Since 1982 the Museum Management Program (MMP) has specified that paper labels be of 100% white rag or alpha cellulose content or be maximum permanence paper (with alkaline filler). The MMP makes these labels available through *Tools of the Trade*. Previously, Lewis, in *Manual for Museums* (1976), specified high quality, liquid-resistant paper. Burns, in *Field Manual for Museums* (1941), recommended white linen tags tied with linen thread for mammal specimens and high quality white paper for insects on pins. Older park collections will probably contain all these types of labels in their collections, as well as other labels that outside collectors used.

You must use NPS supplied labels when tagging specimens. Specify this requirement in collecting permits. When replacing old, non-standard labels be sure to keep the originals.

Refer to *MH-II*, Appendix H, for information on natural history specimen labels and their content.

F. Glossary

*Arthropods – a*ny of numerous invertebrate organisms of the phylum Arthropoda, which includes insects, crustaceans, arachnids, and myriapods

Articulated – when parts of a skeleton are joined together for display

Biology – the science of living organisms and life processes

Bolus (boluses) – prehistoric mammoth dung

Botany – the scientific study of plants

Brachiopods – any of various marine invertebrates of the phylum Brachiopoda, having bivalve shells and a pair of tentacled, arm-like structures on either side of the mouth

Bryophyte – a plant of the major botanical division Bryophyta; includes the true mosses, peat mosses, and liverworts

Chitin – a semitransparent horny substance that forms the principal component of crustacean shells, insect exoskeletons, and the cell walls of certain fungi

Consolidation – application of a liquid polymer (glue, plastic) that imparts strength to a fragile specimen

Crustaceans – any of the various predominantly aquatic members of the taxonomic group Crustacea, characteristically having a segmented body, a chitinous exoskeleton, and paired joined limbs; includes lobsters, crabs, shrimps, and barnacles

Duff – insect excrement and shed skins left as waste on specimens; frass

Echinoderms – any of a number of radially symmetrical marine invertebrates of the phylum Echinodermata, having a body often covered with spines; includes starfish, sea urchins, and sea cucumbers

Entomology – the scientific study of animals

Exoskeleton – an external protective or supporting structure of many invertebrates

Fixing – the use of a chemical, often formaldehyde, that reacts with tissue to limit deterioration

Frass – insect excrement and shed skins left as waste on specimens; duff

Herbarium – a collection of plants mounted and labeled for use in scientific study

Holotype – the single specimen used as the basis for the original published description of a taxonomic species

Infills – a gape or hole in a specimen that is filled with a foreign material for structural stability or aesthetic integration

Invertebrate – animal lacking a backbone or spinal column

Maceration – using a liquid to soften and remove flesh

Molding and casting – techniques used by preparators and others to make copies of specimens

Mollusks – any of various members of the phylum Mollusca, largely marine invertebrates; includes edible shellfish

Nomenclature – a system of terms used in a particular science or discipline, for example, an international system of standardized New Latin names used in biology for kinds and groups of animals and plants

Ontogeny – the history of the development of an individual organism

Peel – a specimen produced by applying a polymer to the surface of an object to reproduce surface texture that is then "peeled" off

Phylogeny – the ordering of species into taxa; evolutionary history of a species

Preparation – the process of readying natural science specimens for storage in a museum collection

Scat – excrement, fecal material

Scute – plates or shells from armadillos, turtles, or tortoises

Sublimation – the conversion of a solid directly into a vapor without passing through the liquid state

Systematics – the science of classifying all organisms, living and extinct, and of investigating relationships between them; the field of science concerned with taxonomy and phylogeny

Tanning – methods used to change the chemical structure of skin making it resistant to deterioration

Taxa – plural of taxon

Taxon – a group of organisms that makes up one of the categories in taxonomic classification, such as a phylum, order, family, genus, or species

Treatment – usually refers to a repair or restoration done by a conservator

Type – a specimen or sample used as the basis of description of a species

Vertebrate – animals with segmented bony or cartilagenous spinal columns

Zoology – the biological science of animals

Appendix R: Curatorial Care of Photographic Collections

List of Figures

APPENDIX R: CURATORIAL CARE OF PHOTOGRAPHIC COLLECTIONS

A. Overview

1. ***What information will I find in this appendix?***

This appendix discusses the composition and physical structure of photographic materials and outlines their long-term care and preservation.

2. ***Why is preventive conservation important for these materials?***

All photographic materials are especially vulnerable to deterioration when exposed to:

- inadequate environmental conditions
- improper storage enclosures
- careless handling practices
- damaging exhibition procedures

For this reason, preventive care is absolutely critical to the long-term preservation of these irreplaceable images.

3. ***How can I find the latest information on care of these types of materials?***

Watch the following sources for new information and techniques:

- NPS *Conserve O Gram* (*COG*) series
- e-mail NPS Museum Management Newsletter

> ***See the NPS Museum Handbook, Part I (MH-I), Chapter 3, Museum Objects Preservation: Getting Started, for a discussion of preventive conservation and conservation treatment.***

B. The Nature of Photographic Materials

Photographs are images formed by the action of radiation, usually light, upon a sensitized surface. While often thought of as a single technique, photography is many hundreds of related chemical processes known by a wide variety of process and trade names. Sources of assistance for descriptions of the various photographic processes are included in Section K.

1. ***What is the component structure of photographic materials?***

The component structure of photographic materials includes a variety of:

- ***final image materials***, such as silver
- ***binders***, such as albumen, collodion, and gelatin
- ***supports***, such as paper, plastic film, metal, or glass (also called the *base*)

Negatives, prints, transparencies, and slides are all photographs.

The laminate structure of prints is often further complicated by the presence of:

- secondary supports
- additional colorants
- coatings
- adhesive layers

2. ***Why should I identify photographic processes?***

Identifying the photographic process (final image material, binder, and base) will allow you to accurately assess the relative short- and long-term stability of a specific photographic object.

3. ***What are the basic types of final image materials and how do they deteriorate?***

The image in every photograph is created by materials that absorb and scatter light. Final image materials may include:

- photolytic or filamentary silver
- metallic platinum
- pigments
- organic dyes

The final image material in most nineteenth-century photographic prints is a finely divided ***metallic silver***, identified as "printed-out" or "photolytic" silver. Photolytic, or metallic, silver particles are rounded in shape and scatter light, and, as a result, produce the red or brown image tones associated with nineteenth-century print materials in good condition. Photolytic silver particles are quite small and are extremely susceptible to image deterioration and rapid loss of highlight detail.

The final image material in most twentieth-century photographic prints is ***filamentary silver***, which consists of bundles of intertwined filaments, resembling steel wool, that are huge in comparison to photolytic silver particles. These larger particles are significantly less vulnerable to image deterioration. Their irregular structure absorbs light rather than scatters it. Therefore, filamentary silver images are characterized by a neutral black image color, unless toned with gold, sepia, selenium, or hand-colorant.

All silver images are prone to severe oxidation and, as a result, undergo characteristic changes. Photolytic silver images exhibit general fading throughout, a loss of highlight detail, and a shift in image color toward warmer (more red or yellow) tones. Filamentary silver images, on the other hand, exhibit a significant shift in color from neutral black to yellow brown as they deteriorate.

Mirroring, a dark, mirror-like, reflective tarnish stain caused by oxidation, is a common symptom of deterioration in silver images. It often appears as

a bluish, metallic sheen visible in a photograph's dense image areas when examined in reflected or raking light. Silver images also can be adversely affected by improper processing during manufacture, resulting in a severely yellowed and faded final image material.

In platinum prints, the final image material is ***metallic platinum***. Since platinum is a noble metal, it's not susceptible to oxidation. Therefore, platinum images don't tarnish or fade. Platinum is, however, a catalyst for cellulose deterioration. Platinum prints may exhibit an embrittled and discolored primary paper support.

Pigments, such as lamp black, burnt and raw umber, burnt sienna, and Prussian blue, often have been used as final image materials for such printing processes as carbon, gum bichromate, and cyanotype. These pigments usually are dispersed in a binder, such as gelatin, gum arabic, or linseed oil, and tend to have good to excellent overall stability.

Finally, ***organic (synthetic) dyes***, as used in most contemporary negative and positive color processes, are considerably less stable, and will fade both in the dark and upon exposure to light. The destruction or decolorization of organic dyestuffs in color photographs is due to irreversible changes in their chemical structure. Upon exposure to light, high humidity, or high temperature conditions, organic dyes are readily converted to oxidized and often colorless dye fragments.

4. *What are the various types of binder layers?*

The binder in photographic material is the transparent layer in which the final image material is suspended and protected. Binders are important in determining optical properties, such as surface smoothness, gloss, density, and color, as well as the overall stability of specific print materials. The binders most commonly used throughout the history of photography include:

- ***albumen***, a globular protein from the white of hens' eggs
- ***collodion***, a form of cellulose nitrate
- ***gelatin***, a highly purified protein commercially produced primarily from animal hides and bones

Albumen (ca 1850-1900) actively deteriorates and yellows due to the inherent characteristics of the egg white protein and its chemistry. Albumen has a strong affinity for silver ions, and as a result, in processing these materials, colorless silver-albuminate complexes may be formed. Upon exposure to reactive sulfiding compounds, these colorless complexes may be converted to a yellow silver sulfide with a resulting increase in overall discoloration or staining leading to yellowing and loss of detail in non-image (highlight) areas. Albumen yellowing also occurs from prolonged exposure to light and high relative humidity conditions.

The albumen binder will expand and contract when exposed to fluctuating environmental conditions. Albumen prints, therefore, characteristically exhibit severely cracked and crazed binder layers. Albumen images almost always are mounted on a secondary support, since unsupported images will

curl into tight rolls.

Collodion (ca 1851-1920) was used as a transparent binder in both glossy- and matte-surfaced photographic printing papers manufactured at the turn of the century as well as for ambrotypes, tintypes and the wet plate negative process that was introduced in 1851. Collodion is brittle, and is easily abraded and mechanically damaged when handled improperly.

Photographic ***gelatin*** (ca 1870-present) is a highly purified, homogeneous protein. While it is relatively stable and doesn't yellow severely like albumen, it is very reactive to changes in temperature and relative humidity conditions. When exposed to moisture, gelatin swells up to twenty times its volume, becoming soft and tacky. Finally, gelatin can serve as a nutrient for microbiological or fungal activity in conditions of high relative humidity and also is attractive to insects and vermin as a food source.

5. *What are examples of primary supports?*

The most common primary supports used throughout the history of photography include:

- paper
- glass
- flexible film
- sheet metal

In both historic and contemporary photographic print materials, the image-bearing layer usually consists of a coating on a ***paper-based*** support. When handled improperly, paper supports are susceptible to irreversible mechanical damage in the form of tears, creases, and losses.

In the early days of photography, these paper supports were manufactured from the highest quality rag fiber or chemically purified wood pulp. After 1881, machine-manufactured photographic papers were coated in the factory with a baryta layer, which consisted of the white pigment barium sulfate and gelatin. The baryta layer produced a highly reflective surface, allowing for greater contrast and brilliance in the final print. It also acted as a protective barrier between trace impurities in the primary support and the light-sensitive materials.

Plastic-coated, or resin-coated, photographic papers were introduced in the late 1960s. They were often subject to embrittlement, cracking, and/or localized fading of the photograph's silver image. Within recent years stabilizers have been introduced into these papers. As a result, current plastic-coated papers, when processed correctly, are considered to be as stable as fiber-based supports.

While ***glass*** was the favored image support material in the nineteenth century, these supports may deteriorate under unfavorable environmental conditions. The chemical composition of support glass is the single most important factor pertaining to the long-term preservation of collodion plates. Deterioration of the glass support can result in softening and flaking of the collodion binder and varnish layers as well as discoloration and

fading of the silver image.

Nearly all existing still and motion picture ***films***, prior to the introduction of polyester film in 1955, were produced on a cellulose plastic support. Earlier films were made from cellulose nitrate, first marketed in 1889 and manufactured until 1951. See NPS *MH-I*, Appendix M, Care of Cellulose Nitrate Negatives. Later films were composed of a variety of cellulose acetate supports. All cellulose plastic bases are subject to hydrolysis upon exposure to adverse environmental conditions, particularly high relative humidity. The hydrolysis of cellulose nitrate film, for example, releases nitrous oxide, a strong oxidizing agent that aggressively attacks image silver and severely embrittles the plastic film base as well as all nearby materials. Cellulose nitrate film base also is highly flammable and will burn underwater, as it produces it's own oxygen during combustion. Valuable cellulose nitrate negatives must be reformatted and placed in cold storage.

In acetate films, acid hydrolysis won't accelerate silver image deterioration. However, the indirect consequences of hydrolysis may result in massive shrinkage and physical deformation, such as cockling, buckling, and channeling of the film base. Furthermore, acid-catalyzed hydrolysis will cause fire-retardant additives, historically incorporated into the film base during manufacture, to be released and deposited as liquid-filled bubbles in the gelatin binder.

Some of the earliest photographic processes used ***metal*** as the image's primary support. A daguerreotype photograph, for example, is a silver-plated sheet of copper with the whites or highlights of the image being a silver-mercury-gold amalgam and the darks pure silver metal. The daguerreotype plate is susceptible to deterioration resulting in the formation of corrosion films, primarily silver sulfide, on the support's surface. Tintypes were manufactured on japanned iron plates. The japanned surface was usually composed of a mixture of raw linseed oil, asphaltum, and lamp black pigment. A tintype's iron support may corrode or rust at the plate's unvarnished edges or anywhere the protective japanned surface has been scratched or otherwise damaged. Corrosion of the iron support may result in irreversible flaking and/or loss of a tintype's image-bearing (collodion) layer.

6. ***Are there other structural concerns?***

Yes. When you analyze the component structure of photographic materials, you will also need to evaluate the presence or absence of a secondary support, hand colorants, final coatings (waxes, gelatin, and spirit varnishes such as shellac) and adhesive layers. Photographic prints often have been hand-colored with a variety of media, sometimes fugitive, including watercolors, pastels, and aniline dyes. These additional components can strongly influence the final appearance and stability of all photographic materials. Rubber cement adhesives, for example, can irreversibly stain and yellow binder layers.

C. Preparing a Preservation Strategy

A general understanding of the nature of photographic materials provides a basis for developing a preservation strategy for the collection.

1. *Why do I need a preservation strategy?*

A preservation strategy will help you care for and protect these diversified collections. In establishing a preservation plan, you need to understand and consider many issues pertaining to format and type, condition, housing, value, access, and use. In determining value, for example, you need to ensure that the collection materials support the park's approved Scope of Collection Statement and that these photographs are important for their artifactual, evidential, associational, administrative, or informational value. For example, heavily-used collections of lower value may be granted higher preservation priority when compared with little-used materials of higher value. See *COG* 19/10, Reformatting for Preservation and Access: Prioritizing Materials for Duplication.

Photographic collections should be assessed by a conservator for condition, processes, and format. The conservator should carefully examine all types of items in the collections, including albums, scrapbooks, and newer items such as microforms. Owing to quantity, it is often difficult, if not impossible, to examine all photographic objects in a collection; however, boxes and groups of items can be randomly sampled and assessed for storage, treatment, handling, and exhibition needs. In doing so, the conservator may make a checklist for tracking and quantifying general condition and deterioration problems associated with various photographic items. See Section H for a condition checklist.

2. *What are the basic elements of a preservation strategy?*

A preservation strategy tells you how to do the following:

- monitor, assess and control the environment
- establish handling procedures and a disaster plan
- rehouse photographic images
- reformat color materials and preserve originals in cold storage, where appropriate
- evaluate photographic materials for conservation treatment
- inspect negatives
- duplicate deteriorating materials
- inspect copy images

3. *How should I assess and control the environment?*

Survey storage facilities and exhibition spaces for evidence of the potentially damaging environmental conditions of relative humidity, temperature, light, and pests.

- Maintain the relative humidity (RH) levels for most photographic materials at 20% to 40%. You should strive for this range when

storing all types of photos in one area. However, if you are storing only film-base materials, the preferred range is at 20% to 30% RH.

- Store most color and film-base collections at 4.4°C (40°F) or below. When you place collections in cold storage, they should remain in cold storage as much as possible. Therefore, make copy negatives and prints available for duplication and research use.

- Monitor and control the environmental conditions, especially relative humidity, in collections storage and exhibits to reduce the potential for microorganism growth. When RH reaches 65% and temperature rises above 75°F, the potential for microorganism growth increases.

- Use the photographs at the appropriate light levels. See Figure R.1.

Century	Type of Photograph	Appropriate Light Levels
19th	Most 19th century processes	<50 Lux or 5 footcandles
Late 19th (1880s)-20th	Photographs with Baryta Layers, such as Gelatin Printing-Out Paper, Collodion Printing-Out Paper, and Gelatin Developing-Out Paper	<100 Lux or 10 footcandles
20th	Modern color photographs	<50-100 Lux or 5-10 footcandles

Figure R.1. Appropriate Light Levels for Photographic Media

4. ***Should I establish handling procedures and a disaster plan?***

Yes! First, establish handling and preservation procedures that are oriented toward stabilizing the condition of the entire collection.

Then, ensure that these procedures are followed so that the level of preservation is consistent throughout the collection.

Finally, establish a disaster plan to protect the museum collections in an emergency.

5. ***Should I rehouse photographic prints and negatives?***

If the photographic prints are in acid-free or acid-neutral housings, you don't need to rehouse them, unless the housing is damaged. In all other situations, you need to rehouse photographic materials in acid-free archival sleeves and folders.

6. ***How do I rehouse photographic prints and film negatives?***

If you need to rehouse ***photographic prints***:

- place each print in archival-quality plastic or paper enclosures to prevent damage from chemical deterioration and improper handling

- place the enclosure containing prints in a box or drawer

- place boxes or drawers on shelves or in cabinets

If you need to rehouse ***glass plate negatives*** and stabilize them:

- place negatives in four-fold archival paper enclosures
- place negatives upright on their long edge in padded boxes
- place boxes on shelves
- label boxes "Fragile Glass"

If you need to rehouse ***photographic albums and scrapbooks***:

- box them to protect them from dirt, dust, and gaseous pollutants
- interleave photograph albums with neutral pH tissue

> ***Don't use buffered tissue or acid-free paper.***

- don't use interleaving materials if they will cause stress on album bindings (such as significantly swelling a volume's width)

If you need to rehouse ***daguerreotypes, ambrotypes, and tintypes***:

- house them in acid-free folding boxes
- identify actively deteriorating cover glasses and replace them with contemporary high-grade alumina silicate glass
- have a trained conservator supervise the uncasing and resealing operations

If you need to rehouse ***film-based negatives***:

- place each negative in a sleeve
- place each sleeved negative in a box or drawer
- place each box or drawer on a shelf or in cabinet

7. *How should I preserve color materials?*

After housing, place color photographic materials in refrigeration or cold storage to slow irreversible deterioration. Cold storage promotes a longer life for the photographs being preserved. Even 20°F below room temperature provides many decades of additional life for photographic materials. Store collections of color negatives, transparencies, and prints, in archival housing within Ziplock bags in boxes, in a frost-free refrigerator with low-humidity refrigeration. You may place humidity indicator strips within the bag to help monitor environmental conditions.

If you must remove materials from the cold storage vault, for example if the power has been out for longer than 48 hours, allow the materials to acclimatize at room temperature for several hours before handling them.

Don't forget to monitor the frost-free refrigerator for temperature and humidity levels and to establish retrieval and access guidelines to severely limit the removal of materials.

8. ***How do I evaluate photographic materials for conservation and further preservation?***

You should work with a conservator to learn how to identify photographic processes and formats and deterioration characteristics. Check photographic materials for:

- active flaking or powdering
- mold growth
- tape or adhesives present
- severely deteriorated supports

Ensure that photographic materials with these conditions receive conservation treatment.

9. ***Who should inspect film-base negatives?***

You should work with a conservator to:

- inspect film-base negative collections and evaluate them for deterioration
- establish duplication programs
- develop handling guidelines
- establish archival storage procedures

10. ***What about reformatting and duplicating deteriorating materials?***

You won't always be able to preserve all photographs in pristine condition. When faced with massive deteriorating photographic holdings, you will need to strike a balance between stabilization, treatment, and duplication.

Some processes, such as cellulose acetate and cellulose nitrate negatives may totally self-destruct over time in a normal storage environment. The self-destructive images are said to have inherent fault or inherent vice. The only way to preserve cellulose nitrate and cellulose acetate negatives may be permanent cold storage. In order to save the informational content of these negatives, it is necessary to duplicate these images using more stable materials. See *MH-I*, Appendix M, Care of Cellulose Nitrate Film, and *COGs* 19/10 through 19/13 on preservation reformatting.

Other photographic materials, while not as prone to self-destruction as cellulose acetate or cellulose nitrate, will deteriorate as a result of use, such as exhibition, regular handling, or frequent duplication. These heavily used materials will also benefit from duplication, as the duplicates may become the copies for use while the originals are preserved in cold storage.

Some scholarly researchers may still need to view the originals in order to study the image's process, format, or technique. In most cases, researchers

are interested in the informational value of an image. Informational values may be captured in high-quality photographic copies.

If you need to rehouse and/or duplicate film-base collections, carefully consider the following options:

- ***Interpositives***. For maximum quality control during duplication, you should produce an interpositive (intermediate positive image on clear film). Make this interpositive from the original negative by contact printing the image onto a sheet of clear film, producing a positive transparency. Then, make a laterally correct (not reversed) copy negative from the interpositive. Retain the interpositive to serve as an archival master used for the creation of additional copy negatives. Use the copy negative as the duplication master to produce copy prints for staff and researchers. Keep the original negative in cold storage.

- ***Direct Reversal Film***. Another procedure requires the use of direct reversal film, to produce a direct but laterally reversed duplicate negative. The resolution of direct-duplicating film is good, although tone reproduction can be poor. Because of their fine-grained structure these films are prone to oxidation leading to silvering out and mirroring, hence image detail loss. These images must be accurately processed and toned during use and carefully inspected and tested after creation. Such requirements make the actual cost of direct duplicates equivalent to interpositive processes without providing the same quality of images. Request either polysulfide toning or gold toning which will extend the life of the negative. Be aware that gold toning can add 20-50% to the cost. In many cases, direct reversal or direct duplicate images, also known as direct positive images, don't produce publication quality negatives.

  Selenium toner was frequently recommended for use with all copy negatives, particularly direct duplicate negatives. However, the Image Permanence Institute (IPI) in Rochester, New York has found that selenium may not adequately protect a filamentary silver image in low density regions from oxidative attack. Don't request selenium toning of photographs. IPI is currently investigating the use of a polysulfide toner to which a small percentage of borax is added. For additional information, contact the Image Permanence Institute, Rochester Institute of Technology, 70 Lomb Memorial Drive, Rochester, NY 14623-5604, 716-475-5199.

- ***Copy prints and camera negatives or long-roll camera film***. Other duplication options to consider include producing of copy prints and camera negatives from the original negative or using a long-roll camera film for efficient and cost-effective duplication of large collections. As with direct reversal film, these processes won't necessarily produce publication or exhibition quality copies and some of the images' informational value may be lost.

When you are faced with massive deteriorating film holdings, consult a conservator. See *COG* 19/10, Reformatting for Preservation and Access: Prioritizing Materials for Duplication. You should carefully evaluate the

available duplication options discussed above and consider the following factors:

- collection's size
- informational value
- evidential value
- associational value
- administrative value
- artifactual value
- condition
- projected use
- funding and staffing resources available

Collection value, usage, and risk or stability probably should determine which items you duplicate first. Don't dispose of original negatives once duplicated unless they are in an advanced state of deterioration.

Finally, you should establish two regular inspection programs:

- One should evaluate the technical and archival quality of the duplicate negatives. Compare the duplicate's optical, tonal, and physical characteristics with the originals. See *COG* 19/13, Preservation Reformatting: Inspection of Copy Photographs.
- The other should be used for all deteriorated film holdings. Select envelopes from every drawer at random and examine them for signs of deterioration as mentioned above. Note incipient deterioration so that you can monitor specific materials during the following inspections. Inspect collections with unregulated climates and generally poor conditions as many as four times per year.

11. *Who should inspect copy images?*

You should have all interpositives, negatives, prints, and slides, whether produced internally or by an outside photographic studio, inspected upon return.

All photographic copy work done for preservation purposes should be done to American National Standards Institute (ANSI) standards. Cite these standards in all contracts with photographers. Don't pay for duplication until after the copies pass inspection. Inspect the copy versus the original for: resolution, tonal range, completeness of image, and residual levels of chemicals. Materials that don't pass inspection criteria should be reshot at the photographic laboratory's expense. See Section K for a list of the appropriate standards.

Have someone experienced in reading negatives and in darkroom work, such as a photographer (other than the photographer who did the copy work), inspect all images. Inspection requires experience and a trained eye.

See *COG* 19/13, Preservation Reformatting: Inspection of Copy Photographs.

D. Preventive Conservation: Handling Photographic Collections

All photographic materials, color as well as black-and-white, may be irreversibly damaged by fingerprints, scratches, abrasions, and other forms of mechanical damage or mishandling. Here are some guidelines.

1. *How do I handle photographic prints?*

Historic photographic prints may be irreversibly damaged if handled carelessly. The surfaces of these prints are delicate and, therefore, easily scratched, abraded, creased, cracked, or torn.

General guidelines for ensuring object safety during any handling procedure are outlined in *MH-I*, Chapter 6, Handling, Packing, and Shipping Museum Objects. Some basic principles for the safe handling of historic and contemporary photographic print materials are listed below.

- Prepare a clean and uncluttered workspace for the safe handling of photographic collections. Instruct staff and researchers on the proper ways to handle photographs.

- Establish and enforce handling guidelines (for example, restricting food, drink, smoking, the use of pens) for all staff.

- Wear gloves when accessing collections that aren't protected by enclosures and when handling photographs that require temporary removal from paper or plastic sleeves. Research at the National Archives of Canada shows that immediate interactions will occur between salt in human perspiration and a photograph's final image material. These interactions result in irreversible oxidation of image silver to silver chloride followed by image staining or mirroring where the fingers touch the image. Staff and researchers who are required to wear cotton gloves will often approach a photographic collection with additional care and respect.

- Use temporary or permanent auxiliary supports (such as pH neutral board) during handling if necessary. In all instances, handle the auxiliary support and not the object itself.

- Exercise special caution when using plastic sleeves. Clear plastic sleeves are often too flexible to prevent structural damage. Slip a piece of archival bond (neutral pH) behind the image back before placing it in the sleeve. Transcribe any information from the back of the image in pencil to the back of the archival bond.

  Removing unmounted photographic prints from their polyester sleeves may prove difficult because of the static charge of the polyester film. Slit the plastic sleeve at a sealed edge and gently separate the cover sheet from the photograph by rolling it away from the object's surface.

- Control access to all collections. Using copy prints and/or xerographic copies will greatly reduce handling and subsequent damage. Restrict

the photocopying of all original materials. In doing so, maintain and use a "master" set of xerographic copies for all subsequent photocopying. See *COG* 19/4, Archives: Preservation Through Photocopying, and 19/7, Archives: Reference Photocopying. Any collection that is regularly reproduced should have an effective system for creating master negatives so that originals need not be constantly photographed.

- Establish current inventories, finding aids, and container (such as box or folder) lists for all photographic collections to further reduce unnecessary handling.

2. ***How do I handle daguerreotypes, ambrotypes, and tintypes: cased and uncased formats?***

You should consider the daguerreotype, ambrotype or tintype and its original housing as a total artifact deserving protection as a whole. Don't disturb these housings unless absolutely necessary. If for any reason you remove an original housing, carefully label and retain them.

If you remove an original housing, use a small suction cup to carefully lift the "photographic package" out of the miniature case interior. This maintains proper configuration and orientation of the fabric liner that serves as a "compression seal" within the case and further protects the photographic image from oxidation. Don't use a suction cup if the brass mat and tape assembly are damaged or not present.

> ***Do not disassemble the photographic package without the supervision of a trained conservator.***

Restrict the handling of all original material to only those researchers who are working on images as evidence of connoisseurship issues or those who can't obtain sufficient information from the copy. All other researchers should use copy prints. Secure totally unprotected daguerreotypes and ambrotypes immediately. See Section G. Separate them from the collection to ensure protection against casual handling. Use a Form 10-645, Archives and Manuscript Collections, Separation Sheet to maintain the link between the object and its original location within the collection. See NPS *Museum Handbook*, Part II, Appendix D, Museum Archives and Manuscript Collections for guidance on this form. The surfaces of primary images may be damaged by careless handling because they are very fragile.

Caution both researchers and staff not to open a case completely (180 degrees) when viewing an image as this may cause severe stress on the hinge. Don't use the metallic clasps as they tend to abrade the surrounding leather or paper on the case. If the case is warped, locking the case may break the spine.

Remove loose surface dirt from the case's interior and exterior surfaces with a soft brush. Don't use other cleaning methods because the unprotected surfaces of both daguerreotypes and ambrotypes are extremely sensitive and must be handled with utmost care. Only a trained conservator should clean these materials following a careful assessment of need.

3. ***How do I handle glass plate negatives and***

Collodion and gelatin glass plate negatives and transparencies are very susceptible to damage. Their weight, bulk, and inherent fragility often pose

transparencies?

the potential for serious handling problems. When handling glass plate collections, follow these guidelines carefully:

- Never underestimate the weight of glass. When working with these materials, be sure to have a firm grip on all enclosures in which glass plates are housed.
- Always handle glass on a padded and smooth work surface. You can construct this type of surface by padding a rigid piece of eight-ply board with successive layers of unbleached linen followed by sheets of lens tissues attached to the reverse of the work surface with pressure sensitive tape. As the surface becomes dirty, the sheets of lens tissue can be easily removed.
- Never handle the emulsion surface of a glass plate negative or transparency directly. Wear unpowdered latex gloves, since cotton gloves may be awkward and are inappropriate for the handling of glass artifacts.
- Before removing glass plate negatives or transparencies from their original (and often opaque) storage enclosures, always examine them carefully to determine the negatives' condition. In some cases, binder layers may be actively flaking and/or partially adhered to their enclosures. Glass supports may be broken or cracked. Safe removal may require that the original enclosures be slit at two edges with a microspatula and the plate carefully removed without scratching the glass or emulsion.
- Duplicate these fragile materials whenever possible. Use the copies for duplication services and reference purposes in order to avoid unnecessary handling of the original materials.

4. ***How do I handle film-base black-and-white negatives and transparencies?***

Carefully restrict access to all film negative or transparency collections. The chemical by-products of deteriorating film could be dangerous to staff and visitors, resulting in skin and eye irritation, headache, nausea, and respiratory difficulty

You can mitigate these effects by taking the following precautions:

- Improve room ventilation and air quality by changing the position of supply air registers and the overall level of air movement
- Use fans to maintain air movement while working with these collections
- Wear protective gloves at all times when handling film collection material
- Wear an appropriately rated respirator when handling large quantities of these materials. Respirators are not considered protective if facial hair interferes, because a proper fit cannot be assured. The respirators must be fitted to each employee. See NPS-50, *Guideline for Loss*

Control Management, Release No. 2, Chapter 32, Respiratory Protection Program, for detailed guidance.

- Limit exposure time by staff and visitors

See *MH-I*, Chapter 11, Curatorial Health and Safety, for additional guidance.

5. ***How do I handle slide collections?***

- Handle slide collections carefully to protect them from physical damage, fingerprints, and dirt.
- Don't leave slides in illuminated viewers or on light tables for longer than is absolutely necessary. (Kodachrome slides are particularly sensitive to light fading.) Also, don't leave slides uncovered on desks and table tops, as this exposure to ambient light may induce irregular fading and image deterioration.
- Keep the projection time for original slides to a minimum and use expendable duplicates whenever possible.
- Don't use high-intensity xenon arc projectors or other projectors that have been modified to increase their light intensity. It is usually light, and not heat, that causes fading when a slide is projected. (Some slides, however, may be more susceptible to heat-related damage, such as those with silver images including Polaroid Polachrome instant color slides and all types of black-and-white transparencies.)

E. Preventive Conservation: Storing Photographic Collections in the Proper Environment

Environmental stability is essential to the longevity of all photographic collections. Where different types of photographic collections are stored in one space, you will need to set up many microenvironments in boxes or cabinets. Find the mean average humidity of what all materials in the room may need and use silica gel, humidifiers, or dehumidifiers as necessary to adjust the relative humidity. Specific materials need specific preventive conservation measures.

1. ***How do I store photographic prints?***

Store photographic print materials at a **constant** relative humidity (RH) between 30% and 50%, in dark storage (boxed). Avoid RH fluctuations of more than 5%. Exposure to high relative humidity levels dramatically accelerates the rate of deterioration and can result in the oxidation of silver image materials, binder layer staining, mold, and even permanent changes in size and shape. Excessively dry conditions, on the other hand, may cause cracking, crazing, and embrittlement.

Store most photographic prints at 20°C (68°F) or below. Store contemporary color print materials at 4.4°C (40°F) or below.

The fading of color images is primarily controlled by the storage temperature and to a lesser degree by relative humidity. In all cases, carefully monitor temperature and relative humidity levels as described in *MH-I*, Chapter 4, Museum Collections Environment. See Figure R.2 for relative humidity and temperature requirements for various media.

Also, you will need to monitor and control (through air filtration) the levels of particulates and gaseous pollutants such as nitrogen dioxide, sulfur dioxide, hydrogen sulfide, and ozone.

Type of Photograph	Storage Temperature	Storage RH (Relative Humidity)
Most photographic prints, black and white negatives, direct positives, and transparencies	<68°F (20°C)	30-50% RH
Ambrotypes, daguerreotypes, and tintypes (Cased and Uncased)	65-68°F (18-20°C) ±2°	40-50% RH
Glass plate negatives and positives	68°F (4.4°C) ±2°	35% RH±3%
Black-and-white silver gelatin film based negatives cellulose nitrate and acetate	As low as possible	20-30% RH
Color photographic prints, negatives, slides, and positive transparencies	35-50°F (2-10°C)	20-30% RH

Figure R.2. Relative Humidity and Temperature Requirements for Photographic Media

2. ***How do I store daguerreotypes, ambrotypes, and tintypes: cased and uncased formats?***

Daguerreotypes, ambrotypes, and tintypes are composed of a wide variety of materials. Store them at a RH of 40%-50% and temperature of 18°-20°C (65°-68°F).

Brass mats and preservers and iron supports of tintypes corrode at high relative humidity levels. Also, the glass used in glazing materials or actual supports for these photographic images is often chemically unstable. Don't store them in relative humidity conditions above 50% RH. On the other hand, leather, paper, and wood may become embrittled and cracked if stored in very dry conditions, contributing to structural deformations of the case. Maintain the relative humidity for these materials above 40%.

3. ***How do I store glass plate negatives?***

Historic glass plate negatives are complex, laminate objects that require specific and controlled storage environments. The safe relative humidity range for the storage of glass plate negatives at room temperature conditions is 35% ± 3%. Avoid temperature and relative humidity fluctuations.

If the relative humidity is too low (below 30%), you may see severe flaking of the image-bearing layer from its glass support. If RH is too high (greater than 40%), you may see glass corrosion, silver image deterioration, microbiological attack, and even physical damage to the binder layer and varnish coatings.

4. ***How do I store film-base***

One of the most pressing problems facing large photographic holdings is

black-and-white negatives?

the active and rapid deterioration of their film-base negative collections. Many unique images exist only as negatives. You will need to give the preservation of their informational content the highest priority.

Store these materials at 20%-30% RH and at temperatures as low as possible.

A very significant increase in film life is possible when storage humidity is lowered below 50%. Lowering the RH from 50% to 20%, for example, can improve expected film life four-fold.

Some other storage considerations for film-base negatives:

- Use a cold storage vault or commercially-available frost-free refrigerator or freezer to retard deterioration and prevent irreversible loss. Select these units carefully and monitor them routinely for temperature and relative humidity levels. See Section F.10.
- Restrict access to the materials housed within these units to staff who have been instructed in the procedures for collection retrieval of refrigerated or frozen items.
- Pack the negatives carefully in boxes. House negatives in Ziplock brand bags with humidity indicator strips.
- Use copies to access the original negatives in cold storage for copying or reference. If you must remove the originals for any reason (such as if you have a power outage of greater than 48 hours) allow them to acclimatize at room temperature for several hours before allowing access and use.
- Store deteriorated film-base collections in a well-ventilated location.
- Segregate nitrate films from other collections, preferably in their own freezer.

5. ***How do I store color photographic collections?***

Color materials, including color negatives, slides, positive transparencies, and prints, are considerably more complex in construction than contemporary black-and-white materials. The storage environment is important.

Store these materials at 20-30% RH with a maximum temperature of 2°-10°C (35°-50°F). Store them for long-term at the lower rate, and be sure to avoid cycling. With color print, negative, transparency, and slide collections, storage *temperature is the most significant factor* in determining the rate of image fading and staining. Each -12°C (10°F) reduction in temperature will approximately double the life expectancy of color materials, as long as they aren't removed regularly from cold storage. High RH levels (greater than 65% RH) will promote the growth of fungus on emulsions, resulting in irreversible damage.

Color photographs are typically composed of at least three separate dye layers, consisting of cyan, magenta, and yellow organic dyes. The specific

deterioration of these color photographic processes is often characterized by an overall loss of density; shifts in color balance caused by the unequal fading of the cyan, magenta, and yellow dyes; changes in contrast; loss of detail; and overall yellowish staining.

In addition, color photographic prints may crack and delaminate due to exposure to light or to widely fluctuating relative humidity.

Color image deterioration is the result of inherent instability of organic dyes. Consult Henry Wilhelm's and Carol Brower's book, The Permanence and Care of Color Photographs: Traditional and Digital Color Prints, Color Negatives, Slides, and Motion Pictures for more specific information on identifying and categorizing these unique deterioration characteristics.

6. ***What characteristics do I need to know about color photographic collections?***

- ***Dye fading that occurs in dark storage.*** Like light fading, dark fading stability is also specific to the type of color film or print materials. The rate of dark fading is primarily a function of temperature and typically results in a final shift in color balance, as the cyan, magenta, and yellow dyes fade at differing rates.

  Some color processes, such as Ilfochrome and Kodak Dye Transfer, are very stable in the dark. Kodachrome slide film is more stable in dark storage than Ektachrome slide film. Ektachrome, however, is more stable than Kodachrome if they are routinely projected.

- ***Dark storage yellow stain formation.*** This type of deterioration typically occurs with some color (chromogenic processes, including Kodachrome and Ektachrome) materials and often is a more serious problem than dye fading. For example, many Kodacolor prints dating from 1942-1953 now exhibit severe yellow stain formation especially prominent in their margins. This discoloration is caused by the unstable magenta dye-forming color couplers that remained in these prints following processing.

- ***Choice of processing method.*** The method of processing (stabilized or water wash) will often directly influence final image stability and the rate of stain formation. The image stability of instant color photographic processes (a stabilized process), for example, is very poor. Objectionable levels of yellowish stain may be observed in these stabilized, non-water washed materials after only a few months of dark storage.

- ***Processing shortcomings.*** Decreased dye stability and/or increased stain levels may result if color materials are processed using improperly replenished or contaminated chemicals or if the photograph isn't washed adequately so that residual processing chemicals remain. See Section G for a list of ANSI standards.

- ***Image fading, staining, or physical deterioration.*** These factors may be worsened by post-processing treatments. The application of lacquers, retouching materials, and high-pressure mounting techniques may adversely affect a photograph's final image stability.

F. Preventive Conservation: Housing Photographic Collections

1. ***How do I house photographic prints and negatives?***

Consider funding and staffing, environmental conditions, and the use of the collection when deciding which type and style of enclosure to use. Individually folder, sleeve, or interleave mounted and unmounted photographs within acid-free boxes or stainless steel file drawers. Suitable photographic enclosure materials may be composed of chemically stable plastic or unbuffered, neutral pH paper materials. See *COG* 14/2, Storage Enclosures for Photographic Prints and Negatives.

Use the following guideline when selecting and ordering supplies, and require that the vendor meet its specifications: ANSI Standard IT9.2 1991, *Photographic Processed Films, Plates and Papers - Filing Enclosures and Storage Containers* (see Section K).

See the NPS Tools of the Trade (TOT), A Listing of Materials and Equipment for Managing Museum Collections, for sources of housing materials as well as other curatorial supplies discussed in this appendix.

2. ***What about paper photographic storage enclosures?***

Paper storage materials must have passed an accelerated aging test known as the Photographic Activity Test (PAT). (Check with the vendor.) The PAT determines whether there will be harmful chemical or physical interactions between a photograph and its paper enclosure over its storage lifetime. (The PAT is described completely in ANSI IT9.16-1993.)

Photographic storage enclosures made of paper should have a high alpha cellulose content, a non-degraded form of cellulose frequently found in high-rag-content paper most desirable for paper to be permanent. Paper enclosures should contain no lignin, ground wood, or alum-rosin sizing. Printing ink shouldn't bleed or transfer, nor affect the image of the photograph.

The enclosure materials should be pH neutral at 7-7.5, and the paper *must be unbuffered* (not have an alkaline reserve). Current research, however, indicates that using buffered enclosures to house salted paper, albumen, gelatin, platinum, and collodion processes isn't detrimental provided humidity levels are maintained. It isn't necessary therefore to replace present buffered enclosures with unbuffered materials; however, purchase unbuffered paper enclosures when choosing new supplies.

Contemporary color processes, most particularly dye transfer and cyanotypes, require the use of unbuffered papers and enclosures.

There are a number of advantages and disadvantages in using paper enclosures for photographic storage. They are easy to write on and are generally less expensive than plastic materials. They are opaque, thereby protecting photographs from light. Unfortunately, this requires the users to remove each photograph from its individual paper enclosure prior to

examination, which increases the possibility of damage.

All enclosures should be standardized and made to fit easily in acid-free boxes. Identify the photographic image in pencil on the outside of each folder before inserting the print.

Paper enclosures are available in several forms including envelopes, seamless enclosures, and folders. Try to use the four-fold seamless storage enclosure; it has no adhesive seam to attract moisture and contribute to image deterioration. You can easily remove the image from the enclosure without danger of abrasion. You can, however, support fragile materials on two-ply ragboard (of neutral pH bond) by placing the ragboard behind the image within the envelope to provide better support.

You can also place prints in individual acid-free folders, even placing several photographs in one folder. In this situation, interleave each photograph with a neutral pH, unbuffered sheet of paper which has been cut to the size of the folder. Don't place more than 15 items in a single folder.

Various types of unbuffered paper envelopes are available from conservation supply companies. Use envelopes with a narrow side seam, sealed with a non-hygroscopic and non-reactive adhesive, rather than a thick central seam. During storage, be sure the emulsion or binder side of the photograph faces away from the seam. Use envelopes with a top flap, as the flap prevents dust from entering the envelope. Each envelope should only hold one photograph; when this isn't possible, interleave them.

Don't use glassine or kraft paper envelopes for photographic storage.

You can mat mounted and unmounted photographs with 100% acid-free neutral pH ragboard window and back mats. See *COG* 13/1, Window Mats for Paper Objects. Fragile, damaged or severely warped mounted photographs as well as all photographs exhibiting a flaking binder layer may require sink mat and mount housing for additional protection. A sink mat is a museum mat for paper objects that has a recessed section in the bottom sheet that protects the paper object from contact with the overmat or cover sheet. Use sink mats for photographs that have been hand-colored with friable media such as charcoal, pastel, conte crayon, and similar media that can easily be smeared, as well as for photographic prints that have damaged surfaces.

Never dry mount onto secondary supports or laminate previously unmounted photographic prints.

Matted photographs may be hinged into their back mats with long-fibered Japanese tissue hinges attached with wheat starch paste, or mounted with good quality paper photo corners. Don't use polyester photocorners, particularly on fragile images, because they can cause abrasion. Don't use hard plastic corners or flanges because they may not be chemically neutral and some have sharp edges that may scratch, abrade, or emboss a photograph.

Paper photo corners, which should be as large as possible, are the most convenient and safe means of attachment when used properly. You can fabricate these in-house from acid-free dense paper or purchase them from a conservation supply company. See *COG* 14/1, Making Mounting Corners for Photographs and Paper Objects. Any photograph with edges covered by the window mat may be mounted this way if it is strong enough to withstand its own weight resting on its lower corners while on display. The corners should be loose around the outer edges, to allow the photograph to expand with changes in relative humidity.

Reinforce the corners with a strip of archival quality linen tape or with pressure-sensitive tape adhered to the back mount. (The recommended pressure-sensitive tape for archival purposes is 3M 415 double-sided, polyester transparent tape coated with an acrylic adhesive.)

For storage, insert a sheet of unbuffered, lightweight neutral pH paper or polyester film between the photograph and the window mat to guard against abrasion. Examine carefully previously matted materials to determine their construction and materials stability.

3. ***What about plastic photographic enclosures?***

Use plastic enclosures because they have the advantage of allowing an image to be viewed without removing it from the enclosure. This technique *greatly* reduces the possibility of handling damage and is ideal for large, high-access collections that haven't been copied.

If you use plastic enclosures, give special concern to humidity control. Photographic emulsions may stick, or "ferrotype," to the slick surface of these materials.

> ***Use plastic materials ONLY if you can maintain relative humidity below 70%.***

Suitable plastic enclosure materials include uncoated polyester and polypropylene. Don't use the following materials for housing photographic prints, negatives, transparencies or slides: chlorinated plastic such as polyvinyl chloride (PVC) or polyethylene sheeting, highly plasticized sheeting or coatings, or cellulose triacetate film.

Because of the build-up of static electricity, don't use plastic materials, especially polyester film, for housing photographs that have a flaking or friable binder layer or applied color.

> ***Don't use plastic housing materials for images on glass, either negative or positive, as they are very prone to image flaking.***

Also, one side of some polyester film photographic storage sleeves is slightly matted to avoid ferrotyping. The matting is done with silica dioxide or through roughening of one surface. Don't use these "matted" or "frosted" films for photographic storage.

You can choose from a wide variety of plastic enclosure designs available from conservation supply companies. Here are a few examples:

- ***Plastic sleeve.*** The sleeve is a plastic enclosure that opens along two or three sides. One particular polyester sleeve design you may want to use opens along both long sides with a flap. The flap allows inserting and removing of the photographs without potentially dangerous sliding. "L" sleeves, sealed along a long and short edge, also allow for easy and safe access to a photographic print.

  You can cut neutral pH, unbuffered mat boards (.01"-.02" thickness) to standard sizes and then insert them into the plastic sleeve, behind the photograph. The clear plastic sleeve allows the photograph to be viewed without being removed, and therefore protects the photograph from scratches, dirt and fingerprints. The neutral pH, unbuffered board neutralizes acids, provides fragile photographs with additional support, and allows the print to be identified without labeling directly on the image.

  Take care when handling sleeved photographs, since they may slip or fall out of the open sides of the enclosures.

- ***Polyester folder.*** This enclosure is made by welding two sheets of polyester film together along one edge. These folders are most successful when used inside neutral pH, unbuffered paper envelopes. The polyester folder protects the photograph from handling whenever you remove it from the envelope.

- ***Polyester sheet with multiple pockets.*** You can use this system for housing small mounted and unmounted photographic prints within a larger-sized standard folder. It consists of two polyester film sheets that have been welded together to form standard-sized clear polyester film pockets or pouches. To maintain the original order of a collection, all images should be of the same size if this system is being used. Therefore, it may not be practical for a varied size collection.

- ***Unbuffered acid-free folder with polyester film overlay.*** This paper folder has the addition of a sheet of clear polyester film attached to its inside, along the right margin. It can be made in-house or purchased from archival vendors. This storage enclosure is particularly effective for housing unmounted and fragile albumen photographs that often have a strong tendency to curl.

- ***Polyester/ragboard enclosure.*** These "handling folders" are available commercially in standard sizes. They consist of a sheet of polyester film adhered at two edges in an "L" shape, adhered to a fractionally larger sheet of four-ply buffered acid-free ragboard. The photographic print is slipped under the polyester sheet and housed flat. This enclosure provides unmounted and fragile photographic prints with additional protection. However, mounted photographs are more likely to slip and slide within it, so this design isn't appropriate for all photographic formats.

4. ***How do I house panoramic (oversized) prints?***

Panoramic prints, usually longer than “normal” photographic prints, are often found in a tightly rolled and vulnerable configuration. While you can flatten a loosely rolled print by placing it between two pieces of clean, dry, blotting paper under weights, many tightly rolled prints will crack and tear irreversibly if forced open without the proper humidification and flattening procedures. Consult a trained photographic conservator if in doubt.

You can house flattened panoramic prints in polyester film sleeves with a fold-lock closure at the long edge. You can purchase pre-welded lengths of rolled polyester in a variety of widths that can be cut to size as required. You can also insert a four-ply ragboard support into the sleeve for increased protection. Be sure to transfer any identification information from the back of the print to the back of the board *before* housing the print in the sleeve.

You also may house panoramic prints flat in heavyweight paper folders. In some instances, it may be necessary to house these large format materials rolled onto neutral pH unbuffered tubes. Take care that the diameter of the tube is sufficiently large (4" or greater) to ensure adequate protection of the photograph. Once rolled with the binder side inward, cover the tube with polyester film, attached with a Velcro button closure.

5. ***How do I containerize sleeved prints?***

Once they are housed in individual storage enclosures, you can place photographic prints in acid-free file folders and special acid-free storage boxes that are free of lignin, ground wood, and alum-rosin sizing. Paper and board stock used to construct these storage boxes may be buffered (have an alkaline reserve). Use flat storage, in shallow acid-free boxes or flat file drawers, for fragile photographs and those that are adhered to brittle mounts. Be sure that all folders or enclosures exactly fit the inner dimensions of the storage box, so that they will stack neatly and not shift dangerously.

If they are in generally good condition, you can store 10" x 12" or smaller photographs upright in boxes or acid-free hanging file folders. Boxes and file cabinets must not be overcrowded, but also must not be so loosely filled that all support is lost. Equip vertical file drawers with rigid support of metal or acid-free mat board every 6"-8".

Fire resistive (insulated) filing cabinets are not recommended because they don't use space efficiently. They also are bulky for storage areas, and very expensive. A better storage method is to house photographs upright in boxes on steel shelving units.

6. ***What storage techniques do I use to rehouse photographic materials?***

No single storage system is ideal for all photographic materials. Base your storage decisions upon format, type, condition, use, and value of the photographs. Those materials that are most heavily used should probably be rehoused first, followed by original photographic prints of high value and/or in fragile condition. A strategy for setting priorities is described in *COG* 19/10, Reformatting for Preservation and Access: Prioritizing Materials for Duplication. In order to reduce damage caused by handling, house those photographs most often used and requested in plastic enclosures. In all cases, use standard-sized storage enclosures only.

Photographic objects are particularly susceptible to the potentially reactive and volatile by-products released by some of the materials used in the manufacture of storage cabinets. Use only galvanized or stainless steel cabinets or steel cabinets coated with a baked-on-enamel finish or non-reactive powder coatings. These powder coatings are made by electrostatically applying powdered epoxy resin that is fused to the enamel finish with heat. No solvents or plasticizers are used in the process.

Remove paper clips and staples from all photographs before storing them. Rusty paper clips or staples or other metal attachments may permanently stain, fade, emboss, and/or tear photographic prints. See *COG* 19/5, Removing Original Fasteners from Archival Documents.

During rehousing, examine all photographic items to assess the need for further preservation treatment. Learn to identify those deterioration problems that require immediate conservation treatment, such as photographic materials exhibiting actively flaking binder layers, the presence of pressure-sensitive and rubber-cement adhesives, and severely deteriorated and embrittled primary and secondary supports.

The presence of active mold growth is another critical problem that you should address immediately. You can prevent continued bio-deterioration by removing spores via aspiration, and then controlling the environment stringently.

7. ***How do I house daguerreotypes, ambrotypes, and tintypes: cased and uncased formats?***

These objects are frequently found housed in their original decorative folding cases that were often constructed of wood covered with embossed leather or paper. The photographic images are protected by a lacquered brass mat and a cover glass, usually bound together with paper tape and further covered with a decorative brass foil or preserver.

Each miniature-cased object should have individual housing protection in the form of a wrapper or container that conforms to its three- dimensional format. You can house cased photographs in individual, custom made, four-flap boxes of heavyweight acid-free folder stock. Boxes are also available from a variety of conservation suppliers in stock sizes.

Write the catalog number and other identifying information in pencil on the outside of the box. If possible, use acrylic adhesive on 3M mounting tape to adhere a 35mm contact print of the image to the outside of the storage box to help minimize handling of these fragile artifacts. Store the arranged cases flat, by size, in acid-free boxes or padded drawers. Vertical storage may be necessary for larger collections where space is a problem.

- ***Loose daguerreotype plates***. These materials are extremely vulnerable, so give them the highest priority for protective housing. This may consist of a sink mat (see Section G), alumina silicate cover glass, and a pressure-sensitive tape seal. The sink mat may be fabricated from an acid-free unbuffered ragboard or die cut from 60 point polypropylene sheeting. To ensure adequate protection, use ragboard that has passed the PAT. When purchasing ragboard, check vendor's specifications. Filmoplast P-90 and Permacel J-Lar 4000 pressure-sensitive tapes have been successfully used for binding daguerreotypes. These chemically

stable tapes are both manufactured using an acrylic adhesive. J-Lar provides a better barrier to moisture. The specific composition of these tapes may change in time. Therefore, rehoused daguerreotype plates must be carefully monitored to ensure that their deterioration isn't progressive.

Identify actively deteriorating cover glasses and replace them, as time permits, with contemporary glass. Ask a conservator to supervise all uncasing and resealing operations.

- ***Loose ambrotypes***. House loose ambrotypes in four-flap neutral pH paper enclosures or envelopes. Protect the glass support from breakage by including a four-ply neutral pH ragboard sheet. House broken or cracked ambrotype supports in a sink mat, or sandwich them between two sheets of ragboard to await further treatment. Note that the ambrotype's surface is easily abraded and scratched, although the surface isn't as delicate as the daguerreotype's surface.

- ***Loose tintypes***. House loose tintypes in good-quality paper or plastic, such as polyester and polypropylene film, enclosures. Four-ply ragboard inserted behind the tintype will provide its flexible support with additional protection. House sleeved tintypes vertically in acid-free boxes (never in plastic enclosures).

> ***For tintypes that exhibit a flaking collodion binder layer, use four-flap paper enclosures only.***

8. *How do I house glass plate negatives and positives (lantern slides)?*

Use a four-flap neutral pH paper enclosure for storing glass plate negatives and lantern slides in good condition. These enclosures should meet ANSI IT9.2 specifications (see Section K).

Storing each plate in its own enclosure prevents rubbing and abrasion on the plate. When using the four-flap enclosure, place the glass plate image in the center with each flap carefully folded over the emulsion side. This avoids the necessity of sliding the image in and out of the enclosure. Write any pertinent information in graphite on the outside of the seamless enclosure before the image is inserted. Some commercially made paper sleeves aren't suitable for glass plate storage, as photographic emulsions can be irreversibly damaged through the action of sliding the plate in and out of an envelope.

> ***Never use plastic sleeves, envelopes, or folders with glass plates. Don't place glass plates in cold storage.***

Caution: Only excessively dirty materials and/or those designated for duplication require cleaning. You should only attempt this cleaning after determining the emulsion side of the glass plate, usually the less glossy side. (If a question remains, consult a conservator.) During rehousing, carefully clean the non-emulsion or base side of the glass plate with a soft brush followed by a cloth slightly dampened with distilled water. Don't allow moisture to come in contact with the emulsion side of the glass plate.

House all glass plates according to size after making careful notes on their original order. Store glass plate negatives and lantern slides that are in good condition and smaller than 10" x 16", vertically (upright) on their long edge within the sleeves. Store them in metal file drawers or in acid-free, flip-top, reinforced boxes that contain no lignin, ground wood, or alum rosin sizing.

In each case, cut pieces of four-ply neutral pH ragboard to the size of the enclosures and place them as rigid dividers between every five to ten individually enclosed plates. These dividers will help support the weight of the plates and will also ensure that these fragile glass plates remain in an upright position as the collection is accessed by staff. Insert additional dividers or wedges to fill up extra space in a box or drawer.

Don't use traditional wooden grooved boxes for glass plate storage.

Cracked or broken glass plates should be duplicated to eliminate the need for further handling. Support them on their emulsion side with a clean, clear single-weight piece of high alumina silicate glass or non-textured Plexiglas of the same dimension. Protect the supported plate on both sides with four-ply neutral pH ragboard also cut to the size of the damaged negative. Then seal the sandwich at all edges with Filmoplast P-90 pressure-sensitive tape, and note the subject matter and condition on the ragboard support.

House glass plate negatives that exhibit active flaking or deteriorated binder layers and/or broken glass supports in custom-made neutral pH sink mat housings. Build these mats out of acid-free, single-walled corrugated board, laminated together with 3M 415 double-sided pressure-sensitive tape. Use neutral pH ragboard shims, attached to the back mat with 3M 415 tape to separate glass fragments to prevent abrasion along broken interfaces. Construct each sink mat with a hinged lid and be sure its height is sufficient so that its lid doesn't come in contact with the negative's surface. Standardize the outer dimensions of all sink mats.

In most cases mending isn't required and protective housing as described above should be sufficient. If mending is deemed necessary, ask a conservator to do it.

Finally, mark all folders and boxes containing glass clearly with the word "GLASS." Don't house boxes of glass plate negatives on upper or bottom shelves where they may be difficult to reach or lift.

9. ***How do I house black-and-white negatives?***

Use three layers of protection when storing black-and-white negatives.

- Place each negative in a sleeve
- Place each sleeve in a box or drawer
- Place each box or drawer on a shelf or in a cabinet

House nitrate and acetate film-base materials in chemically stable buffered paper enclosures that meet ANSI IT9.2 specifications (see Section K).

House sheet film negatives in four flap seamless enclosures or envelopes with a side, rather than central, seam. If envelopes are used, insert the negatives so that their emulsion surfaces face away from the seam.

Don't use plastic materials including Mylar polyester for the storage of nitrate or deteriorated acetate negatives.

10. ***Why do I place color photographic collections in cold storage?***

Cold storage is the only way to preserve color photographs in their original form for long periods of time. Therefore, with valuable color collections, be sure to use humidity-controlled cold storage for originals and copies for reference and duplication purposes.

Cold stored masters should be the originals, regardless of process. Duplication and viewing copies should be available so that the original images don't need to be removed from cold storage. Each generation of copies loses some image detail and has some color shift. Avoid introducing a copy as the master, because subsequent copies are apt to be too distorted.

While all color photographic materials will benefit from cold storage, according to Henry Wilhelm there are specific color photographic processes for which cold storage is particularly imperative. These include pre-1984 Ektacolor, Fujicolor, Agfacolor, and Konica Color prints; all pre-1991 Kodak Ektachrome prints; color negative films, especially Ektacolor, Vericolor II, Kodacolor-X, and Kodacolor II; and color transparency films such as Process E-1, E-2, E-3, and E-4 Ektachrome films, ANSCO and GAF films.

The majority of color slides are one-of-a-kind transparencies produced by the reversal processing of chromogenic (Kodachrome and Ektachrome) film. No negative remains. The most important factors you need to consider in determining the useful life of color slides is their inherent dye stability and resistance to stain formation during aging. Improper processing of color materials can also adversely affect image stability.

The stability of color transparency film varies considerably. Kodachrome film, for example, is clearly the most stable transparency film in dark storage, yet it has the worst projector fading stability of any slide film currently available. E-6 Ektachrome film, in comparison, will develop high levels of yellow stain during dark storage but is more stable than Kodachrome when projected.

11. ***How do I determine what is appropriate cold storage?***

You can create cold storage either by using a frost-free refrigerator or by constructing a cold storage facility. The latter option is significantly more costly and only appropriate for large collections of materials for which the use of refrigerator units isn't feasible.

12. ***What do I need to know about storage in a frost-free refrigerator?***

Refrigerated storage is vital for the long-term preservation of pre-1984 Ektacolor, Fujicolor, Agfacolor, and Konica Color prints; all pre-1991 Kodak Ektachrome prints; color negative films including Ektacolor, Vericolor II, Kodacolor-X, and Kodacolor II; and color transparency films such as Process E-1, E-2, E-3, and E-4 Ektachrome films, ANSCO and GAF films.

A frost-free refrigerator will effectively slow the fading rates and greatly extend the life of color photographic materials. See *TOT* for specific makes and manufacturers. Operate these refrigerators in a well-ventilated room, but not in the museum storage room. They give off a considerable amount of heat. In the event of a power failure lasting longer than 48 hours, unplug the unit and leave the door open until the power is restored.

- ***Environmental Monitoring and Control***. Maintain refrigerators properly. Monitor temperature and humidity levels at all times, ideally through the use of a datalogger drilled and attached to the refrigerator for external monitoring. Use conditioned silica canisters to help maintain the relative humidity. Place a separate thermometer in the refrigerator compartment where temperatures should be adjusted to 1.7°-4.4°C (35°-40°F).

- ***Fullness.*** Don't pack the refrigerator too tightly as constant air circulation is essential. You can use the vegetable and fruit storage drawers, but never place photographic collections directly on the bottom of the refrigerator compartment. Don't block the vent for forced cold air, and don't keep food and drink in the refrigerator.

- ***Housing.*** Package all color films and prints in envelopes and boxes and place them in polyethylene bags, such as heavy duty freezer Ziplock bags, or wrap them in polyethylene with all seams carefully sealed with freezer tape. Slide collections, packaged in paper or plastic boxes or slide pages, should also be sealed with polyethylene. This eliminates the need for pre-conditioning and prevents moisture condensation on the collection materials when the refrigerator door is opened or when they are removed and warmed to room temperature. Place moisture indicators inside the bags to help monitor environmental conditions.

  If it is unavoidable, then carefully seal all photographs in vapor proof enclosures such as heat-sealable, aluminum foil envelopes. In doing so, precondition these materials at a low (30%-40%) relative humidity. These kinds of storage systems come with a constant risk of improper seals and punctured enclosures, so they tend to reduce, and in some cases realistically eliminate, access to the collection.

- ***Preconditioning.*** Pre-condition valuable photographs by storing them for several days at a low relative humidity for maximum safety. Keep objects in the surrounding environment several hours while they reach equilibrium with the surrounding air. Then seal them in vapor-proof envelopes and place them in the refrigerator.

- ***Retrieval Guidelines.*** Develop proper collection retrieval guidelines in consultation with a conservator. Warm-up times will vary and are dependent upon the amount of materials being removed. Don't routinely retrieve collections from cold storage. Instead, use access and duplication copies for research access and copying.

  Allow a collection to warm up for 24 hours if you must retrieve it. During this time the collections should remain wrapped in polyethylene

bags to prevent moisture condensation. Air should be allowed to circulate freely around the collections as they gradually warm to room temperature.

- ***Refrigerator Selection.*** If at all possible, don't use a freezer, or an older manual defrost or newer cycle defrost (energy saver) refrigerator. The unit should have separate refrigerator and freezer compartments. Both compartments must be guaranteed to be frost-free.

  – Cooling coils in the unit should be located only in the side of the freezer section. No part of the refrigerator or freezer that condenses moisture or forms ice crystals should be visible in the unit.

  – Air should be forced over the cooling coils and into the freezer section by an internal fan.

  – All cooling in the refrigerator section should come from cold air blown in from the freezer section by an internal fan.

13. *What do I need to know about storage in a cold storage vault?*

Because the design and construction of a cold storage vault for photographic materials requires specialized knowledge, you will need to select an experienced contractor and consult with curators, archivists, and conservators familiar with cold storage systems.

- ***Environment.*** For optimum protection, experts may recommend vault temperatures of -18°C (0°F) and relative humidity levels of 30%. These levels are difficult and expensive to maintain and aren't ideal in situations where collections are regularly accessed. For these reasons, many cold storage vaults in the United States are currently operating at 4.4°C (40°F) and 40% RH. Whatever the temperature, humidity cycling must be avoided in all cases.

  Equip your vault with redundant and independent environmental systems in the event of equipment failure. Install air filtration systems to remove acetic acid and oxidizing gases. Outside the storage, install automatic dry-desiccant dehumidifiers with high efficiency particulate air (HEPA) filters. All cold storage vaults should have automatic shutdown systems that will activate when deviations from pre-set limits of temperature and relative humidity occur.

- ***Housing***. Storage in a low temperature vault requires that the photographic materials be placed in acid-free boxes, portfolio cases, motion picture cans, and other enclosures safe for the long-term storage of photographs. Vapor-proof packaging isn't required.

- ***Retrieval.*** You also need to be aware that regular and constant retrieval of materials from cold vaults will directly affect their projected life expectancy. Heavily accessed materials may not benefit as significantly from storage in low temperature vaults—below -9.5°C (15°F). Therefore, be sure to make use and duplication copies of rare or fragile materials ***before*** placing the items in cold storage, so that the originals can fully benefit from cold storage and be preserved for a maximum lifetime.

Place packages removed from the vault in polyethylene bags and allow them to warm up gradually. Small packages, such as a single matted color print, should have very short warm-up times and should be available for use almost immediately upon removal from cold storage.

14. ***When can I remove original photographic materials from cold storage?***

Don't remove originals from cold storage except in three cases:

- power outages of longer than 48 hours
- visits by photographic researchers who are studying details of process, format, and image manipulation
- the need to replace a damaged, deteriorated, or lost copy negative

15. ***How do I house color slide collections?***

Color slides not in cold storage, such as those that may be heavily used, should be enclosed in individual polypropylene or triacetate sleeves, unless kept in permanent or inactive storage. These sleeves should fit tightly around each slide so that the slides won't fall out. These sleeves aren't necessary for glass-mounted slides because glass mounts offer protection from fingerprints and scratches. Glass mounts don't reduce the rate of fading associated with dark or light storage.

You can also house slide collections in polypropylene slide pages, available in several gauges. (These pages may be used in conjunction with individual acetate sleeves.) The heavier gauge (5.0) is recommended for its superior handling characteristics. Rigid, open frame polypropylene Saf-T-Stor slide pages supplied by Franklin Distributors Corporation are also recommended. Avoid polyvinyl chloride (PVC) pages as well as low density polyethylene. Polyethylene's physical strength is inadequate and the presence of anti-block and slip agents that have been incorporated during manufacture may promote ferrotyping of the slide surfaces.

You can house large slide collections in acid-free boxes fitted with movable interior dividers or in baked-on enamel or powder-coated cabinets, but be sure that non-glass mounted slides are carefully protected from handling.

G. Preventive Conservation: Exhibiting Photographic Collections

1. ***How do I exhibit photographic prints?***

The recommended environmental conditions for the exhibition of photographic print materials are identical to those for storage: 30%-50% RH and 20°C (68°F). Never exhibit photographic prints for more than four months per year.

> ***Never place original photographic print materials on permanent display. Consider exhibiting facsimiles or copy prints where the use of original prints isn't essential.***

Restrict illumination, either artificial or natural, for display of most

nineteenth century photographic print materials to 50 lux (5 footcandles). This standard applies to all photographic materials which have exposed paper fibers, such as salted paper, platinum, and cyanotype; photomechanical processes, such as collotype and photogravure; and albumen photographs. Fifty lux (5 footcandles) also is recommended for photographic prints that have applied color such as hand tinting and/or tinted binder/baryta layers. Prints with untinted baryta layers, most silver gelatin and collodion-chloride processes, may tolerate up to 100 lux (10 footcandles) exposure.

Never expose photographic materials to direct sunlight or ultraviolet radiation. If possible, use tungsten (incandescent) or fiber optic illumination instead. Incorporate filters and diffusers with all case lighting.

It's also a good practice to monitor the condition of photographic prints at frequent intervals while they are on display. Photochemical damage is usually most apparent as a difference in appearance between exposed print areas and those protected by the window mat. You can find procedures for monitoring print materials in Section K.

All framed photographs you select for exhibition should be paper hinged or photocornered into 100% neutral pH ragboard mats and glazed with ultraviolet filtering acrylic sheeting (Plexiglas). *Only* latex paints should be used to prepare walls and exhibition spaces, since the peroxides emitted during the curing of oil-base paints will accelerate silver image deterioration.

Finally, have a conservator stabilize any photographs that exhibit serious deterioration problems before exhibiting them. See *MH-I*, Chapter 8, Conservation Treatment, for guidance on conservation treatment.

2. ***How do I exhibit daguerreotypes, ambrotypes, and tintypes: cased and uncased formats?***

A cased object consists of the photographic image, decorative brass mat, and cover glass. These components are usually sealed with paper tape and flexible brass preserver. The photographic images themselves aren't particularly light sensitive (for example, a daguerreotype plate won't fade upon exposure to light). However, the dyed decorative fabrics, paper, and leather integral to case construction, as well as some of the pigments used in hand coloring, are very susceptible to fading. Natural resin varnish layers on tintype and ambrotype surfaces may yellow upon exposure to light.

Exhibit cased objects within closed display cases at low light levels (50 lux or 5 footcandles) for limited periods of time.

You also should maintain stable temperature and relative humidity levels within these cases. A sudden rise in temperature may cause an ambrotype's black lacquer backing to irreversibly crack and craze or a daguerreotype's gilded surface to exfoliate.

3. ***How do I exhibit color photographic collections?***

All color prints, with the exception of Ultrastable Permanent Color, will fade when exposed to light during exhibition. Different types fade differently with some lasting significantly longer than others. Never subject valuable or non-replaceable color prints to prolonged (more than

one week) display. Use copies instead.

For most color print materials the spectral distribution of the illumination source, for example, incandescent versus fluorescent, has relatively little effect on their fading rates. In fact, it is the intensity of illumination that is important.

Keep illumination levels low: 50 to 100 lux (5 to 10 footcandles) is frequently recommended for the exhibition of color photographic material. Also, be sure to monitor prints with a reflection densitometer prior to and following exhibition, in order to have a qualitative record of a print's original condition and the complex changes that may take place following exhibition. Consult a photograph conservator for procedural guidelines to ensure that prints aren't damaged during the monitoring process and that the results are valid.

Color images deteriorate due to inherent instability of organic dyes. Wilhelm (previously cited) identifies and categorizes these unique deterioration characteristics. The characteristics pertaining to exhibited collections are as follows:

- Fading caused by exposure to light and ultraviolet radiation during display or projection. The rate of light fading is a function of the intensity of illumination and the duration of exposure. The rate of fading is also specific to each type of color film and print material. Most Kodak Ektacolor RC prints made between 1968-1977 and displayed for extended periods of time, for example, now exhibit severe image fading and color balance shift.

  The light fading characteristics of modern materials vary considerably. Most modern chromogenic color print materials have an ultraviolet-absorbing coating and, therefore, UV radiation isn't considered to be a major contributing factor to the light degradation of these materials. Most of the fading that occurs with these papers is caused by exposure to visible light. Ilford, Ilfochrome and Kodak Dye Transfer prints don't have UV-absorbing coating. These materials will be quickly and irreversibly damaged by exposure to ultraviolet radiation. Ektachrome slide film is more stable than Kodachrome when the processes experience regular exposure to light.

  In general, you should carefully restrict the exhibition of original color photographic prints and, where acceptable, substitute facsimile copy prints for long-term display.

- Light-induced yellow stain formation. For most modern color materials light-induced staining is a relatively minor problem when compared with the irreversible fading of cyan, magenta, and yellow dye layers.

H. Preventive Conservation: Inspecting Photographic Collections

1. ***What is the Condition Checklist for Visual Images?***

The Condition Checklist for Visual Images provides a simple way for conservators or park curators who are familiar with visual images and their conditions to record the overall condition of an image, group of images, or collection, as well as the control numbers, location within a specific collection, physical process, format, and techniques, and specific deterioration conditions.

2. ***How do I use this checklist?***

The form can be used to record this information for: a single image (for example, negative 5, of folder 9, of box 3, of collection X); a group of images (for example, negatives 43-97, of boxes 1-2, of collection X); an entire collection (for example, negatives 1-2000, of boxes 1-20, of collection X). When using the form for more than one image, check all categories that apply for that group of materials. You may need more specific data for planning purposes, such as the estimation of the amount of treatment work needed or rehousing needs. In such cases, use specific numbers to indicate the quantities of images that exhibit a specific trait (for example, brittleness 10 indicates that 10 images exhibit brittleness in the materials being evaluated).

3. ***Where do I find the checklist?***

See Figures R.3a and R.3b for the checklist. An unpunched full size checklist accompanies this appendix. Keep the full size checklist as a master and make copies for your use.

I. Conservation Treatment Issues for Deteriorated Photographic Materials

1. ***What does this section cover?***

This section describes appropriate treatments for different kinds of deteriorated photographic print materials in order to give you a sense of what will need to be done. In some cases, no treatment may be appropriate. In all cases, have a conservator treat these materials.

2. ***Why use a conservator?***

In devising a valid treatment proposal, a conservator will evaluate the physical condition and chemical composition of all components that may be incorporated into these photographic materials, including the secondary support and its method of attachment, as well as the presence of hand coloring, retouching, and/or additional varnish layers. Historic and contemporary photographic materials are composed of a wide variety of organic and inorganic compounds, synthesized into a complex, multi-layered structure. The conservator will:

- consider potential reactions and interactions of these materials to proposed conservation treatment procedures.
- evaluate the photograph's historic and aesthetic integrity as well as the short- and long-term risks and merits of a particular treatment procedure

- identify the purpose (exhibition versus storage) and scope (single item versus large group) of a particular treatment in order to determine the nature and extent of possible reconstruction or restoration

- propose a viable treatment procedure to the curator that is based on all of these critical factors

3. ***What are the ethical considerations?***

An accurate discussion of current conservation treatment practice should include an acknowledgement and understanding of the ethical principles and standard guidelines that conservators follow. All conservators are bound by a Code of Ethics. See *MH-I*, Chapter 8, Conservation Treatment, and Appendix D, Code of Ethics, for a detailed discussion of conservation treatment and the Conservator's Code of Ethics. These codes address the critical issues of treatment practice, such as:

- In the treatment of photographic materials, all actions must be governed by respect for the integrity of the photograph including its physical, historical, aesthetic, and cultural significance. The conservator must adhere to the highest and most exacting standards.

- The conservator must restore deteriorating materials according to an understanding with the owner, custodian and, in some cases, the photographer, if living. Conservation treatment must not modify or conceal the true nature of the object. It must be detectable, although it need not be conspicuous, and must be fully documented. A conservator must use appropriate materials and techniques that will have the least adverse effects and that can be removed most easily and completely. Conservation treatment procedures must not impede future examination or treatment possibilities.

Figure R.3b. Condition Checklist for Visual Images (Sample)

4. ***What treatments will the conservator use?***

While many of the conservation treatments discussed apply to both nineteenth- and twentieth-century photographs, they do *not* apply to contemporary color materials. The complexity of modern color materials eliminates most treatment options.

> ***It is important that these treatments be carried out by a conservator who specializes in photographic materials. Improperly done, these treatments will cause irreversible and catastrophic damage.***

Practical, reversible, and predictable conservation treatment procedures for deteriorated photographic print materials are continually being developed and refined. However, many questions remain unanswered. Many objects are left untreated as informed conservators advocate restricted handling and stringent environmental control for the preservation of particularly fragile materials for which treatment isn't, at this time, an option.

- ***Removal of Microorganisms***

  The organic constituents of photographic materials are vulnerable to microbiological attack associated with upper extremes of temperature and relative humidity. The most effective treatment in all but the most severe cases is modification of the environment and removal of the mold growth from the affected item by using a vacuum aspirator or tweezers.

  Mold removal may yield a fragile and disfigured surface, requiring careful consolidation and inpainting by a conservator. Primarily because of their potential toxicity and chemical reactivity, the use of fungicides or fumigants in the treatment of mold-damaged photographic materials has been curtailed radically. See *COG* 3/4, Mold and Mildew: Prevention of Microorganism Growth in Museum Collections, for guidance on monitoring and controlling the environment to prevent microorganism growth in collections.

- ***Consolidation of Flaking Binder Layers***

  In some cases, photographic images will exhibit moderate to severe flaking of their binder layer, thus requiring immediate consolidation by a conservator. (Consolidation is the application of an adhesive to improve cohesion between a deteriorated binder layer and its substrate.)

  Consolidation techniques also may incorporate the use of aqueous or non-aqueous solutions, the choice of which is typically dependent on the physical and chemical compatibility of the consolidant and its selected solvent with the deteriorated binder layer. The use of solvent-soluble adhesives such as acrylic resins, for example, may not be appropriate for the consolidation of a deteriorated collodion binder layer. Likewise, the high pH of acrylic dispersions, often ranging from 8.0 to 9.0, may prove problematic for use with proteinaceous binders. The conservator will also need to evaluate any additional properties, such as long- and short-term reversibility, flexibility, adhesive strength,

chemical reactivity, and the possibility for irreversible visual alteration.

- ***Reduction of Surface Dirt***

  Photographic images exhibiting embedded dirt and grime may be carefully surface cleaned after a conservator has thoroughly evaluated the possibility for physical or chemical damage, as well as permanent alteration in surface reflectance or gloss. Conservators employ a variety of materials and techniques in an attempt to reduce dirt and grime layers effectively from photographic surfaces. These include soft brushes, non-sulphur-containing crumbled vinyl erasers, distilled water and organic solvent solutions applied with cotton swabs and/or balls.

  Severe structural damage to a binder layer may prevent dirt removal. This is often true of deteriorated albumen photographs, in which the egg white binder is severely cracked and crazed. The conservator must be extremely careful when cleaning photographs in which the final image material is embedded in the paper support, such as salted paper or platinum prints, as these images are abraded easily.

  On film-based negatives and transparencies and slides, park staff may use compressed air available in aerosol cans (for example, Dust-Off, Omit) to reduce surface dirt. This procedure should be performed under the guidance of a conservator and only on film in good condition with no evidence of physical damage. Some aerosol-canned products contain oily gray substances. Test first by spraying on a white blotter.

  Photographic materials that have accumulated a lot of surface dirt and dust may require immediate attention by a conservator, who will safely remove superficial loosely attached dirt with a dry, soft brush.

- ***Removal of Tapes and Adhesives***

  In order to safely remove paper hinges, residual adhesives, and pressure-sensitive tapes from a photograph's surface, a conservator may use direct or indirect moisture vapor, methyl cellulose poultices, aqueous solutions, organic solvents, and many other accepted paper conservation techniques.

- ***Removal of Poor-Quality Secondary Supports***

  The vast majority of historic photographic prints were mounted during manufacture, with mounts usually consisting of a poor-quality lignin-core board sandwiched between two thin, high-quality papers. Lignin decomposition products may react with proteinaceous materials such as albumen or gelatin, producing a highly colored compound and/or emitting oxidants such as peroxides and causing silver and dye image materials to fade and discolor. In addition, these secondary supports are often acidic and embrittled, posing serious structural danger to the photographs themselves. If this is the case, use extreme care in handling these fragile materials, and consider conservation treatment.

If undertaking treatments of this type, the conservator will consider the historic and aesthetic integrity of the photograph's secondary support. Through careful visual and microscopic examination, the conservator will evaluate the possible deleterious effects associated with the mounted photograph's adhesive and secondary support material, as well as the sensitivity of the photograph's component structure to possible physical or chemical damage during treatment.

Typical backing removal techniques involve mechanical removal, the local application of moisture vapor or steam, and/or immersion in aqueous or organic solutions. Treatment choice will be dictated by the photograph's structural and chemical condition. Inadequately hardened gelatin prints, for example, may swell dangerously when exposed to moisture. Exposure to moisture via surface cleaning, humidification or immersion will likely cause albumen binder layers to crack and craze, with a resultant loss of surface gloss. Many albumen and silver gelatin photographic prints, therefore, may require absolutely dry techniques, such as the use of metal or Teflon spatulas, for the safe removal of their deteriorated secondary supports.

- ***Humidification and Flattening***

  Humidification and flattening of rolled, cockled or warped photographic prints are critical operations that, if done incorrectly, may induce dimensional instability, irreversible damage to a binder layer, and/or irreversible staining in the photograph's primary support. However, a conservator can develop treatment strategies for the humidification and flattening of curled photographic prints and, in some cases, park staff can be trained to carry out these procedures as well.

- ***Chemical Treatment***

  An issue of considerable importance and active debate in the photograph conservation field today is the use of chemical treatment. The dire consequences of ill-advised treatments can't be ignored. For this reason, most practicing conservators agree that many chemical treatments, such as the bleach and redevelopment of faded silver images, particularly on fine art photographs, require more research before use.

- ***Structural Repair***

  Photographic prints exhibiting creases, tears, losses, and other structural damages may be mended by a conservator utilizing accepted paper conservation techniques. In most cases, the conservator can mend tears successfully by using the appropriate weight Japanese paper combined with wheat starch, gelatin, or methyl cellulose adhesive.

- ***Remounting of Photographic Prints***

  Photographic prints that have been removed from their mounts during treatment may require lining or remounting in an attempt to stabilize, consolidate, strengthen, and facilitate handling for exhibition and/or

storage.

In selecting the appropriate mounting technique, the conservator will consider a variety of factors pertaining to the photograph's condition and appearance prior to and following mounting. The conservator must take into account the potential for cracking or crazing of an albumen binder layer, for example due to the expansion and contraction of a wet secondary support. This may occur in many currently practiced remounting techniques.

Methods used by conservators to remount photographic prints include:

– line unmounted photographs directly onto Japanese papers or rag papers and boards using methyl cellulose or wheat starch adhesives

– line a humidified photograph with Japanese paper and wheat starch paste onto a sheet of unbuffered two- or four-ply ragboard that has been counterlined on the reverse to minimize warpage

– adhere the unmounted photograph onto a smooth-surfaced rag paper with wheat starch or methyl cellulose adhesive

  The polyester fabric or "Dacron," which is then pasted onto sanded Plexiglas, acts to hold the photograph's secondary support under tension and is removed following drying.

The latter technique may be particularly suitable for the mounting of larger collections or holdings of photographic prints, as the cost of materials and time requirements can be minimized.

Each of these mounting techniques has distinct advantages and disadvantages. Discuss the ramifications associated with each of these options with your conservator.

- ***Compensation of Losses***

Following remounting, a conservator may inpaint abrasions, scratches, tear edges, and other disfiguring damage in a photograph's surface by using a variety of media, including watercolors, ground pigments in acrylic resins, and pastel pencils. In all instances, the conservator will first evaluate the long-term aging characteristics of the selected media and their "compatibility" with the damaged photograph in terms of chemical reactivity, solubility parameters, and surface qualities. The extent of compensation should also be discussed and agreed upon in collaboration with the curator or collection manager.

J. The Recovery of Water-Damaged Photographic Materials

See *MH-I*, Chapter 10, Museum Collections: Emergency Planning for guidance on emergency planning, and to Chapter 8, Conservation Treatment, for general rules on appropriate response to emergency situations involving museum objects.

1. *How should I recover water-damaged materials?*

If at all possible, water-soaked photographic materials should be air-dried, laid flat on a clean surface or hung on a line with clips that won't leave indentations (not binder clips). If you can't air-dry these materials, due to lack of personnel, facilities, and/or time, freeze them and then thaw and air-dry them later. Don't freeze glass plates or lantern slides.

Vacuum freeze-drying is the next preferable alternative. In this system place the photographs in a vacuum chamber either wet or frozen. The vacuum is pulled, a source of heat introduced, and the photographs, which dry at temperatures below 0°C (32°F), remain frozen until dried. Vacuum freeze-drying may result in a significant loss of gloss and/or a strong tendency to curl. The tendency to curl may be overcome by careful humidification following freeze-drying. In all cases, ***avoid vacuum thermal-drying*** whereby photographic materials are dried at temperatures above 0°C (32°F). As a result, photographic binder layers will have a strong tendency to block or stick together irreversibly. Don't vacuum freeze dry glass plates or lantern slides.

If photographs have been immersed in dirty water, a disaster recovery team should carefully wash them in changes of cold, preferably distilled, water prior to air-drying or freezing. Carefully monitor the condition of the photographs to ensure that binder layers or original ink annotation on mounts aren't being damaged. Some color processes may require bathing in a stabilizer prior to air-drying. Consult a conservator.

2. *What should I salvage first?*

In general, black-and-white photographic prints appear to be more resistant to water damage than contemporary color materials. Photographic film-base negatives are more resistant to deterioration than print materials. Depending upon the collection priority, you may want to salvage color materials first.

Mold grows after 48 hours above 65% RH and 21°C (70°F). Emulsions soften and stick if not separated during the drying process. During salvage, rescue the following first: silver gelatin processes (prints, negatives, and transparencies), glass plates, lantern slides, ambrotypes, daguerreotypes, color materials and acetate and nitrate film base. Albumen processes, collodion prints, salted paper prints, cyanotypes, and platinum prints can be done last.

Additional Comments:

APPENDIX S: CURATORIAL CARE OF OBJECTS MADE FROM LEATHER AND SKIN PRODUCTS

A. Overview

1. *What information will I find in this appendix?*

You will find the National Park Service's present understanding of objects made of leather and skin products. You also will learn about preventive care for these objects including:

- agents of deterioration posing the greatest threat to these objects
- measures for preventing or minimizing the impact of these agents
- techniques for handling, marking, and cleaning these objects
- methods and techniques for improving storage and exhibit conditions
- methods for monitoring the condition of these objects

2. *Why is it important for me to practice preventive conservation with these objects?*

Advancements in the treatment of leather and skin products have not kept pace with the progress made in conserving other kinds of museum objects. The conservation field only can offer limited solutions to the problems facing objects made of leather and skin. Conservators and the scientific community have begun to focus more specifically on developing new treatment strategies for the preservation of leather and skin. While new information is provided as it becomes available, you need to practice sound preventive conservation now because:

- preventive measures stabilize objects and leave opportunity for appropriate future interventive treatments
- conservators can only offer limited treatment solutions

Conservators discourage traditional interventive treatments, such as the application of saddle soaps and dressings. *Avoid interventive conservation treatment of leather and skin objects whenever possible.*

> ***See NPS Museum Handbook, Part I (MH-I), Chapter 3, Museum Objects Preservation: Getting Started, for a discussion of preventive conservation and conservation treatment.***

3. *How can I find the latest information on care of these types of materials?*

Refer to the following sources for new information and techniques:

- NPS *Conserve O Gram* series
- e-mail NPS Museum Management Newsletter

B. The Nature of Leather and Skin Products

The skins and hides from vertebrates constitute the class of natural materials called skin products. Leather is one type of skin product that is produced by a particular tanning process. Processed and unprocessed animal skins have supplied the basic fabric for making utilitarian and decorative objects since prehistoric times. You will often find these materials in art, history, ethnology, and science collections.

1. *What is the structure of skin?*

Animal skin is a fibrous layer of living tissue that protects an organism from the elements. Figure S.1 illustrates its structure.

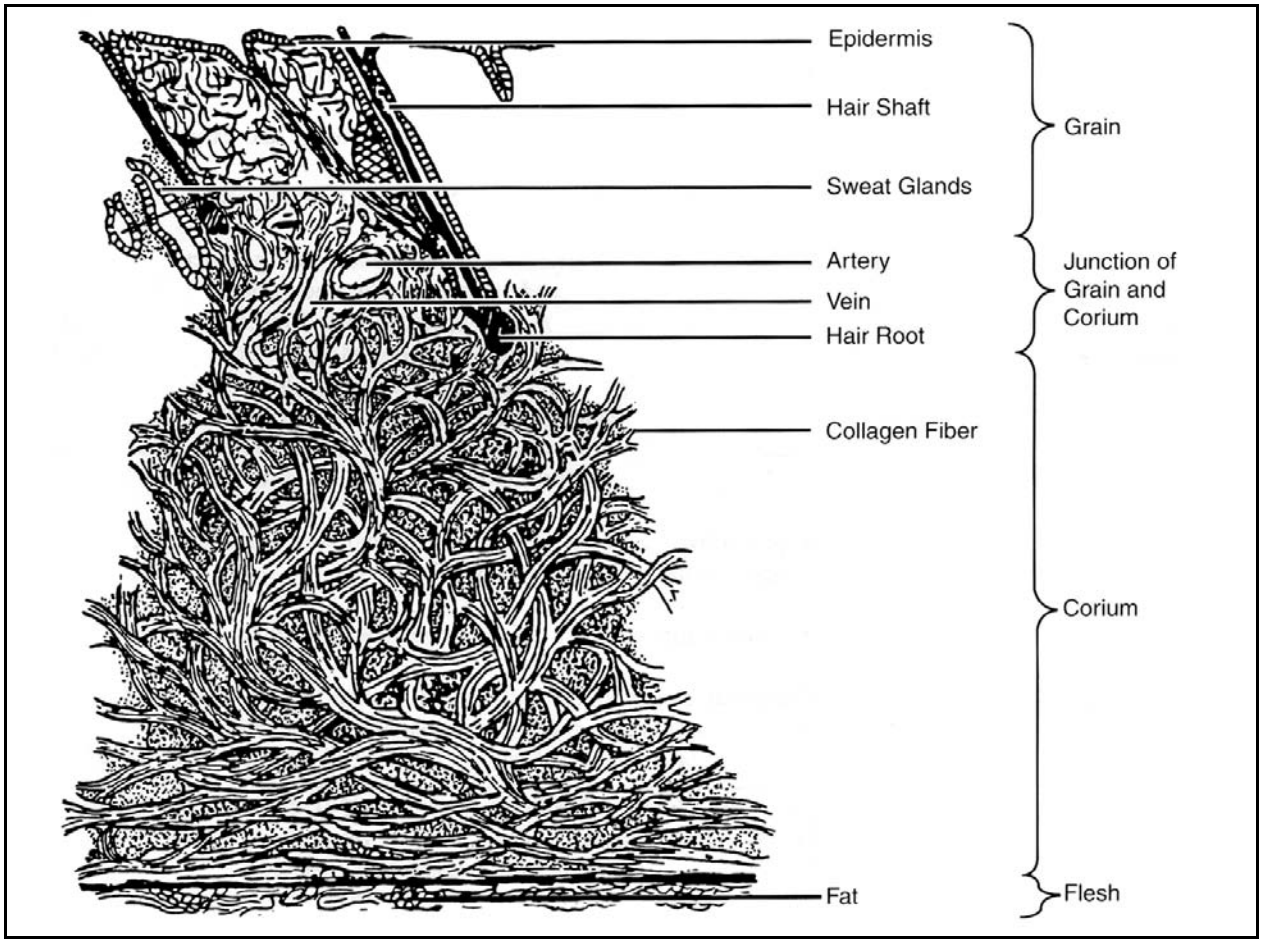

Figure S.1. The Structure of Skin

Once removed, an unadulterated skin is a proteinaceous sheet containing hair, sweat glands, fat and blood vessels, as well as its basic constituent of collagen fibers. These protein fibers are composed of coil-like molecules built of tiny fibrous strands that are twisted together, then aligned side by side overlapping one another, much like cotton fibers are arranged in a textile yarn. (To prevent separation of the cotton fibers the yarn is twisted during manufacture to produce a strong and usable thread.)

