of Metro Edison Co. v. People Against Nuclear Energy, 460 U.S. 766, 777-78 (1983), where the U.S. Supreme Court states, among related holdings, that “It would be extraordinarily difficult for agencies to differentiate between ‘genuine’ claims of psychological health damage and claims that are grounded solely in disagreement with a[n agency] policy.”	The potential for the project to cause psychological harm to members of the Japanese American community was determined through direct feedback received during BLM’s engagement efforts with the Japanese American community. In addition, EIS Section 3.6.1 has been revised to include a new literature citation that supports the idea of there being extended consequences of historical trauma on former incarcerees. Therefore, the statement in the EIS is not considered speculative and will remain in the analysis.

11978-35	Magic Valley Energy, LLC	Section 3.6.2.2.2 – Table 3.6-2: Impacts to Dispersed Environmental Justice Communities 31. MVE Comment: This summary table, and the subsequent analysis of Alternative E, states that all Alternatives would have disproportionately high and adverse impacts to the Japanese American community and Native American tribes from a number of effects, including increased noise. This contradicts Section 2.5.6.2.5, which states that: "The auditory component of the APE for Alternative E would not reach Minidoka WRC, and therefore, results in 100% less potential auditory impact to Minidoka NHS and Minidoka WRC than for Alternative B, and proportionally less than any of the other action alternatives." As such, Table 3.6-2 and Section 3.6.2.2.5 should be revised to clarify that Alternative E would have no auditory impacts to the Minidoka NHS or the Minidoka WRC.	Section 3.6.1.2.2 has been revised to clarify which effects would be reduced versus eliminated under each of the action alternatives.
11982-1	Joan Hurlock	A memorandum to heads of federal departments and agencies accompanied Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations". The memorandum emphasized the importance of public participation in the NEPA process and states "each Federal agency shall provide opportunities for community input in the NEPA process" and the agencies are directed to "identify potential effects and mitigation measures in consultation with affected communities, and improve the accessibility of meetings, crucial documents, and notices". (italics mine) This Executive Order requires that each agency shall, "wherever practicable and appropriate, translate crucial public documents, notices and hearings, relating to human health or the environment for limited English speaking populations", and should work to "ensure that public documents, notices, and hearings relating to human health or the environment are concise, understandable, and readily accessible to the public." Also, Executive Order 13166, "Improving Access to Services for Persons with Limited English Proficiency", requires Federal agencies to provide meaningful access for people with Limited English Proficiency. Noticeably absent from the Lava Ridge Wind Project (LRWP) NEPA process is any attempt to involve the non-English speaking community residing within the three counties in the LRWP impact area. This process included: pubic scoping, the BLM's open house meetings, Magic Valley Energy's community outreach events, BLM notices of upcoming meetings, and the actual DEIS document. A significant percentage of the population in these counties – Lincoln, Jerome, and Minidoka – is non-English speaking or Limited English Proficiency, with Spanish being the primary minority population language. There has been no outreach to, or communication with, this particular community. I have attended a majority of BLM's online and in-person meetings, and have been to MVE's community outreach events. None of the meetings have had translators present, no advertising has been directed to Spanish language media sources and, until just a few days ago, no written documents were provided in Spanish. The members of the BLM Resource Advisory Committee, Lava Ridge Subcommittee had representatives from various affected stakeholder groups including: Japanese/Americans, Native American Communities, Wildlife, county commissioners, grazers, and recreational groups. Absent from this subcommittee was a representative from the Minority or Limited English Proficiency constituencies. The counties (Jerome, Lincoln, and Minidoka) in the impact area of the Lava Ridge Project have a large percentage of Hispanic and Latino people*. These residents have not been informed about this project, nor been provided information in Spanish in order to have the ability to submit an informed comment regarding the LRWP. I personally have made more effort to inform this community about Lava Ridge than both the BLM and Magic Valley Energy. I spoke about the LRWP on the Spanish radio station (99 .1 FM, La Perrona), I have provided information and documents to leaders in the Hispanic community, and along with other individuals, have gone door to door in the Jerome area, to invite people with Limited English Proficiency to Stop Lava Ridge events. Until people with Limited English Proficiency (LEP) have been fully informed about the Lava Ridge Wind Project, documents have been made available at least in Spanish (there is a significant Basque, and Portuguese speaking community in the area as well), and people with LEP have been afforded the opportunity and ample time to comment on the DEIS, Alternative A, the No Build Option, must be selected. The BLM must comply with Executive Orders that address environmental justice in low-income and Minority populations and improve access to persons with Limited English Proficiency. *Hispanic or Latino Population Jerome County: 38.3% Lincoln County: 32.5% Minidoka County: 36.0% Source: www.census.gov <https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwww.census.gov%2F&data=05%7C01%7Cblm_id_lavaridge%40blm.gov%7Cc41e15729c774463887e08db41c7cac8%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638176098584409532%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=PD6a2KuHzBkMZZUL1hh5apWoblQ7Hpef1d5i1Bm7ZGg%3D&reserved=0>	EIS Section 3.6.1 (Environmental Justice Communities) has been revised to describe the percentage of the analysis area population with limited English proficiency. The BLM published notices for public scoping and public comment periods in both English and Spanish. In addition, Spanish speakers were present at public scoping meetings and draft EIS open-house meetings. See also response to comment 12398-5 (see in Table A-3h, Environmental Justice and Socioeconomics) and see response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
11991-3	Julie Abo	"About half of all census tracts and block groups within the analysis area were identified as a low-income population, minority population, or both. (page 3-192)" The fact that "half of all census tracks and block groups within the analysis area were identified as low-income population, minority population, or both" raises an alarm. This pattern of federal projects negatively impacting low income and minority populations is highly unacceptable in 2023. Please refer to this reference: "How infrastructure has historically promoted inequality" https://www.pbs.org/newshour/politics/how-infrastructure-has-historically-promoted-inequality The Native American Tribes have already had cumulative negative effects over the past centries due to "agricultural land use, private property development, livestock grazing and associated infrastructure, motorized access, existing linear features (e.g., roads, transmission lines, railroads), electrical substations, existing wind and solar development, irrigation canals, aquifer recharge sites and monitoring wells, ESR and vegetation treatment projects, and existing ROW projects." This is unacceptable, particularly in light of Secretary Haaland's EO 14008 that aims to address "cumulative impacts on disadvantaged communities."	EIS Section 3.6.1 (Environmental Justice Communities) analyzes potential effects of the Proposed Action and alternatives on environmental justice populations. This analysis includes a discussion of potential cumulative effects on Native American populations. The referenced article does not contradict the EIS analysis or present new information that is relevant to the analysis. Identifying low-income or minority block groups within the analysis area is meant to describe the affected environment, and the mere presence of environmental justice populations within the analysis area does not necessarily mean that those populations would be subject to disproportionately high and adverse effects. Also see responses to comments 11535-49 and 11535-50 (see both in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
11991-4	Julie Abo	I would also argue that Indigeouns peoples and Japanese Americans are disproportionately adversely affected because of multigenerational trauma passed on from historical negative treatment by the US government and Department of the Interior, therefore adding an additional layer of non-physicall impacts in this encounter wth the NEPA process and the BLM, a governmental entity of the United States and the LS Power's Lava Ridge Wind Project. (Racism, Culture and Trauma: The Japanese American Internment. A Teacher's Guide for the Children of the Camps Documentary by Satsuki Ina, PhD) Dr. Donna Nagata has also done research studies on this topic of multigenerational trauma of the Japanese Americans who were incarcerated during WWII and concluded that as a community, this shared history had very negative psychological impacts. See: Nagata, D. K., & Patel, R. A. (2021). "Forever foreigners": Intergenerational impacts of historical trauma from the World War II Japanese American incarceration. In P. Tummala-Narra (Ed.), Trauma and racial minority immigrants: Turmoil, uncertainty, and resistance (pp. 105–126). American Psychological Association. https://doi.org/10.1037/0000214-007 The multigenerational trauma impacts noted as silence about emotional issues, hoarding, alcoholism and workaholic behavior have even presented in fourth generation Japanese Americans with Dr. Nagata's more recent study. Nagata, Donna. "Intergenerational Impacts of the World War II Japanese American Incarceration." Uploaded by University of Michigan, April 6, 2021, https://www.youtube.com/watch?v=AufjbkE9xlQ The category of "environmental social justice communities" has been decades in the making. However, I would argue that this is not just another category to tick off in the checklist of the NEPA process, but rather a framework by which the NEPA process should be guided by. Shouldn't we learn the well-known lessons of the past federal infrastructure projects, such as the highway system, that negatively impacted communities of color and low-income and center the interests of all groups in the formation and conceptualizing of large sustainable energy projects?	The BLM has reviewed the referenced article and will incorporate it into EIS Section 3.6.1 (Environmental Justice Communities) to provide additional context regarding the extended consequences of historical trauma on former incarcerees.
11991-16	Julie Abo	I wholeheartedly support sustainable energy. I agree with the Biden Administration's policy to support and encourage sustainable energy projects, but we should also be collaborating with environmental social justice communities and the greater population, particularly indigenous peoples (identified as "Native Americans" in the DEIS) on deciding what kind of sustainable energy is the best fit for the community, locally and dispersed. This process is not collaborative.	See response to comment 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics).
11991-19	Julie Abo	Having a smaller footprint does not reduce the overall impact on affected communities of people. This kind of solution reflects a lack of cultural competence and a misunderstanding of these irreversible impacts. Simply making the physical size of the project smaller does not make the impact smaller. This cannot be quantified in this way. Whether wildlife, Native American, Japanese American, American, the physical effects of the project will have a lasting negative impact on these communities. (See page ES xviii Environmental justice communities and ES xxii) While the DEIS states "decreased degree of visual change.." and "reduced visual change due to increased distance" this is only a reduction of visual effects which does not resolve the issue of impacts to the "setting, feeling and visitor experience at the Minidoka National Historic site and for Native American Nations." No matter what the size of the visual impact, the negative impact persists and is irreversible. Although the visual and auditory impact numbers are reduced, it does not reduce the overall negative impact to these cultural resources. (see page 3- 183) The KOP negative visual impacts with a minimum of "moderate" are not acceptable.(page 3-206 -Table 3.6-3. Environmental Justice Key Observation Points) None of these poles or lines were included in the visual simulation of the KOPs: Alternative C 201 miles total 53 miles underground 148 miles overhead Estimated 2,664 poles Alternative E 145 miles total 38 miles underground 107 miles overhead Estimated 1,926 poles (page 2-6). It's clear these would have an impact on the setting, feeling and visitor experience at the Minidoka National Historic site and for Native American Nations. If there are expected projects in neighboring parcels of land, then shouldn't they be included in all of the simulations as cumulative effects? I am concerned that the neighboring projects are of the same size and scale. (See page 3-18) The visual change for all alternatives clearly has a negative impact on the viewshed and in effect, the immersive feeling of the incarceration site and the power of place that educates all who visit. (page 3-412) It is significant that a Traditional Cultural Property has been designated and the viewshed is part of this TCP.	The environmental justice analysis in Section 3.6.1 concludes that although the smaller footprint of some alternatives would reduce the magnitude of potential effects, disproportionately high and adverse impacts to the Japanese American community and Native American Tribes would still occur under all of the action alternatives. Cumulative visual effects from reasonably foreseeable projects in the surrounding areas are considered and analyzed in EIS Section 3.6.1.2.7. Also see response to comment 11454-2 (see in Table A-3y, Visual Resources).
12048-2	Karen Matsumoto	I enthusiastically support the proposed Greater Minidoka Area of Critical Environmental Concern (ACEC). This designation provides permanent protections for Minidoka as a historic site as well as other traditional uses of the land. This proposed designation should be considered by the BLM in the decision-making process.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12050-3	Roger LeRoy Miller	Then there is the question of how your group created a cost-benefit analysis of this project. I did not see any real analysis of this kind that accurately assessed the real cost to society of this project. I believe that you are violating existing environmental law.	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
12054-6	Kevin Emmerich	The Friends on Minidoka have submitted a nomination to create the Greater Minidoka Area of Critical Environmental Concern, in order to protect the cultural landscape that is visible from the Minidoka National Historic Site. This was intended to be a conservation alternative to the proposed wind project. While the nomination came in only a couple months ago, it should be considered significant new information and the BLM should extend this comment period and prepare an additional EIS that considers this alternative.	See responses to comments 12859-2 and 12859-16 (see in Table A-3h, Environmental Justice and Socioeconomics).
12054-11	Kevin Emmerich	Establishing a Greater Minidoka Area of Critical Environmental Concern would create a reason to raise the VRM Class to VRM Class II. Since the Minidoka National Historic Site has a cultural landscape and the viewshed disturbance would impact Craters of the Moon National Monument, the VRM Class could easily be upgraded to VRM Class II. A large sprawling wind project with 700-foot turbines would not be consistent with even VRM Class III let alone VRM Class II. In 2017, the BLM released a NEPA review for the Crescent Peak Wind Project	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		in Southern Nevada. Like the Lava Ridge Project, it would have been located next to a National Park Service unit – the Mojave National Preserve. Since the 1997 Las Vegas RMP designated the site a VRM Class III, a plan amendment was required to downgrade the VRM Class for this project. The turbines would have been about 600 feet tall, lower than what is proposed on Lava Ridge.	
12083-1	Adrian Arp	After studying the 4-volume Lava Ridge DEIS Report, conspicuously absent from the document is a thorough cost analysis of the different components of the project. This cost sheet should include the estimated costs of: raw materials, transportation, construction, facility operations, component manufacture, labor, decommissioning and mitigation efforts. The more one reads the DEIS, the more one realizes that the expense to build, operate, and decommission the project will be staggering! For the sake of transparency, and to give taxpayers assurance that the benefits of the Lava Ridge Project outweigh the risks and costs, the BLM should require Magic Valley Energy/LS Power to provide a balance sheet - "show me the money" in other words. Where is the Business Plan? Where is the list of projected and estimated costs – a detailed budget? How will this project be funded? Where is the balance sheet for the company? A profit/loss statement should be posted for the public to look over. How do we know this company has the funds to see this project through to completion? What is the amount of the Federal subsidies MVE/LS Power will receive? Cost projections should include: road material concrete wind turbine components and structures transportation of wind turbine components transmission lines wages and benefits for employees herbicides 126,000 pounds of explosives compensation for sage grouse fatalities fire suppression applicable licenses, permits, and fees biologists for surveys lease, rental, or purchase of heavy machinery and equipment fines for excessive eagle kills repairing/replacing damaged or contaminated wells water for dust control feed replacement for displaced cattle settlements of any liability lawsuits due to injuries or deaths and most importantly… funding alternative sources of water for agriculture, livestock and residential use if the Snake River Plains Aquifer is damaged. Due to rising inflation and higher interest rates, how will the Lava Ridge project even be profitable? What assurance do taxpayers have that MVE/LS Power won't go bankrupt when the time comes to mitigate everything that must be mitigated? The public has been told that MVE/LS Power will provide a bond to pay for the necessary mitigation plans, for example the cost of repairing and replacing damaged roads. If MVE/LS Power goes bankrupt, who will be responsible for any compensatory mitigation? Will the affected cities, counties, or state be responsible to cover any unpaid bills? Magic Valley Energy and LS Power – open up your books!	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
12136-3	Diane Honda	The implementation of the Lava Ridge Wind project is contrary and insensitive to cultural competency mandated by President Biden's Executive Order on Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.whitehouse.gov%2Fbriefing-room%2Fpresidential-actions%2F2023%2F02%2F16%2Fexecutive-order-on-further-advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government%2F&data=05%7C01%7Cblm_id_lavaridge%40blm.gov%7C29b6d9aeadab438769b508db4135cc85%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638175471547161429%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=OM5FuUXpEshKlWGT4acl3%2FNXbt5Qqp8jyc%2FiYsr4%2B9U%3D&reserved=0> A section referencing this executive order should be added the DEIS as well as updating DEIS Alternatives to ensure they meet the specifications of this order.	See response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics).
12151-2	Matt Reifer	my biggest concern is the loss in value of my property. I live just 1.5 miles east of the proposed project, so not only would my view be distorted, but there would be major impacts to my land due to the loss in the number of raptors and bats, the number of rodents and insects would most likely increase tenfold on my property. My other concern is the possibility of additional dust during high winds due to the hundreds of miles of new dirt roads being built, and the possibility of the groundwater dropping and well water quality. My father homesteaded the land I live on, and he also built the house and other outbuildings on the property. I have also lived and worked in many other places in the United States over the past 30 years, and most people would consider those places paradise. However, three years ago I had the opportunity to return to my home here in Idaho to live and work. I did not come back here because I had to, I came back because there's no other place in the world more desirable to live than here. If these wind turbines are built, it would destroy my life, and the home my father built. Please have LS Power tell me how they will compensate me for my loss.	All of the issues mentioned by the commenter are analyzed in EIS Sections 3.16 (Visual), 3.3 (Avian and Bat Species), 3.2 (Air Quality), 3.17 (Waters Resources), and 3.6.4 (Residential Property Values). The commenter has not identified any deficiencies in these analyses. Also see response to comment 11535-55 (see in Table A-3h, Environmental Justice and Socioeconomics) regarding property values.
12159-2	Marie Matsuno, Dan Sakura	I also support the petition from the Friends of Minidoka to designate the Greater Minidoka Area of Critical of Environmental Concern (ACEC). Minidoka is a sacred place for Japanese Alaskans, like me, who have both Japanese and Alaska Native ancestry (Aleut).	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12159-4	Marie Matsuno, Dan Sakura	The DEIS fails to analyze the impacts of the project on Japanese Alaskans, including Tlingit, Haida, Tsimshian, Aleut, Inupiat and others, who were wrongfully incarcerated. Because of the unique circumstances of the Japanese Alaskans, many families were separated from their fathers further compounding the harmful impact of the incarceration on Japanese Alaskans. As noted by a multi-agency Memorandum of Understanding (MOU) signed by the Department of the Interior: … the relocation of many Indian Tribes, the Native Hawaiian Community, and Indigenous peoples from their original homelands has had traumatic impacts on those people collectively at the time, and has enduring negative impacts on the social, cultural, spiritual, mental, and physical wellbeing of Indian Tribes, the Native Hawaiian Community, and Indigenous peoples today. The Sacred Sites MOU states the that "Federal agencies, including those that approve or fund projects, are responsible for assessing and considering the potential impacts of their decisions on sacred sites and historic properties of	See response to comment 11315-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		traditional cultural and religious importance." I encourage BLM to accurately describe the baseline of the Japanese Alaskan community and the adverse impacts of the wind project on Japanese Alaskans and include relevant analysis of the project on Alaska Native survivors and descendants and include them as a separate category of "Dispersed Environmental Justice Community," throughout the FEIS.	
12159-6	Marie Matsuno, Dan Sakura	Federal Trust Responsibility. Please describe the Department of the Interior's trust responsibility to protect Alaska Native Tribal interests with regard to the Japanese Alaskan community, which is a dispersed environmental justice community. Please explain how BLM Alternatives C & E's disproportionately high and adverse impacts on Alaska Native sacred ground are consistent with this trust responsibility.	See response to comment 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
12159-7	Marie Matsuno, Dan Sakura	Area of Critical Environmental Concern: In announcing the Sacred Sites MOU, I appreciate Sec. Haaland's leadership to preserve sacred sites important to Indigenous people and her support for actions to protect Indigenous Sacred Sites: "Since time immemorial, the Earth's lands and waters have been central to the social, cultural, spiritual, mental, and physical wellbeing of Indigenous peoples. It is essential that we do everything we can to honor sites that hold historical, spiritual or ceremonial significance …. The Interior Department is committed to protecting these sacred sites from desecration, while at the same time collaborating with Indigenous communities to increase access and ensure good stewardship of their lands." The MOU includes guidance to federal agencies to avoid actions that could damage sacred sites and to take pro-active measures to ensure good stewardship: "agencies should take a forward-thinking approach and not only seek to avoid adverse actions, but collaborate with Indian Tribes and Native Hawaiian organizations to ensure good stewardship of their lands and allow their rightful access and use to certain public lands …"6 The further MOU states that sacred sites include broader landscapes with cultural significance to Indigenous People: "Participating Agencies acknowledge that sites sacred to Indian tribes and the Native Hawaiian Community often occur within a larger landform or are connected through physical features or ceremonies to other sites or a larger sacred landscape." The proposed Greater Minidoka ACEC is a sacred landscape for Alaska Natives along with the Japanese American community. I encourage the BLM to begin a public planning process to designate the Greater Minidoka ACEC, as required by the Sacred Sites MOU, the Federal Land and Policy Management Act, National Park Service Organic Act, Minidoka National Historic Site authorizing legislation and other relevant authorities.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12182-2	Mark Jones	Over the years we have had Farm and Ranches for sale and have worked with buyers looking at Farm and Ranches located directly by windmill farms. Those Farm and Ranches took a longer time to sell, and with a discounted price. The biggest concern was the image of the area with the windmills and the noise. The other big concern is the Farms and Ranches that are by the transmission lines have reported that their irrigation pivots would be breaking down more frequently due to electronic pump panel boxes and motor damage due to the overhead high voltages. Therefore, it is in my opinion that this project would have a sociological and locational negative factor and would send the surrounding properties into declining values, not only for the Farm and Ranches, but also, the residential acreages.	See response to comment 11535-56 (see in Table A-3h, Environmental Justice and Socioeconomics).
12307-23	Dean Dimond	Need analysis of adverse economic impacts to counties, communities, tribes, and state, Need up to date economic impact analysis with cost /benefit to taxpayer in federal PILT and other payments to counties,	The potential for adverse economic effects are discussed in the context of the livestock grazing economy (Section 3.9.1), residential property values (Section 3.6.4), and hunting spending (AIB-29 in EIS Appendix 3). Also see response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
1233-1	Carolyn Dimond	We cannot find anywhere in the DEIS that protects Magic Valley contractors and other businesses/jobs from loss & bankruptcies because of overuse of our cement and other building supplies. The past few years there have been already severe shortages, causing high costs and many delays in construction projects throughout the whole area. A project the size of Lava Ridge would no doubt take what is c. I,I.5(. 1'1<'/\'l. tJ"" available, because they seem to have deep pockets and are willing to bribesWith , leaving the local economy with no ability to buy or afford the supplies necessary to survive. This becomes very personal to those of us who have family members in these businesses.	See response to comment 2100-4 (see in Table A-3h, Environmental Justice and Socioeconomics).
12338-14	National Park Service	Section: 3.6.2.4 Environmental Justice and Socioeconomics Page: 3-216 The NPS suggests that the compensatory measures apply to all action alternatives rather than just Alternative B. Revised text could state: "The following compensatory mitigation measures could be applied to all action alternatives if the BLM determines it is warranted (see EIS Appendix 4)."	Revisions made as suggested.
12390-2	Jon McGregor	Studies have shown there is a property value decrease were wind turbines have been built. 3.6.6.2.2 of the Dies states, studies indicate that proximity to wind energy facilities and and wind turbine visibility can negatively influence property values in some cases (Gibbons 2015; Heinyzelman and Tuttle 2012; SunakMadlener 2013)Gibbons (2015) evaluated the effects of Turbine visibility on home prices in EnglandWales and found that turbine visibility reduced home prices by approximately 6% to 12% (depending on size of wind facility) where turbines were visible within approximately 1.25 miles the effects on property values decreased. There have not been any wind turbines of this size used before, therefore one would suggest that these numbers climb. I do not want my property values to fall.	The EIS analyzes potential effects on residential property values in EIS Section 3.6.4 (Residential Property Values). As stated in Section 3.6.4, the likelihood or degree to which property values may or may not be affected cannot be predicted with any certainty. However, the analysis concludes that there is a potential for property values in the analysis area to be affected by the project.
12398-1	US Environmental Protection Agency	The DEIS describes communities with EJ concerns based on BLM analysis tools. EPA recommends that the FEIS analysis include the use of EPA's interactive web-based screening tool, the Environmental Justice Screening and Mapping (EJScreen, Version 2.1) Tool6, to further evaluate where EJ concerns may exist. EPA	The BLM's environmental justice analysis in Section 3.6.1 (Environmental Justice Communities) complies with EO 12898 and the BLM's environmental justice guidance document (IM 2022-059), issued in September 2022. IM 2022-059 allows for the use of U.S. census data when identifying low-income and minority populations within

