Museum Handbook Quick Reference

MUSEUM HANDBOOK

PART I

MUSEUM COLLECTIONS

ACKNOWLEDGMENTS

The preparation of the NPS *Museum Handbook*, Part I, is coordinated by the Preservation and Protection Team, Museum Management Program.

The entire Handbook was reissued in 1990. Additional revisions were issued in 1994, 1996, 1998, 1999, 2000, 2001, 2002, 2003, 2005 and 2006. Additional Plain Language revisions and updates are currently being prepared. The authors and the date each chapter or appendix was issued or revised are listed below:

Chapter 1 (2006) – Ann Hitchcock, Chief Curator; Steve Floray, Museum Specialist, Park Museum Management Program.

Chapter 2 (2003) – Steve Floray, Museum Specialist, Park Museum Management Program; Tony Knapp, Training Manager, Cultural Resources Stewardship, Stephen T. Mather Training Center.

Chapter 3 (1999) – Jessica S. Johnson, Conservator, Museum Management Program and Martin Burke, Associate Manager, Department of Conservation, Harpers Ferry Center.

Chapter 4 (1999) – Jessica S. Johnson, based on 1990 version. The previous version was written by Edward McManus, Regional Conservator, North Atlantic Region; Tom Carter, Paintings Conservator, Division of Conservation, Harpers Ferry Center; Diana Pardue, Staff Curator, Curatorial Services Division; John Hunter, Supervisory Staff Curator, Curatorial Services Division; and Toby Raphael, Conservator, Division of Conservation, Harpers Ferry Center.

Chapter 5 (1998) – Jessica S. Johnson.

Chapter 6 (1999) – Jessica S. Johnson, based on the 1990 version written by Kathleen Byrne, Staff Curator, Curatorial Services Division.

Chapter 7 (1999) – Donald Cumberland, Museum Specialist, Museum Management Program, with additions by Steve Floray, Museum Specialist, Museum Management Program (2001).

Chapter 8 (2001) – Sara J. Wolf, Conservator, Museum Management Program, and Jessica S. Johnson.

Chapter 9 (2002) – Danny McDaniel, Director, Security, Safety and Transportation, The Colonial Williamsburg Foundation; John Hunter; Tony Knapp; with additions by Steve Floray and Sara J. Wolf.

Chapter 10 (2000) – Diane Vogt O'Connor, Senior Archivist, Museum Management Program.

Chapter 11 (2001) – Jessica S. Johnson based on the 1990 version written by Tony Knapp; Bill Meuse, Museum Curator, Springfield Armory NHS; Bart Roberts, Metals Conservator, Division of Conservation, Harpers Ferry Center.

Chapter 12 (2003) – Abby Sue Fisher, Chief of Museum Services, Keweenaw National Historical Park; Sara J. Wolf.

Appendix A (2000) – Steve Floray, based on the 1990 version written by Tony Knapp.

Appendix B (2006) – Ann Hitchcock.

Appendix C (2000) – Steve Floray, based on the 1990 version written by Tony Knapp.

Appendix D (2006) – Ann Hitchcock.

Appendix E (2003) – Steve Floray.

Appendix F (1999) – Jessica S. Johnson, with additions by Steve Floray (2005).

Appendix G (1996) – Danny McDaniel; John Hunter; Tony Knapp.

Appendix I (2001) – Cynthia Murdock, Program Assistant, Museum Management Program, and Jessica S. Johnson, based on the 1999 version written by Brigid Sullivan, Regional Conservator, Midwest Region.

Appendix J (2003) – Sara J. Wolf.

Appendix K (2002) – Sara J. Wolf.

Appendix L (2000) – Jessica S. Johnson and Karen Bennett, Intern, Museum Management Program, based on the 1990 version written by Tom Carter.

Appendix M (1999) – Diane Vogt O'Connor.

Appendix N (2002) – Cynthia Murdock, based on the 1990 version written by Al Levitan, Furniture Conservator, Division of Conservation, Harpers Ferry Center.

Appendix O (2002) – Martin Burke.

Appendix P (2000) – Jessica S. Johnson, based on the 1990 version written by Shelley Sturman, Objects Conservator, and Judy Ozone, Objects Conservator, National Gallery of Art.

Appendix Q (1999) – Catherine Hawks, Private Conservator.

Appendix R (1996) – Debbie Hess Norris, Assistant Professor of Photographic Conservation, University of Delaware, and President of the American Institute for Conservation of Historic and Artistic Works.

Appendix S (1996) – Toby Raphael.

Appendix T (2005) - Stephen L. Williams, Assistant Professor of Museum Studies, Baylor University and Collections Manager, Strecker Museum Complex (adapted from Mr. Williams' Ph.D. dissertation); Catherine Hawks.

Appendix U (2005) - Greg McDonald, Senior Curator of Natural History, Park Museum Management Program; Ann Elder, Paleontologist and Museum Curator, Dinosaur National Monument; Sally Shelton, Collections Officer, Smithsonian Institution, National Museum of Natural History.

Additional thanks go to the numerous other individuals who have assisted or advised on the Handbook since 1990. Individuals who assisted with the 1999, 2000, 2001, 2002, 2003, 2005 and 2006 revisions include: Carol diSalvo, Integrated Pest Management Coordinator, and Barbara Cumberland, Assistant Conservator, Department of Conservation, Harpers Ferry Center, for Chapter 5; Harold L. Spencer, Structural Fire Training and Education Specialist, National Interagency Fire Center, Structural Fire Program, for Chapter 9; Carol diSalvo and Kathryn Makos, Senior Industrial Hygienist, Smithsonian Institution, for Chapter 11; Nancy Purinton, Conservator, Department of Conservation, Harpers Ferry Center, for Appendix J; Sara McElroy, Paintings Conservator, University of Texas at Austin, for Appendix L.

Thanks to the following individuals for their critical review of the text: John W. Roberts, Chief National Register of Historic Places and National Historic Landmarks Program (former Manager, Park Museum Management Program); Joan Bacharach, Curator, Park Museum Management Program; Janet Pasiuk, Museum Technician, Clara Barton National Historic Site; Melinda Snarr, Intern, Park Museum Management Program; Museum Management Program Council members; NPS Chief Curator Ann Hitchcock. Additional thanks to Lea Anne Chapman, Program Assistant, Park Museum Management Program, and Cynthia Murdock for their careful copyediting and formatting of the text.

LIST OF FIGURES

INTRODUCTION

The *Museum Handbook* covers a broad range of topics to guide National Park Service staff in managing museum and archival collections:

- Part I covers planning, preservation, and protection for the disciplines and materials represented in NPS collections, including professional ethics, specialized storage, environment standards, conservation treatments, and emergency preparedness.

- Part II outlines procedures for museum record keeping, including accessioning, cataloging, loans, deaccessioning, photography, and reporting annual collection management data.

- Part III provides guidance on access and use for interpretation, education, exhibition, and research. It covers legal issues, publications, two and three-dimensional reproductions, using museum objects in exhibits and furnished historic structures, and providing access for research.

NPS staff responsible for collections should make informed choices based on their own skills and experience, standards and procedures outlined in the *Museum Handbook*, advice provided by specialists, and additional information provided in the references found in the *Museum Handbook*. Staff should, as needed, seek advice or technical information from regional and support offices, the Harpers Ferry Center, and the Park Museum Management Program, National Center for Cultural Resources.

By following the practices represented in this guidance, trained staff can ensure that the National Park Service collections will be, as mandated by the 1916 NPS Organic Act, preserved and maintained for the use and enjoyment of the present and future generations.

Chapter 1: National Park Service Museums and Collections

CHAPTER 1: NATIONAL PARK SERVICE MUSEUMS AND COLLECTIONS

A. Overview

1. *What information will I find in this chapter?*

This chapter will introduce you to the National Park Service (NPS) museum program. It includes information on:

- The purpose of NPS museums
- The history of NPS museums
- The kinds of NPS museum collections
- Introduction to NPS museum collections management
- Organizational structure for the servicewide museum program
- Planning for park museum collections
- Ethics, standards, and professional organizations

2. *Where can I find additional information on these topics?*

Consult the references in sections G and H for a listing of associations, Web sites, books, and journals with useful information.

B. Purpose of National Park Service Museums

1. *What is a museum?*

In 1895, George Browne Goode, Director of the Smithsonian Institution's United States National Museum, defined a museum as "…an institution for the preservation of those objects which best illustrate the phenomena of nature and the works of Man, and the utilization of these for the increase in knowledge of the people," (Goode, 1895). The United States Congress, in the Museum and Library Services Act (Title II of P.L. 94–462), defined a museum as "…a public or private nonprofit agency or institution organized on a permanent basis for essentially educational or aesthetic purposes, that utilizes a professional staff, owns or utilizes tangible objects, cares for the tangible objects, and exhibits the tangible objects to the public on a regular basis." Both definitions have important qualifiers that distinguish museums from exhibit galleries, curio collections, and other types of property that an institution may manage. Professional museum associations offer additional variations on these basic definitions.

2. *What is a museum object?*

A museum object is a material thing possessing functional, aesthetic, cultural, symbolic, and/or scientific value, usually movable by nature or design. Museum objects include prehistoric and historic objects, artifacts, works of art, archival material, and natural history specimens that are part of a museum collection. (Large or immovable properties, such as

monumental statuary, trains, nautical vessels, cairns, and rock paintings, are defined as structures or features of sites.) (See NPS *Cultural Resource Management Guideline*, Appendix A, Glossary.)

3. *What do museums do?*

Museums collect, preserve, study and interpret, and provide appropriate public access to natural and cultural materials that have been assembled according to a plan.

The collection must have a written scope statement (see *Museum Handbook,* Part I, Chapter 2, Scope of Collections). The items in the collection, whether cultural or natural, and their associated documentation are valuable for the information that they convey about people, processes, events, and interrelationships within cultural and natural systems. Placing objects within a broader context, through research, analysis and documentary records, provides the greatest public enjoyment and benefit.

4. *What do I need to know about a museum's primary responsibilities?*

With few exceptions, after their founding, museums continue to collect within their stated scope. All activities in the museum revolve around the collection. **Collecting, and documenting the resulting collection, is the first responsibility.**

Because the collection is a non-renewable resource, the museum must ensure its preservation. Museum objects and specimens lose their value if they, or their associated data, are damaged or lost. **Preserving the collection is the second responsibility.**

In order to ensure public benefit from the collections, the museum must provide for access, use, and interpretation, including research and exhibit. Research, by the museum staff and others, is the foundation for public exhibit and museum education programs. Research and the resulting interpretation to the public, either through exhibits or public programs, demonstrate the collection's value to the public. **Providing for collection access, use, and interpretation is the third responsibility.**

Museum Handbook, Part I, provides information on collecting, preservation, and protection. *Museum Handbook*, Part II, has procedures for documenting collections. *Museum Handbook*, Part III, addresses collections access and use.

5. *What is museum management?*

Museum management consists of the policy, procedures, processes, and activities that are essential to fulfilling functions that are specific to museums, such as acquiring, documenting, and preserving collections in appropriate facilities and providing for access to and use of the collections for such purposes as research, exhibition and education. The production of exhibits, the presentation of interpretive and education programs, and the publication of catalogs, books, and Web sites featuring museum collections and themes are part of museum management. The administrative functions relating to funding, human resources, maintenance, and property management are also part of museum management and require certain knowledge and skills specific to the museum environment.

6. *What is museum*

Museum collections management is one aspect of museum management. It

collections management?

is a process, not a product. It is a systematic approach to the proper preservation and the wise use of museum objects. It includes any activity associated with the acquisition, accountability, documentation, conservation, protection, disposition, and use of museum objects. It involves assessing and planning for the short-term and long-term needs of a collection as well as carrying out the day-to-day activities of caring for objects on exhibit and in storage. The goal of collections management is to make museum collections available to the user for exhibit and study while preserving them for future generations.

7. *Under what authorities does NPS manage museums?*

Five laws provide the basic legal mandate for the NPS to manage museums. The laws are:

Antiquities Act of 1906
16 USC 431— 433; June 8, 1906, ch. 3060, 34 Stat. 225

National Park Service Organic Act
16 USC 1— 4; Aug. 25, 1916, ch. 408, 39 Stat. 535

Historic Sites, Buildings, Objects, and Antiquities Act (commonly known as the Historic Sites Act of 1935)
16 USC 461— 467; Aug. 21, 1935, ch. 593, 49 Stat. 666

Management of Museum Properties Act (commonly known as the Museum Act)
16 USC 18f— 18f- 3; July 1, 1955, ch. 259, 69 Stat. 242, PL 104- 333

Archaeological Resources Protection Act of 1979 (ARPA)
16 USC 470aa— 470mm; PL 96- 95

See Appendix A for a description of these and other relevant laws.

8. *What distinguishes NPS museums?*

NPS museums collect objects specific to the mission of the individual parks and interpret those collections in their original context. The collections are site-specific, that is, they pertain to that particular NPS site. With the exception of house museums, most other museums gather thematic collections from many different sites and house them in one place. By contrast, NPS museums collect and interpret many objects and specimens at the site of origin. For example, the furnishings and personal belongings at Harry S Truman National Historic Site are preserved and exhibited in the Truman Home as they were when the family occupied the house. The vast majority of holdings in NPS museums are derived either from within the park boundaries or from areas intimately associated with the parks.

Another distinguishing characteristic of NPS museums is that they are part of a larger NPS museum system. While park museums are site-specific, each is part of a greater system that sets policies and standards and guides their operation. No other museum network is so varied and dispersed, yet so administratively bound as a unit. The NPS museum system provides broad representation of the natural and cultural heritage of the United States. The scope of the system is wider than that of most public or private institutions. The NPS museum system is the largest such system in the

world.

Although NPS museums may store their collections at another location, such as a NPS archeological center or a non-Federal museum, the park site retains ultimate responsibility for the collections.

National Park Service museums (and their collections):

- directly support the park mission
- aid understanding among park visitors
- advance knowledge in the humanities and sciences
- provide baseline data for NPS managers, scientists, and other researchers
- preserve scientific and historical documentation of the park's resources and purpose

Park collections range in size from fewer than 100 to over 6 million items.

9. *How are NPS collections used?*

National Park Service museum collections are used in a variety of ways. In keeping with the Service's public trust responsibilities, most uses of collections are educational. The dominant uses are:

- **Research** conducted by NPS and non-NPS scientists, historians, archeologists, ethnographers and other specialists.
- **Publications** that the park or others produce. Each year, photographs and/or descriptions of NPS museum objects appear in numerous articles, books, and other publications.
- **Exhibits** in NPS museums and visitor centers, as well as loans to non-NPS museums for special exhibitions.
- **Educational programs** at the park, schools, or other public venues.
- **Media products**, such as documentaries (motion picture, television, and radio), Web sites, "Web casts," and virtually any other new media format.

As society develops new media technologies, the opportunities to provide access to collections expand. Park visitors can view objects, specimens and archives in the museum or furnished historic structure at the site and gain the special understanding that comes with seeing the items "in context." New technologies, however, can reach previously underserved populations. For example, data and images in the NPS Web Catalog (http://www.museum.nps.gov) and Web exhibits featuring museum collections (http://www.cr.nps.gov/museum) are available worldwide in homes, schools, offices, and libraries. By effectively using these technologies NPS can greatly expand the audience served and the public benefit.

However you use the park's collection, remember that accurate interpretation and preservation of each object and the collection as a whole are primary considerations.

C. History of National Park Service Museums

1. *How did national park museums originate?*

For over a century, museums have been an integral part of America's national parks. From modest beginnings in 1904 to today's state-of-the-art park museums and visitor centers, visitors have encountered engaging museums in units of the National Park Service.

NPS museum operations chief Ralph Lewis observed that National Park Service "…museums did not grow from a single root, nor did any central authority decree their initial establishment. The first ones developed independently, created by local initiative to meet perceived needs," (1993). NPS Chief Curator Ann Hitchcock explained, "Initially, [museums in parks]…were rudimentary—a 1904 arboretum in Yosemite, a table of artifacts in the ruins at Casa Grande…even a museum in a tent at Sequoia. This strong association with place is a characteristic that continues to distinguish park museums and collections," (2004).

2. *How quickly did NPS develop museums?*

The National Park Service established new museums quite rapidly—Stephen T. Mather, the first NPS director, was an enthusiastic supporter who understood the importance of museums in the parks. In his 1920 annual report, he noted, "One of the most important matters to receive earnest consideration is the early establishment of adequate museums in every one of our parks."

Director Mather initiated numerous campaigns to encourage additional support for the parks, with the public and with government and business interests. These activities included special exhibitions of national park-themed art. Mather arranged an exhibition of paintings of national park scenes in January 1917 in conjunction with the Fourth National Park Conference. The Smithsonian Institution exhibited the works by Albert Bierstadt, Thomas Moran, Carl Rungius, and other noted artists for some time following the conference. The Director also developed a "…traveling exhibition intended for display in libraries [of]…24 framed photographs of park scenery packed in two reusable shipping boxes." The exhibition was so popular that Mather "…request[ed] funds to produce and circulate additional sets," (Lewis 1993).

A little more than a year later, Secretary of the Interior Franklin K. Lane established guidelines for the new National Park Service. The guidance included the statement that "Museums containing specimens of wild flowers, shrubs, and trees, and mounted animals, birds, and fish native to the parks, and other exhibits of this character will be established as authorized." Support for NPS museums was strong and that support was at the highest levels in Washington. At the same time, increased public and philanthropic interest in NPS museums provided additional opportunities for growth.

3. *How did NPS museums grow in the 1920s?*

In the early 1920s, Chauncey Hamlin of Buffalo, New York, (who had helped to endow the Buffalo Museum of Science) became a supporter of the national parks. As Hamlin's interest grew, he also supported the establishment of new museums in the parks. Following his election as president of the American Association of Museums (AAM) in 1923, Hamlin was able to procure funding from the Laura Spelman Rockefeller Memorial to help underwrite a new museum at Yosemite. By 1926, the new Yosemite Museum opened to the public (Lewis 1993).

Yellowstone opened its first museum in 1922. Over the following eight years, the park developed branch museums at Old Faithful, Madison Junction, and Norris Geyser Basin, all with the assistance of AAM. Meanwhile, the AAM, the Laura Spelman Rockefeller Memorial, and John C. Merriam of the Carnegie Institution supported the development of the Yavapai Point Museum at Grand Canyon National Park. Merriam, who actually oversaw the work "...created a museum where the canyon was the exhibit and the museum housed viewing instruments, labels, and guided interpretation. The model was so successful that a generation later it was deemed a classic example of interpretive planning in parks," (Hitchcock 2004).

Yellowstone naturalist Carl P. Russell was promoted to the new position of field naturalist-museum advisor in 1929. Russell relocated to California, and reported to Chief Naturalist Ansel Hall at the NPS Field Division of Education, located at the University of California, Berkeley.

4. *How did the 1930s and the Great Depression impact NPS museums?*

The 1930s brought tremendous change to the NPS. Shortly after taking office in 1933, President Franklin Roosevelt transferred the various historical areas managed by the War Department (primarily American Revolution and Civil War battlefields) to the National Park Service. Other parks, monuments, and memorials were transferred to the NPS as well—national monuments managed by the Forest Service and the National Capital Parks in Washington, DC. Many of these areas already managed museum collections, which also transferred to NPS stewardship.

NPS museums, like many other Federal projects in the 1930s, received increased support resulting from the economic recovery efforts of President Roosevelt's New Deal. One such windfall occurred in 1935, when $65,000 in Public Works Administration (PWA) funds became available to support new museums in the parks. In January of that year, Carl P. Russell was detailed from Berkeley to Washington to establish a new Eastern Museum Division. He also recruited a temporary staff of curators, artists, and craftsmen.

At the same time, funding and labor provided by the Civilian Conservation Corps (CCC) and Works Progress Administration (WPA) allowed for the construction of several new park museums. In workshops at Berkeley, California, and Fort Hunt, Virginia, "CCC boys" fabricated exhibits and park topographical map models (some of which are still in use at NPS visitor centers). The National Park Service's first curators (in title) were funded by the PWA. Curators, assistant curators, and museum assistants developed museum planning documents; planned, supervised, and

constructed exhibits; and helped Russell carry out the multitude of tasks connected with the newly enlarged NPS museum program.

In 1935, Congress passed the Historic Sites, Buildings, Objects, and Antiquities Act. The new law declared that "…it is a national policy to preserve for public use historic sites, buildings, and objects of national significance for the inspiration and benefit of the people of the United States." This legislation empowered the Secretary of the Interior (working through the NPS) to preserve and maintain objects of national historical or archeological significance and to "establish and maintain museums in connection therewith."

5. *How did the NPS museum program fare in the 1940s and 1950s?*

The 1940s began with the NPS placing even greater emphasis on the development of museum standards. With strong support from Carl Russell, Ned Burns (who followed Russell as chief of the NPS museum division) prepared the National Park Service *Field Manual for Museums* in 1941. Intended as a guide to park museum development and operation, the field manual was available to other museums, institutions, and the general public through the Government Printing Office. Non-NPS museums as well as park museums used the publication.

World War II caused a virtual halt in park museum growth, as NPS budgets and personnel were transferred to the war effort. After the war, however, the museum program once again began to grow. The museum laboratory in Washington, DC, reopened in 1946. Four years later, NPS appointed its first conservator, Elizabeth Jones, a paintings conservator from the Fogg Art Museum at Harvard University. Jones quickly developed a new conservation laboratory and the first NPS conservation treatment program. Then, in 1954, following Ned Burns's death, Ralph Lewis became the Chief of the Branch of Museums. In 1956, NPS launched Mission 66, a ten-year program that planned to install ten new exhibits each year.

The decade of the 1950s also saw two other important events: Congress passed the Museum Act in 1955, and two years later, the Service issued the *Museum Records Handbook (*today's *Museum Handbook*, Part II: Museum Records*)*. (The *Museum Handbook*, Part I: Museum Collections, would debut in 1967.)

6. *How did the Museum Act affect NPS museum operations?*

During the early 1950s, the Service recognized the need for additional legislative guidance concerning its legal authority to acquire, preserve, and dispose of museum objects. In a number of past situations, the Service's authority to carry out some common museum practices was lacking or unclear. Congress passed the Museum Act to provide clear guidance to the Service in these matters. The law authorized the Secretary of the Interior through the National Park Service to acquire museum collections through donation and purchase and to loan and exchange collections "…in such manner as he shall consider to be in the public interest."

7. *What was the impact of Mission 66 on park museums?*

In 1956, in response to a growing number of park visitors, NPS launched a ten-year program, dubbed Mission 66, to build museums. Not since the New Deal of the 1930s did the parks experience such growth, renewal, refurbishment, new facilities, and corresponding staff to carry out the

work. The Service constructed nearly 100 new visitor centers and museums during Mission 66. Mission 66 funded new visitor centers at Zion National Park, Dinosaur National Monument (Quarry Visitor Center), Everglades National Park (Flamingo Visitor Center), Booker T. Washington National Monument, Great Smoky Mountains National Park (Sugarlands Visitor Center), and the Museum of Westward Expansion beneath the Gateway Arch at Jefferson National Expansion Memorial in St. Louis. Although many parks have outgrown and replaced (or added to) their Mission 66 facilities, many others continue in use to this day. Mission 66 provided the parks with critical, needed improvements.

8. *What other initiatives and programs have influenced NPS museum operations in the decades since Mission 66?*

The 1970s

In the 1970s, NPS museum programs continued to grow. In 1974, the Branch of Museum Operations became the Division of Museum Services. The following year, NPS staff conducted the first Collection Management Plan, at Hubbell Trading Post National Historic Site. In 1976, the Service published the *Manual for Museums*, a bound version of the looseleaf *Museum Handbook*, which was available to the larger museum community (and the general public) through the Government Printing Office. Also, in the 1970s, the *Conserve O Gram* series of museum preservation technical leaflets debuted.

On the legislative front, Congress passed two new laws pertaining to archeological resources on Federal lands, the Archaeological and Historic Preservation Act of 1974, and the Archaeological Resources Protection Act of 1979 (ARPA) . Both acts mention museum collections resulting from archeological activities. (See Appendix A.)

Understandably, following the enactment of ARPA, NPS collections grew in both size and scope.

The 1980s and Beyond

NPS museum programs continued to expand in the 1980s, 1990s, and into the new millennium. In 1980, the Director appointed a Chief Curator, Ann Hitchcock. Three years later, key Washington and field curatorial staff met to develop a servicewide museum management strategy that stressed:

- Establishing minimum preservation standards
- Accountability of museum property
- Strengthening training and development opportunities for staff
- Incorporating curatorial review in the planning process
- Improving collections management policy guidance to the field

Over the next quarter century, these five goals have been the driving force behind the Service's museum programs. Minimum preservation and protection standards were established with Special Directive 80-1, its subsequent revision, and eventual replacement by the NPS Checklist for

the Preservation and Protection of Museum Collections (Museum Checklist).

In the annual Collections Management Report (CMR), initiated in 1983, parks provided information on the number of items acquired, deaccessioned, cataloged, loaned and used in exhibits. Accountability was strengthened when, in 1984, and again in 2000, the *Museum Handbook*, Part II, was revised to reflect the latest, accepted museum practices for collections documentation. In 1985, a servicewide call was issued for every park to have an approved Scope of Collection Statement. Two years later, the NPS issued the Automated National Cataloging System (ANCS) to further the parks' accountability efforts. This program, augmented, improved, and modernized with a Windows platform in 1998, became ANCS+. No longer limited to accessioning and cataloging, the system covers documentation for all aspects of collections management, including loans, deaccessioning, housekeeping, Museum Checklist standards, annual inventories, and annual reporting.

In addition to the reissued Part II of the *Museum Handbook*, Part I: "Museum Collections," was reissued in 1990, with more revisions and additions issued nearly every year since 1999. *Museum Handbook*, Part III: "Museum Collections Use," was issued in 1998. The three-part *Museum Handbook* provides NPS staff not only with critical guidance concerning documentation, preservation, and access to and use of collections, but also with important collections management policy guidance to the field. The other preservation publication, the *Conserve O Gram* series, which was first issued in 1975, was revised and reissued in 1993, with additional leaflets added to the series annually.

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 USC 3001-3013) has had a profound impact on NPS museum collections. The law and associated regulations address the rights of lineal descendants, Indian tribes, and Native Hawaiian organizations to Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony. They require Federal agencies and institutions that receive Federal funds to provide information about Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony to lineal descendants, Indian tribes, and Native Hawaiian organizations and, upon presentation of a valid request, return these cultural items to them. NPS has repatriated items subject to NAGPRA and has consulted with traditionally associated groups when managing museum collections.

Implementation of the Government Performance and Results Act of 1993 (GPRA) presented new challenges to NPS museum programs. Performance management has increased annual reporting responsibilities for field, regional, and WASO staff. Yet, at the same time, programming, prioritization of work, and accountability were strengthened. The museum program applied the existing CMR and Museum Checklist data to meet the performance reporting requirements of GPRA. The ANCS+ collections management software program includes the Museum Checklist and CMR, which enable park staff to quickly produce annual museum reporting data.

The advent of the Web provided new ways to make park collections

accessible to the public through Web exhibits and the Web Catalog. In 2004, NPS initiated the Teaching with Museum Collections program, which introduced object-based lesson plans for teachers to use Web-accessible NPS museum collections resources in the classroom. See http://www.cr.nps.gov/museum/.

Communication across division, park, regional, and servicewide lines is vital to the success of park museum programs. Facility management, resource management, interpretation and education, administration, and resource and visitor protection—virtually every park function is in some way supportive of, a user of, or a collector or creator of museum collections. The superintendent delegates responsibility for the park collection to the park curator or collateral-duty curator, but many offices collaborate to provide effective collections management.

In 2004, the Service observed the NPS Museum Centennial—the first century of museums in the parks. This history began with several small, independently established park museums created on shoestring budgets, without the assistance of professional curators. Early on, these programs received additional attention, funding, and professional assistance. Although not every park has a curator on site, each park has a curatorial contact and a qualified curator must have oversight for each park's museum operations.

From these humble beginnings over a century ago, the NPS museum system has become the world's largest. As of 2005, more than 350 park units preserve over 115 million museum objects, specimens and archival items to tell the stories of the places where many of the most exciting events of American history, cultural experiences, and natural phenomena have taken place.

D. Types of Collections

The National Park Service is one of the primary Federal entities that preserves cultural and natural resources. NPS museum collections include diverse disciplines and represent a significant portion of the resources that the Service is charged to preserve and protect. The collections are characterized as cultural, natural, and archival. The documentation system further classifies the items. The broad categories are divided into general disciplines as follows:

- Archival Collections
  - Personal papers and manuscripts
  - Resource management records

- Cultural Collections
  - Archeology
  - Ethnology
  - History

- Natural History Collections (also called natural resource collections)
  - Biology
  - Geology
  - Paleontology

E. Archival Collections

1. *What do NPS archival collections include?*

Archival holdings are the largest component of servicewide collections by item count. At the park-level, archives form a key part of the park's resources. In many cases, archives are original to the site and date to the historic period. For example, archives at Edison National Historic Site greatly expand our understanding of Thomas Edison's business as well as his private life.

Park archival collections contain information essential for understanding the park's past, natural and cultural interrelationships, events, and changes over time, as well as the human impact (including NPS management) on the park. Personal papers illuminate our understanding of the individuals whose lives are documented and interpreted at park sites. Resource management records that park staff and researchers create become part of the archival collections. Resource management records address:

- Management of cultural and natural resources over time
- Scientific research

2. *What types of archival materials are in NPS collections?*

NPS archival collections include:

- Personal papers, organizational archives, and assembled manuscript collections that NPS receives from non-Federal sources.
- Copies of records (formerly sub-official records). Occasionally, selected copies of Federal records may be kept for purposes of reference or convenience. For example, selected copies of superintendent correspondence that is particularly relevant to a resource management issue may be kept.
- Resource Management Records. Records associated with resource management typically include field notes and catalogs, daily journals, drawings and maps, photographs and negatives, slides, sound recordings, raw data sheets, instrument charts, remote sensing materials, collection inventories, analytical study data, computer documentation and data, as well as reports and any other documents generated through the resource management activity. Oral histories created by NPS employees are a special type of resource management record. Although these records are created by a Federal employee, contractor, or partner, the Service retains and manages them in the museum collection because ready access is critical to the ongoing interpretation, management, and preservation of other park natural and cultural resources. Resource management records are identified on the NPS records schedule for retention and management in the museum collection.

Other than resource management records, Federal records should not be included in the museum collection without specific authorization from the National Archives and Records Administration (NARA). These records are the original or "record copy" documents created or received in the course of performing the daily work of the NPS. Examples of records that do not belong in the museum collection include audit records, budget materials, central files, contracting files, financial records, law enforcement records, legal records, museum and project administrative records, permits, personnel records, and superintendent's correspondence files. By law, NARA

See *Museum Handbook,* Part II, Appendix D: Museum Archives and Manuscript Collections, for additional information concerning NPS archival collections.

Examples of archival collections include:

- The Edison Archives, Edison National Historic Site

- John R. Fordyce Archival Collection, 1897-1912, documenting Fordyce's engineering activities and the dealings of the Thomas-Fordyce Manufacturing Company, as well as personal correspondence, Hot Springs National Park

- Archeology Project Records, Mesa Verde National Park

- Albright Manuscript Collection, papers of Horace Albright pertaining to conflict over Mineral King, Sequoia and Kings Canyon National Parks

- Shenandoah National Park Resource Management Records, 1880-1996, Shenandoah National Park

F. Cultural Collections

Cultural collections are human-made objects or natural history specimens collected because of their human cultural context.

1. *What are archeological collections?*

Archeological collections are material remains that are recovered using archeological methods. Associated records (resource management records), such as maps, logs, research notes, laboratory analyses, and photographs, are classified as archival collections, although they remain connected to their related archeological collections. (See section E.2.) Archeological collections may represent any period in human history as long as the material was recovered by archeological methods. These collections help us to understand past cultures and their natural world. By preserving and studying these collections, we gain insight into the lives and worlds of those individuals and groups who previously inhabited park areas.

Archeological collections are created through authorized NPS undertakings, including Archaeological Resources Protection Act (ARPA) violation cases. NPS archeological collections include materials generated by researchers working under Antiquities Act or ARPA permits and by professional or avocational archeologists using a valid scientific

methodology before the establishment of the park. Both surveys and excavations can generate archeological materials and associated records.

2. *What methods does an archeologist use to recover and interpret archeological resources?*

Archeological methods recover materials from the ground surface or subsurface using systematic procedures and documentation. Whenever an archeologist investigates a site and removes materials, the site is altered, perhaps even destroyed. At the very least, the original context, "the way artifacts and other material lay in relation to one another" is destroyed. Archeological procedures ensure thoroughness and regularity in data recovery. One goal is to have a systematic collection—a unified collection of objects and associated records and data (resource management records). These data play a key role in the ongoing management of the excavated site and other archeological resources.

Once the site is altered and objects are removed, the records that document the archeological investigation become the basis for understanding the site and the meaning of the objects in context. These documented collections are available for research and exhibit. For new research projects, the NPS encourages use of these well-documented systematic collections rather than excavation in order to preserve and protect remaining archeological sites, which are non-renewable resources.

3. *Does NPS keep all materials recovered from archeological investigations?*

Most, but not all. Archeological materials excavated or removed from NPS lands remain the property of the United States (see 43 CFR 7.13) except human remains, associated funerary objects, and cultural patrimony subject to NAGPRA, which specifies conditions for their recovery and disposition to lineal descendants, Indian tribes, or Native Hawaiian organizations (see 43 CFR 10). With the exception of the items subject to NAGPRA, artifacts and specimens recovered from archeological resources, along with associated records and reports, are maintained together in the park museum collection (Management Policies, 5.3.5.1). Human remains, associated funerary objects, and cultural patrimony subject to NAGPRA, but in park collections prior to passage of the Act in 1990, were included in summaries and inventories and are available for deaccessioning and repatriation in accordance with 43 CFR 10. Other archeological collections may be deaccessioned under limited conditions, such as approved destructive analysis; when the park lands from which the items come are deauthorized; or when the materials are hazardous (see *Museum Handbook*, Part II, Chapter 6, Deaccessioning).

Human remains, associated funerary objects and cultural patrimony subject to NAGPRA and discovered inadvertently or intentionally excavated after the passage of the Act are held in suitable conditions until appropriate and legal disposition occurs. They are not accessioned into the museum collection, but the park must ensure inventory control. Any resource management records concerning such remains and objects become part of the museum collection.

4. *What types of archeological materials are in NPS collections?*

Archeological material remains are artifacts, cultural objects manufactured by humans in the past, intact or fragmentary natural objects, by-products, organic materials, paleontological specimens found in physical relationship with prehistoric or historic resources, specimens (or *ecofacts*) associated with cultural activity (such as shells, seeds, floral remains, and soil

samples), and environmental and chronometric specimens.

Examples of archeological collections include:

- Adze, Bering Land Bridge National Preserve
- Arrow Shaft Smoother (750-1150 AD) and a Puerco Black-on-White Bowl (1030-1200 AD), Chaco Culture National Historical Park
- Copper falcon effigy (1-350 AD), Hopewell Culture National Historical Park
- Civil War minié balls, Stones River National Battlefield
- Soil sample, Conways Brigade, Valley Forge National Historical Park
- Sherd, slip-decorated red earthenware, Narbonne House, Salem Maritime National Historic Site

5. *What are ethnological collections?*

Ethnology is the comparative and analytic study of cultures. Ethnography is the scientific description of individual societies and cultures. Ethnological collections may be from any contemporary culture or from the historical and traditional culture from which the contemporary culture and people are descended. Ethnological collections are usually comprised of objects from many different cultures. Generally, but not always, NPS ethnological collections are from cultures considered indigenous to the park, to the surrounding geographic area, or to a large geographic area addressed in the park's mission. In addition, most NPS ethnological collections are Native American, Alaska Native, Native Hawaiian or Polynesian.

Most ethnological objects in NPS collections are traditionally manufactured. They range from utilitarian objects to works of art. Raw materials collected for use in the production of ethnological objects, such as pigments, fibers, and foodstuffs are classified as ethnological although they might otherwise be considered natural history collections.

When ethnographers and others make collections they usually will have associated records, such as field notes and photographs. These associated records go into the park's archival collection.

6. *What are some of the types of ethnological items that make up park collections?*

Examples of NPS ethnological collections:

- Yokut baskets at Sequoia and Kings Canyon National Parks
- Oglala headdresses at Badlands National Park
- Teak box with inlaid abalone shell decoration, Samoan, at San Francisco Maritime National Historical Park
- Navajo blankets and rugs at Hubbell Trading Post National Historic Site

7. *Are there any special considerations when managing archeology and ethnology collections?*

Yes. Be sure to engage in proper consultations with traditionally associated peoples well before you begin any new initiatives regarding archeology and ethnology collections. Some examples of initiatives include exhibits, relocation of collections, and changes to collections-use policies. Native peoples who are culturally affiliated with a park's ethnological collections may want to consult regarding the preservation, care and use of these collections. NPS policy mandates that the Service consult with traditionally associated peoples when developing such policies and initiatives.

In addition, NAGPRA requires that NPS provide information about Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony to lineal descendants and culturally affiliated Indian tribes and Native Hawaiian organizations and, upon presentation of a valid request, return these cultural items to them. NPS has repatriated items subject to NAGPRA and, since passage of the Act in 1990, has carried out consultations with traditionally associated groups when managing museum collections. (See *Cultural Resource Management Guideline*, Appendix R, Guidance for National Park Service Compliance with NAGPRA, and *Museum Handbook*, Part II, Chapter 6, Deaccessioning.)

In accordance with NPS *Management Policies* (2006), Chapters 5 and 7, the Service will not exhibit Native American, Alaska Native, and Native Hawaiian human remains or photographs of those remains. Drawings, renderings, or casts of such remains will not be displayed without the consent of culturally affiliated Indian tribes and Native Hawaiian organizations. Parks must consult with culturally affiliated or traditionally associated peoples to determine the cultural significance and the culturally appropriate treatment of any object whose cultural importance is suspected but not confirmed, such as a sacred object. These consultations must occur before such an object is exhibited and before any action that might affect the resource.

8. *What are NPS history collections?*

NPS history collections reflect the entire spectrum of materials made and used during recorded times by humans residing in what today is the United States. They include cultural collections that are neither archeological nor ethnological. These collections may document individual or community life and social, cultural, political, economic, and technological trends and events. They also include art, such as paintings and sculpture. As a whole, the diverse assemblages of NPS history collections document continuity and change over time in the nation.

Some history collections reflect elite lives and activities of well-known individuals; others evidence everyday lives and actions of working men and women. The owners of some objects were Presidents; the owners of others are unknown. The significance and value of both is that they document American social, cultural, political and economic histories. Documenting and interpreting those objects to the public in the context of their original settings enhances the public's understanding.

To fill minor interpretive gaps, especially in exhibits and furnished historic structures, parks may acquire items that are of the same period and are documented to be similar to items originally at the site. Parks may

also add reproductions to the collections to fill gaps or to substitute on exhibit for a fragile original. Both period pieces and reproductions must be clearly documented so that they are not confused with objects original to the site.

9. *What types of objects make up NPS history collections?*

History collections range from high style furnishings at Hampton National Historic Site, to simple furnishings and books at Carl Sandburg Home National Historic Site, to tools of the 19th century textile industry at Lowell National Historical Park. They include inventions at Thomas Edison National Historic Site and medals and sculptures at an artist's home (Saint-Gaudens National Historic Site). Civil War military armaments and artifacts at Gettysburg National Military Park and collections as diverse as architectural fragments and portraits by the famous Peale family at Independence National Historic Site are in NPS history collections.

Additional examples include:

- Personal Items:
  - Frederick Douglass's top hat, Frederick Douglass National Historic Site
  - George Washington's dress sword, which he wore during his Inauguration, April 30, 1789, from Morristown National Historic Park
  - Ranch hand Jack Peters's cowboy boots (circa 1930), Grant-Kohrs Ranch National Historic Site
  - Joseph Hopkins's carpentry and blacksmithing tools, used by Hopkins to help construct the fort at Pipe Spring, 1870, Pipe Spring National Monument
- Historic Furnishings:
  - Mahogany furniture, antebellum era, from the collection of William Johnson, a free African-American, from Natchez National Historical Park
  - "Fruit case furniture" made from left-over and recycled wood, by Japanese Americans imprisoned in World War II internment camps, at Manzanar National Historic Site
  - The Lincoln Family's mahogany and horsehair upholstered sofa, Lincoln Home National Historic Site
- Religious artifacts:
  - The nineteenth century "Icon of St. Innocent of Irkutsk," in the Russian Bishop's House, Sitka National Historical Park
  - Eleanor Roosevelt's *Book of Common Prayer*, Eleanor Roosevelt

National Historic Site

- Vehicles:
  - Truck, "The Booker T. Washington Agricultural School on Wheels," manufactured by the White Motor Company in 1930, at Tuskegee Institute National Historic Site
  - President Harry S Truman's automobile, a 1972 Chrysler Newport Royal, still parked in the garage of the Truman Home at Harry S Truman National Historic Site
- Artwork
  - "Cathedral Rock, Yosemite," Albert Bierstadt, 1870, oil on canvas, Marsh-Billings-Rockefeller National Historical Park
  - "Yellowstone Canyon, 1871," Thomas Moran, watercolor, Yellowstone National Park

G. Natural History Collections

NPS natural history collections are diverse, including plant, animal, geological, and paleontological specimens associated with the lands that today are under NPS stewardship. NPS natural history collections are primarily specimens collected from within park boundaries. Because ecosystems, both living and fossil, and geological features extend beyond park boundaries, some specimens may originate outside park boundaries and be acquired by means other than field collection.

1. *Why does NPS collect and maintain natural history collections?*

The National Park Service maintains natural history collections primarily to voucher, or document, the presence of plants, animals, fossils, rocks and minerals in the park at a particular place and time. Researchers and resource managers use this information for science and resource management decisions. In addition, the results of the research and the specimens may be used in exhibits and as the basis for education and interpretive programs in parks. Natural history collections and their associated records, which are managed as archival collections, document the park's natural environment—its geological history, current conditions, and changes over time. For example, the collections can be the basis for resource management decisions, such as eradication of an exotic or restoration of native species; or provide evidence of environmental change, such as in water or air quality; or document the occurrence of environmental toxins such as DDT or mercury.

For more information on collecting and natural resource management, see *Management Policies*, Chapter 4, Natural Resource Management, and *Reference Manual 77, Natural Resource Management*.

2. *How does NPS authorize the collection of natural history specimens and determine their*

Parks encourage and permit scientists to conduct research, including collecting specimens, to further the park mission of encouraging science and provide the scientific basis for resource management decisions. Specimen collection is governed by 36 CFR 2.5 (see *Museum Handbook*,

disposition?

Part II, Chapter 4, section VI) and the Research Permit and Reporting System (see http://science.nature.nps.gov/research/ac/ResearchIndex). Specimens collected on park lands and not consumed in analysis or otherwise destroyed are permanently retained, remain federal property, and become part of the park museum collection, as stated in the servicewide General Conditions for Scientific Research and Collecting Permit (General Conditions).

Superintendents may authorize park employees and non-NPS researchers to collect specimens in parks. Non-NPS researchers must have a permit. Both NPS and non-NPS researchers must comply with the General Conditions. Park curators are part of the permitting process, reviewing permit applications that involve specimen collection, including providing advice on where the specimens will be housed (in a NPS or non-NPS repository), and providing guidance to researchers on the collection, documentation, preparation and mounting, cataloging, and submission of specimens. Curators also manage loans of specimens to other institutions for research and repository purposes.

3. *What kinds of specimens are in NPS natural history collections?*

Typical specimens in NPS collections include but are not limited to:

- Biological Collections: vascular and non-vascular plant, fungus, insect, arachnid, other invertebrate (such as snail), reptile, amphibian, fish, bird, and mammal specimens.
- Geological Collections: rocks, minerals, surface process samples, and soils.
- Paleontological Collections: plant, animal, and trace fossils.

These collections are preserved using methods and conditions that vary from dry to fluid to low-temperature to microscopic. For additional information, refer to Appendix Q: Curatorial Care of Natural History Collections; Appendix T: Curatorial Care of Biological Collections; Appendix U: Curatorial Care of Paleontological and Geological Collections; and *Museum Handbook*, Part II, Appendix H, Natural History.

4. *Why are natural history collections important?*

Natural history collections provide:

- Baseline documentation over time for science, resource management and interpretation
- Vouchers for research, documenting the existence of a physical or biological component at a given place and time
- Holotype specimens used to formally describe a new taxon
- Specimens of special historical value
- Specimens indicating ecological condition
- Specimens that may be used for future destructive sampling

- Specimens that may be used in exhibits or interpretive and education programs
- Documentation of change in natural conditions over time and response of physical and biological components to that change
- Evidence of human-caused environmental changes (such as variations in land use patterns or road building) and response of physical and biological components to those changes
- Documentation of the effects of NPS management decisions
- Indication of gaps in knowledge of park natural resources

Natural history collections are integral to resource management, science, and education in the parks.

5. *What characterizes NPS biological collections?*

Park biological collections consist of Monera, Fungi, Plantae, Protista, and Animalia specimens, generally collected within park boundaries. Collections of plant, fungi, monera, and protista that are separately assembled and managed are called herbaria. Most parks have a herbarium as part of their museum collection.

The collections document the non-human biology of the park at a given time and place. When researchers make observations about the park environment, they often collect voucher specimens to vouch for, or testify to, their observations. If these specimens are not destroyed or consumed in analysis, they become part of the park's collection. NPS has an ongoing program to inventory and monitor living resources in the parks that generates many specimens for the museum collections. Parks may manage collections on site or off site in collaboration with another park, an NPS center, or a partner repository, such as a regional or university museum. Many park biological collections are on loan to partner repositories for management.

Over time, NPS biological collections can help document changes in the park environment and changes in species thus helping to inform park planning, natural resource management, cultural landscape management, and interpretive programs. For example, the Yosemite National Park collection has 50 specimens of the foothill yellow-legged frog, *Rana boylii*, which were collected in the 1930s by the Yosemite Field School. This frog has now been extirpated from the region (Hitchcock 1994).

Major park herbaria are listed in the Index Herbariorum, which the New York Botanical Garden maintains at http://sciweb.nybg.org/science2/IndexHerbariorum.asp. Such listing increases worldwide awareness of and access to park herbaria.

6. *What are some examples of NPS biological collections?*

Examples of biological collections include:

- pressed plants mounted on herbarium sheets

- specimens mounted on microscope slides (such as algae and pollen)
- seeds
- bones (osteological collections)
- eggs
- animal skins
- animal tissues or whole animals preserved in liquid
- mounted or freeze-dried animal specimens
- marine and fresh water shells
- insects mounted on pins
- casts of tracks and tunnels
- nests
- live strains of microorganisms, such as bacteria, fungi, and protozoa

Examples of park biological collections include:

- Herbarium at Yellowstone National Park
- Microbial strains developed from specimens from multiple park collections at a repository that makes them available for laboratory research (see http://www.atcc.com/common/specialCollections/NPS.cfm)
- Tree snail collection at Everglades National Park
- Specimens from Great Smoky Mountains National Park documenting the park's All Taxa Biodiversity Inventory

7. *What disciplines collect and study biological collections?*

The disciplines that study biological collections are many. The most common in parks are:

- Botany (plants)
- Entomology (insects)
- Herpetology (reptiles and amphibians)
- Ichthyology (fish)
- Limnology (study of inland waters, saline and fresh)
- Malacology (mollusks)

- Mammalogy (mammals)
- Ornithology (birds)

8. *What characterizes NPS geological collections?*

Geological specimens document the presence of geological materials and the processes that influenced them. For example, in a rock specimen, the mineral composition, structure and texture reveal the origin of the unit from which the specimen came (such as a granitic pluton). The surface may show the physical processes of its most recent history (such as glacial striations). Its chemical alteration may record the weathering process it has experienced through the breakdown of feldspars and oxidation and hydration of other minerals.

We can learn about a rock's	By looking at
Origin	Mineral composition
	Structure
	Texture
History	Physical processes, such as glacial striations
	Weathering processes, both mechanical and chemical, such as oxidation
Age	Direction and strength of the earth's magnetic field when it formed, breakdown of radioactive elements

Geological collections can include:

- rocks
  - igneous (volcanic rocks, such as obsidian, lava, and tephra; or intrusive rocks such as granite)
  - sedimentary (rocks formed by deposition via wind and water, such as shale, sandstone, limestone)
  - metamorphic (rocks transformed under heat and pressure, such as schist, gneiss, marble)
- mineral specimens (such as quartz, malachite, and calcite)
- surface process materials, such as evidence of desert varnish or glacial action
- ores (often associated with historical mines in parks)
- samples of cave formations
- soils

- building stone samples
- extraterrestrial materials, such as meteorites
- environmental samples (such as air and water)

Geological collections can inform park planning and development (for example, knowledge of rock types helps planners select sites for buildings); natural and cultural resources management (for example, a soil analysis may suggest reasons for the prehistoric abandonment of an archeological site); and interpretation.

9. *What are some examples of geological specimens in NPS collections?*

Examples of geological specimens in NPS collections include:

- Agate, chalcedony, and quartz specimens at Badlands National Park
- Sandstone and basalt specimens at Zion National Park
- Slate, quartz, and schist specimens at Bering Land Bridge National Preserve
- Calcite, gypsum, and limestone specimens at Mammoth Cave National Park
- Granite, marble, and ore sample specimens at Sequoia and Kings Canyon National Parks.

10. *What characterizes NPS paleontological collections?*

Paleontology specimens are fossils of plants and animals and naturally occurring tracks, impressions and casts. They record past life on earth. In addition, the collections often include human-made molds and casts of specimens. In size, fossils range from microscopic pollen and spores studied with scanning electron microscopes to dinosaurs 100 feet in length.

Although the primary NPS paleontological collections reflect the resources in parks that were established specifically for their paleontological significance, paleontological resources occur in parks throughout the system. NPS paleontological collections cover the entire span of geological time and represent all five kingdoms of life (Monera, Protista, Fungi, Plantae, and Animalia), but most park paleontological collections are identified as:

- vertebrates
- invertebrates
- plants

Fossils can be divided into two main categories—body fossils and trace fossils—as follows:

Body Fossils	Trace Fossils
Petrified wood	Tracks
Fossil bones	Trails
Fossil plants	Burrows
Fossil tissue	Borings
Fossil pollen	Gnaw or bite marks
	Casts
	Coprolites (fossilized feces)

11. *What are some examples of paleontological specimens in NPS collections?*

Examples of fossils in NPS collections include:

- Sauropod (the largest land animal) specimens at Dinosaur National Monument
- Fish at Fossil Butte National Monument
- Insects and leaves at Florissant Fossil Beds National Monument
- Fossilized logs at Petrified Forest National Park
- Camel, rhinoceros, and sloth specimens at John Day Fossil Beds National Monument
- Mastodon, saber-toothed cat, and horse specimens at Hagerman Fossil Beds National Monument
- Sponges, brachiopods, and trilobites at Guadalupe Mountains National Park

These examples illustrate the diversity of NPS paleontological collections. For additional information, refer to Appendix U: "Curatorial Care of Paleontological and Geological Collections."

12. *What specialties are represented in the discipline of paleontology?*

The discipline of paleontology has several subdisciplines. For example:

- Paleobotany (the study of fossil plants)
- Vertebrate paleontology (the study of animals with backbones)
- Invertebrate paleontology (the study of animals without backbones)
- Palynology (the study of pollen and spores, both living and fossil)
- Paleoclimatology or paleoecology (the study of past climates and ecology)
- Ichnology (the study of fossil tracks, trails, and footprints)
- Micropaleontology (study of microscopic fossils)
- Taphonomy (study of the processes of decay, preservation, and the formation of fossils)

13. *How have park natural history collections developed over time?*

The development and organization of park natural history collections has reflected park needs related to interpretation and education, management, and research. The parks that were established primarily for their natural resources developed scientific collections early in their history. These nonrenewable collections document change in conditions, species, and habitat over time. For example, soon after Great Smoky Mountains National Park was established in 1934, the superintendent gave priority to forming a study collection to document park resources.

Many park naturalists (today's interpretive rangers) started collecting specimens for use in public education programs and those collections have subsequently become important for science and resource management. For example, at Everglades National Park, a Florida cougar skull, collected solely for exhibit in the 1960s, later became important for its scientific value in helping to resolve taxonomic questions regarding the description of the subspecies *Felis concolor coryi* (now *Puma concolor coryi*), (Hitchcock 1994). Although some park collections started around the turn of the century, many natural history collections were begun in the 1920s and 1930s. These collections now form important baseline data for the parks.

Park naturalists and associated researchers (primarily those with government agencies, universities, or large museums) have long collected specimens from parks. In many cases these collections pre-date the establishment of the park. For example, the Jepson Herbarium at the University of California, Berkeley, has early collections from Yosemite and Sequoia National Parks. Because research on park collections furthers the mission of the parks, parks welcome researchers and often assist with funding or in-kind contributions to the research effort.

14. *What has driven recent growth of NPS natural history collections?*

In the latter part of the 20th century, NPS became concerned that it lacked good documentation, vouchers, and results from the many research projects on park lands. These projects had collected important baseline data, yet parks often did not know where or how to access it. In response, NPS promulgated a new regulation that became effective April 30, 1984, requiring that all specimens collected in parks and retained in museum collections have NPS labels and be cataloged in the NPS National Catalog. This regulation and standardization of the permitting system in 2001 have contributed significantly to the ability of parks to track and use research information and specimens, whether the collections and associated records are managed at the park, at another park or NPS center, or on loan to a non-NPS repository, such as a university or a natural history museum.

In 2000, under the Natural Resource Challenge, NPS initiated the NPS Inventory and Monitoring Program to provide NPS managers with the information and expertise needed to maintain ecosystem integrity. For example, NPS scientists are currently conducting baseline inventories of basic biological and geophysical natural resources for all natural resource parks. These inventories result in collections of both specimens and corresponding data, in various forms. This initiative has accelerated the growth of park natural history collections. Currently, natural history collections represent two percent of the total NPS museum collections.

15. *What determines how NPS natural history collections are used?*

Collections use depends on:

- available documentation and access venues, such as ANCS+, Web Catalog, Index Herbariorum
- the specimens or parts available
- available expertise
- methods of preservation
- preservation quality

H. Introduction to NPS Museum Collections Management

1. *What are the main elements of NPS Museum Collections Management?*

Collections management is a process, not a product. It is a systematic approach to the proper documentation, preservation and use of museum objects—one that allows for public and research access while at the same time providing preventive care and long-term stewardship of these resources.

Collections management includes any activity associated with the acquisition, accountability, documentation, conservation, protection, disposition, and use of museum objects. It involves:

- assessing and prioritizing both short and long-term curatorial needs
- effective short-term and long-range planning to address those needs
- carrying out the daily activities necessary to properly care for the collection

> ***The goal of collections management is to make museum collections available for exhibit and research use while simultaneously preserving them for future generations.***

2. *What policy guidance is available on managing NPS museum collections?*

The following documents, which are available at http://data2.itc.nps.gov/npspolicy/index.cfm, provide guidance that is particularly relevant to NPS museum collections.

- *Management Policies*—key chapter citations are
  - 3. Land Protection (specifically 3.3 Land Protection Plans)
  - 4. Natural Resource Management (especially 4.2 Studies and Collections [all sections]; 4.8.2.1 Paleontological Resources and Their Contexts)

  - 5. Cultural Resource Management
  - 7. Interpretation and Education (especially 7.3.2 Non-personal Services; 7.5.5 Consultation; 7.5.7 Historic Weapons)
  - 8. Use of the Parks (especially 8.6 Special Park Uses; 8.10 Natural and Cultural Studies Research and Collection Activities; 8.11.3 Independent and Commercial Studies)
  - 9. Park Facilities (especially 9.3.1.3 Visitor Centers; 9.4.2 Museum Collections Management Facilities)
  - 10. Commercial Visitor Services (specifically 10.2.4.9 Natural and Cultural Resource Management Requirements; 10.2.4.6 Artifacts and Specimens)

- Director's Order #6: Interpretation and Education
- Director's Order #19: Records Management
- Director's Order #20: Agreements
- Director's Order #21: Donations and Fundraising
- Director's Order #24: NPS Museum Collections Management (DO #24)
- Director's Order #28: Cultural Resource Management
- Director's Order #28A: Archeology
- Director's Order #28C: Oral History
- Director's Order #29: Ethnography Program (in process)
- Director's Order #44: Personal Property Management
- Director's Order #53: Special Park Uses
- Director's Order #58: Structural Fire Management
- Director's Order #84: Library Management (in process)
- Records Disposition Schedule and *Records Management Handbook*
- NPS-28 *Cultural Resource Management Guideline*
- *Museum Handbook*, Parts I-III
- *Property Management Handbook*
- *Reference Manual 77: Natural Resource Management*

3. *What are the levels of responsibility for NPS collections management?*

Every park with a museum collection is part of the larger NPS museum system. Although responsibility for managing these collections is shared among the Washington Office, the regional offices, parks, centers, and park partners, the superintendent is the accountable official for the park's museum collections regardless of the location of the collection. All individuals with responsibility for museum collections must follow the Code of Ethics (see *Museum Handbook*, Part I, Appendix D).

4. *What are the museum management responsibilities of the Washington Office?*

As described in DO #24, the Associate Director, Cultural Resources, with the assistance of the Chief Curator and the Park Museum Management Program, has the following responsibilities:

- Develop and oversee policies and procedures for NPS museum collections.
- Develop, issue, and periodically update the NPS *Museum Handbook*.
- Develop strategic plans and goals to improve and maintain the management of NPS museum collections servicewide.
- Maintain the National Catalog of Museum Objects and its automated version, ANCS+ (and its successor).
- Maintain, analyze, and report on annual data that parks, centers, and regions, submit including:
  - Collections Management Report
  - NPS Checklist for Preservation and Protection of Museum Collections
  - Annual Inventory of Museum Property
  - Funding distributions and accomplishments
- Research products and facilitate park and center acquisition and use of appropriate supplies, forms, equipment, and technologies for management of museum collections.
- Develop and coordinate servicewide initiatives and funding to improve museum management.
- Publicize and disseminate technical information on museum management, such as the *Conserve O Gram* series.
- Develop and maintain access to servicewide information about NPS museum collections through various media, including ANCS+ and the Web.
- Evaluate and coordinate servicewide professional competencies and training needs and develop strategies, guidelines, and curricula to meet those needs. Coordinate training to address new technologies,

programs, and initiatives.

- Review draft park plans that receive WASO review, such as General Management Plans, for appropriate coverage of museum management.

- Provide technical assistance and advice to park and center managers regarding museum collections management.

5. *What are the museum management responsibilities of the Regional Offices?*

As described in DO #24, regional directors, assisted by the regional curator and other museum management staff, have the following responsibilities:

- Conduct plan and performance reviews to ensure that superintendents and center managers meet their responsibilities to manage museum collections according to NPS requirements.

- Provide technical assistance and advice to park and center managers regarding museum collections management.

- Evaluate museum management staffing and training needs, and develop and provide training to park and center staff.

- Develop plans and set priorities (including funding priorities) for managing museum collections based on all approved planning documents and information provided through servicewide reports and requirements.

- Review park and center annual inventories, take any necessary corrective actions, and annually certify to the Associate Director, Cultural Resources, that parks and centers have completed their annual inventories.

- Approve destructive analysis and consumptive use of museum collections. After careful review, if the benefits can be clearly shown to outweigh the resulting or potential damage or loss, the Regional Director may approve destructive analysis of rare or highly significant objects, specimens, and archival items, and consumptive use of museum collections.

- Grant exceptions to the unconditional gift policy on a rare and case-by-case basis, when justified.

6. *What are the museum management responsibilities of the parks and centers?*

As described in DO #24, park superintendents, center managers, and others who manage collections (with the assistance of the curator and other museum management staff) have the following responsibilities. See DO #24 for additional detail and submission and reporting requirements.

- Meet the museum management standards and follow the procedures outlined in the NPS *Museum Handbook*.

- Provide ongoing funding for recurring museum management functions.

- Identify, prioritize, and correct preservation, protection, documentation, and access and use deficiencies, including programming for funding to correct such deficiencies.

- Complete Project Management Information System (PMIS) project statements that identify all preservation, protection, documentation, access, and use needs.

- Evaluate and address museum management staffing and training needs according to established personnel qualifications standards and servicewide professional competencies.

- Approve and keep current a Scope of Collection Statement. Ensure acquisitions are consistent with the Scope of Collection Statement and deaccession those objects that are inconsistent with the statement.

- Approve, keep current, and implement the following plans:

  – Collection Management Plan

  – Housekeeping Plan

  – Integrated Pest Management Plan

  – Museum Collections Emergency Operations Plan (part of the park's Emergency Operations Plan)

- Ensure that staff is practiced and prepared for emergency response.

- Prepare a job hazard analysis for all museum jobs that have an associated history of injury, illness, or death; or that require the use of personal protection equipment; or that involve activities that are clearly dangerous.

- Monitor and record information about the environment in spaces housing collections and manage the environment to maximize preservation and complete Collection Condition Surveys, as needed.

- Accession collections upon acquisition to establish basic accountability.

- Catalog collections immediately following acquisition, or program to catalog them in the near future.

- Survey, appraise, rehouse, arrange, and describe archival and manuscript collections and prepare finding aids. Develop park archival duplication and reference procedures.

- Maintain a complete and current backup of all electronic accession

and catalog records at a second, separate location. Submit a complete annual backup to the National Catalog in Harpers Ferry, WV.

- Accept only unconditional gifts and bequests and obtain applicable copyrights and releases with acquisitions.

- Require all project budgets to include funding for the preparation, documentation and initial storage of collections that are project-generated.

- Add collections made through systematic research to the museum collection. As appropriate, lend these collections for exhibit, research, conservation, and other approved uses.

- Annually complete the following reports:

  – Collections Management Report

  – Annual Inventory of Museum Property

  – NPS Checklist for Preservation and Protection of Museum Collections

- Document treatment of collections, and record that information in ANCS+.

- Promote access to cataloged collections for research and interpretive purposes through a variety of means, such as exhibits, interpretive programs, loans, publications, Web exhibits, and the Web Catalog. Post finding aids and repository level-guides for archival collections in the National Union Catalog of Manuscript Collections (NUCMC).

- Ensure that access and use are consistent with all laws and NPS policies.

- Document access and use of collections.

- Consult with affiliated groups in managing collections, including Native American groups when managing collections subject to the Native American Graves Protection and Repatriation Act.

- Manage objects to preserve their condition, including using reproductions when originals may be damaged by use. When appropriate, approve destructive analysis, except for rare or highly significant items.

- Exhibit collections according to an approved exhibit plan, accompanied by maintenance instructions. Ensure that all exhibits meet the standards in the NPS Checklist for Preservation and Protection of Museum Collections.

- Document furnishings that are exhibited in their associated historic structures with an approved Historic Furnishings Report. Consider the

preservation requirements of both objects and historic structures when objects are on exhibit or in storage in historic structures.

- Never exhibit Native American human remains or photographs, drawings or renderings, or casts of the remains. Exhibit non-Native American human remains and photographs, drawings or renderings, or casts of the remains only in consultation with traditionally associated groups.

- Ensure that approved museum plans are entered in the Cultural Resource Management Bibliography (CRBIB).

7. *What additional roles do the servicewide centers have?*

The **Harpers Ferry Center** (HFC) coordinates the planning, design, production, and rehabilitation of museum exhibits and exhibits of historic furnishings. It also coordinates publications, wayside exhibits, and audiovisual programs. It provides conservation services for exhibit production and, on a reimbursable basis, provides other conservation services for parks, such as collection condition surveys, advising on environmental conditions and storage techniques, providing treatments, and training park staff in preventive conservation. Other services are interpretive planning, audiovisual equipment repair, graphics research, replacement of wayside exhibits, and the revision and reprinting of publications. The center also maintains the NPS history collection with documents, photographs and objects representing NPS administrative history. See http://www.nps.gov/hfc/.

The **Denver Service Center** (DSC) provides major planning, design, and construction services to parks, regions, architecture/engineering firms, and other partners. DSC provides these services jointly with private industry. DSC's projects are worldwide—ranging from designing a mass transit system in Zion National Park in Utah, to planning and designing the FDR Memorial in Washington, DC, to assisting Sri Lanka and other countries with their emerging park systems.

I. Planning for Park Museum Collections

1. *What general park plans are relevant to planning for park museum collections?*

The following integrated planning framework, as described in *Management Policies*, Chapter 2, guides park decisions and management.

- Foundation Statement

- General Management Plan

- Program Management Plans

- Strategic Plans

- Implementation Plans

- Annual Performance Plans and Reports

2. *What does the Foundation*

The Foundation statement is a succinct statement describing the park

Statement say about the museum collection?

purpose, significance, fundamental resources (including the museum collection) and values, and primary interpretive themes. It is based on the park's establishing legislation or Presidential Proclamation.

3. *How does the General Management Plan relate to the museum collection?*

The General Management Plan (GMP) is a park's primary planning document. It sets the long-term goals for the park based on the Foundation Statement. It clearly defines the desired natural and cultural resource conditions, including the museum collection, the conditions necessary to support the desired visitor use, and the management actions and standards to maintain these conditions. The management prescriptions identified in a park's General Management Plan are applied parkwide by resource topic and by specific geographic area as a management zone. All subsequent park planning documents flow from the GMP.

4. *What program management plans are specific to the museum collections?*

Program management plans describe program-specific measures or strategies to achieve and maintain the desired resource conditions and visitor experiences. Program-specific plans that address museum collections documentation, preservation, access, and/or use include but are not limited to:

- Scope of Collection Statement
- Collection Management Plan
- Park Resource Stewardship Plan
- Comprehensive Interpretive Plan

5. *How does the park Strategic Plan address museum collections?*

Strategic planning addresses performance management and accountability. NPS policies require that the National Park Service as a whole, and every park, program, and central office have its own strategic plan.

A park's strategic plan is based on the park's mission goals, GMP, and the NPS and Department of the Interior strategic plans.

The two servicewide goals that measure performance specific to museum collections are:

- Ia6 Museum Collections: Percentage of preservation and protection standards for park museum collections met
- Ib2D Museum objects cataloged

All parks with museum collections must include these servicewide goals in their strategic plans. Parks may include additional park-specific goals related to their museum collections.

6. *What is an implementation plan for*

An implementation plan focuses on activities and projects needed to achieve the desired conditions identified in the GMP, strategic plan, and

museum collections?

program management plan. Examples of implementation plans for museum collections include:

- Collection Management Plan
- Housekeeping Plan
- Museum Emergency Operations Plan
- Integrated Pest Management Plan
- Collection Condition Survey
- Historic Furnishings Report
- Exhibit Plan
- Museum Security Survey
- Museum Fire Protection Survey
- Storage Plan

Implementation plans may also be project-specific plans, such as a plan to catalog the backlog of uncataloged collections, or a plan to install data loggers in all museum spaces.

7. *What are Annual Performance Plans and Reports?*

Each park prepares an Annual Performance Plan that is tied to its Strategic Plan. The Annual Performance Plan includes:

- Annual goals (the outcomes expected to be achieved). For example: "In FY2007, the park will catalog 2000 geology specimens."
- An annual work plan, which allocates budget and personnel needed to accomplish the work.

Each park also prepares an Annual Performance Report that documents progress in meeting the annual goals.

8. *What are the requirements for museum-specific planning documents?*

DO #24 requires all parks to have the following planning documents specific to museum collections:

- Scope of Collection Statement (SOCS). The SOCS is a stand-alone museum planning document that succinctly defines the scope of the park's museum collection holdings at the present and for the future. The SOCS derives from the park's mission, as well as laws and regulations mandating the preservation of collections. See Chapter 2: Scope of Museum Collections for additional information.
- Collection Management Plan (CMP). All parks must have an up-to-date, approved, and implemented Collection Management Plan (CMP). A park's CMP:

- evaluates issues of preserving, protecting (including security and fire protection), documenting, accessing, and using collections.

- addresses issues specific to archival and manuscript collections (appraising, arranging, describing, producing finding aids, and providing reference and duplication services).

- proposes a strategy to address the issues, including staffing and cost estimates.

- Housekeeping Plan. Every space that houses museum collections must have an approved, current, and operational Housekeeping Plan. A current Housekeeping Plan that the staff consistently follows ensures that housekeeping routines are sensitive to museum collections preservation needs.

- Museum Emergency Operations Plan (MEOP). Parks must have an operational, approved, and current MEOP. The MEOP is part of the park's Emergency Operations Plan (EOP). The MEOP identifies:

  - museum collection vulnerabilities to events (such as fire, earthquakes, and floods)

  - responses that will protect resources without endangering human health and safety

  - strategies to implement appropriate pre-plans and carry out scheduled and unscheduled drills, exercises, briefings/meetings, and training opportunities to ensure that all park employees are prepared for emergency response

For additional information, refer to Chapter 10: Emergency Planning, *Conserve O Grams* 21/9 – 21/11, and the National Fire Protection Association's publication *NFPA 1600: Standard for Disaster/Emergency Management and Business Continuity Programs*.

- Museum Integrated Pest Management Plan (IPM Plan). Parks must have an approved, current, and implemented IPM Plan that specifically addresses the museum collections. The museum IPM Plan can be either a stand-alone document or part of the recognized parkwide IPM program.

- Collection Condition Survey. DO #24 requires parks to monitor and record information about the environment in spaces housing collections, manage the environment to maximize preservation, and complete Collection Condition Surveys (CCS), as needed, to assess conditions in spaces housing museum collections.

- Historic Furnishings Report (HFR). The HFR documents furnishings exhibited in associated historic structures. The HFR documents the history of a structure's use and interior appearance, and, if appropriate, provides a plan for recreating and/or maintaining the

historic interior. The furnishings plan addresses interpretive objectives, operating plans that include recommendations for staffing and visitor circulation, and detailed plans for furnishing. Guidelines for furnishings installation and maintenance are included. The HFR must consider the preservation requirements of both objects and historic structures.

- Exhibit Plan. The Exhibit Plan provides the label copy and detailed design and construction plans. It must also address the preservation and security needs of exhibited objects. The plan and design must include specifications for environmental needs (for example, relative humidity, temperature, light, and dust control), security, and access to exhibit cases for maintenance and management. The plan ensures that all exhibits meet the standards in the Museum Checklist.

Other museum-specific plans that are included as a standard on the Museum Checklist are:

- Museum Security Survey. All parks must implement a Museum Security Survey and ensure that it remains current. It can be either a stand-alone document or part of a parkwide security survey. The regional curator and park chief ranger may assist in arranging for this specialized survey. See Chapter 9: Security and Fire Protection, for more information.

- Museum Fire Protection Survey. All parks must implement a Museum Fire Protection Survey and ensure that it remains current. It may be a stand-alone document or part of a parkwide fire protection survey. *Reference Manual 58: Structural Fire Management*, requires annual fire inspections of all NPS structures. Annual inspections do not assess the structure with the same level of detail as a complete fire protection survey; however, the annual inspections are an important part of the National Park Service's ongoing fire prevention and safety efforts. Consult the park structural fire coordinator, regional curator, and regional structural fire management officer for assistance. See Chapter 9: Security and Fire Protection, for more information.

- Collection Storage Plan. The park may require a stand-alone Collection Storage Plan (CSP) if this need has been identified on the park's Museum Checklist, in consultation with the regional curator. Not all parks need a CSP, as the Collection Management Plan addresses museum storage issues.

9. *Are there any other park planning documents that may impact museum collections?*

Yes, there are a number of other park program management and implementation plans that may impact museum operations. Examples include:

  – Development Concept Plan (for the development of facilities)

  – Vital Signs Network Monitoring Plan

  – Fire Management Plan

- Cultural Landscape Report
- Historic Structure Report
- Archeological Overview and Assessment
- Ethnobotanical Study
- Other resource management plans

Many park planning efforts, when implemented, may impact museum operations. For example archeological compliance preliminary to or during construction may generate new objects and associated records; the construction of new facilities may provide space for museum operations; and the installation of new exhibits may increase visitation and staff responsibilities. Other park initiatives may similarly impact museum operations.

Effective communication is vital. So that you won't have any surprises (such as large unexpected accessions from park construction work, field projects, or upcoming exhibits planned around objects that aren't in the park's collection), be sure to keep inter-divisional lines of communication open. Involve other divisions in museum planning efforts. Likewise, make curatorial staff available to contribute to other planning efforts.

Planning teams composed of individuals with varied jobs, backgrounds, experience, and skill sets help to ensure that the team considers multiple perspectives, strategies, and methods and delivers an appropriate, well-considered product.

J. Ethics, Standards and Professional Associations

Professional associations have played an important role in the NPS museum program from its inception. Non-NPS museum professionals helped to create the vision for NPS museums (see sections C.2 and C.3) and professional associations and their members have provided ongoing support and guidance to NPS museums. Professional associations establish ethical guidance and standards that guide the actions and decisions of all museum employees, volunteers and board members. The associations offer training, publications, Web sites, conferences and professional development opportunities and work with government and foundations to gain recognition and funding for museums. The American Association of Museums (AAM) operates an accreditation program for museums in which the NPS participates (see *Museum Handbook*, Part I, Appendix B). NPS museum professionals have individual memberships in national and regional professional museum associations and support their associations by serving on councils and committees, presenting papers at conferences, and contributing to publications.

1. *What standards of ethical conduct apply to NPS museum professionals?*

As Federal employees, NPS museum professionals look first to the Standards of Ethical Conduct for Employees of the Executive Branch (5 CFR 2635), Employee Responsibilities and Conduct (43 CFR 20), the Supplemental Standards of Ethical Conduct for Employees of the

Department of the Interior (5 CFR 3501), and the criminal conflict of interest statutes (18 USC 201, 203, 205, 207-209) for guidance. The Code of Ethics for NPS Museums (see *Museum Handbook*, Part I, Appendix D) guides the decisions of employees and volunteers who manage NPS museum collections and museum functions. In addition, NPS employees with museum responsibilities are guided by the codes of ethics of professional associations, such as the Society of American Archivists and American Institute for Conservation. See a list of professional organizations and applicable codes of ethics in Appendix D, section D. As civil servants NPS employees work for and are responsible to the American public and have an obligation to act according to the law and the highest ethical standards.

2. *What other professional museum standards apply to NPS museums?*

Museum-related guidance in *Management Policies*, Director's Orders and related reference manuals, and the NPS *Museum Handbook* provides NPS staff with standards and procedures for preservation, protection, documentation, and access to and use of NPS collections. These documents adopt and promulgate the generally accepted standards of the museum profession, and, in some cases, incorporate the codes of ethics of other organizations by reference. The *Museum Handbook* provides guidance on and reference to the code of ethics, standards, and required and recommended procedures that employees and volunteers with responsibility for NPS museum collections follow. Each chapter and appendix contains a selected bibliography.

Park planning documents (see section I) provide park-specific guidance for management of the museum collections, consistent with professional standards and NPS standards and procedures. An up-to-date CMP provides information on the collection's current status, recommendations for improvements, prioritization strategies, and suggestions concerning long-range and short-term planning, programming, funding, and training. If the CMP is out-of-date, note this deficiency on the Museum Checklist, prepare a PMIS Project Statement to fund this work, and coordinate with the regional curator.

> ***If the park's CMP is out-of-date, ask the regional curator to provide a recent example from another park. Use that document to gain ideas for the park's museum program.***

3. *How can the park and I benefit from what professional associations offer?*

NPS parks and offices may be institutional members of professional associations and NPS museum employees may be individual members. Membership establishes a lasting partnership that serves to enhance the mission, goals, and operations of the museum and the career of the individual. Professional associations provide not only codes of ethics and standards, but opportunities for growth, inspiration for change, and guidance and support in challenging situations. Each association has a different focus. You will need to decide which associations best match the park's and your needs.

Selected professional museum-related associations are described below. Additional associations and contact information are in Appendix D, NPS Code of Ethics.

- **American Association for State and Local History** - The American Association for State and Local History (AASLH) is a national non-profit organization that serves organizations and people who work to preserve and interpret history, including historical societies, museums, historic sites, parks, libraries, archives, historic preservation organizations, and schools and colleges. The association has adopted and published the "AASLH Statement of Professional Ethics." Publications include a quarterly magazine, *History News*, and a monthly newsletter, *Dispatch*. The association produces and sells publications and educational materials (such as books, technical leaflets, reports, and video programs) on the documentation, preservation, and interpretation of history, including the care and conservation of museum objects. The association sponsors seminars, workshops, and an annual meeting.

  Contact: American Association for State and Local History
  1717 Church Street
  Nashville, TN 37203
  (615) 320-3203
  www.aaslh.org

- **American Association of Museums** - The American Association of Museums (AAM), founded in 1906, addresses the concerns of the country's museum community. The association represents art and natural history museums, zoos, botanical gardens, arboretums, planetariums, science and technology centers, nature centers, children's museums, and history museums, historic sites, and historical societies. Members include museum directors, curators, registrars, educators, marketing and development directors, public relations personnel, and others. It offers institutional, individual, and commercial memberships.

  The AAM's Accreditation Program (see *Museum Handbook*, Part I, Appendix B) is a leader in establishing professional standards for museums and museum professionals. Publications include a bi-monthly journal, *Museum News*, and a monthly newsletter *Aviso*. The AAM bookstore stocks publications that address topics such as collections management, museum ethics, conservation, marketing, and fundraising. The association holds an annual meeting.

  Contact: American Association of Museums
  1575 Eye Street, NW, Suite 400
  Washington, DC 20005
  (202) 289-1818
  http://www.aam-us.org

- **American Institute for Conservation of Historic and Artistic Works** - The American Institute for Conservation of Historic and Artistic Works (AIC) addresses the concerns of the conservation profession. Members include conservators who practice in all of the material specialties (such as, paintings, books and paper, textiles, wood, photographic materials, architecture, electronic media, and

objects of leather, ceramic, glass, metal, and stone) and conservation scientists. Librarians, archivists, and curators may also be members. This organization has adopted and published the "AIC Code of Ethics and Guidelines for Practice" for the conservation profession in the United States. Publications include the *Journal of the American Institute for Conservation* (published three times a year) and the bimonthly newsletter, *AIC News*. The newsletter includes information from the various specialties, health and safety updates, preventive conservation information, and a list of conferences, courses, and seminars. The association sponsors an annual meeting, including a pre-meeting workshop. The association also publishes an annual directory of its membership. It offers institutional and individual memberships.

Contact: American Institute for Conservation of Historic and Artistic Works
1717 K Street, NW, Suite 200
Washington, DC 20006
(202) 452-9545
http://aic.stanford.edu/

- **Society of American Archivists** - The Society of American Archivists (SAA), founded in 1936, promotes the preservation and use of archival materials (such as, documents, manuscripts, films, maps, photographs, sound recordings, and machine-readable records). This organization provides a wide range of educational workshops, maintains an active publications program, and promotes cooperation, growth, and development in the archival field. The society has adopted and published "A Code of Ethics for Archivists with Commentary." Publications include a semi-annual journal, *American Archivist*, and a bimonthly newsletter, *Archival Outlook*. The SAA's publication program offers basic manuals on the arrangement, description, access, conservation and care, and exhibition of archival collections. The society sponsors an annual meeting. It offers institutional and individual memberships.

  Contact: Society of American Archivists
  527 South Wells Street, 5th Floor
  Chicago, IL 60607
  (312) 922-0140
  http://www.archivists.org

- **Society for the Preservation of Natural History Collections** - The Society for the Preservation of Natural History Collections (SPNHC) represents the interests of natural history collections and the people associated with the management and care of these collections. Membership includes individuals from the fields of anthropology, botany, geology, paleontology, zoology and others interested in the development and preservation of natural history collections. Publications include a journal, *Collection Forum*, a newsletter, *SPNHC Newsletter*, and the "Guidelines for Care of Natural History Collections." The journal, published twice a year, provides up-to-date technical and documentary information on the care of natural history

collections. The society conducts annual meetings that include formal presentations and workshops. It offers individual, library, and institutional (associate/corporate) memberships.

Contact: Society for the Preservation of Natural History Collections
PO Box 797
Washington, DC 20044
(202) 786-2426
http://www.spnhc.org

- **International Council of Museums** - The International Council of Museums (ICOM) is an international non-governmental organization (NGO) which is "…committed to the conservation, continuation and communication to society of the world's natural and cultural heritage, present and future, tangible and intangible," (2004). ICOM is affiliated with the United Nations Educational, Scientific and Cultural Organization (UNESCO) and carries out part of UNESCO's program for museums.

  ICOM initiatives include: "…professional cooperation and exchange, dissemination of knowledge and raising public awareness of museums, training of personnel, advancement of professional standards, elaboration and promotion of professional ethics, [and] preservation of heritage and combating the illicit traffic in cultural property," (2004).

  To raise global awareness of museum issues, ICOM sponsors "International Museum Day" each May 18. The organization has adopted the "ICOM Code of Ethics for Museums." It offers institutional and individual memberships.

  Contact: ICOM Secretariat
  Maison de l'UNESCO
  1, rue Miollis
  75732 Paris Cedex 15
  France
  Tel: 011+33 (0) 1 47.34.05.00
  http://icom.museum

- **State and Regional Museum Associations** - Regional museum organizations are good resources for professional standards, training, and networking. Many states have statewide museum associations as well. The American Association of Museums has six affiliated regional museum associations (see http://www.aam-us.org/aboutaam/councils/region/index.cfm). Consult the NPS regional curator for additional information on such organizations serving your area.

Chapter 2: Scope of Museum Collections

List of Figures

CHAPTER 2: SCOPE OF MUSEUM COLLECTIONS

A. Overview

1. *What information will I find in this chapter?*

In this chapter you will find answers to these questions:

- What is a museum collection?
- Who can accept a museum collection?
- What is a Scope of Collection Statement (SOCS)?
- Why does my park need a SOCS?
- How do I write a Scope of Collection Statement?
- Why should I include an Executive Summary (Scope of Collection Statement Summary)?
- How do I write a Scope of Collection Statement Summary?
- How do I implement a museum collection acquisition program?
- What criteria can I use to justify acceptance or rejection of museum objects?
- What is a Collections Advisory Committee?
- Who serves on a Collections Advisory Committee?

2. *What other resources can help me prepare and implement my park's Scope of Collection Statement?*

For additional information, see the:

- **Sample Scope of Collection Statement** in Appendix E: Scope of Collection Statement
- **Checklist for Evaluating a Scope of Collection Statement** in Appendix E
- **Bibliography** in Section L., at the end of this chapter

B. Museum Collections

1. *What is a museum collection?*

A museum collection is a group of artifacts (including archives) and/or scientific specimens that are relevant to the park's mission, mandates, history, and themes, and which the park manages, preserves, and makes available for access (through research, exhibits, and other media) for the public benefit.

The Departmental Manual (411 DM 1.3) defines museum property (museum collections) as:

"an assemblage of museum objects collected according to some rational scheme and maintained so they can be preserved, studied, or interpreted for public benefit. Museum objects include prehistoric and historic objects, artifacts, works of art, archival documents [historical and/or scientific documents collections as defined in the Departmental Museum Property Handbook, 411 DM Volume I, Appendix A, Section A.2.d.] and natural history specimens that are a part of museum collections. Elements, fragments, and components of structures are objects if they are no longer a part of the original structure. Museum property does not include those items necessary to display a collection such as exhibit cases, dioramas, special lighting, graphics, etc."

Consult with your regional/SO curator and regional historical architect for guidance concerning accessioning structural components and historic fabric into your park's collection.

Note: In rare instances, museum dioramas or exhibit cases may be considered museum property (such as dioramas constructed by the Civilian Conservation Corps) or historic fabric.

NPS *Management Policies* (2001), 5.3.5.5 "Museum Collections" states:

"The Service will collect, protect, preserve, provide access to, and use objects, specimens, and archival and manuscript collections (henceforth referred to collectively as 'collections,' or individually as 'items') in the disciplines of archeology, ethnography, history, biology, geology, and paleontology to aid understanding among park visitors and to advance knowledge in the humanities and sciences."

2. *Why should parks acquire and manage museum collections?*

Chapter 9 of *Cultural Resource Management Guideline*, Release No. 5 (1997), which implements Director's Order #28: Cultural Resource Management (June 1998), states:

"Museum collections (objects, specimens, and archival and manuscript collections) are important park resources in their own right as well as being valuable for the information they provide about processes, events, and interactions among people and the environment. Natural and cultural objects and their associated records provide baseline data, serving as scientific and historical documentation of the park's resources and purpose. All resource management records that are directly associated with museum objects are managed as museum property. These and other resource management records are preserved as part of the archival and manuscript collection because they document and provide an information base for the continuing management of the park's resources. Museum objects used in exhibits, furnished historic structures, and other interpretive programs help visitors gain better understanding of the events, activities, and people commemorated by parks."

Museum collection records such as accession records, catalog records, loan records, conservation records, and inventory records are not included in the museum collection. They are official records that are generated in the course of doing government business. You must retain these records in association with museum collections. Do not catalog or include them as part of the park's museum collection. The management of these records is governed by Director's Order #19: Records Management (Jan 2001). Because they are used in the day-to-day management of the park collection, they are listed on the Records Disposition Schedule as being permanently retained in association with museum collections. See Museum Handbook, Part II (MH-II), Museum Records.

3. ***Who can accept museum collections?***

By delegation, your park's superintendent represents the Director and the Secretary of the Interior in accepting title to and responsibility for museum collections. (See *MH-II*, Museum Records, Chapter 1, for guidance on delegation of authority and museum property management.)

Each park superintendent is responsible for ensuring that all collections acquired are in keeping with the Scope of Collection Statement before accepting the items as part of the permanent collection.

C. The Scope of Collection Statement

1. ***What is a Scope of Collection Statement?***

A Scope of Collection Statement is a stand-alone museum planning document that succinctly defines the scope of the park's museum collection holdings at the present and for the future. The SOCS derives from the park's mission, as well as laws and regulations mandating the preservation of collections. It is:

- the critical basis for managing museum collections
- referenced in each park's General Management Plan, Resource Management Plan, Long-Range Interpretive Plan, and other planning documents that may affect the collection of museum objects or their management and use

2. ***Does every park require a Scope of Collection Statement?***

Yes, all parks must have a Scope of Collection Statement. Although some parks may not intend to acquire a "typical" museum collection, each park will, at a minimum, possess archives documenting the history and management of the park, as well as objects and specimens generated from resource management activities. Other NPS organizational units (such as conservation centers, regional offices, or support offices) that acquire and maintain museum collections must also have a fully developed SOCS.

3. ***Why does my park need a Scope of Collection Statement?***

A Scope of Collection Statement guides your park in the acquisition and management of those museum objects that contribute directly to the park's mission, as well as those additional collections that the Service is legally mandated to preserve. A SOCS:

- defines the purpose of the park's museum collection
- sets agreed-upon limits that specify the subject matter, geographical location, and time period to which the collection must relate
- evolves from legislation and planning documents specific to each park, and from laws, regulations, and NPS policies governing research and specimen collection conducted within park boundaries
- states what types of objects will be acquired to fulfill the park's mission
- considers collection use and restrictions

Director's Order #24: NPS Museum Collection Management, 4.3.6 "Scope of Collections" states that NPS units with museum collections must:

"Approve and keep current a Scope of Collection Statement to identify the scope of collecting activities and define the purpose of the collection. Ensure acquisitions are consistent with the Scope of Collection Statement. Deaccession objects inconsistent with the Scope of Collection Statement."

4. ***How do I determine the scope of my park's museum collection?***

To determine the scope of your park's museum collection, you should:

- study the mission of the park as stated in its enabling legislation, presidential proclamation, executive order, or subsequent legislation that may revise a park's mission.
- determine what cultural evidence and scientific information is needed to document and support the park's resource management and interpretive programs.
- include archeological collections, certain natural history collections, and associated records that are mandated by law, regulation, and policy to be a part of the park's museum collection.

5. ***What is a park Collections Advisory Committee?***

A Collections Advisory Committee is chaired by the curator or collections manager and includes park staff who represent relevant disciplines (interpretation, natural resource management, archeology, and others). Committee members may also include subject matter specialists from neighboring parks and/or the regional office. The roles of the committee members are to:

- determine which of the park's missions and programs are relevant to museum collections
- determine which types of museum objects the park will maintain to support those missions, programs, and mandates
- draft a new or revised SOCS for the park
- review and make recommendations to the superintendent concerning all potential additions by gift, purchase, transfer, exchange, and loan to the museum collection

- review and make recommendations to the superintendent concerning all potential deaccessions of objects determined to be outside the Scope of Collection

- review and make recommendations to the superintendent concerning all potential deaccessions of objects that involve voluntary destruction or abandonment

6. ***Are parks required to have a Collections Advisory Committee?***

No, a Collections Advisory Committee is optional. However, you should consider establishing one. A committee with good representation from different park divisions and across various disciplines will allow for enlightened discussions reflecting diverse viewpoints, and eliminate any appearance of curatorial self-interest unduly influencing the park's acquisitions policies. Most professional museums have a Collections Advisory Committee. The guidance provided by this committee, combined with a well-written SOCS, should ensure that the museum collection is clearly relevant to your park's mission.

7. ***Who prepares and approves a Scope of Collection Statement?***

The curator, collections manager, or other park staff responsible for the collection (ideally with the assistance of the Collections Advisory Committee) prepares the Scope of Collection Statement. Be sure to coordinate the development of your SOCS with your regional/SO curator, as s/he can provide help. Following review by appropriate park staff (such as archeologists, interpreters, scientists, naturalists, historians, archivists, and other resource management staff) and your regional/SO curator, the superintendent approves the document.

8. ***What is the distribution of an approved Scope of Collection Statement?***

The park or other NPS unit maintains the original approved Scope of Collection Statement. A copy of the approved SOCS should be forwarded to the regional/SO curator.

9. ***How often should I review and revise my park's Scope of Collection Statement?***

Review your park's Scope of Collection Statement at least every five years. Revise it whenever changed conditions clearly alter the mission of your park or when priorities in a specific collecting category have been met. Your superintendent must review and approve any changes made to the SOCS. See Appendix E, for a checklist that you can use to prepare or review your park's Scope of Collection Statement.

10. ***What are the parts of a Scope of Collection Statement?***

Include the following sections in your Scope of Collection Statement:

- Title Page

- Table of Contents

- Executive Summary

- Introduction

- Types of Collections

- Museum Collections Subject to the Native American Graves Protection and Repatriation Act (NAGPRA) of 1990

- Acquisition

- Uses of Collections
- Restrictions
- Management Actions

The Introduction and Types of Collections sections are the most important components of the document. These two sections establish the purpose of the park's museum collection and describe the types of objects that the park will collect. The information in these two sections ensures the collection's logical growth while guarding against the acquisition of objects that are not clearly relevant to the park. See Appendix E, for an example of a Scope of Collection Statement.

11. ***What is the Executive Summary (Scope of Collection Summary)?***

The Executive Summary (or Scope of Collection Summary) is one or a few paragraphs that summarize the park's collections and highlight the most significant aspects or individual items. The Executive Summary should be located at the beginning of your Scope of Collection Statement. You also may wish to include this same information in a single stand-alone document that you can distribute to park staff, visitors, the press, and other interested parties. Figure 2.1 includes an example Scope of Collection Summary document. This example is available in electronic format. Contact your regional/SO curator to get an electronic copy to use as a template when preparing your park's Scope of Collection Summary.

12. ***When should I use the Scope of Collection Summary?***

Use the Scope of Collection Summary when you need a description of the collection for:

- park planning documents
- entries in directories
- press releases
- web sites
- other publications

> ***You can use the Scope of Collection Summary to update your park's "Collection Summary" on "About Museum Collections" on InsideNPS. Go to <http://inside.nps.gov/documents/museum> and follow the instructions under "Edit Park Data."***

D. Writing the Introductory Section of the Scope of Collection Statement

1. ***What should I include on the Title Page?***

Prepare a title page that spells out the full name of the park (for example, Zion National Park, Fort Clatsop National Memorial). The Title Page also serves as the review and approval page. See Appendix E, for the Scope of Collection Statement Title Page format.

2. ***What should I include in the Executive Summary?***

Prepare an Executive Summary that consists of one to a few paragraphs that succinctly outlines the park's collections and highlights the most significant aspects or individual items. The Executive Summary is a useful resource for providing concise collections information to park management, planning staff, and others. You may wish to include this same information in a single stand-alone document (or Scope of Collection Summary) that you can distribute to park staff, visitors, the press, and other interested parties (see Figure 2.1). Use the Scope of Collection Summary when you need a description of the collection for park planning documents, entries in directories, press releases, public inquiries, web sites, or publications. The Scope of Collection Summary can also be made available via the web. See Appendix E, for the Scope of Collection Statement Executive Summary format.

3. ***What should I include in the Table of Contents?***

Prepare a Table of Contents that lists all of the sections and sub-sections of the SOCS with page numbers. See Appendix E, for the Scope of Collection Statement Table of Contents format.

4. ***How do I prepare the Introduction?***

The Introduction defines the purpose of your park's museum collection. Justify the collection's significance and include pertinent elements from the park's enabling legislation, other mandates, mission statement, and approved park planning documents. When writing your Introduction, you should state the purpose of the park's Scope of Collection Statement. Sample wording for this section is as follows:

> *This Scope of Collection Statement defines the scope of present and future museum collection holdings of Lewis Mountains National Park that contribute directly to the understanding and interpretation of the park's purpose, themes, and resources, as well as those objects that the Service is legally mandated to preserve. It is designed to ensure that the museum collection is clearly relevant to the park.*

5. ***What legal authorities should I reference?***

Reference the legal authorities for the Service to acquire, document, preserve, and provide access to museum collections:

- Antiquities Act of 1906 (16 USC 431-433)
- Organic Act of 1916 (16 USC 1 et. seq.)
- Historic Sites Act of 1935 (16 USC 461-467)
- Management of Museum Properties Act of 1955, as amended (16 USC 18f)
- Reservoir Salvage Act of 1960, as amended (16 USC 469-469C)
- National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.)
- Archeological and Historic Preservation Act of 1974, as amended (16 USC 469-469l-2)
- Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm)

- National Parks Omnibus Management Act of 1998 (16 USC 5901)

See Appendix A for a summary of these laws.

Sample wording for this section is as follows:

> *The National Park Service's (NPS) legal mandate for acquiring and preserving museum collections is contained in the Antiquities Act of 1906 (16 USC 431-433); the Organic Act of 1916 (16 USC 1 et. seq.); the Historic Sites Act of 1935 (16 USC 461-467); the Management of Museum Properties Act of 1955, as amended (16 USC 18f); the Reservoir Salvage Act of 1960, as amended (16 USC 469-469c); the National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.); the Archeological and Historic Preservation Act of 1974, as amended (16 USC 469-469l-2); the Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm); the National Parks Omnibus Management Act of 1998 (16 USC 5901).*

6. ***What information should I include about the park's mission?***

State the park's mission. Cite the park's enabling legislation and any relevant subsequent legislation. Include excerpts. If applicable, note that the legislation for the park requires the establishment and maintenance of a museum collection. Be sure to mention any litigation or judgements relating to the collection as well.

7. ***What information should I include about the purpose of the collection?***

State the purpose of the park's museum collection. A park's museum collection:

- provides valuable information about processes, events, and interactions among cultures, individuals, and the environment
- places objects and specimens within a broader context, through research, analysis, and documentary records
- provides for the greatest benefit and enjoyment by the public
- provides baseline data, serving as scientific and historical documentation of the Service's resources, and of the purpose for which the park was established
- may document important events or people in the nation's history, technological processes, or artistic endeavors

8. ***What park documents should I reference?***

Refer to your park's General Management Plan (GMP) (in lieu of a GMP, refer to the park's current Government Performance Results Act [GPRA] Strategic Plan), Resource Management Plan, Long-Range Interpretive Plan, Historic Furnishings Reports, Historic Structure Reports, exhibit planning documents, or other relevant planning documents in defining the purpose of your park's museum collection.

Study your park's interpretive planning documents, and relate how the museum collection supports the interpretive program. List the interpretive themes and periods. If they exist, cite the park's Long-Range Interpretive Plan and other interpretive plans. Include title(s) and approval date(s).

Study your park's resource management planning documents, and, where relevant, state how the museum collection supports the park's resource management program. List pertinent resource management goals and objectives. If they exist, cite the park's Resource Management Plan, Natural Resources Network Inventory and Monitoring Study Plan, Fire Management Plan, and other resource management plans. Include title(s) and approval date(s).

9. ***What should I include about mandated collections?***

Identify mandated collections. The purpose for the park's museum collection also includes managing objects that the Service is mandated to preserve.

43 CFR 7.13, "Custody of Archeological Resources," and NPS *Management Policies* (2001), mandate that archeological collections (including associated records) acquired as a result of systematic investigation within a park's boundary must be managed intact as part of the park's resources and, therefore, never can be outside a park's approved Scope of Collection Statement.

Certain natural history specimens that are not consumed in analysis and are determined to be appropriate for long-term preservation are included in a NPS museum collection in compliance with 36 CFR 2.5, "Research Specimens."

Sample wording for this section is as follows:

> *Archeological collections, except inalienable and communal property (as defined by the Native American Graves Protection and Repatriation Act of 1990 [25 USC 3001-13]), recovered from within park boundaries through systematic collection are Federal property and must be retained in the park's museum collection in accordance with 43 CFR 7.13 and NPS Management Policies (2001).*
>
> *In accordance with the NPS Research Permit and Reporting System, permits to collect natural resource specimens state that retained specimens remain Federal property, are incorporated into the park museum collection and, as required by 36 CFR 2.5g, must bear official National Park Service museum labels and their catalog numbers will be registered in the National Park Service National Catalog.*

10. ***Should I include information on the significance of the collection?***

Yes. Be sure to discuss the significance and history of your park's museum collection. This is an important part of every SOCS, as it:

- details the development of your park's collection
- ensures that important collections history information is not lost due to staff turnover
- documents the significance of the museum collections in text that can also be used in PMIS project justifications and other funding requests

Note: You also may want to include information concerning your park's past curators and managers, as well as past management priorities. Such information may prove helpful as you attempt to develop solutions to

various museum management issues.

11. ***What other references should I include in the Introduction?***

List other laws, regulations, directives, and conventions that are pertinent to the acquisition of museum collections. See Appendix A, for a list and summary of these documents. Suggested wording for this section is as follows:

> *Other laws, regulations, directives and conventions pertinent to the acquisition of museum collections at the park include: the Lacey Act of 1900 (18 USC 43-44); the Migratory Bird Treaty Act of 1918 (16 USC 703-711); the Bald Eagle Protection Act of 1940, as amended (16 USC 668-668d); the Federal Property and Administrative Services Act of 1949, as amended (40 USC 483[b]); the Federal Records Act of 1950, as amended ("Records Management by Federal Agencies" [44 USC 3101 et. seq.]); the Freedom of Information Act of 1966, as amended (5 USC 552); the Marine Mammal Protection Act of 1972 (16 USC 1361-1407); the Endangered Species Act of 1973, as amended (16 USC 1531-1543); the Privacy Act of 1974 (5 USC 552a); the Copyright Act of 1976 (17 USC 101 et seq. [1988 & Supp. V 1993]); the American Indian Religious Freedom Act of 1978 (42 USC 1996); the Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 USC 3001-3013); Federal Property Management Regulations (FPMR), 41 CFR 101; 410 Departmental Manual, Interior Property Management Regulations (IPMR); 411 Departmental Manual, "Managing Museum Property," Chapters 1-3; "Curation of Federally-Owned and Administered Archeological Collections," 36 CFR 79; NAGPRA Final Regulations, 43 CFR 10; "Disposition of Federal Records," 36 CFR 1228; "Protection of Archeological Resources", 43 CFR 7; "Preservation of American Antiquities", 43 CFR 3; "Preservation, Arrangement, Duplication, Exhibition of Records" (44 USC 2109); "Disposal of Records" (44 USC 3301 et seq.); Director's Order #19: Records Management; Director's Order #24: NPS Museum Collections Management; Director's Order #28: Cultural Resource Management; Director's Order #44: Personal Property Management; the 1983 Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES); the 1970 UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (implemented in the United States by P.L. 97-446 in 1983, 19 USC 2601).*

Identify any special designations (such as Biosphere Reserve, National Historic Landmark, World Heritage Site) that may be relevant to the park's museum collection. At the same time, be sure to note if the park is part of a larger (but local) heritage area designation or historic preservation district.

Refer to the sample Scope of Collection Statement in Appendix E, for additional help when drafting the Introduction section of your SOCS.

E. Writing the Types of Collections Section

1. ***What should I include in the Types of Collections section?***

In the Types of Collections section, identify the specific types of museum collections that your park acquires to meet the purpose(s) stated in the Introduction. Describe what should be collected to meet the park's enabling legislation, any subsequent legislation, and approved resource management

and interpretive goals and objectives, as well as mandates relevant to archeological and natural history collections. You should:

- State that the Introduction defines the purpose of the park's museum collection.

- Note the two major categories of museum collections: Natural History and Cultural Collections.

  - **Natural History Collections.** Your park's natural history collection may include specimens from the disciplines of biology, geology, and paleontology.

  - **Cultural Collections.** Your park's cultural collection may include objects from the disciplines of archeology, ethnography, and history (including archives and manuscripts).

- Subdivide each appropriate discipline into collecting categories that reflect the purposes of the park. Establish the collecting categories based on classification, time period, themes, or other criteria. Examples may include types of biological collections (birds, mammals, and fungi), archeological materials recovered during pre-construction compliance work, archival materials associated with certain individuals related to the park.

- Briefly describe current representation of object types under each collecting category.

  - Discuss strengths of the existing collection.

  - Identify any current deficiencies to help define acquisition priorities.

  - Provide sufficient detail to distinguish the various types of items that may be considered for acquisition.

  - Establish quantitative or qualitative limits on the size of the collection when possible.

- Include all archeological materials and natural history specimens collected within park boundaries that the park is mandated to maintain in park collections.

  - These items are Federal property and must be retained in the museum collection according to law, regulation, and policy.

  - State the requirement to retain all resource management records prepared or assembled as a result of archeological survey, excavation, or other study. State the requirement to retain resource management records generated by natural resource studies that the NPS initiates. When these records are associated with collected artifacts or specimens they are known as associated records. In accordance with NPS *Management Policies* (2001), 4.2.2. Independent Studies, and the NPS Research Permit and Reporting

System, parks may require researchers doing independent (non-NPS) studies to provide the park with copies of field notes, final reports, or other documentation related to the project. If the park has this requirement, include it in the SOCS. See *MH-II*, Appendix D, for information concerning associated records.

2. ***What do I need to know about natural history collections to help me prepare the Types of Collections section?***

Parks generate natural history collections in relation to the size and complexity of natural resources within the park, the number of research and monitoring projects, and for multiple uses. Natural history collections contain materials from the disciplines of biology, paleontology, and geology. Your park's collection may include:

- **Reference Collections.** Many living organisms, fossils, and minerals are difficult to identify. Reference collections allow identification by comparison with actual specimens.

- **Synoptic Collections.** Synoptic collections contain multiple representatives of a particular group from the park. They are generated to document presence and distribution, to establish baseline inventories, for monitoring, or to illustrate the morphological variations within a genus or a species.

- **Voucher Collections.** Studies and projects generate voucher specimens that document by date and locality species identity, age classes, genetic variations, and other information that may be reviewed in the future by other investigators.

- **Type Collections.** A type specimen is the specimen used to describe a new species for the first time. The definitions and procedures for type specimens are tightly controlled by international codes (such as the *International Code of Botanical Nomenclature*). Type specimens have extremely high scientific value. They are managed as NPS controlled museum property and must be afforded appropriate storage and security.

- **Tissue Samples**. Viable tissue samples are rare in NPS collections, as the specimens must be stored within specialized equipment that can maintain ultracold (about -80°C) or cryogenic temperatures (below -130°C) for their preservation. The exact temperature is usually determined by the sensitivity of the specimens. -130°C is the maximum temperature for long-term stability of plant and animal cells and -150°C or lower is considered to be optimum for preservation. See *MH-I*, Appendix T, for additional information on tissue samples.

Natural history collections can result from ongoing park projects such as Fire Effects projects, Inventorying and Monitoring projects, Cultural Landscape Reports, Ethnobotanical Studies, and other activities. These collections can also result from research conducted by non-NPS scientists working in the park under permit. Be sure to develop your park's natural history collection in close coordination with your park's Research Coordinator, resource management and interpretive staff, scientists, your regional/SO curator, and Native American and other cultural groups associated with the park.

3. ***What other information concerning natural history collections should I include in the Types of Collections section?***

Your discussion of natural history collections should include a brief paragraph that describes a program for the selective acquisition of natural history specimens for the collection. Base this paragraph on appropriate resource management and interpretive goals and objectives of your park. Be sure to state that:

- Specimens must be collected scientifically, so that only well documented and appropriate specimens are retained in the collection.

- No non-NPS collector can work in the park without first obtaining a permit. The permit's "Collections Section" must also be completed, documenting where collections of specimens and associated records will be housed.

Note: You may want to encourage park staff to obtain a permit for projects that they undertake in the park as well. Consult with your park's research coordinator concerning this and other related matters.

> ***Neither the Collections Advisory Committee nor the museum staff decide what research will be conducted in the park. The superintendent, with the input of your park's research coordinator, makes that decision. Both the committee and the museum staff advise the superintendent on what objects and specimens should be (or must be, according to statute) accessioned into the park's museum collection.***
>
> ***In some parks, curatorial and natural resource staff work together to review collection permit requests, advising the superintendent to reject certain requests that are duplicative of existing collections and re-direct the researcher to the existing park collections. This policy is particularly valuable to support park goals of protecting rare species and limiting/preventing duplicative collecting.***

Other information that you should mention in this section includes:

- The collecting category "Associated Records" under each discipline. (See *MH-II*, Appendix D: Archival and Manuscript Collections and Question 6. below, "What do I need to know about Archival and Manuscript Collections…" for information concerning associated records.)

- A statement that addresses the park's program to curtail uncontrolled collecting of natural resources by staff and visitors.

Note: Many parks maintain teaching collections of herbarium, mammal, bird, and other specimens. Such collections are usually managed by the park's interpretive division and are typically located in an environmental education center, visitor center "hands-on displays," or are included within a "traveling trunk" used for off-site programs. Such specimens do not result from authorized scientific research in the park, but rather from road kills, collecting outside park boundaries, and illegally possessed flora, fauna, and other specimens seized by state and Federal authorities. Since these

collections are truly interpretive in nature and were not a product of scientific research, do not accession these materials into the museum collection. If your park has such a teaching collection, it is useful to note this fact in the SOCS to differentiate it from the museum collection.

> ***<u>Except for specimens that the Service is mandated to preserve</u>, a natural history collection may not be applicable to your park's enabling legislation, interpretive themes, and resource management goals and objectives. If your park does not currently possess or intend to acquire a natural history collection (other than mandated collections resulting from resource management activities), include a short statement in this section to that effect.***

See Appendix E, for an example Scope of Collection Statement that includes sample language and content concerning natural history collections.

4. ***What do I need to know about cultural collections to help me prepare the Types of Collections section?***

Your park's cultural collection may contain materials from the disciplines of archeology, ethnology, and history (including, but not limited to, fine and decorative arts, architectural materials, and archival and manuscript collections).

Develop your park's cultural collection in close coordination with park resource management and interpretive staff, your regional/SO curator, historians, archivists, archeologists, ethnographers, and Native Americans and other groups who have a personal or cultural affiliation with the collection.

> ***Limiting the growth of history and ethnographic collections may be an important concern. Consider your park's interpretive and resource management goals and objectives, as well as your capability to properly manage and preserve these collections. If appropriate, indicate the types of objects that should not be part of the collection. History and ethnographic collections may be limited to types and quantities sufficient to implement exhibit planning documents and/or a Historic Furnishings Report.***

5. What other information about cultural collections should I include in the Types of Collections section?

Your discussion of cultural collections should include:

- An introductory paragraph that indicates the purpose of these collections.
- Information concerning archeology collections:
  - Artifacts and Specimens. Include a statement that addresses the park's program to curtail uncontrolled surface collecting by staff and visitors.

- Associated Records. See *MH-II*, Appendix D: Archival and Manuscript Collections and Question 6. below, "What do I need to know about Archival and Manuscript Collections…" for information concerning associated records.

- Your park's collection priorities. State that:

  - An object from the site or directly associated with person(s) or event(s) commemorated by the park is more desirable than a similar object without such association.

  - Priority must be given to the best-documented site-related objects. When a large quantity of an object type is available, priority will be given to acquiring the best-preserved examples (unless there is greater value in the assemblage of a whole set rather than simply of individual items).

- A brief listing of those types of object currently in the collection.

- Information concerning history and ethnographic collections.

  - If a history or ethnographic research/study collection is deemed to be important to fulfilling the park's mission, make such a statement.

  - Justify this collection by referencing appropriate resource management and interpretive goals and objectives.

See Appendix E, for a sample Scope of Collection Statement that includes language and content concerning cultural collections.

6. *What do I need to know about Archival and Manuscript Collections to help me prepare the Types of Collections section?*

Never include official records in the museum collection without specific authorization from the National Archives and Records Administration (NARA). Official records are defined under the Federal Records Act. They are also described in guidelines issued by NARA, and in NPS Director's Order #19: Records Management. Official records include original or "record copy" documents created or received in the course of performing the daily work of the NPS. Examples of official records include audit records, budget materials, central park correspondence files, contracting files, financial records, law enforcement records, legal records, museum administrative records, permits, personnel records, project files, and similar types of materials. By law, the NARA has authority over these materials, and they must be transferred to that agency or otherwise disposed of according to NARA guidelines.

The museum collection may include several categories of archival and manuscript materials that do not meet the statutory definition of official records, as well as official records that the National Archives has authorized NPS to retain. These materials include:

- **Personal Papers or Organizational Archives** donated to the NPS by non-Federal sources. Because these materials are non-Federal in origin and because the NPS obtained them as museum objects rather than as records of NPS activity, they are not considered to be official records.

Note: Acquiring such collections without also acquiring the copyrights can severely limit the park's use of the items. NPS acquisition policy requires parks to:

- determine who owns the copyright
- if possible, have the owner transfer the copyrights to the NPS

See Section E: Acquiring Copyrights, in *MH-II*, Chapter 2: Accessioning, for additional information.

- **Sub-Official Records**. These include ***copies*** of official records, such as bibliographies, desk files maintained by individual NPS employees, park handouts, and other documents kept for purposes of reference or convenience.

- **Resource Management Files**. These records are defined in the Departmental Manual (411 DM 1, Policy and Responsibilities for Managing Museum Property), and include site forms, field notes, drawings, maps, photographs, video tapes, sound recordings, oral histories, inventories of artifacts, laboratory reports, and "Associated Records" that are created in connection with specific sites, objects, and specimens. Although these are official records created by a Federal employee, contractor, or partner, the Service has permission from the NARA to keep them because they relate directly to museum collections and park resources, and because they are critical for the interpretation, management, or preservation of the nation's natural and cultural heritage. See 36 CFR 79 for additional information concerning associated records related to archeological resources.

Archival documents can be in any format: paper, film, audio or video recordings, or electronic (computer-based) media, to name but a few.

Also, except for materials compiled by NPS staff into "assembled collections," it is seldom appropriate to acquire or maintain archival materials on a document-by-document basis. Instead, archival materials usually are kept in their original groupings, following the filing schemes developed by the person or organization that created them. Therefore, it is preferable to acquire archival materials on a collection-by-collection basis. See *MH-II*, Appendix D: Museum Archival and Manuscript Collections for additional information.

See *MH-I*, Appendix E, for a sample Scope of Collection Statement that illustrates sample language and content for this collecting category.

7. ***How do I determine if material belongs in the park library or the museum collection?***

Library Collections. As a general rule, place publications that are not rare or assembled by an eminent figure related to the park's mission in the park library. See *Conserve O Gram* 19/1, "What Makes a Book Rare" for the definition of a rare book.

Museum Collections. In addition to the excepted publications noted above, place all original archival documents, whether in audio-visual, electronic, textual, or visual format, in the museum collection. These

original materials include such items as audiotapes, correspondence, graphic prints, manuscripts, motion picture film footage, photographs, reports, and videotapes, plus all other original documentary formats.

Books associated with a significant individual (such as Frederick Douglass) or acquired in response to a deficiency identified in a Historic Furnishings Report or Exhibit Plan should be placed in the museum collection.

F. Writing the Museum Collections Subject to NAGPRA Section

1. *What is NAGPRA?*

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 USC Chapter 32) recognizes the rights of lineal descendants, culturally affiliated Indian tribes (including Native Alaskan villages or corporations), or Native Hawaiian organizations to control or own Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony that are held by federal agencies and museums that receive federal funds. In addition to its other provisions, the law requires these agencies and museums to:

- conduct inventories and produce written summaries of such items in their collections
- repatriate (return) identified NAGPRA associated items to the appropriate lineal descendants, culturally affiliated Indian tribes, or Native Hawaiian organizations in compliance with the law, if requested to do so by these groups

For additional information concerning NAGPRA, see Appendix A: Mandates and Standards and *MH-II*, Chapter 6: Deaccessioning.

2. *What do I include in the SOCS about NAGPRA?*

If applicable to your park, include information on the written summary and inventory.

Written Summary. If applicable to your park, state that the NPS met the legal requirement by distribution of the Servicewide Summary, listed by park, to all Indian Tribes, Alaskan Native villages or corporations, and Native Hawaiian organizations on October 27, 1993. In accordance with *Cultural Resource Management Guideline* (1997), Appendix R, NAGPRA Compliance, superintendents must periodically review and update summaries to reflect new acquisitions and newly recognized Indian tribes. State that an updated copy of this summary is on file at your park. If your park has no museum objects in the NAGPRA defined categories of unassociated funerary objects, sacred objects, or objects of cultural patrimony, make a statement to that effect. Suggested wording for this section is as follows:

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA), 25 USC 3001-13, requires, in addition to other actions, a written summary of unassociated funerary objects, sacred objects, and

objects of cultural patrimony. The park's holdings that fall into these NAGPRA categories are listed in the Servicewide Summary that was distributed to all Indian Tribes, Alaska Native villages, and Native Hawaiian organizations on October 27, 1993. An updated copy of this summary is on file at the park.

Inventory. If applicable, state that your park has human remains or associated funerary objects subject to NAGPRA in its collection. State as of **[note date]** the park completed the inventory of Native American human remains and funerary objects. In accordance with *Cultural Resource Management Guideline* (1997), Appendix R, NAGPRA Compliance, superintendents must periodically review and update the inventory to reflect new acquisitions and newly recognized Indian tribes. State that an updated copy of this inventory is on file at your park. If the park has no human remains or associated funerary objects, make a statement to that effect. Suggested wording for this section is as follows:

NAGPRA requires a written, item-by-item inventory of human remains and associated funerary objects to be completed no later than November 16, 1995. The park has human remains and associated funerary objects subject to NAGPRA in its museum collection. A detailed listing of these items is contained in the park's NAGPRA Inventory, completed **[note date]**. *An updated copy of this inventory is on file at the park.*

Note: You must keep all NAGPRA summaries and inventories up-to-date. If your park has acquired NAGPRA related items since 1993, be sure to amend your park's summary and inventory to reflect this. For additional information, see *Cultural Resource Management Guideline*, Appendix R, NAGPRA Compliance, pp. 325-326.

G. Writing the Acquisition Section

1. *How do I prepare the Acquisition section?*

When writing the Acquisition section, be sure to:

- Describe the various types of acquisition sources.
- State that museum objects must be acquired, accessioned, and cataloged in accordance with *Museum Handbook*, Part II, Museum Records.
- State that the acquisition of museum objects is governed by the park's ability to manage, preserve, and provide access to them according to:
  - NPS *Management Policies* (2001), Chapter 5
  - Director's Order #28, Cultural Resource Management (1998)
  - *Cultural Resource Management Guideline* (1997)
  - Director's Order #24: NPS Museum Collections Management (2000)
  - NPS *Museum Handbook*, Part I, Museum Collections, Part II,

Museum Records, and Part III, Access and Use

- State that the park will not be a partner to, or encourage in any way, the trafficking in illicitly collected materials. Be sure that all acquisitions were collected, exported, imported, transported, or otherwise obtained and possessed in full compliance with the laws and regulations of:

  - the country of origin

  - the United States federal government (including NAGPRA)

  - the individual states within the U.S.

See *MH-II*, Chapter 2: Accessioning, Section D. Special Considerations for Accessions, for information on the illicit trade of collections.

- State that the acquisition of firearms included on the Bureau of Alcohol, Tobacco, and Firearms (ATF) list of prohibited/restricted weapons requires concurrent review by the regional/SO curator and the regional/SO law enforcement specialist.

- State that NPS policy requires superintendents to accept only unconditional gifts. This includes acquiring all copyrights at the time of acquisition. Only the regional director has the authority to approve conditional gifts for rare exceptions, on a case-by-case basis. See Director's Order #24: NPS Museum Collections Management (2000), 4.3.15 Unconditional Gifts and *Museum Handbook*, Part II: Museum Records, Chapter 2, Section E. "Acquiring Copyrights."

- Make a statement regarding delegation to the park superintendent of the responsibility for accepting title to museum collections and for their subsequent management. As appropriate, outline any park-specific acquisition procedures that supplement the Servicewide requirements.

2. ***What is some suggested wording for the Acquisition section?***

Suggested wording for the Acquisition section is as follows:

The park acquires objects for its museum collections by gift, purchase, exchange, transfer, field collection, and loan. Museum objects must be acquired, accessioned, and cataloged in accordance with Museum Handbook, Part II, Museum Records. Acquisition of museum objects are governed by the park's ability to manage, preserve, and provide access to them according to NPS Management Policies (2001), Chapter 5; the standards for managing museum objects in Director's Order #28: Cultural Resource Management (1998), Cultural Resource Management Guideline (1997), and Director's Order #24: NPS Museum Collections Management (2000); the NPS Museum Handbook, Part I, Museum Collections and Part III, Access and Use.

In accordance with NPS policy, the park will prohibit the acquisition of gifts with restrictions or limiting conditions. Such restrictions include copyrights; the park will acquire copyrights to all incoming accessions. Incoming loans will be acquired only for a particular purpose such as research or exhibition, and for a specified period of time. Museum objects are acquired, accessioned, and cataloged in accordance with

the NPS Museum Handbook, Part II, Museum Records.

The park will not be a partner to, or encourage in any way, the trafficking in illicitly collected materials. All acquisitions must be collected, exported, imported, transported, or otherwise obtained and possessed in full compliance with the laws and regulations of the country of origin, the United States federal government (including NAGPRA), and the individual states of the United States.

The acquisition of firearms included on the Bureau of Alcohol, Tobacco, and Firearms (ATF) list of prohibited/restricted weapons requires concurrent review by the regional/SO curator and the regional/SO law enforcement specialist.

The park superintendent, by delegation, represents the Director of the National Park Service and the Secretary of the Interior in accepting title to and responsibility for museum objects. The superintendent bears the ultimate responsibility for the acquisition and proper care and management of the museum collection. The superintendent has delegated the day-to-day care of the collection to the museum curator.

All acquisitions must receive formal approval from the superintendent before they can be accepted into the museum collection. Upon receipt, all newly acquired objects and related documentation must be turned over to the museum curator. The museum curator prepares, for the superintendent's signature, all instruments of conveyance, and letters of thanks, acceptance, or rejection, and transmits them as appropriate, to the donor, lender, vendor, or other source of acquisition.

Refer to the Acquisition section of the sample Scope of Collection Statement in Appendix E, for additional help when drafting this section of your SOCS.

H. Writing the Uses of Collections Section

1. *How do I prepare the Uses of Collections section?*

When writing the Uses of Collections section, you should:

- Briefly describe the desired and acceptable uses of the museum collection and establish the limits of such uses. Possible uses include exhibits (including web features), interpretive programs, research, and other interpretive media (such as publications).

- State that the primary consideration in all uses of museum objects is the preservation of each object in question and of the museum collection as a whole.

- If applicable, state that the park may consult with local and/or affiliated Native American tribes, Native Hawaiian organizations, or Alaskan Native villages and corporations about providing access to certain items of concern.

- State that in accordance with NPS *Management Policies* (2001), Chapters 5 and 7, the park will not exhibit Native American human remains or photographs of those remains. You should also include

language concerning the NPS management policies regarding the display of Native American grave goods or other objects considered sacred. See NPS *Management Policies* (2001), 5.3.4 "Stewardship of Human Remains and Burials," 5.3.5.5 "Museum Collections," and 7.5.5 "Consultation."

- State that any interpretive use defined as consumptive must be authorized in advance, as outlined in Director's Order #28: Cultural Resources Management (1998) and Director's Order #6: Interpretation and Education (Draft, 2003).

> ***The NPS prefers the use of reproductions to the consumptive use of original objects.***

2. ***What is some suggested wording for the Uses of Collections section?***

Suggested wording for Uses of Collections section is as follows:

The park's museum collection may be used for exhibits, interpretive programs, research, publications, or other interpretive media. The primary considerations for the use of museum objects are the preservation of each object in question and of the collection as a whole, and accurate interpretation.

In accordance with NPS Management Policies (2001), Chapters 5 and 7, the park will not exhibit Native American human remains or photographs of those remains. Drawings, renderings, or casts of such remains will not be displayed without the consent of culturally affiliated Indian tribes and Native Hawaiian organizations. The park will consult with culturally affiliated or traditionally associated peoples to determine the religious status of any object whose sacred nature is suspected but not confirmed. These consultations will occur before such an object is exhibited or any action is taken that may have an adverse effect on its religious qualities.

Researchers and other specialists may examine objects and archival materials under the conditions and procedures outlined in Director's Order #24: NPS Museum Collections Management (2000), Director's Order #28: Cultural Resource Management (1998), Cultural Resource Management Guideline (1997), and in the park's written "Museum Collections Access Procedures." Outside researchers must submit a research proposal to the superintendent for review by the park's Research Committee. If applicable, the research proposal may be presented for review during consultation with the **[list all local and/or affiliated Native American tribes, Native Hawaiian organizations, or Alaskan Native villages and corporations with whom you should consult]** *before access to certain items in the collection is granted.*

Any interpretive use defined as consumptive must be authorized in advance, as outlined in Director's Order #24: NPS Museum Collections Management (2000), Director's Order #28: Cultural Resource Management (1998), Cultural Resource Management Guideline (1997), and Director's Order #6: Interpretation and Education (Draft, 2003). The use of reproductions is preferred to the

consumptive use of original objects.

Destructive analysis is a legitimate use of museum collections for approved research purposes when the impact is minor or when the object is common, in which case approval by the superintendent is required. If an object is rare or significant, a request for destructive analysis should be reviewed by the regional/SO curator and may be approved only by the regional director, as outlined in Director's Order #28: Cultural Resource Management (1998) and Cultural Resource Management Guideline (1997).

Objects may be loaned out to qualified institutions for approved purposes in accordance with NPS Museum Handbook, Part II, Chapter 5: Outgoing Loans. Institutions must meet accepted museum standards for security, handling, and exhibition of NPS museum objects. Sensitive materials may require additional conditions prior to a loan commitment. Expenses related to loans of museum objects, including shipping and insurance, will normally be assumed by the borrower.

Refer to the Uses of Collections section of the sample Scope of Collection Statement in Appendix E for additional help when drafting this section of your SOCS.

I. Writing the Restrictions Section

1. *How do I prepare the Restrictions section?*

You should list any restrictions on the museum collection. Restrictions that you should mention include:

- requirements for consultation with culturally affiliated and traditionally associated peoples and other cultural and community groups for whom the collection has significance in accordance with NPS *Management Policies* (2001) 7.5.5 "Consultation" and 5.3.5.5 "Museum Collections," and DO #24: NPS Museum Collections Management (2000)

- limited public disclosure of sensitive information concerning the following NPS resources in compliance with the National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.), the Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm), the National Parks Omnibus Management Act of 1998 (16 USC 5937) and NPS *Management Policies* (2001) 4.1.2. "Natural Resource Information" and 5.2.3 "Confidentiality":

  - rare, threatened, or endangered species
  - commercially valuable resources
  - minerals
  - paleontological resources
  - archeological resources

- objects of cultural patrimony and sensitive ethnographic information

- intellectual property rights limitations on publication of archival and manuscript materials, works of art, and other objects (see *MH-III*, Chapter 2: Legal Issues)

- restrictions on the disposition of type specimens

- limited conditions under which endangered, threatened, or rare animals and plants may be collected in accordance with 36 CFR 2.5

- restrictions to ensure an object's preservation

- limited access to certain objects for security purposes

- any limiting conditions placed on objects when they were acquired

2. ***What is some suggested wording for the Restrictions section?***

Suggested wording for this section is as follows:

In accordance with NPS Management Policies (2001) 7.5.5. "Consultation" and 5.3.5.5 "Museum Collections," and DO #24: NPS Museum Collections Management, curatorial staff should consult with traditionally associated peoples and other cultural and community groups for whom the collection has significance. Archeological objects in the museum collection shall be made available to persons for use in religious rituals or spiritual activities in accordance with 36 CFR 79, Section 79.10(c), "Curation of Federally-owned and Administered Archeological Collections." Requests to borrow non-archeological material for religious ritual or spiritual activities will be addressed on a case-by-case basis.

The park will not approve research on human remains and associated funerary objects without the consent of the affected group(s).

In accordance with the National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.), the Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm), the National Parks Omnibus Management Act of 1998 (16 USC 5937), and NPS Management Policies (2001) 4.1.2. "Natural Resource Information" and 5.2.3 "Confidentiality," the park may withhold from the public sensitive information concerning: rare, threatened, or endangered species; commercially valuable resources; minerals; paleontological resources; archeological and other cultural resources; objects of cultural patrimony and sensitive ethnographic information; information provided by individuals who wish the information to remain confidential; the identities of individuals who wish to remain anonymous. Inquiries of this nature will be referred to the regional Freedom of Information Act (FOIA) and Privacy Act Officer for consultation and possible review.

Restrictions may be placed on the publication of images or manuscripts in the museum collection if these materials are subject to copyright, and the National Park Service does not hold the copyright.

All endangered, threatened, or rare plants and vertebrate and invertebrate animals will be collected only when accidentally killed or when dead from natural causes. The collection of threatened, endangered, or rare plant and animal species will comply with NPS Management Policies (2001), be in accordance with the provisions of the Endangered Species Act of 1973, as amended, and will be strictly limited according to the applicable rules of the U.S. Fish and Wildlife Service.

Final disposition of type specimens will be determined at the Servicewide level and will adhere to recognized conventions established for specific disciplines.

Refer to the Restrictions section of the sample Scope of Collection Statement in Appendix E for additional help when drafting this section of your SOCS.

J. Writing the Management Actions Section

1. *How do I prepare the Management Actions section?*

When you prepare the Management Actions section, you should:

- State that the park must review the Scope of Collection Statement at least every five years and revise it when necessary, to remain supportive of and consistent with the park's mission.
- Note that appropriate park staff (such as archeologists, interpreters, scientists, naturalists, and other resource management staff) and your regional/SO curator should review any revisions to the Scope of Collection Statement. The superintendent must approve any revision to the SOCS.
- Identify the need for a Collection Management Plan (CMP), if appropriate. Document this need in the park's Resource Management Plan. If this plan has already been prepared, state that fact and give the completion date. See Chapter 3 for information concerning a CMP.
- Identify any park collections that are stored in a repository outside of the park's boundaries (such as a NPS archeological or preservation center, another park, or a non-NPS repository). If this situation exists, list the name of the repository and its location.

2. *What is some suggested wording for the Management Actions section?*

Suggested wording for this section is as follows:

This Scope of Collection Statement must be reviewed every five years, and when necessary, must be revised to remain supportive of and consistent with any changes in the park's mission. Any revision to this document requires the approval of the superintendent.

The park has an approved Collection Management Plan. The plan was approved on **[note date]**.

A number of objects from the collection are housed at repositories

outside of the park **[note item type, quantity, institution name, and location]**.

Refer to the Management Actions section of the sample Scope of Collection Statement in Appendix E for additional help when drafting this section of your SOCS.

K. Implementing the Scope of Collection Statement

1. ***Does my park need to develop an acquisition strategy?***

Yes. You should develop an acquisition strategy to fully implement your park's approved Scope of Collection Statement. An acquisition strategy will help you to:

- understand the disciplines and object types represented in the existing collection
- discover gaps in the collection
- identify excess objects not relevant to the scope of your park's collection
- limit acquisitions to only those items identified as mission-related or those deemed necessary to fill pre-determined gaps in the collection

2. ***Is there a standard format for an acquisition strategy?***

No, there is no standard format. However, you should consider the following steps in developing an acquisition strategy:

- Assess the types of objects in the museum collection. Include objects, specimens, and archival and manuscript collections on loan to other institutions.
- Identify gaps by comparing the classes of objects identified in the assessment with the types of objects identified in the Scope of Collection Statement.
- Compare objects in the existing collection with object needs identified in an Exhibit Plan or a Historic Furnishings Report. These plans help you to identify objects that are required for the park's interpretive program.
- Develop a prioritized list of items needed for your park's museum collection. One method is to list specific types of collections needed under the disciplines identified in the Scope of Collection Statement. Use the following criteria in prioritizing needs:
    - Acquire objects to replace those borrowed from other parks or institutions.
    - Acquire only those objects that have a strong relationship to the mission of the park and the purpose of the collection as stated in the Scope of Collection Statement. This includes priorities established by an Exhibit Plan or a Historic Furnishings Report.

Note: In order to preserve your collection's original site-specific objects, you should mention a strategy to acquire "duplicates" (similar objects without site association) or reproductions. You can periodically rotate the "originals" and "duplicates" or reproductions between storage and exhibit to address preservation and security concerns.

- Focus on objects associated with events and activities that took place inside your park's boundaries.

- Study the park museum files to determine if there are any known sources available to fill identified gaps in the collection. Keep records of potential sources of objects and their locations for future acquisition by the park.

Visitors may express interest in donating or selling museum objects to your park (or they may know of items of interest). See Figure 2.2 for an example Potential Museum Acquisitions sheet that staff can use to record this information. Contact your regional/SO curator to obtain an electronic copy. You also may develop your own park-specific format for recording this information. Provide copies to staff at all visitor contact locations and be sure to train all staff in the purpose, proper use, and disposition of this information sheet.

3. ***What other factors should we consider when developing our park's acquisition strategy?***

Take into account the following issues as well:

Mandated Collections. Include archeological and certain natural history collections in your acquisition strategy. These collections are generated in response to a park's cultural or scientific resource management requirements and research projects authorized under the Archaeological Resources Protection Act of 1979 (ARPA), 43 CFR 7.13, 36 CFR 2, and the NPS Research Permit and Reporting System. You may not be able to predict the size and scope of these collections, so be sure to work closely with park/center/regional archeologists and scientists to stay informed of the needs, including potential growth, of these collections.

Ability to Manage. Consider any deficiencies (such as the lack of a proper storage facility or inadequate staffing levels) that limit your park's capability to properly manage additional collections.

4. ***What criteria should my park use to acquire collections?***

If the acquisition of an object or objects is justified by your park's Scope of Collection Statement, you and your superintendent may reserve the right to accept or reject objects on the basis of the following criteria:

- **Site-Specific Objects.** Give first priority to acquiring objects original to a park, as determined by the Scope of Collection Statement, over non-site-specific objects.

- **Objects that are not Site-Specific**

- Consider objects related to the themes or periods of a park, but not original to the site, as your next priority.

- Make decisions concerning the acquisition of non-site-specific objects based on their significance to the park's interpretive and resource management programs. You should also consider such factors as authenticity and their potential for use as comparative collections.

- Reproductions are considered non-site-specific objects.

- **Physical Condition.** In some cases, damage that is the result of historic use or neglect may enhance the intrinsic value of an object (such as the clock from the USS *Arizona* that was damaged in the December 7, 1941 attack on Pearl Harbor). However, a park should consider carefully the acquisition of an object whose integrity has been significantly compromised by deterioration or abuse. In general, the following questions are helpful when evaluating an object:

  - Is the object intact?

  - Are all parts present?

  - Is there evidence of deliberate or accidental damage (such as paint spilled on the object)?

  - Does the object show signs of abuse or neglect (for example, an axe that was used for prying or hammering)?

  - Is the object made of materials that are inherently unstable (such as cellulose nitrate negatives)?

- **Rarity.** If an object is considered rare, it may be advisable for the park to accept a donation regardless of defacement, damage, incompleteness, or the quantity of a class of object already in the collection. **This criterion is particularly important when considering site-specific objects.**

- **Part of a Set**. Individual items that are part of a complete set or assemblage may not be individually important, but when taken together possess importance, and should be acquired as a set.

- **Availability.** Except for objects original to the park, you should take advantage of the availability of proposed donations to augment or replace like objects already in the collection that are in poorer condition or of lower quality.

- **Authenticity.** You need to determine that the object is authentic and that the owner acquired it legally. If you aren't sure about an item's authenticity, consult appropriate subject matter experts (historians, curators, archeologists, scientists, appraisers, and others) or staff at institutions with similar collections.

- **Collections Management Issues.** You must ensure that your park has the proper resources (funding, staffing, facilities, and equipment) to properly manage and preserve the object(s).

5. ***Where can I find additional information concerning acquisitions?***

Consult your regional/SO curator and refer to *MH-II*, Chapter 2: Accessioning, Section C: Acquisition Policies, for additional information.

6. ***What should I do if the collection includes museum objects that are not relevant to our park?***

Use your park's approved Scope of Collection Statement as the basis for determining what objects in the current collection may not be relevant to the park. Prepare a list of these objects for deaccessioning. See *MH-I*, Part II, Chapter 6, for guidance on deaccessioning museum objects.

Scope of Collection Summary

The museum collection includes both natural history and cultural collections. The natural history collection includes: mammal and bird collections; the park herbarium; paleontological collections from the Bear Valley Shale Formation; geological specimens from the Bear Valley Shale and Lewis Granite Formations. Other natural history collections within the museum collection include: fungi; reptiles and amphibians; fish; insects and arachnids. At present, these collections are relatively small, as little research pertaining to these disciplines has been conducted in the park to date.

The cultural collection includes: archeological materials systematically excavated from within the park's boundaries and associated field records (circa 1000 BCE – circa 1940); an ethnology collection of Paiute and Shoshone basketry, watercolors, beadwork, and textiles; historic objects associated with the area's 19th century miners, railroad workers, and homesteaders, and items related to the Civilian Conservation Corps and President Franklin D. Roosevelt's 1938 park vacation; archival and manuscript collections such as the Joseph Jakes papers, oral histories, photographs, and scientific and resource management records.

Chapter 3: Preservation: Getting Started

List of Figures

CHAPTER 3: PRESERVATION: GETTING STARTED

A. Overview

This chapter will introduce you to one of the main goals of the National Park Service museum program — to preserve museum objects, specimens and archival collections. These collections are natural and cultural resources for our parks. They provide baseline information and are resources for on-going study and use over time. For example, historic objects and archival collections document the lives and history of people and groups throughout the nation. Natural history specimens and their associated documentation record evolving park ecosystems and provide information that helps parks manage natural resources. Archeological collections and their associated documentation record archeological activity and preserve data (artifacts, reports, photographs, maps) for future analysis.

The NPS uses the term **object conservation** to describe the activities that preserve museum collections. The use of the term "object" distinguishes these activities from conservation of the environment. Object conservation activities include examination, documentation, treatment, and preventive care, supported by research and education. You can find definitions of these and other terms in the glossary at the end of this chapter. NPS policies for the treatment of museum objects, excerpted fromthe NPS *Management Policies,* are in Appendix A.

This chapter will give you information on:

- preventive care and treatment for museum collections
- NPS resources for preventive care
- how to plan for object conservation
- the role of a collection management plan (CMP) in conservation planning
- the role of a collection condition survey (CCS) in conservation planning
- balancing preservation of historic structures and museum objects

We use museum object conservation to preserve objects by minimizing chemical and physical change. In the NPS, object conservation is an ongoing process of **preventive care** supplemented by **conservation treatment.**

1. *What is preventive care?*

The role of preventive care (also known as preventive conservation) is to avoid, block, or minimize the **agents of deterioration**. By using preventive care techniques you can limit the imperceptible deterioration that occurs on a daily basis (but is cumulative over time) and the catastrophic damage that occurs occasionally. Only when preventive care techniques are not implemented or objects are inherently unstable, is conservation treatment necessary.

The agents of deterioration are forces that act upon objects causing chemical and physical damage. The Canadian Conservation Institute has defined the agents of deterioration as:

- **Direct physical forces**, such as shock, vibration, and abrasion that can break, distort, puncture, dent, and scratch all types of objects. These forces may be c*umulative,* such as improper handling or support or *catastrophic,* such as earthquake, war, or shelf collapse.

- **Thieves, vandals, or careless individuals** who misplace objects. Some of these agents are *intentional,* such as criminals who steal or disfigure objects. Others are *unintentional,* such as staff or users who misfile objects.

- **Fire** that destroys, scorches, or deposits smoke on all types of objects.

- **Water** that causes efflorescence in porous materials, swells organic materials, corrodes metals, delaminates and/or buckles layered components, and loosens joined components.

- **Pests,** such as *insects* that consume, perforate, cut, graze, tunnel and/or excrete which destroys, weakens, disfigures, or etches organic materials. Pests also include *vermin* such as birds and other animals that gnaw organic materials and displace small objects, foul objects with feces and urine and *mold and microbes* that weaken or stain objects.

- **Contaminants** that disintegrate, discolor, or corrode all types of objects, especially reactive and porous materials. This includes *gases* (such as pollution, oxygen*), liquids* (such as plasticizers, grease), and *solids* (such as dust, salt).

- **Radiation**, including both ultraviolet radiation and visible light. *Ultraviolet* radiation disintegrates, fades, darkens, and/or yellows the outer layer of organic materials and some colored inorganic materials. *Unnecessary visible light* fades or darkens the outer layer of paints and wood.

- **Incorrect temperature** that can be *too high* causing gradual disintegration or discoloration of organic materials; *too low* causing embrittlement, which results in fractures of paints and other polymers; or *fluctuating* causing fractures and delamination in brittle, solid materials. Fluctuations in temperature also cause fluctuations in RH.

- **Incorrect relative humidity** that can be *damp (over 65% RH),* causing mold and corrosion, or *above or below a critical value,* hydrating or dehydrating some minerals and corroding metals that contain salts. Organic materials will gradually disintegrate and discolor, especially materials that are chemically unstable at any RH level *above 0%*. *Fluctuating* RH will shrink and swell unconstrained organic materials, crush or fracture constrained organic materials, cause layered organic materials to delaminate and/or buckle, and loosen joints in organic components.

Most objects are affected by a variety of these agents of deterioration at the same time. As you improve preventive care of your collections, you will be addressing each of the agents of deterioration through a variety of policies and procedures. Later chapters will address how you do this.

The park curator has primary responsibility for preventive care of the museum collections**.** Preventive care requires vigilance by park curators to ensure that damage does not occur. This handbook contains the information you will need to protect your collection by developing a variety of park procedures and programs for preventive care. In order to carry out a proper preventive care program you should:

- know the causes and recognize the symptoms of object deterioration
- inspect collections on a regular basis
- monitor and control the museum environment (relative humidity, temperature, light, pests, dust, and other pollutants)
- practice proper techniques for the handling, storage, exhibit, packing, and shipping of objects
- provide appropriate security and fire protection for collections
- prepare and be able to implement emergency management plans for collections

This introductory chapter will describe how to identify your preventive conservation needs and develop a strong program with a Collection Management Plan (CMP). It will also tell you how to plan for object conservation treatment, using Collection Condition Surveys (CCS) when preventive care is not enough.

2. *What is conservation treatment?*

Conservation treatment is the deliberate alteration of the chemical and/or physical aspects of an item from a museum collection, in order to prolong the item's existence. Treatment may consist of stabilization and/or restoration. **Stabilization** consists of those treatment procedures applied to maintain the integrity of a museum object and to minimize further deterioration. For example, when a conservator washes paper, the washing removes acidic by-products of deterioration. This is a method of stabilization. **Restoration** consists of those treatment procedures intended to return cultural property to a known or assumed state, often through the addition of non-original material. For example, to restore a broken ceramic pot a conservator might glue broken pieces together and fill the losses with plaster.

You should consider conservation treatment in the following cases:

- when preventive care measures are not enough to reduce the rate of deterioration to a tolerable level, such as deteriorating plastic objects
- when deterioration has proceeded to a point where the object is extremely fragile and is in danger in any circumstances, such as when paint is flaking from a picture

- when stabilization or restoration is required for exhibit
- when stabilization or restoration is required for research

Work with your regional/support office (SO) curator to decide whether conservation treatment is required. In the National Park Service, following NPS Management Policies, we keep conservation treatment to a minimum. This approach reduces the chances of compromising the aesthetic, archeological, cultural, historical, physical, religious, or scientific integrity of objects. We emphasize preserving original materials and minimizing restoration.

Any person who performs conservation treatments for the NPS must agree to adhere to the American Institute for Conservation of Historic and Artistic Works (AIC) Code of Ethics and Guidelines for Practice. A copy of this Code of Ethics is included in Appendix D. You should include this requirement in all requests for proposals (RFQs) or contracts with conservators.

B. Planning for Object Conservation

1. *Who is responsible for museum object conservation?*

Preventive conservation is the responsibility of everyone who works in and around museum collections, including archivists, museum technicians, collection managers, conservators, curators, interpreters, maintenance personnel, preparators, and researchers.

The **collection management specialist (curator, archivist, collection manager)** is the person with primary responsibility for the day-to-day management of the museum collection. The duties of these professionals include:

- acquisition
- documentation
- preventive care (preventive conservation)
- interpretation and exhibits
- research and publication

A curator has expertise in material culture studies and is trained and skilled in the history and philosophy of museums, as well as the practical aspects of preventive conservation.

The **conservator** is trained and skilled in the theoretical and practical aspects of preventive conservation and conservation treatment. Most conservators specialize in the treatment of specific groups of objects (for example, archeological objects, books, ethnographic objects, natural science specimens, fine and decorative art objects, photographic materials, paintings, paper, sculpture, textiles, or wooden artifacts). There is some

overlap among these groups, so one conservator may work on a range of these materials.

The collection management specialist (such as a curator, archivist or collections manager) and the conservator work together and with other professionals to develop a successful conservation program. Conservators are responsible for recommending and carrying out conservation treatments. Untrained staff should **NOT** attempt to do treatments. However, the collection management specialist has the ultimate responsibility for deciding on the care and management of the collections.

The roles of the collection management specialist and the conservator in object conservation management are illustrated in Figure 3.1.

Scientific collections (such as natural science and archeological collections) recovered in the field are often prepared by the collector who has expertise in an academic discipline (paleontology, mammology, archeology). Many techniques are used to uncover, clean, sample, identify, stabilize, and preserve materials so they can be used for research and exhibit. For example, most reptiles and fish are prepared by stabilizing specimens in formaldehyde and storing them in alcohol in the field, so that decomposition does not occur. Archeological collections are usually washed and sometimes treated with other chemicals to remove deposits from burial so surfaces can be examined. Within the museum, individuals called preparators, often continue to work on collections— most notably with paleontological and biological collections. Many preparators also are directly responsible for collections care.

All preparation techniques used before accessioning an object, and later in the museum, directly affect the long-term preservation of the specimen or object. There are also many health and safety concerns that occur because of preparation techniques. The curator/collections manager and the conservator must work with others who prepare objects and specimens so that from the time they are collected, thoughtful choices are made that help to preserve them for the long-term. (See the *Conserve O Gram* series for information on many of these concerns.)

Preventive Care	
Curator/Archivist/Collections Manager	***Conservator***
• Monitors and assesses condition of collections • Monitors and evaluates museum environment and alerts staff to signs and causes of deterioration • Practices proper methods and techniques for storing, exhibiting, handling, packing and shipping of objects, and pest management • Develops and implements ongoing Integrated Pest Management (IPM), and housekeeping/maintenance program for collections • Prepares emergency operation plan for museum collections	• Assesses condition of objects; conducts Collection Condition Surveys • Alerts staff to signs and causes of deterioration • Provides technical guidance on museum environment, storage, exhibits, handling, packing and shipping, pest management • Assists in development of Integrated Pest Management (IPM) and housekeeping/maintenance programs • Assists in development and preparation of emergency operation plans
Conservation Treatment	
Curator/Archivist/Collections Manager	***Conservator***
• Documents history, significance, value, and proposed use of each object to be treated • Develops and monitors contracts for conservation services • Assesses, in consultation with conservator, the suitability of written treatment proposals and authorizes treatments • Monitors progress of treatment for each object • Ensures continuing care for treated objects	• Examines and documents conditions and problems of objects and collections • Prepares treatment proposals for curatorial review and approval • Performs suitable treatments • Documents treatments performed • Recommends methods for the future maintenance and care of treated objects • Performs analysis for research and interpretation

Figure 3.1. Different Roles of Curator/Archivist/Collection Manager and Conservator in Object Conservation Management in the Museum

2. *What are the NPS information resources for conservation?*

There are a number of information resources you can refer to when developing your knowledge of conservation and preventive care:

- NPS *Museum Handbook,* Part I *(MH-I)* has a wide variety of information on all the essential parts of your preventive conservation program. Review the chapters in this handbook for information on techniques for setting up your preventive maintenance programs, including security and fire protection, pest management, emergency planning, environmental monitoring, storage, and handling, packing and shipping. It also includes appendices with specific information on the preventive care of the variety of materials you will have to care for in your collection, such as archeological or natural history objects, metals, ceramics, and glass.

- *Conserve O Gram (COG)* leaflets are short technical leaflets on specific topics in collection care and planning, published by the Museum Management Program (MMP). These leaflets are intended to expand and update the information contained in the *MH-I*. These leaflets cover a wide range of subjects including:

  - agents of deterioration
  - archeological objects
  - archival and manuscript collections and rare books
  - ceramics, glass, and plaster objects
  - ethnographic objects
  - furniture and wooden objects
  - leather and skin objects
  - metal, and organic and metal objects
  - natural history specimens
  - museum collection preservation
  - museum collection storage
  - museum exhibits
  - paintings
  - packing and shipping museum objects
  - paper objects
  - photographs

- security, fire, and curatorial safety
- stone objects
- textile objects

The MMP provides all parks with copies of *COG* leaflets. They are also available on the web at: <http://www.cr.nps.gov/csd/publications/index.htm>.

- NPS *Tools of the Trade,* published by the MMP, is a catalog of curatorial supplies and equipment. It includes museum record keeping materials and forms, storage containers, specialty curatorial items (white cotton and latex gloves, polyethylene drawer liners), natural history supplies, museum cabinetry, shelving and racks, and environmental monitoring and control apparatus. *Tools of the Trade* can also give you instructions on how to obtain museum supplies and equipment, get answers to questions about storage techniques, meet special storage requirements, properly use materials and equipment, and find source information for purchasing supplies or equipment. The MMP updates this catalog periodically. Copies have been distributed to all regional offices, parks, and centers. If you don't have this publication, contact the MMP. Keep this catalog handy for reference.

- ANCS+ is the collection management documentation system provided to all parks for cataloging and other documentation purposes. This program contains associated modules and supplemental records that will allow you to incorporate information provided by a conservator. This information includes condition description, and treatment reports and maintenance recommendations. The conservation module (to be released in 2000) helps parks and conservators efficiently incorporate survey, treatment, and analysis information into object documentation.

- There are several conservation laboratories in the NPS that work on museum objects beyond individual parks. Conservators from these labs can assist with surveys, carry out treatments and give you other advice about conservation and conservation contracting. The current labs are at:
  - Harpers Ferry Center, Harpers Ferry, West Virginia
  - Northeast Cultural Resources Center, Lowell, Massachusetts
  - Western Archeological and Conservation Center, Tucson, Arizona

3. *What are some other sources for conservation information?*

There are a wide variety of resources for information on conservation outside the NPS. To start, review the resources listed in the bibliography and web sources.

The American Institute for Conservation of Historic and Artistic Works (AIC) administers the *Guide to Conservation Services*. This free database service can provide you with the names of conservators in your region who have the expertise you need for your project. For information contact AIC at (202) 452-9545 or InfoAIC@aol.com.

There are a number of regional conservation laboratories that can help you. To locate the closest regional lab contact the MMP at (202) 343-8142 or your regional/support office (SO) curator.

4. *What do I need to do to develop a preservation program for my park?*

There are a variety of actions to take in planning and carrying out your preservation program.

> **Remember:** ***Museum preservation is an ongoing process, not a one-time effort.***

When you have a well-planned program, you use staff time and funding more efficiently. Your program should include the following actions:

- Document the collection as required by the NPS *Museum Handbook*, Part II: Museum Records *(MH-II).*

- Conduct a self-evaluation to identify deficiencies using the NPS Checklist for Preservation and Protection of Museum Collections (see Appendix F). Use the Automated Checklist Program (ACP), one of the utilities in ANCS+, to fill out and submit your Checklist. You must keep the Checklist up-to-date. The Checklist is also used for Government Performance and Results Act (GPRA) reporting requirements. Use reports from the ACP to provide the "number of standards met" and the "percentage of standards met" to report accomplishments under GPRA. To get more information about the ACP, see the *ANCS+ User Manual*, Appendix G: The Automated Checklist Program.

- Implement a program of preventive care. Start your program by correcting deficiencies in the ACP and developing programming documents to implement recommendations in a Collection Management Plan (CMP) and other surveys. As you correct each deficiency, you will develop your preventive care program. The parts of a program will include:

  - monitoring and controlling the museum environment

  - using proper techniques for the handling, storage, exhibit, and packing and shipping of objects

  - providing security and fire protection

  - planning for emergency operations

  - inspecting objects on a regular basis

  - applying for conservation treatment when necessary

- Complete a Collection Management Plan (CMP) to assess your park's collection management program and to provide specific guidance on improving the care of the collections. Refer to Section C for additional information on the CMP.

- Complete a Collection Condition Survey (CCS) of the collection after examining the objects and assessing condition and treatment needs. Based on this report and available information regarding use and significance of each object, develop a prioritized object conservation treatment list. Refer to Section D for additional information on the CCS.

- If you have a historic structure housing museum objects, assess the condition and preservation needs of the structure. You need to ensure that the actions you take to preserve the museum objects don't harm the historic structure. You should follow the principles outlined in the New Orleans Charter for Joint Preservation of Historic Structures and Artifacts. You can find the Charter on the web at <http://palimpsest.stanford.edu/bytopic/ethics/neworlea.html>. See Section E for more discussion about preservation of collections in historic structures.

- Prepare budget documents to improve and maintain the object conservation program. You can find information on programming and budgeting in Chapter 12: Programming, Funding, and Staffing.

- Develop and implement training sessions or obtain external training for park staff who handle and work with museum objects.

The rest of this chapter will describe how to complete the Collection Management Plan (CMP) and Collection Condition Survey (CCS). Use the CMP and the CCS as planning documents to help you establish and implement a long-term, ongoing program for the preventive care and treatment of your collection. These documents will help you budget time, funds, and staff to address preservation needs. These plans, however, will only be useful if you are committed to implementing the recommended actions.

C. The Collection Management Plan

A Collection Management Plan (CMP) is a review of your park's collection management program to identify problems and make recommendations on the management and care of the collections. To prepare the plan, use consultants from outside the park that have expertise in a variety of areas. They can advise you on how to improve your program efficiently and effectively. A Collection Management Plan will give you advice on issues such as your:

Scope of Collection statement (SOCS)

- museum records and documentation

- preventive care issues, including environmental conditions, storage, fire and security protection, and emergency management

- collections accessibility and use

- staffing and funding needs
- archival and manuscript collections
- access and use

Refer to Appendix F for an example outline of a CMP.

1. *Why should my park have a CMP?*

A CMP gives you a set of guidelines and recommendations for improving the collection management at your park. You will use it as a prioritzed planning document, to plan tasks and to identify long-range curatorial staffing needs. By using the CMP you will be able to develop a series of projects that will allow you to:

- document your collections
- care for them in a way that will best preserve them
- make them available for use

A CMP is a framework that will help you organize the variety of tasks that you are responsible for as the park curator.

2. *What is the process for having a CMP done at my park?*

Follow these steps to get a CMP done.

Request the plan.
Include a project statement in the park Resource Management Plan (RMP) and in the NPS Project Management Information System (PMIS). You can consult the regional/SO curator for assistance in requesting a CMP. Prepare and submit a project statement to PMIS. Refer to Chapter 12 for guidance on programming and budgeting for museum collection management.

Select a planning team.
To ensure objectivity and diversity of views, select a team of NPS or contract museum professionals with expertise appropriate to the nature and needs of the park's collections. The team is generally made up of curators or collections managers and can also include archivists and conservators. The regional/SO curator often assists with the plan. The CMP team will visit your park and collect information from park staff, the regional/SO curator, and other regional specialists, as appropriate.

Prepare and review the plan.
Assign a team coordinator from outside the park. This coordinator will have a variety of duties including:

- coordinating selection of team members and planning the site visit
- coordinating pre-visit activities, such as preparing a pre-visit questionnaire for park staff and collecting previous planning documents
- coordinating on-site activity to ensure that the team collects adequate and appropriate information

- preparing a brief summary of findings for the close-out meeting
- as requested, writing a trip report for the region and park that outlines some of the basic findings and recommendations, including those that should be implemented prior to the completion of the CMP
- reviewing and editing the draft plan and forwarding it to the park for review and approval

The duties for each team member include:

- reviewing all relevant park documents
- participating in the site visit
- evaluating collections, facilities, park procedures and record keeping
- writing assigned CMP sections and submitting them to the team coordinator by the deadline
- revising sections as necessary based on comments

The team submits a review draft of the CMP to the park and region. They may also submit a draft to the MMP and other WASO offices as appropriate. A second draft is prepared incorporating comments. The Superintendent approves the plan upon recommendation by the regional/SO curator and concurrence of the Regional Deputy Director.

Distribute the final plan.
Distribute your CMP to all offices and repositories listed in Director's Order #28: Cultural Resources Management Guideline, Appendix D: Distribution/Availability of Final Cultural Resource Reports. There may be other offices that are also designated by your park or region for distribution.

Note: Sensitive information, such as security systems and the location of museum collection storage facilities, is restricted information and not released to all offices.

Implement the plan.
The plan will list a variety of tasks that will take time, and often money, to carry out. Use these tasks to develop a series of goals that you can strive to accomplish. You will finish some tasks quickly; others require long-term planning and effort. You should review the plan regularly to be sure you are completing necessary actions. It may be necessary to update the plan as your situation changes; for example, as you add new collections or build new facilities. You should consult with your regional/SO curator about options for updating your plan.

3. *What other kinds of surveys and plans will help me preserve collections?*

There are several other planning tools that you may find useful. Each of these surveys focuses on one aspect of **preventive care** and can give you more in-depth information. Some of these reviews are requirements on the Checklist for Preservation and Protection of Museum Collections. These documents include:

- security survey, which helps you plan for appropriate security systems (Checklist question H.2). See Chapter 9: Security and Fire Protection.

- fire protection survey, leading to a structural fire management plan (Checklist question H.3). See Chapter 9: Security and Fire Protection.

- storage survey, leading to a Collection Storage Plan (CSP) (Checklist question H.7). See Chapter 7: Museum Collections Storage.

- archival survey, to identify official and non-official records, provide a collection level description of materials, develop a draft processing plan, review legal issues, identify preventive care issues for the archival and manuscript collections, and provide planning advice for future work. See *MH-II,* Appendix D: Archives and Manuscript Collections.

- general condition surveys, to evaluate the overall condition of collections and make recommendations about how to improve preventive conservation practices. This survey may be part of a CMP or a stand-alone document.

- written recommendations by a professional, for improving the museum environment (temperature, relative humidity and light) based on ongoing park environmental monitoring (Checklist question H.1). See Chapter 4: Museum Collections Environment.

- The Collection Condition Survey (CCS) **identifies condition and treatment needs** and may include preventive care recommendations (Checklist question H.6.).

D. The Collection Condition Survey

A Collection Condition Survey (CCS) is a report on the status of the condition of individual or groups of like items in a park's museum collection. Conservators specialize in different types of materials, so you should select a conservator who has the right expertise for the segment of your collection to be surveyed. For example, you can request that a conservator do a survey of your historic photographs to determine treatment needs and record baseline data for future assessment of deterioration. You might ask another conservator to examine your visitor center to evaluate the objects on exhibit for signs of deterioration and to evaluate the mounts, lighting, case design, and construction. The survey report may also include recommendations about preventive care needs, such as storage techniques, environmental conditions, and pest control.

Over a period of time, you may need several different surveys by conservators who specialize in different types of materials. Your needs will depend on the size and type of your collections and your park programs and priorities.

You must use a qualified conservator to do a Collection Condition Survey.

If you are contracting with a conservator from outside the NPS, get recommendations and descriptions of previous work to be sure the individual is qualified.

1. *How do the CCS and the CMP overlap?*

You should request a CCS only after you have a CMP. Conservation treatment is not appropriate when collections are not documented and basic preventive care programs are not in place. The CMP and the CCS can both contain information on preventive care. Preventive care must be taken into account when carrying out all of your duties with the museum collections. Recommendations on preventive care included in a CMP usually focus on general conditions in exhibit and storage areas and curatorial specialists other than conservators may make these recommendations. The preventive care recommendations in a CCS will advise you how to stop the deterioration seen in the item-by-item survey.

2. *What are the steps involved in the survey process?*

Request the survey.
If you would like to request a CCS, consult the regional/SO curator for assistance. Refer to Chapter 12 for guidance on programming and budgeting. Be sure to include the need for a conservation survey in the park's RMP and in PMIS. See Section C.2.

Select the conservator(s).
A NPS or contract conservator or team of conservators will visit your park to make observations and collect information that goes into the CCS. The size of the team depends on the types of materials to be examined at one time. Conservators conducting a CCS must be specialists in the treatment of the specific class of objects they are examining (for example, furniture, textiles, metals, archeological objects, paper, books, paintings, ethnographic objects, or natural history specimens).

You should be sure that the conservator you select has appropriate knowledge and experience to evaluate your collection. Gather information to be sure you get a conservator with appropriate expertise.

Ask the following questions:

- What kind of training do you have? Conservators get training both through academic departments and internships. They should be willing to describe to you how their training is appropriate to your park's needs.
- How long have you been a conservator? You want to work with conservators who have finished their training and worked professionally for at least three years.
- Is your business mostly conservation?
- Have you worked on this type of material/done this kind of survey before?
- What museum conservation organizations do you belong to?
- Are you available when I need you?
- Can you give me references and contacts with previous clients?

- Do you agree to follow the AIC Code of Ethics and Guidelines for Practice?

You are looking for a knowledgeable, experienced conservator who has worked on the type of material that you have in your collection. If a conservator agrees to follow the AIC Code of Ethics and Guidelines they are agreeing to follow current and generally accepted standards and practices of the conservation profession.

See Figure 3.2 for an example Scope of Work (SOW).

Conduct the survey.
The conservator will need to work directly in your collection storage area in order to see both the objects and the conditions in which they are stored. Each conservator will conduct the survey a little differently, but some responsibilities you should expect include providing:

- a staff member to work with the conservator to:
  - access collection storage rooms, vaults, cabinets, shelves, and other locations where objects are stored
  - assist in moving heavy or unwieldy objects
  - answer questions about environmental monitoring, IPM programs, preventive maintenance, collection use, plans for future acquisition and deaccessioning and other information as necessary
- a suitable workplace near the objects
- catalog, accession, and previous conservation (treatment and survey) records when required
- access to ANCS+

  This would be required if the SOW requires information from the survey to be input directly into catalog records. ANCS+ is also a convenient way to provide access to catalog, accession, and conservation records that are available in the database.

Prepare and review the CCS report.
At the start of the project, agree when a draft report will be available for review. One month is usually a reasonable amount of time to produce a draft report. Review the draft carefully and request additional information and clarification where necessary. The conservator should be able to finalize the report within another month, after all NPS reviews are finished.

Distribute the report.
Distribute the CCS to the park and the regional/SO curator and to others designated by the park and region.

Implement the Collection Condition Survey report.
The CCS report documents the condition of the objects that the conservator examined, identifies treatment needs, and sets priorities for treatment based

solely on physical condition and risk. You must evaluate this information in terms of curatorial priorities, such as significance, interpretive programs, and research needs in deciding which objects to treat. Balancing preservation with access and use allows you to develop a program for conservation treatment.

Park curatorial staff should implement the preventive care recommendations in a CCS. You will need to hire a conservator to provide treatments.

Add CCS data on individual objects to collection records. Section D.5 discusses how you can incorporate this information into ANCS+ records. Adding this information to ANCS+ ensures that it will be maintained with other information about the object for the long-term.

3. *What format should the CCS have?*

CCS reports will vary in the information they provide. Because they may give general preventive care recommendations in addition to item-by-item condition assessments, the structure will reflect the information they contain. The CCS **must** include the following information:

- Introduction: The report should contain a narrative introduction that gives general information about the park visit (for example, park name, dates, name of conservator(s), and explanations of all technical terms).

- General recommendations: If appropriate, the report will include general recommendations and preventive care tasks.

- Item-by-item assessments: Individual object assessments may be either in narrative or checklist format. However, they must include information to complete the Condition field on the catalog record. See a description of this field below.

- The report should incorporate draft language that can be incorporated into Resources Management Plan (RMP) and/or Performance Management Information System (PMIS) statements. See Figure 3.3 for examples. For additional examples, see *Project Statements for Museum Collections* prepared by the Museum Services Division, Southeast Regional Office, January 1994. This document was supplied to all parks. It is also available on disk from most regional/SO curators.

The conservation module in ANCS+ (to be released in 2000) allows you to incorporate the information on condition and maintenance collected in conservation surveys directly into ANCS+ collection management records. Guidance on using the Conservation Module is provided in the *ANCS+ User Manual*. You can also incorporate information from CCS reports manually in ANCS+.

4. *What is the Condition Field in ANCS+?*

As part of the condition assessment of the CCS ask the conservator to supply you with the standard NPS abbreviation for the Condition field on the Collection Record for each item examined. Incorporating this information into your catalog records will help parks, centers, and the Museum Management Program make more accurate estimates of the condition of all park collections. It also allows you to track change in condition over time.

For objects, use one term from each of the two criteria groups below:

Group I		**Abbreviation**
Complete:	100% of object present	COM
Incomplete:	more than 50% and less than 100% of object present	INC
Fragment:	less than or equal to 50% of object present	FRG
Group II The following descriptions are for the object in hand regardless of whether it is complete, incomplete, or fragmentary. Note that an object can be incomplete, yet still be in excellent or good condition.		
		Abbreviation
Excellent:	No damage or deterioration. No treatment needed; no change will occur with good preventive conservation practices in place (for example, a pristine porcelain plate).	EX
Good:	Minor damage and no active deterioration. No change will occur with good preventive conservation practices. Minor cosmetic treatment may be needed before exhibit (for example, many historic objects that have been used.)	GD
Fair:	Some damage and/or slow but active deterioration. Treatment may be needed to stabilize or before object is displayed (for example, a decorative ceramic object with losses to the rim, or slowly rusting iron objects).	FR
Poor:	Significant damage and/or active deterioration. Treatment is needed to prevent additional damage or deterioration (for example, a table with one leg missing, making it structurally unstable or an archeological copper alloy object with "bronze disease").	PR

Entries are made using a slash between each term, such as INC/FR.

Examples:

- An unbroken drinking glass with no surface deterioration and no deposits would be COM/EX.
- A single archeological painted ceramic sherd that had been abraded during burial would be FRG/GD.
- A chest of drawers with lifting and lost veneer would be INC/FR.
- A leather saddle with red rot would be COM/PR.

5. *What other information can I add to the ANCS+ collection management program?*

The Conservation Module of ANCS+ (to be released in 2000) provides a way for parks to easily extract data from NPS and contract conservators' condition assessments and include that data in the collection management records. Instructions for using the Conservation Module are included in the *ANCS+ User Manual*. Until this module is released there is still some information that can be included in catalog records. You can request that conservators input this data (which may add cost to the contract), provide it in a format that can be transferred electronically, or input it into records yourself.

Condition description: Depending on the style of survey the conservator does you may be able to transfer condition description information to the Condition Description (Cons Desc) field on the catalog record. Some surveyors will use a narrative form that will be simple to cut and paste into the field. Other conservators will use a checklist form. If you want to be able to transfer information, be sure to incorporate it as a requirement in your SOW and contract. When the Conservation Module is released, this information can be incorporated automatically.

Preservation Supplemental Record: You can use the Preservation supplemental record in ANCS+ to record a treatment priority from the surveyor. For information see the NPS *ANCS+ User Manual*, Chapter 3: Supplemental Records, XIV Preservation Supplemental. You can record that the object was surveyed by using S for "Surveyed/Not Treated" in the Treatment By field. You can also record any treatment priority that the conservator supplies in the Priority field. When the Conservation Module is released, this information can be incorporated automatically.

Maintenance Associated Module: You can use this module to record regular maintenance that is recommended by the surveyor. This module will help you develop schedules for carrying out and documenting maintenance treatments. For example, if a conservator recommends monthly vacuuming of all upholstered furniture on display, you should record it here. For information see the NPS *ANCS+ User Manual*, Chapter 4: Associated Modules, VI Maintenance Associated Module. When the Conservation Module is released, this information can be incorporated automatically.

E. Preservation of Historic Structures Housing Park Collections

Your museum collections may be housed in a park structure that has great historic significance of its own. Historic structures have their own preservation needs. These needs may be different from the needs of the museum objects. For example, the environment that best preserves museum objects often differs from the best environment to preserve the fabric or envelope of the structure. While managing museum objects, you should keep in mind the nature and significance of the historic structure, too.

There are a number of examples to illustrate how using a historic structure to house museum objects may cause more wear on the structure than its original use:

- Installation of museum exhibits or storage areas may impose loads or require physical design changes to the structure in conflict with its original design and historic integrity.

- Controlling relative humidity levels to strict object standards may cause serious damage to the structure because of condensation within walls.

- Installation and operation of modern mechanical, electrical, plumbing, security, and fire detection and suppression systems may require changes that impact both the historic and structural integrity of the structure.

If you plan to alter a historic structure to improve the care of your collections, you should seek the assistance of other curators, conservators, historical architects, and preservation engineers. Consider the following factors simultaneously in your decision-making process:

- the nature, condition, and preservation needs of the museum collection

- the nature, condition, and preservation needs of the structure housing the museum collection

- the effects of the planned use (for example, interpretive programs) on the structure and the museum collections

The concerns for preserving artifacts and historic structures that house them have led to the development of a set of principles that have been published as the New Orleans Charter for Joint Preservation of Historic Structures and Artifacts. You can view the charter on the web at <http://palimpsest.stanford.edu/bytopic/ethics/neworlea.html>. Use these principles when developing your own preventive care projects for museum collections in historic structures in your park.

You must have a Historic Structure Report (HSR) completed prior to a major intervention (for example, environmental control system, intrusion detection system, fire detection/suppression system). Additionally, any

project, activity, or program that can result in changes in the character or use of historic properties that meet National Register criteria are subject to Section 106 review (36 CFR 800). Consult with your park or regional/SO office historical architect and refer to D.O. #28: Cultural Resource Management Guideline for guidance.

F. Glossary

Agents of deterioration – those agents that act upon museum artifacts to cause physical and/or chemical changes that limit their lifespan due to deterioration or damage. The agents are listed in Section A.1.

Archivist – a professional responsible for managing and providing access to archival and manuscript collections

Collections Manager – a professional responsible for managing and providing access to museum collections

Conservator (museum object) – a person trained in the theoretical and practical aspects of preventive conservation and in performing treatments to prolong the lives of museum objects. Most conservators specialize in specific classes of objects (for example, paintings, furniture, books, paper, textiles, metals, ceramics and glass, architecture, ethnographic objects, archeological objects, photographs). They formulate and implement conservation activities in accordance with an ethical code such as the AIC Code of Ethics and Guidelines for Practice.

Curator –in the NPS, a person professionally responsible for the management, preservation, and use of museum objects/specimens. Collection management responsibilities include acquisition and disposal, documentation and cataloging, preventive conservation, storage, access, interpretation and exhibition, and research and publication. Often the curator is a discipline or material culture specialist (for example, archeology, history, biology, fine arts, Civil War weapons). Curators on park staffs who work directly with collections are known as museum curators; curators in other offices generally are known as staff curators. In the absence of archivists, curators are normally responsible for historic documents.

Object Conservation – measures taken to prolong the life of a museum object and its associated data

Preservation – the act or process of applying measures to sustain the existing form, integrity, and material of an object by activities that minimize chemical and physical deterioration and damage and prevent loss of information; primary goal of preservation is to prolong the existence of cultural property

Preventive Care (or *Preventive Conservation*) – non-interventive actions taken to prevent damage to and minimize deterioration of a museum object. Such actions include monitoring, recording, and controlling environmental agents; inspecting and recording the condition of objects; establishing an integrated pest management program; practicing proper handling, storage, exhibit, housekeeping and packing and shipping techniques; and incorporating needed information and procedures about objects in emergency operation plans.

Reformatting – for preservation, producing a copy of an original item or copy in the same or a different format to preserve the information it contains. Making a copy negative or digital copy of an original photographic negative is an example of reformatting.

Restoration – interventive treatment action taken to bring an object as close as possible to its original or former appearance by removing accretions and later additions and/or by replacing missing elements

Stabilization – interventive treatment action taken to increase the stability or durability of an object when preventive conservation measures fail to decrease its rate of deterioration to an acceptable level or when it has deteriorated so far that its existence is jeopardized

Treatment – the deliberate alteration of the chemical and/or physical aspects of museum objects, aimed primarily at prolonging their existence; treatment may consist of stabilization and/or restoration

SCOPE OF WORK (Sample)

Collection Condition Survey

[Park Name]

I. Background Statement

[Provide information on the size and breadth of collections and why a Collection Condition Survey is needed.]

The park requesting a Collection Condition Survey of collections is:

[name - address - telephone number]

II. Purpose/Objectives

A. The purpose of the work is to 1) conduct an on-site Collection Condition Survey (CCS) at **[park]**; and 2) produce a report identifying the conservation and preservation needs of individual objects stored and exhibited at the park. The results of the survey will provide guidance to the park and Regional curatorial staff in setting priorities for object stabilization and/or treatment, and preservation management of the park collections. The survey will also facilitate budgeting, scheduling, and subsequent communications with conservators regarding treatment. Object-specific data from the survey will be entered into ANCS+, the park's automated collections management system.

The focus of the survey is upon conservation treatment needs, i.e., on determining and recording the conditions of individual objects or groups of objects in the collection which are in need of some form of professional conservation treatment or treatment by technicians with the input of a conservator. Secondary information will include recommendations for preventive care, and improvements to storage and exhibit conditions.

B. The Surveyor must comply with the *Code of Ethics and Guidelines for Practice* of the American Institute for Conservation of Historic and Artistic Works (AIC) in all work performed.

C. A time will be set for the site visit in conjunction with the park Superintendent and the Surveyor when it is convenient for both.

D. Prior to the visit the park will provide:

- a copy of the Scope of Collection Statement (SOCS),
- any previous surveys or reports that may assist the conservator in understanding the history of park collections including:
- Collection Management Plan
- Collection Storage Plan
- environmental monitoring records
- fire protection or security surveys
- Emergency Operation Plan (EOP)
- Structural Fire Plan
- significance criteria, if available, for all objects to be evaluated by the conservator. This information will be entered into ANCS+ before the survey takes place.

The conservator may provide the park with a pre-visit survey that will be completed before the visit.

Figure 3.2. Sample Scope of Work for Requesting a Collection Condition Survey

E. Except as may be additionally approved in advance by the Superintendent, the park staff will provide on-site:

- significance criteria, if available, for all objects to be evaluated by the conservator. This information will be entered into ANCS+ before the survey takes place.
- a suitable work space
- access to collection storage rooms, vaults, cabinets, shelves, and other locations of museum objects
- opening and closing of storage cabinets and vault or other containers that may be locked
- assistance with moving heavy or unwieldy objects
- access to museum property accountability (catalog and accession) and conservation (treatment and survey) records when required
- answers to questions about such matters as existing environmental monitoring and control, preventive care of objects, uses of objects, plans for future acquisition and disposition of objects, and the park's pest management program
- other information as reasonably may be needed

III. Tasks

A. The conservator will conduct an entrance interview upon arrival at the park with the Superintendent with designated park staff (curatorial, maintenance and other cultural resources staff). The purpose of the interview is to explain to the staff the Surveyor's methodology and anticipated schedule for the survey and to detail any local support that may be expected.

B. Conduct a hands-on survey of collections by examining each object individually, or, as appropriate, by examining representative samples of large groups of essentially identical objects. The following factors shall be considered in determining the condition of an object and conservation treatment needs:

- The nature of the environment in which collections are stored or exhibited including building construction, temperature, relative humidity, dust, natural and artificial light sources, pests, and other agents of deterioration.
- Storage methods, mounts, and techniques including appropriateness, quality, and efficiency of use.
- Evidence of recent damage or deterioration, including failure of preservation treatments, damage to objects during their use for interpretation and study, effects of visitor handling or vandalism, and deterioration due to adverse environmental factors.
- Any other general or specific issues concerning the collection's preservation, conservation, and/or treatment needs.

C. Upon completion of the survey, the conservator will meet with the park Superintendent and designated curatorial staff to go over the results of the survey. The close-out meeting should cover substantially the same subjects and recommendations the surveyor anticipates including in his/her report. At this time, the conservator will gather any data or information not already obtained that will be required for production of the survey report.

D. The conservator will prepare a written report of the survey just completed. The report shall include the following elements:

- Brief description of the schedule, sequence, procedures, and methodology used in conducting the survey in the park; identification of person(s) conducting the survey; identification of park staff who were involved in the survey and how they were involved; a brief summary of the entrance and exit interviews.

Figure 3.2. Sample Scope of Work for Requesting a Collection Condition Survey (continued)

- Condition information on individual items or groups of items in an electronic format.

  This information must be transferable to the Conservation Module in ANCS+. [Required and optional fields are described fully in the *ANCS+ User Manual*.] The contractor will provide these fields on disk using an Access template provided by the NPS or using the ANCS+ Conservation Module provided by the park. The park will transfer this information to the ANCS+ files.

E. When preventive maintenance treatment or simple treatments that can be carried out by park staff are identified, the treatment should be described briefly. When simple treatments are described, the materials to be used should also be recommended. All recommended materials should be those commonly used by conservators and selected for reversibility, stability, and ease of use. Materials should be described generically, though brand names also may be given for reference purposes.

F. Provide instructions for the park curatorial staff to follow when carrying out work that the Surveyor recommends they perform. In most instances, such instructions will have been previously prepared for another institution or will be copied from published works.

G. Provide estimate of time required for a professional conservator to carry out each recommended treatment. If possible, provide an estimate of what the treatment would cost if done by a conservator specializing in that work. The park can use this information to program funds to accomplish the work. When appropriate, note economies of cost or other benefits that might be realized by simultaneously treating similar objects, or objects with similar treatment needs.

IV DELIVERABLES AND PAYMENT SCHEDULE

A. Five copies of the draft survey report on 8 1/2" x 11" paper, single sided with each line numbered at the left side of the page shall be provided. A title page is required indicating the name of the park, the Surveyor's name, and completion date of the project. A table of contents may be necessary. Individual object information must also be provided in electronic format as described in the *ANCS+ User Manual.*

B. The Surveyor's report must be on 8 1/2" x 11" neutral pH, high alphacellulose, white paper such as Permalife Bond Paper from Howard Paper Mills or equivalent, single-sided, with page numbers in carbon-based, black laser printer ink. A title page is required indicating the name of the park, the Surveyor's name, and completion date of the project. A table of contents may be necessary. One hard copy and an electronic copy should be provided. The diskette should be labeled with the same title as the report plus the file name. Any revised individual object information must also be provided in electronic format as described in the *ANCS+ User Manual*.

C. Photographic documentation must be in black and white with both the negative and a 4" x 5" print supplied. All photographs must meet ANSI specifications (see information in Appendix R). Surveyor must sign a release form granting copyrights to all photographs to the park. (See NPS *Museum Handbook*, Part III, Figure 3.4, Assignment of Copyright by Contractor.) Surveyor may keep a copy of each image for private or educational use. Images kept by the contractor may not be used in for-profit publications, for commercial distribution, or for exhibitions by the surveyor or any other individual or institution without written permission from the Superintendent or Park Curator. The credit line shall include the following information: "Courtesy of the National Park Service," Park Name, Object Name, Object Date, Catalog Number.

D. A separate sheet of photographic captions will be prepared and the file will be on the diskette with the report. When applicable, the captions will link directly to an object's accession or catalog number. The number shall be written in carbon black ink or pencil on the non-emulsion side of the image on the border or non-image area in neat, easily readable print.

Figure 3.2. Sample Scope of Work for Requesting a Collection Condition Survey (continued)

E. Digital images shall be recorded for supplementary documentation of each object. A copy of each file, in uncompressed TIFF format, shall be provided to the park with sufficient information to allow transfer of the image into ANCS+. JPEG files or any form of lossy compression files will not be accepted.

F. Payment shall be made in two phases.

- Phase I involves the site visit and preparation of the DRAFT Collection Condition Survey. The first draft will be due 30 days following the site visit (or sooner if the Surveyor elects to do so). Upon receipt of the draft document and an invoice, 50% of the total sum will be delivered to the contractor. The park will provide government review comments within 30 days.
- Phase II includes delivery of the final document, which is due 30 days following receipt of the review comments. Phase II payment of the remaining 50% of the total sum will be delivered upon receipt and acceptance of the final documents and receipt of an invoice.

The final Collection Condition Survey shall be sent to:

[name - address - telephone number]

Figure 3.2. Sample Scope of Work for Requesting a Collection Condition Survey (continued)

Project Description:

The park has a collection of approximately 300 desiccated wood and fiber objects recovered from dry caves throughout the Southwest. These materials include basketry, sandals, textiles, cordage, and a number of small wooden artifacts. In 1998 a conservator carried out a Collection Condition Survey on this collection. Items were prioritized for treatment and a basic treatment methodology was recommended.

Needs include stabilization of loose fragments, basic cleaning, removal of deposits from burial and construction of specialized mounts. Conservation treatment will also identify fiber and wood types and construction methodology. These objects are primary sources for archeological research and conservation treatment is necessary so that the materials can safely be made available to researchers for study. Analysis carried out during treatment will add to the documentation available on these objects.

Chapter 4: Museum Collections Environment

List of Figures

CHAPTER 4: MUSEUM COLLECTIONS ENVIRONMENT

A. Overview

1. *What information will I find in this chapter?*

This chapter will give you information on how to protect your collection from deterioration caused by interaction with the surrounding environment. From the moment an object is created, it begins to deteriorate. The factors that can cause deterioration are called "agents of deterioration." See Chapter 3 for a more complete discussion of the agents of deterioration.

This chapter will address four agents that can be grouped under the term **environment**:

- temperature
- relative humidity
- light
- air pollution

Understanding how the environment affects your collection and how to monitor and control these agents of deterioration is the most important part of a preventive conservation program.

In order to understand how the agents of deterioration react with the objects in your collection, you must develop a "critical eye." This skill allows you to identify active deterioration and its causes. How you do this is described below.

2. *Who should read this chapter?*

You should read this chapter if you are responsible for the care of the museum collections. Use this chapter to develop an understanding of how objects deteriorate. This chapter will help you develop environmental monitoring programs so you can identify and block these agents of deterioration before they can damage your collections or so you can mitigate the damage that has been caused. Every park should have an environmental monitoring program.

3. *What are the agents of deterioration that affect the museum environment?*

The agents of deterioration are forces that act upon objects causing chemical and physical damage.

- **Contaminants** disintegrate, discolor or corrode all types of objects, especially reactive and porous materials. Contaminants include:
  - *gases* (pollutants such as hydrogen sulfide, nitrogen dioxide, sulfur dioxide and ozone; oxygen)
  - *liquids* (plasticizers that ooze from adhesives, grease from human hands)
  - *solids* (dust that can abrade surfaces, salt that corrodes metals)

  - Air pollution can include all these types of contaminants.

- Radiation can be:

  - *ultraviolet* radiation that disintegrates, fades, darkens, and/or yellows the outer layer of organic materials and some colored inorganic materials

  - *unnecessary visible light* that fades or darkens the outer layer of paints and wood

- Incorrect temperature can be:

  - *too high* causing gradual disintegration or discoloration of organic materials

  - *too low* causing desiccation, which results in fractures of paints, adhesives, and other polymers

  - *fluctuating* causing fractures and delamination in brittle, solid materials

- Incorrect relative humidity can be:

  - *damp (over 65% RH)* causing mold and corrosion

  - *above or below a critical value* hydrating/dehydrating some minerals

  - *above 0%* supports hydrolysis that gradually disintegrates and discolors organic materials, especially materials that are chemically unstable

  - *fluctuating*, which shrinks and swells unconstrained organic materials, crushes or fractures constrained organic materials, causes layered organic materials to delaminate and/or buckle, loosens joints in organic components.

This chapter discusses protection from incorrect temperature, incorrect relative humidity, light (electromagnetic radiation), and pollutants. Other chapters cover the other agents of deterioration. Direct physical forces are discussed in Chapter 7: Handling, Packing and Shipping. Thieves, vandals, and fire are discussed in Chapter 9: Security and Fire Protection. Pests are described in Chapter 5: Biological Infestations. Water and many of the other agents are discussed in Chapter 10: Emergency Operation Plans.

There are a variety of ways you can protect your collections from the agents of deterioration. There are four steps to stop or minimize damage:

- **Avoid the agents of deterioration.** For example, choose a site for your collection storage that is away from the flood plain of a river or

stream. Build a storage facility that is properly insulated and does not have windows in collections areas.

- **Block the agents when you cannot avoid them.** This is probably the main way most museums protect their collections in historic buildings. For example, if your collection storage area has windows, cover them with plywood. Place UV filters on fluorescent lights to block damaging radiation. Fill cracks and gaps in a building structure to limit entry to pests.

- **Test the methods you use to block agents of deterioration by monitoring**. For example, set up an Integrated Pest Management (IPM) program to find out if you have pests. Monitor relative humidity and temperature to find out if your HVAC system is working properly.

- **Respond to information you gather with your monitoring programs.** Monitoring is a waste of time if you do not review, interpret, and use the information. This chapter will tell you how to monitor temperature and relative humidity, light, and air pollution and how to respond to the data that you collect.

Only if these first four approaches fail should you have to recover from deterioration. Recovery usually means treating an object. While a treated object may *look* the same, once damage has occurred, an object will never *be* the same. Your aim in caring for your collection should be to carry out preventive tasks so that treatment is not needed.

Many objects will come to your museum collections damaged and deteriorated from use and exposure. Because of their history, even in the best museum environment, some objects will need treatment. You should develop a treatment plan for immediate problems in the collection. Your primary goal, however, is to create a facility that will minimize damage and maintain the collection through preventive measures.

B. Developing the Critical Eye

1. *What is the "critical eye?"*

The "critical eye" is a way of looking at objects to evaluate their condition and identify reasons for changes in the condition. You develop this skill over a period of time through both training and experience. You must continually ask yourself the questions:

- What is occurring?

- Why is it occurring?

- What does it mean?

The critical eye is a trained eye.

Your trained eyes will focus on the materials and structure of the object and look for visual clues to the agents of deterioration in the environment. A person with a trained eye readily recognizes danger signs, records them and

associates them with the condition of the museum collections, and implements actions to slow down or stop deterioration. Examples of problems that you will see with a trained eye include:

- sunlight falling on a light sensitive surface
- condensation forming on cold surfaces
- water stains appearing on ceilings or walls
- insect residues and mouse droppings

You must learn about the following topics to develop your critical eye:

- types of materials that make up a museum collection
- inherent characteristics of objects
- types of deterioration

The success of a preventive conservation program relies on the gathering, recording, and evaluating of all this information in order to implement solutions and to mitigate environmental factors that are harmful to a park's museum collection.

2. *What kinds of materials will I find in a museum collection?*

Museum objects are often divided into three material-type categories: organic, inorganic, and composite. You must understand the properties of each of the materials in each of these categories.

Organic Objects: Organic objects are derived from things that were once living — plants or animals. Materials are processed in a multitude of ways to produce the objects that come into your collections. Various material types include wood, paper, textiles, leather and skins, horn, bone and ivory, grasses and bark, lacquers and waxes, plastics, some pigments, shell, and biological natural history specimens.

All organic materials share some common characteristics. They:

- contain the element carbon
- are combustible
- are made of complicated molecular structures that are susceptible to deterioration from extremes and changes in relative humidity and temperature
- absorb water from and emit water to the surrounding air in an ongoing attempt to reach an equilibrium (hygroscopic)
- are sensitive to light
- are a source of food for mold, insects, and vermin

Inorganic Objects: Inorganic objects have a geological origin. Just like organic objects, the materials are processed in a variety of ways to produce objects found in your collections. Material types include: metals, ceramics, glass, stone, minerals, and some pigments.

All inorganic objects share some common characteristics. They:

- have undergone extreme pressure or heat
- are usually not combustible at normal temperature
- can react with the environment to change their chemical structure (for example, corrosion or dissolution of constituents)
- may be porous (ceramics and stone) and will absorb contaminants (for example, water, salts, pollution, and acids)
- are not sensitive to light, except for certain types of glass and pigments

Composite Objects: Composite or mixed media objects are made up of two or more materials. For example, a painting may be made of a wood frame and stretcher, a canvas support, a variety of pigments of organic and inorganic origin, and a coating over the paint. A book is composed of several materials such as paper, ink, leather, thread, and glue. Depending on their materials, composite objects may have characteristics of both organic and inorganic objects. The individual materials in the object will react with the environment in different ways. Also, different materials may react in opposition to each other, setting up physical stress and causing chemical interactions that cause deterioration.

3. *What is deterioration?*

Deterioration is any physical or chemical change in the condition of an object. Deterioration is inevitable. It is a natural process by which an object reaches a state of physical and chemical equilibrium with its immediate environment.

The types of deterioration can be divided into two broad categories: physical deterioration and chemical deterioration. Both types often occur simultaneously.

4. *What is chemical deterioration?*

Chemical deterioration is any change in an object that involves an alteration of its chemical composition. It is a change at the atomic and molecular level. Chemical change usually occurs because of reaction with another chemical substance (pollution, water, pest waste) or radiation (light and heat). Examples of chemical change include:

- oxidation of metals (rusting)
- corrosion of metals and stone caused by air pollution
- damage to pigments by air pollution or reaction with other pigments
- staining of paper documents by adjacent acidic materials

- fading of dyes and pigments
- darkening of resins
- darkening and embrittlement of pulp papers
- burning or scorching of material in a fire
- embrittlement of textile fibers
- bleaching of many organic materials
- cross-linking (development of additional chemical bonds) of plastics
- rotting of wood by growing fungus

5. *What is physical deterioration?*

Physical deterioration is a change in the physical structure of an object. It is any change in an object that does not involve a change in the chemical composition. Physical deterioration is often caused by variation in improper levels of temperature and relative humidity or interaction with some mechanical force. Examples of physical deterioration include:

- melting or softening of plastics, waxes, and resins caused by high temperature
- cracking or buckling of wood caused by fluctuations in relative humidity
- warping of organic materials caused by high relative humidity
- warping or checking of organic materials caused by low relative humidity
- shattering, cracking, or chipping caused by impact
- crushing or distortion caused by a harder material pressing against flexible material
- abrasion caused by a harder material rubbing against a softer material
- structural failure (for example, metal fatigue, tears in paper, rips in textiles)
- loss of organic material due to feeding by insects and/or their larvae
- staining of textiles and paper by mold

Physical deterioration and chemical deterioration are interrelated. For example, chemical changes in textiles caused by interaction with light also weaken the fabric so that physical damage such as rips and tears may occur.