2. *How is animal skin processed?*

Animal skin can be tanned and untanned. Examples of untanned skin include rawhide, parchment, and vellum. Stable skin is processed by chemically binding fibers together, commonly referred to as tanning. The amount and type of bonding that occurs within a skin establishes its "degree of tannage." The term "leather" refers technically only to the fully tanned skin products. Figure S.2 describes degrees and types of tannage of most skin and leather objects in park collections.

Un-tanned	Semi-tanned	Native-tanned	Fully-tanned
rawhide parchment vellum	oil tannage alum tannage	smoke tannage brain tannage oil tannage	vegetable tannage mineral tannage combination tannage

Figure S.2. Degrees and Types of Tannage

People have preserved or “tanned” skin products in many ways to render them strong, insoluble, and more resistant to temperature and moisture. Nearly all of the methods of skin processing techniques used by skin and leather workers throughout the ages achieve some degree of tannage. Many of these procedures rely on mechanical properties more heavily than chemical tanning, such as the softening that results from introducing oils.

Unfortunately, determining an object's original manufacture requires considerable study. While laboratory treatments vary for different types of skins and leathers, *preventive conservation procedures are similar for most of these materials*. Your familiarity with the general skin processing categories can be very useful since these methods are responsible for many of the object's functional characteristics. See Figure S.3 for physical characteristics of these products.

3. *How do I recognize different species?*

The skin or hide of each animal species is recognizable by its physical characteristics. The principle variations among animal types are the size, density, and distribution of the animal’s hair, which gives rise to a distinctive grain pattern.

The relative thickness of hide and skin products is traditionally measured in “ounces.” Each ounce represents 1/64 of an inch. The black solid lines in Figure S.4. represent the thickness of leather being measured.

CHARACTERISTICS OF LEATHER AND SKIN PRODUCTS

	RAWHIDE	OIL TANNAGE	ALUM TANNAGE	SMOKE TANNAGE	BRAIN TANNAGE	VEGETABLE TANNAGE	MINERAL TANNAGE
TANNING MATERIAL	No Tannage Applied	Cod Liver Oil and Other Oils	Alum or Aluminum Sulphates or Chlorides	Aldehydes from Wood Smoke	Animal Brains	Extracts of Wood Chips, Bark, Leaves, Roots, Fruit	Chromium Sulphates or Chlorides
COLOR AFTER TANNAGE	White to Yellow	Dull Yellow	White	Yellow to Yellow/ Brown	White to Yellow	Yellow/Orange to Light Brown	Bluish White to Pale Green
EFFECT OF WATER	Stiffens, Dissolves, Turns Transparent	Water Absorbed, Tan Stable	Stiffens, Water Removes Tan	Water Resistant	Stiffens, Water Absorbed	Water Absorbed, Water Removes Tan Slowly	Water Absorbed, Tan Stable
TYPICAL USES	Saddle Trees, Drumheads, Scabbards	Gloves, Wettable Leathers	Gloves, Pelts and Furs, Book Bindings	Native American Clothing, Lodges	Native American "Buckskin" Clothing and Objects	Shoe Soles, Saddles, Book Bindings	Clothing Shoe Uppers

Figure S.3. Characteristics of Leather and Skin Products

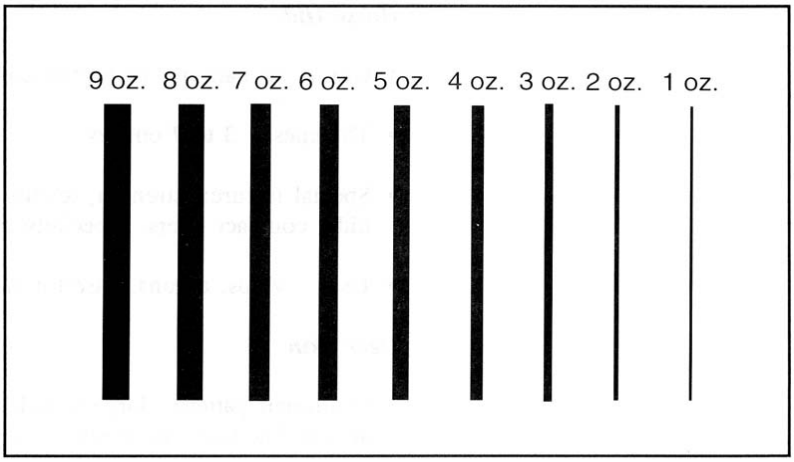

Figure S.4. Thickness of Skins and Hides

The characteristics and uses of common animal skins and hides are listed below.

Cow Hide

- Grain/hair pattern: pebbly, pronounced with large, equidistant hair spacing
- Thickness: 2 to 20 ounces
- Processing note: often split into several pieces
- Special feature: very durable, excellent for tooling and carving
- Uses: shoe soles, belting, trunks, clothing

Calf Skin

- Grain/hair pattern: same as cowhide only smaller
- Thickness: 1.5 to 4 ounces
- Special feature: greater uniformity and fineness than cowhide
- Uses: upholstery, shoe uppers, clothing, bookbindings

Bison Hide

- Grain/hair pattern: similar but less uniform than cattle
- Thickness: 5 to 20 ounces
- Special feature: loose-knit fibers on flesh side; very large hide size; stiff hump between shoulders
- Uses: 19th century boots, sleigh blankets, Native American shields, robes, clothing, tipis

Horse Hide

- Grain/hair pattern: resembles cow hide but less dense
- Thickness: 3 to 7 ounces
- Special feature: strength, texture and thickness are inferior to cow hide; compact fibers, especially in butt region
- Uses: whips, aprons, base for enameled leathers, trunks

Deer Skin

- Grain/hair pattern: large follicles form definite single rows; closely spaced fine hairs are similar to goat skin
- Thickness: 2 to 9 ounces
- Processing note: hairs are sometimes left on
- Special feature: loose structure (like sheep) results in a very stretchy leather
- Uses: parchment, gloves, clothing; Native American clothing, moccasins, containers

Sheep Skin

- Grain/hair pattern: linear groupings of large and small groups
- Thickness: 1.5 to 3 ounces
- Special feature: weaker, less durable skin (loose interweave of fibers); loosened texture (fibers run parallel to skin surface)
- Uses: suede leathers, bookbindings, jackets, gloves, chamois

Goat Skin

- Grain/hair pattern: groupings of three coarser hair follicles with closely spaced fine hair follicles
- Thickness: 2 to 3 ounces
- Special feature: close-knit collagen fibers; more durable and stronger than sheep skin
- Uses: linings, billfolds, shoe uppers

Pig Skin

- Grain/hair pattern: very coarse hairs are sparsely distributed in groups of three
- Thickness: 3 to 4 ounces

- Special feature: high fat cell content produces tough but spongy leather; very rough surface; limited water resistance

- Uses: shoes, bags, gloves, pants

Exotic Leathers

Reptile

- Special feature: surface patterns distinguish reptile type: crocodile, alligator, snake, or lizard

- Special feature: light, thin, grainless leathers often are made from bellies

Fish

- Special feature: structure is different from mammals but scales are comparable to hair on mammals

Seal

- Special feature: proportionally stronger than other leather materials; fur is left on for coats, fur is removed from base for enameled leather

C. Agents of Deterioration

The ways that skin products deteriorate can be identified and categorized. The interdependency of these mechanisms cannot be overstated. For example, temperature changes directly affect a skin or hide's moisture content, the rate at which chemical deterioration proceeds, and the object's susceptibility to biological infestation.

1. *What is the threat of biological infestation?*

A great variety of biological organisms are attracted to skin and hide products making these materials subject to quick and irreversible damage or total destruction. For example, insects are frequently attracted to the oils present in skin products as well as surface soils. Also, poorly cleaned materials are particularly attractive as a nutrient material for insects and microorganisms, as are all items made from rawhide.

Most insects prefer skin products made from fur and unborn animal skins. The most frequent infestations involve dermestid beetles and clothes moths, but other beetles and moths also attack skin and fur on occasion, as do silverfish and cockroaches.

Insect development usually relies on higher levels of humidity and temperature.

Since skin products are acidic in nature, microbic deterioration of skin products is generally limited to molds and occasionally bacteria. This deterioration is primarily due to environmental factors such as high humidity (above 65% RH) and a wide temperature range (in most cases 10°-40°C [50°-104°F]). These organisms produce organic acids and enzymes that bleach and stain the skin. Fungal growths are often

characterized by a white, gray, or green fuzzy appearance. These growths occur most commonly on objects made from rawhide and on those skin products that have become heavily soiled.

2. *How do I prevent pest problems?*

Here are some measures to prevent or minimize biological infestation:

- Monitor all areas of the museum continually and systematically to identify insect and microbial problems at an early stage. Use insect monitoring traps and routinely inspect objects for frass, nesting materials and damage. See *MH-I*, Chapter 5, Biological Infestations, for guidance on developing a museum Integrated Pest Management (IPM) Program.

- Identify dead or living pests that you suspect of attacking skin objects.

- Develop a pest control program that includes a designated staff coordinator, with guidelines for preventive and emergency measures. Its focus should be pest control through good housekeeping and modifying the environment.

- Minimize microbiological attack of skin products by keeping relative humidity below 65% and by keeping areas clean.

- Never apply insecticides and fungicides directly to hide artifacts because they can damage the objects, complicate long term preservation, and contaminate the material for future handling and study.

- Gaseous fumigation methods available for skin and hide materials are few and require coordination by a conservator. In addition, contact the park, center, or your IPM coordinator prior to pesticide use. Technology is constantly changing and the coordinator will have access to the latest and most appropriate solutions. Your IPM coordinator must authorize and approve all pesticide use before application.

Non-toxic means of extermination such as freezing are preferable. See NPS Conserve O Gram 3/6, An Insect Pest Control Procedure: The Freezing Process, for guidance on the technique of freezing for controlling pest infestations.

3. *What about the loss of hair and fur?*

The loss of hair and fur from skins and hides not only devalues an object, but also can destroy its potential usefulness. The causes of hair or fur loss are complex and usually depend on the form and structure of the animal, the hide's original processing techniques, and the environmental conditions to which it has been subjected.

There are numerous types of hair loss:

- Epidermal slippage: hair is lost as the epidermal layer separates from the dermal layer.

- Deterioration of the individual hair follicles: hair roots become loose and hair falls out.

- Hair shaft breakage: mechanical damage weakens the hair and it breaks at its base.

- Biological attack: insects feed on the hair itself or epidermal layer, resulting in the hair being severed.

You can't do much about hair loss that is due to insufficient fixing during processing, but you can control many of the other causes, such as high temperatures, low relative humidity, photochemical degradation, and insect damage.

4. *How can I stop hair and fur loss?*

To limit the loss of hair and fur:

- Minimize the exposure of fur or hair products to lighting; illuminate only to the minimum level necessary to see the object. Recommended levels are 50 lux (5 footcandles) or less.

- Minimize handling.

- Stabilize the relative humidity and temperature to which hides with hair and fur are exposed. Don't expose them to rapid changes of either temperature or humidity and protect them from desiccation.

- Routinely inspect hair and fur products for insect damage. Remove loose or broken hair by brushing and vacuuming, and store materials in insect-proof containers such as metal museum storage cabinets with door gaskets.

5. *What is the threat of thermal reaction?*

Skin and leather products are thermosensitive. Skin tissue has a heating threshold, or point of thermal contraction, which is referred to as its shrinkage temperature. For newly processed skins and hides, this point is frequently between 60°-75°C (140°-167°F). However, the shrinkage temperature of degraded hides of aged objects can be considerably lower.

Heating dries out, embrittles, and deforms skin and leather objects. Changes in temperature also can destabilize relative humidity levels. Exhibit lighting, direct sunlight, and proximity to heating registers and radiators can easily damage leather and skin objects, which also become more sensitive to heat as they age.

Elevated temperatures cause eventual damage not only by speeding up the chemical deterioration processes, but by causing unstable fats and oils to come to the surface where they often deposit as unsightly spews. Spews (also spelled spues) are surface deposits of solidified fats and oils that exude from the interior of the leather/skin material. They appear as a white crystalline deposit or as a whitish bloom. Desiccation can also result from over-heating.

6. *How can I minimize the threat of thermal reactions?*

Try these preventive measures to minimize thermal reaction:

- Safeguard skins from exposure to warm, moist air. The acceptable minimum and maximum temperature levels are from just above freezing to 20°C (70°F).

- Reduce the damaging effect of heat cycling by placing objects away from external building walls, exterior doors and windows, exposed pipes, heating and air conditioning vents, direct sunlight, exhibit lighting sources, and locations such as hot attic spaces.

7. *What about water and moisture damage?*

While skin materials have a great affinity for water, inappropriate levels of atmospheric moisture or direct wetting usually cause serious damage. The direct wetting of skin products initiates deterioration because these materials have only a limited degree of water resistance. Rawhide, parchment and vellum are most prone to damage. Aged objects made of full-tanned leather are also highly susceptible to stiffening and darkening from wetting.

All animal materials readily absorb moisture from the air. Excessive moisture (levels above 65% RH) causes swelling of the skin's fibers and encourages biological infestation. Excessive dehydration (humidity levels below 22% RH) forces the skin to give up moisture permanently, which results in shrinkage and deformity.

Dehydration reduces the skin's ability to take up and hold moisture, thus weakening it and dramatically decreasing its flexibility. Repeated exposure to moist and dry cycles will, eventually, physically stress the hide's fibers enough to induce mechanical damage and increase its susceptibility to chemical deterioration. The hide's soluble components are frequently displaced, leached, or deposited on the surface resulting in the alteration of physical characteristics.

When skin material is subjected to either excessive moisture or high humidity in conjunction with heat and acid conditions, its chemical structure is attacked, causing shrinkage and embrittlement. If allowed to continue, the skin will lose its structure and become gelatinous. The boiling of skin to produce gelatin or hide glue is an example of this process.

8. *What are the measures for limiting water and moisture damage?*

To minimize water and moisture damage:

- Keep hide materials dry by protecting them from wetting and exposure to relative humidity levels above 65%. House objects in water-resistant containers, such as storage cabinets and exhibit cases. Whenever possible, include moisture absorbing materials to buffer enclosed spaces against extreme fluctuation of RH. These materials may include commercially-available buffers such as cotton or linen cloth, acid-free paper products, or silica gel. See *MH-I*, Appendix I, Curatorial Care of Archeological Objects, for a discussion of the use of silica gel.

- Control the relative humidity to conform to the recommended levels suitable for the collection's circumstances. Stabilize humidity fluctuation to the recommended range of 40-60% RH. Normally, you will regulate humidity through the central air-handling system, but you also can use localized and portable sources of humidification/ dehumidification to protect objects from unnecessary damage.

- If you discover mold on objects made of leather or skin, consult a conservator regarding vacuum cleaning and disinfectant procedures.

9. *What is the threat of prolonged exposure to oxygen?*

For organically-based materials like skin products, prolonged exposure to oxygen is one of the more serious and avoidable chemical factors that causes deterioration and is responsible for altering both the skin's chemical structure and many of its tanning compounds.

Its long-term effects include the hardening of skin and hide material, embrittlement, cracking and crazing of the skin surface and overall yellowing or darkening as well as a number of serious internal structural changes. Oxidative degradation is caused by high temperatures and humidities and exposure to light radiation.

10. *How can I minimize these oxidation reactions?*

By taking the following preventive measures:

- While it is impractical to keep most of these materials from being exposed to oxygen, if an object is extremely rare, consult with a conservator about storage and display in a hermetically sealed container filled with inert gas (such as nitrogen or helium).

- Don't expose hide materials to excessive humidity or heat. Use air conditioning, storage design and exhibit design to eliminate the detrimental effects of these environmental stimulants of oxidation.

- Reduce the level of visible light to the minimum required and eliminate exposure to ultraviolet light.

11. *What about pollutants?*

The threatening forms of pollutants to skin products are particulate and gaseous pollutants. Particulates are solids that are suspended in air and range in composition from inorganic to organic. Because skin has such a porous and absorbent surface, these solid foreign materials easily work their way into the fibrous network of skin products causing soiling, staining, and eventual stiffness.

Little data is available regarding the effect of gaseous pollutants on skin but it is probable that oxidant, acidic and sulphating gases play some role in the deterioration process. Native-tanned and semi-tanned materials seem relatively more resistant than do commercial, vegetable-tanned leathers. It is likely that pollutants promote oxidation, hydrolysis and overall discoloration.

12. *How can I minimize the effects of pollutants?*

To minimize their effects:

- Modify the building's central air conditioning and filtering system. Various filters can trap different size particles, and effectively remove gaseous contaminates.

- Exhibit and store your objects in tightly sealed enclosures constructed of the highest quality inert materials. Install specialized pollutant absorbers with individual storage cabinets.

13. *What harm can light cause?*

Light is an important factor in the process that degrades skin products. Its damage is cumulative and irreversible.

Certain wavelengths break down polymeric bonds and are detrimental to all skin materials. The ultraviolet range of light is one of the most dangerous wavelengths for skin products; however, visible light also causes structural damage and color change.

Light can act as a catalyst when oxygen, water vapor and various pollutants in the atmosphere combine to increase the rate of deterioration. The rate of degradation is generally related to the intensity and length of light exposure. Fading of smoked and pigmented hides is a particular problem where prolonged light exposure is involved.

14. *How can I minimize the effects of light?*

Take these preventive measures:

- Minimize the exposure of skin materials to visible light; illuminate only to the minimum level necessary to see the object. Recommended maximum levels are 150 lux (15 footcandles) for most materials and 50 lux (5 footcandles) for painted skins and hides with fur.

- Eliminate ultraviolet (UV) radiation through the use of UV absorbing filters installed between the light source and the artifact or on the light source itself. Select lighting systems with low proportions of UV radiation. The maximum acceptable proportion of UV radiation is 75 microwatts per lumen.

- Maintain stored objects in darkness. Ensure that unfiltered light does not reach stored skin and hide materials.

- Monitor and adjust lighting fixture locations and light bulb wattage individually. Use timers and dimmers for controlling light in exhibits.

See MH-I, Chapter 4, The Museum Environment, for general guidance on temperature, relative humidity, light, and pollution.

D. Preventive Conservation: Guidelines for Leather and Skin Object Care, Handling, and Storage

The most successful method of preserving leather and skin products is a good preventive conservation program. This program needs to include systematic collection care, handling and storage practices, and regular inspection and condition evaluation. This approach replaces the traditional practices and remedies of the past that have been found to be detrimental to museum objects.

For longer life of skin and leather objects follow these general guidelines:

- Identify the general category of the skin product correctly.

- Understand the product's basic characteristics, as well as its deterioration features.

- Upgrade the general environment that includes controlling climatic conditions, minimizing light exposure, providing physical support, and protecting from mishandling, soil accumulation, and pest infestation.

- Inspect, evaluate, monitor, and document an object's condition, periodically; record the urgency for conservation treatment.

- Provide specialist care for those objects requiring complex or considerable conservation treatment.

And follow these specific guidelines:

1. *How do I provide a stable and appropriate humidity?*

Use enclosures such as exhibit cases or storage cabinets to stabilize humidity and reduce handling, soil accumulation, and attack from microorganisms and insects.

Set relative humidity to an acceptable range: less than 5% RH change within a 24-hour period and an annual change of no more than ±8% fluctuation from the set point.

Humidity parameters are frequently 40%-60% RH; however, the specific set points will vary according to:

- climatic considerations

- an object's state of deterioration

- your facility's air handling capability

- requirements of any composite and associated materials present

- the relative humidity with which the object has reached equilibrium

2. *How do I monitor the condition of objects?*

Inspect objects for deterioration regularly. If you do not regularly evaluate and document their state of degradation, deterioration of leather and skin objects can go undetected and unchecked. Evaluate the condition of objects thoroughly when they are acquired. Then, inspect the objects periodically to identify progressive damage, such as lengthening of tears, increases in surface or pigment loss, and evidence of biological attack. Finally, use a conservator to assist in periodic surveying of significant objects in order to establish conservation treatment needs. See *MH-I*, Chapter 3, Museum Objects Preservation: Getting/Started, for guidance on Collection Condition Surveys.

3. *How do I clean objects?*

The degree to which each soiled object can be cleaned is a function of the nature of the soil and the sensitivity of the object. Clean an object only as necessary to remove airborne soil accumulation.

> ***Don't directly apply chemical reagents such as cleaners, dressings, waxes, and coatings: they are not beneficial and will complicate future conservation treatment.***

You can't remove some surface soils by simple cleaning methods, and other soils are not removable at all. Highly deteriorated objects cannot be cleaned by routine procedures so degraded surfaces should be noted and protected so that cleaning will be avoided.

When decorative elements on an object are extensive and very delicate, refer cleaning to a professional conservator. Surfaces that have specialized finishes also may require exemption from cleaning. Figure S.5 describes cleaning techniques that can be considered for objects in good condition.

4. *How do I handle skin and hide materials?*

Much of the damage caused to leather and skin products is due to improper handling. Therefore, you need to train staff in proper handling techniques. See *MH-I*, Chapter 6, Handling, Packing, and Shipping Museum Objects, for general handling rules.

In addition to the general rules there are a few essential rules for the safe handling of these objects:

- Be prepared before handling these objects by having a clean area ready to receive the object. Arrange for assistance from others when necessary.
- Consider the weight of the entire object before lifting; aged and deteriorated fibers cannot tolerate much physical stress. Avoid suspending, creasing, and folding items.
- Move leather and skin artifacts on a tray support, in a drawer, or in a box; if direct handling is necessary, use both hands and support the object from underneath, not from original handles and straps.
- Accommodate the special handling requirements of appendages and decorative elements such as beadwork and dangles.
- Handle skin and hide materials only while wearing clean, cotton gloves; if hand contact is required, wash hands just before handling.

See MH-I, Appendix I, Curatorial Care of Archeological Objects, for a discussion of support trays for objects.

5. *What about catalog labeling?*

Marking and labeling leather and skin artifacts for cataloging purposes can present a number of preservation problems:

- The porous, absorbent nature of all skin products can cause labeling inks, paints and varnishes to be absorbed into the skin tissue causing irreversible staining and stiffening.
- The adhesives associated with commercial labeling tapes have poor long-term stability.
- Pressure sensitive tapes and embossed plastic tapes tend to fall off in time, and their adhesives are generally not removable from the skin.
- Any type of metal tag (including aluminum) or metal ringed tag can cause corrosion. Aluminum in contact with skin and hide materials causes dark spots on the surface of the object.

Cleaning Techniques	Tools	Caution
VACUUMING - This is the safest cleaning method, if carefully executed.	Use fine plastic screening and a vacuum cleaner with adjustable suction or a rheostat and a small standard nozzle attachment.	Screening between the leather and the nozzle protects the leather, but movement of the screen can also cause abrasion. Flaking surfaces and loose parts may be accidentally removed.
DUSTING - This is the most frequently used technique. It can be combined with vacuuming.	Use camel hair brushes.	Dust acts as an abrasive; each time a material is brushed, surface material may be removed. Brushing also increases the danger of knocking off delicate pieces.
FORCED AIR - Compressed air cleaning must be done outside the collection area or dust will simply be redistributed.	Use a compressor, air hose, and broad compressed air nozzle.	Loose or fragile pieces can be blown off if too great a pressure is used; 40 pounds/square inch is maximum.
ARTIST'S ERASER - This method can occasionally remove stubborn surface deposits from the grain side of firm, intact leathers and skins.	Use artist's block or powder eraser. (Testing has shown "Magic Rub" block and "Scum X" powder to be the least damaging.)	This technique is not useful on deteriorated surfaces or where skin or decorative layers may be susceptible to flaking. Remnants of the eraser may become deposited in textured surfaces and require vacuuming.

Figure S.5. Cleaning Techniques for Leather and Skin Objects in Good Condition

You can determine the specific labeling technique you will need by considering the individual object. Maintain consistency throughout the collection and use the least damaging method. Consider both indirect and direct labeling.

- Indirect labeling allows you to avoid irreversibly damaging the hide material with ink. The two recommended methods of indirect labeling are tie-on tags and fabric labels.

  – Make tie-on tags from high quality, acid-free paper products or inert plastic materials. Corners should not be sharp. Attach tags in a manner that does not cause undue stress, such as to an orifice, strap or handle. Use soft cotton string or a non-abrasive plastic loop for attachment.

  – If you can't label an object with a tie-on tag, use a fabric label, such as those made from cotton twill tape or non-woven spun-bonded polyester; these can be sewn to soft skin products using a beading needle and single strand, white cotton thread. You can usually attach these labels without passing completely through the skin, and you can limit stitches to the upper edge of the label. Attach at a seam or inconspicuous area of the skin or hide material, or loop to a permanent strap.

- Direct labeling on skin products can be recommended only for firm leathers and rawhide. You can apply a barrier coating or ground of clear Acryloid B-72 resin to a small, inconspicuous area

(approximately 1 cm x 3 cm in size). When dry, apply the catalog number directly. The ink should have different solubility than that of the ground resin, so it may be changed if necessary.

See NPS Conserve O Gram 1/4, Use of Acryloid B-72 Lacquer for Labeling Museum Objects and the Museum Handbook, Part II, Chapter 3, Cataloging. In addition to normal health precautions, exercise additional caution when using solvents around leather and skin products because excessive amounts can cause deterioration.

Label the object neatly in the most inconspicuous place possible. Your labels should be small yet clearly readable from a distance of one foot. Use a high quality and iron-free ink, such as India ink.

6. *How do I provide adequate physical support for objects?*

Most organic materials lose their structural integrity as they age. Collapsed, creased, or folded materials will develop local weaknesses and damage if not protected by custom mounts and supports.

Use high quality, non-reactive materials:

- rigid acrylic sheeting
- acid-free matboard and unbuffered paper tissues
- washed and undyed cotton and linen fabrics
- polyester batting
- polyethylene foam products

Attached components can cause deterioration when in contact with other materials (such as metal parts). Separate components by a barrier of polyethylene sheeting or layers of acid-free tissue.

7. *How do I store objects properly?*

Store skin and leather objects in a space that is dedicated to the storage of museum collections, where climate control and security can be adequately controlled. Although storage requirements vary somewhat for individual leather and skin materials, basic conservation principles recommend that you provide a spacious and secure storage area, appropriate cabinets and containers, an area that is as free as possible from environmental threats, and individual storage supports. See MH-I, Chapter 7, Museum Collections Storage, for guidance on storage of museum collections.

The storage needs of tanned and untanned materials can be discussed at two levels. The first level addresses the overall collections storage facility with its system of shelving, cabinets, drawers, and trays. The second level focuses on individualized object supports. The following discussion provides more guidance based on these basic principles.

- ***Provide Appropriate Cabinets and Containers***
  - Protect objects made of skin products within cabinets or on shelving with dust covers. Items should not be piled, folded, squashed or leaned. Use cabinets and storage furniture made of

metal with a baked enamel finish. Don't use wooden cabinets and shelving, because wood products emit damaging vapors.

– Use storage trays and containers to house and support individual objects as well as to reduce stress and damage during handling. Any material that directly contacts the specimen, such as boxes, tubes and tissue papers, must be of acid-free unbuffered paper. Limit your use of plastics to pure polyethylene, acrylic and polyester products.

– Vacuum and dust your storage areas regularly. Dust is acidic, abrasive and damaging to these materials. Routine and systematic housekeeping also lessens the chance of insect problems that can harm leather and skin objects.

- ***Provide Individual Storage Supports***

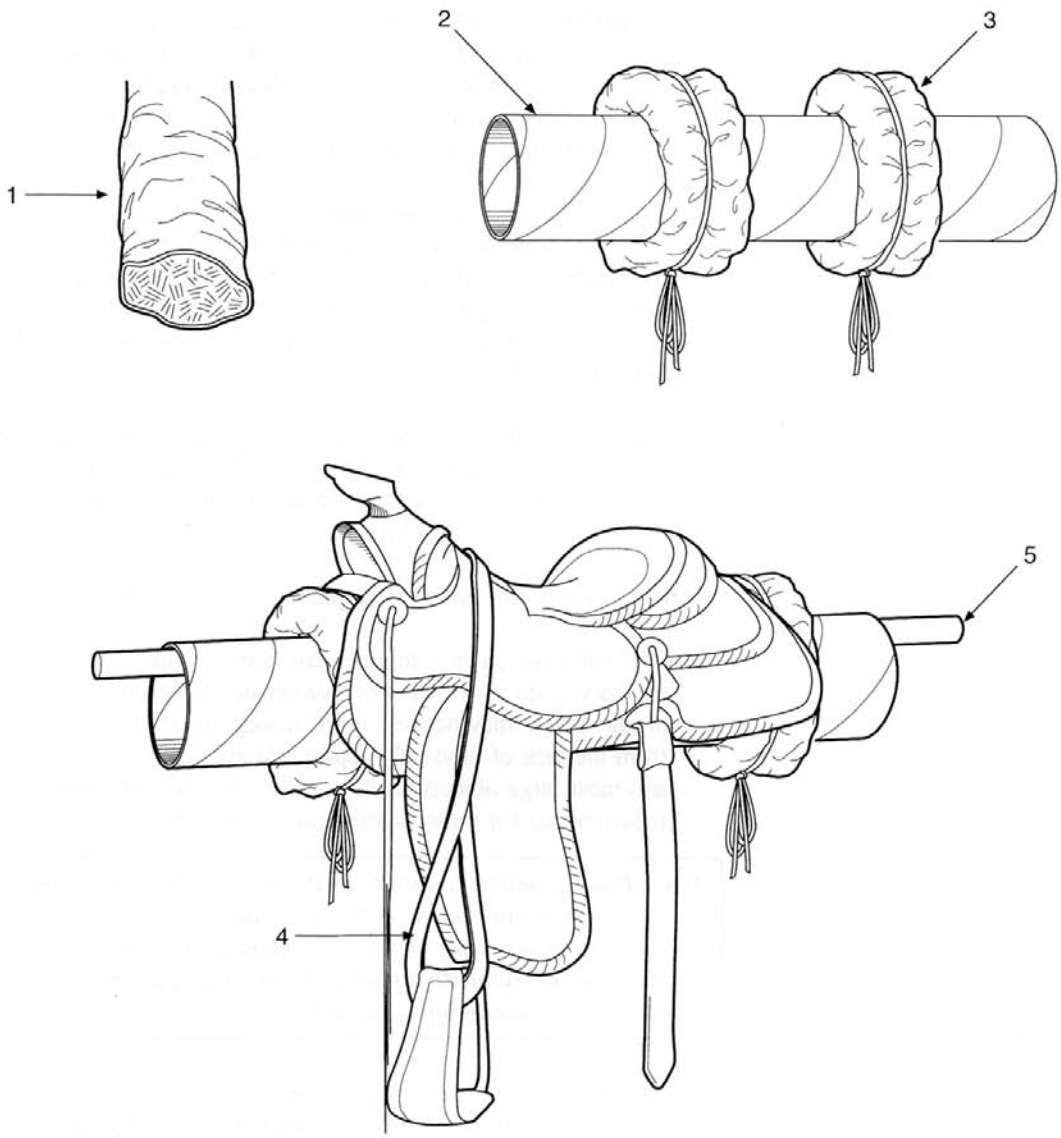
– You will need custom supports for many leather and skin artifacts just as you do for other sensitive organic materials. As skin products age, they become more susceptible to damage resulting from the lack of physical support. Many three-dimensional objects and most large objects (such as saddles) have additional requirements for either internal or external reinforcement.

> ***Individual supports shouldn't constrict or interfere with the expansion and contraction of the skin materials, restrict the gain and release of moisture as the hide responds to environmental changes, be permanently attached to be object, or provide harborage for damaging insect pests.***

– Use supports to provide specific reinforcement to all vulnerable areas that are prone to damage under the object's own weight or because of the limitations of the storage container. Disfigurement and folding of skin materials frequently leads to permanent deformity, the straining of fibers and eventual cracking.

– The design and materials (see page 16, item 6) you will use in your supports depends on the shape, weight and needs of the individual object. For instance, you can roll flat hides and robes around large diameter (minimum of 6" diameter) tubes. Store garments flat and stuffed with a light weight support to eliminate creasing. Place saddles on a rigid saddle tree or dummy support if fenders are likely to become deformed. See Figure S.6 for an illustration of how to construct a saddle mount.

– Hide objects can deteriorate because of poorly selected and inappropriate support materials. Harmful materials are those that emit damaging vapors and organic compounds.



1. Fabricate a muslin sleeve filled with acrylic polyester batting to a diameter of 4 to 5 inches. The padding should not be overly tight or loose to permit firm support.

2. Use a heavy cardboard tube 6" in diameter.

3. Tie the rings of the filled muslin sleeves around the cardboard tubes with twill tape in the location of the saddle bow (front) and hind bow (back) for full support. The acrylic polyester padding will compress to fill the interior dimensions of the saddle so that the saddle will not rock or slip when placed on the mount. The weight of the saddle should keep it in place, although the saddle can be tied to the padded tube with wide twill tape in the area of the cinch belt as an added precaution.

4. Loop a sling made of wide twill tape or a strip of muslin around the saddle to support the stirrups.

5. Use a metal pipe, length of slotted angle, or 2" x 4" wooden board to support the mount.

Figure S.6. Constructing a Saddlemount

E. Summary: Leather and Skin Product Deterioration and Preventive Care

The previous two sections discussed deterioration, the causes of deterioration, and ways to limit deterioration through preventive conservation efforts. Figure S.7 summarizes some of this information.

CONDITION	PROBABLE CAUSE	PREVENTIVE ACTION
Deformation (contraction, cockling, cupping, shrinkage)	Physical alteration during use, storage or exhibition	Support in unconfined space
	Desiccation	Raise & stabilize ambient RH
	Alternate wetting or drying	Use container to protect against humidity extremes
	Excessive heating	Lower ambient temperature
	Photochemical reaction	Filter UV radiation, lower visible light
Embrittlement (rigid, inflexible, brittle)	Disuse, absence of flexing	None available
	Desiccation	Raise and stabilize ambient RH
	Soil impregnation	Use container, filter air
	Deterioration, loss of fat	Filter UV radiation, lower visible light
	Detanning	Use container
	Photochemical reaction	Filter UV radiation, lower visible light
Low cohesive strength (weakened, powdering, separating, fibrous)	Poor manufacture	None available
	Mechanical abuse	Use container, eliminate handling
	Chemical air pollution	Use container, filter air
	High acidity	Use container, filter air, stabilize ambient RH
	Oxidation	None available
	Loss of fat or water content	Stabilize ambient RH
	Photochemical reaction	Filter UV radiation, lower visible light
Physical Damage (abrasion, tearing, splitting, holes, missing parts, disjoined section)	Historic usage	Support, limit handling
	Inherent stress	Support, limit handling
	Dimensional movement	Stabilize ambient RH
	Handling	Use container, limit handling
	Stitching failure	Use container, limit handling
	Adhesive failure	Use container, limit handling
	Biological attack	Inspect, initiate control program
Soil or stain accumulation (oiliness, water staining)	Use during historical period	Document, identify using remaining characteristics
	Improper handling	Instruct staff in proper handling, limit handling
	Unprotected storage or display	Use container, filter air
	Unstable fat spew formation	Stabilize ambient temperature
Discoloration (fading, darkening, lightening)	Soiling or staining	Use container, filter air
	Excessive fat content	None available
	Acid deterioration	Use container, filter air
	Photochemical reaction	Filter UV radiation, lower visible light
Loss of grain layer or exterior surface	Morphological feature of skin	Use container, limit handling
	Poor manufacture	Use container, limit handling
	Mechanical abuse	Limit handling
	Uneven consolidation	None available
Loss of fur or hair (slippage, breakage)	Morphological feature of hair	Use container, limit handling
	Poor manufacture	Use container, limit handling
	Desiccation	Stabilize RH
	Insect attack	Initiate periodic inspection and control program

Figure S.7. Leather and Skin Product Deterioration and Preventive Care

F. Conservation Treatment Issues

Curators, collectors, and conservators alike have been guilty of relying on old treatments to preserve skin materials, and far too frequently they accepted the promotions of commercial products designed for contemporary leathers. This history of haphazard treatment and unsystematic evaluation of skin products has resulted in considerable damage and loss. Common criticisms of past treatments of skin and leather products are that preservation attempts have not differentiated among the distinct categories of skin materials and have relied too heavily on the application of "preservatives."

The traditional remedies and reagents once routinely used in museum collections are now being carefully scrutinized by museum conservators. With the aid of scientific investigation and the assessment of the results of past treatment, several important new directions are being taken. The findings on past treatments have not been encouraging.

> ***The routine application of preservatives (such as saddle soaps and leather dressings) is discouraged.***

1. *What are the perils of saddle soap?*

There are many problems associated with the use of "saddle soap" on historic and artistic objects made from animal skin products. With the best of intentions, this commercial product has been inappropriately applied to just about every form of skin material in the past.

"Saddle soap" was not developed as a cleaner, but as a 19th century leather conditioner. Its basic components of neatsfoot oil and cod or sperm oil were emulsified with soap in water to produce an emulsion fat-liquor introduced during early tanning. As a conditioner, saddle soap is considered obsolete by tanners today.

Its application has caused considerable permanent damage to skin and leather objects since its components cannot be easily rinsed out and adequately removed (as manufacturer instructions often suggest). Saddle soap effectively softens and emulsifies surface oil and dirt, however it usually distributes them deeper into the material. The mixture's high moisture content presents a hazard to aged skin materials that should not be wetted, as well as light colored vegetable and/or alum tanned leathers.

Commercial formulations of saddle soap differ in their ingredients, some containing abrasives and even colorants. Saddle soap quality fluctuates greatly among manufacturers.

Perhaps most importantly, conservators now suspect that the surface cracking on many older skin and leather objects may well be due to past "saddle soap" application. Avoid it.

2. *What are the drawbacks of leather dressings?*

The care of skin and leather goods has traditionally involved the routine use of leather dressings, solutions of fats and oils that lubricate skin products to increase flexibility. Modern research has shown, however, that the haphazard use of dressings has been the cause of considerable deterioration within museum collections.

These solutions should never be applied to Native-tanned materials or objects comprised of untanned or semi-tanned skin products. Avoid the use of leather dressings on museum objects.

Numerous drawbacks are associated with dressing of skin products. For example, dressings frequently:

- darken lighter colored leathers
- encourage biological attack
- form fatty spews at the surface
- oxidize over time and stiffen the material
- wick into surrounding materials
- soften original finishes and decoration
- cause dust to accumulate
- impede future conservation treatment
- contaminate the material for future analysis

3. *What about neutralization of acids?*

The chemical decay and disintegration of leather resulting from exposure to acids is a well-known problem and its solution for older leathers remains unresolved. Vegetable-tanned leathers produced since the mid-19th century frequently exhibit a condition of internal fiber degradation known as "red rot." The color of the leather actually reddens as the deterioration progresses. In its advanced state, affected leather will disintegrate into a powdery form.

This condition is most always associated with sulfuric acid, introduced either during the tanning process or from atmospheric contact with the contaminant sulphur dioxide. (Leather readily absorbs acid from the air.) Sulphur dioxide, when absorbed, becomes sulphur trioxide, which unites with water to form sulfuric acid, resulting in a devastating effect on collagen fibers. Certain vegetable tannages (the ones categorized as condensed tannins) have been identified as being much more susceptible to this mechanism of deterioration.

Modern leathers are fortified against acid formation by incorporating buffering salts that repress acid formation and action. Some of the museum preservation literature during the last decade recommended that older leathers be treated with similar buffering salts, such as potassium lactate and potassium citrate, to protect them from acid attack.

The problem that museum curators face is that there is no easy and safe method for long-term neutralization of acids that are present in historic leather objects. There are three drawbacks associated with the treatment of leather with standard buffering salt solutions:

- The salts must be introduced in an aqueous solution yet water can be very damaging to historic leather causing stiffening, color change and disruption of applied finishes.

- Salt solutions are meant only for vegetable-tanned leather and will de-tan and damage mineral-tanned materials; the applicator must, therefore, be able to distinguish between them, which is not an easy task.

- The addition of buffering salts will do nothing for leathers that have already begun to deteriorate from acid exposure.

The conservation field is looking at other methods of deacidifying leathers; vapor phase reagents and non-aqueous chemicals are being investigated. The importance of this conservation issue is clear to those involved, and acceptable procedures should be available to museum staffs in the near future.

Appendix T: Curatorial Care of Biological Collections

List of Figures

APPENDIX T: CURATORIAL CARE OF BIOLOGICAL COLLECTIONS

SECTION I: THE NATURE OF BIOLOGICAL COLLECTIONS

A. Overview

1. *What information will I find in this appendix?*

This appendix discusses the nature of biological collections and outlines strategies for their long-term care and preservation.

Most biological collections are either dry collections or wet collections. They also may include collections preserved at low temperatures or microscopy collections. This appendix discusses all four types of biological collections. It also includes the four basic stages of preservation: stabilization, processing, storage, and maintenance.

2. *What are biological collections?*

Biological collections are typically:

- preserved plant or animal specimens
- specimen documentation, such as labels and notations (**Note:** associated project data, reports, notes, etc. should be accessioned into the park's archives and cross-referenced to the related specimens)

Normally biological materials are maintained as separate collections based on:

- the types of specimens
- the type of preservation
- differences related to management, care, and use

Plants would be a part of a plant collection, but depending on the size and diversity of the collection, it might be appropriate to differentiate types of plants, and include a vascular plant collection and a non-vascular plant collection.

B. Introduction to Biological Collections

1. *What types of specimens are included in biological collections?*

Common biological collections include non-vascular and vascular plants, and animals, both vertebrate and invertebrate. See Table T.1 for a listing of common biological collections and their phylogenetic relationships to one another.

Plants		Animals	
Non-vascular Plants	**Vascular Plants**	**Invertebrates**	**Vertebrates**
• Aquatic - algae • Terrestrial - fungi - lichens - mosses	• Gymnosperms - conifers • Angiosperms - flowering plants	• Porifera - sponges • Cnidaria - jellyfishes - corals, sea fans, anemones • Ctenophora - comb jellies • "Vermes" - various phyla of worms and leeches • Arthropoda - crustaceans - spiders and mites - horseshoe-crabs - insects - centipedes and millipedes • Mollusca - snails, slugs, abalones - clams - squid, octopuses, nautiluses • Echinodermata - sand/sea stars - brittle stars - sea urchins - sea cucumbers - sea daisies - sea lilies and feather stars	• Fish • Amphibians and Reptiles • Birds • Mammals

Table T.1. Common biological collections and their phylogenetic relationships to one another

Table T.1 lists the most common types of biological collections. Your collection may include more specialized collections such as parasites, butterflies, or beetles. Table T.1 does not include specimens from other kingdoms of living things, such as bacteria and amoebas. Nor does it cover all known phyla of plants and animals. Other objects or specimen parts also may be included in various specialty collections (see Table T.2.).

Note: Most specimen parts and related archives have little relevance unless they are linked to a voucher specimen with sufficient characteristics to permit identification using the techniques of classical taxonomy.

	Macroscopic material	Microscopic material, including SEM stubs)	Replicas (casts, molds, and models)	Specimen documentation (in addition to accession, catalog, and loan records)
Plants	Wood samples, tree rings, large seeds or fruits, exsiccati (usually collections of specimens in bound volumes), economic botany samples such as cultivars	Pollen, very small seeds, dissected parts	Models in wax, glass, synthetic polymers etc.; molds	Primary labels and annotation labels Place all project documentation in the park archives: field records; notes and manuscripts; permits; original art work; images (photographic, digital, video, film.
Invertebrates	Larvae, dissected organs or other tissues, freeze-dried specimens, eggs, pupae	Dissected organs or other tissues; some whole organisms (larvae, shell ultrastructures)	Models in wax, glass, synthetic polymers; molds; some larvae	Specimen labels Place all project documentation in the park archives.
Fish	Taxidermy preparations, gut contents, eggs, larvae, fin clips, freeze-dried specimens, cleared and stained specimens, frozen tissues	Scales, otoliths	Casts or models in plaster, synthetic polymers, etc.; molds	Field identification tags and specimen labels. Place all project documentation in the park archives.
Amphibians & Reptiles	Nests, eggs, taxidermy preparations, cleared and stained specimens, skeletons, dry or tanned skins, gut contents, larvae, frozen tissues, freeze-dried specimens	Internal and external parasites	Casts or models in plaster, synthetic polymers, etc.; molds	Field identification tags and specimen labels Place all project documentation in the park archives.
Birds	Scats, eggs, nests, spread wings, taxidermy preparations, skeletons, complete or partial dioramas, samples of feathers, feet and bills, some large parasites, gut contents, embryos, frozen tissues, freeze-dried specimens, naturally mummified specimens	Internal and external parasites	Casts or models of whole specimens or tracks in plaster, synthetic polymers, etc.; molds	Specimen labels and leg bands Place all project documentation in the park archives.

Table T.2. Specimen parts and other materials included with voucher specimens in a collection.

Mammals	Scats, eggs, nests, taxidermy preparations, skeletons, complete or partial dioramas, naturally mummified specimens,	Internal and external parasites, hair samples, baculi, phalli, karyotypes	Casts or models of whole specimens or tracks in plaster, synthetic polymers, etc.; molds	Field identification tags, specimen labels, and ear tags Place all project

	tanned skins, horns and antlers, gut contents, dissected organs, embryos, frozen tissues, freeze-dried specimens or specimen parts, sectioned teeth, some dissected baculi; some large parasites			documentation in the park archives.

Table T.2. Specimen parts and other materials included with voucher specimens in a collection (continued)

Biological collections may be grouped within broad taxonomic categories according to the nature of preservation. Biological specimens normally are preserved by drying, preservative fluids (either as macroscopic or microscopic preparations), or storage at low temperatures.

2. *What is the value of biological collections?*

Biological collections are valuable (in order of rank) as:

- types (specimens referred to in the first published account of a new taxonomic group)
- rare, endangered or extinct species
- vouchers for specific research studies or specimens of special historical value
- specimens rarely found in any collections or those that are rare in the particular collection in question
- specimens that fully document the existence of a species at a given place and time (most properly collected and maintained biological specimens will fit this category)
- specimens collected specifically for destructive sampling or for interpretive programs

Some specimens fall into more than one of these categories.

The most common uses of biological collections are to resolve issues related to taxonomic identification and provide physical evidence of the presence of a particular taxon at a specific place and point in time.

3. *What is the basis for collecting appropriate specimens?*

Before you can understand if a particular specimen is appropriate in a collection, you first must understand its value. You also need to know how the specimen might be handled and used. Cultural value, usually for historical or scientific purposes, is the basis for responsibly selecting material for biological collections.

Note: Many historical specimens were not necessarily collected to answer a

specific research question, as specimens collected for scientific purposes today are. However, if historic specimen collections do include adequate documentation, (detailing the existence of a taxon at a place and point in time), they are scientific collections too.

Collecting based on emotional values can result in collection biases and inappropriate commitments for the collection. Examples of collecting for emotional value may include:

- the acquisition of particularly attractive or unusual specimens
- some salvage operations

Collecting for use often assumes eventual destruction or transfer of the specimen in question. For responsible resource management, you must evaluate:

- the level of initial preparation that a specimen needs for placement in the collection
- the amount of long-term management and care required for such specimens once placed in the collection

For instance, a taxidermy mount of a commonly occurring animal, which lacks collecting, preparation, and provenience data, has little purpose other than exhibition or teaching. It may not be appropriate to allocate resources for long-term management and care of such a specimen.

4. *How are biological collections used?*

Collection use is dependent on many factors, such as the specimens or parts available, expertise available, preservation methods, and preservation quality. The use of most collections falls into specific categories, which vary according to the number of specimens involved. For instance, a single specimen can be used for:

- a voucher of research
- a synoptic reference sample
- documentation of the occurrence of a species at a given place and time
- interpretation

As the number of specimens of a given species increases, the types of use expand substantially. Besides the uses noted above, the collection can document:

- variations
  - among individuals
  - among age groups
  - between sexes
- seasonal variation
- geographical variation

- geographical distribution
- ecological relationships and associations

> ***Remember: The basic reason for maintaining biological collections is to promote their use in both science and education.***

5. *Does preservation method affect use?*

Yes, the method of specimen preservation has an impact on collection use.

Dry preservation is useful for visual examination of characteristics, particularly where a degree of color and some delicate parts are important.

Fluid preservation may sacrifice color, but is useful for preserving internal organs that might be exposed by dissection.

Because there is no single preservation method that will accommodate all possible uses of a specimen, a collection often includes specimens preserved by different methods.

Many of the modern research uses for biological collections involve very specialized preservation methods and materials. These include:

- histology
- parasitology
- chemical or biochemical analyses
- molecular genetics
- analyses of environmental pollutants

These uses require appropriate research personnel, facilities, and equipment. Many institutions with collections lack the expertise to carry out or even to properly evaluate requests for these kinds of fairly sophisticated research. Such institutions also can rarely provide appropriate care for the materials generated by the research.

6. *How should I manage biological collections?*

Manage collections to ensure that they are available for use. When you decide to preserve a specimen, you should:

- utilize appropriate processing methods. Such methods must comply with standard practices appropriate to the type of biological materials. This will ensure the quality and integrity of:
  - the specimen
  - associated information
- organize the specimens (with hundreds, perhaps thousands, of others) in an established order

- this facilitates retrieval of specimens

- use storage equipment and supplies that best serve the goals of preservation and access

Your management responsibilities also include:

- updating the organization of the collection
- directing collection growth as scientific research changes

7. What is involved with the proper care of biological collections?

To provide proper care, document and use the best:

- preservation methods
- preservation materials
- collection environments
- handling practices
- storage designs
- emergency salvage and response procedures
- condition reporting
- collection treatments

When you practice proper collections management and care, your collections will be accessible, useful, and stable. Remember to incorporate management and care concerns in the development of all recommended policies and procedures.

8. What are the agents of deterioration that affect biological collections?

Biological materials are designed to decompose. They can be damaged by any of the following processes:

- Mechanical
- Biological
- Chemical

Remember: Damage from one process can sometimes cause another. The specific agents of deterioration that affect biological collections are:

- visible and ultraviolet (UV) light
- inappropriate temperature
- inappropriate relative humidity levels and fluctuations (especially at extreme levels)
- contaminants or pollutants

- pests
- fire
- water
- physical forces
- criminal activity
- neglect

All of these agents may act on biological specimens. The risk of one agent over another may vary considerably, depending on the type of preservation or collection.

9. *What should I know about preventive conservation of biological collections?*

Biological collections have research potential. New and innovative technological approaches to research are common. Avoid any action that might compromise the research integrity of the specimens. For this reason, your response to threats of mechanical, biological, or chemical damage should **emphasize stabilization before interventive treatments**.

10. *How should I handle biological specimens?*

Some specimens may have special handling requirements. Discuss these issues with the researcher who collected and/or prepared the specimens. Contact your regional/SO curator or the Senior Curator of Natural History if you have any questions.

In general, handle specimens as you would other museum objects:

- Handle specimens as infrequently as possible.
- Handle each specimen as though it's irreplaceable and the most specimen valuable in the collection.
- Never smoke, eat, or drink while handling specimens.
- Don't wear anything that may damage the specimen. To avoid scratching and snagging surfaces, be careful of breast pocket contents, jewelry, watches, and belt buckles.
- Use only a pencil when examining specimens.
- Save <u>all</u> information that is associated with the specimen, such as tags and labels.
- Know the condition of a specimen before moving it.
- Lift and/or move the specimen by supporting its strongest structural component. Do not lift it by protruding parts, small bones, wings, or attachments. These areas are weak. They also can be easily separated from the rest of the specimen (and lost!).
- Use a utility cart with padded shelves and raised sides to transport specimens from one room, area, or building to another. See *Tools of the Trade* for additional information.

- Handle only one specimen at a time and use both hands. Use one hand for support and the other hand for balance.

- If you transport a specimen via a specimen tray, be sure that it cannot shift or fall out. Use cavity packing (see Appendix I, Figure I.6., page I:11) to keep specimens from shifting.

- If you need to temporarily place a specimen in an unstable position for examination, be sure to support it. Exercise extreme caution in these situations. Return the specimen to a stable base or surface as soon as possible.

- Never hurry when handling specimens. Move slowly.

Figure T.1. Use extra care when transporting specimens with delicate parts, such as this pinned butterfly specimen. Photograph courtesy of the Bohart Museum of Entomology, University of California, Davis.

If part of a specimen is broken, reattach it as soon as possible to prevent it from becoming separated or lost. At a minimum, place the broken part in a labeled polyethylene bag or acid-free (not buffered) envelope to ensure that it doesn't become lost. Consult with your regional/SO curator, the Senior Curator of Natural History, or a natural history conservator for advice.

11. *Are there any other handling issues that I should be aware of?*

Researchers will need to handle specimens in order to study them. But don't assume that everyone who requests collections access (including scientists) is aware of all the proper handling procedures.

Be sure that you:

- know how to appropriately handle all of the specimens in your collection.
- thoroughly brief all collections users on proper specimen handling techniques. A good way to do this is to provide all researchers with a copy of your park's "Collections Handling Guidelines."
- require all collections users to sign a statement agreeing to abide by these and any other applicable rules, as a condition of access.

For additional information, refer to Chapter 6: Handling, Packing, and Shipping. You also may find the following example standard operating procedures to be useful:

- Figure 6.14, "Example of Written Handling Rules for NPS Collections" on page 6:30
- Figure G.6., "Sample Visitor Log" on page G:32
- Figure G.7., "Conditions for Access to Museum Collections" on page G:33

12. *Are there any health and safety concerns related to biological collections?*

The collection, preparation, and handling of biological specimens can pose various risks to human health and safety. One of the most familiar concerns is the historic use of toxic chemicals, such as arsenic, for preservation and pest control. These collections may involve other risks as well.

Collecting living organisms can be dangerous because of:

- the organisms' natural defense systems, such as:
  - marine organisms that sting (jellyfish, stingrays, sea urchins, octopuses, and others)
  - venom in snakes
- non-target species in the same habitat.

Even after collection, be sure to handle all organisms with care. Natural toxins in the plant or animal and diseases can be transferred to humans from an animal or its parasites. Health hazards include:

Bacterial Diseases

- Anthrax (hoofed animals)
- Bucellosis (cattle, goats, hares, pigs)
- Erysipelas (pigs, marine mammals, possibly birds)
- Leptospirosis (rodents, hares, hedgehogs, possibly others)
- Plague (rodents)

- Pseudotuberculosis (birds, some rodents and possibly other small animals)
- Psittacosis/ornithosis (birds)
- Rickettsial diseases such as Rocky Mountain spotted fever, rickettsialpox, recrudescent typhus, murine typhus, Q fever, and momcytic erlichiosis (small mammals, carnivores, deer)
- Salmonellosis (primarily rodents, reptiles, some birds)
- Tetanus (most animals)
- Tick-borne spirochetal diseases such as Lyme disease, and other relapsing fevers (rodents)
- Tuberculosis, avian (birds)
- Tuberculosis, mammalian (relatively uncommon in wild animals)
- Tularemia (burrowing rodents, ground squirrels, rabbits and hares)

Fungal Diseases

- Aspergillosis (birds, occasionally mammals)
- Histoplasmosis (colonial birds or mammals where excrement accumulates)
- Ringworm (mammals, occasionally birds)

Viral Diseases

- Hantavirus (rodents)
- Rabies (coyotes, foxes, raccoons, skunks, some bats)
- West Nile virus (birds)

Often, only someone with expertise in a particular species may recognize an animal's symptoms indicating a potential human health hazard. Eliminating the hazards can be complicated. Each one is resistant to different factors. For example, freezing specimens prior to preparation will not destroy some bacteria and viruses, such as some rickettsial diseases and rabies. Freeze-drying will preserve many pathogens for prolonged periods.

Taking material from the wild into collections also can involve hazardous materials used to tranquilize, kill, clean, or otherwise prepare specimens. These hazards vary with the type of specimen and preservation method (dry, wet, low temperature, microscopy).

Provide safe conditions; ensure that:

- human health and safety is paramount; superseding all other concerns
- all health and safety risks are taken seriously and eliminated to the degree possible
- unnecessary risks are avoided
- warnings about health and safety risks are provided verbally and in writing to staff and collection users
- compliance with governmental health and safety regulations is standard practice, including:
    - monitoring for hazards
    - using engineering controls to mitigate hazards
    - worker training, including training in the use of personal protective equipment where engineering controls are not feasible
- collection personnel work in pairs when safety is a concern (for example, handling heavy equipment or toxic chemicals)
- staff properly dispose of all parts discarded during the preservation process (such as internal organs of vertebrates preserved as dried skins)

For additional information related to curatorial health and safety, see Chapter 11. You can also obtain information concerning methods to mitigate biohazards without compromising the utility of specimens from:

- The Centers for Disease Control and Prevention (CDC)
  (800) 311-3435
  www.cdc.gov
- The American Society of Mammalogists
  www.mammalsociety.org

SECTION II: PRESERVATION OF BIOLOGICAL COLLECTIONS IN GENERAL

A. Overview

For purposes of organization and discussion, preservation is subdivided into the following stages:

- **Stabilization:** preservation activities associated with halting active deterioration and minimizing the risk of loss, damage, or disorder as it relates to the specimen and its associated information
- **Processing:** preservation activities beyond stabilization that are related to making the specimen available for use
- **Storage:** preservation activities associated with housing of the

specimens for the sake of access, organization, and protection

- **Maintenance:** preservation activities associated with corrective actions in response to a real or perceived problem

  By definition, both emergency management and pest management are "maintenance" activities.

Note: Most specimens you receive will already be stabilized. They probably will have undergone some degree of processing too. Park biologists or outside researchers working under contract usually carry out this work. These scientists are familiar with the standard protocols for specimen stabilization and processing in their fields. Curatorial staff should be involved only in some aspects of processing, and in the storage and maintenance of the collections.

Make sure you have documentation as to what processes were used by the researcher.

B. Stabilization of Biological Specimens

1. *What is stabilization?*

Stabilization includes:

- halting active deterioration of a specimen
- minimizing the risk of loss, damage, or disorder of the specimen and its associated information

2. *What issues should I consider prior to stabilization?*

Carefully evaluate all incoming material:

- Does the quality of the specimen(s) and associated information comply with standards for the collection?
- Does the acquisition of the specimen(s) comply with the park's Scope of Collection Statement and:
  - serve institutional mission and goals?
  - contribute to the utility of the collection?
  - pose any health and safety risks?
  - pose any legal, ethical, or social problems?
  - require special resources for collection or salvage, preparation, or long-term care?

3. *What issues should I consider once we decide to initiate stabilization of specimens?*

- What is the condition of the specimen? Keep in mind that it may be:
  - alive
  - recently dead

- in some state of decomposition (as a result of necropsy, freezing, or delay between collection and initial stabilization)

- What parts of the specimen are to be preserved?
- What kind of stabilization (dry, wet, low temperature) is appropriate?
- Does stabilization require additional materials for support of the specimen and/or specialized equipment for the process?
- What professional standards (for example, positioning) apply to the stabilization technique?
- What special methods (for example, exposing diagnostic features) must be applied to insure maximum use of the specimen?
- Does completion of the stabilization of choice make the specimen available for use? Will subsequent processing treatments be required? For example, a vascular plant specimen may be stable after pressing to remove moisture. However, it won't be useful until it has been mounted.

4. *What information should I document during stabilization of biological specimens?*

Because so much information is lost when a specimen is removed from its natural setting and collected, the collector documents:

- ecological information
- field conditions
- observations about the specimen and its habitat
- accurate locality data

Such documentation usually includes:

- field notes
- field tags applied to the specimen
- photographs
- digital images
- original artwork
- sound or video recordings.

Remember: At a minimum, researchers working in NPS areas are required to provide the park with:

- an Investigator's Annual Report for each year of the permit
- copies of field notes, data, reports, publications and/or other materials resulting from the studies

Be sure that these data are included in the collection and are cross-

referenced with the specimen/s, including all catalog information in ANCS+.

Note information about the individual specimen. Often this involves recognizing the species and assigning a field or preparation number (especially in the case of tissues and/or parasites removed from the specimen). This allows the specimen to be cross-referenced to other related information. Some disciplines may not assign these numbers because all of the pertinent information is maintained with the dry specimen (this is sometimes the case in botany).

The collector also should have provided provenience information. This is especially important for ensuring specimen value and use within the collection. Such data include:

- the species
- the field or preparation number
- the methods used for stabilization from the time of collecting until received at the park
- where the specimen was collected
- when the specimen was
    - collected (including the method, as well as any drug and/or chemical used during the collection of animal specimens)
    - prepared
- who collected the specimen
- who stabilized the specimen

Hopefully, the collector also included:

- any special handling procedures
- information related to parasites or tissues collected from the specimen

You also need to be sure to document the natural conditions and features of the specimen, particularly those that may be changed by stabilization. Examples include color, markings, weight, dimensions, sex, reproductive condition, age, and physical condition.

> ***Any documentation about specimen history, such as condition of the specimen, environmental conditions, and stabilization methods and materials, may prove useful in determining the integrity of the specimen for various uses.***

5. *Are there any other issues related to stabilization that*

Yes. Be sure to bear in mind that:

I should consider?

- Various stabilization methods are used but can vary significantly between disciplines. Refer to the specific stabilization methods in subsequent sections for more information.
- The intended use of the specimen can significantly influence how it will be preserved.
- Stabilization should be the first step in preservation. Take care to ensure that stabilization practices comply with disciplinary standards.

6. *What protection concerns and practices are involved with stabilization of biological specimens?*

During stabilization, you should:

- ensure the relationship of the specimens and their data
- protect the specimens from all agents of deterioration

The agents of deterioration that most often damage specimens during stabilization depend greatly on the nature of stabilization. Refer to the specific stabilization methods in subsequent sections for more information.

7. *What health and safety concerns should I be aware of during stabilization?*

Specimens may contain animal-borne pathogens and/or toxic chemicals that are part of the plants or animals themselves. If chemicals are used as part of the stabilization process there may be additional risks. These hazards depend upon the specific chemicals. Protect yourself with good personal hygiene. Use appropriate engineering controls (such as biohazards hoods and chemical vapor hoods), and properly chosen gloves. If engineering controls are unavailable (as is often the case during field stabilization), you may need to use additional personal protective equipment.

C. Processing of Biological Specimens

1. *What is processing?*

Processing involves those activities beyond stabilization that are related to making the specimen available for use. These activities depend on standard practices established by individual disciplines. Processing typically includes a sequence of steps that includes:

- preparation
- accessioning
- cataloging
- labeling
- loans or other collection access

2. *What are the NPS requirements for processing of project-generated specimens?*

Specimens that you acquire should already have been accessioned, cataloged, and labeled. This is required of researchers (NPS and non-NPS) who have NPS collection permits.

Director's Order #24: NPS Museum Collections Management, requires all project budgets to include funding for the basic management of project-generated collections. Collections management includes:

- cataloging
- labeling
- conservation examination and treatment (including preparation)
- initial storage of objects and specimens
- organization and storage of project documentation (field data, reports, and other associated archival materials)

Do not accept project-generated collections that lack such basic documentation and means for protection. As noted above, DO #24 requires project budgets to include funding for basic collections management. It is not the responsibility of the park's museum program to fund cataloging and initial storage and organization of project-generated specimens and archives. You can contact your regional/SO curator or the Senior Curator of Natural History for advice.

All resource management projects that generate collections must provide funding for accessioning, cataloging, and labeling of specimens, as well as initial conservation and storage of both specimens and related archives. Budgets should include sufficient funding for NPS or contract cataloging or specimens and archives, storage materials, and equipment, such as cabinetry.

3. *What is involved in preparation of specimens?*

The initial step in processing is the preparation of the specimen (although it can be part of the stabilization process). If you lack critical data about the specimen (such as measurements), it is important to obtain the information at this time.

Anticipate specimen use, so that you can make correct decisions about:

- applying appropriate preparation techniques
- conforming to disciplinary standards
- positioning and exposing diagnostic features
- possibly exposing additional features commonly used for descriptive and comparative research

You also must ultimately decide wi
only part(s) of it. This will lead to
supplemental support systems. To
appropriate subject matter experts

***Processing can require specia
sure that you have all of the n
processing obligations. If you
backlog of unprocessed or par
little or no utility.***

4. *What is involved in accessioning biological specimens?*

For information concerning accessioning of museum collections, see *Museum Handbook*, Part II (*MH-II*), Chapter 2. Additional accession information relevant to biological acquisitions that you should document includes:

- What taxonomic groups of specimens are represented by the acquisition?
- What methods of preservation are represented by the acquisition?
- Where was the acquisition collected?
- When was the material collected?

You should also include the following materials in the accession folder:

- a copy of the research proposal
- a copy of the research/collecting permit(s)

It's also helpful for researchers if you also provide a cross-reference to these documents' physical locations in the park archives in the ANCS+ catalog record(s).

> ***Do not assume responsibility for specimens that have not been appropriately stabilized and prepared (such as a backlog of unprepared specimens maintained in freezers).***

5. *What is involved in cataloging biological specimens?*

For information concerning cataloging biological specimens, see *MH-II*, Chapter 3 and the *ANCS User Manual*, Chapter 2, Section V. You also should include the following:

- When was the specimen collected?
- When was the specimen stabilized and prepared?
- Who stabilized and prepared the specimen?

6. *How should I label specimens?*

Depending on the specimen and preservation method, you can label:

- the specimen itself (some invertebrates and bones)
- support materials for the specimen, such as:
  - labels attached to herbarium sheets
  - microscope slides
  - insect pins
- tags tied to these specimens

- birds
- mammal skins
- fluid-preserved specimens

- labels attached to the outside or placed inside of containers
  - bags
  - boxes
  - vials
  - jars

In many instances, the park acronym and a catalog number may be the only label data. Additional information can be valuable for facilitating collection use and organization. See *MH-II*, Appendix J, Section K, "Natural History Specimens" for information concerning labeling biological collections.

7. *What materials should I use to label specimens?*

Always use stable materials and in an appropriate manner. Most specimens that you acquire will already have been accessioned, cataloged, and labeled. This is required of researchers who have NPS collection permits. Sometimes park staff may undertake these activities for material they have collected.

Paper Labels

Paper products can vary in quality and appropriateness for the preservation of biological specimens. Paper labels that you use should:

- be white
- have a neutral to slightly alkaline pH (pH 6.0-8.0);
- have a lignin content of less than 0.3%
- be of long-fibered cotton stock, although alpha-cellulose, ground-wood papers are also acceptable

Alkaline-buffered papers, which have a pH of 8.5 or higher, are not acceptable unless they are labels applied to herbarium sheets or packets, insect pins, microscope slides, or the exterior of boxes or other containers where they are not in direct contact with the specimens.

You can obtain acceptable archival-quality paper from various vendors. These include firms listed in *Tools of the Trade* or from some full-line office supply stores (although you may have to place a special order).

Plastic Labels

Do not use plastic labels. Most of the plastic labels that have been used with specimens in the past have not been stable. The exception to this general rule is Tyvek®, a stable non-woven polyester.

Metal Labels

Metal labels are sometimes part of a specimen in the form of leg bands or ear tags. Always retain these with the specimen. **Do not use metal for other labels or label attachments**, as:

- most metals will oxidize and corrode when in contact with the specimens
- sharp edges and corners of the metal can cause physical damage to the specimen

Note: If a metal leg band or ear tag attached to a specimen is actively corroding, you may need to remove it from the specimen. Be sure to consult with a conservator and/or you regional/SO curator for guidance.

Inks

Inks must be resistant to light, fluids, and abrasion. Only use carbon-based, permanent, black ink to label specimens. Carbon inks do not fade. Commercial, black printing inks are usually carbon-based. Most laser printer and photocopier toner is also carbon-based. Laser and photocopiers apply toner with a certain amount of heat. This helps fuse the toner particles to the paper. Some inkjet printers now use pigment-based inks. Keep in mind though that only black, carbon-based pigments are acceptable for labeling biological specimens.

Liquid inks vary in quality. Black inks suitable for labeling should be drafting inks designed for writing on drafting film, using technical pens. These inks tend to be carbon-based with a neutral pH. They adhere well to almost any surface.

You also can use some fiber-tipped pens for labeling specimens. Once again, be sure to choose pens with carbon-based, black, liquid ink.

To test an ink, see how:

- long it takes for the ink to dry so that it will not smear
- well the dry ink resists abrasion
- well it resists water, alcohol, or other fluids that may be used in specimen preservation

For information concerning acceptable permanent inks, refer to *Tools of the Trade*.

Label Attachments

Attach tags to specimens with cotton thread of a thickness appropriate to the size of the specimen. The attachment should be:

- long enough to permit the tag to be read on both sides without stress on the specimen
- short enough that it does not become entangled with the specimen or

adjacent specimens

Do not use plastic or metal ties when labeling specimens. These can deteriorate from contact with the specimens. They also can cause mechanical and/or chemical damage to the specimens.

Herbarium Sheet Labels

Attach labels to herbarium sheets and specimen packets in botany collections using methylcellulose paste. Other types of adhesives may break down over time and cause:

- labels to separate from sheets
- deposits of deterioration products on labels and sheets

Methylcellulose paste is compatible with the sheets, packets, and labels. To make this adhesive, follow these steps:

1. Choose a very pure, high-viscosity methylcellulose powder (such as Methocel A4M, a grade A, 4,000 viscosity methylcellulose made by Dow Chemical).
2. Mix the methylcellulose powder with distilled or deionized water.
3. Form a thick gel (following the manufacturer's directions).
4. Dilute the mixture with ethanol or an ethanol and water solution.
5. This creates a quick drying adhesive for paper materials.

Methylcellulose may not work well to attach paper labels to all surfaces. To adhere a label to a glass vial you may need to use an acrylic adhesive. Self-adhesive, foil-backed, paper labels with an acrylic adhesive are available from various conservation suppliers.

Labeling Directly On Specimens

You can directly label bone, shell, and other fairly smooth-surfaced specimens. Use a stable acrylic resin (such as Acryloid® B-72) to seal the surface below the number. If you don't seal the surface, the ink can penetrate and disperse through cracks. This can cause permanent alteration or requiring aggressive scraping to remove labeling errors. See *Conserve O Gram* (*COG*) 1/4 for additional information.

8. *How should I handle biological specimens during processing?*

To protect specimens during processing:

- provide dedicated, open workspace
- use stable work surfaces
- provide ultraviolet-filtered lighting with good color rendering capacity (a Color Rendering Index of 90 or higher)
- maintain clean surfaces
- remove clutter

- wear nitrile gloves
- maintain sufficient space for each specimen
- handle only one specimen at a time
- use trays or carts to move specimens to and from work areas
- keep food, fluids, and other contaminants away from work and storage areas
- avoid working with specimens in areas where environmental conditions are outside an acceptable range
- don't handle or move specimens more than necessary (use a padded turntable for examination to reduce handling)
- request assistance if needed to safely handle or transport a specimen

9. *What should I know about preparation materials?*

Most specimens have been fully stabilized and prepared prior to receipt. The materials used in these processes can affect the preservation and utility of the specimens. It is impossible at this time to state the best preparation techniques with certainty. Therefore, it's always important to carefully document all methods and materials to help determine appropriate use of the specimens over time and to aid future conservation efforts.

10. *How should I document a specimen's condition during processing?*

Prepare condition reports to document a specimen's condition. Collections care routinely involves condition reporting. It's impossible for you to prepare a condition report for each specimen. Therefore, you'll need to prioritize specimen condition reporting. At a minimum, prepare condition reports for:

- type specimens
- endangered or rare species
- unique and historically important specimens
- specimens that are removed from the collection to be sent on loan, or to be used for interpretation or exhibition
- specimens that need treatment

ANCS+ contains a condition report module that you can use to document the condition of specimens in your collection. See the *ANCS User Manual*, Chapter 3, Section IV: Condition Reports Supplemental Record, for additional information.

Your collection may require a more detailed condition examination. You also may require additional information concerning appropriate care for certain specimens. Discuss these needs with your regional/SO curator. He or she can assist you to hire a natural history conservator to conduct a Collection Condition Survey (CCS) of your collection. For additional information concerning a CCS, see Chapter 3, Section D.

11. *Are there any special*

If the specimens were not fully prepared when received at the park, the health and safety issues may be similar to those for stabilization. If the

health and safety concerns during processing?

specimens have been fully prepared, the risks will be primarily physical or chemical. If you know about all stabilization and preparation materials, it's possible for you to mitigate or eliminate chemical threats through the use of engineering controls and personal protective equipment (PPE). You can reduce the physical risks by paying careful attention to proper handling and storage techniques.

12. *What do I need to know about loans of specimens?*

For information concerning incoming loans, see *MH-II*, Chapter 2, Section P. For information concerning outgoing loans, see *MH-II*, Chapter 5. The following additional standards pertain to loans of biological specimens:

Type Specimens

- are never loaned in some disciplines (e.g., mammalogy)
- are routinely loaned in some disciplines (e.g., invertebrate zoology and botany)
- are usually subject to more stringent loan conditions than non-type material

Important Notes Concerning Transport of Type Specimens:

- The best method of transport to ensure a type specimen's security is hand delivery.
- Specimens shipped by air or mail may be subjected to various types of electronic, chemical, or radiological examination and treatment. Such procedures may damage the specimen; either physically and/or render it useless for certain types of research.
- Some commercial carriers do not accept animals, either alive or dead, for transport. Consult with your carrier in advance concerning their policies.
- If you must send a type specimen by post or commercial carrier, be sure that you can track the package.

Other Important Points Concerning Loans

- rare species or unique specimens are almost never loaned
- entire holdings of a series of specimens are not sent in a single loan
- normal loan duration is six months with provisions for extensions upon request
- shipping containers for outgoing loans are used to return the loans
- loans are not shipped during the end-of-year holiday season due to the risk of delays or losses due to the increased volume of holiday mail
- loan shipments (and indeed, any shipment of specimens for any reason) must fully comply with all applicable State and Federal regulations regarding:
    - shipping documentation

- the shipment of endangered species

- transporting hazardous materials

Be sure that the borrowing institution uses the NPS annotation label (Form 10-510) to note any annotations. The NPS annotation label is available in ANCS+. It's a good idea to send several blank NPS annotation labels with the loan paperwork for the borrower to use, if needed. Upon the loan's return to the park, be sure to note label annotations on the specimen's catalog record in ANCS+.

13. *What techniques should I use when packing and shipping specimens for loans?*

For information concerning proper packing and shipping techniques, see Chapter 6, "Handling, Packing, and Shipping Museum Objects." To ensure proper handling of specimens, you also should:

- use a rigid container (ideally a watertight container) for shipping to protect from external physical forces and environmental risks
- include appropriate invoices, permit information, and other shipping documentation to avoid unnecessary opening of the container
- provide instructions on how to properly open and remove the contents of the shipment
- provide appropriate support and cushioning in the container to protect the specimens from mechanical damage
- provide reasonably stable materials in contact with specimens
- wrap each specimen individually for protection and to contain specimen parts in the event of damage
- be sure address information is correct and legible, and that copies of the shipper and recipient addresses are inside the package
- follow all applicable laws and regulations regarding the packaging of any hazardous materials for any shipping method

There is no guarantee that the same care will be provided when the loan is returned, but hopefully your demonstration of proper methods and materials will serve as a positive example for loan recipients.

14. *What are the regulations pertaining to shipments of hazardous specimens?*

If you ship any hazardous materials (HAZMAT), including some specimens (such as radioactive, toxic, flammable, or otherwise dangerous specimens) via a **commercial carrier** (Federal Express, UPS, or similar firms) you must comply with all State and Federal regulations, especially Title 49, Code of Federal Regulations (49CFR).

YOU CANNOT SHIP HAZARDOUS MATERIALS USING THE U.S. POSTAL SERVICE. IT'S ILLEGAL.

In the United States, the U.S. Department of Transportation (DOT) administers the Federal regulations pertaining to transportation of HAZMAT, known internationally as dangerous goods. 49CFR, Parts 100 through 185, govern the transportation of hazardous materials in the U.S. As noted above, all commercial shipments of hazardous material must be in accordance with the Hazardous Materials Regulations (HMR) found in

Parts 171 through 180 of Title 49, CFR.

According to 49CFR, you **CANNOT** offer a HAZMAT shipment to a commercial carrier for transportation unless it has been packaged, labeled, and prepared for shipment in accordance with the Hazardous Materials Regulations (HMR) (see Parts 171 through 180 of 49CFR). The regulations also require that:

- All packages and containers that you use for shipping by commercial carrier must meet the requirements of the HMR
- Individuals who package, label, and/or prepare shipping papers for hazardous shipments must take a HAZMAT shipping training course. The training must include general awareness and familiarization, function-specific, and safety training.

If your park needs to transport a specimen that is considered HAZMAT, you have three options:

- **Use a U.S. Government vehicle** driven by a properly trained park employee who is knowledgeable of any risks posed by the specimen(s). Such shipments are not regulated by the requirements of the HMR noted above.
- **Hire a Commercial Carrier and a hazardous materials packaging contractor**. The contractor (who has been trained and certified in all DOT HAZMAT regulations) will prepare your package for shipment according to the HMR. The contractor will then forward your shipment to the commercial carrier. Companies that offer these services are usually located near large international airports or port facilities.
- **Complete a HAZMAT shipping training course that meets DOT requirements**. Several firms and organizations offer such courses, which are classroom-based, distance-learning/Internet, or via a CD-ROM or other method. The DOT has a CD-ROM based training program. Once you have completed the training you can legally pack such shipments for commercial transport.

For additional information concerning transportation of hazardous specimens and training requirements, consult the DOT:

U.S. Department of Transportation
Research and Special Programs Administration
Office of Hazardous Materials Safety
400 7th Street, SW
Washington, DC 20590
(800) 467-4922; (202) 366-8553
http://hazmat.dot.gov

D. Storage of Biological Collections

1. *How should I store biological collections?*

To ensure proper storage, consider:

- location

- security
- organization
- housings
  - storage designs
  - storage systems
  - storage materials

2. *Where should I locate storage?*

Locate biological collection storage in an area:

- where there are minimal natural or human-caused hazards
- where you can control access
- where you can organize the collection in a logical manner
- that staff can easily monitor and control the environment

Off-site facilities, basements, attics, and irregular or fragmented spaces do not serve the interests of good collection management, care, or use. Storage should meet the standards of the NPS Checklist for Preservation and protection of Museum Collections ("Museum Checklist"). For additional information concerning the Museum Checklist, see Appendix F: NPS Museum Collections Management Checklists.

3. *How can I ensure the security of biological collections in storage?*

Provide appropriate security for the specimens through:

- control of access and use
  - policies
  - procedures and other standard operations
  - key control
  - restrictions
- physical security
  - door and cabinet locks
  - staff supervision of all collection access
  - electronic detection and surveillance systems (alarm systems, coded keycards, closed circuit television surveillance, etc.)

For further information concerning the security of collections, see:

- Chapter 9, "Museum Collections Security and Fire Protection."
- ASIS Standing Committee on Museum, Library and Archive Security. *Suggested Guidelines in Museum Security*. Alexandria: ASIS International, 1997. Available at on the web at:

<www.stevekeller.com/steve/pdf_files/SecurityStandards/GuidelinesRev97.pdf>.

- Layne, Stevan P. *The Cultural Property Protection Manual*. Denver: Layne Consultants International, 2002.

4. *How should I organize my park's biological collection?*

You can organize your collection:

- following disciplinary standards that comply with the most recently accepted classification system for the taxonomic group in question
- based on a progression from primitive to complex forms, often reflecting a described classification system
  - begin subdivisions within the broadest pertinent taxonomic division (phyla or class)
  - continue the phylogenetic arrangement at least to the family or subfamily level

Below these levels it is common to use an alphabetic arrangement:

- genera are organized alphabetically within a given family
- species are organized alphabetically within a given genus
- such organization may continue to sub-specific levels as well

Organization beyond the classification system may vary among disciplines and/or parks:

- Parks with large collections of specimens of the same genus or species (or subspecies, if applicable) may want to arrange specimens alphabetically by geographical designations for the collecting locality (such as state, park district, or county).
- Beyond classification and geographical arrangement, arrange specimens numerically by catalog number.

If you organize your park's biological collection this way, every specimen has a designated and predictable location. You can then easily retrieve and replace specimens and conduct periodic inventories without difficulty.

5. *What about other methods of arrangement?*

Sometimes you may need to adapt your arrangement patterns to provide effective use of space for:

- over-sized specimens
- specimens with multiple parts that are not best accommodated in the same storage unit (dry study skins with parts preserved in fluids)
- collections from more than one park

Remember: Be sure that your method of arrangement:

- provides appropriate protection for the specimens

- enables the specimens to be accessed with ease for research use

For additional assistance deciding on a suitable arrangement system, consult:

- Your regional and network-level contacts:
  - regional /SO curator
  - regional chief scientist
  - network inventory and monitoring coordinator
- NPS Senior Curator of Natural History
- Park scientists/natural resource management staff
- Major research users of your park's natural science collection

6. *Are there any other issues related to collection arrangement that I should consider?*

After you organize your biological collection based on an acceptable classification system, and arrange it in a simple and logical pattern, be sure that you can easily locate specimens. You can facilitate this by:

- signage
  - label each aisle of storage units to indicate the beginning and ending groups housed within the aisle
  - label each cabinet, drawer, and shelf to indicate the beginning and ending groups in the unit
- floor plans that detail where the various specimen groups are located

The ultimate goal is to allow ease of access to a specimen with minimal handling of other specimens.

7. *What issues should I consider when planning a new or upgraded storage facility for biological specimens?*

Discuss your storage needs with your regional/SO curator, park and regional/SO natural resource management staff, network inventory and monitoring coordinator, park maintenance staff, park partners such as local universities, other agencies, and museums, and other subject matter experts. Refer to Chapter 7, "Museum Collections Storage" for NPS standards and requirements for collections storage. Also refer to:

- Rose, C., C. Hawks, and H. Genoways (eds.). *Storage of Natural History Collections: A Preventive Conservation Approach*. Washington, D.C.: Society for the Preservation of Natural History Collections, 1995.
- Rose, C. L., and A. R. de Torres (eds.). *Storage of Natural History Collections: Ideas and Practical Solutions*. Washington, D.C.: Society for the Preservation of Natural History Collections, 1992.

For ordering information concerning either volume, visit the Society for the Preservation of Natural History Collections' (SPNHC) website at: <http://www.spnhc.org/>.

Things to consider for biological collections storage facilities include:

- Have a dedicated storage area. Do not co-locate offices, collections processing, supply storage, or any other functions within collections

storage areas.

- Provide 350 lbs. per square foot floor-loading capacity for storage areas that will house compact or mobile storage systems.

  - This will also permit you to safely move cabinets, collections on pallets, or objects in crates using lift equipment such as power lift stackers and pallet trucks.

  - Make sure that access corridors between freight elevators, storerooms, and exhibit areas have similar floor loading capacities.

- Ensure that the entrance to any storage area is large enough in both dimensions to accommodate full-unit cabinets and large objects.

- Avoid dropped ceilings in all storage areas, and, to the extent possible, elsewhere in the building. Dropped ceilings:

  - provide a habitat for pests

  - disguise the source of leaks

  - contain materials that can generate dust and debris that foul particulate filtration systems

- Avoid raised decks or other raised flooring for compact storage systems. These provide a habitat for pests. Install compactor tracks into properly leveled and coated concrete floors (see below).

- Install a sanitary perimeter around any building that houses collections. This is a 3' wide pea gravel border, 4" deep, along the outside of the exterior walls.

  - The trench should slope away from the building and be lined with a polyethylene membrane to inhibit plant growth.

  - Use non-flowering plants for landscaping outside the sanitary perimeter. Flowering plants attract dermestid beetles.

  - Avoid attaching mercury vapor or tungsten lighting to buildings as these attract insects.

- Equip all storerooms with fire detection and water-based, automatic fire suppression systems.

  - Program for, and ensure regular testing, inspection, and maintenance of the systems.

  - For assistance, contact your regional structural fire management officer (SFMO) and regional/SO curator.

- Label all pipes and ductwork so that staff can adequately protect collections that may have to be stored below them. Do not locate any pipes (other than sprinkler lines and minimal ductwork) inside storage areas.
- Install seals around all duct and pipe chases where they pass through walls, floors, or ceilings. You can block these passages with "Stuf-it"

copper wool gauze to keep insect pests and rodents out of storage areas. "Stuf-it" copper wool gauze is available from:

Allen Special Products, Inc.
1610 Bethlehem Pike #B3
Hatfield, PA 19440
(800) 848-6805

- Avoid interior duct linings. Where needed for noise control or to reduce condensation, use external duct linings.

- Install climate control equipment outside the storage room. This eliminates the need to access the room to maintain the equipment. This will also help protect the collections from equipment leaks.

- Filter all incoming and recirculated air to the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) 90-95% level.

- Plan for a moderately dry environment.

  - The relative humidity (RH) range that is most suited to the majority of natural history collections is 40-60%. This assumes that the building fabric is designed for this range.

  - Specimens and objects inside well-sealed cabinets can withstand external environments from 30-65% RH over the course of a year. In a temperate climate, the collections inside the cabinets will enjoy a very stable RH somewhere between 45% and 55%.

  - Most natural history materials will preserve very well at a RH of 40-50%.

  - Some materials are very sensitive to mechanical damage at a RH below 40%, (teeth, bone, and shell). Fluctuations in RH below 40% can cause these materials to crack and spall, even without the impetus of mechanical damage.

- The optimum temperature for storage of biological collections depends upon the type of preservation (dry, wet, low temperature). Consult the appropriate sections of the text for information.

- Avoid all natural light, and use indirect lighting or filtered fluorescent lighting to reduce the potential for damage to collections from ultraviolet radiation.

- Paint walls and ceilings white or a very light color. White reflects much of the visible-light spectrum. You can then reduce the intensity of the light from various light sources in work or storage areas.

  – White or light walls and ceilings permit easy monitoring for dust, and cobwebs and other indications that insects may be present.

  – Most white paints contain titanium dioxide, which absorbs part of the ultraviolet radiation from fluorescent lighting, reducing the UV

in any reflected light.

– Avoid oil-based paints, single-component epoxies, alkyd paints, or oil-modified polyurethane coatings.

– Select an acrylic emulsion latex (interior or exterior), vinyl acrylic, or acrylic urethane coating for walls and ceilings.

- Coat concrete floors (after appropriate curing) with a solvent-borne epoxy sealer, topped with a moisture-cure epoxy sealer.

  - Avoid all other floor coverings. Anything else will require wet cleaning or will be a source of particulate or gaseous pollutants.

  - When worn, you can replace the topcoat without having to evacuate the collections from the area.

  - Use a clear or pigmented epoxy. Do not use white, it will always appear scuffed.

8. *What storage systems will best protect my park's biological collections?*

The agents of deterioration that pose the greatest risks in storage of collections vary according to the level of containment for the specimens. Collections in open storage are far more vulnerable than those stored in closed storage, as shown in Tables T.3 and T.4., below:

Threat	Floor	Racks/Screens	Shelving
Neglect	Poor	Poor	Poor-Fair

Direct Physical Forces	Poor	Fair	Poor-Fair
Criminal Activity	Poor	Poor-Good	Poor
Fire	Poor	Poor	Poor
Water	Poor	Fair	Fair
Pests	Poor	Poor	Poor
Contaminants (especially dust and outdoor air pollutants)	Poor	Poor	Poor
Visible and UV Light	Poor	Poor-Fair	Fair
Inappropriate Temperature	Poor	Poor	Poor
Inappropriate/Fluctuating Relative Humidity	Poor	Poor	Poor

Table T.3. Quality of protection against agents of deterioration for collections in open storage. Based on work by Barbara Moore and Stephen Williams.

Threat	Poorly Sealed Cabinet	Well Sealed Cabinet (elevated or on compactor storage)	Compactor Shelves
Neglect	Poor	Fair-Good	Poor-Fair
Direct Physical Forces	Good	Good	Fair-Good
Criminal Activity	Good	Good	Good
Fire	Fair	Fair-Good	Fair
Water	Fair	Good	Fair
Pests	Fair	Good	Fair
Contaminants (especially dust and outdoor air pollutants)	Poor-Fair	Good	Fair-Good
Visible and UV Light	Good	Good	Fair-Good
Inappropriate Temperature	Poor-Fair	Good	Fair
Inappropriate/Fluctuating Relative Humidity	Poor-Fair	Good	Poor

Table T.4. Quality of protection against agents of deterioration on collections in closed storage. Based on work by Barbara Moore and Stephen Williams.

For most collections, locked, well-sealed, properly installed and leveled cabinets reduce the risk of most agents of deterioration. Good cabinets:

- exclude pests (most pest infestations are then the result of negligence)
- greatly deter theft
- can eliminate damage from:
  - water leaks
  - light
  - most particulate pollutants
  - soot and other debris during a fire
  - some forms of physical damage
  - the impact of humidity extremes and fluctuations

Cabinets can maintain a reasonably stable relative humidity level (even

when you open doors periodically for access). If you keep doors closed, the cabinets will provide acceptable environments through short-term failure of building systems.

> ***Remember: Cabinets do not provide protection against neglect. Lack of appropriate organization, cushioning, and support will still expose specimens to mechanical damage from physical forces. Well-sealed cabinets also will contain any vapor off-gassed by poor quality storage materials. This will increase the potential for chemical damage to collections stored with these materials.***

9. *What types of storage equipment should I use for biological collections?*

The storage equipment of choice may depend on the type of biological collection (dry, wet, low temperature, etc.). Refer to subsequent sections for more information.

One of the best ways to provide proper long-term care for your collections at minimal cost is to use appropriate storage equipment. Good quality cabinets and other storage equipment will last for several decades if properly maintained. Purchase and use standardized storage equipment. This permits:

- bulk purchases, which can result in substantial cost savings
- drawers and other interior fittings to be traded among cabinets to suit specific needs

When purchasing new storage equipment, include the following specifications:

- steel construction (some lightweight aluminum or molded high-density polyethylene shelving may be useful in certain instances)
- high gloss, epoxy powder coatings
- exterior surfaces that are flush (no indentations or recesses other than at door latches)
- no interior spaces of any kind that cannot be reached with a vacuum cleaner - this includes hollow doors unless they are completely sealed
- hinged, lift-off doors, or doors that open completely and fold back flat against adjacent cabinets to facilitate
    - cleaning of the cabinet interiors
    - rearrangement of drawers and shelves
    - installation and removal of specimens
- door locks, generally keyed alike to prevent a proliferation of keys or a tendency to avoid locking the doors
- d-style tubular neoprene or silicone door gaskets

  - these “rubberized” materials will off-gas minor amounts of sulfur (herbarium materials are sensitive to sulfur gases)

  - you can use either neoprene or silicone foam gaskets for sulfur-sensitive collections, but the d-style gaskets provide a better seal against pests and pollutants and for most biological collections are probably worth the comparatively minor risk from the sulfur

- alcohol-cure silicone sealants (no acetic acid should be present in any sealants used in cabinets)

- powder-coated steel interior fittings

- light-tight construction for all cabinets (where light can enter, so can insect pests and dust)

- leveling feet

- 4” or higher legs

  Note: The GSA contractors that manufacture NPS standard museum storage cabinets also sell cabinet platforms that you can use to elevate the cabinets 6” above the floor. See *Tools of the Trade* for more information.