Comment ID	Commenter	Public Comment	Response to Comment
		considers a project to be in an area of potential EJ concern when an EJScreen analysis for the project area shows one or more of the twelve EJ Indices at or above the 80th percentile in the nation and/or state. For example, the EJScreen tool indicates that households with limited English- speaking abilities are in the 80th percentile or higher in all three counties in the project area. Strategic outreach tailored to these limited English-speaking communities may be required to achieve meaningful engagement in the project planning, during NEPA analysis, and decision making. Another tool available to help agencies and decision makers screen for potential EJ concerns is the Climate and Economic Justice Screening Tool (CEJST)7. EJScreen and CEJST are complementary tools8.	the analysis area, and although EJScreen or CEJST are data sources that the BLM can electively use to support their analysis, particularly when characterizing the affected environment for environmental justice communities, the BLM is not required to use these data sources. Additionally, EJScreen (Version 2.1) and CJEST are aggregate tools that use the same U.S. census data that were used in the EIS analysis, and CJEST is only applicable for Justice40 projects. Revisions have been made to EIS Section 3.6.1 (Environmental Justice Communities) to incorporate updated definitions and thresholds for identifying low-income and minority populations, using U.S. census data. With these revisions, the EIS is in full compliance with EO 12898 and IM 2022-059. Section 3.6.1 has also been revised to incorporate additional EJScreen index data to further characterize the affected environment for identified environmental justice communities in the analysis area.
12398-3	US Environmental Protection Agency	In consideration of the potential disproportionate impacts by the proposed project to communities with EJ concerns, EPA provides the following recommendations for the FEIS: • Continue to take steps taken to meaningfully engage communities with EJ concerns in the NEPA and Section 106 processes. The Promising Practices for EJ Methodologies in NEPA reviews12 is a useful resource to ensure people have the opportunity to participate in decision making; community feedback is effectively utilized and reflected in the decision-making process; and decision makers seek out and facilitate the involvement of those potentially affected. • Describe how the proposed project will be addressing the disproportionately high and adverse human health, environmental, climate-related, and other cumulative impacts on disadvantaged communities, as well as the accompanying economic challenges of such impacts, consistent with Executive Order 14008 that requires federal agencies to “make achieving environmental justice” part of their missions. Also consider including E.O. 14008 on the list of other Federal E.Os. that will guide evaluation and implementation of the proposed action.13	See response to comment 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics).
12398-5	US Environmental Protection Agency	• Consistent with CEQ’s EJ Guidance, EPA recommends that the NEPA analysis describe the distribution and magnitude of disproportionate impacts to communities with EJ concerns as a factor in determining the environmentally preferable alternative in the Record of Decision. Include the concerns and recommendations received from the affected communities, the magnitude of the environmental impacts associated with alternatives that have a less disproportionate and adverse effect on communities with EJ concerns. Describe mechanisms to avoid impacts, mitigate impacts and potential mitigation measures, as well as related affected communities input. • Consistent with CEQ’s EJ Guidance, EPA recommends that the NEPA analysis research and analyze multiple and cumulative environmental hazards to communities with EJ concerns. This include evaluating of potential construction and traffic impacts on communities with EJ concerns. As part of the assessment, EPA recommends the development of a survey to focus on how community members utilize roadways and obtain input from the community regarding potential impacts of increased traffic congestion, detours, and closures. EPA recommends considering use of translators that speak local languages to ensure greater and more meaningful engagement of communities with native languages other than English. • In developing mitigation measures for potential disproportionate impacts, consider mechanisms to minimize impacts by the proposed project to low-income communities such as: maximizing the number of local hires for the project work, e.g., provide job certified training within low- income areas and prioritize recruitment of local workers within these areas for project related work; offer transportation for local workers; fund childcare or childcare subsidies for workers and project outreach events; and make language translation services available.	The environmental justice analysis (EIS Section 3.6.1) has been prepared in accordance with EO 12898 and IM 2022-059. The analysis describes the magnitude and distribution of effects to environmental justice populations and compares effects across all of the alternatives. Mitigation measures are also discussed, including those which have been developed specifically to address the concerns expressed by members of Japanese American and Minidoka-Connected EJ communities. The Preferred Alternative was identified, in part, to increase the distance of turbine siting corridors from the Minidoka NHS and greater Minidoka WRC area in response to the concerns expressed by members of the Japanese American and Minidoka-Connected EJ communities. The Preferred Alternative would also reduce the potential magnitude of impacts for all EJ communities and residences to the greatest extent compared to all other action alternatives, largely due to the smaller footprint of the siting corridors relative to all other action alternatives (see EIS Section 3.6.1.2.6). See responses to comments 11535-50 and 11982-1 (see in Table A-3h, Environmental Justice and Socioeconomics) and see response to comment 11629-1 (see in Table A-3kk, Public and Stakeholder Involvement).
12398-24	US Environmental Protection Agency	EPA supports the development of alternative and environmentally sustainable sources of energy, such as wind power. In reviewing the DEIS, EPA identified that this project has the potential to disproportionally impact communities with environmental justice (EJ) concerns, including Japanese American, tribal, minority and low-income communities, and recommends such impacts be avoided in the preferred alternative in the FEIS. Specifically, EPA provides the following key recommendations to address impacts to communities with EJ concerns in the FEIS: • Further evaluate and identify communities with EJ concerns who may be impacted by the proposed project utilizing EPA’s EJ Screen tool. • Clearly articulate how the alternatives align with the project purpose and the opportunities to avoid disproportionate impacts to communities with EJ concerns. • Continue to coordinate with communities with EJ concerns who are disproportionately impacted by the proposed project; adjacent land owners; tribes; and federal and state agencies. Include in the FEIS a description of the efforts to engage these communities when: analyzing for disproportionate impacts; developing ways to avoid, mitigate and minimize those impacts; and the outcome of the engagement efforts on the proposed project. • Consistent with CEQ’s EJ Guidance Under NEPA1, describe the distribution and magnitude of disproportionate impacts to communities with EJ concerns as a factor in determining the environmentally preferable alternative. Include the views received from the affected communities and the magnitude of the environmental impacts associated with alternatives that have a less disproportionate and adverse effect on communities with EJ concerns.	See responses to comments 12398-1 and 11535-50 (see in Table A-3h, Environmental Justice and Socioeconomics).
12469-11	Mike Telford	Ability to continue farming and living near the project Our farm relies on aerial applicators to apply products to our variety of crops. The most sensitive of the crops, is certified seed potatoes. The landing strips for the applicators must be reasonably close because of the heavy loads of water and material that they must take off with and then return to the strip for another load. The landing strips are on the east side of Kimama Butte west of 750 west. The proposed project would make it near impossible for the planes to function safely. They tell me that they need at least one mile set back from the farms to safely apply products to my farm. Any requirement to fly around windmills to get to my place may make it economically impossible to do. They now climb over the Buttes to get to Hidden valley and my farm. This alone could put us out of business. The strip of BLM lands directly west of our farm is a designated stock drive way and is approximately one to one and a half miles wide. The	AIB-15 in EIS Appendix 3 states that the while the potential for wake turbulence from wind turbines has been documented, it is well within the ability of pilots to avoid this potential hazard. Pilots are instructed about the effects of turbulence and wake and are trained how to recognize situations that might create the turbulence, avoidance, and/or how to handle it. Therefore, while the project would not preclude crop dusting in the project vicinity, it would require pilots to assess situation-specific risks when flying crop dusting or other small aircraft. None of the information provided by the commenter contradicts what is stated in the EIS.