6. *What is inherent vice?*

In addition to deterioration caused by the agents of deterioration, certain types of objects will deteriorate because of their internal characteristics. This mechanism of deterioration is often called ***inherent vice*** or ***inherent fault***. It occurs either because of the incompatibility of different materials or because of poor quality or unstable materials.

In nature, materials often possess characteristics that protect them from natural degradation. Their structure and composition may include features such as protective layers, insect and mold resistant chemicals, and photochemical protection. Processing during object manufacture can remove these natural safeguards. Additives may be applied to give a desired result, without concern for long-term preservation (for example, the addition of metal oxides in the manufacture of weighted silk). This processing results in inherently less stable materials or combinations of mutually incompatible substances that have damaging interaction. There are three kinds of inherent vice:

Short-lived materials: Short-lived materials are often the result of manufacturing processes that do not consider the long-term stability of the items that were produced. Many objects now in park museum collections originally were made to fulfill temporary needs. Examples of impermanent materials with inherent vice include:

- cellulose nitrate and cellulose ester film
- wood pulp paper
- many 20th century plastics
- magnetic media, including electronic records

Structural nature: Inherent vice can also be related to the structure of an object. Poor design, poor construction, or poor application of materials may cause structural failure. Examples of such damage include:

- drying cracks in paint improperly applied
- broken or lost attachments
- loose joints

History: The way an object was used or where it was stored or deposited before it comes into your collection may lead to inherent vice. Here, damage and deterioration is caused by the original function of the object, its maintenance, or its environment. Examples of inherent vice caused by history include:

- accumulation of dissimilar paint layers, such as oil and latex
- saturation in a wooden bowl that had been used as a container for oil
- deposits of soluble salts in an archeological ceramic during burial

You may have trouble identifying deterioration caused by inherent vice because often there is little or no information on the selection and processing of materials, manufacturing details, and previous use of an object. Train your critical eye by reviewing similar objects and by developing knowledge of object technology. Over time, you will become more proficient at identifying inherent vice.

7. *Why is it important to understand the environmental agents of deterioration and how to monitor them?*

If you understand basic information about the chemistry and physics of temperature, relative humidity, light, and pollution, you will be better able to interpret how they are affecting your museum collections. This chapter gives you a basic overview of these agents and describes how to monitor them. You will be able to tell how good or bad the conditions in your museum are and whether or not the decisions you make to improve the environment are working the way you expect.

The rest of this chapter gives you guidelines for deciding on the best environment that you can provide for your collections. However, because of the huge variation in materials found in collections and the extremes in geography where NPS collections are stored, no strict standards can be set. In the past, simplified standards such as 50% RH and 65°F were promoted. With research and experience, it is now understood that different materials require different environments. You must understand the needs of your collection for the long-term in order to make thoughtful decisions about proper care.

You will want to develop microenvironments for storage of particularly fragile objects. A microenvironment (microclimate) is a smaller area (box, cabinet, or separate room) where temperature and/or humidity are controlled to a different level than the general storage area. Common microenvironments include:

- freezer storage for cellulose nitrate film
- dry environments for archeological metals
- humidity-buffered exhibit cases for fragile organic materials
- temperature-controlled vaults for manuscript collections

C. Temperature

1. *What is temperature?*

Temperature is a measure of the motion of molecules in a material. Molecules are the basic building blocks of everything. When the temperature increases, molecules in an object move faster and spread out; the material then expands. When the temperature decreases, molecules slow down and come closer together; materials then contract. Temperature and temperature variations can directly affect the preservation of park collections in several ways.

2. *How does temperature affect museum collections?*

Temperature affects museum collections in a variety of ways.

- At higher temperatures, chemical reactions increase. For example, high temperature leads to the increased deterioration of cellulose nitrate

film. If this deterioration is not detected, it can lead to a fire. As a rule of thumb, most chemical reactions double in rate with each increase of 10°C (18°F).

- Biological activity also increases at warmer temperatures. Insects will eat more and breed faster, and mold will grow faster within certain temperature ranges.

- At high temperatures materials can soften. Wax may sag or collect dust more easily on soft surfaces, adhesives can fail, lacquers and magnetic tape may become sticky.

In exhibit, storage and research spaces, where comfort of people is a factor, the recommended temperature level is 18-20° C (64-68° F). Temperature should not exceed 24° C (75° F). Try to keep temperatures as level as possible.

In areas where comfort of people is not a concern, temperature can be kept at much lower levels—but above freezing.

Avoid abrupt changes in temperature. It is often quick variations that cause more problems than the specific level. Fluctuating temperatures can cause materials to expand and contract rapidly, setting up destructive stresses in the object. If objects are stored outside, repeated freezing and thawing can cause damage.

Temperature is also a primary factor in determining relative humidity levels. When temperature varies, RH will vary. This is discussed in more detail in the next section.

D. Relative Humidity

1. *What is relative humidity (RH)?*

Relative humidity is a relationship between the volume of air and the amount of water vapor it holds at a given temperature. Relative humidity is important because water plays a role in various chemical and physical forms of deterioration. There are many sources for excess water in a museum: exterior humidity levels, rain, nearby bodies of water, wet ground, broken gutters, leaking pipes, moisture in walls, human respiration and perspiration, wet mopping, flooding, and cycles of condensation and evaporation.

All organic materials and some inorganic materials absorb and give off water depending on the relative humidity of the surrounding air. Metal objects will corrode faster at higher relative humidity. Pests are more active at higher relative humidities.

We use relative humidity to describe how saturated the air is with water vapor. "50% RH" means that the air being measured has 50% of the total amount of water vapor it could hold at a specific temperature. **It is important to understand that the temperature of the air determines how much moisture the air can hold.** Warmer air can hold more water vapor. This is because an increase in the temperature causes the air molecules to move faster and spread out, creating space for more water

molecules. For example, warm air at 25°C (77°F) can hold a maximum of about 24 grams/cubic meter (g/m^3), whereas cooler air at 10°C (50°F) can hold only about 9 g/m^3.

Relative humidity is directly related to temperature. In a closed volume of air (such as a storage cabinet or exhibit case) where the amount of moisture is constant, a rise in temperature results in a decrease in relative humidity and a drop in temperature results in an increase in relative humidity. For example, turning up the heat when you come into work in the morning will decrease the RH; turning it down at night will increase the RH.

Relative humidity is* inversely *related to temperature. In a closed system, when the temperature goes up, the RH goes down; when temperature goes down, the RH goes up.

2. *What is the psychrometric chart?*

The relationships between relative humidity, temperature, and other factors such as absolute humidity and dew point can be graphically displayed on a **psychrometric chart**. Refer to Figure 4.1 for an explanation of how to use this chart. The following definitions will help you understand the factors displayed on the chart and how they affect the environment in your museum.

- **Absolute humidity** (AH) is the quantity of moisture present in a given volume of air. It is not temperature dependent. It can be expressed as grams of water per cubic meter of air (g/m^3). A cubic meter of air in a storage case might hold 10 g of water. The AH would be 10 g/m^3.

- **Dew point** (or saturation temperature) is the temperature at which the water vapor present saturates the air. If the temperature is lowered the water will begin to condense forming dew. In a building, the water vapor may condense on colder surfaces in a room, for example, walls or window panes. If a shipping crate is allowed to stand outside on a hot day, the air inside the box will heat up, and water will and condense on the cooler objects.

- **Relative humidity** relates the moisture content of the air you are measuring (AH) to the amount of water vapor the air could hold at saturation at a certain temperature. Relative humidity is expressed as a percentage at a certain temperature. This can be expressed as the equation:

$$RH = \frac{\text{Absolute Humidity of Sampled Air} \times 100}{\text{Absolute Humidity of Saturated Air at Same Temperature}}$$

Use the following example to understand how this concept relates to your museum environment.

In many buildings it is common to turn the temperature down in the evenings when people are not present. If you do this in your storage space, you will be causing daily swings in the RH. Suppose you keep the air at 20°C (68°F) while people are working in the building. A cubic meter of air in a closed space at 20°C (68°F) can hold a maximum of 17 grams of water

vapor. If there are only 8.5 grams of water in this air, you can calculate the relative humidity.

The AH of the air = 8.5 grams
The AH of saturated air at 20°C = 17.0 grams
Using the equation above

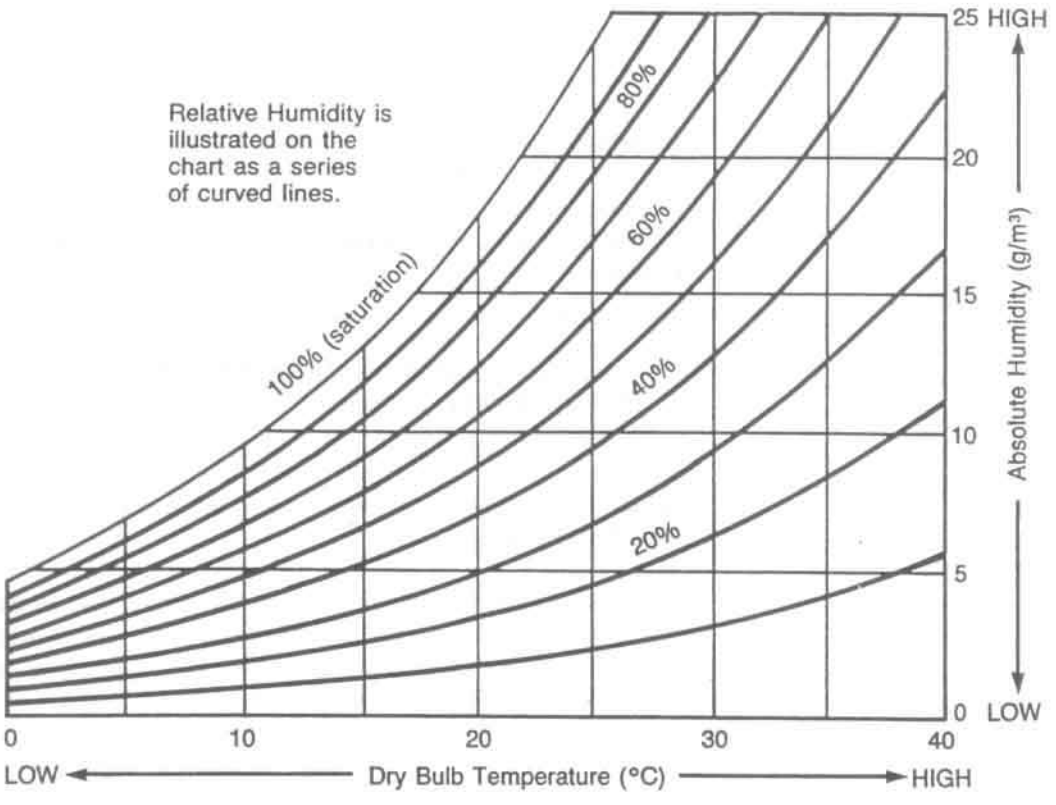
$$RH = \frac{8.5 \times 100\%}{17.0} = 50\%$$

50% RH may be a reasonable RH for your storage areas. But, if you turn down the heat when you leave the building at night, the RH of the air in the building will rise rapidly. You can figure out how much by using the same equation. If the temperature is decreased to 15°C (59°F), the same cubic meter of air can hold only about 13 grams of water vapor. Using the same equation

The AH of the air = 8.5 grams
The AH of saturated air at 15°C (59°F) = 13.0 grams

$$RH = \frac{8.5 \times 100\%}{13.0} = 65\%$$

By turning down the heat each night and turning it up in the morning you will cause a 15% daily rise and fall in RH.



Follow any horizontal line (representing a specific amount of moisture in the air) from left to right on the chart (i.e., from lower to higher temperature levels). Note that RH decreases as temperature increases, so long as the quantity of moisture in the air does not change.

Again, follow any horizontal line, but this time from right to left (i.e., from higher to lower temperatures). Note that RH levels increase, although the amount of moisture in the air remains constant. Finally, 100% RH is reached at the left edge of the chart, when the temperature drops to the dew point. The air is now saturated and will have to give up water (e.g., as condensation) at any lower temperature.

Note that moving from left to right on the chart along the upward curving RH lines corresponds to increasing amounts of moisture in the air. This shows that maintaining a constant level of relative humidity, as the temperature rises, requires adding moisture to the air. Conversely, if the temperature falls, the downward sloping RH lines indicate that water has to be removed from the air to maintain RH at a constant level.

Turning down the heat to increase the RH may be beneficial to a museum collection if the RH is too low. On the other hand, turning down the heat in relatively damp conditions may increase the RH to the level where mold grows, or even to the dew point where condensation may harm vulnerable surfaces.

Figure 4.1. How to Use a Psychrometric Chart

3. *How do organic objects react with relative humidity?*

Organic materials are ***hygroscopic***. Hygroscopic materials absorb and release moisture to the air. The RH of the surrounding air determines the amount of water in organic materials. When RH increases they absorb more water; when it decreases they release moisture to reach an equilibrium with the surrounding environment. The amount of moisture in a material at a certain RH is called the ***Equilibrium Moisture Content*** (EMC). Refer to Appendix N: Curatorial Care of Wooden Objects, for a further explanation of this concept. Over time, these reactions with water can cause deterioration.

4. *What deterioration is caused by relative humidity?*

Deterioration can occur when RH is too high, variable, or too low.

- **Too high:** When relative humidity is high, chemical reactions may increase, just as when temperature is elevated. Many chemical reactions require water; if there is lots of it available, then chemical deterioration can proceed more quickly. Examples include metal corrosion or fading of dyes. High RH levels cause swelling and warping of wood and ivory. High RH can make adhesives or sizing softer or sticky. Paper may cockle, or buckle; stretched canvas paintings may become too slack. High humidity also supports biological activity. Mold growth is more likely as RH rises above 65%. Insect activity may increase.

- **Too low:** Very low RH levels cause shrinkage, warping, and cracking of wood and ivory; shrinkage, stiffening, cracking, and flaking of photographic emulsions and leather; desiccation of paper and adhesives; and dessication of basketry fibers.

- **Variable:** Changes in the surrounding RH can affect the water content of objects, which can result in dimensional changes in hygroscopic materials. They swell or contract, constantly adjusting to the environment until the rate or magnitude of change is too great and deterioration occurs. Deterioration may occur in imperceptible increments, and therefore go unnoticed for a long time (for example, cracking paint layers). The damage may also occur suddenly (for example, cracking of wood). Materials particularly at high risk due to fluctuations are laminate and composite materials such as photographs, magnetic media, veneered furniture, paintings, and other similar objects.

5. *What are the recommendations for relative humidity control?*

You should **monitor** relative humidity and implement improvements to stabilize the environment. There are many ways to limit fluctuations, not all dependent on having an expensive mechanical system. For example, good control is achievable simply by using well-designed and well-constructed storage and exhibit cases.

Ideally, fluctuations should not exceed ±5% from a set point, each month. You should decide on a set point based on an evaluation of your particular regional environment. Consult your regional/SO curator, a conservator or other expert in museum environments. Establish maximum and minimum levels by assessing the nature and condition of the materials in the collection and the space where they are housed. Establishing ranges is discussed in more detail in Section B. For example, if you are in Ohio you may decide on a set point of 50%±5%. The humidity could go as high as

55% or as low as 45% within a month. If you are in the arid southwest you might choose 35% as your set point as objects have equilibrated at much lower RH levels. Be aware though, you should not allow your RH to go as high as 65% because of the chance that mold might develop. Below 30% some objects may become stiff and brittle.

Over the year you may want to allow ***drift.*** Drift means that your set point varies in different seasons—usually higher RH in the summer and lower RH in the winter. Allowing drift will often save you money over the long-term as mechanical systems work less to maintain the proper environment. If your collections are housed in a historic structure, preservation of the structure may require drift. It is important to understand that these variations in RH and temperature should be slow and gradual variations (over weeks and months), not brief and variable.

Archeological Materials	
Negligible Climate-Sensitive Materials	30% – 65%
Climate Sensitive Materials	30% - 55%
Significantly Climate Sensitive Materials	30% - 40%
Metals	<35%
Natural History Materials	
Biological specimens	40% - 60%
Bone and teeth	45% - 60%
Paleontological specimens	45% - 55%
Pyrite specimens	<30%
Paintings	40% - 65%
Paper	45% - 55%
Photographs/Film/Negatives	30% - 40%
Other organics (wood, leather, textiles, ivory)	45% - 60%
Metals	<35%
Ceramics, glass, stone	40% - 60%

Figure 4.2. Relative Humidity Optimum Ranges for Various Materials Housed in a Park's Museum Collection.[1]

E. Monitoring and Controlling Temperature and Relative Humidity

1. *Why should I monitor temperature and relative humidity?*

You must monitor temperature and relative humidity so that you know what the environment in your storage and exhibit spaces is like over time. Monitoring helps you:

- set a baseline of temperature and humidity to see if the storage space is adequate
- identify variations in the temperature and humidity throughout collections areas

- monitor equipment to be sure it is working right
- help develop strategies to improve the environment
- identify whether your strategies are working to improve the environment

2. *What kind of monitoring equipment should I have?*

There are a variety of temperature and relative humidity monitoring tools that are available for monitoring the environment in your museum. They can be divided into two types: spot measuring devices and continuous recording devices. Each type is most effective for different specific tasks so you may need to purchase more than one of the following pieces of equipment:

- **Psychrometers:** All parks should have a psychrometer. There are two types: **sling psychrometer** and **aspirating psychrometer.** Of the two, an aspirating psychrometer is more accurate. You use a psychrometer to record daily readings (if you don't have a hygrothermograph), to make spot readings, and to calibrate dial hygrometers and hygrothermographs. See *Conserve O Gram* 3/1, "Using a Psychrometer To Measure Relative Humidity."

  A psychrometer gives you the RH by comparing the temperature between a "dry bulb" and "wet bulb." The dry bulb is a mercury thermometer. The wet bulb is an identical thermometer covered with a wetted cotton wick. Because of the cooling effect of evaporating water, the wet bulb reads lower than the dry bulb. The drier the air, the faster the water evaporates and the lower the reading.

  To take readings with a sling psychrometer, whirl it around for one minute to pass air over the wet and dry bulbs. Read the wet bulb immediately and record the results. Repeat the process until you get the same readings two times in a row.

  The aspirating psychrometer uses a battery powered fan to steadily blow air over the bulb at a set speed. Both these instruments are accurate to ±5%. The aspirating psychrometer is more reliable because it minimizes possible errors by the operator and ensures a constant air flow past the wick. Accuracy will also depend on the length of the thermometer and how accurately you can read the temperature.

  Before you use a psychrometer, be sure to read the manufacturer's instructions. To ensure you get an accurate reading keep the following points in mind:

  – keep wick closely fitted to the thermometer bulb
  – do not touch the wick
  – keep the wick clean
  – use only deionized water to wet the wick
  – be sure that the aspirating psychrometer has a good battery

Accuracy of aspirating and sling psychrometers can be affected by altitude, especially at lower relative humidities. At lower atmospheric pressure water evaporates faster, lowering the temperature of the dry bulb more. If your collections are 900 meters or more above sea level, you should obtain pressure-corrected charts, tables, or slide rules or use a pressure correction formula. See the article by Hitchcock and Jacoby (listed in the bibliography) for more information about the effects of high altitude on psychrometers, and indirectly on the equipment that you calibrate using a psychrometer.

- **Hygrometers:** You can use a hygrometer to measure relative humidity levels when you don't have a hygrothermograph or datalogger or in spaces that are too small for psychrometers (for example, inside an exhibit or a storage case). When you use a hygrometer, also record the temperature. There are three types of hygrometers: dial hygrometers, electronic hygrometers, and humidity strips.

  In a **dial hygrometer,** a hygroscopic material (often paper) is attached to a hand on a dial. As the hygroscopic material absorbs or gives off moisture, it expands and contracts, causing the hand to move across the dial. Dial hygrometers can be accurate to $\pm$5%, but they are very inaccurate at low (<40%) and high (>80%) RH levels. Often they are hard to calibrate, so over time will drift and become inaccurate. See *Conserve O Gram* 3/2, "Calibration of Hygrometers and Hygrothermographs."

  Digital hygrometers often have a built-in temperature monitor. If you purchase one of these tools be sure it can be calibrated. They are often calibrated with saturated salt solutions provided in a kit by the manufacturer. Electronic hygrometers can be used to calibrate hygrothermographs if you are sure the hygrometer is in proper calibration.

  Humidity indicator strips are a special kind of hygrometer that use paper impregnated with cobalt salts. A series of patches are labeled with RH, usually in 10% increments. The color is blue at low RH levels and pink at high RH levels. Read the RH at the point of change between pink and blue. These strips are inexpensive and can give you some basic understanding of your RH levels at a variety of spots around your building. If used in a moist environment, they can become inaccurate.

- **Hygrothermographs:** Hygrothermographs have been the basic monitoring tool in museums for some time. They give you a continuous record of temperature and humidity variations over a period of 1, 7, 31, or 62 days. The instrument consists of six major components:

  – the housing

  – a temperature element, usually a bimetal strip

  – a relative humidity element, which may be a human hair bundle or a polymer membrane

- linkage arms and recording pens

- a drive mechanism, which may be spring wound or battery operated, that rotates a chart

- a chart, which may be wrapped around a cylindrical drum or be a circular disk

The temperature-sensitive element (the bimetal strip) and the hygroscopic material (for example, the human hair) are connected to arms with pens at their tips. The pens rest on a revolving chart and move up and down as the bimetal strip and the hair react to environmental changes.

Hygrothermographs are accurate within ±3-5% when properly calibrated. They are most accurate within the range of 30-60% RH. **Note:** You must calibrate your hygrothermograph at least quarterly; monthly is better. It is especially important to calibrate your machine if you experience sudden extremes of humidity in your collection areas. See *Conserve O Gram* 3/2, "Calibration of Hygrometers and Hygrothermographs."

- **Electronic datalogger:** Electronic dataloggers have become common in museums. There are a variety of types of dataloggers available at a range of prices. A model that records temperature, relative humidity, and light will meet typical museum needs. The data must be downloaded onto a computer. All datalogger companies provide at least basic software programs that allow you to manipulate the data to produce graphs and tables of information. Most allow you to transfer this information in ASCII format to a spreadsheet program. They require less calibration than hygrothermographs, though they must usually be sent back to the company for calibration.

  Many dataloggers do not display data so you will not have any indication of what is occurring in your environment until you download the data. Some now include a liquid crystal display unit. See *Conserve O Gram* 3/3, "Datalogger Applications in Monitoring the Museum Environment" for a discussion of your options when choosing a datalogger. See *Conserve O Gram* 14/6, "Caring for Color Photographs," for information about using the Preservation Environment Monitor (PEM). The PEM is a datalogger that automatically figures the time-weighted preservation index (TWPI). The TWPI is an estimate of how long organic objects will last at a given temperature and RH. See Section F.10 for a further explanation of the TWPI.

  Electronic dataloggers can be very useful instruments, but they are not exact replacements for hygrothermographs. Before purchasing all new equipment evaluate what information you need from your continuous monitoring equipment, consider these questions:

  - How much can you spend?

  - How many areas do you need to monitor?

- Do you need a portable monitor or will it remain in the same place all the time?

- Do you have the computer equipment and knowledge to properly use dataloggers?

- How much time do you have available for changing charts, downloading data, calibrating instruments, and manipulating data.

- How much data manipulation do you require? Can you just review charts or do you want do be able to look at and produce graphs that reflect daily, monthly, and yearly trends?

- Do you need immediate notification of the environment in an area so you can respond to changes?

- Information regarding some kinds of environmental equipment is published in the NPS *Tools of the Trade*. It is important to evaluate equipment available through a variety of other companies, as well. Electronic hygrometers and dataloggers are changing constantly and you should make yourself aware of new options before making your final choice.

3. *How do I maintain a hygrothermograph?*

In order to get the best information possible from your hygrothermograph, you must maintain and calibrate it on a regular basis. Make it a standard maintenance chore that you do at the same time each quarter, or preferably once a month when you change the recording paper.

Before using your instrument, read the manufacturer's instruction for operation and maintenance. Hygrothermographs are delicate instruments and you can easily damage yours by improper handling. See *Conserve O Gram* 3/2, "Calibration of Hygrometers and Hygrothermographs." Keep the following points in mind when changing the paper and calibrating:

- Keep the instrument clean and free of dust.

- Locate the instrument in an area that minimizes vibration, but reflects the environment throughout the room.

- Do not touch the relative humidity sensor.

- Replace the relative humidity sensor when you find you are frequently adjusting the RH calibration.

- Keep the pens clean and free flowing.

- If you have metal tipped pens, use only the glycerine based ink supplied with your instrument. Other types of ink will not work. You can also get felt-tip cartridge pens, which are are easier to use. However, these pens have a shorter shelf life. If properly maintained, the metal pen points with ink are more cost effective.

When you calibrate your hygrothermograph, you will check the instrument against known relative humidity and/or temperature levels and make adjustments as necessary. **Note:** Temperature rarely goes out of calibration because the bimetal element is very stable. Use either a sling psychrometer or an aspirating psychrometer to determine the relative humidity. See *Conserve O Gram* 3/1, "Using a Psychrometer to Measure Relative Humidity." Next adjust the hygrothermograph to match the known conditions. Use the example chart in Figure 4.3, Hygrothermograph Calibration Record, to document the calibration.

Do the calibration:

- Read and follow any suggestions made by the manufacturer concerning calibration of the instrument.

- Record the information requested on the chart: date, time of day, relative humidity reading from the hygrothermograph, and temperature reading from the hygrothermograph.

- Immediately after recording readings obtained from the hygrothermograph, operate the psychrometer **at the same location,** following the manufacturer's instructions. Record the relative humidity and dry bulb temperature readings on the psychrometer in the spaces provided on the record.

- Adjust the hygrothermograph to match the psychrometer readings. Follow the instructions for making adjustments provided by the instrument's manufacturer. If the average differences are found to be greater than 1% relative humidity or 1° in temperature, adjust the hygrothermograph up or down to match the calibrating instrument reading. For example, if the hygrothermograph is recording high by 5%, adjust the recording arm so that it shows the proper reading. If the hygrothermograph is recording temperature low by 4º, adjust the recording arm to the actual reading.

- If the hygrothermograph requires calibration, record the temperature and humidity difference in the appropriate spaces. For example, if the relative humidity reading on the hygrothermograph was 48% and the reading from the psychrometer was 45%, record the difference between them as "hygro high by 3% RH." **Always record differences in terms of whether the hygrothermograph reading is higher or lower than the psychrometer reading** because you are calibrating the hygrothermograph. If there is no difference between the two readings, simply enter "0 difference" in the space.

- Wait for 15 minutes and take another psychrometer reading. Check the reading on the hygrothermograph again. You may need to adjust the instrument because the linkages often require time to equalize.

- If significant differences still exist (over 5%) after a third check, refer to the instruction manual for the hygrothermograph to determine why the instrument might be malfunctioning. Relative humidity readings most often are erroneous because of a broken or dirty hair element. Temperature readings can be in error because of dust or other fouling of the bimetal strip. **Read and follow the manufacturer's**

instructions for cleaning, maintaining, and repairing the hygrothermograph.

After the calibration has been completed and the hygrothermograph has been adjusted properly, file the calibration record form with the charts from the hygrothermograph. It is important that the forms be kept so that they can be compared to future calibration records on the same instrument in order to determine if there is a pattern of incorrect readings. If it becomes apparent that a hygrothermograph has consistently given incorrect readings, return it to the manufacturer for repairs.

Figure 4.3. Example Hygrothermograph Calibration Record

4. *How do I read a hygrothermograph chart or datalogger graph?*

If you have spent any time inspecting hygrothermograph charts or datalogger graphs you may have observed readings that defy simple explanations. There are many variables that may account for unusual readings. Some of them include:

- the quality and condition of the building where your collection is housed (the "envelope")
- staff activity
- public visitation
- HVAC equipment performance and failure
- barometric pressure
- weather
- the condition and accuracy of the monitoring equipment
- an unusual source for moisture such as curing concrete, underground cisterns, clogged drains

It is impossible to explain all of the patterns you may encounter in a monitoring program. However, some common patterns and causes can be explained:

- Examine the hygrothermograph chart in Figure 4.4. This pattern clearly illustrates the relationship between temperature and relative humidity. As the temperature goes down, the RH goes up. As the temperature goes up, the RH goes down. You may see this pattern most often in well-enclosed spaces with minimal human activity (for example, a storage space). A large number of people gathering in a room would probably cause an increase in both temperature (because of body heat) and relative humidity (because of perspiration and transpiration).

- Examine the hygrothermograph chart in Figure 4.5. This pattern is characteristic of changes caused by regulated air-handling equipment. In this case, a thermostat is regulating a furnace. The temperature changes are so small (2°F) and rapid that the RH does not vary enough to show up clearly on the chart until a larger, longer swing occurs and is mirrored in the relative humdity.

  A similar sawtooth pattern could be seen in the RH if your building had humidification or dehumidification equipment controlled by a humidistat. Cycling is generally harmful to museum materials that respond quickly to environmental change. It is also very difficult to completely elimate cycling from most ordinary HVAC equipment.

- Examine the hygrothermograph chart in Figure 4.6. You may find that changes in activity on the weekends result in a different pattern on your hygrothermograph charts. In this instance, the furnace was turned

down or off. Note the resulting rise in RH over the course of the weekend. Note too, the high temperatures and the resulting low RH during the week. In this instance, lowering the thermostat setting and keeping the same setting throughout the week would be much better for the museum objects and would conserve energy.

You may need more than one hygrothermograph or datalogger for your monitoring program, especially in a historic structure located in a temperate zone where summers are hot and humid and winters are cold and very dry. You may need to place a hygrothermograph or datalogger in different spaces (for example, basement, first and second floors) to gather enough data to evaluate conditions properly.

5. *How do I use the hygrothermograph or datalogger data?*

Imagine that the record reveals that the conditions within the structure are too damp for most environmentally sensitive objects (for example, furniture and wooden objects, textile and paper objects). Probably the basement will have consistently high RH levels, the first floor will be somewhat drier, and the second floor might be drier than the first floor. If you do find that the building is too damp, there may be problems in your collections. You will need to look with a critical eye for evidence of mold and insect activity and/or damage and for sources of moisture in the structure's walls and basement. For example, rainwater runoff from the roof may be entering the basement through deep window wells and masonry cellar walls.

Once you identify the problem you must take action. While waiting for modifications to correct the runoff problem, you could put a dehumidifier and fans in the basement. Be sure to seek advice on correcting the problem from others who can help including: your regional/SO curator, conservators, historic architects, cultural resources specialists, and maintenance staff.

6. *How do I organize and summarize the data from my hygrothermograph charts or datalogger graphs?*

You must organize the data recorded by each hygrothermograph or datalogger to make it useful in developing strategies. Keep a record of daily observations, noting occurrences, such as, unusual exterior climatic conditions, a leaky roof, re-calibration of the equipment, or an unusual visitation pattern. At the end of each month when you remove the hygrothermograph chart or download datalogger data, compare this information to the daily record. It may help to record unusual occurrences directly on the chart or graph so that it is easy to see how the environment affected temperature and relative humidity.

Figure 4.7. Museum Environmental Monitoring Record

7. *How do I summarize long-term data?*

You can use a table or graph to summarize relative humidity and temperature data. One way is to prepare a table that records information collected over a period of time (for example, four to six weeks). You can put the following information in a table:

- high temperature
- low temperature
- maximum diurnal (24 hour) temperature change
- high relative humidity
- low relative humidity
- maximum diurnal relative humidity change

The following example shows this information recorded for two hygrothermographs in separate museum storage spaces in the park.

Monthly Summary of Temperature and Relative Humidity			
Chart Date	**Data**	**Storage #1**	**Storage #2**
5/18-6/15/99	high temperature	29°C (84°F)	28°C (83°F)
	low temperature	21°C (69°F)	19°C (66°F)
	max. 24 hr. temp. change	4°F	4°F
	high RH	54%	56%
	low RH	45%	46%
	max. 24 hr. RH change	4%	3%

You can also summarize the data using graphs. You can design your graphs in a variety of ways. For example:

- Record both temperature and relative humidity on the same graph.
- Record temperature for several different floors of a historic structure.
- Compare temperature or RH parameters set for a building against recorded data.

You can also summarize data by preparing room-by-room records for a year. Each week, for each room or space:

- Record high/low readings for temperature and relative humidity.
- Record fluctuation patterns of temperature and relative humidity by correlating with the time of day.
- Note maximum diurnal RH fluctations.

For example:

Furnished Historic Structure	
Room A	Temperature: 18°-22°C (64°-71°F)
5/18-5/24	Gradual rise in relative humidity through week; no rapid fluctuations
	Gradual daily fluctuations from 18°(64°F) to 22°C (71°F); low about midnight, high around 3 p.m.
	Relative Humidity: 22%-32% RH
	Maximum diurnal fluctuations: 10% RH

You should summarize data gathered from instruments and recorded on your monitoring record. This helps you evaluate long-term trends and watch for problems. Summary information helps you develop new environmental control measures.

You can summarize your data for each space by season in the same format as above. A summary gives you an idea of the variation that you have throughout the year.

Use the summary documents in a variety of ways:

- Identify problems with your environment.
- Build an argument about the need to get environmental upgrades or a new building.
- Evaluate whether or not changes you have made really do improve the environment.

8. *How do I control temperature and relative humidity?*

General considerations: When you control the climate surrounding museum objects, you provide a stable environment that eliminates rapid fluctuations and extremes in temperature and RH. When you develop a strategy to control the environment in your museum spaces, keep the following points in mind:

- NPS units are located in many different climate zones, so you must develop acceptable ranges and limits of relative humidity for your individual park. There is no general solution to controlling your relative humidity. Every situation presents different variables that you must evaluate before setting standards. Base your standards on:
  - the local climate (for example, tropical, temperate, arid)
  - the nature and condition of the materials in your collection
  - the nature and condition of the structure housing the collection

  - the ability of HVAC equipment to maintain the standard
  - the ability of staff to maintain equipment

- In order to develop an effective control program, you must have good information. Collect data for one year before establishing acceptable ranges and limits.

- Use a team approach in controlling relative humidity. Once you have gathered your data, discuss control strategies with your regional/SO curator, and others, such as conservators, historic architects, and mechanical engineers. Strategies for controlling levels of RH and temperature should keep energy costs in mind. Refer to Director's Order #28: *Cultural Resource Management Guideline* for guidance.

- You will need to develop both active and passive measures for controlling the environment. When adapting a historic structure explore the use of simple modifications to your structure or space and employ portable mechanical equipment (humidifier, dehumidifier, heater, and air conditioner) or passive storage controls.

- Once you have implemented strategies to improve the environment, continue monitoring to evaluate whether or not your strategies are working.

Maintain building envelope: With the help of your maintenance division examine the structure and/or museum space for possible sources of moisture. You must eliminate sources of moisture by repairing the structure or correcting drainage problems. Problems that may cause high levels of relative humidity include:

- leaking roof, ceiling, or windows
- gaps in walls, floors, or foundation vapor barrier
- leaking plumbing
- damaged gutters and downspouts
- wet walls and foundations from poor drainage
- open water sources such as sinks or toilets

Passive methods of control: There are a variety of practices that you can adopt to passively control the temperature and RH. Carefully develop a plan to use passive controls. After adopting the practice, continue to monitor to be sure that the action improves that environment the way you expect it to.

- Avoid turning HVAC equipment on during the day and off at night. This practice causes daily fluctations in RH levels.

- Limit the number of people in a room. Large groups of people can raise the relative humidity from moisture introduced by breathing and perspiring. You may have to open doors within a building to change the circulation of the air.

- Locate sensitive objects away from spotlights, windows, exterior walls, air vents, and entrance doorways. You can also limit increased temperatures caused by the sun by using existing blinds, curtains, drapes, or exterior shutters.

- In temperate zones, reduce temperature levels during the winter. Lowering the set point of the heating equipment by several degrees raises the interior relative humidity to stabilize conditions overall. **Note:** Gradually reduce the temperature over a period of weeks. In the spring, gradually raise the temperature back to the appropriate set point. See the next section for a more in-depth discussion of humidistatic control.

- Store objects in cases, boxes, and folders. Containers are a very effective method of buffering temperature and RH fluctuations. They also limit light damage and protect collections from pests.

- To control relative humidity levels for sensitive objects (for example, some metals, textiles, paper, pyritic mineral, and fossil specimens) you may need to create a microenvironment to stabilize and maintain conditions that are different from the general museum environment. The use of a properly sealed storage cabinet or exhibit case with buffering material (for example silica gel) can provide a proper microclimate for sensitive objects. Refer to *Conserve O Gram* 1/8, "Using Silica Gel in Microenvironments" for guidance on using silica gel. There are a variety of other materials that can be used to produce microenvironments for storage of particularly sensitive objects. Consult with a conservator to discuss various options for your particular problem.

- Many materials in a museum environment absorb water and give off water. This slows changes in RH and *buffers* the environment around the object. Damage can be limited by slowing down RH changes. Natural organic materials (wood, textiles, cotton, and paper) are especially good at buffering. You can use this property to help limit changes in an environment. For example, when packing objects for shipping, wrap them in layers of paper and use pads of paper to fill the box and limit RH changes.

Active methods of control. A properly designed heating, ventilation and air conditioning (HVAC) system can maintain appropriate levels of relative humidity and temperature and filter particulate gases from the air.[2] Installing an HVAC system that achieves and maintains the environment to the levels described in this chapter is not easy. In some cases, especially with historic buildings, this approach can be detrimental to the historic building. Before embarking on a program to install, upgrade, or design a new HVAC system, assemble a team of experts and plan a system that protects both the collections and the museum building. Choose team

members with expertise in historic collections care, preservation, mechanical, electrical, and structural engineering.

You must have good information from your ongoing monitoring program to help you identify the needs and problems of your current system. Working from this information, your team can design a practical system that will preserve both the collection and the building.

In some cases, you may choose to use portable humidifiers, dehumidifiers, heaters, and air conditioners. In the short-term this equipment can do a lot to improve the environment in a museum collection space. It is also less expensive than installing a new HVAC system. Refer to the NPS *Tools of the Trade* for sources of equipment.

- **Humidifiers** quickly add moisture to the air. Use a humidifier in the winter to counteract the drying effect of a central heating system. Use only an unheated evaporative humidifier. This type of humidifier does not disperse minerals in the air, and if the humidistat (a switch that turns off the equipment when a certain RH is reached) malfunctions, this type of humidifier will not raise the RH level above 65-70%. Be sure air is well circulated. You may have to use fans for circulation. You must select the size and number of humidifiers based on the size of the space, the air exchange rate, differences between the inside and outside of the building, and the number of people using the room. The *Humidification Handbook*[3] listed in the bibliography provides useful information about humidification.

- **Dehumidifiers** remove moisture from the air and lower the RH. Don't use this equipment as a permanent corrective measure – instead, find out why the air is so damp and work to remove the source of the water. There are two types of dehumidifiers:

  – Refrigerant dehumidifiers work on the same principle as a refrigerator. Cool air cannot hold as much moisture as warm air and it condenses within the machine. Use this type of dehumidifier in warm climates. You must drain dehumidifiers at least daily.

  – Desiccant dehumidifiers force air through a moisture-absorbing material (for example, lithium chloride) to reduce moisture. Hot air is blown over the desiccant to regenerate it. Desiccant dehumidifiers are useful in colder areas where refrigerant dehumidifiers may ice up and stop working.

The *Cargocaire Dehumidification Handbook* is a basic sourcebook for understanding dehumidification.[4]

9. *What are humidistatically controlled heating and ventilation systems?*

Humidistatic control is a way to control relative humidity in a building without using a HVAC system. The basic idea behind humidistatic control takes advantage of the inverse relationship between temperature and relative humidity.

Humidistatically controlled heating is based on the idea that if the absolute humidity of a given volume of air changes, it is possible to maintain a stable RH by manipulating and varying the temperature. A humidistat

sensor adjusts the temperature up and down to maintain a stable RH. If the RH rises above a set point, the heat is turned on until the RH drops back down. However, using this system, temperatures can drop very low, so this type of environmental control system is best used in areas that are infrequently accessed.

Humidistatically controlled ventilation is used in areas with high relative humidity. If interior RH is lower than exterior RH, dampers are opened by sensors and the air is circulated through the building. If exterior RH is too high, the dampers remain closed.

Both of these techniques may be cost effective ways of improving the environment in historic buildings that were not built to house museum collections. They are generally less intrusive to the building fabric, and maintenance and energy costs are lower than typical HVAC systems. If you are considering using humidistatic controls work with an engineer or architect who has experience with the technique.

10. *What is the time-weighted preservation index (TWPI)?*

The time-weighted preservation index is a mathematical model developed to estimate how long some organic materials will last at certain temperature and RH levels. Using the TWPI you can make educated decisions choosing a setpoint for RH and temperature in your collection.

The TWPI was developed specifically for paper-based collections and is more commonly used for archives and libraries. It may not be appropriate for mixed collections found in many NPS parks, though its use in various types of collections is being actively researched. However, you can use it to develop microenvironments, or separate storage rooms for your paper and photo collections. See the reference by James Reilly et al. (1995) for a complete discussion of the TWPI.

F. Light

Light is another agent of deterioration that can cause damage to museum objects. Light causes fading, darkening, yellowing, embrittlement, stiffening, and a host of other chemical and physical changes. This section gives an overview of the nature of light. It will help you understand and interpret monitoring data and the standards given for light levels in museum storage and exhibits.

Be aware of the types of objects that are particularly sensitive to light damage including: book covers, inks, feathers, furs, leather and skins, paper, photographs, textiles, watercolors, and wooden furniture.

1. *What is light?*

Light is a form of energy that stimulates our sense of vision. This energy has both electrical and magnetic properties, so it known as electromagnetic radiation. To help visualize this energy, imagine a stone dropped in a pond. The energy from that stone causes the water to flow out in waves. Light acts the same way. We can measure the "wavelength" (the length from the top of each wave to the next) to measure the energy of the light. The unit of measurement is the nanometer (1 nanometer (nm) equals 1 thousand millionth of a meter). We can divide the spectrum of electromagnetic radiation into parts based on the wavelength. The ultraviolet (UV) has very short wavelengths (300-400 nm) and high energy. We cannot perceive UV

light. The visible portion of the spectrum has longer wavelengths (400-760 nm) and our eyes can see this light. Infrared (IR) wavelengths start at about 760 nm. We perceive IR as heat.

The energy in light reacts with the molecules in objects causing physical and chemical changes. Because humans only need the visible portion of the spectrum to see, you can limit the amount of energy that contacts objects by excluding UV and IR radiation that reaches objects from light sources.

All types of lighting in museums (daylight, fluorescent lamps, incandescent (tungsten), and tungsten-halogen lamps) emit varying degrees of UV radiation. This radiation (which has the most energy) is the most damaging to museum objects. Equipment, materials, and techniques now exist to block all UV. No UV should be allowed in museum exhibit and storage spaces.

The strength of visible light is referred to as the *illumination level* or *illuminance*. You measure illuminance in *lux*, the amount of light flowing out from a source that reaches and falls on one square meter. We measure illuminance in museums because we are concerned with the light energy that falls on our objects, not how much light energy comes from the source. When you measure light levels (see Section H), hold your meter at the surface of the object to catch the light that is reaching that surface.

Illuminance was previously measured in *footcandles*. You may find older equipment or references that list footcandle levels. Ten footcandles equal about 1 lux.

When considering light levels in your museum you should keep in mind the "reciprocity law."

The reciprocity law states, "Low light levels for extended periods cause as much damage as high light levels for brief periods."

The rate of damage is directly proportional to the illumination level multiplied by the time of exposure. A 200-watt light bulb causes twice as much damage as a 100-watt bulb in the same amount of time. A dyed textile on exhibit for six months will fade about half as much as it would if left on exhibit for one year. So if you want to limit damage from light you have two options:

- reduce the amo unt of light
- reduce the exposure time

Note: Even small amounts of light will cause damage. Damage as a result of exposure to light is cumulative. It cannot be reversed. However, you can stop the continuation of damage by placing an object in dark storage. Cases, boxes, and folders are the first defense against light damage.

If lighting is too close to or focussed on an object, IR can raise the temperature. It may also lower the water content of porous materials. You can get heat buildup from:

- sunlight
- incandescent spotlights
- fluorescent ballasts
- lights in closed cases

Design exhibits so there is no heat buildup from IR generated by lights.

2. *What are the standards for visible light levels?*

You can protect your exhibits from damage caused by lighting by keeping the artificial light levels low. The human eye can adapt to a wide variety of lighting levels, so a low light level should pose no visibility problems. However, the eye requires time to adjust when moving from a bright area to a more dimly lighted space. This is particularly apparent when moving from daylight into a darker exhibit area. When developing exhibit spaces, gradually decrease lighting from the entrance so visitors' eyes have time to adjust. Do not display objects that are sensitive to light near windows or outside doors.

See the next section for ideas on how to control visible, UV, and IR light.

Basic standards[5] for exhibit light levels are:

- **50 lux maximum** for especially light-sensitive materials including:
  - dyed organic materials
  - textiles
  - watercolors
  - photographs and blueprints
  - tapestries
  - prints and drawings
  - manuscripts
  - leather
  - wallpapers
  - biological specimens
  - fur
  - feathers
- **200 lux maximum** for less light-sensitive objects including:
  - undyed organic materials

  - oil and tempera paintings
  - finished wooden surfaces

- **300 lux** for other materials that are not light-sensitive including:
  - metals
  - stone
  - ceramics
  - some glass

In general don't use levels above 300 lux in your exhibit space so that light level variation between exhibit spaces is not too great. With this method, people's eyes will not have to keep adapting to changing light levels, and they will be able to see objects exhibited at lower levels much more easily.

These standards should serve as a starting point for developing lighting standards for your collections. In order for collections to be seen and used in various ways (for example, long-term exhibit, short-term exhibit, research, teaching) you should take into account a variety of factors:

- light sensitivity of the object
- time of exposure
- light level
- type of use
- color and contrast of object

For example, if a researcher needs to examine fine detail in the weave of a textile, but will only be working on the object for one day you should allow more light (up to 1350 lux) than if the same textile were going on exhibit for two years.

Note: These light levels are a compromise between the need to see exhibits and the need to preserve the objects. All light exposure will cause damage to sensitive objects. There is no minimum level where damage will not occur.

See references in the bibliography for more information on light and designing appropriate lighting for your exhibit and storage areas.

G. Monitoring and Controlling Light

To be sure that light levels are at required levels and to be sure that any UV filtering material is still effective, you should measure light levels at least once a year. If you change lighting fixtures, take new measurements to be sure the changes are within recommended levels. If the source of light is daylight (for example, in a historic house museum) you should measure light in the morning and afternoon throughout the seasons.

1. *How do I monitor light levels?*

You monitor light levels using specialized equipment. This equipment is necessary because your eye is not a reliable guide as it easily adapts to changes in visible light and can't see UV or IR light. Use a visible light meter to measure visible light and a UV meter to measure ultraviolet light. Use a thermometer to measure heat buildup from IR. Several different meters are available for measuring visible and UV light. See NPS *Tools of the Trade* for sources for light monitoring equipment.

- **Visible Light Meter:** Use a visible light meter to measure the visible portion of the electromagnetic spectrum. If you purchase a new meter, you should be sure to purchase one that measures in the standard unit, lux. The meter you choose should be sensitive enough to measure light levels as low as 25 to 50 lux with a reasonable degree of accuracy (10% or better).

- **Ultraviolet Meter:** The Crawford UV Monitor is the standard piece of equipment used in museums for measuring UV levels. This monitor gives UV readings in microwatts per lumen. Older models depended on adjusting a knob until one red indicator light jumped to another light, giving a fairly inaccurate measure. Newer models are more accurate, providing the reading on a direct analog scale. There are also models of UV meters from different manufacturers that will provide a digital readout.

Use a standard set of procedures when monitoring light levels with either piece of equipment. Aim the sensor toward the light source so you are catching the light that is hitting the object you are monitoring. Be sure no shadows from your hand or body are in the way. Make sure the sensor is parallel to the surface of the object and aimed toward the light source. If the object is larger than about one foot square, take several readings. Before using any equipment, carefully read the manufacturer's instructions for operation and maintenance.

2. *How do I improve the lighting to minimize damage to objects on exhibit or in storage?*

You should develop a plan of action first, to determine if a lighting problem exists, then to determine the cause, and solutions to correct the problem. To develop your plan you first need to collect information, evaluate the data, and then develop solutions to problems that you find.

Obtain and record the following information:

- types of existing lighting fixtures, ballasts, and filters

- movement of sunlight in the room throughout the day

- seasonal variations in light

- unusual events that occur (for example, filming in a historic structure, drapes removed for cleaning)

Once you have identified the types of light and variations in lighting, you need to evaluate how light may affect the objects. Identify museum objects that are most susceptible to light damage and establish monitoring sites nearby. You will use these same sites for each monitoring session. Abandon old sites and es tablish new ones as conditions change. Document your monitoring and any corrective actions that you take:

- Prepare a floor plan for each exhibit or storage space that indicates the location of each monitoring site.

- Record data on the Light and Heat Measurement Record illustrated in Figure 4.8.

- Note any corrective actions taken in the comments section, for example:

  – curtains drawn

  – historic awnings replaced

  – UV filtering film installed over windows or fluorescent tubes

  – electric voltage stepped down

  – light fixtures replaced

  – new procedures to turn off lights when room is not in use

3. *How do I limit light damage from research use?*

When historic objects, archival materials, and natural history specimens are used by researchers they are exposed to light. Set up separate work spaces and research rooms so that your entire collection is not exposed to light when people are working with individual objects. Incorporate the following practices into research room use to limit the damage that occurs from this use.

- Develop procedures so that collection items are exposed to light only while the researcher is using them.

  – Keep documents in boxes or folders.

  – Remove objects from cabinets only when the researcher is ready to work.

- Limit the number of times an individual document can be photocopied.

See *Museum Handbook*, Part III, Appendix D: Planning a Research Space, and *Conserve O Gram* 19/7, "Archives: Reference Photocopying," and 4/14, "Planning a Research Space," for more information on limiting light damage from collection use.

Evaluate the data you collect using the Light and Heat Measurement Record. Look carefully at the information and use it to decide how to minimize the damage from light. You may want to consult the regional/SO curator and/or a conservator for help with your evaluation. Think about the following:

- Which areas have acceptable levels of light for the objects? How long have objects been on exhibit in these areas? Do they show signs of damage? Remember, not all damage can be detected by visual inspection.

- Which areas have light levels that are too high? You will need to make changes in these areas and evaluate whether your changes have helped. For example, if UV filtering film is installed on glass window panes, monitor for UV before and after application. Has the UV been eliminated? Has it affected visible light? Does the visible light still exceed the standard?

- Compare existing light levels with historic lighting conditions. Do objects on exhibit receive more or less light than they did historically? Will reducing light levels in a historic structure improve the interpretation of the building and the collection, and at the same time improve preservation?

- How often are collections used? Where and how are they used? What levels and duration of light exposure do they normally receive? Can you reduce light levels in research rooms to improve preservation and still provide adequate access?

- How often are archival collections copied? Can you produce a 'duplication master' so that originals will not have to be continuously copied?

You should keep the data you collect. It can help you make a case for needed changes in lighting or removal of threatened objects. Keep a permanent file of all light monitoring data.

4. *How do I fill out the Light and Heat Measurement Record?*

Follow these instructions for filling out the Light and Heat Measurement Record shown in Figure 4.8. You should use building floor plans in conjunction with this record.

- Identify the park and structure in the appropriate blocks.

- Enter the day, month, and year, and the time of day in the appropriate blocks.

- On the building floor plan enter a number at a light measurement site. Enter this station number on the Record in the Location block.

- Record the ultraviolet light reading from the UV meter. If the reading is above 75 microwatts per lumen, you should take corrective action.

- Record the visible light reading from the visible light meter in the Lux block. If you are using a meter that records in footcandles, convert to lux by multiplying by 10 (1 footcandle = approx. 10 lux).

- Record the temperature in the Temperature block.

- Record any information about the type of light source, the weather, and other comments in the comments box. Record any unusual circumstances in this block.

Figure 4.8. Example Light and Heat Measurement Record

5. *Is there any way to directly monitor light damage?*

You can directly monitor light damage by using Blue Wool light standards. Blue Wool light standards are specially dyed textiles made so that the most sensitive sample fades in half the time needed to fade the next most sensitive sample. There are eight samples to a set. You can use the Blue Wool standards in two ways:

- Place one set of standards at the place you want to measure. Place another set in total darkness.

- Place aluminum foil over one half of a set of standards.

By comparing the two sets of standards, or two halves of one set, you can determine the light fastness of a material. The standards will not help you estimate how much exposure to light a material will stand in a particular situation. You can use Blue Wool standards to help you make an argument that light damage is occurring and that changes are needed to protect museum objects.

6. *How do I control light levels?*

All light causes damage and the damage is cumulative. Therefore, you must control all light in museum spaces that contain museum objects. There are several control methods that you can use. Be creative and use a variety of strategies to minimize light. Always monitor before and after to be sure that your changes have really helped. Remember, your eye is not a good tool for measuring light levels—use monitors.

Visible light must be maintained at or below the recommended levels. You can obtain these levels using any of the control methods below:

- Use window coverings such as blinds, shades, curtains, shutters, and exterior awnings. Close window coverings as much as possible to prevent light from reaching museum spaces. If windows must be uncovered for visitors, install UV filters and work out schedules so that windows are uncovered for only part of each day.

- Use opaque dust covers (for example, cotton muslin or Gortex®) to cover light-sensitive objects, including floor coverings. Dust covers should be used whenever visitors are not present for extended periods. They are useful in storage areas and exhibit areas that are not open to the public for part of the year.

- You can use tinted light filters (for example, films or glazing) on windows or over artificial lighting. Don't use reflective films or tints that call attention to the windows or are historically inappropriate. Consult the park or regional historic architect and your regional/SO curator to be sure filters are appropriate.

- You can reduce the amount of light from fixtures by using colored filters, lowering the wattage of incandescent bulbs, using fewer fixtures, using flood light bulbs instead of spots, and turning off lights when people are not present. You can install motion detectors in exhibit areas that activate lighting only when a person is present. You can attach timers so that lights are on only for a specific period of time.

- Use incandescent lights (which produce very little UV) instead of fluorescent lights.

Ultraviolet light should be completely eliminated. All of the techniques used to limit visible light will also cut down on UV light. To block the remaining UV light:

- Install filtering material. Refer to NPS *Tools of the Trade* for sources of UV filtering material. Types of filters include:
  - UV filtering film for windows or glass on framed objects
  - UV filtering plexiglass instead of glass
  - filter sleeves for fluorescent tubes
  - UV filtered fluorescent tubes

The plastic material that carries the UV filtering coating often breaks down faster than the filtering chemical. You should replace filters whenever they begin to turn yellow or crack. Monitor UV radiation at least every five years to be sure the filtering material is still effective.

Infrared radiation (heat) generated by natural or artificial lighting should also be controlled to prevent rapid changes in relative humidity. Window coverings and filters and good air circulation systems (for example, fans and air conditioners) help control heat buildup. You can control the heat produced by artificial lighting fixtures by using filters and good air circulation systems, as well as keeping lights outside exhibit cases.

Floodlights used for professional and motion picture photography and photocopy machines can cause excessive heat buildup. Discourage photography in museum storage areas. When photography is allowed in museum areas request heat absorbing light filters and be sure the area is well-ventilated with fans or air conditioners. Lights should be turned off whenever filming is not taking place. If lighted rehearsals are necessary, use dummy objects until the final filming will take place.

H. Dust and Gaseous Air Pollution

Air pollution comes from contaminants produced outside and inside museums. Common pollutants include: dirt, which includes sharp silica crystals; grease, ash, and soot from industrial smoke; sulfur dioxide, hydrogen sulfide, and nitrogen dioxide from industrial pollution; formaldehyde, and formic and acetic acid from a wide variety of construction materials; ozone from photocopy machines and printers; and a wide variety of other materials that can damage museum collections. Air pollutants are divided into two types:

- ***particulate pollutants*** (for example, dirt, dust, soot, ash, molds, and fibers)
- ***gaseous pollutants*** (for example, sulphur dioxide, hydrogen sulphide, nitrogen dioxide, formaldehyde, ozone, formic and acetic acids)

1. *What are particulate air pollutants?*

Particulate pollutants are solid particles suspended in the air. Particulate matter comes both from outdoor and indoor sources. These particles are mainly dirt, dust, mold, pollen, and skin cells, though a variety of other materials are mixed in smaller amounts. The diameter of these pollutants is measured in microns (1/1,000,000 of a meter). Knowing the particulate size is important when you are determining the size of air filters to use in a building.

Some particles, such as silica, are abrasive. Pollen, mold and skin cells can be attractive to pests. Particulates are particularly dangerous because they can attract moisture and gaseous pollutants. Particulates can interact with gaseous pollutants and cause deterioration in three different ways. Particulates may be:

- a source for sulfates and nitrates (These particles readily become acidic on contact with moisture.)
- a catalyst for chemical formation of acids from gases
- an attractant for moisture and gaseous pollutants

2. *What are gaseous air pollutants?*

Gaseous pollutants are reactive chemicals that can attack museum objects. These pollutants come from both indoor and outdoor sources.

Outdoor pollutants are brought indoors through a structure's HVAC system or open windows. There are three main types of outdoor pollution:

- sulfur dioxide (SO_2), and hydrogen sulphide (H_2SO) produced by burning fossil fuels, sulfur bearing coal, and other organic materials
- nitrogen oxide (NO) and nitrogen dioxide (NO_2), produced by any kind of combustion, such as car exhaust as well as deteriorating nitrocellulose film, negatives, and objects
- ozone (O_3), produced by sunlight reacting with pollutants in the upper atmosphere and indoors by electric or light equipment, such as photocopy machines, printers, some air filtering equipment

When sulfur and nitrogen compounds combine with moisture and other contaminants in the air, sulfuric acid or nitric acid is produced. This acid then causes deterioration in a wide variety of objects. Ozone reacts directly with the objects causing deterioration.

The main sources of **indoor air pollution** come from building materials and include:

- wood, which can release acids
- plywood and particle board, which give off acids from wood and formaldehyde and acids from glues
- unsealed concrete, which releases minute alkaline particles

- some paints and varnishes, which release organic acids, peroxides, and organic solvents
- fabrics and carpeting with finishes, such as urea-formaldehyde, and wool fabrics that release sulfur compounds.
- glues, used to attach carpets, that can release formaldehyde
- plastics that release plasticizers and harmful degradation products such as phthalates and acids

Museum objects themselves may also contribute to indoor air pollution. For example, many plastics are inherently unstable and as they deteriorate they give off acidic by-products. Examples of sources of pollutants from museum objects include:

- celluloid and other unstable plastics used to produce many 20th-century objects
- cellulose nitrate and diacetate plastic, used for film
- pyroxylin impregnated cloth used for book bindings
- residual fumigants, such as ethylene oxide

Object Materials	***Deterioration***	***Primary Air Pollutants***	***Environmental Factors Accelerating Damage***
metals	corrosion/tarnishing	sulfur oxides and other acidic gases	water, oxygen, salts
stone	surface erosion, discoloration	sulfur oxides and other acidic gases, particulates	water, temperature fluctuations, salt, vibration, microorganisms, carbon dioxide
paint	surface erosion, discoloration	sulfur oxides, hydrogen sulfide, ozone, particulates	water, sunlight, microorganisms
textile dyes and pigments	fading, color change	nitrogen oxides, ozone	sunlight
textiles	weakened fibers, soiling	sulfur oxides, nitrogen oxides, particulates	water, sunlight, mechanical wear
paper	embrittlement	sulfur oxides	moisture, mechanical wear
leather	weakening, powdered surface	sulfur oxides	mechanical wear
ceramics	damaged surface	acid gases	moisture

Figure 4.9. Deterioration to Museum Objects Caused by Air Pollution

I. Monitoring and Controlling Particulate and Gaseous Air Pollution

As with problems from other agents of deterioration, you need to monitor your collections to identify whether or not air pollution is causing damage to your collections.

1. *How do I monitor air pollution?*

There are a variety of monitoring devices that can be used to directly measure pollutants in the museum. If you feel direct measurement is needed, contact your regional/SO curator for assistance. There are other steps you can take to identify and understand air pollution levels.

- Inspect storage spaces (for example, floors, open shelving, tops of cabinets and tables) for dust. Note how much dust has built-up since the last cleaning. Watch for increased insect activity using your IPM program. Increased insect activity is often related to an unacceptable accumulation of dust.

- In coastal areas, watch for pollution from chlorides by observing and noting active corrosion on metal objects. Chlorides will react with unpainted iron or steel objects, causing rust.

- Observe and document a building's air control system and the nature of the structure. Concrete walls and adobe are sources of high levels of dust. Some concrete dating from 1940-1975 contains asbestos, making it a health risk as well as a source of particulates. Improperly filtered air intakes can transfer high levels of pollutants into museum spaces.

- Identify exhibit cases, storage cabinets, and shelving made out of untreated wood or painted with the wrong paints that can outgas formaldehyde and acetic acid.

- Watch to see how much dust and dirt is tracked into spaces by visitors and employees.

Some parks have on-going air monitoring research. You can also contact the Environmental Protection Agency (EPA), Office of Air Quality Planning and Standards to obtain information on levels of ozone, sulfur dioxide, nitrogen dioxide, and particulates recorded in the park. These data will assist park staff in identifying potential pollutant problems that may exist. Areas with high concentrations of gaseous pollutants in the air will definitely want to establish a program for monitoring signs of active deterioration on objects in museum storage and exhibit areas.

2. *Are there ways to monitor for air pollution?*

There are several ways to monitor air pollutants that are simple to use in museums. Each has good points and bad points so before you choose one method, investigate each type of monitor and evaluate the type of information you want to recover. You can get advice from a conservator or your regional/SO curator. There is more information in the bibliography on using and evaluating monitoring devices.

Oddy tests: Oddy tests have been used for some time as a simple method of evaluating materials that are used in contact with objects in storage or on exhibit. In this test, metal coupons (small samples of metal) are placed in a closed container with the material being tested and a small amount of moisture. The container is slightly heated and after a set amount of time, the metal is examined for corrosion. It gives you some idea of how 'safe' a material is and whether or not it will cause deterioration? Problems with this test include:

- unusual reactions—because heat and moisture are raised in the container, reactions may occur that would not happen in a normal museum environment

- little reproducibility—for a variety of reasons, results from this test are widely variable

Passive sampling devices: These are devices that absorb particular pollutants. They are placed in the area you want to test for some period of time and then removed and sent to a lab to be tested for presence and levels of pollutants. Each passive sampling device measures one type of pollutant. For example, one device will measure for formaldehyde, another for acetic acid. However, there are problems with these devices:

- They may require off-site analysis.

- The devices have varying sensitivities. Use devices that can detect gaseous pollutant in parts per billion (1:1,000,000,000 ppb) or lower levels.

A-D strips. These strips detect acetic acid. They were developed to detect and measure acetate film deterioration or "vinegar syndrome" in film collections. They change color as the level of acidity increases. They are used to set priorities for film reformatting.

3. *How do I control air pollution?*

The NPS standard in the Checklist for Preservation and Protection of Museum Collections on controlling air pollution states, "Eliminate gaseous and particulate pollution to the lowest practical level." There is no minimum acceptable level of pollution. You can do the following to reduce levels of air pollution:

- In storage spaces, keep floors, tops of cabinets, and work surfaces clean to minimize dust accumulation. Work with custodial staff to keep areas clean. Use high efficiency particulate air (HEPA) vacuums which catch more particulates. Regular vacuum cleaners simply throw many smaller particles up into the air.

- Separate office and curatorial work spaces from museum collections storage spaces. Areas that are not accessed often will stay cleaner than high traffic areas.

- Upgrade and maintain seals and weatherstripping around doors and windows to keep pollutants out.

- Store sensitive objects in appropriate museum specimen cabinets. Maintain sound gaskets on all storage cabinets. Replace old gaskets with neoprene gaskets. Refer to NPS *Tools of the Trade* for the source of retrofit gasket kits. NPS *Conserve O Gram* 4/8 explains how to install the retrofit gasket kit.

- Store archival materials in boxes, map cases, and folders.

- Use dust covers to protect objects on open shelving. Dust cover material should be chemically and physically non-damaging and provide as complete a dust seal as possible, while allowing easy access. Use clear polyethylene sheeting, unbleached cotton muslin, Tyvek®, or Gore-Tex®. Refer to NPS *Conserve O Gram* 4/7, "Dust Covers for Steel Shelving," for additional information on constructing dust covers.

- Segregate objects that outgas pollutants (for example cellulose nitrate negatives or objects, diacetate negatives, or hardwoods such as oak, birch or beechwood) from other objects.

- Store, exhibit, and transport objects in appropriate cases. Avoid using exhibit materials (for example, hardwoods) that outgas organic acids. The adhesives used in plywood and veneers may be a source of pollutants. See Figure 4.10 for a list of both harmful and safe materials.

- In areas with high air pollution levels you may want to install pollution filtering in your HVAC system. These filters extract gaseous and particulate pollutants before they get into a museum space. Work with HVAC engineers to design a system appropriate to your facility. Do not use filtering systems that generate damaging ozone.

- You can use portable air filters with activated-carbon filters to remove particulates from the air. These filters will also remove some gaseous pollutants. Refer to NPS *Tools of the Trade* for sources for this equipment.

Storage and Exhibit Construction Materials Known to Release Harmful Substances	
Materials	***Harmful Vapors***
wood (particularly oak, birch, beech)	organic acids
wood panel products	organic acids, formaldehyde
protein-based glues, wool	volatile sulfides
vulcanized rubber	volatile sulfides
some dyes	sulfur compounds
cellulose nitrate	nitrogen oxides
cellulose acetate	acetic acid
polyvinyl chloride	hydrogen chloride
polyurethanes	volatile additives
Storage and Exhibit Construction Materials That Appear to be Safe	
metals	
glass	
ceramics	
inorganic pigments	
polyethylene and polypropylene	
acrylic solutions (some acrylic emulsions are suspect)	
polyester fibers	
cotton and linen	

Note: while these materials are considered safe, manufacturing processes may add coatings and additives that can damage museum collections.

Figure 4.10. Types of Materials That Can Harm Objects and Types of Materials That are Considered Safe to Use with Museum Objects for Storage and Exhibit[6]

K. Endnotes

1. Relative humidity optimum ranges for materials included in Figure 4.2 are based on information from *Climate in Museums: Measurement* (3d ed.) by Gael De Guichen, and on information included in curatorial care appendices of this handbook.

2. *The ABCs of Air Conditioning: A Primer of Air Conditioning Types and Methods* outlines the types of air conditioning systems, introduces cooling load calculation, and compares the functioning of system types. A copy of this publication may be obtained from:

   Carrier Air Conditioning
   P.O. Box 4800
   Syracuse, NY 13221
   (315) 432-6000

3. *The Humidification Handbook: What, Why and How,* written by Bernard W. Morton, includes an introduction to humidity theory and measurement, and provides specification information on the determination of humidification load, methods of humidification, and system design considerations. It is available from:

   Dri-Steem Humidifier Company
   14949 Technology Drive
   Eden Prairie, MN 55344
   (800) 728-8336

4. *The Cargocaire Dehumidification Handbook* discusses methods of dehumidification, system design, and selection, and provides an introduction to calculations of moisture loads. A copy of this publication may be obtained from:

   Cargocaire Engineering Corporation
   79 Monroe Street
   P.O. 640
   Amesbury, MA 01913
   (800) 843-5360

5. Illumination levels are based on information in *The Museum Environment* (2d ed.), "Light," Part I by Garry Thomson.

6. Information included in Figure 4.10 is taken from "Trouble in Store" by T. Padfield, D. Erhardt, and W. Hopwood, and "Materials for Exhibit, Storage, and Packing," by J. Tétreault and S. Williams.

Chapter 5: Biological Infestations

CHAPTER 5: BIOLOGICAL INFESTATIONS

A. Overview

1. *What information will I find in this chapter?*

This chapter contains information on:

- pests that can damage museum collections
- setting up an Integrated Pest Management (IPM) plan for museum collections

2. *Who should read this chapter?*

You should read this chapter if you are responsible for museum collections. You can use this chapter to develop a museum Integrated Pest Management Program yourself or to evaluate the need for IPM in your museum management strategy. IPM is an ecosystem approach to the control of pests. IPM uses a variety of techniques to prevent and solve pest problems so that pesticides are used only as a tool when other techniques will not work. Pesticides are any chemicals with an EPA registration number used to control pests of any type.

3. *What is a museum pest?*

A pest is an organism that jeopardizes museum resources. Dermestid beetles in a woolen rug are pests. Dermestid beetles in an animal carcass in the field are not.

B. Active Infestations

1. *What do I do if I find live pests in the museum?*

Follow these steps to stop an infestation and prevent it from recurring.

- Don't panic. If you rush to kill the pests you may cause more harm to the artifact (and to yourself) than if you leave the pests alone for a short time. Be thoughtful about each step you take. Remove pests safely and set up a program to keep the infestation from recurring.
- If an infestation is found on objects, isolate them immediately. Put the infested objects in a sealed plastic bag. Don't carry infested material through the collection without isolating it. You can drop eggs or larvae that can spread the infestation.
- Identify the pests. You may find that insects you see are not museum pests. More information on pests and identification is included in Section C.
- Determine the extent of the infestation. Start at the site where the first infested object was found and inspect the collections/areas in ever widening circles. Isolate infested materials as they are found and document the findings.
- Determine the source of the infestation. If the problem is gaps in the building structure, collaborate with appropriate staff and make repairs to the building. If infested materials were brought into the collection,

evaluate and modify the policies and procedures that allowed this to happen. See Section E for more information on keeping pests out of museum collections.

- Develop a treatment strategy. Include the following steps:
  - Identify and document the pest and its development stage.
  - Identify the materials in the infested object.
- Based on these findings, answer the following questions:
  - Can you simply remove the pest?
  - Are eggs present?
  - What is the least damaging approach to treatment?
- There are a number of options for treatment described below. Only after you've considered all options should you treat the object.
- After treatment, clean the artifacts to remove dead pests and waste. Dead pests, larval skins, and nests can all attract new pests.
- Document the treatment. More information on documentation is included in section F.

2. *How do I stop an infestation?*

Use these methods to stop an infestation in objects:

- ***Identification:*** Identify the insect to be sure that it is a museum pest and will cause damage to museum objects. Section C has information on how to have pests identified.
- ***Cleaning:*** If an infestation is limited to a single object and has not progressed too far, careful vacuuming may remove the problem. Before cleaning, you should be sure the structure of the object can withstand the stress of vacuuming. Cleaning will probably not remove all eggs (some can be microscopic). Remove the vacuum bag from the building immediately so it doesn't become a source of new infestations. After cleaning, place the object in a plastic bag and isolate it from the rest of the collection. Determine the life cycle of the pest and monitor the object until you are sure no more insects will hatch.
- ***Freezing:*** Freezing has become the method of choice for treating most active infestations of individual objects and collections. See *Conserve O Gram* 3/6, An Insect Pest Control Procedure: The Freezing Process. Be aware that a few types of materials—lacquer, bone, painted surfaces, and some woods—can be significantly damaged by freezing. Organic and inorganic portions of composite objects will react differently and cracking may result. If you have a question about the safety of freezing an object, contact your Support Office (SO) curator or a conservator.

- ***Anoxic Environments:*** Replacing the air with a gas (nitrogen, argon, carbon dioxide) in a closed space can also kill insects and their eggs. A wide variety of techniques are used, some by museums, others by professional pest control companies. These techniques require special equipment and experience. For more information on anoxic environments and their use in pest control see *Conserve O Gram* 3/8, Managing Insect Pests: Alternatives to Pesticides, and the references listed at the end of this chapter.

- ***Conventional Chemical Fumigation:*** Fumigation is only appropriate if you cannot treat individual objects. It may be appropriate to fumigate a museum space. Vikane (sulfuryl fluoride) is now the only product available; all others have been banned. It is a restricted use pesticide that requires park and regional IPM approval before applications. Work with park and regional IPM coordinators to develop your IPM plan and make decisions about pesticide use.

  – Use of any pesticide requires at least regional approval.

  – Check with a SO curator or a conservator to be sure that the pesticide you choose will not harm collections.

C. Identification of Museum Pests

1. *What are museum pests?*

Museum pests are biological agents that can cause damage to museum collections. Insects, mold, mice, rats, birds, and bats are all museum pests. The damage pests do comes from feeding or nesting behavior or by attracting other types of pests. Pests that regularly damage museum collections can be roughly grouped as:

- fabric pests
- wood pests
- stored product pests
- moisture pests
- general pests

Identifying an insect and its life stage is critical in determining what is happening in the areas being monitored. This chapter gives only brief descriptions of some types of pests. Many other pests may be found. You should familiarize yourself with other resources. Refer to the NPS Integrated Pest Management Information Manual and other references at the end of the chapter. Good illustrations to help you identify pests can be found in the references by Zycherman and Schrock (1988) and Mallis (1982). To get help in identifying unknown pests, contact park and regional IPM coordinators, SO curators, or NPS Cooperative Park Study Units. You can also get assistance from entomologists in the cooperative

Extension Service, U.S. Forest Service, state departments of food and agriculture, and at local universities and natural history museums. See Figure 5.1 for a sample pest identification request letter.

You should also start your own reference collection of pests to compare to when identifying new pests that you trap. These insects can be stored on small squares cut from insect sticky traps (discussed below) and placed in small plastic boxes. You can also use small vials or boxes to store pests you find or trap using other methods.

2. *What are fabric pests?*

Fabric pests are protein eaters. The two main groups are carpet beetles (of the family Dermestidae) or clothes moths (of the family Tineidae). The larvae of these types of insects feed on animal products used in museum collections, such as wool, fur, feathers, and horns.

Carpet beetles are also commonly known as dermestids. Carpet beetle larvae cause damage by feeding on a wide variety of materials including fur, feathers, wool and silk cloth, wool felt, hair, study skins, and trophy mounts. They may not be seen because they hide from light, burrowing deep into artifacts. The larvae shed their skins as they grow and these skins are one of the signs of infestation to watch for. The adults are attracted to light and come out of hiding to mate. They may collect along windowsills. There are many species of carpet beetles, but the four described below are commonly found in museums. These beetles can be easily mistaken for other types of beetles that do not damage museum collections. Be sure to carefully identify the beetle before taking action.

- **Black carpet beetle** (*Attagenus unicolor*) is the most abundant and destructive of the carpet beetles. The adult is 1/8"- 3/16" long, a solid dark brown or dull black color, and more elongated than carpet beetles described below. The larva is less than 1/4" long and carrot-shaped. It is covered with golden brown hairs and has a characteristic "tail" of long hairs at the rear end.

- **Varied carpet beetle** (*Anthrenus verbasci*) is primarily a scavenger. It is common in the nests of birds, on dead animals, and in insect collections. It can damage woolens, carpets, wall hangings, hides, horns, and bone artifacts. Small populations often go unnoticed behind furniture or along baseboards, feeding on accumulated lint, hair, food crumbs, dead insects, and other organic debris. The adult is about 1/8" long, oval to round, blackish with splotches of white, yellow, and black on its back. The larva is 4-5 mm long, teardrop-shaped, and covered with rows of light brown hairs.

- **Common carpet beetle** (*Anthrenus scrophulariae*) attacks carpets, woolens, and animal products such as feathers, furs, leather, silks, mounted museum specimens, and pressed plants. The adult is about 1/8" long and black with white scales and a band of orange scales down the middle of its back. The larva is reddish-brown and covered with brown or black hairs. Larvae are active and move rapidly.

- **Furniture carpet beetle** (*Anthrenus flavipes*) attacks upholstery

(particularly old horsehair-stuffed furniture) and items made from wool, fur, feathers, silk, horns, and tortoise shell. The adult is about 1/8" long and is rounded and blackish with variable mottling of yellow and white scales on the back and yellow scales on the legs. The larva is difficult to distinguish from the common carpet beetle.

Clothes moths are small, silvery-beige moths with a wingspan of less than 1/2". They have narrow wings fringed with long hairs. Small grain- and flour-infesting moths are often confused with clothes moths, however, clothes moths have different flying habits. They avoid light and are rarely seen flying. They prefer dark corners, closets, and storage areas, and usually remain out of sight.

The primary food of clothes moth larvae is soiled woolens, but they also feed on silk, felt, fur, feathers, and hairs. In museums they often damage woolen clothes (particularly old military uniforms), feather hats, dolls and toys, bristle brushes, weavings, and wall hangings.

- The **webbing clothes moth** (*Tineola bisselliella*) and the **casemaking clothes moth** (*Tinea pellionella*) are the two most common clothes moths found in museums. The larvae are small white caterpillars with brown heads. They feed on the surface of the material infested. The webbing clothes moth produces feeding tunnels of silk and patches of silken webbing on the fabric's surface. The casemaking clothes moth is rarely seen since it constructs a cylindrical case of fabric that it carries around to hide and feed in. The color of the larval case will match the material on which it's feeding. Using this clue can help you locate infested materials.

3. *What are wood pests?*

Materials made of wood are susceptible to attack by a number of wood-infesting pests. The culprits in museums are usually woodboring beetles or drywood termites. Both can severely damage valuable artifacts while remaining invisible to the untrained eye.

Woodboring beetles are a group of beetles in the insect families Anobiidae (anobiid, furniture, and deathwatch beetles), Lyctidae (true powderpost beetles), and Bostrichidae (false powderpost beetles). The term "powderpost" comes from the fact that the larvae of these beetles feed on wood and, given enough time, can reduce it to a mass of fine powder.

Woodboring beetles spend months or years inside the wood in the larval stage. Their presence is only apparent when they emerge from the wood as adults, leaving pin hole openings, often called "shot holes," behind and piles of powdery frass (digested wood that looks somewhat like sawdust) below. Shot holes normally range in diameter from 1/32" to 1/8", depending on the species of beetle. If wood conditions are right, female beetles may lay their eggs and reinfest the wood, continuing the cycle for generations. Heavily infested wood becomes riddled with holes and tunnels packed with a dusty frass. Powderpost beetles can attack both hardwood and softwood, although lyctids only infest hardwoods.

Items in museums that can be infested by woodboring beetles include wooden artifacts, frames, furniture, tool handles, gunstocks, books, toys,

bamboo, flooring, and structural timbers.

Drywood termites, unlike their cousins the subterranean termites, establish colonies in dry, sound wood with low levels of moisture, and they do not require contact with the soil. They are primarily found in the coastal southern states, California, and Hawaii, but they are easily transported to northern states in lumber, furniture, and wooden artifacts. Drywood termites attack wooden items of all kinds. The termites feed across the grain of the wood, excavating chambers connected by small tunnels. The galleries feel sandpaper-smooth. Dry, six-sided fecal pellets are found in piles where they have been kicked out of the chambers. The pellets may also be found in spider webs or in the galleries themselves.

A swarming flight of winged reproductive termites can occur anytime from spring to fall. Most drywood termites swarm at night, often flying to lights.

4. *What are stored product pests?*

Many museums include items made in part of seeds, nuts, grains, spices, dried fruits and vegetables, and other foods. A long list of pests, traditionally called "stored product pests" or "pantry pests," can infest items containing these foods. Probably the most common of such pests in museums are the cigarette beetle and the drugstore beetle.

Cigarette beetle (*Lasioderma serricorne*) is named for the fact that it is a pest of stored tobacco, but is also a serious pest of flax, spices, crude drugs, seeds, and, most importantly for museums, books and dried plants. This beetle has been called the "herbarium beetle" because of the damage it can cause to dried herbarium specimens. It has also been found infesting rodent bait.

The adult beetle is light brown, 1/8" long, and the head is bent downward so that the beetle has a distinctive "hump-backed" look. It is a good flier. The small larva is grub-shaped and whitish, with long hairs that make it appear "fuzzy." It has yellow-brown markings on the head.

Drugstore beetle (*Stegobium paniceum*) feeds on a wide variety of foods and spices (particularly paprika or red pepper). It is also a serious pest of books and manuscripts, has been reported "feeding on a mummy," and has been known to chew through tin foil and lead sheeting.

The adult beetle is very similar to the cigarette beetle. With careful examination through a magnifying lens, the three-segmented antennal club may distinguish the drugstore beetle. The larva, too, is similar, but does not appear as "fuzzy."

5. *What are moisture pests?*

Not only is moisture a threat to museum specimens on its own, it may attract a number of moisture-loving pests that can do additional damage. Molds can be a big problem in damp conditions and can attract insects in the order Psocoptera that feed on those molds.

Molds are fungi that can cause damage or disintegration of organic matter. Basically plants without roots, stems, leaves, or chlorophyll, molds occur nearly everywhere. When moisture and other environmental conditions

are right, molds can appear and cause significant damage to wood, textiles, books, fabrics, insect specimens, and many other items in a collection. Their growth can be rapid under the right conditions.

It is important to realize that fungal spores, basically the "seeds" of the fungus, are practically everywhere. Whether molds attack suitable hosts in a museum depends almost exclusively on one factor—moisture. When moisture becomes a problem, molds will likely become a problem too.

For this reason museum objects should not be stored in humidity above 65%. Be aware, however, that some molds can grow at a lower humidity. **Psocids** are commonly called booklice, but they are not related to parasites such as head lice or body lice. They are referred to as booklice because they often infest damp, moldy books. They feed on the mold growing on paper and the starchy glue in the binding. Psocids also infest such items as dried plants in herbaria, insect collections, manuscripts, cardboard boxes, and furniture stuffed with flax, hemp, jute, or Spanish moss.

Psocids do not themselves cause damage. They become pests simply by their presence. However, their presence also indicates a moisture problem and the likely presence of damaging molds. They are tiny insects, less than 1/8" long, and range in color from clear to light gray or light brown. Most indoor psocids are wingless, looking a bit like a tiny termite.

6. *What are general pests (perimeter invaders)?*

Any household pest may become a pest in a museum. Many kinds of pests can get into a building that has not been well sealed. Cockroaches, crickets, silverfish, ants, millipedes, and other common pests can invade and infest a museum as well as a house or other structure. Mice, rats, birds and bats can also infest museum collections and buildings. They can cause direct damage to collections through nesting and feeding behavior. Their nests will also attract many other kinds of insects that can then move into the collections.

German cockroaches (*Blatella germanica)* are omnivorous. They are familiar as they are the most common cockroach found in the United States. They feed on leather, paper, glues, animal skins, and hair. Damage to objects is caused by chewing. They are especially attracted to objects stained with sweat. They can also stain objects by depositing various bodily fluids.

House crickets (*Acheta domesticus)* commonly come into buildings at the onset of cold weather. Like german cockroaches they are omnivorous and will eat protein and cellulosic materials. These include textiles (wool, silk, linen, cotton), leather, and animal skins and fur. They are especially attracted to stains.

Silverfish (*Lepisma saccharina*) and firebrats (*Thermobia domestica*) will eat fabrics, paper and sizing, and glue and paste in book bindings. They are omnivorous, so will eat protein materials as well as cellulose. They are especially damaging in dark, damp storage areas. They have a distinct carrot shaped body, short legs, long slender antennae, and three tail-like appendages.

D. Integrated Pest Management (IPM)

1. *What is Integrated Pest Management?*

Integrated Pest Management (IPM) is a decision-making process that helps you determine if, when, and where you need pest suppression. It helps you develop a strategy to keep pests from attacking collections. IPM uses a variety of techniques to prevent and solve pest problems using pesticides only as a last resort. It depends on knowledge of a pest's habits, ecology and the environment in which it thrives and survives. IPM is also site-specific and adaptable to any museum. It provides a structure in which to make responsible decisions about treating pests. Museum IPM has two goals:

- protect the museum and its collections from pests
- reduce the amount of pesticides used in collections

2. *Why should I use IPM?*

Pesticides can be health hazards for staff. Exposure to pesticides used incorrectly can cause acute symptoms such as nausea, vomiting, and breathing difficulty. Exposure can also cause chronic effects such as seizures, skin and eye irritation, and memory defects. Many pesticides are carcinogens or suspected carcinogens and human teratogens. For your own safety, as well as that of your offspring, visitors, and researchers, pesticide use should be carefully considered and only applied following label directions.

In 1980, a Presidential memorandum directed all federal agencies to adopt IPM in management policies. This memorandum and excerpts from Department of the Interior (DOI) and NPS policies on IPM are included in Appendix A. NPS-77, *Natural Resources Management Guideline*, provides guidance on pesticide use in the National Park Service.

3. *What types of damage can pesticides do to museum objects?*

Pesticides can cause the following damage:

- metal corrosion, including iron, brass, and other light color metals
- deterioration of proteins, such as fur, feathers, leather, wool, horsehair
- deterioration of paper
- shrinking, stiffening, or softening of plastics
- color change in dyes and pigments
- staining from surface and vapor contact

Museums have routinely used pesticides in collections for years. Many of these materials leave residues on museum artifacts. Search collection documentation for records of previous pesticide use. Be aware, however, that users often did not record pesticide use. Be sure to take precautions when handling the objects. See *Conserve O Grams* 2/2-4 for information on the health and safety risks associated with some pesticides residues that are found on museum objects.

Many different types of pesticides have been used in museum collections. **None**

of these pesticides are now recommended for use. Pesticides that have been commonly used in museums include:

- arsenic (see *Conserve O Gram* 2/3*)*
- mercuric chloride
- thymol
- DDT
- ethylene oxide (see *Conserve O Gram* 2/2)
- dichlorvos (Vapona, DDVP) (see *Conserve O Gram* 2/4)
- naphthalene
- paradichlorobenzene (PDB)

4. *What are the components of an IPM Program?*

Each of these components is on-going and the whole process is cyclical in nature. To carry out an effective IPM program you should:

- ***Build consensus*** by working with other staff in the park. IPM requires coordinated strategies to be effective.
- ***Identify*** pests that can cause damage to your collections.
- ***Review NPS policy*** to understand how IPM works and your responsibilities when using chemical treatments.
- ***Establish priorities*** to focus on tasks in an organized fashion. For example, set up a monitoring program in areas of the collection that contain sensitive botanical specimens first.
- ***Establish action thresholds***. How many insects in a collection are too many?
- ***Monitor*** pests and environmental factors.
- ***Implement non-chemical management***. Modify pest habitats, use good housekeeping, and use non-chemical treatments such as freezing and anoxic environments.

  If needed, review and obtain approval for an appropriate chemical pesticide. Treatments should only be done when pests have been found and identified. You must get approval from the regional IPM coordinator to use any pesticide in your park.
- ***Evaluate*** results to be sure your strategies are working.
- ***Document*** monitoring and treatments.

E. Monitoring

1. *Why should I monitor for pests and monitor the environment?*

Monitoring for pests and monitoring the environment provide you with different kinds of information.

Pest monitoring tells you . . .	***Environmental monitoring tells you . . .***
Baseline information on the insects in your collection	Baseline information on your museum environment
How pests got into the museum	If conditions will support pest activity
Where pests are in the museum	If your actions are changing the environment
How many pests there are in the museum	
If your control strategies are working	

Taken together, these two types of monitoring can help you determine strategies to eliminate future access and survival of pests in the collection. Monitoring can also help you evaluate the effectiveness of any treatment action you take. You can get more information on environmental monitoring in Chapter 4. It also provides information about environments that might help support an infestation.

2. *How do I know where to monitor?*

When developing a monitoring strategy, think about the resource that you are trying to protect and the kinds of pests that will cause damage to the resource. For example, will you expect mostly protein eaters because of lots of wool textiles? Are the collections in a historic, poorly sealed building with a damp basement?

Think through what kind of pests will be attracted to your collections. Also think about the kind of pests that will be supported in the environment in your building. Then aim your monitoring strategy to find out if those kinds of pests are present. Work with your park and regional IPM coordinators to develop a thoughtful strategy to identify pests for the collections in your park.

3. *What does pest damage look like?*

Different pests cause different types of damage. Evidence of pests includes:

- holes
- chewing marks
- hair loss
- webbing
- cast skins

- "grazed" surfaces
- frass (insect waste, which is usually a soft powdery material)
- fecal pellets

4. *How do I monitor for pests?*

Monitoring relies on a variety of techniques.

- ***Routine inspection of objects:*** Visually inspect the collection to look for cast larval skins, holes in textiles, piles of frass, cut hairs around and below artifacts. Do spot checks at least every six months; check more vulnerable objects like biological specimens and ethnographic objects more often.
- ***Routine inspection of the building:*** You must also routinely inspect the building to look for signs of insects that may get into your collections. Check windowsills and door jams especially carefully.
- ***Trapping:*** Identify pests moving into and throughout the building. Using traps allows you to "zero in" on problem areas where pests may be getting into a building, or where you have infested collections.
- ***Documentation:*** Document your inspection and trapping program carefully so that you have a record of problems that can be evaluated over time.

See *Conserve O Gram* 3/7, Monitoring Insect Pests with Sticky Traps, for more information on using a monitoring program.

5. *What kinds of traps should I use?*

There are three main types of insect traps. Use them in combination. Decide which kind of trap is most appropriate for a particular place and for the problem you have.

- **"Sticky traps"** collect bugs on an adhesive base. They are sometimes known as roach motels and come in a box or tent shape. They are available from a wide variety of manufacturers. For general purpose the tent shaped traps are the best. Replace them regularly as the adhesive will dry out and become ineffective. *Conserve O Gram* 3/7 and NPS *Tools of the Trade* have information on sticky traps.
- **Pheromone traps** are usually sticky traps that include a pheromone attractant specific to one species of insect. These are only available for webbing clothes moths, drug store beetles, cigarette beetles, and the German cockroach, but more are being developed. See *Conserve O Gram* 3/7.
- **Light traps** are useful for detecting and controlling flying insects. They emit ultraviolet light (black light) that attracts flying insects, particularly flies and moths. The insects are drawn toward the light and trapped by a glue board or in a bag. Windows also act as passive light traps so windowsills should also be carefully monitored.

6. *How do I establish an*

Step 1. Draw a floor plan of the area you wish to monitor. Indicate the

insect trapping program?

locations of doors, windows, water and heat sources, and drains. Also include furnishings in the room, such as museum exhibit and storage cabinets and cases. Note what types of materials are stored in the cases.

Step 2. Number and date the tops of the traps for quick identification.

Step 3. Place traps throughout the area to be monitored. Keep in mind that pests like dark, warm, damp places. Where possible place the trap against the wall, as pests tend to move along this surface. Critical areas where pests are likely to be found include:

- along the perimeter walls
- in corners
- near doors
- near windows and other light sources
- under furniture
- near water sources
- near drains
- near heat sources
- inside and outside exhibit and storage cabinets

Step 4. Indicate the location of the traps on the floor plan.

Step 5. Inspect the traps on a regular schedule and record:

- the trap number
- the location of the trap
- the date inspected
- the species of insects
- the number of individuals per species found in the trap
- other useful information, including the life stage of the species, unusual conditions, and replacement date for the trap

You may devise your own survey form. See Figure 5.2 for a sample. Many museums document their pests with a simple computer spreadsheet or database program. During the initial phase of the monitoring period—usually the first three to six months—inspect the traps weekly. This will allow you to identify current problems and solve them quickly. Long-term monitoring will catch problems that develop later on and variations you

may see in different seasons of the year.

Refine the trap placement, as trapping becomes routine. Based on the evidence you find in the traps, you may want to move traps or inspect more or less often. However, don't wait too long to inspect traps, as dead insects are a food source that may attract other pests. With careful placement of traps you will be able to identify problem areas precisely.

Replace traps at least every two months, when they become full, or when the adhesive loses its tackiness—whichever comes first.

7. *What actions should I take to keep pests out?*

Cultural controls and mechanical controls are two basic types of actions you can use to prevent insects from getting into and thriving in your collection. Cultural controls are policies and procedures that you can implement. Mechanical controls are techniques to limit pest habitats and close off areas where pests get into the building.

Cultural controls include:

- inspecting any material (new accessions, loans, storage material) before it comes into collections areas
- developing good housekeeping and interior maintenance programs
- restricting food and smoking in the museum
- barring live and dried plants inside and eliminating plants and mulch next to the building
- developing environmental controls for a stable, low humidity
- putting objects into closed storage and exhibit cases whenever possible

Mechanical controls include:

- installing self-closing devices, sweeps and gaskets on exterior doors
- installing screening on floor drains
- removing ivy and plants growing on the structure
- cleaning gutters regularly
- closing windows and installing 20 mesh screening
- eliminating clutter, including cardboard, which is very attractive to insects
- minimizing dust
- using a vacuum cleaner instead of a broom to clean floors and structures

- caulking or otherwise blocking all holes in the building structure
- using sodium vapor lighting, which is less attractive to insects, for exterior fixtures

8. *How do I know when I have a problem and must take some action?*

Set a **threshold**. A threshold is the point at which you will take some action to remove or prevent the pest. Decide how many pests you must see or trap in an area before taking action. The action will usually not be a pesticide treatment. Establishing a regular vacuuming program is also an action.

The threshold is site-specific for each museum. For example, finding one insect near the door may not warrant action, but it does warrant increased vigilance. Finding an insect in a closed cabinet warrants action. You can expect to trap more insects in historic buildings than in new visitor centers. Decide on your thresholds before you start a monitoring program.

See information in Section A of this chapter for dealing with an active infestation.

F. Documenting and Evaluating Your IPM Program

1. *How should I document my IPM program?*

Use the IPM survey forms described in Section D and Figure 5.2 to document the monitoring. You can also develop your own spreadsheet or database. Use environmental monitoring forms in Chapter 4 to document the environmental monitoring that is done.

Document treatments done to objects (fumigation, freezing, cleaning). Record the treatment for each object in ANCS+ in the Preservation supplemental record. You can also file the information in the appropriate accession file or catalog folder, as outlined in the NPS *Museum Handbook*, Part II, Chapters 2 and 3. Be sure to include the brand name of insecticides and fumigants and the chemical name if known.

2. *How do I know if the IPM strategy is effective?*

Regularly evaluate your strategy. Analyze your survey forms. Are you seeing fewer pests in your traps? Have you stopped infestations?

If your strategy is working, all your time will be spent on prevention and maintenance and none on dealing with live pests and infestations in the collections.

3. *Where can I find other information about IPM and museum pests?*

Work with your park IPM coordinator. A regional IPM coordinator reviews applications for pesticide use. The regional IPM coordinator and the SO curator can help you develop IPM plans and strategies when you discover an infestation. The Associate Director, Natural Resources, and regional offices develop training in IPM. Some of the information contained in this chapter came from a National Park Service website *The NPS Integrated Pest Management Manual* <http://www.colostate.edu/Depts/IPM/natparks/natpark.html>. You can find more information there.

Dr. Melissa Adams
West Virginia Department of Agriculture
100 1st Street
Charleston, WV 25305-0170

Dear Dr. Adams:

The enclosed insect samples were found during monthly pest monitoring at Chris Doe Homeplace. Will you please identify the insects circled in red in the enclosed sticky traps as specifically as possible? We are particularly interested in potential pests to museum objects. Please return the specimens to me so that I can refer to them in the future.

My address is: Mark Hayden
National Park Service
Chris Doe Homeplace
P.O. Box 50
Ridgely, WV 23456-0050

Thank you very much for your help.

Sincerely,

Mark Hayden
Curator

Chapter 6: Handling, Packing, and Shipping

List of Figures

CHAPTER 6: HANDLING, PACKING, AND SHIPPING

A. Introduction

This chapter outlines handling, packing, and shipping guidelines for safely moving museum objects. By following these guidelines, you can prevent damage to the objects in your museum collection. The chapter includes:

- basic practices to ensure object safety
- guidelines for handling objects
- guidelines for moving objects inside the museum
- materials and techniques to properly pack for shipping
- basic directions for shipping objects
- guidelines for unpacking an object
- bibliography of references on handling, packing, and shipping museum objects

Specific guidance for handling different types of objects can be found in the appendices of this volume for each object type.

Figure 6.1. Proper Handling Techniques.
Proper handling techniques are essential to museum housekeeping practices.

B. Handling Objects

When you touch, lift, or hold an object you are handling it. When you work in a museum you will have to handle objects for a variety of tasks. To do this safely and effectively it is important to learn and practice good handling techniques.

1. *Why are careful handling practices important?*

Preventive conservation starts with careful handling. Proper handling is largely a matter of common sense and is necessary for the care and protection of objects. However, good handling techniques are not always obvious. Museum procedures require specialized handling knowledge that must be learned. For example, metals can corrode after being handled without gloves. Paintings may crack as a result of bumping and jarring during movement. Mishandling can cause obvious examples of damage, such as shattered glass in a frame, broken ceramics, torn documents, or dents and scratches in metal objects.

Figure 6.2. Carts and Trays Minimize Handling.
The use of equipment and supplies such as carts and trays minimizes the need to handle objects.

2. *Who needs to learn safe handling practices?*

Anyone who handles museum objects needs to be aware of the guidelines in this chapter. If your day-to-day responsibilities require you to handle objects, you need to be sensitive to their delicate nature. Regular activities like cataloging, photographing, housekeeping, and packing for shipment all require you to handle and work with objects.

3. *What basic practices can I use to safely handle and move objects in the museum?*

Write guidelines.
Establish written guidelines to help foster a professional attitude and respect for objects. Provide **all** staff with a set of written guidelines. Post the guidelines in museum storage areas. Be sure that all staff who handle objects read the guidelines. Researchers who handle objects should read the guidelines when they first use the collections. Staff should read the guidelines when hired and review them periodically. See Figure 6.14 for an example of handling guidelines you can use.

Train your staff.
Don't handle museum objects without training. Training should be an on-going activity, particularly when new types of objects are being handled. Make "hands-on" experience a part of all training for individuals working with collections. Re-training reminds people of the importance of proper handling techniques. You should give a special training session whenever new staff members assist in handling objects.

Use proper supplies and equipment.
Only use equipment that is of good quality and in good condition. Equipment for moving objects includes flatbeds, carts, dollies, pallet lifters, polyethylene tote pans, and object support trays. The supplies you use with the equipment to move objects include polyethylene foam pads for lining carts and trays, quilted furniture pads, acid-free tissue, and clean cotton or plastic gloves. You may need to acquire personal protective equipment such as lab coats and smocks, safety glasses, dust masks, and personally fitted respirators. Supplies and equipment are listed in more detail below.

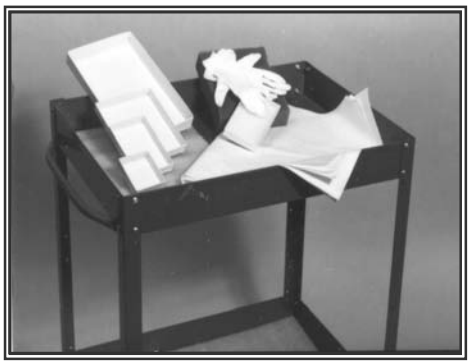

Figure 6.3. Equipment and Supplies.
Equipment and supplies for handling and moving museum objects include trays, padding, tissue, gloves, and carts.

4. *How should I proceed with moving an object?*

Consider safety first.
Before moving an object, inspect equipment to ensure that the object and the handler will be safe during the move. Do you have the proper personal protective equipment? Identify the space where you will move the object. Make sure there is room to house the object in its new location. If you have inadequate equipment, supplies, or space, postpone moving the object.

Plan your move.
Never consider moving an object routine work, even for daily housekeeping tasks. You must plan each step in the process before handling or moving a museum object. Where will you stand before picking up the object? Is there an open space to receive it? Planning helps keep handling to a minimum. When you plan, it helps you remember that each museum object is special. Keep in mind the following factors when you plan to move an object:

- ***Do you need to move the object?*** Is moving the object absolutely necessary? **If not, don't move it.**

- ***What are the object's structural characteristics and condition?*** Is it strong enough to withstand the move?

- ***Is there evidence of previous repairs?*** Review catalog records, condition reports, and photographs and examine the object to identify previous damage that may make the object especially fragile. Is there documentation that gives recommendations on moving hazards or safe moving techniques?

- ***What is the safest way to lift the item?*** How will you need to lift and carry the object to protect it from damage?

- ***How many people are required?*** Do you need help to move the object?

- ***Where is the object's new location?*** Is it large enough to properly house the object? Is the environment appropriate?

- ***What route will you use?*** Is it clear of obstructions?

- ***Will the personal health and safety of the handler be at risk?*** Do you have the proper moving equipment (for example, lumbar support belts or pallet jacks) to avoid physical strain? Do you need to wear a lab coat or dust mask?

5. *What are the basic rules for handling museum objects?*

When you handle objects use common sense and follow these basic rules to prevent damage to objects:

- Treat every museum object as if it were irreplaceable and the most valuable piece in the collection.

- Handle objects only when necessary.

- Move only one object at a time. Note: Small items can be moved together in a tote pan **if** they are separated and supported by padding.

- Never hurry.

- Take no risks.

- Never smoke, eat, or drink while handling objects.

- Avoid wearing anything that might damage objects by scratching or snagging the surface (for example, rings and other jewelry, watches, belt buckles, nametags, service badges).

- Use pencils, **not** pens, when working near objects.

- Keep hands clean, even when wearing gloves.

- Wear appropriate gloves.

  – Wear white cotton gloves when handling most objects.

- Wear plastic gloves (latex or nitrile gloves) when handling these types of objects:

  slick objects like ceramics or glass

  objects with oily or tacky surfaces that can attract cotton fibers

  fragile or damaged paper or other organic materials that may catch on cotton fibers

  some natural history specimens

- Know the condition of an object before moving it.

  - **Don't** lift by protruding handles or rims, which are often structurally weak.

  - Fragile objects should be given additional support, such as a tray or mount, before being lifted.

- Never layer or stack objects when moving them.

- Allow yourself plenty of space in which to work.

- Store objects so they can be easily moved without disturbing other objects.

- Tie on acid-free, cotton string tags or number trays, boxes, and bags so numbers can be easily seen without handling the object.

- Save all information associated with an object (for example, tags or labels).

- Remember to lift items properly.

Figure 6.4. Hold Objects at the Strongest Point. *A teapot should be handled by the base rather than by the handle or spout.*

The less museum objects are handled, the longer they will survive.

6. *What is the best way to protect an object I must pick up?*

When you pick up an object:

- Identify the strongest part of the object and hold it at this point.
- Take your time, handle only one object at a time, and use both hands.
- When an object has more than one part, for example, a teapot and lid, handle each part separately.
- Don't lift objects by protruding parts such as handles or rims.
- Stabilize any loose parts that cannot be removed.
- Move slowly and concentrate on what you're doing.
- Use a support board or tray whenever possible.

7. *When should I wear gloves?*

Gloves protect objects from contaminants such as dirt, salts, acids, and oils on your hands. Even clean hands can transfer these damaging substances. Wear clean, white cotton gloves except when handling ceramics, smooth glass, oily or tacky surfaces, fragile or damaged paper, or some natural history specimens. (Refer to Chapter 11 for a discussion of protective gloves to use when handling natural history specimens.) When handling these objects, wear tight-fitting latex or nitrile gloves for better gripping. Even when wearing cotton gloves, wash your hands frequently. Be careful not to rub your face and hair and then handle objects. Body oils may be transferred to the object and cause damage.

Figure 6.5. Wear Gloves and Use Both Hands.
Use two hands and wear gloves when handling museum objects.

Wear clean, white cotton gloves for handling many museum objects. Wear tight fitting latex or nitrile gloves when handling slick objects like ceramics or glass, objects with oily or tacky surfaces, fragile and damaged paper and other organic materials that can catch on cotton fibers, and some natural history specimens.

8. *What should I do if I damage an object?*

If you damage an object, report the damage. Damage should be recorded in the condition and condition description fields of the ANCS+ catalog record. Follow the instructions in the *ANCS+ User Manual* on reporting condition.

See *Museum Handbook*, Part II, Chapter 3, for information on how to do condition reporting.

Take photographs of the damage if possible. Save all pieces and carefully pack them so that no further damage occurs before a conservator can make repairs. Small pieces may be wrapped and bagged in self-sealing polyethylene bags labeled with the appropriate object identification information.

9. *What personal health and safety issues should I consider when handling museum objects?*

It is very important to follow health and safety precautions when handling museum objects.

- Practice safe lifting techniques. Remember to lift with your legs and not your back. Use proper personal support equipment, such as a lumbar support belt. Don't lift more than you can safely carry. See Figure 6.6 for a list of techniques that will help protect you from injury.

- Be careful how you handle potentially dangerous objects (for example, firearms, ammunition, and medicines). See *Conserve O Gram* 2/5, "Fossil Vertebrates as Radon Source: Health Update"; 2/8, "Hantavirus Disease Health and Safety Update"; and 2/10, "Hazardous Materials in Your Collection."

- Don't touch or inhale fumes or particles from objects treated with pesticides such as arsenic. See *Conserve O Gram* 2/2, "Ethylene Oxide Health and Safety Update"; 2/3, "Arsenic Health and Safety Update"; and 2/4, "Dichlorvos (Vapona) Update."

1. ***Be sure you have firm footing and keep your legs apart.***
2. ***Bend at the knees.***
3. ***Use your leg and stomach muscles, not back muscles, when lifting from a stooped position.***
4. ***Get close to the object and keep it near your body.***
5. ***Avoid twisting; pivot using your feet.***
6. ***Keep your back straight.***

Figure 6.6. How to Lift Properly and Avoid Injury.

Figure 6.7. The Proper Way to Lift a Chair.

Figure 6.8. The Proper Way to Lift a Small, Framed Photograph.

Figure 6.9. The Proper Way to Lift and Carry a Small Textile Object.

C. Moving Objects Within the Museum

Preventive conservation continues with the careful movement of objects. When you move objects you increase the risk of damage and loss because you are both handling them and changing their location.

1. *What should I do before moving objects within the museum?*

Before you move objects within the museum for dusting or cleaning, or any other purpose, be familiar with the rules you should follow that help reduce the risk of damage. Planning is essential before handling or moving any museum objects. Think through your plan so that you lift and move objects properly. With advanced planning, you can keep movement of objects to a minimum.

> ***Moving puts an object at its greatest risk.***

2. *What do I need to know before moving objects?*

Evaluate the object's condition and structure before moving it. Review object catalog records for condition reports, photographs, or other instructions that may provide information on the object's stability.

Know the object's condition and structure.

- Check the catalog card for any record of past damages.
- Check for loose parts or fragile surfaces. Careful examination will usually reveal if an object is not stable.
- Do I have to move the object? Constantly handling and moving objects can cause them harm.

Use safe handling practices.

Know the rules for handling museum objects. See Section B of this chapter. When lifting objects:

- Use both hands.
- Lift most objects from the base and/or close to the center of gravity.
- Don't try to push or drag objects across surfaces.
- Don't handle objects by handles or rims.
- Place objects inside containers (trays or boxes) for carrying (see Figure 6.9).
- Make sure objects are padded using museum materials (for example, polyethylene foam or acid-free tissue).
- Secure objects in separate compartments in a box or tray to prevent them from being damaged.
- Don't allow objects to stick out beyond the sides of the containers.

Figure 6.10. Use Trays and Padding to Prevent Damage.
These pipe bowls were placed in individual specimen trays within a larger tray to prevent damage during movement.

Use trained, experienced staff.

When selecting people to move objects:

- Evaluate the experience of the people handling and moving the objects.
- Assign specific tasks to each person.
- Review the move plan verbally with participants before moving the objects so that all understand their duties and assignments.

Use proper equipment.

Make sure you have the proper moving equipment so that the move is safe for both objects and people.

- Use the correct type of equipment. Useful equipment includes trays or baskets to support objects and flatbeds, carts, dollies, and pallet lifters to move objects.
- Inspect the equipment to make sure that it is safe for both the objects and the person handling the objects before you begin.
- Pad carts and other surfaces with polyethylene foam or another stable material to protect the objects.
- Postpone moving the objects if you don't have proper equipment, supplies, space, and trained helpers.
- Use rubber doorstops to prop doors open before you pass through.
- Use personal protective equipment when appropriate.

Clear the new location and the route there.

Before moving the object:

- Make sure the location is ready to safely house the object.
- Know which route to take, which equipment to use, and how much time you'll need to complete the move.
- Provide written instructions if needed.
- Be aware of all surfaces that the object may contact (for example, doors, floors, and walls).
- Study the spaces through which the object may pass (for example, doorways, stairwells, display areas).
- Avoid tight areas.
- Don't move objects during peak visitation periods or open hours, if possible.
- If transporting the object outdoors, move it when the weather conditions are good, with no rain, snow, or extreme heat. If this isn't possible, then take appropriate precautions such as waterproof coverings and packing to provide environmental buffering.
- Be aware of weather conditions at the final destination to determine the type of protective container needed.

D. Packing and Shipping Preparations

1. *When would I need to pack and ship objects?*

Sometimes you must pack and ship objects to send them to a new location. For example, you may need to pack and ship objects for outgoing loans or conservation work.

2. *Why is it important to properly pack objects for shipping?*

The hazards of shipping an object are numerous. Improper packing can cause an object to be permanently damaged or destroyed. A properly packed container is critical to ensure your objects arrive safely.

3. *How can I learn how to pack museum objects?*

Begin by following the rules for the proper handling of objects. See Sections B and C of this chapter. The best way to learn how to pack is to work with an experienced packer. Learn to pack different types of materials, such as textiles and glass. **Each object requires a unique packing solution.** Museum professional associations often offer classes on packing and shipping.

4. *What kind of workspace do I need for packing?*

You need enough room to work comfortably with the objects you are packing. For small objects you will need a table or desk; for larger objects you may need to have a portion of a room. For these larger objects, figure that you will need a space at least three times the size of the object you plan to pack. If you do a lot of packing, you should have a permanent packing area. When setting up a packing area:

- Select an area that can be cleared so you have sufficient room to safely pack the objects.
- Choose an area close to where the objects are stored to prevent unnecessary handling. Avoid continuously moving objects up and down stairways, around tight corners, or through narrow doorways.
- Pad the table with a few sheets of 1/8" polyethylene foam. Cover the polyethylene foam with 4-mil polyethylene sheeting. Securely fasten the sheeting beneath the work surface.
- When packing textile objects, pad surfaces with unbleached muslin over polyester batting.
- Remove all other tools and materials from the table while packing.

5. *How much time should I allow for packing objects?*

Packing can take several hours or even days, depending on the object. Allow yourself plenty of time to pack correctly. Don't hurry. Make sure each object is secure before moving onto the next.

6. *What do I need to consider before shipping?*

When you are preparing to ship an object, plan carefully. A lot of damage can occur during shipping. Movers may jar or drop objects. Airplane vibrations, exposure to bad weather, and rapid fluctuations in relative humidity can damage objects. Proper packing and shipping will limit these and other travel hazards including:

- shock and vibration
- sudden changes in temperature and humidity
- mishandling
- theft, vandalism, and loss

Before moving a museum object outside of the building, consider:

- the object's fragility
- the shipping method
- the climate through which the objects will travel
- the climate at the object's destination

7. *How do I determine if the object can be safely shipped?*

Carefully examine the object to see if its condition allows for safe travel. Be sure to check the condition and structure of items that can be very fragile. These include glassware, photos on glass, wooden musical instruments, paintings on wood, pastel paintings, charcoal drawings, and cracked porcelain. See the appendices in this volume for the particular problems you may find with different materials.

8. *How do I ship hazardous materials?*

To ship hazardous materials, such as nitrate film or firearms, you must follow special shipping requirements. The Bureau of Alcohol, Tobacco, and Firearms (ATF) has specific guidelines for shipping certain types of firearms. Contact the ATF's National Firearms Act Branch at (202) 927-8330 to determine the shipping requirements for your collection. Work with the company that will do the shipping to find out specific requirements for other types of hazardous materials. *Conserve O Gram* 14/8, "Caring for Cellulose Nitrate Film," gives information on shipping nitrate film.

9. *How should I document the condition of the objects?*

It is important to document the condition of an object before moving it. If an object is damaged, the documentation will help you determine the extent of the damage.

See *Museum Handbook*, Part II, Chapter 5: Outgoing Loans, for information about recording condition for loans. You may want to use the Object Condition Report (Form 10-637) to document an object's condition. For insurance and other purposes, when documenting condition:

- Use a portable light source and magnifying lens to help identify markings.
- Note and document areas that have been previously repaired.
- Carefully examine objects for pest infestation.

E. Packing and Shipping Materials

1. *Why is it important to use the right packing and shipping materials?*

Packing materials can adversely affect the object. Some materials are abrasive and can damage objects. Friable objects (for example, ancient glass, charcoal, pastel and conte crayon drawings, corroded metals) are susceptible to mechanical damage from even minor abrasion. Acidic tissue should not come in contact with objects that are acid sensitive. Some plastic bubbles and foams may leave imprints on polished metals, varnished woods, oriental lacquer and other smooth-surfaced objects. Materials that come in direct contact with the object must not stain, be abrasive or acidic, or off-gas damaging chemicals. To prevent these types of damage you should select appropriate materials for each packing situation. Never re-use packing materials on different types of objects as residues and dirt can be transferred.

This section describes materials commonly used in packing objects for transit. The bibliography lists a variety of references that can aid you in selecting proper materials and techniques. You can also contact your regional/Support Office (SO) curator or a conservator if you have questions about a specific material.

2. *What sources of packing materials are available?*

New packing products are continually appearing on the market. Contact museum packers to learn about new materials. If you choose a new material, be sure it has been tested and generally approved by the museum field. See NPS *Tools of the Trade* for some suggestions. You can obtain other supplies from the following sources:

- General Services Administration Federal Supply Schedule (look under "Cushioning Materials" or "Packaging and Packing Supplies")
- *Storage of Natural History Collections: Ideas and Practical Solutions*, put out by the Society for Preservation of Natural History Collections (listed in the bibliography)
- local telephone directories (look under "Boxes," "Packaging Containers," and "Packaging Materials")
- businesses specializing in packaging for high-tech electronic equipment

Ask your regional/SO curator if you are unsure about any materials you want to use.

3. *What are good covering and wrapping materials?*

Good covering and wrapping materials include:

- ***Acid-free glassine paper*** is stiff, translucent, and glossy in texture. You should use glassine only for short-term storage (less than 30 days). Glassine is recommended for covering paintings, bottles with labels, or objects with a friable or oily/tacky surface. Use only new glassine paper since it deteriorates and becomes acidic over time.
- ***Tyvek*** is an alternative to glassine. This material is available in soft textile-like or slick, smooth finishes. Tyvek is a type of high-density polyethylene and is stable for long-term use.
- ***Tightly woven nylon fabric*** can be used to cover cushioning foams to protect the object. Make sure nylon doesn't come into contact with the surface of delicate materials as it can be abrasive.
- ***Cotton knit*** (available in rolls) is another good covering material. It is a good, soft cover for polyethylene foam supports.
- ***Unbleached washed muslin*** can be used for wrapping sculpture and textiles. Wash muslin in hot water several times before using it to remove sizing and make it softer.
- ***Soft, unbuffered acid-free tissue paper*** is used for covering basketry, metal, and textiles. It is also good for making pads to fill empty spaces and covering appendages on objects.
- ***Mylar®*** is a clear, stable polyester film that serves as a good primary protector for paper. Mylar has an electrostatic charge. **Never use it on pastels or charcoal drawings.**
- ***Blanket pads or quilts*** are used for covering large sculpture and furniture.
- ***Acid-free folders*** are used to contain unframed prints, documents, and photographs.

Examples of when and where to use these materials can be found in the references listed in the bibliography.

4. *What are good cushioning materials?*

Cushioning materials are designed to absorb shock and buffer the humidity. These materials are usually foam products that you can use in a variety of cushioning techniques. Use each type of foam correctly to achieve adequate shock and vibration protection. Because each foam product offers different cushioning qualities, you may want to use a combination of foams. The Canadian Conservation Institute (CCI) has designed tools (The Circular Slide Rule for Cushion Design and PadCAD computer program) to help museums estimate how much cushioning material to use. These aids help you evaluate the shock that occurs when a package is dropped from a certain height. This calculation helps you determine how much and what kind of cushioning materials you should use. You can obtain these aids directly from CCI, 1030 Innes Road. Ottawa, ON KIA OM5, Canada (613) 998-3721 <http://www.pch.gc.ca/cci-icc/>.

A few good cushioning materials are listed here:

- **Bubble-pack™** is a plastic sheet with trapped air bubbles. Bubbles can leave impressions on an object's surface so use this product with the bubble side facing away from the object's surface. Don't use it with sharp objects that can break the bubbles. Use several layers to maximize the padding effect. Always wrap the object first with tissue or muslin to protect the surface and to buffer relative humidity.

- **Polyethylene foam sheets (Ethafoam, Volara)** are light, easily handled, shock absorbing, chemically inert, and a barrier to moisture. Join sections with a heat gun, glue gun, or double-faced tape. These sheets are available in various densities, thicknesses, and textures. Use only white sheets; blue and pink sheets contain additives that may cause deterioration.

- **Polyurethane foam** is one of the best cushioning agents and it cuts easily. Its soft springy nature absorbs shock very effectively. It is very unstable, however, so use it only for **short-term** transport packing. Always put a barrier, such as acid-free tissue or Tyvek, between this foam and the object.

One packing material commonly used is **plastic "peanuts,"** which are expanded polystyrene. These are usually not appropriate for museum objects. They are messy, retain moisture, and they cling to surfaces. They are also difficult to remove if they get caught in appendages. If you must use these peanuts, do so only with small, light objects (<5 lbs.) or as a pad of peanuts collected in polyethylene bags. **Plastic** "**potato chips**" are a better form for providing padding.

5. *What materials make good interior boxes?*

Double boxing gives extra protection to objects (see Section F.5). The interior boxes can be made from a variety of materials. Many objects can be packed inside double-strength fiberboard boxes. You can also use polyethylene or polystyrene boxes. These plastic boxes will also protect objects from water damage.

Sometimes you may need to make a specially shaped box to pack odd-sized objects. There are several materials you can use to produce specialized interior boxes:

- **Foam-Cor®** is a polystyrene foam sandwiched between two layers of clay-worked kraft linerboard.
- **Archival corrugated board** is an acid-free, lignin-free cardboard.
- **Vapor barrier films** are a variety of laminate metal and plastic sheet materials that allow very little penetration of oxygen or water vapor. They make good box liners and can help maintain the interior microclimate.

6. *What kind of tape should I use on the box and the wrapping material?*

- **Cellophane and masking tape** can both be used to attach packing materials. Don't use these for closing the outside of the container, as they are not strong enough to resist damage during shipping.
- **Pressure-sensitive plastic tape** can be used to seal the outside of the container.
- **Water activated paper tape** can be used for sealing containers and attaching kraft paper. The 3"-width tape is best.
- **Nylon reinforced strapping tape** should only be used for closing containers. The adhesive on this tape is very sticky and strong, so be very careful to keep it away from objects or wrapping materials that may contact objects.

Don't allow any tape to contact the surface of objects.

7. *How should I select an exterior container?*

A quality exterior container contributes to an object's safe travel. Select containers prior to packing. Consider the following criteria:

- the physical characteristics of the item you are shipping (for example, size, weight, fragility)
- how much space the object needs inside the container for the object to fit comfortably and securely
- the method of transportation and who will handle the container
- environmental and weather changes that may require humidity and temperature buffering
- the number of times the object will be packed and unpacked

Exterior containers are fabricated from metal, wood, cardboard, fiberglass, and high-density plastics. The best exterior containers are:

- puncture proof
- light proof

- watertight
- protective against shock or vibration
- good environmental buffers

8. *What kinds of containers do I use for objects that have different weights and sizes?*

You should pack objects according to their weight, height, and density. Pack light objects in double strength cardboard boxes. Heavier objects (for example, paintings, sculpture, and furniture) or valuable and fragile items need the extra support of wood, fiberglass, or high-density plastic. You may have to build a special container customized for the object or hire a professional carpenter to build one.

9. *Can I build an exterior container?*

Build a container only if you have good carpentry skills and packing experience. You can use nails and glue to build the container, but use screws on the lid once the object is in the box. Never use nails on the lid because they can accidentally pierce the object. Vibrations from hammering or prying open the lid may also cause damage to the object.

Line the interior of the container with polyethylene sheeting, Tyvek, or vapor barrier film to protect the objects from water and to help buffer the interior microclimate. Add gaskets, skids, handles, and battens as needed for protection. Use castors on large containers to facilitate movement.

For more information on the specifics of making a box for shipping museum objects, see the references at the end of this chapter.

10. *Can I use a reusable shipping container?*

If you frequently pack and ship objects you might want to purchase reusable polyethylene containers. The Museum Management Program can provide more information on reusable containers and where you can get them.

11. *How do I protect objects from environmental changes during shipping?*

Containers will be exposed to temperature and relative humidity changes during the shipping process. These environmental changes can affect the object inside. Hygroscopic materials (materials that readily absorb moisture) used as packing materials can act as a buffer against relative humidity changes within the container. Wood, paper, natural fiber fabrics, and silica gel are good examples of hygroscopic materials that make good packing materials.

12. *How should I store packing materials?*

Keep packing materials in a clean, dust free, controlled environment. Avoid accumulating excess packing materials if you don't have adequate storage space for them because they increase both the risk of fire and the chance of infestation. If possible, store them in an environment with stable humidity between 40-60% RH. Wood crates and packing materials absorb moisture and pollutants. If the crates absorb more moisture than is recommended, allow them to adapt to the same environment as the object for two weeks prior to shipping. Open the lid to speed the process. Before bringing packing materials into the collections area, check all materials for pest infestation.

F. Packing for Shipping

Once you have selected your packing materials and decided on the kind of interior and exterior container you will use, you need to pack your object. This section discusses how to pack and cushion an object so it will not be damaged from shock and vibration. It also describes the documentation that you should include inside the container.

1. *How do I decide which way to position an object in a container?*

Evaluate the object's shape and size before packing. Plan for the worst possible travel scenario. Consider the object's weight and center of gravity. When you position the object:

- Place the heaviest part of the object low and close to the center of the container.
- Place glass-covered framed works of art vertically with padding between each item.
- Separate parts of objects (for example, a teapot and lid) and wrap separately.
- Immobilize and dismember objects with moving parts (for example, a spinning wheel) and wrap parts separately.
- Provide additional support for heavy parts of an object.
- Pack only objects of similar weight in the same container.

Figure 6.11. Pad and Separate Parts.
Pad moveable parts and separate parts of an object to avoid damage during handling.

2. *How do I cover and wrap an object?*

Use an initial covering to protect objects from abrasive packing materials and to serve as an additional buffer. Use soft, unbuffered, acid-free tissue for most objects. If possible, don't use tape to hold the covering material closed. Instead, tuck the tissue in on itself or into an appendage. This removes the chance that tape will get stuck to the object. Don't wedge

tissue so tightly that it exerts stress on the object. **Never crumple tissue in wads.** Insert smooth pillows of tissue between parts of an object.

Wrap paintings in glassine paper or Tyvek. Don't use plastic as it can trap moisture if the temperature drops radically during shipping and condensation occurs. This moisture can support mold growth and many other types of deterioration.

After you cover the object, round off all projecting parts and handles with tissue. For example, imagine you are wrapping a teapot. Place soft, unbuffered, acid-free tissue around the spout, inside the teapot, and in the open space under the handle. The end result is a rounded-off ball of tissue where projecting parts are protected by the whole. Wrap the entire teapot in one sheet of tissue or bubble-wrap to hold padding in place. Label the exterior wrapping with object identification information (for example, object name and catalog number).

3. *How should I cushion the object inside the container?*

There are several ways to properly cushion objects inside the packing container:

- Use packing materials (for example, bubble-wrap, polyurethane, or polyethylene foam blocks) that help absorb shock and vibration and create a thermal barrier.
- Always provide at least two inches of cushioning between objects in the same container.
- Provide at least two inches of cushioning between objects and the walls of the container.
- Allow three to four inches between very fragile items like ceramics and glass and between heavy objects.
- When determining the number of objects you may pack in one container, use common sense. Consider weight, fragility, and sensitivity to environmental conditions. For example, do not pack heavy metal industrial parts with china. Likewise, environmentally sensitive ethnographic objects require more buffering material than historic metals.

Figure 6.12. Wrapping, Padding, and Packing for Shipping an Object.

4. *What other techniques can I use to cushion objects and provide shock absorption?*

There are a variety of techniques that you can use to cushion objects. These techniques include:

- double boxing
- cavity packing
- padding negative spaces
- cushioning braces

You should base your selection on the fragility, size, and construction of the object as well as the modes of transportation during shipping.

Double Boxing

Double boxing is the process of packing an object in two sequential boxes. It's an excellent way to cushion objects. Follow these steps:

- Wrap the objects and cushion them inside one box.
- Pack the first box inside a second box at least two inches larger on all sides.
- Completely fill the spaces between the boxes with newspaper or foam, or use corner blocks or plastic rings between the boxes.

Figure 6.13. Objects Double-boxed for Shipping.
The straps make it simple to remove the interior box.

Cavity Packing
Cavity packing is the process of placing small to medium-sized objects in hollows cut into layers of polyethylene foam. This technique is clean and easy to use in repacking. To cavity pack:

- Trace the shape of the objects.
- Mark the shape on the foam with a pencil.
- Cut out the contour with a bread knife or electric carving knife.
- Protect the object against abrasive polyethylene material by covering the cavity with soft, unbuffered acid-free tissue, Tyvek, or another smooth inert material.

Padding Negative Space
Use this technique for less fragile objects. Surround the object with tissue paper and then wrap it with successive layers of bubble wrap. Place the object inside the container and use pads of tissue, bags of packing peanuts, or soft foam to fill in the excess area. Allow several inches between each object and between the objects and the inner container. Larger, heavier objects will need more separation than small, lightweight objects. When using this technique for open objects (for example, pots or baskets) fill them with tissue to prevent collapse caused by the pressure of surrounding objects.

Cushioning Braces
A cushioning brace holds the object in place and may be necessary to immobilize the object when padding negative spaces. To make a cushioning brace, measure the distance between the object and the container. Build polyethylene blocks to fill in the space. Cover the polyethylene with a less abrasive material such as soft acid-free tissue to protect the object. Place packing material on top of the object to prevent it from moving during shipping, but don't overfill the box. Overfilling places too much compression on the object.

5. *What should I do before closing the container?*

Before you close the container, place packing material above the object to prevent movement if the box is overturned. Avoid too much compression so that padding material does not damage the fragile objects. Cushioning material should support and enclose but not compress the object. After you finish packing, lightly jar the container to determine if objects can shift. If they can, you must repack the container

You should create an inventory of all contents inside the lid of each packing container. If the procedures for unpacking are complicated, include written unpacking instructions or a sequence of photographs showing the proper packing or unpacking procedure. Unpacking in an incorrect order can cause damage. Place a label with the address neatly typed or printed inside the box in case the exterior address is lost or destroyed.

6. *Should I wrap and label the shipping container?*

After a box is packed you may want to wrap it in paper to give it a finished, clean appearance. If you must wrap a box, do it carefully and neatly. A poorly constructed and shoddily wrapped container invites people to mishandle it. A neatly wrapped and properly labeled container encourages handlers to be careful. Kraft paper is an excellent exterior wrap for containers. Tape all open edges and folds of the paper.

7. *What should I put on the label on the exterior of the container?*

Prepare the exterior label as follows:

- Always print the name and address of the recipient in permanent ink.
- Write the recipient's name and address directly on the outside of the box as well as on any wrapper. This way, if the wrapper is torn, the package will not have to be opened to get the name and address of the recipient.
- Place the typed or neatly printed address in the center of the box. Place a duplicate label with this information inside the box. If the address is a P.O. Box, include the telephone number on the label.
- Always include the name of the recipient on the address label. Phone before you ship so that the recipient will be expecting the shipment.

8. *What kind of identification markings should I put on the box?*

- Write neatly on the top, "OPEN THIS SIDE."
- Put arrows on the sides to let the handlers know which end is up.
- Add necessary labels to warn handlers and give them information they may need to know to properly handle the box. For example:
  - Label the package "FRAGILE" if the contents are delicate.
  - Add the proper hazard label for nitrate film and other hazardous materials.
  - Print specific instructions such as, KEEP DRY, DO NOT TILT, HANDLE WITH CARE.
- Mark the total number of boxes on the address labels (Box 1 of 2, Box 2 of 2).
- Make sure all labels are secured with strong tape or adhesive.
- **Don't** attract thieves by writing "Works of art" or "Museum objects."

G. Shipping Objects

1. *What things should I consider if I use a professional packer/shipper?*

You may decide to contract for packing/shipping service. However, be aware that professional packers/shippers seldom have knowledge of and sensitivity to the delicacy of museum objects. Use shippers who've handled museum collections before or who specialize in museum collections. The reputation of a particular art packer or carrier is an important factor to consider. Get referrals from your regional/SO curator and other parks or local museums. Check references of any firm you plan to hire. After you select a company, discuss and confirm the following points of information about the shipment:

- size and weight limitations
- insurance coverage
- costs and payment terms
- pick up and delivery times

The park should also be specific with the carrier about meeting NPS standards. Finally, be prepared to supervise and give specific instructions for packing/shipping the objects.

Park curatorial staff should inform the regional/SO curator of positive and negative experiences with particular art packers and carriers. This information will help to maintain a current list of available packers and carriers for referral to other parks.

2. *What transportation alternatives are available for shipping museum objects?*

There are several options for transporting museum objects. These include:

- U.S. Postal Service
- package delivery services (for example, United Parcel Service (UPS) or Federal Express)
- motor freight
- airfreight
- courier

Your selection depends on:

- size
- weight
- distance
- object fragility
- extra services required

Specific features and limitations of each alternative are described below.

3. *When should I use the U.S. Postal Service?*

Use the U.S. Postal Service (USPS) for objects that are not fragile or of special significance (for example, high monetary, associational, or research value). Always mail "priority" class to reduce transit time. Send by registered mail, return receipt—the most secure service offered by the USPS. With registered mail the USPS monitors the movement of your package from the point of acceptance at the post office to delivery. You will receive a receipt when you mail your package and a delivery record is kept at the post office at the other end. When you request a return receipt, you will receive a receipt showing who signed for the item and the date that it was delivered. Completed packages must weigh less than 70 pounds and measure less than 108 inches in combined length and circumference.

4. *When should I use commercial package delivery services?*

Use commercial package delivery services such as United Parcel Service (UPS), Federal Express, or Airborne Express for shipping sturdy objects. These companies have limits on the value of objects they will ship and insure. Talk to the company you choose to find out:

- value limits (companies often will not ship objects worth more than $50,000) For more information on appraisals, see *Museum Handbook*, Part II, Chapter 4: Inventory and Other Special Instructions.
- insurance requirements (most companies have a basic insurance coverage, but require you to purchase higher limits)
- size and weight limits

- pick up and delivery alternatives (for example next day, second day, weekend)

Be sure to require the service to sign and return an Acknowledgment of Delivery form. When shipping to a large institution, specify that a specific person or department must sign for the delivery. This is to ensure that the package is not left at a loading dock or reception desk.

5. *When should I use an art shuttle van or special product truck?*

Art shuttle vans and special product trucks offer another form of transportation for museum objects. Some national van lines and specialized art handling companies offer these services. However, they are subject to side routing, delay, and transfer between vehicles. When choosing this shipping method, discuss in detail the route and process that the transport will use. Ship only in air-ride suspension trucks that can absorb road shock. Transport objects sensitive to temperature and relative humidity changes in a climate controlled van. Cost is based on size of shipment, weight, distance, and extra services such as pick-up, non-stop delivery, climate control, and daily progress reports. You can find other information about specialized shippers in the AAM Products and Services Directory under "Shipping and Moving Companies."

6. *When should I use airfreight?*

Airfreight is a fast transportation method, but it can be expensive. Airfreight also subjects objects to considerable handling. However, with airfreight, the object is out of your control for the least amount of time.

A typical airfreight-shipping scenario looks like this:

1) Truck or van transports the object to the airport.
2) Objects sit on the loading dock.
3) A forklift carries objects to the plane.
4) The objects fly on one or more planes.
5) A forklift unloads the objects. They may sit for a time on the loading dock:
6) A van takes the objects to the final destination (airfreight companies generally contract for pickup and delivery services).

Plan routing carefully to minimize stopovers and plane changes. This prevents unnecessary loading and unloading or an unattended crate at the loading dock. Be mindful of pressure differences between ground and flight level that may affect pressure-sensitive objects. Size limitations are related to airplane configuration. Weight and dimension of the shipment normally determine air shipment charges. Seek out an airfreight forwarder to help you coordinate air and ground transport.

7. *Should I use a courier?*

All of the above techniques have some level of risk. You can reduce this risk by using a courier. Using a courier decreases the possibility of loss. Because of the fragility, sensitivity, and high value of most museum objects, consider having a courier accompany the object during transit. A courier is also recommended if the trip is complex with many carrier changes. Someone with knowledge of conservation, museum documentation, and object handling techniques may serve as a courier. This person might be either a hired agent or a NPS employee.

As a courier on an airplane, you must:

- Make all arrangements in advance with the airline. Explain what you will be carrying, loading, and unloading.
- Check on airline size limitations before planning for a hand-carried shipment.
- Purchase an extra seat for the object if necessary.
- Secure the object (container) with a seat belt unless it will fit under your seat or overhead compartment.
- Never let the object out of your sight.
- Do not carry hand luggage that gets in the way of the object.
- Do not reveal the contents of the package to other passengers.
- Try to board before and disembark after other passengers.
- Supervise the loading and unloading of objects in the cargo hold and accompany the object from the plane to the cargo shed.
- Deliver the museum object as soon as possible.

If traveling by car:

- Be sure someone is always with the object in the vehicle.
- Stop only when necessary.

H. Receiving and Unpacking the Container

1. *How should I unpack a container?*

You should use as much care unpacking a box as you use in packing it. Follow these basic instructions:

- When you receive a shipment, don't open the box for 24 to 48 hours to allow the contents to acclimate to the new environment.
- If the box exterior is damaged, note the problem on any receipt of acceptance that you sign. This identifies the fact that damage occurred before the box arrived at the park.
- Cut tape carefully to avoid excess pressure on and damage to the object.
- Check for unpacking instructions that may be included with the box.
- Check the contents of the box against the packing list to ensure that everything is present.

- Flatten all packing materials completely to be sure that no object pieces or small items are still inside.
- If the object has to be repacked to return it, place the packing materials inside the box or crate and save the container.
- Take careful notes on the unpacking sequence and label all packing boxes and supports so they can be reused properly.
- Never permanently store museum objects in packing containers. Such containers are for short-term transportation needs.

2. *Should I check for insect infestation?*

As soon as you unpack the box you should check for pests:

- Thoroughly check the object for signs of infestation such as shed larval skins or live insects.
- If infestation is noticed, immediately isolate the object and develop a strategy for dealing with the infestation. If the item does not belong to you, contact the owner and solicit their input when developing your strategy. See Chapter 5: Biological Infestations, in this handbook, or contact your regional/SO curator for additional information.

3. *What do I do if an object is damaged, lost, or destroyed during shipping?*

All shipments should be insured with wall-to-wall insurance coverage. See *MH-II*, Chapter 4, for information about insuring shipments. If an object is damaged when it is returned, document the damage. Damage should be recorded in the condition and condition description fields of the ANCS+ catalog record. Follow the instructions in the *ANCS+ User Manual* on reporting condition. See *MH-II*, Chapter 3: Cataloging, for information on how to do condition reporting.

Take photographs of the damage if possible. Save all pieces and carefully pack them so that no further damage occurs before a conservator can make repairs. Small pieces may be wrapped and bagged in self-sealing polyethylene bags labeled with the appropriate object identification information.

If the damage occurred during shipping, report the damage to the shipping company and submit an insurance claim. You will have to provide evidence that the object was not damaged before shipment.

If an object is lost or destroyed during shipping, report the loss and deaccession the object. Follow the procedures outlined in the *MH-II*, Chapter 4: Inventory and other Special Instructions, Section III, "Reporting Loss of Museum Objects," and Chapter 6: Deaccessioning, Section H, "Loss, Theft, Involuntary Destruction, Abandonment or Destruction."

Rules for Handling Objects in Park Collections

1. AVOID wearing anything that might damage objects by scratching or snagging the surface, such as rings and other jewelry, watches, belt buckles, nametags, and service badges.

2. NEVER smoke, eat, or drink around the objects.

3. Handle objects only when necessary.

4. LOOK carefully at an object before lifting. Ask yourself:
   - Is the surface fragile?
   - Are there any clues to make me think it is damaged?
   - Where am I going to put the object, and is there a clear space set aside for it?

5. Use BOTH HANDS to lift an object.

6. If an object is in a container, lift only the container.

7. WEAR GLOVES when lifting objects

8. Wash your hands before putting on cotton gloves. Oils and acids can soak through gloves.

9. If you break something, tell the Curator.

Figure 6.14. Example of Written Handling Rules for NPS Park Collections

Chapter 7: Museum Collection Storage

CHAPTER 7: MUSEUM COLLECTION STORAGE

A. Overview

1. *What is museum collection storage?*

Museum collection storage is both a space and a process.

- It is space that you dedicate to storing museum objects, natural history specimens and archival items. It is space that is either designed or upgraded for the maximum protection and optimum use of the collection.

- It is the process of properly containing and caring for the museum collection while it is in the collection storage space. Each decision you make about storage should consider how changes would improve the protection and preservation of the museum collection.

2. *How does collection storage fit into my park's preventive conservation program?*

Good collection storage is a major component of a preventive conservation program to preserve your museum collection. A well-planned and organized storage space reduces the risk to the object. Deterioration, damage, or loss will be minimized if you have:

- proper storage techniques

- good handling practices (see Chapter 6)

- effective security and fire protection (see Chapter 9)

- appropriate environmental conditions (see Chapter 4)

- a pest free environment (see Chapter 5)

A well-planned and organized storage space also ensures that the objects are accessible. When you place an object on exhibit you usually compromise the conditions that are best for preservation. However, collection storage is a different matter. You can achieve ideal preservation conditions for objects that you keep in storage.

3. *What is a collection storage system?*

Preserving museum objects in storage involves evaluating the total museum storage system housing the collection. A collection storage system is the protective envelope surrounding the collection. It includes three levels of containment:

- the facility or space

- the equipment

- the containers

Although museum collection storage varies from park to park, the factors that need to be considered to properly house a collection remain the same. Evaluate each level of the system and adapt it to meet your park's specific collection preservation and protection needs. Be practical and evaluate the space available to house the collections as well as the cost, both in funds and staff time available.

The levels of containment in a collection storage system are illustrated in Figure 7.1. Each level adds additional protection to your collection by shielding it from the agents of deterioration.

B. Standards and Requirements for Collection Storage

1. *What are the museum collection storage standards and requirements?*

Museum collections require special storage conditions. Standards and requirements for managing museum property are based on Departmental and NPS policy and professional museum practices.

The Interior Departmental Manual, Part 411, Policies and Standards for Managing Museum Collections, Chapter 3, provides departmental standards for museum property storage.

The NPS *Management Policies* (p.5:13) states*:*

> *"The National Park Service will employ the most effective concepts, techniques, and equipment to protect cultural resources against theft, fire, vandalism, environmental impacts, and other threats without compromising their integrity or unduly limiting their appreciation by the public."*

The "NPS Checklist for Preservation and Protection of Museum Collections" provides general standards for collection preservation and protection. See Appendix F: NPS Museum Collections Management Checklists.

NPS collection storage standards can be summarized as follows:

Safe and secure storage of museum collections requires dedicated space. You must use museum storage areas only for museum collections. To the extent possible, separate museum storage from all other uses, including office space and research and work areas. Museum collections require suitable and sufficient space. The space you select for museum storage must be adequate to accommodate the particular characteristics and quantity of objects, specimens, and archival items you have in your collection and provide adequate space to accommodate reasonable growth of the collection. Organize the space to allow for the efficient use of curatorial equipment and techniques and to provide for effective access and optimum preservation of the museum collection. House objects in appropriate containers and package objects with appropriate materials.

2. *Where do I start in establishing my collection storage needs?*

Complete the "NPS Checklist for Preservation and Protection of Museum Collections." (See Appendix F: NPS Museum Collections Management Checklists.) This checklist helps you evaluate your collection storage needs in the following areas:

- facility and space requirements
- protection requirements (physical security and fire protection)
- environmental requirements
- museum equipment and container requirements
- housekeeping requirements

You complete the checklist using the Automated Checklist Program found in the Utilities Module of ANCS+. See Appendix G in the *ANCS+ User Manual* for more information.

3. *What are the collection storage facility and space requirements?*

Facility and space requirements deal with space adequacy, construction features, and design loads for collection storage.

Make sure the collection has suitable and sufficient space for proper storage. Suitable space is planned space that has been evaluated for its adequacy for storing museum objects. Outbuildings, closets, and unimproved basements and attics are not suitable space. These inadequate spaces rarely contribute to the preservation and effective use of a collection.

The following guidance elaborates or expands on the standards in Appendix F.

4. *How do I ensure that I have adequate space to store the collection?*

The storage space must be large enough to accommodate the existing collection as well as the projected growth of the collection over the next 10 years. Your space should:

- allow use of proper storage equipment and techniques
- incorporate aisles at least 48" wide between rows of equipment; this width allows safe handling and movement of drawers, cabinet doors, and larger objects

Make sure the space allows movement of personnel, equipment and objects in and out without hindrances such as inadequately sized doors; narrow, winding, or steep stairs; or passageways with low ceilings.

Carefully plan and organize your storage space to make the collection easy to access for study, exhibition, or accountability.

5. *What general building features contribute to storing the collection?*

Collection storage facilities and spaces should be constructed to meet the following requirements:

- Make sure the storage space is not located on a 100-year floodplain. This is in accordance with Executive Order 11988, "Floodplain Management," May 24, 1977 (42 USC 4321), and Natural Resources Management Guideline (NPS-77).

- Use space that is constructed of fire-resistant or fireproof materials. Wood framed walls and ceilings should be constructed with gypsum wallboard to achieve a minimum one-hour fire rating (some codes may require a two-hour fire rating).

- Use space with as few windows and doors as practical to enhance security and environmental control, but not so few as to be in violation of health, safety and fire codes. See National Fire Protection Association *NFPA 101,* "Life Safety Codes," 1997 Edition, and *OSHA Standard 1910.36,* "General Requirements, Means of Egress."

- Use space with as few exterior walls as practical. This will minimize the chance of condensation on walls and windows during seasonal and diurnal temperature changes, enhance security, and increase energy efficiency.

- Make sure the space is free of water and sewer pipes and valves that can burst or leak and cause damage. **Note**: Water lines associated with fire suppression systems are allowed. Spaces equipped with fire sprinkler systems should have adequate floor drain(s) with backflow check valve(s).

- Make sure space is free of electric junction boxes, gas and electric meters, and gas lines. This will limit the need for access by non-curatorial staff and minimize security concerns.

- Store only collections in the space. Local and national building codes usually rate collection storage space as "storage occupancy." Locate work, office, research, and supply storage areas close to, but not within, the storage space.

- Insulate the space so it will maintain a stable environment that protects the objects from adverse temperature and relative humidity conditions and damage from biological infestations. Insulate walls to a minimum R-19 rating (usually a 6" thickness of spun glass bat insulation) and the ceiling to a minimum R-30 rating (usually a 9" thickness of spunglass bat insulation). Install a vapor barrier in walls, ceilings, and floors.

- Require woodframe walls to be a minimum of 6" thick, constructed with 6" metal or wood studs. This thickness of wood-frame wall construction provides structural strength and is capable of accommodating the required insulation.

- Use metal hollow-core or wooden solid-core doors equipped with mortise or key-in-knob and deadbolt locks for all entrances into the storage space. Door hinges should be on the interior side of the door. If exterior hinges are used, spot weld hinge pins to prevent easy removal.

- Install rigid foam insulation and a vapor barrier in concrete floors on grade. Make sure the level of the top of the concrete slab is at least 6" above the grade level of the soil.

- Seal concrete floors with a vapor-proof epoxy or urethane paint or cover with dust impervious commercial composition, quarry or ceramic tiles. Use dust impervious commercial composition, quarry or ceramic tiles as a floor finish over plywood sub floor sheathing.

- Make sure all electrical systems and equipment are UL listed and installed in full compliance with local and national electrical codes. You will need outlets to power supplemental environmental conditioning equipment, to allow for any task lighting, and to allow for use of vacuum cleaners.

- Make sure the space is free of ambient light sources that can damage objects. Use non-quartz/halogen incandescent or UV filtered fluorescent lighting and do not exceed 200 lux or 20 footcandles. Turn lights off when the storage space is unoccupied.

- Paint walls and ceiling with paint containing titanium dioxide pigment. Paint with titanium dioxide will absorb ultraviolet radiation emitted by ambient or artificial lighting.

6. *What design loads should my storage space or facility have?*

Your storage facility or space should be designed or modified to meet the following requirements and recommendations:

- Use space capable of sustaining a live floor load of 150 pounds per square foot. Floors constructed to a lesser load capacity may be considered if you install spot load supports (usually post supports from below) and arrange equipment to take advantage of existing structural supports (usually equipment arranged around the perimeter of a room close to load bearing walls). Consult a structural engineer to determine the suitability of a floor and the placement of supports and equipment. A live floor load of 200-250 pounds per square foot is recommended if you use a moveable aisle (compactor) storage system. Consult a structural engineer to determine the required load rating for a floor supporting collections of exceptional weight.

- Design and construct roofs of storage spaces or facilities to accommodate the snow load of the area.

- Design or retrofit structures in areas of seismic activity to minimize earthquake damage.

- Consider reinforced concrete or masonry construction with a wind load rating of 110 miles-per-hour or higher for new construction of stand-alone storage facilities in areas susceptible to severe wind conditions. Fasten roofs to the wall and/or foundation structural components so the roof can withstand hurricane force winds.

7. *Where do I find additional information on storage space requirements?*

Refer to the bibliography at the end of this chapter and the *Conserve O Gram* series for additional information and specific guidance for planning collection storage spaces.

8. *Why should my collection storage space be used exclusively for storing collections?*

Separate curatorial office, work, and research spaces from the space housing your museum collection to minimize environmental impacts on the objects and security risks. Refrain from combining storage space with other functions for the following reasons:

- Collection security generally decreases; theft, mishandling, and vandalism increase with storage room visitation and use.
- People working in the storage area increase the number of air exchanges the area must undergo. Air exchanges cause temperature and relative humidity levels to fluctuate, resulting in the possible deterioration of objects.
- Work areas require lighting levels that may cause damage to unprotected light-sensitive objects.
- Movement of people into and within the area tracks in soil and disperses dust into the air, which in turn, is deposited on surfaces of equipment and objects.
- The chance of pest infestation increases.

Store flammable liquids and materials, curatorial supplies, audiovisual equipment, and other interpretive materials outside the museum storage space. These actions will reduce the risk of fire and lessen clutter within the storage space.

9. *Where should I locate the research space?*

Locate research space convenient to, but not within, the collection storage space. Research is one of the fundamental uses of a museum collection and the space for the research function has specific requirements. Refer to the *Museum Handbook,* Part III *(MH-III),* Appendix D: Guidance on Planning for a Research Space, for information on planning your research space.

10. *Where should I locate work and office spaces?*

Like research space, work and curatorial office areas should be convenient to, but not included in, the storage space for the reasons stated in number 8 above.

11. *How do I establish proper physical security for the collection storage space?*

Your collection must have appropriate security. You will need to conduct an assessment of the security risks to the stored collection. Refer to Chapter 9 of this handbook for details on conducting a risk assessment and for specific security guidance.

12. *How important is fire protection in the storage space?*

Collection storage houses the majority of the museum collection and that space must be assured the safeguard of early fire detection and suppression and prior planning to guarantee the safety of the collection and the personnel who use and care for it. Refer to Chapter 9 of this handbook for information on conducting a fire risk assessment and for specific fire protection guidance.

13. *What should the collection storage environment be?*

Your storage space should maintain an environment conducive to museum object preservation. A proper collection storage environment is one that:

- controls the range of temperature and relative humidity
- reduces the fluctuations of temperature and relative humidity
- prevents damage resulting from air pollutants
- prevents damage resulting from light
- eliminates biological infestations by insect and rodent pests

Refer to Chapters 4 and 5 for guidance on monitoring and controlling the collection storage environment and on establishing an Integrated Pest Management (IPM) Program to monitor pest activity.

14. *What are museum storage equipment and container requirements?*

The use of specialized storage equipment and containers will help you preserve and effectively manage your museum collection. The use of proper storage cabinets, shelves, racks, and containers will make it easier to use the space and access the collection. Storage equipment will prevent damage from agents of deterioration. Appropriate storage containers buffer the objects from their immediate environment by being chemically stable and neutral and by providing physical protection. NPS *Tools of the Trade* provides a list of materials and equipment suitable for managing museum collections. It also provides a vendor address list. Refer to Section G and the bibliography of this chapter for specifics on collection storage equipment and containers.

15. *Does housekeeping have a role in collection storage?*

Yes. Because museum objects are stored in a separate dedicated space and not always on view to staff, there is always the possibility of neglect. Good housekeeping in storage spaces is essential to a park's preventive conservation program.

You should:

- Establish and follow a museum housekeeping plan. Refer to Chapter 13 and the ANCS+ User Manual for guidance on establishing a housekeeping plan.
- Prohibit smoking, eating, and drinking in the storage space.
- Implement and follow an IPM program.
- Routinely dust and vacuum the storage area including cabinets and shelving. Vacuum using a High Efficiency Particulate Air (HEPA) vacuum and dry mop floors to reduce levels of dust and soil.

C. Planning Collection Storage Space

1. *How should I plan my museum storage space?*

Planning for museum storage is essential to ensure maximum preservation and optimum access to the collection. Planning a collection storage space will help ensure that the necessary requirements are met. The process of collection storage planning may focus on:

- the development of a new facility
- the rehabilitation or upgrading of an existing space or facility
- a specific aspect of museum storage such as determining equipment and space requirements for a collection, determining a special layout of equipment, or outlining specific techniques for housing museum objects on shelves or in cabinets

In the National Park Service, the product of collection storage planning may be a Collection Storage Plan (CSP) or a chapter or section on museum collection storage in a Collection Management Plan (CMP), a Collection Condition Survey (CCS), or an archival assessment.

Regardless of the product, some or all of the elements of a CSP, described below, are incorporated into the planning process.

2. *What is a Collection Storage Plan (CSP)?*

A Collection Storage Plan (CSP) is an official stand-alone document developed to help a park or center improve the storage conditions for a museum collection. It may be prepared to solve specific storage problems, guide renovation of an existing space into collection storage, or guide the design of a new facility.

A CSP must include the following core elements:

- a determination of the size of storage space needed
- a determination and listing of specialized storage equipment needed
- a floor plan illustrating a recommended layout of equipment
- an assessment of object storage techniques and methods and recommendations for improvement
- a solution for park-specified or urgent storage problems

A CSP may also include the following:

- an assessment of the nature of the collection
- an assessment of the existing collection storage facility and/or space(s)

- an assessment of the existing storage conditions in comparison with NPS standards and requirements for storage
- identification and discussion of storage space alternatives

The specific nature of the collection and the availability of funding and staffing are factors to consider when selecting alternative storage options.

3. *What does the collection storage chapter or section of a CMP, CCS, or archival assessment contain?*

The storage chapter or section of a CMP, CCS, or archival assessment contains some or all of the elements of a CSP. However, it is incorporated into the larger report instead of being a stand-alone document.

4. *Who can write a collection storage planning document?*

For objectivity and diversity of views, NPS curatorial staff from outside the park usually prepare a collection storage planning document. You can also procure the services of a museum professional or architectural/engineering firm with expertise in collection storage planning.

Contact the regional or support office (SO) curator for guidance on writing a storage planning document. The Museum Management Program can provide examples of a CSP.

5. *How much does a storage planning document cost?*

Producing a basic CSP (incorporating the core elements) requires funds for:

- approximately 2-4 weeks of the preparer's time
- travel and expenses for a 1-2 week site visit
- printing and duplicating the document

To produce a CSP with more than the core elements will require additional time and increased costs.

Consult the Cost Estimates Figure in Appendix F: NPS Museum Collections Checklists, for a current estimated cost to produce a CSP or storage planning document.

6. *Where do I get funding to do a collection storage planning document?*

Possible funding sources to produce collection storage planning documents include:

- Cultural Resources Preservation Program (CRPP)
- Museum Collection Preservation and Protection Program (MCPP)
- park or center base funding
- park cooperating association donation account
- special funding initiatives that may be announced

To obtain storage planning project funding, you must identify the need for a collection storage planning document:

- in the NPS Checklist for Preservation and Protection of Museum Collections using the Automated Checklist Program in *ANCS+*.

  Identifying the need in the Checklist links the project to the NPS Strategic Plan (Goal Ia6) and the Government Performance and Results Act.

- as a project statement in the Resource Management Plan (RMP).

- as a project statement in the Performance Management Information System (PMIS).

D. Assessing Collection Storage Needs

1. *How do I assess the collection?*

To assess the collection:

- Examine the entire collection with emphasis on objects designated for storage. Also consider all objects that may eventually be placed in the storage space.

- Note the types of objects, the quantities of each object type, the relative sizes, and required volumes for storage. For example, consider a hammer and a wagon. Both are historical objects and are made of more than one material, however, each object has different storage requirements and containment needs.

- Note object types by discipline and material makeup. Note the types of objects that are extremely sensitive to the influences of temperature and relative humidity, light, and air pollution.

- Identify the types and approximate quantities of objects that the park plans to acquire in the future. Study the park's approved Scope of Collection Statement for this information. In addition, consider the return of outgoing loans and temporary transfers, and future archeological and natural science research projects that may increase the size of the collection.

2. *How do I assess physical security needs?*

Use the following guidance in assessing the physical security needs:

- Conduct a physical security risk assessment as described in Chapter 9.

- Note any extant intrusion alarm system (type, location of sensors, nature of monitoring, who responds, and response time) serving the space.

- Note the construction and locking mechanisms of doorframes and doors (metal, solid-core wooden, wooden hollow core, dead bolt locks).
- Note how windows are secured (latches, plywood-covered, bars).
- Identify the park staff who have keys to storage areas and park staff who require access but are not issued keys. Note whether staff members from other divisions need to enter or pass through the area to access major junction boxes or cleaning supplies.
- Note any other functions that occur in the storage space.
- If applicable, note any areas in the storage space where security is compromised. For example, is there easy access from an adjoining space such as through a dropped ceiling.
- Note if a visitor/researcher log is used and maintained.

3. *How do I assess fire protection needs?*

Use the following guidance in assessing the fire protection system:

- Conduct a fire protection risk assessment as described in Chapter 9.
- Note any extant fire protection system. Include type of system (wet pipe sprinkler, water mist, Halon™, ionization, smoke, heat activated) serving the space.
- Determine how the detection alarm is monitored, the responsible party for responding to an alarm, and the response time.
- Check to ensure that the park's Structural Fire Plan is current and consistent with *Director's Order #58: Structural Fire Guidelines.* The plan should clearly identify the pre-suppression actions for the responding authorities (for example, how to enter the storage space, or the priority list for evacuating objects).
- Identify the number, types, and locations of hand-held fire extinguishers. Check extinguisher inspection tags and labels to be sure extinguishers are maintained.
- Identify the closest water supply available to suppress a fire.

4. *How do I assess environmental monitoring and control needs?*

In order to assess the collection storage environmental needs:

- Become familiar with the information on environmental monitoring and control found in Chapter 4.
- Note the readings at the time of the site visit for temperature, relative humidity, and light levels of the existing space.
- Note the type of existing environmental monitoring equipment (hygrothermograph, hygrometer).

- Check to ensure that environmental monitoring equipment is properly calibrated and maintained.

- Examine the data recorded on temperature and relative humidity within the storage space. In particular, note the following information:

  – annual *maximum* and *minimum* temperature readings and relative humidity levels

  – monthly *maximum* and *minimum* temperature readings and relative humidity levels

  – maximum diurnal (24 hour) fluctuation for temperature and relative humidity on a *monthly* and an *annual* basis.

- Answer the following questions:

  – Do the records indicate the maintenance of a proper environment?

  – Do building features such as the climate control system (heating, ventilating, air-conditioning [HVAC]) or superior insulation and vapor barrier contribute to maintaining the environment?

  – Do the records indicate diurnal changes if HVAC equipment is turned off after working hours?

- Note the type of HVAC (air-handling) system in use (oil-fired furnace, heat pump, central air). Note whether the system is dedicated to controlling the environment within the storage space or the entire structure. In particular, note the following information:

  – location of the thermostat

  – location of air supply and return registers

  – how the air is filtered

- Obtain manufacturer's equipment operating manual. Determine maintenance history of equipment.

- If applicable, determine if portable dehumidifiers, humidifiers, or air-purifiers have had an impact on controlling conditions.

- Examine the data on visible and UV light levels in the storage space. Check fluorescent lighting to ensure that light filters are installed. Use an ultraviolet radiation monitor to take readings to ensure that filters are blocking ultraviolet light.

- If there are windows in the space, note if:

  – the staff recorded light levels for both winter and summer months

  – blinds, curtains, or light filters have been installed

- Note levels of dust and possible sources of dust. Note the types of dust covers used to protect objects stored on open shelving (for example, plastic, muslin).

- If available, obtain measurements for sulfur dioxide, hydrogen sulfide, and oxides of nitrogen from the Environmental Protection Agency or a local agency. Attempt to identify industry in the area that could produce pollutants that affect the collection. If appropriate, examine data available on pollutant readings from a number of years. Note any trends and describe the existing and potential threats to the collections.

- Note any current evidence and history of biological infestation. Determine if the park has an Integrated Pest Management program in operation. Note data that staff has recorded on types of pests in the traps.

5. *How do I assess museum storage equipment needs?*

Use the following guidance in assessing the storage equipment:

- List the types of existing storage equipment (museum storage and specimen cabinets, map cabinets, file cabinets, shelving, painting racks, specialty racks, high density storage systems). See NPS *Tools of the Trade* for equipment types and descriptions.

- Note the manufacturer and model number of each type of equipment. If the equipment is non-standard, note its size (width, depth, and height).

- Note the condition of the equipment (operation of locks, condition of gaskets, evidence of rust, dents, holes, scratches).

- List any equipment you will need to replace.

- Note if additional museum equipment is needed. Are there museum objects that need to be contained?

- Determine if you will need specialized equipment or adaptations to equipment to house specific types of objects or make more effective use of the space. For example, additional space might be provided by installing a high density storage system or by installing racks to make optimum use of vertical storage space or to store objects on a wall.

- Determine if a rearrangement of the equipment could better use the existing space.

- Note the types and numbers of equipment used to monitor temperature and relative humidity and types of portable equipment used to achieve required environmental levels.

- Note the type of equipment that is used in the housekeeping program for the space (vacuum cleaner, mops, buckets, brooms, dust mops).

6. *How do I assess object storage techniques and methods?*

Use the following guidance for assessing object storage techniques and methods:

- Note the condition and appropriateness of equipment used.
- Note how types of objects are organized in cabinets, racks and shelves. Indicate if objects are crowded or stacked.
- Note how individual objects are contained. Indicate whether containers are appropriate and provide adequate physical protection.
  - Are objects stable and set securely in their containers?
  - Are objects adequately cushioned to prevent them from moving or sliding when being accessed?
- Make recommendations for improving storage techniques.

You may wish to use the assessment worksheet and observation/recommendation codes in Figure 7.2 to simplify the assessment process. Refer to Figure 7.2a for a sample worksheet. Refer to Figure 7.2b for assessment codes.

7. *Where do I include technical supporting information and drawings such as floor plans in the storage planning document?*

Use appendices or attachments for technical information such as product/source information, environmental monitoring data, illustrations for constructing specialized equipment, and floor plans. Preparers should consult their regional/SO curator and the Museum Management Program for assistance in gathering material for appendices.

E. Assessing the Current Collection Storage Facility or Space

1. *How do I assess the existing storage facility or space?*

Examine the existing structure(s) and space(s) within each structure that are used for museum collection storage to identify how well they meet the storage standards:

- Note the structure's construction and fabric (wood, masonry, two-story, one-story).
- Record the overall dimensions of the space and the ceiling height and type (for example, 8' dropped ceiling).
- Note the number and size of access doors (measure all doors that objects will pass through).
- Determine, with the assistance of an architect or engineer, if the structure has the strength to safely withstand the loads associated with the collections to be stored. This is especially important for second floors in a structure. **Note**: Ceramics, metals, paper, glass, and wood objects in great volumes are very heavy.

- Note any characteristics of the structure that would hinder the movement of objects or equipment. Stairs impede the movement of objects, especially large and heavy ones. Such access routes also increase the risk of accidental breakage.

- Note sizes and directional orientation of windows and types of glazing (glass, Plexiglas™ [acrylic], Lexan™ [polycarbonate]).

- Note any electrical service and plumbing fixtures and determine if existing electric service has capacity for add-on functions such as air-conditioners, humidifiers, dehumidifiers, or additional lighting.

- Note wall coverings (dry wall, plaster, brick, paneling). Some wall coverings and construction are more fire-resistant and secure than others.

- Note type and location of light fixtures (incandescent, fluorescent, combination).

2. *How do I represent and record information about the storage space and structure?*

Prepare a floorplan that indicates the following information:

- dimensions and arrangement of storage areas, including structural features that may restrict arrangements of equipment and must be worked around (structural posts, beams, conduit, drains)

- location of doors, stairs, and windows

- location of electrical service (conduit, outlets, switches, fixtures, and panel boxes) and plumbing (pipes, valves, and drains)

- dimensions and existing location of museum specimen cabinets and shelving, including aisle widths

- location of fire detectors/suppression system detectors and sprinkler heads, and fire extinguishers, stand pipes, and any other fire protection equipment

- location of environmental monitoring and control equipment

Security systems and devices are generally not indicated on the floor plan because dissemination of the plan could jeopardize security.

Refer to Figures 7.3, 7.4, and 7.5 for sample floor plans.

F. Planning a New or Upgraded Storage Space

Use the information you gathered in your assessment of storage needs (Section D) and your assessment of the current storage space (Section E) to plan your new or improved storage space.

Only after you determine how much equipment you need and the space you need to house that equipment, can you adequately assess storage locations and spaces.

1. *How do I determine the storage equipment needed?*

Refer to *COG* 4/10, "Determining Museum Storage Equipment Needs," for guidance on determining equipment needs.

2. *How do I determine how much space is needed to store my collection?*

Refer to *COG* 4/11, "Determining Collection Storage Space Requirements," to determine your space requirements.

3. *What process do I use to evaluate potential storage locations?*

You will need to conduct a value analysis of the collection storage function if you find that your current storage space is too small to house the collection or if for other reasons the current space is unsuitable. See *Value Engineering Guideline* (NPS-90), for information on conducting a value analysis. In simplest terms, a value analysis is the process of defining the problem, exploring solutions to the problem, and deciding on the best solution.

Policy requires that you complete a formal value analysis for renovations or new facilities costing over $500,000. You may also do an informal value analysis for small- to medium-sized collection storage spaces costing less than $500,000.

A value analysis includes an informational phase, a creativity phase, an evaluation phase, a development phase, and a recommendation phase.

The informational phase includes a full examination of the collection storage function. You will need to fully understand and state the needs of the collection storage function. The standards and requirements for collection storage should guide the informational phase.

4. *What storage space alternatives should be examined?*

The creativity phase presents alternatives for achieving the collection storage requirements. There are several alternatives that you will need to consider:

- Modify or retrofit the existing storage space.

  This alternative may include upgrading the space with new environmental, fire protection, and security systems; installing insulation and a vapor barrier; or rearranging the storage equipment. Use floorplans and other drawings to represent changes to the space.

Also document previous records of any changes. Describe how existing conditions can be corrected to conform to NPS requirements.

See "Prototype Artifact Storage Structure – Instructional Package," a NPS technical publication available from the Midwest Support Office. This publication guides a park in developing or upgrading storage space in an existing historic structure. The same instructions and information also apply in a non-historic structure.

Retrofitting may also involve the use of an insulated modular structure (see description in the NPS *Tools of the Trade*) and in Section G.2.

- Locate other storage spaces in the park.

  This alternative involves looking at and evaluating other spaces in the building or other buildings in the park. Provide a description of the actions needed to adapt space(s) to conform to NPS storage requirements. You may use an insulated modular structure to adapt an alternate location into acceptable space. In each instance, gather and record the pertinent information you need to assess the appropriateness of the space. Use floorplans and other drawings to detail use of the space. Refer to Section E.2 for information to be recorded on the floorplan.

- Develop new space, either in a dedicated facility or combined with other park functions such as a visitor center or research center.

  Use floorplans and other drawings to detail use of the space. Refer to Section E.2 for information to put on the floorplan.

- Investigate off-site storage in new or leased space.

  Use floorplans and other drawings to detail use of the space. Refer to Section E.2 for information to put on the floorplan.

- Store the collections in a NPS center or regional repository.

  You may house collections in off-site storage centers or repositories. Several NPS centers specialize in storing collections from archeological projects. These centers provide space and manage materials loaned from parks. The centers also conduct archeological research and provide scholars with access to the collections. The centers that specialize in archeological collections include the Southeast Archeological Center in Tallahassee, Florida, the Midwest Archeological Center in Lincoln, Nebraska, and the Western Archeological and Conservation Center in Tucson, Arizona.

  Other repositories accommodate all types of collections. It may be necessary for you to store your collection off-site in a NPS regional repository when your park lacks:

  – acceptable space to house objects safely

  – qualified curatorial staff to provide day-to-day care for the collection

The National Capital Region and the Alaska Region operate repositories that provide space for the storage of museum collections from parks within the region.

- Store the collections at a university, college, museum or other non-NPS institution.

  The regional/SO curator can assist in making arrangements with non-NPS repositories for the storage and curation of collections. **Institutions that house park museum collections must meet NPS standards and requirements for museum object preservation and protection**. NPS collections should be clearly identified and kept as separate as possible from the institution's collection.

- Consolidate storage with another park.

  You may find it necessary or advantageous to arrange to store your collection with a park that has available space and staff to care for it.

- Make no changes to the existing storage space.

  You should list the reasons why your current storage area meets requirements or list possible consequences to the collection if your storage area does not meet storage requirements.

5. *What occurs in the evaluation, development, and recommendation phases of a value analysis?*

In the evaluation phase you assess alternatives for meeting the storage requirements. Consider all alternative locations for museum collections storage. Visit and examine each possible location and record pertinent data. Indicate the potential of each alternative space to satisfy the collection storage requirements. You may use the evaluation process used by the NPS called "Choosing by Advantages" at this phase. Incorporate start-up and life-cycle costs. It is important to document the alternatives you evaluate.

In the development phase, you *reevaluate* the best alternatives.

In the recommendation phase, you *select* the best alternative.

6. *What other storage factors should I consider?*

Consider the following when planning collection storage:

- Phase the project to allow improvements to occur as funding becomes available. For example, rehabilitate the space one year; install environmental control equipment and security and fire protection systems in the second year; purchase replacement and new equipment in the third year.

- Prepare appropriate programming documents. Refer to Chapters 1 and 12 of this handbook for guidance on NPS planning documents for programming and funding curatorial projects.

- Maintain and store only museum collections that are identified in the park's approved Scope of Collection Statement.

- Maintain museum collections for easy access by users. As a rule, the park can make better use of the collection if it is readily accessible on site.

- Store archival and manuscript collections in boxes on shelves or in folders in map cases (for oversize items). Don't store archive collections in file cabinets or fireproof cabinets.

G. Housing Museum Objects

1. *Why is it important to use specialized museum storage equipment?*

Museum storage equipment offers "front line" protection for museum objects. Specialized museum equipment provides physical containment and isolation from many of the factors that negatively affect object condition. Museum cabinets have synthetic gaskets that create an interior microenvironment that buffers temperature and relative humidity fluctuations, prevents insect and vermin infestations, and prevents damage caused by light, dust, and pollution. Shelving units provide physical protection for objects too large, awkward, or heavy to fit within museum cabinets. Specially designed racks accommodate and provide physical protection for hard-to-store objects. Special building systems are available for creating quality space inside other structures.

2. *What types of equipment does the NPS use for storing museum collections?*

Cabinetry
The NPS uses three primary types of cabinets to form a basic modular system that facilitates efficient organization and access to the objects. Refer to *COG* 4/4, "Modular Concept of Museum Specimen Storage Cabinets." These three cabinets are the standard museum cabinet, the doublewide museum cabinet, and the wardrobe cabinet. In addition, there are entomology and herbarium cabinets, map cabinets, large flat storage cabinets, and utility cabinets. Refer to the NPS *Tools of the Trade* for descriptions and sources of available museum cabinetry.

Shelving
Several types of shelving are available. Refer to the NPS *Tools of the Trade* for descriptions, uses, and sources of available museum shelving. Steel shelving units, pallet racks, and slotted angle racks are frequently used. Steel shelving is recommended for boxed archival and manuscript collections. Pallet racks and slotted angle racks are particularly useful for storing furnishings and other larger, heavier items. Slotted angle racks are constructed using lengths of metal angle that can be custom cut. You can configure and construct a slotted angle rack for objects with specific support or space requirements. You can use metal panels or plywood coated with a water-based, two-component epoxy or water based aliphatic urethane paint for shelf decking.

Prefabricated Modular Structures
A prefabricated building system can be used to create a collection storage facility that is economical to construct, efficient to operate, and effective in creating appropriate environmental conditions. The building system is made of superinsulated, foam-core, metal-sheathed panels. It should be used only inside a host structure. Refer to NPS *Preservation Tech Note*, "Museum Collection Storage in an Historic Building Using a Prefabricated Structure;" *CRM* Supplement, "Collection Storage – Making a Case for

Microenvironments"; *COG* 4/7, "Museum Collection Storage Space: Is an Insulated Modular Structure Right for your Collection?"; and *COG* 4/8, "Selecting Environmental Control Systems for Insulated Modular Structures," listed in the bibliography of this chapter. These publications provide discussions and give guidance in using this special building system for museum storage. The NPS *Tools of the Trade* provides information on sources for this building system.

3. *What are some general considerations when using museum equipment?*

Consider the following when using museum storage equipment:

- In planning for cabinets and shelving, examine all objects in the collection. To the extent possible, organize objects by material type and size rather than by provenience or accession/catalog information.

- Ideally, do not install cabinets and shelving units against exterior walls. This arrangement may lead to condensation inside the cabinets.

- Ensure that museum cabinets are free of rust, have intact gaskets to provide good sealing action, have smooth operating doors, and have working keyed or combination lock mechanisms. Early museum specimen cabinets used polyurethane foam gaskets that deteriorate over time or felt gaskets that may contain toxic insecticides. You should replace these gaskets. See *COG* 4/3, "Installing the Retrofit Gasket Kit."

- Keep loads in museum cabinet drawers below 50 pounds. Don't stack museum cabinets more than two high. Raise museum cabinets and shelving units off the floor at least four inches (preferably six inches). Raising cabinets off the floor reduces the chances of damage to objects in case of flooding. It also facilitates the cleaning of floors and inspection for pests.

- Use closed-cell polyethylene foam in museum cabinet drawers and on shelving to cushion objects. Prevent museum objects from sliding or shifting when drawers are opened by stabilizing objects in specimen trays, by padding with foam, or by cavity packing. Refer to the NPS *Tools of the Trade* for sources of foam and museum specimen trays.

- Assign and affix a unique number to all shelving units, individual shelves, cabinets, and individual cabinet drawers. This will help you locate museum objects.

H. Using Containers and Supports

1. *Why is it important to use storage containers and supports?*

Museum storage containers and supports provide a buffer between the object and its immediate environment. Archival quality containers and supports not only increase the level of preservation, but also can help organize the collection.

2. *What kinds of containers and supports should I use for storing museum collections?*

Boxes
Archival boxes come in a variety of types, shapes, and sizes. Most are made of acid-free, buffered board. Inert, corrugated, polypropylene or polyethylene boxes are often used to store archeological materials. (The corrugated plastic boxes are stronger and give additional protection from water damage.)

Archival boxes can be used to store records, artifacts, rare books, documents, prints, photographs, and textiles. See *Museum Handbook*, Part I (*MH-I*), Appendices J, K, and R, and *Tools of the Trade.*

Specimen Trays
Specimen trays are made of buffered, acid-free board. They can be used to hold artifacts and natural history specimens in museum cabinets and for layered storage in archival boxes. A variety of sizes are available.

Alkaline-buffered paper can damage pigments and proteins in bird and mammal specimens. Use unbuffered, acid-free materials, or line buffered trays with polyethylene sheeting (to block the direct migration of alkalis). See *MH-I*, Appendix T and *Tools of the Trade*.

Folders
Archival folders are composed of acid-free, buffered cardstock material and are used to house and protect historic documents. Folders come in many types, including: file folders (both letter and legal size), manuscript folders, and map folders for oversize items. See *MH-I*, Appendix J and *Tools of the Trade*.

Photo Enclosures
Photo enclosures of acid-free unbuffered paper are used to house photographic prints and negatives. Various sizes and varieties including sleeve type (sealed on three sides) and folding type (4 fold) are available. See *MH-I*, Appendix R and *Tools of the Trade*.

Bags
Polyethylene interlocking "zipper" seal bags can be used to house archeological materials and other small artifacts for storage in archival boxes and cabinets, for cold storage of some photographic materials, and as protection from pests. (Avoid the use of bags developed for food storage and home use because of printing inks and dyes. Bags for the storage of museum objects are available through *Tools of the Trade*.) See *MH-1*, Appendix I and *Tools of the Trade*.

Liners
To protect objects from coming into contact with metal drawers or shelves, a ¼"-thick polyethylene foam such as Volara® or Plastazote® may be used as a liner. This foam is inert, closed-cell, and resistant to moisture. See *Tools of the Trade*.

Cavity Packing
Polyethylene foams can also be used to cavity pack certain objects. Cavity packing creates secure compartments for objects. Spaces the size and shapes of the objects are cut from the foam to restrict movement and give support and easy access. See *MH-I*, Appendix I and NPS *Tools of the Trade*.

Cradle Mounts
Polyethylene foams are also used to create cradle mounts. These mounts are used to support structurally weak objects in order to alleviate stress on the weakest points. The foam is cut to the shape of the object and gives it a secure base to rest on. See *MH-I*, Appendices I and P.

3. *Where do I find information on techniques for storing different types of museum objects?*

The appendices in this handbook and the *Conserve O Gram* series address the curatorial care of different types of objects, specimens, and archival collections. The appendices provide guidance on techniques for housing museum objects in storage. The selected bibliography included in each appendix provides additional references for the care and storage of each type of material. *Tools of the Trade* and the appendices list the recommended materials to use. Figures 7.6–7.11 illustrate some of the equipment and techniques for storing museum objects.

I. Storage of Museum Collections Subject to the Native American Graves Protection and Repatriation Act of 1990 (NAGPRA)

1. *What is NAGPRA?*

The Native American Graves Protection and Repatriation Act of 1990 (25 USC Chapter 32) addresses the rights of lineal descendants, culturally affiliated Indian tribes (including Native Alaskan villages or corporations), or Native Hawaiian organizations to certain Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony with which they are affiliated. The law requires federal agencies and museums that receive federal funds to:

- conduct inventories and summaries of such items in their collections
- repatriate (return) items identified pursuant to NAGPRA to the appropriate lineal descendants, culturally affiliated Indian tribes, or Native Hawaiian organizations if requested

Items repatriated pursuant to NAGPRA must be deaccessioned in accordance with Museum Handbook, Part II (MH-II), Chapter 6, Section N: Native American Graves Protection and Repatriation Act.

For additional information concerning NAGPRA, see *MH-I*, Appendix A, *MH-II*, Chapter 6, Section N, and *Cultural Resource Management Guideline*, Appendix R.

2. *What types of items subject to NAGPRA are found in NPS museum collections?*

Your park's museum collection may contain items subject to NAGPRA, such as human remains, pottery, beads, prayer bundles, clothing, weapons, pipes, or other funerary, sacred, and cultural objects that are determined to belong to one or more lineal descendants, Indian tribes, Native Alaskan villages or corporations, or Native Hawaiian organizations. The culturally affiliated organization or lineal descendant with standing may request the repatriation of these items.

The individual, tribe, or organization requesting repatriation may be unable to take immediate possession of the materials, or they might prefer that certain items continue to be housed at your park. Under these circumstances, the individual, tribe, or organization with standing may want to be involved in determining how the items are preserved and stored at your park. Park management and staff will need to consult with parties with standing. Confer with your park and regional NAGPRA coordinator once such a request is made.

3. *Are there any special storage requirements for items subject to NAGPRA?*

You should treat collections subject to NAGPRA with great sensitivity, because of their cultural significance, sacred importance, and the fact that many of these materials were collected without the consent of descendants, tribal leaders, elders, or traditional religious leaders.

Because of their special status, you may need to separate collections subject to NAGPRA from other museum collections. Consult with the lineal descendants, culturally affiliated Indian tribes, Native Alaskan villages or corporations, or Native Hawaiian organizations concerning access, storage, and use. Accommodate the affiliated organizations' or descendants' requirements where possible, and institute any needed revisions to your park's Museum Collection Access Procedures, planning documents, and standard operating procedures.

4. *How should I store collections subject to NAGPRA?*

Protect collections subject to NAGPRA from fire, theft, pests, and environmental and other threats as you would any other museum object. However, you may need to use additional and/or alternative handling and storage methods and materials to show sensitivity and proper respect for these items in accordance with the affiliated individual's or group's request.

Consult with the lineal descendants or culturally affiliated organization with standing. Ascertain their preferences related to proper handling and storage techniques and materials, and defer to their wishes where possible. You may be asked to use some of the following storage methods, procedures, and materials when caring for culturally affiliated items:

- Store human remains aligned in a particular direction (such as the cranium toward the east).

- Construct special storage containers (possibly using wood, plant, or animal products native to the tribe's homeland).

- Ensure that only organic materials touch the items. Possible methods to avoid direct contact with archival foams include:

  – covering the foam's surface with archival tissue paper or unbleached muslin

  – wrapping the item in archival tissue paper or unbleached muslin

- Store newly collected natural plant materials (such as bundles of tobacco) with the items. (You can construct special outer enclosures or boxes to house these materials separately from other collections and to protect against pest infestations.)

- Allow tribal members access to storage areas for relevant religious or ceremonial purposes. This may include actions to protect:

  – individuals working with or viewing the items

  – the facility, collections, and items from a negative force

These are just a few of the possible techniques and procedures that you may be asked to follow with items subject to NAGPRA. This list is not all-inclusive or universal, as one tribe's methods may not be appropriate for another. **Consult with the lineal descendants or culturally affiliated organization with standing for guidance.**

Be sure to document all new or revised procedures and guidelines for handling, storage, and use of collections subject to NAGPRA following the consultation process. This may include notations, additions, or revisions to catalog records, catalog or accession folders, planning documents, access procedures and other standard operating procedures, or other relevant park documents.

5. *Whom should I contact for assistance?*

Contact your regional NAGPRA liaison, regional/SO curator, regional ethnographer, or local tribal members for assistance. **Before you begin the consultation process, determine the proper protocol and be sure to follow it whenever you contact tribal authorities, council members, elders, and traditional religious leaders.** (Your regional NAGPRA liaison, regional/SO curator, regional ethnographer, or local tribal members can assist you with issues of protocol.)

Consult with the lineal descendant, tribe, or culturally affiliated organization with standing concerning proper handling and storage guidelines, appropriate storage materials, and other procedures related to collections subject to NAGPRA at your park.

Many tribal governments have cultural resource management specialists, NAGPRA coordinators, museum staff, or archeologists who can help you. Contact your regional NAGPRA liaison, regional/SO curator, regional ethnographer, or the appropriate tribal headquarters for contact information.

When you ask for help or guidance during the consultation process, members of the culturally affiliated organization may not provide it willingly because the discussion of such topics may be offensive or uncomfortable for them. Even within one tribe there may be different views on procedures. Be aware that this might happen and always show proper respect for these views.

Assessment Code

Cabinet/Shelving Unit Specific (indicate cabinet or shelving type.)

A Gasket is damaged, wrong type, or ineffective. Install retrofit gasket kit. See *COG* 4/3.

B Cabinet has no lock. Install sash lock or other locking device.

C Cabinet or unit is damaged. Repair or replace as required.

D Cabinet or unit is dusty or dirty. Vacuum or wipe interior and exterior of cabinet or unit.

E Cabinet or unit paint surface is chipped, scratched or rusty. Repaint with water-based urethane or epoxy paint.

F Cabinet is directly on floor or shelving unit bottom shelf is not adequately raised off the floor. Raise cabinets on platforms, appliance rollers, or caster bases so that they are 2"–6" off the floor. Adjust shelving unit bottom shelf to be at least six inches off the floor.

G Wooden rack or shelving unit components are unsealed. Seal with water-based urethane or epoxy paint.

H Drawer slipping through glides. Install water-based urethane or epoxy painted metal shims on vertical surfaces of drawer glides to center drawers.

I Shelving unit in earthquake zone lacks shelf retainers. Install shelf retainers to prevent objects from shaking off shelves.

J Objects in open or on shelving units are coated with dust. Install dust covers (See *COG* 4/2).

Drawer/Shelf Specific

K Objects are loose and unprotected in drawers or on shelves. Place objects in specimen trays and/or cavity pack.

L Objects too large for specimen trays rest directly on drawers or shelves. Place polyethylene foam pads under objects to form an inert cushioned surface on which the objects can rest.

M Objects in cabinets or on shelving are unstable and are in danger of damage by sliding or rolling. Pad, cavity pack, or cushion objects with appropriate tissue or foam.

N Objects are stacked and/or overcrowded. Rearrange or move objects to allow adequate separation.

O Weight of objects exceeds 50 pound drawer limitation. Remove objects as needed.

P Objects stored in inappropriate cabinet or rack. Place objects in appropriate cabinet, rack, or shelving unit as indicated.

Figure 7.2b. Assessment Codes for Collection Storage Techniques

Object Specific

Q Documents or books are loose and unprotected. Place documents in archival folders or envelopes and then in document boxes. Place books in rare book boxes (see *COG* 19/2). Place document or rare book boxes in cabinet or on shelving.

R Photo positives and negatives are loose and unprotected. Place photos in appropriate archival photo enclosures and in photo enclosure boxes. Boxes can be placed in cabinets or on shelving. See *COG* 4/9 and *Tools of the Trade* for appropriate usage of enclosures.

S Maps and oversized prints are stored loose and unprotected. Place objects in appropriately sized archival map folders (blueprints and cyanotypes go only in unbuffered folders) and store flat in appropriate cabinet. See *COG* 19/9.

T Framed artwork is stored horizontally or stacked leaning against each other. Place artwork on a rack that will separate pieces and store them vertically. See *COG* 12/1. Use dust covers.

U Unframed artwork and large documents are stored loose and unprotected. Interleave items with archival bond paper and place in print boxes. Boxes can be stored either in cabinets or on shelving.

V Artwork framed with acidic matboard. Consult with conservator regarding rematting with archival matboard.

W Organic and inorganic materials are stored in close proximity. Separate dissimilar materials (e.g., metals from proteinaceous organics, such as leather, fur, silk) and store materials with similar requirements together (ideally in cabinets devoted to each material type).

X Objects stored in containers or labeled with tags made of acidic materials. Replace acidic containers or tags with ones made of archival materials.

Y Objects have active deterioration, mold or physical damage. Conservation survey should be requested.

Z Evidence of pest infestation observed. Integrated Pest Management program needs to be implemented or improved.

XX Other as indicated

Chapter 8: Conservation Treatment

List of Figures

CHAPTER 8: CONSERVATION TREATMENT

A. Overview

This chapter explains how to get appropriate conservation treatments by experts in the conservation field. Care of NPS museum collections is based on a preventive conservation approach to preserve objects, archives, and natural history specimens. Sometimes, however, preventive measures are inadequate, and conservation treatment is necessary to preserve an object:

- If an object has inherent vice, preventive measures may not be enough to reduce the rate of deterioration to a tolerable level. An acceptable treatment can prolong the life of an object. For example, a paper conservator can wash deteriorated wood-pulp paper to remove acidic by-products.

- If an object is extremely fragile from deterioration, appropriate treatment can increase stability and durability. For example, a paintings conservator can reattach flaking paint.

- If an object will be used for exhibit, research, or publication needs, conservation treatment may be needed. For example, a textile conservator can construct a special mount for a flag to allow it to be exhibited vertically. An archeological conservator can clean a metal artifact to reveal important markings.

Conservation treatment is active ("hands-on") work to preserve and/or restore objects. Only trained conservators who have experience in the appropriate material (for example, paintings, textiles, furniture, photographs, books, paper, archeological objects, ethnographic objects, natural history specimens) should treat the objects.

If conservation treatment is required, the park staff must ensure that:

- objects, archives, and specimens receive the most appropriate treatment for their preservation and use

- treatment is appropriate by considering an object's condition, history, significance, and use

- treatments are performed by skilled, experienced conservators and documented properly

Anyone who carries out a treatment on NPS museum collections must agree to follow the principles and practices specified in the AIC Code of Ethics and Guidelines for Practice (American Institute for Conservation of Historic and Artistic Works, 1994). Refer to Appendix D for a copy of the Code of Ethics. Include this requirement in all contracts.

1. *What is treatment?*

Treatment is any action taken to prolong the existence of objects. National Park Service policy defines treatment as the following:

- preservation
- stabilization
- restoration
- reproduction

At the most basic level, preservation activities might include dusting furniture to prevent grime from becoming embedded in an important historic finish. A high level of treatment, such as restoration, might consist of cleaning a painting, filling areas of loss, and coloring the fill with new pigments to simulate the original intent of the painter.

2. *What is preservation?*

The emphasis of NPS policy is on *preservation*. NPS *Management Policies*, Section 5.3.5.5.1 states that "an item in a museum collection will be preserved in its present condition through ongoing preventive care if:

- that condition is satisfactory for exhibit or research; or
- another treatment is warranted, but it cannot be accomplished until some future time."

Many of the chapters and appendices of the *Museum Handbook*, Part I, contain information on collection preservation. In particular, see Chapter 3: Preservation: Getting Started.

3. *What is conservation treatment?*

Conservation treatment is the deliberate alteration of the chemical and/or physical aspects of objects aimed primarily at prolonging their existence. The NPS recognizes two levels of conservation treatment:

- stabilization
- restoration

Stabilization is the first level of conservation treatment. NPS *Management Policies*, Section 5.3.5.5.1, states that "an item will be stabilized if:

- preventive measures are insufficient to reduce deterioration to a tolerable level; or
- the item is so fragile that it will be endangered under any circumstances."