- casters, or dollies with locking casters for deep shelving units, these

  - allow the units to be easily moved, even when fully loaded

  - help maximize the use of space in a storage area (they are an inexpensive compact storage design)

- removable restraining bars to keep items from toppling from shelving units during an earthquake

- suspension (roller-bearing) or Permaslide® or equivalent systems for pull-out drawers. Avoid friction systems as these rapidly abrade and can deposit fine particulates from the paint on collection objects.

> ***When you acquire new storage cabinets, purchase only white or off-white equipment and containers. This facilitates housekeeping, pest monitoring, and "crumb" monitoring. "Crumb" monitoring refers to examining stored collections for signs of decrepitation (small particles dislodged from specimens as a result of biological, chemical, or physical deterioration). It’s virtually impossible to inspect for pests against anything other than a white or very light background.***

For additional information concerning proper storage equipment for biological collections, see *MH-I*, Chapter 7, “Museum Collections Storage” and *Tools of the Trade*. Refer to *Tools of the Trade* for equipment product descriptions and illustrations, vendor contact information, and current Federal government contracts.

10. *What special concerns should I consider when installing new storage equipment?*

Use the following steps when installing new storage equipment. This will help ensure that the equipment will protect the collections and be durable over time. You should use similar steps if you must move storage equipment after the initial installation.

- If possible, arrange for the manufacturer to install the equipment.
- If park staff are moving or installing cabinets:
  - Use mechanized equipment such as a stacker.
  - Move cabinets with a nearly complete complement of shelves or drawers (but without the collections). This helps reduce distortion of the cabinet during the move.
  - Remember that a good quality, steel museum storage cabinet with drawers can weigh as much as 600 lbs.
  - If you move cabinets improperly, this will reduce their capacity to provide protection for collections.
- Test all incoming storage cabinets for off-gassing.
  - This includes any powder-coated cabinets.
  - Coatings may off-gas.
  - Cabinets may contain many other materials besides the coating.
  - Air out all storage cabinets (with doors open) for as long as possible before installation of any collection objects.

Note: Information on test methods is given below.

- Level all cabinets (front-to-back and side-to-side) whenever they are newly installed or moved. Cabinets that are not level will not close properly and:
  - provide limited microclimate control
  - allow dust and insect pests to enter
- After leveling, test all incoming storage cabinets to insure that they are light tight:
  - Place a battery-powered lantern or 9-volt flashlights inside a leveled cabinet, then close and lock the door.
  - Turn off all room lights.
  - Carefully examine the cabinet for several minutes for signs of light from within.
  - If light can be seen, mark the area with a post-it note and examine it under normal lighting.
  - If the light leak is a result of a flaw in the cabinet from anything

other than a minor problem around the door gasket, contact the manufacturer for repairs or replacement.

- You can fill minor leaks around the door gasket. Use 3M® self-adhesive neoprene foam gasket material (or equivalent), which is available in various widths at hardware stores.

- Refer all major problems with door gaskets to the cabinet's manufacturer.

11. *What types of storage materials are appropriate for use with biological collections?*

The storage materials of choice may depend on the type of biological collection (dry, wet, low temperature, etc.). Refer to subsequent sections for more information about storage materials. In general, storage materials that are appropriate for use with biological collections include:

- closed-cell polyethylene foam (Volara® Type A or Plastazote®)
- opaque non-woven (spun-bond) polyethylene fabric (Tyvek®)
- polyester film
- high density molded polypropylene or polyethylene
- pH-neutral, alpha-cellulose, lignin-free, unbuffered papers & boards
- pH-neutral, unbuffered, 100% cotton paper products
- pure cotton fabrics (thoroughly washed)
- polyester fiber (non-bonded, high loft, resin-free polyester fiberfill)
- medium or high density, phenol-formaldehyde-impregnated, exterior grade plywood that is surface laminated with melamine, or with vapor barrier foil/plastic laminates. **Note:** See the Safety Note concerning the use of aluminum foil laminates with certain treated specimens, in #13, below)
- glassware

Contact with alkaline-buffered ("buffered") paper can damage pigments and proteins in bird and mammal specimens. It can also interfere with herbarium chemical taxonomy studies. Always use unbuffered, acid-free materials with natural history specimens, or line buffered trays with unbuffered blotting paper to eliminate direct contact with alkalis.

For additional information concerning proper storage materials for biological collections, see *MH-I*, Chapter 7, "Museum Collections Storage" and *Tools of the Trade*.

12. *Are there any cautions to using the above materials with biological specimens?*

Polyethylene melts at about 250°F. This temperature is far below that at which many bird and mammal study skins, untanned skins, feathered or haired specimens, plant specimens, and paper are damaged by heat alone. If the foam is in direct contact, it will melt and damage the specimens **before** they would ordinarily be damaged by the heat of a fire. Separate from

direct contact with specimens by using pH-neutral, 100% cotton rag blotting paper or pH- neutral, smooth-surfaced tissue.

Polyethylene foams and films develop a static charge in low humidity conditions and can damage:

- friable surfaces, such as the periostracum on many shells
- fragile parts such as those on some plant specimens
- hair or feathers

Other cautions concerning polyethylene foam include:

- Polyethylene foam will readily adhere to some small specimens and objects, such as those with fur or with sharp protrusions (a specimen or object can be easily be torn in lifting it from the foam surface).
- Some expanded polyethylene foams have open pores along cut edges that are an appropriate size for some insects to deposit eggs or for insect larvae to pupate. Using appropriate ventilation, seal edges with a hot air gun, or cut the foam with a hot knife to seal the openings.

Considerations for other materials include:

- Polyester film (Mylar D®, Melinex 516®) has a very high melting point, but develops a static charge at humidity levels of about 40% or less.
- Polypropylene may have the same problems as those noted above for polyethylene foams.
- Polyester fiber should always be separated from direct contact with any collection item that has small protrusions or a friable surface.

13. *What materials should <u>not</u> be used for storage of biological specimens?*

Don't use any of the following materials, they can damage specimens:

- polystyrene
- polyvinyl chloride (PVC) plastics
- polyurethane foams and oil-based polyurethane varnishes
- synthetic polymers containing unstable plasticizers or other additives
- alkyd enamel paints
- bakelite (a hard, black plastic), which decomposes when exposed to alcohol and/or formaldehyde vapor
- acidic paper products
- alkaline-buffered paper products (in collections containing proteins, animal pigments, or intended for use in some biochemical or chemical taxonomy studies)
- wood and most wood products, although you can use wood to construct

pallets for large specimens if:

- you use a well ventilated room
- you properly seal the wood
- the collection materials are not in direct contact with the wood

- most uncoated metals (see safety note below)
- most commercial grade textiles
- cotton batting (is extremely hygroscopic and will attract and hold moisture on specimens)
- natural rubber

IMPORTANT SAFETY NOTE: Aluminum metal, and vapor barrier materials made with aluminum foil can be a hazard if used with collections that have been treated for pest control using mercury salts or chlorinated compounds. These chemicals react with aluminum.

E. Maintenance of Biological Collections

1. *What is maintenance?*

Maintenance includes all of the corrective actions in response to a real or perceived problem. It can include a variety of issues, but the most common maintenance concerns include:

- updating information
- housekeeping in storage and exhibit areas
- emergency preparedness, response, and salvage
- specimen cleaning
- specimen treatment
- pest management

2. *What information management issues are related to maintenance of biological collections?*

Maintenance includes the following information management issues:

- the need to update information (to reflect ongoing changes in the classification system as researchers develop a better understanding of taxonomic relationships) to:
  - specimens
  - drawer labels
  - catalog records

- databases

  Be sure to document information related to any associated collections of tissue or parasites. You also should obtain reports of further analysis of these collections.

- detailed documentation and analyses of environmental conditions in collection areas

- condition reporting

- recording images of specimens

- deaccessioning specimens (see *MH-II*, Chapter 6, "Deaccessioning")

Maintenance activities may depend on the type of biological collection (dry, wet, low temperature, etc.) in question. Refer to subsequent sections for more information about specific maintenance issues.

Include all pertinent information in ANCS+, especially loan, exhibit, and treatment histories. Also, note all publications in which a specimen has been cited. If this information is available, the value of individual specimens and the collection as a whole is enhanced.

3. *How important is housekeeping for biological collections?*

As with all other collections, good housekeeping provides for the long-term preservation of biological specimens. Proper housekeeping minimizes particulate pollutants and eliminates habitats and materials attractive to insect and rodent pests.

4. *What housekeeping strategies should I use for long-term preservation of biological specimens?*

For NPS housekeeping and storage requirements, see the "NPS Checklist for Preservation and Protection of Museum Collections" in Appendix F: NPS Museum Collections Management Checklists, as well as Chapter 7: Museum Collection Storage and Chapter 13: Museum Housekeeping.

Other steps that you should take include:

- Place polypropylene fiber mats outside the doors to the storage rooms to reduce dust and dirt entering the collection area.

- Use High Efficiency Particulate Air (HEPA)-filtered vacuums as your primary cleaning tool. Unlike conventional vacuums, HEPA vacuums do not redistribute fine particulates into the area being cleaned. See *Tools of the Trade* for product information.

- Avoid wet cleaning in collection areas. If necessary, use spot cleaning to remove stains.

  - There is no need for regular wet cleaning in storage areas.
  - Large areas of damp carpet or floors can raise humidity levels.

- Do not use spray cleaners or aerosol cleaners in collection areas.

  - Do not use these in any space that shares a ventilation system with

collection areas.

- Spray on cleaning rags outside collection areas, only.

- Do not use chlorinated cleaners anywhere in collection areas. For safer cleaning alternatives, see *COG* 2/21 "Safer Cleaning Alternatives for the Museum and Visitor Center."

- Use specialized cleaners (such as Brillianize®) for many plastics, such as exhibit cases. Never spray directly onto the case surfaces, or on rags while in collection areas.

5. *What should I know about emergency management, response and recovery?*

Emergency planning and management is vital. Be sure that you are prepared to deal with all emergencies and potential disasters. Have an up-to-date Emergency Operations Plan (EOP), conduct drills, and ensure that all staff are aware of their responsibilities in event of an emergency. This will reduce damage to, or loss of, life or property.

For additional information, refer to *MH-I*, Chapter 10, and your park's EOP. For questions about your park's EOP, consult your chief ranger, safety officer, and regional/SO curator.

6. *What do I need to know about salvaging biological specimens following an emergency?*

Salvaging specimens after an emergency or a disaster is usually geared towards stabilization. It normally occurs within the first 48-hours after the collection and/or area is secured. Initial stabilization may involve some treatments. However, these treatments are not designed for restoration or repair, but to eliminate further damage.

There are a number of salvage techniques for many kinds of specimens. A very useful reference is:

> Ball, C. and A. Yardley-Jones. *Help! A Survivor's Guide to Emergency Preparedness*. Museum Excellence Series: Book 3. Edmonton: Museums Alberta, 2003. Ordering information at: <www.museumsalberta.ab.ca>.

There are conservators who have extensive experience in salvage of biological materials. Be sure to include their names and contact information in your park's EOP response call list. Information about appropriate conservators is available on the web at <http://www.aic-faic.org/guide/form.html>.

> ***Following an emergency, many specimens and/or collections may require treatment. These treatments can be extremely complex. Refer such work to a professional conservator.***

7. *What about cleaning biological specimens?*

Cleaning of specimens poses a variety of problems:

- Removing particulate matter on most specimens can risk mechanical damage.

- Vacuuming some specimens, such as study skins, will remove ectoparasites that may be useful in verifying the identity of the host organism.

  - Before you vacuum or otherwise clean any research specimens, be sure that the "pest" is indeed a "recent" infestation rather than an

ectoparasite.

To ensure that specimens are not damaged during cleaning, follow these general guidelines:

- Carefully vacuum specimens using a HEPA-filtered vacuum and small tools.
  - Do not dust wipe specimens or use forced air.
  - For some hard-surfaced specimens, you can use a soft brush to brush surface dust into the nozzle of a HEPA-filtered vacuum.
- Restrict your cleaning to specimens that are otherwise in good condition.
- Do not attempt to vacuum specimens with:
  - flaking skin, scales, periostraca, or paint
  - loose feathers or hair
  - fragile parts or appendages
- Avoid cleaning botanical specimens, herbarium sheets, and insects.
- Consult a conservator for advice before cleaning any group of specimens for the first time.

> ***Consult with a conservator before attempting any cleaning that may require water or organic solvents. This applies to all types of specimens and whatever sort of material is to be removed from them.***

8. *Are there any other concerns regarding treatments of biological specimens?*

When specimens have suffered mechanical, biological, or chemical damage, you should stabilize the material by non-interventive means rather than to try to repair the damage:

- If there are detached parts, contain them so that they will not be lost. Don't attempt to reattach them.
- You can stabilize a cracked or broken specimen with an appropriate support.

Specimens with historic or interpretive value can be treated, but only by a conservator. Even in these instances, all repair materials must be easily distinguished from original specimen materials.

NOTE: Avoid any action that might compromise the integrity of research specimens.

9. *Are there any health and*

Many of the health and safety concerns can be mitigated by the use of proper personal protective equipment (PPE). This includes gloves and the

safety concerns related to maintenance of biological collections?

use of other appropriate equipment, such as HEPA-filtered vacuums.

Activities beyond routine maintenance may require you to:

- have full knowledge of potential material interactions
- use properly ventilated laboratory facilities
- use respirators and additional PPE

> ***The use of some personal protective equipment (PPE), such as respirators, requires a medical evaluation, formal training, and fit testing. For additional information concerning respirator use, see COG 2/13.***

10. *Should I document cleaning, treatment, and salvage activities?*

Yes. All cleaning is essentially an irreversible treatment. Always document all cleaning activities (whether done by collection staff or a conservator). Provide written documentation and photographs or other images as well. You also should document any treatment (however simple it may appear to be) in writing, and in photographs or images taken before, during, and after the treatment.

During emergency salvage operations, it's acceptable for you to eliminate individual specimen reports. However, you'll need to document all steps in the overall immediate salvage (in writing and in some imaging system). Record specific damage to particularly valuable specimens and specimens on loan from other museums. Note the specific salvage methods used. Such information may be important for insurance purposes as well as for the future preservation and utility of the specimens.

11. *How can I protect biological specimens from pests?*

In the past, pest management incorporated repeated application of pesticides. This often involved multiple types over time. There are numerous problems with this approach, including:

- laws and regulations
- health and safety
- environmental quality
- questionable effectiveness
- materials interactions

Practice the principles of Integrated Pest Management (IPM). IPM is the best approach to dealing with pests in museum collections. It is a holistic, environmentally-friendly, and sustainable means of pest control. IPM does not exclude the use of pesticides. It does however, offer many alternatives for achieving the same goal. Because dry collections are at greater risk from pests than other types of collections, refer to Section III for more information about IPM and pest management.

> ***The National Park Service implemented an IPM program in the early 1980s. Since then, the NPS has reduced pesticide use by over 60 percent, while also improving the effectiveness of Servicewide pest management efforts.***

SECTION III: DRY BIOLOGICAL COLLECTIONS

A. Overview

1. *What are dry biological collections?*

Dry collections consist of those specimens that are preserved in a dry state.

2. *Why are some biological specimens preserved in a dry state?*

Two factors influence decisions about preserving specimens this way:

- **Rigidity.** Some specimens can be preserved naturally (starfish) or artificially (vascular plants) with sufficient rigidity to accommodate normal handling. Such specimens often are suitable for dry preservation.

- **Specific characteristics.** Drying may provide the best available means to preserve natural colors (for example, butterflies) or distinguishing features (such as skeletal parts or surface details). Such specimens in a dry state may have great potential for interpretation and research.

3. *What types of biological specimens are usually included in dry collections?*

Plants

- Non-vascular (selected forms of lower plants such as lichens and many fungi)

- Vascular (flowering and coniferous plants)

Animals

- Invertebrates (selected forms such as many insects, corals and some crustacea, mollusks and echinoderms)

- Vertebrates

  - fish (skeletal parts, mounted specimens)

  - reptiles (skeletal parts, scutes or shells, large skins, mounted specimens)

  - birds (skeletal parts, skins, mounted specimens)

  - mammals (skeletal parts, skins, antlers, horns, mounted specimens)

Ancillary Collections

In addition to the specimens, ancillary or support collections are commonly preserved in a dry state. Examples include nests, eggs, replicas, scats, wood samples, labels, and specimen or collection records.

Note: Some biological collections may include photographs used to represent the voucher specimen, especially for some threatened and endangered species. An example of this is a photograph attached to a labeled herbarium sheet.

4. *What are the primary agents of deterioration that affect dry collections?*

Under certain conditions, dry collections can be damaged by all of the agents of deterioration. They are particularly susceptible to neglect, pests, contaminants, visible and UV light, inappropriate levels of temperature and humidity, and improper handling.

5. *How does neglect affect dry collections?*

Neglect can cause collections to become:

- damaged
- lost
- disordered (a lack of organization that impedes collection access)

Major causes of neglect include:

- insufficient knowledge and skills
- failure to provide adequate documentation
- apathy
- lack of administrative support
- an imbalance of resources

6. *How do pests threaten dry collections?*

Dry biological collections contain organic material that is attractive to many insect pests. Fresh material that is not thoroughly dry is highly at risk. However, even dry material is attractive to some pests. The species of insect pest varies according to the type of collection. Some insect pests prefer dried plant materials, while others feed on animal materials.

Vertebrate pests (such as mice) can damage any material either through nesting or feeding. They can also cause soiling with body fluids or excrement.

7. *How can contaminants adversely affect dry collections?*

Contaminants may occur in particulate or gaseous forms. Specimens can be contaminated due to:

- particulates such as dust and soot from atmospheric pollutants
- emergencies
- poor storage and exhibit designs

Particulates can:

- be abrasive
- soil surfaces
- obscure fine details
- attract and hold gas-phase pollutants on the surface of specimens, promoting chemical damage
- necessitate repeated cleaning of collections that:
    - is a drain on a museum's resources
    - causes wear and tear on the collections

- has the potential for severe damage during the cleaning process.

Specimens may acquire other particulate contaminants such as:

- asbestos from deterioration of building materials
- polychlorinated biphenyls (PCBs), lead, and cadmium as a result of the deterioration of paints used in buildings or on storage furniture
- other chemicals used for preparation treatments or pest control

Not all of these cause chemical or physical deterioration of the specimens, but they may have an impact on use of the specimens for interpretation or research.

Other points to remember include:

- Gaseous pollutants are generally inorganic or organic vapors that form acids when they react with moisture in the air.
- Inorganic acid gases, primarily sulfur and nitrogen oxides, are present in very high concentrations near urban centers. They may be high in some rural areas as well. In a museum, they contribute to deterioration of many materials. However, they will have the greatest effect on cellulosic materials stored or exhibited outside of cabinets.
- Organic acid vapors cause deterioration to most dry specimens and their documentation at varying rates, according to:
  - the type and concentration of pollutant
  - the nature of the materials in the collection

  Organic acids can:

  - cause chemical disintegration of organic materials
  - attack calcareous materials (materials containing calcium such as shell, eggshell, and coral)
  - damage to calcareous materials can range from unsightly surface alteration to complete conversion to a powder

  The major sources of organic acid pollutants are:

  - wood and wood products (including wood pulp paper and cardboard)
  - additives in some plastics and fabrics
  - certain adhesives and coatings, especially alkyd enamel paints, *including the baked enamel paints used on some storage furniture*

8. *How does visible and ultraviolet light affect dry collections?*

Most dry specimen materials are either very sensitive or moderately sensitive to visible light. Visible light causes fading of biological pigments. Fortunately, "structural colors" in animals are not greatly affected by visual light. These include multiple iridescent colors and some blues and greens

that are found in feathers. Others include colors in the exoskeletons and wings of many insects.

As with visible light, most dry specimen materials are also either very sensitive or moderately sensitive to ultraviolet radiation. Ultraviolet radiation causes:

- alteration of biological pigments (fading or shifts in color).
- damage to chemical bonds in plant and animal materials
  - UV breaks down the structure of the materials to leave them weakened or embrittled
  - this loss of structural integrity can alter the appearance of structural colors

9. *How does temperature and relative humidity affect dry collections?*

High temperatures contribute to:

- desiccation
- denaturation of proteins
- lipid and resin migration

In general, the rate of any chemical reaction that damages specimens will double with each 10°C/50° F rise in temperature.

Temperatures below freezing:

- cause expansion of free water, which can result in cell rupture in fresh plant and animal specimens
- permit lipid migration (via ruptured cells) in fresh animal specimens
- will not stop the growth of microorganisms unless the temperatures are below -20°C/-4ºF
- will not stop enzymatic activity
- increase the rate at which lipids oxidize, which can cause damage to pigments and proteins
- may cause migration of salts in tanned skins. This can lead to collapse of capillaries in the skin

Temperature fluctuations can result in expansion and contraction of some materials, such as teeth. This can cause cracking.

Excessive moisture in the air (above about 65% relative humidity) encourages:

- mold

- pest infestations
- chemical reactions that can be damaging to organic material
- deformation of material such as tanned or untanned skins and wood samples (deformation is also caused by fluctuating relative humidity)
- softening of some adhesives

Relative humidity below 40% may contribute to embrittlement of rigid materials such as:

- teeth
- ivory
- bone
- mollusk shell
- the outer covering on some mollusk shells (the periostracum)
- wood samples

Embrittlement will leave these specimens very susceptible to mechanical damage.

Fluctuations in relative humidity can cause cracking or splitting of these materials. This is especially true at humidity levels below 40%.

> ***Maintain relative humidity levels below 40% to promote the preservation of freeze-dried specimens that are prone to deteriorate rapidly at higher levels of RH.***

10. *Are there any special rules for handling dry collections?*

Yes. You can easily damage dry collections by improper handling, inadequate support, carelessness, and poor storage techniques. In addition to the recommendations in Chapter 6 and those previously noted in this appendix, use the following handling guidelines to prevent damage to your dry collections:

- Ensure that everyone who uses the collection knows how to properly handle herbarium specimens. Develop written guidelines for use.
- Use large storage trays to move specimens housed in envelopes and small specimen trays.
- Used a padded cart to move material from room to room.
- Avoid handling specimens with your bare hands. Wear *unpowdered* nitrile gloves. As with other collection items, gloves will protect the specimen from oils in the hands, but they'll also protect you from specimens that may cause you to have an allergic reaction.

- Use a light colored work area, so that any material that breaks off can easily be seen and retrieved.

- If you require extra light, use it sparingly.

- Use forceps or gloved hands to carefully move loose material.

Herbarium Specimens

- Do not overcrowd specimens:

  - Don't place too many specimens on one cabinet shelf.

  - Leave enough space on each shelf to allow for easy expansion of the collection in the future.

- When you access a specimen, always remove the entire genus folder.

  - Never attempt to remove just one herbarium sheet from a stack of folders. This can damage the specimens.

  - Support the bottom of the genus folder with both hands when moving it.

- Move herbarium sheets by providing complete support from the bottom.

- Don't shuffle sheets as if they were cards or pages of a book.

- Do not turn sheets upside-down.

  - Stack sheets neatly to the side if specimens on the bottom of the stack are needed.

  - Be sure that the edges of sheets never hit or scrape specimens below.

- Whenever you remove a folder from storage, place a marker in the location to ensure that the folder is returned to its proper place.

- Do not bend sheets to force them under a microscope. Use a hand lens or long-armed microscope.
- Have fragment folders close at hand for attachment to herbarium sheets if needed. If a portion comes loose, place it in a fragment folder attached to the specimen's sheet immediately.

- Equip the research area with work surfaces that are large enough to accommodate a number of herbarium sheets, as well as additional space to ensure that the individual sheets will not strike each other, which may damage a specimen.

> ***The most common cause of damage to herbarium specimens is through improper handling of herbarium sheets.***

Insect Specimens

- Have empty pinning boxes close by in case they are needed for temporary placement of specimens.

- Do not leave drawers or specimens out of storage cabinets overnight, as they are more likely to be infested when outside cabinets.

- Remove boxes or the entire cabinet drawer; do not remove just single specimens from a cabinet for use.

- Leave specimens in the pinning box when viewing under the microscope.

- Use extreme care when removing an individual specimen from a storage box for such purposes as examining the ventral side of the specimen. Do not hit other specimens in the box.

- If there is not enough room on the pin above the specimen to safely grab it with your fingers use pinning forceps:

  - Use pinning forceps with the smaller size pins that flex easily.

  - Carefully pull the pin straight up from the pinning bottom of the box with an easy, smooth motion.

- Avoid unnecessary shaking of the specimen on the pin; do not jerk or quickly pull at the pin. Rough handling can cause sections of the specimen to fall off.

- If the underside of the pinned specimen must be viewed:

  - Pin the specimen into a large eraser or a piece of cork for easier handling.

  - Other possible pinning surfaces include a pinning box with all but one side removed, or an "L-cork" (two pieces of cork joined in an L-shape). Hold the "L" on either the backside or bottom, as needed to view the specimen.

Bird and Mammal Collections

Important Note: Be very careful if you don't know a specimen's complete treatment history. In such cases, assume that it's been treated with pesticides. For additional information concerning contaminated collections, see Question 12, below.

- Wear a white lab coat or lab apron. Animal hair, feather fragments, and insect frass are most likely to be seen against a white background.

- Handle/examine specimens on clean, cushioned, white or light-colored work surfaces. You can use a covering of 1/8" polyethylene foam to cushion a table or desktop effectively.

- Don't remove taxidermy mounts from their original supports.
    - The specimen armatures are under tension.
    - If you remove the rods extending from the feet from their original support, the armatures can move and damage the specimen.
- Handle freeze-dried specimens as little as possible and with great care. Freeze-dried specimens are extremely fragile.

11. *What security issues are related to dry collections?*

Theft is an increasing concern. This is because these collections are often subject to less stringent security measures than many cultural collections. Specimens at risk of theft include:

- ivory
- rhinoceros horn
- horn sheaths and antlers
- some claws and talons
- tanned skins
- skulls
- mollusk and egg shells
- insects
- seeds
- hallucinogenic plants
- specimens of rare, endangered, and extinct animals and plants

Supplementary archival materials, such as original scientific artwork, photographs, and field journals kept by well-known scientists are also vulnerable to theft.

12. *Are there any health and safety concerns associated with dry collections?*

Toxic materials may be present in various forms. This is usually a result of previous treatments. This includes chemicals that may have been used in specimen preparation or processing, such as:

- tanning with chromium salts
- use of asbestos in some taxidermy preparations
- residues from pesticide treatments such as arsenic, DDT, and mercury salts

Other potential hazards include:

- residues from inadvertent contamination of specimens by asbestos from deteriorating building materials

- lead paint dust from old cabinets
- mold spores from past exposure to liquid water or prolonged high relative humidity

Some park staff and collection users may have allergic reactions to hair, feathers, dander, insect debris, and certain specimens (such as poison ivy). Specimens with thorns, spines, or quills, claws, talons, antlers, horns, and long beaks, can cause physical injury during handling. At the same time, handling biological material during stabilization and preparation can pose the risk of numerous biohazards, varying with the specimen.

For additional information concerning handling of contaminated collections, refer to the following *Conserve O Grams*:

- 2/2 "Ethylene Oxide Health and Safety Update"
- 2/3 "Arsenic Health and Safety Update"
- 2/4 "Diclorvos (Vapona) Update"
- 2/10 "Hazardous Materials in Your Collection"
- 2/11 "Health and Safety Risks of Asbestos"
- 2/14 "DDT Health and Safety Update"
- 2/16 "Chronology of Pesticides Used on National Park Service Collections"
- 2/17 "Physical Properties and Health Effects of Pesticides Used on National Park Service Collections"
- 2/19 "Guidelines for the Handling of Pesticide Contaminated Collections"

B. Special Concerns for the Stabilization of Dry Specimens

1. *How are dry specimens stabilized?*

Dry stabilization is used for many biological collections. However, the activities can vary significantly between disciplines. For example:

- some non-vascular plant specimens (such as lichens) and some types of invertebrate specimens involve simple desiccation, such that the specimen does not need further physical alteration before it is ready for use
- for some non-vascular plants and most vascular plants, researchers use plant presses for positioning, compressing, and drying (with or without heat) individual specimens
- some invertebrates are treated with chemicals to either control bacterial decomposition of soft body parts by removing fats or oils, to degrade

soft body parts to facilitate removal or to relax the specimen

- insects are typically pinned and carefully positioned before being dried
  - some insects (for example, butterflies) are occasionally dried without positioning
  - these specimens are rehydrated and positioned as part of the processing stage or because they will be used for analysis of nucleic acids (rehydration will damage or destroy DNA)
- skins of various vertebrates, particularly oversized specimens, are flattened and dried (or tanned)
- whole skins and wings, or detached wings of some birds are shaped and dried
- skins of smaller birds and mammals are positioned and dried after being stuffed with a fibrous material (for example, cotton or polyester fiber) and supported with rigid materials (for example, wire, wood, or paper board)
- the flesh is normally removed from skeletal parts of vertebrate specimens to facilitate drying

Stabilization should be the first step in preservation. Take care to ensure that stabilization practices comply with disciplinary standards.

2. *What protection concerns and practices are involved with stabilization of dry specimens?*

During stabilization, you should:

- ensure the relationship of the specimens and their data
- protect the specimens from pests
- maintain the specimens in a dry condition

The agents of deterioration that most often damage specimens during stabilization are neglect, pests, and high relative humidity. (See Table T.5 below.)

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Visible light and UV radiation	Criminal Activity
Pests	Contaminants	Fire
Inappropriate RH	Physical Forces	Inappropriate T
	Water	

Table T.5. Agents of deterioration during stabilization of specimens for dry collections.

Well-trained staff and proper procedures reduce the risk of neglect during stabilization. Appropriate use of screened or other enclosures, and careful procedures will reduce the potential for pest infestations. Proper ventilation during drying will reduce the potential for mold and rot that are fostered in fresh specimens by their moisture content and high relatively humidity.

C. Special Concerns for the Processing of Dry Biological Specimens

1. *Are there any general observations about processing of dry specimens?*

- Dried, compressed non-vascular plants and most vascular plants are strapped or glued to herbarium sheets along with appropriate labels.
- Dried skins of various vertebrates, particularly oversized specimens, are often tanned as part of the processing treatment.
- Skeletal parts of vertebrate specimens receive processing treatments, such as mechanical cleaning, cleaning by insects or other invertebrates, and chemical baths, to remove non-osseous tissues and some fats.
- Final preparation of many dry specimens may involve placing the specimen or its parts in a container, such as a box, packet, tray, or vial.

Remember: Processing requires special expertise, time, and facilities. Be sure that you have all of the necessary resources before accepting processing obligations. If you don't, your collection will have a backlog of unprocessed or partially processed specimens. Such collections are of little or no utility.

2. *What are the agents of deterioration that affect dry collections during processing?*

The primary agents of deterioration for dry specimens during processing are neglect, physical forces, and pests (see Table T.6 below). Insufficient knowledge and skills can result in poor processing techniques, rendering a specimen useless. Dry organic material without protection is at risk to pest damage. Many processing treatments result in damage by physical forces as specimens are labeled, reshaped, or shipped for loans.

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Contaminants	Criminal activity
Physical Forces	Water	Fire

Pests	Inappropriate RH	Inappropriate T
	Visible light and UV radiation	

Table T.6. Impact of agents of deterioration on specimens during processing.

D. Special Maintenance Concerns for Dry Collections

1. *What should I do about migrating lipids that are staining the specimen or surrounding materials?*

This can be a complicated cleaning problem. It may indicate that the specimen was not properly processed initially; not all lipids were removed. As lipids migrate from specimens and deteriorate, they can stain the surface of the specimen. They also can:

- stain other surfaces
- collect dust
- dissolve some inks
- develop unpleasant odors
- attract pests

As a result, it's sometimes in the best interests of the specimen (and collection workers) for you to remove migrating lipids.

Traditionally, lipids were removed by "degreasing" treatments that involve various solvents. Many of these solvents pose serious threats to human health and safety. Some degreasing treatments involve hot water or steam, which may damage specimens. Labile lipids (the unsaturated fats and oils that migrate out of specimens) are polyhydric alcohols. Most can be removed with ethanol.

> ***Always refer to a natural history conservator before cleaning a specimen with water or other solvents. This applies to all specimens and all types of material to be removed from the specimen.***

Important Note: (After first consulting a natural history curator), be extremely careful when removing lipids. You do not want the solvent to cause deterioration of other organic material, such as collagen. This can lead to the deterioration of a specimen.

2. *How should I protect dry specimens from pests?*

Practice the principles of Integrated Pest Management (IPM). IPM is the best approach to dealing with pests in museum collections. It is a holistic, environmentally-friendly, and sustainable means of pest control. IPM does not exclude the use of pesticides. It does however, offer many alternatives for achieving the same goal. IPM includes both **passive** and **active measures**.

NPS *Management Policies* (2001) requires that "The Service, and each park unit, will use an IPM approach to address pest issues. Proposed pest management activities must be conducted according to the IPM process prescribed in Director's Order #77-7: Integrated Pest Management."

For additional information, policies, and procedures, see *MH-I,* Chapter 5, "Biological Infestations," Director's Order #77-7, *Integrated Pest Management* (forthcoming) and the *Integrated Pest Management Manual*. You can also consult with your park's IPM coordinator and your regional/SO curator.

3. *What passive IPM measures should I take to protect the collection?*

Passive measures are proactive ongoing daily activities that can significantly reduce the risks of pest infestations. Examples include:

- appropriate housekeeping procedures
- ensuring that food, drink, smoking, and live plants are never allowed in *or near* collections areas
    - Never locate break rooms or other areas were food is stored, prepared, and/or consumed near collections areas.
    - Be sure that garbage and other debris (including recycling materials) for disposal are never stored nor allowed to accumulate near collections areas.
- good work habits, such as replacing specimens in cabinets or other containers after use
- proper storage (using closed storage units)
- basic preventive practices, such as the quarantine of incoming specimens
- not storing curatorial supplies in collections storage areas
    - packing materials can contain pests; store these and all other supplies away from collections areas
- eliminating or reducing one or more of the four requirements for pest survival
    - nourishment
    - water
    - shelter
    - proper climatic conditions
- surveillance
    - periodic inspections, especially of materials particularly prone to pests (freeze-dried specimens) and natural traps (windows and spider webs)

- use of sticky traps (with or without pheromones)

- documentation
  - inspection dates
  - cleaning activities (what and when)
- proper design of facilities
- proper storage equipment

> ***Remember: Passive measures do <u>NOT</u> include ongoing or scheduled application of toxic chemicals on specimens.***

4. *What active IPM measures should I take to protect the collection?*

Active IPM measures are your responses to the discovery of possible pest problems, such as:

- pest damage
- pest excrement
- pest remains
- live pests

> ***Always keep good collection records. They can help you determine if the evidence of pests represents a new problem or a pre-existing problem that has been addressed in the past.***

When you discover a pest problem, the active measures that you can take range from surveillance to eradication procedures.

The first steps that you should take are to:

- Identify the problem:
  - What evidence is there?
  - What species of pest is it?
  - What life stages of pests are involved?
  - Are there active pests present or is it possible that the evidence is from an old infestation that is no longer active?
- Isolate the problem
  - Bag potentially infested specimens in polyethylene sheeting. Monitor them for evidence of pest activity to verify that there is an active infestation.

- Determine the magnitude of the problem. Find out how much of the collection is infested.

- If possible, move affected material away from the rest of the collection.

- Thoroughly inspect and clean the infested areas and materials.

- Replace storage supplies that may have been associated with the infestation.

Maintain close surveillance of the infested area and materials. A good option is to use pest "sticky" traps.

5. *What should I do if eradication is necessary?*

If active measures require eradication procedures, you have several options before you should use hazardous chemical pesticides:

- various kinds of traps

- freezing temperatures

- temperatures of 60°C/140°F
- low-oxygen or anoxic (without oxygen) environments

See *COG* 3/8 "Controlling Insect Pests: Alternatives to Pesticides."

6. *What kind of traps can I use?*

Various kinds of traps can help eradicate pests, but their success will depend on the pest species and circumstances.

- **Sticky traps** involve a variety of forms (boxes, fly-paper, boards) having surfaces with a sticky adhesive to trap pests. Place sticky traps in high-risk areas throughout the facility and inside specimen cases.

  - Check the traps frequently. Use an established schedule

  - Identify and record any pests that you discover.

  - Replace traps as necessary.

  See *COG* 3/7 "Monitoring Insect Pests with Sticky Traps."

- **Pheromone traps** may involve sticky traps, but with the addition of species-specific pheromones.

  - Pheromones are natural scents insect species use to communicate with each other.

  - Pheromone traps tend to be sex-specific in effectiveness.

  - Certain pests can be strongly attracted to the traps from the surrounding area. This provides an extremely effective early warning system of pest presence.

  - Pheromone traps are only available for certain insects such as

cigarette beetles (*Lasioderma*), drug store beetles (*Stegobium*), Indian meal moths (*Plodia*), and warehouse beetles (*Trogoderma*).

- Other types are being developed and may be available soon.

- **Snap traps** (mouse traps) can be used for rats and mice, although they are sometimes messy.

- **Glue boards** are similar to sticky traps but larger.

  - They are often used against rats and mice.

  - Although glue boards are cleaner to use than snap traps, they will not kill the animal. Use snap traps to ensure the pest's quick and painless end.

- **Small electronic devices** that emit high frequency sound waves are sometimes used as a deterrent, in place of traps.

  - They are usually targeted against mice, rats, and other rodents.
  - The effectiveness of such devices is questioned. According to Health Canada's Pest Management Regulatory Agency, "Rodents may adapt to the devices over time and return to areas within the device's range" (Health Canada, 2001).

7. *Are there any cautions related to traps that I should consider?*

Yes. Be sure to bear in mind the following:

- Don't allow traps to become a food source for other problem pests.

  - Conduct regular monitoring of all pest traps.

  - Dispose of traps when they are no longer useful (if they contain a large quantity of trapped pests or loose their "stickiness").

- Avoid the use of pheromone traps or baited traps inside collection storage areas or cabinets if there is a risk of attracting pests into the collection area from an outside location.

8. *How can I use freezing temperatures to eliminate a pest problem?*

You can use freezing temperatures to kill pests in specimens or storage materials. Be sure to properly encapsulate the materials and follow these procedures:

- Encapsulate the items in two layers of well-sealed polyethylene bags or sheeting.

- Freeze the specimen as rapidly as possible. Slow cooling allows some insects to produce a "natural antifreeze."

- Freeze the materials for at least fourteen days at -20°C/-4°F.

  - Shorter periods may be effective with some species or if colder temperatures are used.

  - For temperatures above -20°C/-4°F, much longer periods are required for complete insect pest eradication.

- Do not use shorter periods interrupted by thawing. This will produce freeze-hardy insects. Insect eggs will not be completely eradicated during the shorter freezing periods.

> ***Be sure that the specimens and other materials have thawed completely before you remove the polyethylene wrapping. This will prevent condensation of moisture on the specimens. During thawing, moisture should condense on the polyethylene.***

For additional information concerning freezing for pest control, see:

- *COG* 3/6 "An Insect Pest Control Procedure: The Freezing Process."
- *CCI Notes* 3/3 "Controlling Insect Pests with Low Temperature." By Tom Strang. Canadian Conservation Institute, Ottawa (1997). Available for $2.00 USD (+shipping) from the CCI website at: <http://www.cci-icc.gc.ca>.

9. *How can I use heat to eliminate a pest problem?*

All life stages of insects can be eradicated by subjecting the affected materials to a temperature of 60°C/140°F. Use this method for infested storage materials that have high melting points, and for stacks of dry herbarium specimens. **Do not use this process for animal specimens.**

For an inexpensive and rapid heat treatment:

1) Encapsulate the items to be treated in 6mil black plastic.

2) Then place the encapsulated materials in a clear plastic "greenhouse" and use solar energy to create the heat.

This system was developed by Tom Strang of the Canadian Conservation Institute (CCI), and is fully described in:

> *WAAC Newsletter*, 23:2 "Solar Bagging: Putting Sunlight to Work to Eliminate Insect Infestations in Mere Hours." By B. Baskin. Western Association for Art Conservation (2001). Ordering information available at: <http://palimpsest.stanford.edu/waac>.

10. *How can I use a low-oxygen environment to treat a pest problem?*

Another method to eradicate pests in dry specimens and storage materials is to create a low-oxygen or no-oxygen (anoxic) environment. You can create a low-oxygen or anoxic environment by using carbon dioxide or nitrogen gas in a commercially available chamber. Or you can use an oxygen scavenger in special made-to-order enclosures. These methods require specialized training or assistance for effective use. See *COG* 3/9 "Anoxic Microenvironments: A Treatment for Pest Control."

11. *If necessary, can I still use chemical treatments to eliminate a pest problem?*

If all of the non-chemical methods listed above fail to eradicate the pests affecting your collection, you may need to utilize certain chemical treatments. Discuss the matter with your park's IPM coordinator, safety officer, and regional/SO IPM coordinator if necessary. There may be a least-toxic alternative that will work.

Do not attempt to apply any chemical insecticides yourself. NPS policy and local and state laws require that only individuals with formal training and certification can apply most chemical pesticides.

Only use chemical insecticides on non-collection materials. Such applications include around baseboards in a storage room or possibly to disinfest curatorial supplies.

12. *Where can I find additional information concerning IPM and pest control?*

For additional information, see the NPS *Integrated Pest Management Manual*, available on the web at <http://www1.nature.nps.gov/biology/ipm/manual/ipmmanual.htm>. The manual includes a module on museum pests.

Your park's IPM coordinator, safety officer, and natural resource management staff can assist you to develop an appropriate program to protect your collection. You also may wish to consult your regional/SO IPM coordinator, local university entomology faculty, county extension agent, local university natural history museum staff, or other specialists.

SECTION IV: WET BIOLOGICAL COLLECTIONS

A. Overview

1. *What are wet collections?*

Wet collections are specimens kept in a liquid preservative to prevent their deterioration.

The best available resource on the nature and care of wet biological collections is:

> Simmon, J. 2002. Herpetological Collecting and Collections Management. Rev. ed. Herpetological Circulars No. 31. Society for the Study of Amphibians and Reptiles. For ordering information, visit the "Bibliomania! Herpetological Literature" website at: <http://herplit.com/SSAR/circulars/HC31/simmons.html>.

2. *Why are these specimens preserved in a wet form?*

Certain biological specimens are preserved in a wet form due to:

- convenience
- an intent to preserve body form and soft parts for a variety of uses

When color preservation is not critical and dry preservation sacrifices qualities needed for other intended uses, fluid preservation is beneficial.

Note: The size and flexibility of the specimen (or its parts) must allow effective chemical fixation, chemical preservation, and possible storage inside rigid containers (for example, glass jars, or metal or plastic tanks).

3. *What is fixation?*

Fixation is a stabilization process in which the fixative chemically bonds to the specimen to impede deterioration by enzymatic digestion or autolysis. Formalin, a solution of 40% formaldehyde gas in water that is then further diluted, is a common fixative. Usually the final solution contains about 4% formaldehyde in water and is referred to as 10% formalin.

4. *Are all wet specimens treated with a fixative?*

No. Some specimens are not treated with a fixative, but instead are placed immediately in an alcohol. Alcohols replace water in the tissues to reduce the potential for deterioration. Alcohols are considered to be denaturants, rather than fixatives.

5. *What types of preservative fluids are used for wet collections?*

Preservative fluids are those in which the specimen is housed for long-term storage, usually during the processing stage of specimen preparation. Alcohols, primarily 70-90% ethanol and 50-60% isopropanol, are common storage fluids for specimens that have been fixed or denatured.

6. *What types of specimens are usually included in wet collections?*

The following biological specimens are commonly subjected to wet preservation:

- Plants
  - non-vascular (some forms)
  - vascular (particularly fleshy parts such as fruit or succulent vegetative parts)
- Animals

- invertebrates (most forms)

- vertebrates (especially fish, reptiles, amphibians, soft eggs, larvae, many small specimens of birds and mammals, and viscera of birds and mammals)

7. *What are the primary agents of deterioration for wet collections?*

Most agents of deterioration might cause damage to wet collections under certain conditions, **but the primary causes of deterioration are usually related to fluid and container quality**. Other agents of deterioration that can affect wet collections include:

- Neglect (primarily the failure to monitor and maintain fluid levels and concentrations in containers)

- Visible and UV light

  - most natural pigments are very sensitive to the effects of visible light and ultraviolet radiation

  - visible and UV light will trigger photochemically induced reactions that may increase the rate of deterioration in the fluids around specimens

  - light, particularly UV, will also contribute to the deterioration of glass and plastic containers

- Inappropriate temperature (especially temperature fluctuations)

- Inappropriate relative humidity and fluctuations

- Fire (a special concern for collections stored in alcohols)

  - alcohol vapor from poorly sealed containers creates an explosion hazard

  - alcohols may serve as fuel for a fire

- Physical forces

  - earthquakes or other natural emergencies

  - explosions

  - dropping a glass container housing a wet specimen

Note: Fluids provide excellent cushioning against most vibration and minor shock, as long as the containers are not tightly packed with specimens.

- Contaminants resulting from improper mixing of fluids

8. *How can inappropriate temperature and temperature fluctuations adversely affect wet collections?*

- High temperatures will accelerate the drying of specimens removed from fluid.

- Low temperatures (below about 12.7°C/55°F):

- Will cause polymerization of unfixed formaldehyde. This results in milky strands that cannot maintain the equilibrium reaction that is the basis of fixation.

- Prolonged exposure to low temperatures may cause loss of fixation in formalin-fixed specimens.

- Low temperatures can improve the preservation of material that is denatured and stored in alcohol and has never been fixed in formalin.

9. *Can relative humidity adversely affect wet collections?*

Relative humidity has little importance for specimens in fluid. However:

- Excessively low relative humidity will accelerate drying of specimens removed from fluid.

- Excessively high relative humidity will contribute to corrosion of metal and glass containers.

10. *How can wet collections become contaminated?*

- **Fixatives** may have been improperly mixed using:

  - tap water, which is often very alkaline

  - saltwater, which can impede fixation

  This results in poorly fixed specimens that may contain contaminants from water treatments or seawater components.

- **Alcohols**, the main storage fluids, can be contaminated if the initial quality of the alcohol is poor.

  - Low-grade ethanol may be contaminated by acetone.

  - Any chemical used in the collection should be laboratory grade, or higher.

  - Any ethanol that is used in a collection should be ***undenatured***.

  - Denatured ethanol (ethanol that is not potable) will incorporate any of a number of deliberate contaminants, including, aviation fuel, acetone, fluorescent dyes, methanol, and purgatives. Such contaminants make the alcohol unsuitable for human consumption.

- **Containers** with decomposing seals or corroding metal lids have the potential to contaminate fluid preservatives.

  - They can discolor specimens as the decomposition/corrosion products leach into the fluid.

  - Also, any time fluid types are changed (for example, changing between isopropanol and ethanol) one fluid becomes the

contaminant of the other.

- **Labels** may react with fluid environments, depending on the materials involved.
  - The dissolution of label inks and colorants are common examples.
  - Metal labels and wires used to attach labels often corrode in fluids.
  - Corroding metals will deposit corrosion products on the specimens and can serve as catalysts for other reactions in the fluids.

Fortunately, the fluid environment is dynamic. It provides an optimum medium for chemical reactions and transfer of products; lipids, pigments, proteins, and other specimen components will leach into the fluids.

- If there are no outside energy sources, such as light, to drive the process, these reactions will eventually reach equilibrium.
- This results in both specimens and their fluid achieving a reasonably stable state, unless someone changes the fluids.

11. *Are there any special health and safety concerns related to wet collections?*

Many types of toxic chemicals are used for stabilization treatments and fluid storage media. To reduce your risk, have well-designed preparation, storage, and research facilities. Also, always use appropriate procedures.

Proper ventilation is extremely important. So is personal protective equipment (PPE). Use goggles designed to protect against spills and vapor, and aprons and gloves appropriate for each chemical.

Most chemicals used in fluid-preserved collections pose risks through inhalation or skin absorption. Some, like **alcohols and picric acid, also pose fire and explosion hazards**. The most common chemical hazards are:

- ethanol - flammable
- isopropanol - flammable
- formalin solutions - formaldehyde is considered to be a carcinogen
- fixatives containing metal salts (arsenic, chromium, copper, mercury)
- acids (acetic, boric, carbolic, glacial acetic, nitric, osmic, picric, pyroligneous, sulfuric, sulfurous, trichloroacetic)
- other chemicals that may be toxic (camphor, chloral hydrate, various glycols, phenoxetol, methanol, thymol)
- dyes and stains (used in clearing and staining specimens)
- unknown fluids - fixatives and storage fluids of unknown composition that may contain toxic substances

Other hazards include:

- cuts from broken glassware
- injuries from attempting to lift heavy jars or tanks
- biohazards that were not eliminated in processing

> ***Note: Many infectious agents are killed by formalin but not all are killed by ethanol. For specimens that have been denatured rather than fixed, handle them with special care.***

B. Stabilization of Wet Biological Specimens

1. *What specimen characteristics should I document prior to stabilizing a wet specimen?*

Be sure to document the natural conditions and features of the specimen. Note anything that may be changed by stabilization. The details of such documentation typically follow standard practices of individual disciplines. Examples include color, markings, weight dimensions, sex, reproductive condition, age, and physical condition. It's a good idea to take dimensional measurements when the specimen is still fresh. Fixation or denaturation may cause it to distort, shrink, or swell.

> ***Documentation about specimen history can be useful in determining the integrity of the specimen for research or its safety for use in interpretation. Such information may include the condition of the specimen, environmental conditions, and stabilization methods and materials, to name but a few.***

2. *What should I know about the stabilization process for wet specimens?*

A variety of chemicals can be used for collecting, fixing, and preserving specimens. The choice may be based on the kind of organism involved, disciplinary standards, intended use, and legal possession.

Formalin is a common fixative for soft tissues. Some specimens, such as fish larvae and eggs, are usually fixed and stored in formalin solutions.

Because formalin fixation yields acidic solutions that are harmful to calcium-based materials (shell, bone, and the calcium present in many tissues), formalin solutions may be:

- buffered
- subsequently replaced with an alcohol solution

To avoid potential deterioration in the fixative, some specimen parts may be removed prior to fixation (for example, skulls of vertebrates) then preserved by other means.

3. *Is formalin used with all wet biological specimens?*

No. Some specimens are denatured using alcohol, rather than treated with a fixative. This:

- facilitates extracting nucleic acids from specimens for biochemical

analyses

- avoids the safety hazards associated with formalin
- averts potential decalcification

The technique works especially well for small specimens, such as insects.

Note: You still may find it necessary to transfer the specimens to a fresh alcohol solution during the processing stage. This depends upon the degree to which displacement of water from the specimens has altered the concentration of the alcohol.

4. *How do I protect specimens during stabilization?*

During stabilization you should:

- Ensure the relationship of the specimens to their data.
- Perform the stabilization treatment in a timely manner to minimize the decomposition of the specimen.
- Use trained people to perform the work.
- Use deionized or distilled water to mix fixatives.
  - Tap water, water from local ponds and streams, or saltwater can be sources of fluid contamination.
  - Contaminants may jeopardize preservation by changing the pH of the solution (this can impede fixation or denaturation).
  - Soaking specimens in certain salt solutions has been used as a method to reverse formalin fixation.
- Use fixative or alcohol solutions for specimens for the same taxa collected at the same place and time.
  - This will ensure uncompromised utility of the specimens for biochemical analyses.
  - Components leached from one set of specimens can contaminate the next set.
- Do not crowd specimens in fixative or alcohol solutions.
  - The amount of water that leaches into the fluid from the specimens will weaken the concentration of the solutions.
  - Crowding also may lead to mechanical damage to the specimens.

Other things to remember include:

- **Alcohols are flammable**. Take special precautions to protect the specimens from fire.
- **Fixation with formalin may not work well at low temperatures**. This is because of the potential for polymerization of formaldehyde.

- **High relative humidity** will rapidly decrease the concentration of both alcohols, which rapidly take up moisture from the air.

- **Low temperatures** will cause polymerization of formaldehyde in formalin solutions used as storage fluids.

- **Improper handling** of specimens during processing, and crowding specimens in containers can result in mechanical damage.

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Physical Forces	Criminal Activity
Contaminants	Light	Water
Fire		Pests
Inappropriate T		Inappropriate RH

Table T.7. Impact of the agents of deterioration on specimens during stabilization for wet biological specimens

5. *What are the health and safety issues concerning stabilization of wet specimens?*

Health and safety concerns during stabilization involve:

- external parasites

- diseased carcasses

- decomposing tissues

- toxicity or flammability of the chemicals used in the stabilization process

To protect yourself, other staff, and researchers, use:

- appropriate engineering controls, such as biohazard hoods and chemical vapor hoods

- properly chosen gloves and other protective clothing

These are the best means to ensure your safety. If engineering controls are unavailable (as is often the case during field stabilization), you may need to use additional personal protective equipment.

Remember: Before you use a respirator, you must have a medical exam, training, and be fit tested. See COG 2/13 "An Introduction to Respirator Use in Collections Management" for additional information.

C. Processing of Wet Biological Specimens

1. *What general information about processing should I be aware of?*

- In the past, specimens removed from formalin solutions for transfer to alcohol solutions were first soaked in water for prolonged periods to remove the excess fixative. Today, prudent practice involves briefly soaking the specimens in various concentrations of the final storage fluid (for example, 20%, then 40%, then 60%, then 70% ethanol for specimens that will eventually be stored in 70-75% ethanol).

- Many institutions select 70-75% ethanol as the storage fluid of choice. Institutions that lack a Federal permit for undenatured (potable) ethanol can use a 45-55% isopropanol solution. However, ethanol is the best storage fluid because it preserves the utility of the specimens for many biochemical and other analyses. Isopropanol use can also be problematic, as it:

  - has been shown to change the measurements of some specimens (via shrinkage)

  - renders some specimens transparent

  - may soften bone

  - is difficult to mix thoroughly with water

  Note: To apply for a Federal permit for undenatured ethanol, contact the U.S. Department of the Treasury's Tax and Trade Bureau, National Revenue Center at:

  U.S. Department of the Treasury
  Tax and Trade Bureau
  National Revenue Center
  550 Main Street Suite 8002
  Cincinnati, Ohio 45202
  (877) 882-3277
  www.ttb.gov/nrc/index.htm

- Some vertebrate material will be subjected to clearing and staining techniques to expose the position of skeletal elements within the body of the specimen.

- Some specimens with delicate or soft parts may be secured to a support system (for example, glass plate). This will protect the specimen and make it easy to handle during examination.

- Final preparation of wet specimens involves placing the specimen or its parts in a container, such as a glass vial or jar, or a stainless steel or plastic tank.

Processing requires special expertise, time, & facilities. You must possess <u>ALL</u> of these resources before accepting collections that may require processing. If you don't, you'll have a backlog of unprocessed or partially processed specimens of limited use.

2. *How should I label wet specimens?*

Depending on the specimen(s), you can label specimens with:

- tags tied to the specimen
- labels attached to the outside of the container
- labels placed inside the container, but facing out for visibility

If you place multiple, individually cataloged specimens within the same container, be sure that each specimen has a tag with at least its catalog number.

Remember: Any labels that you place inside the container must be resistant to fluid damage (both label and ink).

3. *What materials should I use to label wet specimens?*

Label Materials

- Use good quality, long-fibered, cotton rag labels. These hold up remarkably well in fluid collections.
- The only synthetic polymer that seems to withstand the fluid environment is non-woven polyester, such as Tyvek®.
- Don't use:
  - **Paper treated with formaldehyde** to make it fluid-resistant. This can cause slight acidification of storage fluids.
  - **Metal labels** can corrode and may also cause mechanical damage to specimens. Keep in mind that leg bands and ear tags should remain with specimens, even when stored in fluids.

Inks and Other Media

- Carbon inks do not fade over time. Use only carbon-based, black inks on specimen labels, including barcode labels.
  - Commercial, black printing inks are usually carbon-based, as are most laser and photocopier toners.
  - Laser and photocopiers also apply the toner with a certain amount of heat, which helps fuse the toner particles to the paper.
- Liquid inks vary greatly in quality. Black inks for labeling wet collections should be drafting inks designed for writing on drafting film, using technical pens.
  - These tend to be carbon-based inks with a neutral pH that adhere well to almost any surface.
  - Such inks do not dissolve in water, alcohol, or formalin solutions.
  - **Note:** They do not have to be used in technical pens or on drafting

film during specimen labeling.

- Black liquid inks in some fiber-tipped pens are acceptable for use in labeling wet specimens. Be sure to choose pens with carbon-based inks, and test:
  - how long it takes for the ink to dry so that it will not smear
  - how well the ink resists water, alcohol, and formalin
  - how well it resists smearing or loss from abrasion when wet with any of these fluids

Attachments for Labels

- Cotton thread or string will work well to attach labels to fluid-preserved specimens.
- Don't use:
  - wire or any other metal fasteners
  - plastics

4. *What agents of deterioration affect wet biological specimens during processing?*

The primary agents of deterioration for wet specimens during processing are:

- **Neglect**, including staff with insufficient knowledge and skills to fulfill processing techniques. This can render a specimen useless.
- **Contaminants** can result from:
  - diluting storage fluids with tap water (which often contains a variety of treatment chemicals)
  - using denatured alcohol or low-grade alcohols that contain impurities
- **Light and ultraviolet radiation** can damage wet specimens during processing while out of their fluid medium or while in transparent containers.
- **Fire** is a hazard with both ethanol and isopropanol.

Other agents of deterioration affecting wet biological specimens include:

- **High relative humidity** will rapidly decrease the concentration of both alcohols, which rapidly take up moisture from the air.
- **Low temperatures** will cause polymerization of formaldehyde in formalin solutions used as storage fluids.
- **Improper handling** of specimens during processing, and crowding specimens in containers can result in mechanical damage.

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Physical Forces	Criminal activity
Contaminants	Inappropriate T	Water
Light	Inappropriate RH	Pests
Fire		

Table T.8. Impact of agents of deterioration during the processing of specimens for wet collections.

5. *How should I handle wet biological specimens during processing?*

To protect wet specimens during processing (or at any other time), be sure to:

- Keep fluid-preserved specimens wet with the appropriate fluid at all times.
- Keep fluid containers closed and sealed when not removing or replacing specimens. The volume and concentration of fluid preservatives will change with evaporation.
- Avoid open flames and sources of heat and sparks. Use lighting and other electrical installations that are designed to be explosion-proof.
- Ask for help when handling large jars or tanks and manipulating large specimens.

6. *Can I keep some wet biological specimens in formalin?*

Yes. Formalin is sometimes used as a storage fluid as well as a fixative. This is less common today due to the health hazards associated with formaldehyde, which is considered to be a carcinogen.

However, formalin is still a common storage fluid for some soft tissues. For example, fish larvae and eggs are usually fixed and stored in formalin solutions. Unlike alcohol, formalin will not dehydrate fish larvae cells causing them to become distorted and difficult to dissect.

Most other specimens can be transferred to alcohol after fixation. If you prefer that a specimen remain in formalin, you may want to buffer the solution if there is a potential for excessive hardening or decalcification of the specimens. You do not need to buffer alcohol solutions.

If you need to buffer a formalin solution, **do not use alkaline chemicals such as calcium carbonate and borax.**

- These alkalis simply raise the pH of a solution, and allow tissues to soften.
- They can also cause fixation to reverse.

- Their impact on the pH of the solution may be short-lived.
- True chemical buffers act continuously to stabilize the pH of the solution to a pH determined by the choice of buffering agent.

> ***An acceptable buffer for formalin is composed of monobasic sodium phosphate monohydrate and dibasic sodium phosphate anhydrate.***

Remember: The rationale for keeping a particular specimen in formalin or transferring it into an alcohol solution might be related to its intended research use.

7. *How do I transfer wet specimens from formalin to an alcohol solution?*

If you transfer specimens from formalin to alcohol, be sure to soak them in increasing concentrations of the storage fluid. This prevents damage from osmotic pressures in the tissues. Osmotic pressures result when you move specimens directly into the final concentration of the storage fluid (alcohol) from a formalin solution, which is mostly water. Prolonged soaking in water, rather than graded alcohols, causes two problems:

- fixation may be reversed, allowing the specimens to begin to rot
- specimens may swell as they become hydrated

Note: You can determine alcohol concentrations by using an alcohol hydrometer.

Test Strips

- During the transfer process, you can use formaldehyde test strips to determine approximately how much fixative remains in the solutions.
- There should be some residual fixative in the final storage solution (even though this has potential to acidity the alcohol) because fixation involves an equilibrium reaction.
- If trace amounts of the fixative are not detected, it may mean that specimens were not originally fixed properly or that fixation was reversed during the transfer process.

Water

- Alcohols are usually diluted with water when used as a transfer or a storage medium.
- **Tap water is not acceptable for mixing these solutions**: it contains water treatment chemicals that may have an impact on specimen preservation and utility.
- Distilled water exposed to carbon dioxide in air tends to be acidic.
- **The best choice is deionized water**, which is pH neutral and should contain no harmful impurities.

Mixing

- Don't mix an alcohol/water solution simply by using fixed volumes, such as 70 parts alcohol to 30 parts water. The result will rarely be 70% alcohol because the concentration is temperature dependent.

- Determine the volume percent concentration of the alcohol.

  - You can use an alcohol hydrometer (available from most laboratory supply companies). Ambient and fluid temperatures must be at about 20°C/68°F.

  - Ideally, measure concentrations using a density meter (also available from laboratory suppliers).

Concentrations

- Check the concentration of alcohols used for specimens that are not treated with a fixative.

- You might have to correct the concentration of the alcohol to create an appropriate storage fluid.

  - If the concentration of the alcohol solution is very low, it may be prudent to replace the fluid entirely, even though this will result in loss of the materials already leached from the specimen.
  - See *COG* 11/5 for methods to correct the alcohol concentration.

8. *Can I transfer wet biological specimens from ethanol to isopropanol?*

No. Do not transfer specimens in ethanol to isopropanol. This change will damage the specimens. Researchers have experimented with transferring specimens from isopropanol to ethanol after conditioning the specimens in increasing concentrations of ethanol. However, this process requires additional research before it can be endorsed as a practice.

9. *What about clearing and staining specimens?*

Some specimens are cleared and stained before being placed in storage fluids, and vice versa. The use of clearing and staining chemicals requires specialized knowledge. The choice of final storage fluid will be determined in part by the solubility of the stains used in the process.

Often the final storage fluid is glycerol. Glycerol supports mold growth, so collection staff sometimes have to mix various chemicals, such as thymol, as anti-fungal agents. These chemicals add to the complexity of preservation problems. When the stains used are not alcohol soluble, a simple way to prevent mold growth is to store the specimens in a mixture of glycerin and ethanol.

10. *Can I keep different wet biological specimens together in the same container?*

No. Various specimen components leach into the fluid. If you mix specimens you risk cross contamination. **This will damage the utility of the specimens for biochemical studies**.

Don't store specimens together in the same container unless they are of the same species or lot and were collected in the same place and at the same time.

11. *How should I document a wet specimen's condition during processing?*

As previously discussed, utilize a condition report. In addition to documenting standard conditions, you may want to also note:

- condition of labels and the label attachments to the specimen
- fluid characteristics
  - color
  - transparency
  - pH
  - formalin concentration
  - alcohol concentration
  - fluid-to-specimen ratio
- condition of the container and closure (corroded, poorly sealed, etc.)

Your collection may require a more detailed condition examination. You also may require additional information concerning appropriate care for certain specimens. Discuss these needs with your regional/SO curator. He or she can assist you to hire a natural history conservator to conduct a Collection Condition Survey (CCS) of your collection. For additional information concerning a CCS, see Chapter 3, Section D.

You might find it helpful to include the name of the individual who prepared the specimen in your condition report as well.

12. *What health and safety concerns should I be aware of during processing?*

Special health and safety concerns during processing are the:

- toxicity or flammability of the chemicals
- potential for ergonomic injuries when handling large containers

Engineering controls, such as chemical vapor hoods, along with proper gloves and other protective clothing are the best means to ensure your safety when handling hazardous chemicals. If engineering controls are unavailable, use additional personal protective equipment. **Note:** The use of respirators requires a medical evaluation, training, and regular fit testing. See *COG* 2/13.

To protect yourself, other staff, and researchers, you should also:

- keep spill cleanup kits on hand for all chemicals used in collection processing
- place large tanks on dollies
- use carts to move large glass jars and smaller tanks

13. *What do I need to know about loans of wet specimens?*

For loan shipments, collections staff usually prepare wet specimens by:

- individually wrapping specimens with cotton gauze that has been saturated with the appropriate fluid preservative

- sealing them in multiple plastic bags, so there's minimal risk of fluids affecting the shipping container

Because wet specimens may not have any information other than the catalog number, you may be required to provide additional information about the specimen for the user. Such information typically includes at least the collecting locality and date, and the fluid in which the specimen should be housed while on loan.

In addition, when packing and shipping specimens preserved in fluids you must:

- include instructions about the type of fluid preservative to be used with the specimens
- insert and seal the bagged specimen in at least one additional polyethylene bag, along with an address label that is visible through the second bag
- place the bags in a sturdy, well-sealed shipping container that has been cushioned on the interior to help protect the specimens during shipment
- comply with all laws and regulations regarding the shipment/transport of biological specimens, rare or endangered species, and hazardous chemicals

Notes:

- As long as you use the shipping method described above (specimens wrapped in cotton gauze saturated with solution and inside plastic bags), your shipment should not contain fluid in an amount to be considered HAZMAT by the DOT. As a result, unless the specimen itself was hazardous, your shipment shouldn't be subject to the Hazardous Materials Regulations, noted previously in this appendix.
- Some commercial shippers (such as Federal Express) do not accept dead animals of any type, including scientific specimens, for transport. Consult with your shipper in advance about any special provisions or requirements of this nature.

D. Storage of Wet Biological Collections

1. *Where should I locate storage?*

You may find it necessary to situate wet collection storage along an exterior wall. Such a location can help mitigate the impact of an explosion on the rest of the building. Note that placement and structural features may be controlled by local building codes. As with all collection storage areas, wet collections should be located where you **can:**

- control access
- organize the collection in a logical manner

- monitor and control the environment

Off-site facilities, basements and attics, and irregular or fragmented spaces are not good choices. Locating collections in such areas does not serve the interests of good collection management, care, or use.

When planning a new wet collection storage area, be sure to consult with your regional/SO curator, regional structural fire management officer, and park staff such as the structural fire management officer, fire inspector, brigade captain, and safety officer. Such NPS staff can assist you with planning a facility that meets both NPS safety and curatorial requirements.

2. *What agents of deterioration pose the greatest threat to wet collections in storage?*

The agents of deterioration that pose the greatest risks in storage are: light, neglect, inappropriate temperature, contaminants, and fire (Table T.9).

- Neglect includes:
  - the improper use of storage equipment
  - careless handling of specimens
  - lack of familiarity with collection organization and arrangement systems
  - failure to monitor storage environments, fluid levels, and container condition
  - mixing of different preservatives or not maintaining the proper concentration of preservative when topping off fluids
- Visible and UV light trigger reactions that can result in changes in fluid quality that may have in impact on specimen preservation.
- Temperature fluctuations cause pressure changes inside storage containers that loosen lids and allow fluid to evaporate.
- Deterioration of containers and closures (gaskets) can result in specimen contamination.
- Collections stored in alcohols can be fire hazards.

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Physical Forces	Criminal Activity
Contaminants		Water
Light		Inappropriate RH

Inappropriate temperature		Pests
Fire		

Table T.9. Relationship of the agents of deterioration to the storage of specimens for wet collections.

3. *Are there any special considerations for storing wet specimens?*

Yes. In addition to the NPS standards listed in Chapter 4: "Museum Collections Environment" and Chapter 7: "Museum Collections Storage," there are a number of extra requirements for fluid collections. Most of these additional standards are designed to reduce the potential for fire or hazards to staff and visitors from fluid vapors and chemical spills. The following specifications are either required (consult your regional structural fire management officer, local fire marshal, and local building codes) or desirable for storage facilities that house wet specimens:

- Segregate the storage of wet collections from other collection storage, and from all other museum functions (including laboratories where specimens are processed or used in research).
- Store bulk chemicals used in fluid preservation in a separate structure outside of the collection building. If this cannot be done, store chemicals in a room that that is:
  - separate
  - reinforced
  - properly drained
  - properly equipped

Store all flammable bulk chemicals (such as alcohol) in an approved flammables storage cabinet. See Tools of the Trade for product information and firms on GSA schedule.

- Provide separate air-handling systems for wet collection storage, processing, and use areas. Seal the storage areas so that vapor from storage fluids does not contaminate other museum spaces.
- Provide a stable, cool temperature of about 18.3°C/65°F.
- Provide sufficient dehumidification of the environment to keep the RH below 65%.
- Plan to install floor drains and gutters in the room to collect and contain chemical spills.
- Equip all storerooms with heat and smoke detectors, and water-based, automatic fire suppression systems. Ensure regular inspection, testing, and maintenance of the systems.
- Install explosion-proof lighting and electrical systems in rooms that house collections stored in alcohols.

- Filter all incoming and recirculated air to the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) 90-95% level.

- Use UV filters on all fluorescent lighting. Keep specimens in a dark environment when not in use for research.

- If wet collection storage rooms are along exterior walls, you may need to design these as breakout walls. You also may need to reinforce interior walls to help contain potential explosions.

- Provide equipment to properly dispose of chemicals and solutions.

Discuss storage requirements with your regional/SO curator, regional and park structural fire management officers, local fire department, park maintenance staff, park safety officer, park and regional/SO natural resource management staff, and other subject matter experts. Refer to Chapter 4: "Museum Collections Environment" and Chapter 7, "Museum Collections Storage," *COG* 2/18 "Safe Storage and Handling of Natural History Specimens Preserved in Fluid," and *COG* 11/3 "Storage Concerns for Fluid-Preserved Collections" for NPS standards and requirements for fluid-preserved collections storage.

> ***Note: Consult your regional structural fire management officer, park structural fire management officer, local fire marshal, and building codes to see if your jurisdiction has any special requirements for structures that house collections preserved in alcohol or formalin.***

4. *What types of storage containers should I use?*

Containers for long-term storage of specimens preserved in fluid must:

- be durable

- be non-reactive towards the specimens and the storage fluids

- seal well enough to prohibit evaporation of the storage fluid

- comfortably accommodate the specimen so that removal and replacement can be done without causing damage (for example, no shoulders on jars or other containers)

- not degrade from environmental agents of deterioration

- be impermeable to oxygen

You can use these containers to store specimens:

- **Glassware**

  - **Borosilicate Glassware** is the best container material for small to mid-sized specimens. It's very resistant to chemical corrosion. Unfortunately, appropriate sizes of borosilicate jars are difficult to find in the United States. As a consequence, most U.S. collections

house wet specimens in soda-lime glass (glass composed of silica, calcium oxide, and sodium oxide).

- **Soda-Lime Glass** is cheap, readily available glass. It has only fair corrosion resistance. This glass will begin to leach its alkaline constituents into distilled water in a matter of minutes. Since most storage fluids have pHs ranging from neutral to moderately acidic, the glass will probably react with the fluids over time.

- **Flint Glass Containers** are also used to store specimens in fluid. Flint glass is made of much the same ingredients as soda-lime glass. It may also contain other components, including lead oxide. Flint Glass is not particularly resistant to acids.

- **Tanks**

  - Large specimens are usually housed in tanks made of stainless steel, molded polyethylene, or molded polypropylene.

  - Stainless steel tanks will corrode in the presence of the fluids

  - Steel tanks may also corrode along the welds at the seams. Most do not seal well enough to stop fluid evaporation.

  - Plastic tanks can deteriorate from long exposure to acids, alkalis, UV radiation, and the stress caused by large volumes of fluid.

- **Lids, Gaskets, and Seals**

  Lids, gaskets, and seals on containers are often a source of contaminants in the storage fluid. As with the containers noted above, stoppers of borosilicate glass are superior, while other types are not as effective:

  - Borosilicate glass stoppers that are manufactured to very fine tolerances seal borosilicate jars very well. These have been used in the United Kingdom for many years.

  - Stoppers for commercial grade glassware are not as carefully manufactured, and usually will fit only the container for which each stopper was produced originally. As a consequence, mixing stoppers and containers results in poorly sealed jars.

  - Metal caps will corrode. Avoid using them.

  - Some plastic lids, such as those made of Bakelite, become brittle in the presence of the vapor from the fluids.

  - Polypropylene lids with polyethylene liners work reasonably well on most soda-lime and flint glass jars. They constitute one of the least expensive, but fairly effective closure systems.

  - Avoid rubber and synthetic rubber gaskets. They will discolor and deteriorate with age. These gaskets also break down when in contact with the fluid preservative (Simmons, 1995). Gaskets of acrylonitrilebutadiene may be an adequate option (Suzumoto, 1992).

When closures are ineffective, your first option should always be to replace the closure, the container, or both. If that is not feasible, you can use 3M® brand #5086 clear polypropylene sealing tape with alcohol-resistant acrylic adhesive as a temporary means to reduce fluid loss. The tape is available at stores that sell building supplies.

- **Vials in a Larger Container**

  Follow the steps below to store small fluid-preserved specimens:
  - Place the specimens in vials filled with the appropriate fluid preservative.
  - Close the vials with a permeable material (such as high-loft, non-bonded polyester fiber).
  - Place the vials in a larger container filled with the same fluid preservative.
  - Seal the outer container with a lid and liner to prevent evaporation.

  This storage method protects individual specimens from mechanical damage and unnecessary handling. It also helps insure that any fluid loss around the specimens will be minimal.

IMPORTANT: Be sure that the ratio of specimens to fluid in a container does not exceed 30%. Fluid quality is jeopardized (the concentration drops, as does the pH) if specimen ratios are higher than 30%.

5. *Are there any other storage requirements that I should consider?*

Yes. The best way to store small wet collections is inside a flammable storage cabinet. Larger collections can be housed on shelves, including mechanically operated mobile storage (although these may not be acceptable to some fire protection authorities). Be sure that the finish on the shelving will resist the collection fluids.

Use bins or trays within cabinets or on shelves to organize specimen containers. This will protect the specimen containers from excess handling and disorder.

Equip all shelving units with removable restraining bars to help keep the containers in place in the event of an emergency. Such rails will also provide protection against someone accidentally knocking a jar off the shelf. Vibration and compactor movement pose little threat to these collections, as long as jars do not topple from the shelves as a result of shifts in position.

See *Tools of the Trade* and *COG* 11/3 "Storage Concerns for Fluid-Preserved Collections" for additional information concerning storage equipment.

6. *What about arranging wet specimens?*

Sometimes you may need to adapt your arrangement patterns. Most fluid-preserved specimens are stored on shelves. You might want to use an arrangement that accommodates a more effective use of available space (such as storing the same size containers on a shelf).

Over-sized specimens are often housed in large, sometimes very heavy containers. Normally, these are stored at or near floor level. Do not store them above head level.

7. *Are there any special health and safety concerns related to storage of wet collections?*

Yes. In addition to threats of fire and explosion, there are the risks of:

- inhalation of vapor
- skin absorption of chemicals

These risks can occur when removing specimens from large containers. Always open containers under local exhaust ventilation, or use appropriate personal protective equipment. You can minimize these risks and ensure that there is little alcohol or formaldehyde vapor in the ambient air if you:

- Design, maintain and use proper general ventilation systems.
- Use specimen containers that seal well.

To reduce the potential for injuries:

- Keep large containers on dollies or casters.
- Do not store heavy jars or other heavy containers on high shelves.

E. Maintenance of Wet Biological Collections

1. *What does maintenance of wet collections include?*

Proper maintenance includes:

- updating information (including deaccessioning [See *MH-II,* Chapter 6: Deaccessioning, for additional information.])
- ensuring fluid quality and levels
- emergency preparedness and response

2. *How do I maintain fluid quality for wet specimens?*

Monitoring

Conduct frequent monitoring of the wet specimens. This includes:

- The visual inspection of fluid levels.
- The use of a digital density meter and temperature correction tables.
    - These tools allow you to determine alcohol concentrations if fluids have evaporated or become exceptionally discolored.
    - **Note:** You can use an alcohol hydrometer to approximate the concentration, but both the fluid and the ambient air temperatures must be 20°C/68°F to achieve accurate results.

Maintaining Fluid Levels

- If room temperatures do not change over time, you can maintain fluid levels by completely filling containers.
- If temperatures change, pressures within containers will cause the lids to loosen
    - This will eventually compromise fluid levels and concentrations.
    - If this occurs, it's best if you maintain fluid levels at a standard distance (at least one inch) below the lip of the closed lid.
    - This allows for the available space to better accommodate changing internal pressures.

Other monitoring considerations include:

- Avoid excessive air. This promotes oxidation of the fluids (acidification of the alcohol).
- Keep all containers filled to the same level. This facilitates inspections for containers that do not seal properly.
- If a container permits fluid loss, replace the appropriate parts (jar, lid, or gasket).
- If the loss of fluid results from use, you'll need to replenish the preservative.

It's vital that you ensure proper fluid levels and concentrations in each individual container housing wet specimens. This requires constant monitoring of fluid conditions and occasional maintenance.

3. *How are fluids lost or compromised?*

Fluids may be lost or altered by:

- defective lids or seals
- changing temperatures that cause closures to loosen
- leaving lids off of the containers for prolonged periods
- removal and replacement of specimens
- spills

In addition, fluid preservatives may become discolored due to:

- unstable gaskets
- corrosion of metal (such as bails, lids, labels, ear tags, leg bands)
- seepage of body fluids (water in the cells, blood, digestive fluids)

- dissolution of specimen pigments
- breakdown of lipids
- polymerization of formaldehyde into milky strings, due to:
  - exposure to low temperatures
  - a change in the pH of the fluid
- contaminants originally present in the fluids (such as minerals from tap water)

The most common problem related to wet collections maintenance is lack of training. Do not attempt to replenish fluids in a collection if you do not have a proper understanding of how to adjust the overall concentration.

4. *How do I replace or replenish the fluid preservative?*

Because the primary environments for wet specimens are the storage fluids, **the quality of those fluids are your main concern**. If fluids evaporate from containers for any reason, the concentration of the remaining fluid is altered. Alcohols evaporate more quickly than the water with which they are mixed. Evaporation results in solutions with low alcohol concentrations and low fluid volumes that no longer fill the jars. The space once filled with fluids is now filled with air. The air fosters oxidation of the alcohol, further changing the chemistry of the solution.

First, fix the problem, even if it means replacing the container. When containers are maintaining fluid levels, the only reason for fluid replacement should be to replenish fluids lost because of specimen use.

Use the following procedures to replenish fluid:

- Determine the concentration of the alcohol in the container.
  - Use a digital density meter and temperature correction tables to determine the concentration of the alcohol in the container. ***OR***
  - Use an alcohol hydrometer to approximate the concentration, but both the fluid and the ambient air temperatures must be 20°C/68°F to achieve accurate results. This requires you to:
    a. take several measurements to determine the true concentration of the reduced fluid in the container
    b. carefully mix the fluid to ensure that there is no possibility of measuring pockets of especially high or low concentration
    c. use sufficient amounts of fluid for measurement
- To determine the appropriate concentration of the make-up fluid, use the formula developed by Kelly Sendall and Grant Hughes: $z(x+y) = ax + by$

  z = desired concentration
  x = height of the fluid in a straight sided container

y = amount of fluid to add (in inches or centimeters)
a = measure concentration of the fluid (percent)
b = the concentration of the fluid being added (percent)

5. *Are there any other ways to adjust fluid concentrations?*

Yes. You also can adjust the concentration by simply adding 95% alcohol to the appropriate level in the container and then checking the concentration with the density meter. If the new concentration reaches the target range (70-75% ethanol) or is higher, that is acceptable. Higher concentrations are not likely to damage the specimens, but concentrations below the optimum range will permit deterioration.

6. *When should I replace the fluid?*

You may need to replace the fluid if any of the following circumstances occur:

- If the alcohol concentration in a container is 20% or less and there is still a fairly large amount of fluid in the container, it may not be possible to bring the concentration back to the appropriate level. If that is the case, you may need to replace at least some portion of the fluid.
- If the addition of 95% alcohol to the fluid in the container does not bring the concentration to the appropriate range or higher, you may need to replace the fluid.
- If the fluid contains sediment or other particulate residue that is shown by analysis to be damaging to the specimen, you can filter the fluid to remove the sediment and then return the fluid to the container. If the sediment is an indication of an ongoing deterioration of the fluid or specimen, then you may need to replace the fluid.
- If specimen containers are crowded with specimens the result will be poor fluid quality. To fix this:
  - Separate the specimens into additional containers.
  - Correct the concentration of the fluid in the initial container.
  - Use new storage fluids in the additional containers.

The fluid surrounding a specimen contains components leached from the specimen. Therefore, loss of specimen material results if you completely replace fluids. You can expect additional leaching as the specimen(s) and replacement fluid reach equilibrium. Replace fluids only under very special circumstances.

Note: Specimens that have become deformed when fluids have evaporated completely may no longer be useful for morphological studies. They are often of limited use after rehydration. However, in the dry state, they may be very stable. They also may be useful for biochemical studies, depending upon the type of fluids that were used originally.

7. *Should I be concerned if some fluids are discolored?*

No. Fluids are often discolored; this is not normally a cause for alarm. However, consult a conservator if:

- a fluid has developed a very dark color, and
- there is any evidence that a lid, gasket, or label is undergoing

deterioration and may be leaching components into the fluid

The conservator or a conservation scientist should determine the appropriate treatment. Do not replace the fluid before you have researched the nature of the deterioration.

8. *When should I consult a conservator?*

Never take any action that might compromise the integrity of research specimens. If specimens are damaged, stabilize the material by non-interventive means. This approach is usually preferable to treatment to repair the damage. For example, you can leave detached parts separate as long as they are kept in the same container with the original specimen. Be sure to separately label the parts to indicate their source.

If a condition indicates active deterioration, the specimen may need treatment to halt further decay. An example might be a metal label that has corroded and become attached directly to a specimen by the corrosion products. Because the corrosion and the specimen damage will continue in a fluid environment, it may be best to remove the label and the corrosion salts, then stabilize the label separately. **Do not attempt this type of interventive treatment. Call a professional conservator for assistance.**

9. *Are there any health and safety concerns related to maintenance of wet collections?*

In general, the safety concerns are the same as those for stabilization and processing of wet collections. Remember to utilize proper waste disposal of any fluids that are replaced during maintenance activities. Use proper engineering controls and personal protective equipment. Always move large tanks and other containers on dollies. Move smaller containers on carts.

10. *What should I know about emergency preparedness, response, salvage, and long-term recovery?*

Potential emergencies include chemical spills and leaks, fire, and explosions. Fluid collections can also be damaged by floods and earthquakes, especially if shelves are not properly secured and specimen containers are not protected by restraining bars on the shelving units.

Be sure that your park's structural fire brigade, law enforcement staff, local fire department, emergency medical technicians, and all other emergency response personnel know of all potential hazards and their locations.

The safety concerns that arise during emergency salvage are noted in Chapter 10: Emergency Planning and *Help! A Survivor's Guide to Emergency Preparedness*, available from the Alberta Museums Association. Ordering information is available on the association's website at <www.museumsalberta.ab.ca>.

If specimen containers have broken and fluids have been lost, the most important salvage step is to keep the specimens damp. Ideally, you should keep them damp using the same kind of fluid in which they were stored prior to the emergency. If that's not possible, at least bag (double bag if you can) the specimens in polyethylene with a small amount of deionized or distilled water. Add a little alcohol to help limit the potential for biodeterioration.

Note: Following an emergency, be sure to consult a conservation professional. Complex, extensive treatments may be needed as part of the long-term recovery process. If containers have been broken or were poorly sealed the contents may no longer have utility for some scientific research.

11. *Do I need to document maintenance activities such as replacing fluids?*

Yes. All adjustments of fluid concentration and fluid replacements are essentially specimen treatments that you should fully document in writing. If you discover that containers or labels have contaminated a specimen, note this as well. Any contamination is likely to affect the long-term preservation and the utility of the specimens for research.

During emergency salvage operations, it's acceptable for you to eliminate individual specimen reports, as long as you document all steps in the overall immediate salvage (in writing and in some imaging system). You should record specific damage to particularly valuable specimens and specimens on loan from other museums, and note the specific salvage methods used, as they may be important for insurance purposes.

SECTION V: BIOLOGICAL LOW-TEMPERATURE COLLECTIONS

A. Overview

1. *Why are specimens preserved at low temperatures?*

Specimens are maintained at low temperatures to preserve:

- soft parts for various biochemical analyses
- whole organisms in a viable (able to live and grow) state

2. *What low temperatures are used?*

Cold Storage includes temperatures above the freezing point of water (0°C/32°F), but not above about 8°C/46.4°F (a range of 2°-8°C/35.6-46.4°F is recommended). Cold storage is used to extend the shelf life of microorganisms prepared by specialized lyophilization (freeze-drying) techniques.

Freezer Storage includes temperatures between 0°C/32°F and -80°C/ -112°F. Although such temperatures are often used for temporary storage, expansion of water in cells, ice crystal formation, and dehydration can damage biological materials stored at these temperatures.

Ultracold Storage at about -80°C/-112°F is used for short-term preservation of non-viable samples, such as animal tissue samples.

True Cryogenic Storage includes temperatures that are usually below -130°C/-202°F (the exact temperature is usually determined by the sensitivity of the specimens). -130°C/-202°F is the maximum temperature for long-term stability of plant and animal cells and **-150°C/-238°F or lower is considered to be optimum for preservation**.

You cannot achieve true preservation of fresh biological material at temperatures between 0°C/32°F and -130°C/-202°F, as:

- fresh material will undergo cellular disruption because of expansion of water in the tissues
- dry biological material will be degraded by an increase in the rate of deterioration of lipids and damage from residual moisture

Note: Increased rate of deterioration of lipids, and increased potential for biodeterioration are hazards for many materials stored at temperatures between 8°C/46.4°F and 16°C/60.8°F.

> ***Lyophilization and cryogenic storage options generally require pre-treatment of the specimens using a cryoprotectant chemical.***

3. *What specimens are preserved at low temperatures?*

- Plants
  - Non-vascular (strains of fungi, including yeasts)
  - Vascular (cell lines, seeds, cloned probes, other samples)

- Protists
  - Some algae
  - Protozoa (especially parasitic strains)
- Viruses
  - Plant, human, and animal viruses
  - Cloned viral genomes
- Bacteria
  - Bacterial strains
  - Bacteriophages
  - Plasmids
- Animals
  - Tissues (dissected organs, muscles)
  - Cell lines
  - Blood and blood components (whole blood, serum, plasma, antisera)
  - Semen
  - Venom
  - Other samples (cloned probes, isolated proteins and nucleic acids, cell suspensions)

Note: The largest organisms that can be preserved in a viable state are some insects.

Cryogenic collections are often samples specifically set aside for destructive analyses, using tissues from voucher specimens in traditional collections. Such cryogenic samples are ancillary or supportive to the voucher specimens. However, ancillary collections may include one or more tissue samples from individual specimens, or include samples from more than one collection or institution. Sometimes there is no voucher specimen. Because of these issues and the fact that various tissues may be indistinguishable without biochemical analyses, you need to ensure that your records are extremely accurate.

4. *What agents of deterioration affect low-*

Inappropriate temperature (including temperature fluctuations) is the primary agent of deterioration for low temperatures collections.

temperature collections?

- **Cold Storage** at temperatures of 2-8°C/35.6-46.4°F will extend the life of some freeze-dried cultures that are reasonably resistant to temperature changes, but may be damaged by temperatures outside this range.

- **Ultracold Storage** at temperatures around -80°C/-112°F:

  - will slow the rate of deterioration of tissue samples preserved for DNA analysis but will not stop the deterioration

  - the rate of deterioration increases when samples are repeatedly removed from storage for use at higher temperatures

- **Cryogenic Storage** at temperatures below -130°C/-202°F will preserve specimens well, but is expensive to install and maintain.

> ***Cryogenic Specimens cannot be stored at temperatures above about -130°C/-202°F and below 0°C/32°F, as this will destroy their utility. To prevent such damage, make sure that you have backup systems in place so that cryogenic units can maintain the appropriate temperatures at all times.***

The other agents of deterioration in addition to inappropriate temperature include:

- **Neglect** includes a lack of knowledge and skills, failure to follow standards or provide adequate documentation, apathy, lack of administrative support and resources. Common instances of neglect are:

  - marking ampoules illegibly or inaccurately

  - failing to link tissues, cell lines, etc. to identifiable voucher specimens

  - failing to monitor storage environments to ensure that appropriate temperatures are maintained constantly

  - failing to provide adequate backup systems to prevent temperature increases

  - the lack of temperature control during sample use

- **Contaminants** can damage low-temperature collections. Do not allow specimens to come into contact with:

  - other specimens, directly or indirectly (for example, transfer through handling)

  - any non-sterile surface

  Contaminants can destroy a specimen's utility for many types of research. Maintain pristine work areas and utilize appropriate biofilters, proper storage containers, and appropriate handling methods to eliminate specimen contamination.

- **Physical Forces** can damage or destroy low-temperature collections.

- Inappropriate ampoules or ampoules containing excessive specimen tissues can burst when removed from liquid nitrogen. (Liquid nitrogen is used to both transport and store some materials preserved at low temperatures.) This will destroy the specimens and pose chemical, physical, and biological hazards to human safety.

- Freezing at temperatures above cryogenic levels will permit moisture in tissue samples to form ice crystals that will damage tissue structures.

- **Criminal Activity** is usually not a major threat to collections stored at low temperatures. However, some low-temperature collections may require additional security measures if they include:

  - viable organisms that are pathogenic to humans or human resources (for example, to agricultural plants and animals, or water supplies)

  - tissues that may contain pathogenic organisms in a viable state

Institutions that maintain such material must possess permits and sufficient security to ensure that their holdings cannot become a danger to public health.