Comment ID	Commenter	Public Comment	Response to Comment
		Robertson family farms lies west of that. With one mile from my farm and one mile the Robertson's farm there is no place for wind turbines in that area. The DEIS states applicators planes can fly at "their Discretion." That is not only unbelievable but unacceptable. (please see Aviation comments by the pilots)	
12859-2	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Summary and Petition to designate Greater Minidoka Area of Critical Environmental Concern (ACEC). We propose the BLM establish a Greater Minidoka ACEC (Attachment A) to protect approximately 237,000-acres of BLM lands surrounding the Minidoka NHS and Minidoka War Relocation Center. Along with multiple uses and valid existing rights, the Minidoka ACEC will protect a sensitive and culturally important area for Minidoka survivors, descendants, the Japanese American community, and our country. The historic Minidoka War Relocation Center and viewshed have been identified as Traditional Cultural Property (TCP) eligible for listing in the National Register of Historic Places (NRHP) by the Idaho State Historic Preservation Officer (SHPO).8 (Attachment B) The proposed ACEC is located in southcentral Idaho, between the Pioneer Mountains, the Snake River and Craters of the Moon National Monument. It includes scenic and cultural values of significant national importance, which are necessary to interpret the experiences of Japanese Americans and Alaska Natives incarcerated at the Minidoka War Relocation Center during World War II. The ACEC is needed because the BLM's Monument RMP "does not establish Visual Resource Management (VRM) classes or associated management objectives for BLM public lands in the siting corridors,"9 as required by BLM policy.	FLPMA requires the BLM to "give priority to the designation and protection of areas of critical environmental concern [ACEC]" in the development and revision of land use plans (43 USC 1712(c)(3)). The BLM conducts ACEC review, full evaluation, and designation through land use planning processes. This project-specific NEPA review of MVE's application for the project is not associated with the development or revision of a land use plan; land use plan development or revision requires its own NEPA process. Coincident to the draft EIS public comment period, the BLM received a proposal for the Greater Minidoka ACEC from Friends of Minidoka. In accordance with the BLM ACEC Manual (BLM 1988), the BLM has conducted preliminary evaluations of two potential ACECs (the proposed Greater Minidoka area and also the Minidoka WRC boundary; see EIS Appendix 13 for these preliminary evaluations). The BLM preliminarily evaluated these two areas for relevance and importance criteria required for ACEC designation (BLM 1988) and to identify whether interim management is warranted to protect values contributing to the relevance and importance criteria. A full evaluation of a proposed ACEC is outside the scope of the project's NEPA process, the purpose and need of which is to respond to MVE's application (EIS Section 1.2). Although the Greater Minidoka and Minidoka WRC areas are not currently designated as ACECs, the EIS analysis evaluates and discloses impacts to resources, which are described in the Friends of Minidoka ACEC proposal, such as visual resources, cultural resources, and natural resources. These resources are also preliminarily evaluated by the BLM in EIS Appendix 13. Having conducted the preliminary evaluations (EIS Appendix 13) and in response to comments on the draft EIS regarding proposed ACECs, the BLM is applying interim project-specific management to the potential Minidoka WRC ACEC. Analysis of impacts to the potential ACEC for Minidoka WRC and BLM's interim management for this area have been added to EIS Section 3.8 (Land Use and Realty). The Idaho SHPO received a draft TCP report for a proposed Minidoka TCP from Friends of Minidoka, and provided their response on February 20, 2023. The SHPO has concurred with the recommended finding that there is an eligible TCP associated with the site, significant under NRHP Criterion A. However, SHPO's comments indicate that more information would be needed to support significance under Criteria B and D, and that SHPO did not agree with the proposed boundary as defined in the study. A copy of this draft TCP report was separately provided to BLM by Friends of Minidoka on January 3, 2023, and BLM received a copy of the February 20, 2023, SHPO response letter. For reference, the draft EIS was finalized in early December 2022, before Friends of Minidoka's draft TCP report was received. The draft EIS was then released for public comments on January 17, 2023. Subsequently, on December 15, 2023, FOM had prepared and then provided to BLM an addendum to their proposed TCP boundary, which reemphasized a Minidoka TCP boundary proposal encompassing large areas beyond the Minidoka WRC, with which SHPO was in disagreement. Therefore, because there has yet to be a defined TCP boundary, the BLM analyzes impacts to the current historic property boundary (Minidoka NHS) in the final EIS, and in that analysis continues to consider potential impacts to Minidoka WRC and to the setting of the Minidoka NHS as it may extend to the Minidoka WRC and the surrounding area beyond. Section 106 consultation will also include the BLM identifying adequate avoidance, minimization, and mitigation measures for adversely affected historic properties, including Minidoka NHS, pursuant to the PA for the project (see EIS Appendix 8). The PA preparation process, including development of appropriate mitigation measures, is ongoing.
12859-3	Kristen Brengel, Robyn Achilles; Friends of Minidoka	The proposed ACEC also includes Indigenous ancestral sites, essential habitats for threatened and migrating species, public lands grazing and opportunities for outdoor recreation. ACEC Requirements: The proposed ACEC meets BLM requirements for relevance, importance, significance, and need for special management to establish an ACEC. Section 103 of FLPMA defines ACECs as: "…areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards." As defined in BLM Manual 1613, an area needs to meet the criteria for relevance, importance, and need for special management attention. A proposed ACEC meets the "relevance" criterion "if it contains one or more" of several qualities, including "significant historical, cultural, or scenic value … and religious or cultural resources important to Native Americans," "a fish and wildlife resource," "a natural process or system," and/or "natural hazards." A proposed ACEC meets the BLM's "importance" criterion if the "resource is characterized by one or more of the following": • "Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness or cause for concern, especially compared to any similar resource." • "Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change." • "Has been recognized as warranting protection in order to satisfy national priority concerns…" • "Has qualities that warrant highlighting in order to satisfy public or management concerns about safety and public welfare."	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-4	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Finally, a proposed ACEC meets the "special management attention" criterion if it requires "management measures" which are "unique to the area involved and include terms and conditions specifically to protect the important and relevant values occurring in that area." After an ACEC is nominated, FLPMA requires that a BLM interdisciplinary team evaluate it to ensure that the proposed ACEC fits the statutory definition. Resources are evaluated based on several criteria, including, for instance, the degree of degradation already present at the	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		resource. After developing a draft land use plan amendment, BLM sets a 90-day public comment period during which citizens can comment on the proposed ACEC. Public comments are incorporated into the ACEC. After the period of public comment, the ACEC is designated by the State Director via a Resource Management Plan amendment if no protests are submitted. Minidoka Meets the ACEC Criteria: The proposed Greater Minidoka Area of Critical Environmental Concern includes imperiled cultural and natural resources.	
12859-5	Kristen Brengel, Robyn Achilles; Friends of Minidoka	The Viewshed: As noted in the ACEC nomination "[i]t is of fundamental importance to the visitor experience at Minidoka that the viewshed – that is, the landscape that can be viewed, night or day, from the site -- be kept as unsullied as possible."20 The ACEC petition defines the methodology for determining the Minidoka viewshed: "[i]n order to quantify the extent of the viewshed, we conducted an analysis using ArcMap 10.8's Viewshed tool (in the Spatial Analyst extension). ArcMap's Viewshed tool uses a raster elevation surface and inputs "observer" points to determine the area visible from the observer point at a given height above the ground. The state of Idaho's Digital Elevation Model was clipped to an approximately 150 x 120-mile rectangle around Minidoka. The National Historic Site's Visitor Center was chosen as the observation point for the analysis, with an eye height of 2 meters (approximately 6 feet) and a refractivity coefficient of 0.13 (tool default). The tool was also set to account for the earth's curvature."21 The representation below shows the results of this analysis. The viewshed from the Minidoka Visitor's Center extends to the borders of the provided clipped raster and includes the mountains to the north and south and some of the buttes and local high points in the Snake River Plain. The nomination for the ACEC includes a more comprehensive viewshed analysis than the one provided in the DEIS. The ACEC nomination also includes information about Tribal resources and values as well as species protection that complement our ACEC petition. The proposed ACEC is consistent with the recommendations of the BLM's Lava Ridge Subcommittee. Because of the project's significant negative impacts on Minidoka's viewshed and a range of other important public values, the Subcommittee unanimously recommended the no Action alternative (Alternative A).22 The Subcommittee also recommended that "BLM adopt protective measures for the cultural landscape and heritage for wise multiple use … [and] begin a public process to amend the Monument RMP to designate protective measures around Minidoka and other wise multiple uses, subject to valid existing rights."	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-6	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Why the ACEC Designation Supports Previous US Government Actions: Designating the ACEC would align BLM land management with the Monument RMP, FLPMA, the Administration's racial justice policies and statutory and policy authorities to protect nationally-significant historic resources. The ACEC petition builds on our recommendation in the scoping letter that "BLM study measures to permanently protect Minidoka's fundamental resources and values from Lava Ridge and future threats."24 Approval of the ACEC would build on nearly fifty years of official U.S. government acknowledgements that the incarceration was wrong and executive branch policy, dating back to President Gerald Ford's decision to rescind Executive Order 9066 in 1976 and the designation of Minidoka on the National Register of Historic Places in 1979. Pursuant to the National Historic Preservation Act, the U.S. Bureau of Reclamation secured approval to add the former Minidoka Relocation Center to the National Register of Historic Places on July 10, 1979. The ACEC would also meet FLPMA's planning requirements and statutory goals and BLM's goals in the proposed Conservation and Landscape Health regulation. FLPMA Section 202(c)(3) requires BLM to "give priority to the designation of and protection of areas of critical environmental concern" and Section 102(a)(11) states that "regulations and plans for the protection of public land areas of critical environmental concern be promptly developed."27 In its Conservation and Landscape Health draft rule, BLM proposes a change to its Section 1610.7-2 of its regulations to "emphasize the requirement that the BLM give priority to the identification, evaluation, and designation of ACECs during the planning process as required by FLPMA…"28 The proposed regulation states that "[i]n the land use planning process, authorized officers must identify, evaluate, and give priority to areas that have potential for designation and management as ACECs."29 Adoption of the ACEC would also meet FLPMA's requirement to coordinate BLM land use planning with the National Park Service. FLPMA section 202(c)(9) requires BLM "to coordinate the land use inventory, planning, and management activities … with the land use planning and management programs of other Federal departments and agencies."	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-9	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Through an Instruction Memorandum (IM2022-59), dated September 20, 2022, BLM provided guidance to field offices: "[w]orking to achieve environmental justice is a whole-of-government responsibility, requiring Federal agencies to provide fair treatment and meaningful involvement to all. The BLM supports this effort."77 The BLM's "Addressing Environmental Justice in NEPA Documents: Frequently Asked Questions," states that: "[f]air treatment means that no group should bear a disproportionate share of the adverse consequences that could result from federal environmental programs or policies. Populations of particular concern are minority, low-income, and tribal communities." The EPA defines environmental justice "as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. The EPA further defines the term fair treatment to mean that 'no group of people should bear a disproportionate burden of environmental harms and risks, including those resulting from the negative environmental consequences of industrial, governmental, and commercial operations or programs and policies'."79 As noted below, BLM's preferred alternatives C and E violate BLM and Administration environmental justice "fair treatment" requirements because of the Alternatives' "disproportionately high and adverse impacts to the Japanese American community and Native American Tribes."80 Adopting the ACEC would avoid disproportionate burdens and ensure fair treatment for our community.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
12859-16	Kristen Brengel, Robyn Achilles; Friends of Minidoka	1.3 Decision to be Made. In light of the petition to designate the ACEC, we respectfully request BLM replace the decision to be made with: • Decide to amend the Monument RMP to designate the Minidoka ACEC as proposed in the petition submitted by the Friends of Minidoka.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics). As stated in EIS Section 1.2 (Purpose and Need), the BLM's purpose is to respond to MVE's application for a ROW grant to construct, operate and maintain, and decommission a wind energy facility on public lands in compliance with FLPMA, BLM ROW regulations, and other applicable federal laws and policies. The need for this action arises from FLPMA, which requires the BLM to manage public lands for multiple use and sustained yield and authorizes the BLM to issue ROW grants on public lands for systems for generation, transmission, and distribution of electric energy (FLPMA Title V). The suggested alternative to "amend the Monument RMP to designate the Minidoka ACEC" does not constitute an alternative that would meet the purpose and need for the Proposed Action. Amending the monument RMP and designating the Minidoka ACEC represent federal management actions that are outside the scope of this NEPA analysis.
12859-17	Kristen Brengel, Robyn Achilles; Friends of Minidoka	1.4 Conformance with Land Use Plans. In addition to supporting the ACEC nomination, the TCP means that LS Power's proposed wind project does not conform with the Monument RMP's requirement to protect cultural resources. Because of the cultural significance of the Minidoka TCP, the RMP requires BLM to reject LS Power's proposal. The RMP designates the lands around Minidoka as a Moderate Use Area and directs that "[s]ensitive and significant values will always be protected consistent with Federal and State law."150 The Monument RMP also requires BLM to "manage cultural resources so that representative samples of the full array of scientific and socio-cultural values are maintained or enhanced consistent with State and Federal laws."151 The RMP continues: …Cultural resource values discovered in a proposed work area will be protected by adhering to the following methods: 1. Redesigning or relocating the project. 2. Salvaging, through scientific methods, the cultural resource values pursuant to the SHPO agreement. 3. Should the site be determined to be of significant value; eligible for or on the National Register of Historic Places; and/or the above mentioned methods are not considered adequate, the project will be abandoned.152 The BLM DEIS is based on inadequate information. BLM is aware of the TCP and, based on the SHPO's determination, the Minidoka TCP "may be eligible for the National Register." As required by the RMP, BLM has not indicated in the DEIS that it has forwarded the documentation to the Keeper for a determination of eligibility. Without a determination of ineligibility by the Keeper of the Register, BLM cannot conclude that the proposed action conforms with the RMP. In addition, the DEIS does not include a determination of adequacy relating to redesigning or relocating the project and salvaging the cultural resource values pursuant to the SHPO agreement. Without a finding of adequacy, the project does not conform with the RMP. Also, regarding cultural resources, the RMP states that "any adverse impacts to sites," constitutes a "variation From RMP warranting management concern."	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-23	Kristen Brengel, Robyn Achilles; Friends of Minidoka	3.6.2.1.3 Existing and Future Trends and Actions. The BLM's Existing and Future Trends and Actions section is narrowly written and does not include "reasonably foreseeable trends and actions form the affected environment" relating to the Japanese American community as a dispersed Environmental Justice Community. Racial Justice Executive Order (EO 13985) Compliance – Actions that Uplift. The description of the Japanese Americans as a dispersed Environmental Justice Community is incomplete. We recommend that BLM add a new section in the EIS entitled "Underserved Community." As noted above, through his Day One E.O. 13895, the President directed the federal government "should pursue a comprehensive approach to advancing equity for all, including people of color and others who have been historically underserved, marginalized, and adversely affected by persistent poverty and inequality." As noted in the FOM Scoping Letter (p. 3) and in comments relating to Statutes, Regulations and Other NEPA Documents, the Japanese American community has been "marginalized" and "adversely affected" by inequality. To carry out E.O. 13985, DOI has deemed the Japanese American community at Minidoka an underserved community through its FY 2022 and FY 2023 budget requests to hire more staff for Minidoka's visitor center to enable the public to better understand the whole story of America. As part of the Administration's commitment to underserved communities, the President's FY 2023 budget proposes a $210,000 base increase to enable Minidoka NHS to hire three additional park staff.	See response to comment 11535-49 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-24	Kristen Brengel, Robyn Achilles; Friends of Minidoka	[Deficiencies cited regarding BLM's Existing and Future Trends and Actions relating to the Japanese American community as a dispersed Environmental Justice Community. Examples included in pdf letter] America's Changing Commemorative Landscape (Actions that Uplift). Through Presidential proclamations and direction from Congress through authorizing legislation and annual appropriations bills, the Japanese American and AANHPI Community has worked to make America's commemorative landscape more inclusive to better reflect America's rich and diverse heritage and to tell the whole story. With the exception for possible decisions relating to renewable energy projects at Japanese American sites in the Western U.S., the Japanese American community anticipates that America's commemorative landscape will continue to trend towards greater inclusion and belonging and encourages BLM to factor this into the baseline condition.	Section 3.6.1.1.1 (Existing and Future Trends and Actions) in the environmental justice analysis has been updated to include a description of Minidoka-related commemorative events and educational programs and Japanese American Confinement Sites Grants, and these trends and actions have been carried throughout the cumulative analysis for environmental justice presented in Section 3.6.1.2.
12859-25	Kristen Brengel, Robyn Achilles; Friends of Minidoka	[Deficiencies cited regarding BLM's Existing and Future Trends and Actions relating to the Japanese American community as a dispersed Environmental Justice Community] Commemorative Events (Actions that Uplift) As part of the baseline description of the Japanese American community, there are several events which uplift our community. The DEIS does not adequately incorporate these events in the baseline description and assess the impacts of the wind project on these uplifting events. These events include Day of Remembrance and associated events (February-March) such as: • Puyallup Fairground, WA – events sponsored by the Minidoka Pilgrimage Planning Committee and the Japanese American Citizens League (JACL) at "Camp Harmony" in Washington State. • Idaho -- commemorative events sponsored by the Friends of Minidoka and JACL, including proclamations by the Governor of Idaho. • Bainbridge Island (Eagledale Ferry Dock), WA -- commemorative events to mark the forced relocation of the Bainbridge Island Japanese American community on March 30, 1942	See response to comment 12859-24 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		sponsored by the Bainbridge Island Japanese American Exclusion Memorial Association (BIJEAMA) and the Bainbridge Island Japanese American Community (BIJAC) With the COVID pandemic in decline, Japanese American groups have restarted annual in-person pilgrimages. These events provide immersive experiences, opportunities for healing, sharing stories, and connecting the Japanese American diaspora and multiple generations. Minidoka Pilgrimage Planning Committee is planning to have its annual pilgrimage in 2023.208 Annual pilgrimages are a critical part of the value of Minidoka for our community. According to Joanne Doi, pilgrimages are a "sacred journey" that captures a "sacred story of suffering and spirit"	
12859-26	Kristen Brengel, Robyn Achilles; Friends of Minidoka	[Deficiencies cited regarding BLM's Existing and Future Trends and Actions relating to the Japanese American community as a dispersed Environmental Justice Community] Japanese American Confinement Sites Grants (Actions that Uplift). In annual appropriations bills from FY 2009-2023, Congress has appropriated funds every year for the JACS program for a total of over $43.5 million. To tell the whole story, the NPS awarded $657,000 in grants for the guard tower, honor roll, interpretive material, digitization of resources and other projects at Minidoka. President Biden's FY 2024 budget request includes a request for JACS grants. Investments in Museum Education (Actions that Uplift). This changing commemorative landscape extends to regional and national museums and other institutions that help tell the full story of America. To complement America's changing commemorative landscapes, our nation is making significant investments in museums focused on the Japanese American and AANHPI experiences. In 2021, the Japanese American Museum of Oregon (JAMO) opened its new building Portland with a focus on Oregon's Nikkei community and the World War II incarceration.211 An affiliate of the National Park Service and the Smithsonian, the Wing Luke Museum in Seattle interprets the stories of Washington States AAPI communities including the Japanese American incarceration.212 The Idaho State Museum in Boise has partnered with Minidoka in its educational programming.213 At the national level, museums have helped tell the story. The Japanese American National Museum (JANM) has taken a lead role to document the lives of Japanese Americans, including before, during and after the incarceration. In 2020, Lonnie Bunch, the Secretary of the Smithsonian, announced "Our Shared Future: Reckoning with Our Racial Past."	See response to comment 12859-24 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-28	Kristen Brengel, Robyn Achilles; Friends of Minidoka	[Deficiencies cited regarding BLM's Existing and Future Trends and Actions relating to the Japanese American community as a dispersed Environmental Justice Community] America's Racial Reckoning – Telling the Whole Story (Actions that Uplift). In 2021, the Department of the Interior has led an effort to acknowledge additional painful chapters in our history including the murder of Emmett Till, the trade in enslaved people at the Forks of the Road site in Natchez, the terrible legacy of family separations and social genocide at federal tribal boarding schools. Contemporary Human Rights issues. As noted in the DEIS, Minidoka is a place "to make connections between past injustices … and contemporary human rights issues."218 The NPS's Foundation Document also notes that the site "provides an opportunity for understanding the need to protect civil rights and liberties for all regardless of gender, race, religion, sexual orientation, or national origin."	See response to comment 12859-24 (see in Table A-3h, Environmental Justice and Socioeconomics).
12859-31	Kristen Brengel, Robyn Achilles; Friends of Minidoka	3.6.2.2.3 Alternative C (Reduced Western Corridors) BLM rightfully finds that any alternative would have "disproportionately high and adverse impacts to the Japanese American community…": "Given the importance of environmental setting and feeling to the visitor experience of remoteness, isolation, abandonment, reflection, and healing at these sites, any adverse effects to the baseline soundscape or landscape would have a disproportionately high and adverse effect on the Japanese American community."228 However, the BLM wrongfully states that the "the degree of visual change … would be reduced from major to moderate."229 The visual simulations from KOP 1, KOP 2 and the Honor Roll clearly show major visual changes. In addition, the visual modeling in the Minidoka ACEC nomination shows major visual changes from the multiple locations in the park.230 3.6.2.2.5 Alternative E (Reduced Southern Corridors) BLM rightfully finds that any alternative would have "disproportionately high and adverse impacts to the Japanese American community…": "Given the importance of environmental setting and feeling to the visitor experience of remoteness, isolation, abandonment, reflection, and healing at these sites, any adverse effects to the baseline soundscape or landscape would have a disproportionately high and adverse effect on the Japanese American community."231 However, the BLM wrongfully states that for both Alternatives C and E "the degree of visual change … would be reduced from major to moderate."232 The visual simulations from KOP 1, KOP 2 and the Honor Roll clearly show major visual changes. In addition, the visual modeling in the Minidoka ACEC nomination shows major visual changes from the multiple locations in the park.	The visual analysis in EIS Section 3.16 has been updated to reflect a higher viewer sensitivity rating for the Minidoka WRC, and the discussion of visual impacts for the Minidoka WRC has been updated accordingly in the environmental justice (EIS Section 3.6) and cultural resource (EIS Section 3.5) analyses. Aside from visual effects, other types of effects such as noise, traffic, and dust would be reduced in certain areas with a smaller footprint of alternatives.
12859-38	Kristen Brengel, Robyn Achilles; Friends of Minidoka	Vulnerability model. We recommend that BLM adopt its own methodologies to assess the visual impacts relating to vulnerability and impact pathway. Under BLM's vulnerability model for environmental justice communities: vulnerability = exposure + sensitivity. "Exposure is used here broadly to mean the potential to be affected by environmental change, whether through physical, technological, or socioeconomic factors. Sensitivity refers to any factor that may increase or decrease the magnitude of impact…To be vulnerable to a change a population must be sensitive to it and exposed to it."250 Alternatively, BLM could consider its impact pathway methodology, which "involves the chain of factors by which an environmental change could have(human) consequences."251 The impact action model considers action, population, exposure, sensitivity and impact.252 Under both methodologies, BLM should consider the emotional sensitivity of the Japanese American community and the impact of the U.S. Government's betrayal on the community. Minidoka is about survivors living with a sense of shame for decades afterward and going to their graves thinking that they were "the enemy." It is about the Japanese American diaspora – families scattered across the country and never returning to their homes on the West Coast. It is a place to heal multi-generational trauma that has flowed through our community for decades. It	The visual analysis in EIS Section 3.16 (Visual Resources) has been updated to reflect a higher viewer sensitivity rating for the Minidoka WRC, and the discussion of visual impacts for the Minidoka WRC has been updated accordingly in the environmental justice (EIS Section 3.6) and cultural resource (EIS Section 3.5 [Cultural Resources]) analyses. Potential psychological effects to the Minidoka community are considered and analyzed in Section 3.6.1 (Environmental Justice Communities).

Comment ID	Commenter	Public Comment	Response to Comment
		is about acknowledging a wrong and helping us heal. Siting wind turbines against the backdrop of the Military Honor Roll is a profound sign of disrespect to the memories of Japanese American veterans and their courage and sacrifice for a nation that imprisoned their families.	
12865-4	Regina Smith	Volume two, page 2 line 10 “provide economic benefits to the state of Idaho and the local communities of Jerome, Lincoln, Minidoka, including the creation of new jobs” Back to volume one, page 3–190, the third bullet states, “the entire workforce needed for the project construction and operation will be non-local workers .” This appears to be the only benefit they have cited. Concerned citizens see no benefits to Idaho or Jerome, Lincoln, Minidoka, Cassia, Gooding, Twin Falls, Washington Counties.	See response to comment 11873-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
12908-2	Diana Jones	The crops we grow, require cool nights and warm days. Wind turbines warm the ground air during the night and cools ground air during the day. What will this do for us and other farmers?	See response to comment 9919-2 (see in Table A-3o, Land Use and Realty, including Aviation).
12969-1	Karen Brockway	The Lava Ridge Wind Project draft EIS has omitted attention to a major drawback of the project, which is the overall cost vs. benefit analysis. The land consumption required for the wind project has an entirely negative impact on all the acreage involved, physically, visually, economically, and environmentally, while providing extremely little exchange for increased benefits for humans and wildlife. ... The exchange of cost vs. benefit makes this project an irrational use of public lands with minimal positive impact for Idahoans. The proposed alternative locations for the wind project will have all the same cost vs. benefit shortcomings and should be opposed based on the simple equation of consumption of land vs. general resulting benefits. Large scale wind farms are a poor use of the vast public land consumption they require.	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
13000-3	Nathan Small	While the Tribes are identified as one of the environmental justice populations in the DEIS, there is a lack of local demographic information for our Tribal populations where the majority of our members physically reside in SE Idaho.	EIS Section 3.6.1 (Environmental Justice Communities) has been revised to include a more detailed description of the non-dispersed minority populations that occur in the analysis area, including but not limited to Native American populations.
13000-5	Nathan Small	The analysis of impacts to socioeconomic conditions fails to mention or evaluate the loss of subsistence hunting and gathering; as well as a robust analysis of lost income or jobs for locals following the temporary construction of the project.	Potential effects to subsistence uses are analyzed within the context of cultural resources (Section 3.5) and environmental justice (Section 3.6.1). Also see responses to comments 11869-11, 1042-32, and 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
13000-8	Nathan Small	The Project and the DEIS does not conclusively show a net-gain in land value or demonstrate the project will be a long-term asset to the local communities, minorities, citizens of Idaho, or Tribes.	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
13006-6	Leon Smith	6) Recommend the Environmental Justice section should include more detail relating to Tribal treaty rights, historic resources, and emotional impacts to Japanese Americans and Alaskan natives. Social and economic data from counties where tribes reside should be included as well.	See responses to comments 13000-3, 11315-2, and 11661-6 (see in Table A-3h, Environmental Justice and Socioeconomics).
13006-35	Leon Smith	11) Recommend No Action Alternative A due to impacts to private property values. If No Action Alternative A is not selected, recommend the DEIS not be finalized until MVE has agreements in place with private landowners to compensate for potential property value loss.	As stated in Section 3.6.4 (Residential Property Values), the likelihood or degree to which property values may or may not be affected cannot be predicted with any certainty. The BLM cannot require compensatory mitigation for impacts that are not proven as likely to occur or may occur, but are not likely to be significant based on review of the best available data. As stated in Section 3.6.4, additional project-specific mitigation measures that the BLM could apply to Alternative B would further reduce the potential for turbines to visually impact surrounding residences, which in turn would reduce the likelihood or degree of influence that turbine visibility could have on property values.
13025-1	Ruth Dimond	We are very much aware of the amount of concrete it took to put up the windmills on Bell Rapids. It was difficult for construction companies to get concrete for their projects at that time. The Lava Ridge Project is massive in comparison. Even now there is a shortage of concrete. A project like Lava Ridge would be devastating to all businesses in this area that are dependent on concrete for their livelihood. This would impact Construction Companies, Lumber Companies, Hardware Companies, Electricians, Plumbers, Dairymen, the list goes on. Building would stop without concrete. We are asking you to reconsider the Environmental Impact for the sake of all of this area.	See response to comment 2100-4 (see in Table A-3h, Environmental Justice and Socioeconomics).
1578-2	The Coalition to Protect America’s National Parks	the DEIS fails to consider recent proposals that the project area be considered a Traditional Cultural Property (TCP) and an Area of Critical Environmental Concern (ACEC), which further complicates the comment process.	See response to comment 12859-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
1689-8	Tammy Larson	The temporary jobs will create an increase in population that will make it harder to get jobs, and will put a strain on our economy. Then once the project is complete all those workers will disappear to the next job once again hurting our economy.	As stated in EIS Section 3.6.2 (Community Services, Employment, and Housing Availability), qualified workers are likely to come from areas outside the analysis area because of the specific specialized skills and trades required and the relatively remote project location. Because of the need for a relatively specialized construction workforce and to provide a conservative assessment of employment and related impacts, the EIS analysis assumed all workers would be non-local. Although MVE would hire as many local workers as possible, the number of local workers having the necessary qualifications and specialized skillsets is expected to be low. Therefore, the project is not expected to put a strain on local workforce numbers since most, if not all, construction workers would be non-local residents.
1691-1	Regina Smith	During the time this EIS has been in progress, the rapid influx of people has already changed some effects. We need more time to review and see if they are adequately covered. So far we have found no benefit for the residents of Idaho.	Section 3.6.2 (Community Services, Employment, and Housing) has been updated to include more recent census data and other references wherever possible.