One objective of any treatment is minimal intervention to reduce the possibility of compromising the item's integrity. Often, efforts to repair, stabilize, and restore objects have been detrimental to the long-term preservation of objects. Earlier techniques may have altered or destroyed important features of objects. In some cases, no treatment might have been a better choice. In part, this is why the preventive conservation approach has developed over the last few decades.

4. *What is stabilization?*

Stabilization or *minimal intervention* is a treatment strategy of doing the least possible to the object. The goal is to limit the possibility that conservation treatment will compromise the object's significance or result in more rapid deterioration in the future.

Information can be destroyed with any active treatment, even if done with preservation as the goal. New analytical techniques are always being developed. Later generations often re-evaluate objects and have different ideas about what makes them significant. You should understand that, even with the best of intentions, interventive treatment usually makes a permanent change to the object. Even simple cleaning is a permanent change.

5. *What are restorations?*

Restorations are treatment procedures intended to return objects to a known or assumed former state, often through the addition of non-original material. Policy on restoration is very specific (see NPS *Management Policies*, Section 5.3.5.5.2). An item may be restored to an earlier appearance if:

- restoration is required for exhibit or research purposes;
- sufficient data about that item's earlier appearance exist to enable its accurate restoration; and
- restoration will not modify that item's known original character.

Additionally:

- restoration will be accomplished using the techniques and materials that least modify the item
- restoration materials should be removable at a later time with minimal adverse effect
- restored areas should be distinguishable from original material, and documented
- restoration will take into account the possible importance of preserving signs of wear, damage, former maintenance, and other historical and scientific evidence

6. *Why use reproductions?*

The use of reproductions is a preservation strategy to make objects available for interpretive and educational presentations when the originals are too fragile, or would be subject to undue deterioration or loss. (See also *Museum Handbook*, Part III, Chapter 4: Two-Dimensional Reproductions, and Chapter 5: Three-Dimensional Reproductions.)

7. *Why should treatments be reversible?*

No treatment is completely reversible. For example, you can't "un-wash" a textile. However, conservators must use, wherever possible, materials that are removable without damage to the original material of the object. The principle of reversibility is important because objects may need to be treated again.

8. *What NPS guidance is available to help me make decisions about conservation treatment?*

Review Chapter 3: Preservation: Getting Started, for information on the roles of the curator/collections manager and the conservator and for information on the Collection Condition Survey (CCS). Review the appendices in this handbook for specific information on preservation of different types of materials and collections. In addition, *Management Policies*, Chapter 5: Cultural Resource Management, discusses NPS policy for conservation treatment of museum objects.

9. *When do I need a conservator?*

All interventive treatments (stabilization and restoration) **must** be undertaken by a professional conservator. A conservator is trained and skilled in the theoretical and practical aspects of preventive conservation and conservation treatment. Most conservators specialize in the treatment of specific groups of objects (for example, archeological objects, books, ethnographic objects, natural science specimens, fine and decorative art objects, photographic materials, paintings, paper, sculpture, textiles, or wooden artifacts). There is some overlap among these groups, so one conservator may work on a range of these materials. For more information on the roles that collection management specialists, curators and conservators play in the preservation of museum objects, see Chapter 3: Preservation: Getting Started.

B. Factors to Consider Before Conservation Treatment

1. *How will I know what conservation treatment is appropriate?*

The treatment choices for objects and collections will vary, based on why they were collected. Share your reasons for keeping an object or collection with the conservator. You may keep objects and collections for a variety of reasons.

Appropriate treatment is developed through discussion between conservator and curator. Consider all technical, historic, scientific, cultural, religious, and aesthetic aspects of an object. Explain why you think conservation treatment is necessary. Talk about the planned use of the object. Explain where the object will be exhibited or stored. Discuss the wishes of affiliated ethnic groups. By developing a shared understanding of the object and its problems, a treatment that takes into account these many different aspects will be developed. Don't approve a treatment simply to make an object look "good" according to your standards.

Reasons for minimal intervention:

- Collections may document the history of a technology. Objects preserve various kinds of information that indicate how they were made and used. These include:
  - design features
  - composition
  - source and processing of raw materials
  - fabrication and manufacturing techniques
  - accretions

- signs of wear
- repair or alterations

In discussions with the conservator, pass on information you may have about paint, markings, residues of associated materials, grime, metallurgical features, and other easily lost remnants.

- Collections may have scientific research value.

  Most archeological, natural history, and archival collections are preserved as evidence or as information for research and study purposes. Some ethnographic and historical collections may be preserved for this reason as well. For these types of collections, appropriate treatment always requires minimal intervention.

- Objects may be culturally or legally significant.

  Many park collections contain objects that have special significance to Native Americans or other cultural groups. Identify the culturally relevant group, if any, for all items in your collections. Consult with a qualified ethnographer to help identify relevant groups, materials, community consultants, and questions that should be raised when considering the treatment. Consultation with representatives of Native American or other groups should be sought to help identify significant objects and determine appropriate treatments. If there are questions about the acceptability of a treatment, wait until more is known.

  Collections may also have associations with eminent individuals, groups, events, or sites. You should be sure that treatment does not destroy evidence of that association. For example, you wouldn't remove bloodstains on the coat Abraham Lincoln was wearing when he was assassinated.

  There may be legal issues to consider as well. For example, land records may be used as legal proof, and treatment may affect their legitimacy.

Reasons for restoration:

- Objects may have a special function.

  Parks collect some objects because of a special function they perform. For example, a certain musical instrument may produce a quality of sound worth preserving. To preserve the functional capability of an object, worn out or defective parts may require replacement. When considering a treatment for this kind of object, ask "Is preservation of function more important than preservation of the original material?"

- Appearance of the object may be important.

  Restoration is often carried out to improve appearance—especially when an object is prepared for exhibit. Often you will have to make a decision about whether to leave signs of wear and tear, or to restore an object closer to original appearance. Ask these questions:

- Why do I want to restore the former appearance? For example, when deciding whether to replace a missing leg on a chair to be displayed in a historic house, consider that the inhabitants probably did not use a broken chair.

- When would restoration go too far and be fraudulent or unethical? For example, overpainting original material so that some of the original is hidden would be fraudulent.

2. *What guidelines should I follow when considering restoration?*

The line between stabilization and restoration is not exact. For example, a torn document can be stabilized by encapsulation between two sheets of Mylar®. This might not be an acceptable treatment for exhibition. A conservator can mend the tear. This is stabilization, but the treatment also *restores* the original shape or format of the document.

Follow these guidelines when reviewing a treatment proposal that suggests restoration:

- Restoration should be based on known facts, not conjecture.

- Restoration should not modify the original character (shape, size, information, visual aesthetic) of an object or item.

- Restoration should be minimally interventive. Agree on techniques and materials that cause the least modification to an object and that can be removed most completely, if necessary, with minimum effect.

- Restored areas should be distinguishable from original material upon close visual inspection, but need not be conspicuous. Ensure that all restored areas are fully documented in the treatment report.

- Restoration should take into account the significance of wear, damage, former maintenance, or other historic or scientific evidence.

3. *What is the difference between conservation treatment and routine maintenance?*

Routine maintenance keeps an object in working order, while conservation treatment stabilizes the condition of an object within a museum context. Many of the objects in NPS collections were used in the everyday world. Utilitarian objects required repair and maintenance in order to function properly. However, once objects are removed from regular use, the same maintenance procedures can cause deterioration. For example, applying "leather dressings" to horse tack is important to keep pieces flexible and clean while they are being used. After accessioning, however, leather dressings will cause build up on the leather and accelerate deterioration.

In contrast to the use objects receive outside a museum, museum objects are preserved so they can be studied or exhibited. The goals for preservation are different, so the procedures and materials for care may be different. Work with a conservator to ensure that routine care and maintenance procedures are appropriate for the long-term preservation of the object. For examples see:

- *Conserve O Gram* 9/1, Leather Dressing: To Dress or Not to Dress

- *Conserve O Gram* 10/3, Preparing Historic Motorized Vehicles for Storage and Exhibit

C. Documentation of Conservation Treatment

All conservation treatment must be documented in writing. Many treatment records will also include graphic documentation (for example, photographs, drawings, analytical results, spectra, and digital images). NPS conservation treatment policy follows the guidelines for documentation in the *Code of Ethics and Guidelines for Practice of the American Institute for Conservation of Historic and Artistic Works* (AIC) (see Figure 8.1).

File all treatment documentation in the appropriate accession folder or catalog folder. You must keep a paper copy of all electronic records.

1. *Why is conservation documentation important?*

Documentation is important for these reasons:

- Conservation documentation is a written and graphic report of the work that is done. It provides the park staff with information on the condition of the object, such as how its original state has been altered, what is original material, and what is old restoration.
- It serves as a permanent record of the treatment procedures performed and the materials and methods used.
- It spells out the understanding reached between the curatorial staff and the conservator on the treatment, including the extent and type of any stabilization or restoration treatment.
- It makes possible the assessment of the success or failure of treatment methods and materials over a long period of time and provides information that will help future conservators to assess an object's condition and devise further treatment.
- It may last longer than the object itself and become the only record.

2. *What is the ANCS+ Conservation Associated Module?*

The Conservation Associated Module is a feature of ANCS+ that allows parks to incorporate conservation documentation directly into park-automated records. The module is a system that transfers copies of basic catalog information to the conservator and then easily transfers conservation documentation back into the park records.

The conservator must use templates created for Access, Excel, or ASCII formats to record survey, treatment, and analytical information. The template is required to make documentation compatible with the ANCS+ database. Complete instructions for using the Conservation Associated Module can be found in the ANCS+ User Manual, Appendix J.

Contracts with NPS and non-NPS conservators must include the requirement for using ANCS+ compatible reporting formats to ensure that data can be uploaded (see ANCS+ User Manual, Appendix J).

3. *What types of conservation projects can be recorded in the Conservation Associated Module?*

There are four types of conservation projects recorded in the Conservation Associated Module:

- Condition Survey
- Treatment Proposal
- Treatment Report
- Analysis

Parks use the Conservation Associated Module to:

- transfer basic catalog data from the park to the conservator to speed data entry and allow for improved conservation documentation
- incorporate documentation produced by conservators directly into park automated records (You don't have to enter data from paper records generated by the conservator.)
- ensure that you get documentation of critical information (The data fields guide the conservator to provide specific kinds of information in the report.)
- ensure documentation does not get lost over time (Paper reports are harder to track and keep associated with the objects over time. Data in the computer remains associated with the objects on a long-term basis. In addition, the National Catalog keeps backups from your yearly submission.)

Conservators use the Conservation Associated Module data templates to:

- facilitate incorporation of information they generate into park automated records as well as conservation lab databases
- ensure that their documentation is readily available to future curators, conservators, and researchers
- integrate conservation information in the primary database used to make management decisions about collections
- assist in managing conservation for the object, for example, the ANCS+ program facilitates:
  - simple estimation of hours for treatment projects on multiple objects
  - documentation of the amount of work accomplished in a year
  - word searches on treatment materials or types of objects treated
  - searches to find similar objects from past work
  - searches to find all work done for a park over numerous projects

Guidance for using the Conservation Associated Module is included in the *ANCS+ User Manual*, Appendix J: The Conservation Associated Module.

4. *What kinds of documentation should I require from the conservator?*

In addition to information recorded in the Conservation Module, get a copy of all documentation recorded by the conservator:

- ***Written reports:*** The conservation profession requires documentation of examination, scientific investigation, and treatment by creating permanent records and reports. The written reports often contain information on research into materials and technology that are beyond the scope of the Conservation Associated Module. They are prepared either in a narrative style or checklist format. See Figures 8.2–8.4 for sample reports. For multiple object treatments, summary reports may be included as well.

- ***Photographs:*** Most treatment documentation will include detailed photography. A complete series will include photos taken before, during, and after treatment. Photographic documentation can be archivally processed black-and-white prints or color slides. Digital images **may not** be substituted for black-and-white prints or color slides. Specialized photographic techniques are often used. These include use of:

  - ultraviolet light—some restorations fluoresce and become more visible

  - infrared light—may reveal details under layers of grime and old coatings; may improve the legibility of difficult-to-read inscriptions

  - raking light—shows surface irregularities by illuminating the surface from an acute angle

  - reflected light—shows variation in gloss or texture by recording the reflection of a light source

  - x-ray radiography—may reveal internal features

  - transmitted light—may show missing areas in translucent objects

  - photomicrography—shows details too small to see with the naked eye

- ***Drawings and illustrations:*** These media are used to note changes or significant features that are hard to illustrate with photographs (for example, repairs, selvage edges, changes in sewing threads in textiles).

- ***Analytical records:*** If analysis is undertaken to identify materials or techniques, additional types of information may be generated, such as analytical reports and interpretation, spectra, and graphs. Parks must keep complete sets of the data as part of the record of conservation work.

	MINIMUM DOCUMENTATION REQUIREMENTS	RECOMMENDED DOCUMENTATION REQUIREMENTS
All Documentation	Include: • purpose • documentation by (name) • date • object name • object ID/unique information • catalog number • registration number • measurements • marks/labels/features	Include associated records such as: • previous treatment • excavation reports • curatorial reports • scientific reports
Examination Reports	Include: • observations • present condition • notation of accessory materials or associated elements • past treatment evidence • methods of examination and testing	Include: • drawings/photos to illustrate condition and relevant details (include control numbers) • size scale • gray/color scale (photos) • light direction (photos) • object ID
Treatment Proposals:	Include: • treatment plan • materials to be used • time estimate • cost estimate (when appropriate)	Include: • objectives and limitations of treatment, benefits, and risks • general description of properties of materials to be used • statement that minor variations in treatment may be required as treatment progresses
Treatment Reports:	Include: • conservator name • report date/treatment date • procedures used that deviate from proposal • added materials that remain on object • materials used on object that do not remain • removed materials • materials obscured by treatment • new information about object revealed in treatment (including features hidden by assembly) • changes in artifact as a result of treatment including its state after treatment • names of assisting conservators, consultants, and contractors • dated graphic documentation	Include: • procedures and materials considered, but not chosen • recommendations for subsequent care and maintenance • treatment time • treatment cost (when needed)

Figure 8.1. Information Required in Conservation Treatment Documentation (Taken from *AIC Guidelines and Standards for Practice)*

5. *What are typical documentation steps when an object is treated?*

Most object conservation treatment documentation will include the following steps:

1) Park staff provide the conservator with historical information relevant to the treatment or any record of condition or treatment.

2) The Conservator prepares an *examination report* (see Fig. 8.2). This examination report is often part of a Collection Condition Survey (CCS). (See Chapter 3: Preservation: Getting Started.) This may also be included as part of the treatment proposal. This report should include:

- a description of the materials, structure, and construction of the object
- an analysis of materials, if appropriate
- a description of the condition of the object and evidence of past treatment, with reference to any previous documentation
- any deductions, interpretations, or comments

3) The conservator prepares a *treatment proposal*. See Figure 8.3 for a sample treatment proposal. In this document the conservator outlines the proposed treatment and includes alternatives, if any. The proposal usually will not list all the technical details that are listed in the treatment report. The treatment proposal should address all the problems identified in the examination report. It should include time/expense estimates. The park curator reviews the treatment proposal and approves it with the concurrence of the park superintendent.

The conservator should discuss any significant departures from the proposal as the treatment is carried out and receive approval for those changes from the curator (and Contracting Officer's Technical Representative [COTR] if applicable).

4) The conservator prepares a *treatment report*. See Figure 8.4 for a sample treatment report. In this document the conservator details the steps of the treatment that were undertaken. The conservator will discuss the treatment results and often make recommendations about future care, exhibition, or storage requirements. If there are any variations from the original treatment proposal, the park will have approved the changes in writing. The conservator will also discuss treatment changes and their rationale in the final report.

6. *What kinds of documentation should park staff generate on its own treatment activities?*

Record two types of activities:

- You must keep a record of housekeeping tasks done by staff. These tasks include:
  - cleaning (method and frequency)
  - dusting
  - waxing

– maintaining proper fluid levels in wet specimens

Record this information in the ANCS+ Maintenance Associated Module. Instructions for using the module can be found in the *ANCS+ User Manual*, Chapter 4: Associated Modules. Provide this information to the conservator as part of the historical information about the object.

For more information about developing a housekeeping plan, including the documentation, see Chapter 13: Museum Housekeeping.

- You should also record any observed changes in the condition of the object. Record these in the Catalog Record in ANCS+ in the condition and condition description fields.

D. Obtaining the Services of a Conservator

When you need a conservator:

- Take time to locate an experienced, well-qualified conservator. This point is critical to the quality of treatment an object will receive.
- Prepare a scope of work (SOW) for the project. Regional/SO curators and NPS conservation laboratories can provide you with sample SOWs.
- Discuss the process with the conservator and others involved in the project to be sure each person (park manager, park curatorial staff, regional curator, and conservator) understands the others' roles.
- Be sure contract conservators understand the NPS conservation treatment policy to preserve what remains of an object in as stable a condition as possible. Provide them with NPS policy and procedural guidelines, such as pertinent sections of the *Museum Handbook* and *ANCS+ User Manual*.

1. *How do I find a conservator?*

Work with your regional/SO curator to find a NPS conservator or a conservation contractor with the appropriate knowledge and experience. The regional/SO curator can help locate possible conservators to perform the work and help you find funds for the project. They will also help set priorities and determine a time frame for the project, as well as help prepare procurement documents. Discuss the type of project (for example, treatment of a single object, treatment of a group of objects, identification of methods and materials used to create an object) with the regional/SO curator and determine:

- the nature of the object or collection (type of material and condition)
- the present use of the object or collection
- the planned use of the object or collection (for example, for research, in an exhibit, as a working piece of equipment in demonstrations)

2. *How do I decide if a suggested conservator and treatment are suitable?*

First, ensure that the treatment proposal is in response to and addresses an existing documented condition. You also can judge this by evaluating treatment recommendations against the AIC Code of Ethics. In particular, be aware of the following points in the Code:

- *The conservation professional shall practice within the limits of personal competence and education as well as within the limits of the available facilities.* Ask the conservator these questions:
  - What is your training for this sort of treatment?
  - Have you ever treated objects like this before?
  - Do you have the proper equipment to carry out this treatment?
  - What kind of security and fire protection does your facility have?
  - Can you give me references from previous clients?
- *The conservation professional must strive to select methods and materials that, to the best of current knowledge, do not adversely affect objects or their future examination, scientific investigation, treatment or function.* Ask the conservator these questions:
  - How will this treatment affect future analysis?
  - If you do this treatment, can the object be re-treated in the future? No treatment is completely reversible, but it is possible to use materials and techniques that allow for re-treatment. For example, you may not be able to remove a consolidant added to give structural strength. However, the choice of consolidant should not rule out the use of a later, alternative treatment, if the original treatment fails.
- *The conservation professional shall document examination, scientific investigation, and treatment by creating permanent records and reports.* Ask the conservator these questions:
  - What kind of photo-documentation will you do?
  - How will you ensure photographs are archivally processed?
- *The conservation professional shall recognize a responsibility for preventive conservation by endeavoring to limit damage or deterioration to objects, providing guidelines for continuing use and care and recommending appropriate environmental conditions for storage and exhibitions, and encouraging proper procedures for handling, packing, and transport.* Ask these questions:
  - How would you recommend I handle and store this object in the future?

- Do you have any recommendations for the future exhibit of this object?

- Does this object pose health and safety risks to staff or risks to nearby materials?

3. *What do I need to know about contracting for conservation treatment services?*

Work directly with your park or regional procurement officer to ensure that you prepare the proper documents for all conservation services. The procurement officer should be able to provide you with the information you need to decide on the appropriate type of procurement.

Consider taking a basic procurement course to get a background in the tasks that are required. The Federal Acquisitions Institute (FAI) sponsors on-line training in acquisition and contracts management at <http://www.faionline.com>.

Ask a NPS conservator to serve as the Contracting Officer's Technical Representative (COTR). The COTR is a federal employee who provides advice on the technical aspects of the work being contracted. A NPS conservator has the technical knowledge to evaluate a treatment proposal and can assist you and the contracting officer with the resolution of technical problems and help approve necessary changes that may come up during the treatment process. **Note:** Be sure the COTR has expertise in the type of material that is being treated.

A regional/SO curator, knowledgeable park curator, or NPS conservator can serve as the COTR for collection condition surveys and general preservation services provided by a conservator.

Ensure that the contract specifies "work for hire" and that the contractor transfers copyright of all documentation, including photographs (see Museum Handbook, Part III, Chapter 2, Sec. C.7 and Chapter 3, Fig. 3.4).

4. *What happens after the conservator is selected?*

Once you have selected a conservator, schedule the project. If objects will be shipped to the conservation lab, schedule the shipment dates with the conservator. Discuss packing and shipping methods to ensure the objects are not damaged in transit.

Review all examination reports and/or treatment proposals. Discuss your questions with the conservator. The person with delegated responsibility (usually the curator) must approve and sign a treatment proposal before work can begin. Get advice from the regional/SO curator or NPS conservators to ensure that the proposal describes an appropriate treatment. File a copy of the signed treatment proposal in the Catalog Folder or Accession File.

5. *When I am evaluating a treatment proposal, what should I consider?*

Before you allow conservators to carry out a treatment on an object, you must approve their written treatment proposal. When evaluating a conservation treatment proposal, consider the following factors:

- The park superintendent has ultimate responsibility for each object. Don't simply accept a recommendation, but question and evaluate its quality. Ask the regional/SO curator or a NPS conservator with expertise

in the type of object to be treated to review treatment proposals before work begins. During treatment, the curator (and COTR, if applicable) must review and approve any significant deviations from the proposal.

- Every active treatment carries inherent risk. No conservator can or will guarantee the final outcome.

- Conservators must convince you that their recommendations are governed by total respect for the physical, historic, and aesthetic integrity of an object by the explanations that they include in the treatment proposal.

6. *What are my responsibilities once the treatment proposal is approved?*

Monitor the work by visiting the conservation lab or discussing progress with the conservator. After treatment is completed, the conservator will return the objects to the park. Before approving payment, ensure that all conditions of the contract or SOW were completed satisfactorily. Review electronic data provided by the conservator and incorporate accepted data into the ANCS+ Conservation Associated Module. Consider having another conservator review the work. File all documentation (reports, photographs, drawings, etc.) in the Catalog Folder or Accession File.

7. *Where can I find information on how to treat objects in an emergency?*

Refer to Chapter 10: Emergency Planning, for information on planning for and recovering from an emergency. This chapter also gives you information on basic actions you can use to minimize damage. In particular, review Figure 10.13, First 48 Hours Emergency Response Checklist.

Use the Emergency Response and Salvage Wheel from Heritage Preservation (mailed to all parks in 1997) <http://www.heritagepreservation.org/>. This tool gives you basic steps to take after a disaster strikes.

Contact a conservator as soon as possible for advice on how to recover from the emergency.

E. Glossary

Accretion – accumulated materials not original to the object that are attached to the surface of an object. For example, calcium deposits may accumulate on buried (archeological) ceramics.

Conservation – the deliberate alteration of the chemical and/or physical aspects of objects, aimed primarily at prolonging their existence. Treatment may consist of stabilization and/or restoration.

Inherent vice – the nature of the material or the results of manufacturing techniques that cause an object to deteriorate more rapidly than normal, or that make stabilization nearly impossible. For example, 19th century silk fabrics were sometimes treated with metallic compounds that cannot be removed from the fabric, but cause the fabric to split and powder.

Intervention – taking direct, hands-on action to stabilize the condition of an object

Minimal intervention – using only those treatments necessary to stabilize the condition of an object

Preservation – all actions taken to prolong the life of an object

Preventive care – synonym for preventive conservation

Preventive conservation – non-interventive actions that can be taken to prevent damage to and minimize deterioration of museum objects

Reproduction – a copy of an item for exhibit, interpretive, educational, sale, research or other purpose, made when use of the original would be inappropriate or would cause undue deterioration or loss

Restoration – an attempt to bring museum objects closer to their original or other previous appearance by removing additions not considered historically important, replacing missing parts, renewing finishes, and/or concealing damage

Reversibility – the principle of using materials that can be removed, in so far as possible, should re-treatment of an object become necessary

Spectrum – a graphic or photographic representation of the distribution of energy emitted by a radiant source. For example, spectra might be produced by analytical techniques used to identify the type of varnish on a piece of furniture.

Stabilization – treatments applied to museum objects to increase their stability or durability when preventive conservation actions are insufficient to reduce the rate of deterioration, or when deterioration has rendered them so fragile as to be in danger under any circumstances

Treatment – methods or techniques that are usually interventive in varying degrees to preserve the condition or appearance of a museum object

Work for hire – work produced by employees as part of their responsibilities, or rights to work transferred to the employer through contractual agreement

Object Examination Report

Owner:	National Park Service	**Laboratory Supervisor:**	
		Proposed by:	Lesley Jones
Catalog No:	WASO1		
		Date Proposed:	January 5, 2001
Object:	Frock coat		
		Estimated Hours:	75 hours
Lab Tracking No:	11788.70		

DESCRIPTION:

The object is a single breasted Civil War frock coat of navy blue doeskin (fulled wool) with a standing collar and long cuffed sleeves. The coat has a nine-button center front closure. It is fully lined—the body and skirt with green wool and the sleeves with natural colored twill weave cotton. There is a belt tab on the proper right (PR) side at the waist and an inner breast pocket on the proper left (PL) side of the coat. The 2.4 cm (7/8 inch) diameter brass buttons depict an eagle with a shield. The eagle holds an olive branch in his PL talons and a shaft of arrows in his PR talons; he faces to the right. Two of the same buttons adorn the back vent of the skirt at the waist; each sleeve cuff contains three smaller diameter buttons—1.5 cm (1/2 inch)—with the same eagle and shield design. The buttons have a maker's mark on the back "HORSTMANN & CO / NY & PHI." Shoulder boards of navy blue wool with sheet brass stamped to resemble gold bullion embellish both shoulders.

Dimensions:

Length: 98.9 cm (39 inches) (measured at the center back from the top of the collar to the bottom edge)

Width: 53.4 cm (21 inches) (measured at the widest point across the shoulders)

Structure or Construction:

This coat is a well-made, hand tailored garment constructed of high quality piece goods. The doeskin is fine. This coat does not have bound buttonholes. The collar is lined in black velvet.

The back is constructed in four pieces with a center back seam and two princess seams. Each front section is a single piece with a dart extending up 14.1 cm (5-1/2 inches) from the waist seam. The sleeves are constructed of two pieces with an added cuff that measures 6.5 cm (2-1/2 inches) in width. The skirt is constructed of two main pieces with small additional pieces used to form the vent in the center back. The entire coat is lined—the body and skirt with a green wool and the sleeves with natural colored twill weave cotton. The inside front panels are quilted; the quilting extends under the arms to the princess seams.

Figure 8.2. Sample Narrative Examination Report

CONDITION:

The coat is in excellent structural and aesthetic condition.

The shoulder guards are very heavy and may not be entirely original. The sheet brass appears to be attached to navy wool, which in turn has been stitched to what may be a modern, black fabric. This final layer is what has been stitched to the shoulders of the coat.

There are several small holes, a result of insect damage, scattered across the surface of the coat; they do not compromise the coat's structural integrity. There is a hole the size of a nickel in the center back along the bottom edge and slightly smaller holes on both sleeves at the elbows. There is a 1.3 cm (½ inch) tear at the PL sleeve seam in the back. The center front edge is unstitched along much of its length on both sides.

The lining is in excellent condition. There is one hole in the lining in the area of the inner breast pocket. The collar lining has come unstitched at the center back.

PREVIOUS REPAIRS, TREATMENT, MOUNTING:

Some buttons may have been resewn. Aside from the difference in thread used, it is possible to tell the difference between original and resewn buttons because the original buttons were sewn on before the facing was attached. As a result, the stitching does not extend through all layers and is not seen on the inside. In contrast, the stitching on resewn buttons extends through all layers and can be seen on the inner face of the coat. Components of the shoulder boards may have been replaced.

PHOTOGRAPHIC DOCUMENTATION:

None

Figure 8.2. Sample Narrative Examination Report (continued)

Object Treatment Proposal

Owner:	National Park Service	**Laboratory Supervisor:**	
		Proposed by:	Lesley Jones
Catalog No:	WASO1	**Date Proposed:**	January 31, 2001
Object:	Frock coat	**Estimated Hours:**	75 hours
Lab Tracking No:	11788.70	**Cost of Treatment:**	

DESCRIPTION AND CONDITION:

See Object Examination Report dated January 5, 2001.

PROPOSED TREATMENT:

1. Vacuum clean coat using reduced suction.
2. Visually reintegrate areas of loss using compatible weight and color fabric to back holes.
3. Clean buttons and apply protective coating of microcrystalline wax.
4. Restitch seams requiring stitching; reinforce with Stabiltex polyester multifilament fabric as needed.
5. Examine shoulder guards. Because of their weight, explore mounting options besides stitching them to shoulder of coat.
6. Prepare custom-built mannequin on which to display coat when on exhibit.

DOCUMENTATION:

The artifact will be photographed with Ektachrome 160 Tungsten color slide film before and after treatment. Minute fiber samples will be taken and mounted on microscope slides for visual analysis.

Figure 8.3. Sample Treatment Proposal

RECOMMENDATIONS FOR SUBSEQUENT CARE:

DISPLAY REQUIREMENTS:

- Light levels should not exceed 5 lux (5 footcandles) using a Visitor Activated lighting system.
- The coat should be inspected annually for signs of pest infestation.
- The coat should be micro vacuumed while on exhibit as required. Vacuuming frequency should be determined by inspecting the textile and noting the accumulation of dust inside the exhibit case.
- The coat should be rotated off display in 2 to 3 years and allowed to remain in storage for at least 5 years before being exhibited again.

POST EXHIBITION CARE:

The coat should remain in storage, in a dark, clean, stable environment for at least 5 years after rotation. See NPS *Museum Handbook*, Part I, pages K:19-29 for preventive conservation, handling and storage procedures.

If you agree with this proposal, please sign it and return it to the conservator. Your approval of this request must be received before work can proceed. The conservator will be happy to discuss this treatment proposal with you and answer any questions. If significant changes to this proposal are anticipated once treatment has begun, the conservator will consult with you.

Object Treatment Report

Owner:	National Park Service	**Laboratory Supervisor:**	
		Treated by:	Lesley Jones
Catalog No:	WASO1		
		Date Completed:	May 10, 2001
Object:	Frock coat		
		Total Lab Hours:	75 hours
Lab Tracking No:	11788.70		

DESCRIPTION:

See Object Examination Report dated January 5, 2001.

CONDITION AND TREATMENT PROPOSAL:

See Object Treatment Proposal dated January 31, 2001.

TREATMENT:

Several small holes scattered across the surface of the coat, a result of insect damage, as well as the insect or rodent damage evident along the bottom edge of the coat in the center front, were repaired using patches of a compatible blue wool fabric placed behind the holes and secured with stitching using a thread pulled from Stabiltex, a polyester multifilament fabric. The buttons were cleaned and degreased with Stoddard solvent and a protective coating of microcrystalline wax was applied using cotton swabs. Stitching securing seams of the coat and lining that had failed in numerous areas was replaced using a thread pulled from Stabiltex. A custom mannequin was built on which to display the coat when on exhibit. Once the coat was fit on the mannequin, it was vacuumed using reduced suction.

The shoulder bars were removed from the coat and gently reshaped to better fit the shoulders of the coat. To prevent further damage to the coat, a Velcro hook was sewn to a support fabric and the fabric was sewn to shoulders of the coat with a black cotton thread, 3 S plied Z. A strip of Velcro fabric was sewn to the underside of the shoulder bars. The Velcro hook attaches to Velcro fabric securing the shoulder bars in place.

RECOMMENDATIONS FOR SUBSEQUENT CARE:

DISPLAY REQUIREMENTS:

- Light levels should not exceed 30 lux (3 footcandles) using a Visitor Activated lighting system.
- The coat should be inspected annually for signs of pest infestation.
- The coat should be micro vacuumed while on exhibit as required. Vacuuming frequency should be determined by inspecting the textile and noting the accumulation of dust inside the exhibit case.
- The coat should be rotated off display in 2 to 3 years and allowed to remain in storage for at least 5 years before being exhibited again.

POST EXHIBITION CARE:

The coat should remain in storage, in a dark, clean, stable environment for at least 5 years after rotation. See NPS *Museum Handbook*, Part I, pages K:19-29 for preventive conservation, handling and storage procedures.

Notes:

Fulled wool was a British specialty. After the cloth was woven, removed from the loom, and scoured to remove the oils used in the spinning process, fulling occurred to both felt the cloth and shrink it. Fulling was done in a fulling mill using wooden hammers or stocks to raise the nap. The cloth was first scoured with the slow motion of hammers, "leisurely without such violence as heats it much;"[1] fulling was then done with "quick heavy strokes which heat the cloth and shrink the fiber"[2] using an *aena*, a flat wooden implement set with spikes. In some cases the woven cloth was burled before being fulled but after being scoured. Fuller's earth in soft water was used as a detergent in the scouring process; if Fuller's earth was not available, sig (stale urine) or swine's dung was employed instead. The scouring agent needed to be alkaline; sig provided a natural source of ammonia.

The main problem in fulling was ensuring that the textile shrank evenly. "Fine medley broadcloth made in the early eighteenth century shrank less than half its width and one-third its length." Shrinkage was proportional to the texture of the cloth and the length of the fulling process; the thinner the cloth, the less the shrinkage. Well-woven Wiltshire medleys of the eighteenth century could be finished in nine hours; the process was lengthened considerably for badly woven cloth. The degree of fulling varied by location —Gloucestershire cloth tended to be more heavily fulled.

Cloth was easily damaged during the fulling process. After emerging from the fulling mill, the cloth was hung on tenters to dry; the tenters served to stretch the wet fabric. The fulling process sometimes left the sides of the cloth longer than the middle section. Gloucestershire led in the mechanization of scouring; Wiltshire led in the mechanization of fulling. The first patent for a fulling machine was obtained in 1833; by the mid-19th century the fulling process was fully mechanized.

Figure 8.4. Sample Treatment Report (continued)

CHAPTER 9: MUSEUM COLLECTIONS SECURITY AND FIRE PROTECTION

A. Overview

As hard as we try, nothing lasts forever. Still, an effective preservation program can delay the inevitable. Preventive conservation can slow the rate of loss to natural, expected causes, while a comprehensive security system can help limit losses from unexpected causes, such as fire, theft, natural disasters, and accidental damage. Security and fire protection are as important to the long-term survival of a collection as proper curation, storage, and conservation and must be an integral part of the day-to-day care of the collection.

1. *What is a comprehensive security system?*

A comprehensive security system combines policies, procedures, personnel, and hardware to protect museum collections from unexpected losses caused by crime, negligence, fire, or other catastrophic events. Four concepts are implicit in such a system:

- The park itself is a system, and security is one of its subsystems.
- Identifying objectives precisely and clearly is the most important step you can take in designing an effective system. A security system for museum collections, for example, has two principal objectives: to protect museum collections and associated records from catastrophic loss, and to protect the documentation related to objects in the collection, such as accession records, catalog records, conservation reports, and photographs.
- No single subsystem or component can achieve a security system's overall objectives. Subsystems must complement each other to make the system efficient and ultimately successful.
- Subsystems and components are interdependent within a system. Changes in one part affect the whole system and may have unexpected consequences. For example, placing an air handler in a museum collection storage area might be an efficient use of space, but it complicates access control, adds a potential source of ignition, and increases the risk of accidental damage to museum objects.

2. *How should I design an effective security system?*

There are no cookbook solutions for security problems, and no single recipe will turn out a perfect security system every time. Each park must develop its own system. Every park is unique, faces different threats, has different short-term objectives, and has different resources available. While security concepts are mostly common sense, applying them effectively requires care, consideration, and experience.

One way you might think about a comprehensive security system is to visualize a series of concentric circles that form a bull's-eye (see Figure 9.1). Simply stated, you should add more and tighter security precautions as

you get physically closer to a high value object, like the rings on the bull's-eye diagram. The more valuable the protected object, the more protection rings there should be, and the more they should focus on the object. The figure also shows the overlapping and complementary roles played by park boundaries, policies, procedures, the building shell, cases, electronic systems, and personnel.

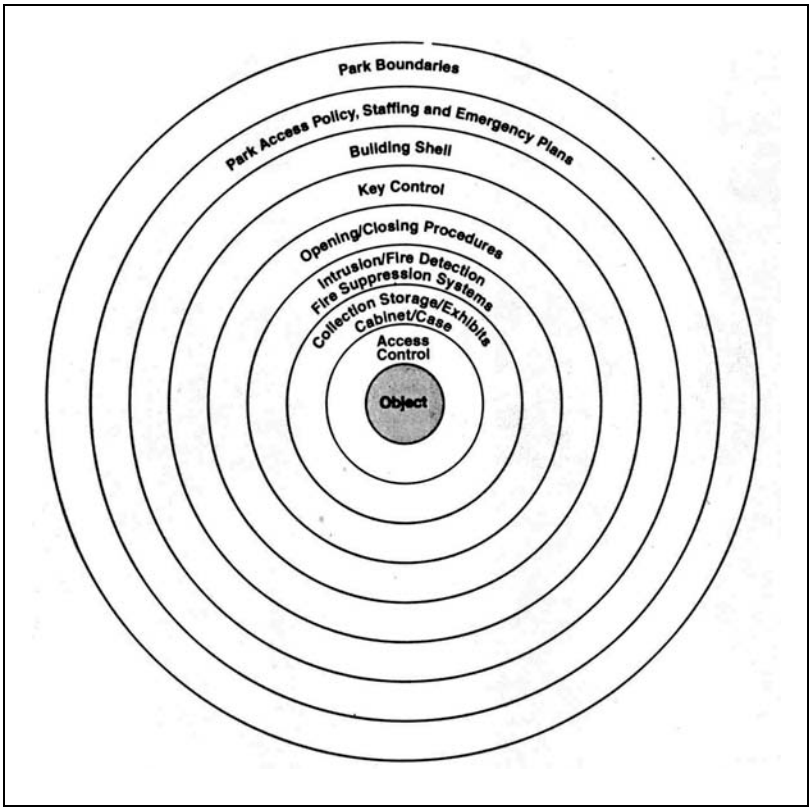

Figure 9.1. Security Bull's-Eye

3. Who is responsible for security?

Overall responsibility for protecting the park's museum collection rests with the superintendent, while museum and law enforcement staff share direct day-to-day responsibility. Nevertheless, you and all of your fellow park employees—permanent, seasonal, salaried, or volunteer—are part of the park's security system and have security responsibilities that should be reflected in the park's standard operating procedures (SOPs).

4. *What information will I find in this chapter?*

Information in this chapter will help you:

- identify threats to your collections
- assess the risk of loss
- select and implement appropriate countermeasures
- measure the effectiveness of those countermeasures

See NPS Museum Handbook, Part I, Appendix G: Protection of National Park Service Museum Collections, for NPS security and fire protection standards, glossary of terms, and sample statements of work, standard operating procedures, and agreements.

B. Legal, Regulatory and Policy Requirements

Protection of museum collections is basic to the mission of the National Park Service. The following digest of statutes and policies provides a starting point for a park's protection program. In essence, they require you to use the most effective means available to protect museum collections against fire, theft, and other threats without compromising their integrity.

1. *What laws and regulations do I need to know?*

Title 40 United States Code (USC), *Public Buildings, Property, and Works* Paragraph 486(c) provides statutory authority for the head of each executive agency to issue orders and directives necessary to manage the Government's property.

Code of Federal Regulations (CFR) 41 *Federal Property Management Regulations* Part 101, Subpart 20.5 "Physical Protection", prescribes policies and methods for physically protecting buildings and grounds operated by GSA and other Federal Executive agencies. The Department of the Interior's property management regulations are in Part 114 of CFR 41.

2. *Which parts of the Department of the Interior's Manual address protecting museum collections?*

Part 411, Chapters 1-3, sets standards and requirements for protecting museum property.

Part 444, Chapter 1, tells you how to safeguard personnel, prevent unauthorized access to Federal property and records, and safeguard against espionage, sabotage, vandalism, and theft.

3. *What sections of NPS Management Policies refer to protecting museum collections?*

Section 5.3, Stewardship concerns the protection and preservation of cultural resources. It states the National Park Service will employ the most effective concepts, techniques and equipment to protect cultural resources against theft, fire, vandalism, overuse, deterioration, environmental impacts, and other threats, without compromising the integrity of the resources. It also states that:

- Measures to protect or rescue cultural resources in the event of an emergency, disaster, or fire will be developed as part of a park's emergency operations and fire management planning processes. Designated personnel will be trained to respond to all emergencies in a manner that maximizes visitor and employee safety and the protection of resources and property.

- In the preservation of historic structures and museum and library collections, every attempt will be made to comply with national building and fire codes. When these cannot be met without significantly impairing a structure's integrity and character, the management and use of the structure will be modified to minimize potential hazards, rather than modifying the structure itself.

- When warranted by the significance of a historic structure or a museum or library collection, adequate fire detection, warning, and suppression systems will be installed. "Pre-fire plans" will be developed for historic structures and buildings housing museum or library collections, designed to identify the floor plan, utilities, hazards, and areas and objects requiring special protection. This information will be kept current and made available to local and park fire personnel.

- Park and local fire personnel will be advised of the locations and characteristics of cultural resources threatened by fire, and of any priorities for protecting them during any planned or unplanned fire incident. At parks with cultural resources, park fire personnel will receive cultural resource protection training. At parks that have wildland or structural fire programs, cultural resource management specialists will receive fire prevention and suppression training and, where appropriate, will be certified for incident management positions commensurate with their individual qualifications.

- Smoking will not be permitted in spaces housing museum or library collections, or in historic structures (except those used as residences in which smoking is permitted by the park superintendent).

4. *Which Director's Orders address protecting museum collections?*

Several Director's Orders contain instructions related to protecting museum collections.

Director's Order #9: Law Enforcement Program, vests considerable authority and responsibility in law enforcement staff for protecting park resources, including museum collections. It tells you to inventory your resources and prioritize protection needs after you assess their significance and vulnerability. It also discusses crime prevention and physical security programs in parks.

Director's Order #28: Cultural Resource Management and Cultural Resource Management Guideline, Release No. 5 (1997), which implements Director's Order #28, addresses protecting and managing all cultural resources, including museum objects.

- *Chapter 4* provides overall guidance on protecting cultural resources. The sections on physical security and structural fire relate to protecting museum objects.

- *Chapter 9* says a systematic approach to protecting museum objects involves:

  – identifying and evaluating threats and risks

  – conducting and reconciling annual inventories of collections

  – developing and implementing good operational procedures and practices, such as key control, access control, and opening and closing procedures

- evaluating the physical security of spaces housing collections, with attention to barriers, cases, locks, doors, and windows
- installing intrusion detection systems and fire detection and suppression systems that are appropriate to the nature of collections and the structures housing them
- incorporating the special needs of collections in physical security plans, structural fire plans, and emergency operations plans
- ensuring that all incidents involving collections are reported

Director's Order #44: Personal Property Management and Personal Property Management Handbook #44, Section 9.3 governs firearms and ammunition that are part of a museum collection.

Director's Order #50B and Reference Manual #50B, Occupational Safety and Health Program state the installation, inspection, and maintenance of fire sprinkler systems, fire alarm systems, life safety systems, smoke detectors, fire extinguishers, and other fire protection features will be in accordance with National Fire Protection Association (NFPA) requirements.

Director's Order #58 and Reference Manual #58, Structural Fire Management tell you how to manage a structural fire program. Structural fire management is defined as the protection of people, content, structures, resources, and the landscape surrounding the structure from the effects of fire.

C. Measuring the Effectiveness of a Security System

Past experience is an important element. Complete and accurate loss records, such as Case Incident Reports, are vital. Nevertheless, past history does not tell the whole story. You also must:

- analyze the risk comprehensively
- evaluate the effectiveness of the countermeasures intended to reduce the risk
- determine how well the security system fits the operational needs of your park

All the elements are important. And remember, a system that reduces risk but paralyzes operations is not effective.

1. *What are the threats to museum collections?*

Figure 9.2 lists the threats to museum collections.

General Category	Specific Threat
Crime	Burglary Larceny Robbery Bombing Vandalism Arson
Civil Disturbances and Warfare	
Natural Catastrophes	Earthquake Flood Landslide Fire Hurricane Tornado Tidal wave Lightning Volcanic eruption Wildlife
Industrial Disasters	Explosion Structural collapse Hazardous materials release Fire Serious employee or visitor accident Nuclear incident Power outage Loss of water, sewer, or gas service
Other Threats	Accidental damage Acts by disturbed persons Transportation accidents

Figure 9.2. Threats to Museum Collections

2. *What is risk assessment?*

In assessing risk, you must analyze a threat's probability of occurrence and the severity of its consequences. You'll need to identify the possible ways losses can occur, what the impact of the losses would be, and how you prevent or reduce the losses.

Probability

While the number of potential threats is unlimited, some are more likely than others. In general, the more ways something can happen, the higher the probability it will happen. For example, consider a park with an extensive collection of Native American artifacts--pots, baskets, and other easily sold items. If the threat is theft, any of the following conditions, or some combination, increase the probability of a loss:

- Pots and archeological fragments on exhibit are not in locked exhibit cases.
- Objects on display are not routinely inventoried.
- There are no procedures for temporarily removing objects from exhibit cases.
- Exhibit cases have plain glass and standard fasteners.
- Exhibit spaces have large windows close to the ground.
- Door locks are not strong enough to prevent forcible entry.

- The building is not protected by an intrusion detection system.

Some threats are unlikely in some parks. For example, a park in New Mexico doesn't need to plan for a tidal wave. Some threats just seem unlikely. For example, a 500-year flood may seem to be a remote threat. But if we remember that the objective of the NPS preservation program is to preserve museum objects and historically significant structures for as long as possible, a 500-year flood is a threat that deserves thoughtful planning.

Severity

Highly probable threats may not require much in the way of preventive measures if the net loss or damage they would cause is small. On the other hand, moderately probable or greater threats demand greater attention if the impact would be great. For example, it is highly probable that someone will take the ball point pen from a visitor registration desk, but it is more cost-effective to use cheap pens, and replace them, than to prevent the loss. On the other hand, a low to moderate probability of arson in an historic structure demands full protective measures because the impact could be significant.

You can measure the impact of a loss by the direct cost, or dollar value, of the lost or damaged property and the cost of its repair or replacement. Direct cost is quantifiable and can be used to evaluate the cost-effectiveness of potential countermeasures. However, it may not be the most important measure, because the indirect costs may have a more severe impact on the park's mission. Indirect costs could include:

- effects on employee morale and reputations
- effects on public relations
- loss of donations to parks that do not protect their assets
- adverse impacts on the park's interpretive program

For example, a soldier's diary may have little dollar value, but it can play a significant part in telling the story of how the soldier lived and how soldiers in general took part in the development of the country. The diary serves both as an information resource and as a tangible point of reference to help visitors relate to the story. The fact that the diary is an original object enhances the relationship. If the diary is stolen, the interpretive story suffers in ways that cannot be translated into dollars.

3. *How do I conduct a risk assessment?*

First, you need to identify the potential threats or hazards that have the greatest probability of occurring and those with the greatest adverse impact on the museum collection.

Then look for irreplaceable, valuable and particularly sensitive objects, especially those on exhibit, such as historic firearms and paintings.

Finally, analyze the nature and effectiveness of the protection currently given such objects. For example, if you want to assess how well an object is protected from theft, try to think like a thief.

- A thief has to touch an object with something--hand, stick, wire hook, an accomplice--to steal it. Look at obvious ways first. In one theft from a park, the thief removed a diary from a case by tilting up the unsecured vitrine cover.

- If the case is small or poorly mounted, the thief might take both the case and the object in it. Look carefully at how cases are mounted. The case may be strong, but the wall mounting may be weak so the thief can pull the case off the wall, or remove it by taking out a few fasteners. So ask yourself:

  – Are doors and cases locked?

  – Are cases structurally sound?

  – Are fasteners firmly in place?

- After checking the obvious, be creative. A thief is not restricted by our concept of what someone might do, only by what it is possible to do. In one incident, a thief boosted a small child over a Plexiglas™ barrier that covered all but a small space at the top of a door into a period room. The child gathered objects and escaped through another door.

4. *How can I limit the risk?*

If possible, eliminate threats; if not, reduce them by:

- ***Risk Assumption*** is the process of using existing resources to absorb losses as and when they occur. It may be appropriate under the following conditions:

  The impact of a loss is small. For example, it is advisable to assume the risk of some forms of vandalism.

  The likelihood of damage is small. For example, it takes considerable effort to damage a stone-grinding wheel. Even if the grinding wheel is original to the site it may not make sense to exhibit it in a case, or even in a building, when it is easier to see outside and the wheel's size and composition make it nearly indestructible.

- ***Risk Transfer*** is the process of transferring a risk to another entity for a fee. It is usually not appropriate because the NPS generally insures property only when it is borrowed from someone outside the government or another government agency.

See the Museum Handbook, Part II, (MH-II) Museum Records, Chapter 4, Inventory and Other Special Instructions for guidance on insuring borrowed objects.

5. *How often should I assess risk and what tools are available?*

Director's Order #24: NPS Museum Collections Management requires parks and centers to keep the NPS Checklist for Preservation and Protection of Museum Collections (Checklist) up-to-date in the Automated Checklist Program (ACP) in ANCS+. The Checklist records information on preservation and protection conditions (including fire and security protection) in parks and centers, identifies deficiencies, and provides estimated costs to correct deficiencies. You can use the checklist to conduct a self-assessment of your park's level of museum security and fire protection. See Appendix F: NPS Museum Collections Management Checklists, and the *Automated National Catalog User Manual*, Appendix G: Automated Checklist Program, for guidance on the checklist.

6. *How do I conduct a self-assessment?*

Conduct a ***Basic Security Inspection*** by using the checklist as a guide to inspect museum collection spaces. There are three steps in this inspection.

- Describe the nature of the museum collection, to include:
  - types of materials used, such as paper, wood, or stone
  - value of objects (for example, monetary, research, interpretation)
  - most significant objects in the collection (for example, letter signed by President Truman)

> ***See the NPS Museum Handbook, Part II, (MH-II) Chapter 4: Inventory and Other Special Instructions, Section IX, Determining the Monetary Value of Museum Objects, for guidance in establishing value.***

- Identify the areas where the collection is kept (such as visitor center exhibit, storage), especially the most valuable and most vulnerable objects.
- Inspect for deficiencies using the NPS Checklist for Preservation and Protection of Museum Collections.

7. *What is a security survey?*

Use a ***security survey*** in the on-site phase of preparing a Collection Management Plan or as a specific need in a self-assessment inspection. Do not forget to include fire protection.

A comprehensive security survey will cover:

- perimeter security
- structures housing the collection
- policies and procedures
- emergency plans
- individual object protection

- fire prevention
- personnel training programs
- structural and procedural fire hazards
- maintenance of protective systems

Either you or a contractor can conduct the survey. Whoever does so must have the following qualifications:

- experience and expertise in protecting museums and historic sites
- sensitivity to the special protection requirements in museum operations
- practical experience in applying the requirements in parks and historic sites

8. *How should I prepare for a survey?*

Write a detailed scope of work (SOW) that serves as a blueprint for the survey and as a standard against which to measure the surveyor's work. See *MH-I*, Appendix G: Protection of National Park Service Museum Collections, for a sample SOW. The scope of work should specify what the surveyor is expected to do, and when, and how to report results.

Make sure all facilities with museum collections will be available during the survey. Brief park staff on the importance of the survey and ask everyone to answer questions candidly.

Prepare the following documents for the surveyor:

- most recently-completed NPS Checklist for Preservation and Protection of Museum Collections
- reports from any earlier security surveys
- plans and drawings of all facilities that house museum collections on which the surveyor will record observations to be included with the final report
- information on installation, operation and maintenance of the existing intrusion, fire detection, and fire suppression systems

Schedule meetings with the superintendent and key security, fire protection, and museum staff at the beginning of the survey to discuss its scope and at the end to discuss findings and recommendations. Also, schedule blocks of time for key staff members to spend with the surveyor during the site visit.

9. *What should the survey report include?*

From the site visit, the surveyor will:

- identify potential threats
- perform a risk analysis

- determine which losses are most likely and which would have the greatest impact
- establish priorities for correcting deficiencies

The final report should include:

- recommended improvements
- countermeasures that correct more than one problem
- alternatives for correcting deficiencies
- estimated cost for each recommended action

10. *What is the final and most important step?*

The last and most important part of your security survey will be the corrective action plan you will develop and implement afterwards. Take corrective actions that do not require funds, such as changing operating policies or procedures, immediately. Changes that can be made at a small cost also should be made relatively soon, while changes that require significant funding must be programmed. See *MH-I*, Chapter 12: Curatorial Programming, Funding, and Staffing, for guidance on programming. Naturally, if money is available, the most serious deficiencies should be corrected first. If funding is a problem, many corrective actions can be implemented in stages, or you may want to use the funds that are available to correct several less severe risks. The combined improvement from correcting several small problems can often outweigh the effect of correcting one large one.

If you discovered weaknesses in your security system, your corrective action plan should have taken care of them. If on the other hand, your security system works, stick with it, make minor improvements on the margin, and continue to self-assess on a regular basis.

But what if you need a new security system, in whole or part? The sections that follow in this chapter will help you design effective fire protection and security systems.

D. Fire Protection

Fire can destroy a park's museum collection in a matter of minutes. While a stolen or damaged object might be recovered and stabilized, burned objects, and sometimes even those just exposed to smoke and heat, may be lost forever. Human error, arson, deteriorating electrical and mechanical systems, and congested storage areas are only a few of the conditions that can increase the threat of fire.

Museum management staff should take a hard look at the park's Structural Fire Plan to make sure it addresses the needs of the museum collections.

1. *Who is responsible for fire protection?*

Preventing fire is a fundamental responsibility for every member of the Park Service, and each employee is responsible for:

- maintaining well-organized storage and work spaces
- storing all flammable materials in approved containers outside spaces housing museum collections
- keeping fire exit routes open and clear
- enforcing a no-smoking policy in museum spaces
- controlling ignition sources, such as fires in the fireplace of a historic structure
- practicing good housekeeping
- checking electrical and mechanical equipment for defective components, improper installation, and overloaded circuits
- correcting or reporting fire hazards

Managers have the following additional responsibilities:

- Training all employees in the elements of fire safety, fire prevention, and emergency response with emphasis on:
  - duties in the event of fire or other emergency
  - how to notify the fire department and other emergency response personnel
  - procedures for evacuating visitors and employees
  - special considerations for protecting museum collections
  - location and use of fire extinguishers, fire detection equipment, and fire suppression systems, including the location of sprinkler control valves and how they operate
- Consulting with the local fire department and acquainting fire-fighting personnel with the museum collection and its special needs.
- Being aware of the major causes of fires in parks and museums, as listed below in Figure 9:3.

Major Cause	Average Fires/Year
Electrical Distribution System	22
Incendiary or Suspicious Causes	17
Other Equipment	10
Open Flame	8
Heating Equipment	7
Smoking Material (e.g., cigarette)	7
Cooking Equipment	6
Exposure (to other hostile fire)	4
Natural Causes (lightning, etc.)	4
Appliance, Tool, or Air Conditioning	3
Other Heat Source	1
Child Playing	<1
Total	89

Figure 9.3. Major Causes of Museum Fires[1]

2. *What are the precautions for construction and renovation?*

The National Fire Protection Association (NFPA) Technical Committee on Protection of Cultural Resources says: "Experience shows that the hazard of fire is increased when a museum is being renovated...." [2]

These are only a few of the fire hazards associated with construction and renovation:

- spontaneous ignition of rags used for painting, cleaning and polishing
- careless smoking
- torches and other open flames
- escaping flammable gas
- improper storage and use of flammable and combustible liquids
- poor housekeeping

You must be vigilant during periods of construction and renovation to maintain high standards of housekeeping and to control potential ignition sources.

3. *What about open flames in structures?*

You need to recognize the increased number of fire emergencies due to open flames, such as campfires, candles, lanterns, fireplaces, and stoves that are popular elements in living history programs. You should ensure that the park has written procedures that include:

- Open flames will never be left unattended.

- At the end of the day an appropriate screen will be placed across the opening of any fireplace where there has been a fire that day.
- An appropriate fire extinguisher will be within easy reach when open flames are used inside a building.
- Staff will be trained to use open flame devices properly.
- Fires are not permitted in fireplaces or stoves with unlined chimneys.
- Active chimneys will be inspected and swept annually.

4. *What's the threat from fires?*

When a fire starts, the temperature in the room of origin can be lethal in two to three minutes, and everything combustible in the room can ignite in as little as four to five minutes. If the fire continues to build for another ten to fifteen minutes, chances are the structure will suffer significant damage.

Even a quickly extinguished fire will damage fragile objects. By the time the fire department starts manual suppression, museum objects close to the room of the fire's origin will be damaged or destroyed unless there is an automatic suppression system. When fire fighters start manual suppression, they will pump water on the fire through two or more hoses, each delivering 125–250 gallons per minute. But even a well-trained fire department located close to a burning structure requires more than 10 minutes to:

- receive the alarm
- travel to the site
- set-up equipment
- search for occupants
- find the origin of the fire
- begin manual suppression

5. *What should a structural fire plan cover?*

You need to ensure that your park's Structural Fire Plan includes protecting museum collections. The overall plan should address preventing, detecting, and suppressing fire throughout the park. The section of the plan that deals specifically with museum collections should also include the following:

- a memorandum of agreement with the local fire department calling for mutual cooperation in preparing a pre-fire plan for each structure

  Curatorial staff should be involved in planning and have input into developing fire department response and salvage plans. See *MH-I*, Appendix G: Protection of National Park Service Museum Collections, for a sample memorandum of agreement.

- operating and maintaining any automatic suppression systems

- a list of personnel designated to respond to a fire involving museum objects and their specific responsibilities
- training all park staff in procedures to follow in the event of a fire to minimize damage to museum collections
- a plan to relocate important objects in the collection to a pre-designated secure location

6. *How do I limit fire risk?*

By preventing, detecting, and suppressing fire.

7. *What constitutes a good fire prevention program?*

Do these three things:

- **Prevent ignition:** The employee responsibilities listed above accomplish this. Unfortunately, people still make mistakes, and some things are always beyond our control. Between the two, fires will happen.
- **Prevent fire spread**: When a fire starts, prevent its spread by
  - limiting the amount of fuel available
  - confining the fire in a space with a limited amount of oxygen
  - activating an automatic fire suppression system

  Barriers can limit the spread of fire, smoke, and other combustion products.

  An enclosed stairway is an excellent example of a structural feature that serves both as a fire and a smoke barrier. Open stairways act as chimneys in a fire, drawing flame, smoke, and products of combustion from one floor to another. Well fitting doors on each floor can prevent the spread of fire and smoke, but all it takes to compromise the protection is a single chocked open door.

  And more than one closed bedroom door has protected a sleeping person from the effects of smoke and carbon monoxide.
- **Prevent fire from reaching vulnerable objects:** If you've used properly designed storage containers, you can protect vulnerable objects or records from fire for a time. For example, a locking, insulated safe, filing cabinet, or vault designed to maintain an interior temperature of less than 350°F during a one-hour exposure to exterior temperatures of at least 1700°F can protect paper accession records. Similarly, a media box that will maintain an interior temperature of not more than 125°F during a one hour exposure to an exterior temperature of 1700°F can protect floppy disks or magnetic tapes, such as those used to back up the Automated National Catalog System (ANCS) data files.

8. *Is a fire detection system essential?*

Even with the best fire prevention program, you will still need a good fire detection system. Human error, natural conditions, and deterioration of buildings and systems almost guarantee a fire at some point, and life safety concerns alone demand rapid detection in an occupied structure.

Consider the following factors to determine fire detection needs:

- significance or value of the collection
- construction of the building
- nature of the collections
- number of occupants and what they are doing
- time needed to evacuate
- likely speed of fire spread
- time it will take to start suppressing a fire
- types of fire detectors available

9. *Who should monitor a detection system?*

A fire detection system only provides information. Someone who can use the information to send help must monitor it constantly. If the park does not have the staff or equipment to do this, the system should be monitored by the local fire department (if they provide this service, and someone is always there) or by a commercial central station that is listed by Underwriter's Laboratory (UL).

Sometimes parks in remote areas do not have access to a UL-Listed central station. In these instances, an unlisted facility may be adequate. You should make sure that the unlisted facility has enough staff to monitor alarms constantly, uses reliable equipment, and provides training to its staff.

10. *Why should I contact the local fire service provider?*

There are several advantages to contacting the local fire service provider. These contacts should be initiated during normal business hours so that they will not have to occur under the pressure of emergency operations. The advantages include:

- learning the availability of expertise for fire prevention inspections and code enforcement
- providing company inspections (orienting and familiarizing each shift)
- identifying the key person and contacts
- training/drills (joint activities to include day/night operations; business open/business shut down; seasonal - summer/winter)
- pre-fire planning (focusing on floor plans, access, utility shut-off locations, and sensitive items/areas)

11. *What types of fire detectors are available?*

The types of fire detectors normally used to protect museum collections and historic structures are listed in Figure 9.4.

TYPE	BEST USE OF THE DEVICE	WHERE SHOULD IT BE LOCATED?	THINGS TO AVOID
Photoelectric Smoke Detector (Spot Type)	To detect slow, smoldering fires that generate large amounts of visible smoke	• On the ceiling or wall at least 6" from the junction of the ceiling and wall • In the path of air circulation where smoke will reach the detector	• Locating detector directly in the path of air from an air supply or return grill • Hot (>100°F) or very cold (<32°F) spaces • Dead air spaces • Spaces where steam or smoke are expected-- boiler rooms • Within 8' of an active fireplace • Dusty areas • Outside **NOTE**: New detectors have protective screens to keep out insects. Very small spiders can still get into these detectors and cause false alarms.
Photoelectric Beam Smoke Detector (Line Type)	• Large open spaces (30'x30' or greater) with high ceilings (>12') • Slow, smoldering fires	• Large gallery spaces • Auditoriums	• Mounting detectors low (generally below 8') if the beam is broken or partially blocked the detector goes into alarm • Same conditions as spot type photoelectric detector
Ionization Detector (Spot Type)	To detect fast, flaming fires that may not generate much visible smoke	Same as spot type photoelectric smoke detector	Same as photoelectric **NOTE**: Insects are not a problem with ionization detectors, but they are much more sensitive to steam or the fine products of combustion normally found in boiler rooms.
Air Sampling Smoke Detector	Areas where very early detection is vital--these detectors are intended to react before fire reaches the flaming stage	High value areas such as vaults, or sensitive areas such as computer facilities	Where candles, fireplaces, wood stoves, or any other open flame will be used regularly
Flame Detector	Same as air sampling detector--frequently used in explosion-detection systems	Where large concentrations of flammable or combustible gas or dust are found	Same as air sampling smoke detector
Heat Detector	Spaces where environmental conditions cause unwanted alarms from smoke detectors, or where conditions (heat, cold, humidity) will damage electronic devices.	Same as spot type photoelectric or ionization detector	Where life-safety is the major concern--sleeping quarters, etc.-- Heat detectors are not approved for life-safety applications.

Figure 9.4. Types of Fire Detectors

12. *What about maintenance and testing?*

A fire detection system needs routine maintenance and testing to keep it operating as designed and expected.

- Dirty smoke detectors are the most frequent cause of unwanted alarms.
- The control panel can fail, or operate erratically, particularly in areas prone to lightning or unreliable electric power.
- Evacuation alarms may fail, or people may not be able to hear them everywhere in the building.
- Telephone lines may fail, and dialers fail regularly.

Test and maintain fire detection systems in accordance with the requirements of NFPA 72, *National Fire Alarm Code* (listed in Section K).

13. *How important is fire suppression?*

A fire detection system is effective only if detection is followed by **suppression**, such as fire extinguishers, stand-pipe, response by fire fighting personnel, or an automatic sprinkler system.

14. *Are fire extinguishers enough?*

An employee with a fire extinguisher often is the first line of defense when a fire starts. But first:

- Evacuate the building.
- Notify the fire department by the fastest available means, such as telephone, manual fire alarm.
- Fight the fire.

Fire produces carbon monoxide and other toxic gases that affect judgment and coordination and are the major killers in fires. So, attempt to fight a fire only if you are in good physical condition, are trained, and properly equipped.

15. *Who should know how to use a fire extinguisher?*

Every employee should know how to use the park's fire extinguishers and where they are located. OSHA Regulation Standard 29CFR, Standard Number 1910.157G1 states, "when the employer has provided portable fire extinguishers for employee use in the workplace, the employer shall also provide an educational program to familiarize employees with the general principles of fire extinguisher use and other hazards involved with incipient stage fire fighting." Standard 1910.157G2 states that, "the employer shall employ the education required upon initial employment and at least annually thereafter."

Training also should include instruction on the proper types for the most likely kinds of fires. Fire extinguishers have a label with a letter (**A**, **B**, **C**, or some combination) that tells the user what class fire it is designed to extinguish. See NFPA 10, *Portable Fire Extinguishers*, for additional information.

16. *What is the most common type of extinguisher?*

The **ABC** multi-purpose dry chemical extinguisher is the most common type in parks because it is safe for use on all fires except those involving combustible metal. Multi-purpose dry chemical extinguishers use a fine powder, similar to baking soda, to smother fire. Not all dry chemical extinguishers are multi-purpose. **Purple K** dry chemical extinguishers are designed for flammable liquid fires and may harm some objects.

> ***Don't use Purple K dry chemical extinguishers in museum spaces.***

17. *What about Halon extinguishers?*

Many parks, concerned about the residue from dry chemical extinguishers, installed Halon 1211 or 1301 extinguishers in museum collection spaces. Halon is an ozone-depleting substance. As of January 1, 1994, the United States, and the other signatories of the Montreal Protocol, in order to protect the earth's ozone layer, stopped manufacturing halon and added a heavy tax to new halon imported into the country. It has not been banned, and there is no immediate reason for parks to remove their halon extinguishers. Halon is still available and will be for some time. Still, in time halon will become hard to get, and it will be expensive. Prudence, as well as concern for the environment, suggests that you should replace halon extinguishers with other types (multi-purpose dry chemical or CO_2 extinguishers) as they are used or start to leak.

18. *What are the maintenance and testing requirements?*

Fire extinguishers should be checked monthly and must be inspected annually. See NFPA 10, *Portable Fire Extinguishers* (listed in Section K) for maintenance and testing requirements.

19. *What about standpipe and hose systems?*

A standpipe hose in untrained hands is a liability, can increase the amount of fire and water damage, and may place the person using it at risk of serious injury or death. Only physically capable, properly equipped, and properly trained employees should use a standpipe hose to fight a fire.

20. *What about sprinkler systems?*

A standard sprinkler system operates when a sprinkler head reaches its design operating temperature and opens. One sprinkler head opens at a time delivering about 25 gallons of water per minute to the fire. Most fires in sprinklered structures are controlled with five or fewer sprinkler heads opening. There are four types:

- ***Wet pipe systems*** generally are not used in spaces where the temperature drops below 32°F. An experienced fire protection specialist should evaluate the conditions before the park decides to use one of them.

- ***Dry pipe systems*** are designed for use in spaces where the temperature does fall below 32°F. Some museums use dry pipe systems to protect storage and exhibit spaces because there normally is no water in the pipe.

- ***Pre-action systems*** may be installed in areas where freezing or mechanical damage to sprinkler heads or pipes is likely. The disadvantage of a pre-action system is that when the fire detection

system fails, or is out of service, the sprinkler system can't operate automatically. Routine maintenance on a pre-action system also is more complex and time consuming than on other types of sprinkler systems

- ***Cycling systems*** turn off when the fire is out. If it depends on the fire detection system, it also can't operate automatically when that system is out of service. Some cycling systems have a separate detection system to control the sprinklers. In either case, maintenance of the system is complex.

Before selecting a sprinkler system, a structure's construction, environmental conditions, space, nature of museum collection, and protection priorities need to be studied. Consult with a qualified fire safety professional before deciding which type of system best suits your needs.

21. *What about water damage and accidental discharges?*

When there is a fire in a sprinklered structure, only those sprinkler heads exposed to heat (usually between 165°- 225°F) open and discharge water individually to extinguish or control the fire, thereby limiting to some extent possible water damage.

Sprinklers with higher temperature elements are available for special applications, such as protecting foundries, food preparation areas, or other higher temperature environments.

Curators frequently ask about potential collections damage from an accidental sprinkler discharge. Nearly all documented accidental discharges happened because of:

- improper design
- improper maintenance
- human error

Maintenance and testing is a particularly important element in preventing accidental sprinkler discharges. NFPA 25, *Inspection, Testing and Maintenance of Water-Based Fire Protection Systems*, lists and describes the requirements (see Section K).

A sprinkler system also has to be monitored. When the fire is out, someone has to turn the system off and restore it to service.

One way to limit the amount of water a sprinkler system discharges after the fire is out, without installing a complex cycling system, is to use on-off, or controlled flow, sprinkler heads on a wet pipe system. Although they cost 5-10 times more than a standard sprinkler head, controlled flow heads may add only 5%-15% to the total cost of the system.

22. *What about other automatic suppression systems?*

Halon 1301 systems are still being used in some NPS suppression systems and portable extinguishers. Since the Montreal Protocol, however, the NPS's policy is not to install any new halon systems and to program for replacing existing systems.

The fire suppression industry is experimenting with Halon substitutes, and several have been approved. Ansel's ***Inergen™***, Dupont's ***FE 13***, and Great Lakes Chemical Corporation's ***FM 200™*** are the most popular. However, they are not drop-in replacements. To use any substitute now available in an existing halon system, you must modify the pipes, agent storage tanks, or discharge heads.

Carbon dioxide systems extinguish fire by reducing the oxygen content of the space below the point that it will support combustion or life. Thus, people must evacuate before the gas discharges or they may suffocate. Carbon dioxide is best for suppressing surface fires in service, utility, or other unoccupied areas.

23. *What do I need to know about installing mobile compact shelving?*

As parks seek to make better use of existing space, more and more of them are installing mobile compact storage systems to store museum objects. These systems eliminate fixed aisles and can expand a room's storage capacity as much as 40%. Combustible objects, records, books, and manuscripts stored in compact shelving units increase the fuel load in the room: there is more to burn, it will burn longer, and it will burn hotter. There are considerable fire risks. Before installing such shelving:

- A qualified structural engineer should evaluate the floor load-bearing capacity of the space. If the space is above grade, assess the potential impact of a fire on the floors below and above.

- A qualified fire protection specialist should evaluate the adequacy and effectiveness of systems to detect and suppress fire considering the potential for a concentrated fire load.

- You should consider modifying opening and closing procedures to include leaving open space between mobile shelving units when the area is unoccupied.

Mobile compact shelving units in the fully closed position delay both detecting and suppressing fire inside the shelving module. Closed, the shelving modules hold smoke and heat inside and can prevent water from reaching the fire to extinguish it. In a study conducted for the General Services Administration (GSA), and in later studies conducted for the National Archives and Records Administration (NARA) and for the National Library of Canada, tests showed that a fire can burn inside a closed shelving module for an hour and a half, or more, before activating ceiling mounted smoke detectors. Sprinkler operation is delayed, as well. The NARA and Canadian studies found that when compact storage modules are completely closed, severe fire damage will occur in more than one shelving module, even when fire detection and automatic suppression systems operate as designed.

Both tests showed that a small open space between shelving units reduces fire damage. NARA uses a computer-controlled system in Archives II to leave a 9" opening between the shelf units when the facility is closed or when the fire detection system activates. The Canadians use rubber bumpers to keep an opening of 1½ - 2 inches between shelving units, and a sprinkler system that puts a large amount of water on the fire quickly. Both methods prevent the spread of fire to other shelving modules and limit damage to materials on the shelves where the fire starts.

24. *What about salvage after the fire?*

After a fire, successful salvage operations require immediate action as long as they do not hinder suppression operations or compromise life-safety.

- In a fire, the fire department is in the best position to protect museum collections from damage. Museum staff should discuss these issues with fire-fighting personnel when they are preparing, or up-dating pre-fire plans for the building. Fire-fighting personnel need to know about particularly important or vulnerable objects, and they need help establishing priorities, i.e., what should be protected first.

- The park's Emergency Operations Plan (EOP) should include the following information regarding salvage for the museum collection.

  – temporary storage for museum objects removed from the fire area

  – location of protective coverings, such as salvage covers, and how and under what circumstances they should be used

  – names and telephone numbers of contractors who can make temporary repairs, provide emergency supplies, or provide salvage services such as freeze-dry units and water extraction

  – how and where to purchase materials and supplies, how to pay for them, and how to move them

  – other sources of help (other parks, museums with similar collections that are close by, etc.)

  – instructions for placing security, fire detection and fire suppression systems back in service

  – procedures for the security, inventory and tracking of museum collections affected by the emergency

  – temporary measures to protect the collection and the structure until repairs are completed

25. *Where can I get help?*

- Consult your park or regional structural fire management officer. Specific technical assistance and information can be obtained from the following National Park Service offices:

  – Structural Fire Chief, NPS Fire Program Management Center, National Interagency Fire Center (NIFC), Boise, ID
  Telephone: 208-387-5209
  FAX: 208-387-5250

  – NPS Safety Engineer, Denver Service Center, Technical Expert, Safety and Codes, Denver, CO
  Telephone: 303-969-2196
  FAX: 303-969-2930

  – NPS Risk Management Division, Washington, DC
  Telephone: 202-208-6350
  FAX: 202-208-6756

- The security or protection services departments in most large museums, such as the Smithsonian Institution, give advice and answer questions.

- Invite your local fire department to inspect spaces housing museum collections. Consult regional, county and State Fire Marshall's offices and Fire Prevention Bureaus for additional information and guidance on fire safety.

- You should obtain copies of the National Fire Protection Association's recommended practices. These documents contain useful information on fire prevention, detection, suppression, and safety self-inspection. See Section K for a list of these publications.

E. Operational Security

When designing a new security system, or redesigning your existing one, you will want to reduce or remove the risks you have identified. Then you can develop and implement your day-to-day operating procedures, as well as your emergency procedures. Finally, you will need to train the staff on the new or revised system.

1. *What are some of the design issues I should consider?*

The value of cooperation in security planning is never more apparent than in the design phase of a new project--a new exhibit, a new storage facility, or refurnishing and restoring a historic structure. Working together, curators, security specialists, architects, engineers, exhibit designers, historic preservation specialists, interpreters, maintenance personnel, and fire safety professionals often can resolve security issues before they become a problem. Before you start work, prepare a written list of minimum security standards to include:

- proximity of staff to the exhibit area

- tours--size, type (self-guided versus staff-guided) and tour route

- proximity of exhibit objects to the tour path
- features that limit public access to exhibits

> ***The Architectural Barriers Act of 1968, Section 504, and the Americans with Disabilities Act of 1990 require museums to be as accessible as practicable, both architecturally and programmatically. The NPS has installed equipment to make structures accessible to the mobility-impaired. In some historic structures, for example, access equipment is located out of public view to minimize the visual intrusion, and disabled visitors are routed through otherwise closed spaces. In the rare instances where an alternative access route goes through exhibit spaces, the planning team must consider the impact on the security of exhibit objects and their vulnerability to accidental damage.***

- security issues raised by making exhibits accessible for people with disabilities
- vulnerability of exhibit objects to theft, vandalism, touching and accidental damage

You should resolve these and any other security issues before the design is approved to avoid the need to make costly corrections later.

Be aware that technology is developing so fast in some areas (such as computers and detection systems) that it may make sense to select the technology as close as possible to completion of the project, provided this does not require significant changes in the structure.

Finally, document **all** decisions.

2. *What should I cover in our day-to-day operational policies and procedures?*

The need for these detailed, day-to-day policies and procedures is to control access to vulnerable objects, a key element in your security program. The key in protecting museum collections is to allow reasonable access without creating undue risk. How? By controlling legitimate access while preventing unauthorized or unnecessary access.

Security programs depend on trusted agents, such as our Park Service employees, but even so, one individual should not have the freedom to care for and account for museum collections without routine oversight by someone who understands the system well enough to spot discrepancies. Your access control policy must include inspection, oversight, and audit safeguards to reduce the risk.

3. *What should I include in an access policy?*

When writing an access policy, include the following elements:

- statement of purpose
- general access procedures

- general guidelines for employees, scholars, researchers, visitors, service vendors, emergency response personnel, and others who are eligible for access to the museum collections
- conditions that justify access
- superintendent's signature

See *MH-I*, Appendix G: Protection of National Park Service Museum Collections, and *MH-II*, Appendix D: Museum Archives and Manuscript Collections, for sample access policy and procedures.

4. *What else should I do regarding access?*

- Know the people who have access to the collection. The more access someone has, the more you should know about him or her.
- Look for other ways for the person to accomplish his or her objective without allowing access to original pieces.
- Specify how someone receives authorization for access to collections:
  - Who is authorized to grant access?
  - How much access can they grant (i.e., escorted, unescorted)?
  - What justifies granting access?
  - When are escorts required?
- Keep access lists up-to-date and make sure they are used routinely.
- Specify minimum parcel control procedures:
  - Limit the size of parcels visitors are allowed to carry into collection areas (anything larger than 11" X 15" can be a problem).
  - Search parcels larger than 11" X 15" if they are taken into research or non-public areas by non-employee researchers.
  - Use property passes to identify personal property taken out of the building by employees.

5. *Why should I be concerned about key control?*

Barriers and locks are the most common tools used to accomplish the objectives of your access control policy. While keys are a symbol of trust, as well as a way of controlling access, the key as status symbol sometimes overrides the importance of the key as a tool for access control.

The fewer keys there are, the better.

- Keys multiply over time, particularly at the master and grand master levels. Unchecked, this quickly compromises the access control program.

- Good key control requires ongoing maintenance and cooperation by all staff.
- Lost or stolen keys to museum collection spaces, such as storage or exhibit cases, increase the risk of loss.
- Lack of accountability invites unauthorized possession and duplication of keys.

6. *How do I control keys?*

Ask your superintendent to sign written procedures that:

- Designate one person as responsible for controlling keys, including issuing or transferring keys, having keys made and inventorying keys annually.
- Designate, by name, those authorized to have keys to museum collections storage spaces and exhibit cases.
- List the responsibilities that go along with having park keys:
  - safeguarding keys
  - reporting lost keys
  - returning keys when they are no longer needed
- Require a signed and dated Receipt of Property Form, DI-105, or its equivalent, when keys are issued.

7. *What should I do to safeguard keys?*

First, decide where and how to store spare keys and operational keys that remain on-site; then, think about off-site concerns.

In an ideal world, no keys would leave the park, but this is almost never possible, therefore:

- Designate which keys employees can take off-site.
- Specify limitations on taking keys off-site (overnight versus a two week vacation).
- Restrict the number of keys that leave the park, and be sure that grand master keys never leave the park (if lost or stolen the whole key system is compromised).
- Place keys to museum exhibit cases and specimen storage cabinets in a key cabinet (located in museum storage, where possible) or some other appropriate locked container at the end of each day.
- Limit access to the curatorial key cabinet to the curatorial staff.
- Keep other keys in a key cabinet in a protected space that is convenient for opening and closing.

- Lock up any keys that are not in use.
- Store spare removable cylinder cores and core removal keys in a safe, preferably separate from key blanks.

8. *What about access to keys in emergencies?*

Specify in your key control policy who may obtain keys in an emergency, how to get them, and where they are kept.

9. *How do I ensure accountability?*

- Develop audit and inventory procedures.
- Report results of the inventory to the superintendent.
- Review key control records annually to make sure they are current.
- Make sure all museum keys are returned by transferring museum employees.

10. *What should I do if a key is lost or stolen?*

When a key is lost or stolen, the only sure way you can protect the facility is to rekey every lock it opens. If the missing key is a master, or grand master, then you should rekey all the locks.

11. *Are combination locks better than keyed locks?*

Combination locks have many applications. File cabinets and secure areas used by a large number of employees often have combination locks. The gate to a vehicle storage area is an example. Other applications include very high security areas, such as safes and vaults, where the physical existence of the key poses a threat because of its vulnerability to loss, theft, or unauthorized use.

Combination locks have advantages and drawbacks. For example, while it is easier and less costly to change a combination than to rekey a lock, these locks can also be greater security risks. Why? Because many find it difficult to remember random number combinations. They:

- write down the combination (a quick look around a safe or file cabinet often turns up the combination written on something close by),
- use number combinations that are easy to defeat, or
- use birth dates or other number combinations easily associated with the safe's custodian.

Because of such security concerns, be sure that you change combinations annually, or when anyone with the combination transfers or quits, or whenever evidence suggests the combination has been compromised.

Also, you will want to seal a written record of the combination in an envelope designed to show evidence of tampering and keep it in another safe. Finally, do not forget to protect change keys/wrenches and the instructions for changing combinations from unauthorized use.

12. *What should I include in opening and closing procedures?*

The best access and key control programs in the world are of no value if you do not open or close the facility properly. Written opening and closing procedures provide a checklist for transitioning from one condition to the other and, at a minimum should:

- Identify who may open or close.

  If you designate who has authority to open a building or controlled area, you establish both the responsibility and the authority to control access.

- Specify locking and unlocking sequences and paths.

  There should be a clearly defined entry and exit procedure. The person opening the building should enter at a designated point, and the person closing the building should leave the same way.

- Require checking for stay-behinds.

  Don't forget to inspect the building for someone trying to stay behind after closing.

  – Buildings often have places someone can hide (closets, stairways), so the first step to prevent a stay-behind is to keep potential hiding places locked while visitors are in the building.

  – For potential hiding places that cannot be locked, consider local daytime intrusion detectors to alert staff when someone enters them.

  – When closing the building it is important to search it in a systematic way--start at the top, work down and out.

  – Where possible, lock areas of the building as they are inspected to prevent someone moving back into a space after it is inspected.

  – Written procedures should highlight vulnerable areas for special attention.

  – It may be possible in a large building to activate the intrusion detection system by areas to detect someone trying to get back into an inspected area.

See *MH-I*, Appendix G: Protection of National Park Service Museum Collections, for sample opening and closing procedures.

13. *What else should I include in the opening and closing procedures?*

Opening and closing procedures should include:

- Alarm system information--include arming and disarming sequences.

Don't include alarm codes in the written procedures.

- Doors and windows to be opened and closed.
- Mechanical system information--how to activate and secure, systems that should be on when the building is open and off when it is closed, location of controls, and how to operate them.
- Potential fire hazards--locations of coffee pots, hot plates, and other heat producing devices (all of which should be turned off and unplugged at the end of the day).
- Opening procedures, such as the need to:
  - look for signs of unauthorized entry or theft
  - inventory particularly valuable or sensitive objects
  - check for unusual conditions (e.g., leaks in roof)
  - make sure all objects on exhibit are in place
  - make sure cases are locked
- Other site-specific conditions that require attention.

14. *What about the park's crime prevention and physical security plans?*

The park's crime prevention program should include:

- leadership and participation by management in developing and operating the security program
- regular security surveys by qualified personnel and provisions for corrective actions
- orientating and training all employees (permanent, temporary, seasonal, and volunteers) in security awareness, with emphasis on each employee's security responsibilities
- an appropriate level of security for all park property-- including museum collections, capital equipment, supplies, buildings, money, firearms, and historic sites, monuments, and ruins
- procedures for guides, reception desk personnel, and cashiers to surreptitiously summon help in an emergency or when a visitor becomes unruly
- an annual review of the park's crime and security problems followed by implementing preventive measures
- appointing a full time or collateral duty Physical Security Coordinator

15. *What should I include in the Emergency Operations Plan?*

Be sure that protecting the museum collection is in the park's Emergency Operations Plan (EOP). See *MH-I*, Chapter 10: Emergency Planning, for guidance on museum collections emergency planning. Staff should be trained to act promptly in an emergency and should be prepared to remove museum collections after seeing to the safety of visitors and other staff.

The Emergency Operation Plan should include specific information regarding:

- command and control
- controlling access in an emergency
- location of emergency keys
- inventory and location of emergency supplies
- location and operating instructions for fire extinguishers, fire alarm equipment and other fire suppression and emergency response equipment
- emergency telephone numbers for assistance--both on-site (curators, conservators) and off-site (regional/SO personnel, other cooperating agencies and institutions, commercial recovery firms, and emergency response personnel)

16. *What should I include in staff training?*

The final and most important element in your operational security program is staff training. Written policies and procedures are valuable only if all employees know what they are and how to implement them. Staff training should be specific and cover all basic security practices. Hold mandatory training sessions regularly.

Be sure to include these topics in the training:

- importance of routine security measures, such as locking doors and windows when the building is unattended
- importance of routine inventories of objects on exhibit and in storage
- reminder that theft is preventable
- reminder that most thefts are spontaneous events that occur because of simple oversights
- importance of maintaining the integrity of non-public spaces by challenging those who are not members of the staff when they are in these areas without an escort
- fire safety
- routine and emergency operations
- use and maintenance of equipment

17. *Where can I get help?*

For additional information, contact your park or regional/SO protection staff and regional/SO curator. You can also consult:

- The security or protection services departments in most large museums, such as the Smithsonian Institution, for advice and answers to specific questions.
- The American Society for Industrial Security's (ASIS) Standing Committee on Museum, Library and Archive Security. Members of the Standing Committee will give advice on specific problems. Call ASIS headquarters at (703) 519-6200, or visit their website at <http://www.asisonline.org>. You can also order their publication *Suggested Guidelines in Museum Security.*

F. Physical Security

While the previous section of this chapter discussed the concept of designing for security, this section examines the specific physical security elements you can use to satisfy your security standards. You can also incorporate these elements into existing facilities to help remove or reduce threats.

1. *What is physical security?*

Physical security includes all measures intended to prevent acts of violence against persons and destructive or unauthorized access to or removal of property. Physical security elements deny, delay, or discourage criminal acts, and are the means for achieving the objectives of the access control policy.

Physical security is a **crime prevention** tool. Three factors have to be present for a crime to occur:

MEANS + MOTIVE + OPPORTUNITY = CRIME

The criminal brings **MEANS** and **MOTIVE** to the crime. There is little we can do to remove them from the equation. We can use physical security measures, however, to remove or limit **OPPORTUNITY**.

2. *What are the tools of physical security?*

There are many, but the primary ones are:

- barriers
- locks
- lights

3. *Why do I need barriers?*

Barriers limit access by delaying the intruder, by making the intruder visible, or both. Given enough time a determined person can breach the most elaborate barrier, but you can discourage entry by increasing the time it takes and the chances of being seen, and by encouraging the thief to look for an easier target elsewhere.

Typical barriers might include:

- Park boundaries
  - natural barriers (e.g., ravines, mountains, water)
  - fences
  - well lighted open spaces
- Building structure
  - walls
  - foundations
  - roof
  - doors
  - windows
- Interior barriers
  - storage rooms
  - cabinets
  - vaults and safes
  - cases
  - temporary or permanent exhibit barriers

4. *How many barriers are enough?*

Figure 9.1 illustrates how you can use barriers to protect valuable objects:

- Add barriers, like the rings of the bull's-eye, to protect high value objects.
- The more valuable the object, the more rings you need.
- There have to be enough barriers to delay entry until the responder arrives.

5. *Why do I need locks?*

Properly designed and installed locks are one of the first lines of defense in a museum protection program. The locking system should not rely on

- warded locks
- spring latches
- deadbolts less than ¾" long

- key-in-knob locks
- locks installed with screws ½" or less in length

> ***A lock is no better than the door it is on or the strike and jam the bolt fits into, and even the best quality lock is of little value without an active key control program.***

Most historic structures have old style locks on exterior doors. Authenticity considerations do not allow changing to modern locks in most cases. Where this is true, the park should include additional protection features, such as alarms, to supplement the locks.

6. *What criteria should I use in selecting locks?*

An effective locking system must fit the needs of the park and of the space it protects. Many types of locks are available, but they are not all equally effective in all circumstances. Isolated spaces and high security areas need heavy-duty locks.

7. *What is required for museum storage spaces?*

Museum storage spaces should have metal or solid-core wood doors. Each door should have:

- a dead bolt lock
  - 1" or longer bolt
  - exclusive non-mastered key code
- hinges located with pins are on the secured side of the door (When this is not possible, spot-weld the hinge pins so they cannot be removed, or replace the existing hinges with hinges that have non-removable pins.)

You may want to use a proprietary or regionally propriety keyway--a lock system with a keyway the manufacturer guarantees not to sell to anyone else within a specified area. Keys for a proprietary keyway must be made by the manufacturer, or the park must purchase specialized key cutting equipment. The advantage is that the local hardware store cannot duplicate the park's keys.

8. *Why is an effective lighting system important?*

Good lighting makes criminals nervous because it increases the chances of detection and identification. It has the opposite effect on employees and the public. Light increases the public's perception of the safety of an area and lets law enforcement patrols see what's going on and detect the physical signs of a break-in.

It is not the intensity of the lighting as much as the evenness of the illumination that makes a lighting system effective. The area should be free of glare and shadows. Lights close to structures should illuminate toward the structure, not out and away from the structure. A properly designed

lighting system eliminates hiding places and facilitates the ability of security patrols to observe.

9. *Is lighting always necessary?*

Under some conditions lighting may attract unwanted attention to the site. In isolated rural areas, for example, a well-lighted building in an otherwise dark landscape makes an attractive target. Some parks have found that lighting remote parking lots also can bring unwanted visitors, making the lots a local hangout. In both cases, you may want to use time-clocks so the grounds or parking lots are lighted when legitimate visitors are using them, but dark afterward.

10. *What about light for closed circuit television (CCTV)?*

Exhibit areas and visitor centers may use closed circuit television (CCTV) as a protection and control tool. A video recorder makes CCTV useful for after-hours protection by visually documenting unusual conditions. CCTV is also useful to those responding to intrusion or fire alarms. The cameras provide a quick way to survey a large building.

If exhibit objects could be damaged by light, cameras are available that need little background illumination. Infrared illuminators also are available to boost the efficiency of CCTV cameras where visible light levels must remain low.

Where CCTV is part of the protection system, after-hours lighting is an important consideration.

- Motion detectors can turn on lights and the VCR.
- In a large building, you may want to have central light controls, so specific areas, or the whole building, can be illuminated at once. Low voltage remote control switches are well suited to that purpose.

11. *What is the value of human presence?*

A human presence or response is a critical element in any physical security system. The mere presence of a person on the site is a deterrent. Of more importance, however, is a prompt response by a trained person when an attempt is made to breach the physical security of the site.

12. *Where can I get help?*

Refer to the following resources for additional information:

- NPS law enforcement and physical security specialists.
- Your regional/SO curator.
- The security or protection services departments in most large museums, such as the Smithsonian Institution, for advice and answers to specific questions.
- The American Society for Industrial Security's (ASIS) Standing Committee on Museum, Library, and Archive Security. Members of the Standing Committee will give advice on specific problems. Call the ASIS Headquarters at (703) 519-6200, or visit their website at <http://www.asisonline.org>. You can also order their publication *Suggested Guidelines in Museum Security*.

- Burke, Robert B. and Adeloye, Sam. *A Manual of Basic Museum Security*. Paris, France: International Council of Museums (ICOM), International Committee on Museum Security, 1986.

- Department of the Army. *Physical Security. Field Manual No. 19-30*. Washington, D.C.: Department of the Army, 1979.

G. Electronic Security Systems

Electronic systems (e.g., CCTV, alarm systems) are only extensions of staff eyes and ears; they only provide information. There are four important questions you should answer before selecting an electronic security system to protect museum collections.

- What is the threat?
- How vulnerable is the collection?
- Are there restrictions on the installation?
- What should the system do?

1. *What is the threat?*

Learn as much past history as possible about thefts, acts of vandalism, accidental damage, and wear and tear on furnishings.

2. *How vulnerable is the collection?*

Go through room by room and identify museum objects that are vulnerable to theft, accidental damage, and wear and tear from visitor touching (whether purposeful or inadvertent).

3. *Are there restrictions on the installation?*

With the range of technology available, devices in period rooms do not have to be intrusive. Some security specialists argue that making detectors visible acts as a deterrent. Others make the case that visible detectors give away valuable information a thief can use to defeat the system and allow the potential burglar to spot weak points. Management has to make the final decision based on the level of the threat, the value and vulnerability of the collection, and the interpretive objectives. There is no completely right or wrong answer.

If you do use visible detectors, there are several things that can be done to minimize the information the potential thief can get while walking through the building.

- Mix visible and hidden devices. Visible detectors signal the would-be thief that there is a protection system, while the hidden devices provide back-up if the thief tries to exploit perceived weaknesses.

- Many parks leave the walk-test lights active on motion detectors. These lights are there so the installer can test the detector and measure

the area it covers. Active walk-test lights give the same information to a would-be intruder. There are two schools of thought on how you might protect a space with motion detectors: position detectors to cover areas the intruder most likely will cross (creating traps), or install enough detectors so the intruder cannot move more than 6" undetected anywhere in the space.

As an added deterrent, you can also leave walk-test lights active where there is 100% saturation coverage, although such coverage is expensive and more intrusive in a period room. Designers usually specify saturation coverage for vaults and other highly protected spaces. Where detectors create traps, the walk-test lights should be disabled. On most detectors this involves changing a switch or jumper wire inside the detector. Follow the instructions that accompany the detector. If all else fails, a piece of tape covering the light serves the same purpose.

- Damage to historic fabric

  – Be sensitive in placing security devices so as to prevent unnecessary damage and ensure that necessary damage is repairable.

  – Be aware of vertical and horizontal spaces where installers can run alarm wire.

  – Know if other work is planned that will open walls or ceilings. This may help with the placement of detectors.

  – Where physical or aesthetic considerations limit the ability to run wire, consider using wireless alarm devices so you don't have to penetrate surfaces. A combination of hard-wired and wireless devices may be optimum in many historic buildings.

- Placement of furnishings

  – The location of furniture in a room greatly influences the type and location of detectors that will be appropriate. Furniture can block a detector, making it ineffective, or, used properly, furniture can help disguise a well-placed detector.

4. *What should the system do?*

- If you install a **daytime alarm system**, is it more important to deter the act or catch the person who commits the act? If deterrence is preferred—as it normally should be—the design will include audible and visual indications that the act has triggered an alarm. If apprehension is preferred, audible and visual alarms may defeat the purpose.

- A **nighttime alarm system** has both deterrent and apprehension objectives. First, decide if a silent alarm, that summons law enforcement personnel, or a noisy one, that both summons law enforcement personnel and draws attention to the site, is the most effective.

A silent intrusion detection system is more likely to lead to catching the intruder. And, in a populated area, an intrusion detection system sounding a loud horn or turning on lights may scare the intruder away empty handed. The determining factor should be a reasonable estimate of how much time the intruder needs versus the length of time before someone notices the alarm and takes action to stop the theft. If it only takes a few minutes, then doing everything reasonable to prevent the loss must take precedence over apprehension.

- **Personal Protection Alarms** allow people working in the building the ability to summon help quickly and silently, especially where assault, robbery, or harassment is a threat. (The reception desk in an urban park headquarters building located in a high crime area is a good example.)

  Personal protection alarm systems (duress or panic alarms) can use small push-button radio transmitters, worn either as a pendant around the neck or on a belt, for protection of staff members who must move around in the course of their work, or fixed position transmitters for personnel at fee collection or sales shop cash registers.

5. *What factors influence a system's design?*

- Know who the responders are, where they are located, and the resources they have.

- Know how long it will take the responders to get to the site at different times of the day. Many jurisdictions have more police on duty between 4:00 p.m. and midnight than other times, but they are busier during that period. Rural areas may have only one or two officers on duty, each covering many square miles of area.

  Where response time is long, the security system must include both electronic and physical security elements to be effective. If it takes the first responder 15 minutes to get to the site after the alarm sounds, then, to prevent the thief from taking an object it must be physically impossible to remove it in less than 15 minutes:

  – It must be large and heavy enough to delay removal.

  – It must be located in a room or vault that will withstand a determined attack for more than 15 minutes.

  – It must be in a case that can withstand attack until help arrives.

  – It must be some combination of the above.

Otherwise, the alarm only indicates someone entered the building and something may be gone.

- Think about what the responders know about the site. Consider access to the site, familiarity with the physical layout, and the responder's general level of training..

- Decide what information is needed by thinking about what will be done with it. Electronic systems provide all kinds of information. The more complex the system, the more costly it is to maintain, and the more important it is to maintain it regularly. Just as you would not under design an electronic security system, do not over design it.

- Determine the system's operating parameters. Some objects on display may need 24-hour individual protection. Value, replaceability, sensitivity to controversy, ease of sale, and vulnerability to damage. Precious metals, gems, firearms, edged weapons, currency, coins, jewelry, original documents, rare books, and stamps are all candidates for 24 hour protection systems.

- Identify how you will need to change operations. You can determine which changes are necessary by considering these issues:

  – Electronic systems complicate access, even for authorized personnel.

  – Electronic systems create the need for additional staff training.

  – Someone has to manage the electronic system.

  – Those operating, managing, and maintaining sophisticated electronic systems need different skills than those using less complicated systems. An electronic system may, in some cases, require more staff.

  – It is very expensive to contract out all routine maintenance and minor repairs. If no one in the maintenance division can take care of them, money must be programmed into the budget, or someone must be trained, or both.

- Consider the following park specific issues:

  – The schedule for opening and closing the structures when staff arrive and depart, and visitor hours.

  – The procedures and staffing needed for opening and closing the structure.

  – The number and location of people on duty at any given time governs the nature of the response to daytime alarms and influences where and how to display the alarms.

  – The visitor tour path and direction, the number of persons on a tour, and the number of staff with each tour group help determine daytime alarm needs.

    When all visitors are in tour groups, closely monitored by staff at all times, there may be less reason to install sophisticated alarm devices. However, when visitors wander freely through a structure,

and there are not enough staff to provide surveillance, electronic protection for objects becomes more important.

  - You need to know the parts of the structure that are off-limits to visitors. Define the nature and level of access control needed in those places, and identify who is allowed in and under what circumstances. Provide information about physical access control measures, such as locks, and indicate whether to incorporate card readers, numeric keypads, or other devices into the overall alarm system.

- Study the environment. Where the components will be installed determines which technology you select. For example, if the building is reinforced concrete, or has a large amount of metal in the structure (including, perhaps, metal foil backed wall paper) then a wireless system may be a poor choice. Ambient temperature, humidity, and dust levels also are important considerations.

- Consider not only who responds, but also who monitors your system. With CCTV, for example, experience shows that someone can watch a monitor for about 30 minutes before it starts to become part of the visual background. This suggests the person assigned to monitor the system should be rotated every half hour. If not, then the system must include additional devices to identify potential threats and attract the operator's attention, such as a video motion detector.

- Observe the physical characteristics of the exhibit. For example, in a museum gallery where many people are present, color CCTV displays make it easier to distinguish and describe an individual. Where the camera is located in a little-used hallway, however, less expensive black and white monitors are usually sufficient.

6. *What are the types of intrusion detection devices?*

There is no cookbook way to design an effective intrusion detection system. Each protection problem is different, and the design of the intrusion detection system must reflect this. If not, the system will not provide effective protection, or the nuisance alarm rate will destroy confidence in it. Figure 9.5 describes commonly used intrusion detectors, how they detect, where to put them and common sources of nuisance alarms.

Each detector has strengths and weaknesses so an intrusion detection system that relies on one type has all the weaknesses of the detector selected. For example, using only contacts to protect doors, windows, and cases makes the building vulnerable if the intruder breaks the glass in a window and enters through the hole without raising the sash. Glass-break or motion detectors complement and provide back up for perimeter and case protection detectors.

TYPE	WHAT IT DETECTS	WHERE TO PUT IT	COMMON SOURCES OF NUISANCE ALARMS
Passive Infrared (PIR)	• Movement of an infrared heat source (in the range generated by the human body	• Best located so intruder's path of travel crosses the detection zone of the detector; least effective where intruder's path of travel is directly toward or away from the detector. • Aimed at a wall, floor or ceiling with a stable background temperature located within the design range of the detector.	• Heat sources (radiant heaters, hot water pipes, heat supply grills, etc.) • Surfaces heated quickly by the sun (metal doors, large areas of glass, etc.) • Aimed into open space, no stable background within detector range (for example, aiming a detector with a 50' range into a space 75' wide). Hot air moving at the detector's outer range can cause alarms. • Temperature extremes (below 32°F or above 100°F). • Small animals, such as cats, dogs, raccoons, large rats. Birds generally are not a problem. • Large amounts of dust. • Large electric motors, air compressors that cycle on and off.
Photoelectric Beam	• Movement of a solid object crossing the infrared light beam.	• Large open spaces • Out-door applications • Period rooms or other locations where an unobtrusive detector is desirable. The transmitter and receiver can be disguised or mounted inside a wall or other structure, although the transmitter must have a clear path to the receiver. If not hidden or disguised the intruder can step over or go under the beam.	• Birds or large insects. If used outside, set the beam far enough off the ground to let small animals cross the path, or the area must be fenced to keep them out. Stacked arrays or multiple beams can compensate for this. • Accumulations of dust, although more sophisticated devices compensate for gradual changes caused by environmental conditions.
Microwave Motion Detection	• Changes in microwave frequency. The detector transmits and receives electromagnetic energy in the microwave range (radar). Microwaves leave the transmitter, bounce off the target back to the receiver. The detector operates on the doppler effect (the frequency of the microwave energy changes as a target gets closer to or further away from the detector).	• Best located so intruder travels toward or away from the device. A target that stays exactly the same distance from the device, but moves laterally to it, may not be detected. • Can be mounted behind some solids (microwaves will penetrate 1" or more of wood. Useful where visual intrusion is a concern (place detector inside a piece of furniture, behind wainscoting, etc.) • Aimed at a solid structural feature (masonry wall, etc).	• Two devices in the same room operating on the same frequency. (One detects energy radiating from the other, causing unwanted alarms. Not a problem if detectors operate on different frequencies.) • Detector aimed at an outside wall fronting on a busy street, or a thin wall with foot traffic close to the building. • Aimed at a window or glass door. (Glass is invisible to microwave.) • Aimed at objects that move under normal conditions (curtains in the path of an air supply or draft from a door or window, for example).

Figure 9.5. Types of Intrusion Detection Devices

TYPE	WHAT IT DETECTS	WHERE TO PUT IT	COMMON SOURCES OF NUISANCE ALARMS
Ultrasonic Motion Detection	• Changes in high-frequency sound. Similar to microwave, except uses high frequency sound energy.	• Similar to microwave, but does not penetrate solids, including glass.	• Strong air movement. • Aimed at object that moves under normal conditions. Unwanted alarms make these devices unpopular except where used with another technology (PIR or microwave in dual technology devices). Stable when used inside vitrine cases (alarms if cover is removed or broken).
Dual Technology Detectors	• Detector combines two technologies (e.g., micro-wave and passive infrared or ultrasonic and passive infrared), Activation of both technologies needed for alarm. Fewer unwanted alarms when used properly.	• Same general considerations as other motion detectors.	• Environmental conditions or installation that voids one of the detection technologies (see above).
Sonic Sensors	• Sound in the frequency range associated with movement.	• Quiet locations such as inside a vault.	• Vibration, shock, and some ambient noise conditions.
Passive Audio Sensors	• Any sound in the protected space.	• Quiet locations such as inside of a vault.	• Ambient noise.
Contact Switches	• Opening or closing a mechanical switch—includes magnetic door and window contacts, plunger switches, and roller or ball switches. Magnetic contacts are in two parts: a magnet mounted on a movable surface and a switch mounted on a fixed surface. Moving the magnet away from the switch causes the device to go into alarm. Properly installed, they are stable with a low failure rate.	• Doors, windows, hatches, etc. • Exhibit cases, object protection (e.g., plunger switch under a object to detect movement of the object.) • If there is a large gap between the magnet and the contact switch (e.g., the door on an historic building is warped or fits loosely), a larger magnet may stabilize the alarm. If warping at the top and bottom of the door is extreme, install contacts near the latch. • Mount magnetic contacts on top or bottom of door about 6" from the latch edge. • Magnetic contacts mounted on the hinge edge of the door allow the door to open enough to enter without an alarm. Use roller or ball switches for this.	• Flimsy doors that rattle excessively in the wind • Doors that shrink or swell excessively as weather and the seasons change • Wide gaps between the magnet and the contact switch caused by settling of the building • Overhead doors with excess up and down movement when locked.

Figure 9.5. Types of Intrusion Detection Devices (continued)

TYPE	WHAT IT DETECTS	WHERE TO PUT IT	COMMON SOURCES OF NUISANCE ALARMS
Capacitance Motion Detection	• The device generates a capacitance field 4-6" from the protected object. Detects any electrical conductor that enters the field. • Most sound a local alarm to let the person know he or she is too close. Used to prevent touching--alarm sounds before person touches the protected object.	• Primarily used in museums to protect high value wall hangings or paintings from touching. • Must be used with physical barriers to prevent accidentally getting too close to the protected object.	• Lack of physical barriers to prevent visitors from accidentally getting too close to the object. • Requires frequent adjustment, and is sensitive to humidity and moisture.
Pressure Mats	• Pressure	• Usually placed under a rug or carpet to detect an intruder who steps into the protected space. • Period rooms with a rug or floor cloth.	• Lack of barriers to prevent visitors from stepping into protected area accidentally.
Vibration or Shock Detection	• Vibration or shock	• Attached directly to the protected object, an exhibit platform, or the structure of an exhibit case.	• Vibration from a train, trucks or cars on a busy highway, or an air handler that cycles on and off. Some have adjustments to screen out ambient vibration.
Glass Break Detection	• Frequency Discriminators: A sound detector activated by frequencies generated by breaking glass. • Metallic Foil or Wire: A ribbon of lead foil or small wire that acts as an electrical path. Attaches in a pattern around the outside of a window glass. Breaking the glass breaks the electrical circuit to activate an alarm.	• Frequency discriminators can be concealed near the protected glass. • Foil must be mounted directly to the protected glass (limiting its usefulness in historic houses with original glass).	• Frequency Discriminators: Clicking sounds, such as the sound of a heel tap on a tile floor, air moving through supply and return grills in the HVAC system, pipes heating and cooling, and some equipment noises. • Foil: Accidental damage and damage from water, sun, and temperature changes.
Strain Sensors	• Detects elongation of the under side of a joist, floor, or platform that occurs when weight is applied to the top surface.	• Underside of floors, stair treads, and other surfaces an intruder might walk over. • Under surfaces supporting high value objects to detect removal of the object. The sensor adjusts for weight normally on the surface. After it adjusts, the device alarms if the weight increases or decreases.	• Large animals with access to the protected area.

Figure 9.5. Types of Intrusion Detection Devices (continued)

7. *What are the most common causes of a false alarm?*

There is no such thing as a false alarm. An electronic detection system alarms because something approximates the conditions that one or more of the components of the system are designed to detect.

- If a rat runs in front of a microwave detector, it should alarm. The rat's movement has all the qualities that the detector was designed to detect. The alarm may be unwanted and a nuisance, but it is not false. To stop unwanted alarms like this, either select another type of detector that will not register the movement of the rat, or get rid of the rats!

- Power-induced alarms are unwanted, but power fluctuations can mimic the conditions the system is designed to register. The fix for this problem is to clean up the power supply.

The primary cause is human error. Someone either forgets to turn the system off, turns it on or off incorrectly, or accidentally triggers the system in some other way. The solution is either educating the users better or simplifying the system. Poor system design and lack of maintenance are other causes.

8. *What can I do to reduce the number of false alarms?*

Think about the conditions the system is designed to detect and then look for those conditions or conditions that mimic them. Look for patterns in the alarm records. For example, protection staff at a park noted a passive infrared detector in a loading dock often went into alarm between 6:30 a.m. and 8:00 a.m. Examining the area showed the device was aimed at a metal roll-up door facing east. As the sun came up and heated the door, infrared radiation inside the loading dock put the device into alarm. Repositioning the device cured the problem.

9. *What are other design considerations?*

Electronic access control systems can stand alone, or they can be computer controlled. Some use cards, some use keypads, and some use both. Some can be integrated with a CCTV system. The advantages are:

- You can customize a person's access to a particular area at a particular time. High security areas can be programmed to require two authorized people before entry is granted.

- A lost card can be programmed out of the system and does not have to be recovered (unlike a lock system where a lost key requires extensive and expensive rekeying).

- The system can provide a record of who entered a space and when.

Closed circuit television (CCTV) systems can improve the efficiency of the protection staff. With CCTV one person can monitor multiple and remote locations. CCTV does not replace personnel, however; someone always has to respond to prevent losses.

Lighting is also an important consideration in the design of a CCTV system. See the discussion on lighting in Section F.

Electronic exhibit and case protection systems require technical input from someone familiar with the design of exhibit and case protection systems.

Many of the detectors discussed in Figure 9.5 are useful for protecting exhibits and cases. As with intrusion detection systems, there is no cookbook way to protect cases or exhibits.

Alarm response time is critical because exhibit and storage cases are the innermost rings of the bull's-eye. They directly house the objects we most need to protect. When the thief is inside the case or exhibit, the loss is imminent. At that point only the exhibit mounting stands between the thief and the object. If vandalism is the intent, the object will already be damaged.

Electronic system maintenance components are sensitive to heat, cold, dust, lightning, power fluctuations, power outages and mechanical damage, and must have regular routine maintenance to operate as designed.

System maintenance can be contracted out, although as a rule, standard maintenance agreements do not cover damage from electrical power problems, lightning, accidental or deliberate mechanical damage, or natural disasters. Repairs not covered by the maintenance agreement usually are made on a time and materials basis. The alternative is to train or hire in-house staff to maintain the systems.

10. *Where can I get help?*

You can obtain additional assistance from:

- Park or regional/SO protection staff.
- Your regional/SO curator.
- The security or protection services departments in most large museums, such as the Smithsonian Institution, for advice and answers to specific questions.
- The American Society for Industrial Security's (ASIS) Standing Committee on Museum, Library, and Archive Security. Members of the Standing Committee will give advice on specific problems. Call ASIS headquarters at (703) 519-6200, or visit their website at <http://www.asisonline.org>. You can also order their publication *Suggested Guidelines in Museum Security.*

H. Protecting Collections in Transit

Museum objects are at greatest risk when in transit from one place to another. Whether in the custody of a courier, a bonded mover, or the U.S. mail, the act of transporting objects exposes them to risks not encountered in the park. Deciding how to transport a museum object safely, how much protection to provide, and how much it will cost, demands a rigorous analysis of the risk. Consider the following issues before consigning museum objects to a mover.

1. *What are the object's characteristics?*

Consider the object's value (monetary, historic significance), its vulnerability to theft or damage, and its physical characteristics, that limit the appropriate means of transportation such as size, weight, and composition.

2. *What means of transportation should I select?*

Objects that are especially vulnerable to theft or damage or that have significant value should be carried by the most secure means possible. That may mean a courier, a contract carrier, or both.

The most significant threat to an object in transit is a transportation accident. Like a fire, an accident involving the transport vehicle can destroy everything in it. The prospective transporter's safety record should be a significant factor in selecting a carrier.

3. *How should objects be handled in transit?*

Discuss special handling considerations with the transporter. For example, mechanical lifting devices, such as forklifts, should not be used for most categories of museum objects. Spell out these requirements to the transporter in advance.

4. *Is chain of custody important?*

Yes! A courier is the optimum way to handle chain of custody. However, except for very important objects, a courier may not be practical because of the cost. Nevertheless, it is vital to define how accountability transfers from one person or organization to another.

- Establish inventory procedures that do not require the objects to be unpacked when custody changes.

- When the objects are transported by a bonded mover, the contract should state that the driver will not leave the truck unattended for breaks, meals, or any other reasons.

5. *What about intermediate stops?*

Long distance movers often route objects from one place to another by way of central collection points, much as an airline routes passengers to one city via a hub in another. Intermediate loading and unloading of museum objects increases the risk of damage significantly.

If possible, museum objects should be moved directly from point A to point B with no intermediate unloading and reloading. If the values do not justify the cost of direct, non-stop routing, try to keep intermediate stops to a minimum.

If objects are placed into temporary storage along the way, the warehouse should be bonded, and the park should review the warehouse's security procedures.

6. *What about delivery time?*

When the objects reach their destination, someone should be on site to receive them. Specify in the contract that the mover will schedule the arrival of the van at a time when the receiving facility is open or staffed.

7. *Where can I get help?*

- The Registrar's Committee and the Security Committee of the American Association of Museums (AAM) provide specialized publications and referrals. Call the AAM in Washington, D.C. (202-289-1818) for a contact.

I. Reporting and Recovering Stolen Museum Objects

Time is critical after a theft because after only a few hours the likelihood of recovery for most museum objects is very small. Success depends on:

- detecting the loss quickly
- notifying law enforcement agencies rapidly
- providing a detailed description of the objects and, if possible, a photograph

1. *What should I do if I suspect a theft?*

Before calling the police, make sure that a staff member has not moved the object to another location within the park. If you cannot locate the missing object within a reasonable time, call the park law enforcement specialist and the police.

- Secure the area and do not permit anyone to enter.
- Determine exactly what is missing, but do not handle or move anything, or allow anyone else to do so. Consider everything in the area of the theft as potential evidence.
- Locate the following records:
  - Museum Catalog Record (Form 10-254) for each missing object. Make photocopies for use during the investigation.
  - A clear photograph of the missing objects.
- The park's law enforcement officer must complete a Case Incident Record (Form 10-343), with a copy of each relevant museum catalog record attached to the report.

See the NPS MH-II, Chapter 4, Inventory and Other Special Instructions, for guidance on reporting the loss of museum objects.

2. *How do I report a theft to outside agencies?*

Theft of museum objects and library, archival and manuscript materials is a serious international problem, and only 10 to 15 percent of stolen museum objects are recovered. This is because it is difficult to alert law enforcement agencies outside the area where the theft occurred about the theft. The problem is especially acute when the thief takes the stolen object over a

state or international boundary, a common occurrence with stolen museum objects.

You should notify other appropriate agencies and offices as soon as possible after notifying local law enforcement authorities and the NPS law enforcement specialist. It is vital to report all losses, because the more widely a loss is reported, the better the chance of recovery.

Depending on your arrangements with the local police, they may be the conduit for reporting crimes to the Federal Bureau of Investigation (FBI) and to the International Police Organization (INTERPOL). See NPS *MH-II*, Chapter 4, Inventory and Other Special Instructions, Section III, for a list of agencies to which you can report a theft.

3. *How should I handle the news media after a theft?*

Dealing successfully with the news media can help limit the public relations impact of a theft.

- Detail **one** person as the media spokesperson and coordinate **all** communication with the news media through that person.
- Do not discuss details of the theft with the public, news media, or other employees.
- Do not speculate about what happened, what was stolen, or the value of the missing objects.
- Prepare a statement for the news media with general information about the incident, and release it as soon as practical.

J. Museum Collection Records

Museum records are as valuable as any object in the collection and should be just as well protected.

1. *Why are the records important?*

Records, catalogs, and photographs of the park's museum collection are vital for security of the collection. For example, stolen objects are more likely to be recovered if they have been cataloged and if a full description and even a photograph of the object is available for law enforcement agencies.

2. *When should I use the camera?*

Photographs are better for describing and identifying objects than written records.

- Photograph the museum collection, or at least the more valuable or sensitive objects.
- Photograph exhibits, both as a record of the exhibit and as a quick way to inventory objects on exhibit when opening and closing for the day. Consider keeping photographs in a three ring binder as a quick reference for interpreters. Some museums and historic sites keep catalog information about specific objects in the binder as well to help interpreters answer visitor questions about the history of the objects on

exhibit. See *MH-II*, Chapter 3: Cataloging, for procedures on cataloging, and Appendix K: Photography, for guidance on photographing museum objects.

3. *Should I review my museum records protection program?*

Yes. Records are vulnerable to a wide range of threats--human error, fire, theft, mildew, mold, pests, paper deterioration, water damage, disasters and electronic media deterioration--and require constant attention.

- Keep duplicates of all museum property records in a secure location off-site. Avoid a location that will be affected by an area-wide natural disaster, such as an earthquake, that would affect both the park and the off-site location.
- Restrict access. Catalog and accession records should not be accessible to visitors, researchers, or non-museum employees except under the close supervision of the curatorial staff. Theft of an object and its associated museum records makes it extremely difficult to trace the object or to prove its ownership.
- Check environmental conditions and make sure there is an active pest management program.
- Keep records away from pipes and out of basements or flood plains. Use water or leak detection alarms where water damage is a potential threat.
- Make sure records are included in disaster and recovery plans.
- Train personnel in proper record maintenance techniques, and check work for accuracy.
- Keep important records on high quality paper (high rag content with alkaline deterioration buffer).
- Make sure electronic media are backed-up, stored properly, and access is controlled.
- Store paper records in a locking, approved UL-Rated Class C or D, as appropriate) insulated filing cabinet.

4. *Where can I get help?*

Consult the following resources for additional information:

- For detailed descriptions and applications guidelines, see the *CRM Bulletin Supplement* by John E. Hunter cited in Section K.
- Your park's fire safety officer, a local fire marshal or an NPS archivist or collection manager.
- NPS *Tools of the Trade* for sources of approved insulated files.
- *MH-II*, Chapter 2: Accessioning, for guidance on protecting museum records.

CHAPTER 10: EMERGENCY PLANNING

A. Overview

Museum and archival collections inevitably deteriorate over time. You, as a member of the museum staff, minimize this collection deterioration through preventive conservation such as proper housing and handling. Although you are unlikely to frequently encounter fires, floods, volcanic eruptions, and similar events, ***ultimately no park is immune from emergencies***. Once neglected or handled inappropriately, an emergency goes out of control and becomes a disaster.

> ***Your goals are to:***
>
> 1. ***Identify, anticipate, and avoid preventable emergencies.***
> 2. ***Mitigate damage when an emergency occurs so that disaster is avoided or minimized.***
> 3. ***Recover from disasters as quickly and professionally as possible so that no human life is lost and minimal collection damage and loss occurs.***

Disaster is often sudden and unpredictable. Catastrophes like the Florence, Italy, flood; the Mount St. Helens eruption; and the North Ridge, California earthquake are the stuff of newspaper headlines and curatorial nightmares. This chapter explains how to:

- ***assign responsibility*** for emergency planning, management, and response
- ***gather essential planning tools*** such as those described in the bibliography and Appendix G
- ***understand and manage the various generic types of risk that exist for museum collections***, including how to prepare for them, manage risks during an emergency, and survive them
- ***analyze your park's own particular risk level*** for the various types of hazards (potential natural and cultural threat factors) and vulnerabilities (likelihood of sustaining damage)
- ***begin salvage*** during the first 24 hours following an emergency
- ***prepare a Museum Collection Emergency Operation Plan (MCEOP) as part of the park's Emergency Operations Plan (EOP***) to cover the protection and prioritized salvage of the park's museum and archival collections based upon all the likely contingencies that form part of the park's risk
- ***stockpile essential emergency response equipment and supplies***

- ***train staff*** in emergency planning, management, and response activities

- ***test, evaluate, and update your MCEOP***

Advance planning is the key to effective emergency response and the recovery of museum and archival collections. Your planning today will control how effectively damage is mitigated in tomorrow's emergency. No park has the equipment, supplies, and expertise necessary to cope professionally with a significant emergency without a good MCEOP. Strive for thoroughness, clarity, and practicality when preparing your plan**.** Keep your plan simple, flexible, and based upon existing museum routines so as to make it easy to implement.

1. *Who can help me with emergency planning?*

Emergency planning involves:

- ***coordinating with the park's EOP coordinator*** to ensure that the museum collections will be integrated into the park's EOP and with local emergency services agencies to identify sources of assistance. Work with the EOP coordinator to identify who will be responsible for managing and updating the museum component of the plan.

- ***working with the Regional Curator and others*** such as the Regional Office's Division of Ranger Activities and your regional/Support Office (SO) curator to identify individuals who should be involved in the museum component of the plan.

- ***working with contract personnel*** as necessary. Contractors can help you regularly reexamine assumptions about risks to collections so you can update the plan and training. See Section C and Appendix G: Museum Collections Protection.

2. *Why should I plan for emergencies?*

There are many good reasons to plan for emergencies, including:

- saving lives

- preserving collections

- saving time and resources

Practically speaking, when you are in the midst of responding to emergencies you are probably not thinking clearly. During an emergency is not the time to conduct research on how to salvage collections. You need the knowledge before the emergency, to reduce the risk of human injury and resource damage and loss.

3. *What authorities and federal guidance exist on emergency planning and disaster prevention?*

Consult the following:

- 36 CFR 1236, Vital Records During an Emergency Executive Order

- 44 CFR 101-2, Occupant Emergency Plan

- 12656, Assignment of National Security and Emergency Preparedness Responsibilities, November 18, 1988
- Executive Order 12148, *Federal Emergency Management,* July 20, 1979
- Federal Preparedness Circular 61, Emergency Succession to Key Positions of the Federal Departments and Agencies
- Federal Preparedness Circular 62, Predelegation of Emergency Authorities
- Federal Preparedness Circular 64, Continuity of the Executive Branch of the Federal Government at the Regional level during National Emergencies
- *Federal Response Plan* (Federal Emergency Management Agency)
- Federal Response Planning Guidance FRPG 01-94, *Continuity of Operations,* December 4, 1994

B. Museum Collections Hazards, Vulnerabilities, and Disaster Prevention

Museum collections risk is composed of two key elements:

- ***hazards,*** which are the natural factors (such as storms, fire, and flood), your park's landscape and location risk factors (proximity to a tidal river or coast, volcano, or placement in a valley or near a nuclear reactor), and social factors (such as civil unrest, terrorism, and vandalism) that threaten museum collections
- ***vulnerabilities,*** which is the likelihood that your collection will sustain damage, due to the:
  - composition of the park museum collection (such as ceramics, glass, and friable media)
  - structures housing your materials (such as older wooden structures or flat roofed masonry structures)
  - staff-training level (explicit or textbook-type knowledge), hands-on experience-level (implicit knowledge), and state of preparedness

Your job is to understand the hazards that afflict your region, the vulnerabilities of your structure and collection, and therefore the risks you must manage. Don't forget materials in exhibition areas, research rooms, workspaces, and separate on-site or off-site structures when planning for emergencies. Park records, particularly museum records, also must be salvaged immediately or your ability to use your collections effectively in the future will be compromised. This chapter serves as an introduction to the

various hazards, vulnerabilities, and risks of museum collections. For more information, go to the sources listed in the bibliography.

1. *What kinds of emergencies exist?*

Emergencies may take many forms, including civil unrest, earthquakes, explosions, fire, flood, hazardous materials accidents, storms, structural collapse, terrorism, transportation accidents, and utility failures. They can cause damage to museum collections from bacteria, chemical change, heat, physical damage due to movement (called kinetic damage throughout this chapter), soot, water, and many other agents.

2. *What do I need to know about fire hazards?*

Fire is the most serious single threat to all park museum collections. It may lead to loss of life, loss of collections, and loss of building structural integrity—causing great physical damage to the unburned collections. During fire suppression, water, chemical, and physical damage may all occur and mold may later result. Fire hazards vary by region, with forested areas and dry plains being at particular risk of wildfires.

Fire vulnerabilities: The museum materials most vulnerable to fire are:

- botanical collections
- black powder weaponry and similar weapons and ordnance
- nitrate (nitrate) film, including negatives, motion picture film, and X-rays (***Note:*** These are particularly dangerous if the nitrate exists in quantities greater than 35 pounds.)
- paper-based materials, including artwork, documents, and museum documentation
- plastics, particularly those with antioxidants, dyes, toxic fire retardants, and other additives (dioxin, lead, and antimony), for example, vinyl chloride plastics
- specimens in alcohol and formaldehyde
- textiles
- vehicles, motors, and equipment containing oil and gasoline
- wooden objects, particularly older wooden furniture

Classic fire damage includes:

- consumption and loss of materials, particularly organic materials
- embrittlement of most organic materials
- explosions due to nitrate fires, leading to structural collapse and collection loss
- heat and smoke from fire causing accelerated aging of materials not consumed by the fire

- loss or damage of museum records, park records, and archives and manuscript collections
- melting
- mold, insect, and vermin outbreaks in the water damaged materials following fire fighting
- oxidation of metals
- fading, scorching, charring, staining, or accelerated aging of wood, paper, and textiles
- subsidiary water damage due to fire suppression (See Water damage and Floods below.)

Fire prevention: To stop fires, you need to stop ignition sources, remove potential fuel—particularly fuel that can self-ignite such as nitrate film—and maintain a proper environment that isolates museum storage, work, exhibit, and research room spaces from other spaces that may not be as well controlled. Don't allow smoking in the museum building. Allow cooking in the museum building only when precautions are taken, such as the use of fire-resistant surfaces and evening shut-down procedures that ensure heat sources are turned off. A good fire alarm, fire extinguishers, heat and smoke detectors, and a fire suppression system, including sprinklers, are also helpful. Select fire extinguishers based on the type of collections you have and the chemicals being stored in the museum building. For guidance, see *MH-I,* Chapter 9: Museum Collections Security and Fire Protection.

Maintaining good housekeeping, preventing smoking, placing highly flammable materials such as nitrate off-site, maintaining electrical systems to standards, and removing trash often will be the most important steps in preventing fires.

Museum staff should be aware of how the alarm systems, fire extinguishers, sprinklers, and other systems work. Occupational Safety and Health Administration (OSHA) and the Code of Federal Regulations (CFR 1910.157[g][2]) mandate that all staff receive training in fire extinguisher use annually. The museum building must have two usable escape routes from all areas—whether exhibit, storage, work, or reference space. All exits must be clearly visible and labeled from all locations and points-of-view. Federal law (29 CFR 1910.36[c][2]) requires that all exits, fire doors, panic bars and bolts, fire protection, and fire detection alarm systems be fully operative while any workers are in the building. If a fire system is damaged, the MCEOP should contain information on how to contact the firm for repair work. See *MH-I,* Appendix F: Collections Management Checklists, Checklist for Preservation and Protection of Museum Collections (Checklist), Questions 1-12 under Fire Protection.

Chose fire-resistant furniture, equipment (such as UL listed appliances), and carpeting or ceramic tiles. Store museum records in fireproof cabinets. For shelved items, keep a full two feet of space between the top of the shelving unit and the ceiling to avoid blocking sprinklers and fire fighting activities. Don't store collections near vents or flammable chemicals. Keep only small, carefully labeled quantities of flammable chemicals in appropriate fire-rated storage cabinets outside of museum storage areas. Provide up-to-date OSHA surveys of the chemicals or toxic collections materials to local fire fighters and emergency workers, and include them in your MCEOP. Hazardous materials (HAZMAT) storage spaces should be labeled with the appropriate OSHA warning label. See Appendix F: Collections Management Checklists, Checklist for Preservation and Protection of Museum Collections (Checklist), Fire Protection, Question 3.

Check vents of all equipment, including computers, electrical equipment, photocopiers, and similar devices to ensure that they are not obstructed. Avoid using carpeting and map case interior dust covers that contain polyvinyl chloride (PVC). Check all appliance cords regularly and unplug them at night. Replace fluorescent light bulb ballasts—particularly those over lamps that are older than 15 years—with thermally protected Class P ballasts. Keep all brush, vegetation, and trash away from your buildings. Prohibit smoking in your buildings. Keep all walkways and aisles free to facilitate fire fighting and evacuation. ***Keep exits unobstructed.***

Fire survival: If you are present during a fire, activate the fire alarm immediately. During evacuation keep close to the ground. If smoke is bad, place a wet cloth over your face. Don't open windows. Check the elevator for trapped individuals. Help disabled or injured people evacuate safely without using elevators. As you evacuate, close all doors behind you. If possible, take the visitor log and your MCEOP with you to help you account for everyone in the building. Call the fire department and park fire protection staff (a ranger, park police, or maintenance) immediately.

Your MCEOP should indicate whom to contact and list their numbers (telephone, fax, beeper) and e-mail addresses. Provide the fire fighters with your MCEOP building plans and visitor log to help them in their efforts. Check to ensure all staff and visitors have departed the building. Move to a safe distance from the affected area. Try to determine if everyone has safely evacuated the building. Alert professional rescue personnel about any missing or trapped individuals and their probable location.

Never allow a fire to get between you and the door. If the fire is very small and you have time before departing with no risk to yourself, disconnect electrical equipment. Shut down the air intake system and HVAC. Place plastic sheeting over collections. Use a handheld fire extinguisher on a small non-toxic (not plastic or nitrate burning) fire, as long as you have the appropriate type of extinguisher and have been trained in its use.

Never jeopardize your safety by trying to put out a nitrate or plastics fire. Be aware of the extreme danger posed by the off-gassing of burning materials, such as nitrate and PVC. Stay away from soot and smoke, as it may be carcinogenic. If plastic or nitrate materials are in museum storage, evacuate as fast as possible during a fire. See *MH-I,* Chapter 9: Museum Collections Security and Fire Protection, for further guidance.

Before attempting to salvage museum collections, maintenance and fire staff must determine if the space is safe to enter. Once the fire is out and the structure has been stabilized for access, the composition of the soot should be determined to ensure that no carcinogens or toxic substances, such as lead, polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCBs), hazardous residues, or lethal molds or bacteria are present. Museum staff may be expected to take samples of substances with cotton swabs, scotch tape, or agar slides for immediate delivery to the testing lab for toxicity tests.

If requested to take samples of mold or hazardous substances work with the park's hazardous materials coordinator. Wear protective clothing (nitrile gloves and a smock) and an appropriately rated breathing apparatus that has been fitted to you. The MCEOP should indicate the location of testing laboratories that can identify whether the materials encountered after the fire are potentially toxic, such as P&K Micro, Unit L, 19050 Old Cuthbert Rd, Cherry Hill, NH 08034 (Tel: 609-427-4044). If large quantities of toxic substances are found in the soot or other residues, a professional abatement team may need to be hired.

After determining that the space is safe to enter and no safety hazards exist for salvage, follow salvage procedures as described in the National Task Force on Emergency Response *Safeguarding Our Cultural Heritage, Emergency Response and Salvage Wheel* and similar sources listed in the bibliography and Figure 10.13, First 48 Hours Emergency Response Checklist. If you plan to use museum personnel in response to fire emergencies, read OSHA, Emergency Plans and Fire Prevention (1910.151, 1926.50). See *MH-I*, Chapter 9: Museum Collections Security and Fire Protection, for additional guidance. Also see the U.S. Fire Administration Website at <http://www.usfa.fema.gov/>.

3. *What do I need to know about water damage and floods?*

Water damage is perhaps the second most common type of museum collections damage. Floods are the most widespread form of natural disaster after fire. Floods and flash floods occur in all 50 states according to the Federal Emergency Management Agency (FEMA). Since 1900 over 10,000 people have died in flooding in the U.S. Dam failures are the most dangerous form of flood.

Water damage is often the result of fire-fighting activities, storms, and structural damage, but may also be due to flash floods; floor drainage back-ups; leaking HVAC systems, pipes, roofs, and skylights; seepage and slow-rising floods; and tidal waves. Loss of life is always the greatest risk for floods.

Flood and water damage vulnerabilities: The materials most vulnerable to water damage are:

- archival materials, such as architectural drawings, plans, and blueprints; coated paper books and documents; parchment and vellum documents; documents on heavily sized paper; documents with water soluble media, such as some ballpoint or fiber tip pen ink or friable media such as charcoal or graphite; and historic photographs and film, including nitrate

- artworks**,** such as chalk, charcoal, collages, conte crayon, gouache, montages, paintings (paintings on canvas or panels), polychrome sculpture, and watercolors

- bone and ivory, which are hygroscopic—particularly thin sections, which warp easily

- basket and other fibrous materials with applied paint or decoration or repairs

- furniture/wood with applied gilt, fine veneer, inlays, lacquer, or attached ironwork

- furs, leather, and skin–particularly under tension (such as drums) or with applied paint–including parchment and vellum and other alum tawed leathers

- glass and ceramics with mends or that are heavily adulterated with non-silica materials

- metal objects made of bronze, brass, copper, iron, and steel

- natural history specimens**,** particularly extinct or endangered species or type specimens, water sensitive geological specimens (particularly shale), and paleontological specimens

- previously moldy items

- textiles**,** particularly thinly woven materials

- unfired clay

Classic water damage includes:

- adhesion of art, book, paper, and photographic items to other objects of organic materials

- bleeding of color from one object to another

- corrosion and rusting of metals

- erosion of stone or masonry

- finish loss on art works, photographs, textiles, and wood

- lifting of veneers on furniture

- loss or damage to museum records, park records, and museum archives and manuscript collections

- loss of dimensional stability of paper, textiles, and wood

- mineral deposits on ceramics, metal, meteorites, minerals, and stone
- molding and rotting of animal and botanical specimens, books, furniture, paper, parchment, photographs, textiles, and vellum
- pigment and dye loss on artworks, books, paper, photographs, textiles
- ripping or splitting of animal skins, paper, photographs, and fragile textiles
- separation of emulsion layers on photographs
- splitting of skins and of leather on bound volumes
- staining and deposition of contaminants on bone, ivory, paper, shell, and textiles
- structural integrity loss for paper, plaster objects, and textiles
- swelling and pressure damage that cracks or destroys nearby objects
- warpage of board, paper, thin sections, and wood
- weakening of fibers in paper, textiles, and some wood

Flood and water damage prevention: To stop floods and water damage:

- locate your collections far from dams and flood plains
- locate collections in buildings with good structural seals (including a sound and sealed roof, windows, and basements)
- keep all storage equipment at least 4 inches off the floor, preferably 6 inches off the floor
- use only spaces that will not flood if pipes break or drains back up
- See Appendix F: Collections Management Checklists, Checklist for Preservation and Protection of Museum Collections (Checklist), Museum Collections Storage, Questions 4, 5, 7, 9, and 20.

Be aware of whether your building is located on an underground stream, a swamp, or other water source or near a tidal river or coastline area. Find out if you live in a flood-prone area from your local emergency management office or Red Cross chapter. FEMA offices are listed on the FEMA Website at <http://www.fema.gov/>. The National Oceanic and Atmospheric Administration (NOAA) Website at <http://iwin.nws.noaa.gov/iwin/nationalwarnings.html> also contains excellent flash flood and flood warnings. Know the area flood stage water table level so that you can avoid storing items below this level, thus placing them at risk.

Avoid using spaces with overhead pipes, whether for water, waste, steam, fuel, or other liquid. See Appendix F: Collections Management Checklists, Checklist for Preservation and Protection of Museum Collections, Museum Collections Storage, Questions 5 and 9. Don't store materials in particularly vulnerable spaces, such as attics or basements. Ensure that all drainage and water removal systems are functioning well. Have check valves installed in building sewer traps to prevent floodwaters from backing up in sewer drains. Know where your water and utility shut-off valves are and how to operate them. Work with park maintenance to ensure they keep your building in excellent repair, regularly checking and testing foundations, walls, windows, roofs, door seals, piping, sprinkler systems, gutters, and other structural components. In particular check to ensure that the building is firmly attached to the foundation. Work with park landscapers to ensure that the landscape drains away from the buildings.

Chose storage equipment and supplies that will not cause additional damage in case of flooding. Avoid using wooden storage equipment as it:

- floats (***Note:*** Also avoid metal cases with sealed air spaces that promote floating.)
- feeds insects
- may swell and crush materials housed inside
- drains poorly, holding water
- weighs a great deal when wet, potentially leading to excessive floor loading and structural collapse

Be aware of how different decorative materials and storage furniture may hold water and humidity when designing a museum storage space. For example, wallpaper, wood furniture, and carpeting hold humidity and water, while paint, metal furniture, and tile don't. When decorating your structure, use tiles, metal storage furniture, and paint, rather than wallpaper, wooden furniture, and carpeting. Avoid using acidic cardboard housing as it may stain paper and textiles if wet. Avoid using water-soluble markers on file labels and boxes, as they may wash off. Avoid using staples and metal clips as they may rust; use plastic clips instead. Select polyethylene storage boxes, where possible, as they won't collapse spilling contents if wet. Boxes with several small vents in their bottoms to allow water to run out are ideal. Poke several small drainage holes (<3 inches) in the empty boxes.

Flood watches and warnings: Know the difference between a flood watch and a flood warning. A watch is advance notice, first announced when a threat is noticed—often up to 36 hours before the event. A warning tells you it is about to happen within the next 24 hours.

> ***Flood watch:*** If you are in the museum when a flood watch is announced, listen to local emergency broadcast system radio and/or a National Weather Service (weather band) radio at 162.475 MHz-FM. Ask local disaster planning experts for their predictions. Check the

Floodcast Website at <http://www.earthsat.com/flood/floodcast.html> and the NOAA Website at <http://iwin.nws.noaa.gov/iwin/nationalwarnings.html> for predictions of areas that will flood or experience flash floods or severe thunderstorms within 24 hours. Alert the MCEOP team that they are on stand-by status. Listen for alarms and updates. Listen for emergency alarm signals. To find the other six frequencies and 530 transmitters NOAA Weather Radio uses, go to <http://www.noaa.gov/nwr>.

As you wait for updates, unplug all non-essential electrical equipment and secure the building. Check battery-powered equipment, alternative power and communications systems, and emergency supplies. Ensure that batteries on water alarms are fresh and in place. Place water alarms near all collection storage areas to provide you with early warnings in case of roof or window leaks or backed up drains.

Fill evacuation vehicle gas tanks. Collect clean water in jugs for clean-up activities. Secure all loose objects outside, preferably by bringing them into the building. Tape windows and then pad them with bubble wrap before closing the storm shutters. If you lack storm shutters, tape windows. Use additional tape to attach plastic sheeting over the entire window well area, attaching the sheeting to the surrounding wall to provide some additional insulation and a humidity barrier. Disconnect non-essential electrical equipment. Back-up all computer files. Move unnecessary vehicles to high ground. If time allows, prepare to evacuate collections to an alternate storage location on high ground using designated vehicles as described in the MCEOP. Be prepared to drive significantly inland to get away from washed out bridges and coastal flooding. Notify authorities of any safety problems along the route.

- ***Flood warning:*** Evacuate and close the museum. Check to ensure that everyone has left safely. Mobilize the MCEOP team. Turn refrigerators and cold storage units to the coldest settings and tape them shut as early as possible to give them some residual cold to carry them through the crisis. Move designated high-risk materials, key documentation, and one copy of your MCEOP to the upper floors of the storage structure as indicated by the museum MCEOP. If there is no time to move the rest of the collection to the upper floor, move all easily movable collection items off the floor to the highest-level storage space available within the room. Place plastic sheeting over all vulnerable collections and tape in place if necessary.

Use dehumidifiers and sump pumps as necessary in the fight to prevent water damage. Place heavy screens over floor drains to keep small items from washing away. Lock all cabinets and move equipment away from windows and out of basements. Secure non-movable items. Gather emergency supplies. Just before you leave, shut down all utilities, turn off electricity at the building's main circuit breaker, unplug all electrical equipment on lower floors, seal all doors and windows, and secure the building.

Flood survival: If you are in the museum when a flood occurs, stay in the building and go to the top floor. Contact authorities by cellular phone to alert them to your situation and request rescue. Be extremely cautious around

electrical appliances and outlets. If necessary go onto the roof as long as no thunderstorm is in progress. If time allows, take a copy of the MCEOP, protective clothing, a bright rain poncho, and a colorful blanket with you to help rescue personnel locate you.

Don't try to walk or drive through water once the flood has started. Even six inches of rapidly moving floodwaters can sweep you off your feet. If you are caught outdoors or in a car, drive to high ground. Don't stay with a stalled car in rapidly rising water. Cars can be swept away by just two feet of moving water. Flash floods can tear down trees and destroy buildings and bridges.

Don't return to the building after evacuation until it is judged safe by the individuals designated in the MCEOP, usually your maintenance liaison. The maintenance liaison may need to check the safety of floors, walls, and stairways, as well as checking to ensure that the building meets federal codes and OSHA requirements. See Section D.5. When re-entering the building, watch for broken or leaking gas lines, flooded electrical circuits, submerged furnaces and appliances, flammable or explosive materials that entered the building as a liquid, contaminants that are health hazards (gas, biological waste), and biological problems, including vermin, snakes, mold, and similar problems.

Wear nitrile gloves and use sticks or shovels when poking through debris. Working in water cooler than 75°F (24°C) can result in hypothermia, so avoid working alone or without heavy clothing and rubber boots. If working near floodwaters, wear a life vest.

After the flood, be prepared to remove water, commercially dehumidify the building, air dry and/or wrap and freeze designated collections in priority order according to the MCEOP. Collection removal work will have to be done speedily and in priority order, for many items must be salvaged within 48 hours to prevent significant deterioration.

Pump no more than a third of the water out each day to avoid structural collapse and allow the building to settle gradually. Be cautious when working with gas or diesel-powered pumps as they often give off carbon monoxide, and can't be operated indoors without a significant risk of suffocation.

For help, see the First 48 Hours Emergency Response Checklist (Figure 10.14) and the National Task Force on Emergency Response: *Safeguarding Our Cultural Heritage, Emergency Response and Salvage Wheel* and other sources listed in the references for guidance. Also see the Websites under ***Flood watch*** and the National Institute for Occupational Safety and Health (NIOSH) Website for warnings of hazards of flood cleanup work at<http://www.cdc.gov/niosh/flood.html>.

4. *What do I need to know about storms?*

Storms are perhaps the most varied form of emergency, as they include blizzards, electrical storms, hail, hurricanes, sleet, tornadoes, and other wind and winter storms. On average, the U.S. gets 10,000 thunderstorms, 1,000 tornadoes, and about 10 tropical storms annually, 2 of which develop into major hurricanes. Use the NOAA Website at <http://iwin.nws.noaa.gov/iwin/nationalwarnings.html> and the Earth Watch Weather on Demand Website at <http://www.earthwatch.com/STORMWATCH/stormwatch.html> for maps of U.S. storms and predictions of upcoming storms.

Storms may cause fires, floods, and structural collapse that threaten loss of life and damage museum collections as well as:

- explosions
- hazardous material accidents
- transportation accidents
- utility failures

Storm vulnerabilities: Storms may cause fires and floods, noted above. In addition, a storm may cause significant kinetic damage (movement, impact, or abrasion) due to high winds, structural movement, and structural damage. The materials most frequently damaged by movement due to winds include:

- artwork in frames or under glass
- bone and ivory, particularly thin sections or slices of these materials
- brittle metal objects,
- ceramics, glass (including glass photographic plates), and mirrors
- specimens in alcohol and formaldehyde and collections housed nearby
- furniture and wood
- materials under tension, such as drums
- paper and photographs, including museum archives and documentation

Classic storm damage includes:

- broken bone, ceramic, glass, ivory, metal, and mirror items
- contamination of dry collections with alcohol or formaldehyde from wet specimens
- cracked, smashed, or otherwise damaged furniture, glass plate images, herbaria, and wet specimen jars
- missing objects that have been carried away by the winds

- soaked or water damaged archeological or ethnographic specimens, archival materials, artwork, books, furniture, museum documentation, and specimens

Storm damage prevention: Know whether you are located in an area vulnerable to major storms, such as "tornado alley," which includes parts of Arkansas, Iowa, Kansas, Missouri, Nebraska, Oklahoma, and Texas. For example, the states with the highest rate of thunderstorm-linked lightening fatalities are in the South and Southwest, particularly Arizona, Arkansas, Mississippi, and New Mexico. Tornadoes usually occur at the end of a thunderstorm. Use the FEMA Website at <http://www.fema.gov> and the NOAA Website at <http://iwin.nws.noaa.gov/iwin/nationalwarnings.html> to identify the level of risk your park has from each of the various types of storms and to track storms as they develop.

Familiarize yourself with emergency broadcast stations on television and radio (particularly the National Weather Service radio station at 162.475 MHz-FM), with the Websites listed above, and with alarm sirens. Work with your park EOP coordinator and local emergency personnel. Ensure that your park is listed as a "must call" on telephone calling trees for storm alerts and that the MCEOP team leader is on the park EOP coordinator's "must call" list. Storms can make access to the park to assess the collection condition difficult or impossible without an all-terrain vehicle and extensive help to remove downed trees and rubble.

Protect your collections from storms by locating your collections on level plains or slight inclines, not in valleys or flood plains, or on hill or mountaintops. Install storm shutters on your windows. Install lightning rods. Place museum storage, work, exhibit, and research rooms in buildings with good structural seals on the roof, windows, and basements. Avoid using fragile historic structures, attics, or basements for museum storage. Work with park maintenance staff to ensure that the museum structure roof, HVAC, and similar large structural elements are bolted with heavy-duty fasteners. Consult with your cultural resource management specialist before making changes to historic structures.

Place pressure-sensitive UV filtering film over glass to help minimize glass shard projectiles and window breakage. Cover windows with storm shutters and secure after first padding them with a sheet of polyethylene foam or bubble wrap to prevent shock damage. Place sandbags near doors. If possible, bolt the structure itself to the foundation and install tempered glass in museum windows. Also secure all fences and outbuildings to the building and to the ground. Some of these actions have historic structure ramifications and must be coordinated with your park historic preservation or cultural resources officer.

Ensure that all drainage and water removal systems are functioning well. Request emergency power back-up systems for environmental controls when possible. Avoid placing any materials near or in the museum that might function as projectiles in a high wind, including gravel, tiles, roof slates, benches, statuary, trash cans, and outdoor displays. Cut back all dead

branches on trees near your building. Attach guy wires to large trees near the museum building to prevent them from damaging the museum during high winds.

- ***Storm watch:*** Hurricane watches are issued by the National Weather Service when 74 mile-per-hour winds or greater or dangerously high water and rough seas are expected within the next 24-36 hours. A severe thunderstorm watch is issued when damaging winds of 58 miles or more or hail of 3/4 of an inch or more is expected A tornado or winter storm watch is issued when the National Weather Service identifies classic danger signs, such as approaching storm clouds or a severe thunderstorm.

  If you are in the museum when the storm watch is announced, turn on an emergency broadcast (EBS) station on radio or television or listen to National Weather Service radio at 162.475 MHz-FM for information. Listen for emergency alarm signals.

  Tie down loose items outside or move them indoors. Disconnect all non-essential electrical equipment. Ensure all vehicle gas tanks are full for emergency evacuation as necessary after the storm. Check all battery-powered equipment and power back-up sources and fire fighting equipment, emergency exit lights, and back-up security systems. Capture clean water in clean jugs in case you are stranded or must do emergency clean up. Locate emergency response equipment.

- ***Storm warning:*** A National Weather Service storm warning indicates that a storm is imminent (within the next 24 hours). For thunderstorms, tornadoes, and hurricanes, open windows very slightly on the side away from the direction of the storm's approach. Move collection items in priority order away from glass, doors, and windows and out of basements to a safe space designated in the MCEOP. Cover collections with tarps and polyester sheeting and lash down to the heaviest furniture and to wall braces if possible.

  Clear away all loose items to padded storage (use polyethylene foam or bubble wrap) in cabinets or cupboards that can be secured. Cover non-movable items, such as architectural fragments and sculptures, with plastic sheeting. Shut-off electricity and gas mains. Close storm shutters, tape unprotected windows, and lock up. Shut down all utilities, including electric appliances. Evacuate to the designated storm area, taking the visitor log and the MCEOP with you. Leave as soon as possible, avoiding flooded or washed out areas and structures. You may need to drive 20-50 miles inland to avoid hurricanes and their subsequent tidal waves and flooding.

- ***Storm survival:*** If you are in the museum when a storm strikes, remain in the building. Don't use elevators, matches, candles, or lighters. Stay away from upper floors, windows, glass doors, overhead lighting, and areas with unsecured furniture including filing cabinets, museum storage equipment, shelving, and small-unsecured objects. For example, don't go into wood or metal shops or into offices with lots of unsecured officesupplies. ***Avoid all rooms or spaces with wide span roofs*** such as barns or garages, as well as attics or top floor areas. Either get into a

windowless closet toward the center of the lower floors or stay in the center of a small windowless room, as the corners tend to accumulate debris. ***Get under a sturdy piece of furniture if possible, such as a heavy desk and use your arms to protect your head and neck.***

- ***If the storm is a tornado,*** go to the designated shelter, basement, or an empty interior hallway or windowless closet. Stay away from upper floors. If you are stranded on an upper floor, go to a small windowless closet or hallway. Get under sturdy furniture and hang on. ***Note:*** The Fujita tornado scale runs from F-0, winds of up to 72 miles an hour with accompanying tree and chimney damage; to F-5, with winds of up to 318 miles per hour causing complete structures to be carried off their foundations.

- ***If the storm is a hurricane,*** go to the ground floor (not the basement). Get into an empty interior hallway or windowless closet. Hurricanes frequently lead to flooding so stay above the water table or flood level. Hurricanes have a lull period, called an "eye," during which the storm seems to have ended. Instead, the storm will return with all of its original ferocity. After the "eye," the hurricane winds will come from the opposite direction. Don't try to evacuate during the "eye." Get under sturdy furniture, protect your head, and hang on.

- ***If the storm is a thunderstorm,*** use only battery operated equipment and avoid all telephones, televisions, bathtubs, outlets, water faucets, sinks, metal structural elements, and outlets. If you notice your hair is standing on end (which indicates lightening is about to strike), bend forward and place your hands on your knees. Keep your feet together and crouch low. To estimate your distance in miles from a thunderstorm, count the number of seconds between the flash of lightning and the next clap of thunder, and then divide by five.

- ***If the storm is a winter storm,*** find blankets and emergency heating equipment, such as space heaters. Use such equipment carefully to avoid the risk of fire. Avoid evacuating until sleet and hail have ended and authorities state that roads are passable. If stranded in a car, stay with the car unless you can clearly see nearby shelter with heating.

- ***If you hear hissing or smell gas,*** open a window and evacuate the building immediately. If possible, turn off the gas main valve as you leave. If you see sparks or smell smoke ensure that the power is turned off at the main fuse box or circuit breaker. If you must step through water to get to the circuit breaker, don't attempt to do so. Take the MCEOP and visitor log with you if possible. Try to determine if everyone has safely evacuated. Notify authorities of any missing or trapped individuals and their probable location. Wait until the maintenance liaison uses a flashlight to check for broken utility lines before turning utilities back on.

- ***If outside during a storm***, don't try to outdrive a storm. Try to get into a building. If no building is available, stay in the car for an electrical storm or winter storm, but get out and into a ditch for a

hurricane or tornado. If in a ditch, lie down facing away from the storm.

5. *What do I need to know about medical emergencies?*

Medical emergencies can happen at any time to almost anyone.

Medical emergency vulnerabilities: Staff are vulnerable if they are inadequately trained or equipped, or if they are required to work at a pace that doesn't allow them to use appropriate safeguards. Visitors may be vulnerable if the exhibit area or research areas are improperly equipped or located. For example, if the research room is on the seventh floor and there is no elevator, a visitor might either fall or have a stroke in attempting to get to the space.

Classic medical problems include:

- accidents, such as falls resulting in broken limbs or concussion
- health hazard induced medical problems, such as those resulting from working around asbestos, chemicals, mold and nitrate (respiratory damage); ticks (Lyme disease); birds (histoplasmosis), or vermin (hantavirus)
- medical conditions such as epileptic seizure or heart attack or stroke from over exertion

Medical emergency prevention: Clearly label all exits; keep the museum storage, work, exhibit, and research areas clean and unobstructed. Attach all carpeting and mats to the floor firmly. Clearly mark and light all hazards, such as uneven floors or stairs. Check all furniture and equipment regularly to ensure that it functions well. Replace old or worn-out equipment and furniture. Limit access to dangerous areas where chemicals or high voltage equipment is stored. Get first aid training. Obtain the proper protective clothing and personally fitted rated breathing apparatuses before exposure to potentially hazardous materials. Document staff exposure.

Be aware that you must not let untrained staff onto a disaster site or expose them to any equivalent health and safety risk, or you may be subject to OSHA fines and citations. All workers at a disaster site must have training, proof of comprehension of training (such as quizzes), appropriate equipment, and a written plan. For more information on OSHA requirements, see Section D.5 and the OSHA Website in the bibliography on:

- blood-borne pathogen standard
- emergency plans and fire protection
- hazardous waste operations and emergency response
- medical services and first aid
- personal protective equipment
- respiratory protection

Know which hospital is closest and who has advanced first aid training within the park. Keep a list of emergency help sources, such as local doctors and hospitals. Train staff in CPR and other basic first aid. Post a basic first aid manual and supplies in the building. Ask all staff to have a tetanus immunization. Ensure that all staff knows how to lift without hurting themselves.

Teach all staff how to identify and protect themselves from health hazards such as animal waste, asbestos- or arsenic-contaminated materials, bacteria- and virus-contaminated materials, insects, mold, nitrate fumes, and similar health hazards.

Medical emergency survival: Remain calm. Contact the hospital immediately for assistance. Tell the hospital or ambulance staff:

- the location of the victim
- your name and telephone number
- the nature and extent of the emergency
- how the emergency happened
- any hazards that might be encountered by the ambulance on route to pick up the victim

Have someone wait outside to show the ambulance staff to the victim. Avoid moving injured or ill individuals unless they are at great risk from their surroundings. Wear nitrile gloves if blood is visible on the emergency site. Assess the level and extent of injury and deal with the most endangered individuals first, unless their problems are beyond your skill level.

Don't try to administer first aid without consent unless the victim is unconscious. Don't ever try to administer first aid beyond your training and skill level. When administering first aid, check first for life threatening conditions. Clear the victim's airway, if necessary. Don't apologize or talk about the incident or its cause to the victim, the family, or the press, other than to reassure the victim or determine the extent of the injury. Complete a case incident report for future records. Follow the park medical emergency reporting and documentation requirements.

6. *What do I need to know about utility failures?*

Utility failures may make it impossible to begin emergency recovery without back-up power and water sources. Light, drinking and washing water, heat, and a bathroom facility must be established as soon as possible to allow for emergency recovery. Often it is the temporary lack of light, clean water, and heat that can incapacitate a park during the vital first 48 hours of museum collections emergency recovery, regardless of the original type of emergency. For a summary of the OSHA requirements for salvage, see D.5.

Utility failure vulnerabilities: You may injure yourself or cause physical damage while trying to find doors, emergency equipment lights, and telephones. Vulnerabilities include:

- personal safety
- all collections lacking good alarm systems with alternative sources of power and law enforcement protection
- all collections housed in buildings with inadequate emergency lighting
- all materials housed incorrectly, maintained improperly in research room areas, or kept in spaces with inadequate walkways
- items easily destroyed by mishandling, such as bone, ceramics, glass, ivory, paper, and specimens in alcohol
- all collections susceptible to motion (kinetic) damage (See the vulnerabilities section under Storms.)

Classic utility failure problems include:

- accelerated aging of most organic collections due to environmental instability
- accidents
- breakage of brittle items, such as bone, ceramics, glass, ivory, and glass jars of specimens in alcohol and formaldehyde
- contamination of other collections from shattered specimens in alcohol and formaldehyde
- failure of cold storage for nitrate and special frozen materials leading to deterioration and potential fire hazard
- medical emergencies due to dislocation and confusion in a darkened room

Utility failure prevention: To avoid utility failures, ask your maintenance staff to regularly inspect all utilities. Work with your park EOP to meet with regional utility authorities to ensure you are alerted when an outage is planned or likely. Your space should have a back-up power source for essential services, such as emergency exit lights, HVAC, and security lighting. Consider solar powered exterior lights. Test all back-up power sources on a regular basis. Set up a regular schedule for changing and checking such batteries.

Teach all staff how to evacuate in case of a power failure. Install battery-powered emergency lights near electrical, fire, and security panels and along the evacuation route. Keep bushes, leaves, trees, and trash far from the building and any outside HVAC units. Keep a log of problems. Ask staff to use UL rated surge suppressors on all major equipment. Unplug non-essential equipment at night. Keep extra supplies of fuses, bulbs, and other materials near where they are needed. Ensure that the elevator has an emergency alarm, a working phone that goes to a 24-hour monitored area, and a trap door.

Utility failure survival: If you are in the museum during a power failure, stay calm and find your flashlights. Then, move single file from room-to-room along the evacuation route, preparing to evacuate via the stairs. Take the MCEOP and visitor log with you. The first person in line should have a flashlight. The first person in line opens all window shades along the evacuation route to increase illumination. Don't open the windows themselves. The last person in line closes the shades and doors as he or she departs.

As you leave the building, check to see if anyone was caught by the outage in the elevator. If so, reassure them that you are getting help. Secure the facility and don't allow public access until regular services and security can be restored. Help the disabled or injured to safety. Once outside, assemble in the designated area and check to see if anyone is missing. Alert designated rescue staff about missing or trapped individuals. Then contact the groups designated in the MCEOP as emergency utility contacts. Be prepared to search visitor bags, coats, and parcels if the evacuation involves entering normally restricted spaces. If a theft is discovered, notify law enforcement personnel, but don't attempt to restrain the perpetrator. Instead, note down the individual's appearance, license plate number, and type of vehicle, and collect the names of witnesses.

The team leader should close fresh air ducts, intakes, vents, and secure doors and windows as you leave to help maintain the internal environment. If the utility that fails is the sewer or water supply, which is causing flooding, follow the Section on Floods and Water Damage, in Section B.3. For long-term outages, ensure that the environmental monitors are still working. Before reentering, the maintenance liaison should use a flashlight to check for downed utility lines. If the utility line is down, use the main shut-off valves to disconnect the utilities. Follow the salvage procedures designated in the MCEOP.

7. *What do I need to know about hazardous materials accidents?*

Hazardous materials accidents may result from broken fuel pipelines, civil unrest, earthquakes, explosions, fire, fuel spillage, high-level smog, smoke, storms, terrorism, transportation accidents, volcanic fumes, warfare, and other problems. These accidents can make it impossible for staff and researchers to use collections, requiring total reformatting (copying) of all materials affected.

Hazardous materials vulnerabilities: These include hazardous objects and contamination when materials are exposed to hazardous chemicals, such as:

- any item that might weaken or lose structural integrity, such as repaired or treated materials
- archival materials, such as paper and photographs, which may stain or discolor
- textiles, which can be damaged by absorption of radiation or hazardous chemicals or which may stain or dissolve
- explosive ordnance
- glass, mirrors, ivory, ceramics or metal, which may break
- images with applied color or pigment, which may dissolve
- ivory, paper, photographs, and textiles, which may stain
- metals such as brass, bronze, copper, and silver which may corrode

Classic hazardous materials damage might include:

- adhesion of art, book, paper, and photographic items to other objects
- contamination of objects, so that they can't be routinely handled and must be treated or reformatted
- corrosion and rusting of metals
- erosion of stone or masonry
- finish loss on most materials, particularly photographs, textiles, and wood
- loss of museum records and documentation
- loss of object due to explosion
- rotting of leather
- pigment and dye loss of most painted objects
- staining and deposition of contaminants on objects, particularly bone, ivory, paper, shell, and textiles
- structural integrity loss for plaster and terra cotta
- swelling and pressure damage of wood and paper

Note: The type of damage is entirely dependent upon what is spilled. Spillages can range from toxic waste, radioactive materials, and biological waste, to gasoline. Consult a conservator for specific guidance.

Hazardous materials accident prevention: To avoid hazardous materials accidents, house your collections far from chemical storage areas, construction sites, fuel storage areas, garages, highways, laboratories, and nuclear reactors. Maintain an inventory of all hazardous materials maintained in the museum, including locations and quantities. Share copies of this inventory with your local fire department, MCEOP and EOP coordinators, and park hazardous waste coordinator. Place one copy of the inventory in the MCEOP and clearly label one map with the location of the chemicals and include this also in the MCEOP.

Label the chemicals and their storage spaces according to park hazardous waste guidance and OSHA requirements. See the OSHA Website in the bibliography and Section D.5 for an overview of OSHA requirements. Inform staff of any collection materials that may be hazards in both normal use and contaminants that may appear after a disaster. Train park staff in safe handling of chemicals, including cleaning chemicals, and contaminants. Provide regular refresher hands-on training to expand staff expertise. Provide in-depth training to the MCEOP team. Gather and maintain proof of staff and MCEOP team comprehension of training, such as tests. See the *MH-I*, Chapter 11: Curatorial Health and Safety, for more detailed guidance.

Provide staff with necessary preventive equipment as required by OSHA, including fume hoods, nitrile gloves, rated breathing apparatus fitted to the user, and washable smocks. Know the properties of the chemicals you store, such as ammonia and bleach interactions. Keep only enough chemicals for a short-term use. Select fire extinguishers based upon the types of chemicals held by the museum. Maintain a local file of how to handle exposures to these materials. Establish local eyewash and shower stations and note them on the building plans in the MCEOP. Place OSHA emergency action charts on the wall near chemical usage areas.

Be aware of how your air-intake and HVAC systems function so you can turn them off to avoid bringing contaminated air into your building. Check seals on all wet specimens regularly. Place a fixed and padded railing around shelving units holding wet specimens to limit the chance of materials falling and shattering due to heavy vibration, a storm, or earthquake. Discourage use of pesticides in or around the building.

Check potentially hazardous objects or specimens in storage before handling them or providing them to researchers if you have reason to believe they may be hazardous, such as:

- arsenic contaminated taxidermy mounts
- geology specimens that are radioactive
- historical batteries or motors

- historical farming equipment with chemical residues
- historical medical equipment
- historical motors and vehicles with gasoline and lubricants still inside
- items contaminated with vermin, feces, and other biological waste
- live ammunition
- nitrate negatives and film
- war souvenirs contaminated with radiation

If you are uncertain, have them tested before providing them. Train all staff in how to identify, handle, and work with hazardous materials. Never pour chemicals into the ground or down a drain. Work with your NPS park hazardous waste coordinator.

Hazardous materials accident survival: Evacuate the area immediately, using stairs instead of elevators. Assess risks as you evacuate (spills, power lines down, fires) so you can alert authorities. Check to ensure that no one is trapped in the elevator. Help injured or disabled people. Don't open doors and windows as you evacuate. Keep the building shut down with air handling off. Contact authorities immediately. Avoid re-entering the area. Move to a safe distance from the affected area, taking your visitor log and MCEOP with you. You may have to move several miles distant if fumes are evident. Try to determine if everyone has safely evacuated the building. Alert professional rescue personnel about any missing individuals and the nature and extent of the disaster. Call the hospital for emergency medical help.

As soon as possible, set up a triage area for administration of first aid. Use nitrile gloves to remove contaminated clothing and wash affected skin with much fresh water as soon as possible. Follow the instructions under medical emergencies, but ***don't attempt mouth-to-mouth CPR on unconscious persons who may have breathed in fumes,*** as you place yourself at risk. Follow the MCEOP guidelines on specific actions for the types of hazardous materials your park holds.

8. *What do I need to know about transportation accidents?*

Transportation accidents may result in standing pools of fuel, which are fire and explosion hazards; toxic fumes from fires; spillage of chemicals and hazardous wastes, and similar contaminants that can pose severe health and safety threats to staff, as well as museum collections.

Transportation accident vulnerabilities: See storm damage and hazardous materials accidents vulnerabilities.

Classic transportation accident damage: See hazardous materials accidents.

Transportation accident prevention: Don't place museum storage, work, exhibit, or research rooms within proximity to active train tracks, major airport flight paths, major highways, and similar transportation routes.

Transportation accident survival: Evacuate the building, if possible. Assess risks as you leave, for example, fires and major fuel spills. Check the elevator for trapped people. Help injured or disabled people. Contact authorities immediately. Avoid re-entering the area. Move to a safe distance from the affected area. Try to determine if everyone has safely evacuated the building. Alert professional rescue personnel about any missing or trapped individuals. Contact park and local authorities. Provide first aid assistance as necessary.

9. *What do I need to know about civil unrest, vandalism, and terrorism?*

Civil unrest, vandalism, and terrorism can limit access to collections or cause their damage or destruction. Planning for them is challenging, as it involves being aware of potential political and social issues related to your park. Try to anticipate potential problems, such as demonstrations that are symbolically or politically linked to your park. Terrorism is a relatively unlikely risk for most parks when compared to the much greater risk of fire or flood damage. However, terrorism is increasingly a force in modern life. Museums must protect themselves from such activities. The highest risks for demonstrations and terrorism are sites that embody American history or that have high symbolic value, such as the Statue of Liberty, Mount Rushmore, or the Washington Monument

Civil unrest, vandalism, and terrorism vulnerabilities: The materials most vulnerable to damage include:

- collections lacking good alarm systems and nearby onsite park police protection
- materials inadequately housed
- items easily destroyed by mishandling, such as ceramics, glass, paper, specimens in alcohol or formaldehyde, and textiles
- items in parks with employee relations problems

Classic civil unrest, vandalism, and terrorism damage includes:

- explosion damage resulting from bombs
- fire and smoke damage
- fouling of collections with food, garbage, and human waste
- graffiti marking on objects, such as paper

Civil unrest, vandalism, and terrorism prevention: To avoid problems with civil unrest, vandalism, and terrorism, house your museum collections storage, work, and research room areas in secured park areas away from ceremonial spaces or public spaces. Secure collections if demonstrations are planned. Maintain security, particularly key control and alarm systems. Ensure that you have back-up power sources for your security system and emergency evacuation lighting in case of emergency utility failures. Follow established access procedures as described in *Museum Handbook,* Part III

(MH-III), Chapter 1: Evaluating and Documenting Museum Collections Use. If a researcher becomes distraught, contact park police for assistance. Never physically restrain a visitor or staff member.

Civil unrest, vandalism, and terrorism survival: To survive, notify park and local authorities immediately of any incidents. Follow their instructions. Remain calm. Never argue with armed individuals. Stay away from windows and glass doors. Evacuate as instructed by authorities after first ensuring that no bombs or other hazards exist on the evacuation route. Check the area to which you are evacuating as well for hazards and bombs. Be aware that bombs often are planted to go off serially. Help injured and disabled individuals evacuate. Assess risks as you leave, for example, the number and location of armed individuals and the nature of barricades. Close all doors and windows as you leave. Check all elevators and bathrooms as you leave for trapped individuals. Take your MCEOP and visitor log with you as you leave so you can share them with bomb squad personnel. Call for medical help immediately. Have park law enforcement fill out a case incident report. Work with your park law enforcement and public relations officers on follow-up actions.

10. *What do I need to know about explosions and bombs?*

Explosions are a greater threat to most parks museum collections than terrorism. Nitrate based still photographic negatives and motion picture film are perhaps the greatest explosion threat to museum collections. Copy nitrate film, inspect it, and don't store it in parks for longer than it takes to copy it (less than 5 years). See *MH-III,* Appendix M: Management of Cellulose Nitrate and Ester Film.

Explosion and bomb vulnerabilities: See hazardous materials accidents and storm damage. Explosion vulnerabilities include:

- black powder and other weaponry or supplies, such as ordnance
- nitrate negatives or motion picture film in quantities of more than 35 pounds or that are deteriorated or largely motion picture or large format negatives and X-ray film (See Appendix M: Management of Cellulose Nitrate and Ester Film.)
- gas appliances older than 10 years that are not regularly inspected
- nearby fuel storage or transportation storage facility such as a garage or service station
- substantial wet specimens in a building where smoking is allowed
- vehicles, power tools, and motors in collections that have not been adequately drained of fuel

Classic explosion and bomb damage: See fire damage, hazardous materials damage, and storm damage.

Bomb threat: If you experience a bomb threat, listen for background noise and try to distinguish the caller's age, sex, and accent. Write down every word said, paying particular attention to when the bomb will explode, where

it is, what kind of bomb it is, and why it was placed. Contact law enforcement immediately, unless the explosion is imminent. If the explosion is imminent, evacuate immediately, sounding the fire alarm as you leave.

Otherwise, if the explosion is not imminent, investigate the evacuation route and staging area to ensure that there is no bomb there as well. Then, evacuate the area, sounding the fire alarm, if possible, and closing all doors and windows as you depart. Help handicapped or injured individuals evacuate and check all elevators for trapped individuals. Take the MCEOP and the visitor log with you as you evacuate. Immediately contact park and local police from a separate building. Keep well away from the area. Try to determine if everyone has left the building. Notify rescue personnel if anyone is missing.

Explosion and bomb survival: If you are in the museum during an explosion, take cover under a sturdy table or desk. Stay far away from windows, mirrors, exhibit cases, unsecured equipment, museum storage areas, office bookcases, and file cabinets. Watch for falling objects.

> *Expect additional explosions, so evacuate with care along routes that have been checked for safety to assemblage areas that have been checked for hazards and additional bombs.*

Evacuate via stairs, not elevators. Help injured or disabled individuals. Don't light matches, candles, or lighters, as gas lines may be broken. Stay away from areas with small hard objects such as machine or wood shops, kitchens, or museum storage. Call authorities as soon as you are outside and safely away from the building. If a fire results, stay well clear of the fumes, particularly if the fire is a nitrate fire. Fill out a case incident report.

11. *What do I need to know about structural collapse?*

Structural collapse caused by accidents, earthquakes, explosions (particularly nitrate explosions), fires, floods, storms, terrorism, and neglect pose a significant threat to museum collections. Structural damage leads to broken, cracked, or buried items. Structural collapse may cause fires due to broken gas lines, as well as water damage to collections from broken pipes, and sewer, fuel, and power lines.

Structural collapse vulnerabilities: See Storm Vulnerabilities and Explosion Vulnerabilities.

Classic structural collapse damage: See Explosion, Fire, and Storm Damage Sections.

Structural collapse prevention: To avoid structural collapse, have your building inspected by park maintenance and the regional architect if you see any physical problems such as cracked or weakening support beams or worse, sagging floors or ceilings. See Earthquake Prevention in Section B.12 for further guidance. Avoid excessive floor loading until structural integrity and floor loading capacity can be determined. To minimize potential problems, bolt non-historic bookcases, file cabinets, and heavy equipment and furniture to walls.

Structural collapse survival: If you are in a building when it collapses, take cover under a sturdy desk or table or in a supported and reinforced doorway, preferably in the center of the building. Avoid all spaces with wide span roofs, such as auditoriums, barns, and garages. Stay away from filing cabinets, bookcases, overhead lights, electrical equipment, mirrors, glass doors, and rooms with many unsecured objects, such as metal shops. Before evacuating, inspect the evacuation route and staging area to ensure that they are safe and not in a state of collapse. Stay out of elevators, but listen for trapped individuals.

Once the collapse has stopped, evacuate cautiously using the stairs or a door or window. Don't use matches, candles, or lighters for illumination as gas pipes may be broken; use flashlights. Take the MCEOP and visitor log with you if possible. Help handicapped or hurt individuals to move to a safe and stable evacuation assemblage area that has been checked for problems. Avoid running for the stairs at the first sign of trouble, as they may be broken or full of stampeding people. Move cautiously. Be prepared for additional shocks and structural instability.

Stay away from glass windows, doors, exhibit areas, overhead lighting fixtures, and bookcases as you evacuate. Avoid tall, heavy, and unsecured furniture. Call authorities once you are safely away from the building. Try to determine if everyone has safely evacuated. Notify authorities of missing or trapped individuals and their likely location. Set up a medical triage station. Call for medical assistance. Help care for injured people to the extent of your medical knowledge and skills.

12. *What do I need to know about earthquakes?*

FEMA experts estimate that 39 out of 50 states in the U.S. are at risk of an earthquake. We can't yet predict earthquakes accurately; however, we are getting much better at estimating earthquake probabilities. For example, scientists predict a 60 percent chance of an earthquake greater than 6.7 magnitude in Southern California in the next 30 years. Based on long-term records of the U.S. Geological Survey (USGS), scientists expect about 18 major earthquakes (7.0 magnitude or greater) and one great earthquake (8.0 or greater magnitude) annually worldwide.

Of the last 15 large earthquakes in the U.S., 10 were in Alaska and 3 in California, while the others were in Hawaii and Missouri. On the continental U.S. the last 15 largest earthquakes include 8 in California; 3 in Missouri; and 2 in Nevada; with the others being in Montana and Idaho. Alaska far exceeds all other earthquake zones in the U.S., with over 82 major quakes of 7.0 or greater since records were first kept in the late 18th century.

Earthquakes may abrade, break, smash or damage items and buildings or drown them in mudslides, flooding, or under collapsed buildings. Earthquakes can also be an aftereffect of volcanic activity. Almost all kinds of damage listed under "Fire," "Flood," and other emergencies covered in this Section may happen during earthquakes as well. Generally earthquake damage levels depend upon the earthquake magnitude, duration, distance from the epicenter of the quake, the type of structure, the type of ground on which your structure rests, and the level of preparedness. ***Note:*** The thicker and looser the soil on which your structure rests, the more amplified the earthquake effect will be.

Earthquakes may lead to explosions from broken gas mains, floods from broken water lines, and similar damage. In addition, earthquakes may cause a major loss of original order for archeological objects and archives and records. For archeological and archival materials, the original order of the collection may provide information on the circumstances of creation or usage and relationship to other materials within the collection. Losing this arrangement through an earthquake, flood, or other disaster can significantly diminish the value of the collection.

Earthquake vulnerabilities: If your collections are housed in an unreinforced structure in an earthquake zone, you are at risk if basic prevention steps aren't taken. Vulnerability of collections is also dependent on what steps you have taken to mitigate risk, such as placing restraining bars or cords on shelving. See *MH-I,* Appendix F: Collections Management Checklists, Checklist for Preservation and Protection of Museum Collections, Question B.23. Be aware of tectonic plate fault lines in your area and of your region's estimated probability of an earthquake. In many areas experts have predicted the actual size and impact area of future earthquakes. See the Bibliography under Earthquakes for sources. Work with park architects and maintenance staff to reinforce your building and storage equipment appropriately. See Fire, Hazardous Material Accident, and Storm Vulnerability for further information.

Classic earthquake damage: See Fire, Hazardous Material Accident, and Storm Damage.

Earthquake damage prevention: Avoid placing museum storage, work, exhibit, or research spaces on or near geological fault lines. If this is impossible, follow the guidance in the resources in the bibliography on how to secure collections and furniture to avoid destruction in an earthquake. Select a building that has been built or modified to withstand an earthquake. Standard earthquake modifications include the addition of sheathing on roofs and floors and of steel braces, frames, or brackets. Reinforce walls, beams, chimneys, and damaged mortar. Securely install track-type lighting. Have the building inspected by a structural engineer and your park maintenance staff to ensure that it is structurally sound. Identify risks from surrounding structures or trees. Cut down dead limbs. If necessary, place guy wires on nearby trees.

For masonry, bolt roofs to walls and walls to foundations using steel brackets. Reinforce building openings, such as crawl spaces, doors, and windows by placing steel frames around them or steel beams in them. Repoint mortar as necessary. Check with park architect and maintenance staff for help or talk to your regional/SO curator. Keep all aisles, walkways, and doorways clear when planning your space.

Select steel shelving with welded frames and cross-braces but without tightly sealed and enclosed air pockets that may promote floating during a flood. Bolt shelving, filing cabinets, map cases, and major furniture to solid structural components, such as walls, ceilings, and floors, far from doors, escape routes, and computers. Pad all shelving with polyethylene foam sheets to limit kinetic damage. Store fragile items, such as ceramics, glass, and bone, in hollowed out blocks of polyethylene foam or use fishing line or cloth straps to hold the items to their shelves. Place small items in polyethylene padded drawers of cabinets, map cases, or small boxes. Pad large, tall, or

heavy items, then place them horizontally on bottom shelves. Use restraining bars or cords and similar devices to prevent materials from rolling off open shelves.

Remove artwork from glass-covered frames. Store unframed artwork flat in solandar boxes. If you decide not to remove artwork from frames, use steel S-hooks or double-end bolt snaps to secure framed objects at their top and bottom to storage screens. Replace glass shelves in exhibit cases and housing with tempered glass or Plexiglas. Slip a wooden rod into the handles of filing cabinets to ensure that they are held closed. Purchase Velcro type tie-downs for computers.

Earthquake survival: Stay inside. Go to a small windowless room in the center of the building. Stay out of rooms with wide span roofs, such as barns and garages, and away from museum storage areas or any space with lots of furniture and loose materials, such as metal shops or libraries. Get under a heavy piece of furniture, such as a desk. Duck, cover your head, and stay curled up until the shaking is over. Stay away from windows, overhead fixtures, bookcases, filing cabinets, loose tools, and electrical equipment. Prepare for aftershocks. Put out small fires. Follow the guidance under structural collapse (Section B.11) and fires (Section B.2) above.

13. *What do I need to know about volcanoes?*

More than 80% of the earth's surface above water is of volcanic origin. There are currently about 53 historically active volcanoes in the U.S. of which 43 are in Alaska according to *Volcanoes of the World.* According to FEMA, all parks in Alaska are at the highest level of risk. Moderate-risk parks include those in the Pacific Rim states of California, Hawaii, Oregon, and Washington. Montana and Wyoming are at a slightly lower level of risk. All other states are at a still lower level of risk with a few isolated exceptions, such as Hot Springs National Park.

Some parks have active or previously active hot springs and volcanoes, such as Capulin Volcano National Monument, Crater Lake National Park, Haleakala National Park, Hawaii Volcanoes National Park, Hot Springs National Park, Lassen Volcanic National Park, Lava Beds National Monument, Mount Rainier National Park, and Sunset Crater Volcano National Monument. Such parks need to be very alert to increased levels of risk. Besides the obvious concern of being buried by lava if museum storage is too close to lava tubes or pathways, volcanoes emit hot ash and acidic gases and cause mudslides, flash floods, tidal waves, earthquakes, rock falls, and explosive lateral blasts that shoot hot rocks for up to 20 miles. Noxious and occasionally lethal fumes can spread up to 100 miles. Acidic and corrosive ash can spread over 1,000 miles. For lists of active volcanoes see <http://www.volcano.und.nodak.edu/wvdocs/volc-images/>.

Volcano vulnerabilities include:

- *all collections on open shelves*, which can be coated with corrosive and acidic volcanic ash

- *archival materials*, particularly architectural drawings and plans, documents, electronic records, photographs and film, and sound recordings, which may suffer abrasion, embrittlement, oxidation, loss of data (magnetic and electronic), and silvering out

- *artworks*, particularly chalk, charcoal, collages, conte crayon, gouache, montages, paintings, both on canvas and on panels, polychrome sculptures, and watercolor

- *bone and ivory*, which may be discolored or lose applied color or be stained

- *baskets and similar fibrous materials*, such as sandals, which may be stained or lose color

- *ceramics*, which may be abraded or scratched or lose color

- *furniture/wood*, which may loose surface finish or suffer oxidation of attached metals

- *glass*, which may be abraded or scratched

- *metal objects*, which may be scratched or oxidized—silver may corrode due to fumes and toxic gases

- *natural history specimens*, which may be stained or covered with ash

- *textiles*, which may suffer from staining or weakening

Classic volcano damage: These volcanic gases, mud, lava, and ash pose particular threats as they:

- *corrode and oxidize* metal and photographs

- *damage surface finishes* on paper, photographs, wood, textiles, and other objects

- *destroy magnetic media*, particularly audiotapes, digital files, software, and videotapes

- *embrittle* paper, photographs, textiles, and other objects

- *fade and/or stain* art work or paper

Volcano damage prevention: Avoid placing museum storage, work, exhibit, or reading room areas near active volcanoes. Be aware of any road, or river, valley, or other geological feature that could lead the lava and mud to the museum. Purchase vacuuming equipment with a water filtration system. Check on purchasing special furnace filters for screening out particulate ash. Know how to totally shut down the museum air intake system and tape up all ducts, valves, vents, and windows.

Volcanic activity alert: If a volcanic activity alert is announced, evacuate visitors and non-essential staff first. Then work with essential staff to evacuate collections to the extent possible to a safe alternative facility at least 20 miles from the volcano. Before evacuation, staff should change into long-sleeved shirts and pants and locate goggles and dust-masks or rated breathing

apparatuses that have been fitted to each staff member. Turn off all air intake equipment and ensure that the ducts and vents are taped shut. Disconnect all electrical equipment except essential emergency equipment. Shut down utilities. Tape shut all window gaps and poorly grouted areas. Place coverings over chimneys.

Wrap fragile materials and shelves in plastic to prevent volcanic ash build-up. Remove all sources of humidity, such as dehumidifier pans and standing water, as volcanic ash combined with water can produce sulfuric acid. Try to keep the humidity low.

Check all emergency supplies and emergency equipment. Fill evacuation vehicle gas tanks. Don't leave car engines running longer than necessary as volcanic ash and fumes can destroy car and truck engines. Extinguish all fires in non-essential appliances and unplug them. Evacuate, providing assistance to disabled and injured people as necessary. Ensure that no one is left trapped in the building, such as in an elevator. Take the MCEOP and visitor log with you. Travel on high ground as much as possible, avoiding areas where potentially lethal lava, mudslides, and fumes can accumulate. Attempt to get at least 20 miles from the volcano; some danger from fumes and gases still exists up to 100 miles away. Avoid routes with numerous bridges, valleys, tunnels, or bottlenecks.

Volcanic activity survival: Evacuate as ordered when the alert occurs. Wear breathing apparatus and goggles, if possible; otherwise keep a damp cloth over your mouth and nose. People can die from breathing toxic volcanic fumes. Stay away from low lying areas and all lava flows, volcanic ashfall areas, and mudflows. Go to high ground and keep moving away from the volcano. Use a cell phone or mobile phone, if possible, to determine if your evacuation route is safe and that all bridges are still available. Assist disabled and injured individuals. Notify authorities of any trapped individuals and their likely location.

Don't return until an "all clear" is announced and park authorities indicate it is safe. Wear goggles, a scarf or hat, and an appropriately rated breathing apparatus fitted to the wearer, as well as a long-sleeved smock and slacks during recovery work. Clear roofs, gutters, and drains of ash fall as it can become heavy enough to collapse buildings. Don't turn on the air handling system until the air has cleared and ash has been removed. Keep doors and windows closed. Keep the environment very dry. Put mats outside the building to avoid tracking ash inside. Place plastic sheeting on the floors near any entry points and windows to capture ash. Vacuum everything. Wash nothing. Avoid rubbing, wiping, or washing surfaces. Change building air filters very frequently.

C. Analysis of Risk to Your Park's Museum Collections

Not all parks are at equal risk for all types of emergency. For example, Statue of Liberty National Monument is at greater risk of from flooding, storms, terrorism, than it is volcanoes and mudslides. Hawaii Volcanoes and to a lesser extent Mount Rainier are at greater risk of volcanic activity and mudslides than of terrorism.

Each park and center has a unique blend of:

- ***existing hazards*** (such as a river, high water table, or near-by cliff or highway), *and*
- ***collection vulnerabilities*** (the size and type of collection housed in each at-risk structure and the level of the loss occurring when a disastrous event of a certain magnitude and type occurs)

Taken together, hazards and vulnerabilities equal risk.

Risk assessment is a matter of:

- ***analyzing the hazards and vulnerabilities*** of a park's museum collections (See Figure 10.2.)
- ***defining acceptable risk levels*** for each type of potential emergency
- ***making decisions*** about acceptable prevention and mitigation (contingency response actions)

All emergencies have one common characteristic: if not dealt with rapidly, thoroughly, and thoughtfully, emergencies get significantly worse and become disasters.

1. *How do I assess the level of risk to my park for various kinds of emergencies?*

Use the risk assessment worksheet (Figure 10.2) to determine the risk and hazard factors your park faces for each type of emergency. Mitigate these risks, wherever possible. Request funding to mitigate risks that the park can't afford. If after completing the worksheet you determine that your park has many more risks for fire than for earthquake, spend your park's money on more fire mitigation than on earthquake mitigation.

2. *How do I determine which emergencies to assess?*

Read the park administrative history and talk to park staff who have been in the park the longest. Ask them if the park has ever had a problem with each type of emergency. Call your park EOP coordinator to try to discover the frequency of this type of emergency in your site's area. Talk to your local public library reference librarian for help. Use the Websites listed in the bibliography—some of which provide specific risk information on certain types of disasters, such as:

- Floodcast Website at <http://www.earthsat.com/flood/floodcast.html>
- U.S. Fire Administration Website at <http://www.usfa.fema.gov/>
- Volcano World, the active volcano site, at <http://www.volcano.und.nodak.edu/wvdocs/current_volcs/current.html/>
- National Oceanic and Atmospheric Administration's flood and storm watch and warning page at <http://iwin.nws.noaa.gov/iwin/nationalwarnings.html>
- Earth Watch site at <http://www.earthwatch.com/STORMWATCH/stormwatch.html>
- Federal Emergency Management Agency (FEMA) Website at <http://www.fema.gov>

3. *How do I complete the Risk Assessment Worksheets?*

Look at Figure 10.2. The worksheet is a list of risk factors (for example, having the museum storage structure on a flood plain) that relate to the 11 key types of emergencies described in this chapter. Read the list, to remind yourself of the various risks and hazards that your park faces for each type of emergency. If you wish to fully assess each facility in your park for risks and hazards, as you read the worksheet determine if each point applies to the particular facility you are assessing, then answer each question "yes" or "no." If you answer "no," this factor is a risk for the listed emergencies. Only use the NA or "not applicable" category if the risk factor has no relevance to your facility. Repeat the task until you have completed the form for each facility that houses museum collections. References to the Checklist for Preservation and Protection of Museum Collections in Appendix F within a question indicate when answers may be found in the Checklist. When checklist requirements match Risk Assessment risk factors, the Checklist section letter and question number is noted in the final column.

When you have completed the Risk Assessment Worksheet, add up the number of "no" responses that apply to each emergency type (fire, flood, etc). The more "no" responses, the greater your risk for this type of emergency.

4. *How do I determine the likelihood of a particular type of emergency?*

Use the Emergency Master Planning Worksheet (Figure 10.1a). Once the Risk Assessment Worksheet (Figure 10.2) is completed for all types of emergencies, you should have a sound grasp of what remains to be done. You can now identify the greatest risks and hazards for your collections by prioritizing your risks on the Emergency Planning Master Worksheet. You can focus the largest part of your planning energies on the likeliest forms of emergencies, buying the necessary supplies and training staff most thoroughly in activities for those types of emergencies.

Use the Emergency Planning Master Worksheet to identify the sort of mitigation you should consider undertaking for each facility. Note on the Emergency Planning Master Worksheet which facilities and what types of emergencies were assessed. Make note of mitigation actions needed. While the Emergency Planning Master Worksheet contains spaces for tracking all conceivable types of emergencies from fires and floods to volcanoes, you may already know that your park has little or no risk from certain types of emergencies. When a particular type of emergency is very unlikely, such as a volcano in Iowa, you will be able to focus on more likely types of emergencies. As you complete the worksheet, do the steps listed in C.2 (interviewing staff). Also consider the number of "no" responses when you prioritize your risks.

5. *Once I have completed the Emergency Planning Master Worksheet, what new information do I have?*

Following this exercise, you should know:

- which emergencies are most likely for your park and which are your greatest risks as noted here (your emergency priorities)
- specific situations in your park that place museum collections at risk for each type of emergency
- some basic steps for preventing these emergencies (also see Sections B.2-13)

Your MCEOP should address your emergencies in priority order as established by this risk assessment procedure. The greatest amount of attention on how to plan for, mitigate, survive, and recover from an emergency should be focused on the emergencies you are most likely to face. Secondary types of emergencies, such as volcanoes in New England or tornadoes in California, may be dealt with more generically as part of a general category of similar disasters, such as "earthquakes and volcanoes" or "storms." Focus your planning, training, supply, and other resources on the high priority emergencies that you are likely to face.