5. *What health and safety concerns are related to low-temperature collections?*

As with fresh or semi-fresh biological material, there is the possibility of that **human pathogens are present in low-temperature materials**. These may include either the specimens themselves or as infectious agents in the specimens. Other potential hazards include:

- **Liquid nitrogen**, which is the best storage medium for cryogenic preservation. If you use liquid nitrogen, you need:

  - special personal protective equipment (PPE)

  - special building ventilation systems

  - appropriate ampoules that are resistant to breakage resulting from thermal changes

  - possible replenishment of liquid nitrogen, depending on the system used

  You also may need to equip your building with special piping for delivery of the liquid nitrogen to cryogenic units.
- **Dry ice** (solid carbon dioxide) is sometimes used to protect material removed from cryogenic storage. If you use dry ice:

  - utilize special containers and personal protective equipment

  - do not use dry ice in confined closed areas because of respiratory concerns involving excessively high atmospheric quantities of carbon dioxide

Don't store dry ice in sealed rigid containers. This can cause an explosion when the containers are opened. Use vented containers.

- **Ethylene oxide** is used in some preparation procedures to sterilize the preparation chambers. This chemical requires:
  - special exhaust ventilation
  - personal protective equipment
  - specialized training

To reduce risks to you, other staff, and researchers, be sure to utilize:

- proper procedures
- well-designed preparation, storage, and research facilities
- biohazards hoods for any work with specimens preserved at low temperature
- personal protective equipment, including long insulated gloves and face shields when working with material stored at cryogenic temperatures
- properly fitted respiratory protection, and proper gloves and other protective clothing when
  - handling microorganisms
  - working with liquid nitrogen and ethylene oxide

B. Stabilization and Processing of Low-Temperature Collections

IMPORTANT NOTES CONCERNING LOW-TEMPERATURE COLLECTIONS:

Stabilization of low-temperature collections should not be the responsibility of the park's collection staff. Researchers, research designs, and material utilization will control the conditions of biological specimens and specimen parts intended for low-temperature preservation. Stabilization of such material is beyond the control or operations of the park.

Low-temperature collections can pose serious health and safety risks. They can also involve significant resource commitments (time, money, personnel, space, facilities, and equipment) for operating specialized low-temperature equipment.

No individual should be involved with stabilization of biological materials for low-temperature collections without first receiving specialized training. Such training far surpasses any guidance provided in this appendix. Therefore, the following information attempts to focus on the processing, storage, and maintenance of low-temperature collections. Be aware that serious health and safety risks are still present with these stages of preservation.

Finally, considering evolving issues of national security as they relate to the legality of some preserved biological materials (viruses, spores, toxins, etc.), special permits and security clearance may be required for any possession, handling, or transport of hazardous biological materials. The information contained in this appendix does not address any stage of preservation of such materials.

1. *How should I label low-temperature collections?*

Refer to the previous general discussions of labeling specimens, as well as those noted in *MH-II*, Appendix J, Section K, Natural History Specimens. Other considerations specific to low temperature include:

- **Condensation** on cold surfaces, water solubility of some inks, and impervious surfaces (like plastic ampoules) can create the problems for using inks in low-temperature collections. Staff sometime use alternative methods such as soft pencils or mechanical inscription.

- **Carbon-based, black inks** are the only type of inks that you should use on specimen labels. Carbon inks do not fade over time.

  - Commercial, black printing inks are usually carbon-based.

  - Most laser and photocopier toners are usually carbon-based.

  - Laser and photocopiers apply the toner with a certain amount of heat, which helps fuse the toner particles to the paper.

  Liquid inks vary in quality. A good choice is **black ink designed for writing on drafting film**, using technical pens. These tend to be carbon-based inks with a neutral pH that adhere well to almost any surface.

- **Fiber-tipped pens.** Black liquid inks in some fiber-tipped pens are acceptable for labeling specimen containers.

  - Be sure to choose pens with carbon-based inks.

  - Fiber-tipped pens that contain colored or black dye inks are also available.

  - Many of these products may not function well if water from condensation is present.

  - Cold temperatures will slow the fading of the dyes in these inks, but rate of fading will depend upon both the temperature and the humidity level in storage.

  - Time spent out of the low-temperature environment will permit the inks to fade quite rapidly.

- **Testing of Inks**. Test inks to see:

  - How long does it takes for any ink to dry so that it won't smear?

  - How well does it resist smearing when wet?

  - What's the resistance of the ink to various fluids, minimal abrasive

forces, and to prolonged exposure to UV radiation?

Avoid any ink that fails such tests.

- **Bar Coding** is often used for the specimen and sample vials used in low-temperature preservation. Bar coding facilitates rapid inventory and reduced risk of mismatching specimens with data.

2. *What should I know about loans of low-temperature collections?*

For information concerning incoming loans, see *MH-II*, Chapter 2, Section P. For information concerning outgoing loans, see *MH-II*, Chapter 5. You should also be aware of the following additional standards that pertain to loans of specimens preserved at low temperature:

- The use of hazardous biological materials may be restricted.
- Do not loan entire holdings of a taxon for use at a single time (it may be necessary to culture a new colony before allowing specimens to be sent).
- Commercial shipments of hazardous biological materials must be in compliance with all Federal and State regulations, including the Hazardous Materials Regulations (49CFR, Parts 171 through 180).

3. *What agents of deterioration affect low-temperature collections during processing?*

The primary agents of deterioration during processing are:

- Insufficient knowledge and skills (neglect) that can render a specimen useless.
- Contaminants can result from poor handling techniques. Both physical damage and contamination can result from removing improperly sealed ampoules from some types of cryogenic storage.
- If liquid nitrogen has leaked into specimen containers, the containers may burst when exposed to warmer temperatures.
- Inappropriate temperatures can rapidly destroy the utility of specimens preserved at low temperatures.

These agents of deterioration are shown in Table T.10., below.

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Criminal activity	Light
Contaminants		Water
Physical Forces		Fire
Inappropriate T		Pests

		Inappropriate RH

Table T.10. Impact of agents of deterioration during the processing of low-temperature specimens.

4. *How should I handle specimens during processing?*

The basic rules for properly handling, moving, and placing specimens preserved at low temperature are:

- Keep specimens as close as possible to storage temperatures at all times. Use insulated containers, small tanks of liquid nitrogen, or containers with dry ice to move specimens. Use carts to move these containers.
- Some institutions require that handling tissue samples be done in a chest freezer.
- Keep storage freezers or tanks closed when not removing or replacing specimens. Make sure that all removal/replacement is done quickly.
- Provide dedicated workspace, stable work surfaces, appropriate local exhaust ventilation, and appropriate personal protective equipment.
- Provide UV-filtered lighting with good color rendering capacity (a color rendering Index of 90 or higher) and preferably, lighting free of most infrared (heat) radiation.
- Maintain clean and orderly work areas and eliminate unnecessary risks such food, beverages, and other potential contaminants.
- Maintain sufficient space for each specimen.
- Handle only one specimen container or sample at a time.
- Avoid unnecessary handling.

5. *How should I pack and ship specimens for loans?*

Refer to the general packing and shipping guidelines listed in Chapter 6, "Handling, Packing, and Shipping Museum Objects." Specimens preserved at low temperatures require additional precautions. Be sure to:

- Provide an appropriately sealed and insulated container that will maintain the required temperature for the specimens/samples.
- Provide appropriate invoices and shipping documentation (including hazardous materials warnings and endangered species documentation where pertinent) to avoid unnecessary opening of the container.
- Provide instructions on how to properly open the container and remove the specimens.
- Provide instructions to the recipient about the type of preservation to be used for the specimens; **especially the required temperature**.

- Send loans by overnight express at the beginning of the week to ensure better control and to minimize risks of thawing prior to delivery.

- Send frozen materials in heavily insulated containers with "ice-packs."

  Note: Dry ice is considered to be a dangerous good. Do not use dry ice in a commercial shipment unless you have received DOT-approved training in packing, labeling, and shipping dangerous goods ***OR*** hire a certified HAZMAT shipping contractor to properly pack, prepare, and label the shipment for transport.

- Be sure that all shipments fully comply with Federal regulations regarding:

  - shipping documentation

  - the shipment of endangered species

  - the shipment of hazardous materials.

- Ensure that the specimens are properly packaged, to protect both the specimens and anyone handling the shipment.

- Mark outside of shipments as "FROZEN MATERIALS - KEEP FROZEN" or "TEMPERATURE SENSITIVE MATERIAL - KEEP REFRIGERATED."

6. *How should I document a specimen's condition during processing?*

Condition reporting of most cryogenic materials is not performed in the traditional manner. Be sure to report any adverse conditions. For example, document samples that have experienced thawing, freezer-burn, and potentially compromised data.

If the cryogenic materials are more consistent to traditional collections (where whole identifiable organisms are maintained), you may be able to use a traditional natural history condition report, as previously noted.

7. *What health and safety concerns should I be aware of during processing?*

Health and safety concerns during processing are primarily associated with human pathogens. However, there also are concerns associated with storage in liquid nitrogen. To prevent injury, be sure to:

- Wear long, insulated gloves to protect the hands and arms against the cold.

- Wear a face shield when accessing material that may have been in the liquid phase of liquid nitrogen.

- Protect all skin against contact with dry ice.

Other hazards that you should be aware of include:

Dry Ice

Do not use dry ice in well-sealed rigid containers. Sublimation of the dry ice can increase internal pressure to the point that the container may explode. Use **vented** containers only.

> ***Don't store containers of dry ice in enclosed areas. As dry ice "melts," carbon dioxide is released. Within enclosed areas, carbon dioxide can build to levels dangerous to people.***

Freeze-Dried Specimens

Anyone handling specimens that are being freeze-dried must wear both respiratory protection and gloves for safety. If freeze-dryers are sterilized using ethylene oxide, the staff members who apply the chemical must have special training. They also may be required to have a general license or certification for application of a pesticide and a special license or certification for application of a fumigant. Additional requirements include:

- medical monitoring of personnel
- environmental monitoring for residual ethylene oxide levels
- full compliance with all applicable OSHA regulations

C. Storage of Low-temperature Collections

1. *Are there any special storage considerations concerning low-temperature collections?*

If there are biological toxins or pathogens involved, you MUST possess specialized training, permits, and sufficient security to ensure that the holdings cannot become a danger to public health.

For detailed information concerning the security of collections, see Chapter 9, "Museum Collections Security and Fire Protection."

2. *How should I organize low-temperature collections?*

Organize the collection to enable rapid retrieval and replacement of specimens. Don't let access risk temperature control for other specimens or samples. Place specimens that are frequently used within easy reach. There are two primary methods of organizing cryogenic materials. Both have advantages and disadvantages. Your choice should depend on how your collection is used.

Sequential or chronological organization groups material from a common time and source. Every sample has a definite and predictable location in the storage unit. If a sample has been consumed through prior research, an empty space is left.

- The advantage to this type of organization is the maximization of space.
- The disadvantage is that some research is based on multiple samples of common taxa. This would require the researcher to go through the entire cryogenic collection to obtain the needed samples.

Identification and classification systems organization is another method of arrangement. This involves maintaining samples in groups based on various identification and classification systems.

- The primary advantage is that most material needed for research purposes will be located in one area of the collection. This is less disruptive to the collection as whole.

- The disadvantages are:
    - As new material is added to specific taxa, more space within expensive storage units is required to accommodate expansion
    - The location of individual samples is less definite and predictable than the sequential or chronological organization.

Remember that organization can vary among disciplines and institutions. It may be more practical to simply arrange specimens according to catalog number. Whichever method you choose, be sure that every specimen has a designated and predictable location.

After you have organized your collection, don't forget cabinet signage, labels, and floor plans. Label each low-temperature storage unit with a sign indicating the beginning and ending taxa and catalog numbers. This avoids unnecessary opening of the unit. Use the same method for individual shelves, trays, or other equipment used to hold samples or specimen vials.

The ultimate goal is to allow rapid and easy access to a specimen with minimal handling of other specimen containers.

3. *What are the primary agents of deterioration that affect specimens in storage?*

The agents of deterioration that pose the greatest risks to low-temperature collections in storage are:

- **Neglect**, such as:
    - the improper use of storage equipment
    - failure to monitor environmental conditions
    - careless handling of specimens
    - lack of familiarity with collection organization and arrangement systems
    - disassociation of specimens from data
- **Inappropriate Temperature**, especially:
    - temperature increases
    - repeated exposure to freezing and warming temperatures

    Such circumstances will cause specimens to deteriorate.

PRIORITY 1	PRIORITY 2	PRIORITY 3
Neglect	Contaminants	Inappropriate RH

Inappropriate T	Water	Light
	Physical Forces	Pests
	Criminal activity	Fire

Table T.11. Agents of deterioration related to low-temperature storage of specimens.

4. *What special features should I include in low-temperature storage areas?*

Refer to the storage requirements listed in Chapter 7: Museum Collection Storage. To reduce biohazards and chemical hazards, and protect the collections from malfunctioning equipment, you also should:

- Segregate the storage of low-temperature collections from other collection storage operations.
- Provide separate air-handling systems for low-temperature collection storage areas. This will:
  - permit cold rooms and rooms that house mechanical freezers to be cooled on a year-round basis
  - allow special ventilation designs for rooms housing liquid nitrogen tanks
- Provide appropriate security measures.
  - Install key code or other electronic entry control devices for storage rooms.
  - If electronic security is not possible, use a highly restricted key system for entry.
  - Consider adding a security window to the door to permit inspection of the room from the exterior.
  - Activate lighting from outside the room. This will facilitate inspections.
- Equip storerooms with water-based, automatic fire suppression systems and provide for regular inspection, testing, and maintenance of the systems.
- Filter all incoming and recirculated air to the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) 90-95% level.

5. *What types of supplies and equipment are used for storage of low-temperature collections?*

Containers. Containers for specimens must be:

- clean (and in some cases sterile)
- able to withstand the temperatures used for low-temperature storage
- non-reactive towards the specimens and any cryoprotectant fluids

- sealed well enough to prohibit ingress of contaminants or release of material from the specimens

- impermeable to oxygen

Glass or polypropylene containers are usually used for many cryogenic or other low-temperature storage methods. Be aware that:

- Polypropylene is rapidly becoming the most popular type of container material.

- Only some polypropylene or glass vials can be used in the liquid phase of liquid nitrogen. Most must be kept in the nitrogen vapor over the liquid to avoid the potential for rupture unless they are further sealed in polyethylene tubing.

- Some polypropylene vial and closure systems have been designed especially for use in tanks containing liquid nitrogen. These are the best choice for shipping samples collected in the field.

Container closures. The closures for containers vary with the temperature at which the container will be stored. There are some vial and cap systems that are designed to withstand liquid nitrogen temperatures, but it's important to carefully consult the manufacturer's recommendations when choosing a system. **Do not use rubber-stoppered vials for storage at liquid nitrogen temperatures.**

Rack and Trays. A good technique for storing specimens inside mechanical freezers is to use stainless steel racks to hold divided cardboard or polypropylene trays containing the sample vials.

- This allows you to easily label the freezer contents and reduces the number of samples exposed to ambient air during retrieval and replacement.

- There are stainless steel racks suitable for use in either upright or chest freezers.

- Stainless steel racks for use with divided polypropylene trays and aluminum canes have also been developed to hold specimen vials for storage in the vapor over liquid nitrogen. These systems permit retrieval of selected vials without exposing large numbers of specimens to temperature changes.

- You can also use divided tray systems for freeze-dried specimens stored in sealed vials in cold storage rooms or in refrigerators capable of maintaining 2-8°C/35.6-46.4°F or less.

Cold Rooms used to store freeze-dried material are maintained at temperatures just above freezing (2-8°C/35.6-46.4°F).

- Cold Rooms require dehumidification of incoming air to ensure that there is not a problem with condensation that could lead to mold growth.

- They require backup power supplies to ensure that the temperatures are maintained in the event of a power failure.

- Cold Rooms will prolong the shelf life of viable specimens that are preserved by freeze-drying, **but do not guarantee long-term preservation**. You may need to periodically grow new colonies and create new specimens to ensure that stocks are maintained.

Mechanical Freezers (standard freezers and ultracold freezers) are also used to store low-temperature collections.

- Freezers can meet virtually any temperature requirement, **but initial costs and operating costs increase as the desired temperature goes down**.

- Many institutions maintain tissue samples in mechanical freezers at -80°C/-112°F.

    - Long-term preservation that would be achieved at true cryogenic temperatures is sacrificed to economics.

    - Most institutions can afford to maintain temperatures of -80°C/-112°F but cannot afford the cost of lower temperatures.

6. *What else should I know about mechanical freezers?*

Freezers use a lot of energy to obtain temperatures of -80°C/-112°F. They also produce a great deal of heat. Because of this, **only use freezers in rooms that have constant (24 hours/day, year-round) air conditioning or appropriate heat exhaust systems**. You also need to equip the freezers with back-up generators in case of a power failure.

There are two main kinds of mechanical freezers:

- **Upright freezers** are easy for staff to use. However, there is a tendency for temperature gradients to form when the door is opened. This can compromise temperature control.

- **Chest freezers** are less prone to the problem of temperature gradients forming. As noted above, both types become increasingly expensive to purchase and operate as the target temperature drops.

Liquid nitrogen freezers provide an excellent storage medium. They can maintain specimens at temperatures below -130°C/-202°F (usually at least -150°C/-238°F).

- Rooms that contain liquid nitrogen freezers must be properly ventilated:

    - when the freezers are refilled with liquid nitrogen

    - when oxygen levels in the room become too low for human safety

- If a number of liquid nitrogen freezers are housed in the same room, it's best to deliver the nitrogen through pipes from a bulk tank. Don't try to refill the freezers manually.

- Piping for liquid nitrogen has special design requirements, including:

    - insulation

- safety valves

- Use low-pressure tanks to supply the liquid nitrogen. High-pressure tanks can be hazardous to staff during manual refilling. They also can damage the automatic supply units.

- Within the tanks, specimens are usually stored in the vapor over the liquid, but can be stored in the liquid itself.

7. *How should I store specimens inside a freezer?*

Use stainless steel racks to hold divided cardboard or polypropylene trays containing the sample vials. This is a good technique, which:

- allows you to easily label the freezer contents

- reduces the number of samples exposed to ambient air during retrieval and replacement

Stainless steel racks are available for use in either upright or chest freezers.

To hold specimen vials for storage in the vapor over liquid nitrogen, you can use specialized:

- stainless steel racks and divided polypropylene trays

- aluminum canes

These systems permit retrieval of selected vials without exposing large numbers of specimens to temperature changes.

You can also use divided tray systems for freeze-dried specimens stored in sealed vials in cold storage rooms or in refrigerators capable of maintaining 2-8°C/35.6-46.4°F or less.

8. *What about storage of DNA samples?*

Low-temperature storage is not a prerequisite for successful extraction of DNA from specimens. In some cases, it is possible that simply freeze-drying some organ tissues, and then maintaining them in dry conditions might work as well as storing fresh samples at very low temperatures.

The main reason for low-temperature storage for samples preserved for nucleic acids analyses seems to be the ease of extraction when specimens have not been treated by any other methods, rather than the quality of preservation.

DNA can now be removed from highly degraded materials using the polymerase chain reaction (PCR) technique. This method allows DNA to be successfully extracted from increasingly smaller samples of old museum materials. This practice has improved steadily as a result of interest by forensic scientists. As a result, sample size and environmental conditions are not as important as they were when the techniques for DNA extraction were initially developed.

As long as biological tissues have not been contaminated in some adverse fashion, or chemically treated in a way that destroys the nucleic acids, most dry biological specimens can be used for DNA analyses.

9. *Are there any special health and safety concerns related to storage of low-temperature collections?*

The primary health and safety concerns include:

- protection against biohazards
- exposure to high concentrations of carbon dioxide from dry ice
- skin lacerations from exploding ampoules or vials
- injuries resulting from exposure to very low temperatures
- displacement of oxygen caused by evaporation of liquid nitrogen in confined spaces

Consult your regional curator, an industrial hygienist, the Centers for Disease Control and Prevention (CDC), and the National Research Council of the National Academy of Sciences for information concerning the control of specific biohazards. Use face shields and long, insulated gloves when retrieving or replacing samples from the liquid phase of liquid nitrogen. Use long, insulated gloves when working with material in the vapor phase over liquid nitrogen. To protect against low oxygen environments when dealing with liquid nitrogen, equip all storage areas with oxygen monitors, and audible and visible alarms that alert staff to problems before they enter.

D. Maintenance of Low-temperature Collections

1. *Are there any special maintenance issues concerning storage of low-temperature collections?*

Low-Temperature Equipment

Specific maintenance concerns depend on the type of low-temperature equipment that you use. Be sure to discuss these issues with the equipment manufacturer and/or distributor.

Alarm systems are vital! Alarm systems that can warn of power or equipment failures at any time of the day or night are an important part of emergency preparedness for collections preserved at low temperatures. Many "freezer alarms" are designed to be audible or visible only to someone who is nearby when the alarm is triggered. Such alarms are useless 16 hours every weekday and on weekends. Install alarm systems that are monitored 24 hours a day by a UL-listed central station that will immediately notify staff in the event of a power or equipment failure.

> ***Be sure that your park has emergency generators, backup freezers, and/or transportation and storage arrangements in place to move collections in the event of an emergency. This information should be included in your park's Emergency Operations Plan. Make sure that all staff are aware of these procedures and their individual responsibilities.***

Staff Training

Be sure that **all** collection staff have been properly trained. The most common problem with the maintenance of low-temperature collections is

lack of training. Without proper training, uninformed "good intentions" easily can cause specimen damage. For example, tissue samples and other frozen material may deteriorate if:

- freezers are left open
- specimens are transported from freezers to work areas without temperature protection
- specimens are used at room temperature
- you allow repeated cycles of freezing and warming, which will:
    - cause physical damage to the specimens
    - destroy the viability of cell suspensions when their cryoprotective fluids are allowed to warm to room temperature and then are re-frozen
- mishandled, causing:
    - breakage of vials or ampoules
    - contamination by contact with non-sterile surfaces

Any of these instances can destroy the utility of the material. For this reason, full documentation is required for every sample that has been compromised.

> ***Don't underestimate staff training needs, equipment needs, and operational costs for low-temperature storage. All of these requirements can be quite expensive. As with all other types of museum collections, if you cannot provide an appropriate level of care for them, you shouldn't attempt to maintain low-temperature collections at your park. Such collections would be better housed at an institution that specializes in research and care of such collections.***

2. *What is involved in salvage of low-temperature collections?*

Salvaging specimens after an emergency or a disaster:

- is usually concerned with stabilizing the specimens
- normally occurs within the first 48-hours after the collection or area is secured from the situation

This initial stabilization may involve some treatments. However, such treatments are not designed for restoration or repair, but to keep further damage at bay. **The primary concern for salvage of low-temperature collections is maintaining the proper preservation temperatures**.

Once most collections preserved at -80°C/-112°F or lower have been defrosted and allowed to remain at room temperatures for more than a few hours, they can be damaged by bacteriological and enzymatic processes. Tissue samples are especially susceptible to this type of damage. Freeze-

dried materials may last much longer if kept in well-sealed containers and not exposed to moisture.

3. *What is the "best method" of salvage?*

Preplanning

As with all potential disasters and emergencies, preplanning is vital. An appropriate and effective emergency and salvage plan can spell the difference between an inconvenience and a major disaster. Be sure that your park's Emergency Operations Plan (EOP) includes relevant information concerning low-temperature collections if your park maintains such materials, **especially information related to any biohazards.**

- Ensure that all staff:
  - are aware of their emergency responsibilities
  - possess appropriate training
  - have full knowledge of all potential hazards (including biohazards)
  - possess proper personal protective equipment
- Conduct periodic reviews of the potential for biohazards for all low-temperature collections.
- Ensure that you implement adequate control measures for any type of emergency situation involving biohazards.
- To prevent release of hazardous organisms during salvage efforts, request assistance from the Centers for Disease Control and Prevention (CDC) and your state health department.
  - **Don't wait until an emergency to contact these organizations and agencies; by then it could be too late**.
  - Include the CDC and your state health department in emergency pre-planning efforts.
  - Be sure that your park's EOP contains all such relevant information.

Emergency Response

HUMAN SAFETY IS PARAMOUNT! Address all potential life safety issues before you attempt any collection salvage. Ensure that:

- All staff possess full knowledge of potential biohazards.
- Facilities are properly ventilated.
- All staff possess appropriate training and personal protective equipment (PPE).
- The park has procedures for the proper disposal of any biohazards, if portions of some samples are not salvageable.

Once it is safe to enter the area, you can start the salvage operation:

- Transfer frozen specimens to backup freezers or to temporary storage in containers with dry ice or liquid nitrogen. Store the specimen over the liquid, not in it, if possible.

- It may be possible to salvage some tissue samples by freeze-drying. This requires that you maintain sterile conditions throughout the freeze-drying process.

Notes:

- If samples from the same voucher specimens are available at other repositories, heroic salvage efforts may not be worthwhile.

- To be effective, all salvage operations should be targeted toward specimens whose importance has been determined in advance. These must be well marked and placed in storage so as to facilitate salvage activities.

> ***IMPORTANT: Be sure that your museum standard operating procedures include information pertaining to the proper disposal of any biohazards, if portions of some samples are not returned to storage after salvage or research use.***

4. *Where can I get salvage advice and assistance?*

Contact your regional/SO curator, the Senior Curator of Natural History, a natural history conservator, or staff from a nearby large natural history museum or university repository. You can also contact organizations such as:

The American Type Culture Collection
PO Box 1549
Manassas, Virginia 20108
(703) 365-2700
www.atcc.org

The American Type Culture Collection's staff have specialized expertise in dealing with collections preserved at low temperatures. It's a good idea to include this organization on your park's emergency salvage call list.

5. *How should I document emergency salvage efforts?*

Tissue samples are unlikely to survive for more than a few years at the storage temperatures commonly used for their preservation. As a result, management and care issues tend to overlap for documentation, as with emergency salvage. The primary concerns for collections care documentation are:

- How long has the specimen been in storage?

- How often and under what circumstances has the specimen been used?

Tracking this information will provide a reasonable schedule for disposal of specimens that have outlived their utility and therefore are no longer worth the costs of preservation.

During emergency salvage it is acceptable to simply document all

immediate salvage steps, both in writing and in some type of imaging system. Record specific damage to particularly valuable specimens and specimens from other institutions, and note specific salvage methods that are used. Such data may be important for insurance purposes or essential in resolving liability issues.

SECTION VI: BIOLOGICAL MICROSCOPY COLLECTIONS

A. Overview

1. *Why are some specimens preserved as microscope preparations?*

Scientists preserve certain specimens as microscope preparations to preserve whole or partial organisms for:

- various kinds of microscopic examination
- some kinds of biochemical analyses, including extraction of DNA

Specimens prepared for microscopy may be found in all biological collections, but are most common in these collections:

- entomology
- mycology
- palynology
- parasitology

It's also common for microscopy collections to be ancillary to more traditional collections. Examples of such ancillary collections include:

- histology
- karyology
- hair samples
- scales
- some gentalia

> ***Be sure that microscope slides of parts tied to another specimen are given the same catalog number as the specimen. Link or otherwise cross-reference all data too.***

2. *How are specimens preserved as microscope preparations?*

There are several basic types of microscope preparations for biological specimens or specimen parts:

- mounted on flat, glass microscope slides of various sizes, usually with round, square, or oblong cover slips
- in micromounts (paperboard, aluminum, or glass slides that have one or more cavities for the specimen(s), usually with a polyester film or glass cover slip on one side or possibly on both sides
- mounted on stubs for scanning electron microscopy (SEM)
- removed from SEM stubs

- prepared as thin sections (cut into very thin slices) for subsequent examination under various levels of magnification

They can also include casts or other replicas of specimens or specimen parts (often used for SEM).

The specimens or specimen parts for microscopy may be:

- immersed in a natural or synthetic liquid or resinous mounting medium, often with a ringing medium (a material used around the margin of the cover slip to protect the specimen and the mounting medium)
- embedded in a solid or semi-solid wax or resin (often used for thin sections)
- dry-mounted without a mounting medium or coating, but often attached to the slide or stub with a small amount of an adhesive
- coated with various metallic (e.g., aluminum, gold, gold-palladium alloy) or non-metallic substances (such as carbon) to improve the image of the specimen/specimen part for SEM, and attached to a stub with a small amount of adhesive

Specimens prepared for microscope slides or for thin sections are often:

- **cleared** (treated with a enzymes or alkaline chemicals that render parts of the specimen transparent to light)
- **stained** (treated with dyes that differentially color various tissues to make them easily visible)

3. *What agents of deterioration affect microscopy collections?*

The impact of various agents of deterioration on microscopy collections is largely unknown. This topic has not yet been adequately examined in scientific studies. As a result, what little that is known comes from observations by collections staff. As with other biological collections, inappropriate temperature, contaminants, neglect, and inappropriate relative humidity levels undoubtedly pose risks to specimens preserved for microscopy. Be aware of the following risks:

Physical Forces

- Glass breakage: specimens mounted on glass substrates are prone to damage from breakage of the glass.
- Specimens mounted on scanning electron microscope stubs are small and usually very fragile.
- Gravity can damage many specimens in mounting media. This is because the media can flow over time and move specimens out from under protective cover slips.

Inappropriate Temperature

The precise temperatures that pose risks vary with the particular medium.

- The mounting, ringing, and sometimes the embedding media used in preparing specimens for microscopy can flow under the force of gravity at room temperatures.

- Elevated temperatures can increase the tendency for mounting media to flow.

- Temperatures at or below freezing may cause the mounting media to fracture.

Contaminants

In general, any gas phase material that can promote the oxidation of an organic substance is likely to cause damage to the synthetic and natural resins used in many mounting and ringing media. This includes peroxides emitted by wood and wood by-products, including many poor quality paper products.

Particulates may also damage specimens prepared for microscopy. This is because they can become absorbed into the surface of some resins, and obscure fine details in the specimens.

Inappropriate Relative Humidity

- Inappropriate relative humidity levels, whether very high or very low are thought to damage some ringing and mounting media.

- It is possible that very high relative humidity could cause some resins to become cloudy or moldy. This would obscure the specimen.

- Very low relative humidity might cause desiccation of mounting, ringing or embedding media. This can lead to physical damage to specimens.

Neglect

Neglect can result in damage to all collections, including microscopy preparations, and is characterized by:

- insufficient knowledge and skills

- failure to follow standards and/or provide adequate documentation

- apathy

- lack of adequate administrative support and funding

Common instances of neglect in microscopy collections include the failure to: link specimen parts to identifiable voucher specimens; provide backup systems to ensure appropriate environmental conditions; provide adequate storage to protect against contaminants.

Visible and UV Light

Microscopy preparations are generally kept in cabinets or boxes that protect them from light. However, during examination, they are apt to be exposed to very intense light. Prolonged exposure will fade the color in some stains. Light sources rich in ultraviolet radiation will not only increase this rate of fading, but may also promote the oxidation (aging, usually accompanied by yellowing) of many media used for embedding, mounting, or ringing.

Pests

Other than insects attracted to the adhesive on paper slide labels, insect and rodent pests are rarely, if ever, a threat to microscopy preparations.

Water

Prolonged immersion in water from a flood or leak will soften some natural and synthetic resins used as various media. Immersion might soften the adhesives used to mount specimens on SEM stubs. It also may damage the ink, paper, or adhesives used in labeling slides, resulting in loss of essential data.

Fire

Fire can cause slides to break, soften media, and may deposit soot on slides and specimens mounted on SEM stubs.

4. *Are there any health and safety concerns related to microscopy collections?*

Yes. Be aware of the following safety issues:

- Any risk from human pathogens that may be present in the specimens is usually greatly reduced if the specimens are mounted in some type of medium.
- The greatest human safety risk is the preparation of the media, due to the toxic nature of some of the chemicals used.
- Once the specimens have been prepared, the risks in subsequent handling of microscope preparations should be minimal. Even so, **always wear nitrile gloves when handling these preparations**.
- Any effort to remount slides or to remove the coatings from SEM specimens can pose significant risks.

There are hundreds of different chemicals and chemical mixtures that have been used in creating microscope preparations in the biological sciences. Some of these include:

- polychlorinated biphenyls (PCBs)
- cyanide solutions (used to remove SEM coatings)
- naphthalene resins or polymers mixed with toluene or other solvents
- organic stains and dyes, many of which are toxic
- chloral hydrate, the common component of most formulations of Hoyer's mounting media, and also an ingredient in many other

mounting media

- phenol
- thymol
- phenolic resins
- Eurparal, a commercial product containing paraldehyde
- cellulose nitrate (flammable)
- formaldehyde
- inorganic and organic acids
- natural plant resin (Canada balsam), which while not a threat in itself, is often thinned with phenol alcohol or xylene
- epoxy resins
- polystyrene resins
- phthalate plasticizers
- metal salts

Refer any interventive treatment of microscope preparations to a conservator or to a specialist in the preparation of the organisms. To ensure human safety and preservation of the specimen, be sure to acquire information on the preparation methods used for any specimens prepared for microscopy.

Of particular concern are:

- the use of toxic chemicals during preparation work
- the impact of toxic chemicals during subsequent handling of the specimens

Be sure to use appropriate engineering controls and personal protective equipment when examining microscope preparations.

B. Stabilization and Processing of Microscopy Collections

IMPORTANT NOTE: For purposes of these guidelines, it is assumed that the conditions of biological specimens and specimen parts intended for a microscopy collection will be under the control of research designs and material utilization. Therefore, the stabilization stage of

microscopy preservation is not a topic of this appendix and should not be part of the responsibility of the collection staff of the park.

Because of the risks to health and safety, as well as the expense of specialized equipment, no individual should be involved with stabilization for microscopy collections without first receiving specialized training that far surpasses any instructions and information provided herein.

1. *What are the primary agents of deterioration that affect microscopy collections?*

For most microscope preparations, there is a great risk of physical damage during processing. This results from direct damage to the specimen during preparation or by damage to the slide, stub, or other support for the specimen during subsequent use. Insufficient knowledge and skills (neglect) can render a specimen useless.

Priority 1	Priority 2	Priority 3
Neglect	Contaminants	Criminal Activity
Physical Forces	Fire	Pests
Inappropriate T°	Water	
Light/radiation		
Inappropriate RH		

Table T.12. Impact of agents of deterioration during processing of microscopy specimens.

2. *How should I handle specimens during processing?*

In addition to following the basic rules for handling collections (listed in Chapter 6), you also should be sure to:

- Keep material in environments that are as close as possible to those used for long-term storage.
- Carefully clean microscope slides of any immersion oils (oils used to enhance viewing when the slides are examined at high magnification) after use.

3. *How should I label microscope slides?*

Paper labels are often used on microscope slides. However, the choice of adhesives for these labels has caused many problems. You can purchase foil-backed, alkaline-buffered paper labels with a neutral acrylic adhesive

from conservation suppliers. You can either cut them to fit the slides or other microscope mounts, or order them pre-cut to specifications.

Note: It's a good idea to also use a diamond-tipped scriber to mark the specimen number on glass slides in case the paper label is lost for any reason.

4. *What types of specimen containers should I use for microscopy preparations?*

The primary specimen container for microscopy preparations is usually a microscope slide, SEM stub, or a micromount. Glass slides, SEM stubs, and the new generation of micromounts made from good quality paper and polyethylene terephthalate film (Mylar D® or Melinex 516®) are excellent.

You can purchase various boxes that are available from archival and scientific supply firms to store slides, SEM stubs, and micromounts.

Use These Containers:	Don't Use These Containers:
• molded polypropylene • polyethylene • metal with powder coatings or uncoated aluminum	• wooden boxes • boxes of poor quality paper products • boxes with interiors of cork, acidic paper boards, and various plastics, such as polyvinyl chlorides (PVC) or polyurethane foam • unstable plastic containers (such as pill boxes or gel containers) • polystyrene (can only be used to house specimens that will not be used for biochemical analysis).

Table T.13. Recommended Storage for Microscopy Collections

5. *How should I pack and ship microscopy specimens for loans?*

Refer to the general packing and shipping guidelines listed in Chapter 6, "Handling, Packing, and Shipping Museum Objects." Be sure to also:

- Cushion specimens in their primary boxes to ensure that there is no movement of the slides, stubs, or micromounts during transport.
- Provide an appropriately sealed and cushioned container that will maintain a stable relative humidity for the specimens.
- Provide a legible and accurate mailing address.
- Provide appropriate invoices and shipping documentation, (including hazardous materials warning and endangered species documentation, where pertinent) to avoid unnecessary opening of the container.
- Provide instructions on how to properly open the container and remove the specimens.
- Provide instructions about the type of preservation to be used for the specimen.
- Comply with all laws and regulations regarding the shipment of

endangered species or hazardous materials.

6. *How should I document a specimen's condition during processing?*

For condition reports for microscope preparations, be sure to include information about the support as well as the specimen. For example, be sure to note:

- chipped, cracked, or broken slides or cover slips (slides with these conditions should not be shipped on loans until the specimens can be remounted properly)
- "infingering" of air into mounting media (usually evidenced by bubbles or voids in the media that extend from the edge of the cover slip inwards)
- flow of mounting media (usually indicated by a less-than-centered position of the specimen)
- cloudiness, discoloration, or crazing of mounting media
- voids or cracks in ringing media
- torn or distorted specimens
- faded stains or dyes
- discolored specimens
- dirt or debris on slides, stubs, or specimens
- mold

C. Storage of Microscopy Collections

1. *How should I organize the collection?*

The most important organization concern is to be sure that the arrangement allows access to selected specimens without jeopardizing other specimens. Organization may vary among disciplines and institutions. In most instances, the organization will be first by nature of preservation (slide or SEM stub), then by taxonomic group, and then catalog number, or simply by catalog number. This type of organization ensures that every specimen has a more-or-less designated and predictable location.

Once the collection is organized, be sure to:

- post adequate informational signage and floor plans throughout the area
- label all storage units with beginning & ending taxa and catalog numbers
- label each slide box or SEM stub box with beginning and ending catalog numbers

> ***Ease of access to a specimen with minimal handling of other specimen containers is the ultimate goal***.

2. *What are the primary agents of deterioration for microscopy collections in storage?*

The agents of deterioration that pose the greatest risks in storage of microscope preparations are:

- **Neglect** may be evident through the improper use of storage equip-ment, careless handling, lack of familiarity with organization and arrangement systems, or disassociation of specimen and data.
- **Temperature increases** may cause some mounting media to flow, damaging specimens in the process. Exposure to freezing temper-atures may damage some mounting, ringing, and embedding media.
- **Inappropriate relative humidity (high)** can promote mold growth on some specimens, labels, and some media.
- **Low relative humidity** may promote embrittlement of some media, which can subsequently cause damage to specimens.

Priority 1	Priority 2	Priority 3
Neglect	Contaminants	Criminal Activity
Physical Forces	Fire	Pests
Inappropriate Temperature	Water	Light/UV radiation
Inappropriate RH		

Table T.14. Relationship of the agents of deterioration to the storage of microscope preparations.

3. *What are the appropriate environmental conditions for storage of microscopy collections?*

The optimu m conditions for storage of microscope preparations have never been defined. However, reasonable conditions for long-term storage are:

- moderate temperatures, probably in the range of 16.6-22.2°C/62-72°F
- moderate relative humidity, probably in the range of 40-50%

4. *What types of storage equipment should I use?*

Store microscopy collections inside closed storage cabinets. Make sure that the cabinets are properly designed and used.

- All slides must be properly supported and positioned horizontally.
- The stubs should remain upright for SEM preparations.
- Microscope slides and micromounts should be stored flat. See Figure T.2., below.
    - Slides stored vertically will allow some mounting media to flow

toward the edge of the cover slip. This often results in damage to the specimens.

- Similar harm can occur if specimens in micromounts are stored vertically. This allows the specimens to rest against the edge of a well or cavity, rather than in the center.

The Best Option:

Acquire steel storage cabinets designed to hold boxes of slides in the proper position so that the slides themselves are horizontal. These cabinets are available with smooth roller-bearing drawers that minimize shock and vibration and are the best available option for most microscopy preparations.

Another Option:

You also can use standard museum storage cabinets to house boxes of slides or micromounts in a horizontal position. If you use this option, be sure that the slides are positioned horizontal to the shelves and that the shelves are cushioned with polyethylene foam (such as Volara® Type A).

Figure T.2. Microscope slides stored horizontally in a slide cabinet. Photograph courtesy of the Entomology Research Museum, University of California, Riverside.

5. *Are there any common problems with microscopy collections?*

Yes. They include:

- deteriorating mounting, ringing, or embedding media
- researchers, who may:
  - wish to have an SEM coating removed from a specimen
  - leave a coating of immersion oils on a microscope slide
- a lack of training among staff and/or researchers

6. *What should I do if specimens need to be cleaned, remounted, or treated?*

Aside from gently wiping off immersion oil residues, leave any other cleaning of specimens prepared for microscopy to experts. The removal of SEM coatings can involve the use of extremely dangerous chemicals and is generally not recommended for any biological specimens.

Always refer to an experienced conservator concerning remounting specimens that exhibit deteriorating mounting or ringing media. Most of the common mounting, ringing, and embedding media in collections are not stable. They were chosen for their ability to enhance microscopic examinations, not for longevity. As a result, it is not unusual to see many thousands of deteriorating preparations in a single collection.

Some unpublished studies have been conducted, especially in parasitology collections, to replace deteriorating mounting media. Although there are some successes with certain mounting media, this remains a topic requiring additional research.

7. *What should I know about salvaging microscopy collections?*

Unfortunately, there are no data on the salvage of microscope preparations following disasters. Because most emergencies will result in water damage and subsequent high humidity, the most useful steps probably will involve achieving control over the environment, such as:

- exhausting moisture-laden air from the storage room and replacing it with conditioned (drier) air using specialized dehumidification equipment and fans (leaving specimens in containers and inside closed cabinets)
- air-drying, by removing specimens from containers and cabinets to an area with good ventilation and dehumidification
- arranging to transfer the collection to an environmentally controlled location for examination and possible treatment by experts

8. *Are there any health and safety issues that I should consider?*

As noted above, during any cleaning or remounting process, anyone handling specimens prepared for microscopy can be exposed repeatedly to small quantities of highly toxic materials. When working with such chemicals be sure that:

- all staff have received appropriate training
- all staff possess a full knowledge of the potential chemical hazards
- proper engineering controls are in place

- all staff have appropriate personal protective equipment
- all hazardous waste is properly disposed of

Remember: Human safety is paramount. Address all human safety issues prior to attempting collection salvage. Do not put staff at risk during emergency salvage efforts.

SECTION VII: GLOSSARY

Autolysis:	deterioration of a specimen's cells or tissues due to enzymatic digestion
Denaturant:	chemicals added to ethanol to make it unsuitable for human consumption
Ectoparasites:	a parasite that lives on the exterior of its "host" organism; examples include ticks, lice, and fleas
Exsiccati:	dried fungi specimens that have been identified and labeled
Fixation:	applying a substance that chemically bonds to a specimen to impede deterioration of the specimen by enzymatic digestion
Karyotypes:	a photograph or "map" of a cell's chromosomes
Larvae:	young of any insects that undergo a complete metamorphosis in the course of development into adults
Lipid:	organic fats, oils, and waxes contained in all life forms, which serve as cellular building blocks and provide energy
Lyophilization:	the process of freeze-drying a specimen
Maintenance:	preservation activities associated with corrective actions in response to a real or perceived problem
Periostracum:	the hard outer covering of a mollusk's shell
Processing:	preservation activities beyond stabilization that are related to making the specimen available for use
Pupae:	the metamorphic stage of an insect's life between larvae and adult
Stabilization:	preservation activities associated with halting active deterioration and minimizing the risk of loss, damage, or disorder as it relates to the specimen and its associated information
Storage:	preservation activities associated with housing of the specimens for the sake of access, organization, and protection
Type Specimen:	the specimen used to describe a new species for the first time; type specimens have extremely high scientific value; they are managed as NPS controlled museum property and must be afforded appropriate storage and security
Ultrastructure:	a detailed, complete view of a cell or tissue; visible only through electron microscopy

SECTION IX: NON-NPS REPOSITORIES WITH SERVICEWIDE OR MULTI-REGIONAL AGREEMENTS TO HOUSE PARK BIOLOGICAL COLLECTIONS

The National Park Service seeks and maintains long-term agreements with qualified institutions to assist in managing park collections. These umbrella agreements establish terms and conditions under which park collections will be preserved, housed, managed, and accessed, as well as the responsibilities of all parties to the agreement.

The Chief Curator and the Associate Director, Natural Resources negotiate the agreements. Parks that place specimens with a cooperating repository must prepare a loan form documenting all specimens.

The contact information for institutions with Servicewide agreements to curate NPS natural science collections are as follows:

A. Low-Temperature Collections

The American Type Culture Collection
PO Box 1549
Manassas, Virginia 20108
(703) 365-2700
http://www.atcc.org/SpecialCollection/NPS.cfm

The American Type Culture Collection (ATCC) makes available for research microorganisms collected in parks. Park collections are on loan to ATCC under the terms of this agreement. Copies of the agreement, which includes related NPS procedures, are available from the Chief Curator at **ann_hitchcock@nps.gov**.

B. Other Specimens

At this time, the National Park Service has no Servicewide agreements with any non-NPS repositories for curation of NPS botanical, animal, fluid-preserved, or microscopy collections. Several parks, regions, and/or networks have agreements at that level; contact your regional/SO curator for additional information.

Appendix U: Curatorial Care of Paleontological and Geological Collections

List of Figures

APPENDIX U: CURATORIAL CARE OF PALEONTOLOGICAL AND GEOLOGICAL COLLECTIONS

SECTION I: PALEONTOLOGICAL COLLECTIONS

A. Overview

1. *What information concerning paleontological collections will I find in this appendix?*

This appendix will:

- introduce you to the preventive conservation of paleontological specimens
- provide you with the information necessary for the day-to-day management of your fossil collections
- prepare you to carry out the duties associated with the long-term storage of a paleontological collection
- not teach you the skills of fossil preparation or conservation, as practiced by trained preparators and conservators

The appendix includes:

- a discussion of the characteristics of paleontological collections
- tools to help you recognize deterioration
- information about proper storage environments
- health and safety concerns
- a listing of NPS resources and outside organizations that can provide you with additional information

2. *Why is it important to practice preventive conservation with paleontological specimens?*

Fossils may seem to be "hard as stone." You might then assume that fossils require little monitoring or preventive conservation. This isn't the case. Paleontological collections do require an appropriate level of preventive conservation. Without routine monitoring (including good baseline information), the first indication of a problem is usually when a specimen starts to crumble. Often, little can be done at this point. The deterioration is irreversible. This results in:

- damage to the specimen
- the loss of scientific information.

3. *How can I learn about preventive conservation?*

Read about the agents of deterioration in Section E and the proper storage of paleontological specimens in Section F. See Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment, for a discussion on the agents of deterioration. For information on exhibits, refer to *Museum Handbook*, Part III (*MH-III*), Chapter 7: Using Museum Collections in Exhibits and NPS CD-ROM publication, *Exhibit Conservation Guidelines*, available from the Harpers Ferry Center (see

Section III. References).

4. *Where can I find the latest information on care of paleontological specimens?*

See Section III. References. This section lists contact information for NPS resources, professional organizations devoted to paleontology and geology, a glossary, Internet resources, and a bibliography.

B. Paleontological Collections and Fossils

1. *What are paleontological collections?*

Paleontology is the study of ancient life. It includes the five kingdoms of life (Monera, Protista, Fungi, Plantae, and Animalia), but most paleontological collections are identified as:

- vertebrates
- invertebrates
- plants

NPS paleontological collections cover the entire span of geological time and represent all five kingdoms of life.

2. *What is a fossil?*

A fossil is any evidence of past life preserved in the earth's crust. Fossils can be divided into two main categories:

- body fossils are the preserved remains of a plant or animal
- trace fossils are indications of past animal activity such as:
  - tracks
  - burrows
  - borings
  - gnaw or bite marks
  - coprolites (fossilized feces)

The study of trace fossils is called ichnology.

3. *Are there other types of fossils?*

Unaltered fossils result from burial conditions that prevent decomposition, such as low temperatures or low humidity. The classic example of an unaltered fossil is a frozen woolly mammoth. Bison and horses also have been found preserved in Alaskan permafrost. In arid environments, mummified specimens may be preserved in caves or in pack rat middens.

Unaltered fossils are extremely sensitive to changing environmental conditions. If you remove such specimens from the field, you must duplicate the field environment within the museum (temperature,

humidity, etc.). This will ensure their continued preservation.

4. *How can I identify the fossils in my collection?*

Because a wide variety of plants and animals have fossilized, it's very difficult for anyone to identify every type of fossil. You can consult a paleontologist, but remember that even the experts can't identify all fossils. Most paleontologists specialize in one (or several) plant or animal group(s), fossils from a specific geologic time, or fossils in a given geographic area.

There are many "popular" guides to fossils, but you'll probably need to consult the scientific literature to confirm a fossil's identification.

C. Body Fossils

1. *How did body fossils develop?*

Body fossils formed when an organism died and was rapidly buried. This minimized decomposition and destruction from scavengers. (These fossils escaped the natural recycling process!)

Common burial sites include rivers and lakes or other areas of rapid sedimentation. The death either occurred there or the specimen was quickly transported to the area shortly after death. After burial, the specimen was protected from further transport, scavenging, and some types of decay. Eventually, minerals from ground water cemented the surrounding sediments. Body fossils were preserved by:

- permineralization
- replacement
- carbonization
- molds and casts
- nodules
- amber

> *Organisms, particularly vertebrates with a skeleton made of numerous parts often are represented by isolated bones and teeth. Individuals that died at the site of deposition and were quickly buried are more likely to be preserved as complete, well-preserved specimens.*
>
> *Organisms that were transported are more likely to be incomplete. They also may show signs of transport such as*

2. *What is Permineralization?*

Permineralization is what we commonly associate with fossils. "Petrified" or "fossilized" are words used to describe a fossil preserved this way. Minerals have been deposited in the specimen. It has "turned to stone." Even though minerals were deposited in the specimen, it still may retain part of its original organic structure. If you examine the fossil under a microscope at high magnification, you may see the original organic material with minerals deposited in spaces. The logs at Petrified Forest

National Park are a good example of permineralization.

3. *What is replacement?*

Replacement is similar to permineralization, except that none of the original specimen survived. Minerals *replaced* the original components. The replacement occurred at the molecular level, so all of the original details may be preserved.

4. *What is carbonization?*

Carbonized fossils are often preserved on the bedding planes of shale. These shales were often deposited in water that is low in oxygen. This permitted the preservation of soft-bodied organisms that would not otherwise have been preserved. Heat and pressure of sediments reduced the original plant or animal to a carbon film. Many types of plants and animals that would not normally be preserved in other environments are preserved this way. The best examples are fossil fish from the Green River Formation at Fossil Butte National Monument and the insects and leaves at Florissant Fossil Beds National Monument.

5. *What are molds and casts?*

- A mold formed when the original fossil dissolved. This left a cavity within the surrounding rock. This negative impression preserves the external details of the original specimen. One rare form of mold can form when lava flows around a living tree. Tree molds are found at Craters of the Moon, El Malpais, and Lava Beds National Monuments.
- A cast is formed if this negative impression later filled with sediment. The cast may preserve all of the external morphological details of the original specimen but lacks any microscopic details.
- A steinkern is another type of mold. Steinkerns can result when a shell (such as a snail or clam) filled with sediment and then dissolved. The hardened sediment preserves a reverse image of the formerly hollow inside of the shell.

6. *What are nodules?*

During preservation the original organic material may serve as a nucleus around which minerals are deposited. The minerals may be deposited in layers and eventually the original specimen becomes completely encased in a nodule. Depending on the types of minerals and environment of deposition, the original fossil may be preserved or only an impression may be left. Often the fossil can only be seen when the nodule is cracked open.

7. *What is amber?*

Amber is fossilized resin produced by various trees. Amber results from the evaporation of volatile organic compounds, and oxidation and polymerization. Amber often includes insects or other arthropods and pieces of plants.

D. Trace Fossils

1. *How did trace fossils form?*

Trace fossils result from an animal disturbing sediments (such as burrowing worms, a dinosaur leaving footprints in the mud, or depositing dung). These specimens are usually found in rock.

2. *How are trace fossils usually exhibited?*

Because there are no hard parts to be preserved, trace fossils are generally found as molds, casts, and infillings. They may be difficult to distinguish from the surrounding rock. Larger trace fossils, such as track sites of multiple tracks, are usually left *in-situ*.

Smaller specimens, such as large pieces of rock containing trace fossils, are sometimes transported to the visitor center for an outdoor display. Such specimens may not have been accessioned and cataloged into the museum collection. If not, you should accession and catalog them. Remember: If such fossils are displayed outdoors, or within reach of visitors, the specimens are subject to consumptive use, including wear, deterioration, vandalism, or environmental damage.

Trace fossils are not expendable. Take proper steps to ensure their long-term preservation. Even tracks displayed in a "structure" that prevents visitors from touching them can suffer deterioration, due to environmental fluctuations (Shelton et al, 1993). Ensure that all paleontological exhibits at your park have addressed preventive conservation issues to the extent possible. For additional information, refer to Section I. "Exhibiting Paleontological Specimen" below, and the National Park Service CD-ROM publication, *Exhibit Conservation Guidelines* (see Section III. References).

> *For a more conservation-friendly approach to outdoor exhibits, use reproductions of fossils for visitor center design elements and interpretive dinosaur "track walks."*

3. *What else should I know about trace fossils?*

Trace fossils generally require less preparation than body fossils. Different kinds of trace fossils may require different types of care. For example, caves in the Grand Canyon and the Guadalupe Mountains preserve unaltered dung of the extinct ground sloth. Dung of mammoths and extinct brush-ox are found in alcoves in Glen Canyon. This type of original organic material requires a different preservation approach than slabs of rock with tracks. Such specimens are extremely fragile and break easily; handle them with extreme care.

For storage of dung or other trace fossils of original organic material:

- Store the specimens in cabinets with low humidity.
- Protect the fossils from insect pests.

You may need to build a microclimate within the storage cabinet using desiccants (see *Conserve O Gram* [*COG*] 1/8 "Using Silica Gel in Microenvironments").

E. Factors that Contribute to Specimen Deterioration

1. *How can I minimize deterioration of paleontological specimens?*

Preservation of paleontological collections is a collaborative effort between field paleontologists, laboratory preparators, and curators. Everyone brings a different perspective and expertise to the matter. It's important to understand the concerns and needs of each professional when making decisions about how to care for the specimens.

Preservation begins in the field. You should:

- Work with the paleontologist who collects the specimen and the preparator who prepares it in the laboratory.
- Address conservation issues throughout the project.
- Ensure that everyone is using current conservation techniques. When in doubt, contact the NPS Geologic Research Division (GRD), Paleontology Program Coordinator or the Senior Curator of Natural History for advice.
- Make any necessary notations to catalog records or other documentation, such as:
  - conservation information from the paleontologist or preparator
  - type of glues and preservatives used to stabilize the fossil, both in the field and in the lab

  Note: Be sure to request <u>all</u> preparation data from the preparator. This includes a list of solvents and any other chemicals used on a specimen.
- Follow through with proper curatorial care and museum storage conditions.

2. *How can I identify active deterioration of a paleontological specimen in storage?*

The best way to detect active deterioration is careful, routine observation:

- Note the condition of specimens when they arrive for storage.
- Create a baseline photograph of every specimen upon arrival.
- Are there small bits of unattached bone associated with the specimen, or is the specimen completely intact?
- Is the specimen well supported and padded with an appropriate material such as polyethylene foam?
- Are some delicate parts prone to damage from gravity or mishandling?
- Previously attached bone or rock pieces under/around a specimen are a sign of deterioration and crumbling!

3. *How can I stop active deterioration of a specimen once it's started?*

First, determine the cause of the deterioration:

- Was the specimen mishandled?
- Are the environmental conditions in storage appropriate?
- Did the deterioration occur because of routine cleaning?
- Is the specimen properly supported (such as cavity packing using

polyethylene foam)?

- Is the specimen crumbing due to glue failure or a preservative used during preparation?

You should be able to eliminate some of these causes of deterioration. Others require the skills of an experienced paleontologist. When in doubt, contact the GRD Paleontology Program Coordinator or the Senior Curator of Natural History for advice. Be prepared to discuss:

- the type of paleontological specimen
- what formation it came from
- who collected it
- its present storage environment
- types of preservatives used

The GRD Paleontology Program Coordinator or the Senior Curator of Natural History may suggest that you contact the person who collected or prepared the specimen, or possibly a professional paleontologist who works at another park.

Do not undertake any type of conservation procedure on a specimen unless you are an experienced paleontologist with appropriate training.

4. *What is pyrite disease?*

Pyrite disease is common in some fossil collections. Pyrite disease results from the oxidation of iron pyrite ("fool's gold") in a fossil. Pyrite can be present in bone, invertebrate shell, or plant fossils. The oxidation of pyrite will affect microcrystalline or framboidal pyrite far more than it does larger crystals. The resultant iron sulphate ($FeSO_4$) causes fossils to crumble as the crystals grow and expand. The damage is preventable, but irreversible once it begins.

5. *How can I protect my specimens from pyrite disease?*

Keep the fossils in a stable environment. Temperature and humidity fluctuations promote pyrite "rot." Consolidants, coatings, or adhesives can be of use only if they are introduced to the specimen under vacuum conditions to coat all surfaces internally and externally. Even carefully conserved specimens can explode spectacularly due to pyrite "rot" building up under the protective skin of preservatives.

The only way to slow the oxidation is to lower the relative humidity. If the reaction has not started, keep RH at 45% or lower; if it has started, reduce it to 30% or lower. It's possible to clean the reaction products off the surface of a specimen. This requires a very specific procedure and specialized training. Untrained personnel can easily inflict further damage to, or destroy the specimen.

Remember: Prevention is always better than treatment.

6. *What should I do if I*

Follow these steps:

notice pyrite disease?

- Remove the specimen from its storage environment to a work area.
- Brush away and discard the dry powdery reaction product with a dry, soft brush. If you're fortunate, you may need to do nothing more than rehouse the specimen at this point.
- If you can't keep the RH below 45%, and pyrite problems exist, you'll have to upgrade your storage environment. Possible solutions:
  - Build a microclimate within the storage cabinet using desiccants (see *COG* 1/8 "Using Silica Gel in Microenvironments").
  - Create an anoxic (low- or no-oxygen) environment (see *COG* 3/9 "Anoxic Microenvironments: A Treatment for Pest Control"). For a collection of known reactive specimens, anoxic film enclosures will help slow the reaction. But be aware that it never stops.
  - For a large collection, consider installing climate-control equipment for an entire case or cases.

7. *What else should I consider when confronting pyrite disease?*

Cross-Contamination

The pyrite oxidation reaction liberates sulfuric acid. This can damage other specimens and storage materials. Do not let other specimens touch infected ones. Also, encapsulate specimen labels (don't laminate them) so that they are not in direct contact with the specimen.

Susceptibility to pyrite disease

A fossil's susceptibility to pyrite disease may depend on the types of rock in which it was preserved. Holmberg (2000) noted a good example of this principle:

> Two fossil whale skeletons containing pyrite were obtained from Miocene clay. They were found in different states of preservation, though they had been stored under identical conditions. One of the skeletons was embedded primarily in light-colored clay dominated by the mineral smectite. (Smectite has a high absorption capability and low pH.) The other embedding medium consisted of other clay minerals, mainly kaolinite and illite. (These minerals have a neutral pH resulting from the presence of carbonates, which work as buffers.) Pyrite in the fossil bones from smectite-rich clays was more susceptible to deterioration after exposure than bone containing pyrite preserved in clays dominated by other clay minerals.

F. Handling and Storage of Paleontological Specimens

1. *What factors should I consider when accepting paleontological specimens for storage?*

Specimens collected and prepared by experienced paleontologists should arrive well supported, padded, and stable. The fossils can range in size from less than a millimeter to thousands of pounds. They are stored in many different ways, including:

- attached to the head of a pin inserted into a polyethylene stopper in a vial
- "cavity packed" in their own form-fitted plaster cradle
- in specimen trays of various sizes with polyethylene sheeting used as padding
- small microfossils mounted on special slides that can be stored in a slide cabinet

When accepting collections for storage, be sure to:

- inspect each specimen and make sure each one is well supported and padded
- ask the paleontologist about the materials used for padding:
  - Do they off gas?
  - Are they durable?
  - If the materials used to pad the specimens have loose threads or fibers, such as cotton and cheesecloth, these can easily snag on delicate parts of the fossil. Ask the paleontologist about other options.
- ask the paleontologist to demonstrate how the specimens should be handled.
- see how easily the specimens return to the storage container.
- note if the specimen label can be seen without handling the specimen. If not, discuss other options with the paleontologist.

Remember: Don't accept the specimens if they have not been properly prepared for storage. You can contact the GRD Paleontology Program Coordinator, the Senior Curator of Natural History, or your regional/SO curator for advice.

2. *How do I ensure the preservation of specimens in storage?*

Practice preventive conservation. Be sure to:

- House the specimens in a proper environment. See the CD-Rom publication *Exhibit Conservation Guidelines*, available from the Harpers Ferry Center.
- Use standard geology/paleontology cabinets for most specimens (see *Tools of the Trade* for additional information). As with other collections, you can store small specimens in trays, and cavity-pack them in polyethylene foam.
- For larger specimens, you'll probably need to use open shelf storage.
    - Very large specimens such as sections of petrified logs may require their own pallet for support.
    - To move these specimens, you'll need a pallet jack.
- Protect the collection from dust and excessive light levels.
- Always use proper handling techniques.
- Pad and support each specimen appropriately.
- Use appropriate storage equipment (see *Tools of the Trade*).

> *Improper storage and handling is a leading cause of specimen deterioration. Fossils are often more fragile than they appear, even if they are mostly rock. Many specimens cannot support their own weight, which makes them extremely vulnerable to improper handling.*

3. *What temperature and humidity levels should I maintain in storage?*

For a mixed paleontological collection, keep a stable:

- temperature between 59° and 77°F.
- relative humidity at 45-55%.

4. *Should I be concerned about light levels?*

There is no evidence that light levels (UV or visible) adversely affect fossils. However, they do affect glues and preservatives used to preserve specimens. So be sure to keep light levels as low as possible.

5. *What about dust?*

Airborne dust that settles on specimens is highly abrasive. Cleaning fossils, even with the gentlest techniques, causes damage too. To help eliminate dust in storage areas:

- keep circulating air as clean as possible (use primary and secondary filtering systems whenever possible)
- keep museum cabinet doors closed
- use dust covers on open rack shelving

- practice good housekeeping procedures:
  - consistently carry out all specified duties
  - use appropriate methods as approved by your park's Housekeeping Plan
  - use proper equipment, such as a HEPA vacuum cleaner and a HEPA air purifier (if needed). See *Tools of the Trade* for information concerning supplies and equipment.

6. *What is the proper way to handle paleontological specimens?*

Contrary to standard museum practice, DO NOT wear cotton gloves when handling paleontological specimens. Fossils may be slippery. You can easily drop a specimen. Use your clean, bare hands to assure a good grip.

Some specimens may have special handling requirements. Discuss these issues with the paleontologist who collected or prepared the specimens. Call the GRD Paleontology Program Coordinator or Senior Curator of Natural History if questions arise. Have enough staff available to assist with especially vulnerable or heavy specimens.

In general, handle specimens as you would other museum objects:

- Handle specimens as infrequently as possible.
- Handle each specimen as though it's irreplaceable and the most specimen valuable in the collection.
- Never smoke, eat, or drink while handling specimens.
- Don't wear anything that may damage the specimen. To avoid scratching and snagging surfaces, be careful of breast pocket contents, jewelry, watches, and belt buckles.
- Use only a pencil when examining specimens.
- Save all information that is associated with the specimen, such as tags and labels.
- Know the condition of a specimen before moving it.
- Lift and/or move the specimen by supporting its strongest structural component. Do not lift it by protruding parts, small bones, or attachments. These areas are weak.
- Use a utility cart with padded shelves and raised sides to transport specimens from one room, area, or building to another. See *Tools of the Trade* for additional information.
- Handle only one specimen at a time and use both hands. Use one hand for support and the other hand for balance.

- If you need to temporarily place a specimen in an unstable position for examination, be sure to support it. Exercise extreme caution in these situations. Return the specimen to a stable base or surface as soon as possible.

- Never hurry when handling specimens. Move slowly.

> *If part of a specimen is broken, reattach it as soon as possible to prevent it from becoming separated or lost.*

7. *Are there any other handling issues?*

Researchers will need to handle specimens in order to study them. But don't assume that every paleontologist who requests collections access is aware of all the proper handling procedures.

Be sure that you:

- know how to appropriately handle all of the specimens in your collection.

- thoroughly brief all collections users on proper specimen handling techniques. A good way to do this is to provide all researchers with a copy of your park's "Collections Handling Guidelines."

- require all collections users to sign a statement agreeing to abide by these and any other applicable rules, as a condition of access.

For additional information, refer to:

- Chapter 6: Figure 6.14, "Example of Written Handling Rules for NPS Collections" on page 6:30

- Appendix G: Figure G.6., "Sample Visitor Log" on page G:32, and Figure G.7., "Conditions for Access to Museum Collections" on page G:33

8. *What type of storage equipment should I use?*

Paleontological specimens can vary in size from less than a millimeter to thousands of pounds. You may need to use several different types of storage equipment. Options include:

Standard museum cabinets offer an added measure of security and environmental control. Use cabinets for all specimens small enough to fit safely in a drawer. Take care not to overload cabinets or drawers. As with other collections, use cavity packing and padding to keep specimens in place and eliminate any movement when someone opens a drawer. See Figure U.1. below.

Figure U.1. Cabinet storage of paleontological specimens. Individual specimens are cavity-packed in polyethylene foam-lined specimen trays. Courtesy of John Day Fossil Beds National Monument.

Open rack shelving with a steel frame and ¾ inch plywood shelves, will safely hold moderate size specimens. Use exterior grade plywood and completely seal all surfaces. You can use either a 2-component water-based epoxy paint or a water-based urethane sealant. Line each shelf with polyethylene foam and pad/support each specimen with foam or another suitable material. Another option is to use custom-made reinforced fiberglass jackets (see Figure U.2. below). This is the same principle as cavity packing, but on a much larger scale.

Figure U.2. Paleontological Specimen cradled in polyethylene foam-lined fiberglass jacket. Courtesy of John Day Fossil Beds National Monument.

Remember: Unsupported components of specimens can easily be damaged by gravity. Also, do not over-pack shelves. This will increase the likelihood of damage from handling.

Pallets are a safe technique to store large specimens. Some fossils may weigh thousands of pounds. Pallets are a relatively inexpensive alternative to specially designed, heavyweight shelves. You'll need a pallet jack, a front-end loader, or a forklift to transport these large specimens. Be sure to properly support all specimens, especially before moving them. You will also need to have room for the forks of a loader to get under the pallet without damaging the specimen or support structure. Discuss methods for moving the specimens with the paleontologist who collected or prepared them. You can also contact the GRD Paleontology Program Coordinator or the Senior Curator of Natural History for assistance.

9. *How should I label fossil specimens?*

Labeling Directly on Specimens

You can directly label bone, shell, and other specimens with a hard, fairly smooth surface. Be sure to use a stable acrylic resin (such as Acryloid B-72) to the seal the surface below the number. If you don't, inks can penetrate many surfaces. This can cause permanent alteration or require aggressive scraping to remove labeling errors. See *COG* 1/4 for additional information.

If the surface is too rough or irregular to permit writing directly on the specimen:

- Place a small square of enamel paint (usually white) on the specimen to provide a surface for the catalog number.
- Make sure the paint is completely dry before writing the catalog number.
- Keep the painted area as small as possible in order not to obscure anatomical details.

> *Be careful not to write the catalog number in a place that will obscure any critical anatomical details.*

Other Labeling Strategies

For other types of fossils (those that lack a hard surface), such as the trace fossils discussed above, you'll have to use different labeling methods. Such techniques are similar to those used for other types of collection materials, and may include:

- paper labels tied to the specimen with string
- catalog numbers written on storage containers (using permanent ink)
- labels attached to storage containers
- labels otherwise attached to the specimens in a non-permanent way, such as:
    - a twill tape label (with the catalog number written on the tape in permanent ink) tied to or gently, *but not tightly!* tied around the

specimen
- a similarly-used Tyvek® label

For additional labeling strategies, refer to Appendix T: Curatorial Care of Biological Collections, *COG* 1/4, your regional/SO curator, the NPS Geologic Research Division (GRD), Paleontology Program Coordinator or the Senior Curator of Natural History.

G. Health and Safety Issues

1. *What health and safety issues are related to paleontological specimens?*

Many fossils are oversized and heavy. Don't injure yourself or others. Always:

- Lift properly (use your legs to avoid back strain). For moving and lifting heavy specimens use a:
  - pallet jack
  - forklift
  - other equipment

  Note: Before using any such equipment, be sure that you and others are properly trained in its safe operation.
- Maintain a good grip; don't drop a specimen on someone's foot.
- Wear personal protective equipment (PPE), if needed, such as:
  - Hard hats when working beneath large full skeleton exhibits or whenever you're below overhead hazards that:
    a) might fall on you
    b) you might bump your head against.
  - Respirators if a specimen is being prepared. This will protect you from inhaling hazardous mineral dust.

    Note: Before you can use a respirator, you must first undergo a medical evaluation, formal training, and fit testing. For additional information concerning respirator use, see *COG* 2/13.

> ***Be aware that some specimens may be radioactive.***

2. *What types of specimens might be radioactive?*

Fossils from any of these deposits may be radioactive:

- The Morrison Formation and the Glenns Ferry Formation contain uranium.

- Black Shales can emit radon.
- Phosphate deposits like the Phosphoria Formation may include radon-producing minerals.
- Carnotite, which contains uranium, is often found in fossil logs in the Morrison Formation, present in many western parks.
- Sandstone often contains petrified trees and other fossils, which may be radioactive

Ask the collector if the specimens were checked for radioactivity. If not, you'll need to arrange for testing.

3. *How do I test fossils for radioactivity?*

Use a Geiger Counter or a Scintillator. If you do not have this equipment, perhaps a local university's geology department or the state geologist's office can help.

Another option is this low-cost test:

> Place a small piece of unexposed black and white photographic film in a lightproof sleeve and place the specimen on the sleeve. When the film is developed, any fogging will indicate that the specimen is radioactive (Blount, 1990).

4. *What is radon?*

Radon is a radioactive gas resulting from the radioactive decay of radium. Radium is formed by the decay of uranium. As radon decays, it forms radioactive by-products called progeny, decay products, or daughters. These radioactive by-products, if inhaled, can damage lung tissue and cause lung cancer.

Radon is invisible and odorless. It is a dangerous health hazard when it accumulates to high levels inside homes or other structures. Radon is deadly. Indoor radon exposure is estimated to be the second leading cause of lung cancer deaths each year in the United States.

If your park's collection contains radioactive fossils, be sure to monitor radon levels in specimen cabinets and storage areas. Your park safety officer can arrange for appropriate radon

5. *How should I protect staff and the public from radioactive specimens?*

Never be careless around radioactive materials. Follow these general rules:

- Minimize all contact with radioactive specimens.
- Protect everyone from breathing in radon or inhaling or ingesting other radioactive particles.
  - Do not crush, saw, or grind radioactive minerals so as to cause their dust to enter the air, especially indoors.

- As with all museum specimens, never smoke, drink, or eat while handling radioactive minerals.

Note: Inhalation of radon or breathing in or ingesting radioactive minerals or their dust is the most likely method of radiation exposure.

- Wear latex or nitrile gloves whenever handling radioactive specimens.

- Always wash your hands after handling radioactive minerals.

- Work to minimize deposits of radioactive particulates on staff:

  - Always wear a labcoat or other protective outer wear.

- Store all radioactive specimens appropriately. Post proper labels and signage (see Figure U.3. below). Make sure that everyone knows the nature of the materials that they might be handling. Be sure to provide everyone accessing these collections with guidance on handling, precautions, and procedures.

- You may need to store radioactive specimens in a special cabinet with a venting systems (see Figure U.3. below). Refer to *Conserve O Gram* 2/5 "Fossil Vertebrates as Radon Sources: Health Update" for additional information.

- If possible, store radioactive specimens in a separate, secured room that is vented to the outdoors.

Additional Important Safety Notes:

The general rules stated above are NOT adequate for specimens emitting high levels of radiation. Consult an industrial hygienist or the National Institute for Occupational Safety and Health (NIOSH) for assistance developing appropriate control measures.

Contact NIOSH by telephone at: (800) 356-4674 or on the web at: < http://www.cdc.gov/niosh/homepage.html > .

NIOSH also conducts Health Hazard Evaluations (HHE). A HHE is the study of a workplace to see if workers are exposed to hazardous materials or harmful conditions. To request a HHE, or for more information, see the HHE Program website at: < http://www.cdc.gov/niosh/hhe/default.html > . Requests for a HHE must be in writing. The HHE Program website includes an on-line HHE Request Form.

For additional information concerning a HHE relative to paleontological collections, refer to:

Jiggens, Timothy, E., John J. Cardarelli, and Steven H. Arhrenholz. *NIOSH Health Hazard Evaluation Report: Hagerman Fossil Beds National Monument, National Park Service, U.S. Department of the Interior, Hagerman, Idaho*, HETA 96-0264-2713. Cincinnati:

National Institute for Occupational Safety and Health, 1998. Available on the web at: < http://www.cdc.gov/niosh/hhe/reports/pdfs/1996-0264-2713.pdf > .

Remember:

- There is an inverse square relationship between the level of exposure to radiation from a mineral and the distance you are from it. Radiation levels drop off dramatically the farther you are from the specimen.
- If you plan to use shielding for a radioactive mineral on exhibit, build it using wood and/or acrylic (Plexiglas®).

Figure U.3. Radioactive Specimen Cabinet with Venting System and Safety Signage. Courtesy of Hagerman Fossil Beds National Monument.

Always store specimens appropriately and use proper labels and signage that identifies ALL hazardous materials.

6. *Who should I consult for additional safety information?*

For more information, contact your park safety officer, park or regional public health specialist, regional/SO curator, GRD Paleontology Program Coordinator, or the Senior Curator of Natural History.

7. *Are there any special requirements for loans and shipping of radioactive specimens?*

Yes. The U.S. Department of Transportation (DOT) regulates commercial shipments of hazardous materials, including radioactive articles. These regulations also apply to naturally occurring radioactive substances, such as some fossils. All commercial shipments of radioactive specimens must be in accordance with the shielding, packaging, labeling, and other requirements noted in 49CFR173.426.

Note: The DOT regulations do not apply to shipments of specimens by

NPS (or other Federal) employees in a park (or other U.S. Government) vehicle.

> *If you plan to ship radioactive specimens via commercial carrier (Federal Express, UPS, or another firm), and no one at your park has received hazardous materials transportation training, you will need to hire a certified contractor to prepare any such shipments for commercial transport.*

H. Security and Fire Protection of Paleontological Collections

1. *What are the fire and security considerations for paleontological collections?*

Fire and Disasters. Fossils are just as susceptible to damage due to fire and natural disasters as many other collections. Be sure to:

- Always practice fire prevention, including staff training (such as annual extinguisher training).
- Have an appropriate level of fire protection in every structure where specimens are stored and exhibited, preferably a fire suppression system.
- Have an up-to-date Emergency Operations Plan (EOP). Your EOP should include information about the museum collection, including:
  - the special needs of all collections, including paleontological resources
  - all hazardous collections and materials, including locations and any special requirements

Security. Paleontological specimens have a very high monetary value. The market for fossils is similar to the art market. Collectors compete for prize fossils. There is a thriving black market for fossils. As a result, you may need to implement increased security protection for your collection. Discuss the options with your regional/SO curator, park protection staff, and/or regional law enforcement specialist.

Type specimens. Your collection may include type specimens. Type specimens represent a specimen upon which the description of a new type of fossil taxon is based. As such, it is the specimen to which all future specimens will be compared. As a result, they are priceless to science. Designate all type specimens as controlled property.

> ***Designate all type specimens, monetarily valuable specimens, and all exhibited fossils that are particularly vulnerable to damage or theft as controlled property.***

For additional information, contact your regional/SO curator, regional structural fire management officer, and regional law enforcement specialist.

2. *How can I determine if certain specimens are monetarily valuable?*

You don't have to hire a professional appraiser. You can obtain a good estimate of a fossil's current "market" value by consulting the web catalogs of commercial fossil dealers. When in doubt, contact the GRD Paleontology Program Coordinator or the Senior Curator of Natural History for advice.

Note: Once you've determined a specimen's market price, be sure to note that information on the ANCS+ catalog record.

3. *Are some specimens at increased risk of theft and/or vandalism?*

Yes. There is an ever-increasing commercial market for fossils. Some types of fossils tend to remain popular. These include trilobites, dinosaur parts, amber, and shark's teeth. Skulls, teeth, leaves, and insects can also command high prices.

As with any item, "commercial value" depends on rarity, quality and type of preservation, completeness, or a unique attribute. Some petrified wood can be considered gemstone quality.

Ultimately, all fossils can be potentially sold. Consider all paleontological resources as vulnerable.

4. *How should I best protect specimens at risk?*

Ensure that all museum areas have an appropriate level of security and fire protection. This includes:

- security, access, and other relevant standard operating procedures
- locks (which are always used) on doors, exhibit cases, and storage cabinets
- electronic fire and intrusion detection systems
- a fire suppression system
- fire prevention and fire and security awareness training for all staff
- an up-to-date Structural Fire Plan, Security Plan, and Emergency Operations Plan

These are just a few of the fire and security measures that your park should undertake. For additional information, consult your regional/SO curator and Chapter 9: Museum Collections Security and Fire Protection.

I. Exhibiting Paleontological Specimens

1. *What should I consider when planning or rehabilitating an exhibit?*

Fossils come in all shapes and sizes. First and foremost, consider how you'll place the specimen in the exhibit. Many specimens like shells are simple in shape and can support their own weight. For other specimens, you may have to construct special supports. You should also consider:

- Does the design specify placing the specimen on the floor of the case or attached to the wall?
- Is there a particular part of the fossil that should be clearly visible to illustrate a certain exhibit topic? The exhibit's theme may determine how to display the specimen.

- Does the fossil have projections that are easily broken or snapped off? If so, you may need to build a custom support to position the specimen for easy viewing.

- In some cases adhesives have been used to attach fossils to the exhibit case's interior.

  – Will the adhesive damage the fossil?

    Note: Only use adhesives to mount fossils inside exhibits as a last resort. Be sure to consult with an experienced conservator before using any adhesives.

  – Can it be easily removed or dissolved without damaging the fossil?

  – What is the life of the adhesive?

  – If it becomes dry and brittle, is there the potential for the specimen to fall and become broken?

2. *Are there any other exhibit planning considerations?*

Conservation: Be sure that your exhibits are conservation-conscious. Everyone on the planning team (including contractors) must understand that the preservation of the specimen is paramount.

Security: If you plan to mount a complete skeleton, it's critical that you construct a barrier. The barrier must effectively place the specimen beyond the reach of visitors. There is a strong tendency on the part of visitors to want to touch exhibited specimens. Some parts, such as ribs, can be easily grabbed and ends snapped off. Tails are likewise vulnerable.

Also, as noted above, commercially valuable fossils are at increased risk of theft. For unusual or rare specimens on exhibit, you may need to implement additional security measures. Discuss this matter with your regional/SO curator and park law enforcement staff.

3. *Are there any particular environmental concerns for specimens on exhibit?*

Yes. Fossils that retain their original organic constituents, particularly those from the Pleistocene (Ice Age), may be sensitive to high humidity or ultraviolet light. To ensure their preservation, keep relative humidity levels at 45-55% and eliminate all sources of UV light.

4. *Where can I obtain additional information about exhibiting paleontological specimens?*

Consult the following resources:

- Chapter 7: "Using Museum Collections in Exhibits," in the NPS *Museum Handbook*, Part III: Museum Collections Use
- *Exhibit Conservation Guidelines* CD-ROM, available from HFC.

See Section III. References, for ordering information

- NPS Geologic Research Division, Paleontology Program Coordinator
- NPS Senior Curator of Natural History
- your regional/SO curator
- conservation staff at the NPS Harpers Ferry Center (HFC)
- paleontological/curatorial staff at other NPS units
- paleontological, curatorial, and conservation staff at university, state, or regional natural history museums

J. Preparation and Conservation of Specimens

1. *What is preparation?*

Preparation is the process of readying a paleontological specimen for exhibit, curation, or research use. Preparation can include:

- Removing the rock matrix surrounding some fossils. This enables scientists to conduct a more detailed study of the specimen. It also minimizes the amount of dirt and rock introduced into a specimen cabinet.

  Note: Some specimens must be left in the rock matrix. This provides critical support and stability to the fossil. Also, it may be impossible to remove some fossils from the surrounding rock, such as a fossil leaf or insect.

- Re-attaching broken pieces.

- Applying some type of preservative or consolidant (also called a hardener). This can strengthen the specimen and make it more durable for handling.

2. *Who can I contact to prepare my park's fossil specimens?*

Consult a trained fossil preparator for assistance. Only an experienced fossil preparator (or a curator who has received such training from a preparator) should prepare specimens. If you do not possess such training, contact the NPS GRD Paleontology Program, your regional/SO curator, the Senior Curator of Natural History, or a local university's paleontology department for assistance, recommendations, and/or training opportunities.

Figure U.4. Preparator preparing a specimen. Courtesy of Hagerman Fossil Beds National Monument.

3. *Why should I contact a preparator?*

Fossils differ from other natural history collections; they often require preparation. This is an important intermediate step between their collection in the field and final cataloging and exhibit or storage for research. Only trained professionals should attempt to collect and prepare fossil material. Well-meaning but untrained individuals can easily damage or destroy a specimen. This can rob science of vital data and diminish its value for display, education, or future research.

Protect your collections from such avoidable damage:

- Do not attempt to work on fossils unless you are a trained preparator.
- Do not allow additional preparation to be done by anyone without proof of their qualifications.
- Always document all work done to a specimen and all preservatives used. Keep such documentation in the specimen's catalog folder, accession folder, and/or catalog record. Also, record treatments in the Conservation Module and/or the Preparation Treatment Module of ANCS+.
- Be sure that you obtain all associated records about any fossil deposited in your collection. These records should include all pertinent preparation data. In addition to the general provenience and catalog data required for ANCS+, you should maintain a complete preparation history for each specimen. This record should include:
  - any chemical used to clean the specimen
  - a list of all glues and fillers used
  - any comments the preparator may have recorded. Many labs that

do fossil preparation maintain preparation record cards (see Figures U.5 and U.6).

Note: ANCS+ contains a Preparation Treatment Module.

> *Only trained professionals should attempt to collect and prepare fossil material. Unnecessary damage to the specimen can rob science of vital data and diminish its value for display, education, or future research.*

4. *Are there preparators that my park can hire under contract to prepare specimens?*

Yes. You can contract with a museum or university with a fossil preparation laboratory. Parks with paleontology as their focus may have a fully functioning preparation lab. If so, they may be able to assist your park to prepare specimens.

You can hire a trained private practice fossil preparator to work for your park under contract on a project. Check with the Paleontology Program Coordinator in the GRD, the Senior Curator of Natural History, or with paleontologists at other parks on how to proceed if extensive preparation of a specimen is required.

Another option is to use qualified volunteers. Perhaps your park can recruit a retired paleontologist, graduate student, or other individual with fossil preparation skills for the Volunteers-In-Parks (VIP) program. Contact the Paleontology Program Coordinator in the GRD or the Senior Curator of Natural History for assistance.

5. *Are there any special considerations regarding preparation?*

Yes. Fossils should be prepared as quickly as possible. Unprepared fossils are unusable for research, exhibit, or educational purposes and may introduce dust and dirt into storage cabinets.

Also, be aware that:

- Not all glues and consolidants are reversible. Those that contain either alcohol or acetone as a solvent may be reversible. Epoxy adhesives, sometimes used for larger specimens, may not be easily reversed.

- Certain preparation treatments can affect the utility of the specimen:

  – Some hardeners can affect chemical testing.

  – Organic hardeners may contaminate a specimen. This will prevent the use of the Carbon 14 dating technique (for specimens younger than 50,000 years).

  – The ability to extract fossil DNA or study isotopes (to determine the animal's diet) also can be impaired.

  Remember: Many specimens were initially prepared according to the original project's research design and/or the specimen's intended

conservation) will not alter or compromise the specimen's relevance to such research or hinder future investigation.

> *It's impossible to predict what scientific sampling techniques will be developed in the future. Therefore, be sure to keep a permanent record of all chemical treatments applied to the specimen. It then may be possible to remove a chemical at some later date (in order to conduct further analysis).*

6. *How much time does it take to prepare a specimen?*

Preparation time depends on the fossil's size, type of preservation, and nature. Such work can be time consuming. A single dinosaur skeleton such as the *Allosaurus* found at Dinosaur National Monument required 7000 staff-hours of preparation over 4 years. Other types of fossils, such as plant impressions in rock, may require little to no preparation. Other fossils might be ready for exhibit or storage within a matter of days or weeks.

7. *Should I have damaged and/or incomplete specimens repaired?*

Yes, if you don't make necessary repairs, any broken parts can easily become separated and lost. Contact an experienced fossil preparator to repair any broken specimens as soon as possible.

8. *Are there occasions when I should not have a preparator repair a damaged specimen?*

Yes. In some cases repair may not be possible. Store the loose pieces in a properly labeled vial or other container. Depending on the nature of the break, the pieces may be too large or heavy to be reattached (like dinosaur bones).

On rare occasions, breakage may be seen as fortuitous: it permits examination of the specimen's internal structure. In these instances, you may decide against repairing the break.

9. *What's the best way to repair specimens?*

Avoid the need for repair. Make certain that specimens are not damaged in the first place:

- Consistently practice preventive conservation.
- Ensure that all collection users know and use proper handling techniques.

If breakage does occur, take time to determine the cause. Was the breakage:

- accidental (someone bumped into the specimen)?
- due to mishandling (the specimen was handled inappropriately)?
- a result of improper storage or exhibit design? Is the specimen:
  - not in a cradle or other support structure?
  - not properly supported or protected?
  - in a support that needs to be modified?

Remember: The best conservation approach is a preventive one. Once a specimen is broken, it is likely to be broken in the same spot again.

10. *What about applying protective coatings to specimens?*

As noted above, it's appropriate and sometimes necessary to use a hardener or consolidant to strengthen a fossil. This can ensure its long-term stability. However, while the anatomical features may be preserved, such treatments can impact research utility (Carbon 14 dating, isotope studies, or the extraction of DNA).

The best protection for fossils on a flat surface (such as leaves, insects and fish on the bedding plane of shale) is a thin clear coating.

For three-dimensional fossils such as bones, the preparator may need to saturate the specimen with a hardener in order to increase its structural integrity. In these cases, a thin covering may not suffice. If this protective shell is damaged or broken and the specimen lacks internal strength, the entire specimen may crumble.

Once again, you need to consider the intended use of the specimen (exhibit, research, or possibly both) before you make any treatment decisions.

11. *Who should clean specimens?*

To a paleontologist, the cleaning of fossils means the removal of the surrounding rock or matrix during the preparation process, as previously discussed. Once the specimens are prepared, they are subject to accumulating dust, just like other museum objects. To minimize dust on specimens:

- house small specimens in closed storage cabinets
- cover open shelving with plastic sheeting

These actions cannot eliminate all dust. Unless you conduct periodic housekeeping, dust and dirt will accumulate. Consult your park's Museum Housekeeping Plan to determine the frequency that fossil specimens should be periodically cleaned. If you do not have a Housekeeping Plan, or if it is out of date, consult your regional/SO curator, the GRD Paleontology Program Coordinator, the Senior Curator of Natural History, and/or a natural history conservator to establish recommended cleaning guidelines.

From time to time, you'll need to gently vacuum and/or use a soft brush to dust certain specimens. Many larger bones may have fragile processes that are easily broken or snapped. As with all other collections, be very careful whenever removing dust from

SECTION II: GEOLOGICAL COLLECTIONS

A. Overview

1. *What information concerning geological collections will I find in this appendix?*

In this section of the appendix you will find:

- a discussion of the characteristics of geological collections
- guidelines and resources to aid in identifying different types of geological specimens
- tools for recognizing deterioration
- information about proper storage environments
- health and safety concerns
- additional sources of information

2. *Why is it important to practice preventive conservation with geological specimens?*

The general impression that "rocks" are inert, strong, and durable is false. Many geological specimens can be:

- fragile
- chemically active
- easily damaged

3. *How do I learn about preventive conservation?*

Read about the agents of deterioration in Section C and the proper storage of specimens in Section D. See Chapter 3: Preservation: Getting Started, and Chapter 4: Museum Collections Environment, for a discussion on the agents of deterioration. Also refer to *Museum Handbook*, Part III (*MH-III*), Chapter 7: Using Museum Collections in Exhibits.

4. *Where can I find the latest information on care of geological specimens?*

Several professional organizations focus on the care of natural history collections, including geological specimens. Such organizations' publications often contain articles on the care of geological specimens. Examples include:

- The Society for the Preservation of Natural History Collections (SPNHC) publishes *Collection Forum*
- The Geological Curators' Group in England publishes a newsletter, *The Coprolite* and a technical series, *The Geological Curator*.

Refer to Section III of this appendix for additional information.

B. Geological Collections

1. *What types of geological specimens are generally found in park collections?*

Since all parks have geology, there's always the potential for geological specimens in a park's collection. Geological collections can include:

- rocks (igneous, sedimentary, and metamorphic)
- mineral specimens (including crystals)
- ores
- cave formations and minerals
- samples of geological formations
- soils
- building stone samples

2. *What is a rock?*

A rock is an aggregate of one or more minerals or a body of undifferentiated mineral matter. Rocks are divided into three different types:

- Igneous Rocks solidified from molten or partly molten material. Examples include:
  - basalt lava flows found at Hawaii Volcanoes, Craters of the Moon, El Malpais, Lava Beds, and Devil's Postpile
  - lava bombs (features associated with lava flows)
  - granite at Yosemite
  - obsidian at Yellowstone
- Sedimentary Rocks result from the consolidation of loose sediment that has accumulated in layers. Sedimentary rocks are divided into:
  - clastic rocks formed by the mechanical breakdown of fragments of older rock, such as sands and shales
  - chemical rock formed by the precipitation of minerals such as gypsum or limestone from solution
  - organic rock formed by the secretions of plants or animals or accumulations of organic matter such as coal or shell fragments called coquina used in the construction of the fort at Castillo de San Marcos

  Examples include sandstones in Glen Canyon, limestones at Guadalupe Mountains, dolomites, shales, clays like bentonite at Bighorn Canyon and Cuyahoga Valley, and coal at New River Gorge.