Comment ID	Commenter	Public Comment	Response to Comment
19-2	Joan Trabucco	Wind and solar require "backup generators" to provide electricity when the weather doesn't cooperate to make sure the lights don't go out. Having wind, solar, and backup generators means we have to pay for three types of power plants, wind, solar, or natural gas, and this increases the cost of electricity. Because these costs are only incurred because wind and solar are not reliable.	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. The cost effectiveness of renewable energy is not a factor to be considered in the BLM's decision to be made and is outside the scope of this NEPA analysis.
2100-4	Office of Governor Brad Little, Office of Lieutenant Governor Scott Bedke, Office of US Senator Mike Crapo, Office of US Senator Jim Risch, Office of Congressman Mike Simpson	We are concerned about the impact to existing electricity customers and the integrated resource plans of Idaho utilities. The ancillary impacts are also concerning to local Idahoans. As supply chain issues continue to impact commerce in Idaho, we are concerned this project will monopolize valuable and limited resources. Specifically, we are concerned about the consequences to water supply, production and supply of concrete, project materials, as well as the labor market which already pose challenges to businesses across Idaho.	Project-related effects on groundwater quantity are analyzed in EIS Section 3.17.1 (Groundwater Quantity), which compares project-related water withdrawals with existing aquifer volumes. Other construction materials, such as concrete, cement, or gravel, do not have to be sourced locally and would be sourced from outside of the local area, as needed. As stated in Section 2.8 (Gravel, Aggregate, and Concrete) of MVE (2023), aggregate generated on-site from grading and excavation may be used to create road base or concrete materials; however, if the on-site aggregate is not deemed suitable for these uses than alternative commercial sources would be used. The project is not expected to put a strain on local workforce numbers since most, if not all, construction workers would be non-local residents.
2864-1	J.A. Williams	Little information is given regarding the depletion of materials to construct the project as well, which is a concern to citizens and may likely have a substantial impact to industries & individuals in the area	See response to comment 2100-4 (see in Table A-3h, Environmental Justice and Socioeconomics).
2883-2	Gary Cox	the amount of concrete required to build the anchor and the platform for each tower will consume virtually all the available concrete during the construction phase. The scarcity or unavailability of concrete will literally evaporate many jobs and businesses in the local area. This will affect building contractors, lumber and other material suppliers, office and administrative support, banks and credit unions and the list goes on. Hundreds of jobs will be lost with additional impact upon food, clothing, and other vendors. All this potential economic depression in trade for 15 new hires	See response to comment 2100-4 (see in Table A-3h, Environmental Justice and Socioeconomics).
2920-4	Regina Smith	•Increase to population and associated demands on community services during construction and operation. As near as I can determine the only community services analyzed are schools and law-enforcement. There is no discussion of additional use or funding needed to maintain and provide water, water treatment, sewage, dumps, utilities, ambulances and fire staff. These small communities are hard put to deal with the current needs and may not be equipped to handle additional rapid increases. Additional personnel may be needed for school staff, law-enforcement and other first responders. Many rural communities are staffed with volunteers such as fire departments and ambulance drivers. The EIS does commit to cleaning up trash, carcasses etc. for disposal. Where? Where will solid waste be disposed? Hazardous waste? These issues are not addressed completely. •Change in housing availability during construction and operation. During the time this EIS has been in progress, the current rapid influx of people may have filled the "available housing". Table 3.6-4 and Table 3. 6-5 During the same time. Population increases have already pushed rental and purchase prices well beyond what the local residents can afford. Low income and minority populations, college students, young families and elderly cannot afford prices in the current market. Bringing in additional hundreds of workers will increase competition and could cause prices to continue to rise.	Potential effects of the project on water resources are discussed in Section 3.17.1 (Groundwater Quantity). AIB-45 through AIB-46 (EIS Appendix 3) discuss how hazardous and solid waste generated by the project would be managed. AIB-11 (EIS Appendix 3) discusses how the project would affect emergency responders. EIS Appendix 4 (Mitigation) also includes several applicant-committed measures related to the management of the trash and waste, water, animal carcasses, fire safety, and more. Also see response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
2920-5	Regina Smith	In the air emissions section the emissions are projected from the workers driving from Twin Falls. (Top of page 3-12). If the employees are expected to live in the three rural towns the emissions would be lower. But there is no analysis for employees living in Twin Falls. The same impacts on community services can be expected if indeed the employees prefer to live in Twin Falls. Table 3. 6-5	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
3032-2	Robert Johnson	Where in this EIS does it show the impact in material costs for the building industry for new housing, from the amount of gravel, and concrete alone it will not only create a lack of materials but also cause an even bigger problem with cost and availability for contractors in the local areas,I for one have already been affected bye these problems	The construction of new housing is not part of the Proposed Action. See response to comment 2100-4 (see in Table A-3h, Environmental Justice and Socioeconomics).
3063-1	Chris Hopper	Does this project establish a positive cost-benefit over its projected life? Weigh the lost opportunity cost of the existing conditions vs. net energy benefit overall the project life. Don't include government subsidies in this analysis; they don't affect the existing condition or project benefit, they only benefit the developers	See response to comment 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
3477-1	Rebecca Loomis	Permitting this company to use Idaho lands to erect wind turbines to provide other states with power is not justified. Why are they not going to the states who need the power? Other states have not directed power companies to invest in their transformers and power grids. Instead the power companies have invested in "renewable energy" projects that are not reliable or self sustaining. The wind turbines require electric energy to start the turbines and if there is no wind then there is not any energy developed.	See responses to comments 11963-3 and 19-2 (see in Table A-3h, Environmental Justice and Socioeconomics).
3481-1	Jeff Holloway	I am opposed to the Lava Ridge project. No one ever accounts for the year after year, after year, bird kills. Another thing I could not find in the data – Am I subsidizing this private venture through increased electricity rates?	EIS Section 3.3 (Avian and Bat Species) provides fatality estimates for bats and avian species during project operation. Also see response to comment 7344-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
3542-2	Sue Page	And the question still not answered is why is this being allowed? Why is a company from another state strolling onto our land to pillage for the sake of a different state. Is all this energy necessary? Why does it have to come from Idaho to be transmitted down to California? Why can't locations closer to the end user be considered? There is a lot of land along Hwy 80 between Wells and Reno. The same for Jackpot. There is plenty of land in California open and ready for uses. Imperial Sand Dunes, Indio, Eagle Mountain, Palm	See responses to comments 11963-3 and 19-2 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		Springs, Bakersfield. All these open spaces should be considered over our land in Idaho. Why not have home grown power? Because it's not good for their state?	
4018-1	Dave Jakovac	Moreover, who in Idaho will benefit from this proposal? We have only 3 power providers in Idaho and they would be obligated to purchase this power by law. Since the cost of wind mill power has been estimated between 16 - 24 dollars per kilowatt hour, it will cost Idaho residents nearly 2-3 times more that the existing user rate. IDAHO Power would be obligated to pay for use of this power to its grid based on replacement cost, which will cost substantially more. Innocent consumers in Idaho would not materially benefit from the power due to increased cost. I understand that the end user targeted is regional, not for Idahoans based the proposed 100,000 MW facility.	See responses to comments 11963-3 and 7344-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
5189-6	Traci Wood	What about the 700 man crew coming to build said wind farm, where will they be housed? We already have a housing shortage as it is. Our own citizens in our communities can't find houses to rent. I don't agree with the thought someone mentioned on opening R.V. Parks. That takes time, money, permits etc. Not feasible, and to what end when the crew leaves.	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
5896-9	Mike Tylka	Personnel. The types of jobs that building these towers requires is somewhat specialized occupations that are transitory in nature. While there may be some local people hired, for the most part, there are not enough facilities available in the immediate area to house personnel. Camping space is even more limited and we do not need a desert full of "boondockers" despoiling public land. The tradeoff for the few permanent jobs is not worth the risk. The socio-economic aspect would probably increase the likelihood of an additional criminal element in the area tasking local law enforcement personnel.	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).
5920-7	Kelly Varelmann	Many local sub-contractors will be hired during the construction process which is the only positive point that I have about this project. This economic effect will be short lived, though. How many long-term jobs will this project actually produce? As I see it, the BLM is willing to undermine Idaho's environmental integrity in order to provide electrical power to California who can then claim their power as "green".	As stated in EIS Section 3.6.2 (Community Services, Employment, and Housing Availability), project operation is estimated to last 30 years, with approximately 20 to 75 workers employed throughout operation (see Section 3.6.2.1.3).
6075-2	Lorinda Grant; Douglas Grant	We are concerned with the property values of this land if the proposed wind farm is approved, if the values are affected by the wind farm then is MVE going to compensate for the value drop. The vicinity of the wind farm would make our farm ground near impossible to sell. We have lived and farmed this property for years and it is our retirement in the future.	See response to comment 11535-56 (see in Table A-3h, Environmental Justice and Socioeconomics).
6100-1	Bill DeBruin; Vickie DeBruin	First Environmental Justice Communities from page 24 of the EIS you state that the impacts greatest for the environmental justice population are closest to the sitting corridor, and along the haul routes, there are several scattered rural residences within 0-2 miles. This implies that since there's not a large population, or the income level might be below average that consideration of these individuals should be minor or ignored. I would call this discrimination. Everyone is affected by this project regardless of how or where they are living, or what line of work they are engaged in or the population.	The EIS analysis presented in Section 3.6.1 (Environmental Justice Communities) analyzes the potential effects of the project on low-income and minority populations, and the analysis is in compliance with EO 12898 and the BLM's environmental justice guidance document (IM 2022-059). This analysis is solely focused on evaluating impacts to low-income and minority environmental justice populations, including populations closest to the siting corridors, and nowhere in the analysis is it suggested or implied that effects to any individuals within environmental justice populations should be ignored as the commenter is suggesting.
6340-1	Cat Jobes	When I heard that BLM portrayed the Minidoka ancestors "Tourists" I was shocked, saddened and not surprised. They call it "white washing" for a reason. Please issue an apology and rewrite the 3.6-3 Environmental Justice Observation Points.	The EIS has been revised to correctly represent the Japanese American community and Japanese or Alaska Natives. The BLM apologizes for indicating in any manner that the Japanese American community and Native Americans are within the sensitive viewer group of "tourists and recreationists," and the EIS is revised to not indicate or imply this. Because of the sensitive character of resources or landscape features assessed from certain KOPs, and their strong connections to these, the BLM understands and respects that the Japanese American community and Native Americans should not be referred to as "tourists" in any manner in relation. For consistency with the Minidoka NHS foundation document (NPS 2016), the terms "visitors and survivors" were used to characterize Japanese American community members within the Environmental Justice and Cultural Resource sections of the draft EIS (EIS Sections 3.5 and 3.6). In EIS revisions, the group formerly referred to under Visual Resources (EIS Section 3.16) as "tourists and recreationists" has been replaced with "visitors," and the Environmental Justice and Cultural Resource sections of the EIS have been revised to also refer to Minidoka-connected communities as "pilgrims" or "incarcerees and their descendants" where appropriate. In the Environmental Justice section of the EIS, the dispersed environmental justice community formerly called the "Japanese American Community" has been broadened to "Japanese American and Minidoka-Connected Communities" to reflect a greater diversity of communities having ties to Minidoka. The commenter was correct that visual resource management categorizations included categories that did not fully reflect the connection of the Japanese American community to Minidoka NHS and surrounding area and caused offense, no matter how inadvertent. For this reason, the EIS has not solely relied on these categorizations but also considers the unique sensitivities of the Japanese American community, as the commentor has noted. Within the issues analyzed, the sensitivities, perceptions, and concerns of the Japanese American community are therefore specifically addressed in the Visual Resources, Cultural Resources, and Environmental Justice sections of the EIS.
6866-5	David Briggs	Renewable energy hits poor people the hardest as they see their energy bills go up by order(s) of magnitude.	See response to comment 7344-1 (see in Table A-3h, Environmental Justice and Socioeconomics).
6871-2	Name Not Provided	The property values of the farm ground in these areas would be negatively affected if the methods of application are limited. Crop quality would suffer if farmers instead are required to dry out the crop enough to drive a ground applicator through the field. Alternatively some products may be applied through irrigation water referred to as chemigation. Chemigation requires the farmer to have an license and careful calibration and monitoring is required for effective application. Many farms in the area depend on GPS systems for the operation of several machines on their farms. Many of	See response to comment 11535-56 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		these systems depend on a radio signal from a base station for real time kinematics (RTK) correction. Some of these base stations are located within or nearby the project area. Farmers depend on these systems for sub inch accurate placement of their machines to avoid crop damage and maximize efficiency. Signal interference or interruptions during the construction and operation phases may occur. These would be problematic for farmers resulting in crop damage or decreased productivity.	
7320-7	Lora Ohlensehlen	I am greatly offended that the EIS study does not honor the ranching families in the impact area. I read on a poster, "Environmental Justice Communities mandates consideration of environmental justice (EJ) issues, the fair treatment of all potentially affected people, regardless of race, color, national origin, or income." Why are the ranchers of the Star Lake Grazing Association not being held to this degree of respect? These ranchers are contributing members of society. They have been community leaders. Their incomes help support many other local businesses. For years, even generations, they have been good stewards of the land. They have put in water systems for their animals, that also benefit wild life in the area. The grazing animals help lower wild fires. The ranchers cooperate in rotating their animals in allotments to sustain feed for both domestic and wild animals in the area. Now an outside corporation is wanting to use this land, and now the ranchers will suffer consequences. This makes no sense!	The EIS analysis presented in Section 3.6.1 (Environmental Justice Communities) analyzes the potential effects of the project on low-income and minority populations who reside within the tri-county analysis area. Therefore, the local residents and communities mentioned by the commenter have been considered within the context of the environmental justice analysis. In addition, other socioeconomic issues within Section 3.6 of the EIS analyzed potential effects of the project on the local economy, community services and housing, and property values for local residents within the tri-county analysis area (plus the cities of Twin Falls and Burley). Section 3.9.1 of the EIS analyzed potential effects of the project on the and grazing economy/culture. Therefore, potential project related effects on all local residents, regardless of income or race, have also been analyzed in the EIS within the context of various resource issues.
7344-1	Matt F.	Please accept my comment regarding the Lava Ridge Wind Project EIS as it relates to the negative economic impacts to ratepayers caused by the project. It is well known that the unreliable nature of wind and solar makes the electricity they produce very expensive, despite the claims of their proponents. It is also known that BLM is required to include the socioeconomic impact of these projects on surrounding communities in their EISs. What is unknown is a bit of a gray area: what is the economic impact on electricity ratepayers? Is BLM-required to analyze this in their EISs? Jurisdictions which have heavy reliance on wind and solar also have very high energy prices. The state of California is one example (source citation links within): https://www.forbes.com/sites/michaelshellenberger/2018/04/23/if-solar-and-wind-are-so-cheap-why-are-they-making-electricity-more-expensive/ The phenomenon of drastic rate increases seems to follow wind and solar wherever they are deployed (source citation links within these articles): https://www.forbes.com/sites/michaelshellenberger/2018/04/25/yes-solar-and-wind-really-do-increase-electricity-prices-and-for-inherently-physical-reasons/ https://spectrum.ieee.org/electricity-its-wonderfully-affordable-but-its-no-longer-getting-any-cheaper Despite the claims that wind and solar can power a large and modern industrialized society, California's experience proves otherwise. After spending two decades investing heavily in wind and solar, the state still had to import a quarter of its energy in 2019: https://www.eia.gov/todayinenergy/detail.php?id=46156 In 2021, California had to seek permission from the federal government to burn more fossil fuels, because their wind and solar dependent grid could not provide for the residents of the state: https://www.bloomberg.com/news/articles/2021-09-09/california-seeks-to-avert-blackouts-by-burning-more-fossil-fuels If wind and solar worked, then why did the above scenarios happen? The answer is simple: wind and solar don't, can't, and won't ever work for inherently physical reasons. They are intermittent, while the demands of the electricity users are constant. It's a fundamental design incompatibility. Which leads to the economic aspect: if we know that inundating the electrical grid with intermittent, highly volatile power sources leads to more expensive power bills, how can this be reconciled with the need to not negatively financially impact various neighborhoods and communities? How exactly does subjecting an entire state to electricity price spikes, brownouts and blackouts like California has experienced, benefit the state? How does causing manufacturers to flee the state due to unreliable power help us, particularly those of lower and middle incomes who work at such manufacturing facilities?	The BLM relies on industry to identify renewable energy technologies and general project locations and configurations that are technically and economically viable given current market conditions, renewable portfolio standards, technological advancements, and transmission access. Whether and to what extent the Proposed Action would influence the cost of energy for consumers is not a factor to be considered in the BLM's decision to be made and is outside the scope of this NEPA analysis. The BLM's purpose and need for action arises from the BLM's responsibility under FLPMA to respond to a ROW application requesting authorized use of public lands for a specific type of renewable energy development. In accordance with CEQ's NEPA regulations, the BLM analyzed the potential effects of the Proposed Action and alternatives on several different resource topics identified through internal and external scoping including but not limited to natural resources, cultural and historic sources, and socioeconomics. With respect to the economy, the BLM analyzed the potential economic effects of the project in Section 3.6 (Environmental Justice and Socioeconomics). The BLM will make a reasoned choice among the alternatives based on the EIS analysis for all resources, and the BLM cannot determine significance for a proposed action based on economic effects alone.
7744-1	Joan Hurlock	The Lava Ridge project construction is estimated to take 2 years, with approximately 400 to 850 workers on-site during construction, likely to come from areas outside the analysis area due to the specific specialized skills and trades required. One area of concern regarding the Lava Ridge Wind Project is the availability of sufficient housing units to accommodate this number of workers. According to Table 3.6-4. Employment and Housing Characteristics in the Analysis Area, there are 1,737 vacant Housing Units available in the tri-county area (Minidoka, Lincoln, Jerome). This data is taken from the U.S. Census Bureau (2021) and Google Maps (2021). A Housing Unit is defined as "a house, an apartment, a mobile home, a group of rooms, or a single room that is occupied as separate living quarters". I dispute the validity of the data provided in the DEIS. In the last 2-3 years, the Magic Valley has had an influx of people who moved here from other states and a rise in investors who purchased inexpensive rental properties. As a result of this increased demand, the supply dramatically decreased. The rise in the cost of housing, both to purchase and to rent, has led to a severe, affordable housing shortage. Low-income and fixed-income residents can no longer afford to pay the higher rents. Many of these people now live in their vehicles or weekly motel units. After consulting with professional real estate brokers and agents, the listed number of 1,737 housing units available is demonstrably false. One broker laughed when I asked if that many units were vacant, and he said "not even close". I was told that the 5.1% vacancy rate listed in Table 3.6-4, is closer to 1%. The three largest apartment complexes in the area currently have available 3, 8, and 3 units, respectively. An internet search for rentals available in the area netted dozens – not hundreds of rentals: Zillow.com: (6) Burley, (1) Jerome, (0) Lincoln county Homefinder.com: (1) Burley, 3) Twin Falls, (2) Wendell, (1) Jerome Apartmenthomeliving.com: (36)Minidoka County, (8) Lincoln County, (19) Lincoln County Craigslist.com, listings as of March 20, 2023: (26) Twin Falls, (2) Burley, (2) Jerome Western MV Realtors: (16) Twin Falls, (1) Jerome, (1) Heyburn, (1) Hansen I learned from personnel at the Office of Emergency Management that the Magic Valley is experiencing a homelessness crisis, brought on by the increased cost of renting; there are literally no affordable units available for low-income and fixed-income individuals; the long-term	See response to comment 11869-9 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
		stay motels are at capacity. Hundreds of additional workers will further exacerbate the homelessness issue. One can observe small vacant acreages throughout the Magic Valley where 3 to 10 motor homes, campers, and trailers are dry camping. The presence of children's toys at these sites indicates the homelessness issue is affecting children. And there are reports of single moms and their kids living in RV's on property belonging to relatives because they cannot afford the housing that is available. There are several RV parks in the area. I have listed the number of spaces at each park, but they aren't necessarily vacant: Heyburn Riverside RV: 29 full service hookups Country RV Village: 30 sites Lake Walcott State Park: 22 serviced spaces, 18 standard Shoshone RV Park: 41 full service hookups West Magic Resort: 30 RV hookups Big Trees Mobile Park: 25 full hookups As an alternative to rentals, will man camps be situated on the project site or other bare land? Man camps tend to be primarily occupied by men, without their families. With that comes an increase in crime, drugs, and litter. Due to the severe housing shortage, the Magic Valley cannot absorb 400 to 850 additional residents.	
8624-2	Public Comments via Remote Video	It was stated earlier that the property values would decrease, and, thus, that would decrease the amount of tax revenue that's being collected. Would this mean that the tax entities that rely on the tax revenue would have to have their budgets decreased; schools, roads, emergency services, etcetera?	As stated in Section 3.6.4 (Residential Property Values), the likelihood or degree to which property values may or may not be affected cannot be predicted with any certainty. Therefore, the indirect effects of altered property values on property taxes are equally uncertain and difficult to predict. However, the amount of additional local and state taxes that would be generated by project construction and operation are disclosed and analyzed in Section 3.6.3 (Local and Regional Economy).
8624-6	Public Comments via Remote Video	I brought up this area of critical environmental concern nomination. Under the code of federal regulation, the BLM can write a supplemental environmental impact statement based on new information. Because that is new information, you could actually please a lot of the people who are opposing this by creating a new alternative, and that would require a plan amendment, which we've all been asking you to do, and then we could work out some of these issues with visual resources.	See responses to comments 12859-2, 12859-16, and 11672-3 (see in Table A-3h, Environmental Justice and Socioeconomics).
8624-8	Public Comments via Remote Video	I see -- I hear a lot about the environmental justice. And it's talked about, you know, the Japanese Americans and how they were treated poorly and denied their privileges and rights, civil rights, for being citizens of the United States, and I hear a lot about the Native-American tribes and how their rights will also be decreased by Lava Ridge Project, but there's not even consideration about the local population that live in Hidden Valley, the Star Lake areas, the small towns of Dietrich and Shoshone, the people that live on Red Bridge Road and by the substation. The poor people in Hidden Valley will be surrounded by these wind turbines. They'll be in their own prison with wind turbines that they will see that will block every sunset and every full moon and sunrise. They're going to have their property values decreased. And that's in 3.6.6, as Jamie quoted. People within that two to ten miles are having their private landownership rights being violated, and I believe there needs to be some sort -- for them, the only mitigation that's possible is to choose Option A, no action. Anyways, there's some things you just can't mitigate. You either have it or you don't. There's some things that cannot be replaced. And your home is your castle. And in America -- in the United States, you're supposed to have equal rights. And I don't see the local people having equal rights.	The EIS analysis presented in Section 3.6.1 (Environmental Justice Communities) analyzes the potential effects of the project on low-income and minority populations who reside within the tri-county analysis area. Therefore, the local residents and communities mentioned by the commenter have been considered within the context of the environmental justice analysis. In addition, other socioeconomic issues within Section 3.6 analyzed potential effects of the project on the local economy, community services and housing, property values for local residents within the tri-county analysis area (plus the cities of Twin Falls and Burley). Section 3.9.1 of the EIS analyzed potential effects of the project on the and grazing economy/culture. Therefore, potential project related effects on local residents have been analyzed in the EIS within the context of various resource issues.
8632-2	Charles Van Vooren	I wonder if these wind generators will produce some sort of electrical pollution. This needs to be addressed. I know about the power lines because I read about it; if it effects livestock, what about people? You are not allowed to build under power lines. How many of these lines will be crossing or bordering private property? I would be willing to bet property values will decrease. Will your property taxes decrease also?	AIB-12 in EIS Appendix 3 (Issues Analyzed in Brief) analyzes potential effects of EMFs and corona exposures to workers and the public. As stated in Section 3.9.2 (Physiological Effects to Livestock), electric and magnetic fields have not been shown to have harmful impacts to livestock. Potential effects to property values are analyzed in Section 3.6.4 (Residential Property Values). Because the magnitude of effects to property values are uncertain, the indirect effects of altered property values on property taxes cannot be determined.
8639-1	Mark Southwick	The possibility of 700 or more workers with their families moving into the area during a two (2) year construction period is a concerning and a difficult impact to deal with. It is presented as a financial plus to the area, however preparing for and dealing with the stated influx is difficult at best. Consideration to the social, economic and infrastructure changes required during the construction period would likely have lingering effects after those workers, families and construction assets leave the area, leaving it to the Dietrich Hidden Valley Community to fund and deal with.	See responses to comments 11869-9 and 11869-11 (see in Table A-3h, Environmental Justice and Socioeconomics).
8642-5	Carl Montgomery	The final area of concern for Jerome County Farm Bureau is who benefits from the energy produced and the amount of revenue received versus the costs incurred. It is obvious the local people will not benefit directly from the energy produced. It is will be sold to others throughout the West, mainly to those in California. Thus, they are the mass beneficiaries while those of Jerome, Lincoln, and Minidoka counties carry not only the direct costs, but also as the indirect costs. Magic Valley Energy has data on the economic impact of the project. During the construction period the tax revenue is estimated at over $80 million, and $4 million on an annual basis after construction. This is a substantial amount to income at first glance. However, there are numerous organizations to which the funds would go. This would include everything from school and highway districts to emergency services. Once $4 million is allocated as mentioned, the funds will be depleted rapidly with minimal value. As an example, there will be increased costs to replace, repair, and maintain roads, of which the highway districts will not receive enough in tax revenue from the project to make up the difference.	See responses to comments 11963-3 and 1042-31 (see in Table A-3h, Environmental Justice and Socioeconomics).
8790-4	James Ritchie	3. MVE claims the area will have an economic boom during the construction phase of the project. Where will these people find housing? What will happen to our highway districts, police departments, fire districts and school districts? Increased demand for services will as always have the cost paid for by local property taxes. When all is said and done the locals will be left to pick up the pieces.	See responses to comments 11869-9 and 11869-11 (see in Table A-3h, Environmental Justice and Socioeconomics).