6. *How do I limit risks to my museum collections and staff?*

After you have determined your most likely emergencies, you should begin to limit risks. There are a number of tools you can use to identify specific risk factors to mitigate. First mitigate the conditions listed on the Risk Assessment Worksheets (the "no" responses), particularly those that are on the Checklist in *MH-I*, Appendix F. Second, mitigate risks under the header "Prevention" in Sections B.2-13. Taking the steps recommended in these sections should greatly reduce the possibility of an emergency becoming a disaster.

D. Prioritization of Museum Collections for Salvage

When an emergency threatens, you may be required to:

- move materials fast:
  - to an off-site building
  - to a different building within the park
  - to a different floor of the same building
  - to the tops of existing shelving and furniture
  - to an interior area out of the path of the emergency
- salvage materials from fire, kinetic, smoke, storm, volcanic, or water damage
- send collections to cold storage, a safe workspace, or to a conservation laboratory

Prioritize park collections for recovery so you will not have to make vital relocation, salvage, or treatment decisions when you are under stress, without full information, or operating without power, lights, or automated systems.

1. *What preliminary work should I do?*

Before you begin prioritizing your collections for salvage:

- ***Evaluate your structures*** containing museum collection storage, work, exhibit, and research spaces as described in Section C.1. If you have multiple structures, determine if some of these structures face greater hazards than others. For example, is one structure in a flood plain, near a tidal river, or situated near a major highway?

  If so, you may need to prioritize your various structures by the types of disaster they may experience. Review the Risk Assessment Worksheet (Figure 10.2).

- ***Review your risk assessment exercises.*** See Section C.1 and Figures 10.1, Emergency Planning Master Worksheet, and 10.2, the Risk Assessment Worksheet.

- ***Review your types of collection materials*** by walking through your collection storage, work, exhibit, and research spaces and looking at your Scope of Collection Statement, Collections Management Report (CMR) and your Collection Management Plan (CMP)

- ***Determine your criteria*** to be used in setting your MCEOP salvage and treatment priorities

- ***Talk to your staff, cooperators, contractors, and collaborators*** about salvage and treatment priorities

2. *What criteria might I use to set priorities?*

Many factors may be important in salvage recovery. Always the single most important criterion is prevention of loss of life. The health and safety of staff, visitors, and others comes above all collections concerns. After health and safety issues, preservation of the most valuable portions of the museum collections is essential.

Salvage priorities are almost impossible to establish during salvage. Your MCEOP should include salvage priorities. The basic rule for setting priorities is to salvage materials in affected or damaged spaces first. Within the affected spaces, follow the established salvage priorities as expressed in written labels or color codes. For example, you may wish to keep the system simple setting only three priority levels:

- ***High priority materials*** receive a green indicator label or the code HP.
- ***Moderate priority materials*** receive a blue indicator label or the code MP.
- ***Low priority materials*** receive a red indicator label or the code LP.

The most commonly used evaluation criteria for identifying these most valuable museum collection components are:

- ***Value/Significance,*** which includes factors such as:
  - ***artifactual value*** (intrinsic value as material culture)
  - ***associational value*** (direct link to eminent individuals or groups, famous events, projects, or activities)
  - ***informational value*** (as the material records important data on the topics, activities, individuals, groups, and places that form part of the park's Scope of Collection Statement)
  - ***evidential value*** (as historical or legal proof, such as land records or vital records)
  - ***administrative value*** (as active records used by the park for essential resource management activities)
  - ***monetary value*** (as determined by the marketplace)

  Most museum collections have some artifactual value; some however, also have important associations to major figures and events, major value as information (such as type specimens), or evidential value for legal cases or as historical proof of a contested point. See *Conserve O Gram (COG)* 19/10, Reformatting for Preservation and Access: Prioritizing Materials for Duplication, for a fuller discussion of these types of value and how to use them for prioritization of museum collections.

- ***Risk***, which includes hazard likelihood plus vulnerability due to the media, process, format, and material, and local housing and storage concerns. Again see *COG* 19/10 (listed above).

- ***Usage***, which includes the frequency of usage by scholarly researchers, students, and associated communities. ***Note:*** Usage can affect value and significance—for example an upcoming anniversary or planned exhibit may give a collection or item added temporary significance; or risk can be affected by usage—for example a traveling exhibit may provide significant additional risk. Placing an image of a valuable collection item on the Web if you lack good security can also pose a risk as you are increasing the number of people aware of its existence, a certain percentage of whom may be less than honest. Instructions on how to judge these usage levels is included in *COG* 19/10.

  In determining salvage priorities for specific types of emergencies, set up a numeric chart like that in *COG* 19/10. This is a simple scale that judges each group of items being assessed as high, medium, or low for value, use, and risk. For your salvage plan when filling in the numeric chart, consider weighting your criteria giving triple weight to risk factors, so that high risk items are 9 points, medium risk items are 6 points, and low risk items are 3 points. You may score all three criteria the same (high=3 points, medium=2 points, and low=1 point) or differently as shown in the example below.

Example: If the affected items include:

- Item 1: a group of tanned Buffalo hides collected in 1950 for use in interpretive programs

- Item 2: a set of undecorated fruit gathering baskets made by a 12 year old Colonial girl in 1769

- Item 3: several veneered musical instruments including a violin once owned by John Quincy Adams

- Item 4: paleontological specimens in shale collected by the first park geologist

- Item 5: ledger books documenting the botanical collecting activities of the first park botanist

- Item 6: typewritten correspondence between the park founder and various historical figures

- Item 7: rare mineral specimens collected by John Muir

- Item 8: portrait miniatures of unidentified subjects on wood

- Item 9: metal architectural fragments (lead gutters predominantly) from the first park visitor center

- Item 10: models of lead cannons acquired from a collector

You will fill out a form like the example below, which assigns high, medium, or low numerical values for each of the categories. ***Note:*** Since this exercise is for emergency salvage and planning purposes, this example uses a weighted scale that places highest emphasis on risk, then value, then usage. The numerical values are as follows:

For Risk: High=9; Medium=6; and Low=3
For Value: High=6; Medium=4; and Low=2
For Use: High=3; Medium=2; and Low=1
For Total: High=13+; Medium=7-12; Low=1-6

Item Number and Descriptor	***Risk Score***	***Value Score***	***Use Score***	***Point Total***	***High, Medium or Low?***
1-Buffalo Hides	3	2	1	6	Low
2-Colonial Baskets	6	6	1	13	High
3-Musical Instruments	9	6	2	17	High
4-Paleontological Specimens in Shale	9	2	1	12	Medium
5-Botanist's Ledger Books	6	6	3	15	High
6-Correspondence	6	6	2	14	High
7-Mineral Specimens	3	6	1	10	Medium
8-Portrait Miniatures	6	2	3	11	Medium
9-Architectural Fragments	3	2	1	6	Low
10-Cannon Models	3	2	1	6	Low

After scoring each group of items on value, use, and risk, add the total number of points and prioritize the various groups of items by their numerical scores. The higher the score you assign, the higher the material's salvage priority. In the above example, you would remove the musical instruments (particularly the Adams violin) first, followed by botanist's ledger books, the correspondence, and the Colonial baskets.

When assigning numbers, focus on groups of materials rather than individual items. For example, assess your basket collections, your botanical specimens, your metal sculptures, against your archival materials. This procedure will be far too labor intensive to do at an item level. Review the vulnerabilities and classic damage information in Sections B.2-13 for help in judging risks. Use your researcher registration forms and logbook to judge usage. Use your curatorial judgment and the guidance above to judge value.

3. *How do I ensure my priorities are followed?*

To make it easy to follow your priorities, use color coding as described in Section B.2.

When an area or space is in an emergency situation, remove or salvage items in order by priority as expressed by the color or coded labels. If you color code, choose a logical sequence of colors.

4. *How should my plan indicate my priorities?*

Regardless of how you choose to indicate priorities, ensure that samples of your marking system are included in your emergency operations plan so that it is very clear which materials are to be removed first. See the First 48 Hours Emergency Response Checklist (Figure 10.3).

5. *How do I salvage my collection?*

OSHA requires that all work sites, including emergency salvage sites, have certain features and meet certain requirements, including:

- bathroom facilities
- washing facilities with a clean water supply
- a sound structure with no sagging floors or walls
- no uncovered gaps or holes in the floor (Gaps larger than 4 feet require a guard, railings, or covers.)
- ground fault circuit interrupters on all outlets used for power tools and tools within 10 feet of water
- a handrail along each side of stairways with more than 4 steps and a rise greater than a 30 inches
- no unidentified substances contaminating the space
- no garbage and toxic chemicals, including:
  - animal and human waste, including bodies, excrement, and other biological waste, including bird and vermin nests, used condoms, and needles

- asbestos waste from insulation; ceiling, floor, wallboard and acoustic board, and tile; some geological specimens, such as talc; historic papier mache and plaster materials, including stage backdrops; roofing materials; spackle, and wiring coatings and insulation

- lead paint waste

- moldy and mildewed items

- pesticides and chemicals, including spilled chemicals, old containers, and contaminated objects such as taxidermy specimens and pesticide-treated wood waste

If these conditions can't be met, only MCEOP staff who have had HAZMAT training, as required by OSHA, can undertake disaster recovery in the space. All staff working anywhere near any of these hazards must be verbally warned of them. Once judged structurally safe, the composition of any residue (soot or flood mud) should be identified. Look for mold growth, chemical and biological residue, carcinogens, and toxic substances. Problematic materials include:

- ***hazardous residues***, such as:

  - arsenic residue from old taxidermy specimens

  - asbestos particles (from insulation, ceiling and floor tiles, wallboard, plaster, spackle; and other building materials and some taxidermy specimens that can cause lung ailments)

  - cadmium

  - dioxin

  - blood (rickettsia, spirochetes, and viruses)

  - fire extinguishers containing carbon tetrachloride

  - gasoline

  - gun powder

  - lead powder residue (from lead shot, paint, tiles, and toys), which if it becomes dust, can cause many medical problems, including blood and brain problems

  - mercury gauges and daguerreotype equipment

  - old medicines

  - old pesticide residues on farm machinery

- polychlorinated biphenyls (PCBs) in soot
- radioactive source materials, including radium dials on old instruments

- ***dead animals, excrement, and nests***, which can cause:
  - cholera
  - dysentery
  - hantavirus (from rodent waste)
  - hepatitis
  - histoplasmosis (from bird waste)
  - salmonella enteritis
  - shigella
  - tetanus
  - toxoplasmosis

- ***microorganisms***, such as:
  - ***bacteria*** (Anthrax, Brucellosis, Campylobacteriosis, Colibacillosis, Hepatitis, Legionellosis [Legionnaire's disease], Leptospirosis, Melioidosis, Nocardiosis, Plague, Psittacosis, Salmonella Enteritidis, Shigella, Tetanus, and Tularemia)
  - ***fungi and yeasts*** (particularly deadly Aspergillum, Blastomycosis, Candidiasis, Chromomycosis, Coccidioidomycosis, Cryptococcosis, Histoplasmosis, Ringworm, and Stachybotrys atra)
  - ***insects*** (ticks, fleas, lice, mosquitoes, sandflies, and ticks, particularly in high stagnant water situations leading to many diseases including Babesiosis [ticks], Leishmaniasis [sandflies], Lyme disease [ticks], Relapsing fever [ticks], Rocky mountain spotted fever [ticks], Tularemia [ticks], Typhus [lice])
  - ***parasites*** (Acariasis, Babesiasis, Cryptosporidium parvum, Clospora, Hymenolepiasis, Leishmaniasis, Strongyloidiasis, Toxoplasmosis)
  - ***viruses*** (Hantavirus [vermin waste], Hepatitis [skin contact with infected body fluids, needles, or substances], Herpes B [handling primate bodies], Lassa fever [rodents], Lymphocytic choriomeningitis [rodents], and Rabies [contact with infected animals or their bodies])

Museum staff may be expected to take samples of substances with cotton swabs, scotch tape, or agar slides for immediate delivery to the MCEOP-designated testing laboratory for toxicity tests. If requested to take samples of mold or hazardous substances, work with the park's hazardous materials coordinator. Wear protective clothing (nitrile gloves, goggles, and a long washable smock or Tyvek jumpsuit) and an appropriately rated breathing apparatus that has been fitted to you. The MCEOP should indicate the location of testing laboratories that can identify whether the materials encountered are potentially toxic.

If high quantities of toxic substances are found in the residue (such as soot or flood mud), a professional abatement team may be required before any other work can be done. If the laboratory reports that dangerous soot, molds, or bacteria are found in excessive amounts, don't attempt to do the work with park staff. Be particularly careful when cleaning up the dried and powdered residue of floods, as this may contain asbestos particles, chemicals, molds, bacteria, excrement, and hundreds of microorganisms.

If possible, determine the source of any water or other wet contaminant (waste water from plumbing, flood waters, or rainwater), the length of exposure, the speed and type of drying, and other materials that contributed to the flood residue, such as dead animals or asbestos tiles. Your MCEOP team should include at least one team member who can interpret the laboratory report, preferably a conservator. Follow the guidance in the:

- Emergency Planning Master Worksheet (Figure 10.1)
- Risk Assessment Worksheet (Figure 10.2)
- First 48 Hours Emergency Response Checklist (Figure 10.3)

These documents are used in judging the amount of emphasis to be given to each potential type of emergency. The original information is captured on the Risk Assessment Worksheet, which includes significant planning and prevention information. The summary of this information is transferred to the Emergency Planning Master Worksheet to determine disaster priorities.

The Emergency Planning Master Worksheet tells you where to place your time and money for best effect. Once priorities have been established, use the First 48 Hours Emergency Response Checklist to determine how to proceed on a step-by-step basis. Also see the readings provided in the bibliography, particularly:

- Southeastern Registrars Association's *Steal This Handbook! A Template for Creating a Museum's Emergency Preparedness Plan*
- National Task Force on Emergency Response. *Safeguarding Our Cultural Heritage: Emergency Response and Salvage Wheel* (mailed to all parks in 1997)

E. Preparation of a Museum Component to an Emergency Operations Plan

1. *What is an MCEOP?*

Each NPS park has an Emergency Operation Plan or EOP, which indicates how emergencies will be handled to prevent them from becoming disasters. The Museum Collection Emergency Operation Plan (MCEOP) is a museum component of the EOP. This MCEOP should be simple, flexible, and current, focusing on the key actions, resources, and organizations/individuals to be involved. The MCEOP includes:

- ***job descriptions and reporting structure*** for each emergency team member (See Section E.3.)
- ***telephone tree or calling list*** of response team members and alternates (See Section E. 4.)
- ***building floor plans*** for all structures containing museum storage, work, exhibit, and research spaces (See Section E.5.)
- ***key emergency response information,*** including:
  - evacuation plan
  - quick reference checklists on prevention and preparation for emergencies, including:
    emergency security procedures
    emergency utility shut-off procedures
    emergency mechanical work, such as air intake valve closures
    (See Section E.6.)
- ***salvage procedures***
  - Emergency Planning Master Worksheet (Figure 10.1)
  - Risk Assessment Worksheet (see Figure 10.2)
  - First 48 Hours Emergency Response Checklist (Figure 10.3)
- ***list of equipment services and supplies*** (See Section E.8.)
- ***prioritized list of collections*** in paper (not electronic) format that focuses on types of materials. For example,

  Water disaster:

  High priorities: photographs, leather, paper, friable media, and watercolors

  Moderate priorities: herbaria, textiles, iron, brass, copper

Low priorities: stone, paleontological specimens, most metals other than iron, brass, and copper

See Section D.2.

- ***bibliographies*** for further information (See the Bibliography.)

2. *How do I prepare the MCEOP?*

The MCEOP can be completed as a set of lists to be contained in a master set of MCEOP loose-leaf notebooks for distribution to all MCEOP team members. Some of these MCEOP notebooks should be kept at team members' homes as well as offices to ensure ready access at all times.

Keep your plan clear, simple, and flexible.

The simplest plans are the most easily executed. Complexity can delay action and discourage flexibility. Use the plan and the planning process to communicate with all the individuals you will need to have involved in the emergency recovery process. For a sample MCEOP see the Northeast Museum Services Center *Emergency Planning and Response for Museum Collections,* 2nd edition. Boston, Mass.: Northeast Museum Services Center, 1998.

Make certain the plan identifies resources and potential sources of assistance, including park, regional, and SO staff; cooperators such as regional conservation laboratories, local universities, and selected contractors; and federal, state, and county emergency support staff. Set up collaborative or contractual relationships with local universities, state and local archives, libraries, museums, and others to respond in case of emergencies. Identify the materials to be salvaged, their location, and their salvage order. Explain how to salvage them. Indicate within the MCEOP where all the supplies and equipment necessary to salvage are located.

3. *How do I determine who should be involved?*

Keep team leadership at the park level, preferably with the museum staff. Call on park staff. To determine how many people should be involved, look at the collections size, range of types and formats, vulnerabilities, salvage priorities, distribution within various structures, exhibit space, workspaces, and research spaces, as well as off-site storage. How long would it take you to evacuate the collection in case of an emergency (earthquake, fire, flood, storm, or volcano)?

Are you likely to have to move the collection to another structure or locale? This is most likely if you are in a flood plain, near a volcano, or in a similarly hazardous area. What are the environmental and security conditions of this alternate space? Where is it? How will you wrap, document, and transport collections? Your relocation need will depend upon where and how your collection is housed and the sort of collection you have. You may wish to set up a two-tier team with a core MCEOP crew and a larger disaster response support group that includes already trained volunteers and cooperators. The core park staff MCEOP team members plan for, mitigate, supervise, and manage the emergency. The larger group provides additional hands.

You are more likely to succeed at relocating herbaria that are in a volcano's path than in moving a row of cannons or large outdoor sculptures in response to a tornado alert. Exercise judgment, knowing that all collections movement

is also potentially hazardous. Collections in boxes and on shelves are easier to evacuate than those in file cabinets or exhibit cases. Boxed collections on mobile bun rack shelving can simply be rolled onto trucks, shelving unit-by-shelving unit and transported out of harms way. How many people would you need to manage the types of emergencies you are apt to experience? How fast could the work be done? Once you establish this, you can investigate the local and regional resources at your disposal for managing emergencies.

Once you determine how many people are needed, review available park staff, particularly museum staff, records managers, librarians, historians, and similar individuals who have some expertise in working with material culture. If you do not have enough park staff for an emergency response effort, ask SO and regional staff to serve. If the staffing level is still inadequate, ask cooperators for assistance, particularly nearby university personnel, state library or archives staff, and regional conservation labs. Don't forget that you will be able to call upon some selected contractors and federal, state, and county emergency support staff in your region. Meet with these individuals now, before you need them.

As you identify MCEOP team members, remember to write descriptions for each job including:

- ***MCEOP coordinator,*** who supervises emergency planning, response, and mitigation and salvage measures and coordinates with all EOP personnel

- ***emergency registrar,*** who manages documentation, labeling, and treatment, and orders and manages supplies/equipment availability

- ***salvage coordinator,*** who manages priority identification and object salvage, packing and relocation

- ***security coordinator,*** who identifies and helps manage health, safety, and collection risks, ensures security, and cooperates with park EOP coordinator on basic utility and service recovery

- ***MCEOP team members,*** who undertake the basic salvage and recovery work

Lines of authority, work assignments, and actual responsibilities should be clear for all positions. Alternates should be assigned and trained for each position.

Consider setting up cooperative agreements for mutual emergency support and recovery activities. Talk to your regional curator and SO staffs about existing mutual support activities they have already established. Work with your local or regional conservation laboratory as well as state and local archives, libraries, and museums. Ensure that the names, addresses, phone and fax numbers, and e-mail addresses of all individuals involved are incorporated into your plan.

4. *What is a telephone tree?*

Your telephone tree may be one of the most important documents you create. In this section of the MCEOP you will list the fire department, hospital, police department, MCEOP team members and their alternates, giving the following:

- names
- telephone numbers
- beeper numbers
- fax numbers
- e-mail address
- address
- anticipated response time
- special skills, such as photographic documentation, heavy equipment operator, paper preservation
- assigned job title for emergencies (such as salvage registrar or photographic collections salvage team leader)

The telephone tree should be set up so that each staff member is responsible for calling several others at the time of the emergency so as to free up the team leader for emergency response actions.

5. *How do I incorporate floor plans into my MCEOP?*

Your MCEOP should include a full set of floor plans for all structures that house museum storage, work, exhibit, and research spaces. All floors of all structures involved, including attics and basements, should be included.

The floor plans should be appropriately annotated to indicate locations of:

- collections, with salvage priorities marked
- park records, particularly museum documentation
- electricity shut-off valves and breaker boxes
- emergency response equipment and supply caches
- evacuation routes
- fire detectors, extinguishers, and suppression equipment
- utility (gas, water, power) shut-off valves
- HVAC equipment
- alternate power source shut-off valve

- security systems
- sprinkler system shut-off valves
- water detectors/alarms
- appliances with separate shut-off valves (water heaters, stoves, etc)

Due to the complexity of this information, you may need to use a number of different plans with grouped information. For example, keep the evacuation route on one plan, the shut-off valves on another set, and the collections information on yet another.

6. *What other museum collections emergency response planning information should I include in the MCEOP?*

There are several other basic types of emergency response information you should include in the MCEOP. Include guidance on how to:

- ***standardize safety activities*** for staff and visitors during an emergency, including such steps as:
  - setting up an evacuation system and clearly marked route
  - setting up an emergency evacuation assemblage area
  - checking the evacuation route and the emergency assemblage area for potential hazards prior to evacuation
  - avoiding elevators and windows
  - holding an evacuation roll call
  - practicing fire drills and other evacuations
  - training staff how to use equipment, wear protective clothing, and undertake salvage
  - training staff how to report and handle medical emergencies
  - testing staff to ensure comprehension of all training as per OSHA requirements
  - keeping staff tetanus shots current
- ***manage emergency shut-down and lock up procedures***, such as:
  - securing doors and key control to the extent possible
  - training staff to shut-off water, electricity, and gas
  - training staff how to close doors, windows, and blinds
  - training staff how to shut down all air intake and air handling system

- ***assess the damage***, including:
  - making a list of all affected spaces
  - looking for evidence of mold and insect or pest infestations
  - checking for evidence of theft
  - checking for destruction of portions of the collection
  - watching for hazardous contaminants or conditions

See Section B, Section E.7, the First 48 Hours Emergency Response Checklist (Figure 10.3), and the National Task Force on Safeguarding Our Cultural Heritage's *Emergency Response and Salvage Wheel* for detailed descriptions of how to act, particularly during the vital first 48 hours after an emergency. Other resources in the bibliography provide specific guidance for each type of emergency.

7. *What salvage guidance should my MCEOP include?*

Your plan indicates your salvage priorities, the location of your highest priority collections, and procedures to be taken for disaster prevention, survival, mitigation, and recovery. See Sections B.2-B.13 and Figure 10.3 and the sources in the bibliography. Some specific guidance on how to handle, pack, and freeze particular types of materials may also be useful, although most of this knowledge must be gained through disaster recovery exercises rather than through readings.

> ***When disaster strikes, recovery operations should be second nature to staff. To be comfortable, non-threatening, and routine, build your disaster recovery procedures upon routine museum activities. Train staff through hands-on activities.***

8. *What information on equipment, services, and suppliers should my MCEOP include?*

List the following equipment, services, and supplies information:

- ***collections salvage supplies,*** such as acetone, ammonia, bleaches, blotting paper, brooms, buckets, disinfectants, clean garbage cans, dumpsters, clothes pins, garbage bags, dust pans, ethanol, fungicides, masking tape, mops, mylar, Japanese tissue paper, paper towels, plastic sheeting, polyethylene bags, plastic milk crates or records cartons, rags, rope and twine, scoops, scouring powder, scrub brushes, shovels, sponges, towels, and wax paper
- ***construction materials,*** such as glue, lumber, nails, paint, plywood, screws, twine, and wire
- ***documentation supplies,*** such as cameras, film, paper, pencils, tripods, videotape camera and videotapes, a portable computer printer, and portable computers with ANCS+

- ***emergency equipment,*** such as air compressors, many batteries, battery-powered weather band radios, blotters, cellular phone, clothes pins, extension cords, flashlights, hoses, knives, ladders, portable lights, portable tables, polyurethane ice chests, rope, sand bags, pumps, scissors, shovels, squeegees, tools, tarps, tents, weights, such as glass bricks, and wet/dry vacuum cleaners**.** ***Note:*** Store copies of appropriate equipment manuals with the equipment.

- ***emergency work areas and safe storage areas,*** including their location, amount and type of space, security measures, and local contact person's name and number

- ***environmental equipment***, such as dataloggers, dehumidifiers, fans, hygrometers, and space heaters

- ***first aid equipment***, such as blankets, burn packs, first aid kits, resuscitator, stretcher, and 3-4 days of clean water. ***Note:*** You don't need to stockpile perishable supplies. Instead, identify commercial suppliers and make arrangements for rapid delivery of items during an emergency.

- ***hand tools,*** such as axes, block and tackle, bolt cutters, chain saws, crowbars, hammers, pliers, ropes, saws, screwdrivers, sledge hammers, staple guns, staples, tape measurers, tin snips, utility knives, wire cutters, wood saws, and wrenches

- ***off-site salvage equipment and supplier list***, including the supplier location, telephone number, contract or cooperative agreement number or purchasing arrangements, and the contact person's name and telephone numbers for:

  - architects
  - building contractors
  - carpenters
  - chemical testing laboratories
  - cleaning services
  - commercial cold storage vaults
  - computer data recovery services
  - conservation treatment services
  - dehumidification services
  - electricians
  - environmental control services
  - fumigation services
  - glaziers
  - HVAC services
  - mycologists
  - photographic salvage and/or reprocessing services
  - plumbers
  - portable equipment suppliers
  - scientific monitoring equipment suppliers
  - security services
  - transportation rental (including freezer trucks)

- ***planning tools,*** such as battery-operated portable computers and calculators

- ***protective clothing,*** such as dust masks, fitted breathing apparatuses with cartridges for mold, goggles, life vests, nitrile gloves, old wool sweaters, rubber aprons and boots, safety goggles***. Note:*** Some of this equipment must be specially fitted to the individual team member and requires training to use properly.

9. *What kinds of references should I include in the bibliography?*

Include key references from the bibliography at the end of this chapter. In particular, include:

- Southeastern Registrars Association's *Steal This Handbook! A Template for Creating a Museum's Emergency Preparedness Plan*

- National Task Force on Emergency Response. *Safeguarding Our Cultural Heritage: Emergency Response and Salvage Wheel*. (mailed to all parks in 1997)

F. Staff Training and Plan Evaluation and Revision

Train your entire emergency operations team, not just the park staff, to manage the various types of emergencies. The entire team must know each other, be capable of working together efficiently, and be aware of the authority lines within the team. Roles, responsibilities, and reporting structure must be absolutely clear. It is essential that work not be slowed because of operational disagreements or need for contracts or approval for activities. What will be done, how it will be done, and when it will be done must be agreed upon before you begin emergency preparations or salvage.

1. *How do I guarantee my team's efficiency and confidence?*

Don't wait until a disaster happens to begin training exercises. Train, train, and train again! Give the entire team some hands-on training together before you experience problems. Stage simulated disasters in cooperation with other local agencies. Many professional organizations train staff in disaster recovery through use of actual disposable materials. These simulated disasters are the ideal training ground.

While your MCEOP will be helpful, it will not teach your team how to handle wet textiles, charred documents, or metals affected by volcanic ash. Your team's efficiency will only be as good as that of the team's weakest member. Whenever a team member leaves or is replaced, train the entire team again. The team must know exactly what to do without having to think about it. Speed is essential, as is actual hands-on expertise.

2. *How do I prevent panic and ensure the health and safety of staff?*

Write your MCEOP now. Begin training your emergency team today. Don't wait! When training staff, make certain that they know that their health and safety are the most important measures of the success of the emergency plan.

Personal safety comes first, collections safety second.

To achieve staff safety, emergency team members must remain calm and alert, aware of potential dangers such as gas, electrical utility lines, loose asbestos, disease risks, contaminated water, mold, and so forth. A panicked team is useless.

3. *What role does the team leader play?*

The team leader's leadership qualities are a crucial factor in team capabilities and efficiency. An uncertain or squeamish emergency team leader can be disastrous. The first 48 hours of response time are crucial for determining what is salvaged. If major mistakes are made during the first 48 hours, many of them will be irreversible.

The team leader is ultimately responsible for:

- team composition—who serves, who remains on the team, and who doesn't
- job assignments and reporting structure on the team
- frequency of team meetings
- team performance
- team expenses
- museum component of the EOP—development, review, and updating
- training and testing team members, including drills, simulations and tests for safety in all types of emergencies
- critiquing and offering feedback on training exercises
- setting up all outside contacts, such as with the local fire and police departments and the Red Cross
- convincing park staff of the importance of the effort
- ensuring team safety, including identifying structural stability, electrical system damage, leaking gas, raw sewage leaks, mold problems, disease risks, and similar problems that must be solved before work can proceed on site
- determining when salvage must stop due to safety concerns or materials to be salvaged must be removed by HAZMAT specialists to a safe workspace
- pulling together all the necessary supplies, services, contractors, equipment, and participants
- determining salvage priorities without seeking further authorizations, if they are not readily obtainable
- ensuring that the team has all the information and training necessary to make the right decisions

- keeping the plan up to date and distributing updated copies as changes are made

- maintaining a list of plan holders

4. *Who should evaluate the emergency operations plan?*

Everyone, particularly all emergency operation team members, should evaluate the plan.

5. *How do I keep the plan current?*

As you train staff you will find errors or changes you wish to make to the plan. Comments should be provided to the team leader. The team leader should establish a regular review period, preferably about every six months, but at least annually, for updating and revising the plan. Specific events may lead to a need to reissue the plan, such as changes in staff or telephone numbers, development of new park hazards and vulnerabilities, major new equipment, new cooperative relationships, and new park capabilities.

Once evaluated and revised, the new plan must be sent out to all emergency team members, preferably in duplicate so that they have copies for both office and home. The revised plan should be accompanied by a "Record of Amendments and Changes" sheet to alert staff to changed text. Old pages should be replaced with new ones when team members receive the revised pages.

6. *Summary*

Personal and team safety is the top priority of all salvage efforts. Once safety is ensured through proper training, the second priority is disaster prevention through risk assessment and mitigation activities. Preservation and disaster prevention always trump disaster recovery. Finally, disaster recovery is a team effort that builds on careful planning, prioritization, team-building, and hands-on experience, as well as on the ability to rapidly and calmly respond in the face of emergencies.

*Use numbers from 1 (most likely) to 12 (least likely) based upon conversations with long-term staff and upon research. Also consider the "no" responses on the Risk Assessment Worksheet (Figure 10.2). A large number of "no" responses for a particular emergency (e.g., fire) can mean a higher risk for an emergency to become a disaster.

Figure 10.1a. Emergency Planning Master Worksheet

Facility Name: Stayer Bldg, YAPI

Emergency	Prioritize Emergencies*	Reminder of Key Mitigation Actions Necessary	Reminder of Key Mitigation Actions Already Taken
Fire	1	1. Remove nitrate negatives from museum storage, copy, and place in off-site storage 2. Remove stove from curatorial work space. 3. Have shrubs removed from front of building. 4. Obtain back-up power source for fire alarms, detectors, and suppression system.	1. Done on 5/9/99. 2. To be done on 11/15/99 3. Done on 9/9/99. 4. To be done on 11/23/99
Flood and Water Damage	2	1. Relocate collections from basement to 2nd floor. 2. Fix drainage near footings. 3. Replace roof. 4. Install water detectors. 5. Clear gutters and downspouts every 4 months. 6. When selecting new furniture, select metal. 7. When refinishing space, choose tile and paint.	1. Done on 10/18/99 2. Begun on 10/30/99; due to be done on 12/15/99 3. Due to be done in Spring 2000 4. Done on 6/8/99 5. On maintenance schedule; being done regularly. 6. Due to be done in Fall 2000. 7. Due to be done in Spring 2001.
Storms	5	1. Repair building structural seals around windows, doors, etc. 2. Purchase weather band radios. 3. Teach staff how to secure and shut down the building. 4. Bolt furniture to walls. 5. Check to see if near-by utility line can be moved.	1. On maintenance schedule for Fall 1999. 2. Done 5/10/99. 3. Done 4/30/99. 4. Scheduled for Fall 1999. 5. Proposed to Maintenance on 6/30/99; awaiting a decision.
Medical Emergency	6	1. Train museum staff in identification of health and safety hazards. 2. Train one staff member in hazardous waste management and basic CPR. 3. Purchase first aid kits.	1. To be done on 9/5/99 at the Curatorial Retreat 2. To be done at specialized workshops in May and June of 1999. 3. Done on 2/1/99.
Utility Failure	4	1. Arrange for back-up power source for security, emergency lighting, and HVAC. 2. Move boxes away from back door to free up the emergency exit. 3. Teach staff how to shut down and evacuate the building.	1. On RMP projects list as of 8/15/99. 2. Scheduled to be done by maintenance on 7/30/99. 3. Scheduled for regional collections management retreat on 4/15/99.

*****Use numbers from 1 (most likely) to 12 (least likely) based upon conversations with long-term staff and upon research. Also consider the "no" responses on the Risk Assessment Worksheet (Figure 10.2). A large number of "no" responses for a particular emergency (e.g., fire) can mean a higher risk for an emergency to become a disaster.

Figure 10.1b. Sample Completed Emergency Planning Master Worksheet

Facility Name: Stayer Bldg, YAPI

Emergency	Prioritize Emergencies*	Reminder of Key Mitigation Actions Necessary	Reminder of Key Mitigation Actions Already Taken
Accident (Hazardous Material)	7	Will be addressed in 1999.	
Accident (Transportation)	10	Will be addressed in 2002.	
Civil Unrest and Terrorism	9	Will be addressed in 2001.	
Explosions and Bombs	8	Will be addressed in 2000.	
Earthquakes and Structural Collapse	3	1. Museum storage cabinets and shelving must be attached to structural walls and braced with steel cross-braces. 2. All glass, ceramic, and ivory items need to be cavity packed in hollowed-out blocks of polyethylene and labeled. 3. Framed artwork should be placed on storage screens with steel "S" hooks. 4. Plexiglass exhibit cases and furniture should be purchased and used. 5. Museum cabinet drawers should be lined with polyethylene foam (except for some NH items).	1. Done on 7/16/99. 2. Done on 8/19/99. 3. Scheduled for implementation on 10/5/99 by curation and interpretation units. 4. Scheduled for replacement in January 2000 by HFC. 5. Done on 4/15/99.
Volcanoes (includes Mudslides)	12	Will be dealt with in 2004	
Other (Please specify) ***Nuclear Meltdown and Radiation***	11	Will be done in 2003.	

*Use numbers from 1 (most likely) to 12 (least likely) based upon conversations with long-term staff and upon research. Also consider the "no" responses on the Risk Assessment Worksheet (Figure 10.2). A large number of "no" responses for a particular emergency (e.g., fire) can mean a higher risk for an emergency to become a disaster.

	First 48 Hours Emergency Response Checklist
Responsible Person	**Activity**
Team Leader	**Immediately Prior to Emergency, Plan and Prepare:** • Monitor emergency warnings and watches on radio, television, and Web sites. • Check to ensure that alarms for water, fire, and back-up power systems are working. • Check evacuation route to ensure all doors are unblocked and the route is clearly marked. • Keep in touch with authorities. • Prepare to implement MCEOP plan. • Alert MCEOP team to stand-by for emergency recovery. • Check supplies and equipment caches and back-up power sources. • Move collections to safer storage, if possible, such as to higher ground. • Follow appropriate guidance in Section B.2-13 under the appropriate type of emergency (fire or flood) and the categories "Prevention," "Warnings," and "Watches."
Team Leader	**When Emergency Strikes, Ensure Staff, Visitor, and Collections Survival:** • Check the evacuation route for safety, then evacuate the building. Evacuate early enough so that individuals won't be stranded. • Send all individuals to a single assembly site without using the elevators. • Shut down the building as you evacuate (Team Leader and Assistant): – Close doors, blinds, storm shutters, and windows as you leave – Check elevators and stairwells for trapped individuals – Turn off utilities (water, electricity, and gas) at the mains • If your safety is not compromised, deal with manageable emergencies as you evacuate (use a handheld fire extinguisher on a trash can fire, plastic wrap items near a roof leak). • Hold an evacuation roll call to ensure that all individuals have evacuated safely. • Notify appropriate authorities, including the park chain of command and the external emergency authorities such as the Fire Department of any missing individuals and of the emergency situation. • Notify the park public relations officers of the emergency so that they are ready to field public and news inquiries. • Follow guidance in Section B.2-13 under "survival" for the appropriate type of emergency and in your MCEOP plan. Start Telephone Tree calls to all MCEOP team members. Alert them to await notification to come to the park for salvage team work.
Team Leader, EOP head, and Maintenance Liaison	**Following an Emergency, Assess the Situation.** • Notify regional emergency officials including FEMA, regional, and SO Staff. • Determine the level of risk for MCEOP staff to begin salvage: – Test unknown substances for toxicity via a professional laboratory. – Check structural stability to ensure floors, walls, and stairs are safe. – Check for utility problems, which may pose life-threatening situations. – Watch for potential biological hazards, such as mold or snakes due to flood waters. Mold may require laboratory analysis to ensure it is not deadly. – Check for other contaminants, such as asbestos, gasoline, chemicals, and radiation. These materials may require laboratory analysis for toxicity. – Work with Maintenance Liaison, the park structural engineer, and EOP coordinator to determine if it is safe for MCEOP Team to proceed with salvage. – Check the route to the park or center to ensure that it is safe for team arrival. – Ensure that the salvage site meets OSHA standards for worker safety. If so, proceed by notifying the MCEOP team to assemble. • If the site doesn't meet OSHA standards, hire HAZMAT or other professional salvage personnel who are rated to work under the existing conditions. • Contact necessary contractors and service providers to be ready to provide help.

Figure 10.3. First 48 Hours Emergency Response Checklist

	First 48 Hours Emergency Response Checklist
Responsible Person	**Activity**
MCEOP Team and Team Leader	**Get Coordinated:** • Set up emergency escape routes (two escape routes are necessary per area according to OSHA), rest rooms (including washing facilities), water sources, staff clean-up areas, rest spaces, and eating spaces. • Ensure that medical equipment and expertise is available nearby. • Make a list of all affected spaces and identify type and level of damage. • Assemble the MCEOP team. Individuals should wear appropriate clothing, and shoes, and bring fresh water, food, and any other necessary supplies. • Assemble necessary tools and supplies. • Ensure that each staff member has all necessary protective equipment and a current copy of the MCEOP. Remind staff of health and safety concerns. • Obtain priorities for salvage among the buildings, floors, spaces, types of collections, and groups of items affected based upon the priorities listed in the MCEOP from the team leader. The team leader uses the salvage priorities coding during decision-making. • Review the lines of command during the salvage operation. • Review the handling instructions, such as: – assemble pieces of broken objects – handle weak or damaged objects using supports – keep handling to a minimum – be careful not to transfer contaminants to your face and hair by touching • Obtain assignments from team leader. • Schedule work breaks and identify when to go for meals and down-time. • Identify work teams and remind team members of priorities for salvage and crucial issues during handling and preparation. • Prepare work stations for the various types of activities necessary for salvage, such as: – rinsing stations with clean running water and sponges – air-drying stations using clothes lines and plastic or rust-proof bakers racks – interleaving stations with portable metal work tables wrapped in paper – wrapping stations where materials can be boxed for transportation to cold storage – vacuum freeze-drying, or vacuum drying stations off-site – cover all work surfaces with polyethylene • Provide on-site dehumidification for pumping very dry air into the building to dry paper, books, and carpeting, wallboard, and furnishings. ***Note:*** Don't use this for historic structures or general museum collections. • Document the level of damage found photographically or using a video camera. • Set up a mobile communications system including walkie-talkies and/or cellular phones. • Allocate equipment and supplies.
MCEOP team and cooperators who are fully trained.	**Stabilize the Structural Environment:** • Remove standing water and contaminants to the extent possible as speedily as possible. • Set-up environmental controls as soon as the Maintenance Liaison judges that the electricity can be turned on again and the controls may be used safely. • Follow the *Secretary of the Interior's Standards for Treatment of Historic Properties* during work, although it may be necessary to remove carpeting, wallpaper, and wood furniture if they are holding water, hazardous chemicals, or biological contaminants, or are moldy. Ask for assistance from the park's cultural resource manager if you are uncertain how to proceed. • Set up good security including locking doors and key control to the extent possible. • Set up good air circulation and ventilation in all spaces where you will work.

Figure 10.3. First 48 Hours Emergency Response Checklist (continued)

	First 48 Hours Emergency Response Checklist
Responsible Person	**Activity**
MCEOP team	**Begin Salvage:** • Have a conservator on hand to answer questions. • Have a toxic waste disposal contractor available to remove old chemicals, unidentified or unlabeled substances, asbestos, lead paint waste, and similar items. • Have a professional waste handler on hand to remove animal and human waste, mold, dead animals, and medical waste. • Work on high priority collections first, based upon your coded tags. • If an item can't be dried in 48 hours, freeze it unless it is glass, metal, furniture, or photographic. Consult conservators and your MCEOP about what may and may not be frozen. • Do the minimum of work possible per item. Save as much as possible. • Don't attempt complex cleaning or treatment procedures during salvage. Instead transfer the materials to a conservator or stabilize items by drying them and removing them from immediate danger. • Document all work done via a disaster registration process, so that appropriate records of transfers to cold storage, conservation, and so forth can go into the museum records. • Handle objects carefully. • Where possible, work in teams. • Use the gentlest action possible, for example use an air bulb over canned air for cleaning fragile surfaces. Work from the center towards the edges.
MCEOP team	**Fire Damage:** • Avoid moving sooty, smoky, or fire-damaged objects without nitrile gloves and a rated breathing apparatus that has been fitted to the user for smoke and soot. Soot is carcinogenic, so be very, very cautious. • If the fire involved burning pesticide treated wood (often green in color) the soot will be highly hazardous. Use rated breathing apparatus and gloves when working nearby. • Don't touch metallic, gilded, stone or other heat absorptive items soon after a fire. They may still be hot. • Don't try to clean sooty, smoky, or fire damaged objects. Simply remove them to a conservator's care.
MCEOP team	**Flood Damage:** • Lower the humidity by: – Pumping out the water – Using dehumidifiers and room desiccants • Lower the temperature as low as the workers can handle • Improve the air circulation by opening windows and using fans. • Keep the lights on to discourage mold growth. • Remove the wettest high priority objects first to bring the humidity down. • Use a moisture meter or visual testing to determine if items are wet or damp in order to determine how best to stabilize the items. • Move wet objects in safe and sturdy containers such as polyethylene boxes with air holes poked in the bottom to encourage drainage. • Be extremely cautious in the presence of mold: – separate moldy objects from others and move them into cold storage until they can be treated. – avoid blotting moldy objects as you may drive the mold spores deeper or spread them. – always wear nitrile gloves and a rated breathing apparatus when working with mold

Figure 10.3. First 48 Hours Emergency Response Checklist (continued)

	First 48 Hours Emergency Response Checklist
Responsible Person	**Activity**
MCEOP team	**Flood Damage (continued):** • Air dry animal skins, baskets, bone, books, botanical specimens, ceramics, film, framed art work, furniture, geological specimens, glass plates, ivory, leather, magnetic media, metal, photographs, paper, stone, textiles, wooden objects, and so forth at <70°F and < 50% R.H. For detailed instructions see the National Task Force on Emergency Response ***Emergency Response and Salvage Wheel.*** • Use fans and room desiccants such as Damp Rid® to keep the humidity down when you are air drying items, but don't use heat sources such as portable heaters, to hasten the drying. Don't allow breezes to blow directly on objects. • Use wax paper, freezer paper, aluminum foil, silicone paper, or polyethylene sheets to keep objects from sticking to each other. • Use unprinted blotting paper, lint-free towels, or unprinted newsprint to interleave/blot items. Don't reuse dirty blotting materials except for the towels that must be washed in a fungicidal detergent and thoroughly dried before reuse. • If you can't air dry an item within 48 hours; place it in cold storage. Blast freezing at -20°F or less will cause the least damage to objects. • Don't blast freeze or place in a freezer magnetic media, glass plates, glass, historic wooden furniture, ceramics, stone, paintings, geological specimens, bone, shell, ivory, paleontological specimens, or metal. Air-dry these items. • Wrap and pack items for cold storage. Label every box. Keep wet materials separate from damp materials, but do not destroy the original order and provenance to do so. • If you have a lot of flood-damaged items, hire a freezer truck to transport them. Otherwise temporarily use a home freezer, or dry ice (should not touch the materials). • If a single dead mouse or bird or their nest or waste is discovered, only trained staff should deal with the materials wearing nitrile gloves, splash goggles, and a rated breathing apparatus to avoid contracting disease. • For detailed instructions on cleaning, packing, and drying, see the sources in the bibliography.

Figure 10.3. First 48 Hours Emergency Response Checklist (continued)

Chapter 11: Curatorial Health and Safety

CHAPTER 11: CURATORIAL HEALTH AND SAFETY

A. Overview

1. *What information will I find in this chapter?*

This chapter has information on occupational health and safety hazards that are unique to the museum work environment. You will find guidance to assist you in ensuring a healthful and safe curatorial environment. Appendix H has additional information on laws, regulations, policies, and guidelines on the NPS health and safety program.

Review other chapters in this handbook that contain important health and safety information including:

- Chapter 9: Museum Collections Security and Fire Protection, for information on fire safety
- Chapter 7: Museum Collections Storage, for information on structural floor load limits
- Appendix M: Management of Cellulose Nitrate and Cellulose Ester Film, for information on hazards from deteriorating historic film.

2. *What kinds of health and safety hazards will I find in museum collections?*

When you work with museum collections, you may face a wide variety of potential health and safety hazards, including:

- hazardous materials used in collections care:
  - toxic and flammable solvents, such as solvents in waxes or lacquers
  - preservatives, such as alcohol and formalin, used for storing natural history specimens
  - pesticides used to kill or discourage pests
- hazardous objects and conditions in collections
  - pesticide residues from past treatment of collections, such as arsenic
  - objects with inherent vice such as unexploded ordnance or cellulose nitrate film
  - biological hazards such as mold, hantavirus, and insects/arachnids
  - sharp or broken edges on objects

You may also create safety hazards through carelessness in handling collections and supplies (for example, careless lifting and carrying).

You need to know your own susceptibility to allergens and irritants (for example, bee stings or dust) and take appropriate precautions.

You need to acquaint yourself with typical hazards and how you can ensure a healthful and safe curatorial environment.

3. *What is the goal of a health and safety program?*

The ultimate goal of your curatorial health and safety program is to reduce or eliminate occupational illness and injury.

The servicewide policy outlined in Director's Order (DO) #50B, Occupational Safety and Health, outlines a framework for establishing and implementing a Risk Management process that provides for the safety and health of NPS employees and the public. The Reference Manual 50B, Occupational Safety and Health Program, provides more detailed guidance on specific implementation requirements and strategies for the Risk Management Program in the NPS.

Also familiarize yourself with 29 CFR 1910, Occupational Safety and Health Standards for General Industry. You can find the Federal Register on the web at: <http://www.access.gpo.gov/su_docs/>.

Build your curatorial health and safety program on these guidance documents. Address these goals:

- Recognize and identify the hazards.
- Evaluate the hazards.
- Reduce or eliminate the hazards to the extent possible.

4. *What are the general categories of occupational hazards?*

Learn the four general categories of occupational hazards. All of these categories are present in the museum work place:

- ***Chemical Hazards***—including any chemical that can cause a physical or a health hazard. Hazardous chemicals can be in the form of liquids, mists, vapors, dusts, fumes, gases, and solids
- ***Physical Hazards***—including radiation, extreme temperature levels, and noise
- ***Biological Hazards—***including exposures to bacteria, fungi, viruses, and parasites and allergic reactions to plants, animals, and other substances
- ***Ergonomic Hazards***—including problems with the design and selection of a work environment and poor choices in tools and equipment so that excess physical strain and stress occur

Common hazardous materials you should be aware of include: asbestos, biological samples, cellulose nitrate and cellulose acetate, decaying animal matter, disinfectants and other cleaning chemicals, heavy metal-based dyes and paints, laboratory and photographic chemicals, lead-based paints, medications, munitions, oil-filled electrical equipment (such as transformers and large capacitors), pesticides, and some rocks and minerals. The sections in this chapter discuss these materials in more detail.

B. Understanding Health and Safety Issues

1. *What basic occupational health concepts should I understand?*

There are a number of basic concepts you should understand in order to develop a good safety program.

A hazardous substance is any material that can harm the body if it is absorbed in large enough quantities over a period of time. Each hazardous material, or group of materials, has specific toxic effects.

- ***Toxicity*** is the material's capacity to produce injury to the human body. The higher the toxicity of a substance, the smaller the quantity of this substance needed to cause injury.

- ***Chronic health effects*** result from a slow accumulation of small amounts of a hazardous substance. The quantities may seem insignificant; however, with daily exposure over a period of years, material can accumulate in the body. Health effects include respiratory problems, cancer, birth defects in offspring, and damage to the heart, liver and kidneys.

- ***Acute health effects*** result when a worker is accidentally exposed to large quantities of a hazardous substance. A few symptoms are burning eyes, dizziness, and light-headedness.

- ***The exposure limit*** for a substance is the highest exposure level recommended in a work area when workers are in that area without any special protection. The two most widely used criteria are:

  – *Permissible Exposure Limit (PEL):* The PEL, established by the Occupational Health and Safety Administration (OSHA), is the concentration and time of exposure that cannot be exceeded. This standard is enforceable by federal law. Many substances also have a determined ceiling for concentration and time of exposure.

  – *Threshold Limit Value (TLV):* The TLV is a guideline based on current studies of exposed animals. It is the recommended maximum average concentration of a chemical during a 40-hour week (five 8-hour days). Results of these studies are issued annually by the American Conference of Governmental Industrial Hygienists (ACGIH). It is a recommended level and is not enforceable by law. The TLV is typically more stringent than the PEL.

  The NPS uses 50% of the PEL limit as an action level. If the concentration of a contaminant in a workspace is at or above 50% of the PEL, you must take action to monitor the exposure level and reduce the exposure.

2. *How will I know that I am being exposed to hazardous materials?*

Many hazardous materials have good initial warning properties that signal exposure to a potential injury:

- odor
- burning eyes
- skin, nose and throat irritation
- breathing difficulty

However, after a time, olfactory fatigue may set in, and you will no longer be able to smell the contaminant. Other hazardous materials, especially particulates, give little or no warning. These materials can cause harm when they are present in quantities too small to be detected by odor or other unpleasant indications.

> ***You must identify all hazardous materials in the workplace.***

Identifying all hazardous materials in the workplace allows you to identify ways to block and limit exposure.

3. *How does the body absorb substances?*

There are three ways your body absorbs substances:

- ***Skin Contact:*** Healthy, undamaged skin often provides an effective barrier against the absorption of many hazardous substances. Some substances, however, will dissolve or destroy the skin's protective layer. Punctures, scrapes, and cuts increase the risk of absorption. Once a substance is absorbed through the skin, it can cause systemic damage. Be aware of any burning, pain, redness, or irritation when using substances.
- ***Inhalation:*** Hazardous substances are very often airborne (for example, dusts, mists, fumes, vapors, gases). When you inhale these materials, they are absorbed into the blood stream and distributed to all parts of your body. Some materials will damage your lungs; others will pass through into your blood stream. Be aware of common warning signs, such as coughing, a burning sensation, heaviness in the chest, and wheezing or breathing difficulty.
- ***Ingestion:*** You may unknowingly absorb small quantities of a toxic substance into your gastrointestinal system from food or drink or from contaminated hands.

4. *How do I evaluate the degree of a health hazard?*

The factors that determine the degree of a health hazard from a given substance are:

- toxicity of a substance
- amount of a substance
- duration (length and frequency) of exposure

- protective measures used (for example, ventilation, respirators, gloves)
- susceptibility (your health condition at the time of exposure)
- environmental conditions at time of exposure (Temperature, airflow, and humidity affect the dispersion of a hazardous substance, its availability for absorption, and the amount and speed of absorption.)

By looking at each of these factors, you can decide how to limit the hazard to yourself and others in the workplace. For example, you may choose to use a less toxic substance. You might limit how long each day you use the substance. You could choose to wear gloves and protect yourself from direct skin exposure. Looking at each of these factors gives you a number of ways to minimize the hazard.

You should also understand the concept of the breathing zone. The breathing zone is the area around your nose and mouth. Many curatorial tasks are done near the breathing zone, including numbering objects, pulling objects from storage shelves, and dusting. When identifying concentrations of airborne contaminants in a workspace, it is important to determine concentrations in the breathing zone, not just in the general airspace.

Because exposure may occur in more than one way (for example, both ingestion and inhalation of a particulate such as arsenic), biological monitoring may be appropriate. Biological monitoring measures individual absorption by all routes of entry and may include testing of:

- exhaled breath
- urine
- blood

Contact your park safety officer to develop a plan for airborne exposure monitoring and/or biological monitoring if you are concerned about your exposures to hazardous materials.

5. *What is the Job Hazard Analysis?*

The Job Hazard Analysis (JHA) is a written document that evaluates hazards in your workspace (office, storage space, work area, laboratory and research spaces). The purpose of the JHA is to prevent or reduce the risk of job-related injuries and fatalities. The JHA is a tool you use to examine and evaluate activities in the curatorial workplace and to decide on corrective actions to take to prevent accidents. A JHA should be completed for all jobs that:

- have an associated history of injury, illness, or death
- require the use of personal protective equipment (PPE)
- involve activities that are clearly dangerous

Obvious hazards in the curatorial workspace include:

- exposure to toxic chemicals, such as pesticides, preservatives, and solvents
- exposure to dangerous microorganisms, such as hantavirus
- exposure to hazardous materials in collections (for example, nitrate film, radioactive specimens)
- falls from ladders or step stools
- injuries from power tools when constructing storage racks
- injuries from lifting and carrying objects

There may be other hazards specific to your park or its collections.

You can obtain more information about the JHA from:

- Department of Interior Manual (DM), Part 485, Chapter 14
- Reference Manual 50B, Occupational Safety and Health Program, Section 13, available on the web at: <http://www.nps.gov/riskmgmt/>
- OSHA 3071, 1998 (Revised), *Job Hazard Analysis*, an informational booklet that provides a generic overview to conducting a JHA (Available through OSHA on the web at: <http://www.osha.gov/>.)
- OSHA *Self Inspection Checklists*, 1997, checklists that use a question and answer format to guide the user in examining conditions and evaluating hazards, including sections on evaluating a safety and health program and using personal protective equipment (Available through OSHA on the web at: <http://www.osha.gov/>.)

Your park or regional safety officer can also provide specific guidance on conducting a JHA.

C. Controlling Exposure to Hazardous Substances

1. *How do I control exposure to hazardous substances in the workplace?*

When evaluating ways to control exposure in the workspace consider:

- limiting the use of hazardous materials
- installing proper ventilation (including fume hoods, when necessary)
- wearing appropriate personal protective equipment
- practicing good housekeeping and personal hygiene

- storing, handling, and labeling hazardous materials appropriately
- disposing of hazardous materials properly

2. *How do I limit the use of hazardous material?*

Where possible, use a less hazardous material, or use a different method. For example, substitute water-based paints and inks for solvent-based paints and ink. Substitute an IPM monitoring program for use of traditional museum pesticides such as paradichlorobenzene or Vapona. Nitrate negatives can be duplicated and copies provided for research use.

Limit the time of exposure to hazardous substances. Break up tasks that require exposure to hazardous substances into short blocks of time over a number of days.

Close all containers of chemicals when they are not in use. For example, keep the top on the lacquer that you use for numbering objects.

Provide waste receptacles with lids for disposal of toxic materials (especially solvents that will evaporate).

3. *What kinds of ventilation systems are available?*

There are two basic types of ventilation systems:

General or dilution ventilation is designed to keep you comfortable by heating, cooling, and controlling the air's moisture content. The HVAC system for your workspace is a general ventilation system. **Don't** rely on general ventilation to control moderate to high toxicity materials, or reduce concentrations from a "spot source" in your breathing zone.

Local exhaust ventilation captures the hazardous substance where it is generated and carries it away from your breathing zone. It is very effective in removing substances of moderate to high toxicity by using a system of fume or exhaust hoods, ducts, air cleaners, and fans. You should have local exhaust ventilation if you regularly work with hazardous materials. This is the preferred method for removal of air contaminants.

If only low concentrations of hazardous materials are used in your workspace, portable ventilators may be a practical solution. Portable fume or air scrubbers draw air through a charcoal absorption filter with a fan. The filtered air is then released back into you workspace. This is a less expensive alternative, but you must change the filter regularly for these ventilators to remain effective.

Ventilation: A Practical Guide by Clark and others (1984) provides detailed guidance on ventilation systems, including the criteria for designing an exhaust hood system. See Figure 11.1 for the advantages and disadvantages of different types of ventilation. Work with your regional risk manager and park safety manager, the regional/SO curator, and the park's maintenance staff to evaluate the need to improve ventilation in the curatorial workspace.

Ventilation is the key engineering control for protecting staff from the effects of hazardous substances. You should make proper ventilation a high priority when evaluating a curatorial workspace.

4. *How do I install proper ventilation?*

You must work with a ventilation engineer to ensure proper ventilation if a fume hood is installed. For proper ventilation:

- Make sure air in the workspace flows **away** from the breathing zone of each worker to a non-occupied area of the building or to the exterior.
- Pull contaminated air out of the workspace with an exhaust fan. If you try to use a fan to blow air out of a workspace, you will only disperse the contaminant within the workspace.
- Locate the ventilation system's exhaust opening close to the source of the contaminant. Move work to the exhaust area.
- Promote maximum effectiveness of the exhaust system by preventing cross-drafts from interrupting the direct outward flow of air.
- Be sure that the air exhausted from the workspace is replaced. This avoids negative pressure that reduces the ability of the exhaust system to remove contaminants. An engineer will know how quickly air is replaced in the space.
- Ensure that exhaust outlets are not near air intake valves that would pull the contaminant back into the workplace. Work with a ventilation engineer to be sure that outlets are placed properly.
- Avoid polluting the surrounding area with the contaminated exhausts. The level of environmental pollution from exhausts depends on the toxicity and concentration of the substance being vented. These levels must be evaluated by a ventilation engineer.
- Consult local or state environmental regulations on what materials can be directly exhausted. Some materials may require scrubbers in filters under Clean Air Act regulations.

5. *When should I wear Personal Protective Equipment (PPE)?*

Use Personal Protective Equipment (PPE) only when other management controls (for example, ventilation, adoption of an alternative procedure or substance, time limitations on exposure) are not possible. ***Never consider PPE as your primary source of protection.***

PPE includes:

- respiratory devices
- eye and face protection devices
- protective clothing

There is no personal protective equipment designed for universal use. The type of PPE you wear depends on the specific hazardous substances you are using. Material Safety Data Sheets (MSDS) (see Section C) provide specific information about appropriate types of PPE to be used with a specific hazardous substance. See OSHA CFR 1910, Section I, for requirements for PPE usage.

6. *What are respiratory protective devices?*

OSHA CFR 1910.134 specifies that you must use respiratory equipment when engineering controls are not feasible (for example, if you must work temporarily in a dusty attic or basement) or in an emergency. There are two types of respirators: supplied-air devices and air-purifying devices.

- Supplied-Air Respirators bring a fresh air supply from a pressurized tank or compressor. These respirators are complex and expensive. You will rarely need this kind of device in your workspace.

- Air-Purifying Respirators purify air drawn through filters or cartridges before you inhale it. This type of respirator may be made out of a variety of materials depending on the application.

> ***Don't use air-purifying respirators as a substitute for proper ventilation.***

7. *How do I select a respirator?*

Use the following criteria to select a respirator:

- OSHA requires a thorough medical exam for anyone who must wear a respirator. This physical must verify that the employee's health will not be at risk while breathing through a respirator.

- Work with your safety officer to select the proper respirator. Be sure it has been approved by the National Institute for Occupational Safety and Health (NIOSH).

- You must have a leak-tight seal between the face and respirator face piece. Facial hair that interferes with this seal is prohibited by law. You must be fit-tested and trained on the use and maintenance of your respirators. Consult with your safety officer for fit-test procedures.

- Choose the proper filtration system. Air-purifying respirators use two types of purifying material—a filter or a chemical cartridge. Filters trap dusts and mists. For chemical vapors you must use a cartridge. Choose a cartridge that is designed for the specific substance in your workspace. Consult the applicable MSDS for the specific type of respirator required (see Section C).

- Consider comfort. Respirators can become uncomfortable after a few hours. Some materials may be more irritating to a wearer than the presence of the contaminant.

- Consider cost and maintenance. Some respirators (for example, paper) are disposable. Others are not and require periodic maintenance and cartridge replacement.

Refer to Appendix H for sources of respirators. Good sources of information on respiratory protection can be found in *Conserve O Gram* 2/13, "An Introduction to Respirator Use in Collections Management," and on the OSHA Website at <http://www.osha-slc.gov/SLTC/respiratoryprotection/index.html>.

8. *How do I know which gloves to wear?*

There are many types of gloves manufactured to protect against different types of materials. Consider the chemicals you are handling and the permeability rate. For example, gloves made from butyl give the best protection from acetone. You may use properly maintained butyl gloves for over 17 hours before replacing them. In contrast, neoprene gloves provide only 10 minutes of protection from acetone before it penetrates to your skin. Refer to the MSDS or check with manufacturers for each chemical that you are using to identify recommended types of gloves.

Refer to Appendix H for sources of gloves.

9. *What good housekeeping and personal hygiene habits do I need to develop?*

Good housekeeping and personal hygiene can go far in protecting you and others from contact with hazardous substances. Follow these rules:

- Establish a routine program for cleaning floors and work surfaces.
- Change filters in ventilation systems regularly.
- Clean up any spills immediately.
- Don't allow smoking in workspaces.
- Don't allow eating or drinking in workspaces.
- After working with objects, wash your hands before eating, applying makeup, brushing your hair or leaving work.
- Take special note of personal habits and refrain from biting your nails or chewing on pencils.

10. *How do I store, handle, and label hazardous material?*

Follow these rules:

- Store all chemicals in an approved dedicated space and only with compatible materials. Never store these materials in the same space with a museum collection.
- Store large quantities of flammable and combustible materials in special cabinets that meet OSHA and NFPA specifications. Refer to Appendix H for sources of these cabinets.
- Label all containers. Post appropriate warning signs in the storage area. Refer to Section C for information on labeling.
- Close all chemical containers when they are not being used.
- Wear appropriate personal protective equipment when using chemicals.

11. *How do I dispose of hazardous waste?*

Hazardous waste is any hazardous solid, liquid, or contained gaseous material that you no longer use. You must recycle, discard, or store hazardous waste. Common materials that you use in museum tasks may become hazardous waste, such as alcohol and formaldehyde, pesticides, and other solvents.

Under the Federal Hazardous Waste Management Program, you will have to follow different rules depending on the amount of hazardous waste you generate in a given month. Work with your safety officer and the Regional Hazardous Waste Coordinator on proper disposal methods for all hazardous materials, including empty hazardous materials containers.

You must dispose of all hazardous waste in accordance with the Resource Conservation and Recovery Act (RCRA) of 1976. All cataloged museum objects that are disposed of because of hazards must first be evaluated and deaccessioned.

For a detailed explanation of the regulations, obtain a copy of the Environmental Protection Agency (EPA) publication, *Understanding the Hazardous Waste Rules: A Handbook for Small Businesses—1996 Update*. See *MH-II*, Chapter 6: Deaccessioning, Sections B.5 and H.

D. Hazardous Chemicals and Materials Used in Collections Care

Collections care requires the use of numerous hazardous chemicals. The following information gives you basic information about commonly used materials; however, you should evaluate your own workspace and identify all hazardous substances.

1. *What solvents are used regularly?*

You may find numerous hazardous substances in the curatorial workspace. These can include:

- paints
- varnishes
- waxes
- cleaning materials
- preservatives and consolidants
- adhesives

Some of the common hazardous solvents are: acetone, ethanol, kerosene, methanol, mineral spirits, toluene, turpentine, and xylene. Mineral spirits, V.M.&P® Naphtha, and Stoddard Solvent are used in cleaning wooden furniture. The clear and white lacquers recommended by the Supply and Equipment Program for numbering objects contain acetone. In natural history collections, formaldehyde, ethanol, and methanol are used to preserve wet specimens.

Rapid Guide to Hazardous Chemicals in the Workplace by Richard Lewis (2000) is an easy-to-use reference. It deals with the properties and harmful health effects of 700 common substances.

2. *What fumigants and other pesticides do museums use?*

Museums have traditionally used chemicals to control biological infestations, including fumigation and topical application of pesticides. In more recent years, Integrated Pest Management (IPM) has become the standard for protecting collections (see Chapter 5: Biological Infestations). However, many collections are still contaminated with residues from these past treatments.

Fumigation introduces a toxic gas into a fixed space that contains the objects. Fumigants that have been used on museum collections include:

- dichlorvos (DDVP, Vapona)
- ethylene oxide
- methyl bromide
- paradichlorobenzene
- naphthalene (moth balls)
- sulfuryl flouride (Vikane®)
- thymol

Materials that have been applied through topical application include:

- arsenic
- DDT
- mercuric chloride

3. *What should I know about pesticide use?*

Pesticide residues are a serious problem in museum collections and the full extent of the problem is just becoming known. In many cases there is little documentation on past pesticide usage. Repatriated objects are of particular concern because they are returning to communities that may have little or no knowledge of the hazards of pesticide contamination.

Information in Chapter 5: Biological Infestations will help you to identify problems in your collections and show you how to limit or halt the future use of pesticides by using IPM techniques. Refer to Appendix H: Section E, for a list of fumigants that were traditionally used in museums and for health and reactivity information. The *Conserve O Gram* series has additional health and safety information about these materials. Review these publications to acquaint yourself with the dangers of pesticide use and how to manage contaminated collections.

Vikane (sulfuryl fluoride) is now the only fumigant that is legally available to use on collections. All others have been banned. It is a restricted use pesticide that requires park and regional IPM approval before application. See Chapter 5: Biological Infestations and the *Conserve O Gram* series for information on alternative non-toxic treatment strategies if you find an infestation in your collections. Work with your regional/SO curator and park IPM coordinator to develop alternative strategies to pesticide use.

Use of any pesticide must follow policy in NPS-77: Natural Resources Management Guideline, Integrated Pest Management (Chapter 2, p. 217-266).

You must obtain approval for using a pesticide through the Pesticide Use Proposal System (PUPS) or by telephone, as described in NPS-77. A regional/SO or WASO IPM specialist must review and approve all pesticides prior to use.

The regional/SO IPM specialist:

- consults with the regional curator to evaluate the need for pesticide use and to ensure that any approved use is an integral part of the integrated pest management process
- consults with WASO IPM specialist for concurrence if the pesticide is a restricted use product, will be used on or near an aquatic system, may affect threatened or endangered species, or is to be applied over 400 contiguous acres
- responds to park IPM coordinator within five working days with either approval or denial with suggested alternative management strategies

The park IPM coordinator:

- works with curatorial staff to ensure that pest management activities, including use of pesticides, are directed by technical experts and follow pesticide label instructions
- submits PUPS use to regional/SO IPM coordinator at end of each calendar year as directed in NPS-77

There may be times when it is appropriate to use a fumigant on museum objects. It may also be appropriate to use pest deterrent chemicals, such as crack and crevice solutions, in the museum space around collections. However, be sure you make the decision to use pesticides with the approval and advice of experienced and trained NPS staff.

4. *Are there special precautions for using silica gel in exhibition and storage cases?*

Yes. Silica gel may cause irritation to skin, eyes, and the respiratory tract. Goggles, a lab coat, vent hood (or appropriate respirator), and proper gloves should be used when working with bulk silica gel. Obtain a Material Safety Data Sheet (MSDS) from the silica gel manufacturer for further information. (Also see Sections D.5 and D.6 below.)

Cobalt impregnated silica gel should be phased out of use and replaced by Sorbead Orange, Silica Gel Yellow, or other biodegradable indicating gels. Cobalt is a skin and respiratory system sensitizer. Contact your park or regional HAZMAT coordinator to obtain information on appropriate disposal of cobalt impregnated silica gel. (See *COG* 2/15, Cobalt Indicating Silica Gel Health and Safety Update.)

5. *What is the Hazard Communication Standard?*

Your park must implement a program to communicate essential information on hazardous chemicals. This is required by OSHA's 29 CFR 1910.1200 (the Hazard Communication Standard) and NPS policy. This means you must:

- inventory all hazardous substances
- obtain and maintain a Material Safety Data Sheet (MSDS) for all hazardous chemicals
- label all hazardous substances
- receive training in the Hazard Communication Standard

6. *What is a Material Safety Data Sheet (MSDS)?*

A MSDS is a concisely written information sheet that explains the hazards of substances and how you are required to handle and use them. The OSHA standard does not require that MSDS be uniform in format; however, each sheet must contain the following information:

- product name and identification of chemicals including:
  - identification of the substance
  - manufacturer's name
  - both chemical and trade names and any synonyms
  - chemical family and chemical formula
  - name and address of the manufacturer with emergency telephone number
  - hazardous ingredients
  - percentage of each ingredient
  - recommended exposure limits for these ingredients
- physical and chemical characteristics of each hazardous chemical including:
  - physical properties (boiling point, melting point, appearance and odor threshold, solubility in water, evaporation point)
  - fire or explosion hazards (flash point, flammable limits, fire extinguishing equipment needed)
  - list of substances that cause it to burn, explode, or release toxic gases (for example, water or other chemicals)
  - list of environmental conditions that cause a dangerous reaction (for example, heat or direct sunlight)

- health hazards including:
  - known acute and chronic effects
  - exposure limits (PEL and TLV)
  - known or suspected carcinogenic effects
  - emergency and first aid procedures
  - primary route of exposure (for example, skin, nose and mouth)
- special protective information including:
  - special control measures, such as ventilation requirements
  - appropriate personal protective equipment (for example, respirators, gloves, goggles, or clothing)
- spill or leak procedures, handling and storage information:
  - special handling and storage precautions
  - procedures for cleaning up spills and leaks and disposing of resulting waste

This last information is often regulated by the U.S. Department of Transportation and by statues and laws like the Toxic Substances Control Act and the Resource Conservation and Recovery Act. This information is especially important when you prepare your emergency operations plan (EOP).

7. *How do I get and maintain a MSDS?*

You should be able to obtain a MSDS when you purchase a hazardous chemical or a product that contains a hazardous material. If you currently have hazardous materials in your workspace and do not have a MSDS for them, you can get it by contacting the manufacturer. Always ask the manufacturer first. The manufacturer is obliged by law to provide a MSDS. There are also several institutions that maintain collections of material safety data sheets on the Web; however, they may not be the specific formulation you are using. You can search for these at <http://palimpsest.stanford.edu/bytopic/health/#msds>.

Request the MSDS whenever you make a purchase from the Government Services Administration (GSA) and other vendors. Keep the MSDS in an easily accessible file that is available to everyone in the curatorial workspace.

See Figure 11.2, Sample Material Safety Data Sheet and Figure 11.3, MSDS for Formaldehyde.

8. *How should I label hazardous substances?*

OSHA's Hazard Communication Standard requires that all chemical labels include a hazard warning. Prepare labels for chemicals you use in your daily work, such as the lacquer you use for numbering objects. Refer to Appendix H for sources of vendors who provide a variety of label materials.

Include the following information (recommended by the American National Standards Institute) on all labels:

- chemical name and any synonym
- signal word to indicate the degree of severity of a hazard (in increasing order):
  - CAUTION!
  - WARNING!
  - DANGER!
  - POISON! (used only for highly toxic chemicals)
- statement of hazard
- precautionary statement
- effects of over exposure
- first aid procedures
- chemical abstract service number

9. *What is the NFPA Hazard Symbol?*

The National Fire Protection Association (NFPA) Hazard Symbol is an effective labeling system that you should consider using. This system uses a diamond-shaped symbol to rate the health, fire, and reactivity hazard of a substance to warn personnel if there is a fire. See Figure 11.4. The hazard warning system uses a 0 to 4 rating with 0 being the least hazardous and 4 the most hazardous. You can use this label on any size container. You can also post the label on access doors to storage rooms or cabinets containing hazardous materials (for example, cellulose nitrate film). It is a warning to all employees and to firefighters. Refer to Figure 11.4 for an explanation of the NFPA warning rating system.

10. *How can I get occupational safety and health training?*

Your employer must provide you with appropriate occupational safety and health training to equip you with the knowledge and skills to safely perform your job and to respond to potential emergencies.

Contact your Regional Training Coordinator, or your Regional Safety Manager for Safety and Health for available training.

E. Hazardous Objects in Collections

1. *What type of hazardous objects are in collections?*

This section describes what to do with the most common hazards in collections including:

- pesticide residues
- hazardous geological specimens (radioactive minerals, asbestos, toxic minerals)
- cellulose nitrate and cellulose acetate film and negatives
- firearms, edged weapons, ammunition, and unexploded munitions
- medical objects and drugs/chemicals
- objects containing asbestos

You should familiarize yourself with the types of hazardous objects that are typically found in collections. Be aware of the health and safety risks. Review *Conserve O Gram* 2/10, Hazardous Materials in Your Collections, as well as references listed in Section H, to get additional information about hazardous collections and how to protect yourself.

2. *Why should I be concerned about pesticide residues in biological specimens and organic ethnographic and historic objects?*

Many historical biological specimens (birds, mammals, and plants) and ethnographic and historic organic materials were treated with pesticides. These pesticides can leave residues. See the article "Masked Hazard" listed in the references for a discussion of the problems that pesticide residues can cause.

At this time, arsenic is a residue that you can identify with a simple test. See Section E.4 below. The mercuric chloride spot tests that are currently available do not work consistently. Other pesticide residues that may be present don't have simple identification tests. A number of researchers are working in this area, and new information will be published in the *Conserve O Gram* series as it becomes available. The following *Conserve O Gram* leaflets have health and safety information on commonly used pesticides:

- 2/2, Ethylene Oxide Health and Safety Update
- 2/3, Arsenic Health and Safety Update
- 2/4, Dichlorvos (Vapona) Update
- 2/10, Hazardous Materials in Your Collection

Under no circumstances should any taxidermy mount be used for "hands-on" demonstrations for children or adults before it has been tested for the presence of arsenic.

Collect and document information on pesticide use in your collection. Talk to individuals who worked in the park in the past. Search documents such as:

- accession and catalog records
- annual reports
- maintenance records
- purchasing records
- diaries or other informal records from previous curators
- conservation records

3. *What do I do if I have specimens contaminated with arsenic?*

Arsenic can be readily absorbed through the skin, inhaled, and ingested. Arsenic can cause acute symptoms or may lead to chronic disorders. It is a known human carcinogen. In working with contaminated ethnographic and biological collections (especially bird and mammal specimens) use the following handling precautions:

- Do not touch specimens with bare skin. Wear plastic gloves and a protective smock or lab coat. Wear a dust mask rated for toxic dust. If possible, handle an object or specimen by a container or a mount.
- Always wash hands after working with specimens. Discard gloves. Keep the protective smock or lab coat clean. Do not take protective clothing home to wash—especially if you live with small children or elderly people.
- Obtain a Material Safety Data Sheet (MSDS) on arsenic and keep in the park's curatorial workspace/office. Consult the MSDS for specific information on arsenic.
- Label museum cabinets or storage spaces that house specimens contaminated with arsenic with the warning sign "ARSENIC." Also label individual specimens that have been tested. Prepare and post a written set of instructions for handling specimens contaminated with arsenic.

4. *How do I identify specimens that are contaminated with arsenic?*

You should inspect all biological collections (birds, mammals) and ethnographic objects made from organic materials (leather, basketry, textiles). These collections were typically treated with arsenic.

Test all bird and mammal specimens collected and prepared prior to the mid-1970s.

Follow these procedures to identify arsenic:

- Wear plastic gloves and a lab coat or smock while you inspect each specimen or object. Look for powdery or crystalline deposits. On bird and mammal specimens, look on the tips of feathers and hair, along

eyes, in or at the base of ears, around mouth or bill, along ventral incision, at the base of tail, and on foot pads. On ethnographic objects, look along seams, at the base and tips of feathers or hair, in areas of stitching, in folds and on the shelving beneath an object. Some application techniques, however, dispersed the arsenic as such fine powder that you may not be able to see it.

- Study each specimen and object's history. Try to determine who collected and prepared the specimen, when it was collected, and where it was collected.

- Follow the instructions for identifying arsenic residues provided in *Conserve O Gram* 2/6, Arsenic Health and Safety Update. Refer to NPS *Tools of the Trade* for sources of the EM Science arsenic test kit. Document each test with a written report and keep the reports in the museum records accession or catalog folder.

- Tag specimens and objects testing positive for arsenic with an "ARSENIC" warning sign.

- Inform the park safety office about the project and the results.

- Disclose any test results or information on suspected pesticide contamination to researchers or visitors who may touch objects and also to recipients when repatriating objects.

- Develop an emergency response plan to deal with the rescue of contaminated objects after a flood or fire. These objects are a severe health risk when wet.

5. *What hazards will I find in geological collections?*

A few types of geological specimens are hazardous. See *Conserve O Gram* 11/2, Storage Concerns for Geological Collections, for a basic discussion of health hazards. The main hazards are:

- radiation from radioactive specimens (for example, pitchblende [uraninite] is strongly radioactive)

- radon from fossils

- toxic minerals (for example, antimony, arsenic, barium, boron, copper, fluorine, lead, uranium, zinc)

- asbestos (a carcinogen)

- clay and quartz dust

- off-gassing from mercury compounds

Certain individuals may also have allergic responses, such as dermatitis, from particular minerals.

Label all known hazardous materials.

6. *Why are cellulose nitrate and diacetate negatives hazardous?*

Both aging cellulose nitrate and acetate film off-gas chemicals that can be irritants and toxic hazards. Cellulose nitrate emits nitrogen oxide gas, which has a sweet odor; cellulose acetate emits acetic acid, which has a sharp vinegar odor.

Cellulose nitrate is also volatile and flammable. Motion picture film is especially dangerous and in extreme cases has been known to self-ignite when stored improperly. The by-products can also cause deterioration of other materials stored in the same space.

Acute symptoms include:

- eye irritation
- rashes and sores on the face and skin
- vertigo
- nausea
- headaches
- swollen glands
- respiratory irritation and difficulty breathing

Repeated exposure by inhalation to the emissions of these deteriorating films may result in chronic symptoms, such as bronchia irritation or development of an emphysema-like condition. See Appendix M: Management of Cellulose Nitrate and Ester Film, for more information on the hazards of cellulose nitrate and acetate film.

In addition, the silver salts present in negative emulsions may irritate the skin.

7. *How can I protect myself when working with cellulose nitrate and acetate film?*

To protect yourself when working with nitrate and acetate film follow these steps:

- Plan for your project. Make sure you have the required work-space, equipment, and time. Identify any special protective equipment you will need.
- Ensure that the workspace has proper ventilation to remove emitted gases from your breathing zone. See Section C for a discussion of ventilation and respirators.
- Wear goggles unless proper ventilation is established. Do not wear contact lenses. Gases can concentrate under contact lenses causing eye injury and damage to the contact lens.
- Wear plastic gloves (vinyl, latex, nitrile) to minimize the risk of skin irritation. You can wear cotton gloves over the plastic gloves.
- Don't work with nitrate and acetate negatives more than two or three hours a day.

- After each work session, clean the work surface with a solution of baking soda and water. Mix one teaspoon baking soda with one pint of water. This solution neutralizes any acid that the negatives deposit.

- Keep a log in the work area. Note any odors you detect, the time spent each day on the project, and physical discomfort you have during or after work. If you experience any ill effects, notify your supervisor and the park safety officer.

8. *What particular concerns should I have with archival records?*

Other major archival health and safety issues are:

- asbestos that has contaminated records (See *Conserve O Gram* 2/11, Health and Safety Risks of Asbestos.)

- broken glass plate negatives and transparencies, which can be difficult to handle without cutting yourself

- bird, bat, insect, and rodent contaminated materials or flooded materials that may have viral or bacterial contamination, including hantavirus (See *Conserve O Gram* 2/8, Hantavirus Disease Health and Safety Update.)

- chemically or radiologically contaminated records

- mold, fungi, and yeasts, which can cause allergies, asthma, histoplasmosis, and ringworm (See *Conserve O Gram* 3/4, Mold and Mildew: Prevention of Microorganism Growth on Museum Collections.)

9. *What do I need to know about firearms and live ammunition?*

You must inspect all firearms when you acquire them to make sure they are not loaded. Until a historic firearm is examined, treat it as if it were loaded. Inspect all breach loading firearms and pistols for cartridges. Remove any cartridges that you find.

Follow these steps to check a muzzleloader for live ammunition. You will need a wooden dowel smaller in diameter than the firearm's caliber and longer than its barrel.

- Select a safe, dedicated work area. Place the firearm on a padded table. Point the muzzle so nothing will be harmed if it accidentally fires. ***Never stand in front of a firearm's muzzle.***

- Wear leather gloves and safety goggles.

- Be sure the firearm is not cocked.

- Standing to the side of the firearm, gently push the dowel into the muzzle until it stops. Hold the dowel between the thumb and forefinger so that the dowel will be propelled ***between*** the fingers should the firearm discharge. ***Do not hold the dowel in such a way that it can be propelled <u>into</u> your hand.***

- Place a pencil mark on the dowel where it just clears the muzzle of the barrel.

- Gently withdraw the dowel from the barrel.

- Place the dowel on top of the barrel with the pencil mark aligned with the muzzle. If the other end of the dowel extends the full length of the barrel, the weapon is not loaded. However, if the measurement indicates that the dowel stopped forward of the touch-hole, consider the firearm to be loaded with a live round.

- Inform the Park Safety Officer of the potential problem. Label the firearm as unsafe and arrange to store it in a secure space.

- Contact the regional/SO curator for instructions on disarming the weapon.

See *Conserve O Gram* 10/1, Caring for Historic Longarms: Storage and Handling Requirements, for more information on safely disarming weapons.

10. *What do I need to know about small arms ammunition?*

Small arms ammunition includes Revolutionary and Civil War paper musket cartridges; metallic cartridges used in the American West; and contemporary pistol, rifle, and machine gun ammunition from World Wars I and II. These small arms cartridges do not pose a serious risk unless they are damaged. Tests conducted by the U.S. Army, the National Rifle Association, the arms industry, and several fire and insurance companies have repeatedly demonstrated that such ammunition will not detonate by itself. This kind of ammunition requires a direct blow to its primer or a direct spark or flame to detonate the powder. If this ammunition is accidentally detonated when it's not confined within the barrel of a firearm, the pressure drops rapidly. The bullet will fly out of the cartridge with about the same velocity as a cork from a champagne bottle.

Follow these general rules for safely handling small arms ammunition:

- Never attempt to deactivate small arms ammunition. Procedures such as drilling holes in a cartridge case or pulling a bullet to remove the powder and charge can be extremely dangerous. If you must deactivate the ammunition, contact a specialist.

- As with all museum collections, prohibit smoking.

- In parks with large collections, store live cartridges in a separate museum specimen cabinet. Clearly label the cabinet with a warning sign to notify fire-fighting personnel.

- If you want to put fixed ammunition on exhibit, it must be rendered inert. Contact the regional/SO curator for guidance in rendering ammunition inert.

11. *What do I need to know about unexploded munitions?*

Unexploded munitions (e.g., cannon balls, Borman fuses, grenades, artillery projectiles) constitute a major health and safety risk.

Treat any unexploded ordnance discovered in a collection with extreme caution. Considerations for the safety of staff, visitors, and resources take precedence over the preservation of even rare ordnance.

Don't handle this material unless you have received specific training and authorization in writing by the superintendent. If you discover ordnance that you suspect is unexploded, immediately take the following steps:

- Do not move or disturb the object.
- Keep all other persons away from the object. Secure the storage space.
- Notify the Chief Park Ranger or other designated protection officer and the Park Safety Officer. Contact the regional/SO curator.
- Work with the Chief Park Ranger and the regional/SO curator to have the object(s) examined and evaluated by an appropriate authority to identify the type of ordnance, manufacturer, historic period, and significance.

If the object is rare, novel, or limited in production (for example, Whitworth projectile, Armstrong projectile, Confederate Mullane projectile) or is identified in the park's approved Scope of Collection Statement, make every attempt to defuse it and preserve the inert object in the collection.

12. *What types of hazardous medical objects and drugs/ chemicals are in collections?*

Museum collections can contain a variety of hazardous medical objects and drugs/chemicals.

Handle old medical equipment and medicine or chemical bottles with extreme caution.

Knives, saws, scissors, and other objects from military and civilian medical kits may still carry viable germs and may contain active toxic substances (for example, strychnine, opium, and morphine). The active ingredients of drugs or chemicals, originally very potent, may have become even more potent over time. Drugs, medicinals, and other preparations in pharmaceutical collections may contain toxic materials and/or controlled substances (for example, narcotics). The Controlled Substances Act of 1970 regulates these types of substances. Watch for bottles containing:

- acids and other corrosive liquids (for example, nitric acid)
- fuels (for example, kerosene, naptha®)
- solvents (for example, paint thinners, turpentine)

These chemicals are hazardous and pose the threat of fire. Very often old chemicals contain such labels as "Oil of Vitriol" (sulfuric acid) and "Aqua Fortis" (nitric acid).

13. *What should I do with medical objects and drugs/chemicals?*

Survey the park's collections to determine if they contain any drugs, medicinals, or other preparations that pose potential health or safety hazards. Report findings to the park Safety Officer. If the survey identifies that such materials are in the collection, notify the regional/SO curator and regional Risk Manager and proceed with the following steps:

- Prepare an inventory of the drugs and medicinal chemicals. Start with the containers that have labels. Include the following information in the inventory:
  - name of the substance
  - all information on the label
  - type of container (for example, glass bottle, metal canister, cardboard box) and its lid or stopper
  - condition of container (for example, condition of seal; cracked, chipped bottle; rusty metal; punctured box)
  - other (for example, strong odor being emitted from container)
- List material that cannot be identified and isolate it on a separate shelf for a more detailed examination. Agents of the U.S. Department of Justice, state agencies (such as state crime labs), local pharmacists, and local pharmaceutical manufacturers can provide assistance with identifying this material.
- Conduct a detailed examination. Based on the inventory list or an examination by appropriate specialists, divide the substances into the following groups:
  - "over-the-counter" preparations that are considered non-toxic if precautions are followed and that are not controlled substances
  - non-controlled drugs or preparations that may be toxic or potentially hazardous in some applications or that would require a physician's prescription to get today
  - controlled substances (such as narcotics and dangerous drugs) as defined by the Controlled Substances Act of 1970
  - drugs that may pose a health/safety hazard because of their age or level of deterioration
- Implement an action plan. Based on your inventory and on the detailed examination, pursue the following actions:

If drugs, medicinals, and preparations…	Then you should…
are not controlled, are non-toxic (with usual precautions), and pose no other hazards to the rest of the collection or to the staff,	retain them.
are not controlled but may be toxic or require a prescription to obtain,	retain them only if they are stable and pose no health- hazards to the staff or risk to the rest of the collection. House this material in a locked utility cabinet.

If these materials will become a hazard in the future, consider depositing a sample with the Division of Medical Sciences at the Smithsonian Institution, National Museum of American History (NMAH) and destroying the remainder. This ensures that future staff will not be exposed to hazards from these substances. Check with the division in advance to determine what size sample to save.

- Destroy drugs and medical chemicals that are:
  - controlled substances as defined by the Controlled Substances Act of 1970
  - so toxic that their continued presence in the collection poses an unacceptable risk
  - an immediate hazard to the rest of the collection or the staff because they are dangerously unstable, corrosive, or explosive

If you must destroy material, for whatever reason, retain a small sample for research and reference purposes, and deposit it with the Division of Medical Sciences at the NMAH. Take, account for, and transmit samples of controlled substances in accordance with Drug Enforcement Administration (DEA) procedures. Contact the DEA for assistance. If the specimen to be destroyed is not a controlled substance, contact the Regional Hazardous Waste Coordinator for instruction on proper disposal of the material.

14. *What should I do with original containers?*

Take into account preservation of the original containers when saving or destroying drugs and medical chemicals in the collection. You can open an original, unopened container for the purpose of removing its contents only when:

- the act of opening will not permanently damage the container or diminish its value
- there are urgent and compelling health and safety reasons for opening the container
- the contents are endangering the container (for example, by corrosion) and removal of the contents is the only way to stop the problem

- the act of opening the container poses no safety problem (for example, container exploding or releasing toxic material)

If you are keeping substances in the collection, you may want to transfer them to modern containers. Do this if the original containers can no longer hold them safely. Preserving the original containers is a high priority.

If your collections include original, unopened containers of substances that must be destroyed to comply with the law, the containers are in good condition and thus would not have to be opened otherwise, but can't be opened without causing unacceptable permanent damage, then the containers and their contents shall be deaccessioned (out of scope) and transferred to the Division of Medical Sciences at the Smithsonian Institution.

Keep full descriptive information about the transferred objects, including one or more photographs, with the park's catalog records. Refer to *MH-II*, Chapter 6: Deaccessioning, for information on deaccessioning hazardous material.

When substances in the collection are to be destroyed, save the original containers. Previously opened containers may be emptied as necessary with routine precautions taken for their preservation. Clean emptied containers thoroughly before returning them to storage or exhibit.

If the container held a controlled substance, NO residue may remain in the container according to DEA regulations.

F. Safety Rules for Lifting and Carrying

Chapter 6 in this handbook discusses the importance of using proper techniques when lifting and carrying museum objects. Improper handling techniques may lead to accidental damage to the object. You may injure yourself by improperly lifting and carrying boxes of objects, furniture, and other large and heavy objects. Safely lifting and carrying museum objects requires planning.

1. *How should I plan for lifting and moving objects?*

Careful planning before lifting and moving objects can minimize the chance of injury. Follow these guidelines:

- Consider the size and weight of the load and ask for help if the object is too heavy or bulky to lift and carry safely by yourself.
- Examine the objects for hazards: sharp or broken edges, or contamination, such as mold, or asbestos.
- Have mechanical help at hand. Use a push cart or handtruck to move heavy or bulky objects.

2. *How do I lift and carry an object safely?*

Follow these rules:

- Get close to the object.
- Keep your back ***straight*** (not arched) when lifting.
- Keep head high and chin tucked.
- Keep feet apart, one foot ahead and one foot behind, to maintain a wide base of support.
- Use legs to help with the lift.
- Push or pull large, heavy objects on a cart, when possible, rather than carry them.
- Use teamwork and good communication when two or more are helping with a load.
- Pivot your feet rather than twisting them when turning with a load.

3. *How do I reach for an object safely?*

Follow these rules to avoid injury when reaching for museum objects.

- Use a step stool for objects slightly out of reach.
- Use an appropriate and sturdy ladder to reach objects on high shelves.
- Maintain proper posture when reaching overhead.
- Store heaviest objects between knee and chest height.

G. Workspace Conditions

1. *What makes a safe and healthy curatorial workspace?*

A safe and healthy curatorial work environment includes good lighting, ventilation, good housekeeping, appropriate type and number of fire extinguishers, and a comfortable chair. Consult with your safety officer on steps that you can take to improve your workspace. You can find information about creating or improving your workspace by referring to sources in Section I, Web Resources, and Section J, References.

2. *When should I worry about radon?*

Radon may be a concern in some curatorial workspaces, especially in basements or certain well-sealed spaces. The natural disintegration of uranium generates radon gas. Radon is prevalent in areas where soils and rocks naturally contain uranium, phosphates, and pitchblende. It may also be a problem where the soil is contaminated with the by-products from uranium or phosphate mining. This colorless, odorless gas seeps into structures through dirt floors, cracks in concrete floors and walls, floor drains, sumps, slab joints, and cracks and pores in concrete block walls. Radon tends to accumulate in enclosed spaces. Levels of radon depend on the structure's construction and on the concentration of radon in the soil.

Radon in the short-lived gaseous state is not harmful. However, the gas breaks down into radioactive particulates (for example, heavy metals) called "radon daughters." These radioactive decay products attach themselves to dust or exist as free ions. If you inhale these particles, they can become trapped in the lung tissues and eventually cause lung cancer. Curatorial staff should determine if there is a potential radon problem in museum collection spaces, especially in work and storage areas (for example, basements or well-sealed spaces).

3. *How do I know if there is radon in my workspace?*

Discuss a radon monitoring program with the park Safety Officer or the Regional Risk Manager. Radon may already have been identified in park structures.

If radon levels have not been determined, request a short-term screening measurement. There are numerous types of monitoring equipment. Work with an individual who has experience and training in monitoring. For assistance in finding individuals experienced in testing for radon you can contact your state radon office. Contacts are listed on the EPA website at <http://www.epa.gov/iaq/contacts.html>. You can also contact the EPA at: U.S. Environmental Protection Agency, Office of Radiation and Indoor Air, Indoor Environments Division (6609J), 401 M Street SW, Washington, DC 20460; (202) 564-9370; fax: (202) 565-2038.

The amount of radon in the air is measured in "picocuries of radon per liter of air," or "pCi/L." Sometimes test results are expressed in Working Levels (WL). A level of 0.02 WL is equal to about 4 pCi/L.

Practical remediation methods typically can reduce the indoor radon concentrations to well below 4 pCi/L, the current EPA action level for all occupied buildings. EPA indicates that most structures can be reduced readily to below 2 pCi/L.

4. *What do I do if there is a radon problem in the workspace?*

Work with other park staff to reduce the flow of radon into the space. The methods for reducing radon flow include covering exposed earth and sealing cracks and openings (for example, pores in concrete blocks, openings around utility pipes, joints between basement floors and walls, floor drains). This method can achieve the desired reduction in radon levels at small cost. You must implement this method before using other methods. If the radon remains at an unacceptable level, try one or both of the following methods:

- Ventilate the space with natural, forced, or heat recovery systems. Ventilation reduces radon levels by replacing radon-laden indoor air with outdoor air. Change in ventilation, however, may cause problems maintaining the appropriate environment for museum objects.

- Install a system to keep radon from entering space. These more expensive methods include drain-tile suction, sub-slab suction, and block-wall ventilation prevention of space depressurization, and space pressurization.

For a detailed discussion on radon reduction methods, get a copy of the EPA publication *Consumer's Guide to Radon Reduction: How to Reduce Radon Levels in Your Home* (1992) from the nearest EPA Regional Office, or download it from the EPA Website at <http://www.epa.gov/iedweb00/radon/pubs/consguid.html>.

H. Glossary*

Acute conditions: severe, often dangerous conditions in which relatively rapid changes occur

Acute exposure: intense exposure to a hazardous substance over a relatively short period of time

Boiling point: temperature at which the vapor pressure of a liquid equals atmospheric pressure or at which the liquid changes to a vapor. The boiling point is usually expressed in degrees Fahrenheit. *If a flammable material has a low boiling point, it indicates a special fire hazard.*

Breathing Zone: ambient environment in which a person performs normal respiration (around nose and mouth)

Ceiling ("C"): concentration of a substance that should not be exceeded, even for an instant. It may be written as Threshold Limit Value-Ceiling or TLV-C.

Carcinogen: substance or physical agent that may cause cancer in animals or humans

Chronic conditions: persistent, prolonged, or repeated conditions

Chronic exposure: exposure occurring over a period of days, weeks, or years

Combustible liquids: liquids with flash points at or above 100°F (37.8°C) or those that will burn. They do not ignite as easily as flammable liquids. However, combustible liquids can be ignited under certain circumstances, and must be handled with caution. (Substances, such as wood and paper are termed "ordinary combustibles.")

Flammable liquids: liquids with flash points below 100°F

Flash Point: lowest temperature at which a liquid gives off enough vapor to form an ignitable mixture and burn when a source of ignition (e.g., sparks, open flames, cigarettes) is present. Two tests are used to determine the flash point: open cup and closed cup. The test method is indicated on the MSDS after the flash point.

Hazardous material: chemical or mixture of chemicals that is toxic, highly toxic, an irritant, a corrosive, a strong oxidizer, a strong sensitizer, combustible, flammable, extremely flammable, dangerously reactive, pressure-generating, or otherwise may cause substantial personal injury or substantial illness during or as a direct result of any customary or reasonable foreseeable handling or use

Lower Explosive Limit (LEL): lowest concentration of a substance that will produce a fire or flash when an ignition source (for example, flame, spark) is present. It is expressed in percent of vapor or gas in the air by volume. Below the LEL the air/contaminant mixture is theoretically too "lean" to burn.

Mutagen: anything that can cause a change (or mutation) in the genetic material of a living cell

Narcosis: stupor or unconsciousness caused by exposure to a chemical substance

Odor threshold: minimum concentration of a substance at which a majority of test subjects can detect and identify the substance's characteristic odor

Permissible Exposure Limit (PEL): exposure limit that is published and enforced by OSHA as a legal standard. PEL may be a time-weighted-average (TWA) exposure limit (8 hour), a 15-minute short-term exposure limit (STEL), or a ceiling (C). The PELs are found in Tables Z-1, Z-2, or Z-3 of OSHA regulations 1910.1000.

Reactivity: substance's susceptibility to undergoing a chemical reaction or change that may result in dangerous side effects, such as explosion, burning, and corrosive or toxic emissions. The conditions that cause the reaction, such as heat, other chemicals, or mixing with water and dropping, will usually be specified as "Conditions to Avoid" when a chemical's reactivity is discussed on a MSDS.

Short Term Exposure Limit (STEL): maximum concentration to which workers can be exposed for a short period of time (15 minutes) for only four times throughout the day with at least one hour between exposures

Threshold Limit Value (TLV): airborne concentrations of substances established by the ACGIH that represent conditions under which it is believed that nearly all workers may be exposed day after day with no adverse effect. TLVs are advisory exposure guidelines, not legal standards, that are based on evidence from industrial experience, animal studies, or human studies when they exist. There are three different types of TLVs: Time Weighted Average (TLV-TWA), Short Term Exposure Limit (TLV-STEL), and Ceiling (TLV-C).

Time Weighted Average (TLV-TWA): average time, over a given work period (for example, 8-hour workday), of a person's exposure to a chemical or an agent. The average is determined by sampling for the contaminant throughout the time period.

Toxicity: potential of a substance to exert a harmful effect on humans or animals and a description of the effect and the conditions or concentration under which the effect takes place

Trade name: commercial name or trademark by which a chemical is known. One chemical may have a variety of trade names depending on the manufacturers or distributors involved

Upper Explosive Limit (UEL): highest concentration (expressed in percent of vapor or gas in the air by volume) of a substance that will burn or explode when an ignition source is present. Theoretically, above this limit, the mixture is said to be too "rich" to support combustion. The difference between the LEL and the UEL constitutes the flammable range or explosive range of a substance. That is, if the LEL is 1 ppm and the UEL is 5 ppm, then the explosive range of the chemical is 1ppm to 5 ppm.

Vapor: gaseous form of substances that are normally in the liquid or solid state (at normal room temperature and pressure). Vapors evaporate into the air from liquids, such as solvents. Solvents with low boiling points will evaporate readily.

* This glossary was prepared by excerpting selected terms and definitions from the Glossary (Appendix D), 1161-1234, in *Fundamentals of Industrial Hygiene* (Second Edition), edited by Julian B. Olishifski.

K. List of Figures

Dilution Ventilation	
Advantages	***Disadvantages***
• low equipment and installation costs	• does not eliminate exposure to contaminated area
• effective control for small amounts of low and medium toxicity solvents	• should not be used for high toxicity vapors and gases
• effective control for flammable and combustible gases and vapors	• should not be used for large amounts of gases and vapors
• requires little maintenance	• ineffective for particulates (dust, metal particles, metal fumes)
	• requires large volumes of heated or cooled make-up air
	• not effective for handling surges of gases or irregular emissions
	• people working close to contaminant source can still have large exposures
Local Exhaust Ventilation	
Advantages	***Disadvantages***
• captures contaminants at source and removes them from workplace	• system design and installation can be expensive
• can handle all types of contaminates, including dusts, metal fumes, etc.	• requires regular cleaning, inspection and maintenance
• requires small amounts of make-up air since uses low exhaust volumes	
• low on-going energy costs because of low amounts of make-up air	
• only alternative for high toxicity airborne materials	

Figure 11.1. Comparison of Dilution and Local Exhaust Ventilation (after Clark, et. al., 1984).

Section 3 - Hazards Identification

EMERGENCY OVERVIEW

Appearance: not available. Flash Point: 50 deg C. **Danger! Flammable liquid.** May cause allergic skin reaction. This substance has caused adverse reproductive and fetal effects in animals. May cause central nervous system depression. Cannot be made non-poisonous. May cause liver and kidney damage. Causes eye and skin irritation. Causes digestive and respiratory tract irritation. May be fatal or cause blindness if swallowed. Contains formaldehye. Respiratory sensitizer. Potential cancer hazard. Vapor harmful.
Target Organs: Kidneys, central nervous system, liver.

Figure 11.3. Material Safety Data Sheet for Formaldehyde Solution (Reproduced by permission of Fisher Scientific.)

Potential Health Effects

Eye: Causes eye irritation. May cause chemical conjunctivitis and corneal damage.
Skin: Causes skin irritation. May cause skin sensitization, an allergic reaction, which becomes evident upon re-exposure to this material. May cause cyanosis of the extremities.
Ingestion: May be fatal or cause blindness if swallowed. Causes gastrointestinal irritation with nausea, vomiting and diarrhea. May cause liver and kidney damage. May cause central nervous system depression, characterized by excitement, followed by headache, dizziness, drowsiness, and nausea. Advanced stages may cause collapse, unconsciousness, coma and possible death due to respiratory failure. May cause central nervous system depression.
Inhalation: Inhalation of high concentrations may cause central nervous system effects characterized by headache, dizziness, unconsciousness and coma. Causes respiratory tract irritation. May cause asthmatic attacks due to allergic sensitization of the respiratory tract. Aspiration may lead to pulmonary edema. Vapors may cause dizziness or suffocation. May cause burning sensation in the chest.
Chronic: Repeated exposure may cause skin discoloration and thickening and nail decay. Repeated inhalation is associated with nasal and nasopharyngeal cancer.

Section 4 - First Aid Measures

Eyes: Flush eyes with plenty of water for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately. Do NOT allow victim to rub or keep eyes closed.
Skin: Immediately flush skin with plenty of soap and water for at least 15 minutes while removing contaminated clothing and shoes. Get medical aid if irritation develops or persists. Wash clothing before reuse. Destroy contaminated shoes.
Ingestion: Do NOT induce vomiting. If victim is conscious and alert, give 2-4 cupfuls of milk or water. Never give anything by mouth to an unconscious person. Get medical aid immediately.
Inhalation: Get medical aid immediately. Remove from exposure to fresh air immediately. If not breathing, give artificial respiration. If breathing is difficult, give oxygen.
Notes to Physician: Treat symptomatically and supportively.

Section 5 - Firefighting Measures

General Information: As in any fire, wear a self-contained breathing apparatus in pressure-demand, MSHA/NIOSH (approved or equivalent), and full protective gear. Water runoff can cause environmental damage. Dike and collect water used to fight fire. Vapors may form an explosive mixture with air. Vapors can travel to a source of ignition and flash back. Will burn if involved in a fire. Use water spray to keep fire-exposed containers cool. Containers may explode in the heat of a fire. Flammable Liquid.

Figure 11.3. Material Safety Data Sheet for Formaldehyde Solution (cont.) (Reproduced by permission of Fisher Scientific.)

Extinguishing Media: For small fires, use dry chemical, carbon dioxide, water spray or alcohol-resistant foam. For large fires, use water spray, fog, or alcohol-resistant foam. Use water spray to cool fire-exposed containers. Water may be ineffective. Do NOT use straight streams of water.

Section 6 - Accidental Release Measures

General Information: Use proper personal protective equipment as indicated in Section 8.
Spills/Leaks: Absorb spill with inert material, (e.g., dry sand or earth), then place into a chemical waste container. Avoid runoff into storm sewers and ditches, which lead to waterways. Clean up spills immediately, observing precautions in the Protective Equipment section. Remove all sources of ignition. Use a spark-proof tool. Provide ventilation. A vapor suppressing foam may be used to reduce vapors.

Section 7 - Handling and Storage

Handling: Wash thoroughly after handling. Remove contaminated clothing and wash before reuse. Use only in a well-ventilated area. Ground and bond containers when transferring material. Use spark-proof tools and explosion proof equipment. Avoid contact with eyes, skin, and clothing. Empty containers retain product residue, (liquid and/or vapor), and can be dangerous. Keep container tightly closed. Avoid contact with heat, sparks and flame. Avoid ingestion and inhalation. Do not pressurize, cut, weld, braze, solder, drill, grind, or expose empty containers to heat, sparks or open flames.
Storage: Keep away from heat, sparks, and flame. Keep away from sources of ignition. Store in a cool, dry, well-ventilated area away from incompatible substances. Flammables-area. Keep containers tightly closed.

Section 8 - Exposure Controls, Personal Protection

Engineering Controls: Facilities storing or utilizing this material should be equipped with an eyewash facility and a safety shower. Use adequate general or local exhaust ventilation to keep airborne concentrations below the permissible exposure limits.
Exposure Limits

Chemical Name	ACGIH	NIOSH	OSHA - Final PELs
Formaldehyde	C 0.3 ppm	0.016 ppm TWA; NIOSH Potential Occupational Carcinogen - see Appendix A Potential NIOSH carcinogen.	0.75 ppm TWA PEL; 2 ppm STEL; 0.5 ppm TWA action leve
Methyl alcohol	200 ppm; 250 ppm STEL; skin - potential for cutaneous absorption	200 ppm TWA; 260 mg/m3 TWA 6000 ppm IDLH	200 ppm TWA; 260 mg/m3 TWA
Water	none listed	none listed	none listed

Figure 11.3. Material Safety Data Sheet for Formaldehyde Solution (cont.) (Reproduced by permission of Fisher Scientific.)

OSHA Vacated PELs: Formaldehyde: 3 ppm TWA (unless specified in 1910.1048) Methyl alcohol: 200 ppm TWA; 260 mg/m3 TWA Water: No OSHA Vacated PELs are listed for this chemical.
Personal Protective Equipment
Eyes: Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.
Skin: Wear appropriate protective gloves to prevent skin exposure.
Clothing: Wear appropriate protective clothing to prevent skin exposure.
Respirators: Follow the OSHA respirator regulations found in 29CFR 1910.134 or European Standard EN 149. Always use a NIOSH or European Standard EN 149 approved respirator when necessary.

Section 9 - Physical and Chemical Properties

Physical State: Liquid
Appearance: not available
Odor: None reported
pH: Not available.
Vapor Pressure: Not available.
Vapor Density: >1.0
Evaporation Rate: Not available.
Viscosity: Not available.
Boiling Point: 212 deg F
Freezing/Melting Point:32 deg F
Decomposition Temperature: Not available.
Autoignition Temperature: Not applicable.
Flash Point: 50 deg C (122.00 deg F)
NFPA Rating: Not published.
Explosion Limits, Lower: Not available.
Upper: Not available.
Solubility: soluble in water
Specific Gravity/Density: Not available.
Molecular Formula: Mixture
Molecular Weight: Not available

Section 10 - Stability and Reactivity

Chemical Stability: Stable under normal temperatures and pressures.
Conditions to Avoid: Incompatible materials, ignition sources, excess heat, oxidizers.
Incompatibilities with Other Materials: Strong oxidizing agents.
Hazardous Decomposition Products: Carbon monoxide, oxides of phosphorus, irritating and toxic fumes and gases, carbon dioxide, toxic fumes of sodium oxide.
Hazardous Polymerization: Has not been reported.

Figure 11.3. Material Safety Data Sheet for Formaldehyde Solution (cont.) (Reproduced by permission of Fisher Scientific.)

Section 13 - Disposal Considerations

Chemical waste generators must determine whether a discarded chemical is classified as a hazardous waste. US EPA guidelines for the classification determination are listed in 40 CFR Parts 261.3. Additionally, waste generators must consult state and local hazardous waste regulations to ensure complete and accurate classification.
RCRA P-Series: None listed.
RCRA U-Series: CAS# 50-00-0: waste number U122. CAS# 67-56-1: waste number U154; (Ignitable waste).

Section 14 - Transport Information

	US DOT	IATA	RID/ADR	IMO	Canada TDG
Shipping Name:	FORMALDEHYDE, SOLUTIONS, FLAMMABLE				No information available.
Hazard Class:	3				
UN Number:	UN1198				
Packing Group:	III				

Section 15 - Regulatory Information

US FEDERAL

TSCA
CAS# 50-00-0 is listed on the TSCA inventory.
CAS# 67-56-1 is listed on the TSCA inventory.
CAS# 7732-18-5 is listed on the TSCA inventory.
Health & Safety Reporting List
None of the chemicals are on the Health & Safety Reporting List.
Chemical Test Rules
None of the chemicals in this product are under a Chemical Test Rule.
Section 12b
None of the chemicals are listed under TSCA Section 12b.
TSCA Significant New Use Rule
None of the chemicals in this material have a SNUR under TSCA.
SARA
Section 302 (RQ)
CAS# 50-00-0: final RQ = 100 pounds (45.4 kg) CAS# 67-56-1: final RQ = 5000 pounds (2270 kg)
Section 302 (TPQ)
CAS# 50-00-0: TPQ = 500 pounds; RQ = 100 pounds (does not meet toxicity criteria but because of high production volume and recognized toxicity is considered a chemical of concern)

Figure 11.3. Material Safety Data Sheet for Formaldehyde Solution (cont.) (Reproduced by permission of Fisher Scientific.)

SARA Codes
CAS # 50-00-0: acute, chronic. CAS # 67-56-1: acute, flammable.
Section 313
This material contains Formaldehyde (CAS# 50-00-0, 37%),which is subject to the reporting requirements of Section 313 of SARA Title III and 40 CFR Part 373. This material contains Methyl alcohol (CAS# 67-56-1, 15%),which is subject to the reporting requirements of Section 313 of SARA Title III and 40 CFR Part 373.
Clean Air Act:
CAS# 50-00-0 is listed as a hazardous air pollutant (HAP). CAS# 67-56-1 is listed as a hazardous air pollutant (HAP). This material does not contain any Class 1 Ozone depletors. This material does not contain any Class 2 Ozone depletors.
Clean Water Act:
CAS# 50-00-0 is listed as a Hazardous Substance under the CWA. None of the chemicals in this product are listed as Priority Pollutants under the CWA. None of the chemicals in this product are listed as Toxic Pollutants under the CWA.
OSHA:
CAS# 50-00-0 is considered highly hazardous by OSHA.
STATE
CAS# 50-00-0 can be found on the following state right to know lists: California, New Jersey, Florida, Pennsylvania, Minnesota, Massachusetts.
CAS# 67-56-1 can be found on the following state right to know lists: California, New Jersey, Florida, Pennsylvania, Minnesota, Massachusetts.
CAS# 7732-18-5 is not present on state lists from CA, PA, MN, MA, FL, or NJ.
The following statement(s) is(are) made in order to comply with the California Safe Drinking Water Act: WARNING: This product contains Formaldehyde, a chemical known to the state of California to cause cancer. California No Significant Risk Level: CAS# 50-00-0: no significant risk level = 40 ug/day

European/International Regulations

European Labeling in Accordance with EC Directives
Hazard Symbols:
T
Risk Phrases:
R 10 Flammable. R 23/24/25 Toxic by inhalation, in contact with skin and if swallowed. R 34 Causes burns. R 40 Possible risks of irreversible effects. R 43 May cause sensitization by skin contact.
Safety Phrases:
S 26 In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S 36/37 Wear suitable protective clothing and gloves. S 45 In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible). S 51 Use only in well-ventilated areas.
WGK (Water Danger/Protection)
CAS# 50-00-0: 2
CAS# 67-56-1: 1
CAS# 7732-18-5: No information available.

Figure 11.3. Material Safety Data Sheet for Formaldehyde Solution (cont.) (Reproduced by permission of Fisher Scientific.)

General Rating Summary

Health (Blue)

4	**Danger**	May be fatal on short exposure. Specialized protective equipment required.
3	**Warning**	Corrosive or toxic. Avoid skin contact or inhalation.
2	**Warning**	May be harmful if inhaled or absorbed.
1	**Caution**	May be irritating.
0		No unusual hazard.

Flammability (Red)

4	**Danger**	Flammable gas or extremely flammable liquid.
3	**Warning**	Flammable liquid flash point below 100° F.
2	**Caution**	Combustible liquid flash point of 100° to 200° F.
1		Combustible if heated.
0		Not combustible.

Reactivity (Yellow)

4	**Danger**	Explosive material at room temperature.
3	**Danger**	May be explosive if shocked, heated under confinement, or mixed with water.
2	**Warning**	Unstable or may react violently if mixed with water.
1	**Caution**	May react if heated or mixed with water but not violently.
0	**Stable**	Not reactive when mixed with water.

Special Notice Key (White)

W	Water Reactive
OX	Oxidizing Agent

Chapter 12: Curatorial Funding, Staffing, and Reporting

List of Figures

CHAPTER 12: CURATORIAL FUNDING, STAFFING, AND REPORTING

A. Overview

This chapter will introduce you to:

- **Program** documents required to obtain funding
- **Funding** categories available to pay for preservation, protection, and documentation needs
- **Staffing** requirements for collections care activities
- **Reporting** requirements related to strategic planning

Museum program management requires careful planning. For additional information on NPS museum management planning, see:

- Director's Order #2: Park Planning
- Director's Order #24: NPS Museum Collections Management
- Director's Order #28: Cultural Resource Management and *Cultural Resource Management Guideline* (1997)

B. Basic Museum Program Management Issues

1. *How do I determine my park's museum collections management needs?*

- Become familiar with the park's museum collection. Determine the following:
  - present size and scope, as well as potential growth
  - status of accountability and documentation (accession and catalog records, inventories, and similar materials)
  - security and environment of storage and exhibit spaces
  - use of the collection
  - condition of the collection

  Two effective ways to get to know your collection are to:

  - conduct a 100% inventory
  - refer to the Introduction section of your park's Scope of Collection Statement (SOCS) for information concerning the significance of your collection
- Update the NPS Checklist for Preservation and Protection of Museum

Collections (Museum Checklist). The Museum Checklist is a facility report that rates all museum areas (exhibit, storage, administrative) at a park according to Servicewide preservation and protection standards. Director's Order #24: NPS Museum Collections Management, requires that all parks with museum collections have an up-to-date Museum Checklist.

Having an up-to-date Museum Checklist will help you to:

- better understand the museum conditions at your park
- identify preservation and protection deficiencies
- set priorities to address preservation and protection needs

Project funding for preservation is tied to deficiencies reported on the Museum Checklist. Be sure that your Checklist is as complete and accurate as possible. Include detailed information concerning:

- the nature of each deficiency
- the action needed to address the deficiency
- accurate cost estimates (see Appendix F, Figure 1, Cost Estimates)
- cross-referencing of applicable project proposals
- any additional comments

See Appendix F: NPS Museum Collections Management Checklists, and the *ANCS User Manual*, Appendix G: Automated Checklist Program, for additional information.

- Refer to your park's Collections Management Report (CMR) to determine estimated backlogs and cataloging needs.
- Prepare a list of projects for correcting deficiencies. Divide the list into two categories:
  - needs that can be met by existing park funds and staff (such as revising the Scope of Collection Statement, obtaining pest traps for monitoring, cataloging new accessions, key control and rekeying cabinets)
  - needs that require additional funds and staff (such as building a new collections storage area, assistance with an Emergency Operations Plan, conservation treatments, installing fire and security systems, cataloging the backlog of uncataloged items)
- Prioritize both lists. Begin working on those projects that can be accomplished with existing resources.

2. ***What should my next steps be?***

Refine the list of needs that require additional resources to accomplish:

- Develop accurate cost estimates. See Appendix F, Figure 1, Cost

Estimates. Consult your regional/SO curator and park maintenance staff for additional information.

- Integrate these needs into appropriate park planning documents, such as Project Management Information System (PMIS) Project Statements, Resource Management Plan (RMP), General Management Plan (GMP), Exhibit Plans, and Long-Range Interpretive Plan (LRIP).

- Ensure that collections management project statements are included in the park's Strategic and Performance Plans. Include such project statements in PMIS. Additional information may be contained in the park RMP if that document is being used (see B.5 below). Examples of project statements are:

  - Assess and Catalog Park Archival Holdings
  - Catalog Museum Objects
  - Complete Conservation Treatments
  - Conduct an Appraisal of Museum Property
  - Conduct Collection Condition Survey
  - Conduct Curatorial Training
  - Construct a New Museum Storage Facility
  - Perform Conservation Treatment
  - Prepare Collections Management Plan
  - Prepare/Implement a Historic Furnishings Report
  - Install Fire Detection and Suppression Systems
  - Install Intrusion Alarm System
  - Install Security Systems
  - Store Museum Collections
  - Upgrade Exhibits

  These are but a sampling of the many potential projects that your park may require. Contact your regional/SO curator for additional assistance preparing necessary project statements.

3. ***What plans are useful to identify needs and justify funding requests?***

The results and recommendations of various plans and surveys provide justification for operational support and project funding needed to develop a professional museum management program. In addition to the Collections Management Report and Museum Checklist, the most common plans and surveys used to identify collection management needs are:

- Collection Management Plan (CMP)

- Collection Condition Survey (CCS)
- Collection Storage Plan (CSP)
- Emergency Operations Plan (EOP)
- Exhibit Plan
- Integrated Pest Management (IPM) Plan
- Historic Furnishings Plan (HFP)
- Housekeeping Plan
- Security and Fire Protection Survey
- Structural Fire Plan

You also may seek funding to support these plans and surveys if they are out-of-date or do not exist for your unit.

4. ***Where do I document needs?***

Programming documents are the key to obtaining funds for a project. A well-prepared document results from good planning. At the park level, the GMP, Performance Plan, Strategic Plan and RMP serve as the foundation for park resources management programs. At the Servicewide level, staff document these needs using:

- Project Management Information System (PMIS)
- Operations Formulation System (OFS)

5. ***What is a Resource Management Plan?***

The Resource Management Plan (RMP) is a planning document that contains the park's natural and cultural resource management actions. The RMP includes:

- a summary of the resource status evaluating the condition and documentation of the resources and major threats to them
- an action program based on legislative and executive mandates including:
  - NPS *Management Policies* (2001)
  - NPS Director's Orders (DO): DO #24: Museum Collections Management, DO #28: Cultural Resource Management, and DO #77: Natural Resources Management
  - management zoning and provisions of related planning documents
- individual project statements

6. ***What is the Project Management Information System?***

The Project Management Information System (PMIS) is a Servicewide Intranet-based database. Parks and offices use the program to manage information about requests for project funding. With PMIS, you can submit project proposals to be reviewed, approved and prioritized at park, regional, and Washington Office (WASO) levels.

Project funding is "one-time" money used to support park management goals. Some projects (design projects and others taking more than one year) can be phased, though all project funds have finite time limits.

PMIS allows staff to identify project funding needs and report accomplishments. All NPS employees can search the system. Only designated persons in each park and office can make changes and set priorities. Your regional/SO curator and your park's administrative and maintenance staff will be familiar with PMIS and can probably answer any questions that you may have.

7. ***How can I learn more about museum management programming using PMIS?***

The PMIS program is a good place to see how other parks are managing similar projects and to get ideas to enhance your proposals. After you access the system, you can use keywords within the search function to view a variety of projects. You can search any of the various funding sources, such as Backlog Cataloging, Museum Collection Preservation and Protection, or others. You can also search by park, region, state, or a variety of other criteria. The search function allows you to access project narratives, cost estimates, and information on whether projects have been funded and completed.

Another resource is your regional office staff. Each regional office has subject matter experts in various program areas who are available to assist with planning projects, writing and reviewing PMIS project statements, estimating costs, and identifying targeted funding sources. These individuals will be familiar with program criteria, and the funding process particular to your region. Your regional/SO curator will be able to assist you with your collection management projects and help direct you toward other program managers if your project is interdisciplinary.

> ***Access PMIS on the web at: <http://www.nps.gov/pmis>.***

8. ***What is the Operations Formulation System?***

The Operations Formula System (OFS) is an Intranet-based system designed to meet the needs of parks, regions, and WASO in the development and identification of operating increases needed to support the mission and strategic plan of the NPS.

The OFS system contains all unfounded budgetary requirements of the Service for ongoing or operational needs for the next five fiscal years. OFS does not contain requests for funding of individual projects; PMIS contains all the unfounded project requirements. Both systems contain a limited amount of historical information on funded requests.

The system is interactive and normally available 24 hours a day, seven days a week. After reviews are complete, parks and other program managers should be able to prepare new requests and revise most of the existing requests on their own timetables.

All needs or requests for funding should be represented in either the OFS or PMIS system. The information contained in OFS and PMIS serves as the sole source for formulating the three formal NPS budget requests (to the Department of the Interior, the Office of Management and Budget, and the Congress). In addition, the information will serve as the official NPS response to all internal and external inquiries about unfounded budgetary needs and strategies for addressing these needs.

The superintendent, in consultation with the management staff, generally develops OFS submissions. Ask your administrative staff when the OFS call comes out, and take the opportunity to advocate for your programs if you need more staff.

You can search OFS at <http://www.nps.gov/ofs>.

> ***Don't wait until the OFS call comes out to begin advocating for curatorial needs. Be sure to keep your superintendent, division chief, and administrative staff up-to-date at all times concerning museum programming needs.***

9. *How does the budget process work?*

The budget process can last 21 months or more. At any given time, the NPS is engaged in activities related to three separate fiscal year budgets; one enacted by Congress and those proposed for the next two fiscal years. The proposed budgets include the next fiscal year's Appropriations Bill (not yet enacted) and the following fiscal year's NPS budget proposal.

Each fall the NPS issues a Servicewide Comprehensive Call (SCC) for project and operating increase requests. Parks, regions, and offices enter their requests through the PMIS and OFS systems. They tie their requests to their Government Performance Results Act (GPRA) goals, strategic plans, and business plans. Although requests can be added to the systems at any time, review, approval and prioritization occur in response to the schedule set by the SCC.

The WASO budget office coordinates the entire process for the NPS. Procedures vary from region to region, but the general process from the park perspective is as follows:

- Superintendents and division chiefs identify additional resources needed to operate and maintain the park. They set priorities based on recommendations from park staff.

- Regional associate directors, the regional budget office, and the regional director review the park requests (with assistance from program managers and subject matter experts). They add requests for region-wide programs and regional office staff, and then set regional priorities.

- WASO associate directors and program managers submit projects and increase requests for their office and Servicewide programs.

- The Department and Office of Management and Budget (OMB) provide initial guidance and review of the NPS budget and pass back

required changes.

- The President submits the budget to Congress.
- At the Congressional level, House and Senate Sub-Committees and Committees hold hearings to determine what will be included in the appropriations. Votes of the House and Senate result in an appropriations bill that is sent to the President for signature.

Background and current information on the NPS budget process can be found on the Web at: <http://www.nps.gov/budget>.

C. Developing Funding Requests

1. *What are the characteristics of a good funding request?*

A well-written request (project statement) should provide a concise description and justification, and identify expected results. Conduct research to determine how much time the project will take. Contact colleagues in other parks who have conducted similar projects, or contact your regional/SO curator and regional program specialists to help with costs estimates. When writing a project statement, answer the following questions:

- What is the project?
- Why is the project important?
- What problems, needs, or deficiencies will the project address?
- How much will the project cost?
- How will the funds be spent?
- What is the schedule for completion?

Make sure to do the following:

- Be certain that project statements address all criteria outlined in the SCC, the regional budget call and related guidance from Washington associate directors.
- Enter the eligible funding source(s) for each project in PMIS.
- Plan ahead to allow time for internal and external review of your project statement.
- Link desired results to your annual GPRA goals (see Section E. below).

See Figure 12.2 for a sample PMIS project statement and Figure 12.3 for a sample OFS statement.

Remember: The person reviewing these documents won't be familiar with the problem. Submit clear and detailed project statement to have a better chance of being approved.

2. ***How do I prioritize short-term and long-term collection management needs?***

Short-term and long-term priorities depend on your park's mission, existing resources (staffing and funding), and resource management goals. Your Collection Management Plan, Museum Checklist, and Collections Management Report will help you start to identify and prioritize short-term and long-term funding needs.

Review the following park reports, surveys, and planning documents to help set priorities:

- General Management Plan (GMP)
- Development Concept Plan (DCP)

Museum Plans:

- Archival Assessments (see the *Museum Handbook*, Part II, Appendix D)
- Collection Condition Surveys (see *Museum Handbook*, Part I [*MH-I*], Chapter 3)
- Collection Storage Plans (see *MH-I*, Chapter 7)
- Environmental Surveys (see *MH-I*, Chapter 4)
- Emergency Operations Plan (see *MH-I*, Chapter 10)
- Fire Protection Surveys (see *MH-I*, Chapter 9, and Appendix G)
- Historic Furnishing Reports (see *Museum Handbook*, Part III, Chapter 8 [forthcoming]).
- Housekeeping Plans (see *MH-I*, Chapter 13)
- Integrated Pest Management Plan (see *MH-I*, Chapter 5)
- Security Surveys (see *MH-I*, Chapter 9, and Appendix G)
- Structural Fire Plans (see Director's Order #58: Structural Fire Management, *MH-I*, Chapter 9, and *MH-I*, Appendix G)

These reports generally provide a list of priorities in their recommendations. You can probably accomplish some of these recommendations using base funds (see Section D., below). Others will require special funding. When contracting for these reports and plans, include a requirement for a list of prioritized recommendations with funding estimates in the project Scope of Work.

Planning documents developed in other park divisions, such as Interpretation, History, and Maintenance will often have an impact on collections management. Examples are:

- Archeological Overview and Assessment
- Long-Range Interpretive Plan
- Historic Resource Studies
- Historic Structures Reports

Review these documents to ensure that applicable collections management needs are addressed. Also, be sure to brief these same divisions on museum activities that may affect their operations, or if you require their assistance in implementing your programs.

3. ***How do I prioritize specific projects?***

You may want to ask your regional/SO curator to help you identify priorities for your park. In some cases, projects need to take place in a specific progression. For example, a condition assessment is needed prior to conservation treatment, and a security survey is needed prior to the installation of a security system. For additional information concerning the relationships among the various planning documents see Chapter 3: Preservation: Getting Started, Chapter 9: Museum Collections Security and Fire Protection, Chapter 10: Emergency Planning, Chapter 13: Museum Housekeeping, Appendix F: NPS Collections Management Checklists, and Appendix G: Protection of National Park Service Museum Collections.

4. ***How do I determine which curatorial activities can be accomplished with current staff and funding?***

Parks with museum collections have a curator, museum specialist, museum technician, archivist, archives technician, or a person assigned collection management responsibilities as a collateral duty. Ongoing tasks should be conducted by park staff with base funds. Examples include:

- routine housekeeping in exhibit and storage areas
- monitoring for pest activity
- monitoring environmental conditions
- accessioning newly acquired objects
- cataloging objects in ANCS+
    - new acquisitions
    - backlog acquired since 1987 (pre-1987 backlog items are eligible for Backlog Cataloging funds)
    - re-cataloging
- completing and updating the Museum Checklist and Collections Management Report
- answering research requests

- developing project statements for improvements to the park's collections management program

- providing access to collections, such as mounting new exhibits (including Web-based) or assisting researchers

Document the ongoing curatorial workload, accomplishments, and related costs as follows:

- identify the major museum collections management work activities that need to be done

- maintain a general accounting of the hours spent on each major activity

- assess whether the work was fully, partially, or not completed

- keep a record of the costs of curatorial supplies and materials

Use these data annually to help identify any funding needed to fully complete the major work activities. This information supports OFS requests for increased park base funding.

5. ***What kinds of activities require project funding?***

Additional funds are often required to prepare planning documents, surveys, or reports. Other special projects requiring funding include:

- designing and constructing new storage facilities

- improving existing storage

- contracting for exhibit design and fabrication

- contracting for Web-based exhibit design, production, and launch

- obtaining conservation treatment

- installing environmental systems

- contracting for cataloging

6. ***What resources are available to assist in preparing funding requests?***

Obtain assistance in preparing documents by:

- researching successfully funded projects in the PMIS and OFS databases

- requesting assistance from your regional/SO curator

- contacting colleagues who have completed similar park projects

D. Sources of Funding for Collections Management

1. *What are the funding sources for NPS collections management?*

NPS funding is divided into two categories:

- Park Operations (also called Park Base)
- Project Funds

2. *How are base funds used?*

Base funds should support ongoing requirements for collection management, including curatorial staff, clerical support, curatorial supplies and equipment, and travel to training courses and professional conferences. The park's collection management program should have a sufficient funding base to complete all major curatorial activities. Ongoing operations should not be financed with project funds.

The size, nature, and complexity of a park's museum collection are major factors in determining workload. Base funds should be directed at:

- program accountability, documentation, and record keeping
- preventive conservation for objects in storage and on exhibit
- maintenance of security and fire protection systems
- providing for access and use of the collections

Submit requests for base increases in OFS (see Section B.8).

3. *What cultural resource project funds are available for museum collections?*

Project funding is available for cultural resource projects that support the *NPS Strategic Plan* long-term goals and address museum collections. Specific funding programs are:

- **Cultural Cyclic Maintenance.** Projects include repair of a historic property, when its condition warrants, with the least degree of intervention including replacement in-kind, or replacing an entire feature in-kind when the level of deterioration or damage of materials precludes repair. For archeological sites it includes work to moderate, prevent, or arrest erosion. For museum objects it includes actions to prevent damage and to minimize deterioration by practicing preventive conservation or by performing suitable treatments on objects themselves. Such work is performed less than once a year.

- **CRPP—Cultural Resources Preservation Program Base.** Projects include inventory, evaluation, documentation, research, stabilization, and conservation of park resources, including completion of the systemwide resources databases and preparation and publication of professional reports not addressed under other funding sources. Preferred projects include those that provide basic inventory and evaluation data for planning, treatment, protection, management, and interpretation needs; provide National Register documentation; address common resource needs of multiple parks; and respond to accepted findings of the General Accounting Office (GAO) and Inspector General (IG). Projects produce archival material and sometimes

objects that must be cataloged into the museum collections and properly stored. Review cultural resource projects to ensure that these costs are included.

- **CRPP—Museum Collections Backlog Cataloging. (For Post-1987 Collections).** Projects are to catalog previously uncataloged collections. The backlog must be identified on the previous year's Collections Management Report on file with Museum Management Program (MMP), National Center for Cultural Resources. Costs should be consistent with the range of costs in the *Museum Handbook*, Part II, Appendix B. Costs at variance should be explained in the PMIS statement. This activity supports the *NPS Strategic Plan* long-term goal Ib2D. Regions should give priority to projects that commit to mounting the resulting catalog data on the *Web Catalog* and projects that catalog nitrate film that must be cataloged prior to reformatting. **Note:** These funds address the needs of the post-1987 collections acquisitions.

- **Museum Collections Backlog Cataloging. (For Pre-1987 Collections).** Projects include the cataloging of the backlog of uncataloged objects acquired prior to January 1, 1987. Projects include activities essential to cataloging, such as completing catalog worksheets, entering catalog data in the Automated National Catalog System (ANCS+), photographing objects as part of the cataloging process, and purchasing computer equipment to accomplish these tasks. The backlog must be identified on the previous year's Collections Management Report on file with the MMP. Costs should be consistent with the range of costs in the *Museum Handbook*, Part II, Appendix B. Costs at variance should be explained in the PMIS statement. This activity supports the *NPS Strategic Plan* long-term goal Ib2D.

- **CRPP—Systemwide Archeological Resources Inventory (SAIP).** Projects include archeological overviews and assessments, identification and evaluation studies, database documentation using the Archeological Sites Management Information System (ASMIS), National Register nominations and other activities consistent with program requirements, standards and priorities set forth in the *National Park Service's Systemwide Archeological Inventory Program* publication (October 1992), and the priorities established in each region's archeological inventory plan. Projects produce archival material and sometimes objects that must be cataloged into the museum collections and properly stored. Review cultural resource projects to ensure that these costs are included.

- **Museum Collections Preservation and Protection.** Projects include correcting preservation and protection deficiencies identified in each park's and center's Checklist for Preservation and Protection of Museum Collections. Parks and centers must have an up-to-date Museum Checklist on file with MMP. Costs should be consistent with the range of costs in the *Museum Handbook*, Part I, Figure F.1. Costs at variance should be explained in the PMIS statement. This activity supports the *NPS Strategic Plan* and long-term goal Ia6.

- **Park Native American Graves Protection Projects.** Projects include cultural affiliation and lineal descendent studies; consultations related

to inadvertent discoveries, repatriation, planned excavations, modifications in the Summary and Inventory, and development of Memoranda of Understanding and preparation of Written Plans of Action regarding planned excavations and inadvertent discoveries per 43 CFR 10.5 (e); updating of related ANCS+ records. For additional information see *Museum Handbook*, Part II (*MH-II*), Chapter 6: Deaccessioning, Section N, Native American Graves Protection and Repatriation Act and *Cultural Resource Management Guideline*, Appendix R, NAGPRA Compliance.

Access the current National Park Service Strategic Plan on the web at: <http:// www.nps.gov/performance>.

4. ***What natural resources funding programs directly support museum collections?***

There are no natural resource management funds that support the curation or long-term care and maintenance of existing natural history collections. However, in accordance with Director's Order #24: NPS Museum Collections Management, you must ensure that all project budgets include funding for the basic management of any project-generated collections. Basic collections management includes cataloging, labeling, conservation, examination, treatment, specimen preparation, initial storage of objects and specimens, and organization and storage of project documentation.

5. ***Are there any collections management requirements for projects that generate collections?***

Yes, as noted above, Director's Order #24 requires all project budgets to include funding for the basic management of any project-generated collections. Archeological projects generate field records (archives) [see *MH-II*, Appendix D for additional information] and often recover objects that must be accessioned as museum collections. These field records and objects must be cataloged and stored properly for long-term preservation and access. Likewise, other resource management projects such as fire effects projects, inventorying and monitoring projects, Historic Landscape Reports, Ethnobotanical Studies, Historic Resource Studies, oral histories, Ethnographic Overview and Assessments, National Register nominations, and Historic Structure Reports generate archival collections (and may also generate objects and specimens) that must be accessioned and curated in an appropriate facility. Be sure to include adequate funding for cataloging and curation in all project cost estimates.

6. ***What other NPS fund sources can be used to support museum projects?***

Additional funding programs that you can use to support museum projects include:

- **Challenge Cost-Share.** This program provides a maximum of 50% cost-share grant to expedite and complete mutually beneficial projects with outside sources. The purpose is to increase awareness and participation by both neighboring communities and the public at large in the preservation and improvement of NPS recreational, cultural, and natural resources. Park partners include individuals, groups, companies, corporations, state and local agencies, and other non-federal entities that will donate funds, equipment, supplies, or in-kind labor to complete a park project. Projects are generally intended to be small, able to be completed in one year, and consistent with park planning documents.

- **Concessions Franchise Fees.** Fees for concessioner activities are retained entirely by the NPS (80% by the collecting park) for training, the repair and rehabilitation of facilities (including historic structures used by concessioners and NPS exhibits within concession buildings), roads, and utility systems, and other concessions-related projects.

- **Donations.** Although parks cannot solicit donations, they are authorized to accept and use donated funds to meet the purposes of the National Park Service. Use of these funds is strictly controlled, must be consistent with legislative authority, and must meet with the approval of the grantor. Individual park accounts are established for specific-purpose donations (such as a museum management account). A general donation account, not specific-purpose in nature, is also available.

> ***Director's Order #21: Donations and Fundraising, Section 3.1 states that "…neither the NPS nor its employees has authority to solicit donations."***

- **National Parks Pass.** Fees collected from the sale of the National Parks Pass (minus administrative costs) are retained by the NPS (70% by the collecting park) and are available to fund various park projects, including museum and other cultural resource management projects. Funds not retained by the collecting parks (30% of the total) are available to finance various projects at other parks that do not sell the National Parks Pass.

- **Exhibit Rehabilitation and Preservation.** Projects include the repair, rehabilitation or replacement of films, videos, and equipment and visitor center or wayside exhibits. Funding also provides for the preservation of artifacts and museum specimens, and the acquisition of historic furnishings.

- **Recreational Fee Demonstration Program.** Fees collected at participating parks are retained by the NPS (80% by the collecting park) and are immediately available to fund various park projects, including museum and other resource management projects. Funds not retained by the collecting parks (20% of the total) are available to finance various projects at other parks not involved in the Recreational Fee Demonstration Program.

- **Regular Cyclic Maintenance.** Funds are used to maintain park roads, trails, buildings, utility systems, and other facilities on a fixed periodic basis as long as the cycle is longer than one year but no longer than ten years. Budget submissions for the cyclic maintenance program are extracted from the park's ten-year cyclic maintenance program. The work may require the preparation of simple designs and specifications and is performed by contract or day labor. Funding may not be used for new construction without clearance from the regional office and WASO.

- **Repair and Rehabilitation.** Funding is used to cover the cost of repair and rehabilitation of existing facilities, roads, trails, and utility systems.

Funding may not be used for new construction without approval from the regional office and WASO.

- **Save America's Treasures.** Grants are available for preservation and/or conservation work on nationally significant intellectual and cultural artifacts and nationally significant historic structures and sites. A grant requires a dollar-for-dollar non-Federal match. The minimum grant request for collections projects is $50,000 Federal share; the minimum grant request for historic property projects is $250,000 Federal share. The maximum grant request for all projects is $1 million Federal share.

- **Volunteers-in-Parks (VIP).** Funding is available for incidental expenses such as uniforms, period clothing, local travel, supplies, lodging, meals, and other direct costs chargeable to the Volunteers-in-Parks Program. **This fund also provides for the training of volunteers.**

Contact your park and regional/SO budget staff for additional information concerning project eligibility standards, criteria, and funding sources that you may utilize in support of museum projects.

7. ***Are there any other sources of funding for park museum programs?***

Yes. Additional sources of potential funding include:

- Cooperating Associations
- Friends Groups
- Park Partners
- Grants

Contact your regional/SO curator for help identifying additional sources of funding.

> ***Support, donations, and other assistance provided to the Service by cooperating associations, friends groups, park partners, and others must comply with the policies contained in Director's Order #21: Donations and Fundraising and Director's Order #32: Cooperating Associations.***

8. ***How does the construction program address collections management needs?***

There are several categories of facilities maintenance and construction funds that can be used to address collections management needs:

- Repair of a failing fire alarm and/or existing sprinkler system is a ***Critical Health and Safety Deferred Maintenance Need*** (a facility deferred maintenance need that poses a serious threat to public or employee safety or both).

- Installation of a fire alarm system in a public building where one did not previously exist is a ***Critical Health and Safety Capital Improvement Need*** (a condition that poses a serious threat to public or

employee safety or health and can only be reasonably abated by the construction of some capital improvement).

- Repairs to a building housing a museum collection that is threatened because of the poor building condition is a ***Critical Resource Protection Deferred Maintenance Need*** (a facility deferred maintenance that poses a serious threat to natural or cultural resources).

- Installation of a fire sprinkler system for the protection of a building or its contents is a ***Critical Resource Protection Capital Improvement Need*** (a condition that poses a serious threat to natural or cultural resources).

All construction projects must be entered in the PMIS system. Consult with regional construction professionals to develop an appropriate project statement. Estimate costs carefully and refer to cost information provided on the Construction Program Management Intranet site at: <construction.den.nps.gov/html/BenchmarkCosting.htm>.

E. Documenting Results and Performance

1. *What is performance management?*

Performance management ensures that established goals guide daily actions. Performance measures help us know both how effective we are in fulfilling our mission, and how efficient we are in using the least input (time, materials, dollars, and staffing) to achieve the greatest outcome (intended consequences and effects resulting from our activities). Your park will develop a mission statement and long-term and annual performance goals for all major programs, then measure and report on the actual park performance.

The Government Performance and Results Act of 1993 (GPRA) (31 USC 1115) requires federal employees to use performance management in all aspects of daily operations. The strategic planning process is the heart of performance management.

> ***Performance management focuses on the <u>results</u> of efforts rather than the efforts themselves.***

2. *What is strategic planning?*

Strategic planning sets goals to achieve an institution's mission. The *National Park Service Strategic Plan* implements performance management, a business system that:

- provides a Servicewide performance agreement with the public

- sets measurable goals that directly support the NPS mission

- aligns activities and human resources to accomplish the goals

- shows where the NPS can fulfill its mission with current resources and where it cannot

The *National Park Service Strategic Plan* defines success for the Service

and provides Servicewide direction. The NPS developed its strategic plan with public meetings and questionnaires, in consultation with the Office of Management and Budget, Congress, and the Department of the Interior. Each park, program, and central office also has its own strategic plan.

3. ***How does GPRA relate to NPS collection management programs?***

The Servicewide Strategic Plan includes two mission goals and long-term goals that are specific to NPS museum management. Long-term goals stem from mission goals and include a date by which to achieve the goal.

- **Mission Goal Ia** states, "natural and cultural resources and associated values are protected, restored and maintained in good condition and managed with their broader ecosystem and cultural context."

  Long-term goal Ia6 states that a certain percentage of preservation and protection standards for park museum collections will be met. (For example, *By September 30, 2005, 73.4% of preservation and protection standards for park museum collections are met.*)

- **Mission Goal Ib** states, "the National Park Service contributes to knowledge about natural and cultural resources and associated values; management decisions about resources and visitors are based on adequate scholarly and scientific information."

  Long-term goal Ib2D states that the number of museum objects cataloged increases by a certain percent. (For example, *By September 30, 2005, museum objects cataloged are increased by 35.9% from 37.3 million to 50.7 million*)

4. ***Are there any other mission goals relevant to museum management?***

Yes. They include:

- **Mission Goal IIa**, which states, "Visitors safely enjoy and are satisfied with the availability, accessibility, diversity, and quality of park facilities, services, and appropriate recreational opportunities."

- **Mission Goal IIb**, which states, "Park visitors and the general public understand and appreciate the preservation of parks and their resources for this and future generations."

5. ***How do parks estimate Ia6 annual and long-term goal and performance targets?***

This goal corresponds directly to the number of standards met on the Museum Checklist. This number is reported as a percentage of standards met as compared to the number of applicable standards. You can use the Automated Checklist Program deficiency report (see the *ANCS+ User Manual*, Appendix G) to get your current status. To estimate a target, use the sum in the standards met column, and then decide which additional standards you think that you can meet. An example of a goal would be, "By September 30, 2005, 76% of applicable preservation and protection standards are met for the park's museum collections."

6. ***How do parks estimate Ib2D annual and long-term goal and performance targets?***

This goal corresponds directly to the Collections Management Report (CMR). In your most recent CMR, check the "Objects Cataloged" total under the "Total Collection Summary for All Years." This is how many cataloged objects you currently have. Calculate how many objects you want to catalog by the end of the current fiscal year (annual goal), subsequent years (annual goals), and at the end of five years (long-term goal).

7. ***What is the Performance Management Data System?***

The Performance Management Data System (PMDS) is an Intranet database that identifies all of the agency's performance management efforts. Performance management requires that you depict the work you do in terms of measurable outcomes. PMDS records data to measure performance relative to Servicewide and park and/or program-specific long-term goals.

Parks use the Museum Checklist (ACP) and CMR in ANCS+ to submit required electronic reports to the Museum Management Program by November 1 each year. The MMP certifies the data to the Strategic Planning Office, which incorporates it into PMDS.

> ***For more information, access the PMDS website at: <http://www.nps.gov/performance/>.***

8. ***How do I get GPRA credit for long-term goal Ia6 and Ib2D accomplishments?***

Your park PMDS coordinator will report your accomplishments in relation to Goals Ia6 and Ib2D in PMDS. You need to provide the park PMDS coordinator with a copy of your **defrpt.frx** report from the ACP and a copy of your CMR so that person can enter the correct data. In PMDS, the park's data and the certified data entered in Washington should be identical since they come from the same ACP and CMR reports.

F. Staffing

1. ***What are the discipline tracks in NPS museum management programs?***

There are four discipline tracks:

- Collections Management
- Curation
- Archives
- Conservation

2. ***What are the different occupational titles within the career tracks?***

NPS museum management career tracks include the following nine occupational groups:

- Museum Technician (GS-1016)
- Museum Specialist (GS-1016)
- Museum Registrar (GS-1001)
- Collections Manager (GS-1015)
- Museum Curator (GS-1015)
- Archives Technician (GS-1421)
- Archives Specialist (GS-1421)

- Archivist (GS-1420)
- Museum Conservator (GS-1001)

3. ***What are the qualifications for these positions?***

Refer to the list of the principal occupational series in the OPM *Qualification Standards for General Schedule Positions*, available on the web at: < http://www.opm.gov/qualifications/sec-iii/a/num-ndx.htm>.

4. ***What are the typical duties in each career area?***

Collections Manager: Collections managers provide front-line management of collections at parks and centers. Collections managers often begin their careers as museum technicians, and may eventually move on to the:

- curator track
- conservator track

Occasionally, this path can lead to the archivist track. Typically, the collections manager will have an academic degree in museum studies, museology, archeology, natural science, or a related field.

Curator: Curators are responsible for the acquisition, documentation, preservation, and use of collections. Typically, the support office, regional, or center curator will provide technical assistance to field staff in carrying out their responsibilities. Within this track there are three separate sub-tracks or specializations:

- program management
- exhibit development
- subject matter expert

Typically, the curator will have an academic background in American studies, anthropology, history, a natural science discipline, museum studies, or a related field. Experience in addition to education is necessary at the developmental level. As their careers progress, curators should obtain additional education and experience in museum management, exhibit development, or their subject matter specialization.

Archivist: Archivists evaluate, survey, acquire, preserve, arrange, describe, use, and manage archival and manuscript collections. Such collections can include audio-visual, electronic, and textual records. Typically, archivists at the entry or developmental level have a masters degree in library science or history with a specialization in archives management. Archivists gain extra training through a combination of education and experience. They also will have considerable additional experience under the tutelage of another professional. The Society of American Archivists (SAA) and the Academy of Certified Archivists (ACA) both formally endorse archival certification and the hiring of certified archivists.

Conservator: Conservators provide specialized experience in preventive conservation and treatment of collections. Typically, conservators have graduated from a recognized conservation training program. At the entry level, conservators will have both academic training and considerable

experience in either a broad range of conservation issues or a narrowly focused group of materials

5. ***How do I know what staffing or career goals are needed at my park?***

Review planning documents and work with your regional/SO curator to develop guidelines for determining the appropriate staff mix for your collection. Consider your collection's size, complexity, and uses. Be sure to build a trained museum staff adequate to your needs in order to comply with museum management requirements.

In general, for museum-related jobs such as curator (1015), museum specialist (1016), registrar (1001), and archivist (1420), the grade at which the individual acts independently is the GS-11 level. At lower grades, the incumbent requires guidance from a higher graded individual in the same series (or another museum-related classification). It's best if this higher graded person is located in the same park, but they may work in a nearby park or center, or in the regional or support office.

The classifier determines the appropriate classification and grade for a position by:

- working with the supervisor and the description of duties
- following Office of Personnel Management classification standards

Use the Resources Careers Benchmark Position Descriptions (available on the web at **<http://www1.nrintra.nps.gov/careers>**) to facilitate this process.

> ***Communication is essential! Be sure that your superintendent is aware of the value and potential uses of the archival and museum collections. Stress the concept of highly visible and unique natural and cultural resources collections and documentation associated with the site's history and resources to support staffing needs. Collections should be used as a powerful outreach and public relations tool (as well as being resources themselves) while preserving the history and resources of the park.***

6. Are there alternative sources for staffing?

Many parks use alternative sources for staffing their museum management programs. Full time museum staff may not be necessary in a park with a small collection; however, all collections require ongoing documentation, preservation, protection, and access. Alternative sources of staffing for museum management include:

- using collateral duty staff (see below)
- contracting specialized tasks or projects that can be accomplished in a given fiscal year
- establishing cooperative agreements with universities or local museums for collections storage and curatorial staffing
- recruiting volunteers and mentors

- offering internships and fellowships

Generally, cooperative agreements are formed to maintain a portion of a museum collection (e.g. archeology or entomology) that provides mutual benefit to the park and the agency or institution where the collection is housed.

Other sources of staffing include volunteers from the community and student interns. Volunteers and interns can provide assistance with:

- identifying objects and specimens
- cataloging
- photographing
- organizing storage spaces
- museum housekeeping
- assisting researchers and park staff
- conducting collections research

For volunteer programs to work effectively, park staff must provide all volunteers with proper training, supervision, and support.

7. *What is collateral duty?*

Collateral duty is a term used when a person has multiple and highly varied responsibilities in his/her official position description. A collateral duty is secondary to the primary duties that determine the job classification. Often collateral duties for museum management are assigned to a park ranger or a resources management specialist, such as a biologist, historian, or archeologist. Many collateral duty staff bring prior training in museum management to their positions, while others are trained on the job. Collateral duty museum staff should be trained by a full-time curator or museum specialist (GS-1015 or GS-1016), and receive ongoing guidance from a nearby park curator (at GS-11 or above) and/or the regional/SO curator.

G. Training and Development

The NPS is committed to the professional growth and continuous learning of all its employees. It provides them with a comprehensive, competency-based, and mission focused training and development program. The strength of competency-based training is that it is ***outcome-based*** and ***learner-driven***.

The NPS Training and Development Program develops and delivers learning opportunities that provide the knowledge and skills needed by employees to better perform their jobs. These opportunities include:

- formal education

- life experiences
- traditional classroom courses and workshops
- seminars and conferences
- on-the-job experience and training
- technological enhanced learning (TEL), including:
  - self-paced computer courses
  - satellite broadcast courses

For more information on the NPS Training and Development Program, see the NPS "Learning Place" at: <http://www.nps.gov/training>.

1. ***How is competency defined?***

Note: At present, the competencies are to be used only for training and development purposes. They should not be used for hiring and promoting employees. OPM must validate the competencies before the NPS decides how to integrate them into the full NPS Human Resources Performance Process.

The NPS Training and Development Program defines competency as follows:

- **Competency**—"a combination of knowledge, skills, and abilities in a particular career field, which, when acquired, allows a person to perform a task or function at a specifically defined level of proficiency."
- **Essential Competency**—"a competency that forms part of the vital knowledge, skills, and abilities for an individual career field. An essential competency is critical for an employee to perform effectively at his or her level in a Career Field."

Eight essential competencies are common to all employees in and associated with the Cultural Resources Stewardship Career Field. They are:

- Professional Discipline
- Preservation Law, Philosophy, and Practice
- Research and Inventory
- Preservation, Treatment, and Maintenance
- Program and Project Management
- Writing and Communications

- Training
- Safety

Knowledge, skills, and abilities (KSAs) are identified for each competency.

> ***For more information on NPS museum management competencies, see the Cultural Resources Stewardship Career Field Web site: <http:www.nps.gov/training/crs/crs.home.htm>.***

2. ***How do I find out about training in museum management?***

There are a number of sources of museum management training, including:

- **Training and Development Program** develops and delivers Servicewide training and development opportunities. For further information, see the Learning Place website at: **<http://www.nps.gov/training>.**
- **Museum Management Program** works with the Training and Development Program to develop training related to new policies and procedures concerning NPS museum collections management, such as ANCS+ training.
- **Regional offices** offer training in museum management basics and ongoing professional training, including training in NPS procedures. Contact your regional employee development officer and regional/SO curator for further information.

Other museum training opportunities are presented by various local, state, and national organizations. To learn more, refer to:

- the MMP Web site at: **<http://www.cr.nps.gov/museum>** to access a monthly list of museum conferences, courses, seminars, and other opportunities.
- Appendix C: Professional Organizations
- your regional/SO curator

H. Resources

Most of the important NPS resource documents referenced in this chapter are on the Internet. See *Conserve O Gram* 1/7, Useful World Wide Web Resources.

Figure 12.1. NPS Acronyms Related to Servicewide Funding, Programs, and Planning for Museum Collections

Project Identification - PMIS 50283

Project Title: Purchase Museum Storage Equipment (region-wide)	**Project Total Cost:** $114,300.00
Park/Unit: Alaska Regional Office	**Region:** Alaska
States: AK	**Congressional District:** 01
Old Package Number:	**Reference Number:**
Project Type: Non-facility	**Financial System Package Number:** AKRO 050283
Contact Person: Betty Knight	**Contact Phone:** 907-257-2656

Project Status - PMIS 50283

Date Created: 08/09/99	**Review Status:** Region-Reviewed on 11/30/2001
Date of Last Update: 05/29/03	**Updated By:** Stephanie Stephens (SStephens)

Project Narratives - PMIS 50283

Description

This combines PMIS 50287 with this project (50283).

Purchase and install museum cabinets, shelving units, media safes, fireproof filing cabinets and other specialized curatorial storage units throughout the region. Museum quality supplies, as well as the personnel to perform the upgrade are included in these projects.

This will be an annually recurring account of up to $63,000 through 2005.

Justifications

Alaska parks' collections are experiencing major growth, improvement of storage facilities, decompression of objects with improvements of storage conditions. Concurrently management is recognizing the wealth of unique cultural and natural history collections we manage. As the storage facilities are improved and expanded, at last there is room for more of the specialized equipment required. Additionally, we have been assessing archival resource and anticipate major expansion in that area as well as collections resulting from a resource initiative to inventory and monitor paleontological resources.

Measurable Results

Collection storage equipment is available in sufficient quantity and condition to meet standards at 10 collection storage facilities. As a result, GPRA Goal Ib2D will show an increasing percentage of standards met on a regional basis.

Figure 12. 3. Sample OFS Statement

GPRA Goal	Measurable Results	Performance Measure
Ia5	50	Each structure
Ia5	50	Each structure
Ia5	50	Each structure
Ia6	57	Each applicable standard
Ia7	3	Each landscape

Concise Description and Justification:

Golden Gate contains a nationally significant collection of cultural resources including over 1,250 historic structures, 7 cultural landscapes, 4 National Historic Landmark Districts and 6 National Register Districts. Professional expertise is required to manage all aspects of these resources including providing technical direction to maintenance and park partners to guide the repair and rehabilitations of structures and maintenance of cultural landscapes, managing A/E projects and processing compliance actions. In addition, Golden Gate's museum and archival collection of over 4.9 million items, including historic, archival, archeological and biological objects and specimens is the second largest such collection in the NPS. Insufficient resources exist to properly manage and care for this large, significant collection. Funds would provide for an enhanced level of professional management and protection of these irreplaceable cultural resources.

Supporting Information: None

Figure 12. 3. Sample OFS Statement (continued)

Chapter 13: Museum Housekeeping

CHAPTER 13: MUSEUM HOUSEKEEPING

A. Overview

1. *What information will I find in this chapter?*

Information in this chapter will help you to:

- understand the importance of museum housekeeping
- identify the elements of museum housekeeping
- write a Museum Housekeeping Plan
- find additional sources of information

The chapter includes sample formats for a Museum Housekeeping Plan. This format is not required. You can contact your Support Office curator for other sample housekeeping plans that parks have used.

This chapter will not tell you how to clean objects. That specific information is available from a variety of other sources listed in the references. You can also contact your Support Office curator for help.

2. *What is a Museum Housekeeping Plan?*

In the National Park Service, a written housekeeping plan is required for every space that houses museum collections, such as storage spaces, furnished rooms in a historic structure, indoor and outdoor exhibit spaces, curatorial offices, and work and reference spaces. See Cultural Resource Management Guideline (formerly NPS-28), 1997, Chapter 9, D.2.a, Preventive Conservation. Museum objects and historic spaces are cleaned in a different way than modern buildings and equipment that may house museum objects.

A staff curator, collateral duty curator, or contractor who has expertise in the preventive care of museum objects should write the housekeeping plan. The production of the plan should include all staff who will have housekeeping responsibilities. If the plan is written by someone other than the curator, the plan should be reviewed and recommended by the curator before approval by the superintendent. You can use the sample format presented here or contact your Support Office curator for other formats that have been used successfully in parks.

The Museum Housekeeping Plan sets up a schedule for preventive treatments. It serves as a reminder of what needs to be done and, generally, how often it needs to be done. The Museum Housekeeping Plan:

- considers the nature and condition of museum collections
- identifies the location of museum collections
- identifies both routine housekeeping tasks and special housekeeping projects
- identifies equipment, materials, and techniques for carrying out housekeeping tasks

- identifies staff persons responsible for carrying out housekeeping tasks
- establishes a schedule for completing the tasks
- records completed tasks

An approved Museum Housekeeping Plan provides a framework for consistent care of museum objects. It institutionalizes a preventive conservation program. The preservation of the museum collection depends on adherence to the plan by the entire park staff over time. No single employee is responsible for care of the objects. The plan is based on the idea that preventive conservation is an ongoing process—not a product.

A well-written Museum Housekeeping Plan is the basis for your park's preventive conservation program.

3. *Why is museum housekeeping important?*

Preventive conservation, the *primary goal of housekeeping*, aims to prevent damage to museum collections. See Chapter 3, Preservation: Getting Started, for a discussion of preventive conservation. Housekeeping is essential to your preventive conservation program.

From the moment an object is created, it begins to deteriorate as a result of its interaction with the environment. At certain points in its life, a museum object may require the knowledge and skills of a conservator to stabilize its condition. You can minimize the need for conservation treatment by implementing a museum housekeeping program in all spaces that house museum objects, such as:

- exhibit spaces
- historic furnished rooms
- storage spaces
- curatorial offices
- research services spaces
- other work spaces

Each space will require a slightly different approach to cleaning that takes into account how objects are stored and used. For example, exhibit spaces with closed cases may require only annual dusting of objects. Historic furnished rooms, with objects on display in the open air, will require daily or biweekly cleaning.

Preventive Conservation	
Curator/Collateral Duty Curator	Other Park Staff
• Monitors and assesses the condition of objects • Monitors and evaluates the museum environment • Practices proper methods and techniques for storing, exhibiting, handling, packing and shipping of objects • Develops and carries out an ongoing housekeeping program for collection spaces • Prepares an emergency management plan for the museum collection • Prepares an Integrated Pest Management program for the museum collection • Coordinates park's Museum Housekeeping Plan	• Provide guidance, in their area of expertise, on effective means of achieving preservation standards for museum objects • Alert curator to impending activities that may impact museum collections but are not addressed in the Museum Housekeeping Plan • Prepare parkwide emergency management plan • Prepare the parkwide Integrated Pest Management plan • Assist in development and annual review of the Museum Housekeeping Plan • Implement the actions of the Museum Housekeeping Plan for which they are responsible

Figure 13.1. Curator and Other Park Staff Roles in Preserving Museum Collections

4. *Who is responsible for museum housekeeping?*

The park superintendent delegates responsibility for the day-to-day management of museum objects to a permanent full-time, part-time, or collateral duty curator. Non-curatorial staff may also play significant roles in preserving museum objects. For example, keeping air filters clean in a heating, ventilation, air conditioning (HVAC) unit is a preventive conservation action that may be carried out by non-curatorial staff, but that task has significant impact on the long-term preservation of museum objects. This shared responsibility requires close cooperation and open communication between the curatorial and maintenance staff. Although the superintendent may delegate duties, housekeeping must be a primary concern of site management; sound housekeeping practices are significant for the visitor experience and visitor safety, as well as for resource preservation.

Good museum housekeeping needs the contributions of all park staff including maintenance personnel, interpreters, historians, architects, and other cultural resources staff. Individual parks will divide these responsibilities differently. Curatorial staff must keep close watch over the effects of cleaning, informing maintenance when methods or frequency seem harmful. Maintenance and other staff have a reciprocal obligation to consult the curator and take advice or work out acceptable alternatives. See Figure 13.1 for shared roles in preserving museum collections.

5. *What is museum housekeeping?*

In the context of museum collections management, the term "housekeeping" is defined as all of the ongoing actions (tasks) to preserve museum objects, archives, and museum records. Housekeeping is planning and monitoring, as much as it is hands-on collections care. Housekeeping requires *looking* as much as *doing*. Knowing when *not* to clean is as important as knowing when and how to clean. Housekeeping involves such tasks as:

- building and site care
- monitoring the effectiveness of environmental controls
- monitoring and recording light, temperature, and relative humidity levels
- monitoring for pests
- cleaning or replacing filters in air handling units
- monitoring the condition of museum objects
- dusting
- vacuuming
- applying protective waxes

Housekeeping is a major, and very challenging, part of a collections management program.

- It will greatly increase or greatly decrease the life of museum objects.
- It requires direct contact with museum objects.
- It is time consuming.

6. *What is the goal of museum housekeeping?*

Good museum housekeeping minimizes deterioration of objects by focusing on preventive care. Housekeeping relies on blocking the agents that deteriorate artifacts, such as pests, pollutants, and UV light, and monitoring to be sure that preventive actions are working. It enables you to inspect your collection on a routine basis so that deterioration can be detected early. Only when preventive techniques have failed, will cleaning need to be carried out.

If you approach housekeeping with this preventive approach in mind, instead of as a series of hands-on tasks, you will minimize damage to artifacts. In the long run you will also save a lot of time.

For example:

You can place floor mats at the entrance into historic houses where objects are exhibited, limiting the amount of dirt brought into the space that can be kicked up as dust. If you use a HEPA (high efficiency particulate air) filter vacuum when you clean, you minimize the amount of dust blown out into the air. Making sure doors and windows are tight limits the amount of dust blown in from outside. If all these preventive measures are taken, then the amount of dust that collects on objects and the amount of time and energy needed for cleaning will be minimized. With less cleaning and handling the chance that an object will be damaged is curbed.

You must work with and educate other park staff to improve preventive care and limit the amount of cleaning you must do. Effective care requires the cooperation of all staff members that work with and around collections.

7. *What is the goal of cleaning?*

The goal of cleaning is to preserve museum collections. Most of the traditional housekeeping tasks, such as dusting and vacuuming, are tasks also done at home. As a museum professional, you also dust and vacuum in museum exhibits, storage rooms, and furnished structures.

However, you should keep in mind that the significant difference between housekeeping at home and housekeeping in museums is the goal of preservation. Approach cleaning spaces that house museum collections from a different point of view. Consider:

- the nature and condition of objects
- cleaning materials and methods appropriate to object preservation
- signs of object deterioration
- interpretive effects in exhibits and furnished historic rooms

8. *How does museum housekeeping differ from housekeeping at home?*

Think about and understand why you are undertaking a certain housekeeping task. At home, the primary concern is usually aesthetics. You may want home furnishings and fixtures to look clean and shiny with the least amount of effort, so scrubbing and polishing may be done in haste. At a museum, these tasks are undertaken primarily to preserve collections. Cleaning must be careful, gentle, and thorough. If you simply clean for appearance, as you may do at home, then damage to collections will inevitably occur.

> ***Express your museum housekeeping attitude through careful, thoughtful, and gentle actions.***

"Clean" in museums means that enough collected dirt has been removed so that deterioration will not take place. It does not mean spotless or "white glove" or "squeaky" clean. Evaluate the situation each time cleaning is done and decide first, if it is necessary and second, how far you must clean. Careful museum housekeeping requires using the correct supplies and equipment with proper techniques for the preservation of a museum collection. For example:

- When *dusting*, apply minimum pressure, move carefully, and frequently change to a clean dust cloth.
- When *vacuuming*, don't allow the vacuum cleaner, including cords and attachments other than the brush, to come into contact with museum objects.

See the references listed at the end of this chapter for more explanations of cleaning techniques and supplies for all types of materials.

Understand what each housekeeping task will accomplish. What are you doing and why you are doing it? A neat and clean museum will be the result of housekeeping, but it is not the only goal. Think of museum housekeeping as preventive conservation. You and your staff are trying to prevent damage to museum objects before it occurs.

Museum housekeeping requires an objective approach. Before beginning your daily tasks, ask yourself, "Am I prolonging the life of the object?" You need to *think preservation*.

9. *How often should I clean?*

There is no typical time period for cleaning. You might only have to vacuum a secure storage area that you monitor for pests once a month, or twice a year. However, you may need to vacuum the floor once a day in a poorly sealed log cabin that gets many visitors. Unnecessary and frequent cleaning can damage objects and may lead to their consumptive use.

To decide on how often to clean, think critically. Take into account how dirt, pests and other contaminants get into a space. Think about how many people go through an area. Walk through and carefully look at the space to see where dirt collects and how quickly.

A park can decide if cleaning should be done during operating hours when the public can see you care for the collections, or at times when spaces are closed to the public. Explaining housekeeping tasks can be a part of your resource preservation message.

10. *How do I find out the correct techniques for cleaning objects?*

There are a variety of information sources available that give overviews of housekeeping and describe specific techniques and materials. You should obtain books and videos listed in the bibliography and keep them available as references.

Watch the following NPS sources for new information and techniques:

- NPS *Conserve O Gram (COG)* series
- cc:Mail NPS *Museum Management Newsletter*
- NPS *Museum Handbook*, Part I, Curatorial Care Appendices

11. *Where can I get training to learn more about housekeeping?*

There are a variety of places you can find more information about housekeeping.

- The NPS Curatorial Bulletin Board lists advertisements for courses that are taught at various institutions around the country.
- A variety of written references and videos are available. See the bibliography for specific references.
- Contact your Support Office curator for more information.

B. The Museum Housekeeping Plan

1. *What are the components of a Museum Housekeeping Plan?*

There are a variety of ways to format a MHP. The format described here is one example. For other examples contact your Support Office curator.

The Museum Housekeeping Plan illustrated here includes:

- Title Page
- Narrative Section
- Reference File Sheets
- Task Sheets
- Schedules

2. *How do I prepare the title page?*

The title page includes the:

- title
- full name of park
- review and approval signature lines

A table of contents is helpful for people using the plan. You may add additional sign-off lines and circulate the plan through each appropriate division. This practice documents in writing each division's commitment to implement its part of the plan. The superintendent provides final approval. Figure 13.2 illustrates the proper format for the Title Page.

3. *How do I write the narrative section?*

State the purpose of the Museum Housekeeping Plan. Sample language for this section follows. Append additional park-specific language as needed.

> *Preventive conservation is the ongoing activity of non-invasive actions taken to prevent damage to and minimize deterioration of museum objects. Housekeeping, executed faithfully and with professional judgment, is a crucial component of preventive conservation. The park has developed this Museum Housekeeping Plan to ensure consistent, long-term care of its museum collections. The plan is the product of a cooperative effort between all involved divisions and has the support of the superintendent.*

The narrative outlines a cohesive program of care that the plan documents. You can include information on:

- the locations for museum housekeeping
- the tasks to be performed
- the appropriate techniques for accomplishing the tasks
- the frequency of each task
- the title and name of person(s) responsible for performing the tasks
- the appropriate supplies and equipment

4. *What are reference file sheets?*

Reference file sheets can help you collect all the information dispersed in a variety of documents on equipment and supplies and environmental concerns. Using the reference file sheets you collect all this information once, instead of having to find it repeatedly. Documents that contain

information collected in reference file sheets include the Collection Management Plan, (CMP), Collection Condition Survey (CCS), historic furnishings reports, equipment handbooks, and environmental monitoring records.

Complete reference file sheets for:

- environmental concerns
- equipment to monitor and control the environment
- supplies to monitor and control the environment

Reference file sheets provide data necessary to complete the task sheets.

5. *How do I complete the reference file sheet for environmental concerns?*

The reference file sheet for environmental concerns identifies ongoing issues for maintaining environmental standards, and lists tasks necessary to maintain or work toward those standards for each location containing museum objects.

See Figure 13.3 for a suggested format for the reference file sheet.

- Under "Location," enter the park acronym and common name of structure.
- Summarize for each space the existing environmental factors (temperature, relative humidity, light, pest infestation, and dust/pollution).
- List sources from which data were derived.
- List all tasks relevant to the preservation of the museum objects.

6. *How do I complete the reference file sheet for equipment or supplies used to monitor and control the environment?*

Prepare a reference file sheet for equipment and supplies used to monitor and control the environment. Describe the equipment, give model numbers, and location of manuals and supplies. Also list tasks necessary to maintain the equipment.

See Figure 13.4 for a suggested format for a reference file sheet for equipment and supplies used to monitor or control the environment.

- Under "Location," enter the park acronym and the common name of the structure/space.
- List type, size, quantity, and brand of portable equipment (such as vacuum cleaners, humidifiers, dehumidifiers, hygrothermographs, dataloggers).
- State the location of the equipment in the space. You may want to attach a floor plan of the space that indicates the location.
- State the location of operational and maintenance manuals, warranties and additional supplies.

- List all sources for the information on the reference file sheet.

- List all tasks relevant to maintaining the equipment or supply described. Include tasks such as changing vacuum filters and reconditioning silica gel.

Record the quantity of supplies used throughout the year. Keep extra vacuum cleaner bags and cleaning supplies in stock. Track and quantify the expenditure of supplies to ensure that you have sufficient quantities.

Mark or label supplies and equipment used for preventive conservation. Use them only for that purpose. Limiting use prevents the unintentional introduction of dirt and residues into spaces that house museum collections.

7. *What are housekeeping plan task sheets?*

Complete task sheets for all tasks listed on reference file sheets (see no. 4 above). When preparing the sheets, you need to involve discipline and job specialists, as appropriate, from all divisions. Working with other staff members to develop the tasks will identify all the aspects of care that must be addressed. A cooperative approach to preventive care will begin to develop when you work with all staff members involved in caring for collections.

Task sheets and schedules provide a mechanism for tracking the costs of preserving and protecting museum objects. Task sheets can also be used to support the need for additional staff or funding to carry out necessary housekeeping tasks. The task sheets:

- provide detailed procedures to be followed such as specialized handling techniques

- identify appropriate equipment and supplies for each task

- determine the frequency of performance, which must be critically evaluated each time the task is performed

The objectives of the task sheets and schedules are to ensure that no task is overlooked, and to avoid duplication of effort through:

- efficient dove-tailing of divisional responsibilities

- judicious use of limited resources

Review and revise the task sheets at least once a year and whenever other park planning or operational documents (such as the Emergency Operations Plan) are updated.

8. *How do I prepare a task sheet?*

See Figures 13.5-8 for samples of task sheets. You may use this suggested format or design your own reports. Adjust time and cost estimates based on staff experience.

See Section E for a list of MH-I, Curatorial Care Appendices that provide guidance on preventive care and cleaning techniques for specific material and object types.

For each task sheet:

- List the location.

  Include the park acronym and common name of structure.

- Identify the task.

  Option 1: For each task, object, or piece of equipment, use one task sheet. Vacuuming in a historic house could have one task sheet. If one table has an unstable veneer and requires special handling techniques, it should have its own task sheet. Include a task sheet to maintain the equipment. For example, mops and dust cloths must be washed, dried, and put away carefully.

  Option 2: Use one task sheet for several identical objects. For example, all the upholstered furniture may be cared for using the same procedures and techniques.

- State how often a task should be performed (frequency). Be sure to include statements on how to evaluate whether the task needs to be performed. Your observations and experience will influence the frequency for each task. Each time the task is performed, it should be reevaluated. The frequency may also be affected by the interpretive goal of an exhibit or furnished historic structure.

- Describe procedures.

  Describe how the task will be accomplished safely, appropriately, and effectively. **Consult conservators and discipline specialists and refer to professional publications to confirm that procedures are appropriate and current.**

- State cautions.

  Identify any physical hazards associated with the task (such as heavy lifting). When chemicals (even detergents) are used for cleaning, attach a copy of the applicable Material Safety Data Sheet (MSDS) to the task sheet, or state where it may be obtained elsewhere in the park.

- Provide current staff assignment(s). List the name and title of the staff member currently responsible for completing the task.

- Identify skills and training needed.

  Describe the skills or training required to perform the task. Staff should practice only those preventive conservation techniques and procedures for which they are trained. For example, only staff who have been trained by a conservator may undertake treatments such as removing or re-applying wax or lacquers. See Chapter 3 for a discussion of the roles of the curator and conservator.

The hands-on care of collections, including activities that occur near museum objects (such as vacuuming), requires special care and aptitude. If you are involved in such activities, you need to demonstrate sensitivity for the objects as well as the physical coordination needed to handle objects safely. Training and re-training are important elements in developing and improving these skills, and should be addressed in a separate task sheet.

- Identify supplies and equipment needed for each task.

  Provide a common descriptive name that distinguishes between similar pieces of equipment (such as a double filter vacuum or wet-vac). List identification numbers if necessary. See NPS *Tools of the Trade* for information on obtaining museum supplies and equipment.

- State sources used to develop each task sheet. Include published works and personal communications.

- Provide information on who prepared tasks sheets and when.

9. *What is a housekeeping schedule?*

Museum housekeeping schedules are an important part of the plan. The schedules are guides that:

- remind you when to do tasks (Season and visitation variations may affect the frequency of tasks.)

- chart the progress and provide a means of tracking the status of the housekeeping program

- prevent tasks from being crowded out or forgotten

10. How do I prepare a housekeeping schedule?

Combine information on specific tasks and procedures (identified on task sheets) into a schedule for each responsible staff member.

- Allot each task adequate time at the proper intervals. (Refer to frequencies compiled in the task sheets.)

- Organize tasks on the schedule as follows:

  – daily

  – weekly

  – monthly

  – quarterly

  – semi-annually

  – cyclically (less or more often than annually)

  – as needed

- List all tasks concisely.
- Use a chart to format your schedule.
- File all completed charts for future reference.

Provide a space for initials or check-off and dates to document each time a task on the schedule is carried out. You may wish to add other useful information such as cost for the task and account numbers to be charged.

See Figures 13.9-12 for sample formats. You can use these formats as is, or adapt them to your particular park needs as you write your housekeeping plan.

11. *Will ANCS+ help me develop my Museum Housekeeping Plan?*

The task sheets and schedules described in this chapter can be generated using the Maintenance associated module and Maintenance supplemental record in ANCS+. You can find information on using the Maintenance associated module in Chapter 4 and the Maintenance supplemental record in Chapter 3 in the ANCS+ User Manual (1998).

D. List of Figures

Figures 2-12 illustrate sample formats for writing your Museum Housekeeping Plan.

You can use these Sample plans as is or adapt them when preparing your own Museum Housekeeping Plan. MHP Task Sheets, and MHP Daily, Weekly, and Quarterly Schedules can be produced using the Automated National Catalog System (ANCS+). Using ANCS+ to generate your plans will help you track maintenance treatments on individual objects.

Superintendent Date

Figure 13.2. Sample MHP Title Page

NATIONAL PARK SERVICE
MHP REFERENCE FILE SHEET
ENVIRONMENTAL CONCERNS

Location: CHDO, Visitor Center, Exhibit Space

Temperature: Gradual fluctuations occur seasonally within a 5° - 10°C range (60°-70°F). Maintenance staff makes adjustments to climate control equipment only after consultation with curatorial staff.

Relative Humidity: Relative humidity is poorly controlled. Front entrance doors provide immediate access to the outdoors, allowing air and humidity to flood the exhibit area whenever visitors enter. Microclimates in exhibit cases must be maintained to compensate for unacceptable levels of RH. Construction of a separate entrance alcove is planned for FY1999 (refer to Resources Management Plan Project Statement #14 and Development/Study Package Proposal Form 10-238 #93-1).

Light: Applied light tint solar control film to exterior windows in June 1990. Filters remove 96% of UV, and 30-40% of visible light.

Pest Infestations: With the exception of an annual influx of yellow jackets, no insect infestations have been recorded to date. Park curatorial staff arranges for removal of these insects from collection areas.

Dust/pollution: Dust levels are relatively low because concrete sidewalks provide access to the structure. Interpreters bring walking tours from the historic trace road, which is dirt, into the Visitor Center through the side door and across a dust mat.

Source: Environmental monitoring records, curator's office, Cabinet 4, Drawer 3.
CHDO IPM Plan, 1991, p. 44.

Tasks:

- Monitor temperature and relative humidity. Weekly.
- Monitor sticky traps for pests. Weekly.
- Monitor silica gel tiles in cases, and recondition regularly. Monthly.
- Monitor condition of objects, especially those located nearest the entrance. Weekly.
- Monitor progress of Development/Study Package Proposal (Form 10-238) #93-1. Quarterly.
- Monitor condition of UV filters and replace when needed. Quarterly.
- Inspect case seals. Annually.
- Inform interpretive staff of rationale and procedures for following established tour routes at seasonal and permanent staff training sessions. Annually in May.

Information provided for specific tasks on these samples should not be regarded as standards.
See Section A above for a discussion of the decision-making process that goes into developing these sheets.

NATIONAL PARK SERVICE
MHP REFERENCE FILE SHEET
EQUIPMENT/SUPPLIES USED TO CONTROL THE ENVIRONMENT

Location: CHDO, Visitor Center, Storage Space

Type of Equipment/Supplies: HEPA vacuum

Size: Medium, 16" x 12" x 12"

Quantity: 1

Brand: Nilfisk GS80I

Location in Space: See attached floor plan.

Location of Manuals: Operational and repair manual is in Curator's Office, File Cabinet 1, Drawer 2, File "Equipment." Note: The curator's manual is the only copy on site.

Location of Supplies: Replacement bags and filters are in Storage Cabinet 4, Shelf B in the curatorial supplies storage area. Order one year's supply of bags (12) and one HEPA exhaust filter annually in January.

Sources: Nilfisk product information. Duplicates available from Nilfisk (610) 647-6420.

Tasks:

- Purchase replacement bags and filters. January.
- Change bags. Monthly, and more often if necessary.
- Change HEPA filter. January.

Prepared by: Betty Ann Kinitz
Title: Museum Tech
Date: April 1, 1988

Figure 13.4. Sample MHP Reference File Sheet: Equipment/Supplies Used to Control the Environment
You may create a separate sheet for each piece of equipment or combine all equipment on one reference sheet if appropriate.

NATIONAL PARK SERVICE
MHP TASK SHEET
DUSTING

Location: CHDO, LCS#101, Room 101, Wall Cabinet (Chris Doe Homeplace, Front Parlor)

Task: Clean wall cabinet, dust objects in cabinet

Frequency: Monthly. Before dusting, carefully inspect objects and cupboard to decide if cleaning is necessary.

Procedure:
- ☐ Prepare space on table to receive objects.
- ☐ Remove objects from cupboard.
- ☐ Check pest trap on lower shelf. Replace with new trap.
- ☐ Dust wooden cupboard with soft dust cloth. Give special attention to molding, using a soft artist's brush to dust. Dust ceramics and glass with brush.
- ☐ Replace items using sketch from HFR (attached).
- ☐ Incorporate pest trap findings into IPM records. (Forward to Curator.)
- ☐ Wash dust clothes and brushes in non-ionic soap at first sign of darkening.

Cautions:
- ☐ **Lid on stein is not attached; handle top and base separately.**
- ☐ Use surgical gloves when handling china.

Currently Assigned to: Adam Karlson, Museum Technician

Special Skills/Training: Watch curatorial handling video.

Supplies/Equipment:
- ☐ Soft artist's brush
- ☐ Soft dust cloth
- ☐ Pest trap
- ☐ Surgical gloves

You can prepare one sheet for all dusting tasks or divide them as needed for your park. The Maintenance associated module in ANCS+ can help you generate these task sheets.

NATIONAL PARK SERVICE
MHP TASK SHEET
PEST MONITORING

Location: CHDO, Visitor Center, Exhibit Space

Task: Monitor for pests

Frequency: Weekly

Procedure:
- ☐ Prepare new pest traps; write the location and number on each trap. Where necessary for clarity, draw a rough sketch of the room or wall.
- ☐ Collect traps from previous week. Place carefully inside plastic bags and seal.
- ☐ Put new traps into position.
- ☐ In work area (outside of storage room), count numbers of each specimen type and record data on data sheets or enter into database.
- ☐ If action thresholds have been exceeded, take appropriate action. Report action to PCM Coordinator and park IPM Coordinator (Marc Johnson, Resources Management Specialist). Action thresholds listed in CHDO IPM Plan.
- ☐ Incorporate new specimens into the IPM reference collection.
- ☐ Initial and date schedule.

Cautions:
- ☐ Mouse traps were placed in the southwest corner of the Visitor Center on May 31. If a mouse has been caught, discard trap and mouse, and replace trap, notify IPM Coordinator.

Currently Assigned to: Dr. Joachim Kapp, Volunteer

Special Skills/Training:
- ☐ Identify insects and rodents.

Supplies/Equipment:
- ☐ Pest traps
- ☐ Microscope
- ☐ Record sheets and/or database access

NATIONAL PARK SERVICE
MHP TASK SHEET
REVIEW HOUSEKEEPING PLAN

Location: FOLA, Officer's Quarter #14

Task: Review Housekeeping Plan

Frequency: Annually (January)

Procedure:

- ☐ Assess currency of plan. If changes, based on observation and experience with plan, are needed to improve implementation, circulate the revised plan to appropriate reviewers on-site.
- ☐ If necessary, revise to keep plan current with changes in technology and procedure. Make copies for formal review. Reviewers may include: Curator, Park Architect, Building and Utilities Foreman, Conservator, Volunteers involved in implementing the plan, Support Office Curator, Interpretive Staff.
- ☐ Distribute plan for review. Allow a minimum of six weeks for review.
- ☐ Incorporate comments as appropriate into plan.
- ☐ Route for formal signature.
- ☐ Distribute copies of revised plan.
- ☐ Initial and date schedule.

Cautions:

- ☐ A memo reminding staff of impending review is recommended as a courtesy to staff.

Currently Assigned to: Team: Lenore O'Doul, IPM Coordinator and Nathan Santiago, Museum Curator

Special Skills/Training:

- ☐ Familiarity with museum objects and the structure and their respective requirements.

Supplies/Equipment:

- ☐ None

NATIONAL PARK SERVICE
MHP TASK SHEET
SPECIAL USES

Location: CHDO, LCS #101, Chris Doe Homeplace

Task: Plan evening tours of Homeplace, CHDO Birthday Weekend

Frequency: Annually in September-October

Procedure:
- ☐ Review interpretive plans. **Consumptive use of original furnishings as part of the tours is specifically prohibited (e.g., sitting on chairs or using tables as writing surfaces).** If reproductions are substituted, schedule staff and time to move furnishings and to restore rooms to their normal arrangement. No less than one month before event.
- ☐ Review security plan for event with Law Enforcement and Interpretive staff supervisors. Give special attention to opening and closing procedures. Two weeks before event.
- ☐ Consult Interpretive Supervisor. Schedule an adequate number of staff/VIPs to protect objects. No less than two people per floor. Curator and Museum Technician to be stationed at Homeplace during the event. Two pay periods before event.
- ☐ Review security plan with staff and volunteers assigned to homeplace tours no more than one week before event.
- ☐ Install VARDA motion detection units in each room. See attached sheet for locating units out of visitors' sight.
- ☐ Ensure special event supplies and equipment are in homeplace and operational.
- ☐ Clean-up.
- ☐ Conduct visual inventory each evening after tours.
- ☐ Implement weekly housekeeping procedures each day of event, as needed.

Cautions:
- ☐ Attendance at tours has averaged 1500 visitors per night.
- ☐ **Use of lighted candles inside the building is specifically prohibited.**

Currently Assigned to: Lenore O'Doul, IPM Coordinator

Special Skills/Training:
- ☐ Familiarity with security plan.
- ☐ Training in park radio procedures.
- ☐ Training in crowd control/observation in special events.

Supplies/Equipment:
- ☐ 3 Flashlights, extra batteries.
- ☐ Park radio.
- ☐ 8 VARDA units.

Figure 13.12. Sample MHP 5-Day Schedule

Appendix A: Mandates and Standards for NPS Museum Collections

APPENDIX A: MANDATES AND STANDARDS FOR NPS MUSEUM COLLECTIONS MANAGEMENT

A. Overview

In this appendix you will find information on:

- appropriate laws, regulations, and conventions related to NPS museum collections
- governmentwide and departmental standards related to NPS museum collections
- NPS management policies and servicewide standards for museum collections
- mandates and policies for NPS integrated pest management programs

B. Laws, Regulations, and Conventions – NPS Cultural Collections

1. *Laws related to NPS cultural collections*

These laws provide the legal mandates for NPS management of museum collections.

- Act for the Preservation of American Antiquities, June 8, l906 ("The Antiquities Act") (16 USC 431-433):
  - authorizes the President to declare national monuments to protect sites and objects
  - authorizes federal departments to grant permits for survey and excavation and to enforce protection of archeological sites and objects under their jurisdiction
  - requires that excavated materials be permanently preserved in public museums
- Organic Act of 1916 (16 USC 1 et seq.):
  - authorizes the creation of the National Park Service
  - states that the mission of the NPS is "...to conserve the scenery and the natural and historic objects...therein and to provide for the enjoyment of the same in such a manner and by such means as will leave them unimpaired for the enjoyment of future generations"
- Historic Sites Act of 1935 (16 USC 461-467) authorizes the Secretary of the Interior through NPS:
  - to preserve and maintain objects of national historical or archeological significance
  - to establish and maintain museums

- Museum Properties Management Act of 1955, as amended (16 USC, Sect. 18 [f]) authorizes the Secretary of the Interior through NPS:

  – to acquire collections through donation, bequest, and purchase and through transfer from other federal agencies

  – to exchange collections

  – to accept and make loans of museum collections

  – to deaccession collections by transfer to qualified federal agencies, conveyance (donation) to qualified tax exempt private institutions and non-federal governmental agencies, and destruction

  See Figure A.1 for the complete text of this law.

- Reservoir Salvage Act of 1960, as amended (16 USC 469 - 469C):

  provides for the recovery and preservation of "historical and archeological data (including relics and specimens)" that might be lost or destroyed as a result of the construction of dams and reservoirs.

- Archeological and Historic Preservation Act of 1974 (16 USC 469-469C):

  extends the application of the Reservoir Salvage Act of 1960 to recover and preserve "historical and archeological data (including relics and specimens)" that might be lost or destroyed as a result of any federal construction project or federally-licensed activity or program.

- National Historic Preservation Act of 1966, as amended (16 USC 470 - 470t, Sect. 110):

  directs the Secretary of the Interior to issue regulations that ensure that significant prehistoric and historic artifacts, and associated records, subject to Section 110 of this Act, the Reservoir Salvage Act (as amended), and the Archaeological Resources Protection Act are deposited in an institution with adequate long-term curatorial capabilities.