Some parks have loose sands and sand dunes. Samples of sand may be collected and placed in the park collection such as the gypsum sand at White Sands or silica sands at Great Sand Dunes or Sleeping Bear Dunes.

- Metamorphic Rocks are modifided pre-existing rocks. They undergo metamorphosis in response to marked changes in temperature, pressure, shearing stress, and chemical environment. Examples include:
  - gneiss and schist in the Grand Canyon
  - marble at Oregon Caves, Great Basin, and Mojave

3. *What is a mineral?*

Characteristics of minerals include:

- naturally occurring inorganic element or compound
- orderly internal structure
- characteristic chemical composition
- crystal form
- physical properties

Examples include pyrite (also known as "Fools Gold") from Prince William Forest and borate minerals from Death Valley. Today, over 4,200 different types of minerals are known to science.

4. *What are ores?*

Ores are the natural material from which a mineral of economic value can be extracted at a profit. In general, the term is used to refer to metal-bearing rock. Many parks have historic mines and samples of ores from these mines may be present in the park collection. Copper ores are known from Delaware Water Gap, Keweenaw, and Wrangell-St. Elias. Prince William Forest has a historic pyrite mine.

5. *Why do some collections include cave formations?*

Even though NPS policy is to ensure that all cave minerals and formations are managed in place, many parks with caves will have examples of cave formations (stalactites, stalagmites, cave pearls) or minerals in their collections. Often these specimens were salvaged during trail construction or other similar activities.

Most cave formations are composed of calcium carbonate but may be formed by either calcite (more commonly) or aragonite (rarer) crystals. Cave formations composed of aragonite are more fragile and subject to damage. There are a variety of cave minerals. Depending on their chemical composition, they may require special conditions for their preservation.

Cave formations and minerals are in the collections at Mammoth Cave and Carlsbad Caverns. A good reference for helping with the identification of cave formations and minerals is *Cave Minerals of the World* by Carol Hill and Paolo Forti (1997).

6. *Why do some collections contain quarried stone?*

Some parks like Harpers Ferry and Acadia have historic stone quarries that were used in building construction. Examples of the rock types from these quarries may be placed in the park collection. Other parks, such as Alibates Flint Quarries, may have prehistoric quarries where chert or flint was mined by Native Americans or the catlinite quarry at Pipestone. Reference samples of this rock material may be placed in park collections.

7. *How do I identify the different types of specimens?*

You may need a geologist or mineralogist to help you identify a particular mineral, but the standard reference for mineral identification is: *Dana's New Mineralogy: The System of Mineralogy of James Dwight Dana and Edward Salisbury Dana* by Richard V. Gaines et. al. (1997).

C. Factors That Contribute to Specimen Deterioration

1. *What agents of deterioration affect geological specimens?*

Deterioration can result from:

- Physical damage resulting from improper storage or handling
- Chemical changes, depending on the chemical composition of the specimen and the environment in which it is stored.

2. *How can I identify active deterioration?*

Look for:

- physical changes in the specimen, such as changes in size or shape
- "growth" of new minerals on the surface
- spalling
- breakage
- powdery residues
- change in color
- change in translucency
- swelling
- uncharacteristic odors

Also, look for darkening, embrittlement, and shrinkage of old coatings and adhesives. These can be very damaging to geological collections.

3. *How can I protect my specimens from deterioration?*

The best approach is to maintain:

- proper storage
- climate control systems
- an active environmental and Integrated Pest Management (IPM) monitoring program

Begin at the microenvironmental level and work outward. If you have a limited budget, you may have to start small. First, invest in archival-quality enclosures and trays. If you have additional funding available, perhaps you can purchase new storage cabinets. The perfect scenario, if funding is appropriate is:

- a heating and cooling system that maintains appropriate environmental conditions facility-wide
- proper storage cabinets
- archival-quality enclosures and trays

No matter what your park can afford, be sure to take the time to maintain accurate records of your museum facilities' environments, including:

- temperature
- relative humidity
- visible and UV light
- IPM

4. *What is the best relative humidity and temperature for my specimens?*

Maintain a stable storage environment:

- temperature of 59° - 77°F
- relative humidity at 45-55%

Relative humidity may not be a critical factor in the storage of most geological specimens. However, some anhydrous (water-free) minerals will absorb moisture from the atmosphere. Store these specimens in a cabinet or room that is maintained in a low humidity environment. You may need to place trays or packages of silica gel or some other desiccant in the cabinet to help reduce humidity levels. Conduct regular monitoring. Remember to regularly check and recondition or replace the silica gel, as needed. For additional information, see *COG*s 1/8 "Using Silica Gel in Microenvironments" and 2/15 "Cobalt Indicating Silica Gel Health and Safety Update."

5. *Should I be concerned about atmospheric pollution?*

Yes. Both gaseous and particulate pollutants can accelerate deterioration, especially if they are acidic or caustic. Many minerals, including calcium carbonate, are highly susceptible to reactions with acids. Particulates can lodge on surfaces and surface coatings, which you'll need to clean off (this

is never a risk-free procedure [see below]).

In addition, some geological specimens are themselves sources of gaseous pollutants:

- mercury vapor is readily liberated from cinnabar
- a number of uranium-series minerals release radon
- asbestos-containing minerals may break down enough to release inhalable particles

> *Monitor all specimens known to contain hazardous substances. Seek expert advice. Remember that such items may require separate storage (or transfer to a more appropriate facility).*

6. *Does cleaning contribute to deterioration?*

Yes. Both custodial (room-level) cleaning and specimen (preparation-level) cleaning can expose the specimen to rough handling and caustic materials. Maintenance chemicals that can cause severe damage to specimens include: chlorine bleach, ammonia, other cleaning agents, waxes, and related materials. Whenever possible, utilize nontoxic cleaning alternatives (see *COG* 2/21 "Safer Cleaning Alternatives for the Museum and Visitor Center"). Carelessness and improper techniques can cause damage through vibration and impact.

Remember that specimen cleaning is an irreversible process in many instances. Cleaning can cause loss of:

- matrix
- parts of the actual specimen
- associated trace material

Don't clean a specimen just to keep up a routine. Ask yourself if cleaning really is necessary. If not, don't do it.

7. *Are there any other deterioration concerns?*

Some sulphate-based cave minerals such as selenite (calcium sulphate) and epsomite (magnesium sulphate) readily absorb water from the atmosphere and can disintegrate. To prevent deterioration, any mineral that can potentially absorb water must be stored in a low humidity environment. For additional information, see Holmberg (2000) and Jerz (2000), noted in the bibliography.

D. Handling and Storage of Geological Collections

1. *What do I need to know about handling specimens?*

Weight

Depending on the size of the specimen, weight can be a major factor. You may need to access heavily loaded cabinet drawers. Be sure not to overload drawers; consult the manufacturer's recommended weight loads and do not exceed them. Always use extreme caution; due to its weight, if a specimen

shifts it may cause the drawer to tip.

Transport
Never carry specimens to a table or other area. Use a wheeled, sturdy cart with a padded surface to transport specimens between storage cabinets and exhibit or research areas.

Handling
Protect the specimen. Practice limited handling. Specimens should spend as little time outside storage cabinets or exhibit cases as possible. Only handle specimens on or over a work surface.

Gloves
Contrary to standard handling practice with other museum collections, DO NOT wear cotton gloves when handling geology specimens. The specimen may be slippery, and you could easily drop it. Use your clean, bare hands to assure a good grip.

Lab Coats and Other Protective Outerwear
Wear a labcoat or other type of protective outer garment when handling collections. This will help to minimize deposits of particulates and dirt on your clothing. Wearing a labcoat also helps to protect the specimen from damage due to contact with badges, jewelry, and belt buckles. Another option is to wear a Tyvek® "jumpsuit," sold in paint stores.

2. *How should I store specimens?*

Use standard geology cabinets for most specimens (see *Tools of the Trade* for additional information). As with other collection items, you can store small specimens in trays, cavity-packed in polyethylene foam. This is a good idea for items that may require more frequent access and transport for research purposes.

For larger specimens, you'll probably need to use open shelf storage. Very large specimens such as pieces of building stone or larger ore samples may require their own pallet for support. To move these specimens, you'll need a pallet jack.

Since a specimen may spend well over 95% of time in storage, proper storage systems are a wise long-term investment. As with all collections, inappropriate storage materials put the specimen at risk. Always use acid-free, inert storage materials and housings. Cabinetry should be of steel construction, with high gloss, epoxy powder coatings.

3. *What additional protection do geological specimens need in storage?*

- In general, don't leave a specimen on a bare surface exposed to the open lab conditions.
- Make sure that specimens (particularly large ones) are not supporting their weight on appendages, attachments, or other weak areas.
- Pad surfaces with inert closed-cell polyethylene foam (such as Volara® or Plastizote®).
- Use closed storage wherever possible.
- For large specimens, use custom-made reinforced fiberglass jackets (the same principle as cavity packing, but on a much larger scale).

This facilitates open shelf storage.

- Place smaller specimens in specimen trays.

Protection from high and/or fluctuating temperature and relative humidity are important for all specimens. Other threats include:

- UV exposure
- water
- fire
- theft and vandalism
- related factors

E. Health and Safety Issues

1. *What health and safety issues are related to geological specimens?*

Some minerals may contain elements that are toxic. The most common ones are:

- Aluminum
- Antimony
- Arsenic
- Beryllium
- Bismuth
- Bromine
- Cadmium
- Lead
- Mercury
- Selenium
- Thallium
- Uranium

Handle all of these minerals with care.

Many parks have historic mines that extracted minerals that may be considered hazardous to human health. Some examples include:

- Cinnabar, which is a mercury sulfide (HgS) mineral.

- Arsenopyrite (FeAsS), which includes arsenic.
- Asbestos, which is a variety of fibrous, nonflammable minerals with flexibility and high tensile strength. Asbestos includes minerals such as chrysotile, amphibole, and crocidolite.

Specimens of these economically important minerals related to historical mining in the parks may be present in park collections and used in park exhibits.

2. *How can I best protect the health of staff and researchers using potentially toxic collections?*

Make sure that a mineral has been properly identified and that you are aware of its chemical composition. If a mineral does contain potentially toxic elements, always wear neoprene gloves when handling it. Be sure to wash your hands after you finish handling any other minerals with bare hands, as a precaution. As with all collections, never allow food or drink around mineral specimens.

> *Always wear neoprene gloves when handling minerals that contain potentially toxic elements.*

3. *What other safety concerns should I consider?*

Take into account the following:

Heavy Metals
Heavy metals cause problems by displacing or replacing related minerals that are required for essential body functions. For example, cadmium can replace zinc, and lead displaces calcium. When this happens, cadmium or lead is stored in the bones or other tissues and becomes difficult to remove from the body. At the same time, the important functions of the minerals that are replaced cannot be carried out.

Toxic Gases
Some minerals may release gases or vapors. In a closed specimen cabinet, this can generate high concentrations of toxic gases. These can include:

- acidic vapors (thought to be primarily carboxylic acid vapors)
- mercury vapor
- sulfur dioxide
- hydrogen sulfide, the gas that tarnishes silver

Label all cabinets housing such minerals with the appropriate National Fire Protection Association (NFPA) Hazard Warning Symbol. This will ensure that all personnel (staff, visitors, and emergency workers) are aware of these potential hazards.

Note: See Chapter 11: Curatorial Health and Safety, Figure 11:4 on page 11:45, for an example of the NFPA Hazard Warning Symbol System.

Also, be sure to note the presence of these minerals in relevant emergency

planning documents (such as your Museum Emergency Operations Plan [MEOP]) and brief all first responders on their presence and locations.

Mineral Dust
Inhaling mineral dust may be more of a hazard than handling the specimen. The amount of dust depends on how friable the specimen is and how it is handled. For example, handling may release asbestos fibers. Although mineral dust may not be a primary problem in museum collections, at times it may be important to use a good quality respirator when handling specimens, especially if they are being cut or trimmed.

Note: Before you can use a respirator, you must first undergo a medical evaluation, formal training, and fit testing. For additional information concerning respirator use, see *COG* 2/13.

4. *Could some specimens be radioactive?*

Yes. Many parks contain radioactive minerals or ores. Some examples of common radioactive minerals include:

- Autunite (hydrated calcium uranium phosphate)
- Brannerite (uranium titanate)
- Carnotite (potassium uranium vanadate)
- Monazite (a mixed rare earth and thorium phosphate)
- Thorianite (thorium dioxide)
- Uraninite (uranium dioxide)

The vast majority of the radioactive content in minerals or ores is either uranium-238 or thorium-232, although other radioactive elements may be present. Uranium minerals are found in Blue Ridge Parkway, and many western parks such as Canyonlands have abandoned uranium mines, so it is possible that uranium minerals will be present in park collections.

5. *What terms should I know that are relative to radioactivity?*

Radioactivity is the spontaneous release of particles and energy by the nucleus of an unstable atom. This is part of a natural decay process in which an unstable element is transformed into a stable element, such as uranium-238 becoming lead-206. There may be a number of intermediate stages or daughter elements.

Radiation in the common sense refers to *ionizing radiation*: a term for invisible particles or waves with enough energy to strip electrons from atoms, causing chemical changes. The three basic types of natural radiation are alpha, beta, and gamma. There are also X-rays and neutrons.

An alpha particle is composed of two protons and two neutrons-essentially it's a helium nucleus, an ionized helium atom (a helium atom devoid of its electrons and having a net charge of +2). Alpha particles are comparatively large and cannot penetrate much more than a sheet of paper or a few inches of air. However, they are extremely potent ionizing agents because they interact with plenty of matter in their [short] path.

A beta particle (actually a "beta-minus" particle, since it has a charge of -1) is a stray electron originating from an atom's nucleus as the result of neutron breakdown. "Beta-plus" particles are positrons or "positive electrons," something seldom encountered in nature. Beta radiation can be stopped by a few centimeters of wood, plastic, or glass. A few millimeters of aluminum will also stop most beta particles.

Note: Do not use lead or other highly dense materials to shield from beta radiation. Certain types of shielding can actually be worse than none. Lead and other dense metals (including tungsten) can emit X-rays when exposed to beta particles such as those thrown out by the natural decay products of U-238 and Th-232. This phenomenon is called *bremsstrahlung*. If the lead is thick enough, the X-rays won't get out the other side of it. Nevertheless, if you're going to use shielding for a mineral display, it's best to make it out of wood or acrylic (Plexiglas®).

Gamma radiation is composed of high-energy photons (invisible light; electromagnetic waves). It has no charge, but its high energy means that it can cause ionization. Fortunately, gamma rays move so fast and have such energy that they often pass right through matter without interacting at all.

6. *How can I determine if specimens are radioactive?*

It's vital to correctly identify a mineral's composition. If you have a specimen that you suspect is radioactive, confirm its identification with a trained mineralogist. Most university geology departments include a mineralogist on the faculty. The crystal structure, color, and other physical properties may permit a quick identification. If a Geiger counter or scintillator is available, you can use it to detect the presence of radioactive particles. If you do not have access to a Geiger counter or a mineralogist, use the procedure to detect radioactivity in specimens proposed by Blount (1990):

> Place the specimen on a small piece of unexposed black-and-white photographic film in a lightproof sleeve and then have it developed to check for fogging.

7. *What is radon?*

Radon is a naturally occurring radioactive gas that is colorless, odorless, tasteless, and chemically inert. It is found in soils, rock, and water throughout the U.S. Because radon occurs throughout the nation, it's possible that specimens in your collection emit radon. Radon has a half-life of only 3.5 days, but when a radon-emitting sample is stored in a closed specimen cabinet, radon levels may come to equilibrium over time. The actual amount of radon will depend on the number, volume and chemical composition of the radioactive mineral specimens stored in the cabinet.

30 CFR, Part 57, Subpart D regulates occupational levels of alpha and gamma radiation in underground uranium mines. Occupational yearly exposure per individual shall not exceed 4 WLM (working level month) alpha or 5 REM (Roentgen Equivalent Man = the amount of ionizing radiation that when absorbed by a person is equivalent to one roentgen or x-ray or gamma radiation) gamma. While these levels may not exist in most park collections, they do provide a standard by which staff safety can be measured. Generally the EPA typically recommends 10% of occupational limits for the general public.

If you have concerns regarding occupational exposure to radioactive specimens in your park's collection, consult with an industrial hygienist,

NIOSH, and/or the U.S. Public Health Service specialist duty-stationed in your park or region.

8. *How should I protect staff and the public from radioactive specimens?*

Never be careless around radioactive materials. Follow these general rules:

- Minimize all contact with radioactive specimens.
- Protect everyone from breathing in radon or inhaling or ingesting other radioactive particles.
  - Do not crush, saw, or grind radioactive minerals so as to cause their dust to enter the air, especially indoors.
  - As with all museum specimens, never smoke, drink, or eat while handling radioactive minerals.

  Note: Inhalation of radon or breathing in or ingesting radioactive minerals or their dust is the most likely method of radiation exposure.
- Wear latex or nitrile gloves whenever handling radioactive specimens.
- Always wash your hands after handling radioactive minerals.
- Work to minimize deposits of radioactive particulates on staff:
  - Always wear a labcoat or other protective outer wear.
- Store all radioactive specimens appropriately. Post proper labels and signage (see Figure U.3. above). Make sure that everyone knows the nature of the materials that they might be handling. Be sure to provide everyone accessing these collections with guidance on handling, precautions, and procedures.
- You may need to store radioactive specimens in a special cabinet with a venting systems (see Figure U.3.). Refer to *Conserve O Gram* 2/5 "Fossil Vertebrates as Radon Sources: Health Update" for additional information.
- If possible, store radioactive specimens in a separate, secured room that is vented to the outdoors.

Additional Important Safety Notes:

The general rules stated above are NOT adequate for specimens emitting high levels of radiation. Consult an industrial hygienist or the National Institute for Occupational Safety and Health (NIOSH) for assistance developing appropriate control measures.

Contact NIOSH by telephone at: (800) 356-4674 or on the web at: < http://www.cdc.gov/niosh/homepage.html > .

NIOSH also conducts Health Hazard Evaluations (HHE). A HHE is the study of a workplace to see if workers are exposed to hazardous materials or harmful conditions. To request a HHE, or for more information, see the HHE Program website at: < http://www.cdc.gov/niosh/hhe/default.html > .

Requests for a HHE must be in writing. The HHE Program website includes an on-line HHE Request Form.

For additional information concerning a HHE relative to geological and paleontological collections, refer to:

> Jiggens, Timothy, E., John J. Cardarelli, and Steven H. Arhrenholz. *NIOSH Health Hazard Evaluation Report: Hagerman Fossil Beds National Monument, National Park Service, U.S. Department of the Interior, Hagerman, Idaho*, HETA 96-0264-2713. Cincinnati: National Institute for Occupational Safety and Health, 1998. Available on the web at: < http://www.cdc.gov/niosh/hhe/reports/pdfs/1996-0264-2713.pdf > .

Remember:

- There is an inverse square relationship between the level of exposure to radiation from a mineral and the distance you are from it. Radiation levels drop off dramatically the farther you are from the specimen.

- If you're going to use shielding for a radioactive mineral on exhibit, it's best to make it out of wood and/or acrylic (Plexiglas®).

> *Always store specimens appropriately and use proper labels and signage that identifies ALL hazardous materials.*

9. *Are there any other human health risks associated with geological specimens?*

Some specimens of rocks or minerals are large and difficult to move. You may want to store such specimens on pallets and use a pallet jack or forklift to move them. Always follow proper safety precautions. Use appropriate techniques and equipment.

F. Security Concerns

1. *Are some types of specimens at increased risk of theft and/or vandalism?*

Gold nuggets and silver specimens have commercial value; store them in a safe. Other minerals may be vulnerable, including:

- certain rare and valuable mineral specimens
- minerals with good crystal structure
- some minerals of gemstone quality
- small specimens, which are easier for a thief to pick up and steal

2. *How should I best protect specimens at risk?*

You may wish to have a professional mineral appraiser examine your collections. An appraiser can provide an indication of the market value of specimens. Appraisals can help you to decide which specimens may require increased levels of security.

As noted above, some specimens should not be stored with other items. Rather, they require their own secure storage areas. Specimens that may

require separate storage include radioactive specimens and those that produce gases.

For additional information concerning museum security, refer to Chapter 9: Museum Collections Security and Fire Protection.

G. Exhibiting Geological Specimens

1. *What should I consider when planning an exhibit?*

Geology exhibits usually focus on two broad interpretive themes:

- Processes. The specimens illustrate a process such as erosion or volcanic activity.
- Objects. The exhibit focuses on the specimens themselves, such as examples of different rock types or mineral ores.

Do not select specimens for exhibit until the exhibit planning team has developed interpretive themes. As the Exhibit Plan progresses, the planning team can then decide how each specimen can best illustrate the story being told.

> *Always consider the durability of a specimen and its value when deciding how to exhibit it (either as a touch specimen or in an exhibit case).*

2. *Are there any particular concerns for exhibiting geological specimens?*

Many geological specimens are relatively inert; they don't require any special conditions. Often, because of their durability, geological specimens are used as touch exhibits. Make sure that specimens selected for use as touch specimens do not contain any toxic or radioactive substances. Place fragile specimens (such as some smaller crystals) inside an exhibit case. Massive crystals such as quartz may be suitable for a touch exhibit.

3. *Are there any specific situations that I should avoid when exhibiting geological specimens?*

Do not assume that all objects classified as geological specimens are the same. Know the properties of each specimen and how these different properties can affect the potential for damage. This includes damage from environmental conditions, improper display, or inappropriate handling.

4. *What should I know about cleaning geological specimens?*

The care and cleaning of specimens on exhibit is similar to that of other objects. Dry dusting and vacuuming may be appropriate for larger specimens but not for smaller fragile specimens. A damp cloth may be appropriate for some rock types but not water-soluble minerals like certain types of salts.

Practice preventive conservation. A proper exhibit case design can prevent dust accumulation. This approach is preferable to cleaning specimens after they become dusty. Know the composition of the specimen and its degree of durability prior to any decision on how it should be cleaned.

H. Conservation of Specimens

1. *When should I contact a conservator?*

Contact a geological conservator if you notice any signs that the specimen is reacting to environmental conditions such as:

- new crystal growth
- deterioration of labels or storage materials

A trained geological conservator may be able to provide simple corrective steps that will address the immediate problem or determine if more serious treatment is warranted. For example, if there is active deterioration of the specimen, the conservator may be able to determine if it is the result of environmental conditions in storage or other causes. Proper diagnosis of the problem is critical in order to correct the situation.

2. *Should park staff repair damaged and/or incomplete specimens?*

Do not attempt any specimen repairs yourself. The various glues and adhesives in common use can cause long-term damage to the specimen. If the specimen is intended solely for exhibit, you may be able to have a conservator repair it. However, it's vital to ensure that specimens used in research are not chemically contaminated. Do not use any adhesives (or any other chemical additives) on such specimens.

> *Remember: Many specimens were initially prepared according to the original project's research design and/or the specimen's intended use. Be sure that any proposed treatments (including preventive conservation) will not alter or compromise the specimen's relevance to such research or hinder future investigation.*

3. *What types of repairs can a conservator undertake?*

A conservator can:

- recommend what can (and cannot) be done for the specimen
- advise you if conservation work is necessary
- do advanced cleaning and stabilization. Such work may be beyond even the resources of a park that has its own laboratory and trained staff.
- undertake delicate repairs and infills of specimens. Note: Infills, reconstructions and replacement of missing parts may be acceptable for exhibition and interpretive uses. Any such repairs should be:
  - easily distinguishable from the original specimen
  - inert
  - reversible

Exhibiting repaired specimens also may require you to alter or revise related interpretive elements. Each specimen creates its own set of concerns and issues.

4. *What type of damage is beyond repair by a conservator?*

A conservator cannot undo irreversible damage. Such examples include:

- fading caused by UV exposure
- breaks

> *Breaks are irreversible. They do not "go away" when the specimen is glued back together.*

5. *Should protective coatings be applied to specimens?*

As a general rule, protective coatings are not currently applied to geological specimens. Older specimens may have been coated with a variety of poor-quality substances, including shellac, waxes, oils, films, and spray-on polymers.

6. *What about cleaning specimens?*

Many larger, hardier specimens (like rocks and ores) can withstand occasional cleaning. In some cases, trained park staff can clean specimens. Appropriate methods, techniques, cleaning supplies, and equipment vary with the chemical composition of the specimen. For example:

- Don't use water to clean certain minerals, such as salt minerals like halite (sodium chloride) or gypsum (calcium sulfate) because they are soluble in water.
- Specimens with small delicate crystals may require procedures to remove dust and dirt.
- Ultrasonic cleaners can be used to clean some small crystal specimens. The technique used depends on the minerals (Hansen, 1984).

Before starting, be sure to consult your park's Museum Housekeeping Plan. It will help you determine:

- which specimens you can safely clean
- which specimens should only be cleaned by a conservator (or some other specially trained individual)
- the frequency that specimens should be cleaned
- appropriate method, techniques, supplies, and equipment.

If you do not have a Housekeeping Plan, or if it's out of date, consult your regional/SO curator, the NPS Geological Resources Division, and/or a natural history conservator to establish recommended cleaning guidelines.

B. Professional Organizations

The Society of Vertebrate Paleontology has a preparators' group and a special session at their annual meetings to discuss fossil preparation and related topics. Contact the society at:

> Society of Vertebrate Paleontology
> 60 Revere Drive
> Suite 500
> Northbrook, IL 60062
> www.vertpaleo.org

The Society for the Preservation of Natural History Collections (SPNHC), represents the interests of natural history collections and the people associated with the management and care of these collections. Publications include *Collection Forum* and *SPNHC Newsletter*. SPNHC's annual meetings include formal presentations and workshops. Contact SPNHC at:

> Society for the Preservation of Natural History Collections
> PO Box 797
> Washington, DC 20044
> www.spnhc.org

The Paleontological Society is an international association dedicated to the science of paleontology. The organization publishes the *Journal of Paleontology*, *Paleobiology*, *The Paleontological Society Memoirs*, *Short Course Notes*, and various other special publications. The society holds an annual meeting, as well as regional meetings. Contact the society at:

> The Paleontological Society
> PO Box 7075
> Lawrence, KS 66044
> (785) 843-1235 ext. 297
> www.paleosoc.org

The Paleobotanical Section of the Botanical Society of America is an organization of individuals concerned with fossil plants. The section

publishes the *Bibliography of American Paleobotany*, as well as other materials and special publications. The Paleobotanical Section holds workshops and conferences at the annual meeting of the Botanical Society of America. For additional information, refer to their website at: < www.dartmouth.edu/ ~ daghlian/paleo > .

The Mineralogical Society of America promotes scientific research, teaching, and educating the public concerning mineralogy. The Society publishes *American Mineralogist*, *Reviews in Mineralogy and Geochemistry*, monographs, a newsletter, and books. It holds courses, lectureships, symposia, and meetings. The organization also gives grants and awards. For further information, contact the society at:

Mineralogical Society of America

The Geological Curator's Group in England was established in 1974 to improve the status of geology in museums and raise the standard of geological curation. Their goals are to advise, inform, and create a forum for discussion for all aspects of the care of geological collections as an irreplaceable part of our scientific and cultural heritage.

The Geological Curator's Group is affiliated to the Geological Society of London. For further information, refer to the Group's website at: <http://www.hmag.gla.ac.uk/gcg > .

C. Glossary

Body fossil: the preserved remains of any anatomical part of a plant or animal.

Carbonization: the accumulation of residual carbon from a plant or animal by changes in the organic matter and decomposition products.

Consolidant: any type of material, often a plastic or shellac, used to hardened and strengthen a specimen. Applied by either specimen immersion or surface application.

Fossil: any remains, trace or imprint of a plant or animal that has been preserved in the earth's crust since some past geological time.

Mineral: a naturally occurring inorganic element or compound having an orderly internal structure and characteristic chemical composition, crystal form, and physical properties.

Ore: the natural material from which a mineral or minerals of economic value can be extracted at reasonable profit. Usually applied to metalliferous material.

Permineralization: a process of fossilization whereby the original hard parts of a plant or an animal have additional material deposited in their pore space.

Pyrite disease: humidity-driven oxidation of pyrite (iron sulfide) that affects the microcrystalline or framboidal forms that change the iron sulfide to iron sulfate.

Replacement: a process of fossilization involving the substitution of inorganic material for the original organic constituents of an organism.

Rock: an aggregate of one or more minerals or a body of undifferentiated mineral matter. Rocks are divided into three different types: igneous, sedimentary and metamorphic.

a. *Igneous Rock:* rocks or minerals that solidified from molten or partly molten material.

b. *Sedimentary Rock:* a rock resulting from the consolidation of loose sediment that has accumulated in layers. Sedimentary rocks are divided into:

- clastic rocks formed by the mechanical breakdown of fragments of older rock such as sands and shales
- chemical rocks formed by the precipitation of minerals such as gypsum or limestone from solution
- organic rocks formed by the secretions of plants or animals or accumulations of organic matter such as coal.

c. *Metamorphic Rock:* any rock derived from pre-existing rocks by mineralogical, chemical and/or structural changes, essentially in the solid state, in response to marked changes in temperature, pressure, shearing stress, and chemical environment.

Trace fossil: a sedimentary structure resulting from the life activity of an animal such as a track, trail, burrow, tube, boring or tunnel, or marks on other fossils indicating feeding or chewing activities or the preserved feces of an animal.

National Park Service
Paleontological Specimens
Preparation/Conservation Record

Catalog Number JODA 8499 Accession Number 248 Field Number DF8001

Taxon: *Stylemys Sp*.

Description: Cranium and shell fragments

1. Permanent Location: Collection Storage, Cabinet 56, Drawer 3

2. Field Observations: when collected it was not recognized as a turtle skull immediately because it was in about 13 pieces and caked with loose sediment.

3. Condition on Receipt: In several pieces and in need of a good wash to reveal the broken surfaces.

4. Development Notes: Prep by Matt Smith

2000

11th Sept	15 min	Started exploring the matrix on the occipital portion of the cranium, removing loose bits and probing and cleaning obvious foramina. Vinac
12th Sept	7 hours	Continued with occipital portion of cranium. Cleaned out right otic capsule. Portion that I had attached before with a drop of vinac loosened and dropped off I cleaned both surfaces and reattached. Removed matrix from ventral surfaces and the right quadrate. The posterior portion of the skull has suffered some wear and tear pre-burial. The occipital condyl is missing as is bone from the area just behind the right otic capsule. The squamate bone I believe? Also the posterior portions of the parietals and supraoccipital. Just started work on the left post-orbital, jugal, and quadratojugal (pojq) portion of the skull. Vinac
13th Sept	5 hours	Worked mainly on pojq today. Started by cleaning off as much of the exterior surface as possible to ascertain if the fractures would allow me to clean out the interior surfaces or just what. Also worked on left otic capsule and discovered that even more of the squamatic bone is missing on this side. Also, it appears that the articular surface of the quadrate has been damaged. The fracturing of the qj is quite extensive and I don't believe it will allow me to clean out the interior surfaces as I had hoped. Vinac
14th Sept	5:45 hours	Continued cleaning out the left otic capsule today and discovered the stapes is present and intact!! Also the large mass of matrix on the dorsal surface of the prootic and the opisthotic was easily removed revealing the suture where the squamosal would have been. The whole area was easily freed of matrix leaving the posterior portion largely exposed. I have decided to limit the amount of matrix in

		the left postorbital area by confining it to a series of arches to provide strength. There are also impressions of missing bone on these arches that I thought may be worth preserving. Worked a bit on the right orbit. Vinac
15th Sept	7:15	Continued on the right orbit and external surface of the fore part of the skull. I made a supportive jacket for the edge of the maxilla and premaxilla and started to expose the knife like edge of these bones. This was done mainly with a pin-vise to avoid damage. I then started to work down onto the premaxilla at the end of the day. Vinac
16th Sept	2 hours	Worked on premaxillae and maxillae. Vinac.
18th Sept	4:15 hours	Continued on palate working backwards exposing crenellations on maxillae. Injected thick vinac into break in left maxilla. This should hold it if I am careful enough. The matrix is hard and then becomes strangely soft about 1/8 to 1/16 of an inch away from the bone. Vinac.
19th Sept	3:45 hours	Continuing on palate. I am now starting to dip into the internal nares and vomerine area. Exposed an area on the posterior most portion of maxilla or perhaps the pterygoid. It was an extremely thin lip of bone and wanted to shatter. I had to preserve it with paleobond because the vinac was too soft and would soften every time I applied more vinac or 'washed the fossil with acetone. The vomer seems to form a knife like ridge that extends all the way back to the pterygoids from the premaxilla area.
20th Sept	2:45 hours	I have removed the supportive jacket because the danger to the maxillae is over and I need more mobility to reach the areas around the vomer and the orbits. I removed the matrix all along the vomer with a needle and the thing is a amazingly thin ridge of bone over most of its length. I have started to try and work behind the jugal and post orbital of the right orbit and clean that area out entirely. It seems stable enough to do this. Vinac.
21st Sept	5 hours	Worked on right orbital and post orbital areas. It has been exceedingly difficult because of the angles involved in getting under the cheekbones. Also the huge foramen in-between the eyes was a challenge be cause of the ridges of bone along the ventral surface. The anterior portion of one of these ridges began to shatter an I stabilized it with paleobond. Also there is a slight wing of bone that I had to leave some matrix on in the posterior portion of the temporal area. This wing broke off and I reattached it with paleobond. It is too fine and the matrix is too well adhered to attempt to remove it. the corresponding area on the posterior portion of the cranium is broken away and so it looks like it is just hanging out in space but in reality that would not have been the case. Washed the shell fragments and tried to look for further skull fits but found none. Vinac.
22nd Sept	1:40 hours	Did some final picking and probing. Tried to remove as much of the dirt and such as possible that was caked on by too much vinac. Then I tacked it all together in order to store it. I also tacked together two portions of the shell that fitted together. By 'tacked' I mean a drop of thick vinac here and there that will easily come apart with the application of acetone.

MUSEUM HANDBOOK

PART II

MUSEUM RECORDS

ACKNOWLEDGEMENTS

The NPS *Museum Handbook*, Part II, is coordinated by the Information Management Team (IMT), Museum Management Program (MMP), National Center for Cultural Resources. IMT member, Kathleen Byrne, was responsible for coordinating the revision. Several MMP staff contributed to the writing, technical review, and layout of this handbook.

Museum Handbook, Part II authors are:

Chapters 1-6: Kathleen Byrne, Museum Registrar

Appendix A: (1994) Tony Knapp, Staff Curator; revised by Steve Floray, Museum Specialist

Appendix B: Ann Hitchcock, Chief Curator; Lynn Black, Computer Specialist

Appendix D: Diane Vogt-O'Connor, Senior Archivist

All other appendices were revised by Kathleen Byrne with assistance from Kandace Muller, Museum Technician, and interns Barbara Copp, Jason O'Neal, and Jennifer Walton.

Thanks to the Department of the Interior Office of the Solicitor for legal review; the American Association of Museums for review and advice on Chapter 6, Deaccessioning; Joan Bacharach, Museum Registrar, for her work on the 1984 version of the handbook and subsequent revisions; Ann Hitchcock, Chief Curator, for her critical review of the text; and especially Carolyn Moler, Administrative Assistant, for the many hours devoted to formatting and layout of the text and forms.

INTRODUCTION

The *Museum Handbook* covers a broad range of topics to guide National Park Service staff in managing museum and archival collections:

- Part I covers planning, preservation, and protection for the disciplines and materials represented in NPS collections, including professional ethics, specialized storage, environment standards, conservation treatments, and emergency preparedness.

- Part II outlines procedures for museum record keeping, including accessioning, cataloging, loans deaccessioning, photography, and reporting annual collection management data.

- Part III provides guidance on access and use for interpretation, education, exhibition, and research. It covers legal issues, publications, two and three-dimensional reproductions, using museum objects in exhibits and furnished historic structures, and providing access for research.

NPS staff responsible for collections should make informed choices based on their own skills and experience, standards and procedures outlined in the *Museum Handbook*, advice provided by specialists, and additional information provided in the references found in the *Museum Handbook*. Staff should, as needed, seek advice or technical information from support offices, the Harpers Ferry Center, and the Museum Management Program, National Center for Cultural Resources.

By following the practices represented in this guidance, trained staff can ensure that the National Park Service collections will be, as mandated by the 1916 NPS Organic Act, preserved and maintained for the use and enjoyment of the present and future generations.

Ann Hitchcock
Chief Curator
Museum Management Program
National Center for Cultural Resources
September 2000

Chapter 1: Documenting Museum Collections

CHAPTER 1: DOCUMENTING MUSEUM COLLECTIONS

A. Overview

1. *What will I find in this handbook?*

The *Museum Handbook*, Part II, Museum Records, tells you about the records you need to manage National Park Service (NPS) museum collections. These records are consistent with professional standards. Use the handbook as a reference. Refer to it when you:

- accession material into the museum collection (Chapter 2)
- receive incoming loans (Chapter 2)
- catalog objects (Chapter 3)
- photograph objects (Appendix K)
- mark objects with a catalog number (Appendix J)
- report losses of museum objects (Chapter 4)
- conduct the annual inventory of museum property (Chapter 4)
- complete the annual Collections Management Report (Chapter 4)
- place museum collections on outgoing loan (Chapter 5)
- deaccession museum collections (Chapter 6)

Note: The *Museum Handbook*, Part I: Museum Collections (*MH-I*), tells you how to physically care for your collections. The *Museum Handbook*, Part III: Museum Collections Use (*MH-III*), gives you information on providing access to and using your collection.

2. *How is this handbook different from the ANCS+ User Manual?*

This handbook gives you the guidelines for carrying out NPS museum policies on museum records.

The *ANCS+ User Manual* gives you detailed instructions on how to use the ANCS+ collection management system. ANCS+ allows you to automate the procedures in this handbook.

3. *What is ANCS+?*

ANCS+ is the NPS collections management system that allows you to automate all your museum records. It is a customized, commercial program from Re:discovery Software, Inc. You must use ANCS+ to:

- accession and catalog your collection
- complete the annual inventory and Collections Management Report
- document incoming and outgoing loans and deaccessions

4. *Where can I get ANCS+?*

You must order ANCS+ through the Museum Management Program (MMP), WASO. In 1998 most parks received an appropriated increase of $3,000 to their budgets to purchase and support the program. If you are a new park, you may not have this increase in your budget.

Refer to Appendix H in the *ANCS+ User Manual* for information on ordering the program.

5. *What is the purpose for museum records?*

Museum records allow you to properly care for and access your collection. You need records to prove ownership, describe the material in the collection, document loans, and locate objects. Museum records insure that museum collections are physically and intellectually available for collections management, interpretation, exhibition, and research. They give you accountability for your collection.

6. *Who must follow the guidelines in this handbook?*

The person responsible for the park's museum collection must follow the guidelines and procedures in this handbook. These guidelines and procedures insure that the park's museum records meet NPS standards.

Note: Office of Personnel Management (OPM) Personnel Classification Standards require that a GS-11 (or higher) level curator must oversee each park's museum collection. The regional/support office (SO) curator can provide oversight for parks with small collections. The curator provides professional guidance and oversees all documentation work at the park. Equivalent occupation series positions, such as archivist or museum specialist, may serve in this position. Refer to *MH-I*, Chapter 12: Curatorial Programming, Funding, and Staffing for information on staffing for museum collections.

7. *Am I required to follow this handbook?*

Yes. You must follow this handbook to accession, catalog, loan, inventory, and deaccession museum collections. You must use NPS forms to document these actions.

8. *What do I do if I know little about museum management?*

Start by reading the Basic Requirements page at the beginning of each chapter. These one-page summaries tell you the basics on what you must do.

Read the section in this chapter on how to get training in museum records and ANCS+.

> ***Refer to the appropriate chapter or appendix in this handbook for detailed instructions before beginning to do the work.***

Don't be afraid to ask for help. Contact your regional/SO curator or other curators in the area with questions. Make sure your park and region know that you lack experience and are interested in getting training.

9. *What is in this chapter?*

This chapter will help you get started with museum record keeping. It includes sections on:

- museum records training
- preparing a work area
- forms and supplies

- delegation of authority for museum collections
- records protection

B. Training

1. *Where can I get training in museum documentation methods?*

A number of museums, museum organizations, and academic institutions offer excellent short courses in museum record keeping. These courses can give you an understanding of the basic principles of museum records that are common to all museums. However, each museum has its own system for documenting collections. To learn the NPS procedures for museum records, you must take a training class on documenting NPS collections.

2. *Where can I get training in NPS museum documentation methods?*

See the NPS Employee Training and Development Career Planning and Tracking Kit for your essential competencies, which are the skills you need to do your job. Review your KSAs (Knowledge, Skills, and Abilities) under your essential competency "Research and Inventory" and discuss your training needs with your first-line supervisor. Prepare an Individual Development Plan (IDP) that addresses your training needs. You can access the tracking kit at "The Learning Place" web site under the Park Net Home Page at <www.nps.gov/training/npsonly/npsescom.htm>.

Some regions offer specific training courses on documentation and the use of ANCS+. There are also regional training courses on basic curatorial work that include sessions on museum records.

Contact your Regional Employee Development Officer (EDO) or the Training Manager, Cultural Resources Stewardship Career Field, at Stephen T. Mather Training Center, for information on available courses. You may be able to take a course in another region if your region is not offering training.

Note: Refer to Appendix L in this handbook for a bibliography of some of the standard texts on museum records.

3. *What if I can't find a training course?*

One of the best ways to learn about museum records is to get a temporary detail to another park or NPS center. Make sure the park has an active museum program and an experienced curatorial staff. You can gain valuable experience by working with park or center curators who can supervise and review your work. Your regional/SO curator may be able to help you coordinate a detail or locate a cooperating park.

Some regions may send curatorial staff from another park or NPS center to give you hands-on training at your site. Contact your regional/SO curator to find out if someone is available in your region.

C. Work Area

1. *Do I need a special work area for museum record keeping?*

Yes. You need to set up an adequate, secure work area that is separate from the collections storage area. It should contain space for all the museum files, such as the accession file, and your ANCS+ computer. You must keep all museum files in a locked, insulated file cabinet. Refer to Section F in this chapter for information about insulated files.

2. *Are there special requirements for the work area?*

Yes. There are several requirements for the area:

- Post a written warning against smoking, eating, and drinking in the area.
- Don't keep food, live plants, or flowers in the area.
- Keep the area clean and neat with nothing cluttering work surfaces, walkways, and aisles.
- Only issue keys to the area to the employees who have direct responsibility for the collections.
- Keep a current location map of all exhibit and storage areas. Include the letters and numbers of rooms, exhibit cases, and storage equipment, such as cabinets and shelf units.

3. *What should I consider when setting up the work area?*

When setting up the work area, consider the activities you'll be doing there, such as:

- receiving and unpacking objects
- examining objects for accessioning and cataloging
- measuring and weighing objects
- marking catalog numbers on objects
- photography
- entering data into ANCS+ and printing forms

A large padded table, or other flat surface, will be adequate for most objects. You may also need additional tables or shelves to hold items waiting to be accessioned or processed for loan. Organize your equipment, files, and supplies so that you can quickly find the things you frequently use.

Note: You should isolate objects coming into the collection for the first time to make sure they are pest free. Refer to the *MH-I*, Chapter 5, Biological Infestations, for additional information.

D. Forms, Supplies, and Equipment

1. *Where do I get NPS museum forms?*

Official NPS forms begin with "10-". You can print all official NPS museum forms from ANCS+. The program will complete many of the forms for you from data you enter on the screens. It also allows you to print blank forms that you can type or complete by hand. Use archival paper for printing official forms.

Refer to Figure 1.1 for a list of the forms in ANCS+. The list tells you which forms you can complete using ANCS+. The forms that relate to the chapters in this handbook appear at the end of each chapter.

Order accession books, deaccession books, and gift acknowledgement certificates from the Supply and Equipment Program of the Museum Management Program. See the Tools of the Trade catalog.

Note: You can order natural history labels from the Supply and Equipment Program while supplies last. You can also print the labels from ANCS+.

2. *Must I use the forms in ANCS+?*

Yes. You must use the ***official*** NPS museum forms in ANCS+ (forms numbered 10-). Don't modify these forms or create park-specific replacements. These forms meet legal requirements and professional standards. They also provide consistency between sites.

Some forms in ANCS+, such as the Repatriation Agreement, are Word documents that allow you to customize the form. These forms are sample forms for your use.

3. *What forms aren't available in ANCS+?*

ANCS+ doesn't have:

- forms for purchasing museum collections, such as the DI-1 Requisition
- forms for documenting loss of collections, such as the Case Incident Record, Form 10-343, or equivalent, and Report of Survey, Form DI-103
- Scientific Research and Collecting Permit

4. *What supplies do I need for museum record keeping?*

The supplies you need include:

- archival paper (for printing forms)
- pigma pen
- crochet hook
- tweezers (stamp handling variety)
- measuring rule (metric and SAE)
- cloth and metal tape measures (metric and SAE)
- white cotton gloves
- magnifying glass or linen tester
- caliper
- magnet (for testing metal objects)
- metric conversion table

Supplies for marking catalog numbers on objects include:

- technical pen (Rapidograph®) or crowquill pen
- clear lacquer (acrylic resin/acetone)
- white lacquer (acrylic resin/acetone with titanium dioxide white pigment)
- permanent black ink (Higgins®, Black Magic®, or Pelikan 17 Black)
- #2H, HB or softer pencil
- artist brushes (small tip)
- textile marking tape
- sewing needles and thread

Refer to Appendix J in this handbook for information on marking objects.

Supplies for record photography include:

- photo identification stands
- magnetic letters and numbers
- metric scale
- roll labels
- magnetic tape

Refer to Appendix K in this handbook for information on photographing objects.

5. *Where do I get museum record keeping supplies?*

Refer to the NPS *Tools of the Trade* catalog:

- Section II, Record Keeping Supplies, for additional information on supplies
- Section I, Introduction, for information on ordering supplies
- Section IX, Equipment and Supply Sources, for supply sources

The MMP publishes this catalog and updates it periodically. You can get some supplies free through the MMP's Supply and Equipment Program.

Depending on your collection, you may need additional supplies, such as weight scales and color charts. Contact other curators, conservators, and your regional/SO curator for other supply sources.

6. *What types of equipment do I need for museum record keeping?*

You must have:

- a computer capable of running ANCS+
- a printer for printing ANCS+ forms
- the ANCS+ software program
- insulated file cabinet(s) and media safe

If you photograph your collections, you will need a 35mm camera, a tripod, and lights. Many parks also use digital cameras to produce digital images for ANCS+.

7. *Where do I get equipment?*

The park pays for equipment. In FY 1998 parks received a recurring $3,000 increase in base funding for the purchase and support of ANCS+. Your park receives this money every year for catalog-related costs. Use these funds to purchase your annual support and updates to ANCS+. If there is money left over, you may use it to fund cataloging or to purchase cataloging equipment, such as computers, printers, and digital cameras.

Refer to Appendix H, Support, in the *ANCS+ User Manual* for information on purchasing support. Refer to Appendix A, System Requirements, in the *ANCS+ User Manual* for information on the hardware you'll need for ANCS+.

Refer to the *Tools of the Trade* and Section F in this chapter for information on insulated file cabinets.

E. Authorities

1. *Who is responsible for the museum records at a park?*

NPS museum property is accountable property. The accountable officer for museum property is the superintendent or center manager. He or she has the overall responsibility for museum collections and museum records.

The custodial officer is directly accountable and responsible for the physical care and documentation of the museum collection. The custodial officer is the person in charge of the museum collection. At most parks this is the curator or collections manager.

The receiving officer is responsible for documenting the receipt of museum collections. The receiving officer can be one of the museum staff or a staff member from another division in the park.

Refer to the *Personal Property Management Handbook No. 44* for information on property officers.

2. *What are the superintendent's duties as the accountable officer for museum records?*

The superintendent has the authority to approve or disapprove all accessions, loans, and deaccessions.

The superintendent must sign all legal documents that transfer ownership (title) or custody of museum property.

The superintendent is also responsible for verifying and signing the annual inventory of museum property and the annual collections management report. Refer to Chapter 4 in this handbook for information about these reports.

The superintendent appoints, in writing, the custodial officer and the receiving officer for the museum collection.

3. *What forms must the superintendent sign?*

The superintendent must sign the following accession, loan, and deaccession forms. Refer to the chapters in parentheses for information about these forms.

- Deed of Gift, Form 10-830 (Chapter 2)
- Transfer of Property, Form DI-104 (Chapters 2 and 6)
- Exchange Agreement (Chapters 2 and 6)
- Incoming Loan Agreement, Form 10-98 (Chapter 2)
- Outgoing Loan Agreement, Form 10-127 (Chapter 5)
- Outgoing Loan Extension, Form 10-641 (Chapter 5)
- Deaccession Form, Form 10-643 (Chapter 6)
- Conveyance Agreement, Form 10-99 (Chapter 6)
- Repatriation Agreement (Chapter 6)

4. *What are the custodial officer's responsibilities for museum records?*

The custodial officer is in charge of museum records. The custodial officer recommends accessions, loans, and deaccessions to the superintendent and is responsible for justifying and documenting these transactions. He or she is responsible for accessioning and cataloging the collection, conducting the annual museum property inventory, and completing the collections management report. The custodial officer often supervises other staff who are doing the work.

5. *What are the receiving officer's responsibilities for museum records?*

The receiving officer signs the Accession Receiving Report, Form 10-95, the Receipt for Property, DI-105, and any other receipts for museum property. The custodial officer can't serve as the receiving officer.

F. Records Protection

1. *How can I protect my museum records against deterioration and destruction?*

Many of the common threats to museum collections are also threats to your museum records. It's important to take preventive actions against these threats because museum records are a valuable part of your collection.

Threat	Preventive Action
Human error	Training in proper techniques; checking work for accuracy
Fire	Insulated file; media file; good fire

	prevention standards, fire detection devices, and suppression systems; Structural Fire Plan that includes the special needs of museum records
Theft	Locked file; secure storage with adequate key control and access; frequent inspection
Mildew/mold	Environmental monitoring; dehumidification if relative humidity exceeds 60%
Pests	Museum housekeeping program; frequent inspection; active Integrated Pest Management program; fumigation as necessary
Paper deterioration	Acid-free paper for museum forms
Water damage	Keep records away from pipes, basement, or flood plain
Disaster (earthquake, tornado, hurricane)	Emergency Operation Plan that includes the special needs of museum records; duplicate accession book and catalog records kept off-site
Electronic media deterioration	Backup copies (one copy off site); proper storage; media migration strategy

2. *What are the requirements for storing paper museum records?*

To protect museum records from fire and unauthorized use, store them in a locking, insulated file, safe, or vault. The interior of the container or vault must maintain a temperature of less than 350° F during a one-hour exposure to exterior temperatures of at least 1700° F.

3. *What types of storage equipment are available?*

Most parks use two, four, or five-drawer insulated (fire resistive) filing cabinets with combination or key locks. These are convenient to use and fairly inexpensive to purchase. The Underwriters Laboratories (UL) rating is "Insulated Filing Device, Class 350-1 Hour" (Formerly "UL Class D").

Cabinets in spaces above the grade level of the building must be able to survive a drop through the floor during a fire. The UL rating is "Insulated Record Containers, Class 350-1 Hour" (Formerly "UL Class C").

Impact resistant Class 350-2 hour and Class 350-4 hour filing cabinets are also available. Consider using one of these in buildings that are likely to burn long enough or hot enough to warrant the extra protection.

You can use one-door and two-door insulated safes to protect records that don't fit in a filing cabinet. The UL rating is "Fire-Resistive Safe, Class 350-4, 2, or 1-Hour".

See *Tools of the Trade* and National Fire Protection Association (NFPA) 232, *Standard for the Protection of Records,* for information on records storage equipment.

4. *Where can I get storage equipment for my museum records?*

Section VI of the *Tools of the Trade* has information on fire-resistive filing cabinets and media safes. Sections IX and X have information on sources and current equipment contracts. The park pays for storage equipment. You can get money for museum records storage equipment through the Museum Collections Preservation and Protection Program (MCPP).

Your regional/SO curator or MMP staff can give you information on storage equipment for museum records.

5. *What if I have a very large amount of records?*

For very large amounts of records, you may find it more cost-effective to use ordinary steel filing cabinets in a records vault. The vault construction must meet the requirements of the NFPA. See NFPA 232, *Standard for the Protection of Records,* for information on the construction of vaults. See NFPA 232AM, *Manual for the Protection of Archives and Records Centers*, for information on protecting large collections of paper records.

Vaults require doors with a UL rating, "Fire-Resistive Vault Door, Class 350-6, 4, or 2-Hour". This type of door may have a combination lock or key lock. If less protection is acceptable, you can use a door with a UL rating, "Fire-Insulated File Room Doors, Class 350-1 Hour".

6. *What are the requirements for storing media?*

Computer media are plastic-based and will degrade:

- at temperatures above 180°F
- when exposed to the high humidity (usually 100%) present during a fire in an ordinary fire-resistive filing cabinet or safe

Don't store media in the fire-resistive filing cabinet or safe that you use for your paper records.

Store computer media (floppy disks, CDs, zip disks, tapes) in a container that will maintain an interior temperature of not more than 125° F during a one hour exposure to an exterior temperature of 1700°F. The container can be a media safe or a mixed media file. Media boxes are acceptable if you store them in an appropriately rated insulated records file.

7. *What are the differences between a media safe, a mixed media file, and a media box?*

Media safes or files are designed to protect computer media. The UL rating is "Fire-Resistive Safe, Class 125-4, 3, 2, or 1 Hour".

A mixed-media container is a fire-resistive filing cabinet or safe for paper records that has a media container. The container may be removable. It gives additional insulation against heat and protection against high humidity. The UL rating for the media container is "Class 125-4, 3, 2, or 1 Hour" when it is inside the cabinet. Outside the cabinet, the media container may have no rating or a rating of only one-half hour.

A media box is a small, portable container, usually with a lock. You can use media boxes to hold a small amount of media at your desk during the work day. Most media boxes have only a 150°F one-half hour rating. Don't use a media box to protect your data unless you keep it inside a fire-resistive filing cabinet.

8. *Are there requirements for the room where I store museum records?*

Yes. You want the room where you store your museum records to be as fire-resistive and secure as possible.

- Don't store flammable materials in the room.
- Lock the room against unauthorized access.
- Install fire detection and suppression systems.
- Install intrusion detection systems.

Consult with the park safety officer and law enforcement specialist, a local fire marshall, or another qualified expert. They can help you assess the room and make recommendations to improve it.

Refer to *MH-I*, Chapter 9: Security and Fire Protection and Appendix G: Museum Collections Protection for additional information.

G. Information Protection

1. *Can the NPS protect sensitive or confidential information that the park has acquired as part of documentation activities?*

No. The NPS may acquire sensitive or confidential information during record keeping and documentation activities. In certain circumstances, the Freedom of Information Act (FOIA) may require that the NPS release such information. You must inform parties that request confidentiality of information that the NPS:

- won't voluntarily share this information, *but*
- can't guarantee confidentiality

2. *Where can I find more information about protecting sensitive or confidential information?*

Refer to the NPS *Management Policies*, Chapter 5, Cultural Resource Management. For information on the Freedom of Information Act, refer to *MH-III*, Chapter 2: Legal Issues.

H. List of Figures

NPS Forms in ANCS+

Refer to Chapter 5 in the *ANCS+ User Manual* for information on how to complete the forms. You can complete the following forms using ANCS+ or Word.

Accession Forms
Accession Receiving Report, Form 10-95 Rev.
Deed of Gift, Form 10-830 Rev.
Accession Folder Cover Sheet, Form 10-255 Rev. – Word document
Source of Accession Card

Catalog-Related Forms
Museum Catalog Record-CR, Form 10-254 Rev.
Museum Catalog Record-NH, Form 10-254B Rev.
Receipt for Property, DI-105
List of Objects, Form 10-417
Object Condition Report, Form 10-637
Inventory of Museum Property, Form 10-349
Collections Management Report, Form 10-94 Rev.
Object Temporary Removal Slip, Form 10-97

Natural History Labels
Vertebrate Wet Specimen Label, Form 10-500
Vertebrate Specimen Label, Form 10-501
Skull Vial or Box Label, Form 10-502
Invertebrate Specimen Label, Form 10-503
Geology Collection, Form 10-504
Paleontology Label, Form 10-505
Wet Plant Specimen Label, Form 10-506
Invertebrate Label, Form 10-507
Egg Box Label, Form 10-508
Insect Label, Form 10-509
Annotation Label, Form 10-510
Mineral Collection, Form 10-511
Herbarium Collection, Form 10-512

Loan Forms
Incoming Loan Agreement, Form 10-98 Rev.
Outgoing Loan Agreement, Form 10-127 Rev.
Outgoing Loan Folder Cover Sheet, Form 10-640 Rev.
Outgoing Loan Extension, Form 10-641

Deaccession Forms
Deaccession Form, Form 10-643 Rev.
Deaccession Folder Cover Sheet, Form 10-644 Rev. – Word document
Transfer of Property, DI-104
Conveyance Agreement, Form 10-99
Exchange Agreement – Word document
Repatriation Agreement – Word document
Specialist Review Form

Archives Forms
Archives and Manuscript Collections Separation Sheet, Form 10-645 – Word document
Folder List, Form 10-96 Rev. – Word document

Figure 1.1. NPS Forms in ANCS+

Chapter 2: Accessioning

BASIC REQUIREMENTS FOR NPS ACCESSIONS

Accession all objects, specimens, and archival and manuscript collections that are part of the park's museum collection. Accession museum collections when you receive them.

Only accession museum collections that fit within the park's Scope of Collection Statement and that the park can manage according to NPS policies and standards.

An accession can be from only one source. Accession museum collections as one of the following types of transactions: gift, purchase, exchange, transfer, field collection, or incoming loan. Read the appropriate sections of this chapter for the type of accession you are documenting. There are special documentation requirements that you should be aware of for each accession type.

There must be a transfer of ownership document for a gift, purchase, exchange, or transfer.

- gift – Deed of Gift (Form 10-830 Rev.)
- purchase – an appropriate purchase document, such as a DI-1 or Procurement Request and invoice
- exchange – exchange agreement
- transfer – Transfer of Property (DI-104)

Field collections, such as archeological and natural history collections, are collected on park property. Field collections don't require a transfer of ownership document. Use the Accession Receiving Report (Form 10-95 Rev.) to document field collections.

Incoming loans require an Incoming Loan Agreement (Form 10-98 Rev.) to document transfer of custody.

The superintendent must approve all accessions and sign all transfer of ownership documents and incoming loan agreements.

Assign an accession number to all accessions. The NPS accession number consists of the park acronym, a dash, and a number. Tag the objects in the accession with the accession number and store them in an accession storage area until you can catalog them.

Isolate infested or unsafe collections immediately to avoid contaminating other material. Stabilize these collections after consulting with a conservator.

Enter all accessions into ANCS+. Print the accession forms from ANCS+.

Complete an Accession Receiving Report (Form 10-95 Rev.) that lists the objects in the accession for all accessions. Record the condition of the objects.

Enter all accessions into the Accession Book (Form 10-256).

Set up an accession folder for each accession. Store all documents for the accession in the folder.

Store all accession folders and the accession book in an insulated, locked file. Control access to this file.

CHAPTER 2: ACCESSIONING

A. Overview

1. *What is accessioning?*

Accessioning is the process of officially accepting items into National Park Service (NPS) museum collections. Accessioning establishes legal custody and ownership and provides information on how the NPS acquired the items. This chapter discusses the various ways to acquire collections and explains the basic procedures for documenting accessions.

2. *Who must follow this chapter?*

The staff person responsible for the museum collection must follow this chapter to accession museum objects and archival collections. You must accession all items that are part of the park's permanent museum collection and all incoming loans.

See Section A.6 of Chapter 1 in this handbook for information on staffing requirements for museum collections.

The NPS treats incoming loans as accessions. This chapter includes procedures on incoming loans. An incoming loan establishes custody but not ownership.

B. General Information on Accessions

1. *What is an accession?*

An accession is the acquisition of a single item or a group of items:

- from one source
- under one type of transaction (for example, gift)
- on one date

For example, an individual may sell a rifle to the park, and at the same time donate twenty Civil War documents. You would record this as two accession transactions: a purchase and a gift. If the same individual donates additional material one month later, this would be a third transaction. An accession can have one object or thousands of objects.

2. *What are accession records?*

Accession records document the legal transaction that establishes ownership (title) and custody of museum objects. Accession records also document general information about the accession. They consist of the accession book, the accession file, and the Automated National Catalog System (ANCS+) accession database. The accession file contains all pertinent documentation about the accession. It's important to keep records of all the steps you take in the acquisition process.

The accession book and accession file are permanent park records that must remain at the park. Restrict access to these records to the extent permitted by law.

Note: Catalog records provide detailed information about the items in an accession. All museum items must have both an accession number and a catalog number. Refer to Chapter 3 in this handbook for information on cataloging.

3. *When do I accession objects?*

You must accession objects upon receipt. Accessioning is the first step in documenting museum collections. No park should have an accessions backlog.

Note: In 1984, the Director issued a call to accession all museum collections. The call also included an instruction to keep up-to-date accession records for all future accessions.

4. *How soon must I catalog objects after accessioning them?*

Catalog accessions as soon as possible. Accessioned but uncataloged objects are a backlog of work that needs immediate attention. This material isn't a useful part of the collection until you catalog it. Uncataloged material is also more vulnerable to theft, since it lacks identifying numbers and descriptive catalog record data.

5. *What are the types of NPS accessions?*

There are six types of NPS accessions:

- gift
- purchase
- exchange
- transfer
- field collection
- incoming loan

Gifts, purchases, exchanges, and transfers are permanent and involve a transfer of ownership (title). Field collections document the collection of objects that are already park property. Incoming loans are temporary accessions involving a transfer of custody, not ownership.

Refer to Sections F-Q for specific information on the types of accession transactions.

Note: If you're not sure which accession type to use, consult your regional/support office (SO) curator or other curators with similar transactions. Once you make a determination, justify the decision in the accession file.

6. *What is a transfer of ownership document?*

Each accession must have a document transferring ownership (title) or custody. The type of document depends upon the type of accession transaction. For example, you must use a deed of gift to document accessions that the park receives as gifts. The document provides the basis for the park's claim to legal title and custody.

Refer to Sections F-Q for specific information on the types of accession transactions.

7. *Where do I get the forms for accessioning?*

Use ANCS+ to print blank or completed accession forms. Use acid-free paper to print the forms.

Acid-free paper is available from the Supply and Equipment Program of the Museum Management Program (MMP), National Center for Cultural Resources.

8. *Who reviews and makes recommendations about potential accessions?*

The curator and curatorial staff review all potential accessions and make recommendations to the superintendent. You should consult subject-matter specialists as needed.

The superintendent may choose to set up a collections advisory committee to review and make recommendations about potential accessions. A collections advisory committee is recommended, but not required, for accessions. The curator should be a member of the committee. Other members should represent relevant disciplines, depending on the type of material to review.

Note: The park must use a collections advisory committee for some types of deaccessions. The superintendent may want to use the same committee for accessions. Refer to Section C.4 of Chapter 6 in this handbook for information about the collections advisory committee.

9. *Who signs the transfer of ownership document?*

The superintendent and the authorized source of accession (such as the owner or institutional official) must sign the transfer of ownership document.

10. *Must I accession objects left at the park for identification or consideration as a possible acquisition?*

No. If the objects are there for less than 30 days, you don't have to accession them. However, you should discourage people from leaving objects at the park, especially if you can't provide a prompt response. For periods of less than 30 days, you may use a Receipt for Property, DI-105 (Figure 2.1). Note on the receipt the date that the owner must retrieve the property. Include the owner's name, address, and phone number on the receipt. File and track the receipt by the date of return.

You must accession material that is left at the park for more than 30 days as an incoming loan.

Note: Frequently taxonomists need to borrow specimens from other repositories to identify species. You can issue a receipt for property in these instances if the park doesn't keep the specimens for over 30 days.

11. *What if previous accessions lack the documentation outlined in this chapter?*

You must make a good faith effort to get the documentation. For example, the accession may lack a transfer of ownership document. If the other party to the transaction is still available, draft the required document and get it signed and dated. Attach a note that the document confirms a transaction made on an earlier date.

In the absence of any legal documentation, record all actions taken to trace the accession. At a minimum, complete the Accession Receiving Report, Form 10-95 Rev. (Figure 2.2). Refer to Section N of this chapter for additional information on recording undocumented accessions.

12. *Can an object have more than one accession number?*

No. An object can have only one accession number, which represents one accession transaction.

Archival collections can have more than one accession number. Refer to Appendix D: Museum Archives and Manuscript Collections, in this handbook.

C. Acquisition Policies

1. *What is the best accession policy?*

The best accession policy is a good Scope of Collection Statement (SOCS). All parks must have an approved SOCS that provides the basis for reviewing potential acquisitions. This document outlines the type of collections that:

- are essential to fulfilling the park's mission
- will enhance interpretation and research at the site
- legislation requires the park to preserve and maintain

Refer to the *Museum Handbook*, Part I *(MH-I)*, Chapter 2: Scope of Museum Collections, for guidance on writing a SOCS. This chapter also has a section on acquisition criteria.

2. *Must all accessions fit within the SOCS?*

Yes. However, a museum collection may have objects from previous accessions that don't fit within the SOCS. The park's SOCS may also change over the years. In both these cases, you may deaccession objects that no longer fit within your SOCS. Refer to Chapter 6: Deaccessioning, in this handbook.

Note: Accessions that involve special short-term loans for exhibit don't have to fit within the SOCS.

3. *Why is it important to make sure that accessions fit within the SOCS?*

When you accession an object, it becomes subject to NPS regulations for museum property. Museum collections require money, staff time, and specialized supplies and equipment for proper maintenance, preservation, and use. For these reasons, you should carefully review acquisitions to make sure that they fit within the SOCS.

4. *May a park acquire collections if it doesn't have the facilities or staff to manage them?*

No. A park should only acquire museum collections that it can manage according to NPS policies and standards.

5. *May I accession collections if I intend to deaccession them?*

No. You may not accession objects outside the park's SOCS with the intent of deaccessioning them. Accessions are permanent additions to the museum collection that must fit within the park's SOCS. You may not acquire a collection with the intention of deaccessioning part of it.

6. *Should I encourage the park to acquire collections?*

Yes. You should make every reasonable effort to acquire museum collections that:

- become available and fit within the park's SOCS

- you can manage and make accessible according to NPS standards

For guidance and justification on acquisitions, refer to:

- the park's SOCS
- historic furnishings reports
- archival assessments
- exhibit plans
- natural resources inventory and monitoring guidelines
- subject-matter specialists

7. *Do I accession reproductions?*

Yes. You accession and catalog reproductions. You don't accession living history items (unless they are left on exhibit when not in use) or exhibition aids. Refer to Section IV in Chapter 4 of this handbook for additional information. There are special marking guidelines that help differentiate reproductions from originals.

D. Special Considerations for Accessions

1. *What do I need to know about illicit trade?*

Illicit trade involves illegal trafficking in museum items. You need to be aware of the manner in which the current and previous owner(s) obtained the material you plan to accession.

The owner(s) must have collected the material in an ethical manner compatible with professional disciplines and museum standards.

The owner(s) must have collected, exported, imported, transported, or otherwise obtained and possessed the material in full compliance with the laws and regulations of the:

- country of origin
- the United States federal government (including NAGPRA)
- individual states within the U.S.

You must make a reasonable effort to make sure that the owner(s) acquired the objects legally. The amount of effort depends on the type and value of the material. For example, get a complete provenience history from the owner. If you have any doubts about the material, check with organizations or offices that list missing or stolen objects. Refer to Section III in Chapter 4 of this handbook for a list of organizations.

Report suspect materials to the superintendent and the regional/SO curator. If you unknowingly accession objects in violation of this policy, you must make every possible effort to return the objects to the rightful owner.

2. *Are there special acquisition considerations for archival and manuscript collections?*

Yes. It is especially important to get the copyrights for archival or manuscript collections.

If possible, get signed release forms from individuals who appear in oral history or videotapes, photos, digital files, and motion pictures. Without a release form, you must get permission to use these materials in publications or exhibits or provide them to researchers. Refer to the *Museum Handbook*, Part III (*MH-III),* Chapter 3: Publications, for a sample release form.

3. *Are there special procedures for acquiring archival and manuscript collections?*

Yes. Archivists use the process of appraisal and evaluation to determine if a collection has value for a park. Refer to Sections A and G in Appendix D of this handbook for information on the categories of archival value and the appraisal process.

4. *Are there special considerations for acquiring firearms?*

Yes. The acquisition of firearms must be in compliance with all state and local law enforcement regulations. Consult the law enforcement personnel at your park for information on state and local regulations.

5. *Are there special considerations for acquiring NAGPRA material?*

Yes. NAGPRA refers to the Native American Graves Protection and Repatriation Act [P.L. 101-601; 25 USC 3001-3013; 104 Stat. 3048-3058]. The law requires you to consult with affected Native American groups if a proposed accession involves Native American:

- human remains
- associated and unassociated funerary objects
- sacred objects
- objects of cultural patrimony

Refer to the *Cultural Resource Management Guideline,* Appendix R: NAGPRA, for further information on NAGPRA compliance.

6. *Are there special requirements for acquiring threatened and endangered species?*

Yes. You can only acquire threatened and endangered species if the collector:

- has a valid permit from the United States Fish and Wildlife Service or the National Marine Fisheries Service to collect a threatened or endangered species, *and*
- has met all applicable requirements from the state, local government, tribal government, or foreign country to collect a threatened or endangered species

You may receive a gift of endangered or threatened species if the donor:

- has proof of pre-Act ownership, *and*
- the specimens haven't been offered for sale since the date of the Endangered Species Act.

The park must have a permit to purchase threatened and endangered species and objects that contain their parts.

7. *Are there health and safety considerations when acquiring collections?*

Yes. You need to get any treatment history for objects. This is especially important for organic objects that may have been treated with pesticides such as arsenic. If there is no written record, then interview the source.

Refer to the *MH-I*, Chapter 11: Health and Safety, for information on hazardous materials that have been used on objects. Section 2 in the *Conserve O Gram (COG)* series has information on arsenic, dichlorvos (vapona) and other hazardous materials.

E. Acquiring Copyrights

1. *What are copyrights?*

Copyrights are special property rights that legally grant creators, such as artists and authors, exclusive rights to their work. The copyrights to a work consist of a group of rights that a creator can transfer separately from the actual work. Copyrights include the right to reproduce a work, to publicly display it, and to distribute copies by sale.

2. *Why is it important to consider copyrights when acquiring museum collections?*

Acquiring an object without acquiring the copyrights can severely limit the park's use of the object. NPS acquisition policy requires parks to:

- determine who owns the copyrights
- if possible, have the owner transfer the copyrights to the NPS

3. *What types of material have copyrights?*

Copyrights cover original material in fixed form, such as paintings, photographs, sound recordings, and archival materials. Refer to the *MH-III*, Chapter 2: Legal Issues, for additional information on the types of material covered by copyrights.

Note: Government-produced documents and materials are in the public domain and don't have copyrights.

4. *How do I determine who owns the copyrights?*

The creator usually owns the copyrights to his/her work. If you are acquiring the work from someone other than the creator, ask for supporting documentation of copyright ownership.

Frequently, the owner may not know who has the copyrights. You'll then have to research the copyright status of the work. Refer to the *MH-III*, Chapter 2: Legal Issues, for information on the length of copyright protection. This chapter also includes steps you can take to research copyright.

The U.S. Copyright Office, Library of Congress, publishes several circulars on copyright, including Circular 22: *How to Investigate the Copyright Status of a Work*. Call 202-707-9100, or access their publications on-line at <http://www.loc.gov/copyright/circs/>.

5. *How does the owner transfer the copyrights?*

The NPS Deed of Gift, Form 10-830 (Figure 2.3) and sample exchange agreement (Figure 2.8) include copyright ownership and transfer statements. You can use a transfer of copyright statement (Figure 2.7) with purchases and transfers.

You must have a written transfer of copyright interests.

Note: Materials in an archival collection may contain copyrightable works, such as letters and photographs, from other people. The owner of the collection can't transfer the copyrights to these works. You must negotiate with the original creator to get the copyrights to these works.

6. *What if the owner doesn't want to transfer the copyrights?*

You must seriously consider whether to accept an object/archival collection that doesn't include a transfer of copyrights. If you don't own the copyrights, you have a restriction on the material.

Negotiate with the copyright owner to get as many copyrights as possible. At the very least, get written permission to use the materials for special purposes, such as park publications and exhibitions.

7. *What if the owner is willing to transfer some, but not all, of the copyrights?*

In some cases, the copyright owner may be willing to transfer some, but not all, of the copyrights. Clearly document which copyrights the park is receiving on the deed of gift, exchange agreement, or copyright statement. Also place a prominent note in the accession file to document which copyrights the park doesn't own.

8. *What are some questions to ask when acquiring museum collections that have copyrights?*

When you're acquiring and accessioning objects/archival collections that have associated copyrights, ask yourself the following questions:

- How long are the copyrights in effect?
- Who owns the copyrights? Has anyone researched the copyright status and ownership?
- Has the owner transferred all copyrights in writing? Where is the documentation for the transfer?
- If the owner hasn't transferred all copyrights, which ones does the park own? Which copyrights does the owner keep?
- If the owner won't transfer the copyrights, has there been a review and justification for acquiring the material without copyrights?

Be sure to document the answers to these questions. Store this information in the accession folder.

F. Gifts

1. *What is a gift?*

Gifts are outright donations from individuals or institutions, as well as bequests (posthumous gifts made in a will). The donor owns the property and transfers ownership to the NPS. The donor must warrant that he/she has full legal title to the object(s) and has full power and authority to donate the object(s) to the NPS. There can be no liens or other encumbrances of any kind against the gift or title to it.

2. *Who has the authority to accept gifts?*

The park superintendent has the delegated authority, through the Museum Properties Act of 1955, to accept donations. The superintendent cannot redelegate this authority. Single donations valued at $1 million or more require the Director's approval.

The NPS reserves the right to decline any gift.

3. *How do I document a gift?*

You must use the Deed of Gift, Form 10-830 Rev. (Figure 2.3) to document gifts to the NPS. As part of the accessioning process, complete a deed of gift that lists the objects in the gift. The deed of gift is a formal, legal agreement that transfers ownership and legal rights.

You can print a blank or completed deed of gift from ANCS+. Be sure to print this form on acid-free paper.

Make two copies of the deed of gift. The donor or authorized agent and the superintendent sign both copies of the form. The park keeps one copy in the accession folder, and the donor keeps the other copy.

4. *How do I acknowledge a gift?*

The superintendent should write a letter acknowledging receipt of the gift and thanking the donor for his or her support. If you send the letter with the deed of gift, you can include instructions for the donor to sign and return one copy of the deed of gift to the park. Refer to Figure 2.4 for a sample acknowledgement letter.

The letter is an official and personal expression of appreciation. It makes reference to the objects in the donation, and explains the importance of the donation to the museum. It might also mention that the gift is tax deductible to the extent permitted by law.

For some gifts, you may want to use a gift acknowledgement certificate (Figure 2.5). You can get gift certificates from the Supply and Equipment Program of the Museum Management Program, National Center for Cultural Resources.

You can also credit the donor through press releases, public events, and unobtrusive credit lines. The accession information should include the preferred credit line, if appropriate, such as "A gift from the J.H. Smith Family." Refer to Director's Order #21 for guidelines on donor recognition.

Note: You might want to publicize significant accessions to increase public awareness of the museum collection.

5. *Does the NPS prohibit donations from certain sources?*

Yes. Refer to Director's Order #21: Donations and Fundraising, for a list of prohibited sources of donation. For example, a park can't accept donations from persons or entities when acceptance would create a conflict of interest or the appearance of a conflict of interest for the NPS or the Department of the Interior.

6. *When should I refuse a gift?*

The superintendent should decline to accept a gift if:

- the material doesn't fit within the park's SOCS
- the park doesn't have the facilities or staff to manage the material according to NPS standards

- the object is not in good condition

Note: When declining a gift, thank the potential donor for his/her interest in the museum, and explain why the park can't accept the material. If possible, note other parks or museums that may have an interest in the material. The American Association of Museums (AAM) *The Official Museum Directory* is a good source for non-NPS museums.

7. *Can a park refuse a bequest?*

Yes. A park can refuse a bequest or only accept part of the material in the bequest. Consult the regional/SO curator before refusing a bequest. Other parks may be in need of the material.

8. *Are there special considerations for bequests?*

Yes. The lawyers for the estate may use a deed of gift or gift of personalty to document the gift. With the approval of the estate lawyers, you may use the NPS deed of gift form as the title transfer document.

In addition, document the bequest with:

- a copy of the provision of the will that concerns the bequest
- a final receipt accepting the objects in the bequest

Note: A bequest is not final until a court approves the administration of the estate.

9. *Can a park solicit donations?*

No. You may not ask for a donation of museum objects. Refer to Director's Order #21 for prohibitions against soliciting.

You may:

- describe the needs of the museum if a potential donor expresses interest
- respond to questions on how to make a donation
- get your friends group to approach a potential donor for you
- describe the needs of the museum to the general public

10. *Can a park receive a donation for a fractional interest in an object?*

Yes. This is a rare transaction, but a park can acquire an object as a partial gift and a partial purchase. The park pays a portion of the value of the object, and the seller donates a portion of the value. Record the transaction as a purchase, but document the partial donation with a deed of gift. Document the entire transaction on the accession receiving report.

G. Gift Considerations

1. *Does a gift automatically include copyrights?*

No. The Deed of Gift, Form 10-830 Rev. (Figure 2.3) allows the donor to transfer all copyrights. If the donor won't, or can't, transfer all copyrights, delete the copyright phrase from the deed of gift by drawing a line through it. Have both parties initial the change.

You should make every effort to get all copyrights when receiving gifts. Be aware that past gifts may not include copyrights.

Refer to Section E in this chapter for additional information on acquisitions and copyrights.

2. *Can a donor place restrictions on a gift?*

In accordance with NPS policy and general museum practice, you should only accept unrestricted gifts. Only the regional director can allow an exception to this rule. Gifts or bequests must be free of restrictions as to their use and future disposition. However, museum collections are subject to legal restrictions, such as privacy laws and classified data. Refer to the *MH-III*, Chapter 2: Legal Issues, for information on use and access restrictions.

You must carefully evaluate any restrictions on a proposed gift. Consult the regional/SO curator or solicitor or the DOI solicitor. Consider the park's need for the material, its intended use, and the impact of the restrictions on future collections management. Discuss potential gift restrictions, and negotiate with the owner for a more acceptable agreement.

Although counter to NPS policy, your collection may contain past acquisitions with donor restrictions. You must honor these restrictions to the extent allowed by law. Refer to the *MH-III*, Chapter 2: Legal Issues, for information on donor restrictions and the Freedom of Information Act (FOIA).

3. *Can I accession gifts into the collection to use in a deaccession?*

No. Gifts are permanent additions to the museum collection. You can't accession a gift with the intent to later deaccession the objects. Refer to Chapter 6: Deaccessioning, of this handbook for information on potential tax liabilities and the deaccession of gifts.

4. *Are donations tax deductible?*

Yes. Donations to the NPS are tax deductible to the extent permitted by law. The donor is responsible for:

- establishing the value of a gift for tax deduction purposes
- meeting Internal Revenue Service reporting requirements
- completing a Noncash Charitable Contributions form (IRS Form 8283)
- getting a professional (non-NPS) appraisal for items that total over $5,000

The NPS must acknowledge a donation that totals over $5,000 in one year by completing the donee acknowledgment portion of Form 8283. The donor will give you the form. Contact the regional/SO curator and regional solicitor if you have questions about noncash charitable contributions.

5. *Can NPS staff appraise donations?*

No. NPS staff may place values on objects for internal documentation and insurance purposes only.

NPS staff can't give donors monetary appraisals for donations.

Refer to Section IX in Chapter 4 of this handbook for information on appraisals.

6. *Are there special considerations for gifts of archival and manuscript collections?*

Yes. Getting all copyrights is especially important for archival and manuscript collections. See Section E in this chapter for information on copyrights. Be aware that archival collections may contain sensitive or legally-restricted material.

You also need to be aware of the need to get model and interview release forms as needed for the material in the collection. See Section D.2 in this chapter for information on release forms.

7. *What if I don't have a deed of gift on file for previous accessions?*

All gifts should have a signed, original deed of gift form on file. Gifts that the park received before 1985 might not have a deed of gift on file. Previous accessions may be documented by a donor letter signed by both parties or a last will and testament. Some early accessions may not have documentation of any kind.

Make every effort to get a signed deed of gift form if the donor, or donor's agent is still available. Note the earlier date of donation on the form. Document all your efforts to get a deed of gift. Keep this documentation in the accession file.

8. *May a park receive a donation of NAGPRA material?*

Yes. Consult with the affiliated Native American group when considering the acquisition. You must inform the donor that the park may repatriate the gift in response to a request from an affiliated group. You must add the material to the park's NAGPRA inventory or summary and continue to consult with the affiliated group(s). Follow the guidelines in the *Cultural Resource Management Guideline,* Appendix R: NAGPRA Compliance.

9. *What other types of documentation should I get for a gift?*

Get as much information as you can from the donor. You may not be able to get this information later, and it is of primary importance for documenting the object. Don't be afraid to ask questions. You may receive valuable information. Your interest may lead to additional donations that relate to the object. Donors may even spread the word of your interest, which may result in donations from others.

Make a paper copy of the donor information, and store it in the accession folder. You may also have donor information on media, such as tape or videotape. Place a reference in the accession file that includes the type of media and its location. If possible, create a written transcript of the media.

Note: Inform donors that the information they provide will become part of the public record and cannot be guaranteed absolute confidentiality. See Section G of Chapter 1 in this handbook for information on protecting sensitive or confidential information.

10. *Can I restrict access to donor information?*

Yes. Restrict access to donor names and addresses to the fullest extent of the law. You may have to release this information if you receive a Freedom of Information Act (FOIA) request. Refer to the *MH-III,* Chapter 2: Legal Issues, for information on FOIA requests.

H. Purchases

1. *What is a purchase?*

When you buy museum objects with park funds, you accession the objects as a purchase. The seller owns the property and transfers ownership to the NPS. The seller must warrant that he/she has full legal title to the object(s) and has full power and authority to sell the object(s) to the NPS. There can be no liens or other encumbrances of any kind against the object(s).

Note: Your park association or friends group may purchase museum collections for the park and then donate them to the park. These acquisitions are gifts, not purchases, since park funds were not used.

2. *Who has the authority to purchase museum objects?*

The park superintendent has the delegated authority to purchase museum collections at prices he or she considers reasonable. For major purchases, the superintendent should consult with an optional collections advisory committee or the regional/SO curator.

3. *How do I document a purchase?*

Documentation for purchases varies depending upon how you made the purchase and the purchasing authority for the park. Consult with your procurement staff for the appropriate way to make a purchase. Documentation includes:

- receiving report copy of the Order for Supplies or Services, Form 10-3470(2-97) or OF-347
- governmentwide purchase card (credit card) receipt
- DI-1 Requisition or Procurement Request and invoice or sales slip or vendor's receipt
- copy of the purchase contract

Note: If you don't have an original document, make an archival copy to include in the accession folder.

4. *Can a park use appropriated funds to purchase museum collections?*

Yes. A park can use appropriated funds in its budget for the purchase of museum collections. The curator or staff member responsible for the collection, can include the purchase of collections in budget requests.

5. *Can a park accept donations of cash to use for purchasing museum collections?*

Yes. The Museum Act of 1955 (16 U.S.C. 18f) authorizes the NPS to accept donations and bequests of money to purchase museum collections. Refer to Director's Order #21: Donations and Fundraising for a list of prohibited sources of donation. For example, a park can't accept donations from persons or entities when acceptance would create a conflict of interest or the appearance of a conflict of interest for the NPS or the Department of the Interior.

Single donations of $1 million or more require the Director's approval.

6. *Can a park solicit donations of money to purchase museum collections?*

No. You may not ask for donations of money to purchase museum objects. Refer to Director's Order #21 for prohibitions against soliciting.

You may:

- describe the needs of the museum if someone expresses an interest in donating money for purchasing museum collections
- respond to questions on how to donate money for purchasing museum collections
- get your friends group to approach a potential donor for you
- describe the needs of the museum to the general public
- have a catalog of needs with cost estimates

7. *Can a park conduct a fundraising campaign for money to purchase museum collections?*

No. However, a NPS partner, such as a friends group, may conduct fundraising campaigns for purchasing museum collections. The NPS partner must have a written agreement with the park. Refer to Director's Order #21 for guidelines on fundraising campaigns.

8. *Can a park establish endowments to provide a permanent source of money to purchase museum collections?*

No. However, a NPS partner, such as a friends group, can establish and manage an endowment for the park. The NPS partner must have a written agreement with the park. Refer to Director's Order #21 for guidelines on endowments.

9. *How do I acknowledge a donation of money to use for purchasing museum collections?*

The superintendent should write a letter acknowledging receipt of the cash donation and thanking the donor for his or her support. You can credit the donor through press releases, public events, and unobtrusive credit lines. The accession information should include the preferred credit line, if appropriate, such as "Purchased through a gift from the J.H. Smith Family." Refer to Director's Order #21 for guidelines on donor recognition.

I. Purchase Considerations

1. *Do I need an ownership statement from the vendor?*

Yes. Get an ownership statement when you purchase museum collections. An ownership statement protects the park from purchasing stolen property or property acquired through illicit trade. It also gives a history of ownership for the objects.

Note: The need for an ownership statement is dependent on the type of sale and the value of the objects. It is especially important to get an ownership statement from private individuals.

2. *What information should an ownership statement contain?*

An ownership statement should guarantee that the:

- seller is the owner or authorized agent for the owner of the property
- seller owns clear and free title to the objects without liens or other encumbrances
- objects are authentic and of the time period on the bill of sale

- seller has broken no customs, tax, records law, patrimony or other import and export laws or regulations

The seller should also note where he/she acquired the objects. A sample ownership statement appears in Figure 2.6.

3. *Does a purchase automatically include copyrights?*

No. You must have the seller sign a transfer of copyright statement to get the copyrights. A sample copyright statement appears in Figure 2.7.

You should make every effort to get all copyrights when purchasing museum collections. Be aware that past purchases may not include copyrights.

Refer to Section E in this chapter for additional information on acquisitions and copyrights.

4. *May I purchase firearms for the museum collection?*

Yes. However, you must be in compliance with all state and local law enforcement regulations.

> ***You can't use the governmentwide purchase card to purchase firearms for the museum collection.***

5. *May I purchase NAGPRA material?*

It depends on the material. You may not purchase human remains (either those subject to NAGPRA or those not subject to NAGPRA). In certain situations you may purchase funerary objects, sacred objects, or objects of cultural patrimony, if:

- the seller can verify that the original owner acquired the material legally

- the park acquires the material in compliance with NAGPRA, including consultation with the affiliated Native American group(s)

You must add the material to the park's NAGPRA inventory or summary. Follow the guidelines in the *Cultural Resource Management Guideline*, Appendix R: NAGPRA Compliance.

Note: You must be very cautious when purchasing NAGPRA material. It involves careful research and consultation to make sure that you don't acquire material in violation of the law. The park may have to pay for the services of a specialist to do the research.

6. *How do I record purchases that Harpers Ferry Center makes for exhibit or furnishings projects?*

Record objects that Harpers Ferry Center (HFC) purchases for exhibits and furnishings projects as purchases. HFC staff are acting as authorized agents for the park in making purchases with park or center money. HFC provides the park with purchase documentation that includes copies of sales receipts and information about the sale. The park signs a receipt for property when the objects arrive at the park.

7. *How do I record purchases by the park's cooperating association for the park's museum collection?*

When the park's cooperating association purchases museum collections for the park, record the transaction as a gift.

8. *What is a purchase contract?*

You may want to use a purchase contract for large or complex purchases, such as the purchase of an entire collection. A purchase contract spells out the conditions of the purchase.

9. *What do I need to include in a purchase contract?*

There is no standard purchase contract. The content of the contract depends on the purchase. Confer with the procurement staff at the park. The regional/SO curator can assist you with writing a purchase contract. Some things to address in a contract include:

- proof of ownership
- history of ownership (pedigree/provenance)
- transfer of all rights, title, and interests
- transfer of all copyrights
- NAGPRA issues, if relevant
- firearms restrictions, if relevant
- warranty that the collection is free of pesticides and hazards or that they are identified
- shipping and packing information
- insurance information
- date of purchase and possession
- release forms for archives

10. *Are there special considerations for purchasing archival and manuscript collections?*

Yes. Getting all copyrights is especially important for archival and manuscript collections. See Section E in this chapter for information on copyrights.

Be aware that archival collections may contain sensitive or legally-restricted material. You also need to be aware of the need to get model and interview release forms as needed for the material in the collection. See Section D.2 in this chapter for information on release forms.

11. *Should I get an appraisal for objects that the park wants to purchase?*

Yes. Get an appraisal for objects of high value in order to determine a fair purchase price. The seller may have an appraisal for the objects; however, the park may choose to get an independent appraisal.

12. *What other types of documentation should I get for a purchase?*

Get as much information as you can from the vendor. You may not be able to get this information later, and it is of primary importance for documenting the object. Don't be afraid to ask questions. If you don't get a response, document the fact that you asked. File the documentation in the accession folder.

J. Exchanges

1. *What is an exchange?*

You can acquire objects for the museum collection through an exchange. You exchange objects that are outside the park's SOCS for objects that fit the park's SOCS. An exchange involves both a deaccession and an accession. The owner of the property you acquire transfers ownership to the NPS. The owner must warrant that he/she has full legal title to the objects and has full power and authority to use the objects in an exchange. There can be no liens or other encumbrances of any kind against the objects you acquire or the title to those objects.

You must be able to justify that the objects you acquire:

- fit the park's SOCS
- fill a need at the park
- will receive adequate care
- are of museum quality, or fit archival appraisal criteria

Exchanges require the deaccession of museum collections. Refer to Chapter 6: Deaccessioning, in this handbook, for guidelines on deaccessioning.

2. *Who has the authority to make exchanges?*

The park superintendent has the delegated authority to make exchanges that are fair, justified, and in the public interest. For major exchanges, the superintendent should consult with an optional collections advisory committee or the regional/SO curator.

The superintendent must consult with a collections advisory committee for exchanges outside DOI (excluding the exchange of natural history specimens). See Chapter 6: Deaccessioning, in this handbook.