Comment ID	Commenter	Public Comment	Response to Comment
F2-4		These roads, trails and recreation areas are crucial for the local economy for communities that rely on access to these public lands. The U.S. Bureau of Economic Analysis showed that in 2021 the outdoor recreation industry brought in over $800 billion nationwide. By limiting access to this land or decommissioning trails the BLM could be harming the local economy and robbing them of potential income.	See response to comment 11620-10 (see in Table A-3h, Environmental Justice and Socioeconomics).
F2-5		BLM needs to adequately comply with NEPA and fully analyze how the implementation of this proposed wind farm would affect economies. Not only will this ha283rm economic value but also hunting and fishing on this land which is very popular in this area.	See response to comment 11620-10 (see in Table A-3h, Environmental Justice and Socioeconomics).

Fire and Fuels Management

Table A-3i. Fire and Fuels Management

Comment ID	Commenter	Public Comment	Response to Comment
1042-30	WildLands Defense	Public comment expressed concern about ability to respond to brushfires amid the presence of wind turbines. Magic Valley Energy says it'll stop the turbine blades from spinning to allow aircraft … [Turbine accidents frequently CAUSE fires. There is also a serious concern that harmful materials in turbines may be released if the turbines/turbine apparatus burns]. firefighting assets are allowed to fly in that area. The draft EIS states, "FAA regulations do not limit the proximity of aircraft to tall structures for fire suppression and engagement is at the pilot's discretion." The draft EIS said that the turbine corridors would result in fragmentation of fuels, which might aid in suppression of wildfires. [This is grasping at straws].	Regarding wildfire, the BLM has included a discussion of the limited ability of roads to function as fuel breaks in Section 3.7.1.2 (Fire and Fuels Management, Impacts). In the same section, the BLM has also included discussions on fire and ignition risks associated with the wind turbines as well as how the project would reduce aerial wildfire suppression efficiency. Fire risk associated with normal wind turbine operations is discussed in section 3.7.1.2.2 sub header "Ignition". Applicant-committed measures 66–77 and 82 (see EIS Appendix 4) would ensure that flammable hazardous materials and waste are handled and disposed of in a safe and proper manner, reducing the in-situ wildfire hazard potential during construction and operation. See also Section F-6 in the Health and Safety Plan (Appendix F in MVE [2023]).
1049-1	John Cauhorn	With the addition of all the miles of roads, no matter which Alternative, the potential for fire will obviously be greatly increased due to more traffic. The BLM knows as well as anyone, when a fire starts out there and the wind is blowing 20 mph the best chance to contain it is with aircraft. With 400 windmills in the area, air suppression will be more difficult. Fire will easily jump roads with the right amount of wind.	Text has been added within Section 3.7.1.2 (Fire and Fuels Management, Impacts) to discuss increased ignition risk due to the project, decreased aerial suppression efficiency, and wildfire spread potential due to strong winds.
11217-1	Heather Lauer	Also, wind turbine fires are not an uncommon occurrence, and one small spark could be a disaster for thousands of acres of highly flammable desert where the project would be located.	See response to comment 1049-1 (see in Table A-3i, Fire and Fuels Management).
11297-7	Steven Upton, Linda Upton	What about aerial fire suppression and crop dusting capabilities?	See responses to comments 1049-1 (see in Table A-3i, Fire and Fuels Management) and 10512-4 (see in Table A-3o, Land Use and Realty, including Aviation).
11326-10	Filip Camacho, Tasha Sorensen	This region is prone to wildfires, and they move fast. Any hinderance to wildfire suppression and management is a non-starter. As of April 2023, 100% of Jerome County, ID is experiencing abnormally dry conditions and 94% of Lincoln County respectively.8 The deployment of fire suppression aircraft in an area obstructed by windmills, as well as changes to flight patterns is a concern and needs to be addressed. With any surface disturbance, the spread of invasive plant species can be aggressive. Cheatgrass is fueling wildfires in this area and is a menace.9 At one point at the peak of summer last year, we were surrounded by five different grassland wildfires all running at a rapid rate. Without aerial suppression there may have been increased loss of structures as well as loss of life.	See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management).
11396-3	Gina Jerke	The desert is always at risk for fire during the summer which brings the point of how to fight those fires during construction and after completion. Logically air support is off the table and ground support would be hindered as well with the proposed temporary fencing and building of roads.	See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management).
11491-30	Dean Dimond, Jennie Bateman	4. no wildland fire prevention with plan for emergency shutdown of wind turbines, 5. No provision for access in prescribed burning for sagebrush as required treatment for habitat greater prairie sage leks and sagebrush communities	A Fire Protection and Prevention Plan is included as Section F-6 in the Health and Safety Plan (Appendix F in MVE [2023]). Refer to EIS Section 3.7.2 (Fire Reduction and Habitat Restoration Projects) for a detailed discussion of effects to fuels management and habitat restoration projects. See also EIS Section 3.3.4 (Greater Sage-Grouse) and EIS Section 3.15.1 (Native Upland Vegetation Communities).
11527-5	Richard Stover; State of Idaho	The FEIS must acknowledge and analyze fire risks associated with malfunctioning wind turbines posing an ignition risk. Avoidance and minimization methods may include components intended to reduce the likelihood of wildfire ignition and reduce fire spread following ignition.	See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management).
11535-13	Steven Andersen	FAILURE TO COMPLY WITH THE MANAGEMENT OBJECTIVES IN THE MONUMENT RMP The proposed project is inconsistent with the applicable Monument Resource Management Plan – BLM (1986) and effective amendments, and in particular the Fire, Fuel and Vegetation Management Amendment (2008a). Although the siting for the project has not been defined, the DEIS proposes that the 400-plus massive turbines will all be in areas designated for Moderate Use. Moderate Use Areas are suitable for a wide range of uses as long as they are, as the name indicates, "moderate use". Only Intensive Use/Development Areas – another level of land use classification created for a reason – were intended for major or large-scale development such as a major public utility installation; however, no intensive use/development areas were established in the Monument	See responses to comment 11869-8 (in Table A-3i, Fire and Fuels Management), comment 11534-2 (in Table A-3jj, Legal or Policy Compliance), and comment 1049-1 (see in Table A-3i, Fire and Fuels Management). The BLM will continue to manage public lands consistent with the goals and objectives described in the ROD for the Fire, Fuels, and Related Vegetation Management Amendment (FFVM) (BLM 2008a). BLM-required measure GG was added to EIS Appendix 4 and to Table 3.7-3 in Fire and Fuels Management: "MVE's Reclamation Plan (Appendix E of MVE [2023]) would include the goals, objectives, and desired future conditions from BLM (2008a) to the extent practicable."

Comment ID	Commenter	Public Comment	Response to Comment
		RMP. This project is not consistent with a Moderate Use Area, as demonstrated by the definition of an Intensive Use/Development area, which is clearly what was envisioned for such a massive development. Still, a private, free-standing development like this is not a “public utility” lending itself to use of public land for the greater good. The proposal is a private generation project that must tie into a transmission line in order to distribute the generation. Wind turbines without interconnection are mere “accessories” for electrical use. 27 The RMP has a stated goal of “protecting fragile resources and wildlife habitat, preserving natural systems and cultural values, and allowing for nonconsumptive resource uses.”28 The Monument RMP acknowledges the “area is subject to large, repeated fires that degrade wildlife habitat and aggravate soil erosion….”29 It specifies in the Fire Management section that 182,598 areas will be under full fire suppression. The fire management guidance, objectives, policies and actions identified in the Fire, Fuel and Vegetation Management Amendment (2008a) are all impeded, if not made impossible, by the proposed action. Not only does the project increase fire risk, with the exception of Alternative A, low-flying fire suppression aircrafts will be unable to combat fires in this area due to the wind turbines (see flight interference discussion below).	
11535-58	Steven Andersen	While the DEIS acknowledges that the frequency of wildfires is projected to increase, it does not address the full extent of that frequency, nor wind turbine’s effect on the increasing frequency or the interference with wildfire mitigation. Largely due to climate change, on a global level intense wildfires have flared up ranging from California to Russia’s Far East. Moreover, the entire northern hemisphere is grappling with record-breaking heatwaves.201 Because fires are either caused or fueled by extreme heat, even small fire risks pose a significant threat of developing into uncontrollable wildfires that damage large areas. Wind turbines are not exempt from exacerbating the risks wildfires pose or immune to the destruction they cause. The DEIS recognizes the risk of wildfires but fails to include mention of how wind turbines themselves can add to the risk of fire danger. Wind turbines catching fire due to lightning, combustion, or electrical malfunctions are well documented.202 A fire that starts on the wind turbine puts the surrounding locale at risk, especially where temperatures are high, the site is close to dry grasses, and strong winds are present as is the case here.	See response to comment 1042-30 (see in Table A-3i, Fire and Fuels Management).
11535-59	Steven Andersen	Additionally, the DEIS makes no mention of smoke effects stemming from wildfires. While the DEIS is quick to announce that any adoption of the proposal would increase fire risk, it fails to even mention the effects of ensuing smoke. Smoke can result in “a large and growing source of air pollution emanating from wildland fires” which can contain “hundreds of chemicals in the form of gases, liquids, and solids.”203 Smoke can pose potential health, visibility, safety, and nuisance problems to local residents, first responders, and wildlife. Moreover, the study area for smoke can reach far beyond that utilized for wildfire ignition.	Regarding wildfire, the BLM has included a discussion of the fire risks, smoke, and ignition in Section 3.7.1.2 (Fire and Fuels Management, Impacts. In the same section, the BLM has also included discussion on fire and ignition risks associated with the wind turbines, as well as how the project will reduce aerial wildfire suppression efficiency.
11535-60	Steven Andersen	The DEIS does not adequately address the impact of fire on vegetation or animals. The DEIS asserts that mitigation efforts will be used to prevent nonnative invasive plant species. Invasive grasses may especially benefit from fire, and once established, may promote recurrent fire to such an extent that native species decline, and native plant communities are converted to invasive annual grasslands. (Brooks and Pyke 2001). Sagebrush is especially vulnerable to fires and may incur both short and long-term effects. (Quinney 2000). Big sagebrush plants are readily killed by fire, while native grasses and forbs are generally unharmed by fires. (USDA 2002a). Frequently repeated fires reduce or prevent re-establishment of sagebrush seedlings from nearby unburned plants. Fires may kill some seeds of native grasses in upper soil layers, significantly reducing seedling emergence in burned areas. (USDA 2002a). Any ensuing fire increases the growth of noxious weeds in the area. Moreover, preserving large fire tolerant trees can help to reduce the fuel load and reduce the intensity of wildfires. (Stop B2H Coalition Opening Comments FEIS (page 11)). The DEIS does not discuss how native vegetation might be affected by increasing fires in the area.	Historic fire regimes and departures from them are discussed in the Affected Environment section (3.7.1.1) of the Fire and Fuels Management section of Chapter 3. The Impacts section (3.7.1.2) also includes a discussion of how the interaction between invasive plants and wildfire may impact sensitive wildlife and plant populations, such as sage-grouse. See also Section 3.15.1.1 for a description of native upland vegetation communities in the analysis area and how they have been affected by past and present trends and actions.
11554-3	Raul Labrador; Idaho Attorney General’s Office	The draft EIS also ignores the Project’s impact on Idaho’s land, namely the ability to fight and prevent fires. Fire season harms Idaho’s people, animals, agriculture, economy, air quality, and environment.6 As the agency recognizes, the Project’s increased use of power transmission would increase the risk of fire. DEIS 3-242. And the agency further recognizes that aviation resources for fire suppression will be increasingly needed but also impeded by the hundreds of skyscraping turbines. DEIS 3-245-51. So the Project would expose Idaho to greater fire danger while simultaneously limiting Idaho’s ability to fight fires. The draft EIS fails to address this dilemma.	See response to comment 11869-8 (in Table A-3i, Fire and Fuels Management).
11869-8	Raul Labrador, Josh Turner; Idaho Attorney General’s Office	The draft EIS also ignores the Project’s impact on Idaho’s land, namely the ability to fight and prevent fires. Fire season harms Idaho’s people, animals, agriculture, economy, air quality, and environment.6 As the agency recognizes, the Project’s increased use of power transmission would increase the risk of fire. DEIS 3-242. And the agency further recognizes that aviation resources for fire suppression will be increasingly needed but also impeded by the hundreds of skyscraping turbines. DEIS 3-245-51. So the Project would expose Idaho to greater fire danger while simultaneously limiting Idaho’s ability to fight fires. The draft EIS fails to address this dilemma.	Additional discussions regarding impacts to aerial wildfire suppression and increased wildfire risk due to project infrastructure, construction, and increased access have been added to Section 3.7.1.2 (Fire and Fuels Management, Impacts). MVE (2023) also includes a Fire Protection and Prevention Plan section in the Health and Safety Plan (Appendix F in MVE [2023]).
11978-124	Magic Valley Energy, LLC	26. Section 3.07.1.2.2 Fire and Fuels - Alternative B (Proposed Action) - Spread “Fragmentation of fuels from project construction and maintenance may indirectly create fuel breaks in this fuel type; however, fuel breaks typically need to be several hundred feet wide and have a strategic placement and design in order to function most effectively.” Can the BLM provide the source stating the efficacy of the width of fuel breaks and provide the width used by the BLM for developing fuel breaks?	A citation has been added to the end of the noted sentence (BLM 2015b).