- Archaeological Resources Protection Act of 1979 (ARPA) (16 USC 470aa-mm):

  – defines archeological resources as any material remains of human life or activities that are at least 100 years of age, and which are capable of providing scientific or humanistic understandings of past human behavior, cultural adaptation, and related topics through the application of scientific or scholarly techniques

  – requires that a permit be obtained before conducting archeological studies on public and Indian lands

  – requires that information on the nature and location of resources on public and Indian lands remain confidential if its release may harm the resources

- establishes civil and criminal penalties for the excavation, removal, or damage of resources on public and Indian lands without a permit (materials lawfully acquired prior to the passage of the law are not subject to the penalties)

- requires that materials excavated from public lands and Indian lands and associated records be preserved in a suitable repository

- gives the Secretary of the Interior authority to issue regulations for the proper curation of federally-owned and administered archeological collections

- American Indian Religious Freedom Act of 1978 (42 USC 1996):

  reaffirms the constitutional right of "freedom to believe, express, and exercise the traditional religions of the American Indian, Eskimo, Aleut, and Native Hawaiians, including but not limited to access to sites, use, and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites"

- Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 USC 3001-13):

  - states that lineal descendants or culturally affiliated Indian tribes or Native Hawaiian Organizations may claim ownership or control of Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony that are excavated or discovered on federal or tribal lands after passage of the law

  - establishes criminal penalties for trafficking in remains or objects obtained in violation of the law

  - requires federal agencies and museums that receive federal funding to inventory Native American human remains and associated funerary objects in their possession or control and identify their cultural and geographical affiliations within 5 years

  - requires federal agencies and museums that receive federal funding to prepare summaries of information about Native American unassociated funerary objects, sacred objects, or objects of cultural patrimony within 3 years

  Note: The inventories and summaries provide for repatriation of items when lineal descendants or Native American groups request it.

- National Parks Omnibus Management Act of 1998 (16 USC 5937) Sec. 5937:

  - establishes the confidentially of sensitive information regarding certain types of museum objects and other resources

  - mandates a program of inventory and monitoring for NPS resources

  - allows the withholding of information (in response to a Freedom of Information Act request) on the nature and specific location of resources (specimens) that are endangered, threatened, rare, or commercially valuable, mineral or paleontological, and of objects of cultural patrimony

2. *Regulations related to NPS cultural collections*

The following regulations include major requirements for NPS museum collections management. Many other regulations may apply in specific situations.

- 43 CFR Part 3 "Preservation of American Antiquities" (implementing regulations for the Antiquities Act):
  - authorizes federal land managers to seize materials recovered illegally from archeological resources located on federal lands
  - directs federal land managers to dispose of seized materials by depositing them in the proper national depository or by other means
  - requires that every collection recovered under the Antiquities Act be preserved in the public museum designated in the Antiquities Act permit, and be accessible to the public
  - states that the Secretary of the Smithsonian Institution must approve in writing the removal (deaccession) of an Antiquities Act collection
  - mandates that deaccessioned Antiquities Act collections must be transferred to another public museum
  - requires that an Antiquities Act collection revert to the national collections whenever a museum holding such collections ceases to exist
- 43 CFR Part 7 "Protection of Archeological Resources: Uniform Regulations":
  - requires that repositories proposed by ARPA permit applicants to certify in writing their willingness to assume curatorial responsibility for the collections
  - requires that, for resources located on public lands, repositories must certify that they will safeguard and preserve the collections as property of the United States
  - requires that ARPA permit applicants certify that, not later than 90 days after the final report is submitted to the federal land manager, the collections will be delivered to the repository named in the ARPA permit
  - requires that federal land managers specify in ARPA permits the name of the repository in which collections are to be deposited
  - states that archeological resources excavated or removed from public lands remain the property of the United States
  - states that archeological resources excavated or removed from Indian lands remain the property of the Indian or Indian tribe having rights of ownership over such resources
  - authorizes the Secretary of the Interior to issue regulations for the curation of federally-owned and administered collections. In the absence of such regulations Federal land managers are authorized

to provide for the exchange of collections among suitable repositories

  - restates the confidentiality requirement specified in ARPA

- 36 CFR Part 79 "Curation of Federally-Owned and Administered Archeological Collections":

  - states the responsibilities of federal agencies to manage and preserve collections

  - identifies methods for federal agencies to use to secure and fund curatorial services

  - states terms and conditions for federal agencies to include in contracts, memoranda, agreements, and other written instruments with repositories for curatorial services

  - establishes standards for federal agencies to use to determine when a repository has the capability to provide long-term curatorial services

  - provides guidelines for collections use

  - specifies procedures and guidelines for conducting periodic inspections and inventories of collections

3. *International Conventions related to NPS cultural collections*

The following international convention applies to NPS cultural collections.

- 1970 UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (implemented in the United States by P.L. 97-446 in 1983, 19 USC 260l). Signatory nations agree to work to prevent the import of and trade in archeological and ethnographic materials (when requested) and in stolen cultural collections. This convention:

  - was ratified by the United States and 90 other nations by 2000.

  - provides protection for archeological and ethnographic materials when the home nation requests that other signatories not import these materials. (As of 2000, Bolivia, Cambodia, Canada, Cyprus, El Salvador, Guatemala, Mali, and Peru have had such requests approved.)

  - provides protection for stolen property, including cultural and natural history collections, that have been taken from a museum or public institution (including churches, monuments, and archeological sites) To be covered, the materials must have been previously inventoried as part of the institution's collection.

  - exempts objects imported for temporary exhibits

  Note: The United States and France are the only major art-importing countries to sign the convention to date; Canada, Korea, and Australia are also signatories. It is enforced in the United States by the Customs Service.

4. *Contacts for laws, regulations, and conventions – NPS cultural collections*

Direct questions relevant to laws and regulations about cultural collections to the regional/support office (SO) curator, the regional archeologist, historian, archivist, and ethnographer.

C. Laws, Regulations, and Conventions – NPS Natural History Collections

1. *Laws related to NPS natural history collections*

These laws relate to NPS natural history collections.

- Lacey Act of 1900 (18 USC 43-44):
  - makes the violation of any state, federal, or foreign wildlife law a federal offense
  - places stipulations on the importing and labeling of wildlife and their parts
  - poses complex problems for museums in relation to the acquisition and deaccession of wildlife materials and the sale of wildlife materials in museum shops because it is hard to prove the legal history of such pieces
  - requires proof of intentional violation for enforcement, but ignorance of the relevant state, federal, or foreign statutes is not excusable.

  Note: The Black Bass Act of 1930 (16 USC 851) added fish to the list of wildlife under the Lacey Act.

- Migratory Bird Treaty Act of 1918 (16 USC 703-711):
  - protects birds flying between the United States and Canada, Mexico, and Japan
  - covers all wild, native birds not legally hunted by state law
  - clarifies that some non-native species may be covered by state law and, therefore, by the Lacey Act

- makes it illegal to kill, capture, collect, possess, buy, sell, ship, import, or export listed species including their parts, nests, and eggs

- allows museums and non-commercial institutions to get permits for legal possession, collection, and transportation of objects, but permits impose extensive record-keeping requirements

- states that only museums and other specified institutions can purchase any protected bird or part thereof, and the seller must possess a federal permit for a legal sale

- Bald Eagle Protection Act of 1940 (16 USC 668a), amended in 1962 to include golden eagles:

  - prohibits taking, buying, selling, trading, possession, importation or exportation of eagles or their parts, nests, eggs, or products made of them

  - authorizes permits for taking, possessing, and transporting eagles and their parts for scientific, exhibition, and Native American religious purposes

  - exempts possession and transportation of eagles held prior to the law

  - requires permits for any materials acquired by museums after the law was established

- Marine Mammal Protection Act of 1972 (16 USC 1361-1407):

  - places a moratorium on the killing of marine mammals by United States citizens

  - restricts the possession, sale, purchase, importation, or transportation of the animals and their products and parts

  - requires permits for exhibiting marine mammals and their parts and for holding them in storage.

  - allows Native peoples to use such parts for the manufacture and sale of handcrafts as long as the sale is handled by a licensed dealer

  - exempts museums from permit requirements for pre-Act materials or to purchase legitimate handcrafts, although they should consider getting permits for all other marine mammal materials.

- Endangered Species Act of 1973, as amended (16 USC 1531-1543):

  - prohibits harassing, harming, or killing listed species

  - prohibits the purchase, sale, or use of listed species or parts thereof in the course of an interstate commercial activity. Intra-state transactions are allowed if pre-Act ownership can be proven.

  - doesn't apply to fossils and objects greater than 100 years old, but age must be verified

- requires park museums to have a permit to purchase more recent objects that contain parts of endangered or threatened species

- allows gifts of endangered or threatened specimens to museums if there is proof of pre-Act ownership and if the objects have not been offered for sale since the date of this law.

- allows loans or gifts between educational institutions. In such instances permits are not required, even if the objects cross state lines.

2. *Regulations related to NPS natural history collections*

The following regulations apply to NPS museum collections.

- 36 CFR, Section 2.5 (Revision effective April 30, 1984), "Research Specimens" Section 2.5(g) states: "Specimen collection permits shall contain the following conditions:

  - Specimens placed in displays or collections will bear official National Park Service museum labels and their catalog numbers will be registered in the National Park Service National Catalog.

  - Specimens and data derived from consumed specimens will be made available to the public and reports and publications resulting from a research specimen collection permit shall be filed with the superintendent."

  Note: A revision to 36 CFR 2.5 is in progress.

- 50 CFR, Sections 17.11 and 17.12, "Endangered and Threatened Wildlife and Plants." These annually revised sections provide lists of names of all the species of wildlife and plants determined to be endangered or threatened.

3. *International conventions related to NPS natural history collections*

The following international convention applies to NPS natural history collections.

- Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES):

  - protects endangered species of plants and animals by regulating imports and exports

  - was ratified by the United States in 1974, and by 150 other nations by 2000

  - allows for certificates of exemption for the import or export of items acquired before CITES, and for non-commercial exchange between institutions

  - is enforced in the United States by the Fish and Wildlife Service

  - includes three appendices that protect materials of varying degrees of scarcity:

    Appendix I. Species are in danger of extinction and there is no commercial trade in them. Any international transport of these materials requires permits from both the exporting and importing nations.

Appendix II. Species require strict regulation to prevent the danger of extinction and/or look like Appendix I species. Permits for international transport are issued by the exporting nation, and are allowed for any purpose not detrimental to the species.

Appendix III. Species are protected only within their native countries. They require permits for export even if they are plentiful elsewhere.

4. *Contacts for laws, regulations, and conventions – NPS natural history collections*

Direct questions relevant to the Endangered Species Act, and other laws and regulations about natural history collections to the regional/SO curator and the regional chief of natural resources management (or equivalent).

For information on CITES and other wildlife laws, including procedures and applications for getting permits to have endangered or threatened wildlife and plants in a park's museum collection, contact:

D. Policies and Standards

1. *Governmentwide and departmental policies and standards related to NPS museum collections*

The following governmentwide and departmental policies and standards apply to NPS museum collections:

- 41 CFR 101 Federal Property Management Regulations (FPMR) prescribes regulations, policies, procedures, and delegations of authority about the management of federal property.

- Interior Property Management Regulations, *Departmental Manual* Part 410, Personal Property Management (Subpart 114-60):

  – prescribes policies, procedures, and responsibilities governing the receipt, accountability, record-keeping, management, and survey of personal property in the Department of the Interior (DOI)

  – applies to all personal property acquired by all DOI bureaus and offices

  – ensures the safeguarding of government property against waste, fraud, and abuse

- references the management of museum collections, noting exceptions to normal property procedures. These references are summarized in Figure A.2.

- *Departmental Manual* Part 411, Museum Property Management, Chapters 1-3:

  - defines the types of museum property

  - establishes organizational responsibilities, policies, and standards for the preservation, protection, and documentation of museum property

  - establishes organizational responsibilities for developing plans to implement these policies and standards

  - identifies mandatory procedures, reports, and data

- *Departmental Manual* Part 517, Chapter 1, Pesticide Use Policy, outlines the pesticide use policy of the Department of the Interior. It is the policy of the Department:

  "To use pesticides only after full consideration of alternatives - based on competent analyses of environmental effects, safety, specificity, effectiveness, and costs. The full range of alternatives including chemical, biological, and physical methods, and no action will be considered. When it is determined that a pesticide must be used in order to meet important management goals, the least hazardous material that will meet such goals will be chosen."

2. *NPS management policies for museum collections*

Excerpts from NPS *Management Policies* (1988) that are specifically relevant to museum objects are as follows (chapter and page references appear in parentheses). This section will be updated when the revised *Management Policies* is issued (anticipated fall 2000).

Chapter 5 - Cultural Resource Management

Inventories (Page 5:1)

"The following cultural resource inventories will be maintained for the national park system: …(3) a National Catalog of Museum Objects encompassing all cultural and natural history objects in NPS collections."

Preservation of Data and Collections and Protection of Research Potential (Page 5:3)

"Field data, objects, specimens, and features of structures retrieved for preservation during cultural resource research and treatment projects, together with associated records and reports, will be managed within the park museum collection. Where practical, the features of sites and structures will be left in place."

Treatment of Museum Objects (Pages 5:9-10)

"Preservation. A museum object will be preserved in its present condition through ongoing preventive conservation if (1) that condition is satisfactory for exhibit or research, or (2) another treatment is

warranted but cannot be accomplished until some future time. Interventional measures will be taken when preventive conservation measures are insufficient to reduce deterioration to a tolerable level, or when the object is so fragile as to be endangered under any circumstances. Intervention will be minimized to reduce the possibility of compromising the object's integrity.

Restoration. A museum object may be restored to an earlier appearance if (1) restoration is required for exhibit or research purposes, (2) sufficient data exist to permit restoration with minimal conjecture, and (3) restoration will not modify the object's known original character. Restoration will be accomplished using the techniques and materials that least modify the object and in such manner that the materials will be removable at a later time with minimal adverse effect. Restored areas will be distinguishable from original material and documented. Restoration will take into account the possible importance of preserving signs of wear, damage, former maintenance, and other historical and scientific evidence.

Reproduction. Museum objects needed for interpretive presentations will be reproduced for such use when the originals are unavailable or would be subject to undue deterioration or loss. The National Park Service will observe copyright laws with respect to reproduction."

Acquisition, Management, and Disposition of Museum Objects (Page 5:10)

"Objects and related documentation essential to achieving the purposes and objectives of the parks will be acquired and maintained in accordance with approved Scope of Collection Statements for each park. Archeological objects systematically collected within a park and natural history specimens systematically collected within a park for exhibit or permanent retention will be managed as part of the museum collection. Museum collection management and care will be addressed at all appropriate levels of planning.

Museum objects will be acquired and disposed of in conformance with legal authorizations and current NPS curatorial procedures. The National Park Service will acquire only collections having legal and ethical pedigrees, and each park will maintain complete and current accession records to establish the basis for legal custody of the objects in its possession. Museum catalog records will be prepared by each park to record basic property management data and other documentary information for museum objects. Objects will be inventoried in accordance with current procedures."

Historic Furnishings (Page 5:10)

"When the historic furnishings of a structure are present in their original arrangement, they will not be moved or replaced unless required for their protection or preservation, or unless the structure is designated for another use in an approved planning document. A structure may be refurnished in whole or in part if (1) its history is significantly related to a primary park theme, (2) refurnishing is the best way to interpret that history to the public, and (3) sufficient evidence of furniture design and placement exists to refurnish with minimal conjecture. Reproductions will be used only when prototypes exist to ensure the accurate re-recreation of historic pieces."

Archives and Manuscripts (Pages 5:10-11)

> "Archival and manuscript collections are considered museum property and will be managed in ways that preserve them intact for the future while providing current access.
>
> When an archival collection not owned by the National Park Service falls within a park's approved Scope of Collection Statement, every reasonable effort will be made to acquire it if (1) an appropriate storage facility will be provided by the Park Service or a cooperating institution, (2) the facility will be staffed by at least one archivist, curator, librarian, or other person experienced in caring for documentary materials, and (3) the collection will be made available to serious researchers under conditions that maximize both preservation and use and ensure security against theft and vandalism.
>
> Parks will retain notes or copies of records significant to their administrative histories when they periodically ship their official records to federal record centers."

Fire Detection and Suppression (Page 5:14)

> "When warranted by the significance of a historic structure or of the museum objects in a nonhistoric structure, adequate fire detection, warning, and suppression systems will be installed. Fire-fighting personnel will be advised of any peculiarities or dangers inherent in a structure and any objects to be given priority for protection or rescue. Park personnel will receive training in fire prevention and suppression with hand-held extinguishers at historic structures and museums, and designated personnel will be trained to respond to all emergencies involving museum collections.
>
> Smoking will not be permitted in spaces housing museum collections or in historic structures other than those adapted for modern residential and administrative uses."

Pest Management (Page 5:14)

> "The National Park Service will follow the integrated pest management approach in addressing pest problems related to cultural resources. All feasible nonchemical methods will be exhausted before resorting to the use of chemicals. Any use of pesticides for cultural resources will conform to the NPS pesticide use policy."

Chapter 4 - Natural Resource Management

Natural Resource Collections (Page 4:4)

> "Natural resource collections include nonliving and living specimens and associated field records. If placed in exhibits or retained in permanent collections, nonliving specimens and their associated field records will be cataloged into a park's museum collection. Management standards for such collections are specified in the *Cultural Resource Management Guideline* and the *Museum Handbook*."

Integrated Pest Management Procedures (Page 4:13)

> Integrated pest management (IPM) procedures will be used to determine when to control pests and whether to use mechanical, physical, chemical, cultural, or biological means….
>
> The choice to use a chemical pesticide will be based on a review by regional and Washington office coordinators of all other available options and a determination that these options are either not acceptable or not feasible; cost or staffing considerations alone will not be adequate justification for use of chemical control agents. Chemical pesticides that are not specifically exempt from reporting (regardless of who the applicator is) will be used only with prior approval by the Director on an annual basis. The application of such pesticides is subject to the Federal Insecticide, Fungicide, and Rodenticide Act (7 USC 136 et seq.), Department of the Interior policies and procedures (DM 517),…Environmental Protection Agency regulations in 40 CFR, and Occupational Safety and Health Administration regulations."

Paleontologic Resource Management (Page 4:19)

> "Management actions will be taken to prevent illegal collecting and may be taken to prevent damage from natural processes such as erosion. Protection may include construction of shelters over specimens for interpretation in situ, stabilization in the field, or collection, preparation, and placement of specimens in museum collections. The localities and geologic settings of specimens will be adequately documented when specimens are collected."

Chapter 7 - Interpretation and Education

Interpretation and Native Americans (Page 7:5)

> "The National Park Service will not exhibit native American disinterred skeletal or mummified human remains or photographs or replicas of them. There will be no display of grave goods or other objects if native Americans who are culturally associated with them object to such exhibit. Associated native American tribes and groups will be consulted to determine the religious status of any object, the sacred nature of which is suspected but not confirmed, before it is exhibited or before any action is taken."

Chapter 8 - Use of the Parks

Research and Collection Activities (Pages 8:15-16)

> "Research activities by non-NPS personnel that, in the superintendent's judgment, might disturb resources or visitors or that require the waiver of any regulation may be allowed in parks only pursuant to the terms and conditions of an appropriate permit. Scientific collecting activities that involve the removal of plants, animals, minerals, or archeological, historical, or paleontological objects will be allowed only if they are (1) proposed in conjunction with authorized research activities and (2) authorized and conducted in accordance with all applicable legislation, regulations, and guidelines…."

Chapter 9 - Park Facilities

Curatorial Facilities (Page 9:15)

> "Park curatorial facilities should be adapted to the needs of each park. They may share space in visitor centers or administrative office buildings or be housed in completely separate buildings; however, incorporation with maintenance facilities should be avoided because of the heightened danger of fire, chemical spills, and similar accidents. Curatorial facilities will meet the collection's special requirements for security, fire suppression, and environmental controls."

Chapter 10 - Concessions Management

Merchandise and Handcrafts (Pages 10.8-9)

> "Concessioners may not sell merchandise that violates conservation principles. The sale of original prehistoric or historic archeological artifacts or vertebrate paleontologic specimens is prohibited. Clearly labeled replicas of such artifacts and specimens may be sold."

3. *NPS Director's Orders and guidance for museum collections*

Director's Orders supplement the NPS *Management Policies*. All Director's Orders are on the Web at <http://www.nps.gov/refdesk/DOorders/>.

Director's Order #28: Cultural Resource Management

Director's Order #28: Cultural Resource Management, is implemented through Release No. 5 of the *Cultural Resource Management Guideline* (1997). The *Cultural Resource Management Guideline* gives guidance on how to apply policies and standards. The *Cultural Resource Management Guideline* applies to museum objects and archival and manuscript collections that are housed in parks, archeological and preservation centers, and other NPS organizational units. Excerpts from this guideline follow:

Research

- Each park has an approved stand-alone Scope of Collection Statement defining the purpose and prescribing limits and use of its museum collection.
- Every museum object is accessioned as soon as it is in NPS custody and cataloged promptly thereafter. Paper museum records and ANCS+ magnetic media are kept in secure fire-resistant storage.
- All materials resulting from systematic research projects associated with an accession are housed at the same repository, except when on temporary loan for specific use elsewhere. Within that repository, objects and records composing an accession may be stored or filed separately from related objects and records to the extent required for security, fire protection, enhanced or reduced access, preservation, fiscal control, or exhibition.
- Each park has consulted with affected Native Americans on any acquisitions that involve human remains and associated funerary objects, unassociated funerary objects, sacred objects, or objects of cultural patrimony.

- Archival and manuscript collections are surveyed, appraised, accessioned, cataloged, rehoused, arranged, and described according to procedures and guidelines contained in the *Museum Handbook*, Part II, Appendix D.

- Archival and manuscript collections are arranged and described by or under the guidance of an archivist in accordance with professional standards and procedures. A preliminary finding aid is produced as described in the *Museum Handbook*, Part II, Appendix D.

- Museum objects not relevant to a park according to its SOCS are deaccessioned as permitted by current NPS procedures.

- Archeological objects and natural history specimens systematically collected within a park are deaccessioned only if lost or so deteriorated that they no longer have scientific value.

- Objects and archival and manuscript collections in a park's museum collection are made available to qualified researchers who can demonstrate a need to use them. Access is permitted under conditions designed to ensure the security and preservation of the materials, including adequate staff supervision. Copyright is respected in accordance with guidance in the *Museum Handbook*, Part I, Chapter 2; the *Museum Handbook*, Part II, Chapter 2 and Appendix D.

- Each outgoing loan is documented by an outgoing loan agreement. All loaned museum objects are cataloged unless loaned to NPS repositories for collections management and storage purposes. Conditions for preserving, handling, and shipping and an itemized list of museum objects are included in a loan agreement.

Planning

- Plans for park management, development, exhibits, interpretation, and research address the proper documentation, protection, preservation, and use of objects.

- Each park and center has a collection management plan to guide proper management and care of its museum collection and a separate collection storage plan if necessary.

- Each park and center has one or more collection condition surveys to detect problems with the condition of museum objects and determine conservation treatment priorities.

- Proposals for environmental control measures in historic structures are based on data from environmental monitoring for at least one year.

- Each park ensures that the cataloging and curation of objects, specimens, and associated records recovered from archeological and scientific projects are accomplished.

- Each park ensures that approved museum plans and reports are entered in the Cultural Resources Management Bibliography (CRBIB).

Stewardship

- Each park and center has identified threats to the security and protection of its museum collection and has taken appropriate measures to deal with them, including emergency planning.
- Each park and center has implemented a preventive conservation program whereby museum objects are exhibited, handled, and stored with sensitivity to their specific environmental needs and vulnerabilities and are regularly inspected for evidence of deterioration.
- Preservation and use of museum objects accords with Director's Order #24: NPS Museum Collections Management; the *Museum Handbook*, Part I; and National Archives and Records Administration standards.
- Conservation treatment required to stabilize or restore museum objects entails the least intervention necessary to satisfy treatment goals.
- Inventories of museum objects and status reports on collections are completed and submitted in accordance with current NPS museum property procedures and other administrative requirements.
- Any use of museum objects likely to damage them or hasten their deterioration is undertaken only after careful review and approval.

Director's Order #24: NPS Museum Collections Management

Director's Order #24: NPS Museum Collections Management, gives requirements for managing park museum collections. It is supplemented by the *Museum Handbook*, Parts I-III. Director's Order #24 is reprinted in full in Figure A.3.

E. List of Figures

16 USC Sec. 18f Management of museum properties

The purpose of this section and sections 18f-2 and 18f-3 of this title shall be to increase the public benefits from museums established within the individual areas administered by the Secretary of the Interior through the National Park Service as a means of informing the public concerning the areas and preserving valuable objects and relics relating thereto. The Secretary of the Interior, notwithstanding other provisions or limitations of law, may perform the following functions in such manner as he shall consider to be in the public interest:

(a) Donations and bequests—Accept donations and bequests of money or other personal property, and hold, use, expend, and administer the same for purposes of this section and sections 18f-2 and 18f-3 of this title;
(b) Purchases—Purchase museum objects, museum collections, and other personal properties at prices he considers to be reasonable;
(c) Exchanges—Make exchanges by accepting museum objects, museum collections, and other personal properties, and by granting in exchange therefore museum property under the administrative jurisdiction of the Secretary which is no longer needed or which may be held in duplicate among the museum properties administered by the Secretary, such exchanges to be consummated on a basis which the Secretary considers to be equitable and in the public interest;
(d) Accepting loans of museum objects—Accept the loan of museum objects, museum collections, and other personal properties and pay transportation costs incidental thereto, such loans to be accepted upon terms and conditions which he shall consider necessary; and
(e) Making loans of museum objects—Loan to responsible public or private organizations, institutions, or agencies, without cost to the United States, such museum objects, museum collections, and other personal property as he shall consider advisable, such loans to be made upon terms and conditions which he shall consider necessary to protect the public interest in such properties.

Sec. 18f-1. [Does not apply to the National Park Service.]

Sec. 18f-2. Additional functions

(a) Museum objects and collections—In addition to the functions specified in section 18f of this title, the Secretary of the Interior may perform the following functions in such manner as he shall consider to be in the public interest:

(1) Transfer museum objects and museum collections that the Secretary determines are no longer needed for museum purposes to qualified Federal agencies, including the Smithsonian Institution, that have programs to preserve and interpret cultural or natural heritage, and accept the transfer of museum objects and museum collections for the purposes of this section and sections 18f and 18f-3 of this title from any other Federal agency, without reimbursement. The head of any other Federal agency may transfer, without reimbursement, museum objects and museum collections directly to the administrative jurisdiction of the Secretary of the Interior for the purpose of this section and sections 18f and 18f-3 of this title.

(2) Convey museum objects and museum collections that the Secretary determines are no longer needed for museum purposes, without monetary consideration but subject to such terms and conditions as the Secretary deems necessary, to private institutions exempt from Federal taxation under section 501(c)(3) of title 26 and to non-Federal governmental entities if the Secretary determines that the recipient is dedicated to the preservation and interpretation of natural or cultural heritage and is qualified to manage the property, prior to any conveyance under this subsection.

(3) Destroy or cause to be destroyed museum objects and museum collections that the Secretary determines to have no scientific, cultural, historic, educational, esthetic, or monetary value.

(b) Review and approval—The Secretary shall ensure that museum collections are treated in a careful and deliberate manner that protects the public interest. Prior to taking any action under subsection (a) of this section, the Secretary shall establish a systematic review and approval process, including consultation with appropriate experts, that meets the highest standards of the museum profession for all actions taken under this section.

Sec. 18f-3. Application and definitions

(a) Application—Authorities in this section and sections 18f and 18f-2 of this title shall be available to the Secretary of the Interior with regard to museum objects and museum collections that were under the administrative jurisdiction of the Secretary for the purposes of the National Park System before November 12, 1996, as well as those museum objects and museum collections that may be acquired on or after November 12, 1996.
(b) Definitions—For the purposes of this section and sections 18f and 18f-2 of this title, the terms "museum objects" and "museum collections" mean objects that are eligible to be or are made part of a museum, library, or archive collection through a formal procedure, such as accessioning. Such objects are usually movable and include but are not limited to prehistoric and historic artifacts, works of art, books, documents, photographs, and natural history specimens.

Figure A.1. Museum Properties Act of 1955 as amended November 12, 1996

114-60.100(b)	All museum property is accountable with no dollar threshold.
114-60.100(e)	Museum property is not capitalized.
114-60.100(n)	Definition of museum property
114-60.100(bb)	Sensitive property shall, at a minimum, include firearms…
114-60.200(a)	(1)…museum property will not be controlled in a general ledger control account. All items in a museum collection will be controlled through accessioning and cataloging.
114-60.401(c)	All museum property is controlled through accessioning and cataloging, regardless of value.
114-60.503(e)	An Accession Receiving Report will be used to document receipt of museum property.
114-60.601(b)	Because permanent marking of museum property is potentially damaging, items of museum collections are exempted from the marking requirements of this subpart. Bureaus and offices having museum collections will develop and implement procedures: (NPS procedures are outlined in the NPS *Museum Handbook*, Part II).
114-60.802-1(a)	A Certificate on Unserviceable Property will not be issued for…museum property.
114-60.811-2(f)	Examples of property irregularities include…loss or theft of a firearm or weapon.

Figure A.3. Director's Order #24: NPS Museum Collections Management

National Park Service

DIRECTOR'S ORDER #24: NPS MUSEUM COLLECTIONS MANAGEMENT

Approved: /s/ Robert Stanton (original on file)
Director, National Park Service

Effective Date: August 21, 2000
Sunset Date: August 21, 2004

This Director's Order supplements NPS *Management Policies* and, augmented by procedures in the *Museum Handbook*, supercedes Special Directives 80-1, "Guidance for Meeting NPS Preservation and Protection Standards for Museum Collections"; 87-3, "Conservation of Archeological Resources," as it pertains to museum collections; 91-4, "Ensuring that Natural Resource Projects Fund the Curation of Collections"; 94-6, "Ensuring that Projects Generating Museum Collections Fund Cataloging and Basic Preservation"; 93-2, "Preserving NPS Cellulose Nitrate Film Collections"; and Staff Directive 87-1, "NPS Clearinghouse Procedures and Requirements Regarding Disposal and Acquisition of Excess and Needed Museum Objects."

1. Background and Purpose

The National Park Service is custodian in perpetuity of irreplaceable and priceless museum collections that include objects, specimens, and archival and manuscript materials (textual, electronic, and audio-visual documents), representing cultural and natural resources in the United States, including but not limited to the disciplines of archeology, biology, ethnology, geology, history, and paleontology. NPS museum collections are part of the natural and cultural heritage of the country and are collected, preserved, and interpreted for public benefit.

NPS museum collections inform and enhance every aspect of park work, from resource management and interpretation, to research and public accountability. Featured in exhibits, interpretive programs, films, and print and electronic publications, NPS museum collections are key resources for educators, students, researchers, park managers, park neighbors, and the general public. Accessibility of museum collections is a prime component of museum management.

The NPS *Management Policies* lay the foundation by which the NPS meets its responsibilities toward these museum collections. This Director's Order provides further policy guidance, standards, and requirements for preserving, protecting, documenting, and providing access to, and use of, NPS museum collections.

2. Authority for this Director's Order

Authority for issuing this Director's Order is found in 16 U.S.C. 1 through 4, and delegations of authority contained in Part 245 of the Department of the Interior Manual. Additional key related authorities are found in the Antiquities Act of 1906 (16 U.S.C. 431-433), the Historic Sites Act of 1935 (16 U.S.C. 461-467), the Management of Museum Properties Act of 1955, as amended (16 U.S.C. 18f), the Archaeological Resources Protection Act of 1979 (16 U.S.C. 470aa-mm), the Native American Graves Protection and Repatriation Act of 1990 (25 U.S.C. 3001), and the Departmental Manual 411 DM, Managing Museum Property.

3. Objectives

The objectives of this Director's Order, in conjunction with the accompanying Level 3 *Museum Handbook*, are to:

- Ensure that NPS managers and staff have information on the standards and actions for successfully and ethically complying with NPS *Management Policies* on museum collections.

- Provide a means of measuring and evaluating progress in preserving, protecting, documenting, accessing, and using museum collections.

4. Responsibilities

4.1 Associate Director, Cultural Resource Stewardship and Partnerships

The Associate Director, Cultural Resource Stewardship and Partnerships, with the assistance of the Chief Curator, has the following responsibilities:

4.1.1 Code of Ethics: Follow the Code of Ethics for the museum management program.

4.1.2 *Museum Handbook*: Develop, issue, and periodically update a *Museum Handbook* containing the information park managers need to know to comply with laws, departmental and Service-wide policies, regulations, professional standards, and a code of ethics applicable to museum collections management. Include in the *Museum Handbook*, as a supplement to this Director's Order, specific guidance for collecting, preserving, protecting (including security and fire protection), documenting, accessing, and using museum collections, clearly distinguishing between those actions that are mandatory requirements and those that are discretionary. Cite those laws, policies, and regulations in relevant sections.

4.1.3 Strategic Plans: Develop strategic plans and goals to improve and maintain the management of NPS museum collections Service-wide, consistent with the Government Performance and Results Act of 1993 (31 USC 1115).

4.1.4 National Catalog: Maintain for management and public benefit a National Catalog of Museum Objects, consisting of electronic and paper catalog records, with accession and catalog data for all parks. Develop and maintain an automated collections management program (the Automated National Catalog System [ANCS+ and its successor]) for use by parks, centers, and offices Service-wide, as well as the general public.

4.1.5 Report Requirements and Analysis: Identify reports that are required annually, or at other times, to further museum collections management. Reporting requirements will be kept to the minimum necessary. Maintain, analyze, and report on data submitted by parks, centers, and regions, including: the Collections Management Report, the NPS Checklist for Preservation and Protection of Museum Collections; funding distributions and accomplishments; and other required reports and surveys.

4.1.6 Annual Inventory: Review regional certifications of annual inventories, and take any necessary corrective action.

4.1.7 Museum Supplies, Equipment, and Technologies: Research products and facilitate park and center acquisition and use of appropriate supplies, forms, equipment, and technologies for management of museum collections.

4.1.8 Service-wide Initiatives: Develop and coordinate Service-wide initiatives and funding to improve museum management.

4.1.9 Technical Information: Publicize and disseminate technical information on museum management, including conservation and archival collections management.

4.1.10 Information Access: Develop and maintain access to Service-wide information on NPS museum collections through various media (for example, ANCS+ and World Wide Web).

4.1.11 Professional Qualifications and Training: Evaluate Service-wide professional competencies and training needs in museum management, and develop strategies, guidelines, and curricula to meet those needs. Coordinate training to address new technologies, programs, and initiatives.

4.1.12 Plan Review: Review draft park plans that receive Washington Office review, such as General Management Plans, for appropriate coverage of museum management.

4.1.13 Technical Assistance: Provide technical assistance and advice to park and center managers regarding acquiring, preserving, protecting, documenting, accessing, and using museum collections. Provide this assistance and advice at the request of regions.

4.2 Regional Directors and WASO Associate Directors with Museum Collections Responsibility

Regional directors (assisted by regional museum support staff), and WASO associate directors accountable for museum collections, have the following responsibilities:

4.2.1 Code of Ethics: Follow the Code of Ethics for the museum management program.

4.2.2 Plan and Performance Review: Use the strategic and annual performance planning processes, the park planning process, and the performance management system to ensure that superintendents and center managers meet their responsibilities to manage museum collections according to this directive. Review park plans for appropriate coverage of museum collections management, and to ensure consistency with NPS requirements.

4.2.3 Technical Assistance: Provide technical assistance to parks and centers to assist them in meeting NPS museum management requirements, and in providing for access and use of collections.

4.2.4 Staffing and Training: Evaluate museum management staffing and training needs, and develop and provide training to park and center staff. Regional directors will alert the Associate Director, Cultural Resource Stewardship and Partnerships, about regional training needs that may apply Service-wide.

4.2.5 Plans, Priorities, and Reports: Develop plans and set priorities (including funding priorities) for managing museum collections based on all approved planning documents and information provided through Service-wide reports and requirements, including the Collections Management Report, NPS Checklist for Preservation and Protection of Museum Collections, and Automated Inventory Program. Review reports to ensure that parks and centers meet reporting requirements.

4.2.6 Annual Inventory Certification: Annually certify to the Associate Director, Cultural Resource Stewardship and Partnerships, Attention: Chief Curator, no later than September 30 each fiscal year, that parks and centers have completed their annual inventories. Review park and center annual inventories and take any necessary corrective actions. Establish a regular schedule for parks in the region to submit the inventories.

4.2.7 Destructive Analysis and Consumptive Use: After careful review, if the benefits can be clearly shown to outweigh the resulting or potential damage or loss, approve destructive analysis of rare or highly significant objects, specimens, and archival items, and any consumptive use of museum collections.

4.2.8 Unconditional Gifts: Grant exceptions to the unconditional gift policy on a rare, and case-by-case basis.

4.3 Park Superintendents and Center Managers

Park superintendents, center managers, and others who manage collections (with the assistance of museum management staff) have the following responsibilities:

4.3.1 Code of Ethics: Follow the Code of Ethics for the museum management program.

4.3.2 Standards: Meet museum management standards in the NPS *Museum Handbook* (Parts I-III) for:

- acquiring, preserving, protecting, documenting (including accessioning, cataloging, lending, deaccessioning), accessing, and using museum collections; and
- completing actions specific to archival and manuscript collections (appraising, arranging, describing, producing finding aids, and providing reference and duplication services).

4.3.3 Procedures: Follow procedures in the *Museum Handbook*.

4.3.4 Ongoing and Corrective Actions: Provide ongoing funding for recurring museum management functions and take appropriate action to correct identified preservation, protection, documentation, and access and use deficiencies, including programming for funding to correct such deficiencies. Complete Project Management Information System (PMIS) and Resource Management Plan (RMP) project statements that identify all preservation, protection, documentation, access and use needs.

4.3.5 Staffing and Training: Evaluate and address museum management staffing and training needs according to established personnel qualifications standards and Service-wide professional competencies.

4.3.6 Scope of Collection: Approve and keep current a Scope of Collection Statement to identify the scope of collecting activities and define the purpose of the collection. Ensure acquisitions are consistent with the Scope of Collection Statement. Deaccession objects inconsistent with the Scope of Collection Statement.

4.3.7 Collection Management Plan: Approve, keep current, and implement a Collection Management Plan to:

- evaluate issues of preserving, protecting (including security and fire protection), documenting, accessing and using collections;
- address issues specific to archival and manuscript collections (appraising, arranging, describing, producing finding aids, and providing reference and duplication services); and
- propose a strategy to address the issues, including staffing and cost estimates.

4.3.8 Housekeeping Plan: Approve, keep current, and implement a Housekeeping Plan for every space that houses museum collections, to ensure that housekeeping routines are sensitive to museum collections preservation needs.

4.3.9 Integrated Pest Management: Approve, keep current, and implement an Integrated Pest Management Plan that addresses the museum collections.

4.3.10 Emergency Operation: Approve, keep current, and implement a Museum Collections Emergency Operations Plan, as part of the park's Emergency Operations Plan, that identifies museum collection vulnerabilities to events (such as fire, earthquakes, and floods), and identifies responses that will protect resources without endangering human health and safety. Ensure staff is practiced and prepared for emergency response.

4.3.11 Job Hazard Analysis: Complete a Job Hazard Analysis (JHA) for all museum jobs that have an associated history of injury, illness, or death; or that require the use of personal protection equipment, such as respirators; or that involve activities that are clearly dangerous, such as handling collections with mold, working with toxic or flammable chemicals, or operating heavy machinery.

4.3.12 Collection Condition: Monitor and record information about the environment in spaces housing collections and manage the environment to maximize preservation. Complete Collection Condition Surveys, as needed, to assess conditions in spaces housing museum collections, to record the condition of objects or groups of objects, and to determine treatment needs and priorities. Incorporate survey data in ANCS+ and in accession or catalog files.

4.3.13 Accession and Catalog Records: Accession collections upon acquisition to establish basic accountability. Catalog the collections immediately following acquisition, or program to catalog them in the

near future. Survey, appraise, rehouse, arrange, and describe archival and manuscript collections and prepare finding aids. Develop park archival duplication and reference procedures. Have PMIS statements in place to address eliminating any archival processing backlog.

4.3.14 Accession and Catalog Backup: Maintain a complete current backup of all electronic accession and catalog records at a location that is not vulnerable to the same catastrophic events as the computer workstation. Submit a complete annual backup to the National Catalog in Harpers Ferry, West Virginia.

4.3.15 Unconditional Gifts: Accept only unconditional gifts and bequests, and, where possible, obtain applicable copyrights and releases with acquisitions. Obtain regional director's approval for rare exceptions, on a case-by-case basis.

4.3.16 Project-generated Collections: Require project budgets to include funding for the basic management of collections that are project-generated. Collections management includes cataloging; labeling; conservation examination and treatment (including specimen preparation); initial storage of objects and specimens; and organization and storage of project documentation, including appraisal, arrangement, description, finding aid production, and appropriate archival housing.

- Before starting, permitting, or contracting a project, specify in writing in the task directive, proposal, agreement, permit, or contract, the parties responsible, the designated NPS or non-NPS repository, the collections management tasks, and a time schedule for completion.
- Fund subsequent ongoing maintenance costs of collections management from the operating base of the responsible park, center, or other repository.
- If project-generated collections cannot be accommodated in available storage space, and new storage space construction is necessary, program to construct new space to accommodate the expanded collection. If interim storage is needed, specify in the project task directive the location of that storage, and state that it must meet NPS standards. Identify the funding source for interim storage.

4.3.17 Systematic Collections: Add collections made through systematic research to the museum collection. House those associated with a single accession at the same repository to facilitate research and use. As appropriate, lend these collections for exhibit, research, conservation, and other approved uses. Superintendents may authorize housing of collections from the same accession at different repositories if by so doing preservation, research, and use will be improved.

4.3.18 Collections Management Report: Annually complete the automated Collections Management Report (CMR), using ANCS+. The report provides information on accessions, deaccessions, cataloging, backlogs of objects to be cataloged, use of museum collections, and total collection size. The report must include all collections, whether kept in park facilities, other NPS facilities, or in non-NPS repositories. Submit the CMR using ANCS+.

4.3.19 Annual Inventory: Conduct an annual collection inventory on a regular schedule using the Automated Inventory Program (AIP) in ANCS+ and reconcile the results with existing accession and catalog records. Take any necessary corrective action.

4.3.20 Checklist: Keep the NPS Checklist for Preservation and Protection of Museum Collections (Checklist) up-to-date in the Automated Checklist Program (ACP) in ANCS+. The Checklist records information on preservation and protection
conditions in parks and centers, identifies deficiencies, and provides estimated costs to correct deficiencies.

4.3.21 Treatment Documentation: Document treatment of collections, and record that information in ANCS+ and retain reports and documentation in accession or catalog files.

4.3.22 Cellulose Nitrate and Cellulose Ester Film: Identify cellulose nitrate and cellulose ester film, and take steps to preserve the visual information contained by duplicating the images onto safety film. After inspecting the copies, evaluate and either deaccession and destroy or provide for long-term storage of the original film according to the criteria in *Museum Handbook*, Part I, Appendix M, "Management of Cellulose Nitrate and Ester Film."

4.3.23 Access and Use: Promote access to cataloged collections for research and interpretive purposes through a variety of means and media, such as exhibits, interpretive programs, loans, publications, film and television, the World Wide Web, archival finding aid production and distribution, and posting of finding aids and repository-level guides for archival and manuscript collections in the National Union Catalog of Manuscript Collections (NUCMC).

- Ensure that access and use are consistent with the laws and NPS policies pertaining to Freedom of Information Act disclosures, copyright, privacy, publicity, obscenity and pornography, defamation, and resource protection.
- Document access and use with a researcher logbook, signed access policy statement, researcher registration, copyright and privacy restriction statement, and duplication forms.

4.3.24 Consultation: Consult with affiliated groups in managing collections, including Native American groups when managing collections subject to the Native American Graves Protection and Repatriation Act.

4.3.25 Preservation vs. Destructive Use: Manage objects to preserve their condition, including using reproductions when originals may be damaged by use. Authorize in writing destructive analysis of collections, except for rare or highly significant objects, specimens, and archival materials. Obtain regional director approval for destructive analysis of rare or highly significant objects, specimens, and archival materials and for any consumptive use of collections.

4.3.26 Exhibits: Exhibit collections according to an approved exhibit plan, accompanied by maintenance instructions. Ensure that all exhibits meet the standards in the NPS Checklist for Preservation and Protection of Museum Collections.

4.3.27 Objects in Historic Structures: Document furnishings that are exhibited in their associated historic structures with an approved Historic Furnishings Report. Consider the preservation requirements of both objects and historic structures when objects are on exhibit or in storage in historic structures.

4.3.28 Exhibit of Human Remains: Never exhibit Native American human remains or photographs, drawings or renderings, or casts of the remains. Exhibit non-Native-American human remains and photographs, drawings or renderings, or casts of the remains only in consultation with traditionally associated groups.

4.3.29 CRBIB: Ensure that approved museum plans are entered in the Cultural Resource Management Bibliography (CRBIB).

5. Submissions and Deadlines

5.1 Collections Management Report: Parks and centers will submit the CMR for the previous fiscal year by **November 1** simultaneously to the Regional Director, Attention: Regional Curator, and to the Museum Management Program (MMP), National Center for Cultural Resources. The MMP will prepare this information for the strategic planning and annual reporting processes and compile and distribute cluster, regional, and Service-wide reports.

Parks and MMP use CMR data to report on Strategic Plan Goal Ia6 in compliance with the Government Performance and Results Act.

5.2 Checklist: Parks and centers will update their Checklist in the ACP by **November 1** to show changes as of the end of the previous fiscal year. Parks and centers will submit their Checklist data using the ACP simultaneously to the Regional Director, Attention: Regional Curator, and to the MMP. The MMP will compile and distribute cluster, regional, and Service-wide reports.

Parks and MMP use Checklist data to report on Strategic Plan Goal Ib2D in compliance with the Government Performance and Results Act.

5.3 Annual Inventory: Parks and centers will annually submit the inventory generated using the AIP to the regional director, according to a schedule that the region approves. The regional director will certify the completion of the inventories to the Associate Director, Cultural Resource Stewardship and Partnerships, Attention: Chief Curator, no later than **September 30** each fiscal year.

5.4 National Catalog Submissions: Parks and centers will annually submit to the National Catalog complete electronic backups of their ANCS+ accession and catalog records, identifying new or modified records. The submission for the previous fiscal year is due in **November, December, or January,** according to the schedule established in the *Museum Handbook*, Part II. The National Catalog will print and store archival paper copies of the catalog records. The National Catalog will print and send paper copies of catalog records to parks and centers upon request.

--- End of Director's Order ---

Appendix B: Accreditation

List of Figures

APPENDIX B: ACCREDITATION

A. Overview

1. *What is museum accreditation?*

In the United States, the American Association of Museums (AAM) operates a museum accreditation program. The program assesses how well a museum meets current professional standards. The assessment process involves self-study by the museum as well as peer review. The AAM Accreditation Commission, composed of appointed members of the museum community, grants accreditation status to museums that meet the generally accepted standards. The Commission reviews an accredited museum's status every five to ten years.

2. *What institutions are eligible to apply?*

Applicants must meet eligibility criteria and demonstrate the characteristics of an accreditable museum as published by the AAM. Application information is on the AAM Web site at http://www.aam-us.org/museumresources/accred/apply.cfm. See Section A.8 for additional information.

Park museums that have been open for at least two years, have public exhibits, and are operating according to NPS policies and procedures are likely to meet the AAM accreditation eligibility criteria.

In addition, NPS requires that parks meet the following requirements before applying for accreditation:

- All collections are accessioned.
- All collections are cataloged ***or*** the park has an approved action plan that addresses cataloging of the backlog (park-approved Project Management Information System [PMIS] Project Statement for backlog cataloging).
- Collections are adequately stored, secured, and protected by fire detection and suppression systems, ***or*** the park has approved program management plans (such as the park resource stewardship strategy and the Collection Management Plan) that address the correction of deficiencies identified on the NPS Checklist for Preservation and Protection of Museum Collections (Museum Checklist).
- An approved Scope of Collection Statement is in effect.
- Exhibits are relevant to the park mission and adequately maintained.

3. *Why should a park museum apply for accreditation?*

Accreditation provides review and recognition of the park's museum programs and operations by the museum profession. It offers the benefits of ongoing critical self-evaluation and peer review. Accreditation gains public recognition, which attracts volunteers and visitors. It also facilitates loans, traveling exhibitions, and fundraising to support park museum operations.

4. *What does accreditation involve?*

The accreditation process involves the following steps:

- Park reviews information about accreditation, including tips for preparedness, tools for determining readiness, and eligibility criteria, on the AAM Web site.
- Park consults with regional curator about accreditation.
- Park requests approval to apply and Regional Director grants approval or identifies improvements needed.
- Park completes and submits the application form. When the application is accepted, the AAM will bill the park for the application fee of $400. The park should pay this fee with the charge card.
- Park completes self-study.
- AAM Accreditation Commission reviews self-study and grants interim approval, tables interim approval pending submission of clarifying information or correction of deficiencies within six to twelve months, or denies interim approval. Interim approval is necessary to continue in the accreditation process.
- Park reviews list of potential Visiting Committee members that AAM provides, noting any conflicts of interest.
- AAM selects the Visiting Committee Team Contact who then selects a second team member and schedules the visit directly with the park superintendent.
- Visiting Committee visits park.
- Visiting Committee submits report to AAM Accreditation Commission.
- Accreditation Commission reviews the report and grants accreditation, tables the decision pending correction of identified concerns within one year, denies accreditation, or defers a decision pending submission of additional clarifying information.
- AAM initiates mandatory subsequent review of accreditation within ten years (or within five years if the museum was identified for early subsequent review at the time of accreditation).

See Section B for step-by-step procedures in the accreditation process.

5. *How long will accreditation take?*

Generally, the initial accreditation process requires 31-43 months and the subsequent review takes 27-38 months. The process varies for each museum depending on such factors as the:

- time the park takes to prepare the documents

- scheduling of Accreditation Commission reviews and follow-up actions if tabling, denials, or deferrals are involved

- time required to schedule the Visiting Committee

See the "Quick Reference Guide to the Accreditation Review Process" on the AAM Web site.

6. *How much will accreditation cost the park?*

The accreditation process represents a significant commitment of park staff time. In addition, the park pays accreditation fees and travel expenses.

AAM bills the park for accreditation fees and the park uses the charge card to pay:

- a non-refundable one-time application fee billed following acceptance of the application ($400; subject to change). This fee is not required for subsequent reviews.

- an annual participation fee billed each January for accredited museums and applicants ($200 for members; $500 for non-members; both subject to change).

For the Visiting Committee's travel expenses, the park must issue a purchase order to the AAM in advance of the visit for the Visiting Committee's services. The cost estimate should be based on the anticipated travel expenses of the Visiting Committee. Following the visit, the AAM will bill the park for the Visiting Committee's costs.

7. *What funds are available for accreditation?*

Parks may use appropriated funds and donated funds, including cooperating association funds, to pay accreditation fees.

8. *Where can I get an application and further information?*

Complete information on the Accreditation Program, a downloadable application form, and information on ordering an Accreditation Resource Kit are on the AAM Web site at http://www.aam-us.org/museumresources/accred/apply.cfm.

The Accreditation Resource Kit includes the following publications:

- ***A Higher Standard: The Museum Accreditation Handbook.*** This publication is the definitive guide to the accreditation process and a preview of what is expected of an accredited institution.

- ***The Accreditation Self-Study Guide.*** This booklet provides a framework for the institution to conduct a self-evaluation of its operations and for application to the accreditation program.

- ***The Accreditation Self-Study Guide on CD-ROM***

You may also order the Accreditation Resource Kit from the AAM

Bookstore by mail, telephone, or via the online catalog:

E-mail: accreditation@aam-us.org

If you are interested in gaining accreditation for the park museum, be sure to consult the regional curator as far in advance as possible. The region may have additional guidelines and procedures for the park to follow. Also, the regional curator can provide helpful information, insight, and support throughout the process.

B. Accreditation Step-by-Step

Step 1: Consultation

Consult with the regional curator about the park's readiness to apply for accreditation. Confirm that the park meets AAM and NPS eligibility criteria. See Section A.2. If the park doesn't meet the eligibility criteria, correct the deficiencies and repeat Step 1.

Note: During the application or accreditation process the park, regional office, or the Accreditation Commission may identify deficiencies that the park needs to correct before going to the next step.

Step 2: Regional Director Approval

Request Regional Director approval to apply for accreditation. The Regional Director, upon the recommendation of the regional curator, grants approval for the park to apply for accreditation, or identifies deficiencies that the park needs to correct.

Step 3: Application

Study information on the AAM Web site at http://www.aam-us.org/museumresources/accred/index.cfm. Download and complete the application. Consult the regional curator and submit the application to the AAM. Pay the application fee when the AAM bills the park. See Section A.6.

Step 4: Self-Study

The AAM sends the Accreditation Self-Study Questionnaire to the park. Complete the self-study in consultation with the regional curator. Submit the self-study and supporting documents to the AAM within one year of the application. Use Figure B.1, "Attachments Required for Self-Study: AAM Documents and NPS Equivalents," to select supporting documents for submission with the questionnaire.

Step 5: Accreditation Commission Review of Self-Study (first-time applicants only)

The Accreditation Commission reviews the self-study and takes one of the following actions:

- Grants interim approval: the park may proceed to the next step.
- Denies interim approval: the park must withdraw its application but may reapply in the future.
- Tables the decision: the park must provide further information or clarification within six to twelve months. Upon reviewing the additional information, the Accreditation Commission will grant interim approval or deny accreditation.

Step 6: Selection of Visiting Committee

The AAM will send the park a roster of potential Visiting Committee members. Work with the regional curator to identify any conflicts of interest and return the list by the due date (generally one month). AAM selects the Visiting Committee team contact who then selects a second team member.

Step 7: Scheduling the Visiting Committee Visit

The team contact works with the park superintendent to schedule the Visiting Committee's visit. The park issues a purchase order to AAM to cover the travel expenses of the Visiting Committee. See Section A.6.

Step 8: Visiting Committee Visits Park

The Visiting Committee visits the park. AAM bills the park to cover the committee's travel expenses.

Step 9: Visiting Committee Report

The Visiting Committee submits its report to the AAM Accreditation Commission within four weeks of the visit.

Step 10: Accreditation Commission Review

The Accreditation Commission reviews the self-study and the report and takes one of the following actions:

- Grants accreditation (usually for ten years, but may be granted for only five years if the Commission has concerns)

- Denies the award

- Tables its decision for specific concerns or deficiencies to be addressed within one year

- Defers a decision if additional information is needed

The Accreditation Commission Chair sends a written notification to the park superintendent stating the decision and providing a copy of the Visiting Committee's report. The AAM separately returns the self-study materials to the park. If the park museum is accredited, the notification states the date to initiate subsequent accreditation.

Step 11: Subsequent Accreditation

On a cycle of ten (or five) years, as specified at the time of accreditation, the AAM notifies the park of the need to review the park's accredited status. This review involves Steps 4-10. (The Accreditation Commission reviews the self-study only in Step 10.) This process is called subsequent accreditation.

Attachments Required for Self-Study: AAM Documents and NPS Equivalents	
Required AAM Documents Note: See links to document descriptions at http://www.aam-us.org/museumresources/accred/document-list.cfm	**NPS Equivalents** Note: For documents on the Web, provide the URL rather than hardcopy when submitting attachments for the Self-Study.
Institutional code of ethics	NPS *Museum Handbook*, Part I, Appendix D, Code of Ethics for NPS Museums (2006) at http://www.cr.nps.gov/museum/publications/index.htm.
Mission statement	NPS Mission Statement at http://www.nps.gov/legacy/mission.html. Park mission statement (Foundation Statement) is in the park's General Management Plan and in the park's strategic plan posted on the park Web site.
Institutional plan	Strategic plans show goals and accomplishments—see Park Strategic Plan available on park Web site, NPS Strategic Plan at http://www.nps.gov/refdesk/policies.html, Department of the Interior Strategic Plan at http://www.doi.gov/gpra/ (see Resource Protection Goal 3). Provide the park's Annual Performance Plan based on GPRA goals and performance using data from the Performance Management Data System at http://www.nps.gov/performance/. If the Annual Performance Plan is on the park's Web site, provide the URL. As needed, ask the park Government Performance and Results Act (GPRA) coordinator to assist. Park's General Management Plan
Articles of incorporation, charter, or enabling legislation	NPS Organic Act (1916) (16 USC 1) at http://www4.law.cornell.edu/uscode/html/uscode16/usc_sup_01_16_10_1.html. Park's enabling legislation.
Bylaws, constitution, or will	NPS *Management Policies* at http://www.nps.gov/refdesk/mp/index.html.
IRS letter of notification regarding tax-exempt status	Not applicable to US Government.

Figure B. 1. Attachments Required for Self-Study:
AAM Documents and NPS Equivalents

Required AAM Documents	NPS Equivalents
If the museum has a parent organization: Documentation regarding the importance of the museum to the parent, expressing its commitment to support the museum (e.g., resolution of permanence passed by parent, parent organization's by-laws or organizing documents, memorandum of understanding, or management agreement between the parent and the museum)	Park's enabling legislation. The following are optional references that may be submitted: NPS Organic Act (1916) (16 USC 1) at http://www4.law.cornell.edu/uscode/html/uscode16/usc_sup_01_16_10_1.html. Museum Act (1955) (16 USC 18f—18f-3) at http://www.cr.nps.gov/museum/laws/lawregad.html. NPS *Management Policies* at http://www.nps.gov/refdesk/mp/index.html
Documentation of operational relationships with other organizations integrally connected to the museum's governance or operations (e.g., written memorandum of understanding or other type of formal agreement)	*Management Policies*, Chapter 7, section 7.6.2, Cooperating Associations, and Chapter 10, section 10.2, Concessions, at http://www.nps.gov/refdesk/mp/index.html. Cooperating Association Agreement. Concessions Contract.
List of current members of the governing authority	Secretary of the Interior; Director, National Park Service; Regional Director.
Evidence of delegation of authority for day-to-day operation of the museum to the museum director or the equivalent position	Department of the Interior, Departmental Manual, Part 145, National Park Service, Chapter 2, Basic Organization, showing delegation of authority from Director to park superintendent at http://elips.doi.gov/app_dm/act_getfiles.cfm?relnum=3642. Park superintendent is equivalent to the museum director.
Table of contents of the governance manual (i.e., reference manual assembled for use by members of the governing authority to assist with orientation, training, and ongoing work)	Table of Contents of Department of the Interior Departmental Manual available at http://elips.doi.gov/app_dm/index.cfm?fuseaction=home. National Park Service *Management Policies* and Director's Orders available at http://data2.itc.nps.gov/npspolicy/index.cfm.
Organizational chart(s) (including parent organization, governing authority, partner organization, advisory board, supporting organizations, staff, and volunteers as applicable)	NPS organization chart available at http://elips.doi.gov/app_dm/act_getfiles.cfm?relnum=3642. Park organization chart.

Figure B. 1. Attachments Required for Self-Study: AAM Documents and NPS Equivalents (continued)

Required AAM Documents	NPS Equivalents
List of principal professional and administrative staff positions (including the following for each: title, incumbent's name, salary, and employment category)	Park staff list for all supervisors showing title, name, salary, job classification series.
Position descriptions and current resumes for principal professional and administrative staff (both current and vacant positions)	Position descriptions and personal resumes for key positions in chain of command with oversight for museum operations, including superintendent.
List summarizing staffing levels (numbers) by category (e.g., administrative, curatorial, education, security, physical plant, visitor services, etc.)	Same
Personnel policies manual	Department of the Interior, Office of Human Resources, policy guidance at http://www.doi.gov/hrm/guidance/curronly.htm
Repository agreement for objects in custody without title (required for some museums)	Repository Agreement and/or incoming loan agreement if park manages collections for a non-NPS entity.
Visual images to illustrate the scope of the museum's collections	If available, provide URLs for images of the park's collection on the park's Web site, in the Web Catalog at http://www.museum.nps.gov/, or on the Museum Management Program Web site at http://www.cr.nps.gov/museum/. Otherwise, provide a CD of images illustrating the scope of the museum's collections (no more than 20-30 images). If possible, combine all image requirements from this chart on a single CD.
Collections management policy and loan policies (custodial care and borrowing policies for museums that do not own or manage collections, but borrow and use collections for exhibits, education, or research)	Director's Order #24, NPS Museum Collections Management at http://www.nps.gov/policy/DOrders/DOrder24.html. NPS *Museum Handbook*, Parts I-III; *Automated National Catalog System User Manual*; and *Conserve O Gram* at http://www.cr.nps.gov/museum/publications/index.htm.
Sample copy of completed collections documentation record(s) (with accession, catalog, and inventory information)	Copies of the following records with information completed: a Catalog Record (10-254) and an All Fields Report for each of the major disciplines represented in the park's collection (archeology, ethnology, history, archives, biology, geology, paleontology); an Accession Receiving Report (10-95); an Accession Folder Cover Sheet (10-255); a Deed of Gift (10-830); a Receipt for Property (DI-105); the most recently completed annual inventory forms (10-349).

Figure B. 1. Attachments Required for Self-Study:

AAM Documents and NPS Equivalents (continued)

Required AAM Documents	NPS Equivalents
If the museum is authorized to deaccession, a copy of a deaccession form or other written documentation used for deaccessioning purposes (a completed form if applicable, otherwise a blank form)	Copy of completed Deaccession Form (10-643).
Sample copy of a completed outgoing loan agreement	Copy of completed Outgoing Loan Agreement (10-127) with Conditions (10-127a).
Sample copy of a completed incoming loan agreement	Copy of completed Incoming Loan Agreement (10-98) with Conditions (10-98a).
Sample copy of completed condition report form	Copy of completed Condition Report (10-637)
List of titles and dates of the museum's exhibit offerings during the last three years (long-term, temporary, traveling exhibits)	List of long-term, traveling, and temporary exhibits that the park has shown in last three years. Give titles, dates, and locations for exhibits.
Images of exhibits to illustrate various exhibition design techniques used (in galleries, other interiors, interpreted landscapes, other exterior settings)	Provide images of exhibits, historic structures, interiors of furnished historic structures, park features, and landscapes to illustrate exhibit design and visitor-presentation techniques. Include wayside exhibits. Exhibit producers (Harpers Ferry Center or contractors) are good sources of images. If possible, include all image requirements from this chart on a single CD.
Images that illustrate the museum's live interpretive activities in action (e.g., programs, outreach, demonstrations, tours, interpreters, classes, etc.)	Images of the park's interpretive programs (personal services). Contact the park's Chief Interpreter. If possible, combine all image requirements from this chart on a single CD.
List of museum publications and non-print media projects (print, audio, electronic) produced in the past three years (list name, format, and date)	Work with the Chief Interpreter and Chief of Resources Management to identify relevant NPS and cooperating association publications and non-print media projects, such as films, slide shows, postcards, and CDs produced in last three years. List name, media format, and date.
If the museum does original research: List of staff research results published in publications (e.g., books, popular or scholarly journals) other than the museum's in the last three years	Work with the Chief of Resources Management to identify published research results for the last three years. Contact the Inventory and Monitoring Network and the region's Archeological Center for publications relevant to the park.

Figure B. 1. Attachments Required for Self-Study: AAM Documents and NPS Equivalents (continued)

Required AAM Documents	NPS Equivalents
Most recent museum program/exhibit/events calendar	Coordinate with the Public Affairs Officer and Chief of Interpretation for the most recent park events calendar.
Samples of: promotional materials (e.g. program announcements, exhibit brochures, etc.) that illustrate the scope of the museum's interpretive offerings; materials that illustrate the range of programs for students and teachers; museum publications and/or non-print media materials (Four maximum for each category)	Same
Current year operating budget and non-operating expenditures	Provide a copy of the park's current financial plan and information on any construction program activities or other non-operating expenditures.
Audited financial statements for two years plus management letters (if most recent year is not yet available, submit unaudited year-end financial report)	NPS Performance and Accountability Reports are posted at http://www.doi.gov/pfm/burrept.html. The independent auditors' report is at the back of each year's report. Cross-reference the park's Annual Performance Plan provided above. Provide the park's Annual Performance Report based on GPRA goals and data from the Performance Management Data System at http://www.nps.gov/performance/. If this document is on the park's Web site, provide the URL.
Floor plan and/or site map	Official park brochure, plus other site maps and museum floor plans, if available.
Emergency/disaster preparedness plan (covering staff, visitors, and collections)	Park Emergency Operations Plan including the Museum Collections Emergency Operations Plan component (see *Management Policies* 8.2.5.2 and Director's Order #24, 4.3.10).
Images of the museum's public and non-public areas, both indoors and outside (e.g.: grounds, exteriors, galleries/exhibit spaces, classrooms/studios/programming spaces, sales areas, food service areas, collections processing/storage, mechanical areas, laboratories, offices, workshops, loading dock/receiving area, etc.)	Same. Provide a CD with these images. If possible, combine all image requirements from this chart on a single CD.

Figure B. 1. Attachments Required for Self-Study: AAM Documents and NPS Equivalents (continued)

AAM Documents, If Available	NPS Equivalents, If Available
Samples of tools the museum uses to assess whether it has achieved its goals (e.g., visitor satisfaction surveys, exhibition evaluations, program evaluations, focus group questions/reports, community surveys, financial/other performance indicators, etc.)	Strategic plans show goals and accomplishments, see Park Strategic Plan available on park Web site, NPS Strategic Plan at http://www.nps.gov/refdesk/policies.html, Department of the Interior Strategic Plan at http://www.doi.gov/gpra/ (see Resource Protection Goal 3). Recent results for Visitor Survey Card (park reports posted at http://www.psu.uidaho.edu/vsc.schedule.htm, see http://www.psu.uidaho.edu/ for additional information). Office of Management and Budget NPS Visitor Services Assessment at http://www.whitehouse.gov/omb/expectmore/detail.10003723.2005.html. Other park-specific surveys. .
Vision/value statement(s)	Same
Documentation regarding any internal, non-governing groups that serve in an advisory capacity (e.g., resolution of the board establishing this group, statement of purpose, operating guidelines, etc.)	General information on NPS advisory and operating committees at http://www.nps.gov/policy/advisory/boardscomms.htm. National Park System Advisory Board documentation at http://www.nps.gov/policy/advisory/advboard.htm. Park-specific information, as applicable.
Table of contents of volunteer manual	Director's Order #7, Volunteers in Parks at http://www.nps.gov/policy/DOrders/DO-7.htm.
Collections plan	Park's Collection Management Plan; Scope of Collections Statement.
Conservation plan	Park's Collection Management Plan and Collection Condition Survey.
Interpretive plan or education master plan	Park's Comprehensive Interpretive Plan.
Furnishing plan	Park's Historic Furnishings Report, as applicable.
Investment policy	Not applicable to US Government.
Annual reports produced within the last three years	Cross-reference the park's Annual Performance Plan and Annual Performance Report provided above.

Figure B. 1. Attachments Required for Self-Study: AAM Documents and NPS Equivalents (continued)

AAM Documents, If Available	NPS Equivalents, If Available
Printed descriptive materials pertaining to any membership/donor programs (should include dues and benefits structure for each program)	Information on National Park Foundation at http://www.nationalparks.org/Home.asp.
Individual donor support policy	Director's Order #21, Donations and Fundraising, http://data2.itc.nps.gov/npspolicy/DOrders.cfm.
Business support policy	Director's Order #21, Donations and Fundraising, http://data2.itc.nps.gov/npspolicy/DOrders.cfm.
Completed RC-AAM Standard Facility Report	Completed NPS Checklist for Preservation and Protection of Museum Collections (from Automated Checklist Program in ANCS+).

Note: A complete Accreditation Self-Study consists of a detailed questionnaire plus the attachments. The Self-Study Questionnaire is not available on the AAM Web site. Accreditation Program participants can get a copy by calling 202-289-9116 or e-mailing accreditation@aam-us.org. The questionnaire is available to others by purchasing the Accreditation Resource Kit from the AAM Bookstore.

Figure B. 1. Attachments Required for Self-Study: AAM Documents and NPS Equivalents (continued)

Appendix C: Professional Organizations and Societies

APPENDIX C: PROFESSIONAL ORGANIZATIONS AND SOCIETIES

A. Overview

There are several organizations and societies that are involved in various aspects of museum work. This appendix provides a list of the major organizations and societies that provide professional guidance to individuals and institutions in the functions of museum and archival work.

B. National Museum Organizations

- ***The American Association of Museums (AAM),*** founded in 1906, addresses the concerns of the country''s museum community as a whole and represents art and natural history museums, zoos, botanical gardens, arboretums, planetariums, science and technology centers, nature centers, children's museums, and historic museums, sites, and societies. Members include museum directors, curators, registrars, educators, marketing and development directors, public relations personnel, and others. The AAM's Accreditation Program (refer to Appendix B) has long been a leader in establishing professional standards for museums and museum professionals. Publications include a bi-monthly journal, *Museum News*, and a monthly newsletter *Aviso*. The AAM bookstore stocks publications that address such topics as collections management, museum ethics, conservation, marketing, and fund raising. The association holds an annual meeting. Write, call, or visit the AAM Website for information on membership, publications, and other programs.

  American Association of Museums
  1575 Eye Street, NW, Suite 400
  Washington, DC 20005

  Tel: (202) 289-1818
  <http://www.aam-us.org>

- ***The American Association for State and Local History (AASLH***) is a national non-profit organization that serves agencies and people who work to preserve and interpret history, including historical societies, museums, historic sites, parks, libraries, archives, historic preservation organizations, and schools and colleges. The association has adopted and published the "AASLH Statement of Professional Ethics." Publications include a quarterly magazine, *History News*, and a monthly newsletter, *Dispatch*. The association's sales program provides publications and educational materials (e.g., books, technical leaflets, reports, and video
  programs) on the documentation, preservation, and interpretation of

history, including the care and conservation of museum objects.

The association sponsors seminars, workshops, and an annual meeting. Write, call, or visit the AASLH Website for information on membership, publications, and other programs.

American Association for State
and Local History
1717 Church Street
Nashville, TN 37203

Tel: (615) 320-3203
<http://www.aaslh.org>

- ***The American Institute for Conservation of Historic and Artistic Works (AIC)*** addresses the concerns of the conservation profession. Members include conservators who practice in all of the material specialties (e.g., paintings, books and paper, textiles, wood, photographic materials, and objects of leather, ceramic, glass, and stone) and conservation scientists. Librarians, archivists, and curators may also be members. This organization has adopted and published the "AIC Code of Ethics and Guidelines for Practice" for the conservation profession in the United States (refer to Appendix D). Publications include the *Journal of the American Institute for Conservation* (published three times a year) and the bimonthly newsletter, *AIC News*. The newsletter includes information from the various specialties, health and safety updates, preventive conservation information, and a list of conferences, courses, and seminars. The association sponsors an annual meeting, including a pre-meeting workshop. The association also publishes an annual directory of its membership. Write, call, or visit the association's Website for membership or other information.

  American Institute for Conservation
  of Historic and Artistic Works
  1717 K Street, NW, Suite 200
  Washington, DC 20006

  Tel: (202) 452-9545
  <http://aic.stanford.edu>

- ***The Society of American Archivists (SAA),*** founded in 1936, promotes the preservation and use of records materials (e.g., manuscripts, films, maps, photographs, sound recordings, and machine-readable records). This organization provides a wide range of educational workshops, maintains an active publications program, and promotes cooperation, growth, and development in the archival field. The society has adopted and published "A Code of Ethics for Archivists with Commentary." Publications include a semi-annual journal, *American Archivist*, and a bimonthly newsletter, *Archival Outlook*. The SAA's publication program offers basic manuals on the arrangement, description, access, conservation and care, and exhibition of archival collections. The society sponsors an annual meeting. Write, call, or visit the SAA

Website for information on membership, publications, and other programs.

Society of American Archivists
527 South Wells Street, 5th Floor
Chicago, IL 60607

Tel: (312) 922-0140
<http://www.archivists.org>

- ***The Society for the Preservation of Natural History Collections (SPNHC)*** represents the interests of natural history collections and the people associated with the management and care of these collections. Membership includes individuals from the fields of anthropology, botany, geology, paleontology, and zoology and others interested in the development and preservation of natural history collections. Publications include a journal, *Collection Forum*, a newsletter, *SPNHC Newsletter*, and the "Guidelines for Care of Natural History Collections." The journal, published twice a year, provides up-to-date technical and documentary information on the care of natural history collections. The society conducts annual meetings that include formal presentations and workshops. Write, call, or visit the SPNHC Website for membership information.

  Society for the Preservation
  of Natural History Collections
  PO Box 797
  Washington, DC 20044

  Tel: (202) 786-2426
  <http://www.spnhc.org>

C. Regional Museum Conferences and Associations

- Association of Midwest Museums
  PO Box 11940
  St. Louis, MO 63112

  Tel: (314) 454-3110
  <http://www.midwestmuseums.org>

- Mid-Atlantic Association of Museums
  PO Box 27151
  Baltimore, MD 21230

  Tel: (410) 223-1194
  <http://www.midatlanticmuseums.org>

- Mountain Plains Museum Association
  PO Box 8321
  Durango, CO 81301

  Tel: (970) 259-7866
  <http://www.frontier.net/~mpma/mpmaindex.htm>

- New England Museum Association
  Boston National Historical Park
  Charlestown Navy Yard
  Boston, MA 02129

  Tel: (617) 242-2283
  <http://www.nemanet.org>

- Southeastern Museums Conference
  PO Box 3494
  Baton Rouge, LA 70821

  Tel: (225) 383-5042
  <http://www.semcdirect.net>

- Western Museums Association
  PO Box 13314
  Suite 578
  Oakland, CA 94661

  Tel: (510) 428-1380
  <http://www.westmuse.org>

For a list of other regional, state, national, and international museum organizations, contact the American Association of Museums (AAM), or visit the AAM Website at <http://www.aam-us.org>.

D. Regional Conservation Guilds and Associations

There are several regional conservation associations located throughout the country. These groups usually hold monthly meetings that address special topics in conservation including museum environment and other preventive conservation issues. Contact the regional/SO curator or write to or call the American Institute for Conservation for a current list of the names and addresses of these regional associations.

E. Museum Journals and Technical Publications

- ***ASC Newsletter***

  This bimonthly publication is available by subscription from the Association of Systematics Collections (ASC). The newsletter contains articles on systematic natural history collections, as well as brief notes on funding sources, meetings and conferences, and book reviews. For information on subscribing to this newsletter, write or call:

  Association for Systematics Collections
  1725 K Street, NW
  Suite 601
  Washington, DC 20006

  Tel: (202) 835-9050
  <http://www.ascoll.org>

- ***Curator: The Museum Journal***

  This journal, published quarterly by the California Academy of Sciences and Altamira Press, is available by annual subscription. *Curator* provides timely articles on philosophical issues concerning the museum profession, documentation, and care of museum collections, and specific articles on solving storage and exhibit problems. For subscription information write to:

  Curator: The Museum Journal
  15200 NBN Way
  Blue Ridge Summit, PA 17214

  Tel: (717) 794-3800 ext. 3154

- ***Canadian Conservation Institute (CCI/ICC) Notes*** and ***Newsletter***

  The Canadian Conservation Institute (CCI) publishes a series of technical notes, *CCI Notes* (similar to NPS Conserve O Grams), on museum collections care topics (e.g., the museum environment; disaster management; equipment; and techniques of caring for specific types of objects, including paintings, leather, skin, ethnographic materials, textiles, photographic materials). In addition to *CCI Notes*, the institute also publishes the semiannual *CCI Newsletter*, periodic *Technical Bulletins*, books, and other publications. For additional information contact CCI at:

Canadian Conservation Institute
1030 Innes Road
Ottawa, Ontario K1A 0M5
Canada

Tel: (613) 998-3721
<http://www.cci-icc.gc.ca>

F. Funding Organizations

In addition to National Park Service funding programs, parks can apply for other funding to support museum programs. The park's cooperating association may apply for federal funding for a museum collections project on behalf of a park. Parks may also apply to foundations, charitable organizations, and other outside organizations for museum funding. Consult with the regional/SO curator.

Parks can contact the following organizations for further information on the types of grants available:

Federal Programs

- Institute of Museum and Library Services
  Office of Museum Services
  1100 Pennsylvania Avenue, NW
  Suite 609
  Washington, DC 20506

  Tel: (202) 606-8536
  <http://www.imls.gov>

- National Endowment for the Arts
  1100 Pennsylvania Avenue, NW
  Washington, DC 20506

  Tel: (202) 682-5400
  <http://www.nea.gov>

- National Endowment for the Humanities
  1100 Pennsylvania Avenue, NW
  Washington, DC 20506

  Tel: (202) 606-8400
  <http://www.neh.gov>

Non-Governmental Programs

- ***The Foundation Directory***, published by the Foundation Center, lists foundations that provide grants to museums. For a copy of this directory, write to the following address:

  The Foundation Center
  79 Fifth Avenue
  New York, NY 10003

  Tel: (212) 620-4230
  <http://www.fdncenter.org>

Appendix D: CODE OF ETHICS FOR NPS MUSEUMS

APPENDIX D: CODE OF ETHICS FOR NPS MUSEUMS

A. Overview

1. *What information will I find in this appendix?*

This appendix summarizes Federal standards of ethical conduct applicable to NPS museums and provides a Code of Ethics for NPS Museums in section C. It also references codes of ethics statements from the American Association of Museums (AAM), Society of American Archivists, American Institute for Conservation of Historic and Artistic Works (AIC), and other related professional organizations.

2. *What is ethics in the museum context?*

Ethics is a system of moral principles that governs the behavior of individuals and groups, for example, museum employees individually and as a group in a single or multiple museums. It is about what is right, fair, truthful, honest, beautiful, or, in one word, good. Ethics derives from a general moral consciousness affecting individual and group choices about what is best for the common welfare.

3. *What is a code of ethics?*

A code of ethics is a systematic collection of moral principles that a group believes will benefit the whole. There is agreement in the subscribing group that individual choices must be governed by these principles in order for the individual to contribute to the common good. Codes of ethics may evolve over time, as a group (for example, a society, a community, a profession, or a team) collectively identifies and refines its understanding of what is best for the group.

4. *What is a code of ethics for museums?*

A code of ethics for museums identifies principles that govern the conduct of museum employees and the choices that museums make in order to benefit the societal good. The principles must address the choices made by individuals in the museum organization, as well as groups of individuals, and the museum as a whole.

5. *Does the museum profession have a single code of ethics?*

No. Diverse professional organizations of museum workers, such as archivists, conservators, and curators, as well as individual museums, have different codes of ethics. Professional organizations representing individual disciplines, such as anthropology, history, and paleontology, also have codes of ethics. The AAM has issued a Code of Ethics for Museums that applies exclusively to museums, including botanical gardens, planetariums, and zoos. Museums also subscribe to codes of ethics that apply to specific functions and

disciplines represented in the museum. See Section D for references to codes of ethics for museums and other professional organizations. The AAM requires all accredited museums to have a formally approved, separate and distinct institutional code of ethics.

6. *How does a code of ethics relate to law?*

The law protects specific interests, such as property rights and freedoms, in service to the common good. The law sets a minimum standard. A code of ethics often goes beyond the law in establishing principles for the common good. For example, although bleaching an 18th century quilt so that it is bright white may be legal, doing so would not be consistent with the AIC Code of Ethics and Standards of Practice. Such severe treatment would accelerate the deterioration of the quilt, and diminish the public benefit. The legal rights of individuals may come into conflict with ethics and the common good as well. For example, although a museum curator might legally purchase for his own collection paintings of the same type that the museum has, most museum codes of ethics would consider this a conflict of interest and prohibit or place restrictions on this activity.

B. Federal Standards of Ethical Conduct Applicable to NPS Museums

1. *What codes of ethics apply to all NPS employees with responsibility for museum collections?*

All NPS employees with responsibility for museum collections and functions must follow the:

- Standards of Ethical Conduct for Employees of the Executive Branch (5 CFR 2635)
- Employee Responsibilities and Conduct (43 CFR 20), Department of the Interior
- Supplemental Standards of Ethical Conduct for Employees of the Department of the Interior (5 CFR 3501)
- Criminal Conflict of Interest Statutes (18 USC 201, 203, 205, 207-209)
- Code of Ethics for NPS Museums (see Section C)

2. *What does the Ethics Guide for Employees of the Department of the Interior cover?*

Making Ethics a Part of the Workplace: Ethics Guide for Employees of the Department of the Interior, available at http://www.inside.nps.gov/waso/custommenu.cfm?lv=3&prg=37&id=3889, provides plain language guidance to the ethics

laws and regulations that apply to employees of the Department of the Interior (DOI). It addresses actions and responsibilities of the individual employee as follows:

- Basic obligation of public service
- Governmentwide ethics laws
- Department ethics prohibitions
- Accepting gifts
- Traveling for the Department
- Outside work and activities
- Seeking non-Federal employment
- Using Government property, time, and information
- Restrictions that apply after you leave Federal service
- Disclosure of financial interests
- Ethics training and contacts

3. *Where can I find additional information on ethics for NPS employees?*

For all questions concerning ethics, consult your servicing ethics official. Following advice from an ethics official gives an employee a "safe harbor" from disciplinary action. Further information on ethics is in Chapter 9 of *Cultural Resource Management Guideline* (NPS-28, Release No. 5, 1997). In addition, you may want to consult your supervisor, regional curator, or the organizations listed in this appendix. DOI is developing a chapter in the Departmental Manual to address the integrity of scientific activities and a code of scientific conduct.

C. Code of Ethics for NPS Museums

1. *What is the Code of Ethics for NPS Museums?*

The Code of Ethics for NPS Museums is a set of principles that guide the decisions of employees and volunteers who manage or work with NPS museum collections or perform other museum functions. The Code of Ethics was first issued in 1990 in Museum Handbook, Part I (MH-I), Chapter 1. It is reviewed and updated every five years, or more frequently as needed.

2. *How do NPS policies relate to the Code of*

The principles in the Code of Ethics for NPS Museums are

Ethics for NPS Museums?

addressed in all levels of NPS policy. The policy documents include NPS Management Policies, the Director's Order (DO) series, and handbooks. The Code of Ethics for NPS Museums consolidates the ethics information specific to museums.

3. *Who follows the Code of Ethics for NPS Museums?*

The Code of Ethics for NPS Museums applies to NPS employees and volunteers whose actions and decisions directly affect the management of NPS museum collections and/or museum-related functions. It applies to superintendents, managers, museum curators, museum technicians, museum aids, archivists, archives technicians, conservators, housekeepers, maintenance staff, interpreters, park rangers, cultural and natural resource specialists, and all other staff with museum-related functions. It also applies to other staff and volunteers when their jobs interface with museum operations.

4. *What ethics principles do I follow if I am responsible for governance and administration of NPS museums?*

If you are a superintendent, manager, or other employee with administrative responsibility for NPS museums or direct responsibility for museum collections, following NPS Management Policies and Director's Orders you will:

Acquisition, Disposal, and Documentation

- Acquire and dispose of collections consistent with the park's mission and Scope of Collection Statement and in accordance with the Museum Act (16 USC 18f), the Native American Graves Protection and Repatriation Act (25 USC 3001-3013), and NPS policies and procedures.

- Acquire items only if the park can manage them according to NPS policies and standards.

- Acquire items for the museum collections only when you have determined that they have a legal and ethical pedigree. Avoid acquiring, borrowing, and retaining (if previously acquired) any object that has been acquired, exported, or imported contrary to the laws of its country of origin, or any intermediary country, or contrary to the laws and treaties of the United States, including Nazi-era objects that were unlawfully appropriated without subsequent restitution.

- Accept only unconditional gifts for the museum collections, unless the regional director makes exception on a case-by-case basis.

- Avoid conflict of interest and the appearance of conflict of interest when acquiring, borrowing, or disposing of collections and making other decisions affecting collections, including avoiding personal collecting in the same subject area as the museum.

- Follow the prescribed order of preference when deaccessioning,

giving preference to NPS, other DOI bureaus, other Federal agencies, and then non-Federal museums.

See 18 USC 208, Acts Affecting a Personal Financial Interest; 5 CFR 2635.502, Personal and Business Relationships; Management Policies, 5.3.5.5.4 Acquisition, Management and Disposition; DO #24: NPS Museum Collections Management (DO #24), 4.3.2 Standards, 4.3.6 Scope of Collection, 4.3.15 Unconditional Gifts; Cultural Resource Management Guideline, Chapter 9, B.2 Acquisition, B.3 Documentation, and B.7 Deaccessioning; MH-II, Chapter 2 Accessioning, Chapter 6 Deaccessioning.

Preservation and Protection

- Preserve and protect collections while also providing public access.
- Maintain a current Museum Collections Emergency Operations Plan identifying actions required for preparedness and response to protect collections and human health and safety under all risks.
- Authorize conservation treatment consistent with the American Institute for Conservation of Historic and Artistic Works Code of Ethics (AIC)
- Keep information about the security of the museum or of private collections and locations visited during official duties confidential, except to assist law enforcement authorities.

See Management Policies, 5.3.5.5.1 Preservation, 8.2.5.2 Emergency Preparedness and Emergency Operations; DO #24, 4.3.10 Emergency Operation; MH-I, Museum Collections.

Access and Exhibits

- Actively promote appropriate access to collections and data about the collections in order to increase public benefit.
- Ensure that merchandise sold or provided by concessions promotes the park's theme and servicewide mission and values.
- Ensure that concession operations
  - do not sell or offer for sale original objects, artifacts, or specimens of a historic, archeological, paleontological, or biological nature;
  - include with geological merchandise appropriate educational material and a written disclaimer that the items are not from within park boundaries;

- clearly label replicas.

See Management Policies, 10.2.4.5 Merchandise, 10.2.4.6 Artifacts and Specimens; DO #24, 4.3.23 Access and Use; Museum Handbook, Part III (MH-III), Access and Use.

Management

- Ensure that all decisions involving donations to NPS maintain integrity, impartiality, and public confidence as established by the review process in DO#21, Donations and Fundraising (DO #21). Avoid soliciting donations. Avoid accepting donations of money, collections, or services from sources that would contribute to creating a conflict of interest or the appearance of a conflict of interest, including:
  - organizations in which an NPS employee has a leadership role
  - entities that have litigation pending with the Department of Interior, unless that litigation is sufficiently removed so that the donation does not appear to be an attempt to influence the litigation outcome.
  - companies that hold or are seeking concessions contracts or are otherwise engaged in business with the park
  - sources that would identify NPS with alcohol or tobacco products
  - parties that offer donations in order to state or imply the NPS endorsement of a product, service, or entity.
- Authorize fundraising efforts (including marketing relationships with businesses or corporations) to benefit park programs in accordance with DO #21.
- Maintain donation boxes on NPS property only if 100% of the donations go to NPS.
- Avoid naming features or facilities for a donor.
- Provide an annual report on donations.
- Seek and allocate funds sufficient to preserve, document and provide access to the collections and associated documentation.

- Expend funds according to established criteria.

See 5 CFR 2635.201, Gifts from Outside Sources; 5 CFR 2635.502, Personal and Business Relationships; 5 CFR 2635.702, Use of Public Office for Private Gain; 5 CFR 2635.808, Fundraising Activities; 5 CFR 3501.105, Outside Employment and Activities; DO#21, 6.1.1 Maintaining the Integrity and Impartiality of, and Public Confidence in, NPS and the Department of the Interior, 6.1.2 Reviewing Direct Donations, 6.3.1 Donation Boxes, 10.2.6 In-Park Displays, Name Plaques, and Plates; DO#24, 4.3.4 Ongoing and Corrective Actions, 4.3.16 Project-generated Collections.

Human Resources

- Avoid requiring museum staff to act in conflict with this code of ethics or other international, national, or relevant professional codes of ethics.

- Ensure that employees, volunteers and visitors working with museum collections are informed of hazards inherent to the collections (such as pesticides) and protective measures.

- Ensure that all employees with direct responsibility for museum collections management have the knowledge, skill, and ability to perform assigned jobs.

- Foster a cooperative relationship between park cooperating associations and park staff in the interest of the museum collection.

See DO #24, 4.2.4 Staffing and Training, 4.3.11 Job Hazard Analysis.

5. *What ethics principles do I follow if I am responsible for the direct management of collections?*

In addition to the ethics principles in Sections B and C.4, your actions and decisions will follow the ethics principles below.

Acquisition, Disposal, and Documentation

- Fully and accurately document items in the museum collection and ensure that the documentation is current.

- Verify that all acquisitions and incoming loans have a legal and ethical pedigree, including required permits. Document in writing research related to this verification.

- Never traffic in objects and specimens originating on public lands.

- Avoid making any judgment for another party about the value of an object, archival document, or specimen. You may provide

information on obtaining appraisals, but not recommend any single appraiser.

- Cooperate with other institutions to ensure the preservation of significant cultural and natural heritage and avoid competing for acquisitions if such competition would endanger the integrity or safety of such materials.

- Make all deaccession actions open to public scrutiny.

See DO#24, 4.3.2 Standards, 4.3.13 Accession and Catalog Records; MH-II, Museum Records, Chapter 4 Inventory and Other Special Instructions, Section IX, Determining the Monetary Value of Museum Objects, Chapter 6 Deaccessioning.

Preservation and Protection

- Protect and preserve the integrity of collections.

- Avoid using methods and materials that may adversely affect museum collections or their future examination, scientific investigation, treatment or function.

- Document examination, scientific investigation, and treatment of collections for preservation purposes.

- Protect collections against physical threats and unauthorized access.

- Store, handle, use, and exhibit objects to maximize their long-term preservation unless destructive analysis or consumptive use is specifically authorized in writing according to DO#24, 4.2.7 Destructive Analysis and Consumptive Use, 4.3.25 Preservation vs. Destructive Use.

See Management Policies, Chapter 5 Cultural Resource Management; DO #24; MH-I.

Access and Exhibits

- Encourage use of the collections and data for research, exhibits, and education in order to increase public benefit. See also Section C.6.

- Ensure fair and equitable public access to collections, associated documentation, policies, and technical information.

- Maintain the confidentiality of data about the nature and specific location of 1) a national park system resource which is endangered, threatened, rare, or commercially valuable; 2) mineral or paleontological objects within units of the national park system; or 3) objects of cultural patrimony within units of the national park system,

unless the Secretary determines that disclosure would further NPS purposes and would not create an unreasonable risk of harm, theft or destruction of the resource or object, including individual organic or inorganic specimens, and disclosure is consistent with other applicable laws protecting the resource (National Parks Omnibus Management Act of 1998 [16 USC 5937]).

- Ensure that access is consistent with the laws and NPS policies pertaining to Freedom of Information Act disclosures, copyright, privacy, publicity, obscenity and pornography, defamation, and resource protection.

- Never use objects from the museum collection or museum venues for personal purposes, and inform your relatives that they are similarly restricted.

- Never exhibit Native American human remains or photographs of the remains. You may exhibit drawings, renderings or casts of remains with the consent of culturally affiliated Indian tribes and native Hawaiian organizations.

- Borrow and lend museum collections consistent with the Museum Act (16 USC 18f).

- Provide accurate, well-researched information to the public, and maintain accurate documentation about the collections in files and databases.

- Inform researchers of parallel research by others, and supply names if agreeable to the parties involved.

- Avoid borrowing and exhibiting collections from individuals who may have a conflict of interest or an appearance of a conflict of interest (for example, park staff).

- Ensure that reproductions, replicas, and copies are permanently marked as facsimiles to avoid confusion with the original.

See Management Policies, 4.1.2 Natural Resource Information, 5.2.3 Confidentiality, 5.3.4 Stewardship of Human Remains and Burials; DO #24, 4.3.28 Exhibit of Human Remains; MH-II, Chapter 2 Accessioning, Chapter 5 Outgoing Loans; *MH-III, Chapter 1 Evaluating and Documenting Use, Chapter 2 Legal Issues, Chapter 4 Two-Dimensional Reproductions, Chapter 5 Three-Dimensional Reproductions.*

Management

- Consult with affiliated parties in managing collections, including parties subject to the Native American Graves Protection and Repatriation Act.

See Management Policies, 5.2.1 Consultation; DO #24, 4.3.24 Consultation.

Professional Conduct

- Act in the best interests of the museum collection.
- Maintain current knowledge of and follow relevant professional standards and ethics.
- Seek the expertise and advice of colleagues when such input will benefit the museum collections and programs.
- Share information with colleagues and co-workers in order to benefit the museum profession at large, and credit sources for information received.
- Act only within the scope of your knowledge, and seek training to acquire needed knowledge and skills to perform your job.
- Maintain current knowledge of the safety of materials and procedures, and take appropriate protective measures when handling hazardous materials.
- If you perform personal research using NPS collections, inform your supervisor of the research; do the research on your own time, during regular hours when other members of the public also have access, and inform others doing parallel research.
- Obtain a permit in accordance with 36 CFR 2.5 to personally collect in a park for non-official purposes, and do such collecting off-duty. For information on permits and conditions see http://science.nature.nps.gov/research/ac/ResearchIndex.
- Avoid conflict of interest or apparent conflict of interest in pursuing professional activities outside your NPS job responsibilities. Some outside activities may benefit the NPS museum program, such as teaching; participating as an AAM Museum Assessment Program consultant or accreditation team member; or serving a local, regional, national, or international museum association, but be mindful of restrictions in 18 USC 208, Acts Affecting a Personal Financial Interest, and the appearance of a conflict of interest in personal and business relationships as described in 5 CFR 2635.502.
- Clear outside professional activities with your supervisor and servicing ethics official when done on official time. Such activities involving a professional organization may require an ethics Memorandum of Understanding (MOU) between NPS and the organization and/or a waiver in accordance with 18 USC 208(b)(1).
- Avoid using your official title when not representing NPS.

- When you obtain information while performing duties as a Government employee, avoid using that information for personal research or other outside activities, except when that information is also available to the general public.

- Avoid revealing or profiting from information gained through work with restricted collections.

- Have no personal business with dealers who also sell objects to parks.

- Avoid dealing (buying or selling for personal profit) in natural and cultural resources.

- Avoid personal collecting in the same subject area as the museum. If such a collection exists prior to park employment, you should:

  - provide the superintendent with a current inventory

  - keep the private collection in your residence or off of public lands

  - avoid lending items from the private collection for park use

  - avoid adding to the private collection while employed by the park

  - offer the park first option to buy any objects that you propose to sell from your private collection, in order to avoid the appearance of a conflict of interest.

- Never acquire anything for yourself that has formerly been part of any park museum collection. Inform your relatives that they are similarly restricted.

- Avoid using your official title, position, or authority to endorse a product, service, or enterprise, except in furtherance of a specific statutory authority authorizing such endorsement, such as in support of authorized fundraising efforts of friends groups and cooperating associations.

- Avoid irresponsible criticism of other museum professionals or institutions. Address complaints about professional or ethical behavior directly to the individual or institution.

See 18 USC 208, Acts Affecting a Personal Financial Interest; 5 CFR 2635.502, Personal and Business Relationships; 5 CFR 2635.702, Use of Public Office for Private Gain; 5 CFR 2635.703, Use of Nonpublic Information; DO #21, 3.1 Ethical Considerations.

6. *What ethics principles do I follow if I am responsible for interpretation or education programs in the park museum or involving the museum collection?*

Persons responsible for interpretation or education programs that involve the park museum and/or the museum collections will ensure that services:

- Focus on the park's resources and themes and park and servicewide mission.
- Present factual material that is accurate and based on current scholarship and science, and that maintains the intellectual integrity of the information.
- Are accessible to wide audiences, including those with impairments.
- Are available without discrimination. (See 43 CFR 17, subpart E.)
- Consider factors that might influence an individual's needs and interests, such as age, physical and intellectual ability, level of education, ethnicity, religion, social/economic status, sexuality, and gender.

See Management Policies, Chapter 7 Interpretation and Education; DO #6, Interpretation and Education.

See also section C.4 and 5, Access and Exhibits.

7. *What should I do if the Code of Ethics for NPS Museums conflicts with another code of ethics?*

Follow the Code of Ethics for NPS Museums, unless the conflict is with the Standards of Ethical Conduct for Employees of the Executive Branch, the Employee Responsibilities and Conduct, the Supplemental Standards of Ethical Conduct for Employees of the Department of the Interior, or the criminal statutes (see B.1). These regulations and statutes always take precedence.

8. *Where can I find assistance in resolving ethics issues specific to the Code of Ethics for NPS Museums?*

Contact the sources in section B.3. Ethics officials at the park, region, and Washington Office are specifically trained to address ethics issues of all types. As necessary, they will consult with the DOI ethics staff in the Office of the Solicitor before advising you. Regional curators will be especially helpful on ethics issues unique to museum collections or the museum profession. Contact information for park, regional, servicewide center, and Washington Office ethics officials is at http://www.inside.nps.gov/waso/custommenu.cfm?lv=3&prg=37&id=4451.

D. Codes of Ethics for Professional Organizations

American Association of Museums (AAM)

The AAM Code of Ethics for Museums is available at http://www.aam-us.org/museumresources/ethics/coe.cfm. Guidelines on specific ethics-related issues are available at http://www.aam-us.org/museumresources/ethics/index.cfm. The AAM publication entitled Codes of Ethics and Practice of Interest to Museums has codes from all the AAM Standing Professional Committees as well as standards and policy statements from related organizations. This publication and others on ethics are available through the AAM online bookstore at http://www.aam-us.org/bookstore/index.cfm or by contacting the AAM Bookstore at:

American Association of Museums
1575 Eye Street, NW, Suite 400
Washington, DC 20005
(202) 289-1818
Fax (202) 289-6578
E-mail bookstore@aam-us.org

The Curator's Committee of the American Association of Museums has a Curators Code of Ethics available at http://www.curcom.org/ethics.php.

The Society of American Archivists (SAA)

The SAA Code of Ethics for Archivists is available at http://www.archivists.org/governance/handbook/app_ethics.asp . Publication information is online at http://www.archivists.org/catalog/index.asp. For further information contact the SAA at:

The Society of American Archivists
527 S. Wells St., 5th Floor
Chicago, IL 60607
(312) 922-0140
Fax 312/347-1452
E-mail info@archivists.org

The American Institute for Conservation of Historic and Artistic Works (AIC)

The AIC Code of Ethics and Guidelines for Practice is available at http://aic.stanford.edu/about/coredocs/index.html. For further information on ethics, using a keyword, you can search the AIC Web site, including posted publications, such as

the *Journal of the American Institute for Conservation*. For additional information contact the AIC at:

The American Institute for Conservation of Historic and Artistic Works
1717 K Street, NW
Suite 200
Washington, DC 20006
(202) 452-9545
Fax (202) 452-9328
E-mail info@aic-faic.org

American Association for State and Local History (AASLH)

The AASLH Statement of Professional Standards and Ethics is available at http://www.aaslh.org/ethics.htm. For additional information contact the AASLH at:

American Association for State and Local History
1717 Church Street
Nashville, TN 37203-2991
(615) 320-3203
Fax (615) 327-9013
E-mail membership@AASLH.org

International Council of Museums (ICOM)

The ICOM Code of Ethics for Museums is accessible at http://www.icom.org/ethics_rev_engl.html. Using the Web site keyword search function, you may access additional sources on ethics. Further information is available through AAM or from ICOM headquarters at:

International Council of Museums
Maison de l'UNESCO
1, rue Miollis
75732 Paris cedex 15
France

Appendix E: Scope of Collection Statement

Appendix E: Scope of Collection Statement

A. Overview

1. ***What information will I find in this appendix?***

You will find a Scope of Collection Statement checklist that you can use to review a draft or approved Scope of Collection Statement (SOCS). You also will find a sample completed SOCS. This appendix is a supplement to Chapter 2: Scope of Museum Collections.

2. ***Who can assist me in writing or revising my park's Scope of Collection Statement?***

Contact your regional/SO curator for examples of approved SOCS that show how different parks have written their statement. If you have questions about what types of collections to include in the Types of Collections section, contact your park's interpretive staff, resource management staff, and other subject matter experts, as well as your regional/SO curator and other regional/SO discipline specialists.

3. ***Are there any other resources that can help me prepare or revise my park's Scope of Collection Statement?***

Yes. Figure E.1 includes an example Scope of Collection Statement and Figure E.2 includes an example Scope of Collection Summary. These documents are available in electronic format. Contact your regional/SO curator to obtain copies that you can use as templates when developing or revising your park's Scope of Collection Statement and Scope of Collection Summary.

Refer to Chapter 2: Scope of Museum Collections, the resources listed in the bibliography of Chapter 2, and your regional/SO curator for additional information.

B. Evaluating Your Scope of Collection Statement

1. ***How do I evaluate a Scope of Collection Statement?***

Use the Scope of Collection Statement checklist included in Figure E.3 to review a draft or approved SOCS.

2. ***How do I use the Scope of Collection Statement Checklist?***

To use the Scope of Collection Statement checklist:

- Enter the unit's complete name. A unit is a park, center, or office with a museum collection. Place an "X" in either the draft or approved block. Enter the date (month, day, and year) of the draft or approved document. Enter the name of the reviewer and date reviewed.
- Place a checkmark in the "YES" column to indicate that the required wording is in the SOCS, that the wording is accurate, and that it is in the appropriate section.
- Place a checkmark in the "NO" column to indicate that the required statement does not appear in the SOCS.
- Place a checkmark in the "N/A" column to indicate that the question is not applicable to the SOCS.
- Place an "X" in the "Note" column to indicate that there is an attached note pertaining to this question.

- There may be times when the reviewer cannot determine the answer to a specific checklist question. If this is the case, print "ND" meaning "Not Determined" in the "YES" column.

3. ***Where do I find the Scope of Collection Statement Checklist?***

See Figure E.3 for the checklist. An unpunched full size checklist accompanies this appendix. Keep the full size checklist as a master and make copies for your use.

I. INTRODUCTION

A. Executive Summary

The park's museum collection includes both natural history and cultural collections. The park's natural history collection includes: mammal and bird collections; the herbarium, which includes nearly all species of vascular plants that occur in the park; paleontological collections from the Bear Valley Shale Formation; geological specimens from the Bear Valley Shale and Lewis Granite Formations; associated project documentation and reports. Other natural history collections within the museum collection include: fungi; reptiles and amphibians; fish; insects and arachnids. At present, these collections are relatively small, as little research pertaining to these disciplines has been conducted in the park to date.

The cultural collection includes: archeological materials systematically excavated from within the park's boundaries and associated field records (circa 1000 BCE – circa 1940); an ethnology collection of Paiute and Shoshone basketry, watercolors, beadwork, and textiles; historic objects associated with the area's 19th century miners, railroad workers, and homesteaders, and items related to the Civilian Conservation Corps and President Franklin D. Roosevelt's 1938 park vacation; archival and manuscript collections such as the Joseph Jakes papers, oral histories, photographs, and scientific and resource management records.

B. Purpose of the Scope of Collection Statement

This Scope of Collection Statement defines the scope of present and future museum collection holdings of Lewis Mountains National Park that contribute directly to the understanding and interpretation of the park's purpose, themes and resources, as well as those objects that the Service is legally mandated to preserve. It is designed to ensure that the museum collection is clearly relevant to the park.

C. Legislation Related to National Park Service Museum Collections

The National Park Service's (NPS) legal mandate for acquiring and preserving museum collections is contained in the Antiquities Act of 1906 (16 USC 431-433); the Organic Act of 1916 (16 USC 1 et. seq.); the Historic Sites Act of 1935 (16 USC 461-467); the Management of Museum Properties Act of 1955, as amended (16 USC 18f); the Reservoir Salvage Act of 1960, as amended (16 USC 469-469c); the National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.); the Archeological and Historic Preservation Act of 1974, as amended (16 USC 469-469l-2); the Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm); the National Parks Omnibus Management Act of 1998 (16 USC 5901).

D. Park History, Significance, Purpose, Themes, and Goals

The enabling legislation (45 Stat. 616) which established Lewis Mountains National Park on June 12, 1928, states that the park was established to "...preserve from injury or spoliation the Lewis Mountains, Bear Valley, and Shawnee Lake…" as well as "…the structures, other works, and relics of prehistoric cultures contained therein..."

The Bear Valley Lodge, constructed by the Union Pacific Railroad in 1920, was acquired by the park in 1962 through the Mountain Foundation. Additional lands from the adjoining Lewis National Forest were added to the park in 1964 to "…preserve the historical, paleontological, and geological resources of the Buffalo Valley" (63 Stat. 981).

Figure E.1. Example Approved Scope of Collection Statement (continued)

Efforts to assemble a museum collection within the park began in 1929 when Superintendent Charles Jackson established a small museum within one room of the ranger station. The museum was very popular with visitors, and the collection quickly grew due to local donations of Native American, ranching, mining, and other "pioneer" materials as well as natural history specimens collected by the park staff. It was soon apparent that a separate museum building was needed to house this growing collection, and in 1934 the Civilian Conservation Corps (CCC) constructed the Bear Valley Museum.

In 1969, the Henderson Visitor Center (which includes museum exhibit galleries and collection storage space) was completed and the museum collection was moved to that building. Additional exhibit and collection storage space was added to the structure in 1992. Native American history exhibits that were determined through consultation to be offensive to traditionally associated groups (including NAGPRA-identified items) were removed from the museum in 1993. A new permanent exhibit focusing on Paiute and Shoshone tribal culture was developed in consultation with the two tribes and opened in 1995.

In 1988, the park hosted its first annual CCC Reunion. In the years since, the park has received numerous donations of park-related CCC museum objects. In 1998, these collections were moved to the newly renovated Bear Valley Museum, which reopened to the public as a CCC museum and reference library.

The park's natural history collection originally included the herbarium, mammal, and bird collections. The majority of these specimens were collected in the 1930s, 1940s, and 1950s. A limited number of specimens were added to the collection over the next twenty years, primarily herbarium specimens collected by researchers from Boise State University. Since 1992, the natural history collection has experienced tremendous growth, a result of various resource management projects conducted within the park. These include inventory and monitoring, fire effects studies, ethnobotanical studies, historic landscape reports, and studies conducted by researchers from Boise State University, Oregon State University, the Smithsonian Institution, Stanford University, and the University of Utah. It is anticipated that this collection will continue to grow due to park resource management activities, the Inventory and Monitoring program, and other scientific research activities.

The park's purpose, identified in the General Management Plan (1998) is to:

1. Preserve and protect the scenic beauty and unique geologic features of the Lewis Mountains and Bear Valley: jagged mountain peaks; alpine lakes and meadows; remarkable canyons; volcanic phenomena; fossiliferous deposits; rare sedimentation.

2. Preserve and protect the rare paleontological resources of the Buffalo Valley.

3. Preserve the archeological features that pertain to the prehistoric inhabitants of America and the ancestral Native American tribes.

4. Preserve the entire area intact for the purpose of scientific research.

5. Provide a variety of opportunities for visitors to learn about and enjoy the resources without degrading those resources.

The park's General Management Plan (1998), Long-Range Interpretive Plan (1999), and Resource Management Plan (1998) state that the purpose of the park's museum collection is to:

1. Increase knowledge, inspiration, and an awareness of preservation and stewardship among present and future generations through the effective use of exhibits, research, programs, and publications that are related to the park's interpretive themes and resource management objectives and goals.

Figure E.1. Example Approved Scope Collection Statement (continued)

2. Support scientific research and resource management.

3. Assist in the establishment of a permanent database of all organisms found in the park.

4. Preserve important or locally significant species collected in response to specific research or interpretive needs.

5. Guarantee the protection of objects whose in-situ preservation cannot be assured.

The park's museum collection should also support the park's interpretive themes, identified in the Long-Range Interpretive Plan (1999):

1. Human Use

    a. Past Human Use: prehistoric and historic North American native cultures including Paleo and Archaic Indian, Shoshone, and Paiute (to 1928); Euro-American trappers, traders, and immigrants (1820–1928), Union Pacific Railroad (1870-1955); early National Park Service (1928-1940).

    b. Contemporary Human Use: a sanctuary with provisions for scientific use and controlled pursuits compatible with the park's purpose and significance.

    c. Desired Future Use: a sanctuary, but with an increased awareness on the part of citizens of their share in the responsibility of such protection. Future improvements to park infrastructure will serve as examples of sustainable design and construction.

2. Geologic History

    Park geology and morphology span the last 250 million years: deposition, the uplift of the Lewis Mountains, creation of the Bear and Buffalo Valleys, lava flows during the past one million years (that created Shawnee Lake), and earthquakes.

3. Paleontological History

    Within its many geologic formations, the park hides evidence of past life: from mountaintop fossilized seashells to dinosaur bones and footprints along the Buffalo River, from single ferns to petrified logjams.

4. Biological Diversity, Natural Processes, and Wilderness

    a. The park contains many diverse organisms. It preserves ongoing natural processes: geological and biological, which we deem inherently valuable.

    b. The park's many diverse and scientifically valuable resources are located in a wild land with few modern, man-made improvements. As such, they provide outstanding opportunities for preservation, study, and enjoyment.

    c. Wilderness is its own reason for existence. It provides a time capsule of processes and resources which should, to the greatest degree possible, be managed and preserved unencumbered by human intervention.

Figure E.1. Example Approved Scope Collection Statement (continued)

The park's Resource Management Plan (1998) identifies the following resource management objectives and goals:

Management Objectives

1. The park's resources and natural processes are defined, inventoried, and understood by park staff and form a basis for management strategies to fulfill the park's mission.

2. The public and visitor understand and support the missions of the park and the National Park Service. They are advocates of the goals to preserve the nation's heritage and enhance environmental citizenship.

3. The park is managed to assure long-term protection of cultural and natural resources. This includes monitoring impacts of human use in and around the park.

4. The park is managed as a part of a greater regional ecosystem and recognizes the needs of the park, other land management agencies, and private landowners.

5. Management of all park resources, including employees, visitors, and natural resources is recognized and valued worldwide and is a model for national and international managers.

Management Goals:

1. Identify, inventory, and assess the park's natural and cultural resources and natural processes in order to form the basis for management strategies.

2. Manage park resources through a regional ecosystem approach and through cultural contexts.

3. Identify and evaluate the effects of human-caused impacts to park resources to form the basis for implementing management strategies.

4. Based on management strategies, provide a variety of visitor experiences compatible with resource protection.

E. Laws, Regulations, and Conventions Related to Museum Collections

Archeological collections, except inalienable and communal property (as defined by the Native American Graves Protection and Repatriation Act of 1990 [25 USC 3001-13]), recovered from within park boundaries through systematic collection are Federal property and must be retained in the park's museum collection in accordance with 43 CFR 7.13 and NPS *Management Policies* (2001).

In accordance with the NPS Research Permit and Reporting System, permits to collect natural resource specimens state that retained specimens remain Federal property, are incorporated into the park museum collection and, as required by 36 CFR 2.5g, must bear official National Park Service museum labels and their catalog numbers will be registered in the National Park Service National Catalog.

Other laws, regulations, directives and conventions pertinent to the acquisition of museum collections at the park include: the Lacey Act of 1900 (18 USC 43-44); the Migratory Bird Treaty Act of 1918 (16 USC 703-711); the Bald Eagle Protection Act of 1940, as amended (16 USC 668-668d); the Federal Property and Administrative Services Act of 1949, as amended (40 USC 483[b]); the Federal Records Act of 1950, as

Figure E.1. Example Approved Scope Collection Statement (continued)

amended ("Records Management by Federal Agencies" [44 USC 3101 et. seq.]); the Freedom of Information Act of 1966, as amended (5 USC 552); the Marine Mammal Protection Act of 1972 (16 USC 1361-1407); the Endangered Species Act of 1973, as amended (16 USC 1531-1543); the Privacy Act of 1974 (5 USC 552a); the Copyright Act of 1976 (17 USC 101 et seq. [1988 & Supp. V 1993]); the American Indian Religious Freedom Act of 1978 (42 USC 1996); the Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 USC 3001-3013); Federal Property Management Regulations (FPMR), 41 CFR 101; 410 Departmental Manual, Interior Property Management Regulations (IPMR); 411 Departmental Manual, "Managing Museum Property," Chapters 1-3; "Curation of Federally-Owned and Administered Archeological Collections," 36 CFR 79; NAGPRA Final Regulations, 43 CFR 10; "Disposition of Federal Records," 36 CFR 1228; "Protection of Archeological Resources", 43 CFR 7; "Preservation of American Antiquities", 43 CFR 3; "Preservation, Arrangement, Duplication, Exhibition of Records" (44 USC 2109); "Disposal of Records" (44 USC 3301 et seq.); Director's Order #19: Records Management; Director's Order #24: NPS Museum Collections Management; Director's Order #28: Cultural Resource Management; Director's Order #44: Personal Property Management; the 1983 Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES); the 1970 UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (implemented in the United States by P.L. 97-446 in 1983, 19 USC 2601).

F. Structures, Landmarks, and Other Park Resources Listed on National or International Registries

Historic resources within the park listed on the National Register of Historic Places include: Buffalo Valley Archeological District; Shawnee Lake Rendezvous Site; Lewis Mountain Railroad Tunnel; Shawnee Lake Mine Historic District; Bear Valley Lodge; Bear Valley Ranger Station, Museum, Maintenance Facility, Ranger's Residence, Comfort Station, and Amphitheater; East Entrance Sign, Checking Station, and Ranger's Residence; Lewis Mountain Highway and Tunnel.

The park was designated a Biosphere Reserve in 1984.

II. TYPES OF COLLECTIONS

The interpretive themes and resource management goals and objectives stated in the introduction provide direction for the acquisition of museum objects. The following guidelines will prevent arbitrary and excessive growth of the collection, while ensuring that it remains relevant to the park's mission.

A. Cultural Collection

The purpose of this collection is to increase knowledge and inspiration among present and future generations through exhibits, research, and interpretive programs; support research, resource management and education; provide baseline data of park cultural resources; document changes these resources are undergoing because of internal park conditions and external effects; to guarantee the protection of important objects whose in-situ preservation cannot be assured.

Objects and archival collections with a direct association to the park are more desirable for inclusion within the collection than similar items without such primary significance. The cultural collection is subdivided into four disciplines: archeology, ethnology, history, and archives and manuscripts. The following list identifies, by discipline, object types appropriate to the park's museum collection and, as needed, notes current representation.

Figure E.1. Example Approved Scope Collection Statement (continued)

The cultural collection must support these goals. This will ensure that only relevant objects and archival materials are accessioned into the collection. Future growth of the collection should be restricted to items related to:

1. Interpretive and/or research needs identified in the park's General Management Plan (1998), Resource Management Plan (1998), Long-Range Interpretive Plan (1999), historic furnishings reports, exhibit plans, and other applicable park planning documents and resource studies.

2. Enhancing understanding of and promoting increased stewardship of the park's cultural resources.

3. Cultural resources baselines/inventorying and monitoring activities.

4. Regulatory and compliance activities such as those mandated by the National Historic Preservation Act of 1966, as amended and the Archaeological Resources Protection Act of 1979 (ARPA).

1. Archeology Collection

Archeological collections are generated in response to cultural resource management requirements related to legal mandates, to development of park facilities, to preservation-related activities, to research requirements, and to interpretive needs. The archeological collection includes artifacts, human remains, and other materials obtained using archeological methods.

As per 43 CFR Part 7, any archeological materials discovered within the park (except inalienable and communal property, as defined by NAGPRA) are the property of the United States and will be maintained as a part of the park's museum collection.

a. Artifacts and Specimens

Archeological research projects within the park may result in the collection of artifacts, ecofacts, or other data.

Park staff and visitors should be discouraged from picking up surface artifacts. It is preferred that surface artifacts be left in-situ and their location documented. If materials are collected and brought to park staff, appropriate measures must be taken to ensure that the visitor collects no more material, that precise provenience information is recorded, if possible, and that the objects/data are promptly given to the curatorial staff upon receipt by staff members.

The park's archeology collection includes:

1) **Prehistoric Material**. The collection contains 2000 prehistoric Native American items (projectile points, flaked stone, ground stone, and pottery sherds), including twenty items associated with Paleo and Archaic Indian sites within the park.

2) **Historic Material**. The collection contains material from sites related to the settlement of the lands within the park during the historic period (through 1942), and sites associated with early park development, from circa 1920 through 1942. Materials from both Native American sites and Euro-American sites are included in this category. This collection consists of over 4,000 artifacts, including knives, projectile points, flaked stone, ground stone, pottery, household items, tools, glass, porcelain and ceramic sherds, objects related to mining and railroads, and other items.

Figure E.1. Example Approved Scope Collection Statement (continued)

3) **Confiscated Archeological Objects.** These are objects recovered from unauthorized and illegal activities. They might include unearthed artifacts, ecofacts, and human remains illegally excavated or uncontrolled surface collecting by unauthorized individuals within the park boundaries. The museum curator should be consulted as soon as possible to ensure proper handling and transportation of these materials. Such objects might be held temporarily as evidence if legal action is to be taken, but should be formally turned over to the museum curator as soon as possible. Once all legal questions are resolved, the objects and all associated documentation will be added to the museum collection.

b. Associated Field Records

All records associated with archeological collections are retained as part of the museum collection. These records include field notes and catalogs, daily journals, drawings and maps, photographs and negatives, slides, sound recordings, raw data sheets, instrument charts, remote sensing materials, collection inventories, analytical study data, conservation treatment records, computer documentation and data, as well as any other documents generated through archeological activity.

2. Ethnology Collection

The park has important ties to both the Paiute and Shoshone tribes. The ethnology collection is an important component of the park's interpretive and resource management programs and furthers the park's mission. The collection is noted in the Long-Range Interpretive Plan (1999) and is an important element of the plan's Human Use section. The collection's importance is also noted in the General Management Plan (1998), especially concerning tribal consultation and traditional uses of park resources by tribal members.

a. Objects. Acquired, mostly through gifts between 1928 and 1976, the ethnology collection presently includes examples of Native American material culture from the Great Basin, Northwest, and adjacent culture areas. These artifacts illustrate the cultural continuity of the Native American cultures of the area, as well as their cultural adaptation and change as seen through their material culture. They also illustrate Native American artistic traditions in the vicinity and provide examples of the arts and crafts of groups with whom the park has been associated.

The collection consists primarily of Paiute basketry, watercolors, beadwork, and textiles. There are also several fine examples of Shoshone basketry, beadwork, and textiles, most notably the Lillian Wood Collection, acquired by loan in 1976.

b. Associated Records. All records associated with ethnographic collections are retained as part of the museum collection. These records may include field notes; interview schedules, tapes (video and audio), interview transcripts; negatives, prints and slides; data sheets (all subject to restrictions of confidentiality, if any); artifact inventories; analytical study data; computer documentation and data; reports generated by ethnographic investigations; as well as any other documents generated through ethnographic field work.

c. Future Collections Activity. The park will continue to acquire ethnographic material from the Paiute and Shoshone tribes, as well as other Native American groups that have aboriginal, historic, or religious ties to park lands, if such collections will address an interpretive and/or research need identified in the Ethnographic Overview and Assessment (1996), Long-Range

Figure E.1. Example Approved Scope Collection Statement (continued)

Interpretive Plan (1999), Resource Management Plan (1998), cultural affiliation studies, exhibit plans, or other park planning documents. All such future collections activities will proceed in close cooperation with Paiute and Shoshone tribal councils, cultural resource management officers, and councils of Elders.

1) Lillian Wood Collection

The entire collection of Shoshone material culture items consists of the Lillian Wood Collection, which is on loan to the park. This collection is a superb representation of the area's Shoshone culture, circa 1840-1950, and is a vital component of the park's interpretive and research programs. Mrs. Wood's estate is committed to the collection remaining at the park, and the Shoshone tribe and Council of Elders concur. However, the park may be required to purchase the items in order to ensure that they remain at the park. To this end, the park's cooperating association, the Lewis Mountains Association and the Friends of the Lewis Mountains have established a fund-raising campaign to enable the park to purchase the collection outright.

2) Modern Works

During the General Management Plan process, the park and its stakeholders determined that the then-current ethnology collection did not include more recent representations of the area's Paiute and Shoshone material cultures. In response, both the General Management Plan (1998) and Long-Range Interpretive Plan (1999) stress the importance of acquiring a limited number of modern works "…to illustrate the endurance of the area's original Native Peoples, and the continuation and evolution of their culture, arts, and livelihoods through to the present era." The park has since acquired three modern Paiute baskets and two paintings in consultation with Paiute tribal authorities and Elders. Recent consultations with Shoshone Elders determined the need to obtain modern Shoshone textiles and paintings to address these interpretive deficiencies.

3. History

The history collection is an important component of the interpretive and resource management programs and supports the mission of the park. The collection's importance is noted in the Human Use section of the Long-Range Interpretive Plan (1999). The General Management Plan (1998) states that the collection is a "vital element in the interpretation and resource management of historic structures, sites, and other indicators of human use within the present boundaries of the park."

Only historic material that has a direct association with the park is included in the museum collection. When a large quantity of an object type is available, priority is given to acquiring the best-preserved examples. The history collection is based on the park's themes used to establish the following collecting categories:

a. Historic Era: Native American Inhabitants, Euro-American Exploration, Fur Trade, Railroad, Mining, and Homesteading (Pre-1920). There are few objects directly associated with historic era Native American inhabitants, Euro-American exploration, and the fur trade in the collection. It is unlikely that such material of this type will become available, however

Figure E.1. Example Approved Scope Collection Statement (continued)

the park should attempt to obtain an early 19th Century beaver trap to fulfill a deficiency noted in the Henderson Visitor Center Exhibit Plan (1992).

The collection includes several outstanding examples of excavation equipment, tools, and other items associated with the area's 19th century miners, railroad workers, and homesteaders, including the Jakes Collection (first family of homesteaders in the area, now part of the park).

b. Early Park Development (1920-1940). Material in this category includes a Union Pacific/Bear Valley Lodge bus, historic furnishings, staff personal items (e.g., Superintendent Jackson's badge, 1928-35). The park will continue to collect staff members' personal items, furnishings, and other materials that address an interpretive and/or research need identified in an interpretive plan, exhibit plan, or other park planning document.

c. Civilian Conservation Corps (CCC, 1933-1942). The CCC played an important role in the development of the park and in the preservation of its resources. Items in the museum collection from this period include: historic furnishings, copies of administrative records, construction drawings, photographic documentation of projects, tools, artwork (exhibition illustrations, personal sketches and watercolors), and architectural features. If additional material documenting park CCC activities becomes available, it should be collected when it does not duplicate what is presently available. Areas where documentation is incomplete include camp life, identification of personnel in the photographic records on hand, and copies of camp publications such as the *Bear Valley Camp News*.

Many of the park's administrative, maintenance, and residential buildings were either constructed or significantly modified during the CCC period, and are listed on the National Register of Historic Places.

Some works of art, created as exhibition illustrations, have been included in the museum collection. Other important examples remain in the exhibits and these, along with some individual exhibits (dioramas in the Bear Valley Museum) should become part of the museum collection.

d. Commemorative Events. Memorabilia from important current or commemorative events are included in the museum collection. Materials related to President Franklin D. Roosevelt's 1938 park vacation and the park's 75th anniversary have been included. Materials from these types of important park activities will continue to be preserved as they become available.

e. Historic Fabric. When original fabric is removed from a historic structure during a preservation or repair project, a representative portion of the fabric will be preserved and accessioned into the museum collection, along with any associated documentation.

f. Future Collections Activity. Future collections activity in this area will concentrate on the acquisition of outstanding examples of objects currently not represented in the collection, which meet the criteria referenced above and clearly correct an interpretive or research deficiency noted in the park's General Management Plan (1998), Long-Range Interpretive Plan (1999), future exhibit plans, or other planning documents. This will ensure that the history collection is relevant to the interpretive and research needs of the park.

Figure E.1. Example Approved Scope Collection Statement (continued)

4. Archival and Manuscript Collection

The park's archival collection includes oral histories with local residents (including oral histories conducted in 1955 with Mrs. Elsie Johnson and other tribal elders); duplicate copies of administrative records such as Superintendent's Reports and Chief Naturalist's Reports; photographic prints, negatives, and slides; photographs, blueprints, specifications and other items documenting facility development; materials related to scientific studies and resource management activities (Peregrine Falcon studies, mine preservation studies, wilderness areas, etc.); the Josiah Jakes Papers (personal papers of the first Euro-American homesteader in Bear Valley).

Policy and procedures for archival collections and records management are outlined in NPS *Management Policies* (2001), Director's Order #19: Records Management (2001), the *Museum Handbook*, Part II, Appendix D: Archives and Manuscript Collections, and the NPS *Records Disposition Schedule* (1986).

Library Materials

A small number of library materials (e.g., rare books and manuscripts) are included in the museum collection. The park library contains other rare books (e.g., Jonas Fredericson's 1881 publication *Travels Through the Lewis Mountains*) that should also be included in the museum collection. Rare books and original manuscripts, having direct association with the park will continue to be included in the museum collection.

The park's library includes a large number of books that are out of print, technical references, and administrative documents. This material, though valuable, will not be included in the museum collection and will continue to be managed under the park's library management plan. The library and printed matter in the museum collection both support the park's research, interpretive, and resource management programs.

Future Collections Activity

In accordance with Director's Order #19: Records Management (2001) and the NPS *Records Disposition Schedule* (1986), the park Records Management Committee examines all current park files before they are transferred to the National Archives and Records Administration or disposed of, to ensure the retention of copies of important official records in the park. Other materials to be retained include materials related to scientific studies and resource management activities; oral histories, historic resource studies, and similar reports; photographs, blueprints, specifications and other items documenting facility development. Retained materials are managed as part of the museum collection.

In 2002, park staff learned of the existence of two diaries and several letters (circa 1860) kept by Betsy Jakes, niece of Josiah Jakes. These items are currently in the possession of Mrs. Dorothy Samuels of Santa Barbara, California. As these materials document many previously unknown aspects of the area's Euro-American settlement, acquisition of them by the park would constitute an important addition to the collection. The park recently obtained copies of these materials, and Mrs. Samuels has expressed willingness to bequeath the originals to the park. Obtaining these items is a high priority and park staff will continue to work with Mrs. Samuels in this regard.

Figure E.1. Example Approved Scope Collection Statement (continued)

B. Natural History Collection

Purpose

The purpose of this collection is to support scientific research, resource management and education; provide baseline data of park natural resources; document changes these resources are undergoing because of internal park conditions and external effects; provide a database for researchers concerned with resources use by the park's prehistoric occupants; preserve important or locally significant species collected in response to specific research or interpretive needs; to guarantee the protection of important paleontological specimens whose in-situ preservation cannot be assured.

The natural history collection must support these goals. This will ensure that only well-documented and appropriate specimens are retained. Future growth of the collection should be restricted to specimens and associated records generated through:

1. Authorized scholarly research and selective acquisition based on:

    - Needs identified in the park's General Management Plan (1998), Resource Management Plan (1998), and other applicable park planning documents and resource studies

    - Servicewide initiatives such as the Natural Resource Challenge

    - Enhancing understanding of and promoting increased stewardship of the park's ecosystem

2. Inventorying and Monitoring Activities

3. Regulatory and compliance activities such as those mandated by the National Environmental Policy Act of 1969 (NEPA), as amended

Scholarly research may be conducted by park or non-park scientists. All collecting activities must be in compliance with 36 CFR 2.5, the Research Permit and Reporting System, Director's Order #77: Natural Resource Protection (under development), and NPS *Natural Resources Management Guideline* (1991). All researchers must comply with applicable state and Federal laws regulating collecting, documenting collections, and other associated activities. No collector (including park staff) can work in the park without first obtaining a signed permit. The collections section of the permit application must be completed, documenting where collections of specimens and associated records will be housed. Questions related to collecting within the park should be addressed to the park's research coordinator.

Three separate areas of the park, with a total of 8,100 acres, were designated as wilderness in 1973. Alpine Meadow received designation as a "Research Natural Area" in 1969. All collecting of natural resource specimens that impacts these areas must take into consideration restrictions in effect because of these special designations.

Natural resource specimens collected outside the park boundaries will not be included in the collection unless the specimens are required to illustrate interpretive exhibits, to augment specific park-related research projects, or to demonstrate effects on park resources. Written permission from landowners or appropriate officials is obtained when collecting occurs on their land. This documentation or copies must become part of the museum collection's accession file.

Figure E.1. Example Approved Scope Collection Statement (continued)

Taxidermy "mounts" and freeze-dried specimens will be obtained only when a specific need (such as for an exhibit) is identified. Specialty collections such as frozen or other types of tissue samples are beyond the capability of the park to preserve. If they are collected and held by other repositories, they will be accessioned and cataloged in the park's collection. Archived soils and other strictly environmental monitoring samples will only be collected as part of authorized research projects.

This collection is divided into three disciplines: biology, geology, and paleontology. The following list identifies the categories of specimens that are to be included in the museum collection and notes their current representation.

1. **Biology**

   a. **Flora**. Major herbarium collections of vascular plants were made in the 1940s and 1960s. Thus, nearly all species are represented in the herbarium. The non-vascular flora are not well represented in the herbarium. One research project has been conducted in this area; a lichen study was conducted in 1981. Specimens from this project are stored in the park's herbarium. Duplicate specimens are on a repository loan to the University of Utah. It is anticipated that the herbarium collection will continue to grow as a result of park resource management activities (inventory and monitoring, fire effects, etc.) and authorized scholarly research.

      Two state-listed rare plant species have been identified in the park: ***Spiranthes diluvialis*** and ***Astragalus aquilonius*** (Barneby) Barneby. Researchers must comply with all regulations governing these species.

      Note: A teaching collection of herbarium specimens has been developed by the park's interpretive staff. This collection consists of specimens located in the park's Discovery Center, the Environmental Education Center, and additional specimens used for interpretive programs. This collection is managed for consumptive use by the Division of Interpretation; it is not part of the museum collection.

   b. **Fungi**. The fungi collection currently consists of fifty-two specimens collected in 1998 by a researcher from Stanford University. These specimens are currently housed at Stanford University. It is anticipated the fungi collection will continue to grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research.

   c. **Mammals**. The majority of the mammal specimens in the collection were collected in the 1930s. Not all species found in the park are represented. A major research study of small mammals was conducted from 1989-1994. The study included the collection and preservation of small mammal species found in the park. It is anticipated the collection will continue to grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research. The mammal collection is housed at the park.

      No known endangered, threatened, or rare species are known in the park.

      Note: A teaching collection of mammal specimens has been developed by the park's interpretive staff. These specimens include animals accidentally killed on nearby roads, seizures of illegal game by the state Department of Fish and Game and U.S. Fish and Wildlife Service, and skeletal materials. The collection consists of specimens located in the park's

Figure E.1. Example Approved Scope Collection Statement (continued)

Discovery Center, the Environmental Education Center, and additional specimens used for interpretive programs. This collection is managed for consumptive use by the Division of Interpretation; it is not part of the museum collection.

d. **Birds**. The majority of the bird specimens presently in the collection were collected in the 1930s. Not all species found in the park are represented. It is anticipated the collection will continue to grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research.

Two threatened, endangered, or rare species have been recorded in the park. These are: *Haliaeetus leucocephalus* and *Falco peregrinus*. Researchers must comply with all regulations governing these species.

Note: A teaching collection of bird specimens has been developed by the park's interpretive staff. These specimens include animals found dead, specimens seized by the state Department of Fish and Game and U.S. Fish and Wildlife Service, abandoned eggs and nests, and skeletal materials. The collection consists of specimens located in the park's Discovery Center, the Environmental Education Center, and additional specimens used for interpretive programs. The collection includes two examples of *Haliaeetus leucocephalus* and one *Aquila chrysaetos*. This collection is managed for consumptive use by the Division of Interpretation; it is not part of the museum collection. All required permits are maintained by the Division of Interpretation.

e. **Reptiles and Amphibians**. Few species of reptiles and amphibians are currently represented in the museum collection. No major scientific studies involving reptiles and amphibians in the park have been undertaken to date. It is anticipated this collection will grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research.

No known threatened, endangered, or rare species are found in the park.

f. **Fish**. The Bear River flows through the central portion of the park. Other bodies of water in the park include Shawnee Lake and numerous other small lakes and streams. The aquatic life found in these bodies of water in the park have not been studied to date. It is anticipated this collection will grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research.

g. **Insects and Arachnids**. The park's insect collection dates from the 1970s. It is a fairly extensive collection resulting from a cooperative agreement with Oregon State University. The collection also includes insect larvae and soft-bodied arachnids preserved in 70% ethanol.

It is anticipated that this collection will grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research. Species of importance in park management (such as parasites, museum pests, and others potentially requiring control measures) should be similarly represented. This collection is stored at the park.

No known rare, threatened, or endangered species are found in the park.

Figure E.1. Example Approved Scope Collection Statement (continued)

Note: A teaching collection of insect specimens has been developed by the park's interpretive staff. These specimens include those located in the park's Discovery Center, the Environmental Education Center, and additional specimens used for interpretive programs. This collection is managed for consumptive use by the Division of Interpretation; it is not part of the museum collection.

h. Other Invertebrates. Invertebrates other than those referred to above, both aquatic and terrestrial, are not well documented in the park. A small collection of dried land snail shells was made in the 1930s. It is anticipated that this collection may grow in the future, as a result of inventory and monitoring, other park resource management activities, and authorized scholarly research.

i. Associated Records. All records associated with specimens collected in conjunction with biological research are retained in addition to the specimens as part of the museum collection. Archival collections supplement future researchers' understanding of these collected specimens. These records include field notes; daily journals; maps and drawings; photographic negatives, prints, and slides; videotapes; sound recordings; raw data sheets; remote sensing data; copies of contracts; correspondence; repository agreements; specialists' reports and analyses; reports and manuscripts; specimens inventories and field catalogs; analytical study data; computer documentation and data; tabulations and lists; reports on all scientific samples lost through destructive analysis.

2. Geology

a. Rocks and Minerals. The collection contains a number of hand specimens, soil specimens, and mineral specimens that document the major rock types, formations, soils, and minerals found in the park. Additional specimens may be added to the collection as a result of resource management activities or other authorized scientific research.

Note: A small teaching collection of rock and mineral hand specimens has been developed by the park's interpretive staff. These specimens include those located in the park's Discovery Center, the Environmental Education Center, and additional specimens used for interpretive programs. This collection is managed for consumptive use by the Division of Interpretation; it is not part of the museum collection.

b. Associated Records. All records associated with specimens collected in conjunction with geological research are retained in addition to the specimens as part of the museum collection. Archival collections supplement future researchers' understanding of these collected specimens. These records include field notes; daily journals; maps and drawings; photographic negatives, prints, and slides; videotapes; sound recordings; raw data sheets; remote sensing data; copies of contracts; correspondence; repository agreements; specialists reports and analyses; reports and manuscripts; specimen inventories and field catalogs; analytical study data; computer documentation and data; tabulations and lists; reports on all scientific samples lost through destructive analysis.

3. Paleontology

Uncontrolled surface collecting by visitors and park staff is prohibited. Fossils found on the surface by visitors should not be removed from their original location by the finder. They should be reported to park staff. If materials are turned in to park staff, appropriate measures must be

Figure E.1. Example Approved Scope Collection Statement (continued)

taken to ensure that the visitor collects no more material, that precise provenience information is recorded, if possible, and that the objects/data are promptly given to the museum curator upon receipt by staff members.

a. **Fossil Specimens**. The collection contains a representative and well-documented collection of invertebrates, mainly from the Bear Valley Shale Formation that were collected in the 1950s and 1960s. An additional twenty-nine specimens were collected in 1992, and are located at Boise State University. It is anticipated that this collection may grow in the future, as a result of park resource management activities and authorized scholarly research.

b. **Associated Records**. All records associated with specimens collected in conjunction with paleontological research are retained in addition to the specimens as part of the museum collection. Archival collections supplement future researchers' understanding of these collected specimens. These records include field notes; daily journals; maps and drawings; photographic negatives, prints, and slides; videotapes; sound recordings; raw data sheets; remote sensing data; copies of contracts; correspondence; repository agreements; specialists reports and analyses; reports and manuscripts; specimen inventories and field catalogs; analytical study data; computer documentation and data; tabulations and lists; reports on all scientific samples lost through destructive analysis.

III. MUSEUM COLLECTIONS SUBJECT TO THE NATIVE AMERICAN GRAVES PROTECTION AND REPATRIATION ACT OF 1990

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA), 25 USC 3001-13, requires, in addition to other actions, a written summary of unassociated funerary objects, sacred objects, and objects of cultural patrimony. The park's holdings that fall into these NAGPRA categories are listed in a Servicewide summary that was distributed to all Indian Tribes, Alaska Native villages, and Native Hawaiian organizations on October 27, 1993. An updated copy of this summary is on file at the park.

NAGPRA requires a written, item-by-item inventory of human remains and associated funerary objects to be completed no later than November 16, 1995. The park has human remains and associated funerary objects subject to NAGPRA in its museum collection. A detailed listing of these items is contained in the park's NAGPRA Inventory, completed October 10, 1995. An updated copy of this inventory is on file at the park.

IV. ACQUISITION

The park acquires objects for its museum collections by gift, purchase, exchange, transfer, field collection, and loan. Museum objects must be acquired, accessioned, and cataloged in accordance with *Museum Handbook*, Part II, Museum Records. Acquisition of museum objects are governed by the park's ability to manage, preserve, and provide access to them according to NPS *Management Policies* (2001), Chapter 5; the standards for managing museum objects in Director's Order #28: Cultural Resource Management (1998), *Cultural Resource Management Guideline* (1997), and Director's Order #24: NPS Museum Collections Management; the NPS *Museum Handbook*, Part I, Museum Collections and Part III, Access and Use.

In accordance with NPS policy, the park will prohibit the acquisition of gifts with restrictions or limiting conditions. Such restrictions include copyrights; the park will acquire copyrights to all incoming accessions. Incoming loans will be acquired only for a particular purpose such as research or exhibition,

Figure E.1. Example Approved Scope Collection Statement (continued)

and for a specified period of time. Museum objects are acquired, accessioned, and cataloged in accordance with the NPS *Museum Handbook*, Part II, Museum Records.

The park will not be a partner to, or encourage in any way, the trafficking in illicitly collected materials. All acquisitions must be collected, exported, imported, transported, or otherwise obtained and possessed in full compliance with the laws and regulations of the country of origin, the United States federal government (including NAGPRA), and the individual states of the United States.

The acquisition of firearms included on the Bureau of Alcohol, Tobacco, and Firearms (ATF) list of prohibited/restricted weapons requires concurrent review by the regional/SO curator and the regional/SO law enforcement specialist.

The park superintendent, by delegation, represents the Director of the National Park Service and the Secretary of the Interior in accepting title to and responsibility for museum objects. The superintendent will ensure that all collections acquired are in keeping with this Scope of Collection Statement before accepting the items as part of the permanent collection. The superintendent bears the ultimate responsibility for the acquisition and proper care and management of the museum collection. The superintendent has delegated the day-to-day care of the collection to the museum curator.

All acquisitions must receive formal approval from the superintendent before they can be accepted into the museum collection. Upon receipt, all newly acquired objects and related documentation must be turned over to the museum curator. The museum curator prepares, for the superintendent's signature, all instruments of conveyance, and letters of thanks, acceptance, or rejection, and transmits them as appropriate, to the donor, lender, vendor, or other source of acquisition.

V. USES OF COLLECTIONS

The park's museum collection may be used for exhibits, interpretive programs, research, publications, or other interpretive media. The primary considerations for the use of museum objects are the preservation of each object in question and of the collection as a whole, and accurate interpretation.

In accordance with NPS *Management Policies* (2001), Chapters 5 and 7, the park will not exhibit Native American human remains or photographs of those remains. Drawings, renderings, or casts of such remains will not be displayed without the consent of culturally affiliated Indian tribes and Native Hawaiian organizations. The park will consult with culturally affiliated or traditionally associated peoples to determine the religious status of any object whose sacred nature is suspected but not confirmed. These consultations will occur before such an object is exhibited or any action is taken that may have an adverse effect on its religious qualities.

Researchers and other specialists may examine objects and archival materials under the conditions and procedures outlined in Director's Order #24: NPS Museum Collections Management, Director's Order #28: Cultural Resource Management (1998), Cultural Resource Management Guideline (1997), and in the park's written "Museum Collections Access Procedures." Outside researchers must submit a research proposal to the superintendent for review by the park's Research Coordinator and other staff as appropriate. If applicable, the research proposal may be presented for review during consultation with the Paiute and Shoshone tribes before access to certain items in the collection is granted.

Any interpretive use defined as consumptive must be authorized in advance, as outlined in Director's Order #24: NPS Museum Collections Management, Director's Order #28: Cultural Resource Management (1998), *Cultural Resource Management Guideline* (1997), and Director's Order #6: Interpretation and Education (Draft, 2002). The use of reproductions is preferred to the consumptive use of original objects.

Figure E.1. Example Approved Scope Collection Statement (continued)

Destructive analysis is a legitimate use of museum collections for approved research purposes when the impact is minor or when the object is common, in which case approval by the superintendent is required. If an object is rare or significant, a request for destructive analysis should be reviewed by the regional/SO curator and may be approved only by the regional director, as outlined in Director's Order #24: NPS Museum Collections Management, Director's Order #28: Cultural Resource Management (1998) and *Cultural Resource Management Guideline* (1997).

Objects may be loaned out to qualified institutions for approved purposes in accordance with NPS *Museum Handbook*, Part II, Chapter 5: Outgoing Loans. Institutions must meet accepted museum standards for security, handling, and exhibition of NPS museum objects. Sensitive materials may require additional conditions prior to a loan commitment. Expenses related to loans of museum objects, including shipping and insurance, will normally be assumed by the borrower.

Photographs of museum objects are made available to the public to provide an indirect use of the museum collection through publications and exhibits (including exhibits on the park website). Many of the park's artifacts have been illustrated in publications.

All exhibits containing museum objects must have proper security, appropriate environmental controls, and proper mounts to ensure the long-term preservation and protection of the objects.

VI. RESTRICTIONS

Restrictions in addition to those applying to the use of the museum collection outlined in Section IV of this statement are as follows:

In accordance with NPS *Management Policies* (2001) 7.5.5. "Consultation" and 5.3.5.5 "Museum Collections," and DO #24: NPS Museum Collections Management, curatorial staff should consult with traditionally associated peoples and other cultural and community groups for whom the collection has significance. Archeological objects in the museum collection shall be made available to persons for use in religious rituals or spiritual activities in accordance with 36 CFR 79, Section 79.10(c), "Curation of Federally-owned and Administered Archeological Collections." Requests to borrow non-archeological material for religious ritual or spiritual activities will be addressed on a case-by-case basis.

The park will not approve research on human remains and associated funerary objects without the consent of the affected group(s).

In accordance with the National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.), the Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm), the National Parks Omnibus Management Act of 1998 (16 USC 5937), and NPS *Management Policies* (2001) 4.1.2. "Natural Resource Information" and 5.2.3 "Confidentiality," the park may withhold from the public sensitive information concerning: rare, threatened, or endangered species; commercially valuable resources; minerals; paleontological resources; archeological and other cultural resources; objects of cultural patrimony and sensitive ethnographic information; information provided by individuals who wish the information to remain confidential; the identities of individuals who wish to remain anonymous. Inquiries of this nature will be referred to the regional Freedom of Information Act (FOIA) and Privacy Act Officer for consultation and possible review.

Restrictions may be placed on the publication of images or manuscripts in the museum collection if these materials are subject to copyright, and the National Park Service does not hold the copyright.

Figure E.1. Example Approved Scope Collection Statement (continued)

All endangered, threatened, or rare plants and vertebrate and invertebrate animals will be collected only when accidentally killed or when dead from natural causes. The collection of threatened, endangered, or rare plant and animal species will comply with NPS *Management Policies* (2001), be in accordance with the provisions of the Endangered Species Act of 1973, as amended, and will be strictly limited according to the applicable rules of the U.S. Fish and Wildlife Service.

Final disposition of type specimens will be determined at the Servicewide level and will adhere to recognized conventions established for specific disciplines.

The park will not knowingly be a partner to or encourage in any way the trafficking in illicitly collected materials.

VII. MANAGEMENT ACTIONS

This Scope of Collection Statement must be reviewed every five years, and be revised when necessary, to remain supportive of and consistent with any changes in the park's mission. Any revision to this document requires the approval of the superintendent.

The park has an approved Collection Management Plan. The plan was approved on August 2, 1996.

A number of objects from the collection are housed at repositories outside of the park:

1. 493 nitrate film negatives are stored at the Western Archeological and Conservation Center in Tucson, Arizona.

2. Twenty-nine paleontological specimens are located at Boise State University in Boise, Idaho.

3. Ninety-one mammal specimens (collected at the park in the 1930s and 1950s) are housed at the Utah Museum of Natural History, University of Utah, in Salt Lake City.

4. 200 lichen specimens collected in 1981 are stored at the Utah Museum of Natural History, University of Utah, in Salt Lake City.

5. Fifty-two fungi specimens collected in 1998 are housed at Stanford University, in Stanford, California.

The park staff is compiling data on collections in other institutions that were removed from sites within the park. Natural history collections and archeological materials were removed from sites presently within the park boundaries before its creation in 1928 and during the first two decades of the park's existence. The list of institutions in the United States that have important collections from the park include: the Idaho Museum of Natural History in Pocatello, the Smithsonian Institution, the University of Colorado in Boulder, and the University of Utah in Salt Lake City. These collections still contain a wealth of information that has not been fully analyzed to date.

Recall of objects loaned to the park is a possibility. The park needs to seek replacements for exhibited objects on long-term loan in order to prevent potential disruption of exhibits.

Lewis Mountains National Park

Scope of Collection Summary

The park's museum collection includes both natural history and cultural collections. The park's natural history collection includes: mammal and bird collections; the herbarium, which includes nearly all species of vascular plants that occur in the park; paleontological collections from the Bear Valley Shale Formation; geological specimens from the Bear Valley Shale and Lewis Granite Formations. Other natural history collections within the museum collection include: fungi; reptiles and amphibians; fish; insects and arachnids. At present, these collections are relatively small, as little research pertaining to these disciplines has been conducted in the park to date.

The cultural collection includes: archeological materials systematically excavated from within the park's boundaries and associated field records (circa 1000 BCE – circa 1940); an ethnology collection of Paiute and Shoshone basketry, watercolors, beadwork, and textiles; historic objects associated with the area's 19th century miners, railroad workers, and homesteaders, and items related to the Civilian Conservation Corps and President Franklin D. Roosevelt's 1938 park vacation; archival and manuscript collections such as the Joseph Jakes papers, oral histories, photographs, and scientific and resource management records.

	YES	NO	NA	Note*
10. Are other laws, regulations, conventions, and special directives relevant to acquisition of museum objects cited?	____	____	____	____
11. If applicable, are any special unit designations (e.g., Biosphere Reserve, National Historic Landmark, World Heritage Site) that may be pertinent to museum collection cited?	____	____	____	____
C. Does the SOCS have TYPES OF COLLECTIONS section?	____	____	____	____
1. Is there a brief profile of the unit's museum collection?	____	____	____	____
2. Is there an introductory statement indicating that the INTRODUCTION section states the purpose of collection?	____	____	____	____
3. Is section divided into two major categories: Natural History Collection and Cultural Collection?	____	____	____	____
4. Natural History Collection Category:				
a. If appropriate, is there a statement that the unit does not collect/maintain a natural history collection for its own purposes?	____	____	____	____
b. If unit collects/maintains a natural history collection is there an introductory paragraph that briefly outlines the purpose of this collection?	____	____	____	____
c. Is major category subdivided into disciplines (Biology, Geology, Paleontology) pertinent to unit?	____	____	____	____
d. Is each discipline subdivided into collecting categories that reflect unit's purpose for collection?	____	____	____	____
e. If appropriate, under each collecting category:				
1) Is current representation of object types described?	____	____	____	____
2) Are priorities established to fill identified deficiencies (gaps) in existing collection?	____	____	____	____
3) Are limits (quantities) defined?	____	____	____	____
f. Is there a collecting category for "associated records" under each discipline?	____	____	____	____
g. Does paleontology discipline include a statement relevant to uncontrolled surface collecting?	____	____	____	____
5. Cultural Collection Category:				
a. Does introductory paragraph include a statement that describes the purpose of this collection?	____	____	____	____

***See additional notes pertaining to this question on attached pages.**

Figure E.3. Checklist for Evaluating Scope of Collection Statements (continued)

	YES	NO	NA	Note*
b. Does introductory paragraph state that an object or archival/manuscript collection from site or directly associated to person(s) or event(s) commemorated by the unit is more desirable than a similar object without such primary association?	____	____	____	____
c. Is major category subdivided into disciplines pertinent to the unit (Archeology, Ethnology, History, Archives)?	____	____	____	____
d. Is each discipline subdivided into collecting categories that reflect the unit's purpose for collection?	____	____	____	____
e. If appropriate, under each collecting category:				
1) Is current representation of object or archival types described?	____	____	____	____
2) Are priorities established to fill identified deficiencies (gaps) in existing collection?	____	____	____	____
3) Are limits (quantities) defined?	____	____	____	____
f. Does archeology discipline include collecting categories for "artifacts and specimens" and "associated records?"	____	____	____	____
g. Does archeology discipline include a statement relevant to uncontrolled surface collecting?	____	____	____	____
D. Does the SOCS have MUSEUM COLLECTIONS SUBJECT TO THE NATIVE AMERICAN GRAVES PROTECTION & REPATRIATION ACT OF 1990 section?	____	____	____	____
1. Does section contain appropriate statement regarding the required summary of unassociated funerary objects, sacred objects, and objects of cultural patrimony?	____	____	____	____
2. Does section contain appropriate statement regarding the required inventory of human remains and associated funerary objects?	____	____	____	____
E. Does the SOCS have ACQUISITION section?	____	____	____	____
1. Is there a statement describing types of potential acquisition sources?	____	____	____	____
2. Does section include statement that acquisition of objects is governed by the unit's capability to preserve its museum collection in accordance with NPS ***Management Policies*** (2001), DO #28, and the NPS ***Museum Handbook***, Part I?	____	____	____	____
3. Is there a statement that prohibits gifts with restrictions or limiting conditions?	____	____	____	____

***See additional notes pertaining to this question on attached pages.**

Figure E.3. Checklist for Evaluating Scope of Collection Statements (continued)

	YES	NO	NA	Note*
4. Does section state that acquisition of firearms included on the Bureau of Alcohol, Tobacco, & Firearms (ATF) list of prohibited and restricted weapons requires concurrent review prior to acceptance by regional/SO curator and regional/SO law enforcement specialist?	____	____	____	____
5. Does section state that museum objects must be acquired, accessioned, and cataloged in accordance with NPS ***Museum Handbook***, Part II?	____	____	____	____
6. Is there a statement regarding delegation of authority to the unit's superintendent to accept title to and responsibility for museum collections?	____	____	____	____
7. Does this section outline any park-specific acquisition procedures that supplement NPS policies?	____	____	____	____
F. Does the SOCS have USES OF COLLECTIONS section?	____	____	____	____
1. Is there a description of desired and acceptable uses?	____	____	____	____
2. Is there a statement regarding conservation as a primary consideration when determining uses?	____	____	____	____
3. In accordance with the NPS ***Management Policies*** (2001), Chapter 7, does section state that unit shall not place skeletal or mummified human remains, photographs of skeletal or mummified human remains, grave goods, or other objects considered sacred on display?	____	____	____	____
4. Is there a statement regarding access to museum collection?	____	____	____	____
5. Does section reference DO-24, DO-28, and DO-6 relevant to potentially consumptive uses of museum objects?	____	____	____	____
6. Does section reference DO-24, DO-28, and ***Cultural Resource Management Guideline*** relevant to research/destructive analysis of museum objects?	____	____	____	____
G. Does the SOCS have RESTRICTIONS section?	____	____	____	____
1. Does section include a statement regarding consultation with tribal governments, Native Hawaiian organizations, Alaskan Native Corporations, and traditional religious leaders?	____	____	____	____
2. Does section state NPS policy relevant to disclosure of information on location, nature, and character of cultural resources?	____	____	____	____

***See additional notes pertaining to this question on attached pages.**

Figure E.3. Checklist for Evaluating Scope of Collection Statements (continued)

	YES	NO	NA	Note*
3. Does section state NPS policy relevant to keeping confidential identities of community consultants and information about sacred and other culturally sensitive places and practices?	____	____	____	____
4. Is there a statement regarding use of objects subject to copyright?	____	____	____	____
5. If appropriate, is there a statement relevant to the collecting of endangered, threatened, or rare species?	____	____	____	____
6. Is there a statement concerning the disposition of type specimens?	____	____	____	____
7. Does section identify any legal restrictions on disposition or uses of the unit's museum collection?	____	____	____	____
H. Does the SOCS have a MANAGEMENT ACTIONS section?	____	____	____	____
1. Are there statements that require the following:				
a. Periodic review of SOCS?	____	____	____	____
b. SOCS remains supportive of and consistent with unit's mission?	____	____	____	____
c. Unit superintendent's approval of any revisions to SOCS?	____	____	____	____
2. Does section document existence of or need for a Collection Management Plan?	____	____	____	____
3. If any collections are located outside the unit's boundaries, is a brief description of each collection and name and location of each repository identified?	____	____	____	____

I. Comments/Recommendations (If needed, attach additional pages.):

____ See attached copy of unit's approved or draft Scope of Collection Statement for editorial comments.

____ Revise the SOCS to correct the deficiencies noted on this checklist. See NPS ***Museum Handbook***, Part I, (***MH-I***) Chapter 2, Scope of Museum Collections (2003), Sections D-J, for guidance on writing a Scope of Collection Statement. You can also consult the sample Scope of Collection Statement in ***MH-I***, Appendix E, Scope of Collection Statement (2003) for additional assistance.

____ See additional notes on attached pages.

***See additional notes pertaining to this question on attached pages.**

Figure E.3. Checklist for Evaluating Scope of Collection Statements (continued)

Appendix F: NPS Museum Collections Management Checklists

APPENDIX F: NPS MUSEUM COLLECTIONS MANAGEMENT CHECKLISTS

A. Overview

This appendix includes three Checklists that support the preservation of NPS collections.

- NPS Checklist for Preservation and Protection of Museum Collections
- NPS Collection Management Plan Team Site Visit Checklist
- NPS Collection Management Plan Team Reference Document Checklist

The NPS Checklist for Preservation and Protection of Museum Collections is submitted using the Automated Checklist Program (ACP) in the Automated National Catalog System (ANCS+). This Checklist is the responsibility of park museum employees. The information in Figure F.1 will assist you in estimating costs to correct deficiencies identified in the checklist.

The 1996 manual version of the Checklist (before it was incorporated into ANCS+) is in Figure F.2. This version is provided for easy reference to Checklist questions. Though the ACP questions are identical, the ACP allows you to track additional information. Parks and centers must submit their Checklist using the ACP.

The other two checklists (Sections C and D) in this Appendix are used by Collection Management Plan (CMP) teams and serve as outlines for the information that the CMP team collects, reviews, and distributes.

B. NPS Checklist for Preservation and Protection of Museum Collections

The NPS Checklist for Preservation and Protection of Museum Collections (Checklist) has gone through several revisions. It was first issued in 1986 as the Inspection Checklist for Museum Storage and Exhibit Spaces. The Department of the Interior adopted the checklist and in 1992 the NPS used a version entitled the DOI Checklist for the Preservation, Protection and Documentation of Museum Property, Part I: Preservation and Protection of Museum Property (as amended for use by the National Park Service, February 28, 1992). In 1996 it was automated in a DOS-based computer program and submitted by parks in electronic format for the first time. At that time it assumed its current name and the automated program was called the Automated Checklist Program (ACP). Since the issuance of ANCS+ in 1998, the Checklist is submitted using the Windows-based ACP, a utility in ANCS+.

1. *What is the purpose of the Checklist?*

Each unit (park, center, or office) is required to conduct a self-assessment in order to update progress on how well it is preserving and protecting the museum collections in its custody. The Checklist is designed as a tool to facilitate this self-assessment. It will assist you in identifying the preservation and protection needs of your unit's museum collection. The Checklist can help your unit to obtain funding from the servicewide Museum Collections Preservation and Protection Program (MCPP) and other funding sources to correct deficiencies in your:

- facilities
- equipment
- supplies
- planning

You also use the Checklist to report accomplishments regarding NPS Strategic Plan Goal Ia6 for the Government Performance and Results Act (GPRA).

2. *What additional tools do I need to address the ongoing (day-to-day) needs of the museum collection?*

The Checklist provides some data on managing the preservation of museum collections, but does not address all of the needs (including staffing) of your museum collection. The daily responsibilities include accessioning, cataloging, and inventorying; housekeeping; monitoring and controlling the environment and pests; storage; security; fire protection; conservation treatment; access; research; publication; and exhibits (both traditional and Web-based).

In addition to the Checklist, you need to use other planning and budgeting tools to identify the total base funding needs of the collection:

- Collection Management Plan (CMP)
- Resources Management Plan (RMP)
- Resources Management Assessment Program (R-MAP) – includes Natural Resources and Cultural Resources
- Performance Management Information System (PMIS)
- Operations Formulation System (OFS) – documents funding and staffing needs

3. *How do I complete the Checklist?*

To complete the Checklist you must use the Automated Checklist Program (ACP) included in the ANCS+ collection management package. The ACP generates the Checklist for your park, center, or office. Instructions for completing the Checklist using the ACP are in Appendix G: The Automated Checklist Program of the *ANCS+ User Manual* issued in 1998. The *ANCS+ User Manual* is issued to each park and center with ANCS+. You can download extra copies of the manual from the Museum Management Program website at <www.cr.nps.gov/museum/publications/ancs.html>.

4. *What data do I collect and record with the Checklist?*

The Checklist identifies basic preservation and protection deficiencies when you answer a list of questions for each facility in your unit.

A **unit** is defined as a park, center, or office with museum collections. You answer one group of questions (Section H. Professional Assistance and Museum Planning) just for the unit.

A **facility** is defined as a space that houses museum collections, for example, a visitor center, rooms in a historic structure, a barn, or park headquarters. A single building can have more than one facility (or space) where museum objects are located. For example, the exhibit area, the storage room, and the administrative office that houses museum objects or archives could each be a separate facility within one building.

You must answer "YES" or "NO" or "NOT APPLICABLE" to each question and record the following information where appropriate:

- description of the deficiency
- cost estimate to correct the deficiency
- description of the action that will be taken to correct the deficiency
- comments
- funding spent in the previous fiscal year
- previous estimates for cost that have been recorded in the Checklist
- percentage of the deficiency that has been corrected, if not complete

5. *How are NPS preservation and protection standards reflected in the Checklist?*

The NPS standards, or basic requirements, for managing museum collections are represented by each question in the Checklist. You complete this self-assessment to determine which standards your park meets. If the unit does not meet a standard (that is, you answer "NO" on the Checklist), then the unit has a deficiency for that standard. The Checklist has standards in eight categories:

- Administrative offices
- Museum collections storage
- Exhibits
- Museum environment
- Security
- Fire protection
- Housekeeping
- Professional assistance and museum planning

6. *How is the Checklist organized?*

The standards under each category (except professional assistance and museum planning) are organized under the following sub-categories:

- Operations (procedural)
- Museum facility
- Equipment and supplies

You will answer different questions on the Checklist depending on the type of facility (Unit, Administrative, Storage, or Exhibit). These questions will come up automatically in the ACP.

If type of space is . . .	***Then . . .***
Unit	answer Section H. Professional Assistance and Museum Planning
Administrative	answer Section A. Administrative Offices
Storage	answer Sections B. Museum Collection Storage D. Museum Environment E. Security F. Fire Protection G. Housekeeping
Exhibit	answer Sections C. Exhibits D. Museum Environment E. Security F. Fire Protection G. Housekeeping

7. *How do I determine costs for correcting deficiencies identified in the Checklist?*

The information in Figure F.1 will assist you in estimating costs to correct deficiencies identified in the Checklist. All categories and subcategories in the table correspond to the Checklist. The costs shown are average costs that may be increased or decreased in your cost estimates depending on your unit's needs and geographic location.

With two exceptions, you must correct all deficiencies listed under the sub-category "Operations (procedural)" with base funding. Procedural deficiencies have minimal cost and can be corrected with changes in procedures. The two exceptions are under Category E. Security, question 1 (key issuance) and question 8 (Emergency Operation Plan).

Consult with park maintenance and protection staff as well as the regional/SO curator for assistance with estimating costs. If numerous deficiencies are identified, it may be necessary to rehabilitate an existing facility or to construct a new facility. Review programming documents for cost estimates. Look at documents such as the Project Management Information System (PMIS) projects and plans for new construction and repair/rehabilitation of museum collection storage and exhibit facilities.

Prices of equipment and supplies don't include shipping. Units should contact vendors for estimates of shipping to the site. Pricing, except where covered by contracts, is approximate and based on current prices from a range of acceptable models, types, or materials from several vendors. Refer to the NPS *Tools of the Trade* for descriptions and vendor sources of equipment and supplies.

Estimates should be calculated and as close to the real cost as possible. These estimates are important. Servicewide plans and long-range programming and budgeting are based on these data.

8. *How do I use the information in the Checklist?*

Use the reports generated in the Checklist to help you plan improvements to the preservation and protection of your museum collections. As you carry out projects that remove the deficiencies on the Checklist, you will:

- improve the care given to the collections
- meet NPS museum standards
- ensure the continued survival and accessibility of NPS collections
- enhance access and use of NPS museum collections

9. *How is the Checklist used for GPRA?*

The NPS has developed a Servicewide Strategic Plan in response to the Government Performance and Results Act (GPRA). Your park also has a Strategic Plan. The NPS tracks annual performance on the goals in these plans. Goal Ia6, "X% of preservation and protection conditions in park collections meet professional standards," uses Checklist data to track performance.

10. *Who else uses the information in the Checklist?*

The Museum Management Program (MMP) and regional and support offices use the information to:

- track conditions in spaces housing collections at servicewide, regional, cluster, and park levels
- measure strategic plan progress for GPRA goal Ia6
- help determine servicewide funding distributions for correcting identified deficiencies
- prepare budget justifications and develop funding requests
- prepare reports for park, cluster, and regional management; the Director, the Department of the Interior, Congress, and public inquiries

Regional and support offices may collect information from parks to help them organize more local strategies for support and funding.

C. NPS Collection Management Plan Team Site Visit Checklist

A Collection Management Plan is one of the primary planning documents for park museum collections. Each park must have a CMP. A CMP assesses a park's museum collection management program to identify problems and makes recommendations to improve the care of the collection.

When a Collection Management Plan (CMP) team visits your site, it will consider a wide range of topics in evaluating your museum program. The checklist in this section provides a detailed outline of a typical CMP. The broad categories may include:

- history of park and museum collection
- scope of collection
- documentation, including records and information management systems
- archival and manuscript collections
- security
- environment
- storage
- exhibits
- housekeeping and cyclic maintenance
- access and use
- staffing
- planning, programming, and funding

Under each category the checklist provides details of the types of topics that may be addressed by the team members. Each park and its museum collections are unique. The topics and depth of detail addressed in each park's CMP depends on the size, content, and condition of the museum and archival collections.

The checklist may be provided to the park staff in advance of the CMP team's visit to the park. It serves to orient the park superintendent and staff on the types and depth of information that the team will require when preparing a plan that will be useful to the park. The team members use the

checklist as a reminder of topics to cover.

A CMP team may include a variety of professionals depending on the types of collections in the park. Types of professionals who may be on a CMP team include:

- Archeologists
- Archival specialists and technicians
- Archivists
- Collections managers
- Conservators
- Curators
- Historians
- Natural scientists
- Registrars
- Security specialists
- Structure fire management specialists

See Chapter 3: Preservation: Getting Started, for more information on the CMP process and how the CMP relates to the Collection Condition Survey (CCS). See *Museum Handbook*, Part II, Appendix D: Museum Archives and Manuscript Collections, for guidance on incorporating a collection-level survey description of your archival materials into a CMP.

NATIONAL PARK SERVICE
COLLECTION MANAGEMENT PLAN (CMP) TEAM
SITE VISIT CHECKLIST

I. HISTORY OF PARK AND MUSEUM AND ARCHIVAL COLLECTION

___ Enabling legislation/authorization

___ Purpose of site/park

___ Cultural and natural significance of park

___ Provenance/source of collection

___ Significance of collection and relationship to the park

___ Size of collection

- ___ Numbers and types of objects and specimens in collection
  - ___ disciplines
  - ___ object classifications
- ___ Number and types of archival collections
  - ___ total number of separate archival collections (by provenance)
  - ___ linear feet of records
  - ___ types of documents (electronic? photos? films? audio/videotapes?)
  - ___ inclusive dates of archival collections

___ Visitation

- ___ Recent visitor statistics
- ___ Peak season/time
- ___ Visitor impact on collection (annual statistics)
  - ___ number of duplicates provided
  - ___ number of research requests (NPS and external) from Collections Management Report
  - ___ number of research room visits (individual visits), if available
  - ___ number of research room visitors (distinct visitors as opposed to visits), if available
  - ___ number of publications, exhibitions, interpretive sessions, films, etc. produced using collections, if available
  - ___ number of FOIA requests

II. SCOPE OF COLLECTION

___ Review the Scope of Collection Statement by theme, types of materials, historical era, and geographical coverage to ensure it covers all necessary materials. (Use NPS Checklist for Evaluating Scope of Collection Statements. See Appendix E: Scope of Collection Statement.)

___ Acquisition strategies

___ Gaps in collection by theme, type of material, association, historical era, geographical coverage

- ___ Collections development strategy (cooperative acquisition planning with other local/national organizations)
- ___ Priorities for collecting

___ Status of records management program in park

___ Disposition strategies

___ Objects outside scope of collection

___ Deaccession proposal(s)

___ Status of official records disposition, if relevant to collections

___ Identification strategies for park collections held outside the NPS

___ Where managed

___ How managed—preservation, arrangement, description, and access issues

III. MUSEUM DOCUMENTATION (RECORDS AND INFORMATION MANAGEMENT)

___ Records storage and preservation

___ Fire-rated, insulated file cabinet with lock
- ___ load limitation
- ___ need for back-up

___ Magnetic media safes, files, boxes
- ___ floor load
- ___ need for back-up
- ___ refreshing/migration needs

___ Location
- ___ physical and intellectual access
- ___ sensitive data
- ___ vital records security

___ Acid-free photocopies of one-of-a-kind records

___ Use of high-quality storage materials

___ Condition
- ___ reformatting needs
- ___ other treatment needs

___ Accession records

___ Accession Book
- ___ first and last entries/dates
- ___ consecutive entries and pages
- ___ catalog numbers
- ___ received from/how acquired
- ___ recording of multiple objects in single accession

___ Accession folders
- ___ proof of ownership (title documents and physical custody documentation)
- ___ correspondence on acquisition

___ correspondence on donor and legal restrictions, including copyrights, privacy, and publicity rights
___ correspondence on consultations with affiliated groups relating to potential cultural sensitivities
___ model releases, interview releases, permissions, and licenses relating to accessions
___ checklist
___ Accession Receiving Report (Form 10-95)

___ Source of accession file (optional)

___ Unaccessioned objects

___ Number and type

___ Official/non-official, active/inactive records

___ Catalog records

___ Copies
___ electronic copy for National Catalog submission
___ blue "working copies" in post binders (optional)
___ classification and location files (optional)
___ first and last catalog records (number/dates)
___ backup copy of ANCS+ data stored off-site

___ Registration and catalog data in ANCS+
___ all mandatory data complete and accurate
___ classifications correct
___ descriptions sufficiently detailed
___ condition indicated and current
___ locations current
___ values current and updated periodically

__ ANCS+
___ percent of collection in ANCS+
___ type of equipment

___ Retrievability of objects and information
___ objects marked with catalog numbers correctly
___ acronyms used
___ NH labels

___ Cataloging backlog
___ number and type of objects (available on CMR)

___ Catalog folders or ANCS+ supplemental records
___ condition reports
___ object treatment requests and reports
___ appraisals
___ research information
___ restrictions
___ routine maintenance
___ location, status, and catalog history

___ Inventory records
___ 100% inventory, if applicable

___ Automated Inventory Program
    ___ Random Sample Inventory
    ___ Controlled Property Inventory
    ___ Accessions Inventory

___ Missing objects
    ___ Report of Survey (DI-103)

___ Collections Management Report

___ Accurate

___ Center records included

___ Non-NPS repository records included

___ Loans included and accurate

___ Loan records

___ Incoming (number, location, and renewal)

___ Outgoing (number, location, and renewal)

___ Loan agreements

___ Loan folders and files

___ Loan tracking

___ Deaccessions

___ Number and type

___ Disposition documents

___ Photographs

___ Object photos
    ___ room/exhibit installation photos
    ___ record photos
    ___ digital photos in ANCS+

IV. ARCHIVAL AND MANUSCRIPT COLLECTIONS

___ Archival collecting history

___ Synopsis should include:

___ When and why archival and manuscript collecting began

___ The focus (thematic, temporal, and geographic) of early archival collecting

___ Names and titles of major records/archival manuscript collection creators/collectors

___ The history of records management in the park, if known

___ An abstract of the park archival and manuscript collections at the repository level, including:
- ___ number of separate archival/manuscript collections
- ___ number of collections with finding aids
- ___ number of collections cataloged at the archival collection level in ANCS+
- ___ inclusive dates of total archival holdings
- ___ volume of total archival holdings
- ___ major types and estimates of quantities of materials included (e.g., photographs, architectural drawings, sound and video recordings, maps, electronic media, and manuscripts)
- ___ brief description of any exceptionally significant groups of materials
- ___ major gaps in archival collections, if known (e.g., nothing on a particular era, theme, region, group, or entire categories of records, for example, diaries, maps, or photos)
- ___ identification of the various buildings and spaces containing archival materials
- ___ determination of whether an Archival Assessment has been done (all archival and manuscript collections and park records have been surveyed and described at the collection level with recommendations)
- ___ attached copy of any archival assessment or other collection-level survey of park records and manuscripts

___ Records management

___ Does the park have the following:
- ___ a clear file plan
- ___ trained records management staff
- ___ all official records located and labeled with clear disposition plan (to NARA) and cut-off dates
- ___ all inactive non-official records located, compared to the SOCS, and materials for the museum collections transferred and cataloged or disposed of appropriately

___ Procedures

___ Archival processing plan indicating:
- ___ prioritized lists of collections for arrangement, description, preservation, reformatting, and finding aid work
- ___ documentation on major collection risks (preservation, legal, and theft/vandalism)
- ___ definition of resource (staffing, supply, and funding) needs
- ___ staff training needs
- ___ archival storage, work, and reference room improvements necessary
- ___ steps necessary to achieve better access to collections

___ Processing guidance including standard operating procedures for:
- ___ archival collection preservation

___ archival handling
___ archival rehousing and storage
___ archival reformatting and/or treatment
___ archival description and cataloging (including ANCS+ cataloging and description in Collections Management and Archives Module):
    ___ descriptive rules (archives, personal papers, and manuscripts),
    ___ descriptive format (MARC format)
    ___ vocabularies (Library of Congress Subject Headings and AAT)
    ___ personal and corporate names (Library of Congress name authorities)
___ finding aid and guide creation, indexing, and production procedures
___ procedures for mounting finding aids on Web
___ procedures for sending guides and finding aids to National Union Catalog of Manuscript Collections (NUCMC).
___ archival arrangement, including
    ___ preparatory research work
    ___ identification of provenance and original order,
    ___ identification of restrictions
    ___ how to identify and arrange series
    ___ how to identify and arrange file units
    ___ when and how to weed
    ___ how to resolve problems

___ A collections documentation strategy identifying any gaps in collections and indicating how they will be filled

___ Access and use

___ Catalog records at the archival collection-level in ANCS+ Collections Management System
___ Collections processed (arranged and described) by a professional archivist
___ Major collections cataloged within the ANCS+ Archives Module at the series and/or file unit and/or item-level.
___ Item level records linked to an appropriate collection-level record in the ANCS+ Collections Management System
___ Indexed finding aids for each archival or manuscript collection in the park
___ Master guide to all collections with a single index to names, subjects, and formats (document types)
___ Entries in the NUCMC on park collections

___ Equipment

___ On-site freezer, or off-site storage for nitrate film
___ Book trucks to transfer materials to research room

V. MUSEUM SECURITY (Use Survey Checklist) See Chapter 9:"Security and Fire Protection" and Appendix G: "Museum Collections Protection."

___ Procedures

___ Risk assessments

___ Physical and electronic security

___ Fire prevention, detection, and suppression

___ Emergency management, planning, and response

VI. MUSEUM ENVIRONMENT

___ Temperature and relative humidity

- ___ Local climate
  - ___ mean/extreme temperature and RH
  - ___ frost season
  - ___ annual precipitation
- ___ Measurements
  - ___ room-by-room
  - ___ outside
  - ___ past logs/charts and analyses
- ___ Equipment
  - ___ psychrometer (sling/aspirating)
  - ___ hygrothermographs
  - ___ dial thermohygrometers
  - ___ dataloggers
  - ___ calibration frequency
- ___ Climate control
  - ___ HVAC system (type and location of air handlers, vents)
  - ___ portable humidifiers and dehumidifiers (location and number)

___ Light

- ___ Measurements (seasonal)
  - ___ ultraviolet
  - ___ visible
- ___ Light sources
  - ___ natural (doors, windows)
  - ___ artificial (fluorescent, incandescent)
- ___ Protection
  - ___ UV-filtering film on windows
  - ___ UV sleeves on fluorescent lights
  - ___ curtains, shades, shutters

___ Dust and air pollution

___ Local air pollution levels
    ___ monitoring in park (by EPA or other agency)

___ Source of dust air pollution
    ___ highways
    ___ industry
    ___ unexcavated basement
    ___ asbestos containing materials in building
    ___ visitors

___ Air filtration/purification system
    ___ HEPA filter
    ___ activated charcoal filters
    ___ portable air purifiers

___ Protective measures
    ___ entrance mats
    ___ weather-stripping

___ Biological infestation

___ Past infestation
    ___ pests identified (insects, birds and mammals, mold)
    ___ action taken
    ___ damage to collection
    ___ evidence of current infestation (frass and droppings, tunnels and holes, nests, mold)
    ___ staging area and freezer for dealing with infested materials

___ Park IPM Program
    ___ park IPM Coordinator involvement with museum collections
    ___ monitoring program
    ___ periodic inspections
    ___ written log and analyses

___ Potential attraction and harborage sites
    ___ kitchen (food storage)
    ___ appliances
    ___ plumbing/water source
    ___ cracks and gaps
    ___ trash removal (overnight)

___ Pesticides
    ___ unauthorized use of any pesticide
    ___ potential hazards from past pesticide use

___ Hazardous materials and response

___ Labeled hazards
    ___ cellulose nitrate film
    ___ collections with pesticide residues
    ___ firearms, armaments, edged weapons, ammunition
    ___ medical, dental, veterinary equipment
    ___ heavy metals in textiles
    ___ hazardous rocks/fossils
    ___ radiation

___ toxic materials used in construction of objects
___ asbestos
___ flammable supplies
___ moldy materials
___ pest residues

___ Safety equipment
___ rated breathing apparatus, for mold, hantavirus and asbestos fitted to staff who need them
___ smocks, neoprene gloves, goggles

VII. STORAGE

___ Existing storage condition

___ Location of storage
___ hazardous location (fault line, cliff, near water, near highway)
___ attic
___ basement
___ water pipes/roof leaks/open water source overhead/storm drain in or above space
___ available space (square footage)
___ 10 year expansion needs
___ additional space needed for current collection (compactor system, superinsulated building)
___ load limitations
___ space utilization (aisle widths, cabinet arrangement)
___ multiple building use
___ off-site storage
___ collections split, consider all locations

___ Dedicated storage
___ non-museum items or functions that don't belong in collections storage
___ restricted access

___ Exclusively curatorial functions
___ percent of collection in storage
___ type of museum objects
___ organization of storage (by material, provenience or object type)
___ range in size of objects stored

___ Storage equipment
___ number of cabinets/shelves
___ type of cabinets/shelves
___ standard/double specimen cabinets
___ wardrobe/jumbo GL-C cabinets
___ visual storage cabinets
___ entomology cabinets
___ herbarium cabinets
___ map cabinets
___ security gun vaults
___ art storage racks
___ mobile shelving-either bakers rack or installed
___ fire-insulated file cabinets
___ steel shelving
___ equipment needed
___ condition of cabinet gaskets seals
___ cabinet locks

___ Storage methods
- ___ stored correctly using proper equipment
- ___ elevated off floor >4"
- ___ polyethylene drawer liners/shelf pads
- ___ polyethylene foam cavity packing
- ___ stacking/crowding
- ___ dust covers made of stable materials, where appropriate
- ___ labels

___ Curatorial workspace
- ___ separate from storage area
- ___ examining table
- ___ other equipment
- ___ no food or open water sources

___ Research room
- ___ separate from storage and curatorial work areas
- ___ totally and easily visible from the curatorial work space
- ___ lockers or coat rack and storage space nearby
- ___ ANCS+ terminal available
- ___ adequate space
- ___ good lighting at low levels using incandescent spot lights
- ___ stable environment similar to storage space
- ___ continuous staff supervision during operation

___ Off-site storage
- ___ leased space for park collections
- ___ regional NPS repositories
- ___ non-NPS repositories (documented loans)
- ___ cellulose nitrate and cellulose ester cold storage

___ Condition of objects, archival and manuscript materials and specimens in storage

___ Collection Condition Survey needed

___ Storage materials
- ___ inert, archival quality
- ___ acid-free, buffered or unbuffered
- ___ cabinets vs. shelves
- ___ specimen trays
- ___ padding

___ Periodic inspection for deterioration
- ___ frequency
- ___ evidence of deterioration
- ___ conservation treatment needed
- ___ reformatting and retirement or treatment of original

___ Proper storage to maintain condition
- ___ archeological bulk collections
- ___ baskets
- ___ books
- ___ ceramics and glass
- ___ costumes
- ___ electronic records

___ entomology specimens
___ firearms
___ fossils
___ freeze-dried/taxidermy specimens
___ furniture
___ herbarium specimens
___ manuscripts and archival textual materials
___ magnetic media
___ maps
___ metals
___ motion picture film
___ paintings and framed graphics
___ phonograph records
___ photographic images
___ skins
___ textiles
___ unframed graphics
___ wagons, carriages, canoes
___ wet specimens
___ other

VIII. EXHIBITS

___ Evaluation of collection use in exhibits

___ Existing exhibit conditions

- ___ Locations
  - ___ visitor center
  - ___ other exhibits
- ___ Furnished historic structures
  - ___ approved historic furnishing report
  - ___ tour arrangements (average group size, guided/self-guided)
  - ___ placement of objects away from vents/light and potential handling/touching
- ___ Exhibit cases and construction
  - ___ UV glass or Plexiglas
  - ___ UV shields on lights
  - ___ inert materials
  - ___ curatorial access
  - ___ security (tamper-free)
  - ___ air tight (gasket seals)
  - ___ object mounts
- ___ Exhibit lighting
  - ___ low-voltage, cool lights (see also Museum and Archival Environment)
- ___ Exhibit maintenance manual
- ___ Rehabilitation needed

___ Condition of objects on exhibit

- ___ Collection Condition Survey needed

___ Neutral barriers between objects of dissimilar materials (Mylar, acid-free matboard)

___ Neutral barriers between objects and audience

___ Park procedures limiting smoking, eating, and receptions in exhibit spaces

___ Evidence of deterioration
- ___ conservation treatment needed
- ___ weekly/daily inspections
- ___ objects that should not be exhibited

___ Exhibit maintenance
- ___ manuscripts and books (rotated/turned - copies used where possible)
- ___ textiles and costumes (refolded/rotated)
- ___ wood furniture (waxed)
- ___ silver (polished or lacquered)
- ___ iron and steel (microcrystalline wax)
- ___ other

___ Reproductions
- ___ cataloged
- ___ substituted for fragile original in exhibits and for reference

___ Objects accessible for visitors to touch
- ___ consumptive use approved

IX. HOUSEKEEPING AND CYCLIC MAINTENANCE

___ Existing conditions

___ Dust

___ Clutter

___ Written housekeeping manual

___ Cleaning methods

___ Cleaning materials

___ Schedule (documented in ANCS+ Maintenance Module)

___ Equipment

___ Vacuums (HEPA, backpack, portable)

___ Other equipment and supplies

___ Proper handling of museum and archival objects

___ Cyclic preventive building maintenance

___ Maintenance Management System (Facility Management Software system, effective FY2000)

___ Personnel

- ___ Maintenance staff (supervisor)
- ___ Curatorial staff
- ___ Training in curatorial housekeeping

___ Storage of cleaning supplies and equipment

X. ACCESS AND USE

___ Procedures for evaluating museum collections use

- ___ Forms
  - ___ access procedures and rules governing use statement
  - ___ researcher registration form
  - ___ copyright and privacy restrictions statement
  - ___ researcher duplication form
  - ___ researcher log
  - ___ Checklist: Evaluating a Request to Use Museum Objects
- ___ Standard operating procedures
  - ___ access procedures
  - ___ research and reference standard operating procedures
  - ___ handling procedures
  - ___ monitoring research space
  - ___ duplicating and reformatting

___ Research space

- ___ Conditions
  - ___ dedicated space
  - ___ security
  - ___ adequate space
  - ___ location adjacent to work and storage space
  - ___ adequate equipment and utilities
  - ___ disabled access

___ Restrictions and legal issues

- ___ Restrictions
  - ___ donor
  - ___ sensitive data
- ___ Legal issues and compliance
  - ___ copyright
  - ___ privacy and publicity
  - ___ Archaeological Resources Protection Act
  - ___ National Historic Preservation Act
  - ___ Endangered Species Act
  - ___ Public Law 105-391, Title II-National Park System Resource Inventory and Management
  - ___ Freedom of Information Act
  - ___ Native American Graves Protection and Repatriation Act

___ Publications

- ___ Forms
  - ___ intellectual property permission request
  - ___ assignment of copyright by contractor
  - ___ cooperative publishing agreement
  - ___ model release form
  - ___ Memorandum of Agreement or contract with publisher
- ___ Standard operating procedures
  - ___ publication project checklist
  - ___ digital publications project checklist
  - ___ Museum Management Program editing checklist

___ Reproductions

- ___ Forms
  - ___ reproduction order notification sheet
  - ___ permission to publish
  - ___ agreements and contracts for reproductions
  - ___ standard operating procedures for 2-D and 3-D reproductions

___ Special uses

- ___ Forms
  - ___ special use permit
  - ___ hold harmless or liability clause to be included in a special use permit
  - ___ conditions included in special use permit for spaces housing museum collections
- ___ Procedures
  - ___ filming and photography in spaces housing museum collections
  - ___ special events in exhibit spaces
  - ___ keeping objects in working order
  - ___ museum objects used in performance, sound production or demonstration
  - ___ museum objects used in educational and interpretive programs

___ Research

- ___ Staff knowledge of library research techniques
  - ___ basic research
  - ___ special sources on archives
  - ___ special sources on museum objects
- ___ Staff knowledge of museum research techniques
- ___ Staff knowledge of archival research techniques
- ___ Staff knowledge of Web searching techniques
- ___ Staff knowledge of how to interview potential researchers

X. STAFFING

___ Archives Technician (1421 series)
___ Archivist (1420 series)
___ Curator (1015 series)

___ Museum and Archival Aid
___ Museum Technician (1016 series)
___ Park Ranger with collateral duty
___ Supervisor/park division (Interpretation/Resource Management)
___ Registrar (1001)
___ VIPs and student interns

___ Training and experience of incumbent(s)
    ___ Training needs
    ___ Basic curatorial training
    ___ Archives management knowledge including: arrangement, description, handling, rehousing, deterioration and preparation for treatment, reformatting, reference services and research, cataloging in ANCS+ (including descriptive standards), finding aid production, archival guide production, intellectual property rights (copyrights, privacy, and publicity) and restrictions issues
    ___ ANCS+ training
    ___ Conservation management including identifying deterioration and treatment needs, project planning, working with a conservator, contract requirements for survey, treatment and analysis, using the Conservation Module in ANCS+

___ Adequate positions for workload

XII. PLANNING, PROGRAMMING, AND FUNDING

___ Park planning documents include collections

    ___ General Management Plan (GMP)

    ___ Park Strategic Plan

    ___ Annual Performance Plan

    ___ Resources Management Plan (RMP)

___ Funding sources

    ___ Backlog Cataloging (BACAT)

    ___ Cooperating associations

    ___ Cultural Cyclic Maintenance Funds

    ___ Cultural Resources Preservation Program (CRPP)

    ___ Museum Collections Preservation and Protection (MCPP) Program

    ___ ONPS (base funding)

    ___ Recreational Fee Demonstration Program

    ___ other

D. NPS Collection Management Plan Team Reference Document Checklist

The checklist in this section provides a list of park related documents (e.g., legislation, park-specific plans, general park information, park museum operational procedures, curatorial budget, curatorial position descriptions and performance standards) that the team members will need to review and evaluate. Some of these documents (for example, Scope of Collection Statement, General Management Plan, Park Strategic Plan, Annual Performance Plan, Resources Management Plan, NPS Checklist for Preservation and Protection of Museum Collections, Collections Management Reports) may be requested before the team's site visit.

NATIONAL PARK SERVICE
COLLECTION MANAGEMENT PLAN TEAM REFERENCE DOCUMENT CHECKLIST

Legislation

___ Enabling legislation, presidential proclamation, or executive order
___ Subsequent legislation
___ Congressional background reports
___ Other:

General Information

___ Brochure(s)
___ Handbook
___ Other:

General Park Plans

___ General Management Plan
___ Strategic Plan
___ Annual Performance Plan
___ Resources Management Plan (Cultural and Natural - including project statements related to collections and facilities housing them)

Plans and Documentation Specific to Museum Collections

___ Scope of Collection Statement
___ Collection Management Plan
___ Annual Inventory of Museum Property
___ Exhibit Plan(s) (including list of objects)
___ Historic Furnishings Report(s)
___ Collection Condition Survey(s)
___ Collection Storage Plan
___ Collections Management Report (Form 10-94)
___ Checklist for Preservation and Protection of Museum Collections

Other Pertinent Resource Management Plans

___ Historic Resource Study
___ Historic Structure Report(s)
___ Inventory and Condition Assessment Program (ICAP)
___ Ethnographic plans
___ Archeological plans

Park Museum Collection Management Procedures

___ Procedures for access and use of museum collection
___ Opening and closing procedures for museum exhibit and storage spaces
___ Housekeeping plans/schedules
___ Park's Emergency Operation Plan (including Structural Fire, Physical Security, Disaster/Emergency Plans)

___ Integrated Pest Management Plan
___ Building/facility cyclical maintenance manuals/schedules

Other Park Procedures and Documents Relevant to Collection Management

___ Construction drawings or blue prints for buildings housing museum collection (visitor centers, storage rooms, furnished historic structures, etc.)
___ Basic operating plan
___ Staffing/organization chart
___ Position description(s) for staff assigned curatorial responsibilities
___ Performance standards for staff assigned curatorial responsibilities and supervisor
___ Current budget
___ Cooperative agreements
___ Project Management Information System (PMIS) Statements
___ Current permits (36 CFR 2.5g), if expected to generate specimens for the museum collection
___ Performance Management Data System (PMDS) entries for collections-related Strategic Plan goals (Ia6, Ib2D, others)

E. List of Figures

Cost Estimates (2005)

NOTE: $/SF = costs per square foot

Administrative Offices (For costs, see appropriate categories below.)