3. *How do I document an exchange?*

You must use an exchange agreement to document an exchange. The exchange agreement is a formal, legal agreement that transfers ownership and legal rights. A sample exchange agreement appears in Figure 2.8. You may create your own exchange agreement, but it must include the introduction and sections 1-9 of the sample exchange agreement.

You can print a blank or completed exchange agreement from ANCS+. Print the agreement on acid-free paper.

Make two copies of the exchange agreement. The superintendent and the

legal owner, or his/her authorized representative, sign both copies of the agreement. The park keeps one copy in the accession folder, and the other party keeps the other copy. If you use the optional deaccession folder, make a copy of the signed agreement for this folder.

The exchange agreement includes the following attachments:

- a list of the objects that the park is acquiring
- a list of the objects that the park is deaccessioning
- appraisals of the objects (this is only required for exchanges outside the federal government)
- an ownership statement (see Figure 2.6 for a sample statement)

Note: For exchanges within the federal government, write, "Not Applicable" in Section 4 of the exchange agreement.

4. *Does the NPS prohibit exchanges with certain sources?*

Yes. You must clearly justify and document all exchanges so that they can withstand any public or professional scrutiny. You cannot exchange with sources if there is a real or apparent conflict of interest. For example, NPS employees and their relatives cannot appear to benefit in any way from an exchange.

5. *Does the NPS have an order of preference for sources of exchanges?*

Yes. Follow the order of preference in Section K.2 of Chapter 6 in this handbook. You should try to keep museum objects in the public trust whenever possible. According to NPS procedures and generally accepted museum practice, exchanges with private individuals and non-educational or non-cultural institutions are not recommended. Only exchange with private individuals and entities if the exchange is well justified, and you can't acquire the objects by other means.

K. Exchange Considerations

1. *Must exchanges be of equal value?*

Objects in an exchange should be approximately equal in monetary value. However, it is sometimes appropriate to exchange NPS objects for objects of lesser value. This situation might occur when the park has a great need for the objects and has been unable to get them elsewhere. You must fully describe such circumstances in the justification for the exchange. Explain why the exchange is in the best interest of the NPS and the general public.

2. *Must the objects in an exchange be appraised?*

Yes, unless the exchange is within the federal government. The NPS requires formal appraisals for exchanges outside the federal government. Formal appraisals are standard museum practice for determining monetary value. You need appraisals to show that the objects in the exchange are approximately equal in value. Get a minimum of one formal, written appraisal (sometimes referred to as "an arms-length appraisal") for objects below $20,000 in value. Get two appraisals for objects over $20,000 in value. You must have appraisals for the objects you deaccession and the objects you acquire.

Note: You don't need to do appraisals for most exchanges of natural history specimens. See question 4 below.

3. *Where can I find information about appraisals for exchanges?*

Refer to Section E of Chapter 6, in this handbook, for information on the appraisals you will need for an exchange. Refer to Section IX of Chapter 4, in this handbook, for information on appraisers and determining the value of objects.

4. *Can I exchange natural history specimens?*

Yes. The exchange of specimens is a common practice among scientists. The exchange of specimens doesn't require review by the collections advisory committee or a formal appraisal. However, for certain specimens, such as paleontology specimens, an appraisal may be appropriate. Consult the regional/SO curator before exchanging natural history specimens.

> ***You may not exchange type or voucher specimens.***

5. *Does an exchange automatically include copyrights?*

No. Section 5 of the sample exchange agreement allows the owner to transfer all copyright interests. You must include this section in any exchange agreement you create. If the owner won't, or can't, transfer all copyrights, delete the copyright section from the exchange agreement by drawing a line through it. Have both parties initial the change.

> ***You should make every effort to get all copyrights when receiving museum collections. Be aware that past exchanges may not include copyrights.***

Refer to Section E in this chapter for additional information on acquisitions and copyrights.

6. *Can I acquire NAGPRA material through an exchange?*

It depends on the material. You may not acquire human remains (either those subject to NAGPRA or those not subject to NAGPRA) through an exchange. In certain situations you may acquire funerary objects, sacred objects, or objects of cultural patrimony, if:

- the other party can verify that the original owner acquired the material legally
- the other party, if a museum, is in compliance with the NAGPRA statute
- the park acquires the material in compliance with NAGPRA, including consultation with the affiliated Native American group(s)

You must add the material to the park's NAGPRA inventory or summary. Follow the guidelines in the *Cultural Resource Management Guideline*, Appendix R: NAGPRA Compliance.

Note: You must be very cautious when acquiring NAGPRA material in an exchange. It involves careful research and consultation to make sure that you don't acquire material in violation of the law. The park may have to pay for the services of a specialist to do the research.

7. *Are there special considerations for acquiring archival and manuscript collections through an exchange?*

Yes. Getting all copyrights is especially important for archival and manuscript collections. See Section E in this chapter for information on copyrights.

Be aware that archival collections may contain sensitive or legally-restricted material. Be aware that you must get model and interview release forms, as needed, for the material in the collection. See Section D.2 in this chapter for information on release forms.

8. *May I accession objects expressly to use them in an exchange?*

No. The park items you use in an exchange must be outside the SOCS. A park may not acquire objects outside the SOCS. In addition, acquiring objects to use in an exchange gives the impression that the park is dealing in collections. There would also be potential tax liabilities if the park acquired an object for the purpose of using it in an exchange. Refer to Section C.7 of Chapter 6, in this handbook, for information on tax liabilities.

9. *Who pays the transportation costs for an exchange?*

Transportation costs are negotiable in an exchange. Usually the park pays transportation costs for the objects it is deaccessioning. You can modify Section 10 of the sample exchange agreement as needed for each exchange.

10. *What other types of documentation should I get for an exchange?*

Get as much information as you can from the other party in the exchange. You may not be able to get this information later, and it is of primary importance for documenting the object. Don't be afraid to ask questions. If you don't get a response, document the fact that you asked.

Note: Keep the original accession documents for the material you deaccession. Provide the other party with copies of documentation needed to manage the objects.

L. Transfers

1. *What is a transfer?*

When other parks or federal agencies transfer museum objects to your park, you accession the objects as a transfer. The other park or agency transfers title and control of the property to your park. Your park must agree to the transfer. Most transfers occur between parks.

2. *Who has the authority to accept transfers?*

The park superintendent has the delegated authority to accept transfers from any federal agency.

3. *How do I document a transfer?*

Document a transfer with a Transfer of Property, DI-104 (Figure 2.9). The park or agency that is transferring the objects completes the transfer form and makes two copies. The accountable officer for the other park or agency and the superintendent at your park sign both copies of the transfer. Keep one copy in the accession folder and return the other copy.

4. *Do I need an ownership statement for a transfer?*

Yes. You don't necessarily need a signed statement as in Figure 2.6, but you do need copies of the accession or ownership documents. Ownership documents include such items as donor letters, previous transfers of property, and sales receipts. These documents provide a history of ownership for the objects you will accession. File this information in the accession folder.

If you receive a transfer from another park, there should also be a title verification statement on the transfer. Refer to Section L.2 in Chapter 6, in this handbook.

M. Transfer Considerations

1. *Does a transfer automatically include copyrights?*

No. You must have the other park or agency sign a transfer of copyright statement to get the copyrights.

A sample copyright statement appears in Figure 2.7.

You should make every effort to get all copyrights when receiving transfers of museum collections. Be aware that past transfers may not include copyrights.

Refer to Section E in this chapter for additional information on acquisitions and copyrights.

2. *How can I find out if other parks or agencies have material for transfer?*

Parks may advertise the need for objects:

- on the curatorial bulletin board
- on the Museum Management Program's web site
- in the Clearinghouse Classifieds newsletter

Other federal agencies have newsletters, electronic bulletin boards, or web sites that may include lists of objects available for transfer. You may also advertise objects available for transfer using any of these options.

3. *What if I don't have a transfer form on file for previous accessions?*

All transfers should have a signed, original transfer of property form. Transfers that the park received before 1985 might not have a transfer form on file. Some early accessions may have very little documentation of any kind.

If you can determine that a previous accession was a transfer, try to get a signed transfer form from the other park or agency. Note the earlier date of transfer on the form. Document all your efforts to get a transfer form. Keep this documentation in the accession file.

4. *May I receive a transfer of NAGPRA material?*

Yes. However, you must have the consent of all affiliated Native American groups.

You must add the NAGPRA material that you acquire to the park's NAGPRA inventory or summary. Follow the guidelines in the *Cultural Resource Management Guideline*, Appendix R: NAGPRA Compliance.

5. *Are there special considerations for acquiring archival and manuscript collections through a transfer?*

Yes. Getting all copyrights is especially important for archival and manuscript collections. See Section E in this chapter for information on copyrights.

Be aware that archival collections may contain sensitive or legally-restricted material. You also need to be aware of the need to get model and interview release forms as needed for the material in the collection. See Section D.2 in this chapter for information on release forms.

6. *Who pays transportation costs for a transfer?*

Usually the receiving park pays the transportation costs for a transfer.

7. *What other types of*

Request copies of all the documentation for the objects you're receiving.

documentation should I get for a transfer?

This includes accession records, catalog records, research notes, catalog folder contents, conservation records, and any other information available. The park or agency that is transferring the objects keeps the original documents.

N. Field Collections

1. *What is a field collection?*

Field collections are accessions of museum objects/specimens and field records that are park property. Most field collections are archeology or natural history collections. The authority for collecting objects or specimens is usually a permit or contract.

Accession resource management records as a field collection.

A park produces resource management records in the process of preserving its cultural and natural resources. These records document research, preservation, and restoration work and provide "baseline data" for ongoing management of resources. They include records and files that document resource management projects such as:

- ruins maintenance
- natural science inventories
- historical architecture research and maintenance
- cultural landscape research and maintenance

2. *How do I document a field collection?*

There is no transfer of ownership document for field collections, since the park has title to these collections. Use a Receipt for Property, Form DI-105 (Figure 2.1) to document receipt of material from authorized collectors. Print the name of the field collector and the project name on the receipt for property.

Don't issue a receipt for property if the collector doesn't bring the material to the museum. Some collections go directly from the field to a repository for analysis and storage. You'll need to accession the collection and place it on outgoing loan. Note on the Accession Receiving Report, Form 10-95 Rev. (Figure 2.2) that the park didn't receive the collection. Refer to Chapter 5, in this handbook, for information on outgoing loans.

Use the Accession Receiving Report, Form 10-95 Rev. (Figure 2.2) to document information about a field collection. It's important to get information from the collector to complete the report.

3. *What if I receive collections from a field collection over a period of time in more than one batch?*

You may receive more than one delivery of materials (objects/specimens, field records) from a single project. Issue a receipt for property for each delivery. You may assign a single accession number to the material if the project has the same:

- funding source
- project name
- geographic location

You must complete a receipt for property and update the accession receiving report and inventory for each delivery. Add the dates of additional deliveries and other pertinent information about each delivery in the Other Comments field in the ANCS+ accession record. This information will print in the Remarks section of the accession receiving report. Print a copy of the updated Accession Receiving Report, Form 10-95 Rev. (Figure 2.2) for each delivery. Store all copies of the accession receiving reports in the accession folder.

Note: For multi-year accessions, remember to make adjustments to your annual Collections Management Report (CMR). Adjust the number of items in the accession after the first year. Note that the adjustment is due to a multi-year accession.

4. *Can I accession field collections that are not at the park?*

Ideally, you should accession a field collection before it leaves the park. However, at times field collections are removed from a park before being accessioned. You must accession these collections as soon as possible. Contact the repository or collector for the information you will need to complete the accession records. Then give the repository or collector the accession information for the collection. It's not a good practice to assign accession numbers in advance.

Make sure you complete ANCS+ accession records for field collections that are not at the park. Provide accession information to the repository or collector who is cataloging the collection.

5. *What are field records?*

The term "field records" is sometimes used to describe the associated records that accompany the objects and specimens from an authorized collecting project, such as an archeological investigation. These associated records are a subset of resource management records. Field records include:

- field notes, journals, and diaries
- maps, graphs, and charts
- reports
- databases
- geographic information system records
- photographs, slides, and other documentary images of collecting localities, such as large scale aerial photographs

- correspondence
- audiotapes and videotapes

6. *Do I accession the field records when I accession a field collection?*

Yes. You must accession the field records along with the objects/specimens from a field collection. The permit or contract that authorizes the collection should state that all associated records are the property of the park.

The collector must provide a key to any abbreviations or codes.

Note: Collectors frequently keep their original field notes and give copies to the park. This is acceptable. For preservation purposes, it's a good idea to copy all paper field records onto archival paper.

7. *Do field records automatically include copyrights?*

The ownership of the copyrights depends on who created the records:

- When NPS or other federal staff produce field records while functioning in their official capacity as a government employee, the field records are in the public domain.
- Those who produce field records under contract own the copyrights to the records unless the contract states otherwise. The contract should state that:
  - the work (including field records) is a federal work-for-hire, meaning that the contractors have produced the records as part of their responsibilities, and therefore the records are in the public domain, *or*
  - the contractor transfers all intellectual property rights, including all copyrights and release forms, to the park
- Non-federal entities who produce field records under collecting permits own the copyrights to the field records they produce. Parks should try to get the copyrights whenever possible. A good way to do this is to state as a condition of the permit that field records (or copies) and the copyrights become park property.

Refer to the *MH-III*, Chapter 2: Legal Issues, for additional information about copyrights and federal contractors.

8. *Are there restrictions on field records?*

Yes. It is important to note restrictions at the time of accession. By law, you must place restrictions on the location data for:

- archeological excavations, including shipwrecks -- Archaeological Resources Protection Act (ARPA) of 1979 (16 USC 470)
- caves and cave resources – Federal Cave Resources Protection Act of 1988 (16 USC 4301-4309)
- historic resources at risk of harm, theft, or destruction – National Historic Preservation Act of 1966, as amended (16 USC 470-470t, 110)
- information concerning the nature and specific location of mineral or paleontological specimens or objects of cultural patrimony within units

of the NPS or resources that are endangered, threatened, rare, or commercially valuable – National Parks Omnibus Management Act of 1998 (16 USC 5937)

You should also place restrictions on the following location data; however, these data may be subject to Freedom of Information Act (FOIA) requests.

- Indian sacred sites – Executive Order 13007—Indian Sacred Sites (May 24, 1996)
- nesting sites or specific habitat on threatened and endangered species – Endangered Species Act of 1973, as amended (16 USC 1531-1543)
- paleontological sites

Refer to the *MH-III,* Chapter 2: Legal Issues, for additional information about restrictions and FOIA requests.

9. *What if a field collection involves NAGPRA material?*

Authorized collectors must notify and consult with affected Native American groups about NAGPRA material before it is collected. When accessioning NAGPRA items, get as much information as possible from the collector. This is the most readily available evidence for determining cultural affiliation. Recording this information at the time of accession can make NAGPRA compliance much easier.

You must add the NAGPRA material that you acquire to the park's NAGPRA inventory or summary. Follow the guidelines in the *Cultural Resource Management Guideline*, Appendix R: NAGPRA Compliance.

O. Other Field Collections

1. *What is an unauthorized field collection?*

An unauthorized field collection may occur if an individual collects objects/specimens in the park without a permit or contract. For example, visitors may occasionally turn in objects that they have found in the park.

> ***NPS policies prohibit unauthorized collecting. Strongly discourage this type of accession. Consider returning the objects to their original location, if possible.***

Parks may want to establish a Standard Operating Procedure (SOP) for how to handle unauthorized collecting.

2. *How do I document an unauthorized field collection?*

If you have to accession an unauthorized field collection, record it as a field collection. Use the Accession Receiving Report, Form 10-95 Rev. (Figure 2.2) to record the:

- details of the collection location
- finder's name and address
- name of the staff member who received the material
- any other details that relate to the material or its collection

List the park as the source of accession on the report. Don't issue a receipt for property for an unauthorized field collection.

3. *Do I accession objects that were manufactured in the park as a field collection?*

Yes. Park staff, contractors, or cultural demonstrators may make objects in the park that become part of the museum collection. Accession these objects as a field collection. Have the maker sign a statement that he or she produced the objects while working for the park. Get as much information as possible from the maker about the object. File this information in the accession folder.

4. *Do I accession objects without accession documentation as a field collection?*

Yes. If you are unable to find any documentation to tell how the park acquired the objects, accession the objects as a field collection. Many parks have material from unknown sources in the park museum collection. You may find undocumented material in the collection or in other storage areas of the park.

It may not always be easy to determine whether objects that you find without accession documentation are museum material. The objects should fit within the park's SOCS, or relate in some way to other material in the collection. When in doubt, consult other park staff or your regional/SO curator.

Note: If you find out the source of the material at a later date, change the accession information. See Section V.14 for information about changing accession type.

5. *How can I make sure the documentation for an accession is really missing?*

Do a thorough and organized search for the missing documentation. Record everything that you know about the objects and the source of that information. You may want to create a checklist to record the steps you take and the information you find. Some questions to ask include:

- Does the location in which you found the material supply information?
- Can other staff give you information?
- Can you locate former staff and interview them?
- Has someone labeled the material incorrectly?
- Is the material actually part of another accession?

If there is evidence of a source of accession, try to locate the other party to get a transfer of ownership document. Refer to Section B.11 of this chapter.

Be sure to document the sources you contact and the information you find, even if it's negative or inconclusive. Distinguish facts from theories or assumptions. Thorough records can prevent later duplications of effort and add to the interpretive value and history of the collection.

Note: Searching for missing accession documentation can be time-consuming and complex. You often don't get any clear-cut answers or solutions. You may want to consult with your regional/SO curator before conducting a search.

6. *How do I accession objects that don't have documentation?*

Enter only the known facts about the accession in the accession book. Use the date of entry in the accession book as the acquisition date. This is the date that the park acknowledged custody of the objects. The source of

accession for collections without documentation is the National Park Service or "Unknown."

Complete an Accession Receiving Report, Form 10-95 Rev. (Figure 2.2) for the accession. In the Remarks field, describe how and where the material was found and who found it. If you've done research on the accession, include a working hypothesis on the source of the material. List the sources you used, including the names and addresses of people you interviewed.

Include your research notes and documentation in the accession folder. Make sure that the accession folder contains all the information that you know about the objects.

7. *Does the park own the copyrights on materials found in the collection?*

The park can't assume that it owns the copyrights on materials that are found in the collection without accession documentation. Refer to the *MH-III*, Chapter 2: Legal Issues, for information on what types of materials are protected by copyright.

P. Incoming Loans

1. *What is an incoming loan?*

Museum collections for which you have temporary custody are incoming loans. There is no transfer of ownership with an incoming loan. The lender is the owner of the property. The park or NPS center is the custodian of the property for a specific period of time. Parks receive incoming loans from other parks, institutions, or individuals. NPS centers receive incoming loans from parks. The NPS treats incoming loans as accessions.

Note: Museum collections that are at a park for less than 30 days are not incoming loans. Issue a Receipt for Property, DI-105 (Figure 2.1) when you receive objects for less than 30 days. Note on the receipt the date that the owner must get the property. Include the owner's name, address, and phone number on the receipt. File and track the receipt by the date of return. If you decide to keep the objects for more than 30 days, you must complete an Incoming Loan Agreement, Form 10-98 Rev. (Figure 2.11).

2. *Why does the NPS accession incoming loans?*

The NPS uses the accession number as the incoming loan number to avoid an additional numbering system. Accessioning incoming loans also provides these objects with the same accountability system that you use for the collections that the park owns.

You must accession all incoming loans. Follow the procedures in Sections U and V of this chapter.

3. *For what purposes may I borrow museum objects?*

Parks usually borrow museum objects for exhibition or research. You may borrow museum objects for any reason consistent with the purposes of the park.

Note: In general, it doesn't benefit the park to have objects in your collection that you don't own. Limit incoming loans to objects you need for very specific purposes, such as a temporary exhibit.

4. *Must the objects I borrow fit within the park's SOCS?*

No. Objects that you borrow for short-term exhibits and research don't need to fit within the park's SOCS. Objects that you borrow for periods of over a year should fit within the SOCS.

5. *How do I document a loan?*

You must use the Incoming Loan Agreement, Form 10-98 Rev. (Figure 2.11) to document loans to the NPS. As part of the accessioning process complete an incoming loan agreement that lists the objects in the loan. The incoming loan agreement is a formal, legal agreement that transfers custody for a specific period of time.

Refer to Section R of this chapter for additional information on the incoming loan agreement.

6. *For how long may I borrow museum objects?*

Limit the length of incoming loans to three years. You can extend the loan after three years if needed. NPS centers should review and extend incoming loans from parks every ten years.

7. *Must I catalog incoming loans?*

Yes, if you keep them for over a year. You don't have to catalog incoming loans that you keep for less than one year. Cataloging is usually part of the purpose for incoming loans to NPS centers.

Note: Don't mark the objects with a catalog number. Tag incoming loans with the catalog number.

8. *Who makes the loan?*

As the staff person responsible for the museum collection, you must review all potential loans and make recommendations to the superintendent.

The superintendent approves or disapproves all incoming loans.

Once the superintendent approves the loan, you're responsible for processing, documenting, and tracking the loan.

Q. Incoming Loan Considerations

1. *May I make third-party loans?*

No. The NPS doesn't permit third-party loans. You may not loan out material that you acquired as an incoming loan.

Note: Parks may grant NPS centers blanket approval to make third-party loans for routine conservation, exhibit, or analysis.

2. *Are there special procedures for loans between parks?*

Yes. The incoming loan agreement is optional if you receive a loan from another park. The lending park must follow the procedures in Chapter 5: Outgoing Loans, of this handbook.

If your park is the borrower:

- treat the loan as an incoming loan
- use the lending park's outgoing loan agreement in place of an incoming loan agreement
- follow all other incoming documentation procedures as outlined in this chapter
- place the accession number you assign to the incoming loan on the lender's outgoing loan form

Note: For CMR and tracking purposes, you must enter the incoming loan into the Loans In associated module of ANCS+. If you want to have an incoming loan agreement, you can print one from this module.

3. *Are there special procedures for loans between parks and NPS centers?*

Yes. The lending park must follow the procedures in Chapter 5: Outgoing Loans, in this handbook. Refer to Section F of Chapter 5 for special procedures for lending objects to centers.

The NPS center may:

- use the lending park's outgoing loan agreement in place of an incoming loan agreement, *or*
- complete an incoming loan agreement for the park

4. *Must I inventory incoming loans?*

Yes. Incoming loans are controlled property that you must include in the annual inventory. When you catalog incoming loans, enter a "Y" in the Controlled Property field. You must inventory all controlled property annually. Refer to Section I of Chapter 4 in this handbook for instructions on completing a controlled property inventory.

NPS centers don't treat incoming loans from parks as controlled property. Centers inventory individual objects within the loan that meet controlled property criteria.

Note: You must make incoming loans available for the lender to inventory, as needed. The lender may ask you to verify in writing or by phone the presence and condition of objects.

5. *Are incoming loans subject to NPS collections management policies?*

Yes. Objects on incoming loan are subject to NPS museum management policies. Incoming loans appear on the annual Collections Management Report (CMR). Refer to Section VIII of Chapter 4 in this handbook for information on the CMR.

6. *Where do I get the forms for incoming loans?*

Use ANCS+ to print blank or completed incoming loan forms. Use acid-free paper to print the forms.

Acid-free paper is available from the Supply and Equipment Program of the

Museum Management Program, National Center for Cultural Resources.

7. *Does an incoming loan include copyrights?*

No. Incoming loans don't include copyrights. Copyrights for material on loan stay with the owner of the material. As a condition of the loan, you may negotiate permission to use the materials for special purposes, such as park publications and exhibitions.

R. Processing and Documenting Incoming Loans

You are responsible for processing and documenting the loan transaction. For an overall view of the loan process, refer to Flow Chart Figure 2.14.

1. *Loan Identification and Review*

You or other park staff, such as exhibit specialists or interpreters, may identify objects you want to acquire on loan. If your park has a collections advisory committee, have them review the potential loan. You may also want to consult with the regional/SO curator before negotiating the loan.

Refer to Section B.8 of this chapter for information on the collections advisory committee.

2. *Loan Requests*

Request and arrange loans in advance. You should send a formal letter of request from the superintendent. You and the lender must agree to the terms of the loan. The lender may send you a sample loan agreement and conditions. You may want to send the lender a copy of the Incoming Loan Agreement, Form 10-98 Rev. (Figure 2.11) and Conditions for Incoming Loans, Form 10-98a Rev. (Figure 2.12) for review.

Before approving the loan, the lender may request that you complete a facility report. A facility report provides the lender with written evidence that the park can adequately care for the loan. You can get a facility report from the American Association of Museums or the NPS Museum Management Program.

3. *Insurance*

Non-federal museums, private owners, and state or local agencies may require insurance coverage as a condition for a loan. As the borrower, you're responsible for paying for the insurance. You don't need insurance for loans from other parks or from most other federal agencies. The agency will tell you if you need to purchase insurance.

Refer to Section VII of Chapter 4 in this handbook for information on purchasing insurance.

4. *Shipping*

As the borrower, you are responsible for arranging the shipping with the lender's approval. You pay all the shipping costs. You may negotiate to have the lender arrange for shipping and charge the shipping costs to you.

Unless otherwise agreed to in writing, parks are responsible for shipping arrangements and costs for incoming loans to NPS centers.

Refer to *MH-I,* Chapter 6: Handling, Packing and Shipping Museum Objects.

5. *Loan Agreement*

The lender should send you two copies of the lending institution's loan agreement that contains the conditions of the loan. Have your superintendent sign both copies of the agreement, and return one copy to the lender. You must also complete an Incoming Loan Agreement, Form 10-

98 Rev. (Figure 2.11) for all incoming loans. You cannot substitute a non-NPS form for Form 10-98. The loan agreement includes:

- the purpose for the loan
- starting and ending dates
- address and contact names for both parties
- the objects in the loan
- a credit line
- shipping and packing information
- insurance coverage information
- specific conditions concerning the loan

You can print a completed incoming loan agreement by using the Loans In associated module in ANCS+. Refer to the ANCS+ User Manual for instructions. Print the form on acid-free paper.

Note: See Figure 2.10 for instructions on completing and sending the incoming loan agreement.

6. *Attachments to the Loan Agreement*

Attach a list of objects and the conditions for the loan to the loan agreement.

List of Objects

For large loans, attach a list of objects to the loan agreement. You may attach:

- a copy of the lender's list of objects with the lender's catalog numbers, if appropriate
- a copy of the ANCS+ accession receiving report continuation sheet that includes a list of objects in the accession
- an inventory list or computerized list that you create

Note: After you catalog the objects in the loan, you can complete the List of Objects, Form 10-417 (Figure 2.14) using ANCS+. Attach this form to the incoming loan agreement.

The list of objects in the loan should include:

- object name
- brief description
- item count or quantity
- condition
- value (if appropriate)

- space for comment

Conditions
Attach the Conditions for Incoming Loans, Form 10-98a Rev. (Figure 2.12) to the incoming loan agreement. If additional conditions are necessary, note them in the additional loan condition section of the incoming loan agreement.

7. *Signing the Loan Agreement*

Your superintendent and the lending official are responsible for meeting the terms of the loan agreement.

Your superintendent signs two copies of the incoming loan agreement and sends them to the lender. The lender signs both copies, returns one copy to the park, and keeps the other copy.

For incoming loans to NPS centers, the center manager must sign the loan agreement.

8. *Filing the Loan*

Store all the documents for the loan in the accession folder. Refer to Section V of this chapter for information on the accession folder.

9. *Receiving the Objects*

When you receive an incoming loan:

- Give the objects time to acclimatize before unpacking.
- Unpack and inspect the objects.
  - photograph packing techniques for awkward or fragile objects to help you when repacking
  - photograph poor packing to document to the lender that the park is not responsible for shipping damage
  - save and reuse the packing materials (if professionally or well-packed) for return of the loan.
- Document the condition of the objects. Photograph any objects that were damaged in shipment. Notify the owner and insurance company immediately, if necessary.

If the lender…	*Then…*
has completed an object condition report,	note any changes or "no change," date, and sign the report.
hasn't completed an object condition report,	you may want to complete one to protect the park from possible disputes over object condition.

- Record the loan in the accession book (refer to Section U of this chapter for information on the accession book).
- Complete an Accession Receiving Report, Form 10-95 Rev. (Figure 2.2), and create an accession folder. Refer to Section V of this chapter for information on documenting accessions.
- Tag the objects with NPS accession numbers.
- Send a memo or e-mail message to the lender to acknowledge receipt of the objects. Keep a copy in the accession folder.

Note: ANCS+ will print an Object Condition Report, Form 10-637 from the condition information you enter on the catalog record.

S. Tracking Incoming Loans

You are responsible for tracking all incoming loans. Keep up-to-date loan agreements for all incoming loans.

1. *ANCS+ Loans In Associated Module*

Use ANCS+ to track incoming loans by return date. By entering your incoming loans into ANCS+, you can print all the loan forms and sort and track your loans by return date. ANCS+ contains all the required fields for loan data.

Refer to Section V of Chapter 4 in the *ANCS+ User Manual* for information on using the Loans In associated module.

Note: NPS centers may use a customized version of the ANCS+ Loans In associated module to track incoming loans.

2. *Monitoring and Recall*

All incoming loans, with the exception of incoming loans to NPS centers, should include a regular monitoring schedule. Conducting an annual inventory of controlled property is sufficient monitoring for most loans. You may need to monitor certain objects, such as those on exhibit, more frequently.

You should give at least 30 days written notice to cancel a loan before the termination date. Most lenders reserve the right to end a loan within 30 days written notice.

3. *Loan Extensions*

The lender will usually tell you when a loan is coming due. If you don't

hear from the lender, it is your responsibility to contact the lender.

You may request a loan extension. Give an extension a specific ending date, not to exceed three years. NPS centers can extend incoming loans for up to ten years.

The lender may ask you to update a facility report when negotiating a loan extension. You will also have to extend insurance coverage, if applicable. Provide the lender with a copy of the certificate of insurance for the extension period.

The lender may extend the loan with a loan extension form, letter, or new loan agreement. Review the extension document and have the superintendent sign and return it to the lender. Keep a copy with the original loan agreement. If the lender extends the loan by letter, have the superintendent send a written acknowledgment of the extension. Include the new ending date for the loan in the acknowledgment.

Update the Incoming Loan Agreement, Form 10-98 Rev. (Figure 2.11) with the new extension date and any new loan conditions. Don't create a new incoming loan agreement. Send a copy of the updated agreement to the lender. File all loan extension documentation in the accession folder.

4. *Loan Termination*

Before the termination date of the incoming loan, make arrangements for shipping and packing the objects. You, as the borrower, are responsible for shipping and packing costs.

Pack objects using the same packing methods as the lender. If the objects were poorly packed, refer to *MH-I*, Chapter 6, Handling, Packing, and Shipping Museum Objects. Consult with the lender if you change the packing.

Make sure the lender receives the objects. Contact the lender to verify receipt.

Send a letter requesting the lender to sign the original incoming loan agreement and return it to the park. Keep the signed, terminated loan agreement and all other documentation on the loan in the accession file.

5. *Documenting a Loan Return*

To document the return of an incoming loan:

- Note the return of the loan in the accession book in the Remarks column.
- Note the return of the loan on all other accession documents, including the accession receiving report.
- Enter "Returned" in the Status field in the ANCS+ Loans In associated module.
- Enter "Deaccessioned" in the Catalog Status field on the ANCS+ accession record.
- Enter "Deaccessioned-Loan Returned" in the Object Status field on the catalog records for the objects in the loan.

- Change the Location field on the catalog records for the objects in the loan. Note that the loan was returned.

- Change the Controlled Property field to "N" on the catalog records for the objects in the loan.

Don't use the ANCS+ Deaccessions associated module for the return of incoming loans. Use this module only when the park owns an item and is giving up ownership. The NPS uses the term "deaccessioned" for the return of incoming loans because the loan has been accessioned. The return of a loan is a type of deaccession, but it involves a change of custody, not ownership.

Note: The return of incoming loans appears in the deaccession section of the Collections Management Report (CMR).

T. Old Loans

1. *What is an old loan?*

The curatorial staff at many parks face the problem of old loans. Old loans may be:

- loans that have expired, and you cannot locate the owner

- long-term loans without a termination date that the lender hasn't claimed

- partially or undocumented loans

Note: There is generally some form of documentation, such as a letter, that lets you know that you're dealing with a loan. Refer to Section N of this chapter for information on accessioning objects that you find in the collection without any documentation.

To avoid the problem of unclaimed loans in the future, attach the Conditions for Incoming Loans, Form 10-98a Rev. (Figure 2.12) to the loan agreement. The conditions include procedures the NPS will follow for unclaimed loans.

2. *Why is it important to resolve old loans?*

The resolution of old loans should be a high priority. Without legal title, you have limited use of these collections, but you must pay the costs of storing and caring for them. The longer you wait, the harder it may be to find the legal owner.

3. *How do I go about resolving an old loan?*

First you must know the location and condition of the object and what the park wants to do with it.

Many states have enacted old loan laws. Refer to Figure 2.15 for a listing of state laws. If your park is in one of these states, follow the procedures for your state.

If your state hasn't enacted old loan legislation, follow the procedures in Sections T.4-T.8 below. Consult your regional/SO curator and regional solicitor.

4. *How should I contact the*

Send a notice of termination in a certified letter, return receipt requested, to

lender?

the last known address of the lender. The letter should include the following information:

- the date of notice
- the name of the lender
- a description or list of the object(s) in the loan
- the dates of the original loan
- your name, address, and telephone number for contacting you at the park
- a statement that the museum wants to terminate the loan and return the objects
- a request for the lender to contact you within 45 days
- a statement that the park will take title to the objects within one year of the date of the notice if the lender doesn't contact the park

If…	***Then…***
you hear from the lender,	terminate the loan or have it converted to a permanent accession, such as a gift.
you don't hear from the lender,	conduct a reasonable search for the owner, heirs, or designees.

5. *What should I do to locate a missing lender?*

You must make a reasonable effort to locate the lender. Be sure to document the steps you take. Your efforts may become evidence if the owner or heirs resurface at a later date and demand the return of the property. Some sources to search include:

- telephone directories
- relatives
- real estate records
- probate records
- vital (death) records
- Web-based national phone directories

During your search for the lender, you may discover that he/she has died. You must then conduct a reasonable search for the lender's heirs. Contact the heirs with a certified letter.

If you are able to locate the lender, heirs, or designees follow the procedures in Section T.4 above.

Note: Searching for missing lenders takes time and effort. You must determine what is a reasonable search given the particular circumstances of each loan.

6. *What if I'm unable to locate the lender or legal owner?*

If you can't locate the owner of the objects, you must publish a notice of intent to terminate the loan. Publish the notice in a newspaper of general circulation in the local area of the:

- last known address of the lender, *and*
- park (if different from the lender's address)

Publish the notice twice, 60 or more days apart. The one-year waiting period begins with the second publication.

Address the notice to anyone claiming ownership or other legal interest in the property. The notice should include the same information as the certified letter to the lender. Refer to Section T.4 above. For example:

> Second notice to Mr. Jackson B. Smith last of 346 Persimmon Lane, Lancaster, PA. On 8/19/1985 you loaned a miniature painting in a wooden and brass frame to Park National Park. This loan expired 8/19/1988. The park wants to terminate the loan and return the object. Please contact Tom Brown at [park address and telephone number] within 45 days of this notice. The park will take title to the objects within one year of this notice (4/5/2001) if you do not contact the park and make arrangements to terminate the loan. (4/5/2000)

7. *What if someone other than the lender claims to own the property?*

Don't give the property to anyone without proof of ownership. Get enough documentation to prove that the person or institution is the legal owner or authorized representative of the owner.

In the case of an heir or heirs, request a copy of the lender's will. If no will exists, contact a solicitor.

8. *What if more than one person claims to be the owner of the property?*

Don't release the property if there are competing claims of ownership. Wait to release the property until the parties reach an agreement or a court action resolves the dispute.

9. *Does the park own the copyright on materials in unclaimed loans?*

No. The park doesn't own the copyrights on materials in an unclaimed loan. Refer to *MH-III*, Chapter 2: Legal Issues, for information on what types of materials are protected by copyright.

10. *What do I do if the loan remains unclaimed?*

If you follow the notification procedures in this section and the loan remains unclaimed, accession the object as a gift. Note the circumstances of the unclaimed loan on the Accession Receiving Report, Form 10-95 Rev. (Figure 2.2) File all the documentation on your search for the lender in the accession file. Don't use a deed of gift form.

See Section V.14 for procedures for changing accession type.

11. *May I deaccession objects from unclaimed loans?*

Yes. If you follow the notification procedures in this section, you may deaccession the objects from unclaimed loans. Be sure to maintain all documentation on your search for the lender. Refer to Chapter 6 in this handbook for deaccessioning procedures.

12. *What do I do if the owner comes forward after I accession the unclaimed loan as a gift?*

If you follow the notification procedures in this section, and the loan remains unclaimed, it becomes abandoned property to the United States. You don't have to return the material at this point. However, with a solicitor's written opinion, the park may choose to deaccession the material to the original owner. Use the deaccession type "Return to Rightful Owner." Refer to Chapter 6 in this handbook for information on deaccessioning.

U. Accession Book

1. *What is the accession book?*

The Accession Book, Form 10-256 (Figure 2.16) documents the source for **every** object in the park's museum collection. It contains the sequential log of transactions that prove NPS ownership of museum collections and temporary custody for incoming loans. All material in the park's museum collection must be part of an accession in the accession book. You haven't officially accessioned the material until you enter the accession in the accession book.

Treat your accession book as a legal document. It may be used in a court of law, if necessary. The value of the book as a legal document lies in the uninterrupted sequence of entries, without missing pages or erasures.

The accession book is one of your most important museum record-keeping documents. It is designed for permanence. The pages are made of high-quality rag paper. Each page is string-bound into a hard cover. New accession books are available from the Supply and Equipment Program of the Museum Management Program, National Center for Cultural Resources.

2. *May a park have more than one accession book?*

No. You may have only one accession book, or set of books, with one series of accession numbers.

Note: If the park contains different management units in different geographical locations, you may need an accession book for each unit. Consult your regional or support curator. You must submit a written request to keep an accession book at each geographical unit. Submit the request to the Chief Curator, Museum Management Program, National Center for Cultural Resources.

3. *Should I store the accession book in a special place?*

Yes. You must store your accession book in a secure room in an insulated file cabinet with a lock. Monitor and control access to the accession book.

4. *Should I make a copy of the accession book?*

Yes. Make an archival photocopy or microform copy of the original accession book. Store the copy in a different location from the original.

Making a copy of your accession book helps to safeguard against loss and potential fraud or abuse.

5. *How do I make an entry in the accession book?*

Be extremely careful when making entries in the accession book. Making a draft entry on plain paper may help you avoid errors. When you make entries:

- Print neatly.
- Use high quality permanent black carbon (India) ink with fountain, quill, or rapidograph pen, or a fine felt-tip permanent ink pen (pigma ink pen).
- Check to make sure the entry is accurate.

Note: Pens and ink are available from the *Tools of the Trade* catalog.

> ***Entries in the accession book should be chronological. Make entries upon receipt of the objects.***

Complete the columns in the accession book as follows:

Accession Number

Record the number for the accession. The accession number is a unique number that allows you to connect the objects in an accession to the documentation. Use one number for each accession transaction. Some accessions may contain one object; others may contain thousands of objects.

> ***Don't repeat or reuse accession numbers.***

Don't use decimals in the accession number. The NPS accession number is in a three-part format:

- The first part is the four-letter park acronym, in the form of "AAAA."
- The second part is a hyphen, which distinguishes the accession number from the catalog number.

  A few parks will use a collection designation letter, such as A, B, C, in place of the hyphen. Use a collection designation letter only if your park has approved separate accession and catalog systems under one acronym.

  The Chief Curator must approve the designation. Review requests to use a designation with your regional/SO curator. Submit a written request to the Chief Curator, Museum Management Program, National Center for Cultural Resources.

- The third part is the sequential, identification number that you assign to an accession.

Example: DETO-678

Date Received

Record the date that you acquired the material for the museum collection. For gifts, exchanges, transfers, and incoming loans, both the owner and the superintendent must sign the transfer of ownership document or incoming loan agreement. The acquisition date is the later date of these two signatures. This is the date that you completed the transaction and the material became part of the museum collection.

Note: It's important to get a signed transfer of ownership (deed of gift, exchange agreement, transfer of property) or incoming loan agreement before, or at the time, you receive the objects. The park doesn't legally own the objects until both the superintendent and the other party have signed a transfer of ownership document.

For purchases, enter the date of the sale. For field collections, enter the date you received the objects. For field collections that won't remain at the park, enter the date you completed the Accession Receiving Report, Form 10-95 Rev. (Figure 2.2). If you receive field collections from the same project on different dates, use the first date of receipt as the acquisition date.

The date you enter in the accession book will become the date of accession.

Enter the date in standard format using the full year. You can abbreviate the month.

Example: Nov 3, 1997

Dates before 1985 may have been entered without a day and month, such as pre1957, or in other formats. Don't reformat earlier dates. If you now know the correct date, add it as a correction to the date field. Don't remove the previous date.

Use the date of entry in the accession book as the acquisition date for old accessions that haven't been entered into the accession book. In the Remarks column, note the earlier date when the objects were received at the park, if known.

Description

Briefly describe and quantify the material in the accession. Use general terms. The accession book has limited space. You won't be able to list all the objects in a large accession. Include a complete inventory or list of objects with the accession receiving report. If applicable, provide the project name and state site number.

Examples: 7 Civil War uniforms and accoutrements
103 boxes of excavated material from the Hill Site (36CR1947)
Project 116 Prehistoric Occupations and associated field records
125 botanical specimens
one oil painting "Grand Canyon at Dawn" by Thomas Moran

Received From

Record the full name (last name first), address, and telephone number of the source of the accession. The source of accession is the previous owner of the material. If the source of accession is an institution, include the name of the responsible official or contact person. Enter the responsible official's name after the name and address of the institution.

The source of accession for field collections is the National Park Service. Enter the name of the collector as the individual representing the National

Park Service. If the collector is an NPS employee, include his or her title.

How Acquired

Record the type of accession. Use only the following accession types:

- gift
- purchase
- exchange
- transfer
- field collection
- incoming loan

Remarks

Record comments about the accession, as needed. Make sure the documentation in the accession folder supports the remarks. Don't enter transitory notes, such as "Consider for deaccession?"

Example: Returned to lender June 5, 1991.
Loss or theft, March 1991.
Received at park in early 1960s.

Catalog Numbers

For small accessions, record the catalog numbers for the objects in the accession, after you catalog the accession. Including the catalog numbers in the accession book provides a good cross-reference between the accession and catalog records.

For large accessions, leave this column blank. Include the catalog numbers on the list of objects that you attach to the accession receiving report.

6. *How do I make corrections to the accession book?*

If an accession entry contains a mistake, draw a single line through the incorrect information. Enter the correct information above or below or on another line. Initial and date the correction. Clearly enter your signature in the Remarks column.

> ***Never erase or blot out the entries in the accession book. Don't use correction fluid or correction tape.***

7. *What if I find that an object is in the wrong accession?*

Record the object in the correct accession, and note the correction as in Section U.6 above. Cross-reference to the incorrect accession.

8. *How do I correct an entire accession book page?*

In extreme cases, you may have to rewrite whole pages of an accession book. Consult your regional/SO curator if you need to do this.

> ***Never remove pages from the accession book.***

Draw a single diagonal line from the upper left corner to the lower right corner of the page you want to delete. Write your signature and date on the line. Record the corrected entries on the next page. If you can't use the next page, include a note on the deleted page about the location of the corrected entries.

9. *What if I need to recopy the entire accession book?*

In general, you should never recopy your accession book. Consult your regional/SO curator if you think you need to recopy your entire accession book. A "messy" accession book is not a valid reason for recopying the book. You must receive written permission to recopy the book. Consult your regional or system office curator before sending a request. Send your request to the Chief Curator, Museum Management Program, National Center for Cultural Resources.

File the request and its response with the accession book. If you receive permission to recopy the book, keep the old accession book with the accession files.

You may need to recopy the entire book if:

- pages are ripping and tearing due to brittleness or mishandling
- there is severe ink fading
- pages are severely distorted, cockle, or buckled
- it contains mold
- it is contaminated with chemical, biological residue, radiation, or asbestos that can't be mitigated
- there is insect or vermin residue
- it is stained from leaks or spills

Consult a conservator about problems like these before requesting to recopy the book. With conservation treatment, you may be able to continue to use the book. Refer to *Conserve O Gram* (*COG*) 1/5, Salvaging Acidic or Damaged Museum Accession Books.

10. *What if I need to rebind the accession book?*

You may need to rebind your accession book if the pages are coming loose or the spine is coming off. Make a complete photocopy before sending it out for rebinding. Number each page on both sides if both sides are used. Take care not to damage the original volume. Refer to *COG* 19/7, Archives: Reference Photocopying, for instructions on making a high quality copy. To locate a reputable binder, contact the regional/SO curator or the conservator for the Museum Management Program.

If the accession book is too fragile for reference use, carefully photocopy it and place the copy in an archival-quality three-hole binder album. Number each page on both sides if both sides have entries. Use the copy for reference. Purchase an archival book box or slipcase to help store the original book. Use the original only to enter new accessions. Make photocopies of the new accessions as needed. If the original book is too fragile for new entries, order a new book.

11. *Should I replace or deacidify my accession book if it is acidic?*

No. Many NPS museum accession books may border on the acidic. However, under cool, dry storage conditions, acidic paper may last a long time. If you store and handle your accession book correctly, it will last many more decades.

Consult a conservator if you are concerned about the acidity of your accession book. Deacidification isn't the answer to all acidic paper concerns. For example, it doesn't make paper less brittle. Some chemicals used in deacidification may change the appearance of inks, eventually causing fading and information loss. Deacidification also needs to be an ongoing series of treatments. The calcium carbonate buffering that the process uses depletes over time.

V. Documenting Accessions

You are responsible for documenting the accession transaction and maintaining all the original documentation. Accession records should be as accurate and complete as possible. For an overall view of the accessioning process, refer to Flow Chart Figure 2.17.

> ***Before documenting an acquisition, you must have a transfer of ownership document or an incoming loan agreement. Refer to the appropriate section of this chapter for the document to use with each accession type. Section F for gifts, Section H for purchases, Section J for exchanges, Section L for transfers, Sections N and O for field collections, and Section P for incoming loans.***

1. *Receipt of Objects*

When you receive an accession:

- Give the objects time to acclimate before unpacking.
- Unpack and inspect the material as soon as possible. Do this outside the museum storage area.
- Inspect objects for potential insect infestation, mold, vermin, asbestos,

nitrate and other health and safety hazards. Isolate infested or unsafe materials immediately to avoid contaminating other material. Stabilize the collections after consulting with a conservator. Refer to the *MH-I,* Chapter 5, Biological Infestations, and the *COG* series for information on collection hazards.

- Check that the material corresponds to written descriptions on the transfer of ownership document. Refer to Section R of this chapter for information on receiving incoming loans.

2. *Accession Receiving Report*

You must complete an Accession Receiving Report, Form 10-95Rev. (Figure 2.2) for all accessions. The report documents the receipt of the material and information from the source of accession.

Note: You must have an accession receiving report on file for all accessions dating from 1985. Completing an accession receiving report for accessions prior to 1985 is optional.

To complete the accession receiving report, you must first enter the accession into ANCS+. Refer to Chapter 4 of the *ANCS+ User Manual* for instructions on entering accessions into ANCS+. Section V.5 of this chapter contains a list of the fields in the ANCS+ Accession Records associated module.

Complete the accession receiving report with information from the source of the accession. Get as much information as you can. You may not be able to get this information later. It is of primary importance for documenting the material in the accession and can greatly assist you in cataloging the objects.

Don't be afraid to ask questions. Find out how the owner acquired the objects. Ask the owner questions about the use, manufacture, and significance of the objects. Document your findings.

For field collections, note whether the field records are included, or not included, in the accession. Record:

- permit number
- project title and dates
- principal investigator (name and address)
- state site number for archeological collections (you may have to add later when assigned)
- precise locations of the collecting activity, including geographic coordinates (site name or descriptive title for a survey that includes many sites)
- site and field numbers (see above for surveys)
- information about releases
- restrictions or sensitivities

- information on informed consent

File the accession receiving report in the accession folder. Refer to Section V.8 of this chapter for information on the accession folder.

The designated receiving officer signs the accession receiving report.

3. *Recording Condition*

It's important to record the condition of the material upon arrival. Record the overall condition of the accession on the accession receiving report. Record specific object condition on the list of objects that accompanies the accession receiving report. Photographing objects is a good way to record physical condition.

Note: ANCS+ will print an Object Condition Report, Form 10-637 from the condition information you enter on the catalog record.

4. *List of Objects*

You must attach a list of objects to the accession receiving report. You can:

- enter the list in ANCS+ and print it on the Accession Receiving Report (Continued), Form 10-95 Rev.
- use a copy of the itemized list that was attached to the transfer of ownership document
- attach a field level inventory, field specimen, or provenience log for field collections
- attach a list that already exists in another format

Note: After you catalog the objects in the accession, include the catalog numbers on the list of objects.

For small accessions of one to six objects (not more than six lines), the list of objects will print on the accession receiving report.

5. *ANCS+ Accession Records*

You must enter all accessions into the ANCS+ Accession Records associated module. Refer to Section I of Chapter 4 in the *ANCS+ User Manual* for instructions on using the module. You may enter data directly into the program or use the accession worksheet that came with the manual.

Using ANCS+, you can complete and print the:

- Accession Receiving Report, Form 10-95 Rev. (Figure 2.2)
- Deed of Gift, Form 10-830 Rev. (Figure 2.3)
- source of accession card
- Accession Folder Cover Sheet, Form 10-255 Rev. (Figure 2.18)

Make sure that the entries in the ANCS+ accession record match the entries in the accession book.

The ANCS+ accession record includes all the fields you will need to track the accession. The fields include:

Accession Number
Acquisition Type
Acquisition Date
Catalog Status
Region
Cultural Resources Totals (by discipline)
Natural History Totals (by discipline)
Item Total
Source Individual
Source Institution
Source Official
Description
Related Accessions
Condition
Other Comments
Custody Document
Publication
Permit Number
State Site Number
Phase Type
Project Date
Project Title
Project Director

You must submit electronic copies of accession records along with your annual catalog record submission to the National Catalog.

6. *Accession Book*

Make an entry in the accession book. Refer to Section U of this chapter for information about the accession book.

7. *Tagging and Storing Objects*

Tag objects with the accession number. Use acid-free tags without metal rims. Don't use adhesive or pressure sensitive tapes or apply labels directly to objects. Refer to the *Tools of the Trade* catalog for ordering acid-free tags.

Store the tagged objects in an accession storage area until you can catalog them.

Note: If objects are too small to tag individually, tag or label the containers.

8. *Accession Folder*

Create an accession folder to store all the paperwork for the accession. Using ANCS+, print an Accession Folder Cover Sheet, Form 10-255 Rev. (Figure 2.18). The sheet contains a checklist that shows you the documents in the folder. Place the cover sheet inside the front cover of the folder.

Note: You can complete the cover sheet manually or on the computer.

You must have an accession folder for every accession.

Each accession folder contains the originals or archival copies of the documentation that supports the accession. The documentation must correspond with the accession book entry.

For example, if…	***Then…***
The entry in the accession book is for a transfer,	the accession folder should contain a transfer of property form.

The accession folder is an archival file folder. Write the accession number on the folder tab using permanent black carbon ink. Use a fountain, quill or rapidograph pen, or a fine felt-tip permanent ink pen (pigma ink pen). Don't use pressure-sensitive tapes that can fall off in time.

Folders, ink, and pens are available through the *Tools of the Trade* catalog.

Mark the accession number in permanent ink in the upper right corner of all the accession documents in the folder.

Note: You may need to do preservation photocopying for documents in old accession folders. Accession documents may include Thermofax™ and other fading records, brittle or torn documents, or documents on highly acidic paper. Refer to *COG* 19/4, Archives: Preservation Through Photocopying. Mark the copies as copies, and include the date and reason for copying. Don't discard the originals. Encapsulate originals if necessary to protect the document(s) and the other contents of the folder.

9. *Required documents in the Accession Folder*

You must keep the following documents in the accession folder.

- Accession Receiving Report, Form 10-95 Rev. (Figure 2.2)
- transfer of ownership or custody document appropriate to the accession type

Gift:
Deed of Gift, Form 10-830 Rev. (Figure 2.3)
Last Will and Testament

Purchase:
Receiving Report Copy of the Order for Supplies or Services
Form 10-3470 (2-97) or OF-347
Governmentwide Purchase Card (Credit Card) Receipt
DI-1 Requisition or Procurement Request and Invoice or Sales Slip
Copy of the Purchase Contract

Exchange: Exchange Agreement (Figure 2.8)

Transfer: Transfer of Property, Form DI-104 (Figure 2.9)

Field Collection: Receipt for Property, Form DI-105 (Figure 2.1)

Incoming Loan: Incoming Loan Agreement, Form 10-98 Rev. (Figure 2.11)

- legal documents (as applicable)

  - ownership statement
  - copyright statement
  - release forms
  - Noncash Charitable Contributions Form (IRS Form 8283)
  - permits (archival copies of scientific research and collecting permits or Archeological Resources Protection Act permits)
  - insurance documents for incoming loans

10. *Other Documents in the Accession Folder*

Other types of documentation to store in the accession folder include:

- correspondence

  Include telephone notes, memoranda, copies of e-mail correspondence, and any other records of communication about the accession.

- miscellaneous documentation

  - letter of acknowledgement
  - Gift Acknowledgement Certificate (Figure 2.5)
  - restrictions and sensitivities
  - research notes
  - evidence of historical authenticity, such as documents that authenticate age, identity, or historical association*
  - notes and correspondence on specimen taxonomy, identification, and geological provenience*
  - shipping documents
  - appraisals and evaluations
  - Object Condition Reports, Form 10-637
  - object treatment requests and conservation treatment reports*

  * In some instances, you may want to store this information in a catalog folder.

    Include the name and address of the source and the date you receive the information. Include the name and title of the park staff who recorded the information. Refer to Chapter 3: Cataloging, in this handbook for information on catalog folders.

- photographs

  Keep photographs that document an object's acquisition or condition in the accession folder. Store photos in archival sleeves with a cross-reference to the negatives, which you store separately. Provide a cross-reference to images that are too large to fit in the accession folder, such as aerial photographs.

11. *Outgoing Loan and Deaccession Documents in the Accession Folder*

You may store outgoing loan documentation in the accession folder or in an outgoing loan folder.

Refer to Section C of Chapter 5: Outgoing Loans, in this handbook for information on filing paperwork for loans that involve multiple accessions.

You may store deaccession documentation in the accession folder or in a deaccession folder.

Refer to Section D of Chapter 6: Deaccessioning, in this handbook for information on filing paperwork for deaccessions that involve multiple accessions.

12. *Accession File*

The accession file is a series of accession folders that you file numerically with the accession book in an insulated, locked file.

> ***The accession file is a permanent file that never leaves the park. You must monitor and control access to this file and the information it contains.***

The documents in the accession file support the government's claim to the title or custody of museum property. The park uses the accession file in the current, ongoing management of park resources. Accession documents are therefore exempt from Federal Records Management retirement procedures.

Refer to Chapter 1: Getting Started, in this handbook for information on insulated files.

13. *Source of Accession*

You have the option of maintaining a manual source of accession file. ANCS+ will print source of accession information that you can file alphabetically in a 5X8" box or file cabinet. The source of accession card contains:

- source of accession name
- source of accession address
- source of accession telephone
- accession numbers
- description of each accession

See Figure 2.19 for a sample source of accession card.

14. *Changing Accession Type*

Occasionally you may have to document changes in accession type. For example, an incoming loan may become a gift or a purchase.

When you are converting all the objects in an accession to another accession type:

- Retain the original accession number.
- Change the accession type in the accession book. Draw a line through the old entry in the How Acquired column. Enter the new accession type in the column. Include the date of the change and your initials.
- Change the accession type for the ANCS+ accession record. Note the change in type in the Other Comments field.
- Print a new Accession Receiving Report, Form 10-95 Rev. (Figure 2.2).
- File the transfer of ownership document, such as a deed of gift in the accession folder.

When you are converting part of the objects in an accession to another accession type:

- Give a new accession number to the objects that are part of the new accession type.
- Follow accession procedures to document the new accession.
- Cross-reference the two accessions in the accession book, ANCS+, and on the accession receiving reports.
- Update the incoming loan form and original accession records to show the removal of the objects.

Note: You will have to adjust your CMR to show the change.

W. List of Figures

\+ Print these forms from ANCS+.

* You must use the Accession Book (Form 10-256) and the Accession Receiving Report (Form 10-95 Rev.) for all accessions. You must use the Deed of Gift (Form 10-830 Rev.) for all donations. You must use the Transfer of Property (Form DI-104) for all transfers between federal entities. You must use the Incoming Loan Agreement (Form 10-98 Rev.) and Conditions for Incoming Loans (Form 10-98a Rev.) for all incoming loans.

Accession Receiving Report

Park Name

Use this record to document the receipt of objects and collect pertinent information on an accession from the Source of Accession (donor, vendor, field collector, lender, etc). If additional space is needed, attach a separate sheet. Blank copies of this form should be kept on hand by all employees who are likely to receive museum objects on behalf of the National Park Service.

The following information pertains to objects listed on the attached form:

Nature of accession:

Name and address of Source of Accession:

Daytime Telephone Number:

Give a brief description, identification and history of the collection. Note locality collected or purchased, give site names and numbers if appropriate. This information is provided by the source of accession only.

Project name (if applicable):

Give overall condition on arrival. Specific object condition must be noted on attached form.

Remarks:

Objects/Specimens Received by: _____ Date: _____
Signature of Employee, Title

at: _____
(Park location)

I certify that the objects described above and on the attached document have been received and inspected.

_____ Date: _____

Mr. George A. Monroe
912 West Main Street
Kingston, Missouri 63555

Dear Mr. Monroe:

The National Park Service is pleased to accept your very generous donation of your great grandfather's uniform and diary from the Battle of Smith's Creek. The uniform and diary arrived safely at the park on June 1, 1999. As you know from our discussions, these items will be a significant addition to (the park's) museum collection and to the work of preserving and interpreting the park's unique and rich history. The detailed information you provided about these items will be included in the park's museum records.

To complete the transfer of ownership, please sign and date both copies of the enclosed Deed of Gift form. Retain one copy for your records, and return one copy to us. A stamped, pre-addressed envelope for returning the signed gift form is enclosed for your convenience.

Gifts to the National Park Service are tax deductible as charitable contributions, to the extent permitted by law.

We are most grateful for your gift and your interest in the National Park Service.

Sincerely,

Superintendent

Ownership Statement

I/we, _____ (print name), do hereby represent, warrant, certify, and guarantee the following information to be true and correct:

1. I/we am the (*check one)*

   ____ owner

   ____ authorized agent for the owner

   of the object described in the _____ (purchase document) dated _____.

2. [*For authorized agents only*] I am fully authorized by the owner of the object to enter into this transaction and to execute the warranties and representations herein.

3. The object is authentic and of the period indicated on the _____ (purchase document).

4. I acquired the object from _____

   _____

5. If origin is not USA, the object was legally exported from its country of origin. The object has been legally exported from and imported into all countries through which it has passed.

6. No customs, tax, patrimony or other laws or regulations applicable to the object, its sale, export, or import have been broken.

7. There are no liens or other encumbrances of any kind whatsoever against the object or title to them.

8. I/we certify that I/we hold free and clear title to the object and I/we may dispose of it in any manner that I/we may determine.

Exchange Agreement

In accordance with the authority granted to the Secretary of the Interior by the Museum Act of 1955 (16 USC, Sect. 18 [f]), and in consideration of the mutual promises set forth in this Agreement, the National Park Service and _____ (other party) enter into this agreement for the exchange of museum objects.

1. _____ (NPS Unit) hereby becomes the owner of the objects listed on the first attached inventory (Attachment 1 of this Agreement). _____ (other party) hereby becomes the owner of the objects listed on the second attached inventory (Attachment 2 of this Agreement).

2. _____ (other party) represents and warrants that he/she/they will possess clear title, free of all liens, claims, and encumbrances of any kind, to the objects listed in Attachment 1 at the time the exchange takes place. If at the time the exchange is to occur _____ (other party) is unable to present the objects listed on Attachment 1 and proof of ownership for the said objects he/she/they is/are exchanging, the National Park Service is under no obligation to complete the exchange.

3. _____ (other party) represents and warrants that the objects listed on Attachment 1 were secured in compliance with all applicable International, Federal and State laws. Documentation evidencing the source of acquisition of the objects listed on Attachment 1 will be attached to this Agreement at the time the exchange takes place (Attachment 3).

4. _____ (other party) represents and warrants that the objects listed in Attachment 1 have been authenticated and appraised in writing, at market value, by at least one objective appraiser within six months previous to the date of this agreement. Copies of the appraisals for the NPS and non-NPS items are attached to this Agreement (Attachment 4).

5. _____ (other party) represents and warrants that he/she/they is/are the sole owner(s) of all rights in the objects listed on Attachment 1. _____ (other party) hereby assigns in _____ (NPS unit) all of _____ (other party) common law and statutory copyrights to the objects listed in Attachment 1. _____ (other party) agrees to indemnify _____ (NPS unit) against any claims, damages, losses, or expenses of any kind that _____ (NPS unit) may suffer as a result of any infringement or alleged infringement of the copyrights to _____ (NPS unit).

6. Title to the objects exchanged under this agreement shall pass when the objects have been delivered pursuant to the terms of this Agreement and the parties have inspected the objects and found them to be in a satisfactory condition and are as represented in this Agreement. Inspections of the objects shall occur on the date of delivery.

7. As provided by 41 U.S.C. §§ 22, no member of or delegate to Congress, or Resident Commissioner shall be admitted to any share or part of this Agreement or to any benefit that might arise therefrom; but this provision shall not be construed to extend to this Agreement if made with a corporation for its general benefit.

8. No NPS employee or members of a NPS employee's immediate family shall be admitted to any share or part of this Agreement or to any benefits that may arise therefrom.

9. The exchange of all firearms must be in compliance with all state and local law enforcement regulations related to the acquisition of firearms. Upon consummation of this Agreement, the National Park Service shall not be liable for any action related to the use of firearms described within the Agreement.

10. The National Park Service will pay all costs of transporting and insuring the objects listed on Attachment 2 to _____ (address).

Figure 2.8a. Exchange Agreement (Sample)

Exchange Agreement (Continued)

11. The parties agree that the physical transfer of all objects covered by this Agreement will occur on or before _____ (date) and that time is of the essence to this Agreement. If _____ (other party) fails to deliver the objects listed on Attachment 1 to the agreed-upon place of delivery by the date given in this paragraph, the National Park Service may, at its option, terminate this Agreement, recover any objects which it may have delivered pursuant to this Agreement and sue for damages for undue delay of the performance of this Agreement or for specific performance of this Agreement. _____ (NPS unit) remedies hereunder are not exclusive and _____ (NPS unit) retains the right to pursue any and all legal remedies available to it for the breach of this Agreement.

12. Catalog information on all NPS objects incorporated under this Agreement is included by reference to the NPS catalog number listed on Attachment 2.

INSTRUCTIONS FOR INCOMING LOAN AGREEMENT

Accession Number	Enter the accession number for the loan. Example: PARK-55
Borrower	Enter the name of the park.
Borrower Address	Enter the park's street/box, city, state, zip code, telephone number, and FAX number.
Superintendent	Enter the name of the superintendent or center chief, for authorization and contact purposes.
Borrower Shipping Address	Enter the shipping address of the park, if it is different from the mailing address.
Lender	Enter the name of the lender (for example, University of Arizona). Indicate whether the lender is a NPS unit or non-NPS.
Lender (Department)	Enter the department or division of the lending institution (for example, Department of Anthropology), where applicable.
Lender Address	Enter the street/box, city, state, zip code, country (if outside USA), telephone number and FAX number.
Responsible Official (Lending Institution)	Enter the name and title of the responsible individual (or agent) of the lending institution (for example, G. A. Lindsay, Director), if applicable.
Lender Shipping Address	Enter the shipping address of the lender, if it is different from the mailing address.
Purpose of Loan	Indicate the purpose of the loan (exhibit, study, collections management, storage, or other). If other, explain.
Credit Line	Record the credit line as it is to appear in exhibit graphics, publications, or other media.
Objects in Loan	List the objects in the loan. Include the object name, item count or quantification, description, condition, and insurance value (if appropriate). For loans involving several objects, attach an inventory or a computer-generated list.
Initiation Date	Record the date on which the agreement is to go into effect.
Termination Date	Enter the termination date of the loan. Loans to repositories cannot exceed ten years. All other loans cannot exceed three years.
Insurance	Indicate whether the insurance will be waived or carried by the lender or borrower. Enter the name of the insurance company and the policy number. Refer to Chapter 4 of this handbook for information on insurance.
Packing and Shipping	Indicate who will be responsible for packing the objects. Provide information on the method of shipping for sending and returning the loan. If a shipping company is used, include the name, address, and phone number. Indicate who will be responsible for shipping charges.
Loan Conditions	Indicate whether a facilities report is required. Include any other additional conditions. Attach a copy of the Conditions for Incoming Loans (Form 10-98a Rev.).
Signature and Date Lines	Enter the name of the superintendent and the lender. Both parties must sign and date the agreement. The repository chief or institution director must sign the agreement for repository loans.
Return Status (Partial or Complete)	Indicate whether the entire loan has been returned. If part of the loan has been returned, enter date of return for each object returned.
Extension Information	For extended loans, enter the new termination date.
Return Signature	Enter the name of the lender. The lender must sign and date the agreement when the entire loan is returned.
Sending and Returning the Loan Agreement	The superintendent signs two copies of the loan agreement and sends them to the lender. The lender signs and returns one copy to the park and keeps the other signed copy. On return of the entire loan, the lender signs and dates the agreement and sends a copy to the borrower.

Conditions For Incoming Loans

Care and Preservation

1. The NPS will give to objects borrowed the same care as it does comparable property of its own. It is understood by Lender and Borrower that all tangible objects are subject to gradual inherent deterioration for which neither party is responsible.
2. Evidence of damage at the time of receipt or while in NPS custody will be reported as soon as practicable, to the Lender.
3. No alteration, restoration, or repair will be undertaken without the written authorization of the Lender.
4. The Lender certifies that the objects lent are in such condition as to withstand ordinary strains of packing and transportation.

Transportation and Packing

1. Costs of packing and transportation will be borne by the borrowing park unless the loan is at the Lender's request. The method of shipment must be agreed upon by both parties.
2. Customs regulations will be adhered to in international shipments.
3. The Lender will assure that said objects are adequately and securely packed for the type of shipment agreed upon, including any special instructions for unpacking and repacking. Objects will be returned packed in the same or similar manner as received unless authorized by the Lender.

Insurance

1. Unless objects are covered by a specific insurance policy, NPS liability for loss or damages will be subject to recovery under the Federal Tort Claims Act (28 U.S.C. 2671-2630, as amended), if loss or damage occurs while in the custody of the NPS and the loss can be proved to be caused by negligence or wrongful act of the Federal Government.
2. On request of Lender objects will be insured by the NPS under an all risk wall-to-wall museum collections policy subject to the standard exclusions for the duration of the incoming loan agreement. Insurance will be placed in the amount specified by the Lender herein, which must reflect fair market value at the time of the loan. If the Lender fails to indicate an amount, the NPS will set a value for purposes of insurance for the period of the loan.
3. If the Lender elects to maintain his own insurance coverage, the NPS must be supplied with a certificate of insurance naming the NPS and the United States Government as additional insureds or a waiver of subrogation. The NPS shall not be responsible for any error or deficiency in information furnished to the Lender's insurer or for any lapse in coverage.
4. The Lender is responsible for updating insurance valuations.
5. The amount payable by an insurance policy is the sole recovery available to the Lender in event of loss or damage.

Photography

Unless otherwise notified in writing, the objects lent may be photographed by the NPS for record, educational, catalog, and publicity purposes. It is understood that objects on exhibit may be photographed by the general public.

Ownership and Address Change

By signing the Agreement the Lender certifies that he is the legal owner of the described property. It is incumbent upon the Lender to notify the NPS in writing of any change of address. In case of change in legal ownership during the period of the loan, the new owner is required to establish his legal right by proof satisfactory to the NPS.

Return of Loans

The loan agreement may be terminated by either party given reasonable notice in writing. All notices to the Lender in regard to termination of the loan are considered sufficient if sent by registered mail to the Lender at the address given in this record. Unless otherwise notified in writing, the NPS will release the objects only to the Lender. If NPS efforts to contact the Lender, within a reasonable period following the expiration of the loan, are unsuccessful, and no special arrangements have been made for the return of the loan, then the objects will be placed in storage at the Lender's risk and expense. If after 3 years the property is not withdrawn, it may be deemed to become the unrestricted property of the Federal Government for administration by the NPS.

ACCESSION FOLDER COVER SHEET

INSTRUCTIONS: Use this Accession Folder cover sheet when the National Park Service acquires museum collections. Include all documents relating to the accession. Complete box "A" for permanent accessions (gifts, purchases, exchanges, transfers, and field collections). Complete box "B" for temporary accessions (loans). The Accession Receiving Report (Form 10-95) is required for all accessions. Insert this cover sheet in the accession folder.

A. PERMANENT ACCESSIONS

- ☐ Accession Receiving Report (Form 10-95)
  - ☐ Accession Receiving Report: Continuation sheet (Form 10-95c)
- ☐ Gift
  - ☐ Deed of Gift (Form 10-830)
  - ☐ Donor Letter
  - ☐ Last Will and Testament
- ☐ Purchase
  - ☐ Receiving Report Copy of Purchase Order (Form 10-3470 or OF-347)
  - ☐ Requisition (DI-1) and Invoice or Sales Slip
  - ☐ Governmentwide Purchase Card (credit card) Receipt
  - ☐ Purchase Contract
- ☐ Exchange
  - ☐ Exchange Agreement
- ☐ Transfer
  - ☐ Transfer of Property (DI-104)
- ☐ Field Collection
  - ☐ Receipt for Property (DI-105)

B. TEMPORARY ACCESSIONS (LOAN)

- ☐ Accession Receiving Report (Form 10-95)
- ☐ Accession Receiving Report: Continuation Sheet (Form 10-95c)
- ☐ Incoming Loan Agreement (Form 10-98)
- ☐ Receipt for Property (DI-105)
- ☐ Other (Specify) _____

Chapter 3: Cataloging

BASIC REQUIREMENTS FOR NPS CATALOGING

Catalog all objects, specimens, and archival and manuscript collections that are part of the park's museum collection.

Accession objects before you catalog them. Refer to Chapter 2: Accessioning. Catalog museum collections as soon as you are able.

Make sure that contracts and permits that produce museum collections include the requirement to catalog the collections.

Classify museum collections by discipline: archeology, ethnology, history (including archival and manuscript collections), biology, geology, or paleontology. Refer to the appropriate appendix in the handbook for information on each discipline.

Enter all catalog records into ANCS+. Paper catalog records are optional.

To complete a catalog record, follow the:

- guidelines in this chapter and Appendix C of this handbook
- instructions in Chapter 2: Cataloging, in the *ANCS+ User Manual*
- on-line field help in ANCS+
- regional and/or park-specific cataloging guidelines, if applicable

Make sure the catalog record is accurate and understandable to someone looking for information about the object.

Use lot cataloging to catalog like objects in groups, rather than cataloging them individually. Refer to Appendix I in this handbook for guidelines on lot cataloging.

You must catalog all archival and manuscript materials at the collection level. Assign only one catalog number to the entire collection. Don't individually catalog the pieces of the collection. Further describe the collection at the series, file unit, and item level in the Archives Module, if recommended by the archival survey.

Assign a catalog number to each object or group of objects. Mark the catalog number on the object as part of the cataloging process. Refer to Appendix J in this handbook for marking techniques.

Keep track of the catalog numbers you use, including those you release in advance to NPS repositories and contractors.

If possible, photograph objects as part of the cataloging process. Refer to Appendix K in this handbook for basic instructions on record photography.

Make changes to the catalog record as needed to keep the data on the record accurate and current.

Submit a copy of your ANCS+ database to the National Catalog each year. Submit the database even if your park had no cataloging activity during the year. Include any new or recataloged records in a tag file within the database.

CHAPTER 3: CATALOGING

A. Overview

1. *What is cataloging?*

For National Park Service (NPS) museum collections, cataloging is the process of recording detailed information about individual items or groups of related items. Cataloging also includes assigning a unique identifying number to the item or group of items. You must have museum catalog records for all objects, specimens, and archival/manuscript collections in your park's museum collection. The information on the catalog records may be as important as the items themselves.

Note: You can catalog some objects and specimens in lots. Refer to Appendix I: Lot Cataloging, for guidelines on how to determine which items you can lot catalog.

You must catalog all archival and manuscript materials at the collection level. This means that you assign one catalog number to the entire collection. Don't individually catalog the pieces of the collection. You can further describe a collection at the series, file unit, and item level by using the ANCS+ Archives Module. Archivists generally describe very few collections at the item level. See Appendix D in this handbook for additional information about cataloging archives.

2. *What is the purpose for cataloging?*

Catalog records give you access to information about your museum collection for research and interpretation. They are also the primary property accountability records for museum objects. Catalog records tell you what objects you have, their condition, and where they're located. They provide physical and intellectual access to your museum collection.

3. *Who uses catalog data?*

Numerous people and institutions use data from your catalog records, including:

- NPS staff, (curatorial and interpretive staff, cultural and natural resource managers, archeologists, scientists, ethnographers, archivists, and the superintendent)
- exhibit planners
- conservators
- students
- researchers
- general public
- regional and Washington office staff
- educational, cultural, or scientific institutions (such as, museums, historical societies, and universities)

4. *Who must follow this chapter?*

The staff person or persons responsible for the museum collection must follow this chapter to catalog museum collections. You must catalog all objects that are part of the park's museum collection.

Note: You don't have to catalog short-term incoming loans that are at the park for less than a year. You must accession all incoming loans and track them using an incoming loan agreement. Refer to Chapter 2 in this handbook for information on incoming loans. Objects at a park for less than thirty days are in temporary custody and don't require a loan agreement. Refer to Section B.10 in Chapter 2 of this handbook.

See Section A.6 of Chapter 1 in this handbook for information on staffing requirements for museum collections.

B. General Information on Cataloging

1. *What are catalog records?*

Catalog records are both paper and electronic records. The NPS uses Form 10-254 to print catalog records. The form has two formats:

- Museum Catalog Record – CR, Form 10-254 Rev. (Figure 3.1) for cultural resources records for archeology, ethnology, history, and archival/manuscript collections.

- Museum Catalog Record – NH, Form 10-254B Rev. (Figure 3.2) for natural history records for biology, geology, and paleontology.

The electronic catalog record is part of the cultural resources and natural history databases in ANCS+.

Note: The electronic catalog record has more fields than the paper record. The Form 10-254 contains basic catalog data. The electronic catalog record includes separate screens for discipline-specific and park-specific data. You can print all the data in the record using the All Fields report in ANCS+. This report is not the official catalog record.

You must enter all catalog records into ANCS+, the NPS collections management software program. The use of paper records at the park is optional. The National Catalog prints and archives paper copies of all catalog records.

2. *What is a catalog number?*

A catalog number is the unique identification number for a particular item or group of items. You mark the catalog number on the object, and create a catalog record for each number. The number links the object and the documentation. Refer to Section C.11 in this chapter for information on marking the catalog number on the object.

Note: The catalog number identifies the object or group of objects. The accession number identifies the transaction that established NPS ownership of the object or group of objects.

3. *When do I catalog objects?*

If possible, catalog objects when you accession them.

Parks frequently have backlogs of cataloging to complete. Make a plan for reducing or eliminating the backlog, since it's hard to access and account for uncataloged collections. You must report the number of objects that you cataloged and the number of objects in the backlog each year on the Collections Management Report (CMR). Refer to Section VIII in Chapter 4 of this handbook for information on the CMR.

4. *How do I plan to reduce or eliminate my cataloging backlog?*

Planning for cataloging projects is part of the normal planning, programming, and budgeting process for any park. Be sure to include projects for cataloging the museum collection in the park's Resource Management Plan and Project Management Information System (PMIS). You will have to estimate the size and cost of the project and the time it will take to complete. You will also have to justify why the work needs to be done.

Note: Your current Collections Management Report (CMR) will have the number of items, by discipline, in the backlog. You may need to make adjustments to your CMR figures if you find additional items that you need to catalog.

To get an idea of the size of the job, locate all the materials that you need to catalog. Make sure that you have accessioned all items. Remember to include:

- archival collections that may be in offices or storage spaces
- large, mobile items that might be outside, such as farm machinery
- representative pieces of historic building fabric or architectural material

Give an estimate of the number of items in each discipline (such as biology or archives) that you need to catalog. The cost of cataloging varies by discipline.

Refer to Appendix B in this handbook for information on estimating cataloging costs.

5. *How can I prevent a future catalog backlog from occurring?*

It's important to keep your backlog from growing larger in the future. This may not be possible if you receive a large accession of materials. However, you can address the backlog of project-generated collections. Make sure all contract agreements and permits include the requirement to catalog all collections that the project generates.

6. *Where do I get the information for cataloging?*

Cataloging museum objects involves gathering and recording information from:

- physical observation
- accession records
- associated documentation

- research
- subject-matter specialists

Note: Refer to Appendix L: Bibliography, in this handbook for books that may be helpful in cataloging various types of objects and materials.

7. *How much time should I spend researching information for the catalog record?*

The amount of time you spend researching information about an object depends on:

- the importance of the object to your collection
- the availability of information
- your work schedule
- your research skills

Note: You can always add additional information to a catalog record at a later date.

Refer to Appendix B in this handbook for information on the costs of cataloging various types of collections.

8. *How do I prepare to catalog a collection?*

Before beginning to catalog, get a basic understanding of the entire collection and its purpose. Start by surveying the collection, including items on exhibit, on loan, and in storage. Look at the park's enabling legislation and Scope of Collection Statement (SOCS). What are the interpretive themes at the park? What's in the park library?

Become familiar with the park's accession book and records. Look at the cataloging that has been done and any research requests. Identify the material that you still need to catalog.

Knowledge of the collection as a whole allows you to:

- record information that is pertinent to the collection
- efficiently organize the cataloging process by sorting objects by type or material and conducting research on similar objects
- place objects in context within the whole collection
- provide cross-references to related objects

9. *Should I develop site-specific cataloging guidelines?*

Yes. Create written, site-specific cataloging guidelines. These guidelines set up the format for the catalog data at your park. They also help you maintain consistent data. Consistency is especially important if you have numerous catalogers and changes in cataloging staff. The person responsible for the collection should create the guidelines.

Site-specific guidelines might include:

- uniform location descriptions for areas in the park

- lists of eminent figures and organizations that are relevant to the park
- standard descriptions for various types of materials

Some regions provide regional guidelines for cataloging certain types of materials, such as archeology.

Note: Site-specific cataloging guidelines may supplement, but not replace, the NPS cataloging procedures in this handbook and the *ANCS+ User Manual*.

Appendix C in this handbook has information on uniform ways to describe and measure objects.

10. *What is the National Catalog of Museum Objects?*

The National Catalog of Museum Objects is one of the required NPS inventories and databases. It includes all catalog records for cultural objects, archival and manuscript materials, and natural history specimens in NPS museum collections. The National Catalog office is part of the Museum Management Program, National Center for Cultural Resources. The office is in Harpers Ferry, West Virginia. It serves as an off-site repository for your park's paper catalog records and electronic catalog record databases.

The National Catalog helps provide accountability, security, and preservation for electronic and paper catalog records and access to catalog data. The data would otherwise only be located at parks. The National Catalog protects park data during emergencies, disasters, or computer crashes.

Refer to Section H of this chapter for information on submitting catalog records to the National Catalog.

11. *Do I need to restrict access to catalog data?*

You should make most catalog data available to the public. However, you must restrict access to some types of location data. You are required by law to restrict access on the location data for:

- archeological excavations, including shipwrecks – Archaeological Resources Protection Act (ARPA) of 1979 (16 USC 470)
- cave and cave resources – Federal Cave Resources Protection Act of 1988 (16 USC 4301-4309)
- historic resources at risk of harm, theft, or destruction –National Historic Preservation Act of 1966, as amended (16 USC 470-470t, 110)

You should also place restrictions on the following location data. However, these data may be subject to Freedom of Information Act (FOIA) requests.

- Indian sacred sites –Executive Order 13007 – Indian Sacred Sites (May 24, 1996)
- nesting sites or specific habitat on threatened and endangered species – Endangered Species Act of 1973, as amended (16 USC 1531-1543)

You may withhold the following information from a FOIA request unless the Secretary approves release.

- information concerning the nature and specific location of mineral or paleontological specimens or objects of cultural patrimony within units of the NPS or resources that are endangered, threatened, rare, or commercially valuable – National Parks Omnibus Management Act of 1998 (16 USC 5937)

Use common sense when providing catalog data to the public. You should exclude current location and value data from general viewing.

12. *How do I provide access to the park's catalog data?*

ANCS+ has a public search function that allows researchers or non-museum staff to search the park's catalog data. You can choose which data fields on the catalog record are visible. Refer to Appendix C in the *ANCS+ User Manual* for information on using the public search function.

C. Cataloging Procedures

1. *Should I use a worksheet when cataloging collections?*

Use of a worksheet is optional. You can enter catalog data directly into ANCS+. Catalog worksheets for each discipline came with your *ANCS+ User Manual*. Contact the National Catalog office if you need additional copies.

2. *What is a catalog folder?*

A catalog folder is an archival folder that holds information that isn't contained on the catalog record. File the folder in numerical order by catalog number. Mark the catalog number on the folder using permanent ink. You can also write "Catalog Folder" on the tab.

Note: The ANCS+ catalog record includes a Catalog Folder field to tell you if you there is a catalog folder corresponding to the catalog record.

Proof of ownership and accession-related documentation always remain in the accession folder.

Typical contents of a catalog folder may include:

- research notes or reports on a specific object that is not part of a systematic collection

  Note: Catalog the notes and reports from systematic collections as part of the associated records for the project. For example, a large archeological project may have a research report or chemical analysis for thousands of objects. In such cases, catalog the information as archives.

- conservation records, such as an object treatment request, condition report, treatment proposal, and conservation treatment report
- chemical analysis
- appraisals
- exhibition documentation

- publicity or other photographs (see Appendix K: Photography, for filing documentation photos) in protective enclosures
- material samples, such as upholstery, fabric, or paint
- publication citations

If possible, items in the catalog folder should be on acid-free paper. Store catalog folders in a separate drawer in the same, or similar, insulated and fireproof locking file as the accession file.

3. *How do I complete a catalog record?*

Refer to the appropriate section in Chapter 2: Cataloging, in the *ANCS+ User Manual*. The chapter contains a section for each discipline. ANCS+ also contains on-line field help for each field on the catalog record.

To save a record, you must enter data in all the mandatory fields. Refer to Sections E and F of this chapter for a list of the mandatory fields.

You will probably not have enough data on most objects to complete every non-mandatory field on the catalog record. Enter data in the fields for which you have information. The types of data that you record will vary between disciplines. Cite the sources of your data as needed.

Be accurate and thorough. Proof your work. Inaccurate or incomplete cataloging can result in unnecessary confusion in later years. Spelling errors make your work look unprofessional. Remember that other people, such as researchers, internet users, or park staff, may eventually see your work. Make sure the catalog record is clear and understandable to someone looking for information about the object.

Refer to Appendix C: Cataloging Guidelines, in this handbook for information on:

- how to record dimensions and weight in a consistent format
- the types of questions to ask when cataloging an object
- uniform techniques for description
- terms to use when describing condition

4. *How can I gain preliminary control for new accessions?*

You may not have time to do detailed cataloging when you accession an object. However, you can gain basic accountability for the object by completing the mandatory fields on the catalog record. Refer to Sections E and F of this chapter for a list of mandatory fields.

If you have a catalog record in ANCS+, the program will:

- do searches for the data
- get automated data from the record for the Automated Inventory Program (AIP)
- automatically include the data in the CMR

- use the data in reports

Note: You will have to go back to the record to complete the full cataloging at some point. You can't use Backlog Cataloging (BACAT) funds for partially cataloged items.

5. *What if I have unverified data?*

It's important to note when data are unverified. Use a question mark "?" or attributed "(att)" to show data that are probable but not certain.

6. *What if I need to add or change information on the catalog record?*

Cataloging is a continuing process. You may receive additional information about an object, or discover that information on the record is incorrect. You can add, change, or delete information on the catalog record at any time. The Catalog Notes supplemental record in ANCS+ allows you to keep track of changes to the record. Refer to Section II in Chapter 3 of the *ANCS+ User Manual* for information on the Catalog Notes supplemental record. Refer to Section G in this chapter for information on recataloging.

7. *Can I catalog objects that are alike on the same catalog record?*

This depends on the objects. Refer to Appendix I: Lot Cataloging, in this handbook for guidelines on when to lot catalog similar objects. Refer to Appendix C: Recommended Cataloging Guidelines, in this handbook for information on cataloging pairs and sets of objects.

8. *How do I catalog objects with detachable parts?*

Catalog detachable parts as components of the object. Refer to Appendix C: Recommended Cataloging Guidelines, in this handbook for information on cataloging objects with component parts.

9. *Should I photograph objects while I'm cataloging?*

Yes. Photograph most objects as part of the cataloging process. You should have a permanent space in the cataloging area for photographing objects. However, you may have to set up photography sessions as time, staff, and funding permit.

Photographs can aid you in:

- describing an object
- recording condition
- recovering a lost or stolen object
- preserving the object by reducing the need to handle it

A complete record of an object generally requires both a photograph and a catalog record with a cross-reference between the two.

It is highly recommended that you photograph all controlled property:

- ***items with a value over $1,000***
- ***firearms***
- ***type specimens***
- ***incoming loans (with the exception of incoming loans to NPS repositories)***
- ***items especially vulnerable to theft, loss, and damage***

Refer to Appendix K: Photography, in this handbook for information on photographing museum collections.

10. *Are there times when I don't need to photograph collections?*

Yes. You must decide if a photograph is useful. For example, you don't need to photograph most botanical specimens, soil samples, or sherds. Photograph culturally affiliated NAGPRA items in consultation with the affiliated tribe.

You can make a photocopy, rather than a photograph, of some archival materials. Use a photocopy if:

- the item is a line drawing or illustration
- there isn't a lot of shading or nuance in the work
- you don't need to capture extremely fine detail
- the material is already a copy (such as a blueprint drawing of an architectural drawing)
- the material doesn't have high artifactual or evidential value

11. *When do I mark an object with a catalog number?*

Mark the object with a catalog number when you complete the worksheet or catalog record. Placing a catalog number on the object links the object to its documentation. Refer to Appendix J: Marking and Numbering Museum Collections, in this handbook for marking techniques.

> ***Mark objects with the complete catalog number, which includes the park acronym, a space (or collection designator), and a sequential identification number. For example: DETO 3717.***

A catalog number never includes a hyphen between the acronym and the number.

Be sure to enter the catalog number on the natural history labels for natural history specimens. You can't mark the number on many natural history specimens, such as insects or soils.

Mark catalog numbers on folder and box labels for archival collections.

> ***Don't place a number on incoming loans. Use an acid-free tag to label incoming loans with a catalog number. NPS centers may mark numbers on park collections that are on loan to the center for curation and storage.***

12. *What do I do with catalog data that I receive from centers, contractors, and other sources outside the park?*

The catalog data you receive from centers, contractors, and other outside sources is part of your park's database. You must transfer the data into the park database and submit the complete database to the National Catalog every year. A complete database for your park includes the data for all the objects that the park owns. By law and regulation, the park is responsible for archeological and natural history collections that are collected at the park. The park must maintain catalog data on these collections even if the collections are not located at the park. (Before 1984, parks weren't required to catalog natural history specimens that were collected under permit and stored in other repositories.)

13. *What is the relationship between the NPSpecies database and my catalog records?*

The NPSpecies database of the Inventory and Monitoring (I & M) Program uploads data from your ANCS+ natural history catalog records. You can give your data directly to I & M or have the National Catalog give them your data. The park must give the National Catalog permission to send your data to the I & M Program.

Note: Upload data from ANCS+ to NPSpecies. Don't upload data from NPSpecies to ANCS+.

D. Tracking Catalog Numbers

1. *Can I release catalog numbers in advance?*

Yes. You may need to give or release catalog numbers to other institutions or individuals that are responsible for cataloging NPS collections. These include:

- NPS centers, such as the Midwest Archeological Center (MWAC)
- universities
- non-NPS museums or institutions
- contractors
- collectors (collecting under permit)

You may also release catalog numbers in advance if you have a large cataloging staff. Assigning blocks of numbers to each individual is a good way to track your catalog numbers.

ANCS+ has a pre-allocate records function that assigns catalog numbers to blank records. Refer to Section IV in Chapter 6 of the *ANCS+ User Manual* for information on this function.

2. *When should I release catalog numbers outside the park?*

The repository, contractor, or collector must give you a list or estimate of the items to be cataloged. Don't release catalog numbers until you receive an adequate estimation of the material. Make sure that the person cataloging the material has a copy of:

- the appropriate chapters and appendices in this handbook and the *ANCS+ User Manual*
- a copy of ANCS+

- site-specific cataloging guidelines, if available

Use of the program and guidelines should be part of the contract or permit requirements. Refer to the introduction of the *ANCS+ User Manual* for information on contractors and the use of ANCS+.

If you don't require contractors to use ANCS+, be sure they provide the data for all mandatory fields. The data should be in an export format that you can easily import into ANCS+. See Section VI in Chapter 6 of the *ANCS+ User Manual* for information on importing and exporting data.

3. *How should I track the catalog numbers I release?*

Use a bound catalog number logbook or a computer-generated log to track catalog numbers. See Figure 3.3 for a sample logbook page. Be sure to include an "Issued To" column or field to note who has the number. For large collecting projects that use hundreds of catalog numbers, placing lists of catalog numbers in the accession folder for the project is helpful.

Make sure that all the numbers you release have been used and properly assigned to objects. This may be difficult since you may not know which numbers were used for several years. You will also want to keep track of which numbers were not used. You can then reassign these numbers to other objects.

4. *How can I find the last catalog number I used?*

If you don't keep a catalog number log, you will have to check ANCS+ or your catalog worksheets for the last number.

If…	***Then…***
all your records are in ANCS+,	go to the last record in your database (remember to check both the CR and NH databases) and sort your data by catalog number.
you have catalog worksheets waiting for data entry,	look for the catalog number on the last completed worksheet.