Comment ID	Commenter	Public Comment	Response to Comment
12090-2	Chris Bender	This land is also used for grazing, which will affect our local livestock. If the lands are not grazed, in droughts (which often happen here) the land is at greater risk of wildfire. 3. Wildfires happen quite frequently in Idaho, and having a number of wind turbines in the area could impact the effectiveness of containing the blaze before it gets out of hand. If our fire crews are impeded in quickly extinguishing wildfires, it could result in extensive loss of property, homes, and life.	The Grazing Coordination Plan is Appendix S in MVE [2023]). Grazing and livestock impacts are also discussed in Section 3.9.1 (Grazing Allotments and Range Socioeconomics). Most grazing limitations proposed for project construction would last up to three seasons for construction and successful interim reclamation. Interannual fuel load variation and its impacts on modeled fire behavior are discussed in the Affected Environment section (3.7.1.1) and in the Impacts section (3.7.1.2) of the Fire and Fuels Management section of Chapter 3. In the latter section, additional discussion is included on the decreased efficiency of aerial wildfire suppression from proposed wind turbines in the analysis area. Table App4-2g (in EIS Appendix 4 [Mitigation]) includes applicant-committed mitigation measures regarding fire and fuels management, including initial suppression and response.
12685-4	Philip Gossi; Gooding-Lincoln County Farm Bureau	• No control of vegetation growth Number one is the loss of feed for livestock. The real devastation will be caused by not being able to use aerial fire suppression. Currently produces have stated that the proposed area burns every four years.	The BLM has provided additional discussion on the interaction between wind turbines and diminished aerial wildfire suppression efficiency. The BLM has also provided additional discussion on the interaction between invasive plants and heightened wildfire risk. See response to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 1049-1 (see in Table A-3i, Fire and Fuels Management).
2930-2	Regina Smith	It does not take an expert to deduce that spotter planes, helicopters and retardant bomber planes cannot fly in wind and smoke and dodge wind turbines safely and effectively doing wildfire suppression activities. Section 3.7.1.1.4 fire suppression on page 3-245. The last line "FAA regulations do not limit the proximity of aircraft to tall structures for fire suppression and engagement is at the pilot's discretion." Fire suppression, as we all know, is not done at the pilot's discretion but at a highly organized level. Maps 3.7-1 and 3-.7-2 show most of this area has burned in the past however even with the best rehabilitation efforts it is not immune to being burned again. Strategic plans rate human life and property as top priorities. With wind turbines potentially 1 mile from farmlands and homes, turbines may impede aerial suppression activities severely. Fire suppression efforts could impose the question where do wind turbines rate if fire threatens private homes, structures (Minidoka NHS), cattle and features like the wind turbines?	The BLM added additional discussion that details the risk the wind turbines pose to aerial wildfire suppression efforts and highlighted how wind turbines will inhibit and impede aerial wildfire response. See response to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 1049-1 (see in Table A-3i, Fire and Fuels Management).
2930-4	Regina Smith	Page 3-242, section 3.7.1.1.1 Fire History. "Human caused ignitions in Sagebrush communities are generally associated with increased human activity along roads, residential areas or areas frequented for recreation." Alternative B proposes nearly 500 miles of new roads to be explored by OHV and other recreation enthusiasts. If bare statistics are an indication, fire activities will increase. Section 3.7.1.1.3 page 3-245 line 9. No one I worked with at BLM ever calculated the spread of fire in chains. We tended to use wind speed. If we had 30 mile an hour winds, the ranch 15 miles away had half an hour to evacuate. (Actual experience). The use of fire retardant dumps is crucial.	The BLM indicates in the Alternative B analysis that this alternative will result in the greatest number of ignition due the greater road network and the assumed greater road traffic on these roads. The BLM has also updated Table 3.7-2 to reflect this (see Section 3.7.1.2.2).
3198-1	Kellen Richard	They are also proposing building in a zone with high fire risk. What does that mean for fire suppression?	Construction in the high fire risk zone would increase ground suppression efficiency but decrease aerial suppression efficiency. This is discussed in the impact analysis in the Fire and Fuels Management section of Chapter 3. See the Section 3.7.1.2.2 subheading “Response and Suppression.”
3997-7	Angelee Eames	5. Wildfires occur all summer and can certainly occur in this 800,000 acres of land. HOw does stopping the blades-allow for flights to fight the fires when the towers are still in their way?	The BLM has included discussion that addressed impacts from the wind turbines on aerial wildfire suppression efficiency. See the Section 3.7.1.2.2 subheading “Response and Suppression.”
6387-15	AJ Whitecotton	Since living in the area for the last 25 years, I have witnessed fire after fire in the valley, one of which threatened to wipeout my subdivision, Sawtooth Acres, in 2007. Several of my past employees have been volunteer firefighters called out to assist BLM on these fires. When these fires occur in late June, July, August and September with all the dry rangegrass, cheatgrass and sagebrush they can travel at a high rate of speed.	The BLM modeled wildfire rate of spread (ROS) in the analysis area for all alternatives. The modeled ROS is predicted to high throughout the entirety of the analysis area. See Section 3.7.1.1.3, Section 3.7.1.1.4, Figure 3.7-3, and the Section 3.7.1.2.2 subheading “Spread.”
6850-1	Name Not Provided	In reference to the EIS 3.7.1.2.6: Cumulative impacts, p. 3-256, it states "The addition of new roads and areas cleared of vegetation provides anchor points and fuel breaks for firefighters during suppression activities while also potentially lessening fire behavior to allow direct attack methods." A fuel break is considered to be between 200-800 ft. in width, while a road is considered to be between 10-24 ft. in width, according to the USDOT. A fuel break can be added along a road. Although the term is broadly used, it is basically a strip or block of land with low or no ignitable vegetation that will reduce flame lengths and the rate of spread of wildfires. A road can be considered a fuel break, but only under the most favorable conditions. Favorable conditions would be considered weather that is not conducive to fire spread, areas of low ignitable vegetation, and adequate time and resources for fighting fires. Fuel break maintenance would be key to prevent fire spread. Mowed fuel breaks are recommended in or near sagebrush areas. This would include 100-300 ft. on each side of the centerline of an existing road. But the width needs to be balanced with other resource values in sage-grouse habitats. https://www.wlfw.org/fuel-breaks-technical-note/ Just as there is a Fire Triangle (heat, oxygen, and fuel), there also a Fire Behavior Triangle (fuel, weather, and topography). Wind, temperature, and humidity also contribute to fire behavior. Wind is the most destructive, since it adds oxygen to the fire and pushes the fire towards new fuel sources. A fuel break is the only leg of the behavior triangle that can be controlled. Fire season in the western US is June through October. https://www.nps.gov/articles/wildland-fire-behavior.htm It should be noted that wind can blow embers up to a mile on the other side of a fuel break, and then ignite more vegetation. The most destructive fires are wind driven, with high heat, and low moisture. https://lpfw.org/fire/fuel-breaks	Text has been added that discusses the limited capacity for access roads, work areas, and other areas with cleared vegetation to function as effective fuel breaks. See the Section 3.7.1.2.2 subheading “Response and Suppression.” See also response to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 1049-1 (see in Table A-3i, Fire and Fuels Management).
6903-10	Todd Wells	The overgrowth of noxious and invasive weed species has been well documented to significantly harm native species and, in some cases, eliminate native species altogether. Without proper grazing management, the	See response to comment 11535-60 (see in Table A-3i, Fire and Fuels Management). See Section 3.9.1; the project is not proposing changes to grazing management.

Comment ID	Commenter	Public Comment	Response to Comment
		overgrowth of the affected range (by non-native and native species) will serve a tremendous amount of wildfire fuel. The long-term destruction of rangeland from wildfires is well documented, not to mention the loss of habitat and native grasses that are associated with range fires. Range land such as this is a fragile ecosystem.	
7321-2	Travis Wells	Windmills will also affect the way that wildfires will be battled. A key part of containing wildfires is reaching the fire with planes and helicopters to apply water and retardant to the fire. If a fire was to break out within the area of the windmills, it could not be accessed by air because the windmills stand in the way. The effect of wildfires on windmills in not known. Windmills are also susceptible to fires themselves. In a study published by Imperial College London, it was discovered that "the researchers estimate that more than 117 separate fires are breaking out in turbines annually." This study was completed on a wind farm that houses approximately 200,000 turbines. We do not need any reason to increase the risk of wildfires, which are hazardous to people and the environment and leave the ground barren for multiple years.	Text has been added that discusses reduced capacity of aerial wildfire suppression due to the presence of windmills. The BLM has also added text discussing the fire risk that wind turbines themselves pose. See section 3.7.1.2.2, sub-headers “Ignition” and “Response and Suppression.” See also response to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 1049-1 (see in Table A-3i, Fire and Fuels Management).
8206-4	Sheryl May	We are concerned about the ability to fight wildfire with this wind turbines in the desert	Wildfire suppression is addressed in section 3.7.1.2.2 “Response and Suppression” subheading of the fire and fuels impacts analysis located in Chapter 3. Additional information can be found in the Applicant-Committed Measures, Fire section of EIS Appendix 4. Fire response and suppression are also discussed in the Fire Protection and Prevention Plan section in the Health and Safety Plan (Appendix F in MVE [2023]). See also response to comments 1042-30 (see in Table A-3i, Fire and Fuels Management) and 1049-1 (see in Table A-3i, Fire and Fuels Management).
8683-1	Wayne Fischer	3.7 Fire & Fuels The burning of fuels on our forests, deserts, etc. has been occurring for millions of years. Stating that burning is only a recent event is totally wrong. During some of these events, the fire needs to be controlled. There is no way a suppression plane can be used to put out or contain a fire in a specific area with fire suppression planes. The same applied to controlled burns when necessary. Another negative impact of these very tall wind generators is the effect on the Jerome airport, where expansion plans are underway to expand the runway to allow for larger and local fire suppression planes to land and take off. The installation of these very tall wind generators will force the decision to use another airport that will add cost and time for fire suppression of our precious open public lands.	Historic fire regimes and current departures/deviations form historic regimes are discussed in the Fire and Fuels Management Affected Environment section (3.7.1.1). Historically, fires in the analysis area were estimated to be rare, but large and destructive when they did occur. Currently, human activities and invasive plants have resulted in an increase in fire frequency and size in the analysis area. Also see response to comment 11226-3 (see in Table A-3o, Land Use and Realty, including Aviation).
8790-3	James Ritchie	Wildfire is a constant threat and who will pay for the loss of aum's and cost for fighting the fires? The draft EIS does not address the placement of the turbines in any of the alternatives nor does it adequately address rehab when decommissioned. Who will pay for any permanent loss of AUM's due to this project?	See response to comments 11204-13 (see in Table A-3p, Livestock Grazing) and 11204-34 (see in Table A-3dd, Plan of Development – EIS Appendix 1).

Geology

Table A-3j. Geology

Comment ID	Commenter	Public Comment	Response to Comment
10427-4	Jess Bartlett	What about the effects of blasting on the extensive system of lava tunnels throughout the area, and the effect that will have on our aquifer?	See response to comment 1042-14 (in Table A-3z, Water and Wetland Resources).
11186-1	Leena Wray, Dominick Wray, Ezra Wray, Destiny Wray, Jonathan Wray, Maria Wray, Joseph Wray, Wilson Wray	Plus it will also destroy our natural sand pits and lava flows that are historic and iconic for the Magic Valley. There is lava tubes that go straight to yellowstone under there and blasting can cause a series of effects from earthquakes to waking up volcanic activity.	See AIB-30 in EIS Appendix 3: Are earthquakes of concern in the vicinity of the project and if not, why?
11195-7	Sandra Callen	This is a fragile volcanic area, blasting in this area for the proposed unsightly turbines will damage our land beyond repair.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11207-1	Charles Carpenter, Cathy McKay	The area is too extensive and potential for damaging the fragile lava rock is frightening.	Basalt is one of the densest types of rock and is not fragile. Basalt density ranges from 168.5 to 181 pounds per cubic foot (Bureau of Reclamation 2001). Site-specific geotechnical evaluation of all project infrastructure locations that would require blasting would be completed prior to construction. Also see response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11400-2	Deborah Hillier	the fault lines and geological effects, [...] None of which have been addressed and assessed from a blasting perspective by those with educated opinions. What does the Idaho Geological Survey Department have to say of this project? Where is their sign off on this? I've attached their map of earthquake activity for FY 2022. 1385 recorded. Seems relevant to this decision going forward.	See AIB-30 in EIS Appendix 3: Are earthquakes of concern in the vicinity of the project and if not, why?
11458-7	Kathy McKenzie	Seismic Ground Disturbance--Seismic vibration side effects not just from blasting for the deep, wide footings needed to hold 400 of these super size turbines in place but from the perpetual vibration of turbine blade rotation over the next 30 years. Any studies done on actual ground movement from this constant vibration of 400 oversized turbines?	AIB-32 was added to EIS Appendix 3: How would vibrations from project wind turbines affect nearby structures?

Comment ID	Commenter	Public Comment	Response to Comment
11490-1	Liz Niccum	I know from personal experience what blasting to remove basalt rock does to the ground. I lived through the construction of St. Lukes Medical Center in Twin Falls. For an entire summer, we experienced earthquakes four to five times a day. The entire house shook. It was horrible. All of the mice escaped from the construction area and invaded our neighborhood.	See MVE's applicant-committed measure 90: Avoid ground blasting within 1,000 feet of residences, water bodies, and wells to the maximum extent possible. MVE would notify residences that are within 1,000 feet of blasting activities. Also, site-specific geotechnical evaluation of all project infrastructure locations that would require blasting would be completed prior to construction.
11521-2	Angela Mooney	In the 7/2021 Lava Wind Project Proposal submitted by Luke of LS Energy, not the misdirecting name of MVE, never once mentions aquifer in the proposal. That alone is alarming, the fact that we have gotten this far without any consideration of that colossal resource, and the colossal, never-before attempted construction of structures that are known to vibrate constantly. To even consider building hundreds of these is such close proximity to each other in porous, fractured lava bed over an aquifer is preposterous. I believe that those in charge of our public lands are simply allowing due process, but not truly considering approving this. [...] There is no study, not even a projected opinion, about the effect of blasting this many holes into a fractured, newly formed, porous geological composition of he nature of the East Snake River aquifer. There is no study, not even a projected opinion from a geologist, a physicist, or a team of such, about the volume and the effect if the vibrations of operating hundred of these structures over said fractured, newly formed, porous geological composition of he nature of the East Snake River aquifer This is very scary to me, as the results would be irreversible.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11535-69	Steven Andersen	Wind turbine construction can lead to alteration of natural drainage patterns (e.g., alterations of slope or implementation of on-site storm water controls) or increase of precipitation infiltration (e.g., from clearing vegetation, backfilling with permeable materials, roadbed fracturing due to heavy vehicles) that can increase pore pressure, which weakens the strength of soils on slopes or causes accelerated soil erosion, thereby creating slope instability.220 This type of hazard is not addressed in the DEIS. Additionally, soil erosion can be aggravated locally through ground surface disturbance. The impact of soil erosion includes soil nutrient loss and degradation of water quality in nearby surface water bodies. Activities that could contribute to soil erosion include: - Ground surface disturbance on site, at borrow sites, and along access roads. Ground surface disturbance would occur during the construction or installation of access roads, wind tower pads, staging areas, lay-down areas, substations, transformer pads, underground cables, and other on-site structures. The extraction of geologic materials from borrow areas or quarries would also result in ground surface disturbance. - Heavy equipment traffic. Heavy vehicles can disturb or destroy originally stable soil conditions and enhance soil erosion by both wind and surface runoff. - Surface runoff pattern disturbance. Construction activities (e.g., grading and excavation) and the implementation of on-site storm water controls (e.g., culverts and drainage ditches along roads) could alter surface runoff patterns by diverting natural drainage into new areas and locally increasing runoff volume.221 Once the environment is damaged, it is difficult to restore, and erosion and desertification in the region will likely be exacerbated.222 Suitable terrain for wind farms includes flat, open terrain, sparse vegetation, low precipitation, and a large number of days with strong wind. "The construction process, including turbine and transformer foundation excavation and backfilling, aerial cable pole foundation construction, underground cable trench excavation and backfilling, booster station construction, access road construction and expansion, will cause vegetation damage, surface disturbances, and soil structure destruction, which results in a decrease in soil erosion resistance and an increase in the sensitivity to wind and hydraulic action leading to soil erosion. Soil erosion by wind farms has certain telltale characteristics, including the coexistence of point and linear erosion, as well as wind and water erosion."223 The DEIS either does not adequately address these concerns or seeks to minimize the project's ultimate impact on the environment. Such impacts cannot be overlooked.	As described in Section 3.13.1.2.2 (Soils, Alternative B [Proposed Action]), the EIS tiers to BLM (2005), which analyzed the potential impacts to soil by erosion from wind energy facilities and found impacts would be minimal to negligible because best management practices (BMPs) would be followed to prevent or address potential increases in soil erosion (2005:6–3).
11788-4	Representative Jack Nelsen	Some the issues still left unaddressed are: 1. The desert area when the project is proposed contains a layer of cinders. When this cinder layer is disturbed by repeated blasting it has (in the past) affected wells in the surrounding areas. This happened specifically when a local canal company did some blasting for a canal, they ended up having to replace numerous domestic wells because of the damage. While I realize not all areas are the same, this remains a real threat to our residents.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
11860-5	Shauna Robinson	Although Wilson Butte Cave may be the most well-known cave site in the project area, there are many other known caves within the Shoshone Field Office area. The website for the SFO even states, their field office "is home to the largest known density of caves within the BLM." Lava tube caves are of critical importance culturally, serving, for example, as indigenous shelters and food storage areas. Likewise, bats, birds, and other wildlife use them for roosting sites and shelter. For example, on a recent visit to Wilson Butte Cave, we spotted rock pigeons and deer tracks inside the cave itself. With the dense traffic during the construction phase of the planned Lava Ridge project, vibrations from blasting and/or use of heavy equipment, dust, and noise, could affect the stability of caves, making such events as roof collapses possible. Locating caves is not always the easiest thing either since entrance sizes and shapes vary. It would be very easy for destruction of an entrance to occur through collapsing rocks. The BLM should limit turbines and/or establish wide buffer zones to protect caves and their potential resources. It is a unique natural resource the BLM should ensure remains a part of the SFO public lands.	See response to comment 11207-1 (see in Table A-3j, Geology).
11926-4	Name Not Provided, Susan Jesser	Idaho has fault lines in this proposed area and no one can possibly predict the dangers of the blasting, weight of 400 turbines and other structures.	See AIB-30 in EIS Appendix 3: Are earthquakes of concern in the vicinity of the project and if not, why?

Comment ID	Commenter	Public Comment	Response to Comment
11962-11	Cassie Christensen, Tyler Christensen	The proposed area between Shoshone to Twin Falls and Jerome to Minidoka is compromised with a vast majority of Lava Rock and it lies close to the Crater's of the Moon. 4According to the National Park Service, this area believes a future eruption could happen again. I couldn't find any information in the draft EIS that covered this area of concern. Is it possible, that being so close to the Crater's of the Moon, with the vibrations that these towers, they could create seismic activity and cause an expansion between the tectonic plates that could be detrimental to the area?	See AIB-30 in EIS Appendix 3: Are earthquakes of concern in the vicinity of the project and if not, why? There is no evidence that existing wind energy facilities throughout the northwest have caused seismic activity, and none is expected from the project.
12771-2	Shauna Porter	Are there studies to show what kind of ground vibrations we will experience with these wind turbines? These are bigger than any other wind turbines around.	See response to comment 11458-7 (see in Table A-3j, Geology).
12865-1	Regina Smith	Volume one, 3.13 soils This section starts out with several issues analysed in brief. AIB – 30: Are earthquakes of concern in the vicinity of the project, and if not, why? [...] Both questions are worded to presuppose the answer is no. Not even open minded questions. Volume 3, pg. App3-11 state. "The impact context is so low that detailed analysis is not needed to determine significance." followed by " Earthquake stability concerns are AIB due to the relatively thick, basalt geologic units in the vicinity of the project". No data was given to support this statement.	A reference was added to AIB-30 to support the conclusion.
12865-6	Regina Smith	Subject 3.13 soils Volume one, 3.13 soils This section starts out with several issues analysed in brief. [...] AIB – 31: Is the surface geology in the siting corridors suitable for the proposed project infrastructure? Is collapse/subsidence a concern, and if not, why? Both questions are worded to presuppose the answer is no. Not even open minded questions. [...] Regarding AIB – 31: Maybe they are asking the wrong question. On page 3–359 it is stated "the basalt would be re-moved through blasting". The real question here is how will the blasting affect the geology. Two years of multiple daily, blasting to the depth of 10-60 feet for guy anchors or 8-20 feet for concrete piers or 25-55 feet for transmission structures or 8-12 feet by 50-75 feet for turbine foundations could have serious repercussions.	Additional text was added to AIB-30 and AIB-31 to clarify that basalt is one of the densest types of rock. Also see response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
12982-11	Jerry Taylor	When I attended Jerome High School, I worked for Smith Drilling and Pump Company after school, on weekends and during summer breaks as a "driller's helper" and as a laborer pulling and installing well pipe and pumps. I worked for 4 seasoned well drillers in that time and I'm familiar with drilling in basalt formations. I assisted in drilling a large irrigation well on Signal Butte, east of Jerome with a senior driller named Sy Robins for a man named John McGonagal (sp?). This well was meant to irrigate land that had just been taken out of sagebrush. I believe the land was acquired through the Desert Land Entry Program. As I recall, the well was over 500 feet deep and 18 inches wide at the surface. This farm is located a few miles west of the Lava Ridge Project area. The drilling was hard and the driller was always on alert as we were drilling with a "72 Star cable tool rig", which literally pounded its way through the substrate with a "string of tools" (i.e. rope socket, drill stem and drill bit) suspended by a heavy cable. The string of tools, weighing between, 1,500 and over 2,000 lbs. was lifted and dropped repeatedly, with the force of gravity, by the "spuder gear arms", then periodically the drill hole was cleaned of "drill shavings" by running a tool called a "bail bucket" down the hole, which was attached to a smaller cable. Drilling would then resume. The driller's purpose was to drill a straight hole, while avoiding sticking a string or tools down the hole. Drilling progress in basalt could go from inches per hour to a sudden drop of feet or yards in a split second, when a lava tube or cavern was encountered. Long story short, the hardness and variable porosity of basalt lava makes it a challenge to drill and nearly impossible to predict what lies below. Likewise, basalt presents challenges when blasting to remove an obstruction in the drill hole. Since basalt is hard to the point of being brittle, when a cavity or tube is encountered by the drill bit often times large chunks of lava break off. If they fall away and into a cavity off to the side, no problem, but if a fractured chunk falls to the side and blocks part of the hole it can throw the string of tools out of plumb. If it can't be drilled through, it has to be blasted. This was done by suspending sticks of dynamite, wrapped as a bundle, down the hole by what they called a "zip line". The "zip line" was a two strand electrical wire cord sufficient to carry an electrical current from the ignition source down to the blasting cap(s) in the dynamite bundle. The drillers I worked for hated to use dynamite down the hole in basalt because the blast energy could travel in strange, unpredictable ways and create fractures above, below or to the sides creating even more problems. When drilling in basalt went well, with minimal fracturing or surprises, only the top 18 feet required steel casing (by state law). If the basalt was more porous and fractured, steel casing sometimes had to be driven to a depth past the fractured area(s) to prevent future problems in drilling or later when installing the pump and associated pipe. I offer this perspective to illustrate that one never knows what to expect from blasting in basalt lava formations.	MVE has added applicant-committed measures 91 to 94 to reduce the effects from blasting. For Alternative B with Additional Measures and Alternatives C–E and the Preferred Alternative, the BLM has also added additional Project-specific measures yyy through bbbb to further avoid and minimize potential effects from project blasting.
1689-5	Tammy Larson	Another concern of mine is the caves and craters that will be destroyed. Wilson butte cave has a lot of Native American history inside that will be destroyed. The Dietrich crater is a place many people hike to and spend their days enjoying. That will no longer be accessible and a great past time will be lost.	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
3073-3	Becky Ipsen	The vibration in the ground alone should be studied.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3140-3	Susan Page	There has been no environmental study of the impact of the Lava strata vs the heavy equipment required to drive over the Snake River Plain.	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).