Museum Collections Storage **Dollars**

Museum Facility

- Renovating an existing facility 68-113/SF
- Constructing a new facility (DSC designed and coordinated project, does not include site preparation) 248-363/SF
- Insulated Modular Structures (IMS) - recommended only for use inside an existing structure. (See *COG*s 4/7 and 4/8). Costs range from small structures without HVAC, security, and fire protection systems that are assembled by unit staff to large structures with HVAC, security, and fire protection systems that are assembled by a contractor. 60-145/SF
- IMS within an enclosing wood frame or masonry structure built specifically to accommodate the IMS. The cost includes climate control, security and fire protection systems. 106-220/SF
- Park-built structures, including climate control, security and fire protection systems 100-175/SF
- Contractor-built structures, including climate control, security and fire protection systems. 100-200/SF

NOTE: Construction costs vary with the type, size, and configuration of the structure; the locality (costs in Alaska could double those cited); the difficulties of site preparation; and the complexity of the HVAC, security, and fire protection systems. Costs for systems range from $4-15/SF for fire detection/suppression systems, $4-6/SF for intrusion detection systems, and $22-44/SF for HVAC systems. The cost for architectural and engineering planning such as facility preliminary design (Title I) and design and specifications (Title II) may be absorbed in the overall cost of the building (if contractor or park designed and constructed), cost up to $20/SF if obtained separately, or be 17% of the overall project cost if DSC designed and constructed.

Equipment and Supplies

- Retrofit gasket kit 40
- Sash lock 12
- Standard museum cabinet w/10 drawers 775-1,410
- Doublewide museum cabinet w/10 drawers 1,315-1,984
- Wardrobe cabinet w/specialized storage interiors (depends on interior) 1,700-3,300
- Herbarium cabinet, counter height (12 compartments) 567
- Herbarium cabinet, full height (26 compartments) 765
- Entomology cabinet, counter height (15 drawer openings) 680
- Entomology cabinet, full height (24 drawer openings) 1,185-2356
- Cornell drawers for entomology cabinets 41
- Security gun vault with acrylic museum assemblies 2,000
- High density moveable-aisle storage systems 125/SF
- Slotted metal angle for constructing large shelving units (bundles of 10 – 12' angle pieces with 75 nuts and bolts) (2 bundles are needed for unit of 3 shelves measuring 4' x 8'; 3 bundles are needed for unit of 5 shelves measuring 4' x 8') 160/Bundle
- 5/8" – 3/4" plywood sheets for shelving 40/Sheet

Figure F.1. Cost Estimates (2005)

Dollars

- Steel shelving units 250/unit
- Map cabinet 5-drawer unit (need 2 units for counter height) 760
- Map cabinet base units 250
- Sanitary platform for standard museum cabinet 68
- Sanitary platform for doublewide museum cabinet 87
- Sanitary platform for wardrobe cabinet 128
- Safety stacking rim for standard cabinet 35
- Lumber, plywood and paint to construct wooden platform (labor not included) for
  - Standard museum cabinet 45
  - Doublewide and wardrobe cabinet 55
- Flammable liquid cabinet (various sizes) 200-700
- GSA utility cabinet for forms and museum supplies 240
- Costs for polyethylene foam, specimen trays and specialized containers as listed in NPS *Tools of the Trade* vary greatly. Call vendors listed in *Tools of the Trade* for current prices. Units may order modest quantities of these materials through the Museum Supply and Equipment Program, Museum Management Program.

NOTE: The costs for equipment do not include shipping. Shipping costs can be as high as 1/3 of the cost of the equipment when shipped in the contiguous United States, higher when shipped to Alaska, Hawaii, Guam and other locations outside the continental United States.

Museum Exhibit

Equipment and Supplies

- Replacing an exhibit case
  - Table top or pedestal exhibit case 2,800-11,000
  - Walk-in-style exhibit case 11,000-33,000
- Retrofitting existing exhibit case
  - Retrofit of exhibit case, e.g., surfaces/paints, graphics/furniture replacement 2,200-5,500
  - Retrofit of exhibit case structure, e.g., physical security, lighting component 3,000-11,000
  - Retrofit of object mount, e.g., single mount, garment manikin 550-3,300

NOTE: Exhibit replacement and retrofitting costs vary with the size and complexity of the exhibit case. Factors affecting cost include whether or not there is a need for specialized humidity control, lighting, security and museum mount features; the availability of specialized contractors; and the proximity of contractors to the park.

Museum Environment

Museum Facility

HVAC System 24-46/SF

Equipment and Supplies

- Hygrothermograph 625
- Datalogger (temperature and RH recording) 55-565
- Remote probe for datalogger (for use in exhibit cases) 200
- Datalogger computer software for setting up instruments and analyzing data 95-140

Figure F.1. Cost Estimates (2005) (continued)

Dollars

- Electronic thermohygrometer (depending on brand and style) 325-1,000
- Sling psychrometer 25-125
- Aspirated psychrometer 423
- Hygrometer 30-100
- Portable dehumidifier (refrigerant type) 300
- Portable dehumidifier (desiccant type) 1,000
- Humidifier 300
- Portable air purifier with HEPA and activated carbon filters 450
- Visible light meter 150
- UV (ultraviolet radiation) meter 1,500
- Vacuum cleaner (HEPA) 600-1,100
- UV fluorescent filtering sleeves 7
- UV filtering acrylic (Plexiglas®, OP-2®, or similar)
  - 8" x 10" sheet 10
  - 20" x 24" sheet 45
  - 4' x 8' x 1/4" sheet 300
- UV filtering film professionally installed on windows 10/SF

Security

Museum Facility

Intrusion detection system (approximate minimum $2,000) 5-7/SF

Equipment and Supplies

- Recoring locks (contact locksmith or maintenance staff for costs)
- Locking key boxes 40-60
- Metal or solid core doors 275-450
- Deadbolt locks 50

Fire Protection

Museum Facility

- Fire detection system 5-7/SF
- Fire suppression system
  - Wet pipe system (includes smoke or heat detection system) 10-15/SF
  - Dry pipe system (includes smoke or heat detection system) 12-16/SF

NOTE: Costs increase if the system requires the installation of a new dedicated National Fire Protection Association (NFPA) approved 4" or 6" water line or if there is a need for a water storage reservoir. Specific estimated costs for installation of water line and storage reservoir include:

- Pipe installation 43/LF
- Backflow preventer 12,650
- Gate valve 1,330-2,100
- Water meter and box 11,400
- Connection to existing line 2,900
- 10,000 gallon steel on-grade storage reservoir 40,250
  (Prices vary with capacity and type of construction.)

Figure F.1. Cost Estimates (2005) (continued)

Dollars

Equipment and Supplies

- ABC fire extinguisher (20 pound unit) 70
- ABC fire extinguisher (10 pound unit) 50
- Flammable liquid cabinet (various sizes) 200-700
- Four-drawer insulated file cabinet 840
- Media vault 245
- Media safe (various sizes) 3,000-16,000

Professional Assistance and Museum Planning

- Assistance with establishing optimum relative humidity and temperature levels 3,500-6,000
- Security Survey 9,000-12,000
- Fire Protection Survey 9,000-12,000
- Collection Management Plan 12,000-25,000
- Collection Condition Survey 10,000-20,000
- Collection Storage Plan 7,000-13,000
- Integrated Pest Management Plan 10,000-15,000
- Housekeeping Plan 10,000-15,000

CHECKLIST 3

A. ADMINISTRATIVE OFFICES

Are framed artwork or other museum objects (e.g., furniture) on display in one or more administrative offices of the unit? YES___ NO___
If the response is YES, complete this section of the checklist.

Operations (Procedural):

1. Issuing keys to office spaces housing museum objects is strictly controlled by the use of a signed hand receipt. YES___ NO___

2. Opening and closing procedures are written, approved, and practiced. YES___ NO___

3. If time allows in a pending disaster (e.g., storm, flood, fire), there are instructions that provide guidance for the prioritized safe and secure evacuation of artwork. YES___ NO___

4. Smoking is prohibited in offices housing museum objects. YES___ NO___

5. Levels of relative humidity and temperature are monitored and recorded. YES___ NO___

6. The placement of artwork is away from heating and air-conditioning vents. YES___ NO___

7. The visible spectrum of light is monitored for illuminance level and duration, is controlled, and meets the standards outlined in the NPS *Museum Handbook*, Part I (Sep 90). YES___ NO___

8. The placement of artwork is such that outside light does not directly fall on object(s). YES___ NO___

9. Handling and dusting of museum property is performed only by staff who have received appropriate training. YES___ NO___

10. Three-dimensional materials are displayed in areas that minimize accidental damage. (If there are no three-dimensional materials on display, respond NA indicating not applicable.) YES___ NO___ NA___

Equipment and Supplies:

11. Ultraviolet (UV) radiation is controlled by a filtering material that has UV absorbing properties. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST _____ (Park/Center Acronym) 4

12. Artwork is properly framed and is securely hung on the wall. YES___ NO___

Deficiency: Cost: $_____

Professional Assistance and Museum Planning:

13. Through a Collection Condition Survey (CCS), conservators have provided the unit a condition assessment of artwork and other museum property in administrative offices and guidance on setting priorities for care and conservation treatment. YES___ NO___

Deficiency: Cost: $_____

B. MUSEUM COLLECTIONS STORAGE

Are museum collections stored in a facility located within the unit? YES___ NO___
If the response is YES, complete this section of the checklist.

Museum Facility:

1. The museum storage area is used solely for storage of museum objects. YES___ NO___

Deficiency: Cost: $_____

2. The curatorial office and research/reference and work areas are separated from the museum collections storage space. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
5

3. Flammable liquids and materials, audiovisual equipment and other interpretive materials, and curatorial forms and supplies are stored outside the museum storage space in an appropriate cabinet. YES___ NO___

Deficiency: Cost: $_____

4. The space is outside the 100-year floodplain. YES___ NO___

Deficiency: Cost: $_____

5. The space is in an area that will not flood if pipes break, or drains back up. YES___ NO___

Deficiency: Cost: $_____

6. The space is appropriately insulated to help maintain environmental conditions. YES___ NO___

Deficiency: Cost: $_____

7. If space has windows, they are blocked (e.g., covered with plywood sheets) and insulated. (If space has no windows, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
6

8. Space has as few doors as possible to enhance security and environmental control, but has enough to meet requirements for employee safety. YES___ NO___

   Deficiency: Cost: $_____

9. Space is as free of water, steam, drain, and fuel pipes as is practical. YES___ NO___

   Deficiency: Cost: $_____

10. Space is free of water, gas, or electric meters, electrical panels, and utility valves that require monitoring and servicing by non-curatorial personnel. YES___ NO___

    Deficiency: Cost: $_____

11. Space is sufficient for the movement of staff, equipment, and objects in and out without hindrances (e.g., low ceilings; inadequately sized doors; or narrow, winding, or steep stairways). YES___ NO___

    Deficiency: Cost: $_____

12. Space is large enough to accommodate the current museum collection and any anticipated growth. YES___ NO___

    Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
7

13. Space is organized in a way that allows for easy access to museum objects and use of proper storage equipment. YES___ NO___

Deficiency: Cost: $_____

Equipment and Supplies:

14. Sufficient equipment (e.g., quantities, sizes, and appropriateness of cabinets, shelving units, and specialized racks) is used to store and contain museum objects without crowding. YES___ NO___

Deficiency: Cost: $_____

15. Museum storage cabinets are in good condition (e.g., are free of rust, have gaskets intact to provide good sealing action, have smoothly operating doors) and have working, keyed or combination lock mechanisms. YES___ NO___

Deficiency: Cost: $_____

16. Museum cabinet drawers are not loaded beyond the manufacturer's recommended weight capacity. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
8

17. Museum cabinets are stacked no more than two high. YES___ NO___

Deficiency: Cost: $_____

18. Open shelving is free of burrs, splinters, exposed nails, screws, and bolts that can damage museum objects. YES___ NO___

Deficiency: Cost: $_____

19. Museum objects that are stacked are protected by appropriate containers or cushioning materials. YES___ NO___

Deficiency: Cost: $_____

20. Museum cabinets are raised off the floor at least 4″ (preferably 6″) as a precaution against potential flooding and to facilitate cleaning of floors and inspection for pest problems. Bottom shelves of shelving units are raised off the floor 4″ to 6″. YES___ NO___

Deficiency: Cost: $_____

21. Open shelving is stabilized to prevent it from tipping over. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
9

22. The unit is in an earthquake zone. YES___ NO___

23. Restraining bars or cords are attached to edges of shelves to prevent objects from falling off shelves during an earthquake. (If your response to item 22 is NO, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

24. Closed cell polyethylene foam is used in museum cabinet drawers and on shelving to cushion objects. (Exception: If natural history specimens are to be used for analysis of organic chemicals, do not use any kind of plastic in storage containers.) YES___ NO___

Deficiency: Cost: $_____

25. Objects in museum cabinets are placed in specimen trays, padded or otherwise prevented from shifting when drawers are opened and closed. YES___ NO___

Deficiency: Cost: $_____

26. Museum objects and archival materials are housed in storage containers or on mounts (e.g., boxes, folders, envelopes, herbarium paper) that are made of museum/archival quality materials. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
10

27. Natural history specimens stored in fluids are housed in a space that provides appropriate ventilation. (If there are no specimens stored in fluids, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

28. Natural history specimens stored in fluids are housed separately from dry specimen collections. (If there are no specimens stored in fluids, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

29. Nitrate film is housed in buffered sleeves or envelopes, placed in Ziplock™ polyethylene bags, and stored in appropriate frost-free freezers in separate space from all other collections. (If there is no nitrate film, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

30. Spaces and/or cabinets housing specimens stored in fluids, specimens treated with pesticides, rocks/minerals/fossils that are radioactive, or nitrate film are identified by appropriate health/safety sign. (If there are none of these materials, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

CHECKLIST

_____
(Park/Center Acronym)
11

C. EXHIBITS

Are museum collections exhibited in a facility located within the unit? YES___ NO___
If the response is YES, complete this section of the checklist.

Operations (Procedural):

1. Exhibit plans and historic furnishings reports are reviewed by curatorial staff to ensure that preservation, protection, and maintenance needs of museum objects are adequately addressed. YES___ NO___

   Deficiency:

Museum Facility:

2. The space is outside the 100-year floodplain. YES___ NO___

   Deficiency: Cost: $_____

3. The space is in an area that will not flood if pipes break, or drains back up. YES___ NO___

   Deficiency: Cost: $_____

Equipment and Supplies:

4. Exhibit cases are designed and fabricated in a manner that ensures the security and preservation of museum property (e.g., uses tamper-resistant screws; minimizes heat build up; controls light, relative humidity, dust levels; and prevents access by insects). (If there are no exhibit cases, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

5. Exhibit cases are designed and fabricated in a manner that facilitates maintenance (i.e., ease of access for inspection, inventory, cleaning, rotation of sensitive materials). (If there are no exhibit cases, respond NA Indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

6. Where needed, mounts constructed of museum quality material are used to support objects and specimens. (If there are no mounts, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

7. Freestanding museum objects on exhibit are protected by physical barriers, alarm detection systems, or staff on duty. (If there are no freestanding objects, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

D. MUSEUM ENVIRONMENT

Operations (Procedural):

1. Levels of relative humidity and temperature in storage and exhibit spaces are monitored on a daily basis to provide an accurate and complete picture of all changes in both of these environmental factors during each year. (If response is NO and unit does not have monitoring equipment, include equipment purchase cost in item 11.) YES___ NO___

   Deficiency:

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST		_____ (Park/Center Acronym) 13
2.	A record of daily observations, noting occurrences such as unusual exterior climatic conditions, leaky roof, re-calibration of equipment, or an unusual visitation pattern, is maintained to help explain any variations in relative humidity and temperature readings. Deficiency:	YES___ NO___
3.	Records of relative humidity and temperature readings and of daily observations are permanently retained in the unit's curatorial files. Deficiency:	YES___ NO___
4.	Records of relative humidity and temperature readings and of daily observations are reviewed and analyzed monthly to determine relative humidity and temperature highs, lows, and means; and the frequency and extent of fluctuations. Deficiency:	YES___ NO___
5.	The visible spectrum of light is monitored and recorded for illuminance level and duration. (If response is NO and unit does not have a light meter, include purchase cost under item 11.) Deficiency:	YES___ NO___
6.	Levels of natural light (daylight) have been recorded quarterly for one year to establish seasonal variations. Deficiency:	YES___ NO___

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
14

7. The unit has a record of annual seasonal variations and periodically spot checks to ensure that levels do not exceed the upper limits for sensitive objects. YES___ NO___

   Deficiency:

8. UV filtering material is periodically monitored to ensure its continued effectiveness in meeting the standard in the NPS *Museum Handbook*, Part I (Sep 90), Chapter 4. (If there is no UV filtering material, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency:

9. Monitoring (inspections) for evidence of insect, mold, and rodent infestations is conducted on an ongoing basis with especially close inspection of museum objects on a monthly basis. YES___ NO___

   Deficiency:

10. The monitoring and control of pests is coordinated with the unit's Integrated Pest Management Program. YES___ NO___

    Deficiency:

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
15

Equipment and Supplies:

11. The unit has appropriate equipment (e.g., hygrothermograph, datalogger, visible light meter, UV monitor) to implement and maintain an ongoing environmental monitoring program. YES___ NO___

    Deficiency: Cost: $_____

12. The park has installed equipment/system in each space housing museum collections to control relative humidity and temperature. YES___ NO___

    Deficiency: Cost: $_____

13. The visible spectrum of light is controlled to meet the standard in NPS *Museum Handbook*, Part I (Sep 90), Chapter 4. YES___ NO___

    Deficiency: Cost: $_____

14. Ultraviolet (UV) radiation is controlled by a filtering material that has UV absorbing properties. YES___ NO___

    Deficiency: Cost: $_____

15. Dust covers are used on open shelving when objects are not otherwise protected from dust (e.g., in boxes). (If there is no open shelving, respond NA indicating not applicable.) YES___ NO___ NA___

    Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
16

16. Particulates (dust) in museum storage and exhibit spaces are controlled. YES___ NO___

Deficiency: Cost: $_____

E. SECURITY

Operations (Procedural):

1. Keys to museum storage spaces, exhibit cases, and work and research/ reference spaces are issued to only those employees having direct responsibility for the collections. YES___ NO___

Deficiency: Cost: $_____

2. Issuing of keys to museum storage spaces and exhibit cases is strictly controlled by the use of a signed hand receipt (e.g., DI-105 or equivalent form). YES___ NO___

Deficiency:

3. Written, approved procedures for controlling access to the museum collections by non-curatorial staff, outside researchers, and visitors are implemented. YES___ NO___

Deficiency:

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
17

4. All researchers, visitors, and non-curatorial staff who enter the storage area are escorted at all times by unit curatorial staff. (For exhibit spaces, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency:

5. A visitor/researcher sign-in log is used to record name and address of visitor, date of visit, time entered and time departed, and reason for visit. (For exhibit spaces, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency:

6. Opening and closing procedures for museum spaces are written, approved and practiced. YES___ NO___

   Deficiency:

7. Museum objects in exhibit spaces are given additional protection at times of high risk, such as during times of crowding or of special activities. (If there are no exhibits, respond NA indicating not applicable. For storage spaces, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency:

8. The special needs of museum collections and records are incorporated into the unit's Emergency Operation Plan (EOP). YES___ NO___

   Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
18

9. Installed intrusion detection systems are inspected and maintained on a regular schedule to ensure that they are fully operational. (If there are no intrusion detection systems, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency:

10. The unit has determined the extent to which museum collections and associated museum records are at risk from the threats listed in the NPS *Museum Handbook*, Part I (Sep 90), Chapters 9 and 10. YES___ NO___

Deficiency:

Museum Facility:

11. Entrances to museum spaces are equipped with metal or solid-core wood doors that have deadbolt locks. YES___ NO___

Deficiency: Cost: $_____

12. Intrusion detection systems appropriate to the risks involved and to the nature of the museum collection are installed and operable in museum storage and exhibit spaces. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST _____ (Park/Center Acronym) 19

Equipment and Supplies:

13. Small, highly sensitive and valuable museum objects, archival documents, and natural history type specimens housed in museum storage spaces are kept in locked cabinets with keyed or combination locks. (If there are none of these objects, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

14. Irreplaceable or particularly sensitive or valuable objects used in exhibits are protected in cases or by other means that provide protection from theft or vandalism, without making curatorial access impractical. (If there are none of these objects, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

F. FIRE PROTECTION

Operations (Procedural):

1. Fire detection and suppression systems are inspected and maintained on a regular schedule to ensure that they are fully operational. (If unit has no fire detection or suppression systems, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency:

2. Fire extinguishers are inspected annually to ensure that they are operational. YES___ NO___

Deficiency:

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

_____
(Park/Center Acronym)

CHECKLIST 20

3. Staff are trained in the use of fire extinguishers. YES___ NO___

   Deficiency:

4. Museum objects on top of shelving or museum cabinets do not obstruct the discharge heads for fire suppression systems and are not closer than 18" to the ceiling. (If there is no fire suppression system, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency:

5. The special needs of museum objects and museum records are incorporated in the unit's Structural Fire Plan. YES___ NO___

   Deficiency:

6. Orientation on the location, nature, significance, and specific needs of museum property has been provided to NPS and non-NPS fire fighting entities who are responsible for responding to the suppression of a fire. YES___ NO___

   Deficiency:

Museum Facility:

7. Spaces housing museum collections and their structural components (e.g., walls, floors, ceilings, doors and windows) are made fire-resistant to the extent possible, given the nature of the structure. YES___ NO___

   Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
21

8. Fire detection and suppression systems appropriate to the risks involved, to the nature of the museum collection, and to the structure housing the collections are installed and operable. YES___ NO___

Deficiency: Cost: $_____

Equipment and Supplies:

9. An appropriate number and type of fire extinguishers are installed according to the anticipated types of fires, the nature of the collection, and the size of the protected area. YES___ NO___

Deficiency: Cost: $_____

10. Flammable liquids and materials are housed outside museum storage spaces and, regardless of where stored, such materials are housed in approved flammables storage cabinets with proper ventilation. (For exhibit spaces, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

11. All paper museum records are kept in a locking, insulated safe, file, or vault with equivalent or better protection that will maintain an interior temperature of less than 350°F during a one-hour exposure to exterior temperatures of at least 1700°F. YES___ NO___

Deficiency: Cost: $_____

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
22

12. If the container described in item 11 is housed on a level of a building above grade, the container also is rated to withstand a drop of 30 feet. (If there is no container or if the container is housed below grade, respond NA indicating not applicable.) YES___ NO___ NA___

Deficiency: Cost: $_____

13. Magnetic media (floppy disks and tapes) that back up NPS Automated National Catalog System (ANCS) data files and other collection data files are stored in a container (e.g., media safes, media files, mixed media files, and media boxes) that will maintain an interior temperature of not more than 125°F during a one hour exposure to an exterior temperature of 1700°F. (**NOTE**: Media boxes are acceptable only when inserted in an appropriately rated insulated records file as described in item 11.) YES___ NO___

Deficiency: Cost: $_____

G. HOUSEKEEPING

Operations (Procedural):

1. Housekeeping in museum storage and exhibit spaces is performed according to a plan's established schedule. YES___ NO___

Deficiency:

2. Written rules and procedures are available to provide staff with guidance on the handling and moving of museum objects. YES___ NO___

Deficiency:

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST		_____ (Park/Center Acronym) 23
3.	Smoking, drinking, and eating and displaying living plants, fresh flowers, and foodstuffs in museum storage and exhibit spaces and in research, working, and research/reference spaces are prohibited in writing. Deficiency:	YES___ NO___
4.	Relative humidity and temperature monitoring equipment is calibrated quarterly. (If there is no monitoring equipment, respond NA indicating not applicable.) Deficiency:	YES___ NO___ NA___
5.	If a hygrothermograph is used to monitor relative humidity and temperature, it is regularly maintained (e.g., linkage is cleaned, ink is replenished). (If a hygrothermograph is not used, respond NA indicating not applicable.) Deficiency:	YES___ NO___ NA___
6.	The housekeeping plan for museum spaces is reviewed annually and is revised as necessary. (If there is no housekeeping plan, respond NA indicating not applicable.) Deficiency:	YES___ NO___ NA___

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

H. PROFESSIONAL ASSISTANCE AND MUSEUM PLANNING

1. Working with museum environment specialists, the unit has established optimum relative humidity and temperature levels and acceptable highs and lows based on data recorded from ongoing monitoring program. YES___ NO___

   Deficiency: Cost: $_____

2. The unit has conducted a security survey. (If the response is NO, and there is a need for this survey, complete the deficiency and cost blocks below. If there is no need for a security survey, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

3. The unit has conducted a fire protection survey. (If the response is NO, and there is a need for this survey, complete the deficiency and cost blocks. If there is no need for a fire protection survey, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

4. The needs of the museum collection are adequately addressed in project statements that are included in the unit's Resources Management Plan (RMP). YES___ NO___

   Deficiency:

Figure F.2. NPS Checklist for Preservation and Protection of Museum Collections (continued)

CHECKLIST

_____
(Park/Center Acronym)
25

5. The unit has an approved Collection Management Plan (CMP). YES___ NO___

   Deficiency: Cost: $_____

6. Through a Collection Condition Survey (CCS) or multiple surveys, conservators have provided the unit with an assessment of the condition of material specific objects on exhibit and in storage and have provided guidance on setting priorities for conservation treatment. YES___ NO___

   Deficiency: Cost: $_____

7. The unit has an approved Collection Storage Plan (CSP). (If the response is NO, and there is a special need for this plan, independent of a CMP, complete the deficiency and cost blocks. If there is no need for a Collection Storage Plan, respond NA indicating not applicable.) YES___ NO___ NA___

   Deficiency: Cost: $_____

8. An Integrated Pest Management Plan for all spaces housing museum collections has been written. YES___ NO___

   Deficiency: Cost: $_____

9. A housekeeping plan has been written for museum storage, exhibit, work, and research spaces. YES___ NO___

   Deficiency: Cost: $_____

APPENDIX G: PROTECTION OF NATIONAL PARK SERVICE MUSEUM COLLECTIONS

A. Overview

This appendix contains information that supports the guidance we provide in NPS *Museum Handbook*, Part I, Chapter 9, Museum Collections Security and Fire Protection and Chapter 10, Emergency Planning. In this appendix you will find:

- NPS standards for security and fire protection
- Definitions of security and fire protection terms
- Sample statements of work for security and fire protection surveys
- Sample standard operating procedures and agreements
- Mandates and requirements for emergency management

B. NPS Standards for Security and Fire Protection

1. *What general standards do I need to meet?*

- Identify all threats that may affect the museum collection and take steps to counter those threats.
- Ensure that the park's museum protection program applies to everyone on the staff.
- Implement a thorough and vigorously enforced fire prevention program in buildings housing museum collections and museum records.
- Ensure that systems for detecting and controlling access meet Underwriters Laboratories (UL) standards and systems for detecting and suppressing fires meet UL and National Fire Protection Association (NFPA) standards.
- Establish a process for evaluating plans for building and exhibit construction and rehabilitation to ensure that security and fire protection objectives will be met.

The NPS Checklist for Preservation and Protection of Museum Collections (1996) includes mandatory standards for museum security and fire protection. See *MH-I*, Appendix F: NPS Museum Collections Management Checklists, Section A for guidance.

2. *What security standards do I need to meet?*

- Issue keys to storage rooms and exhibit cases only to those employees who have a frequently (at least daily) recurring need for direct, unaccompanied access to collections.
- Control the issuing of keys strictly by using signed hand receipts (Form DI-105, "Receipt for Property" or its equivalent).

- Write and implement procedures for access to museum collections.
- Ensure that researchers or qualified visitors entering a space housing museum objects are accompanied at all times by someone on the park museum staff.
- Maintain a visitor log to record non-museum staff entries into museum storage and work areas.
- Write and implement opening and closing procedures for museum exhibit, storage, research and work spaces.
- Equip museum storage rooms with secure metal or solid-core wooden doors in substantial frames. Equip those doors with deadbolt locks and other appropriate security hardware, such as non-removable pin hinges.
- Install and maintain intrusion detection systems appropriate to the nature of the facility, the nature and value of the collection, and to the known threats.
- Ensure that intrusion detection systems are inspected and maintained on a regular schedule.
- House highly sensitive and valuable objects (such as firearms) in storage cabinets of an appropriate design with keyed or combination locks.
- Protect irreplaceable or particularly sensitive or valuable objects on exhibit by using appropriate mounts, cases, or security electronics (or some combination of the three) or by other means that will protect them from theft or vandalism without making curatorial access or visitor viewing impractical or difficult.
- Give museum objects, especially those on exhibit, additional protection at times of high risk, such as during special events or when exhibit galleries are particularly crowded, or when uniquely threatened, such as by terrorist threats or attack or during times of civil unrest.

3. *What fire protection standards do I need to meet?*

- Incorporate the needs of museum objects and museum records in the Structural Fire Plan.
- Keep all museum property records (paper and electronic) in appropriate locking fire-resistant filing cabinet, safe, or walk-in vault.
- Protect spaces housing museum collections by automatic fire detection and suppression systems appropriate to the risks involved, the nature of the collection, the nature of the fires that could occur in those spaces (including attention to fuel types and loading), the nature of the structure,and the capabilities and timeliness of responding forces.
- Protect spaces housing collections by appropriately rated, sized, and located portable fire extinguishers.

- Instruct designated park staff in proper techniques to prevent and suppress fires and in emergency evacuation and protection of people, structures, and collections.

- Ensure that storage shelves and cabinets and exhibit cases do not obstruct discharge of a suppression agent. Minimize potential damage to objects from agent discharge by ensuring that objects are in cabinets or under protective covers.

- Keep flammable solvents and supplies in museum work spaces only when kept in UL approved safety containers stored inside UL approved flammable storage cabinets. Never house flammable solvents and supplies in collection storage spaces.

- Prohibit smoking and open flames in collection storage, work, and exhibit areas.

- Store cellulose nitrate photographic negatives and motion picture film and other flammable or hazardous objects separately from the rest of the museum collection.

- Construct storage areas and, where possible, exhibit areas of fire-resistant materials.

C. Museum Security and Fire Protection Surveys

1. *What are the subjects that I need to address in a security survey?*

The outline below lists subjects that may be addressed during a protection survey.

- The Park or Facility
  - Name or other identifier
  - Function or purpose
  - Location (including proximity to other facilities and communities)
  - Physical nature of the facility and its surroundings
  - Climate
  - Staffing (including nature and size of staff, hours, seasonal variations)
  - Visitor access (including visitor use characteristics, numbers of visitors, hours, seasonal variations)
  - The law enforcement situation (including type of jurisdiction, reaction/response times)
  - Site loss history (including nature/impact of past criminal activity, nature/impact of other loss events, subsequent mitigating/preventive actions, current loss control policies, programs, procedures)

- Perimeter Security (External)
  - Perimeter barriers and access points: nature and effectiveness (including fences, natural barriers, clear zones, underground passages)
  - Cover (such as vegetation) for possible illegal activity
  - Lighting (including nature, location and areas of coverage, maintenance and testing, power supply, circuit, and switching reliability, tamper resistance, operation)
  - Access points (including controls such as gates, locks, and surveillance)
  - Patrols (including nature, frequency, and seasonal variations)
  - Intrusion detection system (including type of system, power supply, tamper resistance, signal transmission method(s) and supervision)
  - Inspection, testing, and maintenance, operating procedures and instructions, and monitoring of alarms
- The Structure Housing Museum Collections
  - Perimeter security (such as doors, windows, loading docks, walls, roofs, floors, basements, attics, and underground tunnels)
  - Interior security (such as connecting doors and pass-throughs, walls and interior windows, ceilings and spaces above them, floors and crawl spaces, duct work, storerooms, closets, utility rooms, vaults, storage cabinets, elevators and stairwells, and hiding places)
  - Locks and related hardware (including types, mounting, and cyclinders and keys)
  - Interior lighting (including security, emergency types, mounting, and cylinders and keys, lighting reliability)
  - Intrusion detection system (including detectors, controls, tamper resistance of wiring and components, alarm transmission methods and supervision, inspection, testing, and maintenance, operating procedures and instructions, monitoring of alarms)
  - Fire detection systems (including detectors, controls, power supply, tamper resistance of wiring and components, alarm transmission methods and supervision, inspection, testing, and maintenance, operating procedures and instructions, monitoring alarms)
  - Fire suppression systems (including appropriateness relative to threats, reliability, supervision, inspection, testing, and maintenance, response to activation)
  - Fire prevention programs (including policies and procedures, housekeeping, staff training, evacuation)

  - Safes, vaults, and media containers (including type, location, capacity, and use)

- Procedures
  - Key and combination control (including policies and procedures, documentation/records, and security of keys and cores)
  - Building opening and closing (including policies and procedures, checklists, and monitoring by management)
  - Housekeeping practices
  - Employee screening, investigation, and identification
  - Package and material control
  - Visitor control (including control of visitors to staff-only areas, passes, records of visits, and ID's for contractors, tradesmen, utility workers)
  - Visitor surveillance and inspection
  - Protection of administrative records
  - Security of cash and valuables
  - Control of access to restricted areas or facilities (including museum and non-museum staff)
  - Property inventory and control
  - Security communications (including methods, reliability, back-up power, employee operation, and efficiency and speed)
  - Incident reporting (including timeliness, accuracy, and records creation and maintenance)

- Individual Object Protection
  - Storage spaces (including physical construction, access control, housekeeping practices, storage cabinets and shelves, inventory and material movement, and intrusion detection systems)
  - Exhibit spaces (including case construction and object mounting, lighting of space and cases, surveillance by the staff, intrusion and tamper detection systems, inventory, and object removal/movement procedures)
  - Furnished rooms (including access control, intrusion detection systems, housekeeping practices, and inventory)

2. *Where can I obtain a sample scope of work for a security and fire protection survey?*

Figures G.1 and G.2 provide suggested language for a scope of work (SOW) statement for a security survey and a fire protection survey. When contracting for a combined security and fire protection survey, the two documents can be merged and redundant language eliminated. In the sample SOWs, the square brackets [ ] denote alternative words or phrases, one of which must be chosen and the other deleted, depending upon the situation. Square brackets also mark off optional words and phrases that may be applicable. The text for these sample statements of work is available on diskette or via cc:Mail from your SSO Curator.

D. Park Museum Protection Standard Operating Procedures and Agreements

1. *How do I organize museum standard operating procedures?*

In preparing park-level policy statements and procedures, it is important to distinguish between policies and procedures. Policies express what is allowed and not allowed. Procedures express how to carry out the policies (how, when, by whom, and under what circumstances you put the policies into effect.)

Museum facility standard operating procedures (SOPs) share certain common elements with all standard operating procedures. They all include the following information:

- ***Why*** the required actions should be performed. When the purposes for having the SOP are made clear, and when the responsible staff fully understand why they must do certain things, the procedures become more valuable.

- ***Who*** is to perform the required actions. Depending on the circumstances, the SOP may indicate responsibility by name or by position title. The SOP will say that the procedures are to be followed by staff who have the duty by virtue of some roster or work schedule (which you must identify in the SOP). Regardless of how it is done, it is essential that the SOP assign specific responsibility.

- ***When*** the required actions are to be performed. Usually, specific times are given for either initiating or completing the procedures. The times may vary seasonally or according to the day of the week. It may not be necessary to set a specific time for initiating each action. Simply setting a time to begin the procedures or a time by which they are to be completed will suffice.

- ***Where*** the required actions are to be performed. For example, an opening SOP might designate which building entrance is to be opened first, indicate where the intrusion detection system keypad and light switches are located, direct the sequential unlocking of specific emergency exit or other doors, specify where items needed during the procedure, such as flags, are to be found, and indicate which exhibit cases are to be checked.

- ***How*** the required actions must be performed or, as appropriate, may be performed. Unless there is a clear need for an action to be performed in a certain way, however, it is best to allow the responsible persons

flexibility in how they carry out their tasks. When an action must be performed in a certain way, as with operating an intrusion detection system or certain high-security locks, the SOP then should be as specific and detailed as necessary to ensure that it is done that way.

- ***What*** the results of the actions should be. For example, it is not sufficient to say something like "Check all exhibit cases." Instead, the SOP should say "Visually examine exhibit cases 4-13 for evidence of burglary or tampering during the night and for objects and graphics that might have fallen or come loose from their mounts. Inspect exhibit case access doors to ensure that they are still locked and that the locks are in good condition."

2. *Where do I find sample museum standard operating procedures and agreements?*

Figures G.3 through G.8 provide suggested format and language for park collection opening and closing procedures, access policies and procedures, and an agreement with a fire department. The sample documents are designed to cover all elements that normally need to be considered in most parks. You generally should follow the sample formats. However, the language may vary depending on your park's specific requirements and problems.

The electronic Museum Management Newsletter, issued by the NPS Museum Management Program, National Center for Cultural Resources Stewardship and Partnership publishes lists of park museum SOPs that are available upon request. Contact parks for copies of their SOPs. Some SOPs are available as WordPerfect files and can be furnished on disks or via cc:Mail either from the originating parks or your System Support Office (SSO).

3. *Where do I find additional help with preparing access policies and procedures?*

- MH-II, Appendix D, Museum Archives and Manuscript Collections
  - Section T. Providing Access to Archival and Manuscript Collections
  - Section U. Identifying Appropriate Restrictions for Archival and Manuscript Collections.
  - Section V. Implementing Access and Usage Policies for Archival and Manuscript Collections.
  - Section W. Monitoring and Tracking Researcher Use of Archival and Manuscript Collections
  - Figure D.16. Researcher Registration Form (Sample)
- MH-I, Chapter 6, Handling, Packing, and Shipping Museum Objects
  - Section C. General Rules for Handling Museum Objects

4. *Where do I find a sample visitor log?*

See Figure G.6 for a sample visitor log. An unpunched, full size visitor log accompanies this appendix. Keep the full size visitor log as a master and make copies for your use.

5. *Where do I find conditions for access to museum collections?*

See Figure G.7 for conditions for access to museum collections. An unpunched full size conditions for access to museum collections accompanies this appendix. Keep the full size document as a master and make copies for your use.

E. Mandates and Requirements for Emergency Management for Museum Collections

1. *What laws and regulations do I need to know?*

Emergency preparedness is addressed in a number of Federal laws and regulations. The focus of these laws and regulations is on protecting visitors or on broad, general issues of park management and resource protection. See U.S. Code Citations: USC 12 & 17; 16 USC 1a-6, 1b-1, and 3; 28 USC 1346 & 2672; and 31 USC 6483; and 36 CFR 1.5.

2. *What do the NPS Management Policies tell me?*

Chapter 5, Cultural Resource Management, requires:

- Emergency Management [Page 5:14]: "The emergency operations plan for each park with cultural resources will address their protection or rescue in the event of an emergency or disaster."

Chapter 8, Use of the Parks, outlines:

- Emergency Preparedness and Emergency Operations [Page 8:6]: "The National Park Service will develop a program of emergency preparedness in accordance with the Federal Civil Defense Act (50 USC 2251 et seq.), National Security Decision Directive 259 (Feb. 4, 1987), departmental policy, and other considerations at the Washington, region, and park levels. The purpose of the program will be to maximize visitor and employee safety and the protection of property. This program will include a systematic method for alerting visitors to potential disasters and evacuation procedures.

  Superintendents may assist other agencies with emergencies outside parks. To the extent practicable, written agreements with such other agencies in accordance with the Federal Assistance and Interagency Agreements Guideline (NPS-20) must first be in effect. NPS employees who are outside the area of their jurisdiction and who are directed by their supervisors to provide emergency assistance to other agencies will be considered to be acting within the scope of their employment.

  NPS emergency operations will be conducted utilizing the Incident Command System (ICS) of the National Interagency Incident Management System (NIMS). Each park superintendent will develop and maintain an emergency operations plan to ensure an effective response to all types of emergencies that can be reasonably anticipated."

3. *What NPS guidelines do I need to know?*

NPS-28, *Cultural Resource Management Guideline*, is the general guideline for protecting and managing all cultural resources, including museum objects.

- Chapter 4 provides general guidance on including cultural resources in the Emergency Operation Plan (EOP).

- Chapter 9 states that the needs of collections are incorporated in emergency operation plans and that EOPs identify protection and recovery priorities for the most significant objects in the collection.

4. *What are the NPS standards for museum emergency management?*

- Identify all disasters and other emergencies that could cause damage to or loss of the museum collection, in whole or in part.
- Include in the EOP a description of methods for protecting collections in time of emergency or write a separate museum emergency plan that describes such methods.
- Identify methods to mitigate against disaster-related damage, to the extent possible, and develop procedures for responding to and recovering from damages resulting from events that cannot be mitigated against.
- Stockpile emergency materials for use during and after a disaster and take other appropriate preparedness measures in anticipation of emergencies.
- Prioritize in the EOP museum objects according to their value and importance. Ensure that following a disaster, the most valuable or significant objects are given highest priority for emergency treatment.
- Ensure that secure on-site or off-site storage is available for protecting collections if regular storage or exhibit space becomes unusable following a disaster. Keep arrangements for the emergency use of non-NPS space such as freezer plants, current at all times.
- Establish cooperative or other agreements with local law enforcement, civil defense, and emergency response agencies, with other governmental and non governmental agencies, and with nearby NPS units regarding mutual aid in time of disaster.

F. Glossary

- **Air Sampling Smoke Detector:** A device that draws air through small diameter (generally less than 1/8") tubing into a detector unit that uses either the ionization, photoelectric, or cloud chamber principle to analyze the quantity of smoke or combustion products in the sample. (Also called Early Warning or Very Early Warning detectors.)
- **Arson:** The malicious burning of or attempt to burn property. Generally, an entire building will be affected rather than specific objects or property contained within.
- **Automatic Sprinkler System:** A network of overhead pipes with spaced outlets (sprinkler heads) that open at a predetermined temperature to discharge water onto a fire.
- **Barriers:** Tools for physical security designed to prevent, restrict, or delay access to a protected area or object.
- **Burglary:** Breaking and entering with the intent to commit a felony, usually theft, although vandalism also is common.

- **Capacitance Motion Detector:** A motion detector designed to detect motion close to a protected object, generally used to detect and discourage touching of high value exhibits, such as wall hangings or paintings. The device generates a capacitance field 4-6" from the protected object that detects any electrical conductor that enters the field.

- **Central Station:** A privately owned alarm monitoring system monitored by personnel who will report alarms to the police or fire department and to designated members of the staff of the protected site. A central station may be owned by the protected site (proprietary) or by a commercial business (commercial central station).

- **Civil Disturbances:** Disturbance of civil order and the peace. This activity may be organized or spontaneous; may be indiscriminate, involving the park as a consequence of its location, or discriminate, involving the park as a planned target; and may be a prelude to other criminal activity, especially vandalism and larceny and possibly robbery and assault.

- **Class A Fire:** A fire in ordinary combustibles (such as wood, paper, rubbish, and many plastics).

- **Class B Fire:** A fire in petroleum products, flammable gases and other flammable liquids (such as paints, thinners, and solvents).

- **Class C Fire:** A fire in energized electrical equipment and wiring, where the non-conductivity of the extinguishing agent is important.

- **Contact Switch:** A normally open or normally closed electrical switch that triggers an alarm when the switch changes position. Examples include magnetic door and window contacts, plunger switches, and roller or ball switches.

- **Crime Prevention:** Anticipating, recognizing, and appraising the risk of a crime and initiating actions to remove or reduce the risk.

- **Cycling Sprinkler System:** A sprinkler system similar to a Preaction System, except that a separate heat detection system both opens and closes the control valve at predetermined temperatures. After the valve closes, if the fire rekindles, it reopens and water again flows from the opened heads. The valve will continue to open and close in accordance with the temperature sensed by the heat detection system.

- **Dry Pipe Sprinkler System:** A sprinkler system used in areas where temperatures below 32° F are expected. Pipes are filled with air or nitrogen under pressure. When fire opens a sprinkler head, air pressure in the system drops, releasing a valve, letting water flow into pipes and discharge from the open sprinkler(s).

- **Dual Technology Motion Detector:** A motion detector that combines two detection technologies (such as microwave/passive infrared or ultrasonic/passive infrared) to minimize unwanted alarms. Both technologies must detect motion before the device signals an alarm.

- **Duress Alarm:** A personal protection device (also known as a panic or hold-up alarm) consisting of a manually operated switch that triggers a local or remotely monitored alarm to summon assistance.

- **Embezzlement:** Appropriating fraudulently to one's own use or benefit property entrusted to one's care. The property stolen might be sold (fenced) or retained for the personal use of the embezzler.

- **Fire Protection Survey:** A survey of fire prevention and personnel training programs, structural and procedural fire hazards, maintenance of protective systems, and overall effectiveness of the fire protection program.

- **Flame Detector:** Device that detects radiant energy (such as infrared, ultraviolet, or both) that may or may not be visible to the human eye, such as glowing embers or coals, as well as flames.

- **Glass Break Detector:** Device that detects breaking glass. There are two types: frequency discriminators and metallic foil or wire. Frequency Discriminators detect the high frequency sounds generated when glass breaks. Metallic Foil or Wire is a ribbon of lead foil or small wire that carries an electrical current. It is attached to the glass around the perimeter of a window so when the glass breaks, the foil or wire breaks, breaking the electrical circuit, causing an alarm.

- **Heat Detectors:** Heat-responsive devices either of the spot or line type, designed to respond when the operating element reaches a predetermined temperature (Fixed Temperature), when the temperature rises at a rate exceeding 15°F per minute (Rate-of-Rise), or when the temperature of the air surrounding the device reaches a predetermined level, regardless of the rate of temperature rise (Rate Compensation). Some have both fixed temperature and rate-of-rise features.

- **Industrial Disasters:** Involves an explosion, structural collapse, hazardous materials release, fire, a major accident, nuclear incident, major power outage or utility loss, and a serious break in water, sewer, or gas line.

- **Ionization Detectors:** A device that detects small combustion particles generated in the flame stage of a fire.

- **Larceny:** Unlawful taking or stealing of property or articles of value without the use of violence or fraud. There is a presumption that the property was not entrusted to the care of the person committing the theft. A presumption of theft also can be raised by possession of recently stolen property.

- **Line-Type Heat Detector:** A heat sensitive wire or tube, which triggers an alarm when the temperature in the protected space increases at a rate of 15°F, or greater, in a minute.

- **Line-Type (Photoelectric Beam) Smoke Detector:** A device that projects a beam of light (in the infrared range) to a receiver across an open area. The receiver measures light diffraction to detect smoke. These detectors often are used to protect large gallery-type spaces with high ceilings.

- **Local Alarm System:** A fire or intrusion detection system that causes an audible or visual alarm at the protected site, but which is not monitored off-site.

- **Magnetic Contact:** A detection device that uses a magnet mounted on a movable surface to open or close a contact switch mounted on a fixed surface.

- **Microwave Motion Detector:** A device that transmits electromagnetic energy in the microwave range (radar). The device measures the amount of energy reflected back to it and detects motion based on the doppler effect (a frequency shift that occurs as an object moves toward or away from the detector).

- **Natural Catastrophe:** Involves an earthquake, volcanic eruption, landslide, flood, hurricane, tornado, tidal wave, lightning, or wildfire.

- **On-Off Sprinkler Head:** A sprinkler head used on a standard wet-pipe system that makes the system act like a Cycling Sprinkler System. The difference is that each individual sprinkler head contains a temperature-sensitive device that opens the head at a predetermined temperature and closes it automatically when the temperature falls to a preselected point. Systems with on-off sprinkler heads operate independently of the fire alarm system.

- **Passive Audio or Sonic Sensors:** Audio and sonic sensors detect sound. An Audio Sensor is a sound activated microphone that transmits sounds from the protected space to a loud speaker in the monitoring station so the person monitoring the sensor hears what is going on in the protected space. Sonic Sensors are frequency discriminators that detect sound in the frequency range associated with movement.

- **Passive Infrared Motion Detector (PIR):** A device sensitive to infrared heat in the range generated by the average human body. The detector transmits no energy, but uses a series of heat sensitive elements to cover the protected area in a pattern of zones resembling the fingers on a hand. The device detects motion when a heat source moves from one detection zone to another. Everything has an infrared signature, and many mimic that of the human body (for example, a large animal or a radiant heater).

- **Photoelectric Beam Motion Detector:** A device with a transmitter that projects a beam of infrared light across an open space to a receiver. The receiver may be located directly across from the transmitter, or the light beam can be directed around the room with a series of small mirrors. Photoelectric beam devices may use just one beam or, to minimize unwanted alarms, several beams (stacked array).

- **Photoelectric Detector:** A device that detects large combustion particles in visible smoke.

- **Physical Security:** All measures intended to prevent acts of violence against persons and destructive or unauthorized access to, or removal of, property.

- **Preaction Sprinkler System:** A type of dry pipe sprinkler system with the water supply controlled by a fire detection system (either smoke or heat detection) wired so an alarm opens a valve to let water flow into the system piping. After the supply valve opens, the preaction system operates like a wet-pipe system.

- **Pressure Mat:** A pressure-sensitive mat, usually placed under a rug or carpet, to detect an intruder stepping into the protected space.

- **Probability:** The likelihood of a threat becoming an actual loss event.

- **Risk:**

  – **Conventional Risk:** A condition that entails both the possibility of loss and gain, such as investing in the stock market.

  – **Pure Risk:** A condition that is loss-only oriented. Among the pure risks that threaten park assets are crimes, natural disasters, civil unrest, and accidents.

- **Risk Assumption:** Using existing resources to absorb losses as and when they occur.

- **Risk Management:** The process of identifying, evaluating, and eliminating as many risks as possible by selecting and implementing effective countermeasures.

- **Risk Transfer:** The process of transferring a risk to another entity for a fee. A known cost, such as an insurance premium, may be substituted for the chance of a greater loss.

- **Robbery:** Theft by violence or threat of violence to one's person. Also included under this heading is the taking of a hostage to force someone on the museum staff to open the building or a secure area within the building.

- **Security:** Security includes all techniques, procedures, equipment and planning intended to prevent loss of or damage to collection objects from criminal activity, negligence, fire, or other catastrophic events.

- **Security Survey:** The National Institute of Law Enforcement and Criminal Justice describes the security survey as "a critical on-site examination and analysis of an industrial plant, business or home, public or private institution to ascertain the present security status; to identify deficiencies or excesses; to determine the protection needed; and to make recommendation to improve the security."

- **Severity:** The impact or effect upon the assets or upon the organization if a loss does occur.

- **Shoplifting:** A specific type of larceny that involves theft of merchandise for sale. This threat is a concern when there are sales operations within the park.

- **Spot-Type Smoke Detector:** A device that detects products of combustion by either the ionization or photoelectric principle, covering a defined area (generally no more than 900 square feet per detector in an open space with ceiling height less than 15 feet).

- **Standpipe System:** A piping system in a building to which hoses are connected for emergency use by building occupants or by the fire department. Standpipe systems intended for fire department use normally do not have hoses permanently attached; responding fire personnel provide the hose and use the standpipe connection to reduce the amount of hose they must carry into the building. Such systems may be charged with water by fire department pumpers. Standpipe systems intended for occupant use will have hoses, usually 1½ inches in size, already attached. Such systems usually are permanently charged with water.

- **Strain Sensor:** A device that detects the distortion that occurs on the under side of a joist, floor, or platform when weight is applied to the top surface.

- **Threat:** A potential to inflict harm or cause damage or loss.

- **Ultrasonic Motion Detector:** Similar to the microwave motion detector, except the device uses high frequency acoustic (sound) energy that will not penetrate solids.

- **Vandalism:** Willful or malicious destruction or defacement of objects, exhibits, or structures. This crime may be random and indiscriminate or directed toward a particular object, building, or exhibit. Vandalism is called sabotage if committed to hinder operations.

- **Vibration or Shock Detector:** A device that attaches directly to a protected object, an exhibit platform, or the structure of an exhibit case, which detects vibration, such as might occur when someone moves the protected object or strikes the protected exhibit case.

- **Warded Lock:** A lock with gates to which the correct key aligns to allow movement of the bolt and with internal wards, or obstructions, that block the entry or turning of an incorrect key.

- **Wet Pipe Sprinkler System:** A sprinkler system in which the piping permanently contains water.

G. List of Figures

SCOPE OF WORK
Museum Security Survey
[*Park Name*]

Purpose of Work

The work consists of conducting a museum security survey of the [*facility/ facilities*] described below. There are two purposes for the survey. The first is to reveal and identify weaknesses in existing protection systems, equipment, procedures, policies, and operations that could result in the loss of such museum resources as collections, collection records, and exhibits, as well as the museum [*structure/structures*] [*itself/themselves*]. The second purpose is to identify alternatives to correct any weaknesses or deficiencies that may be found. The ultimate goal of performing the survey[s] and of implementing corrective actions is protecting museum property against all forms of losses.

Description of Site[*s*] to be Surveyed

[*Here describe the buildings--visitor center, furnished historic structure, storage facility--to be surveyed. Characterize it/them in terms of location, size, functions, construction, and nature of contents. Provide whatever information is deemed necessary for the contractor to have in advance. In particular, indicate the nature of exhibits to be surveyed, making clear whether they are conventional exhibits or furnished rooms or both. In most cases, the Scope of Work (SOW) statement will become part of the request for proposal sent out to prospective contractors. It is important that prospective contractors have sufficient information about the site and facilities to be surveyed to permit them to make responsive proposals. You may wish to attach more detailed information, such as park brochures, to the SOW to avoid having to put a lot of detail in this section.*]

Scope of Work

The Contractor will survey the structures or facilities described above, identify security weaknesses and deficiencies, and make recommendations for their correction in a separate formal report. [If more than one park is involved, you should request a separate report for each park. Only rarely might you specify a separate report for each structure in the same park.] The Contractor will visit and survey operations and conditions at [the site/each site] for [number of days]. In addition, the Contractor will return to [the site/each site] an additional one-half day to orally present his/her findings and recommendations to the site staff[s]. After completion of the return visit, the final report[s] will be revised as necessary based on comments made during the oral presentation and submitted to the park.

In carrying out this work, the Contractor will perform at a minimum the following tasks:

1. Prior to identifying himself/herself to the staff, tour public spaces in each of the specified facilities as an ordinary visitor and observe conditions and activities affecting protection of the collections and the structures. [If visitors normally have to pay a fee for admission to the site, indicate in this paragraph that fees paid will constitute a cost-reimbursable expense.]

2. Meet with management and staff at each site including [Here specify by title each of the site staff that the contractor must meet. At a minimum, the contractor should meet with the superintendent, the chief ranger, and the park curator.] [At each site other/Other] staff may be interviewed as deemed appropriate by the local manager or necessary by the Contractor and as may be arranged by the local staff.

Figure G.1. Sample Scope of Work for a Security Survey

3. Evaluate the physical security of each building in both public and non-public areas. Note problems with perimeters, including doors, windows, air intakes, roof hatches, and other penetrations. Evaluate perimeter lighting, locks, hardware, hinges, and other security equipment and devices. Evaluate the ease with which someone could penetrate the perimeter with or without being detected. Observe and evaluate perimeter security during the daytime and after dark. Before conducting surveys after hours, inform the local superintendent or site manager of when and how they will be carried out; that will preclude harm to the Contractor or site staff and ensure cooperation of staff on the night shift.

4. Examine and evaluate the electronic alarm systems, including controls, detectors, exhibit case sensors, panic devices, alarm and signaling devices, remote monitoring equipment, remote alarm transmission media (including line supervision), and other pertinent components. Test the proper functioning of the systems and evaluate their operation and maintenance. Evaluate [contract/proprietary] central station services (monitoring, response, premises security, and maintenance support).

5. Examine security staffing for adequacy. Review staffing levels, position descriptions, performance standards, standard operating procedures, training, and delegations of responsibility for all personnel and staff components directly responsible for museum security. Evaluate protection of all areas by security personnel. Review the scheduling and conduct of security patrols. Evaluate adequacy of protection provided by interpreters during interpretive tours or programs. Evaluate the interpretive operations plan in respect to how well it incorporates security concerns into the responsibilities of interpreters. If guards are used on the night shift, evaluate their effectiveness and response capabilities and the extent to which they may be vulnerable to personal injury, attack, or accident during their rounds.

6. Evaluate security training or security awareness programs provided at the site for both security and non-security personnel.

7. Evaluate policies for and staff compliance with access and parcel controls in use at the site[s], particularly in office and work areas, in exhibit areas, and in collections storage.

8. Evaluate security policies and procedures, including standard operating procedures, delegations of authority, and memoranda of agreement or understanding with local police and emergency agencies.

9. Evaluate key control and retrieval. Evaluate the adequacy of locking systems, key documentation, and key security. Determine whether card access or similar control systems would be appropriate and practical for securing or controlling access to buildings and to high-security areas, such as collections storage.

10. Evaluate internal security programs, particularly procedures to account for objects taken outside of collection storage and exhibit areas, such as in offices and workrooms or in transit.

11. Evaluate security for objects on exhibit and in storage, including case design, security hardware, detection systems, locks, keying, accountability procedures, and other internal control procedures and systems. In particular, evaluate the ease with which objects may be stolen from exhibits [and furnished rooms] without immediate detection of the act. Evaluate the ease with which objects on exhibit [and in furnished rooms] may be vandalized, with or without immediate detection.

Figure G.1. Sample Scope of Work for a Security Survey (continued)

12 [*This paragraph is needed only when historic structures are to be surveyed*.] All recommendations for improvements to or replacements of systems and hardware will take into account and be sensitive to the historic nature of the structure[*s*]. As appropriate, alternative recommendations for equipment and/or installation techniques will be made to allow for maximum preservation of historic fabric.

13 Evaluate the timeliness, effectiveness, and accuracy of how the [*site/sites*] report[*s*] criminal or other incidents involving collections.

14 Observe and comment on other security problems that may be noted during the survey[*s*]. Evaluate park policies and documentation for all security procedures not otherwise specified above.

Standards

The following published documents shall be considered the standards against which Contractor shall evaluate security at the site[*s*]. The first [*qty*] items are available for loan to Contractor upon request. The remaining items are standard industry publications, which should already be available to Contractor.

[*Here list relevant documents, such as: NPS Museum Handbook, Part I; NPS-28 "Cultural Resource Management Guideline"; NPS-44 "Personal Property Management Guideline"; NPS-50 "Loss Control Management Guideline"; NPS Management Policies; Special Directive 80-1 and NPS Checklist for Preservation and Protection of Museum Collections; and any other NPS documents that may be relevant. List the American Society for Industrial Security (ASIS) Suggested Guidelines in Museum Security; and other industry publications.]*

Protection of Information

All information and documentation gathered or produced by the Contractor during the course of this work shall be held in strictest confidence and shall be fully protected from access by unauthorized persons. Any documentation furnished by the site[*s*] and retained by the Contractor during the course of the work or thereafter shall be secured in a locked filing cabinet or safe at a minimum. During the initial visit to the site[*s*], the Contractor shall indicate to the superintendent[*s*] the manner in which he/she intends to secure any documentation the site[*s*] may furnish; the superintendent[*s*] will have the prerogative to specify when more stringent security must be provided for any particular documentation furnished to the Contractor. Documentation that cannot be secured to the superintendent's[*s'*] satisfaction still will be furnished to the Contractor, but only for on-site use.

Notes and other information produced by the Contractor, including all versions and copies of his/her report and any drawings that may be produced, shall be secured in a locked filing cabinet or safe, at a minimum. Word processor and other computer files shall be secured in an equivalent manner, such as by retaining files only on diskettes kept in a safe, rather than on a hard drive, and by the use of passwords or encryption. During the initial visit to the site[*s*], the Contractor shall indicate to the superintendent[*s*] the manner in which he/she intends to secure computer data generated during the course of the work; the superintendent[*s*] will have the prerogative of specifying that additional security measures be taken whenever circumstances so dictate.

Figure G.1. Sample Scope of Work for a Security Survey (continued)

Products, Deliverables, and Performance

1. Contractor should discuss his/her findings and recommendations with protection and museum staff at [the/each] site during the initial visit[s], and is encouraged also to discuss recommendations for corrective actions, but is not obliged to do so. Contractor has an ethical obligation to verbally point out serious protection weaknesses as they are encountered, if such weaknesses could, in his/her judgment, result in imminent loss of park resources.

2. Contractor shall prepare and submit a written report of survey [*for each site visited*]. The report shall present findings and recommendations for each applicable subject listed above in the Scope of Work and shall be organized in a logical, easily comprehended manner. [*The/Each*] report shall include an executive summary, a discussion of observations and problems (organized according to areas within [*the/each*] structure or according to each security issue, e.g., training, staffing, and hardware), a list of recommendations and possible alternative solutions for problem areas, a comprehensive prioritized list of recommendations, a list of recommended suppliers of security hardware and systems and cut sheets or other manufacturer's literature on recommended hardware or system components, and a bibliography of recommended readings on the specific protection problems and solutions presented in the report[*s*].
3. Submit draft reports to the park according to the schedule below. Reports will be reviewed promptly and returned with comments. Contractor will be expected to incorporate each comment into the report or be prepared to explain why doing so is not appropriate.

4. After approval of the second draft, return to [*the/each*] park for a followup visit. Orally present findings and recommendations to the assembled park staff. Orally respond to questions, comments, and concerns from the staff. [*The/Each*] presentation[*s*] should include a walk-through of the surveyed [*facility/facilities*] as necessary to make findings and recommendations clear. In order to ensure sufficient time for the presentation[*s*], [*it/they*] should be scheduled to allow for one-half day [*per site*].

Time for performance is [*number of months*]. [*The*] Initial site visit[*s*] must be completed within [*number of days*] from award of contract. The final report must be completed within [*number of days*] after completion of the initial visit[*s*]. [*The following schedule of completion is suggested. Modify as instructed by your contracting officer.*]

Work Element	Completion Time After Award
Initial site visits	[*number of days*]
Submit first draft of report[s] to park	[*number of days*]
Correct report[s] by Contractor	at Contractor's discretion

Figure G.1. Sample Scope of Work for a Security Survey (continued)

Work Element	Completion Time After Award
Followup site visit[*s*] and present report[*s*] to park staffs	[*number of days*]
Complete final report[*s*]	at Contractor's discretion
Submit final report[*s*] to park staffs	[*number of days*]

Schedule of Partial Payments

Partial payments will be made upon successful completion of each successive phase of the work, as outlined below:

Initial site visit[*s*]	50%
Submit second draft[s] of report[*s*]	25%
Submit final report[*s*]	25%

Inspection and Acceptance

[*Insert Name and Title*] shall serve as the Contracting Officer's Technical Representative (COTR) on this project. The COTR is empowered to inspect and evaluate all work of this Contract for compliance with terms of this Scope of Work Statement.

Acceptance of the work of this contract and any changes to the terms of this contract shall be made in writing only by the Contracting Officer.

Figure G.1. Sample Scope of Work for a Security Survey (continued)

SCOPE OF WORK
Fire Protection Survey
[*Park Name*]

Purpose of Work

The work consists of conducting a museum fire protection survey of the [*facility/ facilities*] described below. There are two purposes for the survey. The first is to reveal and identify weaknesses in existing protection systems, equipment, procedures, policies, and operations that could result in the loss of such museum resources as collections, collection records, and exhibits, as well as the museum [*structure/structures*] [*itself/themselves*]. The second purpose is to identify how to correct any weaknesses or deficiencies that may be found. The ultimate goal of performing the survey[s] and of implementing corrective actions is the protection of museum property against all forms of losses due to fire or to fire fighting activities.

Description of Site[*s*] to be Surveyed

[*Here describe the buildings--visitor center, furnished historic structure, storage facility--to be surveyed. Characterize it/them in terms of location, size, functions, construction, nature of contents. Provide whatever information is deemed necessary for the contractor to have in advance. In particular, indicate the nature of exhibits to be surveyed, making clear whether they are conventional exhibits or furnished rooms or both. In most cases, the scope of work (sow) statement will become part of the request for proposal sent out to prospective contractors; it is important that prospective contractors have sufficient information about the site and facilities to be surveyed to permit them to make responsive proposals. You may wish to attach more detailed information, such as park brochures, to the SOW to avoid having to put a lot of detail in this section.*]

Scope of Work

The contractor will survey the structures or facilities described above, identify fire prevention, detection, and suppression weaknesses and deficiencies, and make recommendations for their correction in a separate formal report. [*If more than one park is involved, you should request a separate report for each park. Only rarely might you specify a separate report for each structure in the same park.*] The contractor will visit and survey operations and conditions at [*the site/each site*] for [*number of days*]. In addition, the contractor will return to [*the site/each site*] an additional one-half day to orally present his/her findings and recommendations to the site staff[*s*]. After completion of the return visit, the final report[*s*] will be revised as necessary based on comments made during the oral presentation and submitted to the park.

In carrying out this work, the contractor at a minimum will perform the following tasks:

1. Meet with management and staff at each site including [*Here specify by title each of the site staff that the contractor must meet. At a minimum, the contractor should meet with the superintendent, the chief ranger, the chief of maintenance, the structural fire coordinator, and the park curator.*] [*At each site other/Other*] staff may be interviewed as deemed appropriate by the local manager or as necessary by the Contractor and as may be arranged by the local staff.

2. Evaluate fire prevention policies, programs, and procedures in each building in both public and non-public areas. Examine existing policies and the extent to which they are appropriate to the resources being protected and actually are being followed. Examine the effectiveness of programs and procedures in preventing fires from starting.

Figure G.2. Sample Scope of Work for a Fire Protection Survey

3. Examine and evaluate fire detection and alarm systems, including sensors and detectors, manual pull stations, water flow and position indicating alarms, system controls, standby power, alarm and signaling devices, remote monitoring and annunciation equipment, remote alarm transmission media (including line supervision), and other pertinent components. Determine the extent to which systems comply with current National Fire Protection Association (NFPA) standards for the installation, operation, maintenance, and testing of fire alarm signaling systems (NFPA 72, National Fire Alarm Code). Report on the extent to which system components are listed by Underwriters Laboratories (UL). Test the proper functioning of the systems and evaluate their operation and maintenance. Evaluate [*contract/proprietary*] central station services (monitoring, response, premises security, and maintenance support).

4. Examine and evaluate the types, sizes, locations, etc. of hand-held fire extinguishers currently in use in the [*facility/facilities*] being surveyed. Determine whether different types or sizes would be more appropriate and whether existing extinguishers should be relocated or augmented with additional extinguishers. When extinguishers are concealed for aesthetic reasons, determine whether concealment poses the potential for such problems as delayed access or failure to use an otherwise available extinguisher. Evaluate procedures, programs, and schedules for testing fire extinguishers; determine whether proper records are created and maintained when extinguishers are tested.

5. Examine and evaluate the appropriateness, capacity, spacing, temperature rating, and hazard rating of fixed sprinkler systems. Examine and evaluate hose and standpipe systems inside the [*facility/facilities*] being surveyed. Examine and evaluate the suitability and locations of fire hydrants near the [*facility/facilities*] being surveyed. Determine whether different types or sizes of automatic and manual suppression systems would be more appropriate and whether additional units are required. Determine if water supplies provide the necessary flow rate and volume. Examine the maintenance and protection of fire department connections and the protection of water supply control valves.

6. Examine the adequacy of current staff in respect to their ability to prevent, detect, respond to, and suppress fires. Review staff size, position descriptions, performance standards, standard operating procedures, training, and delegations of responsibility for all personnel and staff components directly responsible for any aspect of fire protection. Determine the adequacy of fire patrols and of those aspects of facility closing procedures that are intended to prevent after hours fires. Evaluate adequacy of protection provided by interpreters during interpretive tours or programs. Evaluate the interpretive operations plan in respect to how well it incorporates fire prevention or awareness concerns into the responsibilities of interpreters. If guards or patrols are used at night, evaluate their effectiveness and the extent to which they are able to detect fires and provide or summon appropriate response.

7. Evaluate training provided to the [*site's/sites'*] fire brigade[*s*] and general staff fire protection awareness programs provided at the [*site/sites*]. Determine whether the right staff are being trained. Determine the extent to which training requirements of NPS-58, Structural Fire Guideline, Chapter 7, are being met. In particular, examine training in the use of hand-held fire extinguishers and fire hoses.

8. Evaluate fire suppression policies and procedures, including standard operating procedures, delegations of authority, and memoranda of understanding with local fire and emergency agencies for fire inspection or suppression services. Memoranda must comply with NPS-58 and with applicable federal regulations.

Figure G.2. Sample Scope of Work for a Fire Protection Survey (continued)

9. Evaluate pre-fire planning and the extent to which such planning is in accordance with NPS-58, Chapter 6. In particular, examine whether pre-fire planning takes into account the special needs of museum objects, records, exhibits, storage areas, and work spaces, as noted on pages 1 and 3 of Chapter 6. Also determine whether pre-fire planning strikes a proper balance between protecting museum resources and the structures housing them. [*When historic structures are involved, you may wish to strengthen this paragraph by adding the issue of protecting historic structures themselves*.]

10. Determine quality of the structural fire inspection programs and extent of compliance with NPS-58, Chapter 5.

11. Evaluate the timeliness, effectiveness, and accuracy of post-fire investigation and reporting. Evaluate reporting in terms of requirements set forth in NPS-58, Chapters 11 and 12.

12. [*This paragraph is needed only when historic structures are to be surveyed.*] All recommendations for improvements to or replacements of systems and hardware will take into account and be sensitive to the historic nature of the structure[*s*]. As appropriate, alternative recommendations for equipment and/or installation techniques will be made to allow for maximum preservation of historic fabric.

13. Observe and comment on other fire protection problems that may be noted during the survey[*s*]. Evaluate park policies and documentation for all fire prevention, detection, and suppression procedures not otherwise specified above.

Standards

The following published documents must be considered the standards against which Contractor shall evaluate security at the site[s]. The first [*qty*] items are available for loan to Contractor upon request. The remaining items are standard industry publications which should already be available to Contractor.

[*Here list relevant documents, such as: NPS Museum Handbook, Part I; NPS-28, Cultural Resources Management Guideline; NPS-58, Structural Fire Guideline; NPS Management Policies; Special Directive 80-1 and NPS Checklist for Preservation and Protection of Museum Collections; and any other NPS documents that may be relevant. List National Fire Protection Association (NFPA) and Factory Mutual (FM) guidelines; fire protection industry publications.]*

Products, Deliverables, and Performance

1. Contractor should discuss his/her findings and recommendations with administrative and resources management staff at [*the/each*] site during the initial visit[*s*], and is encouraged to also discuss recommendations for corrective actions. Contractor has an ethical obligation to verbally point out serious protection weaknesses as they are encountered, if such weaknesses could, in his/her judgement, result in imminent loss of park resources.

2. Contractor shall prepare and submit a written report of survey [*for each site visited*]. The report shall present findings and recommendations for each applicable subject listed above in the Scope of Work and shall be organized in a logical, easily comprehended manner. [*The/Each*] report shall include an executive summary, a discussion of observations and problems (organized according to areas within [*the/each*] structure or according to each fire protection issue, e.g., training, staffing,

Figure G.2. Sample Scope of Work for a Fire Protection Survey (continued)

hardware), a list of recommendations and possible alternative solutions for problem areas, a comprehensive prioritized list of recommendations, a list of recommended suppliers of fire protection hardware and systems and cut sheets or other manufacturer's literature on recommended hardware or system components, and a bibliography of recommended readings on the specific protection problems and solutions presented in the report[*s*].

3. Submit draft reports to the park according to the schedule below. Reports will be reviewed promptly and returned with comments. Contractor will be expected to incorporate each comment into the report or be prepared to explain why doing so is not appropriate.

4. After approval of the second draft, return to [*the/each*] park for a follow-up visit. Orally present findings and recommendations to the assembled park staff. Orally respond to questions, comments, and concerns from the staff. [*The/Each*] presentation[*s*] should include a walk-through of the surveyed [*facility/facilities*] as necessary to make findings and recommendations clear. In order to ensure sufficient time for the presentation[s], [it/they] should be scheduled to allow for one-half day [*per site*].

Time for performance is [*number of months*]. [*The*] Initial site visit[*s*] must be completed within [*number of days*] from award of contract. The final report must be completed within [*number of days*] after completion of the initial visit[s]. [*The following schedule of completion is suggested. Modify as instructed by your contracting officer.*]

Work Element	Completion Time After Award
Initial site visits	[*number of days*]
Submit first draft of report[*s*] to park	[*number of days*]
Correct report[*s*] by Contractor	at contractor's discretion
Submit second draft of report[*s*] to park	[*number of days*]
Correct report[*s*] by Contractor	at contractor's discretion
Followup site visit[*s*] and present report[*s*] to park staffs	[*number of days*]
Complete final report[*s*]	at contractor's discretion
Submit final report[*s*] to park	[*number of days*]

Figure G.2. Sample Scope of Work for a Fire Protection Survey (continued)

Schedule of Partial Payments

Partial payments will be made upon successful completion of each successive phase of the work, as outlined below:

Initial site visit[*s*]	50%
Submit second draft[*s*] of report[*s*]	25%
Submit final report[*s*]	25%

Inspection and Acceptance

The [*Insert Name and Title*] shall serve as the Contracting Officer's Technical Representative (COTR) on this project. The COTR is empowered to inspect and evaluate all work of this Contract for compliance with terms of this Scope of Work Statement.

Acceptance of the work of this contract and any changes to the terms of this contract shall be made in writing only by the Contracting Officer.

Figure G.2. Sample Scope of Work for a Fire Protection Survey (continued)

NATIONAL PARK SERVICE

[Park's Name]

To: All Park Personnel

From: Superintendent

Subject: Opening and Closing Procedures for [*Structure's Name*]

Purpose: To establish responsibilities for security and daily opening and closing procedures of [*Structure's Name*].

Policy: Park personnel assigned to [*Structure's Name*] will follow established guidelines to ensure proper security of the site and protection of the resource.

Guidelines:

The intrusion detection system will be activated during all non-business hours. Generally this is from 4:30 PM to 7:30 AM daily. Hours may vary slightly on weekends.

On days when it is not open to the public, the Curator is responsible for arming the intrusion detection system at the end of the workday. On days when the furnished historic structure is open to the public, it is the responsibility of the interpretive staff to arm the system. Generally the furnished historic structure is open on weekends and [days] during the summer.

Each morning, it is the responsibility of the Park Ranger staff to disarm the intrusion detection system. The guards on duty will turn off the systems during the early morning patrol at about [*Time*].

It is the responsibility of the Curator and custodian to maintain security on days when the house is not open to the public. Exterior doors should remain locked at all times and the house should be secured and alarmed at the end of each workday.

It is the responsibility of the Interpretive staff to secure the structure on weekends and on other days that the furnished historic structure is open to the public. The closing procedures should include inspecting the entire furnished historic structure, not just the areas used by the public.

The evening ranger patrol will include an inspection to ensure that the structure has been properly secured. Before entering, the park ranger will patrol around the exterior of the furnished historic structure shining the flashlight on each of the windows to ensure that they are closed. Only if all appears secure, will the ranger enter the structure alone to complete the inspection.

Closing Procedures:

The following steps are taken by designated interpretive or museum staff. As you walk through the house, note maintenance or safety concerns or questions about museum object security.

1. Ensure that visitors are out of the house. Record tour and visitation statistics when the house has been open to the public.

Figure G.3. Sample Furnished Historic Structure Opening and Closing Procedures

2. Place the moveable "entrance" signs inside the Conservatory when the house has been open to the public.

3. Lock all exterior doors. Exterior doors are located in:
   - Conservatory (2 doors)
   - Front entrance
   - Atrium or Small Conservatory
   - Den
   - Kitchen Pantry Hall
   - Servants' Hallway

4. Close all windows and fasten those that can be locked. Check windows in the Conservatory and on all three floors of the house.

5. Pull down the window shades as you check each window.

6. Put the two tripods with fire detectors in their proper position in the Foyer and the Dining Room. Poles should be extended so the detector heads are as close to the ceiling as possible.

7. Close the following interior doors:
   - Front double doors (dead-bolted top & bottom & chained)
   - Basement electrical room
   - First floor Servants' Hall door to Basement
   - Second floor hall door between Servants' Wing and Staircase
   (Intrusion alarm does not arm properly if they are open.)
   - Basement Furnace Room
   - Third floor door to Attic stairs

8. Close the following interior doors, if possible:
   - All basement room doors except fire control panel room
   - Both doors to China Storage area
   - Servants' Hall door to Front Foyer
   (**NOTE:** Closing these doors reduces the chances for false alarms.)

9. Leave night lights on in the following areas:
   - Laundry Room, above the sinks
   - Kitchen, above the sink
   - Servants' Hall, above the radiator
   - Dining Room, one light on each of the two sconces
   - Entrance Hall, inner chandelier globe. (**NOTE:** The switch is in closet.)
   - Second floor Servants' Hall staircase

10. Activate the two intrusion detection system panels in the Laundry Room. Remember the Servants' Wing exit must be closed before the system is armed. Exit the house through the Servants' Wing door.

11. Make a final patrol around the outside of the house to check doors and windows. Do not jiggle doors or windows from the outside. (Doing so might cause an intrusion alarm.)

Figure G.3. Sample Furnished Historic Structure Opening and Closing Procedures (continued)

Opening Procedures:

Intrusion detection systems are disarmed each morning by the park ranger staff. The systems will be off prior to the time that other park staff need to enter the house.

1. Before entering, walk around the outside of the house and check for signs of entry. If anything looks suspicious do not enter. Report the observation to the protection staff immediately.

2. Enter through the Servants' Wing door. Lock the door behind you.

3. Check the status lamps and alarms on both alarm system panels in the Laundry Room and report any malfunctions.

4. Make a walk-through visual inspection of the entire house, including the basement and upper floors. Make particular note of signs of attempted entry, safety or maintenance needs, and the location of museum objects. Report concerns or problems to the appropriate protection or museum staff.

5. Take down the two portable fire detectors in the Foyer and Dining Room, when the house is open to the public. Place them in the Hall Closet.

6. Prepare the rooms along the tour route by opening shades and turning on the appropriate lights, if the house is to be open to visitors. Make a special note of safety and security concerns in these visitor use areas.

7. Prepare for greeting visitors by placing the entrance signs outside. Establish tour assignments, prepare the visitor statistic sheet and ensure that a supply of park folders is available.

8. In summer, when temperatures are hot, visitors will enter through the front door. When weather is cool, the Conservatory will be opened as a waiting area for visitors. If the Conservatory is to be opened, clean up the room, place literature out on display, and unlock both exit doors from the room.

9. Call the Park's Visitor Center desk to let them know that the house is ready for visitors and to check for any special tours or activities.

10. Throughout the day, be certain that all doors into the house are locked unless you can observe them. Generally, the only doors that should be unlocked during the day are those in the Conservatory when it is being used as a visitor waiting area.

Figure G.3. Sample Furnished Historic Structure Opening and Closing Procedures (continued)

NATIONAL PARK SERVICE
[Park's Name]

To: All Park Personnel

From: Superintendent

Subject: Opening and Closing Procedures for [*Storage Facility's Name*]

Purpose: To establish responsibilities for security, fire prevention and daily opening/closing procedures for the park's museum collection storage facility.

Policy: Park personnel who are assigned responsibility for the park's museum collection are required to follow the established guidelines to ensure the proper security of the site and protection of the resources.

Guidelines

Opening Procedures:

1. Before entering the facility, check for any unusual circumstances (e.g., signs of illegal entry, vandalism or maintenance problems). If anything looks suspicious **DO NOT ENTER**. Report any problems to the appropriate staff person in law enforcement, maintenance and/or supervisor immediately.
2. Unlock exterior doors. Turn off the intrusion detection system.
3. Turn on museum workspace lights.
4. Unlock collection storage space door (when needed) and turn on lights.
5. Inspect museum workspace and collection storage space for unauthorized entry, fire hazards, or other unusual happenings (such as roof leaks, fire suppression system leaks, pests, and damaged objects).

Closing Procedures:

1. Inspect the collection storage space to be sure all museum objects and associated records are returned to their proper locations; dust covers are in place; all storage cabinets are closed and locked, and that all tools, equipment, reference books have been returned to their proper places.
2. Check that all museum storage cabinets that were used during the day are locked. Return all storage cabinet keys to keybox and secure it.
3. Check the workspace and collection storage space to be sure that all staff or any other persons are out of the facility.
4. Turn off lights. Make sure that collection storage space door is locked.
5. Turn off all computer equipment, other electrical equipment, and lights in adjacent office spaces.
6. Lock windows in office spaces.
7. Turn on the intrusion detection system.
8. Lock exterior doors.

Figure G.4. Sample Museum Collections Storage Opening and Closing Procedures

NATIONAL PARK SERVICE

[*Park's Name*]

To: All Park Personnel

From: Superintendent

Subject: Museum Collection Access Policy and Procedures

Purpose: To establish park policy and procedures for access to the museum collection. It is the policy of the National Park Service, and of [*Name of Park*], that its natural and cultural resources shall be made available for educational and research purposes, as long as this access doesn't:

- endanger the item's preservation and security
- conflict with Federal legislation (such as the Copyright Act, the Freedom of Information Act) or state legislation (such as privacy and public laws)

NPS museum collections possess internal administrative importance, as well as importance to educational, research, and publishing communities both inside and outside the Service. Protecting these valuable resources, while making them available to the widest possible audience, requires the park museum staff to manage access to the museum collection.

Times of Operation: Normal hours of access to the park's museum collection are [*Days and Hours*].

General Access Procedures:

1. Except as otherwise noted, this written procedural statement applies equally to museum objects, archival and manuscript materials, museum collection records, and information about such park resources prepared by the staff in the course of their official duties.

2. Access to objects in the collection, to storage cabinets and exhibit cases, and to keys to locks on storage rooms, storage cabinets, and exhibit cases, will be strictly controlled by the Superintendent or designee. These areas shall be designated as secure areas, and except for emergencies, access shall be limited to authorized park staff. Park staff are discouraged from routinely using museum storage space as work or reference room space.

3. Only those persons authorized in writing by the superintendent (authorized park staff) will be permitted unaccompanied access to secure areas, including museum storage, work, and reference/study room spaces, under normal conditions. All other persons must be accompanied by authorized staff while in a secure area. In an emergency, designated emergency response personnel may have access to secure areas in accordance with the provisions of the park's Emergency Operations Plan. An authorized person will continuosly supervise anyone in a secure area who is not on the list of authorized park staff.

4. Granting of access to a secure area does not automatically include access to museum objects, archival materials, or museum records kept in those areas. Only persons with a legitimate need to use collection items will be granted access to them.

5. Anyone requesting access to secure areas or to museum collections must agree to comply with the provisions of the park's "Conditions for Access to Museum Collections."

6. These procedures will be reviewed every two years and revised as necessary.

Figure G.5. Sample Park Museum Collection Access Policy and Procedures

Eligibility for Access to Museum Collections:

Access to the collections should be granted by the Superintendent or designee to the following individuals:

1. **Individuals seeking to use collection for research or study.** An individual may request to conduct research on the collection by registering and making an appointment with the park museum staff.

2. **National Park Service staff from the Field Area Office, System Support Office, the Washington Office, centers, or other parks who are visiting the park on official business**. The nature of their work must require them to evaluate, inspect, or work with the collections or the rooms, cabinets, or cases housing the collections or with park records on the collections. Persons granted access under this category of eligibility do not necessarily have to be accompanied by park staff at all times; a decision in that respect will be based on their reasons for needing access and on other factors that the Superintendent may consider germane at the time.

3. **Representatives of Indian Tribes or Native Hawaiian organizations having official business with the park staff for examining archeological or ethnographic objects in the collections.** The Superintendent should ascertain if the individuals are official tribal representatives. Under this category, individuals will have access to collections associated with their own tribes.

4. **Non-museum park employees, including volunteers, who are being oriented to the park and their work or who require access to collections as part of their internal training.**

5. **Park maintenance and protection staff in the performance of their official duties**. Except in the most unusual circumstances, such personnel shall have access only to rooms in which collections are kept, not to storage cabinets or exhibit cases or to key boxes or other places where keys to cabinets and cases are secured. As provided below, other means shall be made available to these personnel for emergency access. Persons granted access under this item of eligibility do not necessarily have to be accompanied by curatorial staff, but should be whenever possible.

6. **Individuals or representatives of organizations, institutions, or corporations desiring to use objects or records in the collection for commercial or publicity purposes**. Such persons must satisfy the Superintendent that their purposes are legitimate and that the proposed uses are in keeping with park purposes and the NPS mission and will not reflect adversely on the park, the National Park Service, or a Native American tribe, if the request is for tribal materials. Access should not be granted solely on the grounds that access to the park's collection would be more economical or "easier" for them than access to another collection. When the park provides access, it is not authorizing publication, distribution, derivitive works, exhibitions, reproductions, or other non-research activity.

7. **Employees of construction or service companies who require access to collection storage or exhibit areas in order to service or maintain the building or its utilities, including alarm systems**. Such persons will be allowed access only under the terms of a contract or purchase order issued by or for the park and only to those areas where they are supposed to work. Under no circumstances shall such persons be allowed unsupervised access to objects kept in storage cabinets and exhibit cases. Except as may be

Figure G.5. Sample Park Museum Collection Access Policy and Procedures (continued)

otherwise provided in the language of the contract or purchase order, all persons granted access under this item of eligibility must be accompanied at all times by authorized staff. The Superintendent or designee shall have the authority to restrict access otherwise granted by this paragraph, under such circumstances where it is deemed advisable.

8. **Other persons or groups of persons may be allowed limited access to the collections, on determination by the Superintendent or designee that such access will be to the mutual benefit of the persons or groups and the park**. Examples of circumstances to which this item of eligibility might apply include: tours for school classes, tours for members of museum organizations or historical societies, tours for families of park employees, orientation for local political/ governmental officials, orientation for visiting Park Service employees not on official business, and tours for non-NPS museum personnel, teachers, and prospective researchers who are considering applying for permission to use or view the collection.

National Park Service

VISITOR LOG

By signing this visitor log I acknowledge that I have read and agreed to conditions listed on the reverse of this log.

DATE	TIME IN TIME OUT	NAME (Print) (Signature)	ORGANIZATION (Name, Address, Telephone Number)	AREA AND ITEMS OF INTEREST

Figure G.6. Sample Visitor Log

U.S. Department of the Interior
National Park Service

CONDITIONS FOR ACCESS TO MUSEUM COLLECTIONS

1. Access to collections and/or to a secure area by researchers is by appointment. Any limitations imposed on access due to collection conditions, staff availability, and security considerations must be imposed equally on all users, including park staff's personal research. Persons needing to have access are urged to make their requests known to the Superintendent or designee as far in advance as possible.

2. Prospective visitors should be aware that the park staff is extremely busy at certain times of the year and that authorized staff may not be available to assist them at those times. Accordingly, it is suggested that persons needing access make an appointment and be prepared to discuss alternative times with the staff when they submit their requests.

3. The park's decision to allow access may depend upon the condition of the materials, the availability of space for the requester to work, and appropriate supervisory staff. The park keeps space and staff available for visiting researchers.

4. The park requires registration of all researchers (including those inquiring through the mail, on the phone, or Internet). Registration information needs to include full name, address, telephone number(s), institutional affiliation, research topic and publication plans. This information must be updated yearly to remain valid. A valid picture identification card must be shown at the time of the visit. All materials requested by the user are recorded.

5. All non-staff visitors and all staff visitors who are not designated as authorized staff will be accompanied at all times by authorized staff when in museum collection storage areas, when working in open exhibits, or when working with original museum and archival materials.

6. All visitors must sign in and out of museum collection storage area(s) and reference/study rooms on the park's "Visitor Log."

7. Smoking, drinking, and eating are prohibited in collection storage and work spaces and reference/study rooms. Suitcases, briefcases, overcoats, plants, and animals, except guide dogs, are not allowed in collection storage and study areas. Researchers must use pencils/paper or portable computers for taking notes.

8. All guidelines for handling objects and archival and manuscript materials must be read and signed by all collection users, whether staff or non-staff. These guidelines are published separately and may be requested in advance of a visit. A copy of the guidelines also will be provided to each user at the time he/she arrives.

9. The park reserves the right to the following as a condition for granting access to the collections:

   a. The researcher must agree to abide by any copyrights and state privacy and publicity legislation as well as duplication, publication, and citation policies.

   b. The park, as a courtesy, requests two copies of completed research papers; publications; CD-ROMs; screen captures of World Wide Web work, derived from work on the collections, or which contain photographs of objects in the collections or copies of documents in the archival collections. Copies of formal reports and other published materials shall be provided at the researcher's expense. Copies of drawings, photographs, and other products of research shall be provided at the researcher's expense, except when doing so constitutes an economic burden, in which case the Superintendent can elect to defray those costs or waive the requirement for the researcher to provide the materials.

Figure G.7. Conditions for Access to Museum Collections

MEMORANDUM OF UNDERSTANDING

BETWEEN

[*Name of Park*]

and

[*Name of Fire Company*]

[*City, State*]

Article I
Background and Objectives

WHEREAS, [*Name of Fire Company*] hereinafter [*Department/Company*] and the National Park Service (hereinafter Service) and more particularly the [*Name of Park*], hereby enter into an Agreement to provide mutual aid and assistance for occurrences of structural fires, [*As applicable, insert language to identify other needs, such as wildfires, emergency medical services and hazardous materials spills for those occurrences*] on or within the boundary of said Park, a unit of the National Park System, United Stated Department of the Interior, that are within the response area of the [*Name of Fire Company*]; and

WHEREAS, pursuant to 16 U.S.C. 450bb, the Service administers the Park that was established as a unit of the National Park System, United States Department of the Interior; and

WHEREAS, pursuant to 16 U.S.C. 1b.(1), the Service may provide for the rendering of emergency rescue, fire fighting and cooperative assistance to nearby fire prevention agencies and for related purposes outside of the National Park System; and

WHEREAS, pursuant to 42 U.S.C. 1856a, the Service is authorized to enter into reciprocal agreements for mutual aid to furnish fire protection with any fire organization maintaining fire protection facilities in the vicinity of Service property and for other property for which said agency normally provides fire protection; and

WHEREAS, the Service and Company have determined that the Memorandum of Understanding herein described is compatible with the public interest.

NOW,THEREFORE, pursuant to 42 U.S.C. 1856a, both parties do mutually understand and agree as follows:

Figure G.8. Sample Memorandum of Understanding Between a Park and a Fire Company

Article II
Statements of Work

The Memorandum of Understanding (MOU) herein made is subject to the following terms and conditions:

General

(1) The purpose of this MOU is to provide mutual aid and assistance between [*Name of Park*] and the [*Name of Fire Department/Company*] of [*Name of city or county and state*], should emergency medical services be needed in structural fires [*as applicable, include wildfires or hazardous materials spills*] that occur on, or threaten or endanger property under the protection of either agency.

(2) The area of Park property covered by this MOU will be that area within the [*Name of Fire Department/Company*] response area of [*Name of city or county and state*].

(3) In the execution of this MOU, employees or agents of the company are not considered employees of the park or NPS.

(4) The Service, Park and the [*Department/Company*] waive all claims against each other for compensation for any loss, damage, personal injury, or death occurring in consequence of activities pursuant to this MOU.

(5) All structural fire suppression personnel will meet, as a minimum, the requirements found in NPS-58, Structural Fire Guidelines.

(6) The Park and [*Department/Company*] agree to notify the other of available training the areas identified in No. (8) below and participate in joint training exercises when possible.

(7) Park and Company representatives will meet Quarterly (January, April, July, October) to discuss mutual aid operations and to evaluate the MOU for revisions and renewal. Any revisions of this Agreement must be in writing, receive proper approval, and be signed by the parties hereto. Renewals will be subject to regulations existing at the time of renewal and such other terms and conditions deemed necessary to protect the public interest.

(8) The provisions of this MOU are divided into the following sections: Structural Fire; [*as applicable, include other sections, such as Wildfire (Forest Fire); Emergency Medical Service/Search and Rescue; and Hazardous Materials.*]

Structural Fire

(1) As an aid to implementing this MOU, selected members of the [*Department/Company*] (including the Fire Chief and the Ambulance Chief) will, at least annually, visit the Park and, accompanied by the Park Superintendent or designated representative, survey park buildings for the purpose of developing a Building Pre-Plan. Special fire fighting procedures necessary to safeguard museum objects and archival and manuscript collections housed within the structure will be identified in the Building Pre-Plan. Current floor plans of Park buildings will be provided to the Company Fire Chief.

Figure G.8. Sample Memorandum of Understanding Between a Park and a Fire Company (continued)

(2) The Company will respond to all reported structural fires in the Park (within the [*Department's/Company's*] response area) as promptly as possible and with due regard for the safety of all persons. Upon arrival at the scene of the reported structural fire:

(a) *Park Ranger not at the scene*. The Officer-in-Charge for the [*Department/Company*] will check the perimeter of the building for signs of fire. If sign of a fire is detected, he/she will assume direction of all fire fighting activities until relieved by a superior officer or until the fire is extinguished and declared out. If no sign of a fire is detected, he/she will wait for arrival of a Park Ranger.

(b) *Park Ranger at the scene*. If the ranger has already checked the structure for sign of fire and the alarm system, he/she will so advise the Officer-In-Charge of the [*Department/Company*]. If not, the ranger and the Officer-In-Charge will jointly check the structure for sign of fire. If sign of a fire is detected, the Officer-In-Charge for the Company will assume direction of all firefighting activities until relieved by a superior officer or until the fire is extinguished and declared out. If the structure has been identified in the Building pre-Plan as requiring special precautions necessary to safeguard museum objects and archival and manuscript collections within the structure, the ranger will so notify the Officer-In-Charge. The ranger will notify the officer-in-charge of any hazardous materials in the collection (such as cellulose nitrate film).

(3) Each party to this MOU will furnish such equipment and personnel to aid the other party with a structural fire as can be made without jeopardizing the fire protection of its own area of responsibility.

(4) All requests for Park Aid to assist with a structural fire must originate from the Company's senior fire official at the scene of the fire to the Park Superintendent or designated representative.

[*As appropriate, include language on wildfire (forest fire), emergency medical service/search and rescue, and hazardous materials.*]

Article III
Term of Memorandum of Understanding

The Memorandum of Understanding hereby made shall terminate one (1) year from the effective date hereof, at noon, [*Name of State*] time, unless prior thereto it is relinquished, abandoned, or otherwise terminated pursuant to the provisions of this MOU or of any applicable Federal law or regulation. In addition, the MOU will expire at the end of the specified term unless formally reaffirmed or rewritten if necessary. The effective date of this MOU shall be the date of its execution by the Superintendent, [*Name of Park*].

Unless relinquished, abandoned, or otherwise terminated pursuant to the provisions of the MOU or of any applicable Federal law or regulations, the MOU will be considered for renewal.

Figure G.8. Sample Memorandum of Understanding Between a Park and a Fire Company (continued)

Article IV
Key Officials

This Memorandum of Understanding is subject to the conditions of the Superintendent or representative, and shall comply with the regulations of the Secretary of the Interior and other applicable conditions as outlined herein.

Superintendent
[*Name of Park*]
[*Complete Address*]

The President and Fire Chief of [*Name of Fire Department/Company*] will direct operations according to the conditions agreed to in this MOU.

[Name of President]	[*Name of Fire Chief*]
[Name of Department/Company]	[*Name of Department/Company*]
[Complete Address]	[*Complete Address*]

Article V
Reports

Each party is responsible for its respective timekeeping and other required records and reports.

Article VI
Termination

This Memorandum of Understanding may be terminated upon breach of any of the conditions herein or at the discretion of either party. Termination shall be done by providing ninety (90) days written notice to the other.

Article VII
Required Compliance

All activities pursuant to this Memorandum of Understanding shall be in compliance with the requirement of Executive Order 11246, as amended; Title VI of the Civil Rights act of 1964 (78 Stat. 252: 42 U.S.C. 2000d et seq.); and with all other federal laws and regulations prohibiting discrimination on grounds of race, color, national origin, handicap, religion, or sex in employment and in providing facilities and services to the public.

No member or delegate to Congress, or resident Commissioner, shall be admitted to any share or part of this agreement, or to any benefit that may arise therefrom, but this provision shall not be construed to extend to this agreement if made with a corporation for its general benefit.

Figure G.8. Sample Memorandum of Understanding Between a Park and a Fire Company (continued)

This Memorandum of Understanding is subject to the provisions of 18 U.S.C. 1913, which provide:

> No part of the money appropriated by any enactment of Congress shall, in the absence of express authorization by Congress, be used directly or indirectly to pay for any personal service, advertisement, telegram, telephone, letter, printed or written matter, or other device, intended or designed to influence in any manner a Member of Congress, to favor or oppose, by vote or otherwise, any legislation or appropriation by Congress, whether before or after the introduction of any bill or resolution proposing such legislation or appropriation; but this shall not prevent officers or employees of the United States or of its departments or agencies from communicating to Members of Congress on the requests for legislation or appropriations which they deem necessary for the efficient conduct of the public business.
>
> Whoever, being an officer or employee of the United States or of any department or agency thereof, violates or attempts to violate this section, shall be fined not more than $500 or imprisoned not more than one year, or both; and after notice and hearing by the superior officer vested with the power of removing him, shall be removed from office or employment.

Nothing contained in this Memorandum of Understanding shall be construed as binding the Service to expend in any one fiscal year any sum in excess of appropriations made by Congress for the purposes of this Memorandum of Understanding for that fiscal year, or as involving the Service in any contract or other appropriation for the further expenditure of money in excess of such appropriations.

IN WITNESS WHEREOF, the Superintendent of [*Name of Park*], acting on behalf of the National Park Service, in the exercise of the delegated authority from the Secretary of the Department of the Interior, has caused this Memorandum of Understanding to be executed this [Date] day of [month], [year].

[*Name of Superintendent or Manager*]
[*Name of Park or Center*]

ACCEPTED THIS [*Date*] DAY OF [*Month*], [*Year*].

[*Name of Fire Department/Company*]

[*Name of Fire Chief*]
[*Name of Fire Department/Company*]

Figure G.8. Sample Memorandum of Understanding Between a Park and a Fire Company (continued)

Appendix H: Curatorial Health and Safety

APPENDIX H: CURATORIAL HEALTH AND SAFETY

A. Laws, Regulations, and NPS Policies and Guidelines

The following authorities and guidelines cover curatorial health and safety in the NPS:

- The Occupational Safety and Health Act of 1970 provides the requirements on which each federal agency's safety and health program is based. See <http://www.osha-slc.gov/oshAct_data/OSHACT.html>.

- The Comprehensive Drug Abuse Prevention and Control Act of 1970 establishes the mechanisms for reducing the availability of controlled substances and the procedures for bringing a substance under control.

- The Resource Conservation and Recovery Act (RCRA) of 1986 directs the Environmental Protection Agency to develop and implement a program to protect human health and the environment from improper hazardous waste management practices. See <http://www.epa.gov/epahome/laws.html>.

- Executive Order 12196 (1980) directs each federal agency to provide a safe and healthful working environment for its employees. See <http://www.nara.gov/fedreg/eos/e12196.html>.

- 29 CFR 1910.134 provides guidance regarding the use of respirators. See <http://www.osha.gov/comp-links.html>.

- 29 CFR 1910.1000, Subpart Z provides tables listing toxic and hazardous substances and maximum exposure levels. See <http://www.osha.gov/comp-links.html>.

- 29 CFR 1910.1200 (Revised 1987) provides specific guidance on implementing the Occupational Safety and Health Administration (OSHA) Hazard Communication Standard. See <http://www.osha.gov/comp-links.html>.

- 29 CFR 1910.1450 (Effective 5/1/90) provides guidance relevant to occupational exposure to hazardous chemicals in laboratories. See <http://www.osha.gov/comp-links.html>.

- 29 CFR 1910.1047 (Revised 1985) regulates the use of the fumigant ethylene oxide. See <http://www.osha.gov/comp-links.html>.

- 29 CFR 1960 provides basic program direction for Federal Employee Occupational Safety and Health Programs. See <http://www.osha.gov/comp-links.html>.

- The *Department Manual*, Part 485, establishes the Department of the

Interior (DOI) safety and health program. See <http://elips.doi.gov/>.

- Director's Order #50B: Occupational Safety and Health, covers the occupational safety and health of NPS employees. The NPS Risk Management Program has been developed to establish and implement a continuously improving and measurable risk management process. See <http://www.nps.gov/refdesk/DOrders/index.htm#manuals>.

- Director's Order #83: Public Health, and *Reference Manual 83,* outline what the NPS will do to ensure compliance with prescribed public health policies, practices, and procedures. See <http://www.nps.gov/refdesk/DOrders/index.htm#manuals>.

B. Sources of Assistance

1. *Federal agencies and cooperators for health and safety*

The following federal agencies regulate aspects of the National Park Service health and safety program:

- The ***Occupational Safety and Health Administration (OSHA),*** part of the US Department of Labor, publishes and enforces safety and health regulations for most businesses and industries in the United States.

  U.S. Department of Labor
  Office of Public Affairs, Room N3647
  200 Constitution Avenue
  Washington, DC 20210

  Tel: 202-693-1999
  <http://www.osha.gov>

- The ***National Institute for Occupational Safety and Health*** (NIOSH) trains occupational health and safety professionals, conducts research on health and safety concerns, and tests and certifies respirators for workplace use.

  Hubert H. Humphrey Building
  200 Independence Avenue, SW, Room 715H
  Washington, DC 20201

  Tel: 1-800-35-NIOSH
  <http://www.cdc.gov/niosh/homepage.html>

- The ***Environmental Protection Agency (EPA)*** administers laws to control and/or reduce pollution of air, water, and land systems and regulates use and labeling of pesticides in accordance with the Insecticide, Fungicide and Rodenticide Act of 1972.

  1200 Pennsylvania Avenue, NW
  Washington, DC 20460

  Tel: 202-260-4048
  <http://www.epa.gov>

- The ***U.S. Department of Transportation (DOT)*** regulates the labeling and transportation of hazardous materials.

  Research and Special Programs Administration
  Office of Hazardous Materials Safety
  400 7th Street, SW
  Washington, DC 20590

  Tel: 202-366-8553
  <http://www.dot.gov>

- The ***National Pesticide Telecommunications Network*** provides objective pesticide information to any caller.

  333 Weniger Hall
  Oregon State University
  Corvalis, OR 97331

  Tel: 800-858-7378
  <http://www.ace.orst.edu/info/nptn/>

2. *Professional organizations for health and safety management*

In addition to the above federal agencies and cooperators, park staff should be aware of the following professional organizations that are involved in health and safety management:

- The ***American Conference of Governmental Industrial Hygienists (ACGIH)*** develops and publishes recommended occupational exposure limits each year called Threshold Limit Values (TLVs) for hundreds of chemicals, physical agents, and biological exposure indices.

  1330 Kemper Meadow Drive, Suite 600
  Cincinnati, OH 45240

  Tel: 513-742-2020
  <http://www.acgih.org/>

- The ***American Industrial Hygiene Association (AIHA)*** provides information on occupational and environmental health and safety issues and controls, anticipates, and evaluates environmental factors arising in or from the workplace that may result in injury, illness, or impairment, or affect the well-being of workers and members of the community.

  2700 Prosperity Avenue, Suite 250
  Fairfax, VA 22031

  Tel: 703-849-8888
  <http://www.aiha.org>

- The ***National Fire Protection Association (NFPA)***, a voluntary membership organization, promotes and improves fire protection and prevention. The NFPA publication *Standard No. 704*: *Identification of the Fire Hazards of Materials*, rates the hazard of a variety of materials

during a fire.
Batterymarch Park
Quincy, MA 02269

Tel: 617-770-3000
<http://www.nfpa.org>

- The ***National Safety Council*** educates and influences people to adopt safety and health policies, practices, and procedures to prevent losses caused by accidents and hazardous occupational or environmental exposures.

  444 North Michigan Avenue
  Chicago, IL 60611

  Tel: 312-527-4800
  <http://www.nsc.org/>

- The ***American National Standards Institute (ANSI)***, a voluntary membership organization, develops consensus standards nationally for a wide variety of health and safety devices and procedures.

  1420 Broadway
  New York, NY 10018

  Tel: 212-354-3300
  <http://www.ansi.org>

3. *Other organizations*

In addition to the Park Safety Officer, the Regional Safety Officer, the regional/SO curator, the WASO Risk Management Division, and the Museum Management Program, National Center for Cultural Resources, the following organizations have extensive experience in dealing with occupational health and safety issues/problems in museum environments:

- The ***American Institute for Conservation (AIC)*** Health and Safety Committee has produced information directly related to museum and conservation laboratory safety.

  1717 K Street, NW, Suite 200
  Washington, DC 20006

  Tel: 202-452-9545
  <http://aic.stanford.edu/health/>

- ***Arts, Crafts and Theater Safety (ACTS)*** is a not-for-profit corporation dedicated to providing health and safety services to the arts.

  Ms. Monona Rossol, President
  181 Thompson Street, #23
  New York, NY 10012

  Tel: 212-777-0062
  <http://www.caseweb.com/ACTS>

C. Sources of Health and Safety Equipment and Supplies

There are several sources for obtaining desk fans, fume hoods, portable fume hoods and fume scrubbers, laboratory protective clothing and gloves, respirators, chemical storage cabinets, health and safety publications, hazard warning labels, signs and charts, and other supplies. NPS parks and centers should contact the Museum Management Program for current sources of health and safety equipment and supplies. *Tools of the Trade* is periodically updated with new information on health and safety equipment and supplies.

Appendix I: Curatorial Care of Archeological Objects

APPENDIX I: CURATORIAL CARE OF ARCHEOLOGICAL OBJECTS

A. Overview

1. *What is an archeological object?*

Archeological objects are the result or product of an activity in the past that has been recovered from an archeological site. Archeological objects may have originated in the ancient past or quite recently. Depending upon the soil and climate of the site, a wide variety of materials may be excavated.

- ***Inorganic*** artifacts include:
  - metal
  - ceramics
  - glass
  - stone
- ***Organic*** artifacts include:
  - leather
  - basketry
  - textiles
  - modern plastics and other synthetics
  - bone
  - teeth

Archeological collections may also contain non-artifactual samples, such as botanical material, soils, pollen, phytoliths, oxylate crystals, snails, insect remains, and parasites.

While some individual archeological objects are found in NPS collections, the majority have been recovered as part of systematic archeological excavation. Preservation and care of individual objects must also consider the impact on the collection as a whole.

An important part of archeological collections are the associated archival records (for example, field notes, photographs, maps, digital documentation). For information on managing and preserving these archival records see *Museum Handbook,* Park II (*MH-II*), Appendix D: Museum Archives and Manuscript Collections and *Museum Handbook,* Part I (*MH-I*), Appendix J: Care of Paper Objects, Appendix M: Management of Cellulose Nitrate and Cellulose Ester Film, and Appendix R: Curatorial Care of Photographic Collections.

2. *What does this appendix cover?*

This appendix provides guidance only on the care of objects excavated from the ground. For guidance on collections from marine excavations, consult an archeological objects conservator with experience in the treatment of waterlogged materials. See Chapter 3: Preservation: Getting Started, Chapter 8: Introduction to Museum Object Conservation Treatment, and Conserve O Grams 6/1-6/6 for more information.

This appendix does not cover field treatment of objects when first excavated. Good sources of information on this topic include Sease (1987) and Watkinson and Neal (1998) listed in the references.

3. *What makes archeological objects different from other materials commonly found in museum collections?*

What makes archeological objects different is that at some point they were lost or abandoned and buried underground or in water.

The condition of these objects depends entirely on their reaction with the environmental conditions to which they have been exposed through time. Underground the object reaches a kind of equilibrium with the surrounding soil. Then, when the object is excavated, it must adjust to a new and radically different environment. Reactions can involve both physical and chemical changes. Regardless of the condition of the object before excavation, the moment it becomes exposed it is vulnerable to rapid deterioration. Figure I.1 illustrates the deterioration rate of archeological objects through time.

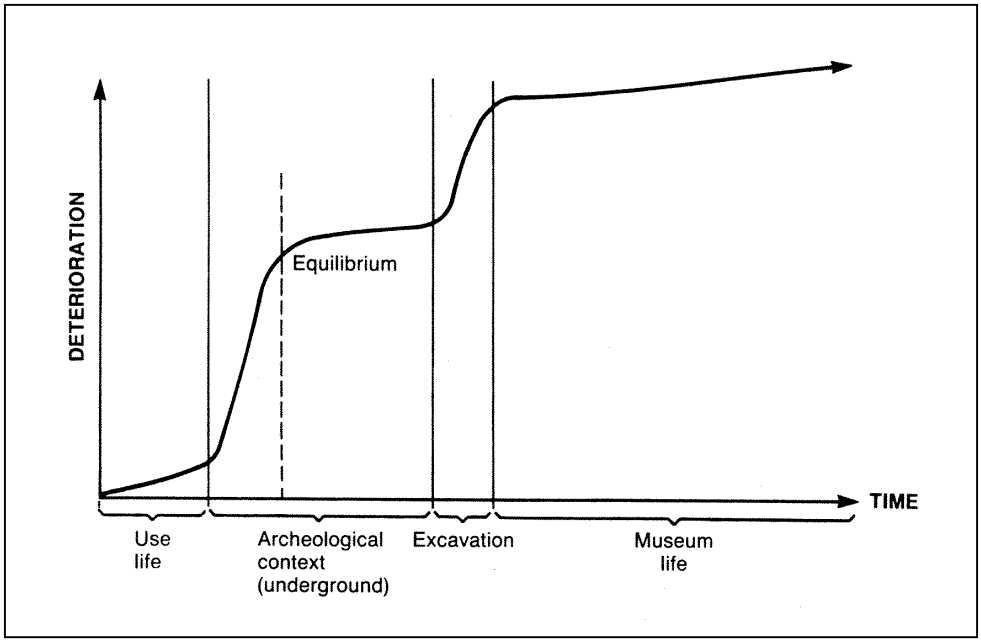

Figure I.1. Deterioration of Archeological Objects through Time

4. *How can I minimize deterioration of archeological objects?*

Preservation of archeological collections is a collaboration between archeologists, curatorial staff and conservators. Each person brings a different perspective and expertise to the problem. It is important to understand the concerns and needs of these other professionals when making decisions about how to care for archeological objects.

Preservation must begin in the field. Curatorial staff should work with archeologists depositing collections to make sure that preservation concerns are addressed during archeological procedures at the site and in the processing laboratory. Work with conservators both in the field and at the repository to ensure preservation choices are based on current research. Follow through with proper curatorial care in museum collections storage.

Refer to Director's Order #28 and Chapter 6: Management of Archeological Resources of the *Cultural Resources Management Guideline*, for guidance on the responsibilities of the archeologist before selecting a repository and depositing collections. See Director's Order #24, NPS Museum Collections Management, for park management's responsibility to ensure appropriate care and management of archeological collections.

C. Handling and Cleaning of Archeological Objects

1. *How should I handle the objects?*

Because the research value of archeological material may be lessened or destroyed by unnecessary handling and inappropriate treatment, preservation of these materials should be based on preventive care. Careful handling, packaging, and storing of archeological objects are crucial for the survival of the material as an artifact. Mishandling and storage will encourage deterioration and can reduce the material to nothing more than powder.

Archeological objects can have a deceptive appearance of strength when first uncovered. All excavated materials have undergone some form of alteration during the equilibration process underground and during the recovery process. This alteration has physically weakened the object. While underground, objects are supported by the surrounding soil, and when excavated, they may be unable to support their own weight. For this reason, archeologists and conservators often use specialized lifting techniques to excavate fragile and potentially fragile objects. During and after excavation, continue to support these objects on a tray or pallet or in a container that distributes weight properly.

An archeological object must always be fully supported. Use both hands, a tray, or a supporting container to lift and carry an object, whether it is large or small. Always assume that an excavated object is weak.

Review the guidelines for handling museum objects in Chapter 6: Handling, Packing, and Shipping Museum Objects.

2. *How should I clean the artifacts in museum collections?*

Cleaning of archeological material should be kept to a minimum. The cleaning process may destroy important archeological evidence such as surface decorations and composite or associated materials that often exist only as impressions on the surface of the object or in the surrounding soil. Original surfaces of metal objects may lie within layers of corrosion. Evidence of use (for example, food residue in containers, pigment traces on stone palettes, or blood traces on stone projectile points) may be removed by unnecessary cleaning.

Cleaning may also interfere with scientific analysis. For example, the use of acid to remove deposits on ceramics may also remove acid-soluble compounds in the ceramic paste and as a result, invalidate compositional analysis used to determine the prehistoric source of clay. See *Conserve O Gram* 6/6, "Long-term Effects of Acid-Cleaning Archeological Ceramics." Water can also remove amino acid traces used to date bone. Washing may also hasten deterioration of salt-contaminated material and can be disastrous to metal objects if they are not carefully and completely dried afterward.

Avoid any treatment that alters the chemical or physical integrity of the artifact. Don't risk losing valuable information or inflicting irreversible damage.

Once an object has reached the repository and is in curatorial care, remove only loose dust and dirt by dry brushing or vacuuming. ***Don't*** wash the object and ***don't*** apply pressure. The surface of an archeological object is often fractured or friable and may be easily dislodged by rubbing. Carefully assess an object's surface ***before*** you start to clean it. If additional cleaning, stabilization, or repair is necessary, consult an experienced conservator.

D. Storage Conditions for Archeological Objects

1. *How should I organize archeological collections in storage for best preservation?*

Archeological collections are often large and contain a variety of materials with different environmental storage requirements and with different research values. Physical organization of the collections by research values, such as source or cultural affiliation, will not necessarily meet preservation needs. It is better to organize the materials by environmental requirements and maintain the research integrity of the collection through good museum records.

Ideally, all archeological objects should be stored in climate-controlled areas, but this often is not practical. Most archeological collections are large and not all storage facilities have enough climate-controlled storage space to house entire collections. In such cases, it is possible to maximize preservation while minimizing utility costs by implementing a storage strategy based on the environmental requirements of various archeological materials.

2. *What are the environmental requirements?* See the chart below for a system to organize archeological material by environmental sensitivity.

Organization of Archeological Material	
Level I: Negligibly climate-sensitive materials	
Materials: • stable stone and fired ceramics • stable inorganic architectural materials (plaster, mud, daub, brick, and stone) • dry pollen, flotation, and unprocessed soil samples • faunal remains	***Required Climate***: Gradual daily and seasonal fluctuations of temperature and relative humidity can be tolerated. • ***Relative Humidity***: Above 30% and below 65%. Mold may become a problem above 65%. • ***Temperature***: Freezing to 100°F. Moderate and cool temperatures are preferred. High temperatures increase deterioration of all materials.
Level II: Climate-sensitive materials	
Materials: • stable metal • stable glass • worked bone, antler, and shell • botanical specimens • textiles • wood • skin, leather, and fur • feathers and horn • natural gums, resins, and lacquer • human remains	***Required Climate***: • ***Relative Humidity***: Determine a stable point based on the object's environmental history and current regional climate. If the materials will be stored near the collection site, you may follow these guidelines. 30-40%--semi-arid areas and deserts 40-50%--central and eastern plains and woodlands 45-55%--seacoast and lakeshore Keep conditions as stable as possible. Many organic materials are more sensitive to fluctuations of relative humidity than to any one unchanging level in the moderate range. Do not allow daily fluctuations of more than 3%. From summer to winter, keep the change to no more than a slow 10% drift. • ***Temperature***: Above 50° F and below 75° F. You may adjust the temperature slightly to control the relative humidity, but do not exceed changes of 5° daily.
Level III: Significantly climate-sensitive materials	
Materials: • unstable (salt-contaminated) ceramics, stone, and bone • unstable glass (glass that appears damp or "weeping") • unstable metal, particularly iron • mummified human and animal remains • composite objects (objects made of several different materials)	***Required Climate***: • ***Relative Humidity***: Keep the RH within the restricted range determined by the object's composition and condition. Follow these guidelines. – metal—under 30%. Unstable iron is best stored below 15%. – unstable glass—30% to 40% – naturally mummified animal remains—15% to 20% – unstable ceramics, stone and bone (salt contaminated)—below 50% (***Note***: Keep the RH as steady as possible to avoid damage by the hydration cycling of soluble salts.) • ***Temperature***: Choose a point between 60° and 72° and keep the temperature steady. Allow it to fluctuate only enough to keep the RH in check.

3. *What are the storage requirements for each of the three levels of climate sensitivity?*

Each level of climate sensitivity requires a different type of storage.

- ***Level I*:** General storage for Level I materials should meet the ***minimum*** overall standards for all NPS storage spaces as outlined in Chapter 7: Museum Collections Storage.

  – Store materials that do not need special attention in boxes on open shelves.

  – Store loose material, including the following, in bags within boxes:
    bulk botanical specimens
    unprocessed soil samples
    dry pollen and flotation samples
    slag
    unworked bone
    lithic cores and debitage
    ceramic sherds

  Make sure the bags are strong and will not tear or puncture. Bags made of Tyvek®, a strong spun polyethylene plastic that allows water vapor to escape, are a good choice. Canvas bags and resealable polyethylene bags can also be used.

- ***Level II*:** Climate-controlled storage for Level II materials should comply with the ***optimum*** standards for NPS storage areas as outlined in Chapter 7.

  If your park has no currently available area where the environment can be controlled, consider putting up a prefabricated, climate-controlled structure. See *Conserve O Gram* 4/7, "Museum Collection Storage Space: Is an Insulated Modular Structure Right for your Collection?" Consult your regional or support office curator, conservators specializing in environmental or preventive conservation, or the Museum Management Program for guidance in developing an acceptable storage area.

- ***Level III*:** Microclimate storage for some Category III materials can be created within the climate-controlled storage area used for Category II materials.

  – Place objects requiring an extremely stable environment within a closed well-gasketed museum cabinet that will shield them from even slight fluctuations in relative humidity.

  – Place metals and unstable glass, which require a relative humidity quite different from other objects in storage, in tightly sealed boxes with moisture-sensitive materials called *sorbents.* Sorbents, such as ***silica gel***, buffer the interior of the container against changes in the relative humidity of the enclosed objects.

E. Storage Techniques for Archeological Collections

1. *What type of storage container should I use to store archeological objects?*

There are many different types of standard boxes and bags that are appropriate for general storage. ***Note: These are not for microclimate storage.*** See Chapter 4 for information on microclimate storage.

- Use acid-free boxes with lids rather than self-closing boxes with flaps that will wear out over time.
- Store small objects like lithic points and nails in boxes manufactured for the storage of archival and photographic collections.
- Use small resealable polyethylene bags for individual specimens and stack them vertically within each section of the box. You can staple them to acid-free index cards to make them easier to stack. If the objects are not numbered, include an acid-free tag with an identification number inside each bag and also be sure to write the number on the outside of the bag or on the card.

See Figure I.2. Note the easy visual access and consistent packaging technique illustrated. Never wrap objects in padding material. Wrapping and unwrapping requires excessive handling.

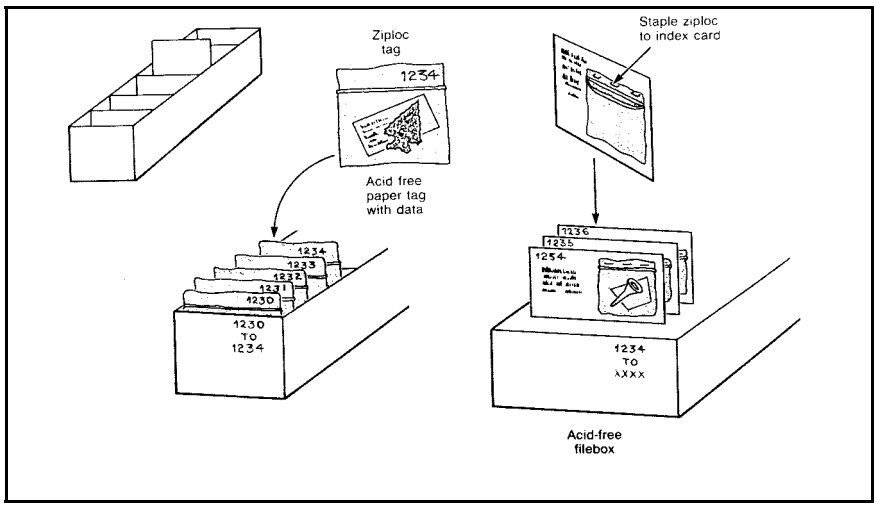

Figure I.2. Vertical Stacking of Small Objects Within Standard Containers

2. *Why is silica gel often used in archeological storage?*

Archeological objects are often unstable and very sensitive to changes in relative humidity. Silica gel can moderate fluctuations in relative humidity within a closed container.

Silica gel is inert, amorphous silicon dioxide in a porous granular form that is able to adsorb moisture from the air. It can adsorb 30-40% of its dry weight and responds more quickly than other sorbents to variations in relative humidity. The gel rapidly senses, corrects, and stabilizes fluctuations in relative humidity by humidifying or dehumidifying the air around it to maintain its own preferred environment. See Chapter 4: Museum Collections Environment, for information on use of silica gel in microclimates.

3. *How should I cushion my objects?*

Use padding material to prevent the contents of a container from shifting when it is moved. Be careful not to overstuff the box with crumpled tissue or other padding material that could exert damaging pressure on fragile objects. Use either of these cushioning techniques:

- Make smooth pillows to place against the surface of the object by folding wadded acid-free *unbuffered* tissue paper within loose rolls of tissue. Wrapping the crumpled tissue will keep it from expanding and exerting pressure.

- Fill resealable sandwich-sized polyethylene bags with cotton.

Don't use cotton or polyester wool alone. Cotton is an excellent sorbent and may hold moisture directly against the object. Fibers from these materials may snag and damage delicate artifacts.

4. *How should I organize the box contents?*

Organize your artifacts so that each object can be easily retrieved without disturbing the rest. One technique is to layer your items. If they are small and lightweight, they can be organized into three or four layers separated by specimen trays within your storage box. Specimen trays make lifting safer. Cushion each layer with a sheet of stable polyethylene foam shelf liner. See Figure I.3. Museum supply companies manufacture acid-free boxes with fitted trays equipped with adjustable interior compartments. These are ideal for the storage of archeological material.

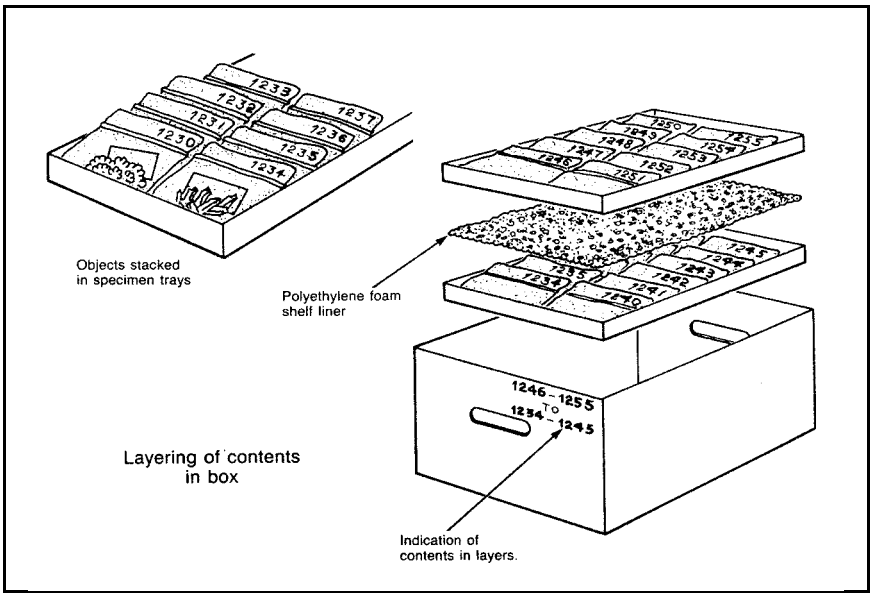

Figure I.3. Organization and Layering of Objects within a Storage Box

5. *How do I keep track of what's in the box?*

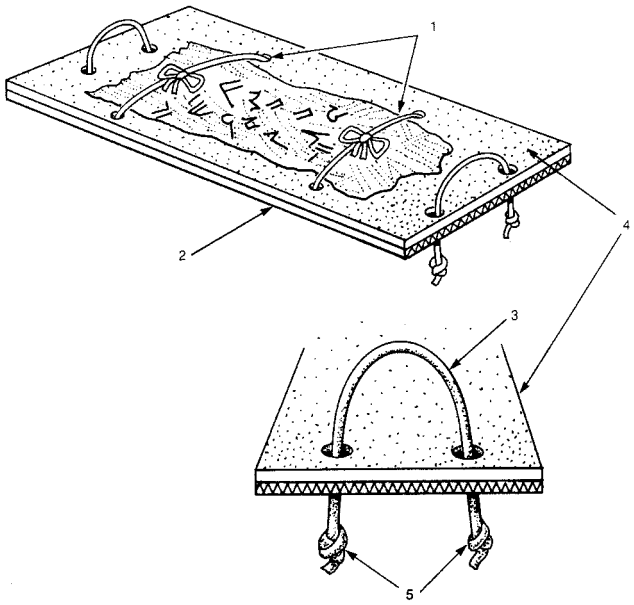
Make an inventory:

- First, make sure that the identification numbers you have written on each bag show clearly.
- Next, label the outside of the box with the numbers by layer.
- Prepare a more detailed list of the contents and place it in the box on top of the contents.

6. *How do I protect and store larger archeological objects?*

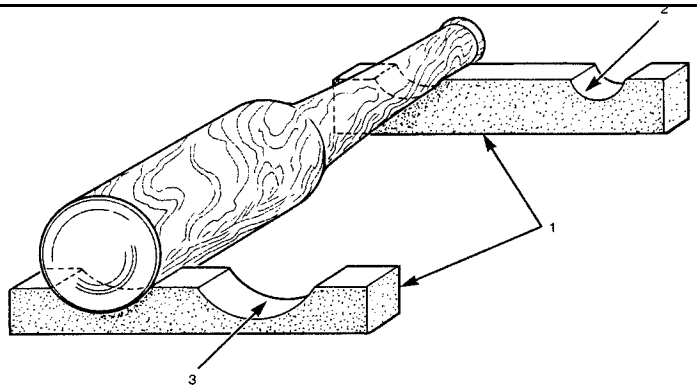
If the objects are too large for standard specimen trays, you can make custom trays from padded, acid-free board fitted with cotton twill-tape handles. See Figure I.4 for an illustration. There are many acid-free boards, including matboard, cardboard, foamboard, and honeycomb board, that can be used to make support trays. Make sure you select a board heavy enough not to bend under the weight of the object. Tie the object to the tray with cotton twill tape to keep it from sliding.

Use rigid polyethylene foam to make tray supports and trays with cavities for fragile three-dimensional objects. You can easily cut large blocks of foam with an electric carving knife and thin sheets with a sharp X-acto knife. Figure I.5 illustrates the use of rigid polyethylene foam blocks to support a fragile bottle. Figure I.6 shows the cavity-packing technique to restrict the movement of smaller, rounded items. Cavity-packing is an excellent way to store objects that are moved periodically for research. Make sure that the fit of the object in the cavity is not too tight and that the object may be safely removed from the tray. The cut edge of the rigid foam block can be abrasive so use thin, soft, polyethylene foam (like Volara®) for objects with fragile surfaces. If necessary, carve a finger grip on each side of the object to make grasping easier.



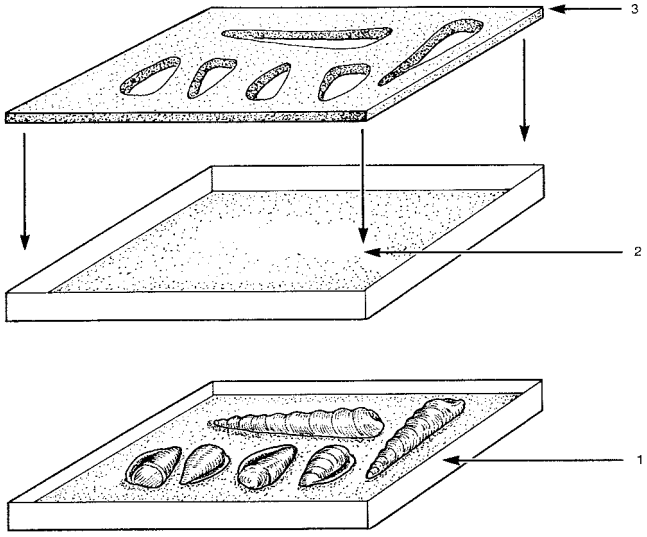
1. Tie twill tape loosely in bows over object to secure it to the tray. The method of attachment should be both obvious and easily unfastened.
2. Use acid-free cardboard, fluted plastic, Fome-cor®, or Tycore® for the tray.
3. Use twill tape or nylon rope for handles.
4. Line rigid board with polyethylene foam pad. Cover foam with washed muslin or unbuffered acid-free tissue. Attach the lining to the board with a good quality double-sided tape (e.g., Scotch 415) or with a hot glue gun. If the support tray is small, the twill tape ties should be enough to hold both the pad and the object in place.
5. Be sure to tie knots larger than punched hole.

Figure I.4. A Support Tray for Fragile Material



1. Use rigid blocks of polyethylene foam to support complete ceramic or glass bottles. The foam blocks can be placed in specimen trays on shelving or in museum specimen cabinet drawers.
2. Cut out wells in each block to fit the diameter of the neck and bottom of the bottle.
3. Because cut foam can scratch, line each well with strips of Tyvek® or smooth foam sheets to protect the surface of the bottle from possible abrasion. Remember that the surface of iridescent excavated glass is particularly fragile. The bottle should never be made to fit tightly in the foam support.

Figure I.5. Customized Support Blocks for a Fragile Glass Bottle to be Fitted in a Museum Specimen Tray



1. Isolating objects in separate cavities restricts movement and provides easy access. A number of small objects may be held in a museum specimen tray.
2. Line the bottom of a museum specimen tray with ¼"-thick polyethylene foam.
3. Mark the outline of the object on a second sheet of ¼"-polyethylene foam. Be very careful not to touch the object with the marking instrument. Avoid using a pen. With a sharp pencil, puncture the foam around the object and twist the pencil to make a clear mark in points about ¼" apart for small objects and 1" apart for larger objects.
4. Move the object out of the way, and cut out this shape by "connecting the dots" with an X-acto knife.

Figure I.6. Cavity Packing Technique for Small Objects

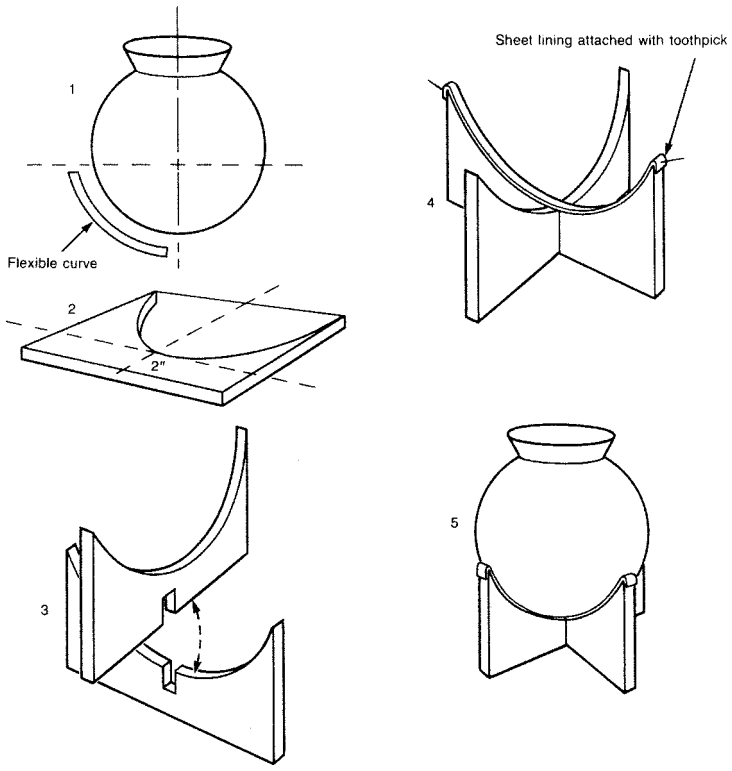
7. *How should I store very weak and fragile objects?*

Archeological objects that are weak from deterioration may require specialized supports to maintain their structural integrity. Before designing a special mount, evaluate the object's strong and weak structural points. Determine:

- what the object is
- how it was used or worn
- how it was made

For example, cone-shaped baskets, worn like backpacks, were used to carry heavy objects. Load stresses were distributed down the sides of the basket and concentrated in the bottom. Though the rim is the weakest part of these baskets, they are frequently, but incorrectly, stored upside down like traffic cones.

A good storage mount takes into account the ***form*** and ***function*** of the object and eliminates stress on the weakest parts. A cradle mount like the one illustrated in Figure I.7 will evenly distribute the weight of an object with an unstable base while keeping it upright as originally used.



1. Starting from the center of the vessel, measure the curve from its base up to 1/3 of its height with a flexible drafting curve.
2. Using a 1"- to 2"-thick piece of rigid polyethylene foam (depending on the size of the vessel to be supported), mark the profiles of a full cross-section of the object, leaving 2" at the bottom of the foam sheet. If the shape of the object is symmetrical, flip the measured curve on one side to the other side as illustrated. Cut the cross-section profile with a sharp knife. Repeat technique to produce another cross-section to be used to bisect the first one.
3. Cut a 1" by 1" notch in the center of the **base** of one cross-section as shown in 3A. Cut a matching notch in the center of the **top** of the curve in the other cross-section as shown in 3B.
4. Fit both cross sections together at the notches. Cut a thin foam sheet for lining the cradle surfaces. Pin foam buffering strips to cradle surfaces with toothpicks as shown.
5. Place vessel in the cradle.

Figure I.7. Construction of a Cradle Mount for Objects with Round Bases

8. *How and when should I design special containers?*

When making a special box or storage container for an archeological object, keep these things in mind.

- Protect the object from dust and light.
- Provide it with good support.
- Allow researchers maximum visual access.
- Discourage any handling of the object.

In the case of a textile fragment, for example, a researcher will want to examine both sides. The container must permit close examination of the contents, but minimize the need to actually handle the object. A portfolio mount, illustrated in Figure I.8, is a good solution to this problem. This technique can also be used to store other flat objects like basketry fragments, thick cordage, and other fragile materials. Adjust the thickness of the interior mat to accommodate the dimensions of the object, avoiding any unsafe pressure or crushing of brittle elements.

Boxes for other types of artifacts should have a drop front so that the tray supporting the item can be slid out onto a stable surface. An accident is more likely to happen if the object must be lifted up and out through the top.

You may need to provide special containers and mounts that will protect fragile, unstable, and top-heavy objects during an earthquake.

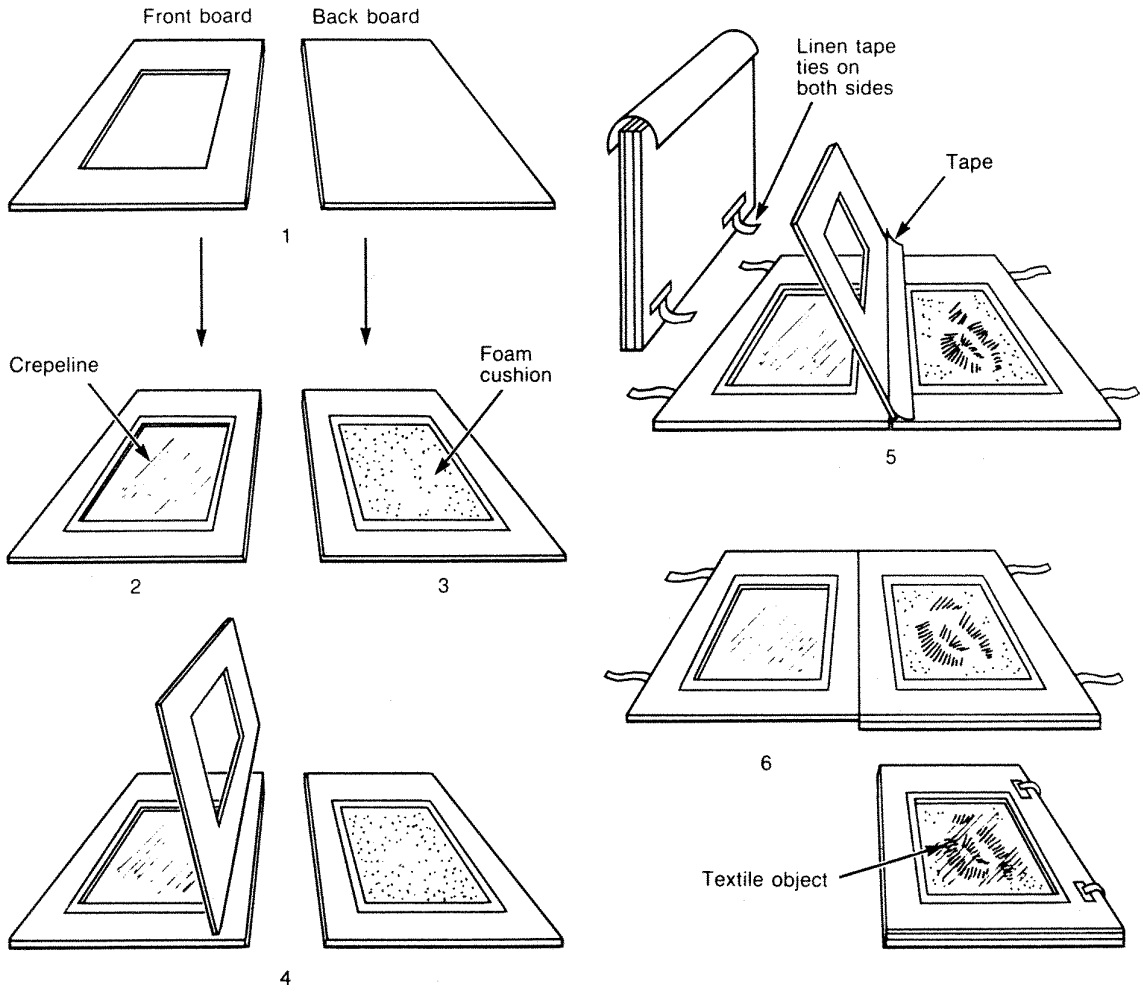
There is much published information containing instructions for building specialized storage mounts. Two very good references are *Storage of Natural History Collections: Ideas and Practical Solutions* (Rose and de Torres, 1995) and *Working with Polyethylene Foam and Fluted Plastic Sheet* (Schlichting, 1994).

To help you select stable materials for constructing containers and mounts for storage see *Materials for Exhibit, Storage, and Transportation and Packing* (Tétreault and Williams, 1992) and "Guidelines for Selecting Materials for Exhibit, Storage, and Transporation" by Jean Tetreault, available on the Web at <http://www.cci-iic.gc.ca/frameset_e.shtml> under Conservation Information.

9. *How should I store items subject to the Native American Graves Protection and Repatriation Act of 1990 (NAGPRA)?*

Your park's archeology collection may contain NAGPRA-related items such as human remains, associated funerary objects, unassociated funerary objects, sacred objects, and objects of cultural patrimony. These collections should be housed and handled with great sensitivity. You may need to store NAGPRA items separately from other collections and limit access to them.

Consult with the lineal descendants, culturally affiliated Indian tribes, Native Alaskan villages or corporations, or Native Hawaiian organizations to ascertain their preferences related to storage techniques and materials. You may need to use alternative storage methods and materials in response to these consultations. See Chapter 7: Museum Collections Storage, for additional information concerning consultation and storage of NAGPRA collections.



1. Cut out front and back of portfolio from a sheet of museum quality mat board. Cut window out of one board. Make window ½" to 1" larger than the dimensions of the textile fragment.
2. Cover window with polyester crepeline (Stabiltex®). Pull taut over window opening and attach with water-activated acid-free linen tape.
3. Cut a piece of cushioning material (e.g. Sentinel Foam®, Volara®, Microfoam®) to the inside dimensions of the window. Place material on board. Cover the foam with a non-woven polyester fabric such as Reemay 2014 and attach with water-activated linen tape.
4. Prepare a third board identical to the window front board. Use this board as a spacer to protect textile specimen from being crushed.
5. Stack the three boards. Attach water-activated linen tape along the outside edge like a book-binding. Attach linen bias tape ties with water-activated tape to the front and back boards. Open portfolio and attach center spacer with water-activated tape.
6. Place textile fragment on cushion and close the portfolio. The polyester crepeline (Stabiltex®) window facilitates visual identification of specimen without having to open the mount and protects the textile specimen from dust.

Figure I.8. Construction of a Portfolio Mount for Archeological Textile Fragments

Recommended Storage Materials

Bags

Use:	Don't Use:
• Resealable polyethylene bags (Ziploc®, Baggies®, Whirl-pak®) • Spun polyethylene bags (Tyvek®) • Bags made from heat-sealable clear plastic laminate film	• Kraft lunch bags • Waxed paper • Envelopes None allow visual inspection and all are made from unstable materials. Waxed paper may leave a coating on the object.

Padding

Use:	Don't Use:
• Acid free tissue • Cotton or polyester batting in plastic or muslin bags • Polyester felt • Bubble-pak or air-cap	• Loose cotton Brittle materials may snag on the loose fibers. Cotton will almost certainly leave lint on the objects. • Paper towels or facial or toilet tissue Papers are not durable and contain impurities. • Newspaper Newsprint smears easily and may leave ink on objects. Newspaper is also very acidic. • Excelsior Material is very acidic. • Vermiculite Substance generates dust that not only is difficult to remove, but also hazardous to museum workers

Figure I.9. Recommended Storage Materials

Plastic Foams	
Use:	**Don't Use:**
• **White** polyethylene closed-cell foam (Polyfoam) • Crosslinked polyethylene foam (Plastazote®, Volara®) • Ethylene/vinyl acetate copolymers (Evazote®, Volara®) • Extruded plank polystyrene (Styrofoam) • Polypropylene closed-cell foam (Microfoam)	• Blue polyethylene foam (fire retardant) Fire retardant additives can migrate to materials. • Pink polyethylene foam (antistatic) Conductor in foam absorbs water from the air and can become soapy. • Chlorinated or nitrated plastic (for example, PVC–polyvinyl chloride) Plastic outgases hydrogen chloride, which can become hydrochloric acid. • Polyurethane This is unstable and may offgas harmful products.

Clear Plastic Sheets	
Use:	**Don't Use:**
• Polyethylene terephthalate clear polyester (Mylar®) • Clear polyester and fluorocarbon laminate (Film-O-Wrap®) • Clear polyester/polyolefin laminate (Scotchpak®)	• Polyvinylidene chloride (for example, Saranwrap®) PVC is unstable, chlorinated plastic. • Cellophane Sulphuric acid used in manufacturing process generates acidic by-products.

Figure I.9 Recommended Storage Materials (continued)

Boards	
Use	**Don't Use**
• Acid-free mat board • Acid-free corrugated board • Acid-free Fome-Cor® (International Paper Co.); extruded polystyrene with polystyrene skin • Honeycomb boards – acid-free rigid paperboard (Tycore®) – aluminum-board (Hexcel Honeycomb®) • Corrugated polypropylene boards (Cor-X®,Coro-plast®) • Double-walled polycarbonate (Lexan®)	• Regular cardboard or matboard Non-archival cardboard and matboard are acidic. • Urea formaldehyde impregnated paper laminated panel board (Gatorfoam®)

Tape/Ties	
Use	**Don't Use**
• Water-activated paper or linen tape • Cotton or polyester twill tape	• Pressure sensitive tapes, including: – cellophane – masking – strapping – duct – electrical The adhesive degrades and the carrier peels off leaving residues and stains. • Rubber bands Rubber degrades and sticks to the surface.

Figure I.9. Recommended Storage Materials (continued)

Fabric	
Use	**Don't Use**
• Polyester Stabiltex • Reemay 2014 • Washed muslin	• Wool fabric • Unwashed muslin Sizing may attract pests.

Figure I.9. Recommended Storage Materials (continued)

Appendix J: Curatorial Care of Paper Objects

List of Figures

APPENDIX J. CURATORIAL CARE OF PAPER OBJECTS

A. Overview

1. ***What information will I find in this appendix?***

This appendix discusses the physical character of paper objects and provides guidance for their long-term preservation. The types of paper objects included in this discussion are:

- archival and manuscript materials (documents, letters, field notes, reports, and project data)
- prints and drawings
- maps
- architectural records

> ***Note: Archival and manuscript materials make up the largest part of NPS museum collections, so most NPS paper objects are part of an archival collection. Be sure to have your park's archival collections surveyed and appraised by an archivist before you give attention to individual items within a collection. This will help you set preservation and treatment priorities. See Museum Handbook, Part II: Museum Records (MH-II), Appendix D: Archives and Manuscript Collections, for additional information.***

The main topics covered in this appendix are:

- the nature of paper
- agents of deterioration
- preventive conservation (collections maintenance, handling, storage, and exhibition)
- working with a conservator when treatment is needed
- emergency procedures for paper objects
- glossary of terms used to describe condition

This appendix does not address the care of photographs (see Appendix R: Curatorial Care of Photographic Collections) or books (see *Conserve O Gram* 19/2, "Care and Security of Rare Books").

2. ***Why is it important to practice preventive conservation with paper objects?***

The role of preventive conservation is to avoid, block, or minimize the ***agents of deterioration***. This practice will decrease the need for costly and time-consuming conservation treatments and irreparable harm to objects.

Poor environment, storage and exhibit techniques, and careless handling easily damage papers. Once the object is stained, embrittled, torn, or creased, it becomes even more fragile. Conservation treatment cannot reverse all damage to an object. Treatment can be expensive. It is unlikely that your park can afford to treat all objects, especially those with little exhibit or monetary value. Preventive conservation is cost effective because care is provided for the collection as a whole, rather than object-by-object.

3. ***How do I learn about preventive conservation?***

Read about the agents of deterioration that affect paper objects so that you can create a preventive conservation plan. These agents are discussed in more detail in Section C. Understanding how to protect your collection from the agents of deterioration will lengthen the life of your paper objects. See Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment, for a complete discussion of the agents of deterioration.

4. ***Where can I find the latest information on care of these types of objects?***

There are a variety of sources for up-to-date information about paper:

- Read the issues in the NPS *Conserve O Gram* series relating to paper.
- Review the references in the bibliography.
- Look up the World Wide Web sources that are listed at the end of this appendix.
- Consult a paper conservator.
- Consult a curator or archivist of a paper/archival collection.

5. ***What should I know about the history of papermaking?***

Collections may contain a variety of papers that have been used in many ways to produce records and other paper objects. Objects predating the mid-19th century are fairly uniform in character. Paper objects produced after this period vary widely in structure and composition as well as in permanence. *Papermaking* by Dard Hunter provides an excellent history of the technology of papermaking (see Section K. Selected Bibliography). In short:

- Paper was invented in China more than 2,000 years ago. It was made by hand from naturally occurring plant fibers, and was for centuries a scarce and expensive commodity. Because the process was a closely guarded secret, papermaking technology was not imported to Europe until the Middle Ages.
- The first American paper mill was established in the late 17th century. By the early 19th century, there were almost 200 mills in the United States making handmade paper from rag fibers.
- Advances in technology during the Industrial Revolution made abundant, inexpensive paper possible. Handmade paper was replaced

by mass-produced, machine-made paper. The demand for fiber was met by adding wood pulp to rag fibers. The cheapest paper, made entirely of groundwood pulp, was used for printing newspapers, broadsides, and other commercial products. Groundwood pulp paper is inherently unstable chemically.

- Higher-quality machine-made papers include more extensively processed fiber and/or some rag fiber. Some applications, like photography, require truly high quality paper made entirely of rag fibers.

6. ***What is the difference between paper and a paper object?***

Paper itself is only part of a paper object. It is often referred to as the *support*. Equally important are the media used on the paper to form a paper object, such as:

- inks
- graphite
- colored pencils
- wax crayon
- pigments and binders (watercolor, pastels)

These are hand-applied media. Media also can be applied mechanically or reprographically. Mechanical processes of reproduction using the medium of printer's ink include:

- letterpress
- engraving
- wood block
- etching
- lithography

Some modern reprographic processes are:

- mimeography
- xerography

Each one of these use a wide variety of inks, pigments, and binders.

B. The Nature of Paper Objects

1. ***What is the structure of paper?***

A sheet of paper is actually a web of fibers held together by their physical entanglement and weak chemical bonds between the fibers. The fibers in paper are primarily cellulose. Materials are added to the fiber to control the properties of the paper, such as absorbency and smoothness. Those

additional materials include:

- **Sizing**. Chemicals added to paper to make it less absorbent so inks will not bleed. Acidic sizings, such as alum-rosin, can cause paper to deteriorate.

- **Fillers**. Materials like clay are used to create very smooth and shiny surfaces for high quality illustration, such as glossy art book paper.

2. ***What is cellulose?***

Cellulose is the basic chemical polymer of all plant fibers. The molecules have a long chain-like structure that is both strong and durable. At the same time, the structure is moisture-sensitive and vulnerable to acidic deterioration.

3. ***What fibers have been used historically to make paper?***

Many different fibers have been used to make paper. These can be grouped into three types according to the source of the fiber:

- cotton and linen rags

- bast (flax, Japanese paper mulberry, hemp)

- wood

The common element of these fiber sources is cellulose.

In early paper, **cotton and linen fibers** were used to make paper by hand. As the need for paper exceeded the supply of fibers, recycled plant fibers were obtained from cotton and linen rags. The term "rag" paper applies to any paper made solely from cotton or linen cloth fibers. European-style paper objects dating from before the mid-19th century almost always are made of rag paper.

Other fibers like **grass** are quite rare, and are unlikely to be found in NPS collections.

Wood-pulp paper (or groundwood paper) is the most prevalent paper in NPS museum and archival collections dating after the mid-19th century, when technology was developed to extract fiber from lumber. This process made paper inexpensive and abundant. However, the **paper made from groundwood pulp is highly acidic and inherently unstable**.

4. ***What causes groundwood paper to be unstable?***

Groundwood paper contains cellulose as well as other materials that occur naturally in wood. One of these, *lignin*, is a plant protein which is inherently unstable and generates acid as it deteriorates. Acid generated by the deteriorating lignin breaks the cellulose chains, making fibers shorter and weakening the paper. Groundwood paper begins to deteriorate as soon as it is made.

Some groundwood pulp is chemically treated to remove all but the cellulose fibers. This "chemical woodpulp" paper is not as strong or stable as rag paper because the fibers are short. However, it is not self-destructive like the groundwood paper because the acid-generating properties have been removed.

5. ***How is paper quality judged?***

The quality of paper is determined by its durability and permanence. The degree to which paper retains its original strength during its history is called

durability. The degree to which paper remains chemically stable and resists deterioration is called *permanence*. See Section C.10 for a discussion of permanence related to acidity and pH.

6. ***How does the nature of some paper objects affect their preservation?***

Every paper object is a combination of fibers, adhesives, and media. If any of these elements are unstable, the paper object will be inherently unstable and will deteriorate. Common examples are:

- manuscripts with iron gall ink on rag paper sized with gelatin. The gelatin size originally served to control absorption of the watery ink, preventing the ink from bleeding into the paper. As the size degrades, any water applied will be quickly absorbed into the paper. Iron gall ink can contain sulfuric acid that eats into the paper, most severely where it was thickly applied. The iron gall ink also fades from its original black to brown. Although the rag paper is sturdy and durable on its own, the deterioration of the ink compromises the stability of the object.

- pencil drawings on tracing paper. Some tracing paper is rendered transparent by an impregnating resin. Over time, the resin oxidizes, darkens, and causes the paper to become brittle. The graphite is chemically stable, but may be lost by abrasion, rubbing, or smudging.

Even when all the paper object's elements are stable, they may not respond positively to environmental changes. Two examples are:

- a tightly framed print. The print paper may be a high quality rag paper and the printing ink a stable one composed primarily of carbon. However, if the print is housed in poor quality framing materials, it will be damaged. Wood backing boards can discolor the print. If the print is held tightly in the frame without a window mat to allow expansion and contraction of the paper with changes in humidity, wrinkles and even tears can result.

- paper repaired with a paper patch. Paper expands and contracts as the relative humidity rises and falls, usually more so in one direction than the other. This can be due to the *grain* of the paper. The dimensional change is less in the direction of the grain rather than across. If the grain of the paper patch is not parallel to the grain of the paper object, the patch and the object will expand and contract in different directions. Over time, this results in *cockles*, or warping of the paper object.

C. Agents of Deterioration

1. ***What causes paper to deteriorate?***

The deterioration of paper may result from:

- inherent conditions (poor quality pulp, bleaching residues, unstable sizings, acidic inks)

- external conditions (fluctuating temperature and relative humidity, light exposure, air pollution, pests, contact with acidic materials, careless handling, improper storage, natural disasters, accidents)

Inherent and external conditions often reinforce each other to promote further deterioration. See Chapter 4: Museum Collections Environment for a discussion of the impact of external (environmental) conditions on

museum objects, and Chapter 5: Biological Infestations for a discussion of pests.

Paper is fragile and susceptible to deterioration caused by ***inherent vice***. The nature of the materials and sometimes methods of manufacture, cause deterioration that may not be treatable. Good preventive conservation practice can minimize the effects of inherent vice and extend the useful "life" of a paper object.

2. ***How does temperature affect paper objects?***

High temperatures cause brittleness, particularly in groundwood paper. Most of the chemical reactions that cause paper to deteriorate proceed twice as fast with each 10°F increase of temperature. Gelatin adhesives shrink and relax as temperature fluctuates.

3. ***How does relative humidity affect paper objects?***

Cellulose is ***hygroscopic***—it has a physical attraction for water, making relative humidity (RH) one of the critical factors for paper preservation. Paper contains water within its chemical structure and water is also bound loosely to its surface. The water in paper is in equilibrium with the water (humidity) in the air. As the relative humidity (RH) drops, paper gives up water to maintain this equilibrium. It contracts physically, becoming smaller as it loses water.

Paper gives up the loosely bound surface water first. Once the surface water is gone, the paper is forced to give up structural water. While surface water can be regained after the humidity rises, the loss of structural water is permanent. This desiccation causes embrittlement. Some media, such as inks and gum-based watercolors, are similarly responsive to changes in RH.

Paper requires a certain amount of moisture to be flexible. Desiccated or brittle paper is:

- less flexible and more subject to damage from handling
- more easily torn during unrolling
- more easily broken when flexed

High relative humidity (above 68%) encourages insect infestation and mold growth. Fluctuating relative humidity:

- causes stress from continual expansion and contraction (particularly damaging to objects composed of more than one material)
- damages materials that are constrained (such as a tight binding, adhesive repair, or fastener)
- causes buckling and cockling to materials that are partially constrained (such as repairs or mounts)

4. ***What are the appropriate temperature and humidity levels for storage of paper objects?***

Store paper objects in a stable environment at a constant temperature between 60°-65°F (+/-3°) and a relative humidity of 40% (+/-3%). Photographs should be stored at slightly cooler and drier levels. See Figure J.1. below.

	T (+/-3°)	RH (+/-3%)
Paper Objects and Human Occupants	65°	40%
Paper Objects Storage	60°	40%
Photograph Storage	50°	35%
Isolated Color Photograph Storage	40°	35%

These numbers are based on NISO TR01-1995 "Environmental Guidelines for the Storage of Paper Records."

Figure J.1. Suitable Temperature and Humidity Levels for Paper Storage

5. ***How does light affect paper objects?***

Both visible light and ultraviolet (UV) radiation cause serious damage to paper objects. The degree of light-sensitivity depends on the nature of the materials and media. For example:

- Groundwood paper quickly turns brown and brittle because the damage from inherent acidity is accelerated by light exposure.
- Rag fibers are fairly stable, but may be stained or bleached by light exposure, depending on the properties of the sizing.
- Colored materials made of dyes (colored papers, colored pencils and crayons, ballpoint and felt-tip pen inks) fade quickly.
- Watercolors are particularly sensitive because the medium contains little dye or pigment.
- Certain photographically produced images (blueprints, sunprints) fade quickly with light exposure.

6. ***How do I protect paper objects from light?***

To protect paper objects from light damage:

- Eliminate all sources of UV from exhibition, storage, and curatorial work areas.
- Keep exhibit area light levels below a **maximum** of 50 lux (5 footcandles).
- Control duration of exhibition to a **maximum** of 6 months. After a paper object has been exhibited for a total of 6 months, consult a conservator before each additional proposed exhibition. If the object is fragile, consult a conservator before the initial exhibition. See Section G. for alternatives to exhibiting original objects

  Note: Use the Exhibits Associated Module in ANCS+ to track the periods of time that an object is exhibited. You can then calculate the total time that the object has been exhibited. You will need to check individual loan records to determine whether an object was exhibited while on loan.

- Keep lights off in storage areas when they are unoccupied.

- Turn off lights when no one is in exhibit areas for extended periods of time.

Some design media are very stable when exposed to light. These include pure minerals such as:

- graphite
- most black printing inks

Where these media were used, the preservation of the object depends on the quality of the paper. For example, an 18th century broadside composed of black ink on rag paper can be exhibited using the maximum conditions stated above.

> ***The effect of light on paper objects is cumulative and irreversible. Do not exhibit original papers for more than six months (cumulative), except in consultation with a conservator. Maintain light levels at 50 lux (5 footcandles) maximum.***

7. ***How can I tell if a paper object has been damaged by light?***

If a paper object has been exposed uniformly to light, fading or discoloration may be uniform and difficult to identify. If the object has been partially covered by a mat, check underneath the mat where the object has been protected, to see if the color is different.

Note: If the cover mat was of poor quality, the mat might have stained the paper object. It may be difficult to determine whether deterioration is a result of light damage, staining from the mat, or a combination of factors.

8. ***What is the impact of gaseous pollutants on paper objects?***

Sulphur dioxide, nitrogen dioxide, and ozone are the primary gaseous pollutants that adversely affect paper collections (Wilson 1995). They are especially damaging when RH, temperature, and light exposure are high.

Oxides of nitrogen and sulfur combine with moisture from the atmosphere to form acids. Groundwood papers are especially vulnerable to acid attack (see Question 11. below, for sources of acid deterioration).

Other gaseous pollutants that may impact paper collections include:

- Acids
- Formaldehyde (used in plywood, particle board, certain foams and synthetic materials)
- Hydrocarbons
- Sulfides

Note: Most gaseous pollutants can be eliminated through the use of air purifiers (Wilson 1995). See *Tools of the Trade* for additional information.

Pollutant	Volume in parts per billion
Sulphur dioxide	5-10
Nitrogen Dioxide	5-10
Ozone	5-10

These recommendations are based on numbers from NISO TR01-1995 "Environmental Guidelines for the Storage of Paper Records."

Figure J.2. Suggested Maximum Levels of Major Gaseous Pollutants

9. ***What is the impact of particulates on paper?***

Particulates come from several sources and can damage paper in many ways. For example:

- Sharp particles (sand, dirt) abrade paper and design media as they are dragged across the object's surface.
- Oily particles from engine exhaust, cigarettes, or cooking smoke may become embedded in paper fibers soiling the paper and providing food for mold and insects.
- Dust that is acidic or contains metal particles accelerates the chemical deterioration of paper.
- Dust contamination can cause irreversible deterioration because paper is fibrous and absorbent. Surface dust can usually be reduced, but rarely removed completely.
- Dust fibers can hold moisture in contact with objects and facilitate mold growth.

10. ***How do I protect paper objects from dust and gaseous pollutants?***

Where practical, locate collections in storage and on exhibition away from:

- roadways
- loading docks
- parking lots
- outside doors
- photocopy machines
- woodworking and maintenance shops, and other sources of on-going pollution

DO....	*DON'T....*
remove paper from locations being painted	return paper to newly painted storerooms or exhibit cases until paint is thoroughly dry and fumes are gone
control dust through filters in ventilation systems, vacuuming, and dusting.	move dust around with brooms or redistribute dust by using vacuums that don't retain the dust in a filter

11. ***What impact do acids have on paper objects?***

Acids are the primary cause of paper deterioration. They cause paper to become weak, brittle, and stained. The source of acids in paper include:

- materials used in the papermaking process, especially from 1850 to the present, such as alum-rosin sizing and lignin groundwood pulp
- residual bleaching chemicals, unstable iron gall ink, air pollutants
- direct contact with acidic materials (file folders, adhesives, mat boards, wood, unstable plastic sheeting)
- exposure to acidic vapors from closed document boxes or wooden storage drawers

Acids move from acidic materials (such as wood) to objects of reduced or no acid (such as rag paper). The rate of this *acid migration* is dependent on the moisture present. It is accelerated in humid conditions.

The concentration of acid is measured on the pH Scale, with numbers ranging from 0 to 14. The number 7.0 on this scale is neutral. All numbers below 7.0 indicate an *acidic* condition. All numbers above 7.0 indicate a basic or *alkaline* condition. The pH scale is logarithmic—a paper object with a pH 3.0 contains 10 times as much acid as an object with a pH 4.0, and 100 times as much acid as paper with a pH 5.0. **A desirable pH range for paper is 6.5 to 8.5**.

12. ***How do molds and pests ffect paper objects?***

A complete description of the biological agents that affect museum objects can be found in Chapter 5: Biological Infestations.

Molds normally thrive in damp environments (RH levels over 65%) with still air. Molds:

- feed on fibers, sizings, coatings and adhesives
- grow on any material that provides moisture and organic nutrients
- destroy the sizing in paper

- cause patches of staining or discoloration
- leave paper structurally weakened and chemically altered

Insects consume parts of paper and leave damaging waste products on the surface. The types of insects that damage paper include:

- **bookworms** (the larval stage of the drugstore and cigarette beetle). Powder and small round holes in book covers or text block indicate an active infestation of bookworms.
- **silverfish** often eat partially through paper. Damage from silverfish can be found particularly in non-design areas of prints and watercolors.
- **cockroaches** feed on the ragged edges of paper and cardboard. Cockroach excrement also causes damage.
- **the common fly** seeks shelter in books or framed paper objects. Their acidic excrement is damaging to paper.

Mice can damage or destroy large collections of unprotected papers. Look for their nests by observing the concentration of droppings.

Your park should have an Integrated Pest Management (IPM) Plan, as well as a Housekeeping Plan and/or a Preventive Conservation Plan. These documents will provide you with important preventive conservation information for paper collections. In addition to regular monitoring, be sure to:

- inspect and isolate all incoming collections
- periodically monitor inside boxes, storage cabinets, exhibit cases, and other closed containers for evidence of pests and mold

D. Collections Maintenance

The park curator has primary responsibility for preventive care of museum collections. In addition to monitoring and controlling the environment, and recognizing symptoms of deterioration of collections, the curator needs to know appropriate techniques for:

- collections maintenance
- handling
- storage
- exhibition
- transportation of collections

1. *What is appropriate collections maintenance or a paper collection?*

The goal of preventive maintenance is to stabilize the collection and minimize the effects of deterioration. There are many non-interventive treatments that curatorial staff can undertake for preservation. For example:

- Remove dust from an item using an air bulb syringe.

- Use a soft artist's or cosmetic brush to gently remove loose dust before handling or storage of paper objects.

- Replace soiled or acidic folders with new, archival folders (acid-free or buffered depending on paper object). File names and other labels must be carefully copied onto the new folders. Retain old folders that contain any annotations that cannot be transcribed, such as sketches.

- Do not overfill folders.

- Remove original fasteners including staples, paper clips, string ties, rubber bands, brads, and straight pins (consult *Conserve O Gram* 19/5, "Removing Original Fasteners from Archival Documents"). Maintain the order and relationship of documents when removing fasteners. If a multi-page document cannot be feasibly stored without fasteners in its own acid-free folder, consult *Conserve O Gram* 19/6, "Attachments for Multi-Page Historic Documents."

- After removing deteriorated rubber bands from rolls of drawings, store the rolls in an acid-free tube. If the sticky residue from the rubber bands does not readily come off, interleave or cover the area with silicone release paper to keep it from sticking to other papers or the storage container.

- Remove stained prints from acidic mats. ***Note***: Do not attempt to remove the print if it is glued to the mat. Removing materials that are adhered to an object goes beyond stabilization. A paper conservator should treat this condition.

- Protect documents from acidic newspaper clippings. If the clippings must be left in place:

  – sleeve the clipping in a stable polyester folder (see Figure J.4., Types of Polyester Enclosures), or

  – interleave between the clippings and other documents with buffered paper

  If you can safely remove the clippings, photocopy the clippings onto archival paper and place the photocopies with the other documents. Store the original clippings separately. Some archives do not retain unannotated original clippings because of their acidity. The curator should make this decision based on the significance of the clippings, the park's storage capabilities, and other preservation and interpretive requirements, in consultation with the regional/SO curator.

- Unfold papers, such as correspondence, and store flat. Flat storage is preferable to rolling for all papers small enough to fit in map case drawers. Refer to *Conserve O Gram* 13/2, "How to Flatten Folded or Rolled Paper Documents."

Note: This procedure requires great care. If the papers are damaged or brittle, and in danger of cracking, request the assistance of a paper conservator before attempting to unfold and flatten them.

You may sometimes need to separate objects, such as dissimilar materials that have different storage requirements. For example, photographic prints and negatives often are removed from a series of papers and stored with other prints and negatives in individual sleeves. In this case:

- Complete and insert an *Archival Separation Sheet* (see Figure J.6) in place of the removed item. Archival Separation Sheets are available in ANCS+.
- Enclose a photocopy on archival paper of the photographic print in place of the original
- Note the original and new locations of negatives and prints in both locations

You can isolate incompatible materials with barriers (sleeves, interleaving sheets), or by planned rearrangement, for preservation reasons. With careful notations, you can preserve the papers' proper relationships.

E. Handling Paper Objects

1. *What are appropriate handling guidelines for paper objects?*

Historic paper objects often are in fragile condition and require more than ordinary care to handle them safely. Require all collection users, be they outside researcher or park/center staff, to receive proper handling guidance before they are allowed to access collections. Review procedures in Chapter 6: Handling, Packing, and Shipping, and *Conserve O Gram* 19/17, "Handling Archival Documents and Manuscripts." **Damage from mishandling is preventable**.

To prevent mishandling of collections, be sure to:

- Prohibit food, drink, and live plants from all collection areas.
- Prepare a written set of procedures for handling (see the example in Figure J.7).
- Enforce the procedures; they only work if you consistently enforce them.
- Require all users to have clean hands and wear clean, white cotton gloves at all times while handling collections.
- Limit handling, and limit the number of people who handle objects.
- Provide a clean and uncluttered workspace.
- Provide each object with appropriate support.
- Ensure that staff with collections responsibility supervise handling by other staff and outside researchers.

- Use facsimiles or duplicates in place of rare or fragile originals (see *Conserve O Gram* 19/4, "Archives: Preservation Through Photocopying").

  The light and heat from repeated photocopying can damage original documents. Limit photocopying to the minimum needed for preservation, exhibit, and other use.

DO....	***DON'T....***
Wash your hands, remove all jewelry, and wear clean, white cotton gloves at all times	Hold an object by one corner
Always use both hands.	Grasp a rolled object; it can be crushed easily
Allow the weight of the paper or roll to rest in your hands	Flex the paper when placing it onto a support
Place the support on the same level as the object and slide the object onto the support	

2. ***What are appropriate supports for handling paper objects?***

The types of supports necessary for safe handling depend on the format and condition of the paper object. The purpose of the support is to relieve the object of the strain of its own weight. **Always handle the object by its support**. Supports may be:

- **long-term**, such as housing or storage enclosures
- **short term**, such as a rigid sheet of paperboard to move the object from one location to another

Examples of appropriate supports for specific situations include:

- an acid-free folder for a manuscript letter on rag paper in good condition
- polyester encapsulation for a fragile architectural plan on tracing paper that has undergone conservation treatment and the pH is stable

Following are additional considerations for handling supports:

- Lightweight, rigid materials, such as archival corrugated cardboard are useful for moving single paper objects by hand.

- Closed supports (archival folders or portfolios) provide more protection than single sheets of cardboard, or open trays.

- Closed supports, such as boxes or portfolios on rolling carts, are good methods of transporting paper objects some distance, particularly if there are any tripping hazards or tight fits

3. ***How do I handle rolled paper objects?***

Do not attempt to unroll brittle or desiccated papers. These require treatment by a conservator before viewing. Flexible rolls can be viewed even if the edges tend to curl. Small weights, such as squares of polished glass, weight bags (available from various archival supply companies), or 35mm film cans filled with lead shot can be used to hold down the object's edges. The weights must be smooth and clean to prevent damage to the paper.

If the object is too long for the available table space, it can be "scrolled." To scroll through a rolled object:

- Unroll only as much as can be supported by the examination surface.

- After examining the exposed part, re-roll from the free end (this gives you two rolls).

- Shift the position of the object carefully so that more can be unrolled.

- Proceed this way until the entire object has been viewed.

- Work slowly and cautiously. The edges of tears tend to spring apart and can cause the object to be torn further.

4. ***How do I insert or remove an object from a polyester nclosure?***

Objects being inserted into or removed from polyester enclosures are extremely vulnerable to tearing because of the static charge on the polyester film. To insert a limp or very lightweight object into a polyester enclosure:

- Use a sheet of 20 lb. acid-free paper as a temporary support.

- Hold the enclosure open and insert the object on its support.

- Allow the enclosure to close, and lightly rub the film with a lint-free cloth (such as cheesecloth) to build up a charge directly over the object. The static charge should help keep the object in place. See also *Conserve O Gram* 13/3, "Polyester Encapsulation."

When removing an object from a polyester enclosure:

- Watch carefully and go slowly.

- Cut through the polyester if the enclosure is sealed on four sides. The least strain is placed on the object if the seals are cut.

- Remove the top layer of polyester by rolling it up if the enclosure is open on 3 sides.

- Separate the top sheet of polyester by lifting its free corner if the enclosure is sealed with an L-seal.

- Cut a second side, then separate the sheets of polyester on a single-opening enclosure by inserting a microspatula or other flat tool.

- If possible, insert a piece of acid-free paper under the object for support as you remove the object from the enclosure.

The static charge that holds the paper object in the polyester enclosure is a disadvantage when you want to remove the enclosure. If the paper does not release easily from the polyester, gently slide a microspatula between the paper and enclosure, following with the acid-free support paper. If the edges of a torn paper adhere to different sheets of the polyester film, also use the spatula to release one edge and hold that edge in place while you remove the film.

F. Storing Paper Objects

1. *What are the guidelines for storing paper collections?*

See Chapter 7: Museum Collection Storage, for standards and requirements, assessing needs, and planning spaces. You can find information on storage supplies and equipment in Chapter 7, *Tools of the Trade*, and *Conserve O Gram* 4/1, "Museum Storage Cabinets." For archival storage and handling information, consult *Conserve O Grams*:

4/1 "Museum Storage Cabinets."
19/15 "Storing Archival Paper-Based Materials"
19/16 "Housing Archival Paper-Based Materials"
19/18 "How to Care for Bound Archival Materials"

Like many other items, paper objects require housings for protection and safe handling in storage cabinets and on shelves. Within the storage environment, housings and enclosures provide the most immediate protection for paper objects. The purpose of the housing system is two-fold, it:

- facilitates the physical organization of the collection

- provides an environment that is as chemically and physically stable

Enclosures are in prolonged and direct contact with objects so it is critical that enclosure materials meet certain specifications. Products of this type are usually called *acid-free*, or *archival.* Scientists at the National Archives and Records Administration (NARA) and Library of Congress are actively engaged in developing standards and testing materials to be used near paper objects. The NPS Museum Management Program acts as a clearinghouse for information on appropriate museum collections storage materials. *Tools of the Trade* and the *Conserve O Gram* series provide updated information on appropriate materials. New developments are also posted to various conservation web sites (see Section L. below).

2. *What are acid-free and archival materials?*

Acid-free and *archival* are general names applied to a variety of plastic and paper products designed for use in proximity to museum objects. When used for the sleeves, boxes, and folders that store paper objects, these products must be free of acid, lignin, alum, and sulfur. The four most commonly used terms are as follows:

- **Archival quality** is a generic term indicating that the product is appropriate for use in contact with your collection objects.

- **Acid free** is also a general term indicating that the product is free of acids, or has a pH of approximately 7.0. This term is often used incorrectly to describe materials that contain alkaline buffers.

- **Alkaline-buffered** products contain an alkaline compound (such as calcium carbonate) designed to neutralize any acids that are present, or retard the evolution of acids in the future. Alkaline-buffered products are often used to interleave between paper objects that might transfer acids to surrounding objects, and generally are in the pH 8.5 range.

- **Unbuffered** or **nonbuffered** products have no alkaline reserve. Generally, they are a neutral pH (7.0) or acid-free material.

- **100% rag** paper products are made exclusively of cotton fibers. Although of good quality, 100% rag paper products do not meet the standards of permanence necessary for the long-term storage of museum collections.

- **Lignin-free** and **pure alpha-cellulose** are terms used to describe some manufactured storage papers, boxes and cardboards. These are made from woodpulp fibers that remain after the lignin is chemically removed.

Two other terms you may see are **neutral** and **inert**. *Neutral* applies to materials that have a pH of around 7.0. You may find this term applied to both paper and plastic materials. The term *inert* is most often applied to materials like polyester film and acrylic sheets like Plexiglas®. It means that the material will not react chemically with your paper objects.

3. ***How do I know which archival paper products to use with the various types of paper objects?***

Buffered paper can prolong the life of an enclosure, and absorb excess acidity from the papers contained inside. Be sure to periodically check buffered enclosures and interleaving papers for acidity. Acids can migrate back to the original documents if you do not replace old enclosures and interleaving papers when necessary. Use a pH testing pen to test acidity levels of enclosures and interleaving papers.

Note: Alkaline buffering damages some paper objects. For example, the buffer alters blueprints.

The following chart lists various paper objects paired with appropriate enclosure papers. Contact a paper conservator for assistance if you are uncertain about appropriate products to use with your collection.

Store Using *Buffered* Materials	Store Using *Unbuffered* Materials
Flat documents	Leather albums and collages with wool or silk components
Manuscripts	Blueprints
Maps	Hand tinted materials (may include some maps, prints, and drawings)
Most papers (see exceptions under unbuffered materials)	Diazo reproductions
Posters	Friable media (especially charcoal and pastel) should be stored in shallow boxes
Prints and drawings (see exceptions under unbuffered)	Watercolors and photographs

Some products are not available in unbuffered form except by special order. Buffered stock can be lined with polyester film to prevent the object from contacting the buffered paper. *Tools of the Trade* contains information on many of the typical products used in NPS museums for storing paper objects.

4. ***How do I know which plastic products to use with the various types of paper objects?***

All plastic materials used for collection storage must be chemically inert. Acceptable plastics are free of powders, coatings, plasticizers, and other additives. Information on the exact composition of plastics should be available from the distributor. See *Tools of the Trade*, Chapter IX: Equipment and Supply Sources, for a listing of vendors.

Common Plastic Products	
Use...	***Avoid….***
• stable polyester • polyethylene • polypropylene	• polyvinyl chloride (vinyl, PVC) • polystyrene

Archival polyester film is the housing material most commonly used for paper collections. It is one of the most dimensionally stable and chemically inert plastics available. However, this and other plastics can develop a static charge that can attract loose media. Do not use plastic housings for objects with:

- powdery or friable media (charcoal or pastel)
- drawings or documents in graphite pencil
- objects with cracking or peeling media
- very deteriorated iron gall ink

5. ***Are there any other situations when I should not use plastic products for storage?***

Do not encapsulate papers or house them in polyester sleeves if you cannot maintain proper environmental levels in your storage and exhibit areas. An improper environment can cause moisture to become trapped inside polyester enclosures. Such moisture can damage the object.

6. ***What are diazotype reproductions and how should I store them?***

Diazotype reproductions are the familiar white paper with blue print used to print plans, maps, and similar oversized documents. Diazotypes off-gas ammonia that can damage other documents; **be sure to store diazotypes separately in their own cabinet**.

7. ***What specific types of enclosures are available for paper objects?***

There are a wide variety of commercially available enclosures for paper objects. See *Tools of the Trade* for descriptions and vendors. While commercial products will be appropriate for most materials in your collection, you may need to make custom enclosures for oversized or oddly shaped objects, and those in very fragile condition. Figure J.3. lists common enclosures, their uses, and cautions about their uses.

Figure J.3. Types of Enclosures

Enclosure type	*Sizes*	*Typical Uses*	*Cautions*
10 point paper folders	Standard (10" x 12") Legal (10" x 15")	Small, flexible objects in good condition	Do not use if paper object is brittle
20 point paper folders (map folders)	Sizes over 20" x 24"	Small to medium sized objects requiring more support than 10 point folders offer	
20 lb. paper folders	Standard and legal	Light-weight folders used within 10 point folders to protect fragile documents stored vertically in document boxes	These folders are suitable only for single sheets and sets of sheets in good condition
20 lb. paper interleaving sheets	Letter size (8 ½" x 11") Legal size (8 ½" x 14")	Placed between objects in a folder; segregating paper objects in good condition from newspaper clippings	
Polyester enclosures (also see Figure J.4., Types of Polyester Enclosures)	Various sizes; several weights and thicknesses (1, 3, 5 and 10 mil)	Housing fragile or torn objects that can be kept together by the static attraction of the enclosure	Can tear fragile paper if not opened carefully; not appropriate for powdery or flaking media (charcoal, chalks, pastels, desiccated paint and inks)
Matboard enclosures	Can be made to size (see *Conserve O Gram* 13/1, "Window Mats for Paper Objects"), 2, 4, and 8-ply thickness	Appropriate for objects being framed for exhibit; added support for objects in polyester sleeves; use thicker types as supports for carrying objects	Thinner boards are flexible and not appropriate for brittle objects; avoid covering edges or face of fragile media with matboard
Corrugated paperboard	Single or double-walled construction; available in sheets 24" x 48" and larger	Similar uses to matboard; very strong. Use to make customized supports, crease and fold to make wedges to fill space within document boxes	Single-walled boards tend to warp in larger sizes
Enclosure type	***Sizes***	***Typical Uses***	***Cautions***
Boxes (See also Figure J.5, Types of Boxes)	Variety of sizes and designs for vertical and horizontal storage	Appropriate for housing multiple objects in enclosures (mats, folders); three-dimensional objects	Do not overfill or allow to become too heavy to handle easily

Figure J.4. Types of Polyester Enclosures

Type	*Description*	*Uses*	*Cautions*
Folders	Sealed on one side (usually lengthwise)	Temporary housing for fragile single sheets being processed; protect single sheets during handling by researchers	Use care to prevent the document from sliding out the unsealed sides
L-seal pockets	Sealed on two adjacent sides	Appropriate for thin pamphlets, single sheets in fragile condition, single sheets of groundwood paper	Use care to prevent tearing the object as it is inserted into the folder

Type	*Description*	*Uses*	*Cautions*
Sleeves	Sealed on two opposite sides (usually lengthwise)	Used in conjunction with supports for thin objects that cannot be flexed (placecards, photographs)	
3-seal pockets	"Open-short" or "open-long", depending on which one of the 4 sides is left unsealed	Appropriate for thick pamphlets and bulky objects; used with rigid inserts for objects that cannot be flexed	Open-short format provides more support than an open-long pocket
Multi-pocket sheets	Various sizes with pockets that vary in size depending on the number per sheet	Minimize storage volume for smaller objects such as advertising cards, baseball cards, small photos	Only appropriate for single sheets in reasonably good condition
Encapsulation (see *Conserve O Gram* 13/3, "Polyester Encapsulation")	Enclosure sealed on 4 sides with ultrasonic or heat seal, or 3M Scotch Brand Double-coated Tape No. 415®	Used for fragile, brittle, or torn objects and objects subjected to frequent handling	Acidic papers should be treated by a conservator before encapsulation to avoid accelerated deterioration, or add a buffered sheet

Figure J.5. Types of Boxes

Type	*Description*	*Uses*	*Comments*
Document	Sizes from 3" x 5" to 10" by 15"; hinged lids	Used to store groups of objects in enclosures, such as folders; objects are removed by lifting the enclosures up and out	Do not use handles that protrude into the interior of the box that can catch on the enclosures and objects inside the box.
Card	Sizes range from 3"x3"x5" to 8"x5"x10" and may have hinged or separate lids	Prints, computer discs, postcards, stereocards	
Solander or Clamshell (also called Portfolio)	Sizes range from 8"x10" to 20"x24"; clamshell boxes are hinged and open completely flat	Used for horizontal storage of paper objects, usually in mats or folders; suitable for works of art on paper	Store objects of different dimensions in standard sized enclosures sized to the box to prevent shifting or sliding in the box
Garment, quilt, oversized	Lidded boxes ranging in size from 13"x15"x10" to 16"x58"x6" and made of heavy corrugated paper or polyethylene board	Suitable for oversized objects or groups of smaller boxes; can be fitted with compartment dividers	Do not overfill
Archival Records Storage	10"x12"x15" boxes with hand holes cut into either end for carrying; lift-off lid; corrugated paper or polyethylene board	Generally used for vertical storage of papers in good to fair condition that are housed in folders	Do not use to hold fragile archival materials or those of high intrinsic value

When choosing any of these products, keep the following in mind:

- have a modular system of standard sizes
- be sure that housings fit snugly inside boxes and drawers so that objects cannot shift or slide

- when storing paper objects together in boxes or drawers, house them in the same size enclosures. Choose the size of the enclosure based on the size of the largest object

8. ***What kinds of equipment should I use to store collections of paper objects?***

Be sure to utilize appropriate storage equipment to physically support paper objects in their enclosures. Use storage equipment to:

- protect the collection from abrupt environmental changes
- protect objects from pest infestations
- maximize the available storage space

Only use storage equipment that is constructed of chemically inert materials. Modular storage units afford the most efficient use of space and retrieval of objects. Refer to Chapter 7: Museum Collection Storage and *Tools of the Trade*, for further guidance.

The most commonly used types of storage equipment for paper collections are:

- **map cabinets** (also called flat files)
- **shelving units**

> ***Only store documents vertically in file cabinets if they are in very good condition and are well supported in their enclosures.***

Use **flat files** or **map cabinets** to store objects too large for boxes.

- All objects should be in enclosures.
- Map cabinets with shallow drawers are more efficient than those with deeper drawers. Store objects of varying sizes in uniform folders that are the size of the drawer.
- Fill empty spaces with blocks of polyethylene foam.
- Separate stacks of enclosures or rolled papers within a drawer with dividers made of archival cardboard.

Stack objects in piles of 1" or less in flat file drawers.

Use **shelving** to store objects in boxes. Use adjustable shelves and place shelves close enough together that boxes cannot be stacked. Roll oversized paper objects around archival tubes and store on end supports.

G. Exhibiting Paper Objects

It's difficult to find an acceptable balance between the benefits of exhibiting original paper objects and the resulting damage. For objects of high intrinsic value, there is no level of loss that is acceptable. For other objects (duplicates, objects of no intrinsic value), there may be a level of loss that is acceptable, such as fading that is imperceptible to the human eye.

To ensure preservation of papers on exhibit:

- **Obtain a copy of the CD-ROM publication *Exhibition Conservation Guidelines: Incorporating Conservation into Exhibit Planning, Design and Fabrication***, available from the Department of Conservation at Harpers Ferry Center. This resource contains a wealth of guidance on developing preservation-responsible exhibitions.

- **Do not exhibit papers for more than six months** (cumulative). Six months of cumulative exposure to controlled, low light levels (50 lux or less) is the maximum exhibition time for original paper objects. Consult a conservator before exhibiting original objects for longer than six months. **Only facsimiles are appropriate for "permanent exhibits."** Be sure to distinguish between facsimiles and duplicates as follows:

  – Facsimiles are new copies of the original objects.

  – Duplicates are multiple originals, such as lithographs and blueprints.

In some collections there may be several identical copies (duplicates) of an object, such as a lithograph map. In some instances, it may be appropriate to treat one of the duplicates as a facsimile for exhibition purposes. It is not appropriate to take this approach if those objects have acquired unique characteristics. For example:

- blueprints (originally printed in multiple copies) containing annotations documenting plan changes made during construction

- the only extant copy of an object originally made in multiples

1. *How can I limit the risks of exhibiting paper objects?*

Do the following:

- Control temperature, relative humidity, pests, and air pollution.

- Eliminate all sources of ultraviolet light.

- Limit light intensity to 50 lux or less.

- Use appropriate display materials in formats that properly support the object.

- Limit the duration of exhibit and/or rotate specific objects to and from storage.

2. ***Which formats are appropriate for displaying paper objects?***

Paper objects on exhibition require special protection. The exhibit mount must provide physical support to avoid mechanical damage. It also must protect the objects from direct handling. The exhibit case protects objects from vandalism.

Paper objects are exhibited in frames or display cases.

- Frames are appropriate for single sheet objects that are strong enough to be displayed upright in a mat, such as:
  - prints
  - drawings
  - manuscript materials
- Cases are required for objects that cannot be housed safely in a mat, such as:
  - multi-sheet objects
  - oversized objects that can't be framed
  - thick, or heavy objects like books

Be sure that exhibition mats and mounts are larger than the object to fully protect its edges. NEVER FOLD OR TRIM AN OBJECT to fit into a housing enclosure.

3. ***What guidance is available for matting and framing paper objects?***

Consult *Conserve O Grams* 13/1, "Window Mats for Paper Objects" and 13/4, "Exhibit Mounting Variations for Objects on Paper," *Matting and Framing Works of Art on Paper* by Elizabeth Kaiser Schulte, Hilary A. Kaplan, and Chris Foster, available on the web at: <http://aic.stanford.edu/treasure/matt.html>, and *Caring for Works of Art on Paper*, on the web at: <http://aic.stanford.edu/treasure/paper.html>.

If you hire a commercial framer, request references of other museum customers and be sure to include a scope of work that specifies their adherence to the guidance listed in these publications.

H. Working With a Conservator When Treatment is Needed

Care of NPS museum collections is based on a preventive conservation approach to preserve objects. Sometimes, however, preventive measures are inadequate, and conservation treatment is necessary to preserve an object. Review Chapter 8: Conservation Treatment, for detailed guidance. See Section J, Glossary of Terms Used to Describe Condition, for definitions of paper condition to aid in discussing the needs of your collection with a conservator.

Conservation treatment is active ("hands-on") work to preserve and/or restore objects. Only trained conservators who have specific expertise should treat paper objects in your collection. If conservation treatment is required, park staff must ensure that:

- objects receive the most appropriate treatment for their preservation and use
- treatment is appropriate (consider the object's condition, history, significance, and use)
- treatments are performed by skilled, experienced conservators and documented properly

1. *How do I know which objects require conservation treatment?*

It is easy to determine treatment needs if objects are extremely fragile, or damaged in such a way that they cannot be displayed. However, it is important to have an overall plan for dealing with the preservation of your entire collection. Therefore, it is important to have a Collection Condition Survey completed by a paper conservator to identify the entire range of problems, and develop priorities for treatment. A survey also will identify housing issues, and minimally interventive treatments that you can undertake to better preserve the collection.

2. *What is stabilization versus treatment?*

Sometimes stabilization is as simple as removing a paperclip or using buffered paper to prevent acid migration. Stabilization of a torn document may be accomplished through encapsulation, or through mending.

The goal of stabilization is to allow the object to be researched, exhibited, and handled without damage. Work with a paper conservator to determine the amount of stabilization required to meet that goal.

Conservation treatment can actually change the chemical or physical stability of a paper object.