Remember that you may have already released catalog numbers that aren't in the database or on worksheets. Also, catalogers may be using skipped numbers. The catalog number on the last completed worksheet may not be the actual last number. You risk fewer errors by keeping a logbook.

Use the missing numbers report in ANCS+ to find missing numbers in the database.

5. *May I reuse catalog numbers?*

Reusing catalog numbers depends on the circumstances. If an object was cataloged under two different numbers, you can void the later number and reuse it. When you reuse the number, make a cross-reference to its earlier use. For example, you can note, "This catalog number was previously used for chair XXXX 567. The chair had been cataloged twice by mistake."

Never reuse catalog numbers for missing or deaccessioned objects.

6. *What if I have missing catalog numbers?*

If you skip a catalog number by mistake, assign the number to the next available object. You may have to spend some time searching for missing numbers if you have released numbers in advance.

7. *What if I have duplicate catalog numbers?*

If the duplicate catalog numbers are for…	***Then…***
identical records,	delete one of the records.
different objects,	assign a new number to one of the objects with a cross-reference to the old number.

Be sure to check the catalog numbers on the objects as well as the catalog records.

8. *How should I cross-reference catalog numbers with the accession records?*

For small accessions, enter the catalog numbers in the Catalog Number column in the accession book. Leave this column blank for large accessions.

Add the catalog numbers to the list of objects or inventory list that is part of the Accession Receiving Report, Form 10-95. This provides a good cross-reference between your accession and catalog records. Be sure to date the list to make clear that it was completed after the accession receiving report.

You can also generate a list from ANCS+ of all the cataloged items in an accession. Add this list to the accession file in place of a written list.

E. Cultural Resources (CR) Catalog Data Fields

1. *Where do I find the data fields for CR catalog records?*

The data fields for your CR catalog records are in the Collections Management Module of ANCS+. This module has your accession records and your cultural resources and natural history catalog records. It also has associated modules that help you with collections management functions, such as outgoing loans.

2. *What are the data fields for CR catalog records?*

The following list of CR data fields includes the mandatory fields. You can't save a record in ANCS+ until you complete all the mandatory fields. Refer to questions 3-6 of this section for discipline-specific fields. Refer to Chapter 2 in the *ANCS+ User Manual* and the on-line help in ANCS+ for information on how to use and complete the fields.

Sample catalog records for archeology, ethnology, history, and archival/manuscript collections appear in Figures 3.4 – 3.7.

* Mandatory Field

@ ANCS+ enters "Not Provided" if you don't complete this field.

\+ ANCS+ enters "Not Provided" in all these fields if you don't complete at least one of them for archeology records.

  - Occupation
- Language
- Local Collection Number
- Organization
- Provenance
- Reference Terms
  - Corporate Name
  - Geographic Name
  - Personal Name
  - Topic

7. *What is the Archives Module in ANCS+?*

The Archives Module is a separate but interfacing element of ANCS+. It allows you to describe archival collections beyond the catalog information in the Collections Management Module. The Archives Module allows you to describe archival collections:

- at multiple levels (collection, series, file unit, and item levels)
- according to archival descriptive standards
- in the Machine Readable Cataloging (MARC) format

Note: Use of the MARC format allows you to upload records into national bibliographic systems.

8. *Must I catalog all archival/manuscript collections in the ANCS+ Archives Module?*

No. The archival survey and processing plan will recommend which collections should be further described in the Archives Module.

You must catalog all archival collections in the Collections Management Module. ANCS+ will copy the information in the Collections Management Module to the Archives Module if you choose to do so.

For some collections, you may decide to use the Archives Module to create a more detailed collection level record. You can then further describe the collection at the series, file unit, and item levels. Refer to Appendix I, Archives Module, in the *ANCS+ User Manual* for information on the data fields in the Archives Module. Refer to Appendix D in this handbook for guidance on archival surveys and processing plans.

9. *Where can I find information about the CR discipline classifications?*

Refer to the appendices in this handbook for information on classifying and naming archeology, ethnology, and history objects and archival/manuscript collections. Figure 3.11 is a flow chart showing CR classifications.

Appendix D: Archival & Manuscript Collections
Appendix E: Archeology
Appendix F: Ethnology
Appendix G: History

F. Natural History (NH) Catalog Data Fields

1. *Where do I find the data fields for NH catalog records?*

The data fields for your NH catalog records are in the Collections Management Module of ANCS+. This module has your accession records and your cultural resources and natural history catalog records. It also has associated modules that help you with collections management functions, such as outgoing loans.

2. *What are the data fields for NH catalog records?*

The following list of NH data fields includes the mandatory fields. You can't save a record in ANCS+ until you complete all the mandatory fields. Refer to questions 3-5 of this section for discipline-specific fields. Refer to Chapter 2 in the *ANCS+ User Manual* and the on-line help in ANCS+ for information on how to use and complete the fields.

Sample catalog records for biology, geology, and paleontology appear in Figures 3.8 – 3.10.

* Mandatory Field

6. *Where can I find information about the NH classifications and cataloging?*

Refer to Appendix H: Natural History for information on classifying and naming biology, geology, and paleontology specimens. Appendix H is an appendix of this handbook, but it is published in a separate volume. It includes the Hierarchical Classification Outline (HCO) for classifying specimens, a scientific name index, and a common name index.

Figure 3.12 is a flow chart showing NH classifications.

G. Making Changes on the Catalog Record

1. *How do I make and track changes to a catalog record?*

Modify the record in ANCS+. When you save the record, the program will prompt you for the level of changes you have made. Choose between:

- Minor Modification, such as a change in location
- Recataloged, such as a change in object name

The optional Catalog Notes supplemental record allows you to note the changes you made. You can track changes to the catalog record, when they were made, and who made them. Refer to information on saving a catalog record in Chapter 2 of the *ANCS+ User Manual*. Refer to Section II in Chapter 3 of the *ANCS+ User Manual* for information on the Catalog Notes supplemental record.

If you keep paper records at the park, have the National Catalog print the records you have changed. Draw a diagonal line through the old record, and place the new record on top. If you keep catalog folders, you may place the old record in the appropriate catalog folder.

2. *How do I change manual records that are not in ANCS+?*

For minor modifications to records that are not yet in ANCS+, write the correction on the record. Include the name of the person who authorized the change and the date of change.

If you are recataloging (see definition below) a manual record, enter the record into ANCS+.

Note: Entering a manual catalog record into ANCS+ without changes is not considered to be recataloging.

3. *What is recataloging?*

Recataloging is any significant change to the data in the catalog record.

Examples: an appraiser tells you that an object is a reproduction

a specialist changes the scientific name of a botany specimen

you deaccession an object

Changes in location and object status (other than deaccessioning), and correction of spelling errors are not recataloging.

In general, when you make changes to the following fields, you are recataloging:

- Accession Number
- Catalog Number
- Item Count or Quantity
- Object Status (if deaccessioned)
- NAGPRA (CR records)
- Classification
- Object Name or Scientific Name
- Description (if substantial changes for CR records)
- Site of Original Collection/Provenience fields (for archeology)
- Manufacture Date (CR records)
- Eminent Figure Association and Eminent Organization (CR records)
- Artist/Maker (CR records)
- Reproduction (CR records)

- Collector, Collection Number, Collection Date (NH records)
- Collection Site Data (NH records)

4. *Do I submit the records I changed to the National Catalog?*

Yes. Each year you must submit a copy of your entire database to the National Catalog. You must also submit a tag file of the catalog records you completed during the fiscal year. If you recataloged records during the fiscal year, include these records in the tag file. Refer to Section VII of Chapter 7 in the *ANCS+ User Manual* for information on preparing records for your annual submission.

> ***Don't include records with minor modifications, such as location changes, in the tag file with the new and recataloged records.***

5. *Does the National Catalog print archival copies of recataloged records?*

Yes. National Catalog staff will print and store white, archival copies of the recataloged records. You can request that the National Catalog print blue, park copies of recataloged records for the park.

6. *Does the National Catalog print archival copies of records with minor modifications?*

No. The National Catalog doesn't print or store archival copies of records with minor modifications.

The National Catalog will print blue, park copies of records with minor modifications if you:

- make a separate tag file of the records with minor modifications that you want to print, and
- request the blue copies

For example, you might want new blue copies of your catalog records after a mass location change.

7. *Can I make changes to the NPS classification systems?*

No. The classification tables in ANCS+ are locked tables. You may not add to, delete, or modify the NPS classification entries. The Museum Management Program may periodically update these tables in consultation with discipline-specific specialists. Send requests and justifications for changes in classification to the Museum Registrar, National Catalog. Refer to Appendix H: Natural History, in this handbook for information on requesting additions to the Hierarchical Classification Outline (HCO).

8. *Can I make changes to the object name lists?*

Yes. You can make changes to all of the object/scientific name lists in ANCS+ except the history object term list. The Museum Management Program will periodically update the history object term list in consultation with discipline-specific specialists. Refer to Appendix G: History, in this handbook for information on requesting additions to the history object term list.

H. Submitting Catalog Records to the National Catalog

1. *Must I submit catalog records to the National Catalog?*

Yes. Each year you must submit a copy of your ANCS+ database to the National Catalog in Harpers Ferry, West Virginia. You must submit a copy of your database even if your park had no cataloging activity during the

year.

If you…	*Then…*
had cataloging activity during the fiscal year,	your database needs to include tag files that contain the fiscal year's catalog records (new and recataloged records).
don't have any electronic records at the park,	please send a memo stating that you don't have a database to submit.

Don't submit paper records to the National Catalog. The National Catalog staff will print white and, if requested, blue paper copies of your records.

2. *Why must I submit my catalog records to the National Catalog?*

The National Catalog is one of the required NPS inventories and databases. It provides:

- off-site storage for your electronic data
- paper copies of your catalog records that serve as backups to your electronic data
- a centralized source of information about NPS museum catalog data

The NPS doesn't consider an object cataloged until you submit the catalog record to the National Catalog.

Note: You should keep a complete, current backup at the park of all accession and catalog records. Refer to Section VII in Chapter 7 of the *ANCS+ User Manual* for backup instructions.

3. *When do I submit my database to the National Catalog?*

Submit your database in the month for your region's submission:

November: Midwest Region, Southeast Region, Harpers Ferry Center, Washington Office

December: Alaska Region, Intermountain Region, Denver Service Center

January: National Capital Region, Northeast Region, Pacific West Region

4. *What do I submit to the National Catalog?*

You need to submit a:

- copy of your entire database on a zip disk, including both CR, NH, and accession records
- tag files that contain the new and recataloged records that you completed during the previous fiscal year (October 1-September 30)

- Receipt for Property, DI-105 that includes a list of the numbers in the tag file
- cover memo indicating if you want the National Catalog to print and return blue copies of the catalog records.
- self-addressed label for return of the receipt for property

Note: If no cataloging activity took place during the fiscal year, you don't need to make tag files.

5. *How do I prepare the data for submission?*

Refer to the *ANCS+ User Manual* for instructions on how to back up your data and create a tag file for submission. See:

- Section VII of Chapter 7 for instructions on how to back up your database
- Section XI of Chapter 6 for information on tag files

6. *How do I prepare the receipt for property?*

Include the following on the receipt for property:

- park name or acronym
- the number of zip disks that you have enclosed
- the name and title of the person issuing the submission and the date of issue
- the ranges of consecutive catalog numbers in the tag file, such as 590-789, 800-867

> ***Don't include ranges of non-consecutive numbers.***

Note: If you have a lot of non-consecutive numbers in your tag file, print a receipt for property from ANCS+. The receipt will list every number in the tag file. Refer to Section II of Chapter 5 in the *ANCS+ User Manual* for information on printing a receipt for property.

Refer to Figure 3.13 for a sample receipt for property.

7. *Where do I send my submission?*

Mail your submission to:

National Park Service
National Catalog
Bombshelter/Fillmore Street
Harpers Ferry, WV 25425

Mail submissions by:

- certified U.S. mail
- United Parcel Service

- Federal Express
- other reputable mail service

Don't send submissions by cc:Mail.

8. *What happens to my records at the National Catalog?*

The National Catalog staff will:

- sign and return your receipt for property
- log in your records and print reports from your database and tag file
- print white, archival copies of your new and recataloged records and store them in the National Catalog vault
- print blue copies of your catalog records at your request
- send you copies of the reports

9. *What should I do with the blue copies of my catalog records?*

Many parks still use paper records along with their ANCS+ database. In the NPS these records are blue to distinguish them from the white archival records at the National Catalog. File these blue records consecutively by catalog number in groups of five hundred, with the highest number on top. Place them in post binders that are available from the Supply and Equipment Program of the Museum Management Program. Most parks keep these records in the curatorial office or collection storage area for quick reference when working with the collection.

10. *Does the National Catalog print white cardstock classification copies of catalog records?*

No. The NPS no longer uses the white cardstock classification copy of the Form 10-254. Some parks with large numbers of manual records may still maintain a classification file for these records. It's a file based on the classification headings and sub-headings for objects in a collection. The use of classification files will become obsolete when all the manual records have been entered into ANCS+. Classification searches will then be done more efficiently by the computer.

It is understood that I am personally responsible for the property listed hereon and that if any of the property is lost, stolen, damaged or destroyed through my simple or ordinary neglect or negligence or gross negligence I can be held financially liable as determined by a Board of Survey.

Received By: (Name and Title)	Signature and Date:

RETURN ORIGINAL TO EMPLOYEE UPON TURN-IN OF PROPERTY

Figure 3.13. Receipt for Property, DI-105 (Sample for National Catalog Submission)

Chapter 4: Inventory and Other Special Instructions

BASIC REQUIREMENTS

Annual Inventory

Conduct an annual inventory of museum property using the Automated Inventory Program (AIP) in ANCS+. There are three parts to the inventory:

- 100% inventory of all controlled museum property
- random sample inventory of all cataloged museum property
- random sample inventory of all accessions, if you have accessions with uncataloged objects

The regional director sends museum property inventory certifications to the Associate Director, Cultural Resource Stewardship and Partnerships, Attention: Chief Curator, by September 30 each year.

Reporting Lost Objects

Report losses of museum objects to a park law enforcement officer as soon as possible after discovery.

Complete a Report of Survey (Form DI-103) for objects that you can't find within thirty days.

36 CFR 2.5 Regulations for Natural History Specimens

Ensure that natural history specimens that are retained in museum collections are cataloged in ANCS+. Place collections stored outside the park on loan.

Collections Management Report (CMR)

Each fiscal year, complete the CMR using ANCS+, and submit it electronically to the Museum Management Program by November 1.

CHAPTER 4: INVENTORY AND OTHER SPECIAL INSTRUCTIONS

Overview

This chapter outlines a variety of procedures that will help you manage museum collections. The chapter is divided into the following sections:

- Section I. Annual Inventory of Museum Property
- Section II. Documenting Object Location
- Section III. Reporting Loss of Museum Objects
- Section IV. Reproductions, Living History Items, Exhibition Aids, and Outdoor Exhibits
- Section V. Consumptive Use of Museum Objects
- Section VI. Following Regulations for Cataloging Natural History Specimens
- Section VII. Buying Insurance for Borrowed Objects
- Section VIII. Completing the Collections Management Report
- Section IX. Determining the Value of Museum Objects

Section I. Annual Inventory of Museum Property

A. Overview

1. *What is the annual inventory?*

The annual museum collection inventory consists of a:

- 100% inventory of all controlled museum property
- random sample inventory of all cataloged museum property (including controlled property)
- random sample inventory of accessions if any accessions have uncataloged museum property

Note: You don't have to do an accessions inventory if the only uncataloged objects are from accessions that you have received within the last year.

You must accession all uncataloged objects before conducting the inventory.

You must complete a 100% inventory instead of the random sample if your park has fewer than 250 catalog records.

You must complete a 100% inventory of accessions if:

- your park has fewer than 250 accessions
- some of those accessions have uncataloged objects that were acquired before the last inventory

2. *What is the purpose of the inventory?*

During the inventory, you will check the physical location, condition, and documentation for objects in the collection. The annual inventory allows you to identify object-specific and systematic accountability and collections management problems.

3. *Who conducts the inventory?*

The superintendent is responsible for insuring that park staff conduct the inventory. The superintendent delegates the authority to conduct inventories of the museum collection to the custodial officer. The custodial officer is usually the staff person responsible for the museum collection. Refer to Chapter 1 in this handbook and *Personal Property Management Handbook No. 44* for the definition of custodial officer.

The superintendent appoints a team of at least two individuals to complete the annual physical inventory:

- the custodial officer for museum property or a person designated by the custodial officer to provide expertise in verifying descriptions and access to the collections
- an impartial reviewer who doesn't have direct responsibility for the museum collection

4. *How often do I conduct the inventory?*

You must complete the inventory annually by the end of the fiscal year. The regional director should set up a regular schedule for parks in the region to complete the inventory. If you don't receive a regional call to do the inventory, the superintendent can set the date.

5. *What is the Automated Inventory Program (AIP)?*

The Automated Inventory Program (AIP) partially automates the inventory process and prints the inventory reports.

> ***You must use the AIP to do the annual inventory. Refer to the ANCS+ User Manual, Appendix F, Automated Inventory Program, for instructions on running the AIP.***

6. *What inventory reports does the AIP produce?*

The AIP will produce the following reports as part of the inventory process:

- Inventory of Museum Property (Random Sample), Form 10-349 (Figures 4.1a – 4.1d)
- Inventory of Museum Property (Controlled), Form 10-349 (Figures 4.2a – 4.2d)
- Inventory of Museum Property (Accessions), Form 10-349 (Figures 4.3a – 4.3d), if appropriate

7. *Will running the AIP change any of my catalog or accession data?*

No. Running the AIP doesn't change ANCS+ catalog or accession data. The AIP extracts information from existing records, but doesn't modify them. You can't change your records from the AIP. You must go to the appropriate database to make changes to your data. If during the inventory you note that there are incorrect data on the catalog record, remember to update the catalog record.

8. *What is controlled property?*

Controlled museum property includes all:

- objects valued at $1,000 or more
- firearms
- incoming loans

> ***NPS repositories do not treat incoming loans from parks as controlled property.***

You should also designate the following as controlled:

- objects that are especially vulnerable to theft, loss or damage (the park must assess the risk)
- natural history specimens with high scientific value, such as type or voucher specimens

You must do a 100% inventory of controlled property.

You must accession and catalog all controlled property. Enter a Y in the Controlled Property field on the catalog record to indicate controlled property.

9. *What is a random sample?*

The random sample used in the inventory serves as an indicator of accountability for the entire collection. If you have accounted for all the objects in the sample inventory, it is assumed that you can account for all objects in the collection.

The AIP creates a valid random sample by randomly selecting catalog and accession numbers from a statistically valid sample size. A random sample is used to complete the Inventory of Museum Property (Random Sample) and Inventory of Museum Property (Accessions).

The sample size and percentage of collection to be sampled varies depending on the size of the collection. The larger the collection, the smaller the percentage of the collection that you must sample. For example, a collection with 253 records will sample 121 records. A collection with 150,000 or more records will sample 203 records. You will never sample more than 203 records.

10. *Why does the random sample inventory include controlled property?*

Controlled property appears in the random sample inventory even though you must conduct a separate, 100% inventory of controlled property. This is because the entire set of sequential numbers is needed to run a statistically valid sample. The AIP randomly selects catalog numbers from the sequential catalog numbers for the entire cataloged collection.

Note: You don't need to inventory controlled property twice. Copy the data for the controlled property that appears in the random sample inventory into the controlled property inventory or vice versa.

11. *What are the steps in completing the inventory?*

To complete the inventory:

- Generate the numbers and data for the inventory using the AIP.
- Print the inventory forms from the AIP.
- Complete the inventory by:
  - finding the objects and records
  - answering the questions on the inventory form
  - totaling the responses
  - completing the summary sheet
- *Optional:* Enter the inventory responses directly into the AIP and print the forms and the summary sheet.
- Have the custodial officer and staff conducting the inventory sign the forms.
- Have the superintendent review and sign the inventory.
- Update the catalog records as needed.

Note: You must repeat the process for all three parts of the inventory.

12. *Do I need to complete the inventory in any special order?*

No. Once you generate the numbers for the inventory, you can complete the inventory in any order you choose.

B. Conducting the Inventory

1. *What does the AIP do?*

The AIP will:

- determine the sample size from the highest catalog number and highest accession number you enter
- randomly select catalog and accession numbers for you to inventory (**Note:** You must generate the numbers in the presence of the custodial officer and all those who sign the inventory form, except the superintendent.)
- pull all controlled property for the controlled property inventory and allow you to enter non-electronic controlled property
- extract selected data from ANCS+ catalog and accession records and index catalog records by location and by ascending numbers for each

location

- allow you to edit selected AIP fields on line
- print the inventory forms containing the randomly selected and controlled property numbers and ANCS+ information
- print the completed inventory forms with the data you have entered
- total the inventory entries and print a summary sheet

2. *What catalog and accession data does the program extract?*

The AIP extracts the location, catalog number, controlled property status, and object/specimen name for all catalog records it pulls from ANCS+. This information appears on the screen and prints on the Form 10-349.

The AIP extracts the accession number and the data in the Catalog Status field for all accession records it pulls from ANCS+. This information appears on the screen and prints on the Form 10-349.

3. *What if my park has objects that are cataloged but not yet entered into ANCS+?*

If a catalog number isn't in ANCS+, the program can't extract data from the record. You will have to enter this information from the paper record. The only fields on the screen that will have entries are the catalog number field and the Rediscovery Status field. "Not in Rediscovery" will appear in the Rediscovery Status field.

Note: For controlled property only, you can add non-electronic catalog numbers to the inventory.

4. *What must I do for the inventory?*

To generate random catalog and accession numbers you must:

- look up the highest catalog number in use and enter it in the AIP
- look up the highest accession number in use and enter it in the AIP

For cataloged objects you must enter the following:

- presence or absence of the museum object
- presence or absence of the catalog record
- accuracy of location information and other data on the catalog record
- any change in the object condition

For accessions, you must enter the following:

- presence or absence of the accession record (including documents in the accession file)
- catalog or deaccession status of the objects in the accessions

If the accession includes uncataloged objects, you must enter the following:

- presence or absence of the objects in the accession as determined by

spot-check

- any change in the overall condition of the objects in the accession as determined by spot-check

5. *Must I inventory objects that are on outgoing loan?*

Yes. You must inventory objects on outgoing loan if their catalog numbers appear on the inventory. Verify the presence and condition of those objects either personally, by telephone, or in writing. Make a note in the Remarks/Condition column on the inventory form.

Note: You don't need to verify an object on outgoing loan if you have checked it within the last year. For example, if you renewed the loan within the last year, you don't need to verify the object.

You don't need to verify the presence and condition of objects on outgoing loan to a NPS repository. Note the acronym of the NPS repository in the Remarks/Condition column on the inventory form. NPS repositories must complete an annual inventory for park collections at the repository.

You must include collections on loan to a non-NPS repository as part of the park's inventory. You must verify the presence and condition of objects on outgoing loan to a non-NPS repository if they appear on the inventory.

6. *What if my park manages more than one collection?*

If you have units with more than one series of accession and catalog numbers, complete a separate inventory for each unit.

7. *What if there are uncataloged objects in the museum collection?*

You must inventory uncataloged objects using the random sample of accessions until you can catalog the objects. You don't have to inventory uncataloged objects from accessions that you've received since the last annual inventory.

8. *What if some accessions have both cataloged and uncataloged objects?*

You will inventory the cataloged objects as part of the random sample and controlled property inventories. You will inventory the uncataloged objects as part of the accessions inventory.

9. *What do I do if deaccessioned objects appear in the inventory?*

You have accounted for the object if it has been deaccessioned. Although you no longer have the object, the catalog number and record for a deaccessioned object remain in the database. Answer the inventory questions about the catalog record, and note in the Remarks/Condition field that the object is deaccessioned.

10. *Do I have to complete all the fields on the inventory?*

No. You may not always have information to enter in the Remarks/Condition field. In some cases, the instructions say to leave fields blank. For example, if a catalog number is not in use, leave the fields blank.

11. *Do I have to complete the inventory on the computer?*

No. You must generate the numbers and print the inventory forms from ANCS+. You can complete the forms by hand or on the computer.

If you…	*Then…*
enter the inventory data on the computer,	the AIP will total the answers and complete the summary sheet.
complete the forms by hand,	you'll have to total the answers, print a blank summary sheet, and complete the summary sheet manually.

C. Completing the Random Sample and Controlled Property Inventories

1. *How do I complete the random sample and controlled property inventories?*

You must complete the inventories using the Automated Inventory Program in ANCS+. Refer to Appendix F: Automated Inventory Program in the *ANCS+ User Manual* for specific information on completing the inventory fields.

2. *What are the data fields for the random sample and controlled property inventories?*

The data fields for the random sample and controlled property inventories are identical. For most fields, use a yes or no entry that is abbreviated "Y" or "N". A few fields, such as the Remarks/Condition field, allow you to enter text.

Column 1 – Location

This is the physical location of the object.

Column 2 – Catalog Number

This is the object's catalog number.

Column 3 – Number In Use

This column shows whether the catalog number is in use.

Note: If the catalog number isn't in use, leave the other fields blank.

Column 4 – Controlled Property

This column shows whether the object is controlled property. Refer to question A.8 in this section of the chapter for a definition of controlled property.

Note: Deaccessioned objects should not be controlled property.

Column 5 – Object Found

This column shows whether you found the object or group of objects corresponding to the catalog number.

Note: Enter a Y (yes) for deaccessioned objects since you have accounted for these objects.

Column 6 – Record Found

This column shows whether you found the catalog record for the object.

Column 7 – Location (Blue)

This column shows whether the location on the blue paper copy of the catalog record is correct.

Note: Leave this field blank if you're using the electronic record in place of the blue paper record.

Column 8 – Location (ANCS+)

This column shows whether the location on the electronic copy of the catalog record is correct.

Note: Leave this field blank if you're using the blue paper record in place of the electronic record.

Column 9 – Other Data OK

This column shows whether the information on the museum catalog record is complete and accurate.

Column 10 – Damaged

This column shows whether you observe any damage or deterioration to the object.

Column 11 – Object/Specimen Name

This is the name of the object.

Column 12 – Remarks/ Condition

Enter any remarks or notes on condition in this column.

D. Accessions Inventory

1. *When do I need to conduct an accessions inventory?*

If…	***Then…***
the entire collection is cataloged,	don't complete an accessions inventory.
the only uncataloged objects in the collection are from accessions that you received within the last year,	don't complete an accessions inventory.
you have uncataloged collections from accessions you received before the last inventory,	you must complete an accessions inventory.

2. *Is the accessions inventory a random sample inventory?*

Yes. When you enter the highest accession number in use, the AIP generates a random sample of accession numbers. If you have fewer than 250 accessions, the AIP will list all the accession numbers.

The accessions inventory is a substandard level of accountability because the property is not cataloged.

3. *Where do I find the accession documentation that I'll need for the inventory?*

Use the accession book, the ANCS+ accession record, and the accession folder to find accession documentation. Also refer to previous annual inventories for these data.

4. *What if an accession on the inventory is fully cataloged?*

Fully cataloged accessions appear in the random sample accessions inventory. This is because the program needs all your accession numbers to run a statistically valid sample. You must verify the accession documentation for fully cataloged accessions, but you don't need to check the objects.

5. *What if an accession has both cataloged and uncataloged objects?*

Inventory only the uncataloged objects. Don't inventory the cataloged objects as part of the accessions inventory.

6. *How do I conduct an inventory if the accession information is not specific?*

You can only conduct the accessions inventory to the level of detail given in the accession record. If the accession information doesn't include a list with the number and type of objects, make a list at the time of inventory. Date the list, and file it in the accession folder. It will allow future inventories to be more precise.

If the accession records shows…	***Then you would check for…***
2 dinner forks	2 dinner forks
5 boxes of archeological material	5 boxes that have an unspecified amount of archeological material
types of objects, such as military gear or household goods	an unspecified amount of military gear or household goods

7. *How do I conduct an inventory of extremely large accessions?*

Do a spot-check of the objects in the accession to see if the objects match the accession information. Use the most detailed object list available. You can spot-check a large accession by doing a random sample of the objects in the accession. For example, you could check every tenth object in the list.

E. Completing the Accessions Inventory

1. *How do I complete the accessions inventory?*

You must complete the accessions inventory using the Automated Inventory Program in ANCS+. Refer to Appendix F: Automated Inventory Program in the *ANCS+ User Manual* for specific information on completing the inventory fields.

2. *What are the data fields for the accessions inventory?*

The data fields for the accessions inventory include:

Column 1 – Location

This is the physical location of the accession. This entry is optional.

Column 2 – Accession Number

This is the number of the accession.

Column 3 – Number in Use

This column shows whether the accession number is in use.

Note: If the accession number isn't in use, leave the other fields blank.

Column 4 – Record Found

This column shows whether you found the accession records for the accession.

Accession records include an:

- entry in the accession book, *and*
- accession folder with the required documents from Chapter 2: Accessioning in this handbook

Column 5 – Catalog Status

This column shows whether the accession is:

- not cataloged
- partially cataloged
- fully cataloged
- deaccessioned

Note: If the accession is fully cataloged, leave the other fields blank.

Column 6 – Object Found

This column shows whether you found the object or group of objects corresponding to the accession number.

Report all missing objects in the Remarks/Condition field.

Column 7 – Damaged

This column shows whether you observe any damage or deterioration to the objects in the accession.

Column 8 – Remarks/Condition

Enter any remarks or notes on condition in this column.

F. Submitting the Inventory

1. *Who signs the inventory reports?*

The staff members who conducted the inventory sign and date the inventory after reviewing and verifying it.

The superintendent and the custodial officer must sign and date the certification statements on the cover sheet of Form 10-349. There is a separate cover sheet for each part of the inventory (random sample, controlled property, and accessions).

2. *What happens to the inventory after signature?*

The superintendent must send a copy of the inventory to the regional director. Director's Order #24: NPS Museum Collections Management, states that the regional director:

- certifies that all parks have completed the annual inventory
- sends the certification to the Associate Director, Cultural Resource Stewardship and Partnerships, Attention: Chief Curator, no later than September 30 each fiscal year.

Note: The superintendent must submit a copy of the full inventory for museum property to the regional director. See Director's Order #24: NPS Museum Collections Management.

3. *Do I keep a copy of the inventory at the park?*

The superintendent must keep a copy of the inventory for three years. It is recommended that you keep a copy of the inventory with the museum records for at least five years.

If you have the space, you may want to keep copies of past inventories indefinitely. Past inventories can be very useful references when an object is missing. You may be able to use the inventory to prove when the object was last seen in the collection.

If the inventory has uncovered problems, such as large numbers of losses, keep a complete copy until you have corrected the problems.

G. Inventory Deficiencies and Property Irregularities

1. *What are inventory deficiencies?*

Inventory deficiencies are problems that the inventory uncovers, such as:

- the loss of an object
- incorrect locations
- damage to an object

2. *What happens if there are inventory deficiencies?*

The superintendent is responsible for the accuracy of the park inventory. He/she must correct any problems that the inventory uncovers and reduce the risk of future problems. The superintendent must request that a Board of Survey investigate the loss or damage of museum property. The regional director is the reviewing authority for the Board of Survey.

The park may want to consult the regional/SO curator for advice on correcting problems and reducing the risk of future loss and damage.

Refer to the *Personal Property Management Handbook No. 44* for information on Board of Survey procedures.

3. *What are property irregularities?*

Property irregularities are losses of property that point to serious accountability and management problems. They include:

- evidence of fraud or falsifying records
- large numbers of damaged or lost objects
- losses of a suspicious nature

Property irregularities are most likely to come to light during the annual inventory.

Refer to the Interior Property Management Regulations (IPMR 420 DM 114-60.811) and the *Personal Property Management Handbook No. 44* (Section 8.24) for information on property irregularities.

4. *What happens if the inventory uncovers property irregularities?*

Property irregularities require an additional investigation beyond a Board of Survey. The Board of Survey reports evidence of property irregularities to the superintendent. The regional director reviews the board's findings and directs the superintendent to take immediate corrective action. This may include a 100% inventory of the collection.

The regional director must send a description of any property irregularities and corrective actions to the Associate Director, Cultural Resource Stewardship and Partnerships, Attention: Chief Curator.

5. *Who investigates property irregularities?*

After reviewing the findings of the Board of Survey, the regional director or Director may call for an investigation by:

- field or Washington office staff, *or*
- the Department of the Interior Office of the Inspector General (OIG)

H. Spot-Check Inventories and Audits

1. *Who conducts a spot-check inventory?*

The regional director and the Associate Director, Cultural Resources, can request spot-check inventories. They may periodically request their staff to do sample spot-checks of park museum collections and records.

2. *What is a spot-check inventory?*

A spot-check inventory involves two parts. The person conducting the spot-check will choose a small sample of objects and unrelated catalog (or accession) records. You must then:

- produce the corresponding catalog (or accession) records for the objects
- locate the corresponding objects for the records

A spot-check inventory may also involve a spot-check of the most recent annual inventory for accuracy.

3. *What happens if a spot-check uncovers deficiencies?*

The staff conducting the spot-check will report any serious deficiencies or property irregularities to the regional director. He or she will direct the superintendent to take corrective action.

4. *Who conducts a museum property audit?*

If requested by the NPS, the OIG will perform audits of park museum collections. The Inspector General may also call for an audit whenever he/she determines the need for one.

5. *What happens to audit reports?*

The OIG sends audit reports to the Director. The Director forwards these reports to the appropriate regional director, who must review the audit and submit a program for corrective action, if necessary. The Inspector General tracks the program until the NPS accomplishes any necessary corrective action.

Section II. Documenting Object Location

A. Overview

1. *Why is it important to document location?*

Documenting the physical location of an object is an important part of cataloging. You need to know the location of objects in the collection to be able to access and care for them.

2. *Who is responsible for documenting object location?*

The staff person responsible for the museum collection must maintain current physical location information for all objects in the collection.

B. Documenting Current Location

1. *Where do I document current location?*

Document current location on the catalog record. Enter the current location in the Object Location field in ANCS+. Enter changes in location for manual, paper records in pencil in the Object Location field.

2. *Why is it important to be consistent in entering location?*

Entering location information consistently in ANCS+ allows you to quickly find the information and create reports on object location. The location should be specific, so that you can easily find the object.
Refer to the *ANCS+ User Manual* for instructions on completing the Object Location field.

Note: Using letters and numbers to identify location areas can help you keep consistent location data. You may want to keep a map of each structure that has museum collections. Identify each room or area by a letter and/or number, including exhibit cases. In storage areas, you may want to keep a map of each storage unit, such as cabinets and cases. Identify each unit by a letter and/or number. Post the map in the storage area. Include location maps as part of your site-specific cataloging guidelines.

3. *What is a location file?*

A location file gives catalog data for objects at a particular location within the park. This electronic or manual file may consist of:

- copies of catalog records arranged in numerical order by catalog number
- an ANCS+ or computer generated report of catalog numbers (and other pertinent data) for each location (index the report on object location and catalog number)

A location file can be especially useful for parks with:

- furnished structures (the file provides a record of furnishings by room)
- large collections housed in several structures (the file shows the objects in each location)
- exhibits with multiple exhibit cases

Use of a location file is optional.

C. Documenting Location Changes

1. *How do I document location changes?*

You must note any changes in object location. Develop a system for documenting location changes as they occur. Update the object location field in ANCS+ and location files as needed.

Note: ANCS+ will track changes in location. You can also do mass location updates in ANCS+. For tracking location changes, refer to the instructions on saving a record in Chapter 2 of the *ANCS+ User Manual*.

Refer to Section X of Chapter 3 in the *ANCS+ User Manual* for information on the Location supplemental record and mass location updates.

2. *How do I document temporary location changes?*

When you temporarily remove an object, you can mark the location with an Object Temporary Removal Slip, Form 10-97 (Figure 4.4). It gives you a visual reminder of an object's location and removal. It's especially useful in exhibits and furnished rooms as a reminder to staff. Use of this form is optional. The form includes:

- catalog number
- permanent location
- purpose for removal
- temporary location
- who removed the object
- the date the object was removed

You can print Form 10-97 from ANCS+.

Use a separation sheet for archival and manuscript collections. See Appendix D in this handbook for an example.

Section III. Reporting Loss of Museum Objects

A. Overview

1. *Who is responsible for reporting the loss of museum objects?*

The staff person who is responsible for the museum collection must:

- report losses to a park law enforcement officer and the accountable officer as soon as possible
- document the loss
- document the circumstances surrounding the loss

2. *What is the definition of "loss"?*

The term "loss" means traumatic and total loss:

- theft
- destruction
- disappearance

It doesn't refer to losses of integrity (breakage, fading, infestation, or other deterioration) or the deliberate deaccession of objects.

3. *Where can I learn about prevention of loss?*

Refer to *MH-I*, Chapter 9, Security and Fire Protection, and Chapter 10, Emergency Planning.

4. *Where can I find the procedures for investigating a loss?*

Procedures for investigating a loss follow:

- Director's Order #9: Law Enforcement Program and the Law Enforcement Reference Manual (RM-9)
- *Personal Property Management Handbook No. 44*
- Interior Personal Property Management Regulations (IPMR 410 DM 114-60)

There may also be park-specific and regional procedures for investigating losses.

B. Discovering Loss

1. *Who usually discovers a loss?*

Staff conducting the annual inventory most frequently discover losses. You may also receive loss reports from housekeepers, security personnel, or interpreters. These staff may notice something missing when they make their customary rounds.

2. *What should I do first upon discovery of a loss?*

Search the area to see if the object has been misplaced in a nearby location. If you can't locate the object:

- make a copy of the Museum Catalog Record (Form 10-254)
- gather any additional information that might be useful, such as additional information in ANCS+ or the catalog folder
- locate any available photographs or other images of the object

Give this information, along with a verbal report of the loss, to a park law enforcement officer. At some parks, there is a designated law enforcement officer who is responsible for the museum collection.

3. *When should I report a loss to a law enforcement officer?*

If you are unable to locate an object after a complete search, contact a law enforcement officer. This should be as soon as possible after discovery of the loss. A delay may jeopardize your ability to reclaim the object if it is later found. Provide the officer investigating the loss with all relevant museum records, including accession and catalog information.

Conduct a search for the object with the law enforcement officer and, if possible, the person who reported the loss. Use a catalog record and photograph, if available, to aid in identification.

C. Reporting Loss

1. *How do I report a loss?*

If the search for the object is unsuccessful, the law enforcement officer must complete a Case Incident Record, Form 10-343, or equivalent. Be sure to get a copy as well as the case number.

Note: The case incident record should show that the missing object is museum property. Attach a copy of the catalog record and any other pertinent data from the catalog or accession folder to the report.

2. *How do I document a loss?*

Change the Object Status field on the catalog record to Missing. Enter the year that you discovered the loss in the Status Date field. Place copies of the case incident record and all other documentation relating to the loss in the appropriate accession folder.

3. *What if the object is found?*

Change the Object Status field from Missing to the appropriate entry, such as Storage or Exhibit. Note the disappearance and recovery of the object on the catalog record or in the accession folder. Assess and record the condition of the object upon its return.

4. *What if the object is not found?*

Start the process of deaccessioning the object if you can't find it within thirty days after reporting its loss. Complete a Report of Survey, Form DI-103 (Figure 4.5). A Board of Survey must review the DI-103. Refer to Chapter 6, Deaccessioning, in this handbook and the *Personal Property Management Handbook No. 44*.

5. *How do I report stolen museum collections to outside agencies?*

Notify NPS and local law enforcement authorities before contacting outside agencies.

The more widely you report a loss, the better chance of its recovery. In some jurisdictions, the local police will report crimes to the FBI and to Interpol. You may have to notify all other agencies and offices. Refer to the following list in the event of a theft or other criminal loss of museum objects.

Agency/Office	Comments
National Stolen Art File **Federal Bureau of Investigation** IT/GRCU Room 5096 935 Pennsylvania Ave, NW Washington, D.C. 20535 Tel: 202 -324-6668 Web Address: <www.fbi.gov/majcases/arttheft/art.htm> Report all information through local FBI office.	• Investigates theft of cultural property valued over $5,000 (fine art, gems, and coins over $2,000) and when interstate commerce is suspected • Stolen and recovered property listed on-line • Art Theft Link: <www.saztv.com/page11.html> - includes a listing of databases of stolen art - lists information on stolen books, manuscripts, musical instruments, artifacts, fossils, and other materials - lists contact information for art detectives, security consultants, art loss register, and insurance

Section IV. Reproductions, Living History Items, Exhibition Aids, and Outdoor Exhibits

A. Reproductions

1. *Why are reproductions used in park exhibits?*

A park may acquire reproductions for exhibit for a variety of reasons:

- the park does not have the specific items needed for the exhibit
- original or period pieces are not available
- to protect original objects, such as replacing an original chair with a reproduction to protect the original

2. *What kinds of reproductions does the NPS use?*

Parks use several different types of reproductions in exhibits:

- commercially produced reproductions
- reproductions created for a specific exhibit installation
- reproductions of objects in the park or in another museum's collection

Refer to Chapters 4 and 5 in the *MH-III* for information on two-dimensional and three-dimensional reproductions.

3. *How are reproductions different from objects in the museum collection?*

Although reproductions have monetary and interpretive value, they generally don't have the associative value that would make them important to the park museum collection. However, in certain cases, reproductions may be the only remaining evidence of the original. They may also be inherently valuable themselves, such as the Navajo rug reproductions at Hubbell Trading Post NHS.

4. *Must I accession and catalog reproductions?*

Yes. To provide accountability, you must accession and catalog reproductions into the museum collection. Follow the instructions in Chapter 2 and Chapter 3 in this handbook. Refer to Section Y in Appendix D of this handbook for information on cataloging two-dimensional reproductions.

5. *How do I document commercially produced reproductions?*

Clearly and permanently mark these items as reproductions. Write "reproduction" in an accessible, but not obtrusive, location on all commercially produced reproductions. Refer to Appendix J in this handbook for marking techniques.

If the park purchased the items from a catalog, make copies of the pertinent pages of the catalog. Place the copies in the accession or catalog folder to give further information on the source and the object.

Enter Reproduction in the Reproduction field in ANCS+. Enter "Reproduction acquired for purposes of exhibition" in the Description field in ANCS+.

6. *How do I document reproductions created for exhibit installation?*

Some reproductions are created specifically for exhibit installation, such as furnishings for a general store. Clearly and permanently mark these items as reproductions. Write "reproduction" on the item in an accessible, but not obtrusive, location. Refer to Appendix J in this handbook for marking techniques. Place copies of the documentation about the production of these items, such as plans and specifications, in the accession or catalog folder.

Enter Reproduction in the Reproduction field in ANCS+. Enter "Reproduction acquired for purposes of exhibition" in the Description field in ANCS+.

7. *How do I document reproductions of specific items in a park or other museum's collection?*

These items have been produced from original objects. They are replicas using the same materials and techniques as the original. Use the accession or catalog folder to file documentation about the current location of the original item and plans and specifications for the reproduction. Clearly and permanently mark these items as reproductions. Write "reproduction" on the item in an accessible, but not obtrusive, location. Refer to Appendix J in this handbook for marking techniques.

Enter Reproduction in the Reproduction field in ANCS+. Enter "Reproduction of [catalog number of the original] acquired for purposes of exhibition" in the Description field in ANCS+.

8. *How do I document natural history specimens acquired for exhibit?*

For exhibit purposes, the park may acquire natural history specimens from outside the park's Scope of Collection Statement. For example, a commercial scientific company may supply a beaver from Michigan to a park in the Southwest. If the park purchased the specimens from a scientific catalog, make copies of the pertinent pages of the catalog. File the copies in the accession folder to show the source.

Enter "Specimen acquired for purpose of exhibition" in the Description field of ANCS+.

Note: See Chapter 2 in this handbook for special requirements for acquiring threatened and endangered species. See Chapter 5 in this handbook for special requirements for loaning threatened and endangered species.

9. *Do I manage reproductions differently from museum collections?*

No. Manage reproductions as part of the museum collection, with one exception. Generally, reproductions receive routine approval for consumptive use. However, reproductions that are of high monetary value and/or importance to the collection, or those that replace badly deteriorated originals, should not be consumptively used.

Refer to Section V in this chapter for information on consumptive use.

10. *May I deaccession reproductions at the end of their useful life?*

Yes. Deaccession all cataloged reproductions by following the guidance in Chapter 6 in this handbook. You may determine the disposition of reproductions at the time of acquisition. This will assist staff in making a decision at the end of an object's useful life. You must fully note the recommended disposition in the accession folder at the time of acquisition. Consider the current market value when determining disposition.

Some reproductions, such as curtains and rugs, will wear out in time. If possible, save a small sample of the reproduction. Generally, worn out reproductions will be destroyed through a Board of Survey. Follow the procedures in Section H of Chapter 6 in this handbook.

Don't reuse the catalog numbers of deaccessioned reproductions.

Note: If the original is badly deteriorated, you may want to keep the reproduction.

B. Living History Items

1. *Are living history items part of the museum collection?*

The park will manage original objects and reproductions that it acquires exclusively for living history separately from the museum collection.

No. Living history items are not left on exhibit. Parks must store them in a separate location from the museum collections and manage them according to the personal property system.

If objects on exhibit are also used for living history, you must accession and catalog them and get approval for consumptive use.

Remove living history materials that have been inappropriately accessioned into the museum collection. Refer to Section B of Chapter 6 in this handbook for information on removing non-museum property from the collection.

2. *How does the park document living history items?*

Clearly and permanently mark living history items with the words “Living History.” Mark them in an accessible, but not obtrusive, location. The park should account for living history items through the personal property system. See the *Personal Property Management Handbook No. 44*.

C. Exhibition Aids

1. *What's the difference between reproductions and exhibit aids?*

Reproductions are exact or close imitations of museum objects. Exhibit aids or props are produced or acquired to create an exhibit. Exhibit aids aren't intended to be original or reproduction museum objects. Examples of exhibit aids include:

- exhibit cases and mounts
- molded plastic fruit
- curtain rods (non-historic)
- panels and dioramas
- display panels
- photographs and other display art

2. *Do I need to accession and catalog exhibit aids and props?*

No. Don't accession and catalog exhibit aids and props. In rare cases, you may want to accession and catalog old exhibit material as examples of:

- notable craftsmanship
- park history
- exhibit techniques or interpretive approaches

D. Outdoor Exhibits

1. *Do I catalog objects in outdoor exhibits?*

Yes. Accession and catalog movable objects that are in outdoor exhibits and are not incorporated in a fixed monument. These include cannons, carriages, wagons, farm equipment, and automobiles.

2. *Do I catalog fixed outdoor monuments?*

No. The List of Classified Structures (LCS) defines fixed outdoor monuments as structures. Refer to *Cultural Resource Management Guideline*, Chapter 8, Management of Historic and Prehistoric Structures, for other examples of structures.

Section V. Consumptive Use of Museum Objects

A. Overview

1. *What is consumptive use?*

Consumptive use is the use of museum objects in a way that may damage them or make them deteriorate more quickly. It includes:

- subjecting objects to unacceptable possibilities of wear, breakage, theft, deterioration, or destruction
- destructive and scientific analysis
- use of objects in interpretive programs

Note: Exhibiting objects is not considered consumptive use.

2. *Where can I find NPS guidelines on consumptive use of museum objects?*

The guidelines for consumptive use are in the *Cultural Resource Management Guideline*, Chapter 9, Management of Museum Objects.

Refer to *MH-III*, Chapter 1, Evaluating and Documenting Use, for more information on consumptive use of collections.

Refer to Chapter 6 in this handbook for information on deaccessioning objects that have been entirely destroyed in analysis.

Refer to Director's Order #24: NPS Museum Collections Management.

B. Consumptive Use Approval

1. *Who approves consumptive use?*

The superintendent can authorize in writing destructive or scientific analysis except for rare or highly significant objects, specimens, and archival materials.

The superintendent must send destructive or scientific analysis requests that involve rare or significant objects to the regional director for approval. The regional/SO curator, archeologist, or natural history specialist should review these requests.

The superintendent must send all other requests for consumptive use to the regional director for approval. Refer to the *Cultural Resource Management Guideline* for the specific information that the superintendent must include in the request.

2. *When is consumptive use acceptable?*

Destructive or scientific analysis is a legitimate use of museum collections for approved research purposes. The research purpose must be based on a professional research design that clearly documents the need for the analysis.

Note: New and developing non-invasive technologies for analysis are preferable to analysis that destroys or alters all or part of an object or specimen.

3. *When is consumptive use not acceptable?*

With the exception of destructive or scientific analysis, consumptive use is generally not acceptable for museum collections. In most cases, you should use a reproduction rather than expose objects to unacceptable wear, deterioration, destruction, or loss. In rare instances, the NPS may permit consumptive use of museum objects after careful review and approval.

The superintendent must justify the request for consumptive use by stating to the regional director:

- how the use will benefit the public, increase understanding and appreciation of cultural and natural heritage, or contribute significantly to heritage preservation and protection
- why the park can't use reproductions of the original or a similar object

4. *Are there types of materials for which the regional director won't grant permission for consumptive use?*

Yes. The regional director won't grant permission for consumptive use if the objects are:

- directly connected with or prime survivors from the park's historic periods, events, or personalities
- type specimens or one-of-a-kind natural history specimens
- from systematic archeological collections that have known site provenience or scientific value that hasn't yet been documented
- of scientific interest

Note: The Director may grant an exemption for this material.

There will be no exemptions for the consumptive use of:

- NAGPRA material, unless the affiliated cultural group has approved the use
- original firearms

Section VI. Following Regulations for Cataloging Natural History Specimens

A. Overview

1. *Where can I find information on collection permits for natural history specimens?*

Title 36 of the Code of Federal Regulations, Chapter 1, Part 2, Section 2.5 (Revised 1984) governs collection permits for natural history specimens. 36 CFR 2.5, Research Specimens, outlines specific conditions that govern specimens and related data that are:

- collected on park lands, *and*
- placed in museum collections or on display

In Section 2.5g, the regulation states:

(g) Specimen collection permits shall contain the following conditions:

(1) Specimens placed in displays or collections will bear official National Park Service museum labels and their catalog numbers will be registered in the National Park Service National Catalog.

(2) Specimens and data derived from consumed specimens will be made available to the public and reports and publications resulting from a research specimen collection permit shall be filed with the superintendent.

(h) Violation of the terms and contents of a permit issued in accordance with this section is prohibited and may result in the suspension or revocation of the permit.

Note: The Secretary's regulations on the preservation, use, and management of fish and wildlife are found in 43 CFR Part 24. Regulations concerning archeological resources are found in 43 CFR, Part 3.

2. *How can I help collectors with 36 CFR 2.5 compliance?*

Supply the collector with the NPS requirements, guidelines, and supplies listed in question B.4 of this section.

3. *Who is considered a collector?*

Collectors include outside researchers, contractors, and NPS employees.

B. Documenting Natural History Collections Collected Under 36 CFR 2.5g

1. *Who accessions natural history specimens collected under 36 CFR 2.5g?*

The NPS must accession specimens collected under 36 CFR 2.5g. Assign one accession number to each project, and accession the specimens as a field collection. Refer to Chapter 2 in this handbook for information on accessioning.

The collector must give you information for accessioning the specimens. You must assign an accession number to the collection, and give the number to the collector.

2. *Who catalogs specimens stored in the park or a NPS repository?*

NPS curatorial staff usually catalog specimens stored in parks or NPS repositories. However, the superintendent may add a condition to the permit to make the collector responsible for cataloging.

In most cases, the collector will be responsible for cataloging specimens that go into a non-NPS repository. In some cases the non-NPS repository may be responsible.

3. *Who catalogs collections stored in a non-NPS repository?*

The collection permit should include a statement that the collector must:

- give the park accession information

- catalog the specimens into ANCS+ or in an export format that can be easily imported into ANCS+ (including data for all the mandatory

fields)

- complete the NPS labels for the specimens
- submit copies of all field notes, data, reports, and other records that relate to the specimens and the collecting project

4. *What materials for documenting collections must I give to the collector?*

Before the end of the project, you must give the collector:

- an accession number for the collection
- a supply of appropriate NPS natural history specimen labels or instructions on how to print the labels from ANCS+
- copies of the *MH-II*, Chapter 3, Cataloging; Appendix H, Natural History; and Appendix I, Lot Cataloging
- the *ANCS+ User Manual*, the ANCS+ program, and sample copies of ANCS+ natural history worksheets

5. *Do I have to buy an additional copy of ANCS+ to give to the collector?*

No. Collectors may use a park's ANCS+ site license for work they are doing for the park. Have the collector complete the contractor agreement form that you received from Re:discovery Software, Inc., the vendor for ANCS+. Contact the company at 804-975-3256 if you need a copy of the form.

Make sure that your park purchased a support plan that includes the collector's work station(s). You may have to buy additional support.

A non-NPS repository can keep the ANCS+ software as long as it's storing and managing NPS collections. If the collections leave the repository, the repository must return its copy of ANCS+ to the park.

6. *What fields on the catalog record must the collector complete?*

The collector must complete or supply data for the following fields in ANCS+:

- Classification
- Specimen Name (scientific name)
- Lot Quantification
- Collection Site
- Township/Range/Section **or** UTM Coordinates **or** Latitude/Longitude
- Collector
- Collection Number
- Collection Date
- Identified By and Date
- Formation (for geology)
- Period/System (for geology and paleontology)

- Condition
- Type (if designated)
- Description
- Preservative and/or preparation

The park may require the collector to provide additional information. If the collector is doing the cataloging, he/she will also need to complete the following mandatory fields:

- Accession Number
- Catalog Number
- Cataloger
- Controlled Property
- Location
- Object Status
- Status Date

Refer to Chapter 2 in the *ANCS+ User Manual* for information on the catalog fields for natural history specimens.

7. *May I release catalog numbers to the collector?*

Yes. You may release catalog numbers for use with the project if the collector:

- provides a list or estimate of items to be cataloged
- has knowledge of the NPS cataloging system

Don't release catalog numbers before the field collecting activity takes place.

Track the catalog numbers that you issue for each accession. Include lists of catalog numbers and object names in the appropriate accession folders.

Follow up to make sure that the collector has:

- used all the numbers
- properly assigned the numbers to objects
- entered catalog records into ANCS+ or in an export format for import into ANCS+

8. *Who is responsible for cataloging the field records?*

The park is responsible for cataloging field records. Refer to Chapter 2 in the *ANCS+ User Manual* for information on cataloging archival collections.

Note: The collector might not turn the field records over to the park until he/she has published or produced a final report. This may take several years. The park should track outstanding field records until the collector turns them over to the park.

Refer to Chapter 2 in this handbook for information on copyrights and field records.

9. *Who is responsible for monitoring the accuracy of the records?*

The collector should send the completed electronic database to you for review. The contract should state that the collector must make corrections or changes to the database based upon your review. It's a good idea to review the database at intervals so that you can catch problems early.

10. *What documentation must the collector submit to you?*

The collector must submit:

- approved electronic copies of the catalog records (if the collector is required to catalog the specimens as a condition of the permit)
- original or reproducible copies on archival quality paper of all field notes and reports (see question 8 above)

Note: When the park submits the records to the National Catalog, the National Catalog will print paper copies of the catalog records at the park's request. The collector may print paper copies of the catalog records, but printing paper records is optional.

11. *Who prepares the NPS natural history labels and marks the specimens?*

If the collection is going into a non-NPS repository, the collector prepares the NPS natural history labels and marks the specimens. The collector is responsible for adding accession and catalog numbers to the labels and marking the specimens with the catalog number. See Appendix J in this handbook for marking techniques. Appendix H of this handbook has information on natural history labels.

Use the field collection number as a reference until the collector marks the catalog number on the specimen. The field specimen number is on the specimen and the accession and catalog records.

Note: If the collections are going into a NPS repository or a park, NPS staff complete the labels and mark the specimens.

C. Natural History Collections on Loan to Non-NPS Repositories

1. *When do I place a natural history collection on loan to a non-NPS repository?*

Many collectors will want to move the collection to their institution at the end of the field collecting period. You may place collections on outgoing loan to a non-NPS respository. If the specimens have not been cataloged, list specimens by accession number and collecting number or groups of similar specimens. Find out the size of the collection. Tell the collector that you will prepare a complete list of specimens for the loan agreement after the collection is fully processed. Follow the procedures for repository loans in Chapter 5 of this handbook. Make arrangements for the collector or non-NPS repository to process and catalog the specimens.

2. *Am I responsible for monitoring the loan?*

Yes. You must periodically monitor the condition of the collections at the borrowing repository. You may supply the borrowing institution with copies of the *MH-I*, Museum Collections.

You will also monitor collections on loan through the annual inventory. See Section I of this chapter and Appendix F in the *ANCS+ User Manual* for information on the annual inventory.

Section VII. Buying Insurance for Borrowed Objects

A. Overview

1. *Why do I need to insure museum objects that I borrow?*

Non-federal museums, private owners, and state or local agencies generally require insurance coverage as a condition for a loan. Insurance is a means of financial compensation if loss and damage occur from unexpected causes. These include fire, smoke, water, flood, vandalism, theft, or shipping damage.

Insurance is not a substitute for good collections management.

2. *Do I need to insure items left at the park for identification?*

No. Generally you don't insure items if they are left at the park for the benefit of the owner. But if the owner could show that government negligence resulted in loss or damage, the owner could file a tort claim. It is wise not to take custody of such items in the first place.

3. *Do I need to insure property of the United States Government?*

No. The U.S. Government assumes its own risks. You don't need to insure your park's collection. You don't need to insure museum collections you borrow from other parks or from other government agencies unless the agency requires insurance.

Note: This doesn't apply to Smithsonian Institution collections that are held in trust by the Institution for the general public (20 USC 41). Smithsonian loan agreements require one of the following:

- insurance to be carried by the Smithsonian and the premium billed to the park

- insurance to be carried by the park

- insurance waived if the park agrees to indemnify (financially back) the Smithsonian for any and all loss or damage to the objects

The last option is unacceptable for the NPS. Government employees aren't authorized to obligate government funds in advance of appropriations (31 USC 665a, 35-CG-85). It's most convenient for you to use the Smithsonian Institution policy. Refer to question B.3 in this section. Consult with the registrar of the appropriate Smithsonian Institution museum for additional information.

4. *What is a tort claim?*

A non-federal owner of an uninsured museum object that's lost or damaged while in NPS custody can file a tort claim against the government for the cost of replacement. To receive a monetary judgement, the plaintiff must prove that the government was negligent or committed a wrongful act. Tort claim procedures are described in the Federal Tort Claims Act (28 USC 2671-2680, as amended).

It's in the lender's best interest to require insurance coverage for borrowed material rather than rely on a tort claim. Tort Claims Act coverage isn't insurance. An insurance policy keeps the lender from filing a tort against the government to recoup losses on damaged or lost museum collections.

B. Buying Insurance

1. *Can the NPS buy insurance?*

Yes. As a result of two Comptroller General decisions (17-CG-55 and 42-CG-392), you can buy insurance when non-federally owned property is in NPS temporary custody. "Where privately owned property is temporarily entrusted to the custody of the Government for public purposes, the cost of insuring such property may be paid from applicable appropriations." (17-CG-55)

You can either use the lender's policy or buy private insurance.

2. *Who pays for the insurance?*

You, as the borrower, are responsible for paying insurance costs unless explicitly agreed to otherwise in writing. Whether you use the lender's policy or buy private insurance, you'll need to submit a requisition for the premium amount.

You can also have your park cooperating association pay the premium. If the association pays the premium, the policy must list the park as the insured.

The value of the insured property may increase over time and the insurer may raise the insurance premium yearly. You will have to budget for these increases. Regularly review the values of the items on loan to make sure they reflect current market value. If you have any questions, contact the regional/SO curator.

3. *How do I use the lender's policy?*

If you use the lender's insurance you'll be billed the premium costs for the loan period. Be sure to:

- get a waiver of subrogation from the insurance company, *or*
- have the park named as an additional insured in the lender's policy

4. *What is a waiver of subrogation?*

Subrogation is a clause in an insurance policy that allows the insurer the rights to any possible legal action. A waiver of subrogation is an assurance by the insurer that it won't subrogate against a third party. If you don't have a waiver of subrogation, the insurance company can recoup its losses by suing the park as a third party. Without a waiver of subrogation, the insurance company could pay the lender and then claim compensation from your park.

The insurance policy should state that the company won't attempt to recover any loss from:

- your park
- any other institution borrowing the covered museum property

5. *What is a certificate of insurance?*

If you're using the lender's policy, you can get a certificate of insurance with the United States and your park named as additional insureds. This puts the park in the same category as the original holder of the policy. The park has to follow the terms of the lender's policy. Put a copy of the policy terms and the certificate of insurance in the loan or accession folder. Send a copy of the documents to your contracting officer.

6. *How do I buy an insurance policy to cover the items I borrow?*

You can arrange with an insurance company to buy museum collections insurance for the items you borrow. Look for a company or agent with experience in insuring museums or fine arts. You'll be billed for the premium costs for the period of the loan. Make sure the policy you buy is a "museum collections policy" as listed in the *Fire, Casualty and Surety Bulletins* (specialty lines Section Fa-1) published by the National Underwriters Company.

Don't get a fine arts dealers policy because the coverage is not as comprehensive as museum collections insurance.

C. Insurance Policies

1. *What standard features must an insurance policy include?*

Make sure the policy you buy for the objects you borrow includes these standard features:

- ***Limits of Liability***

  The policy outlines the limits of liability. They refer to the:

  - maximum amount of coverage the insured (individual or organization) can collect, *or*

- the maximum amount to be paid out in the case of loss or damages

The limits of liability should correspond to the actual dollar values of the museum objects shown on the loan agreement. Liability limits established at less than the total value could result in problems for the park in the event of loss or damage.

- ***Wall to Wall Coverage***

  The policy must include a clause that shows protection for objects is "wall to wall" or "nail to nail." This means that property is covered from the time it leaves its normal repository until it's returned. The policy will be in effect during packing, shipping, temporary storage, and during the period of the loan.

- ***Perils Insured***

  All policies should be "All-Risk." This means the insured is protected against all loss or damage arising from an external cause. The policy must list any specific exclusions for which the insurer won't pay damages.

- ***Exclusions***

  Exclusions are circumstances for which the policy will deny coverage. The policy must spell out all exclusions. Make sure you understand what they are.

  Standard exclusions are:

  - normal wear and tear (damage caused by usual day-to-day handling)
  - gradual deterioration (the effects of time)
  - insects, moths, and rodents
  - inherent vice (a quality in an object which causes it to deteriorate or destroy itself)
  - damage due to or resulting from repair, restoration, or retouching
  - nuclear reaction, radiation, or radioactive contamination
  - insurrection and war
  - government confiscation

You can negotiate to remove standard exclusions if a particular exclusion is not advantageous to the park. This may involve additional expense. If you do negotiate the additional coverage, make sure it's noted on the loan agreement.

- ***Waiver of Subrogation***

  Any insurance policy that you purchase to cover museum collections that you borrow should include a waiver of subrogation for other museums. Museum insurance policies should include this waiver as a courtesy to maintain trust between institutions.

  Refer to question B.4 in this section for information on a waiver of subrogation.

- ***Valuation***

  The lender usually places the monetary value on the museum objects in the loan. However, you need to make sure that the insurance value is reasonable. You and the lender must agree on the dollar amount before signing the loan agreement. The value should be the same as the fair market value at the time of the loan.

  Insurance coverage should not be less than the amount noted in the loan agreement.

  Note that the value of the insured property may increase over time. The insurer may also raise the insurance premium yearly.

- ***Claims***

  The policy should have procedures for handling claims. These include information on who you should notify after a loss and how soon after a loss you should notify them. Don't accept a requirement that notice of loss must be made immediately after loss or damage occurs. Substitute the phrase "as soon as practical."

- ***Deductibles***

  Don't accept a deductible when insuring borrowed objects. Insure the full value of the object to protect the park and the lender in the event of loss. Deductibles are a feature used to cut costs. Museums commonly use them to insure permanent collections but don't use them for loans.

- ***Buy back provision***

  The policy should include a "buy-back" provision. This allows the insured to buy back a lost or stolen item that is recovered after the claim has been paid. It is the right to buy back the item from the insurance company.

  Insurance companies are flexible in meeting the needs of potential customers. Don't hesitate to ask a company to add the provisions that you want.

2. *Do I need to update an existing insurance policy?*

Review insurance arrangements for current loans at the time of renewal to determine if there is proper coverage. Update the policy if necessary.

Section VIII. Completing the Collections Management Report

A. Overview

1. *What is the Collections Management Report?*

The Collections Management Report (CMR) gives information on the size of your museum collection and collection activity during the fiscal year. The report tracks accessions, deaccessions, cataloging, and use of collections.

2. *What is the purpose of the CMR?*

The CMR allows you to see changes in your collection from year to year. It assists the regions and the Washington office in measuring program activity and managing collections. The NPS and Department of Interior (DOI) use CMR numbers to produce Servicewide statistics and departmental reports on museum collections. The NPS has successfully used CMR statistics to justify requests for funding to complete the cataloging backlog. The CMR also supplies the numbers for Government Performance and Results Act (GPRA) reporting on Strategic Plan Goal Ib2D. The goal is to increase the number of NPS museum objects that are cataloged.

3. *Who completes the CMR?*

The staff person responsible for the museum collection completes a CMR each fiscal year.

4. *When is the CMR due?*

You must complete your CMR at the end of each fiscal year. The fiscal year runs from October 1 through September 30.

You must submit an electronic copy of your CMR to the Museum Management Program (MMP) in Washington by November 1.

5. *How do I complete the CMR?*

You must complete the CMR using ANCS+. Refer to Appendix E in the *ANCS+ User Manual* for instructions on using the program. If your previous year's CMR is accurate, and you keep your databases up-to-date, ANCS+ produces an accurate CMR for you.

6. *What's the relationship between the CMR and GRPA?*

Strategic Plan Goal Ib2D measures the number of items entered into ANCS+ and submitted to the National Catalog. The certified data for Goal Ib2D, which is reported in compliance with GRPA, comes directly from the CMRs that parks and centers submit. The certified data are the number of objects cataloged. The number comes from your CMR, Section III, Part A: Total Objects Cataloged plus the number of objects that centers have cataloged during the fiscal year for your park. This is the park's certified data for Goal Ib2D.

B. Reporting Center Collections

1. *Does the CMR include the objects I have at NPS centers and non-NPS repositories, such as universities?*

Yes. Your park CMR represents your entire collection. Your park CMR shows all the museum objects that your park owns, including those that aren't physically located at the park.

If you have collections at NPS centers, the CMR that the park prepares doesn't include the current fiscal year's cataloging and other activities, such as research use, that the center has managed for your park. The MMP will send the park a summary report that includes this activity.

Note: You should have loan agreements for the objects at other facilities. Refer to Chapter 5 in this handbook for information about repository loans.

2. *Who completes the CMR for the collections I have at NPS centers?*

NPS center staff complete a CMR for each park collection at the center. The centers complete these reports each fiscal year and submit them to the MMP. Center CMRs represent only the portion of the park collection that is on loan to the center. The center report for your park tells you the number of cataloged objects, the catalog backlog, and the collection size for those park items on loan to the center. It also tells you the number of objects that the center cataloged for your park during the fiscal year.

Note: Don't double report cataloging. The park report should show only the fiscal year cataloging done at the park. Don't add the center's fiscal year cataloging to your CMR. The center's cataloging appears on the center's CMR for your park. The MMP completes a park summary report that combines the cataloging totals and sends it to the park.

3. *Who completes the CMR for collections I have at non-NPS repositories?*

In 1994, the Interior Museum Program did a survey of non-federal repositories that hold federal collections. Your region received the results of this survey with its summary CMR for FY 1999.

If…	***Then…***
your park has museum items in a non-federal repository,	you should contact the institution and include the items in your park CMR.
the non-federal repository supplies extensive collections management services to your park that includes the use of ANCS+,	you may submit a separate CMR for that institution.

Note: If the repository completes the report, it must send the CMR to you for submission.

4. *Do I need to combine a center or repository CMR with my park CMR?*

No. If the center or repository that submits a CMR cataloged collections for your park, the MMP will create a summary report for your park. The summary report combines the number of items the center cataloged during the fiscal year with the number of items the park cataloged. The MMP will send the summary CMR back to you. The MMP also produces summary reports for centers, clusters, and regions, and a Servicewide summary.

5. *What do I do with the summary report for my park?*

The MMP will send an electronic copy of the summary report directly to your park.

> ***When you receive your summary report, upload it into ANCS+ to update your baseline cataloging data. You must do this before running your next CMR.***

C. CMR Program

1. *What does the CMR program do?*

The CMR program in ANCS+ will:

- extract your last year's CMR data
- extract the current fiscal year's data from ANCS+
- allow you to adjust the data
- total your data
- maintain your CMR data from previous years
- print the CMR, Form 10-94 Rev. (Figure 4.6)
- allow you to submit the CMR files electronically

2. *Will running the CMR program change any of my ANCS+ data?*

No. The CMR extracts information from existing records but doesn't modify them. You can't change your records from the CMR. You must go to the appropriate database to make changes to your data.

3. *What if I have different collections within my park?*

The CMR allows you to extract data from different directories. You can run individual reports for each park collection that you manage. You can also run one report that combines the data for all the collections at the park under one acronym.

4. *What is the structure of the CMR?*

The CMR has three sections:

- Section I. Total Collection Summary From Previous Year (this should be your previous year's CMR data or the data that you uploaded from your park summary report)
- Section II. Collection Summary For Fiscal Year, which has four parts:
  - A. Accessions
  - B. Deaccessions
  - C. Cataloging
  - D. Use of Collections
- Section III. Total Collection Summary For All Years

5. *How does the CMR program count cataloged objects?*

The CMR program counts objects in three ways. The program:

- counts the number of individual items if an exact item count is available
- counts bulk units, such as boxes or bags, as one item, if an exact item count isn't available
- multiplies the number of linear or cubic feet by 1600 to get an item count for archival collections

D. Completing the CMR

1. *What are the steps in completing the CMR?*

To complete the CMR:

- Enter the park, year, and directories for the report you're creating, and have the program extract the data for the report.
- Adjust the numbers from the previous year's CMR, if needed.
- Review the numbers that the program has extracted in the various sections of the report. Make adjustments and add explanations as needed.
- Enter the information on who completed the report.
- Print the report and have the superintendent sign it. File the signed copy.
- Submit an electronic copy of the report by November 1 to the Museum Management Program.
- Update the CMR if you receive a park summary from the MMP.

Note: Specific instructions for completing these steps are in Appendix E of the *ANCS+ User Manual*.

2. *How does ANCS+ create my CMR?*

ANCS+ uses the numbers you reported on last year's CMR (or your summary CMR) as its baseline. The program then adds the numbers for transactions such as new accessions, deaccessions, and cataloging to those totals.

3. *Why would I need to make adjustments to my CMR?*

There are many reasons to make adjustments to your CMR. For example, you might need to adjust accession numbers if you incorrectly estimated the number of items in an accession. It's important to add notes that explain why you made the adjustments.

4. *What do I do if I think the data in my CMR are incorrect?*

ANCS+ has several verification reports that you can run to see how the program pulled the numbers for your report. Run the reports, and then adjust your data as needed, or make changes to your database and rerun the CMR. You may need some of the following information to assist you in verifying your data:

- previous year's CMR
- previous year's CMR from centers or your park summary report that includes center data
- park accession book
- park deaccession book or files (if your park uses these)
- catalog number log book (if your park uses one)
- outgoing loan records
- researcher access records

5. *What are the data fields in Section I of the CMR?*

The fields in Section I of the CMR show the data from your previous year's CMR. The fields are divided by discipline: archeology, ethnology, history, archives, biology, paleontology, and geology.

Objects Cataloged

This field includes the total number of cataloged items and the number of items cataloged by discipline. You can make adjustments to this field.

Catalog Backlog

This field includes the total number of items that need to be cataloged and the number of items that need to be cataloged by discipline. You can make adjustments to this field.

Total Collection

This field includes the total number of items in the park's collection and the total number of items in each discipline. The program automatically tallies the totals.

Notes

Use this field to enter explanations for adjustments you make.

Note: Section I of your current year's CMR should be the same as Section III of your previous year's CMR. Changes you make on your current CMR won't change your previous year's CMR. To make changes on your previous year's CMR, you must go to the report in ANCS+, modify it, and save it. If you make modifications, be sure to resubmit the CMR.

6. *What are the fields in Section II.A of the CMR?*

The fields in Section II.A of the CMR record the number of items you accessioned during the fiscal year of the report.

Objects Accessioned (By Acquisition Type)

This field includes the total number of items that you accessioned and the number of items you accessioned by acquisition type. The acquisition types are: gift, exchange, purchase, field collection, transfer, and incoming loan. The program automatically tallies the totals. You can make adjustments to this field.

Notes

Use this field to enter explanations for adjustments you make.

Objects Accessioned (By Discipline)

This field includes the total number of items that you accessioned and the number of items you accessioned by discipline. The acquisition types are: gift, exchange, purchase, field collection, transfer, and incoming loan. The program automatically tallies the totals. You can make adjustments to this field.

Notes

Use this field to enter explanations for adjustments you make.

Note: The total number of items accessioned by acquisition type must equal the total number of items accessioned by discipline.

7. *What are the fields in Section II.B of the CMR?*

The fields in Section II.B of the CMR record the number of items you deaccessioned during the fiscal year of the report.

Objects Deaccessioned (By Deaccession Type)

This field includes the total number of items that you deaccessioned and the number of items you deaccessioned by deaccession type. The deaccession types are: exchange, transfer, loss, theft, loan return, NAGPRA, conveyance, involuntary destruction, voluntary destruction, return to rightful owner, and destructive analysis. The program automatically tallies the totals. You can make adjustments to this field.

Notes

Use this field to enter explanations for adjustments you make.

Objects Deaccessioned (By Discipline)

This field includes the total number of items that you deaccessioned and the number of items you deaccessioned by discipline. The disciplines are: archeology, ethnology, history, archives, biology, paleontology, and geology. The program automatically tallies the totals. You can make adjustments to this field.

Notes

Use this field to enter explanations for adjustments you make.

Note: The total number of items deaccessioned by deaccession type must equal the total number of items deaccessioned by discipline.

8. *What are the fields in Section II.C of the CMR?*

The fields in Section II.C of the CMR record the number of items you cataloged during the fiscal year of the report.

Objects Cataloged

This field includes the total number of items you cataloged and the number of items you cataloged by discipline. The disciplines are: archeology, ethnology, history, archives, biology, paleontology, and geology. You can make adjustments to this field.

Notes

Use this field to enter explanations for adjustments you make.

Note: Include only those records that you will be submitting for this fiscal year to the National Catalog. To qualify as new cataloging, this must be the first time that you submitted the records.

9. *What are the fields in Section II.D of the CMR?*

The fields in Section II.D of the CMR record information about use of the collection.

Total Number of Outgoing Loans

This field shows the total number of outgoing loans that were active during the fiscal year. You can make adjustments to this field.

> ***Include all loans to NPS centers and non-NPS repositories. You should have a loan agreement for any items that aren't located at the park.***

Total Number of Objects in Outgoing Loans

This field shows the number of objects in outgoing loans during the fiscal year. You can make adjustments to this field.

Total Objects in Exhibits

This field shows the number of objects on exhibit during the fiscal year. You can make adjustments to this field.

Total Number of Research Requests Within Park

This field shows the total number of research requests that park staff made during the fiscal year. Include all inquiries about the collection.

Total Number of Research Requests From Outside Park

This field shows the total number of research requests that outside researchers made during the fiscal year. Outside researchers include anyone from outside the park, such as the general public, scientists, scholars, teachers, students, and journalists.

Note: The number of research requests is important. You can use these numbers to justify the need for museum staff to handle the requests. The MMP submits these numbers to DOI and Congress to show the amount of research being done using NPS collections.

Notes

Use this field to enter explanations for adjustments you make.

10. *What are the fields in Section III of the CMR?*

The fields in Section III of the CMR show the most current data for your collection. The program automatically tallies the data for this section from the data in Sections I and II. You can't make adjustments to the data in this section. If you need to adjust the data, you must make the adjustments in Sections I and II of the report.

The fields are divided by discipline: archeology, ethnology, history, archives, biology, paleontology, and geology.

Objects Cataloged

This field includes the total number of cataloged items and the number of items cataloged by discipline.

Catalog Backlog

This field includes the total number of items that need to be cataloged and the number of items that need to be cataloged by discipline.

Total Collection

This field includes the total number of items in the park's collection and the total number of items in each discipline.

> ***These numbers should be an accurate representation of all the museum objects that your park has. The park CMR should include the objects that centers and repositories store and manage for your park.***

Notes

Use this field to enter explanations about the current collection.

Noteworthy

Use this field to describe important accessions and deaccessions. If you reported losses and/or thefts, include the total value of the objects, if known. You may want to list major achievements in documenting the collection.

Be sure to include an explanation of any major adjustments that you've made. This information will print on the CMR, Form 10-94 Rev. (Figure 4.6).

Completion Information

The fields in this section of the CMR tell you the:

- name, title, and phone number of the person who completed the report
- date the report was completed
- the name of the person who approved the report

E. Submitting the CMR

1. *Do I need to print my CMR?*

Yes. Print the CMR, Form 10-94 Rev. (Figure 4.6) and have the superintendent or center manager sign it. By signing the CMR, the superintendent is certifying that it is a correct representation of the park museum collection.

Keep the signed paper copy on file with your museum records.

2. *Do I need to submit a paper copy of my CMR?*

No. Don't submit a paper copy of your CMR. You must submit an electronic copy of your CMR using ANCS+. Refer to Appendix E of the *ANCS+ User Manual* for instructions on submitting an electronic copy of your CMR.

3. *Does anyone need to review my CMR before I submit it?*

It's a good idea to have your regional/SO curator review your CMR. Some regions may require you to do this.

If you have collections at a center, the center should send you a review copy of the center's CMR for your park collection.

Section IX. Determining the Monetary Value of Museum Objects

A. Overview

1. *What kinds of value do museum collections have?*

Museum collections have scientific, cultural, historic, educational, and esthetic value in addition to their monetary value. NPS collections, in particular, have high associative value. The items in NPS collections are associated with the people, events, and natural features that the park commemorates. These types of values make many museum items irreplaceable and invaluable.

2. *When would I want to assign a monetary value to museum objects?*

Assigning monetary values to museum objects can be an important part of collections management. You can use monetary values to:

- determine replacement value for insuring outgoing loans
- document that an exchange of museum objects is equitable
- choose which objects will be controlled property
- justify protection and preservation actions
- determine loss in case of damage or theft
- confirm purchase price or the monetary value of an acquisition
- document a proposed deaccession

Note: In the case of theft, law enforcement bases the level of investigation on the monetary value of the object.

> ***You must get a formal monetary appraisal for objects in an exchange if the exchange is with individuals or institutions outside the federal government. Refer to Chapter 6 in this handbook for information on exchanges.***

3. *What types of collections don't have a monetary value?*

Curators and discipline specialists are usually reluctant to give a monetary value to most natural history and archeological collections. However, certain archeological, paleontological, and geological items have a very high monetary value in the current market. It's important to give these items a monetary value.

A monetary value may be inappropriate for NAGPRA material and other ethnographic items of cultural significance. Consult with the culturally affiliated group before giving a monetary value to these types of materials.

B. Monetary Values

1. *What is fair market value?*

Fair market value is the price that a willing buyer and seller agree to when there is no pressure to buy or sell. Both the buyer and the seller should have a reasonable knowledge of the facts about the item for sale.

Use fair market value to determine if an exchange is equal. Donors must use fair market value to determine value for tax deduction purposes.

2. *What is replacement value?*

Replacement value is the amount of money you would need to buy a similar item at full retail cost. In the case of replacement value, the owner has no intention of selling the item.

Replacement value is appropriate for most situations in a park, such as:

- placing a value on the catalog record
- determining insurance coverage for an outgoing loan
- making management decisions about the collection

Note: The cost of conservation treatment for a site-specific, irreplaceable object may be more than the fair market or replacement value. Keep this point in mind when assigning values for outgoing loans.

3. *Do all objects have a fair market and replacement value?*

No. You can usually place a fair market or replacement value on items that frequently appear in auction sales and antique stores. These types of items include furniture, porcelain, gems, firearms, coins, jewelry, and books. For other types of material it's much more difficult to place a monetary value because of a less active market. These types of material include certain natural history and archeological items such as soil and lithic samples. These materials may possess great historic or scientific value but little or no market value.

You should know the replacement and market values for the types of material in your collection.

C. Assigning Monetary Value

1. *What makes an object valuable?*

Characteristics that affect object value include:

- condition
- rarity
- authenticity
- fashion (market demand)
- age
- provenience
- documentation

- historic association
- materials
- quality

For example, a table that General Meade used as his desk at the Battle of Gettysburg has historic association. The table will have a higher monetary value because of its association.

The condition of an object often affects its value. Missing pieces or visible repairs usually decrease value. Mint condition greatly increases value.

Sometimes the fact that a collection is complete makes it valuable, such as a collection of 1939 World's Fair bric-a-brac. The completeness of the collection is more valuable than the items within it.

2. *How does a specialist determine monetary value?*

A specialist bases the value of an object on:

- knowledge of the market value (market demand)
- particular characteristics of the piece (quality)
- verification of the date and origin (authenticity)

For example, a chest made by an 18th century cabinetmaker is more valuable than a Colonial Revival piece from the late 20th century. Features such as period hardware and structural details also affect the value.

3. *Can I assign values to museum objects?*

Yes. You can assign values to museum objects for some purposes, such as cataloging, identifying controlled property, and outgoing loans. You can't assign values for exchanges outside the federal government, tax deduction purposes, or in other cases that require a formal appraisal.

4. *What should I do before assigning a value to an object?*

An accurate identification of the object is the first step in assigning value. Once you have identified the item, you may need to:

- do research
- check auction catalogs and retail prices
- get help from NPS specialists
- consult other museum professionals or subject-matter specialists

Note: Examine the object carefully and match it as closely as possible to the examples in the auction catalogs and price guides.

5. *How can I gain expertise in market values?*

Antique shows, auctions, and educational forums are good places to learn market values. Become familiar with auction catalogs, books on collectibles, and trade journals and newsletters. Price guides offer market values for many types of specialized objects such as dolls, pewter, glass, and furniture. You should check price guides at least once a year for changes in market prices. The bibliography in Appendix L of this handbook has a list of some common price guides.

6. *What types of specialists are available in the NPS?*

Within the NPS there is a wide range of specialized knowledge of material culture. A few examples include experts in 18th century furniture, military costume, Native American baskets, and photographic processes. Contact your regional/SO curator for the names of NPS specialists who can help you determine values for objects.

7. *Must the specialist come to the park to evaluate the objects?*

No. Physical observation is the best way to evaluate objects, but specialists often can give you an approximate value from photographs. You may be able to get an approximate value to put on a catalog record or for a loan through a telephone call.

Before contacting the specialist, find out as much information as possible about the object, including the date and condition. You'll need to have a detailed description of the object. Photos must show several views and features such as wear, repairs, and maker's marks.

It's important to remember that a photograph is never as accurate as seeing the original object. For example, the painted finish on a piece of furniture many not be visible in a photograph.

D. Professional Appraisals

1. *What does a professional appraiser do?*

The term "appraise" means to place a value on, rate, or judge. A professional appraiser is an acknowledged expert who places values on objects for a fee. He/she produces a written appraisal statement that includes:

- a description of the objects
- an appraised value for the objects
- the facts that are the basis for the value

Note: An appraisal must be supported by facts. For example, many appraisers use prices from recent sales of similar objects to determine a value.

2. *When do I need to get a professional appraisal?*

You need a professional, or formal, appraisal for:

- objects of extremely high value or questionable authenticity
- an exchange of museum objects with individuals or institutions outside the federal government
- updating the value of an entire collection
- objects that are beyond the area of expertise of the curator or other NPS specialists

Note: To determine the value of an entire collection, an appraiser classifies the types of items in the collection. He/she then estimates a value for each category and totals the figures. At times, an appraiser may place a value on each item and total the values.

3. *What should I look for in an appraiser?*

You need to make sure that the appraiser you hire is qualified and ethical. You want an appraiser with a good reputation who is impartial and honest. An appraiser must have no past, present, or future interest, monetary or otherwise, in the object being appraised. For example, he/she may not be a previous owner or vendor of the object.

Look for an appraiser who is an expert in the type of collections for which you want an appraisal. If the appraiser doesn't know the material, he/she may have to do additional research that will increase the cost of the appraisal. Interview potential appraisers and ask about their training, education, experience, specialties, references, and professional memberships. Ask them about the resources they use and how they determine comparisons. You'll also want to see an example of their work. Look for appraisal reports that are complete and that show an expert knowledge of the material.

A good appraiser will be objective, professional, and businesslike. He/she will produce a well-documented report that can withstand close scrutiny.

4. *How do I find appraisers?*

Appraising objects is not a licensed profession. In fact, most appraisers are commercial dealers. There are professional appraisal organizations that regulate their members and publish directories of certified appraisers. There are also some very good appraisers who aren't members of a professional organization. You may hear about them from colleagues.

To find an appraiser, contact:

- your regional/SO curator
- other NPS curators
- museum staff from other institutions
- private collectors
- insurance agents
- a professional appraisal organization

5. *What is the American Society of Appraisers?*

The American Society of Appraisers (ASA) is an international, non-profit, independent appraisal organization. The ASA tests and certifies potential appraisers, and requires periodic recertification. The ASA also maintains a directory of certified and accredited appraisers in various categories, such as fine arts. You can search the directory on their Web site, or contact them at:

The American Society of Appraisers
555 Herndon Parkway, Suite 125
Herndon, VA 20170
703-478-2228
1-800-272-8258
<www.appraisers.org>

A second group, The Appraisal Foundation on the Web at <www.appraisalfoundation.org> is an authority on the development of appraisal standards and qualifications. Look on their Web site for information on appraisers and the appraisal process.

6. *How much does an appraisal cost?*

Appraisers used to charge a percentage of the total value of the appraised objects. The Internal Revenue Service now prohibits appraisal fees based on percentages. Many appraisers charge an hourly rate plus expenses. Appraisers working with very high value objects are normally justified in charging a rate commensurate with the value of the objects.

A park may also accept donated appraisal services as long as there is no conflict of interest. Apply the same standards to someone donating services as you would to someone you are paying.

To save on costs, several parks may want to do a joint contract for the services of an appraiser. A region or cluster may also administer a contract for appraising objects at various parks.

7. *Should I do a scope of work for the appraiser?*

Yes. Services of an appraiser usually include an on-site visit, some research, and preparation of a written report. It's a good idea to send the appraiser a written scope of work that includes the:

- date the work is to be done
- fee for the appraisal
- objects to be appraised

8. *What must I do to prepare for the appraiser's visit?*

To best use the appraiser's time, make the following preparations:

- Decide whether you want market value or replacement value (see Section B above).
- Make sure that you have physical access to the objects.
- Supply adequate lighting.
- Have relevant documentation for each object readily available. Relevant documentation includes provenience information, photographs, and catalog records.

9. *What does an appraisal report include?*

A professional appraiser's written report should include the following information:

- whether the value is fair market or replacement value
- date and place the appraiser viewed the material
- description of the objects that includes, if applicable, condition, dimensions, materials, style, technique, characteristics, title, date, artist/maker, site of origin, exhibit history, previous owners, authenticity, and value
- names of consultants
- basis for the value, such as auction house prices, current state of the market
- total value
- signature and date of the report
- statement that the appraiser certifies no interest, past, present, or future in the subject property and that the appraisal fee is not contingent on the appraised values
- personal qualifications and credentials data on the appraiser

For example, the description portion of a chair's appraisal might read:

American (New York), mahogany, Chippendale side chair, claw and ball front feet, cabriole legs, slip seat, pierced back splat, arched crest rail ending in molded ears, gadroon molding along seat edge, with pine secondary wood, seat 24" X 24", overall height 60", excellent condition, circa 1760, $15,000.

See Figure 4.7 for a sample of a written appraisal.

10. *Can I request changes in an appraisal report?*

Yes. Read the appraisal report carefully when you receive it. It's easier to ask for changes in the report before you have paid for it. If the documentation is inadequate or there are factual errors, return the report immediately for adjustment. It's not appropriate to question the values, but you can question the appraiser's evidence or lack of documentation.

11. *Do I need to get more than one appraisal?*

If the material is very valuable, you may want to get more than one appraisal and average the values.

You must get two written appraisals for exchanges outside the federal government if the objects are over $20,000 in value.

E. Re-Appraising Objects

1. *How often should I re-appraise the objects in my collection?*

It's important to keep the monetary values on your objects up-to-date. Continual fluctuations in the antiques and fine arts markets mean that values don't remain current. You should periodically re-examine the values on your catalog records. This is particularly important in the event of theft. The value on the catalog record will determine the type of police investigation and whether there are criminal prosecution charges.

Be aware of price fluctuations in "trendy" objects, such as dolls and Civil War material. Price increases on these types of items can be much higher than you expect.

2. *How long is a professional appraisal valid?*

Depending on the material, a professional appraisal may be valid for years or only months. The appraisals that you use in an exchange can't be more than 60 days old. For most transactions, such as acquisitions, loans, and deaccessions, you'll want a current appraisal. For most objects in storage, you'll update the value infrequently. You'll want to update the values of exhibit items and controlled property more often.

F. Documenting Appraisal Information

1. *Where do I document appraisal information on the catalog record?*

Use the Appraisals Supplemental Record in ANCS+ to document appraisal information on the catalog record. This supplemental record allows you to track changes in value. It also links the appraisal data to the name and address of the appraiser. Refer to Section I in Chapter 3 of the *ANCS+ User Manual* for information on how to enter data in this record.

Note: Information in the Appraisals Supplemental Record doesn't appear on the main catalog record screens. Information on the acquisition value and current value for an object prints on the Museum Catalog Record, Form 10-254 and 10-254B.

2. *Where should I keep appraisal reports and other written documentation on monetary value?*

Where you file appraisal information depends on the reason for the appraisal and the number of museum files you use. You can file the information in the accession folder or the optional outgoing loan folder, deaccession folder, or catalog folder. Since most appraisals are for more than one object, you may have to make copies for multiple accession and catalog folders.

G. Appraisals and Tax Deductions

1. *Can I appraise objects for tax deduction purposes?*

No. NPS staff can't give appraisals for tax deduction purposes. Donations to the NPS are tax deductible to the extent permitted by law. The Internal Revenue Service (IRS) requires donors to get a professional appraisal for items that total over $5,000. If the donor wants to take a tax deduction, the donor is responsible for getting the appraisal.