Comment ID	Commenter	Public Comment	Response to Comment
			The BLM also added analysis to Section 3.17 (Water and Wetland Resources) describing whether there is the potential for project impacts to the ESPA.
3171-2	Name Not Provided	there is nothing in the eis that addresses if the project can effect volcanic activity.	There is no evidence that existing wind energy facilities throughout the northwest and other areas that are seismically active have caused further seismic activity. Thus, none is expected as a result of the project.
3230-4	Gary Carney	The Snake River Plain is one of few volcanic hot spots in the world that sits above the ocean floor. The Kimama Desert plays a major role when discussing the future of the Yellowstone Super-Volcano. The ruminants of the blast are throughout the Kimama Desert including the epicenter of many of the past Yellowstone Eruptions. The Snake River plains will play a major part in the geological studies of past events. The damage done to the landscape is going to extremely beneficial to understanding the Yellowstone Super-Volcano and a considerable amount of this geographical pattern will covered up through roads and terminated through blasting that will be necessary. More due diligence is required and necessary to make an informed decision.	See response to comment 3171-2.
3302-6	Susan Canham	Part of each turbine is the base that it securely stands on, How far into the earth are those bases driven	Turbine foundations are described in MVE (2023).
3360-1	Sue Page	What will the exhilarating seismic experience happen to the aquifer? The environment around the area such as Wilson_Butte_Cave? The Lava tunes underground? Craters of the Moon or any other historical sites? There hasn't been any environmental testing to take into accounts the "what if". Our land should not be an experimental site for the tallest, biggest wind farm.	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
3542-4	Sue Page	There hasn't been any environmental testing to determine if this Lava Plain can sustain the vibrations from the heavy-duty equipment haulers, blasting over 500 days, the weight of over 2 million pounds of cement for just 1 of the foundations not including the weight of the tower and blades. What will all this weight, vibrations and the constant vibration from each wind turbine going to do to the Lava strata?	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
3768-2	Sue Page	Is there concerns that the proposed need to blast this area twice a day for over 500 days or the tonnage of the equipment needed to haul in these massive turbines cause for concern that the land may not be sturdy enough to withstand the constant vibration? How can they calculate the blast results or the heavy equipment needs of the strata when there are too many resultant with lava layers? The only studies I have found are drilling no blasting.	See response to comment 3542-4 (see in Table A-3j, Geology).
3768-4	Sue Page	Where is the consideration for the constant heavy equipment over the public roads and on the vibration on top of the aquifer system this will cause?	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3781-1	Adrian Arp	I attended an information meeting concerning the Lava Ridge project last evening at the College of Southern Idaho. One significant opposition item was brought forth by a former Twin Falls County Canal board member. He revealed the real danger of blasting which alone should be sufficient to cancel the wind farms in Southern Idaho. He indicated they blasted a small amount of lava for a project. It was a small blast compared to the proposed Lava Ridge blasting. He said it affected the water and irrigation wells within 3/4 of a mile radius. They had to drill deeper and put in casing to restore water which was very expensive. Because of the nature of lava flows there are already cracks. Blasting he feels will cause irreparable damage to the water supplies in the Magic Valley that could include cities water supplies. The article below points out some real problems with green energy. PLEASE CANCEL THE LAVA RIDGE WIND FARM PROJECT. It is not sustainable as the following article indicates and must rely on fossil fuels to provide the wind towers, etc. They also need a fossil fuel backup with natural gas since wind power is not 24/7. Please read the following: [Article links are contained in comment w/text copied into it]	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
3998-1	Sue Page	https://en.m.wikipedia.org/wiki/Wilson_Butte_Cave <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fen.m.wikipedia.org%2Fwiki%2FWilson_Butte_Cave&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7C024cd4ea8d5d49dd591208db190a8370%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638131305183317906%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C1000%7C%7C%7C&sdata=rfMvNc4bcPzLp7TlaUEGsn8l0sWpyl%2FdLFHCa2F6cso%3D&reserved=0> I cannot find any study on the effects to the lava fields, the underground tunes and the aquifer when foundation construction begins. It's my understanding there will be blasting twice a day for over 500 days. 500 days of mini earthquakes in Volcanic Geographical Axial sounds ridiculous. What do you think, that much earth disruption will have to Wilson Butte Cave? To the shifting soil?	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
4220-2	Sue Page	The foundations will require blasting of 2 times per day for 500 days. Blasting into the Lava beds, which are part of the Volcanic Geographical Axial spanning from Yellowstone eastward through the Craters of the Moon eastward along the Snake River Plain, without knowing how the Lava tunes will be effected until tried!!! Is a joke. How will that blasting effect the schools in Eden? Structures at Minidoka National Historic Site or the aquifer running underground? Once blasting starts the ramifications could be too late	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
4480-1	Sue Page	This is a Volcanic Geographical Study for your review. Lava Ridge Wind Project falls within the Volcanic axial area spanning from Yellowstone National Park through Craters of the Moon then Shoshone Lava fields	See response to comment 3230-4 (see in Table A-3j, Geology).

Comment ID	Commenter	Public Comment	Response to Comment
		westward. What will happen when construction begins for 400 Space Needle sized turbine foundations dug a minimum of 50 to 60 feet deep with 10 to 20 ft deep x 60 feet in diameter concrete slabs approximately 400 cubic yards of concrete is laid? Will 400 holes in this area activated dormant Volcanic activity? How do you know it won't? Have there been windfarms of this size created within Volcanic Geographical areas?	
4485-1	Sue Page	https://www.cnbc.com/2023/01/24/ge-forecasts-weak-2023-profit-on-troubles-at-renewable-business.html Interesting article should give pause to building 400 turbines at Lava Ridge and any other energy proposals. Secondly, what will construction do to the Lava Fields once 400 - 50 to 60 feet deep foundations with tons of steel and over 400 cubic yards of cement are poured for each turbine? Please stop Lava Ridge.	See response to comment 4220-2 (see in Table A-3j, Geology).
4536-1	Sue Page	Has anyone asked what will happen when 400 crates are dug into the volcanic areas proposed for these beasts? The construction of these turbine foundations will destroy areas within the volcanic axial which stretches from Yellowstone, which we know is currently active, through the Craters of the Moon through the Shoshone Lava fields. "The progression of hotspot volanism can be seen along the Snake River Plain. Volcanic features at CRMO are the result of two different regionally extensive processes. The immediate area (where the visitor's center is located) is part of the Eastern Snake River Plain on the track of the Yellowstone hotspot. This region contains both old and young deposits. The larger regional area is part of the Basin and Range Province, a continental rift zone containing young volcanic deposits.Volcanism at Craters of the Moon National Monument and Preserve and the processes that drive it are complex. If you are interested in other volcanoes formed by the same processes, check out the geology in Hagerman Fossil Beds National Monument (ID), John Day Fossil Beds National Monument (OR), and Yellowstone National Park." We must stop the destruction of these fields. Will the excavation methods disrupt a sleeping gift hidden under our land?	See response to comment 3230-4 (see in Table A-3j, Geology).
5189-4	Traci Wood	What about the blasting that could impact the cave systems out in the desert? The impact statement say it won't, but how can you really know.	See responses to comments 11207-1 (see in Table A-3j, Geology) and 1042-14 (see in Table A-3z, Water and Wetland Resources).
5213-2	Sue Page	No study on the effects of this amount of blasting in relationship to the surrounding land, the volcanic caves and lava tunes underground. Further, how far underground east or west will possible fractures go in the lava strata?	See response to comment 4220-2 (see in Table A-3j, Geology).
5464-1	Sue Page	The Environmental Impact Statement seems to have failed to provide on-site testing of the Lava strata and the effects this project can present from collapse of lava tubes to the endangered species to contamination even destructionof Southern Idaho's sole source of drinking water. There has not been any on-site physical study conducted proving the lava strata's capabilities to withstand the magnitude of stress, weight, vibrations associated with not only the construction of the project but with the constant vibrations and sounds of the wind turbines on a daily basis. There must be actual on-site geophysical testing required to determine if the Snake River Plain Aquifer can sustain: 1. the number of structures proposed at the heights, weighs and magnitude proposed And 2. the effects of blasting into the lava strata twice daily for over 500 days And 3. the tonnage of the actual foundations with the turbines spinning daily and the vibrations they will make And 4. the weather vibrations of hot, cold and wind gusts And 5. the constant vibration of the heavy equipment and machinery used for construction. There has not been any substantial testing proving the Snake River Plain Aquifer is capable of withstanding the effects of this many 740ft Space Needle sized turbines. https://www.windfarmbop.com/the-importance-of-the-geophysical-survey-for-a-wind-farm/#comment-28528 <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.windfarmbop.com%2Fthe-importance-of-the-geophysical-survey-for-a-wind-farm%2F%23comment-28528&data=05%7C01%7CBLM_ID_LavaRidge%40blm.gov%7Cf5dfa1dc372f4086d7c708db2892385a%7C0693b5ba4b184d7b9341f32f400a5494%7C0%7C0%7C638148380703810408%7CUnknown%7CTWFpbGZsb3d8eyJWIjoiMC4wLjAwMDAiLCJQIjoiV2luMzIiLCJBTiI6Ik1haWwiLCJXVCI6Mn0%3D%7C3000%7C%7C%7C&sdata=F0t3sscsnB6ljyHuDh7EPwoBdIIbdA%2B7JB76Pv9s1HI%3D&reserved=0>	See response to comment 4220-2 (see in Table A-3j, Geology).
6163-1	Sue Page	The geologist provides the how and why the water flows, the explanation of the lava tubes and the fractures in the rocks and sides of the mountains. This video was created before this project and is a totally independent source for your consideration. What I have learned, between this video and from the last video sent is that the underground water system is fragile. There has been NO testing on the lava strata to date. There has been speculation that the ground is solid and nothing will happen. BUT, the lava tubes are fragile, they can crack and collapse and if they develop further fractures from blasting, vibrations of heavy equipment, what will happen.	See response to comment 4220-2 (see in Table A-3j, Geology).
6167-1	Sue Page	I beg you to watch the attached video about the Lava tubes in the Craters of the Moon and see how fragile they are. They collapse naturally just from the weather changes of hot and cold weather. These lava tubes extend	See response to comment 4220-2 (see in Table A-3j, Geology).

Comment ID	Commenter	Public Comment	Response to Comment
		further west through the Snake River Plain providing Southern Idaho with its sole source of drinking water. There hasn't been any study conducted on the effects blasting, over twice a day x 500+ days, the effects of the vibrations of the heavy equipment or the weight of the foundations and vibrations of the spinning blades will have on the lava tubes created by pillow basalt.	
6167-3	Sue Page	Once blasting starts and the ground shaking starts it will be too late. There is no repair of what Mother Nature created. We have no idea how far and wide the damage will go. No one knows how the fractures in the pillow basalt will react. No one! There has been no testing for anything of this magnitude on lava strata.	See response to comment 4220-2 (see in Table A-3j, Geology).
6868-2	Barbara Martien	Noted that the following areas were not completely covered. [...] The depth and size of holes to be blasted. Stability of Lava rock.	See response to comment 4220-2 (see in Table A-3j, Geology).
7320-8	Lora Ohlensehlen	My concern is about the blasting of the lava rock to create the holes for bases for these gigantic windmills. The blasting bases for fences in the four grazing allotments, and for the significant miles of road that is proposed to be built. Additionally, there will be heavy use of these roads by various truckers bringing in supplies for this project. My concern is that the consequences of this that extreme use of heavy equipment and density of trucks for multiple years. It is unknown what long term consequences this will have to the environment. I am not convinced that the proposed wind mills can be built without compromising the current environment.	See response to comment 4220-2 (see in Table A-3j, Geology).
7369-1	Scott Prow	To yield 400 to 194 wind turbines (EIS p. ES-xi), 56-38 miles of underground collector lines (EIS p. ES-xii), and multiple substations (EIS p. ES-ix) it will require blasting twice per day for 525 days (EIS p. 3-12). This process will permanently impact soils (EIS p. ES-xxi) and have an irreversible loss of basalt(EIS p. 3-361). All this will also cause the possible loss of paleontological resources (EIS p. ES-xx). Anyone who is from Southern Idaho knows that the desert is full of caves and lava tubes. The EIS admits that going forward with this project that the desert will be permanently damaged or at the very least take 125 years for a variety of areas to recover (EIS p. 3-361). Per Idaho Statute 18-7035: DAMAGING CAVES OR CAVERNS if I were to go out into the desert and damage or deface a cave, I would be guilty of a misdemeanor (18-7035 DAMAGING CAVES OR CAVERNS UNLAWFUL -- PENALTY). But if the federal government allows this project to go forward an outside entity will be allowed to come into our state and permanently destroy and scar our land.	See response to comment 4220-2 (see in Table A-3j, Geology).
7548-2	Douglas Miller	I am compelled to point out that the assertion in the draft EIS (Appendix 3) that seismic hazards in the Lava Ridge project area do not merit detailed analysis is not consistent with peer-reviewed science and my personal professional observation as an earthquake seismologist. The risk of a devastating earthquake(s) is very real. To wit, the 1983 M7.3 Borah Peak was one of the largest earthquakes ever recorded in Idaho and the Intermountain West (for example, Breckenridge, 1986. Idaho Geological Survey.) Severe ground shaking was felt over 100 miles away - I know because I felt the frightening shaking in Idaho Falls. Lava Ridge is a comparable epicentral distance and the travel path of seismic energy - both compressional and shear waves - comprises similar geology. Thus, the potential for a severe earthquake at Lava Ridge is very real. Further, design of wind turbines should include potential seismic loads (see Prowell and Veers, 2009. Assessment of Wind Turbine Seismic Risk: Existing Literature and Simple Study of Tower Moment Demand: Sandia National Laboratories Report SAND2009-1100.) Since a meaningful analysis of seismic hazards and a concomitant risk assessment has not been conducted, Alternative A "No Build" is the only acceptable option.	See response to comment 3542-4 (see in Table A-3j, Geology).
8256-3	Sue Page	This area is also part of the Volcanic Geographical Axial spanning westward from Yellowstone through Craters of the Moon, Wilson_Butte_Cave, this project site, through Shoshone, Salmon Falls, Thousand Springs and beyond. There hasn't been any geophysical testing on-site to prove the infrastructure is capable of handling the blasting, heavyweight equipment and vehicles or the tonnage of the wind turbines and vibrations.	See response to comment 4220-2 (see in Table A-3j, Geology).
8421-5	Brian Olmstead	Next, When the Milner Gooding Canal and North Side Canals were blasted through Lava in the early 1900s, they both had hundreds of leaks develop from the canal to the aquifer that took years to repair. Numerous times since then, new sinkholes have developed in these canals and a good portion of those developed right after far away earthquakes of any magnitude. I would be very surprised if the hundreds of mega-blasts required for this project don't cause new and possibly disastrous sinkholes to develop in the Near-by Milner Gooding Canal. That is exactly why The Mile Post 31 recharge site in the Lava Ridge Project Area is the best recharge site in Idaho! There are hundreds of previously unknown vents, fissures, tubes, and cracks that easily transport up to 600 cubic feet per second of water from the canal to the aquifer.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
8790-7	James Ritchie	6. We irrigate approximately 1500 acres with a combination of groundwater and surface water through the Gooding-Milner canal. The draft EIS does not address the blasting involved in placing the concrete for the base of the wind towers. Lava rock is very porous and blasting near a canal could very easily open up a fissure taking precious irrigation water. Also I am concerned for irrigation and domestic wells and what effect the blasting will have on them.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).
9140-1	Regina Smith	Subject: Lava Ridge wind turbines and geology/seismic activity It has occurred to me the geology of the project area is not discussed in the DEIS. Neither is there any discussion on seismic activity in the area. The weight of wind turbines combined with the concrete foundations must be considerable. Two years of daily blasting is proposed. Multiply that by 400 and an additional wind farm adjacent (Taurus) set in an area of seismic activity and what are the impacts? I do not see that even a desktop survey of the geological maps has been done. There	See responses to comments 1042-14 (see in Table A-3z, Water and Wetland Resources) and 4220-2 (see in Table A-3j, Geology).

Comment ID	Commenter	Public Comment	Response to Comment
		have been numerous comments on the aquifer, water diversion and impacts to wells. There have been no substantive answers. There is no discussion in the DEIS on geological structure. With the porous nature of the volcanic rock, years of blasting, a shallow aquifer and seismic activity combined could result in catastrophic impacts. Yet there are no studies or analysis presented either from the project area or other similar ground disturbing projects. Not even conjectures. Local communities, residents, farmers and ranchers are not willing to be subjected to this “great experiment”. Texas is in the news today having a huge sinkhole opening up in a small town outside of Houston. The area was used for underground storage/disposal. One of the causes cited was the weight of the water from recent storms. Neither BLM or MVE offer any assurance that something similar couldn’t happen here. I urge you to select alternative A, no action.	
9266-2	Laura Broussard	Study the geologic effects left behind.	See response to comment 4220-2 (see in Table A-3j, Geology).
9275-4	AJ Whitecotton	I am also greatly concerned about the aquifer and what damage blasting will do to a base that is made from honey combed rocks. Lava rock is porous in the first place and not suited to weight bearing loads of the magnitude of windmills without major footings. Also the constant vibrations that windmills will create I do not think have been evaluated over a long period of time. Since our aquifer is a main water source in Idaho any damage to it could prove catastrophic. Since I have searched and found only studies of actual lava domes or active volcanoes but nothing in depth about building structures of the magnitude discussed in this proposal I would say that a massive amount of study needs to be done on the geology of the area and it’s abilities to support these types of units without any damage to the underlying aquifer.	See response to comment 4220-2 (see in Table A-3j, Geology).
9896-1	AJ Whitecotton	I learned that this project sits on top of the Snake River Plain Aquifer that supplies water to both the Magic Valley and the Treasure Valley. The site that is proposed is made of basalt lava flows. This fragile bedrock provides a natural purification system and channeling for the water in the Snake River Plain aquifer. I have also learned that to install these massive towers, that hundreds if not thousands of holes will need to be "blasted" into that lava bed that makes up the aquifer. Blasting fragile material like this and placing 400+ 740-foot wind towers into the lava bed to me does not sound like the best location for a wind turbine farm. In my opinion the continuous stress on these towers from wind and weather and weight over time could, in my opinion lead to damage to the lava bed and the aquifer and its ability to supply water to our communities without interruption or worst total blockage.	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources).