3. *What restoration treatments are appropriate for paper objects?*

Restoration treatments are intended to return objects to a known or assumed former state, often through the addition of non-original material. Keep the following points in mind to determine if restoration is an appropriate option:

- Restoration treatments should be undertaken only if absolutely required for exhibition or research purposes.
- There must be sufficient data about the object's earlier appearance to enable accurate restoration.
- Restoration must not modify the object's known original character.

- Restoration should be accomplished using the techniques and materials that will least modify the item.
- Restoration materials should be removable at a later time with minimal adverse effect.
- Restored areas should be distinguishable from original material upon careful examination.
- Restoration and the use of added materials must be well documented.
- All restorations will preserve significant evidence of use and other historical evidence.

4. ***What cleaning techniques are appropriate for paper objects?***

You can remove dust from stable media with an air bulb syringe, a soft artist's brush, or a cosmetic brush. Refer all other treatments to a paper conservator.

> ***Note: Some computer-generated documents may have ink/toner that didn't properly bond to the paper originally. Do not use a brush to clean such papers, as you could remove toner from the page. Consult a paper conservator.***

5. ***Can acidity be removed from paper to prolong preservation?***

Yes. A paper conservator often can use a water-based treatment to reduce paper acidity. There also are various treatments to neutralize acids. However, certain pigments, dyes and inks may fade or change color, and some papers darken with these treatments. A paper conservator will be equipped to determine if these treatments are appropriate.

6. ***Are deacidification sprays appropriate for use on aper collections?***

Only a paper conservator should determine whether any form of interventive treatment is appropriate for your collection. These sprays may irreparably change the character of a paper object. **Use only under the guidance of a qualified conservator.**

I. Emergency Procedures For Paper Collections

Your collection is unlikely to be damaged by floods, hurricanes, or tornadoes. However, no park is immune from the threat of emergencies. A broken pipe can do untold damage to a paper collection, causing sheets to stick together and media to run and stain adjacent objects. Both a disaster plan and recovery plan are critical to ensuring the collection's preservation. Review Chapter 10: Emergency Planning for guidance. Make sure that:

- Collection needs are addressed in your park's Emergency Operations Plan
- Local authorities are aware of the special needs of your collections and are familiar with the layout of your exhibition and storage areas
- Sufficient recovery supplies are readily available (see *Conserve O Gram* 21/2, "An Emergency Cart for Salvaging Water-Damaged Objects")

Also review *Conserve O Gram 21/4*, "Salvage at a Glance, Part I: Paper Based Collections."

J. Glossary Of Terms Used To Describe Paper Condition

Abrasion: surface loss caused by friction

Accretion: deposit of extraneous material on the surface of an object

Brittleness or Embrittlement: loss of flexibility causing paper to break or disintegrate when bent

Cockling: buckling or waving of the paper caused by expansion and contraction under changing atmospheric conditions

Crease or fold: line or mark made by bending or folding the paper

Dent: concave defect in the surface

Deterioration: breakdown of the paper caused by added ingredients or by natural aging

Discoloration: changes in color, such as darkening or fading

Dog-ear: term commonly used to describe a diagonal crease across the corner of a page

Fading: discoloration seen as a loss of color and sometimes with a change of hue

Flaking: lifting and sometimes loss of flat areas of the surface layer

Foxing: brown or reddish-brown spots caused by mold or the oxidation of iron particles in the paper support, mount, or backing

Insect damage: holes, surface loss, or organic residue from insect infestation

Gouge: defect in the surface caused by a blow where material has been scooped out

Loss: missing area or hole

Mold: group of small fungi that grow under warm, moist conditions on organic substrates causing the breakdown of the substrate

Mount: materials to which paper objects are attached for additional support

Substrate: the paper itself

Surface dirt: dirty material either loosely distributed on the surface of an object (dust) or firmly ingrained in the surface (grime)

Tear: linear break in paper resulting from tension or torsion

RULES FOR HANDLING ARCHIVAL COLLECTIONS

1. Researchers (NPS and non-NPS staff) must be accompanied by museum staff at all times while in the collection research area.
2. Smoking, drinking, and eating are not allowed in any museum areas.
3. Briefcases, folders, coats, hats, umbrellas, backpacks, or other similar items are prohibited from the research area.
4. All researchers must remove necklaces, watches, bracelets, rings, and other jewelry.
5. All researchers must wear a pair of clean white cotton gloves at all times when handling collections.
6. Keep hands clean even when wearing gloves. All materials and surfaces in contact with the item must also be clean.
7. Handle papers as infrequently as possible.
8. **Only pencils** are allowed when working with collections.
9. Handle every item as though it is irreplaceable and the most valuable in the collection.
10. Researchers are limited to one folder at a time and must sign it out in the receipt book.
11. When finished working with a folder return it to the staff. Circulation to other patrons is prohibited.
12. Save all information that is associated with an item (e.g., folders, tags, labels, notes, etc.).
13. Only staff members are authorized to photocopy original materials. If you require duplication services, notify the staff.
14. If you have any questions or if any problems develop, notify the staff immediately.

Figure J.7. Example of Procedures for Handling NPS Archival Collections

Appendix K: Curatorial Care of Textile Objects

List of Figures:

APPENDIX K: CURATORIAL CARE OF TEXTILES

A. Overview

1. *What information will I find in this appendix?*

This appendix discusses the physical characteristics of textiles and outlines guidelines for their long-term care and preservation. Many different kinds of objects are called textiles. They include:

- quilts and bed covers
- clothing
- tapestries and wall hangings
- rugs
- baskets and mats
- upholstery
- embroidered samplers and other household decorations

The main topics covered in this appendix are:

- textile materials, added materials, and their manufacture
- agents of deterioration
- handling, storage, display, and transportation of textiles
- working with a conservator when treatment is needed
- specific emergency procedures for textiles

2. *Why is it important to practice preventive conservation with textiles?*

The role of preventive conservation is to avoid, block, or minimize the ***agents of deterioration***. This practice will decrease the need for costly and time-consuming conservation treatments.

Textile objects are among the most sensitive in museum collections. They are affected by light, require controlled relative humidity and temperature, and are susceptible to damage from dirt, mold, insects, pollutants and abrasion. A textile's rate of deterioration slows significantly with proper preventive care. Practicing preventive conservation also reduces the likelihood of accidents.

3. *How do I learn about preventive conservation?*

Read about the agents of deterioration that affect textiles so that you can create a preventive conservation plan. These agents are discussed in detail in Section D. Understanding how to protect your textiles from the agents of deterioration will lengthen the life of your textiles. See Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment, for a discussion on the agents of deterioration. Also refer to

Museum Handbook, Part III (*MH-III*), Chapter 7: Using Museum Collections in Exhibits.

4. *Where can I find the latest information on care of these types of materials?*

There are a variety of sources for up-to-date information about textiles:

- Read the NPS *Conserve O Gram* series.
- Review the references in the bibliography. Especially note practical information found in *CCI Notes*, Section 13, Textiles and Fibres.
- Look up the World Wide Web sources that are listed at the end of this appendix.
- Consult a textile conservator.
- Consult a curator or collections manager of a large textile collection.

B. The Nature of Textiles

The history of textiles goes back to the Stone Age. Long plant fibers were intertwined and made into baskets and mats. Basket making formed the basis of weaving technology. *Spinning*—twisting short fibers together to make a long thread—made it possible to use wool, cotton, and silk to make textiles.

Textiles are combinations of fibers, dyes, and finishes. Some textiles are decorated with thread (*embroidery)* and non-textile materials like shell, bone, and metal. It isn't possible to discuss all of these materials in this appendix. Consult the bibliography and list of resources at the end of this appendix for more detailed information

1. *What fibers are used to make textiles?*

Before the 20th century, natural fibers were used to make textiles. These fibers come from two main sources:

- animal fibers
  - hair
  - wool
  - silk
- plant fibers
  - stems
  - leaves
  - seeds

Twentieth century textiles may include synthetic fibers. These include fibers made from natural materials, mainly cellulose or proteins, and include:

- rayon

- cellulose acetate
- triacetate
- natural rubber

Other polymers are created in the laboratory. These include:

- nylon
- polyester
- polyurethanes

Some textiles include metal threads or yarns that are metal and fiber combinations. These can include any combination of metals and alloys, and backings or support materials.

2. *What are the characteristics of animal fibers?*

Animal fibers are made of chain-like molecules of proteins. The basic properties of the fibers are determined by the arrangement of these proteins. The arrangement of the proteins in wool explains why wool stretches and silk is more rigid.

Hairs are usually long and coarse and come from the outer coat of an animal. They are not always woven into fabric. Two examples of their use are:

- padding in furniture and clothing (horse hair)
- felt (made of rabbit hair rather than wool)

Examples of hair fibers that can be spun into yarn that is knitted or woven are:

- cashmere (goat hair)
- angora (rabbit hair or goat hair)
- mohair (rabbit hair)

Wool is the undercoat of sheep. Four factors determine the quality of wool yarn:

- the breed of animal
- the health of the animal
- the shearing process
- the cleaning process

Wool fibers have a "crimp" that lets the fibers cling together and makes them easy to spin. The elasticity and crimp of wool fibers varies by the breed of the sheep.

Silk is the long, continuous filament that comes from the cocoon of silkworms. The molecular structure is rigid. Therefore, silk does not stretch easily. Silk is sometimes treated with finishes and materials that add body and weight to the fabric. The effects of these materials are discussed in Section C.2 of this appendix.

3. *What are the characteristics of plant fibers?*

Plant fibers are composed mainly of cellulose molecules. The basic properties of the plant fibers are determined by the rigid structure of fairly regular chemical groups that attract water. The presence of water makes the fibers flexible and resistant to breaking.

Fibers can come from the stem, leaf, or seeds of plants. After harvesting, the fibers are separated, cleaned, and processed for spinning into thread. Each of these processes has an impact on the quality of the thread, and can influence the long-term preservation of a textile.

Flax is the most common stem (bast) fiber. Flax fibers are spun to make **linen** thread. Flax is soaked in water to loosen the fibers from the inner bark of the plant. This process, called *retting*, causes the fibers to decompose slightly. Further mechanical processing is needed to release the fibers from the bark. These fibers are hard, and not elastic. In processing, linen is:

- strong when wet
- resistant to heat
- difficult to bleach
- difficult to dye to concentrated colors

Leaf fibers are hard and strong. They are good materials for rope, cords, sandals, and baskets. Some examples that may be in collections are:

- sisal
- raffia
- abaca
- hennequin
- yucca

Cotton is the most common seed fiber. Cotton is nearly pure cellulose, and the fiber is relatively rigid. *Mercerization*, a common processing technique introduced in 1844 makes dyeing easier. It also adds softness and flexibility to cotton fabric. Other seed fibers are:

- coir (coconut fiber)

- kapok

4. *What are the characteristics of synthetic fibers?*

Synthetic fibers have been designed to have a variety of performance characteristics. For example, polyester is very strong and resists wrinkling. You should not assume that synthetic fibers are sturdier than older fibers, or even contemporary textiles made of natural fibers. Synthetic fabrics have only been available in large quantities since the 1930s. We already know that some of these fabrics do not age well. Others have not been studied long enough to know the long-term effects of aging. Monitoring the condition of 20th century textiles in collections will help conservators develop a picture of long-term changes in characteristics and preservation concerns for synthetic fibers.

5. *What are the characteristics of metal threads?*

Metallic threads can be woven into the structure of a fabric or used for embellishment. The metals are subject to oxidation (see Appendix O: Curatorial Care of Metal Objects). Metallic threads are produced in various forms including:

- gold metal layer on silver strip
- gold, silver, and other metals and alloys cut into thin strips
- small diameter metal wires of gold, silver, and copper alloys
- thin strips of metal wound around a core of thread (usually silk or linen)
- thin sheets of metal applied to leather or paper
- metallic powders and pigments applied to Mylar® or other synthetic backings

---

C. The Fabrication of Textiles

There are many techniques that result in cloth or cloth-like materials. Fabrication also includes the addition of color (dyes), finishes, and other decorations. It is the structure that is important in determining the characteristics of the cloth and is directly related to its ultimate use.

1. *What techniques are used to make textiles?*

Some of the techniques used to make textiles are included here:

Felting is the process of using heat, water, and pressure to interlock loose fibers together. The best raw material is sheep wool because of its chemical structure and crimp. Lacquers and sizings can be used to stiffen the felt for particular uses. The same basic techniques for making wool felt are used today with synthetic fibers to produce synthetic felt.

Spinning is the process that converts short fibers into long threads or yarns. Loose fibers are pulled from a mass of prepared animal or plant fibers and twisted to create the yarn. This can be done by rolling the fibers down the spinner's thigh, by using a spindle, or by using a spinning wheel.

Netting is produced from a single, continuous strand using a tool called a shuttle. The thread is looped and may be knotted. Netting is the basis of

some lacemaking and tatting. Knitting and crocheting are other looped structures.

Lacemaking refers to a variety of techniques that involve the intricate twisting of fine threads to form a pattern. These include needlelace and bobbin lace that use combinations of twisted, crossed, plaited, and knotted structures.

Macramé is a knotting technique that uses more than one strand of yarn. This technique is used primarily for fringes and edgings.

Weaving is the making of cloth by interlacing threads of the warp and weft on a loom.

- *Warp* is the parallel yarn stretched on a loom (lengthwise).
- *Weft* is the transverse yarn interlacing with the warp in a pattern.

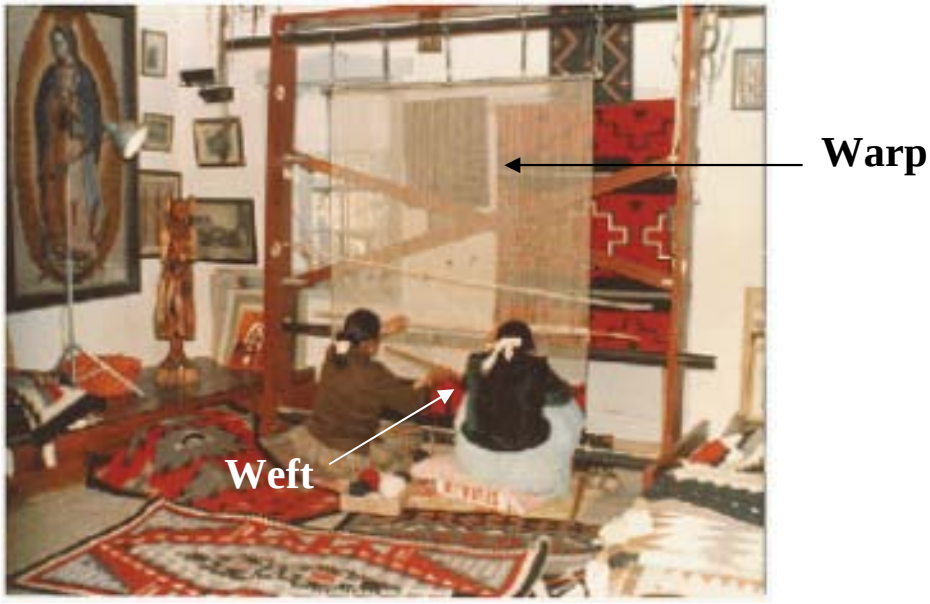

Figure K.1. Upright loom. (Weavers Mae and Sadie Curtis of Ganado at Hubbel Trading Post. Photograph by Fred Mang Jr. HUTR-23347)

Many structures and variations have been developed to produce fabric. The simplest structure of weaving (*plain weave*) is over-one, under-one interlacing of perpendicular warp and weft elements. The structure determines the characteristics of the fabric. Detailed discussions of weaving can be found in references listed in Section Q of this appendix.

2. *What kinds of finishes are used on textiles?*

Few textiles are simply processed fibers made into cloth. Dyes, lubricants, chemical compounds, mechanical treatments, sizing, water and stain repellents, mothproofing, and flameproofing are some of the treatments that prepare fabrics for use.

- *Dyes* are plant materials and various chemicals that add color to textiles. There are two general categories of dyes:

- natural (from plants, some insects, and some mollusks)

- synthetic (chemically produced colors developed in the 19th century)

Many natural dyes have good wash and light fastness. Early synthetic dyes are known for their harsh, bright colors, and poor wash and light fastness.

Some dyes have an affinity for textile fibers, but most require assistance to attach to the fibers. These chemicals, called *mordants*, are usually metallic salts applied to the cloth before dyeing begins. Mordants also can modify the dye color (different mordants used with the same dye material produce different colors).

Natural dyes mordanted with iron produce a black or brown-black color. These dyes deteriorate and destroy the fiber. Many printed cottons and tapestries used iron-mordanted yarns to outline designs. Often there are holes left in the fabric where these yarns used to be.

- *Cropping*, *napping*, and *shearing* of cloth raise the fibers to produce a soft, slightly piled fabric. *Rubbing, pressing*, and *glazing* give a smooth, lustrous surface. These mechanical processes are sometimes combined with oils, gums, starches, beeswax, varnishes, pitch, and gelatin. Egg white and water, or gum arabic was used on glazed woolens and linsey-woolsey blends in the 18th century. These finishes are fragile and can be damaged by handling and moisture.

- During weaving, oils, lubricants, and sizing are often used to keep yarns from tangling and to strengthen the warp against the friction of the loom. These materials are usually washed out by a laundry method called *scouring*. Scouring can range from gentle cleaning to processes using heat, pressure, and agitation.

- *Fulling* involves the use of lubricants, detergents, and other additives with water, heat, and agitation to produce felt. Felting causes the fibers to shrink and adds softness, body, and strength to the fabric. Very thorough felting produces strong, nearly waterproof fabrics that have been used for tents, coats, and shoes.

- Cotton threads and fabrics can be treated with a strongly alkaline chemical to add strength, durability, and luster to the fiber. This process of *mercerization* also reduces shrinking and makes the fiber more receptive to dying.

- During the 18th and 19th centuries, silk fabrics were sometimes treated with a variety of metallic salts to produce fuller, heavier textiles. These *weighted fabrics* were used for clothing, flags and banners, fringes, and tassels. When they were new, these fabrics had a fuller feel and drape than pure silk. However, weighted fabrics are not strong, and when aged, fracture and powder very easily. Washing and dry-cleaning easily damage weighted silks. They are very sensitive to the effects of light, moisture, and air pollution.

Finishing processes for synthetic and newer fabrics include:

- synthetic resins
- plasticizers
- mothproofing agents
- flame proofing chemicals
- emulsions used for soil, crease, and water repellency

Some of these processes are chemically active and their degradation products destructive to the textiles. Others are so recent that their long-term effects are not known.

> ***Finishes are responsible for the performance and many of the characteristics of textiles. However, some of these treatments and chemicals enhance deterioration and limit the possibilities of conservation treatments.***

3. *What other kinds of decorations are used on textiles?*

In addition to dyes, the texture of different weaving structures, and the effects of cutting and piecing fabrics together, textiles can be decorated with *embellishments* including:

- paint, pigments, and gilt
- braids and fringes
- added stitches
- metals
- beads
- fur and feathers

Embellishments may or may not be a structural component of the textile. Some embellishments, like beads, may be quite heavy. The areas where they are attached may be weak, and require extra support and care in handling.

- **Paint, pigment, and gilt** can be added to textiles to create surface designs. Printers' gums, waxes, starch, and adhesives may be present as well. These materials often are soluble in water. They also tend to stiffen the textile. Paints and gilt can crack when the textile is flexed or folded. Special care is needed for display, handling, and storage of painted textiles.

- **Fringes** may be a part of the structure of a textile or added after manufacture. In historic houses, fringes on rugs and carpets are subject to damage if they are in a public pathway.

- **Added stitches or embroidery** is a common form of decoration. All types of thread and yarn are used for embroidery. Embroidered textiles are most vulnerable to damage where the yarn or thread is stitched through the ground fabric. Cutting or tearing of the fabric is a result of the stress from tension on the yarn, or the interaction of the ground fabric and the thread together. For example, metallic thread is heavy and sometimes has sharp edges. It can cut or tear the textile.

- **Metals** in the form of metallic threads, metal strips, braids, and wires are used to decorate textiles. These decorations are often heavy and place strain on the underlying textile. A variety of metal combinations (alloys) have been used on textiles. The preservation concerns for these materials vary with the type of alloy (see Appendix O: Curatorial Care of Metal Objects).

- **Beads, buttons, and sequins** also can be used for decoration on textiles. These can be made of a wide variety of materials including glass, bone, stone, plastic, ceramic, and wood. All of these materials have different rates of deterioration and interaction with the textile. For example, early sequins were made of gelatin. In situations of high humidity these sequins become sticky and can dissolve.

- **Fur and feather** trims are particularly vulnerable to pest infestations and need to be monitored carefully.

D. Deterioration of Textiles

1. *What agents of deterioration affect textiles?*

Many factors contribute to a textile's deterioration. These ***agents of deterioration*** can occur naturally, or they can result from external forces. Avoiding agents of deterioration is the key role of ***preventive conservation***. The agents that affect textile collections most are:

- light (visible and ultraviolet)
- temperature
- humidity
- pollution
- pests

Knowing the ideal settings for temperature, relative humidity, and visible light, and knowing how to filter UV radiation and pollution is essential for preserving your collection. An Integrated Pest Management (IPM) Program is essential to protect your collection from pests. For more information about these agents of deterioration, see Chapter 3: Preservation: Getting Started.

2. *How do textiles change over time?*

As all materials age, they slowly break down and constantly deteriorate. The basic deterioration of textiles is the gradual breaking down of long-chain fiber molecules into shorter chains. The result is brittleness. Other forms of natural deterioration are:

- *gradual loss of inherent moisture*: Natural fibers come from living sources with biological functions. As they age and the structure of the fiber changes, fibers become less elastic and resilient.

- *effects of impurities*: The presence of small amounts of metals, such as copper, can accelerate deterioration in the presence of bleaching agents, ozone, ultraviolet radiation, and moisture.

- *impact of manufacturing*: Iron mordants, oils and lubricants used to facilitate the weaving process, and bleaching are some of the manufacturing processes that can contribute to the deterioration of textiles.

- *inherent vice:* Sometimes methods of manufacture and the nature of materials cause deterioration that cannot be controlled and may not be treatable. The most striking example of inherent vice is the impact of the addition of certain metallic compounds to silks to add weight and drape to silk fabrics. These compounds bond to the silk fiber and cause their eventual splitting and powdering. Another example is the interaction of some metal threads and decorations with textiles. The natural deterioration of wool accelerates deterioration of silver metallic threads causing tarnish. The tarnish can then stain the wool.

- *oxidation*: Fabrics are naturally degraded by the presence of oxygen. The result is an overall brownish discoloration on white or natural-colored textiles. When treated with water, some of these oxidation products are dissolved. However, the oxidation process begins again immediately.

3. *How does the environment affect my collection?*

Temperature, relative humidity, light, and pollution directly affect the rate at which a textile ages. Storing and displaying textiles in areas where temperature is too high and RH is too high or low will increase deterioration rates and promote pest activity. Constant or large fluctuations in temperature and RH are harmful, too. Textile fibers are ***hygroscopic***—they readily take up and lose moisture. Fluctuations of relative humidity and temperature cause textiles to take up or lose moisture. These fluctuations cause dimensional change and mechanical stress that can lead to breakage and structural damage of weak yarns. Natural and artificial lighting cause textile dyes to fade. UV radiation causes fading to happen quickly and fibers to become brittle. Pollution, including dirt, settles in the structure of a textile, causing its character to change completely. Pollutants also affect dyes, finishes, and many embellishments.

4. *What are the ideal temperature and RH ranges for textiles?*

Store textiles at temperatures between 65º and 75º F and relative humidity as close to 50% as possible. Low temperatures are not a problem for textiles and may help slow down the rate of deterioration for textiles that are damaged by weighting. High temperatures can embrittle textiles, and together with high relative humidity, promote biological activity. Low relative humidity (under 35%) can embrittle textiles. Avoid temperature and relative humidity fluctuations.

5. *How does light affect textiles?*

Light causes textile dyes to fade and undyed textiles to bleach or darken. Light can also be a catalyst for deterioration of weighted silks. Light damage is cumulative and irreversible. The amount of light damage

depends on the type of light (ultraviolet and/or visible), intensity of the light, and duration of exposure. Evaluating your collection's lighting conditions and making appropriate adjustments can prolong the life of your collection. Review the natural and artificial light sources in your storage and display areas. Use monitoring equipment to identify levels of UV radiation and illuminance (levels of visible light are measured in "lux").

Reduce your collection's exposure to light by storing and displaying textiles in rooms without windows. (Clear UV-absorbing films will reduce UV levels, but will not reduce illuminance.) Cover all windows with drapes or blinds to further protect textiles. Avoid storing and displaying textiles in rooms with doors that open to the outside.

The maximum illuminance recommended for textiles is 50 lux. All UV light should be filtered. Consider ways to limit the total light exposure, such as automatic dimmer switches, or simply turning out lights when visitors are not present.

6. *What kinds of pollution affect textiles?*

Outdoor pollutants, such as dust and pollen, can easily be brought into a museum through open doors and windows. Industrial emissions as well as natural processes of erosion create pollutants. Cleaning products, asbestos fibers, building materials, paint, carpeting, and other indoor materials can generate pollution from within a museum. Cigarette, cigar, and pipe smoke are also harmful forms of pollution.

Dirt disfigures, dulls, and stains textiles. Dirt and dust also contain a high proportion of silica. The sharp surfaces of silica can cut and abrade textile fibers, especially when the fibers expand and contract in response to changes in RH.

Sulfur dioxide bleaches, discolors, and embrittles textiles. Hydrogen sulfide in the presence of moisture darkens lead pigments, tarnishes metals, and reacts with finishes and some embellishments.

Formaldehyde in paints, varnishes, wood products, and carpeting damage some dyes.

Tar and particulates from tobacco products stain textiles and are difficult to remove.

7. *How can I control pollution in my storage or display area?*

Follow these practices:

- Keep doors, windows, and outside vents closed whenever possible.
- Never allow smoking or fireplace fires in the building.
- Choose new building materials, paints, and carpeting that do not emit harmful gasses.
- Don't use custodial cleaners that emit harmful gasses (for example ammonia).
- Use appropriate particulate and gaseous pollution filters in your HVAC system.

- Store textiles in closed cabinets with appropriate gaskets.

- Keep particularly vulnerable objects in sealed display cases. Make sure these cases meet the recommendations in *MH-III*, Chapter 7: Using Museum Collections in Exhibits, and NPS *Exhibit Conservation Guidelines*.

For more information on controlling pollutants, see Chapter 4: Museum Collections Environment.

8. *What pests are attracted to textiles?*

Textile fibers are an excellent source of food for microbes and insects. Sizing, starch, gelatin, binding media for pigments, soils, and stains also are attractive to pests.

- Case bearer and webbing clothes moths are attracted to high protein material including wool, silk, hair, fur, feathers, and skins. The female moth lays eggs within the weave structure of the textile. The eggs hatch and the larvae feed on the textile material. Larvae take on the color of the materials they consume, making them difficult to see. Moths channel through the textile making holes, or "graze" on the surface thinning the yarns and weakening the textile structure.

- Silverfish, cockroaches, termites, and woodworms eat cellulose and graze on parchment, leather, paper, fabrics, glues, and painted decorations.

- Woodworms, termites, and carpet beetles can be found in furniture and associated furnishing fabrics, upholstery, and the inner structure of upholstery materials. Carpet beetles also attack silk and wool textiles.

- Mold and mildew grow in warm, damp locations. Irreversible brown stains are caused by enzyme attacks from the digestive processes of these organisms.

9. *How can I protect textile collections from pests?*

Follow these practices:

- Develop and implement a regular housekeeping plan. Pests are attracted to soils and a dirty environment.

- Develop and implement an IPM plan. Regular inspection and recording sightings of insects or insect debris is crucial to any pest management system. All park staff can be integral to systematic preventive conservation through identification of problem objects or areas.

- Prevent the initial entrance of insects into the collections. Flowers, plants, and potting soil are good sources for introducing an insect problem to the site. These materials should not be permitted in buildings that house collections.

- Isolate newly acquired collection objects from the rest of the collection. Determine if any insects are present and make sure they have been eradicated before new collections are integrated into storage or exhibition areas.

- If an infestation is suspected or located, isolate affected objects from the rest of the collection. Examine the surrounding area to locate possible sources of infestation (such as beneath floorboards, inside a cushion, or in bird and rodent nests under eaves and between walls).

- Immediately consult with a conservator and your park or regional IPM coordinator to identify appropriate treatments.

For more information about IPM and pest infestations, see Chapter 5: Biological Infestations

Controlling pests and the environment—light, temperature, relative humidity and air pollution—are keys to the long-term preservation of textiles.

E. Proper Handling of Textiles

1. *What do I need to consider before handling a textile?*

Following are a few guidelines:

- Keep hands away from textiles unless handling is absolutely necessary. The body gives off acids and oils through its pores that can damage textiles. Wash hands often and use white cotton gloves whenever possible.

- If the textile is fragile, carry it flat on a support.

- Make sure there is a clean surface of adequate size available before you move a textile from one place to another.

- Avoid carrying all but the smallest textiles by yourself. Get another person to help when you are transporting large, heavy textiles. Use a well-padded cart in good condition to transport boxed and smaller items.

- Remove jewelry, badges, belt buckles, and watches that might catch on and tear textiles, especially during installation and preparation of textiles for storage.

- Use clean, padded surfaces when working with textile collections. Keep tools, inks, and other writing materials away from the work area. Use only pencil when working around textiles.

- Avoid placing textiles one on top of another. When stacking them is absolutely necessary, interleave textiles with unbuffered, acid-free tissue paper, and be aware of the weight of one textile on another.

2. *How should I handle textile objects?*

Unlike a ceramic or wooden sculpture, textiles are not rigid, and need to be supported when they are lifted. Lack of support can result in stretching and tearing of the fabric.

- Roll a flat textile around an archival tube for transport or storage.

- Textiles with fragile surfaces, beads, heavy embroidery, or other surface attachments can be fan-folded and supported on a muslin-covered, corrugated archival board or in an archival cardboard tray (see Figure K.2).

- Place a muslin-covered, corrugated archival board or archival cardboard tray under fragile textiles and fragments for support.

- Large, heavy textiles (such as carpets and tapestries) require two handlers even if rolled on a support tube.

- Pad the interior of costumes with crumpled unbuffered, acid-free tissue and transport them in archival textile boxes.

- Fold pieces as little as possible. Textiles tend to break along fold-lines in time. Pad folds with crumpled unbuffered, acid-free tissue paper.

- Transport supported textiles on a well-padded cart.

Always use a support or container when moving textiles.

Figure K.2. Fan folding a textile into archival tray

F. Storage Specifications

1. *What do I need to know about storing textiles?*

Improper storing of textiles can be a catalyst for deterioration. Consider the elements that affect a textile in storage.

- Control the agents of deterioration.

- Choose appropriate storage space and equipment. Use only archival materials (tubes, unbuffered tissue, cardboard) in contact with textile objects (see Chapter 7: Museum Collections Storage).

- Ensure that proper security and fire detection and suppression equipment is installed and maintained (see Chapter 9: Security and Fire Protection).

2. *Where should I store my textiles?*

Your collection size is an important consideration when you determine where to store your textiles. If you have many textiles, consider creating a dedicated storage room. If you have only a few textiles in your collection, dedicate a space or cabinet in your museum storage area for your textiles. As much as possible, store textiles in properly gasketed closed cabinetry. Closed cabinets provide extra protection from pests, as well as potential water damage that might result from a flood or fire. Never store textiles:

- in attics or basements
- against exterior walls
- near furnaces or heating/air conditioning vents
- in spaces below water pipes

3. *How should I store my textiles?*

The structure of a textile, its condition, and size determine the best storage method. In general, you will choose from the following storage methods:

- archival rolling tubes
- flat-file cabinets
- archival boxes
- costume wardrobe cabinets
- shelving units
- specialized containers

G. Storing Flat Textiles

1. *Which textiles are stored flat?*

Flat storage is ideal for most textiles because it provides complete support for the object. Small textiles (for example, samplers and some household linens), fragments, and particularly fragile textiles should be stored flat. Flat storage is impractical for most large items like carpets and tapestries. However, permanently gathered or pleated curtains should be stored flat in archival costume boxes or drawers using padding techniques described for costume (see H.5 below).

Shallow drawers, like flat file cabinets, are well suited to flat textile storage. Sturdy textiles can be stored between sheets of unbuffered archival tissue. Avoid stacking textiles as much as possible. More delicate textiles may require a support to protect the fabric as it is lifted from the drawer. A simple support can be constructed by covering a piece of corrugated archival cardboard with washed muslin. Line drawers with closed cell polyethylene foam such as Volara®.

Very fragile small textiles (for example, brittle archeological textiles) may require additional protection. A modified print mat provides space economy as well as protection for handling and storage. (see *MH-1*,

Appendix I, Figure I.8 Construction of a Portfolio Mount for Archeological Textile Fragments or *Conserve O Gram* 16/3 "A Simple Storage Mat for Textile Fragments").

Other textiles that are best stored flat include:

- velvets, and other textiles with a pile structure that could be crushed if rolled or folded
- textiles with a fragile surface, such as gilt or paint
- textiles that are particularly brittle or stiff
- textiles with a very uneven surface, such as strongly raised embroidery
- textiles with heavy beading or metallic embroidery
- costumes cut on the bias

2. *Which textiles are rolled for storage?*

Flat textiles (for example, Navajo rugs, tablecloths, and tapestries) are usually rolled for storage because they are too large to handle safely if stored flat. Archival rolling tubes are available in 2" and 3" diameters. Choose a tube with a diameter suitable for the object being stored. The 2" diameter tube is ideal for thin textiles, for example, a length of lace. The larger diameter tube is suitable for carpets or coverlets. The outside of a tube can be covered with bubble wrap to create an even larger diameter tube for oversized, fragile textiles. The tube should be at least 6" longer than the width of the textile.

3. *How do I roll a textile for storage?*

Work on a clean, well-padded surface (mattress pads make good covers for worktables). Lay the textile flat, gently smoothing wrinkles. Most textiles should be rolled face in so that the design will be face up when the textile is unrolled. Textiles with raised surfaces should be rolled face out. If the textile has a lining, roll lining side in. When a double thickness of fabric is rolled, the inner layer tends to wrinkle. It is preferable to create wrinkles on the lining rather than on the face of the textile.

- Roll unbuffered archival tissue once around the tube to provide a "leader" to guide the textile onto the tube (see Figure K.3). The tissue should extend slightly beyond the width of the textile but not beyond the edge of the tube.
- Interleave unbuffered archival tissue as you roll to protect the face of the textile.
- Two or more people should roll large pieces to maintain a uniform tension.
- To protect the roll from dust, cover it with washed muslin tied in place with cotton twill tape. Attach catalog and other identifying numbers to the dust cover to prevent unnecessary unrolling.
- Long or uneven fringes are difficult to roll. Make a "fringe folder" from a piece of unbuffered archival tissue to enclose fringes and

simplify the rolling process.

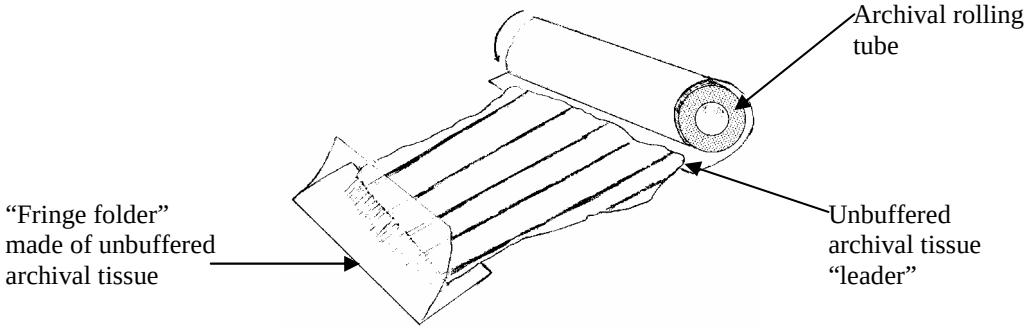

Figure K.3. Technique for rolling flat textiles for storage

4. *Is it safe to roll quilts and counterpanes for storage?*

Quilts and counterpanes are usually three layers thick (face, padding, lining). If the fabrics are in stable condition and there is no weakness in the stitching, they can be safely rolled. As with lined textiles, roll quilts and counterpanes **face out** with the lining or backing side in.

Many Victorian "crazy quilts" are made of weighted silk and velvet fabrics. These fabrics split and become powdery as they deteriorate. They should **not** be rolled for storage. Fragile over-sized textiles, like crazy quilts, can be fan-folded on a support board and stored in a drawer. Alternatively, these textiles can be stored, with minimal folding, in an archival costume box using the same general techniques described in H.5 below.

H. Storing Costume Collections

1. *How do I store dimensional textiles such as costume?*

Costume objects are stored in one of two ways depending on condition:

- hanging in a wardrobe cabinet
- folded in an archival textile or costume box

2. *How do I know which method of storage is best for costume?*

In general, fitted, constructed garments in good condition can be hung for storage (for example, dresses, bodices, coats, and jackets coming from the European clothing tradition). Museum storage hardware companies manufacture both costume wardrobe cabinets and clothing racks for this purpose. This type of storage is the most economical for costume storage because it takes less space than flat storage.

Ask the following questions to evaluate the best form of storage for costume items:

- Are shoulder seams strong and intact?
- Is the fabric in the hanging area free of splits, holes, or other weakness?
- Can the waistline support itself without causing strain at the shoulders or waist?
- If the waistline can't support itself, can it be adequately supported with the addition of waist tapes? (See Question 3 and Figure K.4)

If the answer to all of these questions is "yes," proceed to prepare the costume for hanging storage. If "no," store the costume flat following the instructions in Question 5 below.

Unconstructed clothing is better stored flat, or with minimal folding, in an archival box (for example, kimonos, and many forms of ethnic dress that use the rectangular shape of fabric yardage in clothing construction). The following are also best stored flat in boxes or drawers:

- fragile costumes and garments with weakness at the shoulders
- men's breeches or pants
- dresses with fragile waistlines
- skirts
- costumes with heavy beading
- bias cut garments (for example, some couture costume and "flapper" dresses from the early 20th century)

3. *How do I properly support and protect a garment for hanging storage?*

The goal of good hanging storage is to provide sufficient support to reduce strain across the shoulders and other vulnerable areas (for example, the waistline of a dress with a heavy skirt). See *Conserve O Gram* 4/5, Storage Techniques for Hanging Garments: Padded Hangers, and 4/15, Storage Techniques for Hanging Garments: Dust Covers.

Choose or modify a wooden hanger to provide the base for a hanging support. The ends of the hanger should reach into the sleeve, just beyond the sleeve seam.

- Reduce potential strain from heavy, bulky, or awkward garments by providing waist supports.
- Use a dust cover to protect each costume from dust, light, and abrasion from contact with other garments.
- Label dust covers with catalog and other identifying numbers to avoid unnecessary handling of the garment.
- Hang costumes in closed, properly gasketed cabinets, leaving at least 1.5 inches of space between each object. If costumes must be stored on open racks, always use **closed** dust covers.

Figure K.4. Twill tape waist supports (illustration by Jian Wu, reproduced with permission of Abrams Publishers)

4. *Why should I use dust covers for hanging costume?*

Dust covers do more than protect a garment from dust and light. For example dust covers:

- protect the textiles from oils and acids from your hands
- prevent the transfer of fugitive dyes from one object to another
- prevent metallic embroidery and other attachments (for example braid and buttons on military uniforms) from catching on and tearing other garments

- prevent abrasion of adjacent objects as costume items are moved in and out of storage cabinets

5. *How do I prepare an unconstructed garment for storage?*

Unconstructed garments (such as Pueblo and Hopi kilts and dresses) are stored flat in archival boxes or in drawers. The goal of good flat storage for these garments is to:

- use as few folds as possible
- provide adequate padding in folds to prevent creasing
- provide adequate support to safely lift the garment from the box or drawer

A muslin "sling" is useful to lift a garment from a box (see Figure K.5). A muslin-covered corrugated board, with or without a muslin wrapper, is useful to lift a garment from a drawer.

Figure K.5. Muslin "sling." Muslin can be placed under and folded over a garment to be used as a "sling" to lift and move the item. The "sling" also acts as a dust cover to protect the textile from handling.

To prepare an unconstructed garment for storage using a support board

- Lay the garment flat on a clean, padded surface.
- Cut corrugated board slightly larger than the size of the folded garment and slightly smaller than the interior dimensions of the drawer.
- Cut one piece of washed and ironed muslin the same length as the support board and three times the width, and one piece the exact length and width of the support board.
- Clean-finish the edges of both muslin pieces with pinking shears or a zigzag machine stitch.
- Attach the smaller piece of muslin to the support board with four small tabs of archival double-sided tape at the corners.

- Center the larger piece of muslin below the board and secure it to the board with strips of double-sided archival tape (1/3 of the muslin will extend beyond the edge of the support board on either side).

- Lay the garment on the support board with the neck or top edge just below the edge of the board, and the other three sides hanging over the edges.

- Place padding (for example, crumpled unbuffered archival tissue or batting "sausages") in the garment seams.

- Using as few folds as possible, placing padding in each fold, fit the garment onto the backing board.

- Drape the muslin extensions over the folded garment and tie closed with cotton twill tape.

- Label the cover with catalog or other identifying numbers to prevent unnecessary unwrapping.

To prepare storage without a support board:

- Cut one piece of muslin the same length as the storage box and three times its width.

- Center the garment on the muslin and fold as above, making sure to keep the final size of the folded garment slightly smaller than the box interior.

- Drape the muslin extensions over the folded garment and tie closed with cotton twill tape.

- Using the muslin cover for lifting, lower the folded, wrapped costume into the costume box.

- Label the cover and the outside of the box with catalog or other identifying numbers to prevent unnecessary unwrapping.

Use two people to transport costumes on support boards and to lift costumes from drawers and storage boxes.

Figure K.6. Rolled or crumpled archival tissue pads the folds of the dress. To keep the garment from shifting as the box is transported, additional rolls of tissue fill the empty space in the box.

I. Storing Costume Accessories

1. *What are costume accessories?*

There are many objects besides clothing included in costume collections. These objects are often composed of several materials, including wood, leather, bone, ivory, metal, paper, fur, and feathers. For example, costume accessories include:

- hats and bonnets
- shoes
- gloves
- purses
- fans
- umbrellas and parasols

Costume accessories are composite objects made of several materials. The care of these objects requires attention to the specific needs of those various materials. Refer to the *Conserve O Gram* series for information on the care of individual materials. See also Appendix N: Curatorial Care of Wooden Objects, Appendix O: Curatorial Care of Metal Objects, and Appendix S: Curatorial Care of Leather and Skin Objects. You will need to provide special storage supports for most costume accessories.

2. *How do I store hats and bonnets?*

Construct padded polyethylene foam supports for hats and bonnets to maintain their shape (Figure K.7). The support should raise the brim slightly off the shelf to prevent distortion. Hats with weak brims will require a full support in the crown and under the brim. Hats with weak

crowns should have a soft insert (rather than rigid polyethylene foam).

- Store hats in closed, gasketed cabinetry.
- Store hats separately from original hat boxes.
- Construct a drop-sided box to facilitate handling if a hat needs to be stored in a box for its protection (Figure K.8).
- Do not stack hats.
- Protect bows, feathers and other appendages from abrasion and crushing by padding with unbuffered archival tissue.

Figure K.7. A fabric-covered polyethylene foam support has been created to support the crown of this Civil War cap. A thin piece of Plexiglas® supports the bill.

Figure K.8. Leghorn bonnet on a support inside a drop-front archival storage box.

CAUTION: Hats made of fur, feathers, and pieces of taxidermied birds and animals may contain pesticide residues including arsenic. Test all bird and mammal skins collected and prepared prior to the mid-1980s (see *Conserve O Gram* 2/3, Arsenic Health and Safety Update). If arsenic or another pesticide is suspected, use the following handling precautions:

- Do not touch specimens with bare skin. Wear plastic gloves and a protective smock or lab coat. Wear a dust mask rated for toxic dust. If possible, handle the object or specimen by a container or a mount.

- Always wash hands after working with specimens. Discard gloves. Keep the protective smock or lab coat clean. Do not take protective clothing home to wash—especially if you live with small children or elderly people.

- Obtain a Material Safety Data Sheet (MSDS) on arsenic and other pesticides and keep in the park's curatorial workspace/office. Consult the MSDS for specific information.

- Label museum cabinets or storage spaces that house specimens contaminated with pesticides with warning signs. Also label individual specimens that have been tested. Prepare and post a written set of instructions for handling specimens contaminated with arsenic and other poisons.

Consult Chapter 11: Curatorial Health and Safety, for more information.

3. *How do I store shoes?*

Shoes should be padded for support on display and in storage. Supports should fill the entire shoe all the way to the back of the heel. Make a "sock" of cotton stockinet to fit the interior of the shoe. Stuff the sock with polyester batting from the toe to the arch. Insert a shaped piece of rigid polyethylene foam from the arch to the heel, and stitch the sock closed. The sock should provide uniform, solid support without stuffing the shoe tightly.

- Support the entire shoe. Do not handle shoes by the heel alone.

- Provide adequate support to the ankle and leg sections of boots by constructing a second "sock" filled with polyester batting to fill that

area. If the ankle is weak, the support can be constructed of shaped polyethylene foam.

- For the protection of staff as well as the shoes, do not store shoes and boots on upper shelves or movable shelves. It is best to contain shoes and boots within shallow boxes for storage.

- Store shoes and boots in closed, gasketed cabinetry. If this is not possible, provide dust covers of washed muslin for each pair. Label the dust cover with catalog and other identifying numbers to prevent unnecessary handling.

4. *How do I store gloves and mittens?*

Gloves and mittens may require internal supports to prevent crushing or creasing. Do not force a support into the fingers of the glove. A simple support can be cut from 2-ply archival matboard. Be sure to sand or burnish the cut edges of the board so that there are no rough spots. If more padding is required, pad the matboard with polyester fleece Pellon and finish with a layer of cotton stockinet (Figure K.9).

Figure K.9. Internal support for gloves and mittens. Internal supports should be smooth and slightly smaller than the object. Do not over pad the interior of a dimensional textile.

5. *How do I store bags and purses?*

Bags and purses may need to be gently stuffed with unbuffered archival tissue to maintain their shape. The best way to prevent damage to handles, chains, and clasps, is to wrap them with tissue, or create cavity packs in storage drawers. Cavity packing offers the additional benefit of isolating the metals and other materials of the handles and chains from the textile.

6. *How do I store fans?*

Fans should be stored closed if they are in good condition. Storing fans open may cause distortions that will prevent their being closed in the future. However, if the paper or fabric body of the fan is cracked or split, repeated opening and closing will cause damage. In this case, the fan should be stored open on a graded support (see Figure K.10).

- Provide support for tassels attached to the heel of the fan.

- Store fans separately from original cases or boxes.

Step 1: Cut a fan-shaped support board from 4-ply archival mat board or archival corrugated board at least 1" larger in dimension than the fan.

Step 2: Cut wedge-shaped pieces of polyester batting, layering them on the support board to match the profile of the opened fan.

Step 3: A small roll of batting will be necessary to support the uppermost fan sticks.

Step 4: Cover the padded support with washed cotton fabric, stitching the cover together in the back. Make two parallel cuts through the mount on both sides and thread twill tape ties through to the front. Secure the fan sticks with the twill tape ties.

Figure K.10. Padded support for a fragile fan.

7. *How do I store parasols and umbrellas?*

Parasols and umbrellas are composite objects made of combinations of fabric, paper, bone, wood, and ivory. The condition of individual objects will determine the best storage method.

- Check for metal corrosion and sharp edges. These will need to be wrapped or padded to prevent damage to the rest of the object.
- Store parasols and umbrellas slightly furled, padding the folds with unbuffered archival tissue that is rolled into narrow cones (Figure K.11).
- Do not open a parasol or umbrella completely unless it is absolutely necessary.
- If the parasol or umbrella fabric is relatively sturdy, wrap the padded object in muslin secured with twill-tape ties before laying it in a drawer.
- If the parasol or umbrella fabric is weighted silk or another fragile material, wrap the padded object in unbuffered archival tissue before securing it in a muslin wrapper.
- Label the muslin wrapper with catalog and other identifying numbers to prevent unnecessary handling.

Figure K.11. Pad the folds of an umbrella with cone-shaped rolls of archival tissue.

J. General Considerations for Exhibition

Textiles are fragile. They are subject to deterioration by improper levels of temperature and RH, UV and visible light, pests, pollutants, and improper handling. Like other sensitive materials, you should periodically change textiles in exhibitions.

1. *How often should I rotate textiles in exhibitions?*

Rare or fragile textiles should remain on display for periods of three to six months. Sturdy textiles, properly mounted and displayed in optimum exhibition conditions may remain on display for six to nine months.

Long-term and permanent exhibitions should be designed to allow for rotation of textile objects at three, six, or nine month intervals, depending on the condition of the item.

2. *What are special considerations for exhibiting textiles in open displays in historic houses?*

Location of objects within the display is important. Check the location of lighting fixtures, air vents and intakes, and entry and exit locations for visitors. Avoid placing textiles in these locations in the display. Use these guidelines:

- Place furniture cups or small discs of archival corrugated cardboard under furniture legs and casters when furniture is placed on historic carpets or floor coverings.
- Separate textiles from polished wood and other surfaces with a sheet of thin Mylar® or unbuffered archival tissue.
- Use barriers to prevent visitors from sitting on furniture or entering rooms.

Ropes and chair cords are not always completely effective in preventing visitors from touching fragile objects or sitting on furniture. Place delicate objects beyond reach. Construct chair cords so that they will give way if a visitor sits on the chair. If the cord is tight, it may stress the furniture joints and cause them to break.

3. *What are special considerations for using rugs and carpets in historic house displays?*

Avoid using valuable historic carpets and rugs on the floor unless they are where the public will not walk on them. For all rugs and carpets used on the floor, use the following guidance:

- Appropriate rug pads should be used. Some synthetic padding (Dacron polyester) has a non-skid surface that is placed against the floor to prevent the rug from slipping. Avoid rubber non-skid pads, jute, and horsehair.
- Remove shoes, or cover shoes with operating room "booties" when performing maintenance activities on and around historic carpets.
- Do not use vacuums with beater attachments on historic rugs. All parks should have a vacuum that is reserved for collection objects rather than routine maintenance of the building. Use that vacuum and control the suction. The plastic wood-floor attachment is usually adequate for vacuuming rugs that are not walked on regularly. Vacuum in the direction of the pile.
- Vacuum the back of the rug, padding, and floor underneath at least once a year.
- Monitor pest traps for carpet beetle and moth evidence regularly, and act quickly if an infestation is suspected.

- If visitor traffic must be directed across a carpet, use a runner to designate the walkway. A runner made from synthetic carpet is the best choice. If clear plastic runners must be used, choose one that does not have pointed tabs on the back that are meant to pierce the carpet underneath to hold the runner in place.

- Avoid traffic across the fragile fringe of any carpet.

- Consider using a reproduction carpet.

4. *How should I treat original draperies, fabric wall coverings, and upholstery if they must be replaced by reproductions?*

It is important to keep representative samples of all components of furnishing fabrics as part of the collection. This will include fringe, gimp, decorative tacks, and linings. If samples of materials like horsehair padding are kept, be sure to enclose them in polyethylene zip closure bags to prevent insect infestation. The original material, its location, method of attachment, and any other data should be thoroughly documented in writing and with photographs before it is replaced. Consult with historic furnishing experts before any disassembling or decisions on replacement are taken.

K. Exhibition of Flat Textiles

1. *How should flat textiles be displayed?*

Carefully assess the condition of an object before deciding upon a display technique. If there is any question, consult with a textile conservator for guidance. Use the least interventive method of installing textiles in exhibition wherever possible. Use minimal stitching, or avoid stitching if possible. Pinning is sometimes an option. Use only rustproof entomological pins to secure textiles to supports.

Preparing a stitched textile mount requires skill and care. In most cases, a textile conservator should prepare a stitched

Small and fragile textiles can be placed flat or on a slanted support in an exhibition case.

- Display cases must be constructed of appropriate materials (see the *NPS Exhibit Conservation Guidelines* CD available from the Division of Conservation at Harpers Ferry).

- Avoid folding textiles wherever possible.

- Minimize handling during installation and de-installation by using rigid, padded supports (see Question 2. below).

2. *What is the best way to construct padded supports for flat textiles?*

Choose a lightweight but sturdy material like archival corrugated cardboard, archival honeycomb panels, or corrugated polyethylene sheets (Core-X®) for the support. The board should be equal to or slightly larger than the size of the textile.

- Pad the board with a thin layer of polyester quilt batting or Pellon fleece.

- Wrap washed cotton fabric around the padding and board and secure the fabric to the back of the mount with double-sided archival tape or polyethylene hot-melt adhesive.

- Lay the textile on the fabric surface. Use a few rustproof entomological pins to secure the textile to a slanted support. Try to slide the pins between, rather than through, yarns.

- Avoid using pins if a textile is brittle or fragile. Instead, place the textile on its support flat in the exhibition case.

3. *What are appropriate supports for large textiles?*

Consult with a conservator before attempting to mount large textiles for hanging. A fine silk hanging will have different requirements than a heavy wool tapestry.

- A textile should be hung in the warp direction whenever possible. Do not hang along the bias.

- The mount should distribute the weight of the textile without causing stress to any particular point.

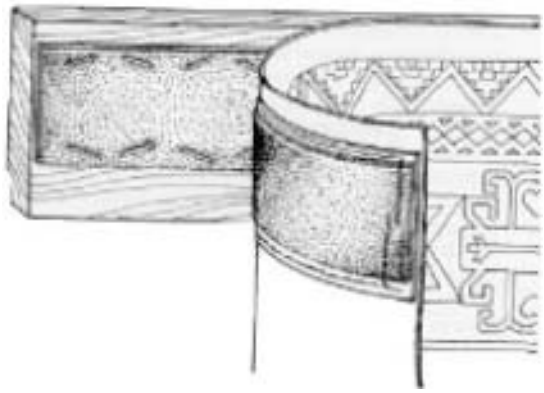
- Roll, rather than fold, excess length for oversized textiles.

- There are several display options for large textiles, including hook and loop tape, draping, rolling, and large slant supports.

4. *What is a hook and loop tape mount?*

Hook and loop tape (also known as VELCRO®) is an appropriate hanging material for large textiles in sturdy condition. Do not use the adhesive-backed tapes. The soft (loop) tape should be machine-sewn to a strip of upholstery webbing, and the webbing hand-sewn to the back of the textile. The stiff, hook tape is attached with rustproof staples to a sealed wooden batten. The wooden batten is installed on the wall, and the two tapes pressed together (see Figure K.12). Hook and loop tapes are sometimes used on the sides of textiles to stabilize areas that are uneven. The bottom of large textiles should not be fastened down to allow the textile to expand and contract in response to small environmental changes.

Figure K.12. Installation of a hook and loop tape mount (drawing by Jian Wu courtesy of Abrams Publishers).



5. *What if the textile is too long for the exhibition space?*

Hang large textiles at least twelve inches above the floor to prevent damage by visitors and cleaning equipment. If a textile is too long for the space, consider the following options:

- Hang the upper edge of the textile with hook and loop tape. Allow the extra length to drape onto a platform in front of the textile. Separate the textile from the platform with a sheet of Mylar®.
- Cover an archival rolling tube with washed cotton fabric and roll the top edge of the textile object onto the tube. Mount the tube on the wall with brackets.
- Drape the textile over a fabric-covered archival rolling tube and install the tube on the wall with brackets. This method is safe for many textiles, but is not very secure against theft. If you use this mounting technique, provide a barrier or enclose the textile in an exhibition case.

6. *What is a slant support?*

Large textiles that are too fragile to be hung by the top edge alone can be displayed flat on a platform, or on a slanted, fabric-covered support. Use the following materials to construct large slanted supports:

- Rigid paper honeycomb panels are among the best materials to use in constructing large supports. Use aluminum channel frames to construct a support with several panels.
- Some woods and plywood can be used to construct a support if properly finished (see Technical Notes 5: Exhibit Case Construction Materials from *NPS Exhibit Conservation Guidelines* available from the Division of Conservation, Harpers Ferry).
  - Choose well-seasoned, air-dried poplar, exterior grade plywood or high or medium-density boards using formaldehyde-free adhesive.

– Finish these boards with several coats of moisture-borne polyurethane varnish and allow to dry completely.

NOTE: Not all moisture-borne polyurethanes are safe for use. Also, formulations can change without notice. Test the varnish prior to use to guarantee its acceptability.

- Place a layer of polyester quilt batting or Pellon® on the finished wood.
- Cover the board with washed cotton fabric. Fabric can be secured at the back of wooden boards with rustproof staples.
- Attach the textile to the display board with hook and loop tape mounts. If the textile is fragmentary or uneven, several short lengths of the hook and loop can be attached strategically behind the textile.

Install slant boards at a maximum angle of 15° to reduce the stress of gravity on weakened textiles.

7. *What are the considerations for framing textiles?*

Small and medium-sized textiles can be framed with stitching techniques, or by using a specialized mount called a "pressure mount." A stitched mount is an interventive technique that must be carried out by a textile conservator. A conservator or technician with specialized training constructs pressure mounts.

Specify the following in working with a conservator to frame a textile:

- Whenever possible, choose cotton fabric as the exhibition fabric. Linen is a second choice. Silk is a poor choice because of dye stability and poor light fastness. Wool is susceptible to insect infestation and should not be used.
- Exhibition fabric should be pre-washed to remove sizings and finishes.
- Wooden elements of stretcher frames should be made of low-resin wood (such as poplar). All wooden framing elements should be coated with an appropriate moisture-borne polyurethane varnish and thoroughly dried before use.
- Stretcher frames should be faced with archival matboard to provide a solid support for the mount.
- One or more layers of padding (thin polyester quilt batting or Pellon® fleece) should be placed behind the exhibition fabric for cushioning. Pressure mounts require several layers that are graded in size, to provide even support (see Question 13 below).
- Use Acrylic® as the glazing material. Avoid glass when working with textiles because it can break and damage the object. Specify ultraviolet-filtering Acrylic® in framing textiles if exhibition lighting conditions are imperfect.

- In a stitch-mount, make sure that the glazing does not come in contact with the textile. Archival mat board or thin acrylic strips at the edges of the frame can act as a spacer between the frame and the textile.

- Never turn under ragged edges or turn part of the textile over the edge of the stretcher. If the edges of the textile are unsightly, consider using a window mat of archival mat board to cover that part of the object.

8. *What is a pressure mount?*

A pressure mount uses the friction of the backing fabric and the glazing material (acrylic) to hold a textile in place without stitching. Padding behind the exhibition fabric provides cushioning to the textile object. This kind of mount is ideal for short-term exhibition of moderate to small-sized textiles and textile fragments. It is often the most suitable mount for somewhat brittle or fragile textiles that might be damaged by sewing techniques. A diagram of a typical pressure mount can be found in Figure K.13.

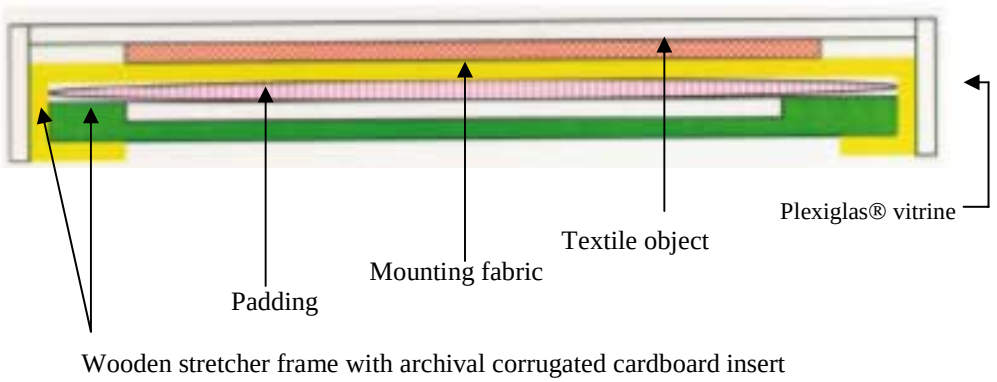


Figure K.13. Diagram of a pressure mount

9. *When do I know if a pressure mount is the most appropriate display method?*

A textile conservator should determine whether a pressure mount is appropriate for a specific textile. There are some risks in using this kind of mount even though no stitching is involved. The Plexiglas® face of the mount often carries a static charge. That charge can lift fibers from a brittle textile. In those cases, a slanted or flat mount in an exhibition case would be a better choice.

The other limit on pressure mounts is size. The maximum size of a pressure mount is limited by the size of acrylic sheet used for the face of the mount. It also is very difficult to maintain complete contact between the textile and the acrylic over a large span. Large sheets of acrylic bow at the center. It requires substantial padding, and sometimes trial and error, to create a pressure mount for a large textile.

L. Display of Historic Costumes

Wearing original historic costumes is unacceptable in a museum context. Accidents, perspiration, make-up, stress of dressing and wear, and sudden gestures or movements create excessive, immediate hazards that cannot be justified. Reproductions can be made and used for educational purposes in conjunction with appropriate display of the collection.

Each costume item should be carefully evaluated before deciding on a display method. If the seams and fabric are sufficiently strong, a mannequin may be the most appropriate choice. If the garment is fragile, it may be necessary to use a flat or slanted display. However, costumes are three-dimensional, and it is important to pad the interior of a garment to prevent folding and creasing.

Costumes need the support of a mannequin of correct size and proportion. The mannequin must represent the fashionable profile of the period to provide appropriate internal support. Certain period costumes may also require the construction of period undergarments such as bustles, hoops and corsets for correct presentation.

Bias cut garments prevalent in costume of the 1920s and 1930s should not be on extended display because of the tendency of the fabrics to stretch. Dresses of this period often have few closures and can be difficult to install on a mannequin.

No seams should be undone in order to put a piece on display.

1. *Where do I find appropriate mannequins to display costumes?*

There are several companies that provide both generic and custom-made mannequins for museum use (see Section R. Additional Resources below). Castoff store mannequins can sometimes be adapted for use. In particular, child and youth mannequins may be adapted to historic costumes that often are smaller in size than current adult clothing.

Simple supports can be constructed by carving polyethylene foam blocks to shape. These forms are covered with layers of batting to pad the form to the correct shape, and then can be finished with cotton knit "skin" (see Figure K.14).

Figure K.14. Polyethylene foam cut to the shape of a torso, then padded with quilt batting and covered with cotton knit.

2. *How do I display unconstructed garments?*

Traditional mannequins may not provide sufficient support for fragile, unconstructed garments like ponchos. An archival tube padded with quilt batting and covered with cotton fabric is a simple mount for display of these kinds of garments.

M. Conservation Treatment

The following section discusses particular considerations before any treatment is carried out either by park staff or a conservator. NPS policy emphasizes stabilization as the goal of conservation treatment. Maintenance of proper environmental control, use of appropriate storage and display techniques, and careful handling can reduce the need for costly, interventive conservation treatments.

1. *What NPS guidance is available to help me make decisions about conservation treatment?*

Review Chapter 3: Preservation: Getting Started, for information on the roles of the curator/collections manager and the conservator and information on the Collection Condition Survey (CCS). Refer to Chapter 8: Conservation Treatment, for information on conservation treatment issues and working with a conservator. In addition, NPS *Management Policies,* (Dec 2000) Chapter 5: Cultural Resource Management, discusses NPS policy for conservation treatment of museum objects.

2. *What kinds of treatment and maintenance can be undertaken by park staff?*

Park staff with appropriate training can undertake many maintenance activities associated with textile collections, such as:

- preparing appropriate storage housings
- constructing mannequins and other support mounts for exhibition
- vacuuming textiles, costume, upholstery and historic carpets on display to remove dust and protect from insect infestation

3. *What kinds of treatment and maintenance should be undertaken only by a conservator?*

All **interventive** treatments must be undertaken by a textile conservator including:

- wet and dry cleaning

- repair using needle and thread techniques
- consolidation with adhesives
- application of linings
- restorations and reconstructions
- specialized mounts (including stitched and pressure mounts)

There are many considerations in developing a conservation treatment. Some of the factors that a textile conservator will take into account before recommending a treatment are:

- no treatment is undertaken that is not absolutely necessary for the preservation, safe storage, or safe display of the object
- no treatment is completely reversible, so conservation should involve materials and methods that are the least harmful to the object
- treatment should not interfere with future research about the properties of the textile and the techniques used in its fabrication

4. *What cleaning methods are used on textiles?*

Cleaning of textile objects requires a different approach from that normally used for your own clothing. Even gentle cleaning is a drastic treatment, but it can be essential to the long-term preservation of a textile object (see Sections D.7 and D.9 above).

There are four categories of cleaning:

- surface (suction cleaning by vacuum)
- wet (cleaning with water or water plus detergent)
- dry (cleaning with organic solvents)
- spotting (treating of localized stains with wet or dry-cleaning solvents)

Wet, dry, and spotting treatments must be carried out by professionals. Vacuum cleaning is a regular form of maintenance of materials on open display, textiles being returned to storage, and newly acquired textiles before they are placed in storage or on display.

5. *What should I know about vacuuming textiles?*

Every park should have at least one vacuum cleaner that is reserved for use on museum objects. A vacuum with a HEPA filter (High Efficiency Particulate Air) that removes 99.97% of particulates 0.3 microns or larger in size is the most appropriate for removing dust and particulates from textiles (see *Conserve O Gram* 1/6: Choosing a Vacuum Cleaner for Use in Museum Collections, and *Tools of the Trade*). Your vacuum also should have a rheostat to allow for suction control. Most textiles should be vacuumed with very low suction. The upholstery or crevice wand is the best tool for vacuuming most textiles and upholstery; an upholstery brush works well on pile carpets.

It is easy to pick up loose threads and surface embellishments like embroidery when vacuuming. To prevent damage when vacuuming, protect the textile surface with polyester or nylon window screening. Sew cotton tape over the cut edges of the screen.

Figure K.15. Proper vacuuming technique. Loop the vacuum hose over your arm to keep from dragging it across the textile. Place the brush down on the surface of the screen. Lift the brush to move it to the next location (do not rub the brush back and forth across the screen).

6. *What techniques are used to repair textiles?*

Many repair techniques involve the use of needle and thread to close broken seams, compensate for fabric loss, or provide support to weakened areas. Work with a conservator to determine which repair technique is appropriate for your textile. Some questions you might want to discuss are:

- What is the goal of the treatment?
- Are repairs necessary to strengthen the textile structurally?
- Are repairs necessary to aesthetically improve the textile?
- What new materials will be introduced into the textile?
- Is it more appropriate to use synthetic or natural fabrics and thread for repairs?
- What is the wash and light-fastness of new materials?
- How will new materials be distinguished from the original?
- Will repairs of seams attempt to use original sewing holes?
- Will repair fabrics be dyed to a shade slightly different than the original?
- What kind of documentation will be used to record the use of new materials?

Some fabrics like weighted silks may be too brittle for needle and thread repairs. Adhesive techniques may be the only way to safely consolidate and repair those textiles. Adhesive techniques cannot be reversed easily. They also change the drape and "hand" of the fabric. Consider all of the options carefully before deciding on an adhesive treatment. You may want to discuss the following questions with the conservator:

- Are any other consolidation and treatment techniques available?
- Is it possible to use an overlay of translucent fabric or netting to hold the damaged areas in place?
- Are there less stressful display and storage techniques that could preserve the textile without further treatment?
- Will the textile continue to deteriorate or be in danger of further damage from handling if it is not treated?

Successful conservation treatment is the result of collaboration between the curator and conservator. Conservation treatments can be expensive and time consuming. Not all treatments result in striking visual changes. A well-structured plan and continuing communication with the conservator can avoid surprises and result in the best possible outcome.

7. *What textile conservation terminology should I be familiar with when talking to a conservator?*

Following are some of the common terms and practices used in textile conservation:

- **Wet cleaning**. Using water or water plus detergents to remove soils from a textile. Water is a powerful solvent. It can solubilize and react with dyes, degraded fibers, chemical pollutants, and other materials and additives found in and on a textile. Wet cleaning requires an understanding of the:
  - physical and chemical nature of the textile
  - source and chemical character of the water to be used
  - properties of the detergent system
  - type and nature of the soils to be removed

A textile conservator will always test the dyes and finishes of a textile before attempting wet cleaning to make sure that the textile can be safely treated.

- **Dry cleaning**. Cleaning using organic solvents with or without detergents or additives. Dry cleaning may be recommended when dyes or finishes are affected by water and there is no other safe cleaning treatment.

Dry cleaning solvents are extremely volatile and should only be handled by experienced professionals. Few historic textiles can withstand conventional dry cleaning. There are few dry cleaners offering hand cleaning. If dry cleaning is recommended, the conservator should provide supervision and

oversight to the cleaner undertaking the work.

- **Spotting**. Spotting or spot cleaning is the treatment of localized stains with water or an organic solvent. Spot cleaning requires specialized equipment to prevent the stains from migrating into surrounding areas. This technique is often used to remove oily stains from a textile prior to wet cleaning.

- **Support**. The term "support" can refer to materials that provide shape and structure (such as a mannequin) or materials used to stabilize weakened areas of a textile. A support also can be a box or tray used to safely transport a textile.

  A support often is a piece of new fabric used as a *patch* or *backing*. Support patches and backings are attached by stitching or adhesive techniques. The fabrics are chosen for their visual and chemical compatibility with the original, as well as light and wash-fastness.

- **Mount**. A mount is a kind of support used to prepare a textile for exhibition or storage. Unlike other kinds of supports, mounts are not permanently attached to the textile. A few examples of mounts are:

  – mannequins

  – frames

  – slant boards

  – structures that provide shape to hats

  – cavity packs

  – padded hangers

- **Lining**. Linings are protective dust covers for the back of a textile. In a garment, linings are integral to the garment structure. A conservator may add additional linings to a garment to protect the original fabric from abrasion from handling or display on a mannequin. Linings for large wall-hung textiles, like tapestries, are usually a tightly woven fabric. Linings are separate from supports, and like mounts, are not permanently attached to the textile.

N. Packing and Shipping Textile Objects

For general information on packing and shipping museum collections see Chapter 6: Handling, Packing, and Shipping. Flat textiles, costumes, and costume accessories should be packed in boxes, and the boxes packed in crates. Rolled textiles should be immobilized in crates by polyethylene foam blocks that suspend the roll in the crate (see Figure K.16).

Figure K.16. Shipping crate with suspended textile rolls. (Photograph courtesy of Harold F. Mailand)

1. *Are there special considerations for packing and shipping textile objects?*

The condition of a textile will determine appropriate packing and shipping techniques. The most difficult situations will occur when it is necessary to ship a fragile textile to a conservator for treatment. Work with the conservator to determine the best method. In general:

- Roll medium to large-size flat textiles if possible. Roll the textile as you would for storage. Wrap clear polyethylene sheeting around the rolled textile and seal completely with packing tape to protect against water damage.

- Fragments and small textiles can be shipped in storage mats (see Appendix I, Figure I.8 Construction of a Portfolio Mount for Archeological Textile Fragments) or padded in archival boxes of various sizes. If you are using a box, be sure to use sufficient padding to fill the box completely. Polyethylene foam blocks covered with polyester batting and muslin are good for this purpose.

- Do not use crumpled tissue in packing textiles and costume. The tissue tends to shift and compress. Use tissue folded into pillows, or batting-stuffed cotton-knit "sausages" in place of crumpled tissue to pad folds and provide interior supports.

2. *Are there special considerations for packing and shipping framed textiles?*

Never ship textiles framed behind glass. Replace glass with acrylic (Plexiglas®). Always wrap framed textiles in clear polyethylene sheeting and seal with packing tape to protect against water damage. Use the "box-within-a-box" method to pack and ship framed textiles.

3. *Are there special considerations for packing and shipping costume accessories such as hats?*

Three-dimensional textiles require the same kinds of interior supports for packing and shipping as for storage. The ideal packing method for three-dimensional textiles are cavity packs within archival boxes (see Chapter 6, F.4).

O. Emergency Procedures for Textile Objects

Appropriate response to emergencies from a natural disaster or vandalism should be incorporated within the park's Emergency Operations Plan (EOP). Consider the following:

- Close off the affected area and assemble sufficient personnel to deal with the problem. Unnecessary or inappropriate handling can create greater loss than the initial situation.
- Prepare a clean, dry workspace. If the emergency includes water or other liquids, have fans and dehumidifiers ready.
- Be aware of the size of doorways, stairways, corridors, and objects that cause difficulty in maneuvering to get to the workspace.
- Deal first with objects that are in danger of additional damage, such as those hanging precariously or with elongated tears.
- Water-soaked textiles are heavy and weaker than when they are dry. Carry one object at a time. Use auxiliary supports such as rolling carts or trays to move wet textiles.
- Be careful to support the whole textile. Avoid handling by edges and corners to avoid stretching and tearing.
- Collect and preserve all fragments.
- No piece should be in contact with another object.
- The immediate danger to wet textiles is dye bleed and mold. Do not attempt to dry textiles with heat. Instead, set up fans and dehumidifiers, and try to absorb excess water. Your emergency supplies should include clean toweling and boxes of disposable baby diapers for this purpose.
- If the liquid is unknown, assume the worst. It might be a corrosive or caustic chemical that could cause damage to personnel. Do not flush the textile with water as this could spread the chemicals and cause further damage and additional chemical reactions. Locate protective equipment, warn other staff of the potential hazard, and contact the park or regional HAZMAT coordinator according to the park's EOP.

P. Glossary

Constructed Garment: clothing that has been made by cutting and piecing fabric(s) together. Most Western dress is made this way (see also: *unconstructed garment*).

Costume Accessory: objects associated with costume collections including hats, bonnets, shoes, gloves, purses, fans, umbrellas, and parasols

Dry Cleaning: textile conservation treatment using organic solvents and detergents

Dye: plant materials and various chemicals that add color to textiles

Felting: the process of using heat, water, and pressure to interlock loose fibers together

Fibers: the raw materials used to make textiles. Fibers come from natural (animal and plant) and synthetic sources and may also include metals and alloys.

Finish: manufacturing process to prepare textiles for use. Finishes include dyes, lubricants, chemical compounds, mechanical treatments, sizing, water and stain repellents, mothproofing, and flameproofing.

Lacemaking: a variety of techniques that involve the intricate twisting of fine threads to form a pattern

Lining: protective dust cover for the back of a textile. Linings for garments are integral to the garment structure.

Macramé: a knotting technique using more than one strand of yarn to create fringes and edgings

Mercerization: cotton processing technique using a strongly alkaline chemical to improve dyeing, add softness, and add flexibility

Mordant: chemicals (usually metallic salts) applied to yarn or cloth to fix dyes

Mount: a type of support used to prepare a textile for exhibition or storage

Netting: textile produced from a single, continuous strand by looping and knotting

Pressure Mount: a temporary framing technique for flat textiles

Retting: soaking flax to loosen fibers from the plant stem

Spinning: twisting short fibers together to make a long thread

Spotting: treatment of localized stains with wet or dry-cleaning solvents

Support: materials that provide shape and structure, or are used to stabilize weakened areas of a textile

Unconstructed Garment: clothing that uses the rectangular shape of fabric yardage for construction. This type of garment is common in many forms of ethnic dress such as Hopi and Pueblo clothing and Japanese kimonos.

Warp: the parallel yarns stretched on a loom (lengthwise)

Weaving: making cloth by interlacing threads of the warp and weft on a loom

Weft: the transverse yarns interlacing with the warp in a pattern

Weighting: an 18th and 19th-century silk processing treatment using metallic salts to produce fuller, heavier fabrics

Wet Cleaning: conservation treatment using water or water plus detergents

Appendix L: Curatorial Care of Easel Paintings

List of Figures

APPENDIX L: CURATORIAL CARE OF EASEL PAINTINGS

A. Overview

1. *What information will I find in this appendix?*

This appendix discusses the physical structure of easel paintings and outlines their long-term care and preservation. Easel painting is historically a European technique using canvas or wooden panels for the image support. The main topics covered in this appendix are:

- canvas and panel painting materials, structure, and construction
- agents of deterioration
- handling, storage, display, and transportation of paintings
- working with a conservator when treatment is needed
- specific emergency procedures for paintings

This appendix does not cover works of art on paper, such as watercolors, scroll paintings, or screens. These materials are covered in Appendix J: Curatorial Care of Paper Objects. This appendix also does not include painting techniques typically associated with architecture, such as fresco and mural painting.

2. *Why is it important to practice preventive conservation with paintings?*

Preventive conservation aims to prevent harm to an object before it occurs. This practice will decrease the need for costly and time-consuming conservation treatments. Paintings are very delicate because they are composite objects made up of a variety of materials. Many factors contribute to their deterioration. A painting's rate of deterioration slows significantly with proper preventive care. Practicing preventive conservation also reduces the likelihood of accidents.

3. *How do I learn about preventive conservation?*

Learn about the ***agents of deterioration*** that affect paintings so that you can create a preventive conservation plan. These agents are discussed in detail in section C. Understanding how to protect your paintings from the agents of deterioration will increase the longevity of your paintings. See Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment, for a discussion on the agents of deterioration. Also refer to *Museum Handbook*, Part III (*MH-III*), Chapter 7: Using Museum Collections in Exhibits.

4. *Where can I find the latest information on care of these types of materials?*

There are a variety of sources for up-to-date information about paintings:

- Read the NPS *Conserve O Gram* series.
- Review the references in the bibliography. Especially note practical information found in *CCI Notes*, Section 10, Paintings.

- Look up the World Wide Web sources that are listed at the end of this appendix.
- Consult a painting conservator.
- Consult a curator or collection manager of a large painting collection.

B. The Nature of Canvas and Panel Paintings

Paintings are ***composite*** objects made up of several distinct parts. Artists create paintings by preparing a support and then painting an image on that support. These two main components of a painting are called the ***support*** and ***image layers***. Both the support and image layers are usually composed of two or more parts. These parts often react differently to external conditions, like temperature and relative humidity (RH), placing stress on the object. Because of this complexity, paintings are delicate objects that must receive specialized care in order to remain in optimum condition.

1. *What are the structural layers of a painting?*

The two principal layers are composed of these parts:

Support layer:

- auxiliary support
  - stretcher or strainer (canvas paintings)
  - mount or cradle (panel paintings)
- support
  - canvas (canvas paintings)
  - wood (panel paintings)

Image layer:

- sizing
- ground
- paint film
- varnish

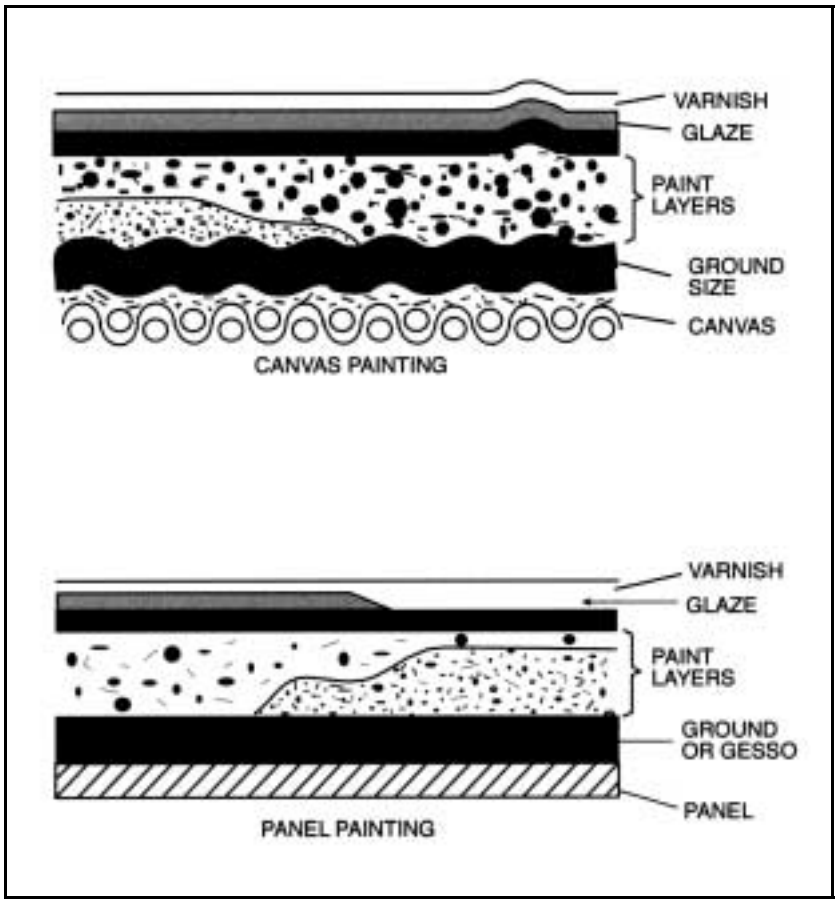

Figure L.1. A cross-section of a painting

Not all canvas and panel paintings have all of these elements. For example, many acrylic paintings are not varnished. Folk artists often paint directly onto wood without first applying sizing or ground. Modern artists often incorporate other materials into the image layer, such as pieces of glass, textiles, paper and plants. Some specialized painting techniques will have different image layer elements from those discussed in this appendix. For example, the encaustic method uses paints that contain a beeswax and resin medium. The painted image is fixed with heat after it is applied to the support. Use the information in this chapter as a guideline for identifying your painting's layers, but realize that it doesn't cover every painting technique.

2. *What are the differences between canvas and panel paintings?*

Canvas paintings consist of a piece of fabric—usually linen, cotton, hemp, polyester, or silk—that is stretched over and attached to a wooden strainer or a stretcher. The fabric (canvas) is the support for the image layer, and the stretcher or strainer is the auxiliary support.

A ***strainer*** is a wooden frame with secured corners that are joined with glue, nails, or screws. Strainers cannot be enlarged mechanically.

A ***stretcher*** is a wooden frame constructed to open out at the joints and tighten the canvas. Small, triangular wooden wedges called ***keys*** are fit into slots on the inner joints of the stretcher to tighten it. This action is called "keying out."

If the stretcher or strainer is damaged or warped so that it does not properly support the canvas, the image layer will also be damaged. The structural stability of a painting is dependent on a sound foundation.

Panel paintings are paintings on wooden supports. The cut of the wood, the type of wood, and the age of the wood are just a few of the factors that influence how prone a panel is to warping. Some panel paintings have an auxiliary support called a ***cradle*****.** A cradle is a system of wooden bars that run in a grid pattern along the back of a panel. It has two purposes: to add support to the panel and to prevent the panel from warping. However, sometimes cradles actually cause the panel to warp or crack because they restrain natural movement of the panel due to changes in RH.

3. *What are the parts of a painting's image layer?*

The image layer is the paint film with one or more of the following layers:

- ***Sizing*** is a solution applied to raw canvas or a wooden support to fill in porous surfaces. Sizing reduces the support's absorbency so that the other layers do not soak into the support. If the ground or paint layers sink into the support, the support will become brittle. Traditionally, sizing is made of glue, varnish, starch, or gelatin. Today, acrylics and other synthetics are often used.

- ***Ground*** is an opaque coating that is applied to the support. It provides texture and evens out the painting surface. Painters often add pigment to the ground, which adds an overall tone to the painting. Common colors include red, brown, and gray. A material that has been used for centuries is "gesso," which is often made from chalk mixed in rabbit skin glue. Many synthetic alternatives are currently used.

- ***Paint film*** is the image layer composed of finely-ground ***pigments*** mixed with a ***medium,*** which binds them together. The pigments are what give the paint color. They are either inorganic (minerals, metals, and earths) or organic (vegetal, animal and synthetic dyes). The most common ingredients in paint mediums are drying oils (like linseed and walnut oil), egg yolk (in tempera paint), synthetic resins (like acrylics), and beeswax (in encaustic paintings).

- ***Varnish*** is a transparent, protective film that is brushed onto a dried painting. It protects the paint and saturates the colors. It was traditionally made from natural resins that are dissolved in oil or solvent. Synthetic varnishes and acrylic resins are the most modern varnishes. Varnish should never be applied to a painting that has not dried properly. Because some oil paints can take a long time to dry, artists often sold paintings with the instruction to varnish in a year's time.

The image you see when looking at a painting is created by the interaction of these layers. The image will change as colors darken, become lighter, yellow, or even fade completely. Physical changes such as cracks, crazing, or bulges may distort the surface. Some of these changes are appreciated as patina of age; others are less desirable, especially if there is a chance that part of the image will be lost if left untreated.

C. Factors that Contribute to a Painting's Deterioration

1. *What agents of deterioration affect paintings?*

Many factors contribute to a painting's deterioration. *These* ***agents of deterioration*** can occur naturally, or they can result from external forces. Avoiding agents of deterioration is the key role of ***preventive conservation***. The agents are:

- direct physical forces, such as shock, vibration, and abrasion
- thieves or vandals
- fire
- water
- pests, such as insects, vermin, or mold
- contaminants, such as air pollution or dust
- ultraviolet and visible light
- high, low, or fluctuating temperatures
- high, low, or fluctuating relative humidity

For more information about these agents of deterioration, see Chapter 3: Preservation: Getting Started.

2. *How do paint films change over time?*

All layers in a painting deteriorate and take on different physical characteristics over time. Paint may become brittle and inflexible, varnish may discolor, and supports may become warped. Changes in temperature and relative humidity affect older paintings more than younger paintings because their materials become less resilient as they age.

Varnish oxidizes with light and air, eventually turning yellow or brown. It can lose transparency, turning milky in appearance. This opacity is called "bloom" and is caused by fingerprints and high relative humidity. Dirt and grime slowly accumulate on the surface, further obscuring the paint layer. Old varnish can also crack, sometimes resulting in damage to the paint layer.

When paintings are in good condition, their ***paint films*** are flexible, and they usually adjust to the expansion and contraction of their supports. However, most paint becomes brittle over time. When an older painting's support changes dimensions, deteriorating paint film may crack. Cracking paint will eventually begin to flake and fall off the support. This loss is irreversible.

3. *Which agents of deterioration will affect my collection the most?*

The following four agents of deterioration are the most likely to cause damage to your paintings:

- temperature

- relative humidity (RH)
- light
  - visible light
  - ultraviolet (UV) radiation
- pollution

Knowing the ideal settings for temperature, RH, and visible light, and knowing how to filter UV radiation and pollution is essential for preserving your collection.

4. *How does the environment affect my collection?*

Temperature, relative humidity, light, and pollution directly affect the rate at which a painting ages. Storing and displaying paintings in areas where temperature and RH are too high or low will increase deterioration rates. Constant fluctuation in temperature and RH is harmful, too, because it causes the materials in the paintings to continuously expand and contract. This often leads to flaking paint. Natural and artificial lighting can cause pigments to fade. Ultraviolet radiation is harmful to all parts of a painting. Atmospheric pollutants can settle onto a painting's surface, masking the artist's image. Pollutants can also break down the chemicals in paint and varnish, acting as a catalyst of deterioration.

Creating an ideal environment for your collection will extend the longevity of your paintings.

Temperature and RH have tremendous effects on paintings. Many structural layers in a painting are ***hygroscopic***--they readily take up and retain moisture. Wood and sizing are particularly hygroscopic. Changes in RH greatly affect these materials. Wood will expand and contract, and subsequently, can twist and warp. Sizing causes a canvas to shrink with dryness and expand with moisture. These changes can be devastating to the entire painting, especially when the paint layer becomes brittle and cannot conform to these changes.

The key to preserving paintings is maintaining stable temperature and RH levels. You must avoid extreme fluctuations in RH and temperature. If you change a painting's environment, do it gradually.

5. *What are the ideal temperature and RH ranges for paintings?*

Store paintings at temperatures between 64º and 75º F (18º to 24º C). Temperature is less important for paintings than RH, but sudden temperature changes can harm paintings. For example, moving a painting from a cool to a warm area can cause moisture to condense on the surface. Maintain a RH of 40% to 55%. Low RH levels (under 35%) can embrittle all parts of a painting and encourage cracks and losses. High RH levels (over 65%) encourage mold growth. Decide on a "set point," and keep temperature and RH as close to this point as possible. See Chapter 4: Museum Collections Environment, for a discussion of proper environment and methods to control that environment.

6. *How does light affect paintings?*

Many pigments are sensitive to light and will eventually fade upon repeated exposure to light. Light can also be a catalyst for the deterioration of the paint medium. Light damage is cumulative and irreversible. Light damage depends on the type of light (ultraviolet and/or visible), intensity of the light, and

duration of exposure. Evaluating your collection's lighting conditions and making appropriate adjustments can prolong the life of your collection. Review the natural and artificial light sources in your storage and display areas. Use monitoring equipment to identify levels of UV radiation and illuminance (levels of visible light measured in "lux").

Reduce your collection's exposure to light by storing and displaying paintings in rooms without windows. If this is not possible, use tinted UV-absorbing films on the windows. (Clear UV-absorbing films will reduce UV levels, but will not reduce illuminance.) Cover all windows with drapes or blinds to further protect paintings. Also, avoid storing and displaying paintings in rooms with doors that open to the outside.

For many situations 50 lux is enough light to view a painting. In cases where higher illuminance is needed, don't allow visible light levels to go above 200 lux. All UV light should be filtered. Consider ways to limit the total light exposure, such as automatic dimmer switches or simply turning out lights when visitors are not present.

Don't use traditional picture lights that are hung just over a painting or on the frame. They concentrate light onto a small portion of the painting, creating light and heat damage. When they are mounted on the frame, their weight strains the entire structure.

7. *What kind of pollution affects paintings?*

Outdoor pollutants, such as dust and pollen, can easily be brought into a museum through open doors and windows. Industrial emissions as well as natural processes of erosion create these pollutants. Cleaning products, asbestos fibers, building materials, paint, carpeting, and other indoor materials can generate pollution within a museum. Cigarette, cigar, and pipe smoke are also harmful forms of pollution.

8. *How can I control pollution in my museum or display area?*

Follow these practices:

- Keep doors, windows, and outside vents closed whenever possible.
- Never allow smoking or fireplace fires in the building.
- Choose new building materials, paints, and carpeting that do not emit harmful gasses.
- Don't use custodial cleaners that emit harmful gasses (for example, ammonia).
- Use appropriate pollution filters in your HVAC system.
- Cover paintings in storage.
- Keep particularly vulnerable objects in sealed display cases. Make sure these cases meet the recommendations in *MH-III*, Chapter 7: Using Museum Collections in Exhibits, and NPS *Exhibit Conservation Guidelines*.

For more information on controlling pollutants, see Chapter 4: Museum Collections Environment.

9. *Are museum pests attracted to paintings?*

Some paintings are extremely attractive to pests, depending on their materials. Termites and other wood-boring pests can damage the wood in panel paintings, in stretchers, and in frames. Rodents have been known to nibble at paintings. Insects, such as moths, silverfish, and beetles, like to eat fabric. The gelatin in size and the egg yolk in tempera paint are also attractive to pests. Mold can destroy canvas. Develop an integrated pest management plan (IPM) to protect your paintings and other objects in your collection to prevent these problems. For more information about IPM and pest infestation, see Chapter 5: Biological Infestations.

10. *How can faulty handling affect a painting?*

Improper handling can affect a painting in various ways:

- Moving a painting suddenly can cause cracks in any of the layers.
- Touching a painting's surface often results in scratches and discoloration of varnish, and can dislodge flaking paint.
- Touching the back of the canvas can undermine the surface layers.
- Picking up a painting by the top of the frame can cause strain to the joints in the frame and stretcher/strainer, damaging the entire painting.
- Picking up a painting that is too large for one person to handle can result in a jolting fall.
- Keying-out a stretcher improperly can over-stretch the canvas, creating cracking and flaking.

Many things happen to a painting during its lifetime that do not show immediate damage, but will surface as the painting ages.

Any pressure applied to a painting can cause hairline cracks that will eventually create problems. This pressure may occur when someone marks the back of a painting or glues a label to it. An improperly framed painting will create strain on the canvas that may not be evident for years. These small problems will escalate over time and eventually require treatment. You must take care now so that the objects in your collection will not deteriorate to the point where treatment is needed.

11. *How can past treatments adversely affect a painting?*

The notion of "treatment" has changed significantly through the years. In the past, paintings were taken to "restorers" rather than "conservators." The emphasis was often on restoring the appearance of the painting, and quite often no consideration was given to the historical importance of the piece. Some restorers slapped patches on the back of a canvas, or sloppily glued on a lining. This has often caused the image layer to flake on the front side of the painting. Restorers sometimes repainted part or all of the surface of a painting. This "overpainting" altered the original image. Some restorers covered their overpainting with brown varnish to give the new paint an old look. Many restorers were careless when they cleaned a painting, removing the original paint along with the varnish. Some restorers just added another layer of varnish on top of everything, including the old varnish and dirt.

12. *How do I know if a painting is actively deteriorating?*

The main purpose of examining paintings is to detect problems as early as possible, and to act accordingly. Carefully examine a painting to identify damage and active deterioration. See Section K for a glossary of terms to use when describing the condition of paintings. In particular, when examining paintings look for these indications of active deterioration:

- cracks in the varnish and/or paint layer
- mold on the canvas or frame
- evidence of pest infestation, such as shed skins and droppings collected in the frame
- rusty or loose hooks and hanging wire
- warping in the frame or stretcher
- slackness in the canvas

These are all indications that your painting may have problems. Some of these problems, if left untreated, may lead to irreversible damage.

D. Proper Handling and Storage of Paintings

1. *What do I need to consider before handling a painting?*

Following are a few guidelines:

- Never touch the paint surface or push on the canvas from the reverse.
- If loose paint is present, carry the painting flat.
- Wash your hands before handling a painting.
- Always wear clean white cotton gloves.
- Clean all surfaces that the painting will touch.
- Check the stretcher keys to ensure that they are secure.
- Carry paintings with both hands on either side. Don't lift the top of the frame or stretcher.
- Carry only one painting at a time.
- Never carry a large painting by yourself. Get another person to help. If it is still too large to handle, place it on a trolley or cart that is well padded and in good condition. An old, rickety cart may produce enough shock to damage a painting.
- Know the painting's destination before you handle it. If you are moving it to hang it, have the mount prepared. If you are moving it to pack it for transport, have the packaging prepared for it. If you are moving it for

examination purposes, make sure you have set padded blocks on your table for its arrival.

- Never stack paintings on top of each other.

Proper handling of paintings is very important. As a general rule, do not handle a painting (or any other museum object) unless it is absolutely necessary.

For more information on handling, see Chapter 6: Handling, Packing, and Shipping.

Figure L.2. Proper way to carry a small painting

2. *What do I need to know about the storage of paintings?*

Improper storage of paintings can be a catalyst for deterioration. Consider the elements that affect a painting in storage.

- Control the agents of deterioration.
- Choose appropriate storage space and equipment. See Chapter 7: Museum Collections Storage.
- Ensure that proper security and fire detection and suppression equipment is installed and maintained. See Chapter 9: Security and Fire Protection.

3. *Where should I store my paintings?*

Your collection size is an important consideration when you determine where to store your paintings. If you have many paintings, consider creating a dedicated storage room. If you have only a few paintings in your collection, dedicate a space in your museum storage area for your paintings:

Never store paintings:

- in attics and basements
- against exterior walls
- near furnaces or heating/air conditioning vents
- in spaces below water pipes
- near sources of asbestos, such as old insulation or wiring
- in areas of extreme vibration, such as well-traveled walkways

Always store paintings at least four inches from the floor to minimize dirt and dust collection on surfaces and to protect them from flooding.

Always remove hanging wires, hooks, and all other hanging devices from a painting before storage. These can easily pierce canvas, and can scratch varnished surfaces and frames.

4. *How should I store my paintings?*

There are three main ways to store paintings:

- Hang them from storage screens.
- Place them on storage shelves.
- Stack them vertically against an interior wall or side of a cabinet.

Do not stack paintings against a wall or cabinet unless you have no other option. ***Never lean paintings against exterior walls.***

However you store paintings, it is helpful to fit canvas paintings with protective backing boards (see *CCI Notes* 10/10, Backing Boards for Paintings on Canvas). Backing boards prevent damage by blocking the reverse of the canvas with a rigid material so it cannot be knocked or pierced. It also buffers RH and temperature next to the canvas. The board is attached to the back of the frame using stable metal screws and plates. Don't use this technique on important historic frames. Contact a conservator if you have questions about attaching backing boards.

Storage screens are constructed of a vertically standing wooden frame onto which fencing material or rigid wire mesh screening is attached. Paintings in good condition are then hung from the screens by rigid hooks. This is a particularly useful painting storage method if your storage area is in an earthquake zone. Paintings without frames, of course, cannot be stored on storage screens because these paintings aren't equipped for hanging.

Conserve O Gram 12/1, Storage Screens for Paintings, provides instructions for constructing storage screens.

Note: Paintings that are not in good condition, especially paintings with flaking paint, should not be stored in a vertical position. Lay damaged paintings flat on shelves.

Storage shelves can be constructed of coated wood or metal and can be either horizontal or vertical (sometimes called storage bins). Storage shelves are recommended for smaller painting collections because empty shelves can be used to store other museum objects. (See *CCI Note* 10/3.) It is inadvisable to store more than one painting in each vertical compartment, but if you must, protect the paintings by placing heavy-duty, acid-free cardboard between them. The cardboard must be larger than the largest painting in each compartment. Never stack paintings horizontally.

Stack paintings vertically against a wall. This method is for temporary storage only and only for paintings in good condition. Lean them against a wall, resting on skid-proof, padded blocks. Make sure the blocks are at least four inches from the ground to avoid potential flood damage. Separate paintings from each other with heavy-duty, acid-free cardboard. The cardboard must be larger than the largest painting that will rest against it. Keep paintings of relatively the same size together, and never stack more than a few paintings on each set of blocks. The stacking angle is very important. Keep the stack's angle as close to vertical as possible, but make sure that the paintings can't topple forward. If the angle is too great, the paintings may collapse backwards onto each other. If an unframed painting has to be stacked in this manner, construct a temporary frame. You can place dust covers of washed cotton muslin over the paintings as additional protection. Do not allow the fabric to touch painted surfaces.

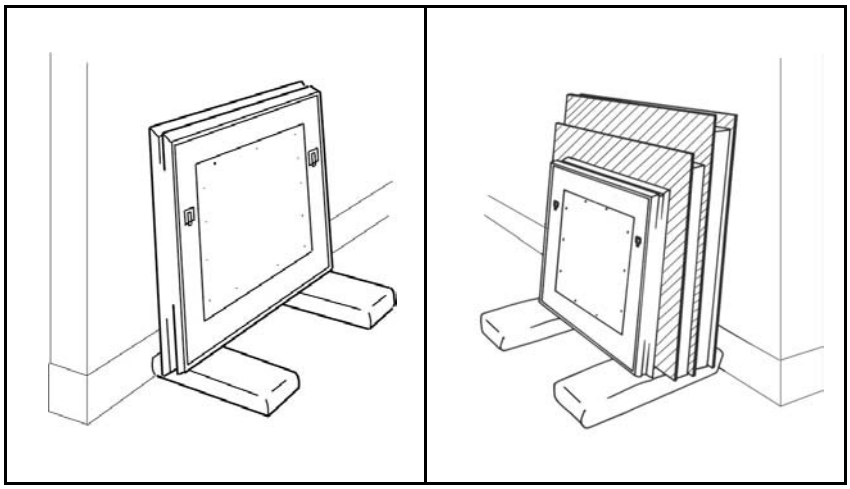

Figure L.3. Paintings stacked against a wall. Redrawn from *CCI Notes* 10/2, Figure 1, and 10/3, Figure 1.

Never stack a damaged painting against a wall.

E. Exhibiting Paintings

1. *What do I need to consider when I am planning an exhibit?*

When you prepare for an exhibit, you need to consider many factors. Refer to *MH-III*, Chapter 7: Using Museum Collections in Exhibits. In addition to factors such as environmental conditions and painting stability, think about:

- placement of paintings
- flow of traffic
- protection from touching and vandalism
- housekeeping requirements

2. *What do I need to consider when installing the exhibit?*

It is very important to make sure that the placement of paintings will not put them in jeopardy. Follow this advice when installing the exhibit:

- Hang paintings away from doors, furniture, or other objects that could bump into the painting.
- Set up the display in a way that is conducive to the optimal movement of visitors.
- Hang paintings in open areas to lessen the chance of visitors brushing up against them.
- Hang paintings away from heat sources, like vents, radiators, and light sources.
- Ensure the security of the paintings.
- Ensure that light sources will not emit UV and that visible light levels on paintings are below 200 lux.

3. *How do I properly hang a painting?*

Use extreme caution when hanging paintings. Improper hanging procedures can allow a painting to fall or allow a theft. Periodically check your paintings to make sure that hangers, hooks, nails, screws, "D"-rings, and all other hanging hardware are securely fastened and not rusty. Make sure that the wall where you hang paintings is strong enough to support the weight. Hang paintings with picture hooks (not nails) and use two hooks for heavy paintings. Drill holes in concrete walls or in studs, not in plaster or sheetrock.

Many paintings are hung by "hanging wire" that is secured to the back of the painting. Hanging wire can become loose if not properly attached and can rust easily, so check it often. To improve security of hanging paintings see *Conserve O Gram* 2/7, Fabricating Secure Hangers for Framed Works of Art.

4. *How do I prevent touching and vandalism?*

Paintings on exhibit are tempting targets for touching and vandalism. Follow these guidelines to prevent the possibility of these hazards:

- Station an employee or security guard in the display room.
- Use guard rails, ropes, platforms, or other deterrents.
- Place "Don't Touch" warning signs near paintings.
- Install security alarms wherever appropriate.

5. *How do I do safe housekeeping?*

If paintings and frames become dusty, you may dust them, but first, carefully examine each painting for loose or flaking paint. If the surface is stable, dust with soft, white-bristle Japanese brushes, or sable or badger-hair brushes. Don't use feather dusters that can scratch paintings. Never try to wet clean a painting yourself or use any liquid or commercial cleaners on a painted surface. Commercial preparations can cause irreparable damage to the fragile layers of a painting. Explain the potential dangers of dusting and cleaning paintings to all staff.

Avoid using pesticides, foggers, air fresheners, or furniture sprays near artworks. Remove paintings from a room before painting, plastering, or steam cleaning carpets or wallpaper. Make sure that cleaning staff are careful with mop and broom handles, which can scratch or puncture a painting. Never use spray cleaners, aerosols, or plant misters in the display rooms because the cleaner or water can settle on the paintings' surfaces. Avoid using very wet mops that can raise the RH.

Refer to Chapter 13: Museum Housekeeping, for additional information.

F. Proper Shipping of Paintings

Unlike people, paintings will live longer if they lead a sedentary life. Shipping a painting increases the likelihood of damage, which could decrease its lifetime. Improper handling, vibration, shock, and uncontrolled temperature and RH are all potential threats to paintings during shipping. In most cases, the reason to ship paintings will be to loan them to another museum or gallery for an exhibition or to a conservator for treatment.

1. *What do I need to consider before loaning my paintings?*

Before agreeing to loan your paintings, you must first assess their condition, and then decide if they can handle the move. If a painting is in good condition, it will probably survive travel with little harm, provided that it is packed and transported properly. Fit the painting with a protective backing board (see *CCI Notes* 10/10, Backing Boards for Paintings on Canvas). Backing boards will protect the canvas. Keep the following in mind:

- In general, travel will impact small, light paintings less than large, heavy paintings.

- Don't loan paintings that are fragile, have flaking paint, or are otherwise in poor condition.

- Canvas paintings that are too slack or that have uneven tension can be easily damaged during transportation because the canvas moves easily. Correct any problems with tension before shipping the painting.

- Paintings with holes, tears, or other damage should not travel because of their vulnerable state.

- Large panel paintings, especially those with separate pieces of wood bonded together, are more likely to bend and flex with the vibrations of transport.

See *MH-III*, Chapter 1: Evaluating and Documenting Collection Use, for information on loans. For in-depth information on proper packing procedures, materials, and supplies, see Chapter 6: Handling, Packing, and Shipping (this volume).

G. Conservation Treatment

1. *Why should I contact a conservator?*

There are many reasons to contact a painting conservator, who is trained to examine, analyze, stabilize, and treat paintings. See Chapter 3: Preservation: Getting Started, for information on choosing and contracting with a conservator. Be sure you check references and question the experience and background of any conservator you choose. Talk over any recommended treatments and be sure you understand what is planned and why it is necessary.

Only experienced conservators who agree to follow the AIC Code of Ethics and Guidelines for Practice should be allowed to treat paintings.

Only an expert should clean a painting that has discolored. Flaking paint and tears in the canvas will only become worse without conservation treatment. Water-damaged paintings require immediate conservation treatment. Fire-damaged paintings will usually have blistered paint, as well as a soot covering, and need expert care.

Never attempt to clean paintings or to treat damaged paintings yourself.

2. *What might a conservator be able to tell me about my painting upon examination?*

When conservators thoroughly examine paintings, they will make a number of observations. Conservators will identify the paint medium, the type of varnish, and the type of sizing. The examination may reveal underpainting below the visible image. Conservators are also able to judge the state and extent of deterioration in your paintings and to recognize past conservation/restoration treatments. This knowledge combined with their art historical understanding, enables conservators to make treatment proposals for your paintings.

3. *What might a conservator do to stabilize my painting?*

There are hundreds of treatment procedures involved in painting conservation. The treatment(s) your conservator uses will decrease your painting's rate of deterioration. Conservation treatments for paintings involve methods that will stabilize and/or restore paintings.

There are many variations in the treatments that conservators do, but typical stabilization might include one or more of the following:

- ***Framing or reframing*** to give structural protection to the painting
- ***Minor repairs to the canvas*** to remove dents or bulges or patch small holes
- ***Minor repairs to panels*** to mend splits or loose joins in the wooden support
- ***Consolidation*** to reattach loose paint to its support with appropriate adhesive
- ***Facing,*** or attaching tissue to the paint with a suitable adhesive. Facing is a protective measure that holds flaking paint in place until the painting can be treated.
- ***Lining,*** or attaching a new piece of fabric or other support material to the back of the original canvas to reinforce it, thus preventing loss that can occur due to a painting's structural weaknesses.
- ***Removing old repairs,*** such as removing patches and tape from the back of a canvas or old cradles on panel paintings that are contributing to a painting's deterioration.

4. *What might conservators do to restore my painting?*

Conservators will choose from among hundreds of restoration techniques, depending on your painting's condition. Restoration includes:

- ***Cleaning:*** This involves removing surface dirt and usually involves removing the varnish. Cleaning methods are chosen based on the type of paint and varnish used on a painting.
- ***Filling:*** This includes filling any losses to the ground layer.
- ***Inpainting:*** This involves painting in areas of paint loss or new fills so they are not obvious. Inpainting is done for aesthetic reasons, so that losses don't detract from the painting's overall appearance. Conservators will usually choose paints that can be easily removed so that future conservation treatments won't have to include difficult paint removal.
- ***Removing old paint:*** This involves removing paint from past "restoration" treatments. Restorers often painted on top of the original paint, known as "overpainting."
- ***Transfer:*** This is an extreme treatment that involves moving the image layers to a new support. This is done only if the existing support is contributing to the image layer's decay. This is a complicated procedure that involves removing the support from the back of a painting.

H. Procedures for Handling Paintings During Emergencies

Chapter 10: Emergency Planning, gives information about planning for emergencies and minimizing damage. This section gives specific information on caring for paintings damaged in an emergency.

1. *In what ways can a disaster affect my paintings?*

Unfortunately, accidents and natural disasters occur and cause damage to museum collections. For paintings, water damage is very serious and requires immediate treatment. Water causes wood to swell, creating instant pressure on panels and stretchers. Water can also dissolve sizing, causing the image layer to separate from the support.

Other accidents and disasters can leave torn, burned, sooty, or muddied paintings. In these cases, the damage to the paintings has already occurred. Contact a conservator immediately. Don't attempt to clean mud, dirt, or soot or to mend a ripped painting. You can increase the damage to the painting.

Fire can blister the paint layers. Never try to press the paint back down into place. A trained conservator will usually apply heat to flatten the blisters before attempting to clean the painting, which is a very delicate procedure.

2. *What do I do if my paintings are water damaged?*

Act quickly. Water can seriously damage paintings in a matter of minutes. Immediately contact a conservator if one is available. If not, salvage your collection in order of priority identified in your park's disaster plan. Salvage paintings that have the highest value in your collection first.

- ***Remove frames***. **Don't** remove canvas from stretchers.
- ***Remove excess water*** by gently tilting each painting to let the water run off the surface.
- ***Set up a work area where there is no danger of further damage***. Paintings with flaking layers should be dried face-up on a table, and should not be touched.
- ***Keep wet paintings horizontal*** and paint side up.
- ***Place fans around the work area*** to increase circulation and decrease drying time.
- ***Use dehumidifiers*** to assist in the drying process. Maintain a RH of 60% to 70% to avoid over drying.

3. *What should I do in the case of an emergency that is NOT water-related?*

In most cases the damage will already be done, so there is no need to rush as you would in the case of water damage. However, be aware that some damage, like rips and tears, usually become worse over time.

- ***Don't touch anything***, if possible.
- ***Contact a conservator*** as soon as you can.
- ***Contact your regional/SO curator*** for additional technical assistance.

- ***Move the paintings only enough to be sure they are not in a vulnerable position that could cause further damage***, such as perched at the edge of a table or hanging crookedly on the wall.

- ***Remove anything that may have fallen onto your paintings***.

I. Glossary of Terms Used for Condition Reporting When Examining Paintings*

Blanching: irregular, obtrusive, pale or milky areas in paint or varnish; not a superficial defect like **bloom** but a general scattering of light from increased porosity or granulation in aged films

Blister: a separation between layers appears as an enclosed, bubbled area

Bloom: a whitish, cloudy appearance in the varnish layer caused by exposure to moisture or resulting from deterioration of wax-based media; sometimes called efflorescence

Buckling: waves or large bulges in a canvas from non-uniform tension around the stretcher or strainer

Chalking: loss of a paint or emulsion layer by powdering off

Check: splitting of wood along the grain, from the edge of a board or panel for a part of its length; usually in response to repeated dimensional change brought on by fluctuations of temperature and humidity

Cleavage: a separation between the paint layers and the support producing tenting (gable-like ridges) or cupping (concave flakes); caused by the contraction of the support, forcing the paint layer up off the surface

Crackle: a network of fine cracks; also found in other materials such as lacquer, and glazed ceramics

Crazing: a fine system of crackling in a varnish layer, usually found in aged films in the final stages of drying and embrittlement

Cupping: see ***cleavage***

Dishing: a defect in the stretcher caused by the torque of a drawn fabric; if the stretcher members are twisted out of a common plane, a shallow angle is formed at the corners

Draw: a local distortion at the corner of a painting, marked by diagonal cockling from the corner toward the center of the mount

Fill: the material used to replace areas of loss; fill is then inpainted

Flaking: lifting and sometimes loss of flat areas of the surface layer

Inpainting: new areas of paint to restore design or color continuity; restricted to areas of loss

Overpainting: areas of repainting over existing original paint

Split: a rupture running along the grain of a piece of wood from end to end, usually caused by exterior mechanical stress

Stretcher crease: a crease or line of cracks in the ground and paint layers of a painting on fabric, following the inside edges of stretcher members or the edges of cross-members; caused by the flexing of the fabric against the edges of these members

Tenting: see cleavage

Warp: in a panel, the planar deformation of the support caused by changes in relative humidity

Wrinkling: small ridges and furrows of crawling paint or varnish caused by improper methods or materials

Appendix M: Management of Cellulose Nitrate and Cellulose Ester Film

List of Figures

Appendix M: Management of Cellulose Nitrate and Ester Film

A. Overview

1. *What is cellulose nitrate (nitrate)?*

Nitrate refers to a group of early transparent plastic film supports that were most common between 1910 and 1950. Created as an easy-to-handle replacement for heavy and awkward glass plates, gelatin film, and paper negatives, nitrate film was used for still photographic negatives and transparencies, as well as motion picture film. Most nitrate film consists of a flexible sheet or roll of cellulose nitrate (nitrate) film base with a silver gelatin photographic emulsion (image bearing layer) on top. During the 20th century, amateur and professional photographers and filmmakers used nitrate more frequently than any other film support to hold the emulsions of their negative and film images.

Cellulose nitrate polymers, initially called gun cotton, were first synthesized over 150 years ago for use in the manufacture of military explosives. Later, cellulose nitrate polymers were treated with camphor to produce some of the earliest plastics. Celluloid, an early plastic replacement for ivory, was made into hairbrushes, billiard balls, toys, and a variety of home products. In the late 1940s, cellulose nitrate lacquers, adhesives, and metal coatings became popular, many of which are still in common use today. More recently, printing inks; plastics; coatings for stone, metal, and ceramics; and common adhesives, such as DUCO Cement and UHU All Purpose Clear Adhesive, have used cellulose nitrate polymers. Cellulose nitrate polymers vary in the amount of actual cellulose nitrate in their composition, from collodion photographic emulsions with a 10.5% concentration, to photographic flexible film bases with a 12% concentration, to explosive weapons-grade gun cotton with a 12.5% concentration.

If deteriorated, nitrate may be yellowed, tannish, stained, bleached, sticky, brittle, blistered, pungent-smelling, or powdery, depending upon the stage of deterioration. Nitrate photographic film has sometimes been called:

- celluloid
- nitrocellulose
- flammable film
- pyroxolin
- flam film
- cellulose nitrate

Nitrate is often confused with the cellulose ester films, including acetate, diacetate, and triacetate negatives, which deteriorate in a similar fashion. Cellulose ester films are described in Section B.1. Paper-based photographs are **never** nitrate. Specific tests have been developed to identify nitrate.

See Section B.6 below for more information on these tests. The modern replacement for nitrate and acetate films is polyester, a stable plastic.

2. *What are nitrate photographic negatives and transparencies?*

In the United States, nitrate-based still photographic negatives and, less commonly, positive transparencies were produced between 1889-1950. Both amateur and professionals photographers used nitrate film for fine art photography, photojournalism, portraits, travel photography, and technical photography such as aerial, dental, legal, and medical photographs (both X-ray and standard negative and transparency images). Manufacturers such as Agfa, Ansco, Defender, DuPont, Hammer, and Kodak produced nitrate films. See Table 1 (Section A.4) to learn when different formats and types of nitrate still negatives were first introduced or last available in the U.S.

The earliest nitrate film (1889-1903) has a thin (<8/1000 of an inch or <8 mil) nitrate film base and gelatin coating on only one side; therefore it tends to curl. This earlier film is more stable than later professional film, which has a thicker nitrate base (8 mil) to keep the film flat during processing. Professional negatives are the least stable of the still negatives. On occasion, rolls of 35mm-nitrate still negative film are confused with motion picture film when the roll film remains in its original roll format. Roll films may be identified by their frame numbers, which motion picture films lack. Nitrate sheet and cut film have a border pattern (frame-like edge) that doesn't occur consistently around the image. On the long edge of the film, the border ends about an inch from the end of the image, while the image reaches to the film edge in this area.

Most nitrate still images are flat sheets of transparent flexible film containing negative or positive photographic images in a wide variety of sizes (formats) from 35mm to greater than 16" x 20". Included in this category are:

- ***aerial film*** (ranging in size from 4" x 5" to 8" x 10"), which is easily identifiable by subject content
- ***X-ray film*** (emulsion coated on both sides of the base), which is also easily identifiable by subject content
- ***film packs*** (up to 5" x 7"), which are recognizable by the lightweight film base, a wide short-edge border (frame-like edge of the image) and thinner long-edge border, and the adhesive or paper residue from a pull tab that may be present on the short border.

3. *What is nitrate motion picture film?*

Nitrate motion picture film consists of varying length strips of flexible film with perforations along both side edges, which allow the film to be fed through a camera, projector, or film editor. Unlike slides and negative roll film, however, the motion picture film frames have no sequential frame numbers. Nitrate motion picture film was used to create educational film strips, amateur films, training films, travel films, and amateur and commercial motion picture releases, both silent and with sound.

Nitrate motion picture film can contain positive or negative motion picture images. These images may be either color or black and white, generally showing motion in sequence from left to right like a comic strip. Most nitrate motion picture film is thinner than negative film but relatively less stable as it is stored tightly rolled and in large quantities, which hastens deterioration.

Nitrate motion picture film was originally available between 1895 and 1951. These nitrate motion picture film availability dates are not absolute, however, as some filmmakers had stockpiles of this film and continued to use it for some years. See Table 1 below for precise dates when specific types of nitrate stopped being manufactured in the U.S.

4. *When was nitrate used in the United States?*

American amateur and commercial still photographers used nitrate-based film most frequently between about 1908-1939, although nitrate film was available between 1889 and 1951. Specific dates vary for some gauges and formats (X-ray, aerial film, and roll film). The history of nitrate and other film types produced in the U.S. is chronicled below.

Table 1: A History of Nitrate Film

1889 – Nitrate film is developed for roll film (not 35mm), sheet film, film pack film, X-ray film, and professional 35mm motion picture film.

1895 – Nitrate commercial motion picture film is available.

1900 – Nitrate motion picture film becomes commonly available.

1903 – Nitrate film is given a thicker nitrate film base and a gelatin backing on both sides.

1908 – Kodak introduces cellulose acetate "safety" roll film negatives for still cameras.

1909 – The National Board of Fire Underwriters develops rules for nitrate handling and storage.

1920 – Nitrate 35mm roll film and aerial film are available.

1920 – Acetate amateur motion picture film is available in 8mm and 16mm formats.

1920 – Nitrate negative film commonly replaces glass plate negatives.

1923 – Kodak introduces cellulose acetate amateur motion picture film.

1925 – 35mm nitrate still negative film begins to be available and cellulose acetate film becomes much more common.

1930 – Acetate sheet film, X-ray film, and 35mm roll film become available.

1933 – Last year Kodak manufactures nitrate X-ray film in the U.S.

1935 – Nitrate still negative film begins to be replaced by cellulose acetate "safety" film.

1937 – Cellulose acetate film begins to be replaced by cellulose diacetate.

1938 – Last year Kodak manufactures 35mm nitrate still negative roll film in the U.S.

1939 – Nitrate still negative film is largely replaced by "safety" films.

1939 – Last year Kodak manufactures portrait and commercial sheet nitrate film.

1940 – Acetate aerial film and roll film (other than 35mm) is developed.

1942 – Last year Kodak manufactures aerial nitrate film in the U.S.

1947 – Cellulose diacetate still negative film begins to be replaced by cellulose triacetate.

1948 – Kodak introduces triacetate motion picture films. *Note***:** If your print is edge marked "safety," it dates after 1948.

1949 – Triacetate motion picture films are now in common use.

1949 – Last year Kodak manufactures nitrate film packs in the U.S.

1950 – Last year Kodak manufactures roll film in sizes 616, 620, and 828 in the U.S.

1950 – Acetate film pack and professional 35mm motion picture film become available.

1951 – Last year Kodak manufactures professional 35mm motion picture film in the U.S.

1951 – After this date, all camera negative separation films (Technicolor camera negatives, master positives, matrices, and release prints) are produced in triacetate. Most film produced before this date in the U.S. is unstable.

1960 – Polyester sheet film, X-ray film, and aerial film become available.

1960s– During this decade, most Technicolor™ films are on polyester support matrix films.

5. *Why should I be concerned about nitrate film?*

As it deteriorates, nitrate gives off highly acidic nitrogen oxide gases, particularly nitric oxide, nitrogen dioxide, and others, which either escape into nearby areas—threatening staff, buildings, and collections—or stay captured in the sealed storage area. Unless allowed to escape, these gases build up, causing an autocatalytic reaction that speeds decomposition of the original nitrate materials. Since the reaction produces heat, which further acts on the available gases and humidity, the environment around the nitrate rapidly becomes toxic. Nitrate poses a variety of problems, including:

- ***Health problems*:** All nitrate film deteriorates naturally over time, unless kept in very cold storage. Deteriorating nitrate film gives off gaseous byproducts, including nitrate oxide and nitrogen dioxide gases, which may threaten researcher and staff health. Health threats include:

  – eye irritation

  – headaches

  – nausea

  – rashes

  – respiratory irritation

  – skin irritation

  – swollen glands

  – vertigo

  All human exposure to nitrate should be limited in duration and monitored for side effects. Staff working with nitrate must keep track of and limit the number of hours of exposure and use special equipment when working with nitrate. See Section C.7 for details.

- ***Safety problem*:** As nitrate decomposes, it releases heat (an exothermic reaction) and acidic gases, including nitric oxide and nitrogen dioxide. In the presence of high humidity or water vapor, the nitrogen dioxide deterioration byproducts can produce nitric acid, a very corrosive compound. Large quantities of nitrate, particularly bulk quantities of roll

film (20,000 linear feet or more), motion picture (20 films or more), or X-ray film (875 X-rays or more than 75 pounds), when housed together, will deteriorate at an ever-accelerating rate due to the build up of heat and acidic gas deterioration byproducts. See Section C.7 for guidance on how to work with nitrate.

If you store quantities of deteriorated nitrate, it may spontaneously ignite at temperatures of 100°F (38°C) or higher. Undeteriorated nitrate ignites at about 266°F (130°C). **Burning nitrate produces toxic gases, such as carbon monoxide and nitrogen peroxide that pose a severe threat to life.** These toxic gases have killed many individuals in theaters, clinics, and storage structures. In 1929, gases from burning X-rays during a clinic fire in Cleveland killed 125 people.

Since nitrate contains chemically combined oxygen, it produces its own oxygen as it burns. Once burning, nitrate roll film or motion picture film is almost impossible to extinguish as the center of the film burns at the same speed as the exterior due to the nitrate's ability to use the chemically combined oxygen. Nitrate is a serious threat to the safety of all people that work in the same building, all collections stored in the building, and all historic structures nearby. Nitrate can burn in a closed film can, under water or sand, and despite modern fire suppression systems including dry chemical and foam fire extinguishers, halon, carbon dioxide fire systems, and similar extinguishers. See Section D for guidance on how to avoid nitrate fires. Nitrate can also suffer from the standard deterioration problems of film, such as mold, insect infestations, and vermin infestations, all of which pose additional health hazards. See *Museum Handbook,* Part II, Appendix R: Curatorial Care of Photographic Collections.

- ***Structural safety problems*:** As well as being toxic, nitrate fires are known for their intensity and explosive force. Nitrate burns at a combustion rate 15 times greater than that of wood. While burning, nitrate produces toxic and flammable gases—including carbon monoxide and nitrogen peroxide.

  Just five pounds of nitrate (1 reel of motion picture film or 125 negatives larger than 4" x 5" in size) can release over 25 cubic feet of carbon monoxide. These gases are produced at such a rate that they place tremendous pressures on building structures, frequently leading to structural collapse. Nitrate fires usually burn until all fuel is consumed, often accompanied by explosions.

- ***Collection problems*:** As it deteriorates, nitrate gives off gases that deteriorate other materials, such as paper, leather, fabric, and wood, as well as stone and some metals. The nitric acid created as the result of nitrate deterioration corrodes metal, makes gelatin binders (part of the film image-bearing emulsion) sticky, and fades silver images.
  Even when in refrigerators or freezers, nitrate should not be housed in general museum or archival storage areas, work spaces, or general office spaces for more than five years) as some fumes are still given off. Nitrate is a threat to the survival of collections housed in the same or nearby buildings. See Sections C.11 and C.12 for guidance on how to house and store nitrate.

6. *What values do nitrate films have for parks?*

Nitrate negatives and motion picture film forms the largest portion of the visual record of the early 20th century. This material has value for a wide variety of purposes, including:

- ***Informational value*:** Nitrate film provides meaningful data and information essential for tracking how parks have changed over time including:
  - activities and events
  - archeological sites
  - buildings and restoration of structures
  - geology
  - historic landscapes and vegetation
  - human impact on ecosystems and fauna

  Nitrate captures the ephemeral, transforming it into a record that can be interpreted, evaluated, utilized as data, and transformed into information and knowledge. Don't lose this information through neglect or disposition. High quality copies can have almost as much informational value as original nitrate. If you have a high quality copy, such as an interpositive copy or a duplicate negative in good condition, you don't have to keep the original negative if it has only informational value.

- ***Artifactual value*:** Materials that are rare, interesting, or outstanding examples of photography or filmmaking have artifactual value. Some nitrate negatives, for example, such as those by Ansel Adams, Lewis Hine, or Carleton Eugene Watkins, are important artifacts in their own right because of their excellence as visual objects.

  Nitrate with high artifactual value will generally have some of the following characteristics:
  - fine composition
  - sharp focus/resolution (unless purposefully impressionistic)
  - good tonal values
  - excellent depth of field (clear focus and image depth in both foreground and background areas)
  - lack of obvious blemishes such as smudges and dust spots
  - representation of the subject matter in a visually arresting, interesting, or surprising way
  - good contrast (clear bright highlights and deep dark shadow areas)

- good range of clear details, even in the dark shadow and bright highlight areas

These high artifactual value nitrate materials must be preserved as major assets until they become so deteriorated that they have lost their functionality and become a threat to other materials. Poorly composed, unfocused, and muddy images would not qualify as having high artifactual value. Generally speaking, high quality copies **don't** capture all the artifactual value of an original photograph. Copy and keep undeteriorated original nitrate that has high artifactual value.

- ***Evidential value*:** Some nitrate negatives serve as either legal or historical proof of an activity, event, occupation, or action, such as law enforcement footage of an illegal activity. The state and federal laws have specific requirements for how evidential materials must be maintained prior to a court case. Such legal requirements might include:

  - an unmanipulated image that has not been dodged, burned, retouched, tinted, or airbrushed, either in the darkroom or afterwards

  - documentation on when, where, how, why, and by whom the image was taken and what it documents

  - a record of a continuous chain of custody by the creator (photographer or his or her employer)

  This evidential nitrate should be kept for its value as legal and historical evidence, although while still active, it is unlikely to be found in museum collections. Legal records may eventually become unnecessary; however, **historical proof is always necessary**. Nitrate film that serves as historical or legal proof must be copied with particular care to ensure that it doesn't lose its usefulness as evidence. You may need to consult with a lawyer or historian before disposing of these legal or historically evidential materials, even after copying. In some cases you may be bound to maintain the original in perpetuity, or at least until it is deteriorated beyond stage 3. See Section B.13 for a description of the stages of deterioration. Copy and keep this original nitrate film. Consult your solicitor for guidance on preserving the evidential value of the original in your copy.

- ***Associational value*:** Some nitrate has importance for its relationship to a notable individual, group, event, place, or activity, such as the images taken by or of presidential family members, famous authors, famous generals, or other notables. Associations might include:

  - an individual or group who created, owned, or was shown in the image, such as Franklin D. Roosevelt

  - an activity, such as a parade, staff-training, or a celebration

  - a movement, such as Suffrage, Emancipation, or Impressionism

  - a geographical locale, such as a particular park site

- an era or event documented, such as the Spanish-American War or Inaugural Day

Generally speaking, associations are more powerful for original materials than with copies. Maintaining the original nitrate will maintain that direct link to the associated individual or group. Copy and keep undeteriorated original nitrate with high associational value.

- ***Administrative value*:** Some nitrate is essential for the day-to-day operation of the parks. This includes nitrate film that documents museum collections; nitrate film used as resource materials for park publications; and nitrate film that serves as documentation of land boundaries, flooding, or forest fire damage. Generally speaking, these materials eventually become part of the park museum collections because of their informational content, if, for example, they contain baseline data on ecosystems. These materials, once copied, inspected, deteriorated, and deaccessioned may be disposed of as NPS hazardous waste according to Environmental Protection Agency (EPA) guidelines. Work with a NPS hazardous waste coordinator. See C.16 and C.17.

B. Identification and Evaluation of Historical Nitrate and Cellulose Ester Film

1. *What transparent flexible film bases have been produced?*

During the late 19th and early 20th century, there were a number of transparent film bases created, including:

- ***Cellulose nitrate (nitrate)*:** Described in Section A.1.

- ***Cellulose ester (acetate) family of safety film bases*:** The cellulose ester family of film bases is usually referred to as triacetate, diacetate, or acetate or is simply called safety film. Though developed to be permanent film bases, unfortunately these films were no more stable than nitrate. Their maximum life expectancy (LE) is 100 years at an average room temperature of 70°F. The major difference between the nitrate and cellulose ester family of film bases is that the cellulose ester films are **not** as flammable. Because of the presence of acidic decomposition byproducts, these cellulose ester film types should be isolated, reformatted, and placed in cold storage as they deteriorate. **Most 20th century color film (slides and negatives) is cellulose ester, even film and transparencies being produced today.** Manufacturers such as Agfa, Ansco, Defender, DuPont, Hammer, and Kodak have produced or are producing cellulose ester films. See Sections B.2-B.4, and B.6.

  - ***Cellulose acetate (acetate, cellulose acetate propionate, and cellulose acetate butyrate)*:** Developed about 1935, these were the first of the "safety" cellulose film types used to replace nitrate. The major improvement over nitrate was an ignition temperature above 800° F.

- ***Cellulose diacetate (diacetate)*:** This is the second of the safety cellulose film types, used to replace nitrate film and acetate around 1937. Like acetate, diacetate is no longer-lived than nitrate. Diacetate films discolor, shrink, and become progressively more brittle over time. Storage environment, particularly temperature and humidity, greatly affects the life of this film. Cellulose diacetate began to be replaced by triacetate in 1948.

- ***Cellulose triacetate (triacetate)*:** This is the last of the cellulose ester films that replaced nitrate around the 1950s. It was first available in 1948 as motion picture film and commonly in use by 1949. As early as 1960, reports began to filter in that cellulose triacetate film was not permanent when stored under warm and humid conditions.

- ***Polyester (polyethylene terephthalate)*:** This refers to a clear neutral plastic film used for film bases since the 1950s. Polyester is a long-lived and durable film base. Films marked "Estar" or "Cronar" are polyester. Manufacturers such as Agfa, Ansco, Dupont, and Kodak produce or have produced polyester films. Polyester is not particularly flammable, does **not** give off dangerous gases, and has a maximum life expectancy (LE) of 500 years.

2. *Does cellulose ester film deteriorate?*

Yes. All flexible films in use before 1950 deteriorate. As cellulose ester films age, deterioration lowers the pH of the cellulose ester's emulsions (image-bearing layer), causing fading and film-base deterioration. Like nitrate, these films become brittle as they age. Cellulose ester film may develop crystals or bubbles on the emulsion surface of the images.

The classic cellulose ester deterioration patterns are "channeling," in which the film image layer (emulsion) forms raised blisters and tunnels on the film base and "vinegar syndrome," described in Section B.3 below. Ultimately, the only effective preservation solutions are reformatting and inspection of the original, followed by cold storage of any undeteriorated originals of continuing value. For more guidance and a rating system for comparing the various types of value, use, and risk, see *Conserve O Gram* (*COG*) 19/10, "Reformatting for Preservation and Access: Prioritizing Materials for Duplication."

3. *What is the vinegar syndrome?*

As the cellulose ester films (acetate, diacetate, and triacetate) deteriorate, they chemically decompose, producing acetic acid. Acetic acid is the cause of the well-known "vinegar" smell frequently noted around collections of acetate, diacetate, and triacetate. Like nitrate, the decomposition is autocatalytic, meaning that the presence of acidic decomposition byproducts near the original film will speed further decomposition. Using sealed or closed containers hastens this deterioration process by maintaining deterioration byproducts and acetic acid gases next to the film. Like nitrate films, cellulose ester films should be isolated for cold storage. Handle cellulose ester film carefully, as acidic gas byproduct build-up near the film can also be a health hazard.

4. *What does deteriorated cellulose acetate, diacetate, and triacetate film look like?*

Most cellulose ester film types deteriorate in the following characteristic ways:

- ***slight film curl*** (***Note*:** This is also exhibited by nitrate from the 1889-1903 era)
- ***vinegar-like or acetic acid smell***, which grows stronger as the film deteriorates
- ***film shrinkage***, which can change the film's dimensions
- ***film embrittlement,*** although it doesn't turn amber-colored like nitrate
- ***some warping and planar distortion***, so that the film is no longer flat, but instead has raised areas
- ***bubbles*** in the film emulsion
- ***channels of raised film emulsion*** on the film surface (as the film emulsion separates or lifts from the film base it produces channels, tunnels, and large blister-like features)
- ***silvering-out*** or metallic mirroring or image tarnishing that begins to occur in the densest image areas

  ***Note*:** Only nitrate has rainbow effects that appear in the darkest and most silvered-out areas of the image. Acetate, diacetate, and triacetate films lose image detail and look dark and reflective when they silver-out; they don't have rainbow-like-patterns.

5. *How do I identify nitrate materials?*

There are several ways to identify nitrate materials, including:

- ***By date of manufacture*:** Table 1 in Section A.4 provides a review of the dates during which various types and format of film were most commonly used. Most film negatives and motion picture film made in the United States before 1951 are suspect as being potentially nitrate. Additionally some negatives and films made in France during World War II were nitrate.
- ***By internal evidence*:** Internal evidence is the best way to identify nitrate. There are several common types of internal evidence, including:
  - ***Edge markings*:** Edge markings or edge prints are actual words on the borders of film that indicate the film name or type. Some manufacturers edge-marked their nitrate film with the word "nitrate," while they marked other film with specific brand names or types of nitrate film, such as "Eastman Nitrate Film." **If** you are dealing with an original negative, you can depend upon the "nitrate" edge marking. ***Note*:** The marking "safety film" indicates that the film is cellulose ester (acetate, diacetate, or triacetate), while films marked "Estar" and "Cronar" are polyester.

Occasionally, when copying nitrate film to a safety base the nitrate edge markings also were copied. These copies of nitrate on safety base would have both "nitrate" and "safety" edge markings, thus alerting you to their "safety" status. So, the presence of the word "nitrate" as an edge marking is **not** conclusive proof that the material is nitrate if you are dealing with a copy image. Look for V-shaped notch codes (punches taken out of an image border in a particular configuration to indicate the film type to photographers working in a darkroom) in addition to the word "nitrate" for more conclusive proof that the image is nitrate (see notch codes below). Your best use of edge markings is to look for the word "safety." Assume that pre-1950 film or negatives not marked with the word "safety" are nitrate. Also assume that unmarked film produced prior to 1950 is nitrate, until you can test it.

Flexible film-based negatives (not glass, paper, or metal based negatives) and motion picture film produced between 1890-1950, which don't have the words "safety film" marked on them, generally are nitrate. Use this distinction as one easy way to identify nitrate.

- ***Notch codes*:** Notch codes are small punches taken out of the border of nitrate, developed to help photographers identify the film type in the dark room. These codes varied over time by manufacturer, process, and format of film. Kodak "V" notch codes, used in combinations of up to three notches, designated that the film was nitrate. When the earliest safety film appeared, the outermost notch became a rectangular "U." After 1949, Kodak reused the old "V" notch codes for safety film. Notch codes provide uncertain guidance and are best used in conjunction with other internal evidence.

- ***Odor*:** Nitrate film has a pungent nitric acid smell as it deteriorates and may have a camphor-like odor when it burns. These odors should not be confused with the vinegar-like acetic acid smell of deteriorating acetate, diacetate, and triacetate safety film.

- ***Yellowish-brown base color*:** As it deteriorates, nitrate film changes in color from clear and transparent to a distinctive dark amber tone. To determine if the base has this tone, look along the border or edge of the film where there is no emulsion or cut a small chip from the edge of the film and place the film chip in water. After about 15 minutes, when the emulsion has softened, scrape it to see if the film is amber in color. If it is, the film is probably nitrate.

- ***Base brittleness*:** Deteriorated nitrate is very brittle. You may cut a tiny chip off the border of a piece of nitrate film and try bending it. Compare the film's resilience to that of a piece of contemporary film by flexing it gently. Nitrate will be significantly more brittle.

- ***Emulsion stickiness*:** Check the image's emulsion border for stickiness. Emulsions on nitrate that has reached stage 2 of deterioration or higher may be sticky or softened. (See B.13 for a review of nitrate deterioration stages.)

- ***Emulsion mirroring or silvering out*:** Both nitrate and acetate film turn mirror-like or look like tarnished silver—usually in the densest image areas. However, in nitrate the mirroring may appear as a black rainbow, while in acetate there is no rainbow-effect.

- ***Emulsion cockling and buckling*:** As it deteriorates, nitrate shrinks. This shrinkage causes the negative emulsion to buckle and lift-off the cellulose nitrate base. Early safety film (acetate, diacetate, and triacetate) also has an emulsion shrinkage problem that causes the emulsion to separate from the base and form long web-like channels. Channelized film, in which the emulsion lifts off the base to form raised honeycomb-like cells or tunnels, is **always** cellulose ester.

- ***Film gauge***: Though motion picture film has come in a wide variety of gauges, nitrate was not available in all of them:

  standard 8mm (never made in nitrate)
  super 8mm (never made in nitrate)
  16mm (never made in nitrate)
  35mm (the most common nitrate gauge)
  70mm (less common nitrate gauge than 35mm)

Use the internal evidence indicators above with care, as they may be inconclusive. You may need to test the material to determine if it is nitrate

6. *How do I determine whether film is nitrate, cellulose ester (acetate, diacetate, triacetate) or polyester?*

You can use any of four tests to determine the composition of photographic negatives, transparencies, or motion picture film in your collection:

- ***The polarization test*** identifies polyester film.
- ***The burn test*** identifies nitrate film.
- ***The float test*** identifies all film types.
- ***The diphenylamine test*** identifies nitrate film.

Before using these tests, attempt to identify the nitrate by one of the techniques described in Section B.4 above. Or, use the polarization test (see Section B.7) in conjunction with the techniques described in B.4. While each of the four film tests has particular advantages and disadvantages as described below, **only the polarization test is non-destructive.** Therefore, the polarization test is the preferred test for use with NPS museum collections. Don't try to undertake the destructive tests (burn test, float test, or diphenylamine test) without training and appropriate facilities, such as fume hoods or an acid/organic vapor cartridge breathing apparatus that has been fitted to the user.

7. *How do I use the polarization test?*

The polarization tests can help you determine if film is made out of polyester. Place the film to be tested between two photographic polarizing filters or two pairs of polarized sunglasses. Twist or "cross" the filters or glasses so that they allow light to pass through them. Project a strong light through the pair of "crossed" polarized filters (or polarized sunglasses) and film. If the film is

polyester-based, the shimmering full spectrum of rainbow-like patches will appear on the film. If the film is one of the cellulose esters or nitrate, you will simply see dimmed light, but no rainbows. As the only non-consumptive film test, **the polarization test is preferred over the other testing options.**

8. *How do I use the burn test?*

You can distinguish nitrate from safety film through the use of the burn test (a consumptive test). Cut a small snippet of film from the border (not the image area) of a negative or motion picture film. **Use a fume hood if one is available or an acid/organic vapor cartridge breathing apparatus that has been fitted to the user.** If you have no fume hood or apparatus, go outside of the building, far from any venting nitrate fumes, gasoline, or other flammable materials. Hold the film carefully by the corner using a hemostat or pair of long-handled tweezers.

Light the film snippet using a match.

- ***Nitrate film*** will burn brightly and consistently with an intense white-to-yellow flame. Fire should consume the nitrate snippet completely. Some nitrate film will have a camphor-like odor as it burns, although formulations varied during creation.

- ***Safety film*** will smolder and go out when the match is removed, leaving a melting or dripping mess behind and an acetic acid, vinegar-like odor.

You will need experience before you can use this test as a conclusive measure. On your first few attempts, work with film that has already been identified in order to experience the testing characteristics of both film types.

9. *How do I use the float test?*

Another way to distinguish nitrate from safety film is the float or trichloroethylene test (a consumptive test). Trichloroethylene is a dangerous volatile chemical and a known carcinogen, so avoid touching the trichloro-ethylene or breathing in the chemical's vapors**. When working with trichloroethylene use a fume hood and wear neoprene gloves** or work outdoors using an acid/organic vapor rated cartridge in a rated breathing apparatus fitted to the user and neoprene gloves. Never carry this open chemical through your storage, work, or reference areas.

Take a 6 mm x 6 mm chip (snip) of film to be identified from a film border. **Be sure to cut only the non-image area**. Place the film chip in a beaker or test tube of trichloroethylene. Place a lid on the beaker and shake it or press the film chip down into the fluid until it is thoroughly wet. The film will either float, sink to the middle of the beaker, or sink to the bottom of the beaker.

- Cellulose ester (cellulose acetate, diacetate, and triacetate) safety films float at the top of the beaker.

- Polyester film floats at the middle of the beaker.

- Nitrate film sinks to the bottom of the beaker.

After the test you must work with your hazardous waste coordinator to store and/or dispose of the trichloroethylene and the test strips according to EPA guidelines.

10. *How do I use the diphenylamine test?*

Perform the diphenylamine test (a consumptive test) very carefully as the solution contains about 90% sulfuric acid. Obtain a solution of diphenylamine and sulfuric acid, as described in the Canadian Conservation Institute's "The diphenylamine spot test for cellulose nitrate in museum objects," *CCI Notes* (17/2). Place a small film chip (from a border or non-image area) on a microscope slide and add a drop of the prepared diphenylamine solution. After 60 seconds, if the film is nitrate, it will turn a deep blue. Both cellulose ester and polyester films will either remain clear or turn a very pale blue, not a vibrant, deep blue.

To confirm the test result, apply two additional drops of the solution to the film chip and wait another minute for the film to turn deep blue. Conduct this test under a fume hood or outdoors wearing an acid/organic-vapor rated cartridge in a rated breathing apparatus fitted to the user, as **the sulfuric acid may irritate your mucous membranes.**

11. *What determines the speed of nitrate deterioration?*

Nitrate begins self-destruction at the moment of creation. **Nitrate film self-destructs at an unpredictable rate.** The only way to estimate when nitrate will be unusable is to have a conservator conduct the consumptive tests listed in Section B.14 on each individual sheet or roll of film—hardly a practical alternative. Several factors cause chemical or mechanical deterioration of nitrate, including:

- ***Manufacturing and processing history*:** During the early days of mass photographic processing each batch of photographic film had a slightly different composition. Factors affecting the life of the image include:
  - the nitrate composition
  - the nitrate thickness
  - the emulsion quality

  Residual processing chemicals, such as sodium thiosulfate and silver complexes, affect the life of the image but seem to have little to do with the actual life of the nitrate base. You may test for residual processing chemicals (particularly thiosulphate) in a variety of ways, ranging from using test strips to hiring a lab to conduct chemical tests, such as the methylene blue test. See Sections B.15 and C.15.

- ***Storage and housing environment*:** The storage and housing environment involves a wide range of factors that may affect the rate of deterioration, including:
  - air contamination and pollution
  - housing envelopes, sleeves, folders, and boxes
  - insects
  - light
  - mold

- relative humidity
- rodents
- storage equipment
- temperature
- ventilation
- water

See Sections C.11 and C.12 for information on how to house and acclimatize nitrate and cellulose ester films.

- ***Handling*:** Abusive handling can cause scratches and abrasion, while direct hand contact can deposit oils, which ultimately lead to emulsion staining. Avoid using nitrate frequently for duplication purposes as this places great stress on a negative. Never project nitrate. Reformat frequently used materials to provide access, duplication, and archival preservation master copies. See *COG* 19/10, "Reformatting for Preservation and Access: Prioritizing Materials for Duplication," for further help in determining what nitrate to reformat first.

12. *Is nitrate deterioration predictable?*

No. Although nitrate does go through five sequential stages of deterioration, without sophisticated chemical testing by a professional, it is impossible to predict how long the negative will exist in each stage. Film that has lasted for 60 years at stage 1 (relatively good condition) may go through stages 2-3 in only a few months, depending upon how the nitrate is stored and handled. Cold storage and regular inspection of nitrate is essential if collections are to be preserved.

13. *What are the stages of nitrate deterioration?*

There are five stages of nitrate deterioration.

- ***Stage 1*:** Film base discolors to a light amber tone.
  - Image fades.
  - A faint acidic or nitric acid smell may be detectable.
  - Image may stain, totally or in part, or exhibit "mirroring," where it becomes dark and reflective.
  - A black, rainbow-like iridescence may be visible, not unlike an oil slick.

  ***(Note*:** Even the best preserved nitrate is now at least in stage 1 deterioration.)

- ***Stage 2*:**
  - Emulsion may soften.

- Negative may become sticky, attaching itself to paper sleeves or other film.

- Film base may become brittle.

- Film base amber color may deepen.

- A slightly stronger acidic or nitric acid smell may be apparent.

***Note*:** In many cases stage 2 is the last stage at which nitrate can be copied or reformatted.

- ***Stage 3*:**

  - Emulsion may begin to separate from the base.

  - Nitric gas bubbles appear between the film base and the emulsion (image-bearing layer).

  - Film base is very brittle and deep amber in color.

  - Significant "mirroring out" or mirror-like, reflective black staining is apparent, often with a rainbow-like appearance.

  - Nitric acid smell is strong.

- ***Stage 4*:**

  - Emulsion begins to flow.

  - Sticky froth appears on the negatives.

  - Film sticks to nearby housing or negatives.

  - Image surface is easily damaged.

  - Nitric acid smell intensifies.

  ***(Note*:** Film in this deterioration stage should be disposed of as hazardous waste. See C.16 and C.17.)

- ***Stage 5*: *(Note*:** Film in this deterioration stage should be disposed of as hazardous waste. See C.16 and C.17.)

  - Emulsion turns into an acrid brownish or tannish powder that is highly acidic.

  - Film shatters or breaks easily, as the nitrate base is **very** brittle.

  - Film can self-combust if stored near high temperatures or sparks. ***Note*:** This is a rare condition in still negatives except for those of the largest sizes housed without sleeves.

14. *What chemical tests can be used to predict whether nitrate life has been exceeded?*

Two chemical tests can indicate whether nitrate should be immediately destroyed or not. These tests are:

- the Alizarin red heat test
- the Micro-crucible test

Don't attempt to do these tests yourself without a sophisticated chemical laboratory and excellent training. Send film to be tested to an outside chemical laboratory, which will provide you with the results and a recommended date for retesting.

15. *What tests can be used to predict the life of cellulose ester films?*

The Image Permanence Institute developed A-D test strips® for use in determining the level of cellulose ester film deterioration. Similar to pH test materials, the strips indicate the level of degradation in individual films. Use the strips to determine if storage conditions are adequate and to help you set reformatting priorities. The strips are available from the Image Permanence Institute (one package contains 250 detector strips about 1 1/2" x 3/8", a color-reference pencil, and instructions), Rochester Institute of Technology, 70 Lomb Memorial Drive, Rochester, NY 14623-5604; Tel: 716-475-5199; Fax: 716-475-7230.

Place an individual strip in the container of the film to be tested (within a motion picture can, bag, box, sleeve, or cabinet). ***Note*:** Wear neoprene gloves to do this if you are working with deteriorated film. You may wear latex or cotton gloves if the film is undeteriorated. After exposure, the test strip color is compared to the reference pencil, which is printed with four bands of color, numbered from 0 to 3. The four bands of color correspond to the four levels of acidity. The reading indicates the extent of deterioration. ***Note*:** A-D test strips® are not useful indicators for polyester film deterioration. Some organizations, including the National Archives, however, are using them for indicating deterioration in **both** cellulose ester films (acetate, diacetate, and triacetate) **and** nitrate.

16. *How do I ensure the long life of cellulose ester films?*

Long life of cellulose ester film depends upon cool temperature, controlled relative humidity, a well-ventilated storage space, and good housing, as well as appropriate handling. The film age and type (acetate, diacetate, or triacetate) doesn't determine the speed of deterioration, though the original manufacturing, processing, storage, and handling history does affect the film life. Lowering the temperature to 2°F (-18°C) can extend by 200 times the life expectancy (LE) of film stored at 80°F. At 70°F the LE is approximately 100 years from the date of manufacture. Lowering relative humidity to 20% from 50% or higher can triple or quadruple the film LE.

The ***IPI Storage Guide for Acetate Film*** created by the University of Rochester's Image Permanence Institute can be used to predict life of acetate film at specific temperatures and relative humidities. Separate all nitrate and cellulose ester films from each other, from other film types, and from all deteriorated films of any kind. House these films in cold storage within the cold storage system configuration described in Sections C.11 and C.12. Place cellulose ester films in a cool, dry, well-ventilated space (ideally 0°F, 30% RH) housed separately from all other materials and office spaces to slow deterioration byproduct build-up. Use copies for reference and access.

Access the originals only when a new set of interpositives and copy negatives must be produced. If cold storage is not possible, house the materials off-site in cold storage. See Sections C.3, C.11, and C.12 for further guidance.

17. *Where can I get help on these issues of nitrate and cellulose ester identification and deterioration analysis?*

You can get help from SO and regional staff, Harpers Ferry Center (HFC) Division of Conservation staff, and from colleagues at your state university and state and local archives and libraries, as well as from contract archivists and curators.

C. Management of Nitrate and Cellulose Ester Films

1. *Do I have to keep nitrate film?*

Yes. You must keep nitrate film at stages 1 and 2 of deterioration (Section B.13) that has high artifactual, evidential, and/or associational value. Keep any nitrate film, regardless of value, if it has not yet deteriorated to stage 3 or beyond and has not been reproduced, inspected, and the reproduction approved. If you are uncertain about the value of film, keep it until an archivist can determine whether it has high artifactual, associational, or evidential value.

You may dispose of:

- ***film with little or no artifactual, associational, or evidential value*** as long as it has been reformatted and the copies have passed inspection
- ***film of informational or administrative value*** after high quality copies have been made that clearly reproduce **all** the information in the original and have passed inspection (If you are uncertain if all the information is conveyed in the copy, keep the original until an expert can check the film and copies to determine if the copies pass inspection.)
- ***all film in stages 3-5 of deterioration*** after you deaccession it, regardless of its original value

Work with your hazardous materials coordinator to dispose of badly deteriorated nitrate as hazardous materials according to the Environmental Protection Agency (EPA) Waste Codes and guidance. Don't attempt to do this by yourself. If your park has no hazardous materials coordinator, talk to your SO or regional curator or work with your local fire department to arrange a multi-park or regional disposition effort.

The only nitrate you must keep permanently after producing high quality copies that have been inspected is nitrate in deterioration stages 1 and 2 that has high artifactual or associational value and material of continuing evidential value. If you are inexperienced in judging value, keep all stage 1 and 2 nitrate film and make immediate arrangements for an experienced archival appraiser to determine whether to keep the originals.

See *COG* 14/8, "Caring for Cellulose Nitrate Film"; 19/10, "Reformatting for Preservation and Access: Prioritizing Materials for Duplication"; 19/12, "Contracting for Reformatting of Photographs"; and 19/13, "Preservation Reformatting: Inspection of Copy Photographs"; and Sections A.6, B.6,

B.11, B.13, and B.14 for further guidance. Also see *Museum Handbook,* Part II (*MH-II*)**,** Chapter 6: Deaccessioning, for guidance.

2. *Do I have to keep other deteriorating film types, such as cellulose acetate, diacetate, and triacetate?*

No. Deal with other deteriorating film types as you would nitrate, although cellulose ester films don't pose such major safety hazards, as they are **not** a fire risk. Some individuals are sensitive to the acetic acid given off by the cellulose ester films. If health or safety issues become a factor, such as those caused by badly deteriorated collections, mold, insect or vermin infestation, or a chemical spill, follow the nitrate guidance.

Keep all original materials of high artifactual, associational, and evidential value in cold storage. Reformat and inspect your deteriorating items **before** they can no longer be used. After deaccessioning contaminated items, work with a NPS hazardous waste coordinator to dispose of them according to EPA guidelines. See Sections A.6, C.14, C.16, and C.17.

3. *What special storage requirements must my facility meet?*

Don't store nitrate, acetate, diacetate, or triacetate in:

- office spaces
- attics
- general museum storage spaces
- historic buildings
- near windows or doors
- near light or heat sources
- in spaces with poor ventilation
- in spaces with no air conditioning
- in spaces without deluge sprinkler systems

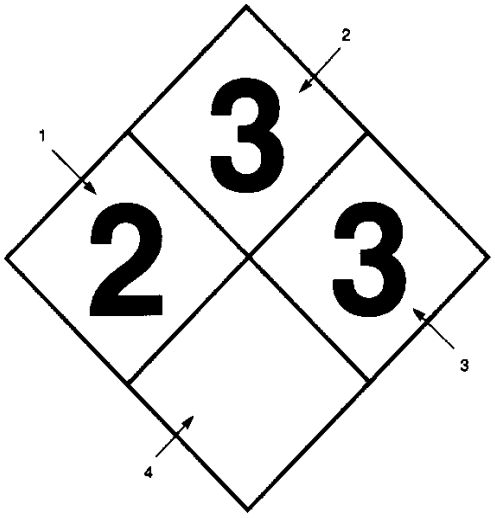
For short-term storage of five years or less, house the collections as described in Section C.12, then place them in frost-free food freezers. This is **not** a recommended long-term solution because the deterioration byproducts may eventually build up in the freezer or refrigerator, causing health and safety hazards.

For long-term storage of more than five years, apply the National Fire Protection Association (NFPA) standards, particularly *NFPA 40, Storage and Handling of Cellulose Nitrate Motion Picture Film,* to all cellulose ester and nitrate film formats. No separate NFPA standards currently exist for still photographic negatives. Parks should not plan to store nitrate film for the long term on park grounds.

NFPA 40 is a rigorous standard that will result in very high-quality cold storage vaults with excellent venting, environmental controls, and fire resistance. However, the cost of applying this standard exceeds $30 a square foot. NFPA 40 standards for vaults include stringent requirements for ventilation, refrigeration, heating, air conditioning, fire resistance, fire suppression, and temperature readouts. The vault will also require constant monitoring, much electricity, and scrupulous management to ensure

environmental stability. **Parks wishing to build a nitrate storage vault should not do so in or near historic structures or in the same building as visitor centers, staff offices, or collections.**

Label all nitrate storage areas and freezer vaults with the National Fire Protection Association (NFPA) Hazard Warning Symbol for nitrate shown in Figure M.1 below. Make sure that you notify all local fire stations of the presence and location of nitrate accumulations in your park. ***Note*:** If you are planning to store only cellulose ester films (which like nitrate should be housed in separate packaging and placed in containers separate from that of nitrate or polyester films), you simply need temperature, humidity, ventilation, and lighting control. See Sections C.11 and C.12 and *COG* 14/4, "Caring for Photographs: General Guidelines."



1 – Health Hazard (BLUE)
2 – Flammability Hazard (RED)
3 – Reactivity Hazard (YELLOW)
4 – Special Hazard (WHITE)

Figure M.1. National Fire Protection Agency Hazard Warning Sign for Cellulose Nitrate Film

4. *What other options do I have if I don't want to store film in my park?*

Consider the following options:

- ***Rent a cold storage vault*:** Hire a cold storage vault outside of the park, such as the Bowers or Iron Mountain facilities in Pennsylvania or Bonded Film Storage in Fort Leigh, New Jersey (201-944-3700) and W.R.S. in Pittsburgh, Pennsylvania (412-937-7700). Although these facilities don't meet the optimum requirements, they do offer improvement over standard office and museum storage.

  ***Note*:** Henry Wilhelm states in *The Permanence and Care of Color Photographs,* on page 342, "At the time this book went to press in late 1992 . . . there was no commercially available humidity-controlled, low-temperature (0°F [-18°C] and 25% to 35% RH) film storage rental space available anywhere in the world." For more current information on cold storage suppliers, equipment, enclosures, and facilities that rent cold storage space, see the list in *Tools of the Trade.*

- ***Use a NPS facility*:** Move your film to a NPS storage and collections management facility with monitored cold storage, such as the Western Archeological and Conservation Center in Tucson or the San Francisco Maritime Museum.

- ***Cooperatively share a vault*:** Share a cold storage vault with a state, federal, or local agency, such as your state archives or library or a local university.

- ***Sublet cold storage space*:** Sublet cold storage space in a vault owned by another organization.

- ***Ask for help*:** Request cold storage space from the National Archives and Records Administration (NARA) or your Regional Archives Center, also operated by NARA.

5. *How should I manage nitrate that I must keep in the park on a short- or long-term basis?*

When managing nitrate, do the following:

- ***Know the law,*** particularly EPA, state, and local ordinances about the keeping and destruction of nitrate. Read the various standards and recommendations in the bibliography.

- ***Talk to your local fire department and safety-related park staff.*** Ensure that they know where the nitrate is located in the park and the quantities and condition of the nitrate. Label the nitrate storage areas clearly with the NFPA Hazard Warning Symbol for nitrate to facilitate effective fire fighting. See Figure M.1.

- ***Isolate and label the materials*** in a safe, humidity-controlled venting cold storage facility (0°F [-18°C] and 30% RH) far from museum storage, work, exhibit, and office areas.

  - Your best option is to use separate storage packets (nitrate separated from cellulose ester) with the nitrate packets housed in a separate environmentally stable vented cold storage chamber (vault room) by itself that meets NFPA standards.

  - Your second best option is to use separate storage packets (nitrate separated from cellulose ester) in environmentally stable cold storage with the nitrate and cellulose ester in the same cold storage vault. This option is perfectly acceptable as long as the temperature and humidity are both controlled (0°F (-18°C) or cooler and 30% RH), there is some venting, and a back-up power source is available.

  - Your third option is to use separate storage packets (nitrate separated from cellulose ester) protected by Molecular Sieves (dispersed molecular traps that absorb gaseous residues) with the temperature and humidity at least somewhat controlled in food freezer-type cold storage as described in Sections C.11 and C.12. Deteriorating materials should be duplicated and removed ASAP. This option is acceptable as long as the temperature and humidity are controlled and there is a back-up power source.

– Your fourth and least desirable option is to use separate storage packets (nitrate separated from cellulose ester) protected by Molecular Sieve materials in standard museum storage. Use this only for short periods as film materials are prepared for duplication prior to cold storage.

Standard food freezers or refrigerators, whether frost-free or not, do NOT meet fire code standards because they are not vented, don't stop the build-up of toxic gases, and don't meet the need for a powerful deluge-type, wet-pipe fire extinguishing system. Such storage is NOT acceptable for permanent nitrate storage.

- ***Duplicate materials*** following American National Standards Institute standards and archival best practices. (See *COG* 19/11, "Preservation Reformatting: Selecting a Copy Technology," and 19/12, "Contracting for Reformatting of Photographs.") ***Note*****:** Digital copies are **not** preservation copies. See Section C.14.

- ***Inspect duplicates*** of the original materials carefully for accuracy, completeness, and technical quality. (See *COG* 19/13, "Preservation Reformatting: Inspection of Copy Photographs.") Make new copies if any don't meet standards and reinspect. Repeat if necessary until high quality copies are achieved. See Section C.15.

- ***Evaluate the remaining nitrate's condition.*** If it is stage 3 or worse, work with a NPS hazardous waste coordinator to dispose of it according to EPA guidelines. See Section B.13 for a review of the stages. Keep materials with high artifactual, associational, and evidential value. (See Section A.6 and *COG* 19/10, "Reformatting for Preservation and Access: Prioritizing Materials for Duplication," for guidance.)

- ***Deaccession and dispose of film*** deteriorated to stage 3 or beyond, film with no relevance to the park's SOCS, and well-copied items with only informational/administrative value. Transfer them to another institution after deaccessioning if they have value or dispose of them. See Sections C.16 and C.17 and *MH-I,* Chapter 6: Deaccessioning, for guidance.

- ***House materials with high artifactual, evidential, and associational values*** in appropriate housing and storage containers in cold storage. See *COG* 14/6, "Caring for Photographs: Special Monochrome Processes," and Sections C.11 and C.12 below.

- ***Manage the cold storage facility*** carefully. Ensure that you have a back-up power source and a power outage alerting system in case of power failure. Inspect the contents every six months (see below). Check the cold storage facility weekly to ensure that there is no power outage or mechanical fault. Never store food or other materials in a film cold storage vault. Maintain monitoring records of the cold storage environment (temperature and RH).

- ***Inspect a different 10% of all retained nitrate, acetate, diacetate, and triacetate every six months*** for deterioration. Check RH indicator strips of materials in cold storage to identify punctured or torn bags requiring

replacement and re-drying of their special humidity-controlling enclosures. See Sections C.11 and C.12 for details on how to house materials for cold storage. Replace all punctured bags and re-dry the special boards being used as humidity buffers. Check the contents of punctured bags or bags whose humidity indicators detect humidity greater than 40% RH. Look for blemishes, silvering out, and other deterioration patterns described in Sections B.4 and B.13.

Remove negatives carefully from sleeves and look at them on a light table. To inspect motion picture film, unwind it slowly onto another reel with a smooth even pressure. If you find some seriously deteriorated items, arrange for their **immediate reformatting**, inspection, and disposal. ***Note*:** If more than 70% of the nitrate viewed during inspection is deteriorated, you should then inspect all of the remaining nitrate.

- ***Move the nitrate, acetate, diacetate, and triacetate to a remote cold storage facility if the power in your cold storage facility should go off for more than 48 hours.*** A nearby backup cold storage facility should be listed in your park's disaster and emergency operations plans. See *COG* 14/8, "Caring for Cellulose Nitrate Film."

6. *Should I isolate and handle cellulose acetate, diacetate, and triacetate in the same way?*

Yes. First reformat all acetate, diacetate, and triacetate film of value and inspect the copies. Place the undeteriorated originals that have high artifactual, evidential, and associational value in cold storage to slow deterioration and minimize the deterioration byproduct gases. Don't place these cellulose ester materials in the same cold storage chamber as nitrate unless the chamber is kept well ventilated and very, very cold (0°F [-18°C] or cooler and 30% RH).

House the film as described in C.11 and C.12. Don't place cellulose ester films in work spaces, museum storage, reference spaces, or office areas because they also give off acidic deterioration gas byproducts that may pose health hazards for some individuals. For more guidance, see the *IPI Storage Guide for Acetate Film* in the bibliography.

7. *What should I do when working with nitrate to avoid health hazards?*

First, isolate nitrate far from other collections, research rooms, and staff work and office spaces. When handling nitrate there are a number of routine precautions you should take:

- ***Maintain a log*** of who works with nitrate for health monitoring.
- ***Stop working with nitrate immediately*** if you experience any shortness of breath or eye or skin irritations.
- ***Wear protective clothing,*** including:
  - latex or cotton gloves for undeteriorated film; neoprene gloves for deteriorated film
  - a long-sleeved, washable smock
  - goggles, if working with deteriorated film

  - an acid/organic vapor-rated cartridge in a rated breathing apparatus fitted to the user

- ***Wash regularly*** all clothing, gloves, goggles, and work surfaces used for nitrate work; don't wear dirty or reused gloves

- ***Don't wear contact lenses*** when working with nitrate. Gases may build up under your lenses causing eye injury.

- ***Limit your work with nitrate*** to three hours per day.

- ***Position a fan*** so that the airflow blows fumes towards an air outtake valve or open window and away from you.

- ***Never rub your skin, hair, or eyes*** with a nitrate contaminated gloved hand.

- ***Never inhale fumes*** from nitrate or cellulose ester film.

- ***Work in a cool space*** far from any sources of heat, flames, or sparks.

8. *How do I avoid health hazards with cellulose ester films?*

Handle cellulose ester film as you would nitrate. Work only in a well-ventilated room to avoid breathing problems caused by acidic byproducts related to vinegar syndrome. (See Section B.3.) If the room lacks good ventilation, place a fan so it blows on you and position yourself in front of an air outtake register or open window, so the fumes are sucked away from you. Wear neoprene gloves if the film is deteriorated, or cotton or latex gloves if the film is in good condition. If the film is deteriorated and the ventilation is poor or you are sensitive to cellulose ester film, wear an acid/organic vapor-rated cartridge in a rated breathing apparatus fitted to the user. Don't wear contact lenses around cellulose ester film.

9. *How should I mark nitrate and cellulose ester films?*

Individual copy negatives and interpositives may be marked on their reverse edge (on the back in an area that is the reverse of the border of the image) with a photographic marking pen that has neutral pH carbon ink and has passed the Photographic Activity Test (PAT). The PAT is described in *COG* 14/2, "Storage Enclosures for Photographic Prints and Negatives." Consider using the Pigma Ink pen by Light Impressions for marking.

Remove all images before writing on an envelope or sleeve. Let image labeling dry thoroughly before re-inserting images in sleeves or envelopes. Generally mark only minimal information (the negative number or catalog number) in very small characters on the non-emulsion side in the non-image area. Never mark in the actual image area or on the reverse of the image. Label envelopes and sleeves on the seamed side, or if using a four-fold sleeve, label on the top of the fold area.

10. *What common factors affect the life expectancy of nitrate and cellulose ester films?*

Of all the factors affecting nitrate life, temperature, relative humidity, ventilation, handling, and housing systems and equipment are perhaps the most significant. Recent studies by Peter Adelstein and others indicate that the nitrate storage environment, particularly temperature and humidity, are crucial to safe handling and long nitrate life. For every 10°F decrease in storage temperature, the film life is almost doubled. Lowering relative

humidity to the 40-60% range from the 70-80% range doubles the life of the film. For long-term storage, 20-30% RH is recommended.

11. *What materials and systems should I use to house my nitrate and cellulose ester?*

Use housing that meets the *American National Standards Institute (ANSI) Standard IT 9.2-1991, Photographic Processed Films, Plates, and Papers-Filing Enclosures and Storage Containers***,** that is a high alpha-cellulose clamshell box made of acid-free materials with reinforced seams**.** Select high-alpha cellulose, four-fold paper sleeves that pass the photographic activity test. Transfer the label and caption information onto this folded side, and place the emulsion so it faces the non-fold side. Place the emulsion side of negatives away from the labeled side of the sleeve to avoid label loss if the film deteriorates. If you use a slide-in sleeve, treat the seamed side like a flap so that the emulsion is away from the seam on the unlabeled side. Use buffered sleeves for cellulose nitrate and for black-and-white cellulose ester film, but use unbuffered sleeves for all color film.

For long-term storage, place your rehoused collections in polyethylene bags or polypropylene film cans within drop-front storage boxes within a second layer of polyethylene bag inside a cold storage vault. Use zeolite materials (dispersed molecular traps that absorb gaseous residues) to protect your film from the buildup of acidic gas byproducts that hasten film destruction if the items are:

- particularly precious
- very large format (8" x 10" and larger) or in large quantity (more than 35 pounds)
- unable to be placed immediately in a cold storage vault
- in a vault with poor environmental controls

Zeolite materials include MicroChamber™ packaging or FPC® Molecular Sieve packets. The packets are placed inside each film container. The packaging is used just as acid-free packaging is normally used. Zeolite materials without cold storage don't by themselves provide adequate protection from deterioration. They simply capture gaseous byproducts that speed deterioration; they don't stop deterioration. Don't reuse zeolite or other housing materials or old containers of any sort. If a film can or box is deteriorated, replace it. Zeolite is an excellent storage material, but may be too expensive for many uses.

The use of the double-bag or Safecare®-type housing system (which includes polyethylene bags, humidity conditioned mat board, RH indicator strips, and boxes) for cold storage of film protects it from condensation, mechanical damage, and handling damage. ***Note*****:** All of the materials found in the Safecare® system are currently found in the *Tools of the Trade.*

If you use venting, hazardous-material freezer(s) for long-term housing without zeolite housing or FPC® Molecular Sieve packets, keep nitrate and cellulose ester films in separate packages within the freezer(s) as described here and in C.12. When possible, also house and store deteriorated film separately from non-deteriorated film. Keep film freezers far from office, museum storage, work, or reference spaces (at least not in the same building and not in any historic structure). Ideally, all vaults and freezers should be checked for collection deterioration at least every six months.

The combination of the two systems—zeolites to control outgassing and Safecare®-type storage systems to control condensation, mechanical damage, and handling damage during cold storage—is ideal. This combination provides maximum protection although the cost may be excessive. Cold storage and the Safecare® system of polyethylene bags, board, and humidity indicator alone are an excellent and relatively inexpensive storage option. A third system is the use of heat or pressure seal bags constructed of layers of foil, paper, and plastic. These bags form an excellent moisture barrier but can't be easily reused after opening, nor are they transparent for examining the condition of the film. These sealed, multi-layered bags are also significantly more expensive than the polyethylene bags.

For long-term storage, house each type of material (deteriorated nitrate, undeteriorated nitrate, deteriorated cellulose ester films and undeteriorated cellulose ester films) separately in its own cold-storage package. Never mix deteriorated and undeteriorated materials or cellulose ester and nitrate materials in the same package. When housed in a cold, dry environment (0°F [-18°C], 30% RH), in dark storage, with low-levels of gaseous pollutants, and a good air circulation/ventilation system, nitrate negatives will endure.

Container selection is also important. Using acidic housing, tightly sealed housing, or no housing hastens nitrate destruction by allowing gas buildup in containers or storage spaces. Except when housed in cold storage or with zeolite materials, place nitrate in vented storage in order to allow the nitric oxide gases to escape. Even cold storage rooms should be explosion proof and vented without internal electrical components other than lighting and humidity/temperature gauges. See Section C.3 for information on short- and long-term storage.

12. *How should I prepare my collections for cold storage?*

Don't rehouse materials for cold storage until **immediately** before storing them. Long-term storage at room temperature in sealed containers or plastic envelopes or sleeves may be damaging. If a film can or box is deteriorated, replace the container. Don't reuse old containers. Ideally, select vented polypropylene cans for film. To implement this system place sleeved film (either buffered or zeolite materials) within cold storage kits configured like the Safecare® system, which works as follows:

- ***Step1*:** Condition the film by storing it at 40% RH for several days to limit the possibility that condensation will form within the sealed bags when the bags are placed in the cold storage.

- ***Step 2*:** Rehouse the images in acid-free sleeves or envelopes or in vented polypropylene film cans. ***Note*:** If you have adequate funds, use zeolite sleeves for negatives and place FPC® Molecular Sieve packets in the boxes housing the film or film cans when you have either rapid deterioration or less than optimum environment controls or you have materials of exceptional artifactual value.

- ***Step 3*:** Place the sleeved or canned film within a polyethylene bag with a RH indicator strip, then gently press all the air out of the bag before sealing.

- ***Step 4*:** Oven-dry (200°F for 3-5 minutes) or microwave-dry (full power for 30 seconds, then turn and repeat) a pre-cut mat board; then allow it to cool.

- ***Step 5*:** Label a 13" x 10" x 1½" drop-front storage box with the collection name, catalog number, "hazardous nitrate," and any other useful information.

- ***Step 6*:** Place the cool oven-dried mat board in the bottom of the storage box. Don't overfill the box.

- ***Step 7*:** Check the bag seal to ensure it is tight and complete.

- ***Step 8*:** Place the bagged film on top of the mat board. Don't place more than one type of film (nitrate, deteriorated cellulose ester, undeteriorated cellulose ester) in a single box.

- ***Step 9*:** Place a second oven-dried mat board on top of the bag holding the film. Close the box lid.

- ***Step 10*:** Place the box inside the second polyethylene bag, add the second RH indicator strip, then press all the extra air out and seal it. Check the RH indicator strips every six months or so.

Sealed materials housed in cold storage in this way should be stable for up to 15 years before you must re-dry the mat board and replace the RH indicator strips. When you remove materials from cold storage, allow them three hours to acclimatize before unsealing. Acclimatize the materials by placing them on an open rack for even heat transfer **before opening the bag.** Wipe off any condensation from the outer bag before opening it.

If you rehouse the image in cold storage, oven dry the mat boards again before replacement. Check all polyethylene bags for holes prior to reuse. Replace all bags with poor seals or holes. Don't place packaged materials directly on the floor of the cold storage facility or on closed shelves directly under pipes. Label the freezer with the NFPA Hazard Warning Symbol for nitrate. See Figure M.1. If you use FPC® Molecular Sieve packets, house the film as described above, but use double polyethylene bags to contain the film storage can or negatives

13. *How should I clean dirty films?*

Never try to clean film in stages 3-5 of nitrate deterioration or any film with a sticky, soft, flowing, flaking, or powdering emulsion. If you must clean cellulose ester or nitrate film, don't use water or solvents, but you may use compressed air or brush the film gently with a soft, clean, and wide camels hair brush. If any damage is noted, stop immediately. Wash the brush regularly and allow it to dry thoroughly before resuming work. Ideally, use several brushes, so you won't have to wait for them to dry before resuming cleaning. Generally, clean only for duplication purposes.

14. *How should I reformat my nitrate and cellulose acetate, diacetate, and triacetate?*

Work with a photographic contractor who is a specialist and understands the fire and safety hazards involved in nitrate duplication and has experience copying deteriorating nitrate or cellulose ester film. Ask your state librarian or archivist for local recommendations.

- Work with a NPS or other expert or your regiona/SO curator to select a reformatting technology, prepare your contract, and implement a quality control program.

- Select a contractor who has scanning laser or cathode ray tube cameras, which don't have hot, quartz-iodine light bulbs.

  - Select items to be reformatted based on the park's Scope of Collection Statement and the film's value, use, and risk. See Section A.6.

  - Select a reformatting process.

  - Write the contract. Insist on the use of long-lived film with a polyester film base, small grain, long tonal range, and good resolving power. Cite the processing standards in the contract.

  - Clean the film, if necessary, using a brush and compressed air. See Section C.13 above.

  - Pack the film for shipment.

  - Inspect the returned copies side-by-side against the original on a light table with color balanced bulbs. Visually inspect the film for completeness. See *COG* 19/13, "Preservation Reformatting: Instpection of Copy Photographs."

  - Have a professional test the film density, resolution, and residual thiosulfate of the copy (densitometric tests and methylene blue tests).

  - Reduplicate any images not meeting inspection and testing standards.

  - Reorganize the copy film to match the original order of the original film. See *MH-II***,** Appendix D: Museum Archives and Manuscript Collections, Section J.

  - Label and rehouse the reformatted copies. See Section C.12 above.

  - Store copies as described in *MH-I,* Appendix R: Curatorial Care of Photographic Collections.

  - Analyze the original film's deterioration state. See Sections B.13 and B.15.

  - Rehouse any originals to be kept in appropriate materials, polypropylene bags, and cold storage after acclimatization at 40% RH. See Sections C.11 and C.12.

  - After deaccessioning, work with the park's hazardous materials coordinator to destroy selected deteriorated originals according to EPA standards. See Section C.1 for guidance on what to destroy and Sections C.15, C.16, and C.17 on how to dispose of it.

  - Set up standard operating procedures to limit access to negatives collections except when making new negatives, answering FOIA requests, or meeting other legal requirements, such as subpoenas.

- Be particularly careful to warn all personnel involved in handling, shipping, or caring for nitrate about the need to keep it cool and away from sparks and ignition sources.

- Don't expect to use digital copies effectively as preservation copies unless your park has developed a professional electronic records migration strategy. Such a policy involves systematic retensioning (rewinding and production of a new tape pack) annually or biannually, data refreshing every three to four years, and migration (copying to new format or media) each time the hardware or software changes (at least every five years). When setting up such a migration strategy, you should plan to keep your large digital master file off-line in non-proprietary and uncompressed formats. You will use derivative usage files online rather than your master files.

- Follow the specific guidance in *COG* 14/8, "Caring for Cellulose Nitrate Film"; 14/4, "Caring for Photographs: General Guidelines"; 19/10, "Reformatting for Preservation and Access: Prioritizing Materials for Duplication"; 19/11, "Preservation Reformatting: Selecting a Copy Technology"; 19/12, "Contracting for Reformatting of Photographs"; and 19/13, "Preservation Reformatting: Inspection of Copy Photographs."

15. *How should I inspect reformatted nitrate that has been returned?*

Follow the techniques for visual inspection, and densitometric, resolution, and residual chemistry testing described in *COG* 19/13, "Preservation Reformatting: Inspection of Copy Photographs." Once the copies have been approved, check the original nitrate's deterioration state. If it is at stage 3 or beyond (see Section B.13), deaccession the nitrate and work with the park or region's hazardous materials coordinator to dispose of the film as hazardous waste according to the EPA guidelines. If the film is at stage 1 or 2 of deterioration, and it has high artifactual, evidential, or associational value (see *COG* 19/10, "Prioritizing Material for Reformatting"), then place the collections in appropriate housing and put them in suitable cold storage after acclimatizing them. See Sections C.11 and C.12. Otherwise, deaccession and dispose of the material.

16. *Do I have to deaccession reformatted nitrate negatives?*

If the nitrate negatives are in…	***Then…***
Stage 1 or Stage 2 of deterioration,	reformat them and inspect the copies. Once you have approved the copies you can dispose of the originals. Don't deaccession the negatives, as you are preserving the images as stable, high quality surrogates.
If the nitrate negatives are in…	***Then…***
Stage 3, Stage 4, or Stage 5 of deterioration and you will be unable to reformat them,	deaccession them and dispose of them as an immediate threat through your hazardous materials coordinator. Negatives that have deteriorated to this level have lost their informational value.

Refer to *MH-II,* Chapter 6, Deaccessioning, for information on deaccessioning nitrate negatives.

17. *Can I destroy reformatted nitrate negatives?*

You can destroy nitrate negatives that have been reformatted if:

- they have only informational or administrative value
- you have a high quality copy that has been inspected to current standards

Don't destroy nitrates that have high artifactual, evidential, or associational value. See Section A of this appendix for definitions of these types of value.

Destroying nitrate negatives that have only informational or administrative value and that have been copied to current standards isn't a deaccession. This is because you still have the image.

18. *How do I document reformatted nitrate negatives?*

Document the reformatting of nitrate negatives in ANCS+. For collections in the Collections Management Module, use the Notes field in the Images supplemental record. Enter the replacement negative(s) in this supplemental record.

For collections in the Archives Module, use the Original Duplicates supplemental record. You can use this record at any level in the module. Enter the replacement negative(s) in this supplemental record. Use the location field in this supplemental record to enter the nitrate location.

Use the following, or similar, wording to document the reformatting of nitrate negatives.

If the original nitrate has been destroyed, note:

Original nitrate(s) replaced on (date) *by* (name) *with* (film type, for example, polysulfide toned black-and-white gelatin silver continuous tone film on polyester base) *and checked for quality by* (name) *on* (date). *Original nitrate destroyed on* (date) *by* (name/title of hazardous materials coordinator).

If you are keeping the original nitrate, note:

Original nitrate(s) replaced on (date) *by* (name) *with polysulfide toned black-and-white gelatin silver continuous tone film on polyester base that has been checked for quality. Original nitrate was separated and removed to* (location that includes cold storage company, cooperator, or park; address; and phone number).

19. *How do I dispose of nitrate?*

Don't do this by yourself. Instead of throwing hazardous nitrate in the trash or burning it, work with your park or regional hazardous waste coordinator to arrange for the disposition of nitrate and deteriorated cellulose ester film according to EPA guidelines. If you have no hazardous materials coordinator, contact your regional/SO curator for help in locating a NPS hazardous materials coordinator who can assist you or work with your local fire department.

20. *When should I keep original nitrate?*

Don't destroy nitrate if you:

- don't have hazardous waste training and facilities
- don't know the EPA guidelines and your state and local laws on nitrate disposition
- find that your nitrate has high artifactual, evidential, and/or associational value (See Section A.6 and *COG* 19/10, "Reformatting for Preservation and Access: Prioritizing Collections for Duplication.") ***Note*****:** If deteriorated beyond stage 3, the nitrate no longer has informational and administrative value. See Section B.13 for an overview.
- find that your nitrate has not yet been duplicated and inspected and the original is in stage 1 or 2 of deterioration (See B.13 for an overview.)
- don't know the values or deterioration state of the original (See Section A.6 and *COG* 19/10, "Reformatting for Preservation and Access: Prioritizing Images for Duplication.")

21. *How do I train my staff to handle, house, store, and manage nitrate and cellulose ester film?*

Work with your regional/SO curator to provide:

- training courses
- details and cross-training under the guidance of trained visual archivists for hands-on experience
- tours and visits to state archives and libraries
- training manuals and Web access

22. *How should I answer requests for access to nitrate?*

Nitrate poses a significant health hazard for researchers***. For health and safety reasons, researchers should work with copy prints, not nitrate or deteriorated cellulose ester films.*** If you receive a Freedom of Information Act (FOIA) request for nitrate or deteriorated cellulose ester film, work with your FOIA officer, regional public relations officer, regional/SO curator, and park superintendent to determine how to proceed without risking the health and safety of staff and researchers.

D. Prevention of Nitrate Fires

1. *What causes nitrate fires?*

At temperatures of 100°F (38°C) or above, quantities of deteriorated nitrate can self-combust, although undeteriorated nitrate doesn't burn until it reaches 266°F (130°C). Self-combustion is caused by the combination of high environmental temperature, low RH, lack of ventilation, flammable material, and a heat producing (exothermic) reaction due to deterioration byproduct gas buildup leading to accelerating deterioration and ever-higher temperatures.

Other, more common causes of nitrate fires include:

- ***sparks*** from:
  - smoking
  - equipment
  - faulty wiring
- ***excessive heat*** from:
  - radiators and space heaters
  - skylights and windows
  - poorly vented attics

2. *How do I prevent a nitrate fire?*

There are several simple rules:

- ***Learn the standards:*** Before housing quantities of nitrate in any structure, obtain the latest National Fire Protection Association NFPA 909, Standard for the Protection of Cultural Resources Including Museums, Libraries, Places of Worship, and Historic Properties. Read it thoroughly and apply it with care. Contact the association at 1 Battery-march Park, PO Box 9101, Quincy, MA 02269-9101; Tel: 617-770-3000.

- ***Limit quantities*** near public spaces, in general museum storage, in offices, or near heavy equipment, and other fragile, valuable, or flammable materials: Never store quantities of nitrate (more than 20 standard rolls or 20,000 feet of roll film—either motion picture film or professional still photographic negatives on the roll—or 35 pounds or 875 individual still negatives [>4" x 5"]).

- ***Rehouse nitrate*****:** House the film as described in Section C.11 and place it in cold storage that meets fire specification standards until you have a chance to reformat and inspect the resulting copies. Never reuse housing that has previously held nitrate film.

- ***Label nitrate clearly*****:** Indicate on all boxes, cans, and other containers, that the material inside is nitrate. Label all cabinets with the phrase, "Hazardous nitrate film is contained." Label the room doors with the NFPA Hazard Warning Symbol for nitrate. See Figure M.1.

- ***Inspect regularly*****:** Never warehouse nitrate. Inspect the film at least every six months. Monitor the cold storage vault weekly to ensure that it is still operating. If not, transfer the film to your back-up cold storage facility. See Sections C.5 and C.15.

- ***Dispose of deteriorated nitrate*****:** Never keep badly deteriorated nitrate (materials in deterioration stages 3-5). Once found, determine if the material is too badly deteriorated to copy (some stage 3 items may be copied). If too badly deteriorated to copy, deaccession and dispose of the nitrate as hazardous material.

- ***Don't project nitrate*:** Never allow projection of nitrate film.

- ***Don't allow ignition sources nearby*:** Never allow any smoking or other sources of ignition or heat (for example: no space heaters or halogen lights) in or near any space where nitrate is housed. The only heating sources allowed in or anywhere near nitrate is steam or water pipe heat kept below 15 psig.

3. *At what temperatures are nitrate materials dangerous?*

According to Photographic Conservator Henry Wilhelm and Eastman Kodak, older deteriorated nitrate film is capable of self-combusting at temperatures as low as 100°F (38°C) when housed at that temperature for prolonged periods. Fires at that temperature, however, are not common. High temperature coupled with the heat generated by the decomposition of gases that can't escape and a low relative humidity can cause these 100°F fires.

Various factors might have halted the self-combustion of these deteriorated nitrate films, including:

- higher relative humidity

- venting of the deterioration gases

- lower ambient temperature

See Sections C.3, C.5, and C.11 for specifics.

Self-Combustion Danger Alert Table	
Temperature	**Type of Material**
100°F (38°C)	Older deteriorated nitrate (stage 3 and above) may spontaneously combust at this temperature.
104°F (40°C)	Motion picture film and large quantities of large-sized (>5" x 7") negatives may self-combust at this temperature.
266°F (130°C)	New undeteriorated nitrate may self-combust at this temperature.

Large quantities of nitrate, when housed together, will deteriorate at an ever accelerating rate due to the buildup of heat and acidic gases and may spontaneously ignite, producing toxic gases.

To prevent nitrate film deterioration, fires, and health hazards, don't store large quantities of nitrate in closed, non-venting packages unless you immediately place the packages in cold storage. Larger format negatives in any quantities should be individually rehoused in zeolite or in buffered paper with an open side next to Molecular Sieve packets. Keep all nitrate storage containers, open or venting, and away from other valuable materials. Ideally use cold storage and acid-free buffered or zeolite paper and Molecular Sieve packets configured as described in Section C.11.

4. *What materials pose the greatest risk of causing a nitrate fire?*

The materials at greatest risk of burning are:

- ***roll film*** (motion picture film or professional still negatives on a film roll that have not been cut up into individual images) in quantities of 20,000 linear feet or greater, 20 or more reels of motion picture film, or 35 pounds or more of large format negatives (that is roughly 875 negatives larger than 4" x 5"), aerial film, or X-ray film

- ***bulk packed nitrate***, particularly professional film, in large quantities (more than 35 pounds or 875 negatives) regardless of format

- ***trapped nitrate*** that is tightly sealed in a non-venting drawer or container that doesn't allow the heat and fumes to safely dissipate

- ***unsleeved negatives*** or items not housed individually in buffered paper or board housing materials that can absorb the acidic fumes, such as papers with buffering, Molecular Sieves, activated carbon, and molecular traps to absorb harmful molecules (Again, professional film is particularly dangerous.)

- ***any deteriorated nitrate*** in large quantities (more than 35 pounds), particularly nitrate deteriorated beyond stage 2 (See Section B.13 for a review of stages of deterioration.)

5. *What nitrate materials pose the least risk of causing a nitrate fire?*

Small quantities of undeteriorated still nitrate sheet film housed in individual buffered sleeves within vented or open containers don't pose as significant a hazard. Despite their relative safety, however, they must be housed long-term (more than 5 years) in cold storage as described in Sections C.11 and C.12, preferably outside of the park.

6. *What should I do in case of a nitrate fire?*

First evacuate the building and the area as nitrate burns explosively producing extremely toxic gases. Call the fire department **immediately** from another building. If you still have time, supercool the fire by directly applying large quantities of the coldest water or snow in any reasonable way possible from fire hoses to heavy equipment. **Don't get so close to a nitrate fire that you breathe in the toxic fumes.**

Prevention is the only truly safe way to stop a nitrate fire. Nitrate fires are rarely put out without first destroying the buildings that house them. While the direct causes of fires are often undiscoverable after a nitrate explosion, they appear most frequently to be heat buildup caused by the accumulation of nitrate deterioration gases due to inadequate housing, venting, and cooling. **Nitrate poses a significant risk to historic structures, staff, and collections.**

- ***Small Fire*****:** To extinguish a small nitrate fire, supercool the fire to below 320°F (160°C) through the application of snow, cold water, or carbon dioxide using any tools at hand, such as fire hoses, hoses, heavy equipment, and so forth. Stay at a safe distance from the fire so you won't be at risk of breathing toxic fumes. It may not be possible to put the fire out, as nitrate produces oxygen as it burns. Nitrate can burn under sand, water, halon, and other smothering-based fire extinguishing systems.