Mineral Resources

Table A-3k. Mineral Resources

Comment ID	Commenter	Public Comment	Response to Comment
11491-18	Dean Dimond, Jennie Bateman	- In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: [...] 13.Need information on actual BLM USA mineral estate status and need new analysis of effects on oil, gas and mining leases, claims, etc., [...]	The BLM discussed the consideration of mineral resources within the draft EIS in EIS Appendix 3 under AIB-17, AIB-18, and AIB-19. The BLM reviewed existing data sources and determined that there are no known locatable minerals located in the siting corridors. To avoid conflict between the project and locatable mineral claims during evaluation of MVE’s ROW application, the BLM temporarily segregated a 106,556-acre area from locatable mineral entry. There are saleable minerals in the siting corridors—volcanic (basalt) and quaternary sediments—none of which are desirable or rare. The project would not preclude the extraction of saleable materials outside of the siting corridors. Applications for saleable minerals on BLM public lands would be evaluated when requests are received. The BLM reviewed existing data sources and determined that there are no known leasable minerals located in the siting corridors.
12240-2	Dean Dimond	The DEIS doesn’t say were they are going to get the gravel for there concrete. With the amounts that will be need if they plan on getting it locally it will total deplete our sources. This would have a huge negative affect on the Magic Valley forever. The DEIS does sase they are planning on crushing Lava Rock for gravel. Lava rock makes a soft gravel and can not be used for roads. Other wise road that need to hold over size loads.	Section 2.8 of MVE (2023) discusses the plans for acquiring and using mineral materials including gravel for roads. Preliminary geotechnical investigations will inform whether the aggregate generated from on-site is suitable for project uses. In the event the material is not suitable, commercial sources in the region will be used to fulfill the project needs.
6387-6	AJ Whitecotton	This has been in very short supply in the Magic Valley for the last two years. Due to my contacts, I have been able to procure concrete for projects I have been involved with. It has also become an expensive commodity. The nearest cement plant is located near Durfee, Oregon. Assuming the project has its own on site plant, this will still necessitate many cement hauling trips to and from the plant to provide the quantity of needed material for this project.	Section 2.8 of MVE (2023) discusses the plans for acquiring and using mineral materials including concrete. Temporary concrete batch plants will likely be established within the project laydown yards for preparing and mixing the concrete used for foundations of wind turbines, substation equipment, transmission structures, the operations and maintenance buildings, and other necessary project facilities. Local concrete suppliers may also be used to provide truck deliveries of concrete. The batch plant complexes consist of a mixing plant, areas for sand and aggregate stockpiles, an access road, and truck loadout and around areas. The batch plants themselves consist of cement storage silos, water and mixture tanks, aggregate hoppers, and conveyors to deliver different materials. The batch plants will be located within project laydown yards or in separate temporary batch yards close to the sites where foundations are being poured. The batch plants will be relocated as needed to maintain efficient operation.

Hazardous Materials and Solid Waste

Table A-3l. Hazardous Materials and Solid Waste

Comment ID	Commenter	Public Comment	Response to Comment
11326-3	Filip Camacho, Tasha Sorensen	The BLM should also consider how developers may dispose of wind towers at the end of a project's life and analyze the impacts of such disposal. There are examples across the West of improper disposal of wind turbines filling up landfills, and other potentially harmful ways of managing waste associated with renewable energy development.10 Many rural communities where these projects will be located do not have sufficient landfill or recycling facilities to accommodate future end-of-life needs for these projects. The BLM should consider these and other potential impacts of decommissioning wind projects.	In accordance with the Decommissioning Plan (Appendix L in MVE [2023]), all dismantling, removal, recycling, and disposal of materials generated during decommissioning will comply with rules, regulations, and prevailing laws at the time decommissioning is initiated, and will use approved local or regional disposal or recycling sites as available. Recyclable materials will be recycled to the furthest extent practicable. Non-recyclable materials will be disposed of in accordance with state and federal law. Also in compliance with regulations found in 43 CFR 2805.20, MVE will be required to furnish a reclamation bond to cover any losses, damages, or injury to human health, the environment, or property in connection with the use and occupancy of the ROW, including costs associated with terminating the grant, and to secure all obligations imposed by the grant and applicable laws and regulation.
11491-27	Dean Dimond, Jennie Bateman	In Summary of my substantive comments I list the following deficiencies or need for new information to be considered in the DEIS for the Lava Ridge Wind Project: 1. plan for mitigation of hazardous waste/oil accidental spills,	Measures to minimize or avoid impacts from the potential for leaks and spills of oil and other hazardous materials are described in the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]). Also see Section F-5.1 (Hazardous Materials Management Plan) in the Health and Safety Plan (Appendix F in MVE [2023]).
11667-5	Alisa Bowman	Concern: Hydraulic fluid leaks and ground contamination Oil leaks from wind turbines can pollute soil and water. The lubricant is not mother's milk. It is a synthetic-based oil that needs to be replaced on a regular basis. If these towers are not maintained and serviced or the gears malfunction, inevitably oil leaks and seeps into the ground making it's way to our soil and into the water supply.	MVE categorized hydraulic fluid as a hazardous material in MVE (2023). The Health and Safety Plan (Appendix F in MVE [2023]) addresses how the material will be handled, transported, used, and disposed of in their Hazardous Material Program. See the Spill Prevention, Control, and Countermeasures Plan (Appendix G in MVE [2023]) for measures regarding spilled materials.
11871-113	WildLands Defense	"PGE has experienced 10 transformer failures at Biglow Canyon that have collectively leaked 3,000 gallons of mineral oil to the ground surrounding turbines and caused two fires. Pictured above, pad-mount transformers sit in cabinets below each turbine at Biglow Canyon." Lenna Cope, a project specialist at PGE, told regulators during a public meeting transformer failures are an industry-wide problem and PGE was replacing them with transformers with different specifications when they failed. She said the demand on turbine transformers is unique because it rises and falls with rapid changes in the wind, and resulting temperature changes can degrade transformer oil and insulators, leading to the buildup of combustible gasses. The gas accumulation can over pressurize a tank, cause a rupture or, if there's an electrical arc, flash off and cause an explosion.	Section 2.10 of MVE (2023) discusses mineral oil use and the incorporation of leak detection and containment systems into the transformers to make the potential risk for accidental spills or malfunctions low. Also in compliance with regulations found in 43 CFR 2805.20, MVE will be required to furnish a reclamation bond to cover any losses, damages, or injury to human health, the environment, or property in connection with the use and occupancy of the ROW.
11873-7	Mary Schwartz, Frank Schwartz	7. The DEIS does not address waste management associated with turbine blades, generators, batteries, transformers and other infrastructure for either the operations phase (replacement of failed/defective components) or the end-of-life decommissioning and disposition of all of the wind farm components. Turbine blades themselves represent a very significant waste volume and a very large associated environmental impact. The disposition path for all infrastructure (towers, generators, turbine blades, batteries, transformers, concrete, underground infrastructure, etc.) must be addressed in this DEIS. This DEIS is grossly incomplete without the analysis of/inclusion of the environmental impacts associated with this waste issue. Quantification of the waste volumes and the intended disposition path and disposal locations must be addressed. The commitment in the DEIS for the development of waste management plans is meaningless without the analysis of the associated environmental impacts, which is the purpose of the DEIS.	In accordance with the Decommissioning Plan (Appendix L in MVE [2023]), all dismantling, removal, recycling, and disposal of materials generated during decommissioning will comply with rules, regulations, and prevailing laws at the time decommissioning is initiated, and will use approved local or regional disposal or recycling sites as available. Recyclable materials will be recycled to the furthest extent practicable. Non-recyclable materials will be disposed of in accordance with state and federal law. Also mentioned in Section L-2 in the Decommissioning Plan, MVE will prioritize the re-use, recycling, or scrap value of decommissioned Project components over direct disposal in approved landfill facilities. Many of the metal project components have potential for re-use or scrap value, depending on the market value of the metals at the time of decommissioning. New industrial technologies that recycle turbine blades are currently gaining traction in the marketplace and are expected to increase in utilization over the lifespan of the project. Should these re-use, recycling, or scrap disposal methods become uneconomic by the end of the project lifespan, MVE would seek appropriate industrial disposal sites or landfill locations that are permitted to accept the project components. MVE would not seek to force landfill facilities to accept the disposal of components if the facility objects to their disposal.
11926-11	Name Not Provided, Susan Jesser	Wind turbines are not green or clean energy. How many gallons of oil does each turbine take to operate? Think about all the semi-trucks, cranes, bulldozers, etc. that will be needed to construct/maintain this project. Most blades are not recycled due to the cost and the chemical composition in the blades so end up in Casper Regional Landfill in Wyoming.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste). Refer also to applicant-committed measure 84 "MVE would prioritize the re-use, recycling, or scrap value of decommissioned project components over direct disposal in approved landfill facilities. Recyclable materials would be recycled to the furthest extent practicable. Non-recyclable materials would be disposed of in accordance with state and federal law."
12226-2	Ted Deetz	EIS Section AIB46 states that "MVE would develop and implement a hazardous materials management plan". Comment: Again, plans should be developed prior to approval. There is no mention of the long term effects on the ESPA. The supposed plan will only address Storage, Use, Transportation and Disposal of hazardous materials and no mention of prevention of hazardous materials such as the tons of ammonium nitrate fuel residue that is forced into the basalt and surrounding environment. This is not a "Green Project".	See response to comment 1042-14 (see in Table A-3z, Water and Wetland Resources). MVE also added details to MVE (2023) regarding blasting and the Blasting Plan Methodology (Appendix I in MVE [2023]).
12228-1	Jane Dyndiuk	As a resident of Blaine County I am most concerned with the risk to our aquifer should oil leak into the soil.	See AIB-47 for information on inadvertent spills or leaks and AIB-48 for information on stormwater runoff (EIS Appendix 3). MVE would develop and implement a Hazardous Materials Management Plan and a Waste Management Plan as part of the Health and Safety Plan (Appendix F in MVE [2023]) and the Spill Prevention,

Comment ID	Commenter	Public Comment	Response to Comment
			Control, and Countermeasures Plan (Appendix G in MVE [2023]) to minimize and avoid the potential risk of surface and groundwater contamination from inadvertent spills and leaks (applicant-committed measures 66, 67, and 77). These plans would address storage, use, transportation, and disposal protocols and BMPs, as well as inspection and training protocols and emergency response procedures for hazardous materials and wastes (applicant-committed measures 68–77). Secondary containment shall be provided for all on-site hazardous materials and waste storage, including fuel (applicant-committed measure 70). With these plans and prevention measures in place, the risk of potential impacts to surface and groundwater quality from inadvertent leaks or spills would be low.
12307-11	Dean Dimond	plan for mitigation of hazardous waste/oil accidental spills	See response to comment 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
12351-5	Julie C. Lynn	Imagine the effects of an oil spill from turbines into the very porous lava beds which are above one of the nation's largest aquifers.	See response to comment 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
12982-15	Jerry Taylor	The DEIS is vague about what happens to the waste generated by Lava Ridge. It says that MVE reports that strides are being made toward recycling of worn out blades. No specifics are offered. MVE says it will contract with landfills in the area to dispose of materials there, but landfill space across the state is fully obligated and shrinking fast. These are unreliable promises. What about the heavy metals associated with batteries? The DEIS should be suspended until these issues are analyzed in full and addressed. ROW bonding alternatives should be fleshed out, analyzed and disclosed upfront, to insure that the company doesn't walk away and leave the county, state or federal government holding the bag.	See response to comment 11326-3 (see in Table A-3l, Hazardous Materials and Solid Waste).
5189-8	Traci Wood	900 tons of steal, 2,500 tons of concrete and 45 tons of non recyclable plastic all for just 1 turbine. And when it's retired, the concrete gets left in the ground. Where do the broken blades end up? Landfills in Wyoming or other states? What about all the oil that is used per turbine. What makes it so green with the 40 acres of battery storage? Batteries that are made by mining the components. Or if there are oil leaks that seep in to the ground. I read it's a synthetic oil. That is also not great for the environment.	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste), 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste), 11326-3 (see in Table A-3l, Hazardous Materials and Solid Waste), and 11926-11 (see in Table A-3l, Hazardous Materials and Solid Waste).
6356-1	Gayle Michelucci	THE MOTORS USE OIL. OIL CONTAMINATES THE ENIVIROMEMNT. I DO NOT TRUST THE MAINTENENCE & SERVICE PERSONAL TO NOT DISCARD OIL PURPOSELY OUT OF LAZINESS OR ACCIDENTALLY INTO OUR SOIL. CREATING DAMAGE TO THE LAND, AGRICULTURE & ANIMALS. TURBINES ARE MORE UP KEEP. I DO NOT TRUST IT WILL BE DONE AS IT SHOULD BE. WHERE WOULD ALL THE USED OIL BE DICARDED AND HOW MUCH WILL IT COST TO KEEP UP TURBINES WITH OIL.	See response to comment 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
6866-6	David Briggs	There are numerous recent news stories from around the world about these towers collapsing.. And what is to become of the used blades? What is the disposal plan for these huge blades that can't be recycled and have a lifespan of less than 20 years?	The wind turbines layouts will be designed with specific setbacks from residences, developments, and other uses in the project area, if the tower, however unlikely, does collapse. Also mentioned in Section L-2 in the Decommissioning Plan (Appendix L in MVE [2023]), MVE will prioritize the re-use, recycling, or scrap value of decommissioned project components over direct disposal in approved landfill facilities. Many of the metal project components have potential for re-use or scrap value, depending on the market value of the metals at the time of decommissioning. New industrial technologies that recycle turbine blades are currently gaining traction in the marketplace and are expected to increase in utilization over the lifespan of the project. Should these re-use, recycling, or scrap disposal methods become uneconomic by the end of the project lifespan, MVE would seek appropriate industrial disposal sites or landfill locations that are permitted to accept the project components. MVE would not seek to force landfill facilities to accept the disposal of components if the facility objects to their disposal.
7318-2	Linda (No Last Name Provided)	Disposal of spent blade material. There's a problem that was detected in 2019, that the waste for wind turbines at a Nevada scrapyard was at >720,000 tons to dispose of for the next 20 years, and that didn't include the newer, taller, higher capacity versions like this project. I understand that this will be the largest one in the US. Does this project include a scrapyard in the middle of Idaho too? Where do the chemicals in these turbines go when they are scraped and can't be recycled? My guess is that they contaminate the earth on which they were placed.	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
7321-1	Travis Wells	According to a report entitled "Renewable Energy Fact Sheep: Wind Turbines", which was published by the EPA, states that the average lifespan of a windmill is twenty years. Some windmills don't last that long for numerous different reasons. Once windmills complete their lifespan, they are generally disposed of in landfills or just abandoned in the area they were erected. Some companies are working to create recycling opportunities for these windmills, but this is not usually feasible due to the transport and deconstruction costs associated with moving large objects. The windmill frames will be an eyesore. Each windmill also has hydraulic oil reservoirs for oils to be housed for lubrication of the gears. If this oil is not handled properly after decommissioning the windmill, it will become a toxic hazard and negatively affect the land around it.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
7349-1	Robin Herrman	Not to mention the blades, which are made of carbon fiber and fiberglass composites held together with plastics, are not typically recyclable and end up in a landfill. It would be reasonable to assume that pressure to landfill these blades in Idaho would occur.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
7758-1	Dawn Leiske	how much oil will be used annually for maintenance, disposal, (oil, blades, etc.), and where they will bury/dispose of the older and dysfunctional parts as the project matures. In my research there is currently no way of disposing of the blades other than burying them.	See responses to comments 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).

Comment ID	Commenter	Public Comment	Response to Comment
7786-4	Dawn Leiske	The life cycle for renewable electricity like wind and solar runs from design, procurement, and construction, through operations and maintenance, and repair, as well as the life ending decommissioning and disposal, but again, recycling and restoration of the landscaping back to its original pristine condition, is also not in the cards in the wealthy countries that are going green. The U.S. will have more than 720,000 tons of blade material to dispose of over the next 20 years, a figure that doesn't include newer, taller higher-capacity versions.No Pages to Reference in the Lava Ridge Wind Turbine EIS Draft, because it does not address these issues. There is no cumulative action for my topics of concern.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) for project specific decommissioning and disposal methods proposed.
7786-6	Dawn Leiske	How much coal will be used to assemble the blades, steel foundations, etc. and how much oil will be used annually for maintenance, disposal, (oil, blades, etc.), and where they will bury/dispose of the older and dysfunctional parts as the project matures. In my research there is currently no way of disposing of the blades other than burying them.	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste).
8629-4	Cathy Schiers	What plans are in place for disposal of the equipment when it fails, wears out, or is no longer functioning? Will Idaho land also be required for landfills for the giant turbine parts and equipment?	See responses to comments 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) and 11926-11 (see in Table A-3l, Hazardous Materials and Solid Waste).
8643-4	Steve Woods, Pam Woods	Disposal at the end of the blade lives should be another concern since the new blades have no proven life, only an estimated life. The current practice for disposal is to cut the blades into manageable lengths and bury them in graveyards located in remote places like Wyoming. Could Idaho be next? Furthermore, the "planned" disposal methods have not been proven. This project will utilize approximately 1200 blades, each about 280 feet long. Life expectancy is believed to be 25 years but there is no actual experience to prove that estimate. One solution being considered is to shatter the blades and use the fibers in highway construction. One wonders how many blades can be used this way especially with the push to eliminate crude oil production (the source of asphalt). Additionally, one wonders if minute fiberglass particles along highways will become a respiratory problem for travelers and wildlife. All as-yet unproven issues. A recent article claimed that there were 8,000 blades, each averaging 200 feet in length, that were retired in 2021 (and the number is growing significantly every year).	See response to comment 11873-7 (see in Table A-3l, Hazardous Materials and Solid Waste) for project specific decommissioning and disposal. Also see response to comment 11926-11 (see in Table A-3l, Hazardous Materials and Solid Waste).
869-3	Michael Crout	You show the end results of what is needed to achieve clean energy with the slight impact on the environment. You don't show the distructivenes and harm to the environment to achieve the end results. Nothing is there about the waist byproducts of maintenance along with its impact on the environment.	See response to comment 12228-1 (see in Table A-3l, Hazardous Materials and Solid Waste).
9186-1	Julie DeWolfe	Failure to include maximum potential volumes of oils, fuels, and lubricants per WT. Failure to include disaster plan for chemical spills. Where is the table and summary listing all hazardous chemicals that will be hauled into the Lava Ridge area, how often they will be hauled in over the lifetime of the project, by what route will they be hauled in, and how they will be stored onsite? WT will need grease for bearings and yaw pinions, hydraulic oil (if applicable), gear oil for drive train gearbox (if applicable), dielectric fluid for transformer, diesel fuel for emergency generator, sulfur hexafluoride for switchgear, propylene glycol for transformer and converter cooling system, ethylene glycol for converter primary cooling, or other products similar for all the moving parts. Wind turbines are filled with toxic chemicals which you do not address adequately or at all for disposal of, storage of, transport of, or use of on public lands. Where is the chemical spill disaster plan for rail, road, and onsite?	See the Hazardous Materials Management Plan portion of the Health and Safety Plan (Appendix F in MVE [2023]).
9864-1	Julee Austin	Disposal of wind turbine blades has been a concern of many for years, with regard to wind energy farms. But a more immediate concern is the shedding of plastics from the turbine blades. The blades are coated with an epoxy resin, which is about 40% Bisphenol-A, a neurotoxin and endocrine disruptor. To minimize the shedding, the blades are coated with another toxic ingredient from the PFAS family of “forever” chemicals. These forever chemicals are biologically cumulative and nondegradable. Microplastic shedding, known as Leading Edge Erosion (LEE) happens only a couple years after installation. LEE is caused by weather, mainly rain and hail. With the impact of rain droplets and hail on the turbine blades that are rotating at a speed of between 30-60 revolutions per minute, the leading edge of the blade starts to wear and erode. The shedding microplastics can spread far and wide with the wind. They can eventually make their way into our drinking water, which will then be contaminated by the toxins. Each turbine can shed about 137 pounds of micro particles per year. Two different studies have been done by the New York State Energy Research and Development Authority regarding utilizing wind energy above Lake Erie. Lake Erie provides drinking water to millions. Considering the shedding of the toxins from the blades, it has been determined that the health of the region’s largest drinking water lake is more important than the goals of the state energy policy. The New York State Department of Public Service has ruled that wind energy facility owners cannot withhold wind turbine blade damage reports from neighbors out of concern for these risks. Since this information is not noted in the DEIS, I am asking you to opt for Alternative A, a no-build option for our Snake River Plain Aquifer Lava Ridge project. https://iowaclimate.org/2022/12/17/clean-energy-scourge-wind-turbine-blades-shedding-tonnes-of-toxic-microplastics/	See response to comment 11686-1 (see in Table A-3dd, Plan of Development – EIS Appendix 1).
9893-2	Michael Chew	[I do not believe this wind farm would be beneficial to the citizens of Idaho for the following reasons:] The turbine blades are typically made of a composite carbon fiberglass material making separating the plastics from the glass fibers to recycle into a workable fiberglass material difficult. The disposal or recycling of the composite fiber turbine blades when units are decommissioned at the end-of-use stage, or when wind farms are upgraded in the	See the Decommissioning Plan (Appendix L in MVE [2023]).