- ***Larger Fire*:** It may not be possible to put out a large nitrate fire, particularly if roll or motion picture film is burning in any quantity. Roll and motion picture film fires usually burn until they have totally consumed the film and the surrounding building

7. *What nitrate fires have occurred recently?*

In 1978, nitrate fires at both the International Museum of Photography and the National Archives cold storage facility in Suitland, Maryland, caused many millions of feet of historic motion picture film and still negatives to be destroyed, as well as the structures holding them. Among the works destroyed were the original motion picture negatives of such commercial works as *Strike Up the Band* with Judy Garland and Mickey Rooney.

8. *What do I do if my nitrate or cellulose ester becomes wet during fire fighting or cold storage?*

Wet nitrate film is at great risk for very rapid deterioration. Take the film within 24 hours to a local photographic salvage shop that works with nitrate or air dry or freeze it immediately. According to Deborah Hess Norris in *Disaster Recovery, Salvaging Photograph Collections*, image–bearing gelatin layers in deteriorated nitrate may dissolve in water, leaving only the nitrate base behind. In cellulose ester films, the water may be trapped in the channelized layers, leading to rapid deterioration. Some dyes in nitrate and cellulose ester films may run and bleed pink or blue onto other nearby materials.

Salvage nitrate and cellulose ester materials rapidly if exposed to water. Separate the materials from their housing and air-dry them immediately in a vertical position using clotheslines and wood or plastic clips, such as clothespins. Salvage and air-dry the housing as well in order to preserve the information it contains. Keep nitrate separate from all other materials in a separate room.

Appendix N: Curatorial Care of Wooden Objects

List of Figures

APPENDIX N: CURATORIAL CARE OF WOODEN OBJECTS

A. Overview

1. ***What is covered in this appendix?***

This appendix deals primarily with the preventive conservation of wooden objects on exhibit and in storage. It discusses proper environmental conditions and details housekeeping procedures. In order to provide an understanding of how and why wooden objects react to the environment and to human intervention, the appendix includes:

- a discussion of the nature of wood
- typical fabrication techniques of wood objects, furniture, and associated materials
- types of deterioration that affect objects made of wood

2. ***What types of wooden objects are found in museum collections?***

Park museum collections contain wooden objects in a wide range of forms:

- utilitarian objects, such as tools and farm vehicles
- religious objects, such as icons and altars
- furniture, significant for historical or decorative reasons

A large percentage of objects in NPS collections are composites—articles made of more than one type of material. Composite objects include:

- frames that house prints, documents, and paintings
- musical instruments
- rifles
- machinery, such as sewing machines and cameras

3. ***How much care do wooden objects require?***

Both the nature of individual objects and how they are exhibited dictate how much and what kind of care is needed. Wooden objects are found under a wide range of exhibit and storage conditions**.**

- Furniture often is in open exhibits in furnished historic structures.
- Vehicles, totem poles, and gun carriages frequently are on exhibit outside, where they are exposed to the weather.
- Smaller objects may be more carefully exhibited in display cases in visitor centers and museums.

4. ***Should I provide on-site care myself or contact a conservator?***

This appendix includes a discussion of how you can assess the condition of wooden objects and when to seek the advice of a conservator.

B. The Nature of Wood

To understand the behavior of wood and its requirements for long-term preservation, you should be aware of the physical and cellular structure of a tree. You will then know why wooden objects react to particular environmental conditions. Some wooden objects from prehistoric sites, such as tools from dry caves in the Southwestern United States, remain in excellent condition, while other wooden objects deteriorate rapidly. The condition of these objects depends on the type of environment in which they were housed.

1. *What is the structure of a tree?*

A tree can be described as a bundle of vessels, its walls composed of cellulose glued together with lignin. New cells grow around the circumference of the tree, forming a ring just within the bark. Wood cells are longer than they are wide and are oriented parallel to the long axis of the trunk and branches. The term *grain* in this appendix refers to the direction of the vessels. "Cross grain," then, refers to the horizontal plane, while "along the grain" refers to the vertical plane.

Looking at the end of a log or a cross-section of a tree, you can see an inner and an outer zone. The outer zone called *sapwood* is lighter than the inner or *heartwood* zone. These two zones serve distinct functions in the living tree and have very different characteristics that influence the behavior of wood even after it has been fashioned into objects. Sapwood is composed of newer living cells, which transport sap or water to the leaves and which store nutrients. As sapwood ages and becomes heartwood, *extractives* form within the cell walls, giving it color, durability, and dimensional stability. The chemical defenses found in the extractives help protect heartwood lumber from biological attack. Lumber from sapwood has no such protection.

2. *What are the three planes common to trees and lumber?*

Lumber has three planes, which are illustrated in Figure N.1:

- cross section
- radial section
- tangential section

The surface exposed in a cross-section is referred to as *end grain*. Because the cell cavities are exposed in end grain, water is both easily absorbed and given off. The surface is hard and prone to splitting. It does not take stain or finish well and cannot be sanded smooth.

The radial plane extends along the long axis of the tree, more or less perpendicular to the growth rings. The grain pattern on this vertical or edge grain is usually straight and regular. Boards cut along this plane are dimensionally stable and distort very little in response to changes in ambient relative humidity. They will also stand up to abrasion and weathering.

The tangential plane extends along the long axis of the tree and forms a tangent with the concentric growth rings. Boards cut along this plane will swell, contract, and become distorted at twice the rate of those cut on a radial plane.

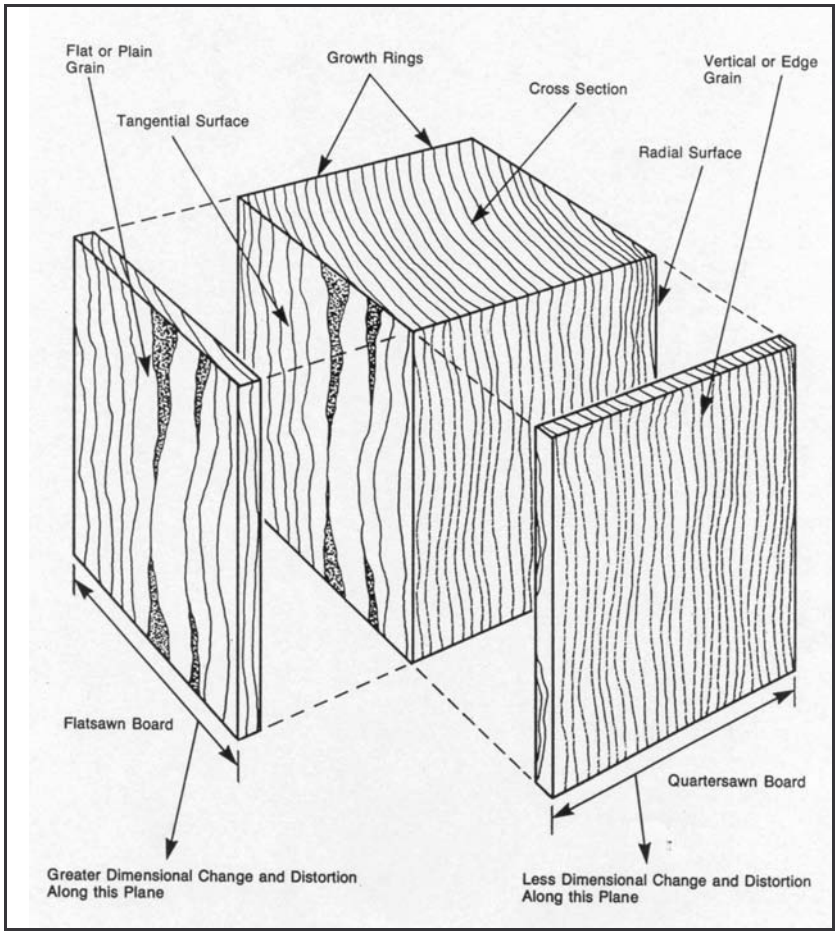

Figure N.1. The Three Principal Planes or Surfaces of a Typical Block of Wood: Tangential, Radial, and Cross Section

3. ***What effect does water have on wood?***

There is a very strong molecular attraction between water and the cellulose in wood (called *hygroscopicity*). In freshly cut wood, water is found in both vessel cavities and cell walls. As the wood dries, the water in the cavities evaporates, but as long as the bound water remains in the walls, the wood will stay at the *fiber saturation point* and will not shrink. The moisture content at saturation is about 25%. When below this point, the wood will respond to changes in ambient relative humidity. Air-dried wood will reach a moisture content of 10%-12%, while kiln-dried wood will reach a moisture content of about 7%. This kiln-dried wood or the objects fashioned from it will absorb water vapor if placed in an environment with high relative humidity.

Wood will eventually arrive at equilibrium with its environment, neither absorbing moisture (swelling) nor giving off moisture (shrinking), as long as the RH remains constant. See Figure N.2 for a graph that illustrates the relationship between relative humidity and equilibrium moisture content in wood. This graph can help you calculate the amount of contraction or expansion that may occur in wooden objects.

When moisture is absorbed and released, the cell walls expand and contract. The cell length, however, remains nearly unchanged. Therefore,

dimensional change in wood is not uniform in all planes (see Figure N.1). While movement **along** the longitudinal plane (the long axis of the tree) is negligible (only about .1%), movement **across** this plane is significant. Along the tangential plane, dimensional change is the greatest, averaging about 8%. Along the radial plane, dimensional change averages about 4%.

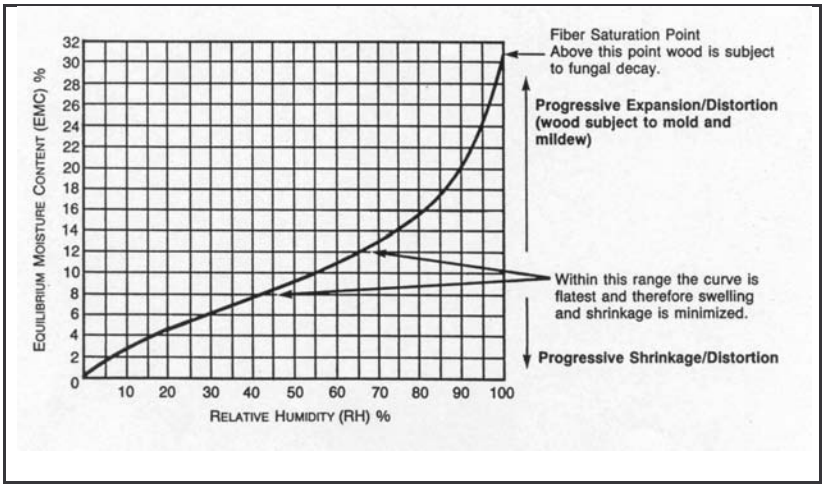

Figure N.2. Graph Illustrating the Relationship Between Relative Humidity and Equilibrium Moisture Content of Wood

4. ***Do all types of wood react in the same way?***

No. The extent of dimensional change varies from species to species, making some kinds of woods more desirable in the making of furniture and wood objects. Teak, mahogany, and redwood are among the more stable woods. Walnut and cherry, popular woods with furniture makers, fall in the middle of the range.

5. ***Where is the difference in dimensional change evident in museum objects?***

The rim of a turned bowl over time will move out of round, becoming slightly oval in shape because of the difference between tangential and radial shrinkage. For the same reason, turned feet become oval, and square legs take on a diamond shape on many pieces of furniture. Rungs and stretchers may become loose in chair legs because of the differential in shrinkage along and across the grain. Veneered surfaces may split or buckle because the grain orientation of the veneer is different from that of the underlying wood.

C. Agents of Deterioration

Wood decays both in nature and in museums as a result of:

- physical deterioration
- chemical deterioration
- biological deterioration

1. ***What's involved in physical deterioration?***

There are three direct causes of physical deterioration.

- changes in relative humidity
- weathering
- human abuse

2. ***How do changes in relative humidity cause physical deterioration?***

Shrinking and swelling, caused by changes in relative humidity, have been addressed in the discussion of the nature of wood. Because this reaction is not uniform across all planes, boards may become distorted or warped. The type of distortion will usually depend on the shape of the board and the orientation of the wood cells. See Figure N.3 for an illustration of characteristic shrinkage and distortion.

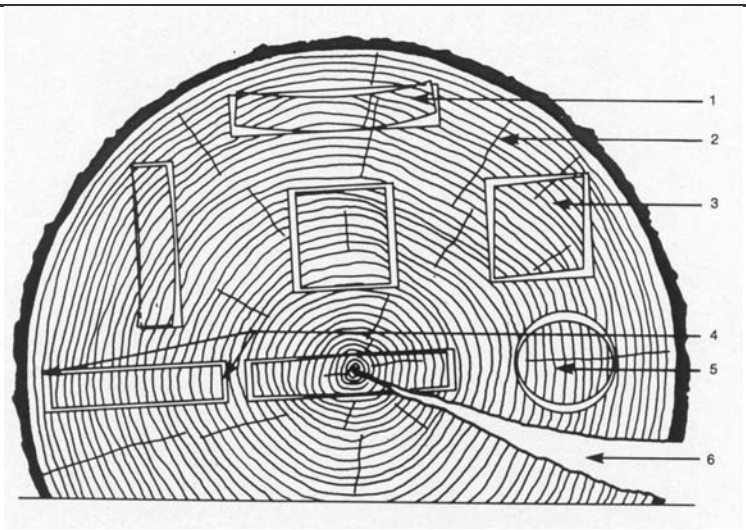
- *Cupping* is a deformation across the width of a board. It is often observed on wide, unrestrained boards, such as leaves on a drop-leaf table. This cupping can occur in the initial seasoning or later on in the life of an object. It can sometimes be caused by applying finish to only one side of the board. It may also occur when different microclimates are present on opposite surfaces. For example, the surface of a table leaf in the sun or near a radiator will become dryer than the surface underneath.

- *Checking* is also a result of uneven shrinkage. Stress can cause cells along the grain to separate, usually at the end grain or near the surface. Checking usually occurs during the initial seasoning, however, it can also occur if the relative humidity drops rapidly. Checks may extend just a short distance, causing only visual damage to the object, or they may extend an inch or more into the board causing actual structural damage.

- *Radial cracking* almost always occurs in logs that are left to dry. A pie-shaped crack will open from pith to bark edge to relieve the stress caused by the differential in shrinkage between the radial and tangential planes. Wood used in making objects that require a wide cross section, such as large bowls and three-dimensional sculpture, must be dried very slowly and carefully. Even with this precaution, the objects will always be prone to radial cracking.

- *Diamonding* is caused by the difference between tangential and radial shrinkage. A piece of lumber originally square (or rectangular) in cross section will become diamond-shaped.

A straight-grained, unrestrained board can usually withstand moderate fluctuations in relative humidty without damage. Because furniture is often made from various members that are connected across grain and are restrained from natural expansion and contraction by glue and nails or screws, the stress can become strong enough to cause the wood to split.



1. Cupping
2. End grain checking
3. Diamonding
4. Cross grain shrinkage
5. Distortion of cylindirical form
6. Radial cracking

Figure N.3. Characteristic Shrinkage and Distortion of Wood (Viewed from the Transverse Plane)

3. ***What effect does weathering have on wooden objects?***

Wooden objects housed outdoors are subject to physical erosion from the action of rain and wind-driven particulates, though that erosion generally does not exceed ¼ inch of unprotected wood surface per 100 years. The weathering process also includes photochemical degradation. The wood surface generally takes on a silver-gray color and a striated texture as the softer earlywood wears away and the harder latewood is exposed. Ultraviolet light breaks down the lignin in the cell walls, which is then washed away by the rain. The silver-gray surface, which is only a few millimeters thick, is actually more resistant to biological attack than non-weathered surfaces.

Many wooden objects now in indoor museum collections spent their useful life outdoors. As long as the objects are free of fungal and insect damage, the weathered condition can be considered stable and the appearance should be preserved as part of the historical evidence.

4. ***What types of deterioration are attributed to human abuse?***

Physical damage to wood objects in museum collections can result from improper handling and housekeeping procedures, and poor storage or exhibit conditions. Physical damage will occur more often in collections exhibited in furnished historic structures where the objects are exposed to more soils and dust in the environment and therefore require more frequent cleaning.

Poorly done repairs are another common cause of damage to wooden objects. Nails may split the wood and mar the surface; glue may leave misaligned surfaces and residue; original finishes may be removed mistakenly. Future conservation treatment may be made more difficult by the use of irreversible materials.

5. ***What are the agents of chemical deterioration?***

There are five basic agents of chemical deterioration:

- ***Light*** causes deterioration of the cellular structure of wood, breaks down the lignin component, and bleaches its colors. The most harmful component of light is ultraviolet (UV) radiation. Light damage to wooden objects in furnished historic structures is most commonly caused by sunlight streaming through unshaded windows. It can also occur from excessive artificial light used to illuminate exhibits. Not only is light harmful, but the heat it generates also does damage, especially when lighting fixtures are placed inside exhibit cases.

- ***Acids*** may deteriorate the cellulose in wood causing it to become brittle. Acid rain on outdoor objects can be a problem.

- ***Alkalies or bases*** degrade the hemicellulose and lignin component of wood and cause the wood to separate into individual fibers. Alkaline solutions are more damaging, as a rule, than acidic solutions.

- ***Salts*** can also result in defibration of the wood tissue, but exposure to salt is less common. It may be seen in wooden objects used in food preparation and in objects exposed to a maritime environment.

- ***Fire*** is the most dramatic and by far the most damaging form of chemical deterioration. Wood is a readily flammable material.

6. ***What are the biological agents of deterioration?***

Wood is subject to deterioration from a number of biological agents. Damage to wooden museum objects often occurs before the object is placed in the museum setting and may happen even before the wood is sawn into lumber.

- ***Bacteria,*** which consumes the starches stored in ray cells, generally affects only water-saturated wood and is therefore not a problem in most museum collections. However, wood that has been made more permeable by bacteria previously can be vulnerable to fungal activity.

- ***Fungi*** cause more biodeterioration in wood than any other agent. Because fungi have no chlorophyll, they must live on other organic material. The plant consists of thin, thread-like material called *hyphae* that mat together to form *myceliu.* Fungi produce large numbers of *spores*. Three types of fungi affect wood:

  – *Mold fungi* live principally on the surface of wood and discolor it. However, they don't consume cellulose and therefore don't weaken the wood.

  – *Stain fungi* invade the cell structure of sapwood and live on stored carbohydrates.

  – *Decay fungi* actually consume the cellular structure of wood, totally destroying it in some cases. These fungi produce enzymes that break down the cells. The two major types of decay-causing fungi are brown rot and white rot. Brown rot consumes cellulose, leaving a brown color and checking both along and across the grain. White rot consumes both cellulose and lignin, causing the

wood to lose color and crack along the grain. Decay fungi, consequently, cause abnormal shrinkage of wood tissue.

Fungal spores are found in virtually every environment. In order to germinate, however, they require air, heat, moisture, and nutrients. By controlling these conditions you can prevent fungal growth on wooden objects in your collection. Ideally, relative humidity should be kept between 45% and 55%. RH must never exceed 65%.

Temperatures high or low enough to effectively stop fungal growth are impractical in a museum. However, maintaining a temperature of 68° F or below will retard the growth of mold. Decay fungi are problems only when the moisture content is at or above the fiber saturation point. The wooden object would have to be in contact with water to reach a moisture content over 30%. See *Conserve O Gram* 3/4, Mold and Mildew: Prevention of Microorganism Growth in Museum Collections, and Chapter 4: Museum Collections Environment.

- ***Insects*** both feed on wood and excavate it to shelter themselves. See Chapter 5: Biological Infestations, for a lengthier description of wood pests and instruction in integrated pest management.

  - *Beetles* do the most damage to furniture and wooden objects, particularly in temperate climates and an environment of high relative humidity. The adult lays its eggs in pores or checks in the wood surface. After the eggs hatch, the larvae excavate tunnels through the interior of the wood, eventually pupate, and then bore holes to the surface to fly off. The larval stage may last up to 10 years.

  - *Termites,* though less of a problem than beetles, can do considerable damage to stationary structures. Drywood termites, found primarily along the southern and southwest coasts of the U.S., do not need moisture and feed on the dry wood they infest.

  - *Carpenter ants* do not eat wood, but excavate large chambers for their colony.

  - *Carpenter bees* bore large chambers and use them for their eggs, but do not actually consume the wood.

- ***Marine organisms*** are a significant problem in wooden ships and other underwater artifacts. *Shipworm* and *gribble* are two of the most destructive marine organisms. Shipworm is a mollusc that lives on wood and plankton and makes channels in the wood up to 2.5 cm in diameter. Gribble is a small crustacean, barely 1/8" long, that tunnels narrow channels close to the surface of the wood.

- ***Rodents*** damage wood by their gnawing to get food and salts from the surface of wood or to get through to the food stored within. Museum furniture, such as pie safes and jelly cupboards, may have large holes through their backboards. Wooden food vessels that may contain food remnants on the surface or in the pores are vulnerable to rodent damage. Removing the food, however, also removes important evidence of historical or cultural use.

- ***Birds***, mainly woodpeckers, are a threat to outdoor wooden objects. They are drawn to wood that may have insect infestations.

D. The Nature of Furniture

Most furniture originally served both functional and decorative purposes. Once in a museum collection, furniture no longer needs to be functional. The conservator and curator, therefore, focus on preserving the decorative and historical aspects of the piece. A single piece of furniture may be formed from several components, each requiring special knowledge and treatment. These components may include joinery, metal fasteners, adhesives, veneer, finishes, hardware, and upholstery.

1. *What are the common types of joinery?*

Almost all furniture is made from two or more pieces of wood, joined together in some fashion.

- The ***mortise and tenon*** joint is one of the most common and earliest joints used in furniture construction. The mortise is a hole chiseled into a piece of wood, while the tenon is the projection on the end of another piece of wood that fits into the mortise. Because these two pieces of wood are at cross grain to one another, different degrees of expansion and contraction can cause problems. The tenon should be slightly smaller than the mortise to prevent the mortise from splitting. These joints are typically held together with glue, though in country pieces, it was common to drive square pegs into round holes drilled through the joint. See Figure N.4 for an illustration of a typical mortise and tenon joint.

- ***Frame and panel construction*** prevents the splitting that often results when wide boards are constrained at their edges. In this technique the frame is made from relatively narrow boards joined at the corners with mortise and tenon. The inner edge of the frame is grooved to hold the edges of a wide panel, which is free floating and therefore able to expand and contract freely with changing relative humidity.

- The ***dovetail joint*** is another traditional technique, generally used to join the edges of wide boards. The edges are cut and chiseled so that they interlock. This technique was typically used on the sides of drawers and chests. Dovetail joints are commonly glued. See Figure N.5 for an illustration.

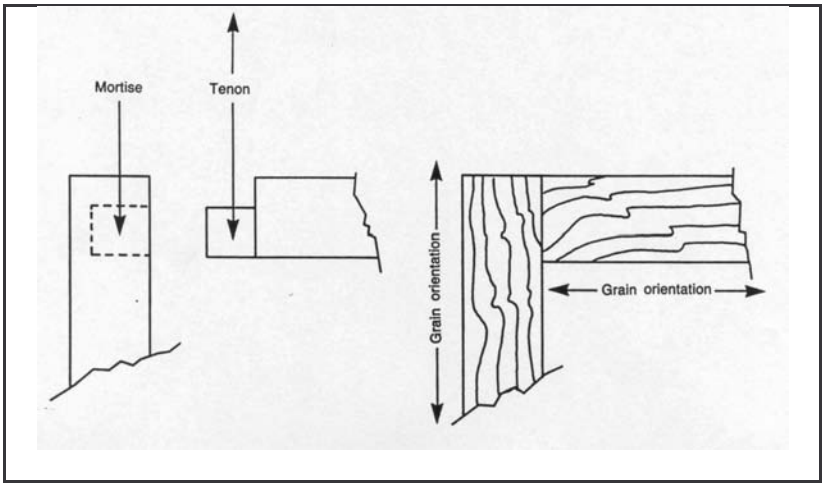


Figure N.4. Typical Mortise and Tenon Joint

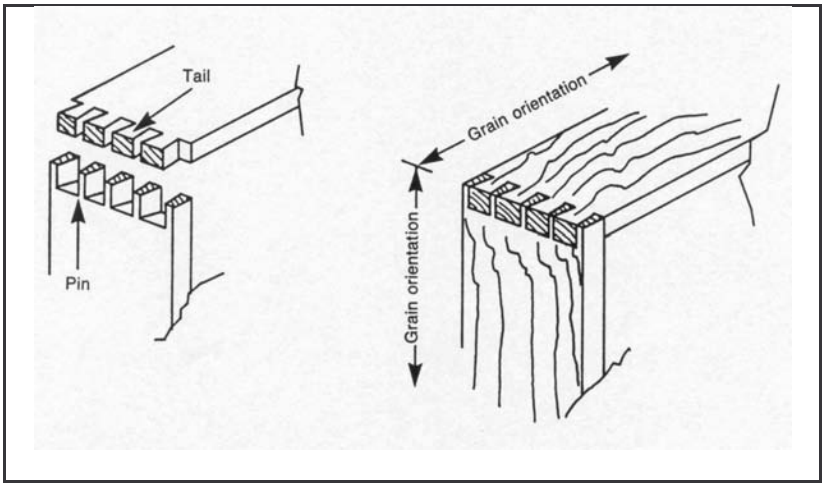

Figure N.5. Typical Dovetail Joint

2. ***What should I know about metal fasteners?***

Various types of metal fasteners have been used in furniture construction, including nails, screws, and bolts. Hardware can be useful in dating furniture. For example, nails became more frequently used when they were first mass-produced in the late 1700s. Screws were not commonly used until the 1840s, when the technology to manufacture them with gimlet points was developed. (A gimlet point is one that can readily penetrate wood.)

Fasteners are most often made from ferrous metals, which corrode in high relative humidity. This corrosion can spread, damaging the appearance and structure of the wooden object. Severely corroded metal will expand, crushing and splitting the surrounding wood. *Corrosion jacking* is most likely to occur at the coast, where there is exposure to salts in the environment. Iron salts, often present at contact points between wood and ferrous metals, degrade and discolor wood. Woods with high tannic acid levels, such as oak, are very susceptible to damage from iron salts. Contact between some woods and metals also will accelerate the oxidation of the metal.

3. ***What types of adhesives are used in creating wooden furniture and other objects?***

Adhesives, used alone or in conjunction with fasteners, come in three basic types:

- **Protein-based glues**

  Animal products are the primary ingredients in protein-based glues. Historically, the two most commonly used varieties were hide glue and fish glue. These were heated to a gel before use. The glue set as it cooled and the water content evaporated. Because this type of glue is readily resoluble and has a long setting time, it is often used in the conservation treatment of furniture and other wood objects.

  Though strong in a proper environment, protein-based glues are water-soluble and therefore fail in high relative humidity. At the other extreme, very low relative humidity, the glue will dry and crack causing the joint to fail. Casein glue, made from milk curds, is occasionally found in furniture and wood objects. It is more resistant to the effects of moisture than the other protein glues. Another disadvantage of these substances is the attraction they hold for insects.

- **Vegetable glue**

  Vegetable glues, such as starch paste, though seldom used for gluing wood joints, can be found adhering paper labels or paper coverings to wooden surfaces. Other types of vegetable glues, like gums and resins produced by trees, are commonly found on ethnographic wooden objects, but not in Western furniture. Like hide and fish glues, vegetable glues are sensitive to changes in relative humidity and are susceptible to biodeterioration.

- **Synthetic resins**

  Synthetic resin adhesives have become increasingly common since the 1940s. They harden either through the evaporation of a solvent, like water, or a chemical reaction between a hardener and a resin. Many post World War II objects in museum collections are constructed with these adhesives. Most synthetic resins form a very strong bond, are durable, and are relatively insensitive to environmental conditions. These qualities become disadvantages when objects need conservation treatment for it is nearly impossible to separate these joints without causing damage to the wood surface.

4. ***What is veneer and what are the problems associated with it?***

Veneer is a thin layer of wood glued to a solid base material for decorative purposes. It ranges in thickness from 1/32" to 1/8". Older veneers were sawn by hand and are thicker than contemporary ones and often irregular. They were often attached with hide or fish glues. Expensive woods (for example, rosewood and mahogany) are typically used for veneering. Many small pieces of veneer are used in marquetry, inlay, and banding to create intricate patterns and pictures.

Generally the grain of the veneer on tabletops and other large, flat surfaces lies in the same direction as the grain of the underlying wood. In other areas the grains may lie perpendicular to each other, or as in marquetry and inlay, at almost any angle. Fluctuating humidity levels can cause severe damage as the woods expand and contract along different planes. See Figure N.6 for common applications of veneer.

Some areas of veneered furniture are more likely than others to receive damage. For example, the veneer on drawer rails and the bottom rails of case furniture, such as chests and sideboards, is very vulnerable. As the underlying wood shrinks, a lip of veneer forms along the top and bottom edges. The drawer, as it moves in and out, can easily snag the protruding veneer and tear it off. Dust cloths can catch on loose veneer and pull off pieces. Mops, brooms, and vacuum cleaners often cause irreparable damage to the lower edge of bottom rails during routine housekeeping.

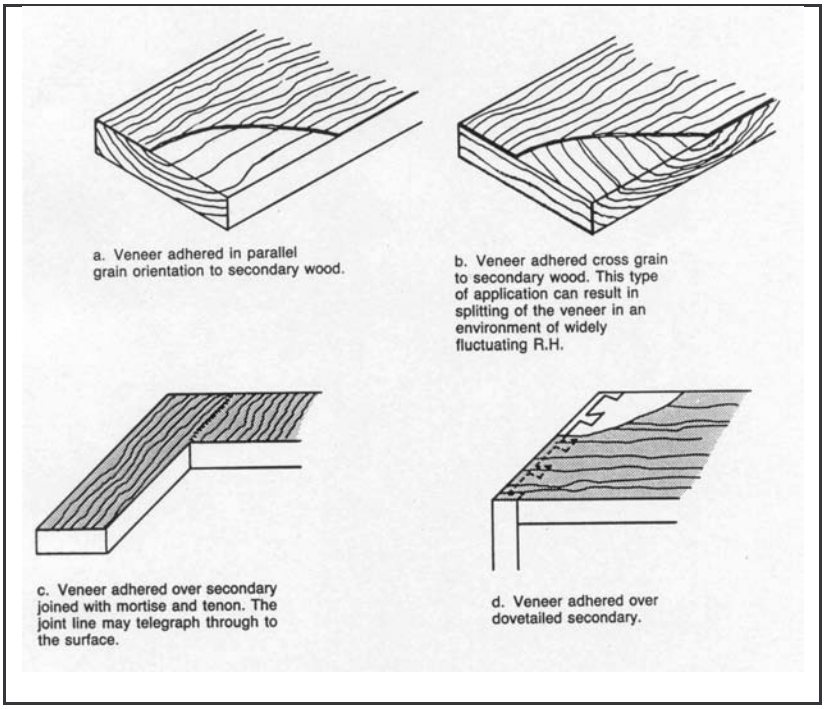

Figure N.6. Common Veneer Applications

5. ***Why are finishes applied to furniture and wooden objects?***

Stains and dyes are often applied to wood to enrich or darken the color. They penetrate the surface but do not leave a film. Alcohol- and water-based stains are sensitive to light damage. Oil-based stain is more resilient.

Transparent or pigmented finishes are applied to wood for more than one reason. They are used aesthetically to bring out the color and grain pattern. In other cases the finish may be strictly utilitarian. They preserve the wood by protecting it from spills and light damage and by slowing the transfer of water vapor from the environment.

6. ***What types of finishes are used?***

Among the most common finishes found on museum pieces are varnish, oil, shellac, wax, paint, and gilt.

- ***Liquid finishes***, including varnishes, oils, and shellacs, are divided into three broad categories: resins, polymers, and paints.

  – *Resins*, such as spirit varnishes, are either dissolved or dispersed in solvent. They harden as the solvent evaporates. Shellac is made from the resinous secretion of insects and is the most common finish found on furniture in park museum collections. It was

particularly popular in the 19th and early part of the 20th centuries. Resins are susceptible to damage from water and alcohol.

– *Polymers*, which include most oil finishes, harden by means of chemical bonding (polymerization) and/or oxidation. Linseed oil and tung oil are commonly used oil finishes. They penetrate the wood but do not provide as hard a finish as resins. Linseed oil, particularly, darkens over time as it oxidizes. Misused in the past, in combination with turpentine and beeswax, it has caused damage to many museum pieces. Though serviceable in moderation, in excess linseed oil remains tacky, gathers dust, and severely darkens the wood. Oils are very difficult to remove without damaging the underlying finish. **Do not apply oil to finished wooden surfaces.**

– *Paints* consist of pigment particles in suspension in a binding medium and a solvent. Most paints are relatively stable, however, calcimine and distemper used during the eighteenth and nineteenth centuries were made with a protein glue binder and therefore dissolve in water. **These soluble finishes should be dusted only**.

A few finishes, such as oil-resin varnishes, are a combination of the two.

- ***Waxes*** are softer and more plastic than other finishes and are readily soluble in most organic solvents. There are few, if any, examples of objects with original wax finishes in park museum collections**. Do not clean a wax finish as you would a hard finish.** Consult a conservator for advice.

- ***Gilt*** may have been used as a decorative accent on furniture or as a finish over the entire surface. It was most commonly used on ornate picture frames. A gilt finish consists of a gesso layer, a sizing layer, and silver or gold leaf that is metal-hammered into extremely thin sheets. Silver and lesser grades of gold oxidize rapidly. Sometimes the leaf was painted with pigmented shellac to protect it.

  Gilt is the most fragile of all finishes, extremely susceptible to damage from rough handling and improper housekeeping. Skin oils can accelerate oxidation, so do not touch the gilt surface. The gesso layer is brittle and often cracked from the expansion and contraction of the underlying wood. Under very humid conditions the gesso will absorb enough water vapor to soften and expand so that it eventually chips away from the wood. **Dust these surfaces gently with a soft bristled brush and a low power vacuum held at least 1/2 inch away.**

7. ***What is patina?***

Patina refers to the distinctive appearance of older finishes. It is used to describe a worn finish, but one with warm tones and satin luster. There is a fine line between patina and a damaged finish. It is important to recognize and protect an unstable finish that may deteriorate further under the existing environmental conditions.

8. ***What happens to finishes as they age?***

The aging qualities of finishes vary. Oriental lacquer, for example, is very sensitive to moisture and light damage. Shellac, on the other hand, is relatively resistant to light damage because it allows the light to pass through and consequently harm the stain and wood beneath.

All finishes are damaged to some extent by exposure to high light levels because light accelerates oxidation. Oxidation prevents the finish from expanding and contracting freely with the wood beneath. Minute cracks, called crazing or "alligatoring," may result. Some light-damaged finishes are dull and chalky, while other more severely damaged finishes become unstable, flaking or breaking down into "islands" that lift at the edges.

Fluctuating relative humidity will worsen the condition of finishes made unstable by exposure to high levels of light. High humidity can cause white "blooms" and mildew damage on even stable finishes.

9. ***What should I know about the hardware on wooden furniture?***

Drawer pulls, knobs, escutcheons, locks, and other types of hardware are typically made out of brass on decorative pieces and ferrous metal on functional pieces. Brass, an alloy of copper and zinc, will dull and darken as it oxidizes. Polishing brass can damage both the hardware and the surrounding wood. Rubbing with abrasive polishes eventually will wear away the surface of the brass. If the hardware is not removed from the piece for cleaning, the wood finish around and beneath the hardware will likely be damaged or even entirely worn away. Hardware that is not washed after polishing will often show a white or green residue. Green residue indicates the presence of ammonia, which will continue to react with the brass.

Pigmented shellac frequently was applied to brass to protect the shine and give it a more golden tone. This coating, however, is easily scratched. Occasionally the brass on very decorative pieces was given a thin coating of gold in a process called fire gilding. This bright, shiny gold layer will prevent oxidation, but like the shellac is easily damaged. Do not clean fire-gilded brass until you have consulted a conservator.

10. ***What potential sources of damage should I look for in upholstered furniture?***

Like wood, upholstery is subject to deterioration from:

- high temperature, which can leave the fabric brittle
- high humidity, which promotes biological activity
- visible and ultraviolet light, which causes all fabrics to fade
- chemical reactions
- bacteria and fungi
- mechanical abuse
- termites and woodworms
- rodents

In addition, look for deterioration from agents that more typically attack textiles. See Appendix K, Section D, for a comprehensive discussion of these:

- pollution, such as dirt and pollen, industrial emissions, and smoke
- fiber-eating insects, such as moths, silverfish, cockroaches, and carpet beetles
- inherent vice, particularly the addition of metallic compounds during manufacture
- oxidation, which discolors white and natural cloths

See *Conserve O Gram* 7/4, Upholstered Furniture: Agents of Deterioration, for a more thorough discussion.

11. ***Should I ever replace the upholstery?***

Yes, under certain circumstances. An upholstered piece in a museum collection may have been re-covered several times during its period of use. The current upholstery fabric may not be appropriate for the period of interpretation or it may be very worn. Because the wood frame might have been damaged by repeatedly attaching the upholstery with tacks, consider using a non-destructive technique when re-covering the piece. See Calinescu and others (1996), for an example of a low-interventive upholstery technique.

E. Preventive Conservation: Controlling the Environment

1. ***What elements of the environment should be controlled?***

To provide a stable environment for wooden objects, control these factors:

- relative humidity
- temperature
- light
- ambient air quality

2. ***What is the ideal relative humidity for furniture and other wooden objects?***

The ideal relative humidity level in most areas of the country for wooden objects is 50% plus or minus 5%. In dry climates, such as the southwest, 35% to 40% is acceptable. These levels are difficult to achieve in very dry climates because the moisture content in wood drops rapidly below 35% RH, causing splits. Below 30% the glue may desiccate, joints may loosen, and finishes will become brittle. Along the coast, 55% to 60% is acceptable, but above 70% mold and insects may become problems. When humidity is this high, glue may weaken, finishes may bloom, hardware will corrode, and wood fibers will swell excessively.

Rapid changes in relative humidity, as mentioned earlier, may cause severe damage to furniture. An increase in RH from 30% to 70% can cause wood to expand as much as 2% across the grain. In this case a 2-foot panel could expand almost 1/2 inch causing splitting, veneer loss, and joint failure.

Avoid temporarily heating, air conditioning, or humidifying spaces that house wooden objects. Do not turn off heat or air conditioning at night.

3. ***Why is temperature important?***

Temperature is important primarily because it affects relative humidity. Though changes in temperature alone also will cause some expansion and contraction of wood, this is a relatively minor concern. Elevated temperatures will speed fungal and insect activity as well as oxidation. High temperatures associated with high relative humidity can cause some old finishes to become tacky.

- Consider installing a humidistat to override the thermostat in spaces housing wooden objects.

- Maintain the temperature at the lowest comfort level in exhibit areas and even lower in storage spaces, but be sure to keep it above freezing at all times.

4. ***What effect does light have on wooden objects?***

Light will change the natural color of heartwood, making light woods darker and dark woods lighter. It will fade stains and embrittle finishes. It also will fade and embrittle the fabric or leather on upholstered furniture. The level for unfinished wooden objects should not exceed 300 lux. The light level for most finished wood objects should not exceed 200 lux. Objects decorated with fugitive stains and dyes and light sensitive fabrics, such as silk, are more prone to light damage and the allowable light level should be even less.

Limit exposure of wooden objects to both natural and artificial light:

- Install UV filters on windows and florescent lamps to reduce most of the harmful UV radiation.

- Use blinds, shutters, curtains, and roller shades in historic structures to reduce visible light.

- Use reproduction slipcovers to protect upholstered furniture.

5. ***How can I control ambient air quality?***

Most modern museums have a variety of filters in their HVAC systems to clean the air and filter out dust and other particulates. In addition, many objects in these buildings are displayed in protective exhibit cases. Historic structures, on the other hand, seldom have good air filtering systems and the furniture is displayed openly. More particulates are generated simply because of the nature of the buildings. Not only is dust abrasive and therefore harmful to wooden surfaces, it is a source of food for mold and is attractive to insects.

F. Preservation Through Good Housekeeping Practices

1. ***What housekeeping practices should I follow?***

The conditions in historic furnished structures require intensified housekeeping both in procedure and frequency. Good housekeeping is essential for aesthetic and preservation reasons. It should be carried out on a regular schedule. See Chapter 13: Museum Housekeeping, to learn about developing a museum housekeeping plan.

Keep this tip in mind when handling wooden furniture and objects:

Don't wear gloves when handling furniture with fragile veneer that might snag or when moving heavy wooden pieces requiring a sure grip. **Do wear them** when handling gilt finished objects or unfinished objects made from light colored wood that might stain.

> ***Frequent and proper housekeeping is critical for the preservation of collections in historic structures.***

2. ***What are the best ways to remove dust?***

Because dust is not only abrasive but also attracts moisture, it should be removed periodically to prevent damage as well as to improve the appearance of objects. Remove it from the environment as completely as possible.

- ***Use a vacuum*** to remove the dust from wood surfaces if possible. (See *Conserve O Gram* 7/5, Dusting Wooden Objects, and *Conserve O Gram* 1/6, Choosing a Vacuum Cleaner for Use in Museum Collections.) Hold the brush attachment just above the wood surface. Use a soft bristled brush to sweep the dust out of crevices and intricately carved areas and toward the vacuum brush. Also vacuum upholstery. (See Appendix K for guidance.) **Keep the vacuum clean.**

- ***Use a clean cotton cloth*** when vacuuming is not an option. Turn the cloth frequently so that accumulated dust does not scratch the object's surface. Wash the cloth after every use. You may dampen the cloth with water or spray it sparingly with a light mineral oil product, such as Endust®, where low relative humidity creates a static charge, causing the cloth to repel the dust. If using water, be sure to dry the surface immediately. **Do not** use scented oil products.

- ***Don't use feather dusters.*** They scatter the dust rather than collect it. Broken feathers may scratch the surface.

- ***Don't wipe unstable finishes.*** This will cause more harm to flaking and lifting edges or surfaces that have loose veneer or splintered corners.

- ***Use compressed air*** on very fragile objects and irregular surfaces. Limit pressure to about 10 pounds and use away from exhibit areas.

3. ***Do furniture and wooden objects require more than thorough dusting?***

Yes. Periodically these require cleaning to remove oils and grime. Objects in storage may need to be cleaned only every ten years while those on exhibit will require cleaning approximately every three years. More frequent cleaning may be necessary if visitors occasionally touch the pieces.

- Use mineral spirits, such as Stoddard solvent or naptha, on greasy types of soils and hand oils. First test a small inconspicuous area with a cotton swab dipped in mineral spirits. If the finish does not get tacky and no finish comes off on the swab, you may begin careful cleaning with a cotton cloth dampened with mineral spirits. Work in a well ventilated area and wear vinyl gloves. Turn the cloth frequently and wipe the object down with a clean, dry cotton cloth after cleaning. **Note:** Some 18th century pieces may still have their original wax finish. Consult your regional/SO curator and a conservator before cleaning furniture that you suspect has an original wax finish.

- Use soap like Vulpex®, Ivory®, and Orvus® and water to remove smoke and soot from stable finishes. Follow manufacturer's instructions for dilution. Never use detergent because it will leave a film on the surface. Again, test a small inconspicuous area before cleaning the entire surface. Wring the cloth well before wiping. When finished, wipe the piece again with a cloth dampened in clear water and then again with a dry cloth. **Do not moisten a damaged, veneered, or inlayed surface.**

Only furniture with a sound finish should be cleaned.

4. ***Should furniture be waxed?***

Yes. The application of wax to clear finishes is recommended for these reasons:

- Wax enhances the appearance of the surface by filling in voids and small depressions, creating an attractive level surface.

- Wax helps protect the surface from abrasive dust and handling.

- Waxing makes dusting easier.

- It slows the penetration of water and water vapor, which will cause the wood to swell.

Note: Always rewax the finished surface after cleaning, since mineral spirits will dissolve and remove wax**.**

5. ***What kind of wax should I use?***

The paste waxes recommended for use on wooden objects in museum collections are made with weak organic solvents, such as turpentine or mineral spirits. When the solvent evaporates, the wax film that remains is lustrous, slippery, and plastic. Waxes are derived from animal, vegetable mineral, and synthetic sources. Natural waxes, like beeswax, have been used for centuries. Most commercial paste wax products are mixtures of various waxes.

- **Don't use** paste wax made with strong solvents, such as xylene and toluene, because they can damage some finishes.

- **Don't use** liquid polishes. They do not offer the same protection as paste and most contain silicones. Silicone migrates into the finish and complicates any future conservation treatment.

6. ***What precautions should I take when waxing furniture?***

Apply wax only to stable, clear finishes, such as shellac, varnish, and modern lacquer. **Don't** apply paste waxes to unfinished objects because it will penetrate into the pores. Wax applied to unfinished wood surfaces cannot be completely removed.

Cover the upholstered parts of the piece so that you don't accidentally get wax on the material.

Be careful not to get wax into cracks or splits in the wood. Later attempts to repair the crack with glue would be very difficult.

7. ***How often should I apply wax?***

The frequency of waxing will depend on environmental factors, such as dust, relative humidity, and light, and on the amount of handling. When museum objects are used or touched, be sure to wax often enough to protect the underlying finish. Most wood objects in furnished historic structures, however, will require rewaxing just every one to four years. Objects in well-gasketed exhibit cases may only require waxing every ten years. As a general rule, rewaxing is not necessary if the existing wax layer can be buffed to a sheen.

8. ***What is the recommended method of applying wax?***

Always follow these procedures:

- Clean the object to remove the existing wax. Waxing over dirty surfaces will produce a grimy buildup and eventually obscure the color and grain of the wood.

- Apply new wax sparingly with a clean, cotton cloth, rubbing first in a circular motion and then along the grain. Wait at least an hour or two for the solvent to evaporate and then buff the wax with another clean, cotton cloth. If the luster is uneven, repeat the procedure. ***Note:*** It is preferable to apply two thin coats rather than a single thick coat.

- On a carved or irregular surface, apply the wax with a soft toothbrush or shoe polish applicator and buff it out with a soft fiber shoe brush. Tape foam padding to the wooden ends of the brush to avoid damaging the object while buffing.

- Don't apply wax when it is hot and humid. The wax may turn white and cloudy. If this happens, remove the wax with mineral spirits and rewax when the environment improves.

- Remove white specks from pores and recesses left by light-colored waxes with a wooden pick or use a pigmented wax on dark wood.

Refer to *Conserve O Gram* 7/2, Waxing Furniture and Wooden Objects, for more guidance.

9. ***What commercial brands of wax can I use?***

There are several good paste waxes on the market. These include Staples®, Butchers®, SC Johnson®, and Trewax®. Renaissance Wax®, a good synthetic with no perfumes or pigments, is frequently used on museum objects. It is durable and highly water resistant. It is recommended for smaller wooden objects, however it can be difficult to buff evenly on large, flat surfaces, such as tabletops.

10. ***How do I care for the hardware on wooden furniture?***

The best way to care for hardware on museum pieces is to clean and polish it once and then spray it with a lacquer containing corrosion inhibitors. This treatment requires specialized equipment and the experience of a conservator, but applied correctly, the finish should last up to 20 years.

If this conservation treatment is not feasible, the following on-site treatment is the next best solution.

- First, remove the hardware if this can be done without damage. Tag it to document its original location. If it cannot be removed easily, slip Mylar® sheets behind the hardware, curtting out slits to get by bolds or bails.

- Determine the type of metal and clean it accordingly.

  - Clean brass hardware with alcohol or stoddard solvent, if necessary, to remove fingerprints.

  - Soak iron hardware for several days in kerosene to remove rust and dry it thoroughly. Dip badly corroded iron hardware into a metal preservative called Ospho to prevent further deterioration.

  - Softly brush gilded bronze with a weak solution of amonia and distilled water (1 part amonia to 40 or 50 parts water). Rinse it with clean distilled water and dry it with a warm, not hot, air-blower.

- After cleaning, you may polish brass hardware with a mild abrasive, such as artist's whiting, that **does not** contain ammonia. **Do not** polish gilded bronze. Be sure to remove all of the polish residue. Use a solvent and wash with distilled water.

- Last, wax all accessible surfaces of the hardware with a microcrystalline wax, such as Renaissance Wax®. Wax will retard oxidation, though not as effectively as lacquer.

See Appendix O for further guidance on cleaning, polishing, and coating metal objects.

G. Preventive Conservation

1. ***How can I provide a protective environment for wooden objects in storage?***

Protecting objects in storage is much easier than protecting them while on exhibit. First of all, you can eliminate the warm temperatures and light that often cause damage during display. There are a few requirements, however:

- Storage spaces need to be easily accessible. When storing furniture, avoid areas with narrow stairwells and doors.

- Never store wooden furniture directly on concrete, stone, or brick floors. The end grain on furniture legs and feet will soak up moisture, causing fungal damage and staining. Store on shelves or blocks.

- When using storage shelves, place large and heavy objects on the lowest level. (Slotted metal angle storage systems can be adapted for furniture storage. Be sure to pad the edges.)

- Store wood frames on stationary or moveable racks, like those used to store framed paintings.

- Don't stack furniture.

- Don't store objects in the drawers of period furniture.

2. ***What is the best way to move large pieces of wooden furniture?***

Because furniture is particularly prone to damage while it is being moved, it is important to carefully plan and execute any move.

- Examine the furniture carefully to detect any structural instability, such as broken or loose joints or splits that may not stand the stress of moving.

- Secure doors, drawers, and drop lids or leaves before moving the piece. Use cotton twill tape rather than twine to avoid scratching the finish. **Never use adhesive backed tape**. Remove drawers if weight is an issue.

- Remove marble tops and store them on edge while you move the base. Large marble tops may fracture from their own weight if held horizontally and supported only at the ends.

- Plan your route and measure doorways, stairways, and aisles along the way to make sure the object and the carriers will fit. (Measure the width of a couch or large chair by placing it against a wall and measuring from the wall out to the middle of the seat rail.)

- Use a dolly.

- Don't attempt to move heavy or awkward objects by yourself.

- Never slide furniture across the floor. Sliding puts too much stress on joints and fragile areas and can cause the feet or legs of dressers, tables, chairs, etc. to break.

- Grasp furniture for lifting where it is strongest, usually the lowest horizontal structural member. For example, lift a table by its apron, a case piece by its bottom rail, and a chair by its side seat rails, being careful not to dislodge the slip seat. Never lift a sofa by its arms—grasp the bottom rails, instead. Moving a particularly large and heavy sofa may require four people.

See Figure N.7 below for the proper moving techniques.

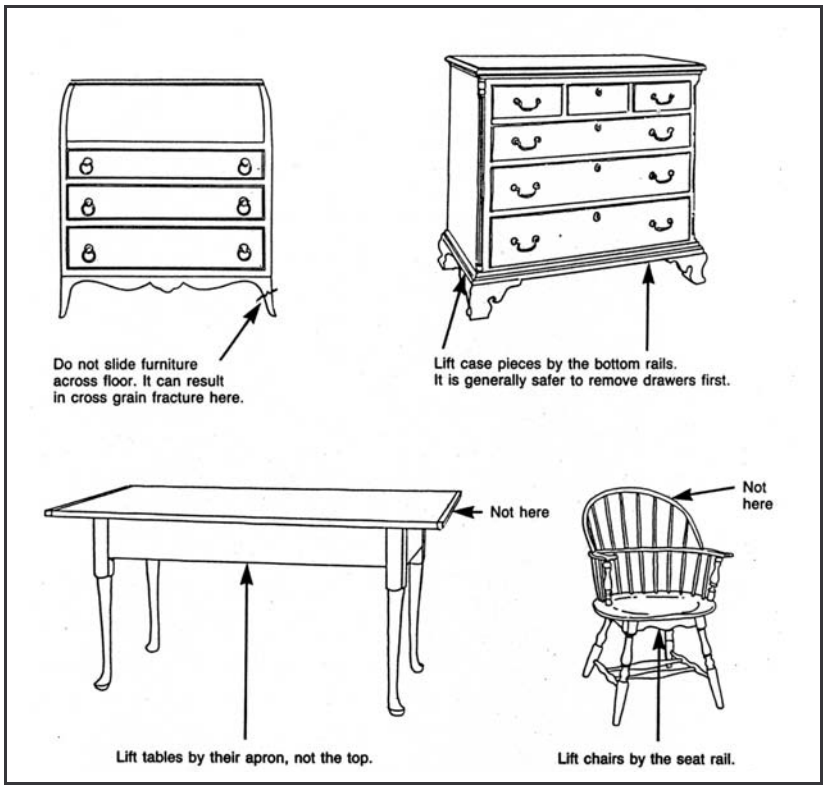

Figure N.7. Proper Techniques for Moving Furniture

3. ***What should I do if a part of the wooden piece becomes loose or falls off?***

If small parts become detached because of glue failure, structural failure, or accidents during moving or cleaning, place them in a closable polyethylene bag with a label that documents the date, location from which the piece came, and the catalog number of the object. Keep the bag with the object, if possible, and contact a conservator.

If there is an urgent need to repair the piece, consult the regional/SO curator and seek permission to use a ***reversible*** glue (for example, hide glue) to reattach the part temporarily. **Do not tack the loose part back into place.**

If more than one piece becomes detached, it usually indicates a problem with either the environment or the housekeeping procedures. The object may be too unstable for exhibit. Seek conservation treatment as soon as possible.

4. ***Is there a special technique for removing mold from wooden objects?***

Because mold growth is the result of environmental factors, your first step is to improve the environment.

- Lower the relative humidity level and increase the air circulation.
- Isolate the object from the rest of the collection and place it where it will receive more light.

- Use a HEPA vacuum to remove the mildew from the object and discard the bag, or brush it off, capturing the spores on a drop cloth. A dust mask or respirator may be necessary (see *Conserve O Gram* 2/13, An Introduction to Respirator Use in Collections Management). Dispose of the cloth in a plastic bag.

- Wipe the remaining mold from the object with a solvent-dampened cloth. Use a 50% mixure of alcohol and water on all but shellaced surfaces. Use mineral spirits to clean a shellac finish. Dispose of the cloth.

5. ***How can I determine if a wooden object has an active beetle infestation and what should I do about it?***

Evidence of active wood boring beetles, the most common museum insects to attack wooden objects, is easy to spot.

- Examine the surfaces of the piece carefully for *flight holes*—the holes made by these insects as they exit. If there are "bright holes" with sharp edges, the infestation is probably current.

- Look for *frass*, a light-colored powder produced by the larva as it eats the cellulose. It may be found on the floor nearby or on the lower horizontal members of wooden objects.

- Check the windowsills for beetle carcasses during the spring.

- Listen carefully. Some species of wood boring beetles can actually be heard as they chew.

If you suspect an active infestation, isolate the object immediately. Place it on a dark paper or other surface, wrap it with polyethylene sheeting, and monitor it carefully for new frass accumulations. Be careful not to jar the piece, since movement may dislodge older deposits of frass.

Refer to Chapter 5: Biological Infestations, for guidance if you determine that beetles are currently at work.

H. Conservation Treatment

The preservation of wooden furniture and other wooden objects is the responsibility of both curator and conservator. The curator must know how far to go with hands-on housekeeping and when to call the conservator for advice or treatment.

1. ***How do I assess the stability of a wooden object?***

Most furniture and other wooden objects in museum collections show evidence of much use and at least some damage. You must be able to determine whether or not that damage makes the object unstable.

> ***An object should be considered unstable when further deterioration is likely to result if the condition is not corrected.***

- ***Examine the object carefully for structural stability***. Look for:

  – glue failure

- mechanical joint failure
- missing and loose elements
- cracks and splits
- fungal or pest activity

Loose joints usually indicate environmental problems that have caused the glue to dissolve or become brittle and fail. Not only is conservation treatment needed to stabilize objects with loose joints, but also the environment must be corrected to prevent the problem from recurring.

Missing parts *may* cause structural instability. A lost finial will not; a lost leg will. If a crack or split occurs in a structural member that must support the weight of the object, conservation treatment is needed. If movement is possible on either side of the split, the object should be treated.

Make sure you can distinguish between decay fungi and mold and mildew. Decay fungi consume cellulose and lignin and will eventually cause severe deterioration. Mold and mildew, on the other hand, disfigure the surface of the wood, but do not cause instability. Decay fungi can be detected by the presence of cracks along and across the grain of the wood, a "dead" sound when tapped, loss of weight, a friable surface, and its characteristic odor. If the decay has not progressed too far, the wood can be consolidated during conservation treatment and a degree of structural stability restored.

Like decay fungi, insects can also cause severe damage to wooden objects. The presence of numerous exit holes on the surface of an object indicates the need for a thorough structural examination. See Section H.4 above.

- ***Examine the finish carefully***. Crazing may or may not require conservation treatment. If the finish is still tightly bonded to the wood surface, it is probably in fairly stable condition. If , however, the islands of finish are loose or are beginning to discolor along the edges, treatment is recommended.

- ***Examine the hardware***. Look for active corrosion. Dull, oxidized hardware is not necessarily unstable, but active green corrosion on brass or copper hardware should be corrected by conservation treatment. On ferrous hardware, a coating or red or red-orange rust also indicates active corrosion. If corrosion is not stopped, it will deteriorate the metal and may stain the underlying wood.

2. ***How should I document the condition of furniture and wooden objects?***

Periodic documentation should be both written and visual. Measured drawings, sketches, and photographs are very useful when they accompany written descriptions.

- Note the occurrence of obvious damage, such as loss of veneer or scratches from cleaning equipment.

- Note deterioration that takes place over a longer period of time, for example, progressive crazing or fading of finishes. Take photographs and date them for comparison.

- Record the length and width of any split you might see. If it is larger on the next inspection, call a conservator for treatment.

- Compare your documentation of condition with the records from environmental monitoring. Seasonal variations in relative humidity may be responsible for the deterioration.

3. ***What will a conservator do in the course of treating wooden objects and furniture?***

The conservator's treatment will be determined by the condition and intended use of the object. Typically a conservator will follow these steps:

- ***Examine the object thoroughly*** with the aid of microscopes and specialized photographic techniques to:

  – determine the stability of the structure and the finish

  – determine the causes of deterioration

  – look for evidence of insect and fungal decay

  – identify the type of wood, finish, and adhesive and joinery techniques

- ***Clean the object carefully*** by mechanical and chemical means to:

  – remove foreign soil buildup

  – remove stains and paint deposits

  – remove unwanted (post-period) surface coatings

  The conservator preserves important signs of use.

- ***Make structural repairs*** by restoring structural integrity, but not necessarily appearance.

  Repairs are reversible so that they can be removed if necessary.

- ***Replicate missing elements*** when desirable with in-kind materials and techniques or modern ones.

  The decision to replace missing elements is made jointly by the conservator and the curator. It will depend, in part, on the object's significance and whether or not the size, shape, and design of the missing element are known. Replacements should be:

  – documented in writing with accompanying photographs

- labeled with maker and date
- removable
- unobtrusive to the museum visitor, but discernable to the curator
- added with a minimum of damage to the object
- reasonable in cost

- ***Consolidate damaged fibers*** when the wood has been damaged by fungal activity, insect attack, or chemical action. Consolidants can be made from a number of natural or synthetic resins and a variety of solvents. The process, however, results in a visual change to the wood surface and is never completely reversible. Therefore, the decision to use consolidants should be carefully weighed.

- ***Preserve the existing finish*** or replace it if necessary. If the existing finish is original, or at least appropriate, and salvagable, preservation is the preferred course. Preservation may involve:
  - cleaning and waxing, if the finish is stable
  - partially dissolving the finish to lay it down if it is lifting and unstable
  - amalgamation of crazed surfaces
  - filling in areas of stain loss with a reversible finish

  Refinishing is preferred if the existing finish is either inappropriate or almost completely worn away. Conservators will use the least harmful means of finish removal and a new finish that is resoluble. A small area is usually left intact to document the finish history of the object. The curator and the conservator should carefully consider the decision to refinish.

- ***Apply a surface barrier*** to protect against moisture, dust, light, and staining. Wax is generally the choice for finished wood surfaces. In some instances, a sheet of acrylic may be used to protect wood surfaces from marring or abrasion.

I. Emergency Procedures for Wooden Objects

1. *What is the most common type of emergency?*

Most emergencies that affect museum objects involve water. Refer to Chapter 10 for guidance on emergency planning. See Chapter 8, *Conserve O Gram* 7/7, Emergency Treatment for Water-Soaked Furniture and Wooden Objects, and *Conserve O Gram* 21/6, Salvage at a Glance Part III: Object Collections, for emergency treatments for wood objects. You will probably need to contact a conservator to take care of the preservation problems created by any disaster.

2. ***What preservation problems will I encounter during a flood?***

Water damage usually affects the finish and causes wood to swell. If there is standing water on the floor for a period of time, the water and any salts that may be dissolved in it will be carried up through the end grain of the feet and legs of furniture creating "tide" lines as the salt effloresces. Floods and water-damaged ceilings may deposit mud, plaster, or gypsum on furniture surfaces. The high relative humidity levels often result in mold growth. Upholstery fabrics will stain and probably shrink. Hardware will rust.

Moving furniture after a flood subjects it to even more potential damage. Move it only if necessary. Your focus should be on removing the water instead.

3. ***What should I do in the event of a flood?***

Take action immediately:

- Remove all water on and around the object as quickly as possible. Lower the relative humidity level slowly to acceptable levels.

  Dry out wet wood objects slowly.

  It may be necessary to cover affected objects with a polyethylene tent so they will not dry out too quickly.

- Remove drawers and open doors to dry all surfaces evenly. If drawers and doors stick because of swelling, **do not** force them open.

- Raise all objects off the floor so that the water will not migrate up the feet and legs.

- Use fans to improve ventilation and therefore decrease the likelihood of mold, but **do not** aim the fans directly at the furniture.

- Remove ferrous hardware to avoid stains, especially on woods with high acid levels like oak. Tag all hardware, furniture elements, and loose pieces as you remove them.

- Remove the outer fabric, padding, and support from very wet upholstered furniture. Saturated fabric left in place may split as it dries. The padding can be dried relatively quickly without damage. Feather cushions can be dried in a clothes drier at a low temperature.

- Gently sponge any mud or plaster from stable wood surfaces with clean, cool water. Rinse the sponge often. Gritty sponges and dry cloths will scratch the wood. Wait for a conservator's assistance to remove mud and plaster from fragile and unstable finished surfaces, such as gold leaf.

Appendix O: Curatorial Care of Metal Objects

List of Figures

APPENDIX O: CURATORIAL CARE OF METAL OBJECTS

A. Overview

1. ***What information will I find in this appendix?***

This appendix discusses historic objects made primarily of metals and their long-term care and preservation. The main topics covered in this appendix are:

- the nature of metals
- agents of deterioration
- handling, storage, and exhibit of metal objects
- working with a conservator when treatment is needed
- specific emergency procedures for metal objects

Note: This appendix does not cover metals recovered from archeological sites. Care of archeological objects is discussed in Appendix I.

2. ***Why is it important to practice preventive conservation with metal objects?***

Metals are very reactive and many factors contribute to their deterioration, but a metal object's rate of deterioration can be slowed significantly with proper preventive care. Practicing preventive conservation will also reduce the need for costly and time-consuming conservation treatment.

3. ***How do I learn about preventive conservation?***

Read about the agents of deterioration that affect metal objects so that you can create a preventive conservation plan. See Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment, for discussions of the agents of deterioration. Refer to the *Museum Handbook* Part III, Chapter 7: Using Museum Collections in Exhibits, for additional information.

4. ***Where can I find the latest information on care of metal objects?***

There are a variety of resources for up-to-date information on metal objects including:

- NPS *Conserve O Gram* series
- World Wide Web sources listed in Section J
- Selected references in Section K
- Regional/SO curator or collections manager of a large metals collection
- Objects conservators

B. The Nature of Metals and Metal Objects

1. ***What are metals?***

Metallic elements compose the largest proportion of materials that make up our planet. Metallic ores are refined by the application of energy to produce metals. The physical properties of metal include:

- luster
- hardness
- strength
- malleability
- temperature sensitivity

Different metals exhibit different physical properties. Historically, these various properties have been exploited in the construction and fabrication of metal objects and structures. Metals are frequently selected for applications in architecture, decorative arts, fine arts, and functional objects.

2. ***What are some of the metals found in park collections?***

Among the metals found in museum objects are gold, silver, copper, tin, iron, lead, zinc, nickel, and aluminum. Metals are frequently combined in order to modify their properties or to obtain a metal that is most suitable to a given application. The process of combining two or more metals is termed *alloying*.

3. ***What is an alloy?***

An alloy is created by melting one metal and then adding another metal to it. An alloy is a solid solution since the metal elements remain distinct, one suspended in the other. Examples of common alloys are ***brass*** (a mixture of copper and zinc), ***bronze*** (a mixture of copper and tin and other metals), and ***sterling silver*** (a mixture of silver and copper). By varying the proportions of copper and zinc in brass alloys it is possible to obtain a range of brass alloys with differing properties including color, strength, corrosion resistance, or working properties.

4. ***What are surface treatments of metals?***

Surface treatment can be an important characteristic of a metal object. Frequently metals are finished to enhance the appearance of the object, to improve the functional performance (for example, corrosion resistance), or a combination of both. Surface treatments include polishing, plating, patination, coatings, heat treatments, and chemical coloring treatments.

5. ***Is it important to identify different metals?***

Yes. Proper identification of metals is important to housekeeping procedures, accurate interpretive program information, storage and exhibit techniques, climate control, handling methods, and the conservation treatment process.

6. ***How do I identify different metals?***

You can identify metals by color, weight, function, magnetic properties, or hardness. If you are unsure of the metal object's identification, consult a conservator or your regional/SO curator. To identify a metal object properly, you need to have a basic knowledge of the properties of metals and have a few tools and supplies. If you can't identify a metal, it is better to use more generic terms to describe it. For example, describe a metal as a

white metal instead of running the risk of misidentifying it as pewter, silver, or nickel.

> ***DO NOT use chemical spot tests or spark tests to identify metals. This can damage or destroy the object.***

Metal	Color	Other Identifying Characteristics	Primary Alloys and Uses
Iron & Iron Alloys	Grey/silver, blue-black and red-brown color.	Some but not all iron alloys are magnetic.	**Cast Iron** (iron & carbon, 2% to 4%). Kettles, door hardware, fire-backs, stoves. **Wrought Iron** (pure iron & carbon, not more than .035%). Railings, nails, wagon hardware. **Steel** (iron & carbon, 0.15% to 2 %). Knives, tools, structural materials.
Copper & Copper Alloys	Yellow to rich browns. Surface may be patinated and vary in color from red, brown, black and blue to shades of green.		**Brass** (copper & zinc). Lighting devices, jewelry, scientific instruments, marine fixtures, cookware. **Bronze** (copper & tin). Bells, cannons, bearings. **Nickel Silver** (copper & nickel & zinc). Household decorative objects.
Lead	Pure lead and lead alloys where lead predominates, dull metallic blue in color.	Very heavy & very malleable.	Pipes, pump wells in ships, toys, roofs, bullets, and solder.
Silver & Silver alloys	White metallic appearance.	Sterling silver is usually hallmarked.	Numerous silver-copper alloys such as Sterling, coin silver, jewelry, and tableware.
Nickel	Gray to white appearance.	Metal is slightly magnetic.	**Nickel** is often used in its pure form as a plate for tableware, kitchenware, and decorative ornaments.
Tin & Tin Alloys	Dull gray.		**Pewter** (tin & antimony & copper). Kitchenware and plating for tin cans and toys

Figure O.1. Identification of Metals

7. ***What is corrosion?***

Corrosion is the chemical or electrochemical reaction between a metal and its environment that produces deterioration of the material and its properties. It is the most commonly occurring problem of metal objects. Corrosion can take many forms depending on the metal(s) that compose the object, the manner in which they are fabricated, or the environment in which they are exhibited or stored. At times, the corrosion source may be from fabrication in the case of stress corrosion cracking in thin turned brass objects or contamination from solder flux in joined metals. In other instances, the conditions responsible for corrosion may be an integral part of the environment, such as a seacoast or polluted urban air.

8. ***Is all metal corrosion harmful?***

No. The presence of a corrosion product on a metal object does not necessarily indicate active corrosion. Corrosion, tarnish, and patination are all examples of metal compounds, some of which are unintentional and considered disfiguring, while others are deliberately created for an aesthetic effect. While some forms of corrosion are more protective and stable than others, almost all are subject to failure at some critical relative humidity level or in the presence of certain pollutants. When metals are cleaned the surface can oxidize and be chemically stable.

9. ***How can I identify active corrosion?***

Active corrosion can be identified visually by the following characteristics:

- color (wet or dry in appearance)
- powdery or flaky formations on the surface of the object and similar deposits around the base of the object
- loosely adhering formations, frequently appearing in patches on the surface as opposed to uniform, dense, well-adhered deposits
- continuing change or growth

10. ***What are the characteristics of corrosion for different metals?***

Surface characteristics and colors of metals vary by alloy. Corrosion products also vary in color, depending on the alloy and cause of corrosion.

See Figure O.2 for additional information.

> ***CAUTION! Lead acetate corrosion is a severe poison that can be fatal if swallowed, inhaled, or absorbed through the skin. If you see white, crystalline corrosion products on lead objects in your collection, assume that they are lead acetate and handle accordingly. Material Safety Data Sheets uniformly state that protective equipment for lead acetate should include goggles, lab coat, vent hood, and rubber or plastic gloves. This type of corrosion is often seen on lead bullets and toy soldiers.***

Metal	Active Corrosion	Stable Surfaces	Causes of Corrosion
Iron & Steel	Orange to reddish-brown. Wet or glossy appearance. A surface that is scaling, flaking or pitting.	Compact blue-black and red-brown color.	High relative humidity, surface moisture.
Lead	Loose white powder in tiny spots or overall.	Smooth gray surface.	Weak organic acid vapors, from sources such as wood, cardboard, and vinegar.
Copper & Copper Alloys	Corrosion forms in small spots overall. Powdery green, blue, and white corrosion products that are generally over the entire surface.	Wide variety of colors: solid blue, green, red, brown, or black. Surfaces are smooth and tightly adherent.	High relative humidity, surface moisture, air pollution, salts from inappropriate cleaning and handling.
Silver and Silver Alloys	Slight gray dullness through blue/purple that deepens to brown/black as corrosion becomes thicker.	Smooth white metallic. A blue/purple surface can be stable if it occurs overall and the object is removed from the source of corrosion.	High humidity, sulfur compounds, etching from fingerprints, organic vapors.
Nickel	Nickel corrosion is reddish brown and is similar in appearance to rust. Green copper corrosion products indicate preferential corrosion from a copper alloy.	Smooth gray appearance.	High humidity and sulfur compounds.
Tin & Tin Alloys	White gray, dark gray to black. Nodules of white to gray corrosion that form under the surface layer in nodules that erupt through the surface exposing a light gray or white corrosion product.	Smooth gray surfaces.	High relative humidity, atmospheric pollutants, low temperatures.

Figure O.2. Identifying Active Corrosion

C. Factors That Contribute to Metal Object Deterioration

1. *What agents of deterioration affect metal objects?*

The primary causes of metal object deterioration in the museum or historic furnished house are:

- relative humidity
- temperature extremes
- atmospheric pollutants

- improper care and handling

2. ***What is the best relative humidity and temperature for my metal objects?***

Keep relative humidity in metal collections as low as possible. Steels will not rust and brass will not tarnish below 15% RH. This is not a practical solution for metal objects in the historic furnished structure, but it may be for objects in storage cabinets or exhibit cases. Ambient temperatures between 60° and 75°F are appropriate for most metals. To inhibit active corrosion in salt air environments, metals should be housed in spaces with relative humidity levels no greater than 35%.

It is generally a good idea to avoid low temperatures for most metal objects. Low temperatures usually result in higher levels of relative humidity and the possibility of condensation on metal surfaces.

3. ***Should I be concerned about atmospheric pollution?***

Yes, many forms of air pollution are corrosive. Polluted urban air and coastal environments are among the more severe areas. Dirt and dust may contain chemical compounds that will react with metals or trap moisture close to the metal surface. Sulfur and sulfur compounds are probably the strongest tarnishing agents. Sulfur is present in the air from burning of fossil fuels and is generated from products such as foam rubber, carpet padding, paints, wool, and felt.

4. ***Does cleaning contribute to deterioration?***

Cleaning and polishing remove original metal. Over-cleaning often results from a desire to have metals bright and shiny, especially brass and silver objects on display in a historic furnished structure. Intense treatment often results in the loss of information from the object. In addition, metal cleaners may leave harmful chemical residues that can generate further corrosion.

D. Proper Handling and Storage of Metal Objects

1. ***What do I need to know about handling metal objects?***

All of the general rules for safe handling of three dimensional museum objects apply to metal objects. Refer to Chapter 6: Handling, Packing, and Shipping, for general guidance on handling museum objects. Two special concerns for metals are the weight of the object and skin contact with bare metal surfaces.

- Metal objects can be heavy. The inadvertent placement of a heavy metal object on another object or on a period piece of furniture may result in dents, scratches, or staining.

- Transport heavy metal objects on carts or dollies.

- Most metal objects should not be handled with bare hands. Salts and oils from your skin can etch metals and may even cause permanent damage.

- Always wear clean cotton, latex, or synthetic rubber gloves when handling metal objects. Avoid cotton gloves if the decorative surface is friable. Avoid cotton gloves with polyvinyl chloride (PVC) nubs when handling metal objects. PVC residues from the nubs may cause oxidation or tarnish. Synthetic rubber gloves are not recommended for handling silver or copper alloys because some brands contain high proportions of sulfur and chlorides.

See caution in B10 on handling corroded lead objects

2. ***Can I use a jeweler's cloth after handling uncoated metal objects?***

Yes. A jeweler's cloth can be used to wipe or buff away fingerprints on uncoated gold, silver, copper alloys, and highly polished steels, if an uncoated metal object is inadvertently touched. Select cloths that contain no abrasive, and rely instead, on the stiffness of the weave for their polishing effect. Any clean, soft cloth may be used to buff an object after handling.

3. ***How should I store my metal objects?***

Follow these guidelines:

- To the extent possible, house metal objects indoors to reduce exposure to rain and temperature extremes.
- If possible, keep all metal objects together. Further isolation can be made according to metal type, object size, and object type.
- Never store metal objects directly on the floor or in close proximity to exterior walls. Avoid storing metal objects in attics and basements.
- Metals are normally immune to biological attack; however, the droppings of pigeons, mice, and even insects will cause pitting and corroding of a metal object's surface.
- Keep metals away from hygroscopic materials such as paper, textiles, and wood.

4. ***What kind of shelving and cabinetry should I use?***

Follow these guidelines:

- Steel shelving is preferred over wood shelving because it is stronger and it does not emit harmful vapors. Line shelves with an inert, nonabsorbent material such as expanded polyethylene.
- The standard museum specimen cabinet provides excellent storage for metal objects. Depending on degree of seal, some of the newer museum storage cabinets can be used to create microenvironments using silica gel to control RH.
- For heavy metal objects such as cannon tubes and sculpture, polyethylene plastic pallets are available to prevent contact with the ground or floor.
- Loosely drape clear polyethylene over shelves to protect metal objects from water leaks and dust.

5. ***What additional protection do metals need in storage?***

You may need to use microclimates to protect some collections. Consult with a conservator to determine which collections are most vulnerable. A conservator may recommend:

- ***Activated charcoal paper:*** Activated charcoal absorbs air pollutants.
- ***Silica gel:*** Silica gel can be used to reduce and to buffer the relative humidity of an enclosed space. The bags must be monitored and reconditioned as necessary. See *COG* 1/8, "Using Silica Gel in Microenvironments."
- ***Vapor phase inhibitors:*** These materials release a vapor that inhibits corrosion. **Note**: Many vapor phase inhibitors are toxic.
- ***Clear plastic boxes & bags:*** Various plastic boxes and bags can be used to create microenvironments and allow conditions to be monitored inside.

E. Exhibiting Metal Objects

1. ***What do I need to consider when planning an exhibit?***

Conditions within the exhibit space are usually more subject to change than those in the storage space. This is especially true for historic furnished structures. The goal is to create an exhibit environment that is just as safe and controlled as possible. All of the general rules for safe display of three-dimensional objects apply to metal objects. Refer to the *Museum Handbook*, Part III, Chapter 7: Using Collections in Exhibits, and NPS *Exhibit Conservation Guidelines*, available from the Harpers Ferry Center.

2. ***Are there any particular concerns for exhibiting metal objects?***

Consider the following:

- Cast and wrought iron objects are often exhibited in hearths, on mantles, or hung on the fireplace. Rainwater may enter through the flue, and brick and mortar will trap the moisture. In addition, chimneys are usually cold. All of these conditions promote condensation and corrosion.
- During seasonal transition periods, fluctuations of temperature and relative humidity can promote condensation and corrosion on metal objects.
- Frequent cleaning of exhibit areas may add moisture and potentially harmful vapors to the environment.
- Ensure that exhibit mounts are padded to prevent scratching

3. ***Are there any specific situations that should be avoided when exhibiting metal objects?***

Follow these guidelines:

- Avoid leaving doors and windows open as gaseous and particulate pollutants can enter the exhibit area causing corrosion. This is a particular concern in urban areas.

- Avoid lighting fixtures such as fluorescent light ballasts or transformers that may generate ozone. Ozone will cause corrosion on metal surfaces.

- Avoid using hardwoods, such as oak, in exhibit cases because they can emit acidic vapors that corrode lead and silver.

- Avoid the use of adhesives, paints, woods, and textiles in exhibition cases and exhibition spaces unless they have been tested for off-gassing. See Chapter 4: Museum Collections Environment, for information on gaseous air pollutants and safe construction materials for exhibitions.

4. ***What should I know about cleaning metal objects?***

Be aware that many proprietary cleaning products contain ammonia, weak acids or bases, solvents, waxes, and fats that may have an adverse effect on metal objects. Refer to Chapter 13: Museum Housekeeping, for additional information.

F. Conservation Treatment

1. ***Why should I contact a conservator?***

All interventive treatment must be undertaken by a conservator trained to examine, analyze, stabilize, and treat objects. Conservators are trained in the treatment of specific materials. See Chapter 3: Preservation: Getting Started, and Chapter 8: Conservation Treatment, for information on choosing and contracting with a conservator. Be sure you check references and question the experience and background of any conservator you choose. Discuss any recommended treatments and be sure you understand what is planned and why it is necessary.

> ***Only experienced conservators who agree to follow the AIC Code of Ethics and Guidelines for Practice should be allowed to treat NPS museum objects.***

2. ***What might a conservator be able to tell me about my metal object upon examination?***

When conservators examine metal objects they can tell you a number of things, including:

- the type of metal

- the type and source of any corrosion product

- the range of possible conservation treatments

3. ***Should protective coatings be applied to metals?***

Protective coatings are often applied to metal objects to prevent or reduce the possibility of corrosion from high humidity, frequent handling, atmospheric pollution, and to reduce the need for aggressive cleaning such as polishing.

4. ***Who should clean and apply coatings to metal objects?***

All metal objects are best left **untreated** until an objects conservator has had an opportunity to examine them. Cleaning involves the risk of over-cleaning, exposure to hazardous solvents and chemicals, and the consequence of higher corrosion rates on freshly exposed metal surfaces.

A conservator should specify the most appropriate coating for an object and determine who best can apply the coating. With appropriate training by a conservator, collections management staff can be trained to coat metals with wax. The scope of treatment may be expanded to include other barrier coatings or corrosion inhibitors. This type of treatment is especially good for objects stored or exhibited outdoors.

5. *What are some common metal coatings?*

The most common metal coatings are:

- waxes
- lacquers
- corrosion inhibitors

Some preventive conservation measures for metal objects require hands-on methods. Preventive measures should mitigate frequent handling of the object, be easy to apply and to remove, and be safe for both the object and the person applying the material. Wax is an example of such a material.

Before applying any surface coating it is very important to properly identify the metal surface. Ask an objects conservator to conduct a Collection Condition Survey that includes current condition and provides information about routine maintenance.

- **Waxes.** Waxes are easy to apply, relatively safe and easy to remove, and provide reasonably long-term protection to the metal surface.
  - Waxes may be natural or synthetic.
  - The metal object should be polished, washed, thoroughly dried, and buffed before waxing.
  - Most waxes suitable for use in an exhibit space can be applied at room temperature.
  - Be aware that waxes will collect dust, are a food source for some molds and fungi, and may blanche or turn white.
  - Avoid natural waxes such as bees wax, which may be acidic. Use instead manufactured microcrystalline waxes as specified by a conservator.
- **Lacquers.** Lacquers, like waxes, can be natural or synthetic. Generally, synthetic lacquers and waxes are considered to be more stable than those derived from natural products. The objections to protective lacquer coatings are not well founded. A common objection is that lacquers make a metal object look “plastic.” Matting agents are available if necessary. Considering the difference in wear caused by frequent polishing or less frequent waxing, the lacquer finish provides the toughest and the longest lasting protection.
  - Lacquers are more difficult to apply and to remove than waxes.

- Lacquers are harder than waxes and will usually last for five to ten years before reapplication is necessary.

- Certain solvents used in lacquers, such as toluene or xylene, pose health hazards. An objects conservator should be consulted and asked to apply the lacquer coating or to train the staff in the use of these materials.

- Lacquers when properly applied will not adversely affect the appearance of an object.

- **Corrosion Inhibitors.** Corrosion inhibitors react with the surface of a metal object to prevent corrosion. Some corrosion inhibitors are available commercially and others can be obtained from chemical supply houses. They also may be incorporated into waxes and resins. This provides an additional degree of protection should the wax or resin be scratched. Most corrosion inhibitors are metal specific.

  Keep in mind that corrosion inhibitors are not fool proof. Any metal treated with an inhibitor is still subject to corrosion at or above the critical relative humidity for that metal. For that reason, coatings, inhibitors and environmental quality should be considered an integrated system requiring ongoing maintenance.

  CAUTION! Many corrosion inhibitors are toxic.

G. Emergency Procedures For Metal Objects

Metals are very reactive materials. In an emergency situation, corrosion can cause irreversible damage to inorganic materials, complicating their salvage. If the metal object has survived a fire and the deluge of water, a flood, or a storm, the first course of action is to isolate it from other materials.

Be sure to:

- Implement security precautions for precious metals and objects of intrinsic value such as metal sculpture.

- Provide a secure dry storage area for all metal objects.

- Have an objects conservator prepare a Collection Condition Survey that documents each object's condition, recommends needed conservation treatment, and outlines remedial preventive conservation procedures.

- Rinse, sponge, and blot metal objects. Air dry.

- If the object has an applied finish, do not clean it. Air dry. Keep flaking surfaces horizontal.

Refer to Chapter 10: Emergency Planning, for information about planning for emergencies and minimizing damage.

> ***In an emergency situation, do not attempt to perform interventive treatments on metal objects.***

H. Special Considerations for Archeological Metal Objects

Considerations for the care and conservation of archeological metals are considerably different than for historic metals. Care of archeological metals is discussed in Appendix I.

I. Glossary

Abrasion: the wearing, grinding, or rubbing away of surface material by friction, usually through the action of particulate matter (e.g., sand) or as a result of rubbing by people, animals, or plants

Accretion: the accumulation of extraneous materials on the surface of an artifact, sculpture, or monument. It may include core materials, deposition of insoluble salts, or even the heavy accumulation of dirt, grime, pollutants, or bird droppings.

Acid deposition: the deposition of acidic constituents onto a surface. This occurs not only by precipitation, but also by the deposition of atmospheric particulate matter and the incorporation of soluble gases.

Acid precipitation: rain, snowfall, or atmospheric moisture below pH 7

Alloy: metallic material composed of two or more elements intimately mixed

Amalgam gilding: a process for applying gold to the surface of another metal, usually a copper or silver alloy, by forming a paste of mercury and gold

Annealing: a process of heating and cooling sheet metal, which has become work-hardened by hammering, spinning, or stamping, in order to relieve stress and to return the metal to a malleable state

Anode: the positive electrode of an electrolytic cell at which oxidation is the principal reaction. Electrons flow away from the anode. Usually the anode is where corrosion occurs and metal ions enter solution.

Bimetallic corrosion: corrosion resulting from dissimilar metal contact; galvanic corrosion

Brazing: a method of joining nonferrous metals using a nonferrous alloy that melts at a lower temperature than that of the metals to be joined. Brazing is similar to soldering; the distinction being that soldering is accomplished at temperatures below 800°F, and brazing is done above 800°F.

Bronze: an alloy of copper and tin and sometimes other elements

Bronze disease: copper corrosion in which chloride is the primary corrosive agent. It is rare, but may develop on archeological specimens or objects that have been recovered from the sea.

Burnish: a method to smooth rough surfaces of a metal by rubbing a hard stone or highly polished, harder metal over the surface

Casting: an object created by pouring molten metal into a mold

Cathode: the negative electrode of an electrolytic cell. Electrons flow toward the cathode in the external

circuit. Corrosion does not occur at the cathode (see Anode).

Chasing: a metal finishing technique intended to sharpen or add detail on an object. For sculpture, the term is expanded to include all finishing techniques.

Checking: surface cracking in a checkerboard-like pattern often associated with the degradation of a protective coating

Chemical conversion coating: a protective or decorative nonmetallic coating created by treating the metal with an acidic or basic compound. Examples are coatings on iron produced by tannic or phosphoric acid.

Coating: a protective barrier, usually a synthetic resin or a wax, applied to a metal surface

Corrosion: the electrochemical degradation of a metal, due primarily to the loss of electrons and the recombination of metal ions with other electro-negative elements such as oxygen, carbon, sulfur, chloride, and nitrogen

Critical humidity: the relative humidity above which atmospheric corrosion rates of some metals increase sharply

Electrolytic cleaning (electrolytic reduction, electrolysis): a powerful method of cleaning metals used particularly if they are heavily corroded or salt contaminated. An object is wired to a low voltage direct current and is suspended between metal plates in a conductive solution.

Electroplating: the deposition of a metal from a solution of one of its salts onto a metal surface using an electrical current

Electrotyping: a process identical to electroplating. Electrotyping is used to build up thick metallic deposits on the interior of nonmetallic molds. It might be thought of as an electrolytic form of casting.

Embossing: raising a design in relief on a surface

Engraving: a decorative technique in which metal is removed by cutting into the surface with gravers

Etching**:** the production of patterns on a surface by the use of a corrosive chemical agent

Ferrous metals: composed of iron as the dominant metal

Filigree: decoration by means of thin, twisted wire soldered together into an openwork structure

Finishing: cleaning, polishing, patinating, and coating metal

Flux: a substance applied to metals being welded, soldered, or brazed to improve flow

Forging: shaping metal, usually steel and iron, by hammering while the metal is hot

Galvanic corrosion: accelerated corrosion of a metal because of an electrical contact with a more noble metal

Gild: to overlay with a thin covering of gold

Glass bead peening: dry blasting of a surface with glass microspheres

Graver: a chisel-like tool used for engraving metal surfaces

Inclusions: particles of impurities, such as mold materials, ferrous metal, or slag

Incralac: synthetic resin that contains the copper corrosion inhibitor, benzotriazole

Intergranular corrosion: preferential corrosion at, or adjacent to the grain boundaries of a metal or alloy

Inhibitor: a chemical substance that prevents or reduces metallic corrosion

Lacquer: an organic resin coating. The resin may contain matting agents or corrosion inhibitors. Some historic resins were pigmented.

Lost wax casting: a casting technique that utilizes a wax model or pattern. A refractory mold material is used to cover the wax pattern. The mold is later heated, the wax melts, and molten metal is poured into the resulting hollow.

Machining: shaping of metal with machines such as the lathe, planer, milling machine, drill press, and grinder

Metals: elements or mixtures of elements that possess high electrical conductivity and a lustrous appearance in the solid state

Mold**:** a form containing a refractory void (mold cavity) into which molten metal is poured during casting

Nonferrous metals: not composed of iron

Passive: the state of a metal surface characterized by low corrosion rates

Patina: a colored layer on the surface of a metal. This term is usually, but not always applied to copper alloys. The layer may be naturally occurring or artificially produced.

Planishing: a forming technique utilizing stakes and highly polished hammers to shape sheet metal

Plating: a thin layer of metal deposited on the surface of another metal

Raising: forming a hollow shape in metal by hammering on the outside surface over a dome headed stake or anvil

Repoussé: a technique whereby hammering from the inside produces raised areas on the outside of a sheet metal object

Rust**:** a corrosion product consisting of hydrated iron oxide. This term is properly applied only to ferrous alloys.

Sand casting**:** a casting technique that uses sand or sandstone as the refractory mold material

Sandstone casting: a casting technique that uses sandstone as the refractory mold material

Soldering: the use of alloys that flow at low temperatures to join two or more metal parts having higher melting points

Spinning: a metal forming technique in which sheet metal is rolled over a form on a lathe

Stamping: impressing a design into sheet metal with a metal die

Steel: an alloy of iron and carbon, with a carbon content between 0.15 and 2.0%

Stress-corrosion cracking: a cracking process that requires the simultaneous action of a corrosive agent and

sustained tensile stress

Tarnish: discoloration of a bright metal surface by a thin film of corrosion products

***Tinning*:** covering a metal surface with tin

Tin Pest, Tin Disease: deterioration of tin caused by changes in the crystal structure at low temperatures (below 56°F)

Welding: joining two pieces of metal at a temperature close to their fusion point

APPENDIX P: CURATORIAL CARE OF CERAMIC, GLASS, AND STONE OBJECTS

A. Overview

This chapter is an overview of three common materials found in many museums:

- ***ceramics***
- ***glass***
- ***stone***

These are all hard, yet brittle and fragile materials that have been used since ancient times. Objects made of ceramic, glass, or stone can be both decorative and practical. They can be as tiny as a bead or as large as an outdoor sculpture, but all these objects share some basic properties in common. To properly care for the ceramic, glass, and stone objects in your collection you need to understand their properties and how they can deteriorate. This appendix will address:

- how ceramic, glass, and stone objects are made
- common deterioration problems
- preventive conservation in caring for these objects
- storage
- basic treatment issues
- specialized procedures for packing and shipping
- basic procedures to limit damage after a disaster

For information on the particular needs of glass plate negatives and transparencies see *Conserve O Gram* 14/5, Caring for Photographs: Special Formats.

B. The Nature of Ceramic Objects

1. *How are ceramic objects made?*

Ceramic objects are made up of a mixture of natural materials that are combined, formed into shape by a variety of processes, and transformed by heat to create a solid, brittle substance not found in nature. Different firing temperatures produce objects with a vast range of hardness and porosity.

Most clay objects are a mixture of materials:

- Clay is a fine-grained mineral--the smallest particles produced by the weathering of certain rocks. Because of the shape and size of the small plate-like clay crystals, bulk clay is plastic when mixed with water. When heated to a high temperature it chemically and physically changes to a hard, brittle material.

- Adding fluxes such as soda, mica, potash, magnesia, or lime lowers the firing temperature of clay. These fluxes may also be found in natural clay deposits.

- Non-plastic additives (temper) are added to clay to reduce shrinkage and cracking during firing and drying. Temper also increases porosity in the finished object.

These basic materials are mixed together by the potter to produce a heterogeneous plastic mass that is then formed into the ceramic object.

2. *How are ceramics fired?*

A kiln is used to fire ceramics to change the physical and chemical structure and fuse it into a rock-like material. Kilns can vary from simple piles of fuel to complex multi-storied structures. However, all kilns work using the same basic principle. Each kiln is designed to:

- house the objects

- control the amount and duration of oxygen and heat

- hold the level of heat surrounding the object

The process of drying and firing is a series of controlled steps. After the object is formed it must be slowly air-dried. Much of the water (up to 25% of prepared clay) evaporates as the object dries. If the air-drying process is not done carefully, you may see shrinkage cracks in the object. After a day or two of drying objects to a "leather-hard" state, ceramics will maintain their shape, but the surface can still be easily worked. Often the potter will do final finishing, smoothing, polishing, and painting at this point. By the time air-drying has finished, most of the free water between the clay particles has evaporated.

Objects may undergo a single firing or multiple firings. Many archeological ceramics are fired a single time at temperatures ranging from 800-1400ºC. Potters may apply glazes to an air-dried object so that glaze and body vitrify together in a single firing. This process is known as "through firing." However, most glazed objects undergo multiple firings. First, the potter does a "bisque" firing by heating the object to about 600ºC to strengthen the object. The glaze is then applied to the cooled bisqueware. It is then returned to the kiln and fired again, this time to a higher temperature (above 800ºC) so that vitrification of the glaze and ceramic occur.

If overglaze decoration, gilding, decals, or enamels are used to decorate the surface, an additional low-temperature (600-900ºC) firing may take place.

3. *What does firing do?*

After clay objects are formed, they are heated to high temperatures or "fired." This action causes chemical changes to the clay. After firing, objects take on hard, brittle characteristics and don't lose these properties when wet. Different processes occur at different temperatures in the firing process. The firing process proceeds through a number of steps:

(1) Added vegetal matter burns off (200-600°C).

(2) Clay decomposition begins as water is lost from the structure (400-700°C).

(3) Carbon and sulfur are burned out (700-900°C).

(4) Sintering occurs as the heat is raised and particles in the ceramic object begin to join together at points of contact. Sintering gives cohesive strength to low-fired ceramics.

(5) Vitrification takes place at higher temperatures (depending on the mixture of clay and fluxes). During vitrification, melted particles flow together and the object as a whole will shrink. Vitrified ceramics are non-porous; not all ceramics are completely vitrified.

Ceramics are loosely divided into four groups. These groups are based on their firing temperature, clay type, and physical characteristics:

- ***Adobe or mudbrick*** is an unfired clay mixture. This material is often used for building, but mudbrick objects, such as cuneiform tablets and sculpture, are often found in museum collections.

- ***Earthenware*** is a low-fired clay mixture. These objects are fired between about 950-1100ºC. At this low temperature sintering occurs but not vitrification. Earthenware is generally soft and scratches easily. It is often red in color from naturally occurring iron in the clay; brown, black, and yellow are also common colors. Earthenware has the following characteristics:

  - It is porous and will readily absorb water unless glazed.

  - The structure is often granular in appearance with numerous coarse particles.

  - There is a clear distinction between the ceramic body and any glaze layer.

- ***Stoneware*** is fired between 1100-1350ºC. Stoneware objects are partially vitrified. Common colors for stoneware are buff, brown, and gray. Stoneware has the following characteristics:

  - It is partially vitrified and less porous than earthenware.

  - It is harder and denser than earthenware and does not scratch easily.

  - If tapped lightly, the body will give a distinctive ring.

  - The glaze and body are tightly adhered.

- ***Porcelain*** is fired at very high temperatures, usually above 1300ºC. Porcelain is made of a special clay called kaolin. This clay is difficult to work and must be fired under precise conditions. Porcelain can be formed into objects with thin, complex structures. Porcelain has the following characteristics:

  – The body is completely vitrified and impervious to water (non-porous).

  – The clay body is white and translucent and extremely hard and brittle.

  – When tapped lightly, the object rings with a higher tone than stoneware.

  – In cross-section, glaze and body are nearly indistinguishable.

4. *What surface treatments are used for ceramics?*

Potters frequently add materials to the surface of the ceramic body both to decorate it and to make it less porous. These materials are either fired on or applied after firing. Fired-on materials are usually more stable. These materials include:

- ***Glazes:*** These are vitrified surface coatings that vary widely in appearance and can be divided into three categories:

  – ***Lead glazes*** are made of the mineral lead oxide, mixed with other materials. Lead oxide melts at a low temperature. Lead glazes characteristically produce smooth, glassy surfaces, but can be easily scratched. Lead glazes can be a health hazard. Weak acids found in foods such as tomatoes, vinegar, and fruit juice can dissolve the glaze, releasing lead that can be ingested. However, if glass powder (frit) is added to the glaze using proper techniques, these glazes are non-toxic.

  – ***Alkaline glazes*** contain alkali fluxes such as sodium, lithium, or potassium. They are also fired at low temperatures. Alkaline glazes usually have brilliant colors and may craze or crawl. They are not very durable and scratch easily. If not adequately fritted, they can remain slightly soluble after firing.

  – ***High-fire glazes*** are primarily feldspar and are used on stoneware and porcelain. These glazes are glass-like and form a hard, smooth, and durable surface. The colors produced are generally more subdued than in low-fire alkaline and lead glazes.

- ***Slip or engobe***: A slip or engobe is a thin layer of colored clay that the potter applies on the surface before the first firing. It generally appears matte (not shiny like most glazes), but may be burnished to get a smooth lustrous look. A potter may also use a brush to apply decorative elements over the slip.

- ***Underglaze***: Underglaze painting is generally used to add fine detail. The potter paints these decorative touches onto the surface of ceramics

after the first firing (bisqueware) (see Section B.5) and then applies a protective transparent glaze.

- ***Overglaze***: Overglaze is used to provide additional decoration to the surface. The potter can apply overglaze decoration in two ways. In one technique, the artist will brush details onto a background of unfired clay and fire the glaze and overglaze at the same time. In the other, two-step technique, the artist applies the overglaze after the glaze has been fired and fires the piece again at a low temperature. Objects produced with the second technique are not as durable as higher-fired glazes.

- ***Other materials***: Potters may apply other coatings or materials to ceramics, such as gesso, resins and waxes, or powdered minerals. These coatings are applied for a variety of decorative and functional reasons.

5. *How are ceramics formed?*

Potters will use one or more of these techniques to produce ceramic objects.

- ***Hand-built ceramics:*** These are crafted using the oldest methods of producing ceramics. Potters roll out flat slabs of clay and assemble a form by pressing the slabs together or they may pinch and manipulate a ball of clay into a small object. They can form coil-built vessels by first shaping long ropes of clay, coiling them into a basic shape and then pinching and shaping the coils into the final form.

- ***Wheel-thrown ceramics:*** The potter shapes the vessel on a rotating wheel. You can often identify these pieces by looking for a flat base with concentric striations on the surface. Vessels are sometimes coil-built and then finished on a wheel.

- ***Mold-pressed ceramics:*** These are made by pressing a slab of clay into an open mold. This technique is often used for shallow shapes (like plates) that are difficult to throw on a wheel.

- ***Slip-cast ceramics:*** This method is often used for delicate porcelain objects. The potter pours a slurry of clay into an absorbant plaster or ceramic mold. The water is drawn from the slurry leaving thickened clay behind. Delicate and complex objects can be made with this method.

6. *What flaws might I find in ceramic objects?*

It is important to recognize the flaws that may occur during the manufacturing process so you can separate flaws from damage or active deterioration.

- ***Ceramic body flaws:***

  - *Warping* may result from uneven heating or cooling during firing.

  - *Spalling* or *delamination* of parts of the clay body can result if the firing temperature is not high enough.

  - *Sagging* is caused by firing at a temperature that is too high for the clay body.

  - *Cracking* will occur if the object is cooled too quickly.

- *Bloating* occurs when heating is too rapid. The gases that are formed during firing don't have enough time to be released and are trapped in the body.

- ***Glaze flaws:***

  - *Crazing* is a fine network of cracks on the surface of the glaze. Crazing results when the glaze is under tension because it has contracted more than the clay body during cooling. It may develop immediately or sometime after firing. Overtiring or rapid cooling can also cause crazing. It is sometimes used as a decorative technique.

  - *Shivering* results when the glaze shrinks less than the clay body. The glaze may peel or flake off the surface.

  - *Crawling* describes the shrinking of the glaze into islands, revealing bare areas of clay. The defect occurs when glaze is applied over a dirty or greasy clay surface and does not adhere properly during firing. Potters may purposely leave areas unglazed.

  - *Pitting* in the glaze can vary in size from pinholes to larger spots. Pits occur when firing temperature is raised and lowered too quickly and volatile materials don't fully escape before the glaze solidifies. Pits may also occur if a vessel is fired at too high a temperature causing the glaze to boil.

  - *Blistering* results when air is trapped between the glaze and the clay body. These surface bumps are easily crushed. This problem often occurs when glaze is applied too thickly.

C. The Nature of Glass Objects

Glass has been used for personal adornment, containers, construction materials, and a host of other purposes throughout the last four millennia. In order to understand how to preserve glass objects, you must understand how they are produced.

1. *What materials make up the structure of glass objects?*

The basic materials of glass are silica and alkaline oxide (also known as flux). Silica generally comes from sand or crushed flint. The flux interacts with the silica and lowers the melting temperature. Typical fluxes include lead, calcium, potassium, and sodium oxides. Other oxides (iron, copper, cobalt, manganese, chromium and nickel) are added as colorants. When melted, this mix of materials flows readily to form various shapes.

Glass is a unique material—a rigid liquid. A liquid is an amorphous material that does not have an organized, crystalline structure. Most materials, such as metals, form a crystalline lattice as they cool from a liquid to a solid state. Molten glass, however, cools too quickly for this structure to form. The structure is "frozen" into a random network of molecules. Glass is rigid and

brittle at room temperature. Depending on the materials included in the mix, it can be transparent, translucent, or opaque.

Glazes and enamels are also glasses with small differences in composition from bulk glass. Glazes are applied to ceramics; enamels are usually applied to a metal support. Glazes and enamels are generally opaque and fired at lower temperatures than glass.

Both hot- and cold-working techniques are used to make glass objects. Generally, the artist forms the object using hot-working techniques. Cold working techniques are used to embellish the surface.

2. *What are the hot shaping processes?*

There are six hot-shaping processes:

- ***Mouth blowing*** begins by gathering a lump of molten glass at the end of a hollow pipe. The worker blows air into the pipe by mouth or with a bellows (which may be automated). Metal tools such as shears or rods are used to help shape the object. Glass can also be blown into a metal, stone, or wooden mold. A mold-blown object may be further hot-worked after it is removed from the mold.

- ***Glass pressing*** is a technique in which molten glass is pressed into a mold with a metal tool. The technology for this method developed in the 19th century and made glassware widely available.

  You can sometimes identify pressed and molded glass by mold lines, though these lines are often ground and polished away.

- ***Core dipping or winding*** is the oldest technique used in making glass vessels. A core of organic material (for example, dung or straw) is mounded onto the end of a rod and coated with sand or clay. This core is dipped into molten glass or wrapped with coils of glass. To produce a consistent structure the glass is heated and rolled over a smooth surface. The core is removed after the glass has cooled.

- ***Pâte de verre*** means literally glass paste. Glass is ground to a powder and mixed with an organic adhesive so it can be molded or modeled much like pottery. After forming, the object is fired to burn away the organic adhesive and to fuse the glass paste. The resulting glass is usually opaque.

- ***Lost wax casting*** is a technique in which a wax model is created, covered with clay, and fired to melt out the wax. Molten glass is poured into the void left behind.

- ***Millefiore*** glass is produced when different colored rods of glass are wrapped with layers of colored glass and heated. The package of glass is rolled on a textured surface to work together and shape the layers. Each thick rod is then cut into short lengths that show a floral design in cross section. These lengths are then used to form objects.

Decorative details can be added to molten glass by fusing colored glass onto the surface of the object or by integrating glass threads or shapes into the body and then reheating.

3. *What cold-working techniques are used to decorate glass?*

Commonly used cold-working techniques used to decorate a glass object after it has cooled include:

- cutting or engraving the glass with a sharp point or cutting wheel
- chipping away the glass inside an engraved design outline
- acid etching a design in the glass (The glass surface is coated with wax and a design is cut through the wax. The piece is then dipped into hydrofluoric acid to etch the exposed glass. This technique has been used since the 19th century to decorate glassware.)

The final step with all these techniques is to polish away surface roughness and imperfections.

4. *What flaws might I find in glass objects?*

Flaws can be introduced during the manufacturing process. Learn to distinguish these flaws from active deterioration problems. Look for:

- ***Bubbles:*** They may also be added intentionally for decorative effect. A few isolated bubbles will not weaken a glass object, however, a cluster of bubbles might. The shape of the bubbles gives clues to the direction that the object was worked in the molten state.
- ***Inclusions or foreign bodies:*** These are more noticeable in translucent glass. Often these flecks come from contamination in the crucible or impurities in the raw materials. Small inclusions may disrupt the surface and look of an object, but they will not affect its strength.
- ***Compositional flaws:*** Sometimes these are not apparent for many years. The symptoms of deterioration from compositional problems are covered in Section E, Agents of Deterioration.

D. The Nature of Stone Objects

Stone in museum collections is often perceived as a material with few problems, but stone is brittle and can break or shatter. While generally, harder and tougher than many other materials found in collections, the agents of deterioration also can affect the preservation of these materials. It reacts with the environment in a variety of ways. Understanding the origin and production of stone objects in your collection will help you identify problems.

1. *What materials make up the structure of stone objects?*

Geologists divide rock into three broad categories:

- ***Igneous rocks*** are formed when magma cools and solidifies. They are generally hard and very stable because of their interlocking crystalline structure. Types of igneous rocks are granite, basalt, obsidian, and porphyry.
- ***Sedimentary rocks*** are formed by the solidification or cementing together of layers of organic and mineral sediments. They are usually more permeable and deteriorate more easily than igneous rock. Examples include sandstone, limestone, alabaster, and travertine.

- ***Metamorphic rocks*** are formed by transformation of igneous or sedimentary rocks with pressure and heat. The structure depends on the parent rocks. For example, marble is metamorphosed from limestone.

The durability of stone depends on its porosity, permeability, hardness, mineral content, and number and type of inclusions. Porosity is the amount of free space in a rock; permeability is the capacity of a rock to allow fluids to pass through it.

2. *How are stone objects formed?*

Stone-working tools and techniques have changed little through time. Although metal tools have replaced stone and, more recently, electric power has speeded up some processes, modern artists use the same basic tools to carve stone. Workers use heavier and thicker tools for carving hard, igneous stones (for example, granite), than for softer limestone and marble. They must also temper steel tools used on hard stones, hardening them by heating, cooling, and slow warming.

The carver holds a carving tool in one hand and uses a hammer or mallet to strike the tool. Stone surfaces are often polished to remove tool marks, but sometimes you can find traces on back surfaces or inaccessible undercuts that can be used to identify techniques. Sculptors use six basic tools:

- ***Point (punch):*** After selecting a stone, the sculptor uses a point for roughing-out the shape from the block. The sculptor holds the point at an oblique angle to the stone surface and hits it with a hammer. Larger masses of stone are removed, progressing from larger to smaller diameter points.

- ***Tooth chisel (claw chisel):*** Following the initial roughing-out, the sculptor uses the tooth chisel to remove more layers of stone and further define the form. The tooth chisel is used primarily on limestone, sandstone, and marble. The sculptor will start with a coarse chisel with well-spaced teeth and progress to a fine chisel with closely spaced teeth. You can identify the tooth marks angled in different directions. Using this tool gives the stone a raked or combed appearance.

- ***Bushhammer:*** Sculptors use a bushhammer on hard stone such as granite. The bushhammer is a series of points or teeth in one head (multi-pick) used to wear down or pulverize a hard stone surface. As when working with a tooth chisel, the sculptor progresses from coarser to finer toothed bushhammers. The bushhammer gives the stone a pitted, granular appearance.

- ***Flat chisel:*** To remove the marks of the tooth chisel and bushhammer, the sculptor often uses a flat chisel. The sculptor holds the flat chisel almost parallel to the surface of the stone and cuts across to remove the rough surface material. On concave surfaces, a rounded chisel edge may be used. Sculptors sometimes use only a flat chisel when carving soft stones or producing low-relief carvings.

- ***Abrasives:*** Rasps, rifflers, and files are abrasive tools. They are used to do rough finishing. Mineral and stone abrasives such as sandstone, pumice, and carborundum (silicon carbide) are used for shaping and smoothing. Sculptors used emery cloth, solid tin oxide, and sandpaper

for finishing the surface. Whiting (calcium carbonate) is used for final polishing. A sculptor may stop at any point in the surface finishing process depending on the desired look.

- ***Drills:*** To split stone the worker drills a series of holes along a stone face and then hammers wedges into the holes. You may see evidence of this technique as a line of parallel vertical marks left by the drill on the face of the stone.

3. *Will I see different techniques used on archeological stone objects?*

Flaking methods were used to produce the stone tools found in many archeological sites. Flint or chert and obsidian were used for tools because they flake easily and give a sharp edge when fractured. You can identify the fracture face by the conchoidal fracture, a series of concentric arcs radiating from the point of impact. You can identify the point of impact by the bulb of percussion, a swelling caused by the compression of the blow.

There are two basic methods for detaching a flake:

- ***percussion flaking***, where the core or parent block is struck with another stone

- ***pressure flaking***, where heavy pressure is applied with a stone, bone or wooden tool

Early stone tools were also drilled and abraded with sand, just like wood, bone, stone or early metal tools.

4. *What different tools and techniques are used on contemporary sculpture?*

Though the basic tools used for modern stone sculpture are the same as those used in the past, the addition of pneumatic equipment speeds the process and makes working stone less physically difficult. Wire saws, diamond saws, and flame cutters are now available to cut and roughly shape stone.

Pointing is a contemporary mechanical process used to duplicate an original model. A pointing machine, a movable instrument with adjustable rods, mechanically measures a number of points on the original and transfers these to the stone block. Holes are drilled into the stone to the point and depth measure with the pointing machine. The stone between the drilled holes is chiseled away. Finer pointing is employed as the reproduction progresses.

Other mechanical aids are also used to produce reduced or enlarged products from a model.

E. Deterioration of Ceramics, Glass, and Stone

You can find general information on the agents of deterioration that affect ceramics, glass, and stone in Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment.

The agents of deterioration that can have the most profound effect on ceramics, glass, and stone in museum collections are direct physical forces. If ceramic or glass objects are dropped, they usually break. Most stone will chip, crack, or break if dropped. Cumulative damage can occur with improper handling—pieces can be chipped off and residues left from

handling. Some ceramic, glass, and stone objects also have flaws, either inherent or from their previous use, that make them vulnerable to heat or moisture.

1. *How do ceramics deteriorate?*

Besides the obvious problems of breakage, ceramics can be vulnerable to changes in temperature and relative humidity. In particular, archeological ceramics may contain "soluble salts" that can crystallize at or near the surface and destroy decoration or even the ceramic structure. See *Conserve O Gram* 6/5, Soluble Salts and Deterioration of Archeological Material. Other historical objects (for example, salt containers or pickling jars) that held contaminants can suffer similar damage.

Unstable glazes may become crizzled and crazed, deterioration problems common to glass and discussed in more detail below.

2. *How does glass deteriorate?*

Most damage to glass is mechanical. It is easily broken and chipped. Water is the major chemical agent of deterioration for glass and the susceptibility of glass to deterioration depends greatly on its original chemical structure. Some deterioration processes are caused by similar reactions, but have different visual characteristics. Be aware of the following deterioration types:

- ***Crizzling*** is a fine network of surface cracks that turn glass translucent. Moisture in the air reacts with unstable glass containing too little lime (calcium oxide). The moisture causes potassium and sodium in the glass structure to leach out. As the structure weakens, small cracks appear.

- ***Weeping*** is caused by leaching sodium or potassium absorbing water on the surface of deteriorating glass to form sodium or potassium hydroxide. These compounds accumulate on the surface of the glass and may give it a greasy feeling. The hydroxides may also react with carbon dioxide in the atmosphere to form carbonates, which can absorb even more water.

- ***Crusty or waxy deposits*** on the surface, which may have a white crystalline appearance, are typically seen on ethnographic beadwork and may be a reaction of the glass deterioration products to oils in adjacent leather.

- ***Iridescence*** is a rainbow-like effect on the glass surface and is an indication of deterioration. The colors are visible when light is diffracted between the air-filled layers of deteriorated glass.

- ***Devitrification*** is the production of small areas of crystal growth in the otherwise amorphous glass structure. These crystals may be intentionally produced during production as they give glass good thermal shock resistance. Unintentional devitrification is caused by unstable glass with too much alumina or too much calcium.

- ***Solarization***, a process that can cause some glass to turn purple or brown, is caused by exposure to sunlight over long periods of time. This deterioration can sometimes be seen in old window glass.

3. *How does stone deteriorate indoors?*

Stone is affected by agents of deterioration—especially when it is not well protected in storage or it is put on exhibit. You must be aware of how damage can occur and how you can protect stone.

- ***Dirt and dust*** accumulate on horizontal surfaces and in nooks and crannies in stone objects. It disfigures the object and over time the dirt can penetrate porous stone and cause staining. High traffic areas will have greater accumulation of dirt.

- ***Oils*** from repeated handling will also cause stains. This is typically seen on protrusions such as noses or knees on sculpture that are accessible to visitors.

- ***Old coatings of wax or oil and old adhesive repairs*** may also discolor over time. Staining will be most noticeable on light colored stones and may have a blotchy appearance.

- ***Relative humidity*** that is fluctuating or too high can also cause damage. Fluctuating humidity can bring salts to the surface and cause spalling. High humidity can react with pollutants and damage stone, just like in an outdoor environment**.**

- ***People*** can cause a lot of damage to stone objects indoors. Breakage and chipping from handling are obvious examples. Graffitti from vandals, paint drips and smears from careless maintenance, and damage from splashed cleaning fluids are other examples.

4. *How does stone deteriorate outdoors?*

Stone is often exhibited outdoors where it is not well protected from the agents of deterioration.

Water causes most of the damage to stone stored or exhibited outdoors. Water can penetrate between the layers in sedimentary rock and push them apart. Water carries salts, such as chlorides, into the stone and as these crystals dry they can damage the surface of the stone (see *Conserve O Gram* 6/5). During the winter, when water freezes, the expansion of the ice can cause cracking, splitting, and spalling. ***Corrosion*** of metal components that may be attached to the surface, mounted into the stone, or used as interior supports in some cases causes severe damage. Copper corrosion will produce green stains; rusting iron produces brown stains. As metal corrodes it expands. Expanding internal supports can crack apart the surrounding stone. Also be aware that some solutions used to clean mounted metals may stain the stone support.

Atmospheric pollutants can react with water and cause damage. Carbon dioxide and water form carbonic acid that can dissolve calcium carbonate, a major component in limestone and marble. Other sources of acid that attack stone come from the reaction of water with chlorides, nitrates, and sulfur. Other chemicals from car exhaust and industrial pollution react with carbonates to create disfiguring brown and black layers on the surface or simply adhere to stone and discolor the surface. Abrasive particles carried by the wind can wear away surface detail.

Biological agents such as bacteria, algae, fungi, and moss grow on stone surfaces and inside cracks pushing them further apart. These agents also retain water and contribute to the damage caused by water and atmospheric pollutants. Their organic waste products can dissolve calcium carbonate. Biological agents can also cause staining. Birds can disfigure and damage stone with their waste.

5. *Should I move stone objects indoors?*

The best way to protect stone objects stored outdoors is to move them inside. This action radically limits the agents of deterioration that will contact the objects. However, be aware that moving an object indoors is a major environmental change and you should carefully examine the object before moving it. Monitor the object after it is brought inside. Most objects will dry out when moved indoors. As water is lost from the interior, residues left by pollutants, biological matter, cleaning agents, and soluble salts may begin to crystallize on the surface. Where previously they were washed away by rain, they can now cause damage to the stone and may require treatment. Mold may grow on dirt and biological waste accumulated on the surface when it was outside.

F. Preventive Conservation

1. *What special handling rules for ceramic and glass objects should I know?*

Follow these special rules when handling ceramic and glass objects:

- Handle glass and ceramic objects as little as possible.
- Before handling, examine the object carefully. Note any unstable repairs, loose parts, lifting glaze, hairline cracks, or vulnerable appendages.
- Don't wear cotton gloves to handle glass or ceramics because the surfaces are slippery. Use clean, bare hands or snug fitting latex or nitrile gloves. In particular, use latex gloves for lustreware, iridescent glasses, and gilded ceramics and glass. The moisture, oils, and acids left from bare hands will disrupt and eventually etch these delicate surfaces.
- Don't lift objects by handles, knobs, rims, or decorative motifs. ***Always use both hands to support the object uniformly.***
- Transport ceramic and glass objects in a padded container. Don't stack objects. Don't allow objects to knock together. If you are moving numerous objects, use a well-balanced and padded cart with a lip at the edge of the surface. Use plenty of soft tissue or cloth diapers to prevent objects from rolling and tipping.
- Transport detachable parts such as lids or bases separately. If there are loose (but not removable parts), slip tissue or polyethylene foam between the parts to prevent rubbing or bouncing.
- Carry thin, flat objects, such as mirrors or panes of glass, vertically. This position distributes the weight and minimizes the chance of cracking the object. If the object is heavy, you may need to use a dolly or hand truck and assistance from other people. Be sure the dolly has soft wheels and all surfaces are cushioned.
- Never apply tape or sticky labels to ceramic or glass objects. When they are removed, delicate overglazes, decals, and gilding may be removed as well. Tape and labels will also leave residues on the surface of the objects that may cause staining or attract dust.

Refer to Chapter 6: Handling, Packing and Shipping Museum Objects, for basic rules on handling museum objects.

2. *What special handling rules for stone objects should I know?*

Follow these rules:

- Wash hands and wear clean, white gloves.
- Always take care when placing your hands on a surface. Paint, gold leaf, and delicately carved areas can be damaged. Previously repaired areas may not be stable.
- Always carry one item at a time and never lift by projecting parts such as arms, legs, or wings.
- Use a cart when moving an object more than a few feet or when moving more than one object. Use padding, wedges, and blankets to stabilize objects and prevent them from touching and abrading each other.
- You may need to use a forklift to move large, heavy stone sculpture. Be sure you have enough help when moving large objects. Make sure straps or chains that secure the object are well padded and cannot slip and scratch the surface. Cover and pad protruding parts. Make sure the object is properly supported on the forklift before putting your hands underneath the object.
- Be sure that equipment used around large stone objects (ladders, scaffolding, other maintenance equipment) is used carefully.

3. *What environmental parameters should I use for ceramic, glass, and stone objects?*

See Chapter 4: Museum Environment, for a discussion of how to set temperature and humidity ranges for your objects. In general, objects should be maintained in a stable temperature and relative humidity with no more than +/-5% variation in a day.

A few types of ceramic, glass, and stone objects will need special consideration when developing their museum environment because of deterioration problems.

- ***Deteriorating glass objects:*** Unstable, weeping and crizzling glass and glass that appears cloudy or iridescent or is suspected of being unstable for some other reason should be stored in a stable microenvironment. The humidity must be tightly controlled: too high and deterioration will progress; too low and cracking may occur. Contact a conservator for advice on how to prepare a microenvironment to store unstable glass. See *Conserve O Gram* 1/8, Using Silica Gel in Microenvironments, for information on using silica gel to buffer the environment.
- ***Archeological ceramics and stone:*** Archeological ceramics and stone may have absorbed soluble salts from burial. (See *Conserve O Gram* 6/5.) These objects must be stored at a low and stable relative humidity. If fluctuations occur, the salts can move through the porous ceramic structure and crystallize near the surface to cause damage.
- ***Composite objects:*** If ceramic, glass, or stone objects are combined with other materials, particularly organic materials, use the environmental parameters recommended for the organic materials. For example, keep stone objects framed in wood in an environment that will preserve the wood. Store polychrome sculpture in a stable environment to protect the painted surface.

4. *What light levels should I set for ceramics, glass, and stone?*

Visible or UV light will not damage most ceramics, glass, and stone. Light will not deteriorate inorganic materials. Infrared (IR), however, can cause damage, by heating objects and by causing changes in relative humidity around the object. These RH fluctuations can cause salts to crystallize out or cause slight expansion and contraction of surfaces. Keep light fixtures outside of exhibit cases. Don't use spotlights directly on objects. See Chapter 4: Museum Collections Environment, for a discussion of light and light levels.

5. *How should I store stable ceramic and glass objects?*

Choose storage solutions that will minimize handling and thus the chance of breakage. Design the storage area so that access is safe, simple, and direct. See Chapter 7: Museum Collections Storage, for more complete information on storage design and choosing cabinetry.

- Cabinets should be in a low traffic area in the storage room to reduce the chance that people will bump into them.

- Store ceramics and glass on stationary shelves to avoid damage from vibration. Line shelves with closed-cell polyethylene foam (Volara®). Attach the foam with double-stick tape so it will not bulge or slide.

- If possible, choose museum cabinets with clear glass doors to allow visual access without handling. Don't store other light sensitive objects in these cabinets. All cabinets should have gaskets and close tightly to minimize dust accumulation. See *Tools of the Trade* for information about storage cabinets. See also, *Conserve O Gram* 4/3, Installing the Retrofit Gasket Kit.

- If possible, choose shelves that are only deep enough to accommodate a single object. This limits the need to move one object to retrieve another. Place small objects in rows with ample space to reach one object without touching another.

- Store the heaviest objects on the bottom shelves.

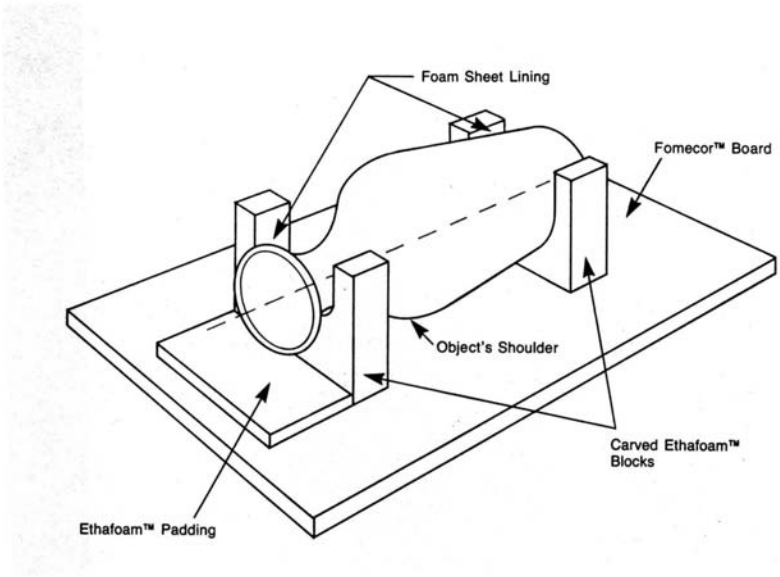
- Don't stack plates, cups, and bowls. If a critical lack of space requires stacking, place soft fabric, such as washed, white cotton flannel or polyethylene foam, between each object. Make sure the objects nest well and don't put pressure on each other.

- If objects are unsteady due to their shape or to damage, store them in a stable position using padding or foam blocks. See Figure P.1 for an illustration.

- Pieces of broken glass and ceramic objects should be kept together. Pad pieces so they don't abrade each other and keep them together in a tray or box.

- Use dust covers on open shelving. See *Conserve O Gram* 4/2, Dust Covers for Open Steel Shelving. If oversized objects must be stored in the open, they should be covered with a polyethylene bag or dust cover.

- Stabilize shelves by bolting them to walls and ceiling. Open shelving should have earthquake bars.



A top heavy or damaged object can be stored in an Ethafoam™ cradle. To make a cradle.

(a) Lay the object on its side, supported so it is level.

(b) Measure the curve of the base and the neck with a flexible drafting curve.

(c) Cut each curve into a 1" - 2" thick Ethafoam™ block. Use a long knife (e.g., bread knife) with a fine serrated edge. Thickness depends on the size of the object. The placement of the curve on the block should allow the shoulder of the object to touch, not rest heavily, on the mat. The foam blocks can be free standing or fixed to a Fomecor™ board so that each cradle is portable.

(d) Place padding or a thickness of Ethafoam™ underneath any projecting part of the object (such as the rim) as a barrier against bumping.

(e) Cut thin foam sheet for lining the cradle surfaces.

Figure P.1. Method of Stabilizing Objects in Storage

See *Conserve O Gram* 14/5, Caring for Photographs: Special Formats, for information on the special housing and storage needs of glass plate negatives and transparencies.

6. *Are there special storage concerns for unstable glass and ceramics?*

You may need to store unstable glass or ceramics in a microenvironment that keeps the relative humidity at a lower level than the general storage environment. Low RH slows the deterioration of weeping glass and ceramics with soluble salts.

Before taking this step, carefully discuss the need for this option and the design of your storage system with a conservator. Creating a microenvironment generally requires long-term maintenance, and if it fails, more harm may come to the objects than if you had done nothing.

You may create a closed microenvironment in:

- an individual container, such as a polyethylene box with a tight fitting lid (Rubbermaid®, Tupperware®)

- a fishtank with a plate glass top
- a single museum cabinet

Use silica gel buffered to 40% RH to control the microenvironment. See *Conserve O Gram* 1/8 for an explanation of how to buffer silica gel and how to figure the quantity of silica gel needed in your container.

Your storage system must isolate the object from the silica gel. ***Don't let the silica gel touch the object.*** Work with a conservator to develop the best storage system for your particular objects. You need to consider the following:

- How many objects do I need to store?
- What size are the objects?
- What shapes are the objects?
- How fragile are the structures of the objects?
- How fragile are the surfaces of the objects?

7. *What are the storage requirements for stone objects?*

Keep in mind the following points when developing a storage system for stone objects:

- Keep dust from the surface of stone objects. Dirt and dust can accumulate in the pores and darken the surface. Use individual polyethylene bags or muslin dust covers (see *Conserve O Gram* 4/2) to keep dust from settling on objects in storage.
- Keep objects away from open windows, air conditioning vents, and heat sources.
- Small objects, such as arrowheads and beads, should be stored in individual bags or boxes so that they are not easily lost.
- Large stone objects present problems because of their weight. Be sure your shelving units can support the weight of the object. Use polyester felt as a shelf liner for heavy stone objects because it will not compress as much over time as polyethylene foam.
- Store heavier objects on bottom shelves. This lowers the center of gravity and minimizes the danger of a rack toppling over.
- Don't allow any part of an object to protrude beyond the edge of shelving where it might be bumped.
- Don't store large sculptures directly on the floor. Create a low deck or use pallets at least four inches off the floor. Raising objects protects them from floor cleaning chemicals and minor flooding.

- Allow sufficient space between objects so that they can be easily moved and periodically inspected. Large objects especially need enough space so they can be handled without knocking other nearby objects. If heavy pieces are regularly moved, store them on dollies with lockable wheels.

- In earthquake prone areas, use earthquake stabilization techniques. Securely bolt shelves and cabinets to walls and floors. Attach restraining bars to the edges of shelves. Be sure overhead lights, pipes, and ductwork are also reinforced.

8. *What special preventive conservation concerns should I have for ceramic, glass, and stone objects on exhibit?*

Exhibiting an object puts it into contact with many more agents of deterioration. See *MH-III*, Chapter 7: Exhibits, for an overview of preservation concerns when objects are put on exhibit. *Exhibit Conservation Guidelines* by Toby Raphael is also a useful guide to incorporating preservation in your exhibit.

Work with a conservator and experienced designers and mountmakers to ensure exhibit techniques will not damage objects. Heed the following when designing a new exhibit or evaluating ways to improve your current exhibit.

- Make sure all objects are securely mounted so that they cannot fall if the case or pedestal is bumped. Construct mounts from stable materials and attach them so they don't put undue physical stress on the objects. Use seismic stabilization mounts in earthquake-prone areas.

- Don't direct spotlights on individual objects. Spotlighting can cause thermal shock as well as raise the interior temperature of the case.

- If sculpture is exhibited outside a case, be sure to provide a physical barrier so it cannot be touched. Use a pedestal or a deck to raise the objects up off the floor. Make the pedestal large enough that it cannot be easily ignored by visitors trying to reach the work of art.

- Busts and small stone objects must be securely mounted to prevent them from toppling over. A variety of techniques can be used to mount the object. Work with an experienced mountmaker and a conservator to design a safe mount.

- Don't plaster or cement stone reliefs directly into the wall. They will be difficult to remove later and moisture and salts from rising dampness can infiltrate the object from the wall.

- When cleaning objects on display, brush the dust off into a vacuum; don't use a cloth. See *Conserve O Gram* 8/1, Removing Dust from Ceramic and Glass Objects.

- If stone sculptures are exhibited outdoors, you should develop an annual monitoring program to watch for deterioration. Conduct a careful condition survey and document the sculpture with detailed photographs. Consider having a conservator conduct a Collection Condition Survey to give you baseline information and train staff in evaluating deterioration. If objects are deteriorating rapidly, they should be brought indoors. Consider putting a replica in place of the original. Refer to *MH-III*, Chapter 5: Three Dimensional Reproductions.

G. Care of Composite Ceramic and Glass Objects

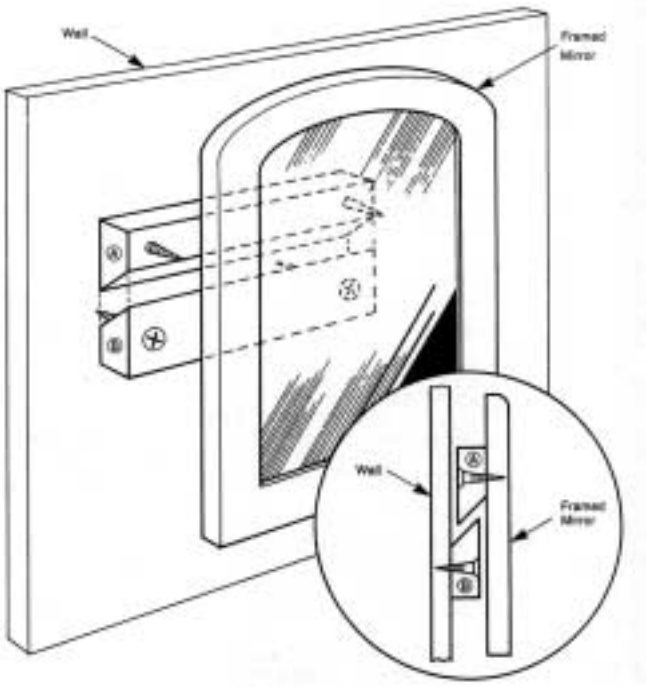
Composite objects are museum objects made of more than one material. These materials can react to the environment differently, setting up stresses that may cause the object to deteriorate more quickly than one made of a single material. Glass, in particular, was used in many types of composite objects and may be sewn or attached to a variety of materials. Be sure to take into account the preservation of all parts of the object. For example, never use water to clean glass beads sewn onto costumes. You may damage the attachment thread and the fabric or leather of the costume.

Two types of composite ceramic and glass objects that have special preservation concerns are:

- ***Mirrors:*** Look closely through the front of the glass to see if any silver-colored droplets or beads have formed on the back of the glass. Before the 19th century, mirrors were made reflective with a toxic mercury/tin amalgam. This coating can break down. Look for droplets collected at the bottom of the frame. Always wear disposable plastic gloves when handling mirrors you suspect may have a mercury coating. Contact a conservator to examine an unstable mirror.

  For all mirrors, examine the glass carefully. Do you see breaks or chips in the glass? Is the glass sticky (weeping glass), or does it have an overall network of very fine cracks (crizzling)? Is the coating on the back still reflective, or do you see black spots or streaks that indicate deterioration or peeling?

  Be sure the glass is securely attached to the frame and the frame is in good repair. Store heavy framed mirrors face up on well-padded shelves. Support the frame with padding. Make sure that all the weight is not resting on the mounting hardware or the glass.



To mount a heavy mirror:

(a) Place the mirror face down on a padded surface. Use additional padding in the flat and recessed areas to relieve any pressure on ornately carved areas.

(b) Measure the width across the back of the frame, approximately one-third down from the top.

(c) Locate a point on each side of the frame back into which the mounting board can be safely attached.

(d) Cut a rectangular clear pine board (e.g. 1" thick x 4" wide, though the actual dimensions depend upon the size and weight of the mirror) to the width of the frame back. Cut the board along the grain at a 45º angle to the edge. Paint all wood surfaces with one coat of two-component epoxy paint.

(e) Screw Part A into the back of the frame and Part B into the wall.

Figure P.2. Flush Mount for Hanging Heavy Mirrors

- ***Chandeliers:*** Look closely to identify parts that are fixed and parts that are free to move before cleaning or moving a chandelier. Ask the questions:

  – How secure are the hooks and joints?

  – Are there any missing prisms or other parts?

  Chandeliers on display in the open air, for example in historic houses, will need to be dusted occasionally. Use a scaffold or sturdy ladder to reach the chandelier so you can keep your hands free and safely move around the chandelier. Move furniture and other items on the floor away from the ladder. Dust prisms or moving parts individually so they don't knock into each other. Follow the instructions for dusting found in *Conserve O Gram* 8/1.

When a chandelier is not on view (for example, when a house is closed for the winter) or has been placed in storage, cover it with a muslin or polyethylene bag to keep it clean. Mark light switches or turn off the power at the fuse box so covered lights will not be turned on.

H. Treatment Issues for Ceramic, Glass and Stone Objects

The following section discusses particular considerations before any treatment is carried out either by park staff or a conservator. See Chapter 3: Preservation Getting Started, and Chapter 8: Conservation Treatment, for general information on working with a conservator. When you work with a conservator, you will need to make choices about the type of treatment that is appropriate for your objects.

If objects are not stored in closed cabinets, for example, on display in a historic house, trained museum staff should dust them. This basic maintenance will avoid the need for more difficult and more expensive cleaning in the future. Follow the instructions in *Conserve O Gram* 8/1, Removing Dust from Ceramic and Glass Objects.

1. *What should I consider before cleaning ceramic and glass objects?*

If objects are dirty enough to require washing, you should work with a conservator to develop a cleaning program. Before placing any ceramic or glass object in water, determine that:

- the ceramic is actually fired
- the glass or ceramic is intact
- there are no previous fills
- no surfaces are powdery, sticky, or crackled
- there are no stains that might migrate

If any of the above conditions is not met, don't wash the object.

2. *What should I consider before cleaning stone objects?*

Stone objects stored indoors should be regularly dusted. Don't wash stone objects. If stone objects are very dirty, get advice from a conservator. Don't use commercial cleaners without the advice of a conservator; many contain acids that can dissolve the stone. Problems that can occur with wet cleaning include:

- stains that move further into the stone, instead of washing out
- loss of polish on soluble stones such as alabaster
- movement of soluble salts that then crystallize and damage the surface of the stone as it dries

3. *How can I tell if an object has been repaired?*

You may be able to identify repaired areas using one of the following methods:

- Examine the surface with a magnifying glass in good light to identify breaks.
- Examine the surface with a hand-held ultraviolet light to identify cracked glaze, fills, adhesive lines, or painted surfaces. Different materials will fluoresce differently and some will not fluoresce at all, allowing you to identify damage and repairs that may not be visible to the naked eye.
- Test different colored areas on the surface in inconspicuous areas with a slightly damp cotton swab to confirm that they are truly glazed.

4. *Should old repairs be removed?*

Work with a conservator to decide whether or not to treat a previously repaired object. A conservator can give you a variety of options for any project. Old repairs should be removed only if they are unstable or obscuring or damaging surface detail, and if they are not an important part of the history of an object. If a heavily repaired object is stable, there is no reason to remove all the old repairs and redo them. You may want to consider doing cosmetic cleanup and restoration if an object is going on exhibit.

5. *What should I discuss with the conservators before losses are filled?*

If there are losses in an object, you will need to discuss with the conservator whether or not they should be filled or replaced. For example, a porcelain vase may have small chips along break lines or even small pieces missing. A stone sculpture may have lost a piece or had it stolen by vandals. Take into account the following before a fill is carried out:

- Is the object stable without the fill?
- Is the loss unsightly?
- Do you know what the loss area looked like previously?
- Do you want the fill to match exactly or only be of similar tone?
- Are available fill materials stable or will they discolor quickly?

Different choices will be made based on the stability of the object and aesthetic desires. In general, fine and decorative art objects are restored to a higher level than archeological objects.

6. *When are objects consolidated?*

Conservators consolidate objects when they have lost cohesiveness in their structure. Examples of objects that might require consolidation include:

- delaminating glass
- ceramics that have been seriously damaged by soluble salts
- stone with a flaking surface

Different consolidants are used for different materials and for different problems. A conservator will evaluate the problem and recommend a specific material and a specific technique for application that will stabilize your object.

I. Packing and Shipping Glass, Ceramic, and Stone Objects

See Chapter 6: Handling, Packing, and Shipping Museum Objects, for general guidance on packing and shipping objects. Since ceramic, glass, and stone objects are all brittle, sufficient padding must be provided to cushion the object from any shock. Always use double boxing when packing and shipping these objects.

1. *How should I pack ceramic, glass and stone objects for shipping?*

In order to ensure that ceramic, glass, and stone objects are protected, they should be packed in individually contoured foam wells. Polyurethane is a good shock absorber, but it is an unstable material. Polyethylene foam is stable, but cut edges are very abrasive. When you use either foam for padding you must isolate the object from the foam with soft tissue or washed cotton flannel. Don't use buffered paper as it can be slightly abrasive to gilded or painted surfaces.

Objects with extremely delicate surfaces and appendages require special attention. Wrap long strips of soft tissue closely around the object to protect the surface. Fit unsupported areas (for example, handles and spouts) with soft tissue prior to overall wrapping. See Figure P.3 for an illustration of the technique to use for wrapping fragile objects. See Figure P.4 for an example of using layers of foam to completely surround, protect, and pad the object.

2. *How will I ship particularly heavy items?*

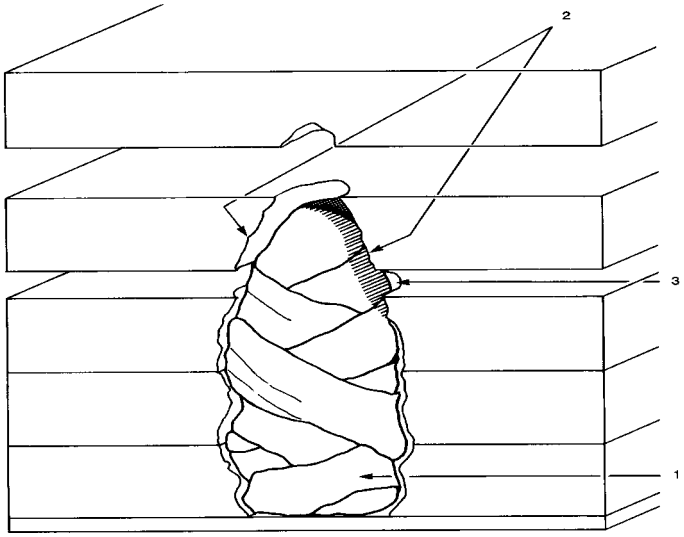
Heavy items like stone sculpture will require specially designed cases with interior supports at weight bearing and stabilizing locations. Pad all interior braces. Build in a pallet base so the object can be lifted with a forklift.

Object with a fragile or delicate surface (1)

Wrapping Technique (2)

(a) Cut soft tissue (does not have to be acid free) into long strips.
(b) Carefully wrap tissue strips around the object.
(c) Tape ends to tissue only.
(d) Repeat wrapping until object is completely covered with a few layers of tissue.

Figure P.3. Technique for Wrapping a Fragile Object



Fragile object that has been enclosed in mummy wrapping (1). The tissue wrapping protects the object's surface from abrasion that may be caused by the foam packing material. This technique works best when the top and front of the crate are removable. Follow these steps:

(a) Cut layers of Ethafoam™ (2) to completely fill the interior dimensions of the foam lined crate. Use a long knife (e.g., bread knife) with a fine serrated edge. The stack of foam is then cut in half vertically. Next, the contours of the object are cut in each half of the foam stack, one layer at a time. Nest the object in the center of the layers.

(b) Fill any gaps in the foam's center with tissue paper (3). *Caution:* Do not put pressure on the object.

Figure P.4. Layered Foam Packing for Fragile Objects

J. Emergency Procedures for Ceramic, Glass, and Stone Objects

See Chapter 10: Emergency Planning, for general information on planning for emergencies and responding to disasters.

1. *What special procedures should I follow for ceramic, glass, and stone objects after a disaster?*

The following procedures give some specific actions you can take to help preserve ceramic, glass, and stone objects immediately after a disaster.

- ***Water:*** If water is dripping onto objects, immediately cover them with plastic sheeting or bags. Water can cause stains and streaks. In particular, protect painted pieces, unfired clay, or deteriorated stone or glass. Don't seal the plastic completely as mold may grow.

- ***Severe weather:*** Move objects away from windows. Cover glass cases or tape the glass to prevent shattering and flying glass. Lay tall objects on their sides and pad so they cannot roll.

- ***Liquid attack*** (for example, acids, bases, or solvents): Vandals may throw or spill chemicals onto objects that are not protected by cases. Avoid contact with unknown liquids, but act quickly and try to identify the substance. Consult a conservator as quickly as possible to get advice and ensure that damage has been contained.

  Small, localized attacks should be rinsed well with water. Water will neutralize acids or bases and slow severe etching.

2. *How do I recover from a disaster with ceramic, glass, and stone objects?*

Air-dry wet ceramic glass and stone objects. If they don't have a damaged or rough surface, you can blot the surface gently with a soft cloth to remove excess water.

If an object is broken, keep people away from it. Photograph it *in situ* if possible. Keep all pieces together, carefully collecting them and placing them in a padded tray or box. Small pieces can be put in plastic bags. Collect even tiny chips. Don't try to fit broken pieces together as this will only abrade edges and prevent a good fit when the object is repaired. Don't allow pieces to rub together. Keep pieces clean; protect them from dust.

Contact a conservator to have the object repaired as soon as possible.

Appendix Q: Curatorial Care of Natural History Collections

Appendix Q: Curatorial Care of Natural History Collections

A. Overview

1. *What information is in this appendix?*

Many parks have Scope of Collections Statements that call for collecting and documenting natural history specimens from the ecosystems in parks. This appendix is a brief introduction to the care of a wide range of specimens found in natural history collections. It contains information about:

- the preventive conservation approach for natural history collections in general
- basic descriptions of the variety of specimens you may find in your natural history collections
- descriptions of the common collecting techniques that have historically been used for natural history specimens

Note: Refer to the glossary at the end of this appendix for the definitions of specific terms.

This appendix will **not** give you information on proper techniques for care and storage of natural history collections. Information on preventive conservation for each type of collection will be contained in Appendix T: Care of Biological Collections, Appendix U: Care of Geological and Paleontological Collections, and Appendix V: Care of Environmental Research Collections, to follow. These appendices will give you information on environmental standards, handling, storage techniques, and shipping natural history collections.

Also, this appendix will **not** tell you how to collect and mount specimens yourself. These are skills requiring specialized education and training.

Preventive conservation is the best approach to caring for the vast amount of scientific data resident in natural history collections. Understanding basic collecting and preparation techniques will help you to understand preservation problems specific to natural history collections.

2. *Why are natural history collections important?*

Natural history collections form the basis for our understanding of the world. Scientists use natural history collections to look at questions of evolution and global change. As non-renewable resources, natural history collections document disappearing habitats, species extinction, and disappearing geological and paleontological sites. Natural history specimens document the presence of a species at a specific place and time.

Research enhances the value of these collections. A vast number of questions can be asked about our parks and the environment using natural history collections. As collections are studied and used, the information generated expands our knowledge of the parks and their relation to the broader environment. Collections that have been used for research can be used to document work, confirm conclusions, and develop new interpretations.

3. *What is the purpose in preserving natural history collections?*

Curators and collection managers maintain natural history specimens so scientists can access these specimens in the future to answer questions about the natural world. Collections document change in the natural world. Each properly documented specimen is a unique historical and scientific record. Each natural history collection may be valuable for scientific research.

Preserving the information contained in specimens is the primary goal of natural history conservation.

Preserve each specimen so that scientists can use it to:

- verify past research
- complement or facilitate current research
- encourage and enhance new research in the future

Use preventive conservation to care for scientific collections and maintain them for research by scientists. Focusing on the research potential of these collections doesn't mean that you can't use them for exhibition or teaching. However, you should first consider the research potential of any specimen when making a decision about its care and use. Research on natural history collections is as diverse as the specimens themselves. Review the importance of NPS collection-based research in Chapter 1: NPS Museums and Collections.

4. *What is preventive conservation?*

A specimen with an unknown collection, preparation, and treatment history cannot be used with confidence for any research. A preventive conservation approach ensures the integrity of the specimens for research by introducing as little change as possible. Preventive conservation also improves specimen potential for use in exhibits and educational programming. For an introduction to preventive conservation, see Chapter 3: Preservation: Getting Started. For a discussion of "minimal intervention," see Chapter 8: Conservation Treatment.

A preventive conservation approach allows access to all collections while minimizing the risk of deterioration and loss. Use this perspective while collecting, preparing, and maintaining specimens. Follow the maxim: "minimal intervention – maximum documentation."

Do as little as possible to a specimen and record whatever you do completely and accurately. Record this information in:

- field notes
- ANCS+
  - preparation/treatment supplemental record
  - preservation supplemental record

Good documentation distinguishes conservation treatment from simple meddling. The documentation requirements for any conservation treatment are discussed in Chapter 8: Conservation Treatment, and the American Institute for Conservation (AIC) Code of Ethics and Guidelines for Practice in Appendix D.

Good storage design promotes preventive conservation. Effective storage designs improve access, minimize unnecessary handling, and properly cushion and support specimens. Good storage protects specimens from agents of deterioration, such as pests, light, improper or fluctuating temperature and relative humidity, and environmental pollutants. Use storage materials that will not interact with the specimens. For more information on safe storage materials see the *Conserve O Gram* (*COG*) series and NPS *Tools of the Trade*.

Active treatments should rarely be performed on a specimen preserved for research. By simply cleaning a specimen you may remove information. Stabilize damaged specimens by means other than active repairs. In contrast, specimens intended for exhibits and educational programming may require repairs for both stability and aesthetics. Repair may be acceptable when it will improve the durability and visual appearance of a specimen for the public.

5. *How can I find the latest information on the care of these natural history collections?*

You can find information on natural history conservation in a variety of sources. Because this is a new and rapidly evolving field, it's important to be aware of new information as it is published.

Sources of information:

- NPS *COG* series includes a section titled "National History Specimens." Watch for updated information.

- The Society for the Preservation of Natural History Collections (SPNHC), a professional organization, specifically supports collections management and preventive conservation for natural history collections. The organization publishes a newsletter and a journal, *Collection Forum*, with information on preservation of natural history collections. SPNHC has published two books that are invaluable resources for any park with natural history collections: *Storage of Natural History Collections: Ideas and Practical Solutions,* edited by Carolyn L. Rose and Amparo R. de Torres and *Storage of Natural History Collections: A Preventive Conservation Approach,* edited by Carolyn L. Rose, Catharine A. Hawks, and Hugh H. Genoways. You can find more information about SPNHC at <http://www.geo.ucalgary.ca/spnhc/>.

- Many natural history disciplines support professional groups that publish specialized newsletters and journals with articles on new research and techniques. See Section F for some of these publications.

- Information on the use of natural history collections can be found in *Museum Handbook,* Part III,*(MH-III)* Chapter 1, Section F.

6. *What other NPS documents give me information about natural history collections?*

There are a variety of NPS sources that contain policy and guidance on natural history collections. You should acquaint yourself with the information in the following documents:

- Chapter 1: Museum Collections, and Chapter 2: Scope of Museum Collections, discuss what kinds of collections (including natural history) you should collect and why.

- Chapter 4: Museum Collections Environment, and Chapter 7: Museum Collections Storage, discuss the building envelope and how it can protect your collections.

- Museum Handbook, Part II (*MH-II*), Chapter 4: Special Instructions, discusses compliance with the Code of Federal Regulations (36 CFR 2.5). This regulation states the conditions under which the superintendent may issue permits to collect natural history specimens. See especially Section VI, Complying with Regulations for Cataloging Natural History Specimens.

- *MH-II*, Appendix H: Natural History, describes cataloging and labeling natural history specimens.

- *MH-III*, Museum Collections Use, discusses research use on existing collections. In particular, see Chapter 1: Evaluating and Documenting Use, Section F, Scientific Issues.

- Special Directive 91-4, Ensuring that Natural Resource Projects Fund the Curation of Collections, provides guidance on cataloging requirements for collectors. A new *Director's Order #24: Museum Collections Management*, will replace this special directive.

- New guidance on research and collecting permits, application procedures and related forms has been published in the Federal Register.

- *Director's Order #28: Cultural Resource Management Guideline*, Chapter 9, Management of Museum Objects, discusses the importance of field notes and other archival and manuscript collections that may help document and interpret museum collections.

7. *Where can I find information about the hazards found in natural history collections?*

Information about hazards found in natural history collections is abundant. Hazards come from preparation, storage materials, pest control methods, or may be inherent in the specimens. To find information about hazards, look at:

- references listed under Health and Safety in Section G, Selected References

- Chapter 11: Curatorial Health and Safety

- NPS *COG* leaflets on a range of topics, especially Section 2, Security, Fire and Curatorial Safety, and Section 11, Natural History Specimens

- the Internet, starting with Conservation OnLine (CoOL) <http:// palimpsest.stanford.edu>, which has a section on health and safety.

B. The Nature of the Collections

The specimens in natural history collections are often diverse and complex. Natural history collections may be:

- organic (such as birds and mammals)
- inorganic (such as rocks and minerals)
- organic/inorganic composites (such as shells, some fossils, and bone)

Specimens are collected from a vast array of natural environments. The one thing most natural history specimens have in common is that they are usually ***prepared*** before being added to the collection.

1. *What is preparation?*

Most specimens come to museums through field collecting. But, whatever their source, all specimens undergo some field and/or laboratory preparation prior to becoming part of a collection. Preparation may entail the skilled excavation of fragile fossils from the surrounding matrix, or the complex chemical fixation of biological tissues to stop putrefaction. Whatever the preparation method, the reason collectors prepare specimens is to make them accessible for research and other use.

Research and other specimen use vary considerably depending on the collector. Research questions have changed historically. For these reasons specimens of the same kind (for example, bird study skins) may have been prepared by a variety of methods.

For biological collections, most basic preparation is done in the field within hours of the collection of the specimen. This ensures that they will not deteriorate before being taken to the laboratory for final preparation, analysis, and storage. Geological and paleontological collections are prepared both in the field and in the laboratory depending on the particular collecting environment and the needs of the specimen.

After preparation, a specimen may consist of several parts. For example, a small mammal specimen may become a study skin and a separately cleaned and stored skull, while the remainder of the body may be stored in fluid. A matrix formed of various rocks and other minerals may surround a mineral specimen. Parts of the mineral specimen or its matrix may be prepared as separate specimens or as mounts for microscopic examination. You should be aware of the importance of diverse kinds of preparation techniques in natural history collections.

2. *Are there standards for preparation?*

There are no standards for preparation that apply to all specimens. The type of preparation depends on a variety of factors including:

- the kind of specimen
- intended research or other use of the specimen
- skill, experience, and research interest of the collector

- tradition
- available resources

In addition, there has been little research into the chemical and physical effects of many types of preparation. Because of all these issues it is impossible to develop a servicewide standard for preparation of an individual species. **There is no one right way.**

You can work with researchers during the permitting process to request that they use preferred techniques for your collections. See *NPS-77*: *Natural Resources Management Guideline*, Chapter 5, Program Administration and Management. For example, you can request that a collector use standard-sized glass jars with polypropylene lids lined with polyethylene for vertebrate specimens preserved in fluid. Be aware, however, that certain research issues may require that the scientists use different preparation techniques.

The natural history collection appendices following this one discuss the storage and care issues involved in the long-term preservation of natural science collections. You can use these requirements to help develop preferred preparation techniques for your collections.

3. *What kinds of natural history materials are particularly important?*

There are two kinds of materials that are especially important:

- **Type specimens** are the most important specimens in natural history collections. There are many categories of type specimens. The most important are the name-bearing types. ***Taxonomy*** is the discipline devoted to the identification, naming, and classification of organisms. Biological specimens are divided into scientific categories called ***taxa*** (singular taxon) and given specifically defined names (known as nomenclature codes). The biological sciences use Latin names rooted in the classification system begun in the 18th century by Carl von Linne (Linneaus). Mineralogy uses a system evolved from the 19th century work of James and Edward Dana. Researchers in both the geological and biological sciences use the concept of the "type."

  Type specimens must be designated in the first published description of the taxon. These are the specimens that are designated as the bearers of the scientific name of a taxon. Name-bearing types serve as international standards of reference in taxonomy. Scientists examine type specimens to verify identifications and to revise taxonomic classifications.

  The ***holotype*** is the most important name-bearing type. A holotype is the single specimen that is designated as the type in the first published account of a newly described taxonomic group. The account must be published in an appropriately reviewed scientific book or journal. There are a variety of other name-bearing types that are defined by the different scientific disciplines.

  Museums hold type specimens in trust to ensure their safekeeping, and equally importantly, their accessibility for research. **Type specimens are considered to be the property or heritage of the scientific community.** The scientific community considers it unethical for institutions to keep type specimens if they cannot adequately manage and preserve them.

- **Documentation** that accompanies scientific collections is as important as the specimens themselves. You should be sure to gather all documentation and data from the collector and incorporate it in museum collections along with the specimens. Section C discusses the wide variety of documentation that can be important to natural history collections. Labels or tags attached directly to specimens should be considered part of the specimens. Refer to Section E for more information on the care of labels and tags.

C. Natural History Collections

This section briefly lists and describes the variety of materials in natural history collections. It also briefly describes how collectors prepare and store specimens of different materials. The types of collections are broadly divided into four groups:

- biological collections
- geological collections
- paleontological collections
- environmental research collections

Specimens also have scientific documentation that is part of the park's archival collections.

1. *What kinds of specimens will I find in biological collections?*

Biological collections contain a wide variety of once-living specimens. Park biological collections document local ecosystems and their changes through time. This historical documentation is important to evaluate the effects of park policies on the natural environment. These specimens are divided in a variety of ways, which may vary from collection to collection. For example, invertebrates are separated between entomological (insect) collections and other invertebrate collections (such as mollusks or crabs).

The main divisions are:

- botanical specimens (plants)
- entomological specimens (insects)
- other invertebrate specimens (species with no backbone or spinal column)
- vertebrate specimens (species with a backbone or spinal column)

Examples of the types of specimens found in each of these types of collections appear below.

Microorganisms (bacteria, yeast, protozoa, viruses, diatoms, etc.) may be collected in parks, but are rarely, if ever, deposited in park collections at this

time. They have very specific and technical care requirements that require specialized repositories. For more information on biological specimens, contact specific discipline specialists and refer to *MH-II*, Appendix H: Natural History.

2. *What groups of species will I find in botanical collections?*

Botanical collections contain a wide range of material. The more common groups are:

- bacteria
- algae
- mosses and liverworts
- clubmosses
- horsetails
- ferns
- conifers and other evergreens
- flowering plants
- fungi

See the *MH-II*, Appendix H: Natural History, for a complete list.

3. *What kinds of specimens and preparations will I find in botanical collections?*

Botanical specimens have been collected and stored in diverse ways. Variations depend mostly on the physical characteristics of the specimens but also on their intended use. These include:

- dried plants on herbaria sheets
- dried specimens, or partial specimens, or dissected parts in packets (fragment folders) sometimes attached to herbaria sheets
- lichens and mosses, dried and stored in folded paper or glassine packets and sometimes attached to herbaria sheets or stored in boxes
- dried specimens in boxes – large fungi, wood samples, pine cones, and generally anything dry that is too large for a packet and too bulky for a herbarium sheet
- specimens in fluid – often cacti and other succulents, or flowering plants, fruits, or other specimens where pressing would be difficult or desiccation would destroy tissues of interest, including diatoms, slime molds, fungi, algae, and phytoplankton
- wood samples
- seeds (sometimes in cold storage)
- pollen

- economic botany collections – agricultural seeds, cultivars that are dry or in fluid, plant products
- freeze-dried display specimens
- plant models – display or teaching models in a variety of materials
- living collections
- DNA/RNA extracts
- various microscopy preparations – stained tissues, scanning electron microscope (SEM) stubs or mounts

4. *What groups of species are in entomological collections?*

Park entomological collections contain invertebrates such as insects and arachnids.

- arachnids – mites, scorpions, spiders, ticks
- insects – ants, beetles, bedbugs, bees, butterflies and moths, cicadas, cockroaches, crickets, damselflies, dragonflies, earwigs, fireflies, flies, gnats, grasshoppers, leafhoppers, lice, mantids, mosquitoes, termites, wasps, water boatmen, and weevils, etc.

This is an incomplete list. See *MH-II*, Appendix H, for a more complete list of entomology specimens.

5. *What kind of specimens and preparations will I find in entomological collections?*

You will find entomological collections as:

- pinned specimens – including spread-wing specimens
- specimens on points – specimens mounted on paper or other materials attached to pins
- specimens in fluid – usually alcohol or formaldehyde
- specimens in envelopes or folded packets
- microscopy preparations
- eggs, egg cases, and cocoons (wet or dry)
- larvae and pupae (wet or dry)
- nests
- living entomology specimens (to study life cycles)
- economic entomology collections – species that inhibit or foster agriculture or health, pest species, products from insects

- cultural or art objects derived from insects that are cataloged under cultural resources and cross-referenced to park entomological collections —for example, a necklace decorated with an amber-trapped insect

6. *What groups of species will I find in other invertebrate collections?*

Invertebrates are animals without backbones or spinal columns. Entomological collections in parks are usually separated from the other invertebrate collections. These other collections have specimens from both land and water (terrestrial and aquatic) environments.

- brachiopods, corals, crustaceans – for example, lobsters – and a few other classes from the phylum Arthropoda
- echinoderms – for example, sea urchins
- mollusks – for example, snails
- sponges
- worms

7. *What kind of specimens and preparations will I find in collections of other invertebrates?*

Invertebrate specimens may be stored as:

- dry specimens – mollusk shells, corals, most echinoderms, exoskeletons of some crustaceans
- specimens in fluid – mollusks with or without shells, brachiopods, crustaceans, plankton, sponges, worms
- specimens or specimen parts as microscopy preparations – mounts from Scanning Electron Microscope (SEM) preparations, mounts on microscope slides, sections of shells
- shell art and craft objects that are cataloged under cultural resources and cross-referenced to park invertebrate collections

8. *What groups of species will I find in vertebrate collections?*

Vertebrates are animals with spinal columns or backbones. Vertebrate collections often include:

- amphibians – for example, frogs
- birds
- fishes
- mammals
- reptiles – for example, snakes

9. *What kinds of specimens and preparations will I find in vertebrate collections?*

Vertebrate specimens may be stored as:

- study skins – untanned skins filled with fibrous materials to approximate the shape of an animal; may contain some skeletal material

- flat skins – tanned or untanned
- taxidermy specimens
  - mounted skins – tanned or untanned skins on mannequins, positioned in a life-like manner; may also contain some skeletal material
  - trophy heads – mounted tanned or untanned skins, sometimes with horns or antlers
- spread wings of birds – dried, untanned, with bones in wings
- naturally mummified specimens
- freeze-dried specimens – complete specimens, or gutted specimens with some fibrous fillings
- fluid-preserved specimens – whole or partial specimens including embryos, larval fish, and some eggs; also includes cleared and stained specimens, such as specimens that have been chemically prepared to be transparent
- skulls
- post-cranial skeletons – articulated, partially articulated, and artificially articulated
- whole skeletons
- dissected parts preserved dry
  - bacula (the penis bone)
  - sectioned teeth
  - stomach contents
  - otoliths (a layered calcium concretion found in the inner ear)
  - hyoids (a bone or a structure formed from cartilage located at the base of the tongue)
  - scutes (plates or shells from armadillos, turtles, tortoises)
- frozen whole specimens – incoming material awaiting processing
- frozen tissues – usually organs preserved for molecular analysis
- scats (dried fecal material)
- regurgitated pellets

- casts, molds, and peels
  - teeth
  - skulls
  - marine mammals
  - fish
  - some reptiles and amphibians
  - animal tracks
- whole eggshells and fragments – bird, mammal, or reptile
- nests – bird, mammal, or reptile
- feathers
- various microscopy preparations
  - SEM mounting stubs
  - tissue sections
  - parasites – both internal and external
- tissues for DNA/RNA extraction
- DNA/RNA, nucleic and amino acids, and other materials extracted from tissues
- feather art (objects crafted from feathers, where the feathers are of interest to scientists)
- animal skin rugs or other objects where the skins are of interest to scientists

10. *What groups of specimens will I find in geology collections?*

Geology collections document geological processes and materials. They can be divided in the following overlapping material types:

- rocks
- surface process materials
- minerals
- organic materials

- extraterrestrial materials
- soils

11. *What kind of specimens and preparations will I find in geological collections?*

Geological collections often contain:

- minerals
- biominerals – amber, pearls, and other materials considered to be minerals that are derived from biological process, such as those in bone and shell
- synthetic minerals
- gems
- rocks
- powders
- drill cores
- frozen specimens – samples of ice or ice cores
- ore samples
- mining concentrates
- soil samples
- products from industrial minerals
- petrology specimens
- meteorites and other materials of extraterrestrial origin
- fossils – collected for mineral content
- various microscopy preparations – thin sections, micromounts, X-ray diffraction mounts, SEM mounting stubs
- jewelry and lapidary art that are cataloged under cultural resources but cross-referenced to park geology collections

12. *How are geological specimens stored?*

Most geological specimens are preserved dry and in a normal oxygen environment. A few minerals require desiccated environments. Some minerals are stored in fluids. Meteorites and other extraterrestrial samples are preserved in specialized gaseous environments. Some radioactive specimens may require specialized housings. There are also a number of light sensitive specimens that should be stored in the dark at all times. For more information on storage and housing of geological specimens, see *COG* 11/2, "Storage Concerns for Geological Collections," and Appendix U: Paleontological and Geological Collections.

13. *What groups of specimens will I find in paleontological collections?*

When considering paleontology collections, most people think of dinosaurs. However, a wide range of plants, insects, invertebrates, and vertebrates will be found in paleontological collections. All ancient biological organisms may be fossilized or preserved in some other manner. For a complete list of paleontology specimens see *MH-II*, Appendix H: Natural History, Paleontology.

14. *What kinds of specimens and preparations will I find in paleontological collections?*

Paleontological collections may include:

- frozen specimens – collected from permafrost areas
- mummified specimens
- vertebrate and invertebrate body fossils
- plant and seed fossils
- trace fossils
- vertebrate and invertebrate sub-fossil specimens (specimens still retaining organic material)
- compression fossils (organic remains flattened by the pressure of soil and rock above)
- mounted skeletons
- reproductions made for study or exhibits – casts, molds, peels
- palynology specimens (pollen)
- specimens in fluid – for example, microfossils in glycerin
- fossils sliced into sections
- specimens in jackets (field material still encased in the plaster or other materials used to protect them during shipping to the museum)
- soil samples – often intended for processing to remove small fossils
- amino acids, DNA, and other materials extracted from specimens

15. *How are paleontological specimens stored in collections?*

Most paleontology specimens are preserved dry, in a normal oxygen environment. Paleontological specimens are often removed from the field in plaster jackets. Before and after preparation, these specimens are stored on shelves or in cabinets. Some microfossils are stored in glycerin or other fluids. Be aware of any radioactive paleontological specimens and use cabinets vented to the outside to store these materials. See *COG* 2/5, "Fossil Vertebrates as Radon Source: Health Update."

16. *What kinds of materials are in environmental research collections?*

Environmental research collections are specimens, samples, and analytical data collected to monitor levels of various elements and compounds in the environment. Environmental research may result in composite samples, such as water, precipitation, air, and sediment. They are classified separately from biology, geology, and paleontology collections because they are often mixtures of materials collected to study specific environments. For example, a water sample may be collected to study biota.

Some of the specimens and samples require extremely rigorous collecting, storage, and handling procedures to ensure specimen integrity for trace element or other analyses. For example, the National Institute of Standards and Technology, in conjunction with the National Oceanic and Atmospheric Administration and the National Marine Fisheries Service, has developed the National Marine Analytical Quality Assurance Program. Part of this program includes specimen banking (storage of specimens under very controlled, known conditions) to permit analysis of changes in marine environments over time.

17. *What kind of specimens and preparations will I find in environmental research collections?*

The variety of materials you may find in environmental research collections includes:

- biological tissues (in ultra-cold storage)
- soil samples
- water samples
- air samples
- air or water filters
- recording charts from analytical instruments – air, noise, water quality
- eggshell and mollusk shell samples
- other specimens or specimen parts collected according to special protocols

Chapter 2: Scope of Museum Collections, discusses environmental research samples in your scope of collection statement. For a discussion of how these specimens should be cataloged see *MH-II*, Appendix H: Natural History.

18. *What kinds of documentation are associated with a natural history collection?*

In some collections, the documentation is considered to be part of the specimen. Color images made when the specimen was collected are especially important. The National Park Service catalogs these collections as archival collections. The variety of materials used in documenting specimens include:

- original catalogs
- field notes
- locality maps (with handwritten notations)

- card files on various topics
- sampling/dissection records
- charts and graphs produced by analytical instruments
- computer tapes/disks
- original sketches/drawings/watercolors or other paintings
- plates or prints
- photographic records – slides or transparencies, prints, negatives, X-radiographs, prints and negatives of X-ray diffraction patterns and autoradiographs, motion picture film, videotapes, CD-ROMs
- sound recordings – reel-to-reel tapes, cassette tapes, phonograph records, compact disks

Other official records associated with natural history collections include:

- permit files and accession and catalog records (including catalog folders with copies of detached specimen labels)
- loan files
- condition records
- offprints of research articles based on the specimens
- exhibit catalogs featuring specimens
- books and periodicals

D. Collecting and Preparation Techniques.

1. *What are preparation techniques?*

Collectors use preparation techniques to prepare specimens for research and storage. These methods focus on the short-term preservation of the specimen. Preparation techniques achieve a particular purpose for research or public programming use of the specimen. Unfortunately, little research has been done to understand how interactions between the specimen and preservative chemicals or other preparation methods affect long-term preservation. Therefore, few preparation methods can be said to be either "right" or "wrong." The effects of preparation and storage techniques are areas of active research. Keep abreast of current literature to be aware of changes in methods. Recommendations may change rapidly.

Literally hundreds of chemical formulas, materials, and techniques have been applied to specimen preparation over the past three centuries. Collectors still use many of these techniques. The methods vary according to:

- the kind of specimen – bird, mammal, fish, amphibian, reptile, plant, mineral, fossil

- the primary purpose for which the specimen is collected – research, education, exhibit

- the specific research purpose for which the specimen is collected – gross anatomy, histology, classical taxonomy, biochemical analysis, crystallography, trace element analysis

- the skill and preference of the collector or preparator

- project budget and staff resources

Talk to discipline-specific researchers to gain an understanding of the preparation techniques commonly used on the specimens in your collection. The information given below describes the most common preparation methods. This overview may assist you in requesting adequate data when you accession new collections. The methods are divided into sections on dry collections, freeze-dried specimens, fluid-preserved materials, specimen labels, and labeling techniques.

2. *What documentation should I keep on preparation techniques?*

You should acquire information on the collecting and preparation techniques used for each specimen. Get this information at the same time the park accepts the specimens for the museum collection. The 1988 article by Gerald R. Fitzgerald, "Documentation Guidelines for the Preparation and Conservation of Paleontological and Geological Specimens," and the 1989 article by Kimball Garrett, "Documentation Guidelines for the Preparation and Conservation of Biological Specimens," provide excellent surveys of the topics of importance. In addition to information on the condition of the specimens at the time of treatment, these guidelines recommend that you obtain documentation on:

- field collecting and shipping techniques – Was the specimen captured (trapping, netting, killing methods) or salvaged (roadkill)? If it is a fossil or mineral, what were the excavation, packing, and transport methods?

- initial treatments – cleaning, freezing, drying, pressing, fixation, coating or application of other preservatives, jacketing materials, and delayed shipments of frozen material

- initial laboratory treatments on arrival at a museum or other collecting institution

- post-collection treatments of specimens – fumigation, degreasing, fluid changes, cleaning, matrix removal, consolidation, coatings, filling gaps, pest-proofing, restoration, repair

- specimen analyses – X-radiography, dissection, molding and casting, sampling, or other procedures that are likely to have an impact on specimen condition

Record this information in ANCS+ in the Preparation/Treatment associated module.

When specimens deteriorate, there is no way to evaluate the impact of their preparation history on that deterioration unless there is documentation on preparation methods. Hundreds of references on preparation methods have been published. However, there are few records that link a specific treatment to a specific specimen. This void in the documentation of specimens limits their utility for research, exhibition, and educational programs.

A scientist must know how a specimen was treated to decide if it is appropriate for current research. For example, scientists may choose not to do biochemical analysis if a specimen has an unknown history. Also, be careful about using a specimen with an unknown history for open display or in hands-on educational programming. Many long-lived toxic chemicals have been used in specimen preparation and in subsequent treatments of specimens for various purposes.

3. *How do collectors prepare dry botanical specimens?*

Collectors use a variety of techniques to prepare botanical specimens. You may find a range of methods in your older collections. Appendix T: Care of Biological Specimens, describes current NPS standards for collecting and storage. Often, specimens are just collected and pressed. Collectors may kill botanical specimens with a fluid – alcohol or petroleum. These fluids also help to remove water from the specimen. Specimens may also be cut open, boiled or salted, or dried/preserved with alcohol or alcohol vapor prior to pressing. It was common in the past to treat nearly every specimen with chemicals to control insects and microorganisms. Today, collectors more often use heat treatments or freezing.

Specimens to be mounted on herbaria sheets are sometimes washed in the field. To dry and flatten the specimen the collector puts it under pressure between sheets of paper, sometimes with heat. Back at the museum, a preparator mounts pressed specimens on paper or, if the specimen is bulky, on board. If you mount herbarium specimens, buffered, acid-free paper or board should be used. Mounting methods include:

- using strips of cloth, polyester film, or paper attached with adhesive
- using strips made with heat set tissues (a pure cellulose lens tissue impregnated with a heat setting adhesive)
- using adhesive alone, either under the specimen, or as straps
- sewing the specimen to the paper or board with thread

Many materials for mounting herbarium specimens are listed in NPS *Tools of the Trade*.

Packets of paper or glassine are used to store some specimens. Samples that collectors may place in packets and attach to sheets include: microscopy samples, dissected parts, seeds, some fruits, delicate parts of some ferns, and some other easily damaged specimen parts. Microscope slides and photographs are often placed in packets on sheets. Collectors attach labels and packets of fragments with a variety of adhesives.

Collectors sometimes dry bryophytes (mosses, liverworts, hornworts) and fungi with gentle heat. They may cut up fungi to speed drying. In humid field conditions the collector may store fungi and bryophytes over a desiccant chemical (such as calcium chloride) after drying. Fungi are particularly susceptible to insects. They are usually treated with a fumigant or are frozen or heated prior to introduction into a collection. In contrast, bryophytes are not particularly attractive to insects. Pest control chemicals can damage bryophytes. Therefore, collectors keep these specimens as dry as possible and don't contaminate them with fumigants.

Collectors usually store fungi and bryophytes in packets. Fungi packets rarely are attached to sheets; bryophytes are usually attached to sheets. Bulky fungi may require storage in boxes. Fragile species may require small boxes or trays inside the packet.

Some large or bulky botanical specimens are housed in polyethylene bags after drying. Bags, containing various parts of the same specimen, are supported on a mat board the size of a standard herbarium sheet. The entire assemblage is then placed inside another polyethylene bag. Very large specimens may simply be housed in a polyethylene bag. Specimens stored in this fashion must be very dry to avoid fungal growth in the bags. Large palm fronds and conifer branches are candidates for this type of storage.

4. *What problems might I see with dry botanical specimens?*

There are a variety of problems you may see in dry botanical specimens:

- Fragments may be lost from fragile specimens.
- Damage may occur from poor handling techniques and storage.
- Adhesives used by collectors may become acidic, discolor, fail, or shrink, causing damage to the specimens or labels.
- Paper and glassine used for packets may be acidic or may become acidic over time.
- Mold growth may occur on acidic, deteriorating glassine, which tends to be hygroscopic.
- Mold growth may occur on improperly dried specimens.
- Insects may damage the specimens.
- Migration of pesticides may stain herbarium sheets.

Many specimens have been treated with chemicals that may be health hazards or cause damage to the specimen. (See *COG* leaflets 3/12-3/14 concerning problems caused by the use of a variety of fumigants.)

5. *How do collectors prepare dry entomological specimens?*

Collectors use a variety of techniques to prepare entomological specimens. You may find a range of methods in your older collections. Appendix T: Care of Biological Specimens describes NPS standards for curatorial care.

Collectors kill entomological specimens with a chemical vapor or by dropping them in alcohol. They pin small specimens immediately. Other specimens are stored in alcohol or triangular glassine or paper packets.

Sometimes collectors relax specimens in a high humidity chamber (with a chemical to control mold) before spreading and mounting them.

Normally, collectors pin specimens through the right side with stainless steel or coated metal pins. The exact pin placement is governed by the position of the segment at the base of the wings. Sometimes collectors will mount them by first adhering the specimen to a paper or plastic point. Poor quality paper, archival paper, and Mylar or acetate films have all been used as points. Thin, dried strips of fungus, *Polyporus*, have also been used.

Collectors use a variety of adhesives to attach specimens to points. The points are then mounted on pins. Labels are commonly pinned below the specimen using the same pin. Collectors will often dry pinned specimens with low heat in an oven. Specimens removed from fluid may be dried in a critical point dryer. The technique involves dehydrating the specimen in acetone, placing it in a chamber filled with acetone, pumping liquid carbon dioxide into the chamber to replace the acetone, then heating the chamber to the critical point at which the liquid carbon dioxide becomes a gas. With moderate additional heat, the specimen dries completely.

6. *What problems might I see with entomological specimens?*

There are a variety of problems you may see in dry entomological specimens. These include:

- Virtually all specimens are exposed to fumigants or other chemicals at some stage in shipping and/or preparation. Some of these materials remain toxic indefinitely. Today, entomologists most commonly use paradichlorobenzene. You may see crystals of paradichlorobenzene and napthalene on the specimens or in specimen containers. Because of health and safety concerns about toxicity, this and any other fumigant you use must be approved through your IPM coordinator. See Chapter 5: Biological Infestations.

- Pins with slippery surfaces can yield specimens that "spin," or turn on the pin.

- Old specimen pins often contain copper or nickel in the alloys. These metals can react with fatty acids in the specimens to produce fibrous blue or green corrosion products.

- The collector may have used unstable papers, films, or adhesives when attaching insects to points.

- Unmounted specimens in paper or glassine packets are often vulnerable to insect pests because they are not yet enclosed in the tightly sealed, glass topped boxes (such as the Cornell-style drawers available through NPS *Tools of the Trade*) that are used to house most pinned insects.

- Damage may be caused by poor storage and handling practices. Sometimes broken body parts will be glued onto a label.

Refer to Appendix T: Care of Biological Collections, for information on preventive care of entomological collections.

7. *How do collectors prepare dry invertebrates?*

Some invertebrates are simply dried. Collectors may also immerse invertebrates in formaldehyde, alcohol, or other solutions. These techniques either kill the animal or work as fixatives. Calcareous materials (shells, corals, echinoderm spines) immersed in formaldehyde and improperly rinsed may be prone to "Byne's Disease." This is a mineral efflorescence that results from the reaction of organic acids, such as formic and acetic acids, with a calcium-based substrate. Byne's Disease usually gives a white powdery appearance to the surface of specimens.

Refer to Appendix T: Care of Biological Collections, for information on preventive care of invertebrate collections.

8. *How do collectors prepare dry vertebrate skins?*

Collectors routinely preserve birds and mammals as dry study skins. In contrast, dry skins of fish, reptiles, and amphibians rarely are preserved in research collections. To prepare study skins, collectors remove the skin from the specimen, treat it with absorbents, and fill it with fibrous materials. The filling is usually cotton batting (although a great many plant fibers and fine sawdust were used in the past). Modern collectors sometimes use polyester batting. Preparators use thin wooden supports inside bird specimens. In mammals, preparators use various types of wire to support the legs and tail. Labels are attached to the hind leg of the specimen with cotton or linen thread. In the past, specimens often were treated with chemicals during their processing. This is less common today, although collectors often rinse mammal skins in alcohol as part of the preparation process, and many collectors use sawdust, cornmeal, or other absorbent materials to facilitate drying. Study skins may be dried with heat. Today, birds sometimes are shipped in dry ice, stored in freezers, and prepared in museums. Collectors usually prepare mammals and birds in the field.

Collectors may dry large flat skins of vertebrates in the field, salt the skins, and later stabilize them using a variety of tanning processes. Sometimes collectors prepare the skins of small vertebrates as untanned flat skins. In this process, they remove the skin from the animal and then pin it to dry in a flat position. They may use absorbents in the skinning process and rinse small skins in alcohol prior to drying.

Taxidermy mounts and trophy heads can be extremely complex. A taxidermist may mount virtually any vertebrate. Taxidermists sometimes tan skins, but often they simply place a skin in a chemical solution to soften it. Once it is flexible enough, they manipulate it over a mannequin and let it dry in place. Mannequins may be bundles of fibrous materials, or a hard body constructed of plaster, fiberglass, or other easily formed materials. An internal armature of wood or metal supports the mannequin. Leg bones, or other skeletal material, and the skull may be used in the mounts. Other techniques used in mounting specimens include freeze-drying (see below).

Sometimes vertebrate shells or plates (scutes) and reptile and amphibian skins are dried and kept in collections. This is no longer a common practice and specimens prepared this way in the past were often treated with pest control chemicals during processing. Scutes are especially likely to have been treated with long-lived toxic materials. In some cases, the skins may have been tanned. Most often, they were prepared as untanned flat skins or were stuffed with any of a variety of fibrous materials.

9. *What problems might I see with traditional mounting techniques?*

There are a variety of problems you might see in specimens prepared using traditional mounting techniques:

- Arsenic and a number of other toxic compounds were used in the preparation and post-preparation treatment of taxidermy specimens. See *COG* 2/3, "Arsenic Health and Safety Update," for information on handling and use of these specimens. Commercial taxidermists may regard their materials and processes as proprietary and often are reluctant to provide detailed information. Tanned skins are rarely

  treated with pest control chemicals because the tanning processes render the skins fairly unattractive to insects and reasonably resistant to mold.

- Study skins of vertebrates with long tails and mammal specimens prepared with ears in upright positions are vulnerable to mechanical damage during storage and handling.

- Metal support wires used in specimens may corrode over time. Because the corrosion products have a greater volume than the original metal, the corrosion process often tears the skins. Metal armature in taxidermy mounts and wires in study skins may be copper or nickel alloys that will produce fibrous, blue or green corrosion products when they react with the fats in skins.

- The skins on taxidermy mounts are under great stress because the skins often shrink tightly to the form during drying. As a consequence, removing mounted specimens from their original stand changes the distribution of the stress, often causing the skins to tear or distort.

Refer to Appendix T: Care of Biological Collections, for information on preventive care of vertebrate collections.

10. *How do collectors prepare skeletal material?*

- Collectors may remove skulls and skeletons from specimens when fresh, after freezing, and occasionally from fluid-preserved specimens. They first remove much of the flesh from the bone. They then clean the specimens using a variety of techniques including:

- enzyme solutions

- maceration (with and without heat, detergents, ammonia, or bleaches)

- burial in sand, soil, or manure

- dermestid beetle colonies

After any of these treatments, further rinsing and some hand cleaning may be necessary. If cleaned by beetles, the specimens usually are fumigated, frozen, or rinsed in alcohol to kill the insects. Then the bones may be soaked in ammonia or chlorine bleach solutions to deodorize. The resulting specimens are then dried (with or without heat). Bones from large animals like bears may be degreased using organic solvents or alcohol. Sometimes large long bones are drilled and the marrow is removed to reduce the potential for migration of fats and oils out of the bone.

Fish skeletons may be removed from frozen specimens and cleaned with enzymes. Sometimes preparators stain the bones with an organic dye and store them in glycerin solutions.

11. *What problems may arise with skeletal material?*

Bone and teeth frequently deteriorate in vertebrate collections. Therefore, try to get documentation on exactly what processes preparators have used on bone. Bone is an organic/inorganic composite material. This means that the organic components are intimately mixed with the inorganic components and help to reinforce them and give them a certain flexibility. There are a variety of problems you might see in skeletal specimens.

- Prolonged maceration, enzyme solutions that have not been properly neutralized, and ammonia and chlorine bleach solutions that have a high pH degrade proteins, the primary organic reinforcement in bone and teeth, leaving the specimens brittle.
- Heat may also denature the protein.
- Acidic solutions attack the inorganic part of the composite, leaving bones soft and easily distorted.
- Poor storage and handling can damage bone causing cracking, abrasion and breakage. Low humidity in storage environments will cause cracking, especially to teeth.
- Numbers that have been written directly on the bone with indelible ink cannot be removed.

Refer to Appendix T: Care of Biological Collections, for information on care of skeletal material.

12. *How do collectors prepare freeze-dried specimens?*

Almost all types of biological specimens have been freeze-dried for exhibit purposes. After the specimens are frozen, the water is removed from them using vacuum sublimation. Specimens may be treated with a variety of chemicals as preparation for freeze-drying. After processing, preparators may use other materials to enhance specimen appearance. Large animals are difficult to freeze-dry, so these are often eviscerated before freezing. After freeze-drying, the specimens are stuffed with fibrous materials.

13. *What problems might I see with freeze-dried specimens?*

The loss of bound water makes freeze-dried specimens extremely fragile. For an excellent review of the problems of freeze-dried specimens see, "The Effects of Freezing and Freeze-drying on Natural History Specimens," by Florian (1990) listed in the Section G, Selected References. Because freeze-dried specimens are vulnerable to rehydration, especially at relative humidity above 40%, they can rot. It is important that you keep them in dry environments. Freeze-dried specimens are especially attractive to insect pests. Place these specimens in tightly sealed cabinets to prevent pests from getting into exhibit and storage cases.

Freeze-dried specimens are often used in NPS exhibits. These specimens are extremely vulnerable to insect attack and may be damaged or destroyed, requiring replacement. If you have freeze-dried specimens on display be sure to use good Integrated Pest Management (IPM) strategies to protect them. See Chapter 5: Biological Infestations, for information on developing an IPM plan.

Refer to Appendix T: Care of Biological Collections, for information on care of freeze-dried specimens.

14. *How do collectors prepare fluid-preserved specimens?*

A fluid-preserved specimen is "fixed," that is, treated with a chemical that causes some cross-linking of cell proteins. Then the specimen is stored in either the original fixative or in a chemical that preserves the fixed tissue. Collectors use a wide variety of chemicals for both processes. Sometimes specimens are not fixed prior to placing them in storage solutions.

Often, you will find small to moderately sized fluid-preserved specimens stored in glass bottles or jars. Large specimens are usually stored in tanks made of a variety of plastics or metals. Occasionally, plastic or metal liners are used inside a wooden frame or box. Collectors mount very tiny specimens on microscope slides or in small glass or plastic vials. Sometimes small containers are grouped inside larger glass containers.

In *botanical* collections perhaps the most common fixative is a solution called formal acetic alcohol (FAA). It is a mixture of formaldehyde (formalin), ethanol (ethyl alcohol), and glacial acetic acid in various proportions. A number of other fluid compositions have also been used. Instead of formalin fixatives, some preparators use alcohol as a preservative or a mixture of ethanol (with or without some methanol), water, and glycerin. There are a number of fixative/storage solutions, many of which contain glycerin.

In *entomology* ethanol is the most common fixative and preservative fluid in entomology. Sometimes other chemicals have been added to ethanol in an effort to preserve color or relax specimens.

Vertebrate specimens are usually fixed in buffered formalin and then preserved in alcohol. Numerous alkali neutralizers or actual buffers may be used in the formalin. Ethanol (70%) is the preferred storage fluid for mammals and birds. Fish, reptiles, and amphibians are stored in various concentrations of isopropanol (isopropyl alcohol) or ethanol. Numerous compounds are used for color preservation in vertebrate specimens. Preparators may have added these to any specimen.

15. *What problems may occur with fluid-preserved specimens?*

The container, closure, and gasket may react with the specimens or the fluid. Ask the donor what kinds of containers were used to house the specimens from the time they were collected. The storage solvent will evaporate over time and have to be replaced. Prior to fixation, collectors sometimes freeze specimens. This often leads to poor quality fixation and preservation.

Solvents used to store fluid-preserved specimens may gradually soak out lipids, proteins, and pigment over time, causing the solution to become discolored or cloudy. Labels printed on poor quality paper may deteriorate. The metal closure on flip-top jars may corrode.

Refer to Appendix T: Care of Biological Collections, *COG* 11/3, "Storage Concerns for Fluid-Preserved Collections," and 11/4, "Storage Containers and Labels for Fluid-Preserved Collections," for additional information on the care of fluid-preserved specimens.

E. Labels and Labeling

Inquire about the materials a collector used to label specimens. This will give you an indication of the preservation problems that may lie ahead. Labels contain important original information about the specimen and in some cases may be the primary documentation on the object. The information recorded on a label may include:

- species scientific name
- species common name
- collector's name
- collecting location
- habitat
- collection date
- field catalog number
- collecting institution
- park code
- catalog number
- accession number
- original fixative
- preservative

All NPS specimens should have NPS labels. See *MH-II,* Appendix H, for information on labels and labeling. Ordering information is available in NPS *Tools of the Trade*.

1. *What types of inks should I use on labels?*

Good inks for documentation are carbon printing inks, heat-fused carbon toner for printers and photocopiers, and carbon-based drafting film ink for technical pens. There are also some pigmented black inks in felt-tip pens that are acceptable for use on labels. Unfortunately, the ink often used on labels or on specimens is a dye that is acidic. It will fade when exposed to light and may fade as a result of exposure to oxygen in the air. Ballpoint pens and fugitive pencil (such as red pencils) will fade and therefore are not acceptable for writing on labels. See Williams and Hawks (1986) and Wood and Williams (1983) for information on inks and pens to use with both dry and fluid-preserved natural science collections. You can order ink and pens for labeling natural history collections through the NPS *Tools of the Trade.*

See more information on recommended inks, pens, and lettering styles and attaching strings and pins in *MH-II*, Appendix H. *COG* 11/4, "Storage Containers and Labels for Fluid-Preserved Collections," also gives information on inks and printers.

2. *What preservation problems will I have with metal labels and tags?*

Preservation problems arise from metal ear tags, bat and bird bands, and the small metal labels that collectors used to apply catalog numbers to some fluid-preserved specimens and skeletal specimens. All these specimens may be subjected to processing or storage in fluids, at which time the labels can begin to corrode.

- Corrosion products can stain specimens and, in some instances, may cause the labels to adhere to the specimens.
- Sharp corners on the labels can tear specimens.
- Metal labels on dry skeletal material scratch and abrade the bone.
- Specimen labels made of pure tin can degrade on frozen specimens.

Though separating the labels from the specimens and storing them is one approach; it is always best to keep labels with the specimens. For bone, you can keep the labels in small polyethylene bags in the container with the specimen, but not attached directly to the bone. In fluids, you can seal the metal ear tags and leg bands in air in small glass vials with polyethylene caps and place them in the container with the specimen. These methods allow the label to remain in the container with the specimen.

3. *What kinds of paper labels are used in collections?*

Paper labels may be made of almost any paper product, many of which are not permanent or durable. The paper may be single-ply or a laminate of two or more layers. Fluid specimen labels are sometimes made of Resistall paper, a cotton rag paper that has been treated with a melamine resin to make it fluid-resistant. Resistall papers often have a fairly low pH (4.5-5.2).

Labels reduced or reproduced by photocopy processes may be alkaline buffered, acid-free paper or may be any type of common photocopy paper. The paper used in printers to generate labels falls into the same categories.

4. *What kinds of paper labels has NPS used in the past?*