2. *Can I refer a donor to an appraiser?*

No. You can't refer donors to specific appraisers in order to get an appraisal for tax deduction purposes. You can refer donors to the ASA and other professional associations of appraisers. You can also help donors by telling them of the IRS law that requires the appraisal.

3. *What do I need to know about the IRS and donations to my museum*

You need to be aware of the current IRS regulations on charitable contributions of property. The IRS requires that museums acknowledge a donation that totals over $5,000 in one year. You must complete the donee

collection?

acknowledgment portion of Form 8283, the IRS Noncash Charitable Contributions form. Refer to Chapter 2 in this handbook for additional information on appraising donations.

Note: Signing Form 8283 does not mean that you agree with the appraised value.

If you deaccession a donation within two years of receipt, you must report the deaccession to the IRS. Use Form 8282, the IRS Donee Information Return. You must include the donor's tax identification number. Refer to Chapter 6 in this handbook for additional information on tax liabilities and deaccessions.

It's against NPS policy to acquire an object with the intention of deaccessioning it.

Send the donor copies of all forms that the park files with the IRS. If requested, the park must give the IRS information on the donor and the donated property. Keep copies of all the forms you file with the IRS for a donation. File them in the accession folder.

Section X. List of Figures

You can print all forms, except the Report of Survey (Form DI-103) from ANCS+.

William Morris, Appraiser
American Society of Appraisers
263 Market Street
Philadelphia, PA 19097

June 7, 1999

Re: Report for Virginia Carter Smith National Historic Site
Ipswich, MA

The following is a list of museum objects that I inspected at your site on June 3, 1999. I have carefully examined each item, and, in my judgement their current replacement values are as follows.

Furniture

English Mahogany Secretary Bookcase, bracket feet, 3 long drawers below 3 short drawers, fitted interior with satinwood fronts, two glass bookcase doors with V-shaped glass divisions, arched cornice, Circa 1790 – 44"w x 93"h	$15,000.00
Mahogany Hepplewhite style Flip Top Dining Table, reproduction, 60" x 36"	1,000.00
Pair of French Walnut Regency style Round Tables, marble top, shelf below, 36" dia. Circa 1900	2,500.00

Sterling Silver

Stuffing Spoon, feather edge, Old English Pattern – Beaver Crest Hallmarked – London 1810	500.00
Pair of Salt Spoons, Fiddle Pattern, Hallmarked London 1810	250.00
Total value:	$19,250.00

The foregoing appraisal is made with the understanding that the appraiser assumes no liability with respect to any action that may be taken on the basis of this appraisal.

The appraiser hereby certifies that he has no interest, present, past or contemplated, in the subject property, and that his fee for this appraisal is not contingent upon the values certified.

Yours very truly,

William Morris

Chapter 5: Outgoing Loans

BASIC REQUIREMENTS FOR NPS OUTGOING LOANS

Outgoing loans must further the NPS mission of preservation, education, and research.

You may loan objects to:

- educational, cultural, or scientific institutions
- service-providing organizations, such as conservation labs or exhibit preparation firms
- NPS centers and non-NPS repositories for collections management

Loans to private individuals are prohibited.

Make sure that the borrower can insure, secure, and transport loaned objects properly.

All loans must have a specific termination date. Limit repository loans to 10 years with a renewal option. Limit all other loans to 3 years or less.

Enter all loans into ANCS+. Print the loan forms from ANCS+.

Record condition for all objects in a loan. Recording object condition for loans to repositories is optional.

Complete an Outgoing Loan Agreement, Form 10-127 Rev. for all loans, and attach the Conditions for Outgoing Loans, Form 10-127a.

The superintendent must approve all loans and sign the loan agreement.

Store all loan documents in an optional loan folder or the accession folder.

Track loans by ending date or loan extension date.

CHAPTER 5: OUTGOING LOANS

A. Overview

1. *Why does the National Park Service make outgoing loans?*

Outgoing loans of museum collections further the National Park Service (NPS) mission of preservation, education,and research. Parks also make outgoing loans to repositories for the purposes of long-term collections management and storage. Outgoing loans give borrowers temporary custody, not title.

2. *Who must follow this chapter?*

The staff person responsible for the museum collection must follow this chapter when loaning museum objects. These procedures ensure that the collections are appropriately managed and that the NPS and the borrower are legally protected.

> ***Refer to Chapter 2, Accessioning, in this handbook for procedures on incoming loans.***

B. General Information on Loans

1. *For what purposes may I lend museum objects?*

You may lend objects from the park museum collection for purposes such as

- exhibition
- research
- scientific or exhibit preparation
- analysis
- photography
- conservation or other requested services
- long-term collections management and storage

2. *How long may I lend museum objects?*

If you are lending...	***Limit the loan to...***
to NPS and non-NPS repositories	10 years
to any other institution or organization	3 years

All loans must have a specific termination date. If a borrower requests an extension, you may grant it if you follow Section F.3 in this chapter.

Repository loans remain at the designated repository until you ask for them back, but you must renew them every ten years. The repository must return the loan if it is unable to meet the terms of the agreement.

3. *To whom may I lend museum objects?*

You may lend museum objects to several different types of recipients:

- educational, cultural, or scientific institutions (for example, NPS park museums, non-NPS museums, historical societies, universities, research institutions, and other organizations)
- service-providing organizations (for example, NPS and non-NPS conservation and analytical laboratories or exhibit preparation firms or contractors providing these services)
- NPS centers for collections management (including cataloging and storage)
- non-NPS repositories for collections management (including cataloging and storage)
- other NPS divisions, offices, and units

You may not lend museum objects to private individuals.

4. *Must I catalog objects before lending them?*

Catalog the following objects before you lend them:

- objects lent for exhibit or exhibit preparation
- objects lent for research or analysis (if you don't catalog them, at least document them adequately—for example, in a field specimen log)
- objects lent for photography or conservation (if items need conservation treatment for identification purposes, document these objects adequately—for example, in a field specimen log)
- objects lent to repositories, unless the purpose of the loan includes cataloging

5. *Who makes the loan?*

As the staff person responsible for the museum collection, you must review all potential loans and make recommendations to the superintendent.

The superintendent approves or disapproves all loans.

Once the superintendent approves the loan, you make all arrangements.

Consult the regional/support office (SO) curator before making loans to repositories. Some regions may have a regional mandate to send archeological or natural history collections to a specific repository.

For loans to non-NPS repositories, send an informational copy of the loan agreement to the regional/SO curator.

6. *How do I document a loan?*

You must use the Outgoing Loan Agreement, Form 10-127 Rev. (Figure 5.3) to document loans. Attach the Conditions for Outgoing Loans, Form 10-127a (Figure 5.4) to the agreement. The outgoing loan agreement is a formal, legal agreement that transfers custody for a specific period of time. This agreement protects both parties by specifying the conditions of the loan.

Refer to Section D in this chapter for more information on the outgoing loan agreement.

C. Outgoing Loan Considerations

1. *May I make third-party loans?*

No. The NPS doesn't permit third party loans. You may lend only the objects the museum owns.

Your superintendent may grant NPS repositories blanket approval to make third party loans for routine conservation or research. Note this authority in the additional loan conditions section of the loan agreement.

Your superintendent may grant NPS conservation treatment facilities the authority to initiate third party loans for contract conservation treatment. Note this authority in the additional loan conditions section of the loan agreement.

2. *Are there special procedures for loans between parks?*

Your park as the lender must follow the outgoing loan procedures in this chapter.

If your park is the borrower:

- treat the loan as an incoming loan
- use the lending park's outgoing loan agreement in place of an incoming loan agreement
- follow all other incoming documentation procedures as outlined in Chapter 2 of this handbook
- place the accession number assigned to the incoming loan on the lender's outgoing loan form

3. *Do I need a special agreement for loans to non-NPS repositories?*

No. Use the Outgoing Loan Agreement, Form 10-127 Rev. (Figure 5.3) to cover the objects on loan to the non-NPS repository.

If…	***Then…***
you are paying the repository for collections management services,	in addition to the loan agreement, you'll need a contract for the services.
the park will have a sub-stantial involvement in the collections management activities, such as park staff on site assisting the repository,	you may need to have a cooperative agreement.

Refer to Director's Order #20: Agreements for information on cooperative agreements.

4. *Must I inventory objects on outgoing loan?*

Yes. Objects on loan are subject to NPS inventory procedures as outlined in Chapter 4. During the first year of a loan, the loan agreement serves as verification for inventory purposes. After the first year, the borrower must make objects available for you to inventory. The borrower may verify in writing or by phone the presence and condition of objects in your inventory.

In addition to inventory, all loans should include a regular monitoring schedule.

5. *Are objects on loan subject to NPS collections management policies?*

Objects on loan remain subject to NPS museum management policies. Federal policies and mandates governing NPS museum collections take precedence over state and local laws and regulations.

Non-NPS repositories must meet National Park Service standards for management of museum collections. These standards are outlined in the NPS *Museum Handbook*, Part I *(MH-I)* and this handbook. Standards for storage of federal archeological objects are outlined in 36 CFR Part 79 "Curation of Federally Owned and Administered Archeological Collections." Systematic collections must remain intact.

Non-federal repositories must give you information each year for the park's Collections Management Report (CMR). Refer to Section VIII of Chapter 4 in this handbook for information on non-federal repositories and the CMR.

6. *Where do I get the forms for making outgoing loans?*

Use ANCS+ to print blank or completed outgoing loan forms. Use acid-free paper to print the forms.

Acid-free paper is available from the Supply and Equipment Program of the Museum Management Program (MMP), National Center for Cultural Resources.

7. *What are some things to consider before making a loan?*

Consider loan requests on a case-by-case basis. Be consistent by setting up written park-specific guidelines for using the collection. Use the following questions to help you determine whether a loan serves the public interest.

- Can the borrower meet the conditions of the outgoing loan agreement?
- Does the loan provide greater public, scholarly, and research access to the park's museum collection?
- Has the borrower asked to handle objects during lectures or demonstrations? The superintendent must approve the request in writing and include any necessary instructions (for example, special handling techniques).
- Is the loan being requested for entertainment or social events (for example, tables used for cocktail parties)? Decline any such request.
- Will you be able to monitor the loan?
- Can the object withstand travel? Does it need any special handling, packing and shipping? If there are questions about an object's stability, get advice from a conservator.
- Is the object one of a kind or otherwise so significant that it should not leave your park?
- Is the object subject to any restrictions that might prevent a loan?
- Have you consulted with affected groups?

8. *Are there special requirements for loaning threatened and endangered species?*

Yes. There are special requirements for loans outside the U.S. You don't need a permit to loan threatened or endangered species across state lines. You do need an export permit to loan threatened or endangered species outside the U.S. Depending on the species, you must contact the Fish and Wildlife Service or the National Marine Fisheries Service for a permit. You'll also need to get an import permit to cover the loan return.

For information on permits, contact:

Fish and Wildlife Service
Office of Management Authority
4401 North Fairfax Drive
Room 430
Arlington, VA 22203
800-358-2104

9. *Must I require insurance for outgoing loans to U.S. Government agencies?*

No. Waive the insurance requirement for outgoing loans to U.S. Government agencies and bureaus (other than the Smithsonian Institution). The U.S. Government is self-insured. The Smithsonian Institution will insure your objects on their insurance policy.

To cover any loss to the park, add the following statement under Additional Loan Conditions on the loan agreement:

"The borrower is responsible for any damage or loss and must reimburse the National Park Service for the cost of conservation, replacement, or reduction in value."

10. *Should I require non-federal borrowers to insure the objects in an outgoing loan?*

Insurance is negotiable. You should require insurance for most outgoing loans. The borrower should give you a certificate of insurance that names the park as an additional insured.

You are responsible for updating the value of the objects on loan, if necessary, for insurance purposes.

11. *Should I require non-NPS conservators to have insurance?*

Many conservators carry insurance. As part of the contract, you can require conservators to cover the cost of insurance while an object is in their care.

D. Documenting Loans

You are responsible for documenting the loan transaction to ensure accountability for the objects. You, as the lender, must maintain all the original documentation.

For an overall view of the loan process, refer to Flow Chart Figure 5.1.

1. *Loan Requests and Consultations*

Loans are requested and arranged in advance. You may send a sample loan agreement and conditions to a potential borrower.

If a NPS repository provides you with written procedures for loans, follow them.

If your park has a collections advisory committee, have it review the potential loan. You may also want to consult with the regional/SO curator before negotiating a loan.

2. *Facility Reports*

You must be sure that a borrower can adequately care for the loan. You may request the borrowing institution to provide written evidence that it can insure, secure, and transport loaned objects properly. You may ask for a facility report before approval of a loan. A facility report allows you to determine the risk of lending an object. A facility report is advisable for loans of controlled property or other sensitive material. The Registrar's Committee of the American Association of Museums publishes a standard facility report. You may get a copy from the MMP, National Center for Cultural Resources.

Waive facility reports for NPS repositories and NPS conservation-treatment facilities.

As part of the loan, you may require non-NPS repositories to complete the NPS Checklist for Preservation and Protection of Museum Collections. Use a paper copy of the Checklist not the automated version. Don't enter the data in ANCS+.

You can print a blank copy of the Checklist from ANCS+.

3. *Condition Reports and Photographs*

You may want to complete an object condition report to document an object's condition before you lend it. Send a copy of this report to the borrower and use it on return of the object to check its condition. The Object Condition Report, Form 10-637 (Figure 5.6) in this chapter is ***optional***. You may report condition on Form 10-637 or a park-specific document.

Note: ANCS+ will complete part of Form 10-637 using the condition data from the catalog record. Refer to Chapter 5 in the *ANCS+ User Manual* for information on which fields map to the form.

If you don't use an object condition report, note each object's condition on the list of objects that you attach to the loan agreement.

You don't need to do an object condition report for loans to repositories.

> ***You should photograph all objects you lend except for loans to repositories.***

4. *ANCS+ Loans Out Associated Module*

Enter the loan in the ANCS+ Loans Out associated module. This module allows you to track the loan, print all loan forms, and attach loan information to the catalog records. Refer to Section IV in Chapter 4 of the *ANCS+ User Manual* for information on using the module. Use of this module is essential for keeping your annual Collections Management Report (CMR) accurate.

5. *Loan Number*

Give each loan a number and put that number on every loan document. A loan number has three parts:

- L (indicates outgoing loan)
- calendar year (four digits indicating the calendar year, such as 1995)
- outgoing loan transaction number (sequential transaction number within the calendar year, such as 12 for the twelfth outgoing loan transaction in the calendar year)

For example, L.1995.2 means the second loan made in calendar year 1995.

6. *Loan Agreement*

Loan Agreement
You must complete an Outgoing Loan Agreement, Form 10-127 Rev. (Figure 5.3), for all outgoing loans. You cannot substitute a non-NPS form for Form 10-127. The loan agreement includes:

- a detailed list of objects in the loan
- the purpose for the loan
- starting and ending dates
- the addresses and contact names for both parties

- a credit line
- your responsibilities and the borrower's
- conditions of physical care
- shipping and handling information
- insurance information
- specific conditions concerning the loan

You can print a completed outgoing loan agreement from ANCS+. Print two copies of the agreement on acid-free paper.

Your superintendent and the borrower must agree to the loan conditions and sign the form before the loan occurs. Some institutions have incoming loan forms that the superintendent must sign. In the case of conflict between the two forms, the lender's form (Form 10-127 Rev.) controls.

See Figure 5.2 for instructions on completing and sending the outgoing loan agreement.

As a service to your park, an NPS repository may prepare the loan agreement for your superintendent to sign.

7. *Attachments to the Loan Agreement*

Attach a list of objects and the conditions for the loan to the loan agreement.

List of Objects
For loans involving several objects, attach a List of Objects, Form 10-417 (Figure 5.5) to the loan agreement. You may create a park-specific document to use in place of Form 10-417. The list, which serves as an inventory of objects on loan, should include:

- catalog number
- accession number
- item count or quantity
- object name
- description
- condition
- value (if appropriate)
- space for comment

For loans to repositories, you may use a field or laboratory inventory instead of a list of objects. You don't have to include value for loans to repositories.

Note: You can print a completed List of Objects, Form 10-417 (Figure 5.5) from ANCS+.

Conditions

Attach the Conditions for Outgoing Loans, Form 10-127a (Figure 5.4) to the loan agreement or cooperative agreement. If additional conditions are necessary, note them in the additional loan conditions section of the outgoing loan agreement. Additional conditions include requirements such as special restrictions on light levels.

8. *Signing the Loan Agreement*

The superintendent and the borrowing official are responsible for meeting the terms of the loan agreement.

Your superintendent signs two copies of the loan agreement and sends them (with attachments) to the borrower. The borrower signs both copies, returns one copy to the park, and keeps the other copy.

For loans to repositories, the repository chief or institution director must sign the loan agreement.

For loans to non-NPS repositories, send an informational copy of the loan agreement to the regional/SO curator.

9. *Loan Folder or Accession Folder*

Store all documents generated by the loan in an acid-free, straight (full) tab cut folder, or in an accession folder. Whatever folder you choose, use it consistently. Refer to Chapter 2 in this handbook for information on the accession folder.

Outgoing Loan Folder

- Store all original documents associated with a loan in this folder. Mark the loan number in the upper left corner of the folder and the termination date in the upper right corner of the folder.
- Insert the optional Outgoing Loan Folder Cover Sheet, Form 10-640 (Figure 5.7). Print this form from ANCS+ on acid-free paper.
- File the folder by loan number or termination date.
- Store the folder in a separate, marked section of your accession filing cabinet.
- Copies of the loan agreement may be added to the catalog or accession folder.
- Keep the folder and contents after the loan ends.

Accession Folder

- File all original paperwork for the loan in the accession folder.
- If multiple accessions are involved, file the original paperwork in the accession folder of the lowest accession number.

File copies of the loan agreement in each subsequent accession folder.

10. *Additional Documentation*

Update the Object Status, Status Date, and Location fields in ANCS+ to show what objects are on loan.

Complete a temporary removal slip for all objects on loan, except for repository loans. Place the removal slip in the object location noted on the ANCS+ catalog record.

Note: Your annual CMR includes the number of outgoing loans and the number of items on loan.

E. Processing Loans

You are responsible for processing the loan. This may include:

- arranging for conservation work (you may arrange with the borrower to cover conservation costs)
- making sure that objects are safe for travel
- making sure that there is insurance coverage, if required
- coordinating packing and shipping arrangements
- completing any additional paperwork

The borrower is responsible for loan-related expenses, unless otherwise arranged in advance. If the loan is for the benefit of the park, such as a loan for conservation or photography, the park pays the cost.

1. *Insurance*

See that non-NPS borrowers get their own insurance coverage. They should give you a certificate of insurance that names the park as an additional insured, unless you waive the insurance requirement.

Insurance requirements are waived for all loans to NPS parks, NPS repositories, and NPS conservation facilities.

Refer to Section VII in Chapter 4 of this handbook for information about insurance policies.

2. *Packing*

Make sure that all objects are packed securely and adequately. Use professional packing and shipping companies if you lack the training, facilities, or materials to pack museum objects.

Pack and label containers according to the *MH-I*, Chapter 6. If non-NPS staff do the packing, oversee the work. The borrower should keep the

original packing materials, if possible. The borrower packs the objects for return in the same way they arrived or improves the packing.

Enclose an inventory of objects and a return address in each container. Include the catalog number and condition of each object or enclose condition reports. Also include any special instructions for unpacking and repacking. Under separate cover send a copy of the inventory.

Unless otherwise noted on the loan agreement, you pack the objects and provide the packing materials for loans to repositories and NPS conservation facilities.

3. *Shipping*

Don't ship the objects until you have a signed loan agreement from the borrower.

The borrower arranges the shipping with your approval and pays all shipping costs. You may arrange for shipping and charge shipping costs to the borrower.

A shipping list is useful to the borrower and the shipping company. Don't put monetary values or historical information on shipping lists. You may use the postal system to mail certain objects that are sturdy and within the specified size limits. Use certified or registered mail with a return receipt requested. Don't use the postal system for items of high intrinsic or monetary value.

Unless otherwise agreed to in writing, you are responsible for shipping costs and the safe transportation of museum objects to repositories and NPS conservation facilities.

Refer to the *MH-I*, Chapter 6: Handling, Packing and Shipping Museum Objects.

4. *Receipt for Property*

Send a Receipt for Property (DI-105) to the borrower under separate cover. The borrower signs the receipt and returns one copy to you.

A memo or electronic mail message may also be used to acknowledge receipt of objects.

F. Tracking Loans

You are responsible for tracking all outgoing loans. Keep up-to-date loan agreements for all outgoing loans.

1. *Loans in ANCS+*

Use ANCS+ to track your loans by return date. ANCS+ has all the required fields for loan data and allows you to sort your loan data by return date.

Refer to Section IV of Chapter 4 in the *ANCS+ User Manual* for information on using the Loans Out associated module.

2. *Monitoring and Recall*

Track loans by date to ensure that you get objects back on time.

Reserve the right to inspect the objects on loan at any time. All loans should include a regular monitoring schedule.

You may end a loan with 30 days notice to the borrower. You may end a loan without notice if an object is at risk.

The borrower must give at least 30 days written notice to cancel a loan before the termination date.

3. *Extensions*

Tell the borrower when a loan is coming due. If the borrower requests a loan extension, review it and make a recommendation to the superintendent. All loan extensions require the superintendent's approval.

Give an extension a specific ending date, not to exceed three years. Loans to repositories may be extended for up to ten years per extension.

You may ask the borrower to update the standard facility report when negotiating a loan extension.

The borrower must extend insurance coverage, if applicable. The borrower gives you a copy of the certificate of insurance for the extension period. The certificate of insurance must name the lending park as an additional insured.

Prepare the loan extension documents. Use either:

- the optional Outgoing Loan Extension, Form 10-641 (Figure 5.8)
- a memorandum to extend the loan
- a new loan agreement, using the same loan number

Note: You can print a completed Outgoing Loan Extension, Form 10-641 from ANCS+. Print two copies of the extension form on acid-free paper.

If a memorandum is used, it must include the same information and signatures as the loan extension form. Keep the original loan number but update other data.

The borrower should sign and return the extension document at least thirty days before the original termination date.

The superintendent signs the extension document upon its return and sends a copy to the borrower. Keep a copy with the loan documentation.

4. *Loan Termination*

If the borrower returns part of a loan before the ending date, note the return date on the outgoing loan agreement or in the comment column on the list of objects. Continue to track partially returned loans until you have all objects back. Keep the original loan number for tracking purposes.
The loan transaction is complete when all objects in the loan have come

back to you Examine the objects for any change in condition upon return of the loan. Contact the borrower immediately if there are problems. Record any changes in condition on the Object Condition Report Form 10-637 (Figure 5.6) and the catalog record. Change the location and object status on the catalog records.

Your superintendent signs the loan agreement acknowledging receipt of all objects. You then send a copy to the borrower. The original stays in your park.

G. Special Procedures for Lending Objects to Repositories

1. *Park Responsibilities*

Loans to repositories are made to manage collections or store them. Consult with the regional/SO curator before sending objects to a NPS center or non-NPS repository. The superintendent should send a written request asking the center or repository to accept the collection as an incoming loan. The center or repository should respond in writing.

In addition to the loan agreement, send the following with the objects you lend to a repository:

Inventories
For cataloged objects, provide an inventory or computer-generated list that includes catalog numbers, item quantification, object name, description, condition, and value (if appropriate).

For uncataloged objects, include field or laboratory-level inventories, or both, provided by the investigator. Produce an updated inventory when cataloging is completed. Include field specimen numbers, NPS catalog numbers, item quantification, object name, description, condition, and value (if appropriate).

Documentation
Accession all objects in the loan.

Provide copies of all appropriate documentation in the accession file, catalog folder, and any supplemental database. Keep all original documentation on ownership.

Include all associated records, such as field and lab records, maps, and photos, as defined in Appendix D of this handbook.

Conservation
Include a list of known conservation problems (for example, rust, mold, weak repairs). Supply copies of object treatment reports or conservation surveys for any prior conservation treatment.

2. *Repository Responsibilities*

If the repository is to catalog the objects, it must use ANCS+ or an export format compatible with ANCS+. The repository must give the park electronic copies of catalog records. Optional paper copies of catalog records can be printed at the National Catalog, Harpers Ferry, WV.

The repository must place any information added to a natural history specimen label on a new label. The old label is kept with the specimen.

A complete inventory and all associated original documents must accompany returned loans.

H. Special Procedures for Lending Objects to NPS Conservation Treatment Facilities

1. *Request for Treatment or Analysis*

You can make a request to a NPS conservation facility by e-mail, phone, or letter. You no longer need to use the Object Treatment Request (OTR). Complete the loan agreement after the facility has reviewed and accepted your request.

2. *Exhibit Plans*

Exhibit projects often include many objects requiring treatment, mounting, or other exhibit preparation. You and/or the conservator prepare a list of objects for conservation, mounting, or other exhibit preparation. This list may be used in place of the List of Objects, Form 10-417 (Figure 5.5).

You may send the objects in batches to the conservation treatment facility over time. You and/or the conservator determine whether objects can withstand shipment. Use a single loan agreement to cover all the shipments needed for an entire exhibit. Document each shipment to and from the treatment facility with a receipt for property.

3. *Documentation*

Provide the facility with paper or electronic copies of catalog records for the objects.

The NPS conservation facility provides you with copies of all reports of examination and treatment.

I. LIST OF FIGURES

\+ Print these forms from ANCS+.

***** You must use the Outgoing Loan Agreement (Form 10-127 Rev.) and the Conditions for Outgoing Loans (Form 10-127a) for all outgoing loans.

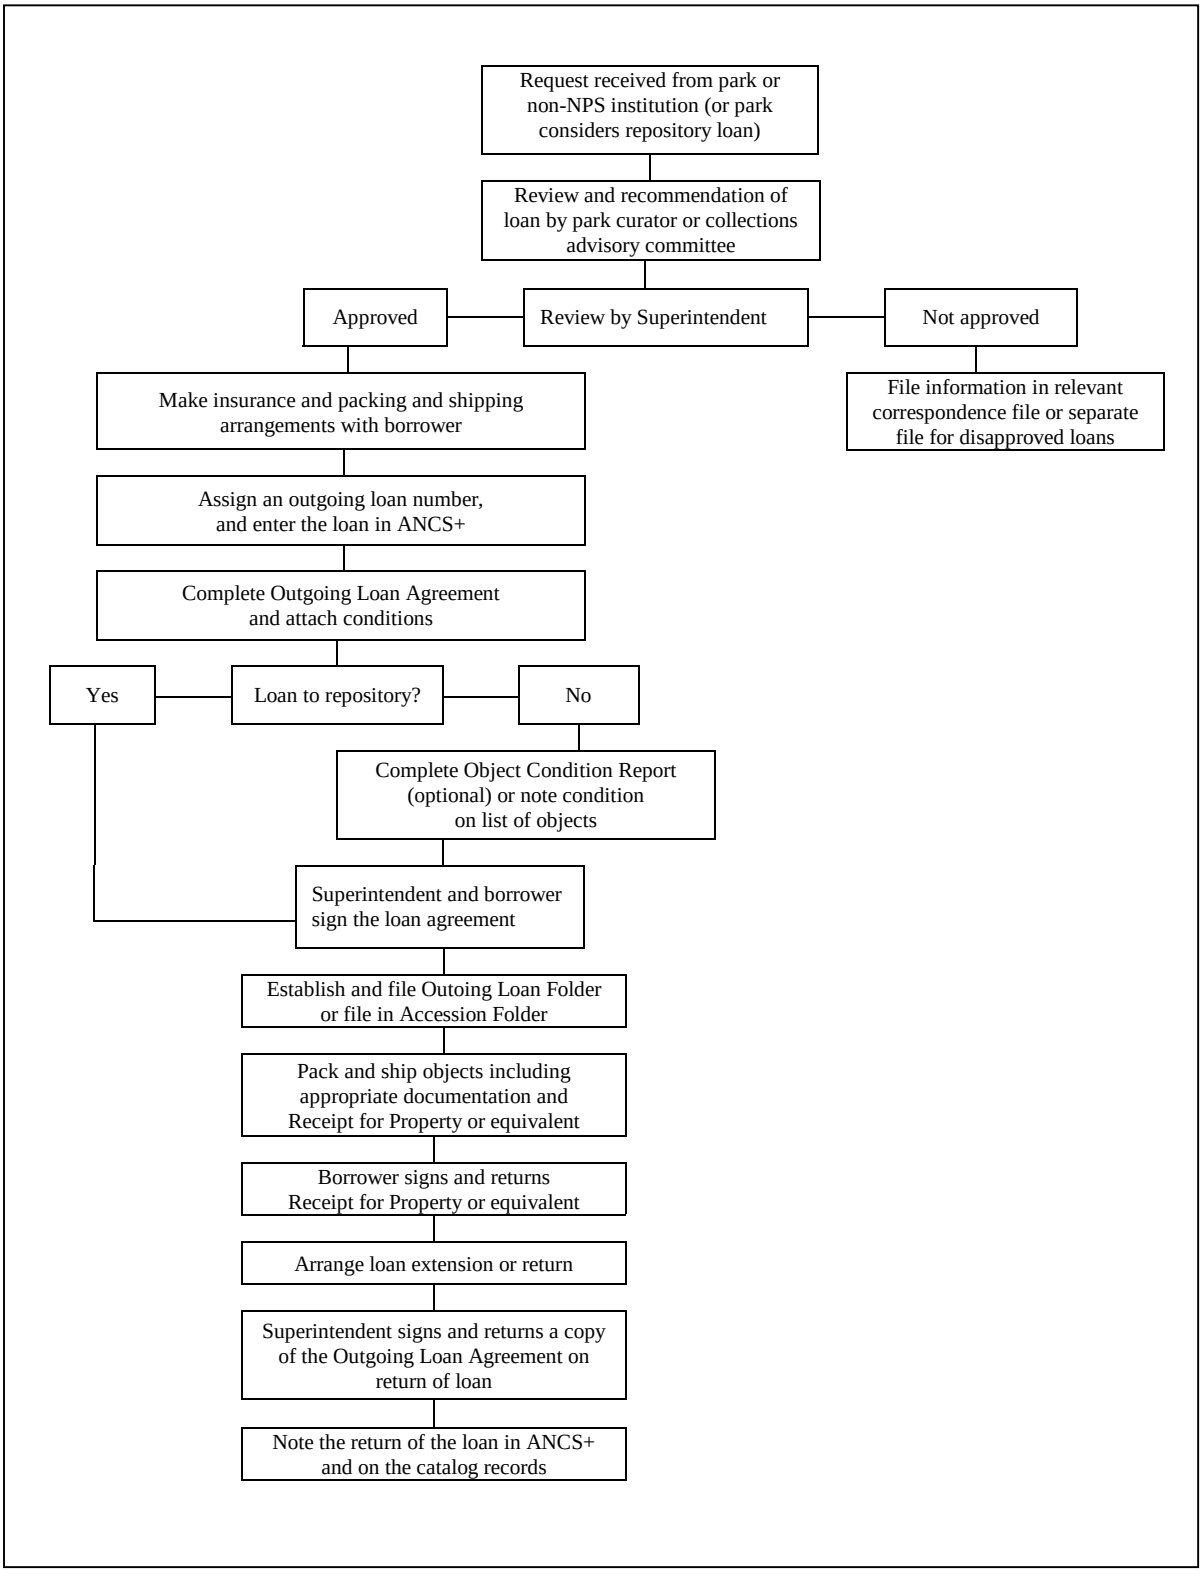

Figure 5.1. Flow Chart for Outgoing Loans

INSTRUCTIONS FOR OUTOING LOAN AGREEMENT

Outgoing Loan Number	Enter the outgoing loan number. Example: L.1993.12. L (outgoing loan indicator), calendar year (four digits indicating the calendar year), outgoing loan transaction number (sequential transaction number within the calendar year).
Lender	Enter the name of the park.
Lender Address	Enter the park's street/box, city, state, zip code, telephone number, and FAX number.
Lender Shipping Address	Enter the shipping address of the park, if it is different from the mailing address.
Superintendent (Lending Park)	Enter the name of the superintendent or center chief, for authorization and contact purposes.
Borrower (Institution)	Enter the name of the institution that is borrowing the material (for example, University of Arizona). Indicate whether it is a NPS unit or a non-NPS institution.
Borrower (Department)	Enter the department or division of the borrowing institution (for example, Department of Anthropology), where applicable.
Borrower Address	Enter the borrower's street/box, city, state, zip code, country (if outside USA), telephone number and FAX number.
Borrower Shipping Address	Enter the shipping address of the borrower, if it is different from the mailing address.
Responsible Official (Borrowing Institution)	Enter the name and title of the responsible individual [or agent] of the borrowing institution (for example, G. A. Lindsay, Director).
Purpose of Loan	Indicate the purpose of the loan (exhibit, study, conservation, exhibit preparation, collections management, storage, or other). If other, explain.
Credit Line	Record the credit line as it is to appear in exhibit graphics, publications, or other media.
Objects in Loan	List the objects in the loan. Include the catalog number, accession number, object name, item count or quantification, description, condition, and insurance value (if appropriate). For loans involving several objects, attach the List of Objects (Form 10-417) or a computer-generated list.
Initiation Date	Record the date on which the agreement is to go into effect.
Termination Date	Enter the termination date of the loan. Loans to repositories cannot exceed ten years. All other loans cannot exceed three years.
Insurance	Indicate whether the insurance will be waived or carried by the borrower. Enter the name of the insurance company and the policy number. Indicate if the certificate of insurance or waiver of subrogation has been received. Refer to Chapter 4 of this handbook for information on insurance.
Packing and Shipping	Indicate who will be responsible for packing the objects. Provide information on the method of shipping for sending and returning the loan. If a shipping company is used, include the name, address, and phone number. Indicate who will be responsible for shipping charges.
Loan Conditions	Indicate whether a facilities report is required. Include any other additional conditions. Attach a copy of the Conditions for Outgoing Loans (Form 10-127a).
Signature and Date Lines	Enter the name of the superintendent and the borrowing official. Both parties must sign and date the agreement. The repository chief or institution director must sign the agreement for repository loans.
Return Status (Partial or Complete)	Indicate whether the entire loan has been returned. If part of the loan has been returned, enter date of return for each object returned.
Extension Information	For extended loans, enter the new termination date.
Return Signature	Enter the name of the superintendent. The superintendent must sign and date the agreement when the entire loan is returned.
Sending and Returning the Loan Agreement	The superintendent signs two copies of the loan agreement and sends them to the borrower. The borrower signs and returns one copy to the park and keeps the other signed copy. The park does not release the objects until the signed agreement is received. On return of the entire loan, the superintendent signs and dates the original agreement and sends a copy to the borrower.

Outgoing Loan Number

Conditions For Outgoing Loans

GENERAL

1. It is the Borrower's responsibility to become familiar with stipulations covering this transaction. Responsibility for meeting the terms agreed to in this loan agreement remains with the borrowing institution and authorized agent.

2. No loans will be made until all necessary documentation has been received by the lending park, and the Outgoing Loan Agreement has been signed by both parties.

3. The borrowing institution is not permitted to make third party loans. Such loan requests shall be treated as an independent outgoing loan and negotiated between the lending park and the second borrowing institution. Unless specifically agreed to in writing on the attached loan agreement, the borrowing institution is not permitted to make third party loans. Such loan requests shall be treated as an independent outgoing loan and negotiated between the lending park and the second borrowing institution.

4. Borrower agrees to incur all expenses relating to this loan unless otherwise noted.

5. Borrower agrees not to use the loaned museum objects/specimens/archival items (henceforth "loaned items") for commercial or other revenue-generating purposes without the prior written authorization of NPS.

6. If the loaned items are to be exhibited, cited, or illustrated in a publication, or otherwise made public, the credit line must cite the following elements and conform to any additional specifications in the loan agreement: "National Park Service," park name, control number (such as a catalog or negative number), object/specimen name, and original creator (if applicable, e.g. artist name). The NPS is not responsible for the quality of exhibits, publications, or interpretive or educational programs that may feature NPS loaned items.

7. The Borrower shall provide to Lender a copy, at no cost, of any publication or report featuring the loaned items.

8. The Borrower, in the event of a change of address, shall provide the NPS with written notification thereof within 15 days of such change.

9. Federal laws and policies governing NPS museum collections take precedence over state and local laws.

10. The borrower agrees to care for loaned items in a manner consistent with NPS policies and procedures as stated in *Director's Order #24: NPS Museum Collections Management* and in NPS *Museum Handbook* (http://www.nps.gov/policy/DOrders/DOrder24.html) (http://www.cr.nps.gov/museum/publications/index.htm).

COPYRIGHT AND PHOTOGRAPHY RESTRICTIONS

1. Loaned items are subject to restrictions outlined in the copyright law of the United States (Title 17, U.S. Code). Borrower will honor copyright restrictions as they apply to the loaned items and will ensure that the appropriate copyright releases are obtained.

2. Unless otherwise agreed to in writing, no reproductions are permitted by the Borrower except photographic copies for condition reports, documentation, damage, educational, and publicity purposes related to the stated purpose of this loan.

INSURANCE

1. All loaned items shall be continuously and fully insured at the Borrower's expense for the amount specified on the loan agreement, unless waived and so noted on the agreement. Insurance shall be wall-to-wall, and provide coverage against all risks of physical loss or damage from any external causes while in transit and on location for the entire duration of the loan. Borrower shall provide proof of insurance to the lending park. The NPS must be notified in writing at least 20 days prior to any cancellation or meaningful change in the Borrower's insurance policy. If additional coverage is taken by the Borrower, the lending park must receive from the Borrower a copy of the certificate of insurance naming the lending park as an additional insured.

2. Any lapses in coverage or any failure to secure insurance and/or any inactions by the Lender regarding notice will not release the Borrower from liability for loss or damage.

3. Dollar values provided are confidential and are for insurance purposes only. The NPS reserves the right to increase the amount of insurance coverage required on the loaned items, if reasonably justified.

4. If insurance is waived, the Borrower agrees to indemnify any and all loss or damage to the loaned items occurring during the course of the loan, except for loss or damage resulting from inherent vice, war, and nuclear incident.

5. Borrower agrees to waive all claims and recourse against the NPS for loss or damage to persons, museum collections, or loaned items arising from this agreement. Borrower agrees to defend, indemnify, and save harmless the NPS from all liability, loss, cost, or obligation on account or arising out of any injury to any person or property of any kind, from any cause whatsoever, in any way connected with Borrower's use of said property, including acceptance and redelivery thereof.

CONDITION, ALTERATION, AND CONSERVATION

1. Each loaned item is considered to be in good condition unless otherwise noted.

2. Loaned items may not be cleaned, repaired, retouched or altered in any way without the express permission of the Lender.

3. Loss, damage or deterioration must be reported to the lending park. If damage occurs, NPS staff will arrange any necessary conservation treatment. The Borrower or its insurance company is liable for all costs resulting from damage, including the cost of conservation, and for any reduction in value or replacement.

HANDLING AND CARE

1. All physical care (e.g., handling, storage, exhibition) should meet or exceed the standards set down in the NPS *Museum Handbook*, Part I.

2. Loss or damage, whether in transit or on the borrower's premises, and regardless of who may be responsible, must be reported immediately. Photographs and documents of the damage (e.g., condition report) with dates, names, and other details of the occurrence (e.g., damage reports) must be sent to the lending park within 5 working days of the loss or damage.

January 2006

Figure 5.4a. Conditions for Outgoing Loans (Form 10-127a)

US Department of the Interior
National Park Service

Outgoing Loan Number

Conditions For Outgoing Loans (Continued)

3. The Borrower and all users of the loaned items have received the U.S. Department of the Interior (DOI) Notice of Potential Hazard in Museum Collections (DI-3320). If the Borrower provides access to the loaned items to users other than those identified in this loan agreement, the Borrower is responsible for providing this DOI notification to the users and returning acknowledgement of notification to the Lender.

SECURITY AND ENVIRONMENTAL CONTROLS

1. Borrower must provide, at all times, adequate security in order to protect loaned items against risk of damage, loss or deterioration due to theft, vandalism, fire, smoke, and water. Adequate protection against insects, vermin, fungi, mold and pollutants must be provided. Conditions should comply with museum standards and the NPS *Museum Handbook*, Part I.

2. Loaned items must be protected, at all times, against damage caused by exposure to direct sunlight, ultraviolet light, excessive humidity, or proximity to heating or cooling sources. Temperature and relative humidity levels should be monitored on a daily basis. Levels are controlled to minimize short-term fluctuations and to avoid harmful extremes. Conditions should comply with museum standards and the NPS *Museum Handbook*, Part I.

3. If these conditions cannot be met, the lending park must be advised in writing. The amended conditions should be attached to the loan agreement and noted in the additional conditions on the face of the attached agreement prior to the completion of the agreement.

PACKING AND SHIPPING

1. Packing and transportation must be by safe methods designated and approved in advance by the Lender and noted on the attached agreement. Borrower must comply with shipping and packing instructions provided by the Lender.

2. Lender will pack the loaned items and will provide packing materials for the loan. If required by the terms of the agreement, the Borrower will pay for packing materials.

3. Unpacking and repacking must be done by experienced personnel under competent supervision. The loan must be repacked in the same manner as received and with the same packing materials, if possible, unless otherwise mutually agreed upon by Lender and Borrower. All packing materials should be stored, if possible, during the loan period in a place fully conditioned to the same temperature and relative humidity as those under which the loan itself is stored or displayed. All packing materials that are to be reused must be protected from contamination by insects, mold, dust, airborne pollutants, and other sources.

ACCESS

1. Access to loaned items by individuals for purposes other than those identified on the attached agreement must receive prior approval by the Lender and must be supervised by the Borrower. Borrower agrees to provide access to loaned items only when all other options, such as photographs or reproductions, have been exhausted. Use of loaned items must be restricted to a supervised area. Researchers will be subject to the Lender's current user rules and restrictions. Borrower will be responsible for any misconduct by persons "using" loaned items.

2. Borrower must provide access to Lender's staff or representatives during regular hours of operations for the purposes of inspections, inventory, repacking, research and condition reporting.

3. Borrower is subject to NPS annual inventory procedures as noted in the NPS *Museum Handbook*, Part II. Either the Borrower will confirm Lender's inventory or will provide access to the Lender to conduct an inventory, as noted in the special conditions on the agreement.

REPOSITORY LOANS

1. Loans for storage and collections management ("repository" loans) may not exceed 20 years, renewable.

2. Items loaned to a repository for the purposes of collections management and/or storage will be cataloged according to the NPS *Museum Handbook*, Part II, and in accordance with requirements established by the lending park. Copies of all catalog records and electronic data will be sent to the lending park by the borrowing repository.

3. The Borrower will either respond to the Lender's requests for information about loaned items for the purposes of completing an annual inventory, or, if approved in advance by the Lender, include the loaned items in the Borrower's annual inventory of its collections and report on the results of the inventory to the Lender. Borrower's inventory must be equivalent to the inventory required by NPS *Director's Order #24.*

4. Unless specifically exempted in this Agreement, the Borrower will complete a Collections Management Report and the Checklist for Preservation and Protection of Museum collections as specified in NPS *Director's Order #24*.

5. Repository loans must remain at the designated repository until they are requested by the lending park or until such time as the repository is unable to care for the loan in accordance with the loan stipulations. The loan may be terminated by either party, by giving 3 months notice, or within 30 days if the lending park determines the loan stipulations are not being met. Should the Borrower be unable to continue care for the loaned items, the items must be returned to the lending NPS park or another designated repository approved by the Lender.

6. The conditions specific to repository loans take precedence when in conflict with other conditions in this Agreement. Otherwise, all conditions apply to repository loans.

EXTENSION AND RECALL

1. Any extensions of the loan period must be requested by the Borrower. The Lender will prepare extension documents to be completed and signed by the Borrower and received by the Lender at least 30 calendar days prior to the original loan expiration date shown on the attached agreement. All additional insurance will be extended by the Borrower and proof of insurance will be provided to the Lender by a copy of the certificate of insurance naming the NPS Lender as an additional insured and dated with the new termination date of the loan.

2. The Lender reserves the right to inspect or audit the loaned items at any time. Should the Lender desire to recall any of the loaned items for its own purposes, it may do so by giving at least 30 days notice to the Borrower. Loaned items may be withdrawn by the Lender without prior written notice to the Borrower if it is determined that they are receiving improper care.

3. Borrower agrees to give at least 30 days written notice to the Lender if electing to cancel this loan prior to the term of this loan agreement.

Chapter 6: Deaccessioning

BASIC REQUIREMENTS FOR NPS DEACCESSIONS

Deaccession museum collections only under the following categories using the appropriate disposition documents that appear after each category.

- return to rightful owner (other than return of an incoming loan) – letter and Receipt for Property
- loss, theft, damage or involuntary destruction – Report of Survey
- voluntary destruction/abandonment – Report of Survey, Witness Statement
- outside Scope of Collection by transfer, exchange, conveyance (donation) or voluntary destruction/abandonment – Transfer of Property, Exchange Agreement, Conveyance (Donation) Agreement, Report of Survey
- destructive analysis – Memorandum of request
- NAGPRA compliance – Repatriation Agreement

Read the appropriate section of this chapter for the type of deaccession you are documenting. There are special requirements that you should be aware of for each deaccession type.

Get formal appraisals for all exchanges outside the DOI.

Place a 45-day public notice on the World Wide Web at <http://www.cr.nps.gov/csd>for all exchanges outside the federal government and all conveyances (donations).

Catalog all objects into ANCS+ before deaccessioning them.

Enter all deaccessions into ANCS+. Print the deaccession forms from ANCS+.

Complete a Deaccession Form (Form 10-643) for all deaccessions. Prepare a deaccession package for each deaccession. Include a justification for the deaccession, catalog records, a legal disposition document, and other documentation related to the deaccession.

A collections advisory committee must review all deaccessions outside the DOI and all deaccessions involving voluntary destruction or abandonment.

The superintendent must approve all deaccessions and sign all disposition documents.

Assign a deaccession number to each deaccession transaction.

Track deaccessions in the accession book or an optional deaccession book.

Store deaccession records in the accession folder or an optional deaccession folder.

Don’t delete accession and catalog records for deaccessioned objects. Don’t reuse these numbers.

CHAPTER 6: DEACCESSIONING

A. *Overview*

1. *What is deaccessioning?*

Deaccessioning is the process of permanently removing National Park Service (NPS) museum collections from a NPS unit's ownership (title) and custody. It should be a rare action. This chapter discusses the types of deaccessions that the NPS permits and explains NPS deaccessioning procedures.

2. *Who must follow this chapter?*

The staff person responsible for a NPS museum collection must follow this chapter to deaccession museum objects. These procedures ensure that NPS deaccession actions:

- meet the highest professional, legal, and ethical standards for accountability of museum collections
- withstand close public scrutiny
- maintain the public's trust
- protect park personnel or their relatives from allegations of unethical conduct, partiality, or conflict of interest

Procedures for returning incoming loans are excluded from this chapter. Refer to Chapter 2, Accessioning, in this handbook for procedures on the return of incoming loans.

B. General Information on Deaccessions

1. *What is the best deaccession policy?*

The best *deaccession* policy is a good *accession* policy. NPS museum procedures require you to accession only objects that are appropriate to the park's scope of collection. Refer to the NPS *Museum Handbook,* Part I (*MH-I*), Chapter 2, Scope of Museum Collections, for guidance on writing a Scope of Collection Statement (SOCS). By setting up a good accession policy, you can avoid lengthy or potentially questionable deaccessions.

2. *What laws grant deaccessioning authority to the NPS?*

Two laws specifically authorize NPS deaccessions:

- Museum Act of 1955, P.L. 84-127, 69 Stat. 242 (codified as amended at 16 U.S.C. §§ 18f to 18f-3 [Supp.1997]).
- Native American Graves Protection and Repatriation Act (NAGPRA), P.L. 101-601 (1990), (codified at 25 U.S.C. §§ 3001-3013 [Supp. 1997]).

Note: Refer to Appendix A in this handbook for the Museum Act of 1955, as amended.

3. *What types of deaccessions are permitted?*

The NPS is authorized by law to deaccession museum collections under these categories:

- return to rightful owner (other than return of an incoming loan)
- loss, theft, damage or involuntary destruction
- voluntary destruction/abandonment
- outside Scope of Collection by:
  - transfer to other NPS units
  - transfer of museum collections outside a park's SOCS and no longer needed for NPS museum purposes to qualified federal agencies dedicated to the preservation and interpretation of natural or cultural heritage and qualified to manage museum collections, including the Smithsonian Institution
  - exchange by accepting museum objects, museum collections, and other personal properties, and by granting in exchange museum property that is no longer needed or that may be held in duplicate, such exchanges to be made on a basis that is equitable and in the public interest, to:

    other NPS units (two transfers is a simpler method)

    other qualified federal agencies

    non-federal governmental entities

    private institutions and individuals
  - conveyance (donation) of museum collections outside the park's SOCS and no longer needed for NPS museum purposes to:

    private institutions exempt from federal taxation under section 501(c)(3) of the Internal Revenue Code of 1986, dedicated to the preservation and interpretation of natural or cultural heritage, and qualified to manage museum collections

    non-federal governmental entities, providing the recipients are dedicated to the preservation and interpretation of natural or cultural heritage and qualified to manage museum collections
  - voluntary destruction/abandonment of museum collections that have been determined to have no scientific, cultural, historic, educational, esthetic, or monetary value
- destructive analysis
- compliance with NAGPRA

You may deaccession museum collections by transfer, exchange, conveyance (donation), voluntary destruction, or destructive analysis only if the NPS owns the objects (clear title) and there are no restrictions on such an action in the documents transferring title to the NPS.

4. *What does the term "conveyance" mean?*

For NPS purposes, a conveyance is a donation, since the NPS can't receive money for museum objects. You only convey objects to entities outside the federal government.

5. *Who determines which objects to deaccession?*

As the staff person responsible for the museum collection, you must propose all potential deaccessions and recommend action to the superintendent.

The superintendent must set up a collections advisory committee to review all exchanges outside the Department of the Interior (DOI), transfers to non-DOI federal agencies, conveyances (donations), and voluntary destruction/abandonment.

The superintendent approves or disapproves all deaccessions.

Note: In accordance with 41 CFR-101-45.902-2, the regional director, or other authorized reviewing official who is not directly accountable for the property, must approve abandonment.

6. *Must I convert previous deaccessions to the new system in this chapter?*

No. You may convert previous deaccessions to the new system described in this chapter, but conversion is not required.

7. *Where do I get the forms for deaccessioning?*

Use ANCS+ to print blank or completed deaccession forms. Use acid-free paper to print the forms.

Acid-free paper is available from the Supply and Equipment Program of the Museum Management Program (MMP), National Center for Cultural Resources.

8. *Must I follow these procedures to deaccession all types of museum material?*

Yes. The law requires you to treat museum collections "in a careful and deliberate manner that protects the public interest." Refer to Section C.6 for information on removing non-museum property from the collection.

Refer to Section IV of Chapter 4 in this handbook for information on deaccessioning reproductions.

C. Special Considerations for Deaccessions

1. *May I deaccession hazardous objects or substances in a museum collection?*

Yes. Refer to the *MH-I*, Chapter 11, Curatorial Health and Safety Issues, Section D, for procedures on hazards in the collection. Follow the Report of Survey procedures in Section I of this chapter to deaccession these materials.

Nitrate negatives in Stages 3-5 of deterioration are hazardous materials. Deaccession them and dispose of them as an immediate threat through your hazardous materials coordinator. Refer to the MH-I, Appendix M: Nitrate and Cellulose Ester Film, for information on nitrate negatives.

2. *Should the park tell a donor about a deaccession?*

Although not legally required, it is a good practice to tell the source of accession (donor) or known heirs before starting a deaccession action. Because of potential tax liabilities defined by the Internal Revenue Service, you should not accession museum objects with the intent to deaccession them later.

Refer to Section C.7 of this chapter for information on tax liabilities.

3. *Must I catalog objects before deaccessioning them?*

Yes. You must catalog all objects proposed for deaccessioning. You must enter pre-Automated National Catalog System (ANCS+) manual catalog records into ANCS+ before deaccessioning them. Complete the registration data for objects that you deaccession due to loss, theft, or involuntary destruction (unless full catalog information is available).

4. *What are some things to consider before deaccessioning museum objects?*

Deaccession actions must:

- be consistent with relevant laws, and with current DOI and NPS policies
- consider the need to safeguard the federal government against loss of the scientific, associational, evidential, artifactual, informational and/or monetary value represented by the objects
- avoid real or apparent conflict of interest. Refer to 5 CFR 2635 and the related supplement, "Employee Responsibilities and Conduct" (43 CFR Part 20). Refer to the most current codes of ethics for curators and registrars published by the American Association of Museums.
- be supported by the catalog data and written justification

Deaccession actions should:

- keep the objects in public ownership whenever possible
- take into consideration any community requests for objects to stay in the museum, city or area, such as a local museum
- avoid the perception that the museum is deaccessioning objects in exchange for objects of lesser importance
- avoid the perception that the action is being made in accordance with current fads or fashions (for example, furniture of a certain period is no longer in high demand and so is deaccessioned)
- preserve the integrity of systematic collections

NPS employees and their relatives must not:

- acquire deaccessioned museum collections (or financial interest therein)
- appear to benefit personally in any way from a deaccession action and subsequent disposition

5. *May I reuse accession or catalog numbers from deaccessioned objects?*

No. Never reuse accession or catalog numbers from deaccessions. These numbers are permanently assigned to the objects in the deaccession.

6. *What can I do about non-museum property that has been accessioned into the museum collection by mistake?*

You must evaluate mistaken accessions on a case by case basis. Errors do occur, but you must correct them as appropriate to the circumstances. Seek the professional, written opinion of the members of the collections advisory committee. See Sections D.4 – D.6.

The mistakenly accessioned property must not fit the definition of museum property as defined in the glossary of the Cultural Resource Management Guideline.

Some examples of mistakenly accessioned non-museum property may include exhibit cases, exhibit mounts, and library books (except historic books such as those in Frederick Douglass's library).

Don't use the formal deaccessioning procedures in this chapter to deaccession non-museum property that has been accessioned in error. You don't need to catalog this material. Instead, use the following procedures:

- recommend the deaccession to the superintendent with a written justification that includes the documented opinions of the members of the collections advisory committee
- have the superintendent sign a document authorizing the transaction

For example, if you recommend transferring exhibit cases to the facility manager, the superintendent signs a transfer of property.

Document the action as follows in order to "close the books" on the mistaken accession:

- place a memo explaining the action and supporting opinions in the accession file and catalog folder, if one exists
- write "Accessioned in Error" in the remarks column of the accession book and sign and date the entry (as appropriate, enter catalog numbers)
- change the object status on the catalog record in ANCS+ to "Removed Non-Museum Property"
- note the mistake in the description field and the disposition in the location field on the catalog record, if a catalog record exists

Don't reuse the accession or catalog numbers.

7. *May I accession objects expressly to use them in an exchange?*

No. The NPS items used in an exchange must be outside the SOCS. A park may not acquire objects outside the SOCS. In addition, acquiring objects to use in an exchange gives the impression that the park is dealing in collections. There are also potential tax liabilities in doing this with donations.

Tax liabilities may relate to the:

- use to which a gift was put
- donor's intent in making the gift and knowledge about its use

If the park...	***Then...***
deaccessions donated objects within two years of the donation	the park must report the transaction to the Internal Revenue Service along with the donor's tax identification number on Form 8282, Donee Information Return
deaccessions donated objects more than two years after the donation	the donor still may be subject to penalties, but the park doesn't report the action to the Internal Revenue Service

With the superintendent's approval, a third party, such as the park's cooperating association, could assist the park with acquiring objects. For example, the association could acquire an object and exchange it for an object that the park wants. The association could then donate the object it acquired through the exchange to the park.

Note: The tax liabilities described above also apply to third party transactions.

8. *Do I deaccession nitrate negatives that have been reformatted?*

No. Don't deaccession nitrate negatives that have been reformatted.

You can destroy nitrate negatives at Stages 1-2 of deterioration if:

- the negatives have only informational or administrative value, *and*
- you have a high quality copy that has been inspected to current standards

Destruction of reformatted nitrate negatives is not a deaccession. Although you are destroying the negative, you still have the image, which will have the same accession and catalog number as the negative.

Refer to the *MH-I,* Appendix M, for information on nitrate negatives.

D. Processing Deaccessions

1. *Deaccession Requests*

You are responsible for processing deaccessions. The deaccession procedures outlined in this section are the same for all types of deaccessions. Actions specific to each deaccession type appear in Sections H-N.

You receive requests to deaccession items in the case of:

- return to rightful owner
- destructive analysis
- repatriation (NAGPRA)

You begin the deaccession process in the case of:

- loss, theft, damage or involuntary destruction
- objects outside the Scope of Collection Statement
- voluntary destruction/abandonment

2. *Consultation with the Regional/SO Curator*

Consultation with the regional/support office (SO) curator is recommended, but not required, for all deaccessions.

The regional/SO curator may consult with appropriate discipline specialists and recommend actions to you regarding the deaccession.

You should consult with the regional/SO curator about all NAGPRA requests.

3. *Deaccession Package*

For each proposed deaccession, prepare a deaccession package that includes all the documentation described in Section E. Prepare one deaccession package for each deaccession type and recipient. The package includes the following documentation:

- Deaccession Form, Form 10-643 (Figure 6.6)
- List of Objects, Form 10-417 (Figure 6.7) or equivalent
- justification for the deaccession (including documentation that the objects have been advertised throughout the NPS, if required)
- justification for disposition out of the order of preference (see Section K.2), if applicable
- catalog records and photographs
- appraisals (if required)
- legal disposition document

ANCS+ will print the deaccession form, list of objects, catalog records, and most disposition documents.

Forward the package to the superintendent for approval or disapproval (see Section C.7). The superintendent will forward the package to the collections advisory committee (see Sections C.4-C.6) for review. Some deaccessions require the committee's review, but the superintendent may choose to use the committee for all deaccessions.

4. *Collections Advisory Committee*

The superintendent must set up a collections advisory committee to review all deaccessions involving:

- transfer to another federal agency outside the DOI including the Smithsonian Institution
- conveyance (donation) to a private institution or non-federal governmental entity, as defined in section B.3
- exchange outside DOI (excluding exchange of natural history specimens)
- voluntary destruction/abandonment of museum objects

Note: The superintendent also may use the members of the collections advisory committee to review potential acquisitions. The committee may review other issues related to the museum collection, such as consumptive use requests.

The collections advisory committee reviews the appropriateness of the deaccession and its disposition. The law requires a systematic review that meets the highest standards of the museum profession. More importantly, a review committee composed of impartial and disinterested individuals provides for checks and balances. It protects the superintendent and park staff from possible accusations of partiality, self-dealing, or vested interest.

5. *Collections Advisory Committee Members*

The committee must include at least two members. One member must be a curator at or above the GS-11 level. The other members of the committee may not be under the supervision of the curator. If the park doesn't have a curator at or above the GS-11 level, the park must appoint a curator from another park or the support office.

Note: The members of the committee must be federal employees due to Federal Advisory Committee Act (FACA) considerations (41 CFR §§ 101-6.1004). On a case by case basis, the superintendent can request a non-federal specialist to review a deaccession transaction. The superintendent may ask the specialist to record his or her comments and recommendations on a specialist review form (Fig. 6:15), but the non-federal specialist cannot serve on the committee.

There is no maximum number of members for the committee. A committee

of three to five members is recommended. Possible sources for members are staff from the park, regional or support office, NPS cultural preservation and archeological centers, Denver Service Center, Harpers Ferry Center, other parks, and other government agencies. It is advisable to have one or more members from outside the park. Committee members should be chosen from the following list of specialists:

curator (a minimum of one at GS-11 or above)
archeologist
archives technician
archivist
biologist
conservator
cultural resource specialist
ethnographer
geologist
historical architect
historical landscape architect
historian
interpreter
museum specialist
museum technician
natural resource specialist
paleontologist

Note: Some parks may choose to use the members from their Section 106 (National Historic Preservation Act) review committee for the collections advisory committee.

The person responsible for the museum collection advises the superintendent as to which members of the committee should review a particular deaccession. A minimum of two members must review and make recommendations on a deaccession. The superintendent notifies committee members who are to review a particular deaccession and appoints a lead committee member. Committee members may consult with subject matter specialists who are not on the committee regarding specific actions.

6. *Collections Advisory Committee Procedures*

The collections advisory committee meets at regular intervals, or as needed. If all the committee members are not at the same location, meetings can be by phone or videoconference.

The committee operates under a documented set of procedures to make sure that all decisions are fair, open, and in the best interests of the public. Each committee member must record his or her comments and document any consultations with other specialists. See Figures 6.14 and 6.15 for a sample set of procedures and a review form.

Committee members may recommend for or against deaccession of all the objects. They may also recommend against deaccession of individual objects, while agreeing with the remainder of the proposal. The lead committee member attaches the comments of the committee members, and any non-federal specialists consulted during the review, to the deaccession package. The committee then returns the package to the superintendent.

7. *Approval or Disapproval*

The superintendent reviews the deaccession package and approves or disapproves the deaccession and disposition.

If the superintendent...	***Then...***
approves the deaccession	he or she signs the deaccession form and disposition action
approves or disapproves a deaccession contrary to one or more of the collections advisory committee member's recommendations	he or she must attach an explanation to the deaccession form
disapproves the deaccession	the action stops

The superintendent may approve exchanges outside the federal government and conveyances (donations) but must inform the intended recipient of the 45 day public notice requirement. See Section K.8-K.11.

The superintendent may disapprove deaccessioning individual objects within the package while approving the remaining objects for deaccession. You can remove the disapproved objects from a partially approved package and return the package to the superintendent for approval. You may resubmit a disapproved package when you have addressed the reasons for disapproval.

Note: The regional director, or other authorized reviewing official who is not directly accountable for the property, must approve abandonment. See 41 CFR-101-45.902-2.

E. Documenting Deaccessions

You are responsible for documenting all deaccessions following the procedures in this section. Documentation must be clear, adequately cross-referenced, and permanently maintained by the park. The deaccession documentation in this section is the same for all types of deaccessions. Documentation specific to each deaccession type appears in Sections H-N. Include this documentation in the deaccession package.

1. *ANCS+ Deaccessions Associated Module*

The Deaccessions associated module in ANCS+ allows you to document and track deaccessions. When you complete the appropriate fields in the program, the program completes and prints all the deaccession forms for you. It also updates the Object Status and Location fields on the catalog records for the deaccessioned objects. Refer to Section VII of Chapter 4 in the *ANCS+ User Manual.* Use of this module is essential for keeping your annual Collections Management Report (CMR) accurate.

2. *Catalog Data*

Catalog all objects proposed for deaccessioning. You must enter pre-ANCS, manual catalog records into ANCS+. Complete both registration and catalog data fields on the Museum Catalog Record (Form 10-254). Complete the registration data for objects that have been lost, stolen, or involuntarily destroyed unless full catalog data are available. Catalog data support the proposed deaccession action and aid in the disposition of the objects. Documentation on the museum catalog record must demonstrate:

- what the object is
- the intrinsic, cultural, and scientific significance of the object
- the monetary value of the object (if the object has no monetary value, list it as $00.00)

Refer to Sections E.5 and E.6 for information on appraisals.

You must keep catalog records for deaccessioned objects in your ANCS+ database. Don't delete these records. They are part of the paper trail for the deaccession.

3. *Photographs*

Where possible, photograph the object before completing the deaccession transaction. Keep the photograph as part of the permanent record for the object.

Photograph NAGPRA items that are determined to be culturally affiliated in consultation with the receiving party.

4. *Justification*

Concisely, justify in writing each deaccession transaction. The justification must clearly outline the details in support of the proposed action. The written justification for NAGPRA deaccessions must reference the data used to determine the NAGPRA categories.

The written justification for objects leaving the NPS must include documentation to show that:

- the park has advertised the objects throughout the NPS
- no other NPS sites are in need of the objects (or why the park denied NPS requests for the objects)

Note: The law states that you may deaccession objects to non-NPS recipients if the objects are no longer needed for NPS museum purposes. Advertising throughout the NPS is necessary to make sure that other parks don't need the objects for museum purposes.

If you propose a deaccession that is out of the order of preference, you must have a written jusitification. See Section K.2 for order of preference.

5. *Informal Appraisals*

Museum collections have scientific, associational, evidential, artifactual, informational and/or monetary value. You or outside specialists determine scientific and intrinsic value by examining the object and its documentation. You also must consider the object's association with the total collection. You may make an informal estimate of the monetary value of each NPS

object to be deaccessioned, as appropriate. This may be done by referencing:

- current values on the catalog record
- purchase price or appraisals made at the time of acquisition
- prices of similar objects paid at auctions, or recorded as paid in catalogs, trade journals, and similar publications

Enter the current value on the museum catalog record. Include the value of each object on the list of objects to be deaccessioned, if appropriate.

6. *Formal Appraisals*

The NPS requires formal appraisals only for exchanges outside the federal government. Get a minimum of one formal, written appraisal (sometimes referred to as "an arms-length appraisal") for objects below $20,000 in value. Get two appraisals for objects over $20,000 in value. You are required to get appraisals for the objects you deaccession as well as those you acquire through an exchange.

Appraisals are recommended, but not required, for:

- transfers to non-DOI federal agencies, including the Smithsonian Institution
- conveyances (donations) to private institutions and non-federal governmental entities, as defined in Section B.3

Use prudent and conservative judgement in deciding whether to appraise objects before deaccessioning. Appraisals are appropriate to all collections for which there is a market. Appraisals are less likely to be needed for certain scientific collections, such as botanical specimens. However, some scientific collections, such as geological and paleontological collections, have a well-established market.

Appraisals are a necessary and accepted museum practice to:

- make sure that the deaccession is credible
- make sure that an exchange is equitable
- maintain the public trust
- avoid any value-related conflict of interest or appearance of conflict of interest

Generally, the NPS unit pays the costs for appraisals.

Enter the current appraisal value on the museum catalog record. Enter the value on the list of objects to be deaccessioned.

A formal appraisal is generally not required for the exchange of natural history specimens. For certain specimens, such as paleontology specimens, an appraisal may be appropriate. Consult the regional/SO curator before exchanging natural history specimens.

7. *Appraisers*

In order to acquire the services of a qualified appraiser, refer to Section IX in Chapter 4 of this handbook. Get lists of appraisers from the regional/SO curator, the NPS Clearinghouse, or curators/archivists of similar collections. Chapter 4 in this handbook has contact information for the American Society of Appraisers.

File copies of appraisals in the appropriate accession folder(s) or the optional deaccession folder.

A qualified appraiser must complete all appraisals.

The appraiser must:

- justify the appraisal in writing and sign the statement
- determine the value objectively
- state in writing that he or she will not acquire title to or interest in, and has no immediate interest in, any of the appraised objects
- avoid any conflict of interest or appearance of conflict of interest. For example, an appraisal by the curator of the collection would have an appearance of conflict of interest. An appraisal by the support office curator involved in the deaccession might have an appearance of conflict of interest.
- have no vested interest in the outcome of the appraisal

8. *Deaccession Form*

You must complete a Deaccession Form, Form 10-643 (Figure 6.6) for each deaccession transaction. The deaccession form includes the following:

- the type of deaccession and disposition
- a detailed list of objects in the deaccession
- a list of attachments to the form
- a brief summary of the deaccession
- your recommendation and signature
- the collections advisory committee's recommendation, if appropriate
- the superintendent's approval and signature

The superintendent must sign the deaccession form showing approval of the deaccession and disposition type.

9. *List of Objects*

For deaccessions involving several objects, attach a List of Objects, Form 10-417 (Figure 6.7) to the deaccession form. You may create a park-specific list to use in place of the List of Objects, Form 10-417. The list, which serves as an inventory of objects in the deaccession, must include:

- catalog number
- accession number
- item count or quantity
- object name
- brief description and condition
- value (if appropriate)
- space for comment

10. *Legal Disposition Document*

The legal disposition document conveys control (possession and title) of a museum object. It must accompany the deaccession form. Disposition documents vary depending upon the type of deaccession transaction. A list of appropriate disposition documents for each deaccession type appears below.

Deaccession Type	***Disposition Document***
Return to Rightful Owner	Receipt for Property
Loss/Theft/Damage Involuntary Destruction	Report of Survey
Voluntary Destruction/ Abandonment	Report of Survey Witness Statement
Outside Scope of Collection	Exchange Agreement *or* Transfer of Property *or* Conveyance (Donation) Agreement
Destructive Analysis	Memorandum of request to superintendent
NAGPRA Compliance	Repatriation Agreement

The superintendent must sign the deaccession form and the appropriate disposition documents. The recipient must sign the receipt for property, exchange agreement, transfer of property, conveyance (donation) agreement, or repatriation agreement.

You should recommend a specific disposition for the object when preparing the deaccession package. However, the superintendent may approve objects for deaccession before a specific disposition has been determined. You must then get separate approval for the disposition.

F. Tracking Deaccessions

You must track all deaccessions following the procedures in this section.

The tracking information outlined in this section is the same for all types of deaccessions.

1. *Filing Disapproved Deaccession Documentation*

File the deaccession package for disapproved deaccessions in the accession folder or in a file folder for deaccession proposals. File disapproved deaccessions by date if placed in a separate file folder. Maintain these files as permanent records.

2. *Deaccession Number*

Give each approved deaccession a number. A deaccession number has two parts separated by a decimal point:

- D (for deaccession)
- deaccession transaction number (sequential transaction number, such as 3 for the third deaccession transaction)

For example, "D.3" means the third deaccession transaction.

Put the deaccession number in the upper right corner of all documents that relate to the deaccession.

Enter the deaccession number in the remarks column of the accession book. The number is a cross-reference to the deaccession package that you filed in the accession or deaccession folder.

3. *Filing Approved Deaccession Documentation*

Permanently maintain the original paperwork for each approved deaccession at the park. This paperwork documents the history of the deaccessioned objects.

File the deaccession package and all associated documentation in the accession folder or an **optional** deaccession folder, described below. Whatever folder you choose, use it consistently. If you anticipate a large number of deaccessions (more than 10 deaccession transactions), use of the optional deaccession folder is recommended. Refer to *MH-II*, Chapter 2 in this handbook for information on the accession folder.

Accession Folder

- File all original paperwork in the accession folder.
- If the deaccession involves multiple accessions, file the original

paperwork in the accession folder of the lowest accession number.

- File archival copies of the deaccession form and disposition document in each subsequent accession folder.

Deaccession Folder (optional)

- Store all original documents associated with the specific deaccession transaction in the folder. Mark the deaccession number in the upper left corner of the folder. Use permanent black ink.
- Insert the optional Deaccession Folder Cover Sheet, Form 10-644 (Figure 6.8).
- File the folder by deaccession number.
- Store the folder in a separate, marked section of your accession filing cabinet.

Note: If you use the deaccession folder, you may also want to place an archival copy of the deaccession form and disposition document in the accession folder.

4. *Deaccession Book or Log System*

Track deaccessions by using the ANCS+ Deaccessions associated module.

You may also use the **optional** Deaccession Book, Form 10-642 (Figure 6.9) or another form of log system to track deaccessions. The bound deaccession book is a sequential log of all deaccession transactions. Enter the following information for each deaccession:

- deaccession number
- deaccession date (the date the other party signs the disposition document). See Section E.10 for a list of disposition documents.
- brief description of items in the deaccession
- disposition (recipient name and address, for institutions include name of responsible official and department); describe disposition for deaccessions that have no recipient
- deaccession type
- accession and catalog numbers of the items in the deaccession (if there is not enough space, refer to a list in the folder)
- number of items in the deaccession (item count)
- remarks

Procedures for data changes and preservation and storage of the deaccession book are identical to those for the accession book. Refer to *MH-II*, Chapter 2, Accessioning, in this handbook.

Note: You can get deaccession books from the Museum Supply and

Equipment Program.

5. *Updating the Museum Records*

You must update both the electronic and paper accession records and electronic catalog records for all deaccessions.

> ***All catalog records for deaccessioned objects must be in ANCS+.***

Accession Records

- Enter the deaccession number in the remarks column of the accession book.
- Note deaccessions in the notes column on the list of objects attached to the accession receiving report.

Catalog Records

- ANCS+ will track the deaccession number automatically and enter "Deaccessioned" in the Location field.
- ANCS+ will enter the appropriate deaccession type in the Object Status field of the catalog record.
- ANCS+ will enter the fiscal year of the deaccession in the Status Year field of the catalog record.
- Change the Controlled Property field on the catalog record to N (no), if needed.
- Send copies of the updated electronic records to the National Catalog along with the annual electronic submission.

Other Documentation

- Note the deaccession on any other pertinent documentation, such as the catalog number log book.

Note: You must report the number of deaccessions for each year on your annual Collections Management Report (CMR).

G. Packing and Shipping Deaccessions

1. *Packing*

You are responsible for packing and shipping all deaccessioned objects.

You must pack all objects securely and adequately to make sure that objects aren't damaged in transit. Use professional packing and shipping companies if you lack the training, facilities, or materials to pack museum objects.

Pack and label containers according to the *MH-I*, Chapter 6, Handling, Packing and Shipping Museum Objects. If non-NPS staff do the packing, oversee the work. Enclose an inventory of objects and a return address in

each container. Include any special instructions for unpacking. Under separate cover send a copy of the inventory.

> ***Before packing, shipping, or delivering NAGPRA items, consult with the receiving tribe or lineal descendant to arrange the return of repatriated items. You are responsible for packing and shipping repatriated items. Pack and ship NAGPRA items following, where possible, the instructions of the receiving tribe or lineal descendant.***

2. *Shipping*

Ship the objects only if you have a signed disposition document (transfer of property, exchange agreement, repatriation agreement, conveyance agreement) from the recipient. It is customary for the receiving party to pay all shipping charges, including insurance, unless otherwise agreed to in writing before shipping. The NPS may pay for shipping repatriated items.

A shipping list is useful to the recipient and the shipping company. Don't put monetary values or historical information on shipping lists. You may use the U.S. postal system for objects that are sturdy and within the specified size limits. Use certified or registered mail with a return receipt requested. Don't use the postal system for fragile or highly valuable objects.

3. *Receipt for Property*

Use a receipt for property, or equivalent, with all deaccessions that involve the physical receipt of objects.

Send a Receipt for Property (DI-105) to the recipient under separate cover. The recipient signs the receipt and returns the original copy to you.

You may use a memo or electronic mail message in place of a receipt for property to acknowledge receipt of objects. The memo must provide all the information that is on the receipt for property. Place an acid-free copy of the message in the appropriate file.

H. Return to Rightful Owner (See Flow Chart Figure 6.1)

Refer to Sections D-G for processing, documenting, tracking, and packing and shipping deaccessions.

1. *When would I return objects to the rightful owner?*

On rare occasions, a park museum collection may have an object acquired from previous holders who were not the legal owners. In other cases, you may not have legal documentation of NPS title. You may receive a request to return the object to the rightful owner(s).

2. *What are the procedures for returning objects to the rightful owner?*

All requests for the return of museum objects must be in writing. You should consult with the regional/SO curator when you receive a request for return of a museum object. Document all conversations and actions taken, and file this information in the appropriate folder.

The justification to return an object must include a solicitor's written opinion or court order. The regional/SO curator can help you contact the region's solicitor. The superintendent must sign the correspondence conveying the object to the rightful owner.

The receiving party and the superintendent sign a Receipt for Property (DI-105) to document receipt by the rightful owner. Keep the original receipt for property and the original copy of the solicitor's opinion or court order. File them in the relevant deaccession or accession folder.

I. Loss, Theft, Involuntary Destruction, Voluntary Destruction/ Abandonment (See Flow Chart Figure 6.2)

Refer to Sections D-F for processing, documenting and tracking deaccessions.

1. *What is loss, theft, or involuntary destruction?*

A deaccession because of loss, theft or involuntary destruction involves "unintentional loss." It is not a purposeful deaccession. Objects in this category are:

- stolen and not recovered within 30 days
- consumed or effectively destroyed by fire, flood, or other disaster
- destroyed by biological or chemical factors
- missing and cannot be located within 30 days after a thorough search

Thoroughly review deaccessions in this category and make changes in collection management practices to prevent similar future occurrences.

2. *What is voluntary destruction or abandonment?*

A deaccession involving voluntary destruction or abandonment is an intentional deaccession. Objects in this category are:

- hazardous materials (refer to *MH-I*, Chapter 11, Curatorial Health and Safety and *Loss Control Management Guideline*), *or*
- involuntarily damaged beyond all treatment and determined to have no scientific, cultural, historic, educational, esthetic, or monetary value

Note: See Section L for information on voluntary destruction/abandonment for objects outside the park's SOCS.

3. *What should I do when I discover a loss?*

Follow the actions outlined in Section III of Chapter 4 in this handbook. A local NPS law enforcement officer will prepare a Case Incident Record (Form 10-343) or equivalent. You must submit a Report of Survey (DI-103) to the superintendent if the object is not found within 30 days.

The report of survey must include:

- a copy of the case incident record or equivalent
- any subsequent reports of investigation
- a photocopy of the catalog record that includes a description of the object
- a photograph of the object, if available

4. *Where can I find Board of Survey Procedures?*

Follow the Report of Survey procedures found in:

- 410 DM, Personal Property Management Regulations
- *Personal Property Management Handbook No. 44*, Section 8

5. *Can the Board of Survey disapprove a deaccession?*

Yes. If the superintendent or the Board of Survey disapproves the Report of Survey, the deaccession action stops. The deaccession documentation remains in the accession file or deaccession proposal file as a permanent record. Disapproval may be due to:

- insufficient verification of loss
- inadequate search
- disagreement as to the degree of damage

You may propose the same objects for deaccession at a later date if you give enough justification.

Note: The superintendent cannot overturn the findings of a Board of Survey. However, in the case of voluntary destruction/abandonment, the superintendent may decide not to send the action to the Board of Survey. The objects then remain in the collection.

6. *What do I do with approved Board of Survey actions?*

You will receive a copy of all reports, findings and recommendations from the Board of Survey. File this documentation in the appropriate accession or deaccession folder and proceed with the deaccession.

7. *What if an object is recovered after being deaccessioned?*

Follow these procedures if a stolen or lost object is later returned to the park's possession:

- Document the circumstances of the recovery in the accession and/or deaccession folders.
- Update all pertinent museum documentation as described in Section I.8 below.

8. *How do I update the museum records for recovered objects?*

You are responsible for updating museum records when an object is recovered.

Deaccession Documents

- If you recover all the objects in the deaccession, mark the deaccession form and the Report of Survey "Void." Have the superintendent sign and date these documents next to the "Void." In ANCS+, enter "VOID" in the Notes field in the Deaccessions associated module.
- If only some of the objects were recovered, note which objects were recovered on the list of objects. Don't void the deaccession form or the Report of Survey. In ANCS+, note which objects were recovered in the Notes field in the Deaccessions associated module.

- Note the recovery in the remarks column of the deaccession book, if the park is using one. In ANCS+, note the recovery in the Notes field in the Deaccessions associated module.

Accession Documents

- Note the recovery in the remarks column of the accession book. Note the recovery on the list of objects attached to the accession receiving report.

Catalog Records

- Remove "Deaccessioned" from the Location field on the catalog record.
- Update the Object Status and Status Year fields on the catalog record.
- Add a note about the deaccession and return in the Description field on the catalog record.
- Enter the deaccession number in the Other Numbers field on the catalog record.
- Send electronic copies of the updated catalog records to the National Catalog along with the annual submission.

Other Documentation

- Note the recovery on any other pertinent documentation, such as the catalog number log book.

9. *When can I use voluntary destruction or abandonment to deaccession an object?*

In extremely rare instances, you may request the voluntary destruction or abandonment of an object. Use the Report of Survey procedures described in this section. The object must be one of the following:

- a hazardous material, *or*
- involuntarily damaged beyond all treatment and determined to have no scientific, cultural, historic, educational, esthetic or monetary value

Note: Generally, worn out reproductions and objects consumed through approved consumptive use fall under this category.

10. *Does the collections advisory committee review deaccessions that involve voluntary destruction or abandonment?*

Yes. The collections advisory committee members (see Section D.4-D.6) must review deaccessions that involve voluntary destruction or abandonment. The superintendent must attest to the destruction or abandonment in a memorandum. The memo must have:

- the date, place, and method of destruction or abandonment
- the catalog number(s) of the object(s) that were destroyed or abandoned

Follow Board of Survey procedures (see Section I.4) for witnessing and documenting destruction and abandonment.

11. *Are there special procedures for*

Yes. The safety officer must be involved in all deaccessions involving hazardous materials. Refer to *MH-I*, Chapter 11, Curatorial Health and

deaccessioning hazardous materials?

Safety and *Loss Control Management Guideline*.

If. . .	***Then. . .***
hazardous materials are an immediate threat	you can destroy or dispose of them immediately without committee review
hazardous materials are not an immediate threat	follow regular procedures, including committee review

12. *Are there special procedures for deaccessioning by abandonment?*

Yes. Abandonment consists of relinquishing title to and possession of an object without vesting it in another institution or person. When the NPS abandons an object it must have no intention of reclaiming it.

Abandonment is a very rare action. The regional director, or other authorized reviewing official who is not directly accountable for the property, must approve abandonment. See 41 CFR-101-45.902-2.

Refer to Section L.10-L.12 for additional information on abandonment.

J. Outside Scope of Collection (See Flow Charts Figures 6.3 and 6.4)

Refer to Sections D-G for processing, documenting, tracking and packing and shipping deaccessions.

1. *What types of objects are outside the park's Scope of Collections Statement (SOCS)?*

Objects in this category are not relevant to the mission and purpose of the park. Carefully consider the park's SOCS before making this determination. You should not deaccession objects that are original to the site and within the SOCS.

You must use extreme caution when deaccessioning objects in this category. The objects must:

- be clearly outside the time, area, and subject limits defined in the SOCS, *or*
- greatly exceed the number of objects of that type needed in the collection for research, interpretation, and exhibition

The park must have a current, approved Scope of Collection Statement to deaccession in this category. Refer to the MH-I, Chapter 2, for information on writing a scope of collection statement.

2. *How can I deaccession objects that are outside my park's SOCS?*

If objects are outside the park's SOCS, you may deaccession the objects by:

- transfer within the NPS or to other qualified federal agencies, including the Smithsonian Institution (see Sections J.9 and L.2)
- exchange with other NPS units, other qualified federal agencies, non-federal governmental entities, private institutions or individuals (see Sections J.10 and L.3-L.6)
- conveyance (donation) to private institutions or non-federal governmental entities, as defined in Section B.3 (see Sections J.11 and L.7)
- voluntary destruction or abandonment (see Sections L.10-L.12)

3. *Can I deaccession archeology collections as outside the park's SOCS?*

No. By NPS policy, archeological and natural history collections and associated records acquired as a result of ***systematic investigations*** within the park boundary:

- cannot be deaccessioned under this category
- must be maintained intact as part of the park's resources, and therefore cannot be outside the Scope of Collection Statement

Refer to the *Cultural Resource Management Guideline*, Chapter 9.

The only exceptions to this policy are NAGPRA-related items, and collections from land that was subsequently deauthorized.

4. *May I deaccession archeological collections that include NAGPRA material?*

Yes. If appropriate, NAGPRA items may be deaccessioned pursuant to the Native American Graves Protection and Repatriation Act (25 U.S.C. §§ 3001-3013). See the NAGPRA procedures in Section N of this chapter. The deaccession is a NAGPRA deaccession. It's not an outside SOCS deaccession.

5. *May I deaccession archeology collections from land that has been deauthorized?*

Yes. If park land has been deauthorized, the park may deaccession archeology collections from the deauthorized land to a qualified recipient. The collections must remain in the public trust, and the transaction must be consistent with any applicable guidance in 36 CFR 79 and 36 CFR 2.

Refer to Appendix A in this handbook for information about deaccessioning objects recovered under the Antiquities Act.

6. *Can I deaccession natural history collections as outside the park's SOCS?*

No. Natural history specimens in a NPS museum collection in compliance with the Code of Federal Regulations (36 CFR 2.5g) cannot be:

- outside the Scope of Collection Statement
- deaccessioned in this category

Refer to Section VI of Chapter 4 in this handbook and the *Cultural Resource Management Guideline*, Chapter 9.

7. *May I deaccession natural history collections from*

Yes. If park land has been deauthorized, the park may deaccession natural history collections from the deauthorized land to a qualified recipient. The

land that has been deauthorized?

collection must remain in the public trust, and the transaction must be consistent with any applicable requirements in 36 CFR 2.

8. *What do I need to know about title and restriction verifications?*

Before transferring, exchanging, or conveying (donating) objects, you must verify in writing that:

- the park legally owns (has title to) the objects proposed for deaccessioning
- the objects are not subject to ownership (title) or disposition restrictions that may prevent deaccessioning

For example, a restriction may require that objects must permanently remain at the park. In such a case, you must either keep the objects or petition a court of law to have the restriction removed.

Place the written verification in the deaccession package.

9. *What is a transfer?*

A transfer conveys title and control of a museum object from one NPS collection to another federal museum collection. You may transfer objects to other federal agencies that have programs to preserve and interpret cultural or natural heritage. Transfers between parks or other agencies within DOI don't require the review of the collections advisory committee.

Transfers to other federal agencies outside DOI require the review of the collections advisory committee. See Sections D.4-D.6.

10. *What is an exchange?*

In an exchange, the NPS conveys title and control of a museum object to another party. The NPS receives an object owned by the other party in return.

You must accession the objects received in the exchange into the museum collection. You may exchange with:

- another park (however, doing two transfers is simpler)
- another federal agency
- a non-federal governmental entity
- a private institution or an individual.

Exchanges between parks and within DOI don't require the review of the collections advisory committee.

All exchanges outside the DOI require the review of the collections advisory committee. See Sections D.4-D.6.

Note: The NPS requires formal appraisals for exchanges outside the federal government (see Section E.6).

11. *What is a conveyance (donation)?*

A conveyance (donation) transfers title and control of museum objects to private institutions and non-federal governmental entities. The recipient institution must be:

- dedicated to the preservation and interpretation of natural or cultural heritage
- qualified to manage the objects prior to any conveyance (donation)

In addition, private institutions must be exempt from federal taxation under section 501(c)(3) of the Internal Revenue Code of 1986.

All conveyances (donations) require the review of the collections advisory committee. See Sections D.4-D.6.

K. Outside SOCS Requirements

You must follow the requirements in this section to deaccession objects that are outside the park's SOCS.

1. *What are the special requirements for deaccessions outside the park's SOCS?*

The special requirements for deaccessioning objects that are outside the park's SOCS include:

- following the order of preference for recipients
- advertising objects throughout the NPS
- using the collections advisory committee to recommend deaccessions outside the DOI and voluntary destruction/abandonment (see Sections D.4-D.6)
- getting formal appraisals for all exchanges outside the DOI (see Section E.6)
- placing a 45-day public notice on the World Wide Web for all exchanges outside the federal government and all conveyances (donations)

2. *What is the order of preference for deaccessioning objects that are outside a park's SOCS?*

You must follow the order of preference below when deaccessioning objects that are outside the park's SOCS.

- transfer to another NPS park or center
- exchange with qualified federal agencies
- transfer to qualified federal agencies
- exchange with private institutions or non-federal governmental entities that meet the criteria of Section J.11
- conveyance (donation) to private institutions or non-federal governmental entities that meet the criteria of J.11
- exchange with individuals or entities other than those listed above

- voluntary destruction or abandonment

The exchange of objects with private individuals and non-educational or non-cultural institutions is not recommended. According to NPS procedures and generally accepted museum practice, such exchanges should occur only if the exchange is explicitly justified in writing and no other alternatives are available.

3. *Why is there an order of preference for deaccessions?*

The order of preference is based on:

- maintaining federal government interest
- keeping the collections in the public trust
- protecting NPS interest (or "investment")

4. *What if there is more than one potential recipient?*

If more than one recipient is available, choose the option that offers the greatest:

- benefit to the park and the NPS
- ability to care for the objects
- ability to preserve the objects in the public sector
- likelihood for public benefit, such as research and exhibit
- consistency with the mission and scope of collections of the recipient

5. *How do I evaluate a potential recipient's qualifications?*

You may have to evaluate a potential recipient's qualifications to receive and properly care for museum collections. To demonstrate their qualifications, potential recipients may provide:

- 501(c)3 tax exempt determination (see Section B.3)
- American Association of Museums (AAM) accreditation
- mission statement demonstrating dedication to natural or cultural preservation and interpretation
- Museum Assessment Program (MAP) or Conservation Assessment Program (CAP) survey
- facility report demonstrating preservation and protection capability

6. *Can a park ever deaccession objects out of the order of preference?*

Yes. With written justification, the superintendent can deaccession objects out of the order of preference. The reason for this action must be well justified.

7. *How do I determine whether other parks need the objects?*

You should not transfer, exchange or convey (donate) objects outside the NPS, or voluntarily destroy objects, if the objects are appropriate to and needed by other parks in the system.

You must determine whether you can transfer or exchange objects proposed for deaccessioning within the Service. Consult with:

- the regional/SO curator
- other parks
- the NPS Clearinghouse, Museum Management Program, National Center for Cultural Resources (see Section O of this chapter)
- the Harpers Ferry Center Department of Historic Furnishings, if appropriate

Contact any interested parks or advertise the objects throughout the Service. It is sufficient to advertise on the Curatorial Bulletin Board in cc:Mail or in the *Clearinghouse Classifieds* newsletter.

Allow at least thirty days from the date of publication for parks to respond to the advertisement. Document all responses. Include documentation in the deaccession package to show that:

- you have circulated the information about the objects throughout the Service
- no park wants the objects (or why the park denied NPS requests for the objects)

8. *When must I publicly advertise a deaccession?*

The park must publish a public notice of intent to deaccession objects to an intended recipient before:

- exchanging objects outside the federal government
- conveying (donating) objects

9. *Where must I place the public notice?*

The park must publish the notice in the Clearinghouse listing on the NPS Museum Management Program World Wide Web site. Refer to Section O for submission procedures.

Note: If you advertised on the World Wide Web for non-NPS recipients, this will be the second time you advertise on the Web.

The NPS will use the AAM newsletter *Aviso* and the American Association for State and Local History (AASLH) newsletter *History News* to publicize the World Wide Web posting. The park must allow at least forty-five days from the date of publication for institutions to register a request or protest.

10. *What must I include in the public notice?*

The notice must include:

- the intent to convey (donate) or exchange objects
- the intended recipient
- a list of the objects that includes the park name, object name, brief

description, material, artist/maker, date, and catalog number

- information on how to contact the park, such as a person to contact and phone number

11. *What happens after the notice has been on the WWW for forty-five days?*

If. . .	***Then. . .***
the park receives no requests or protests over the deaccession within 45 days of publication,	the superintendent signs the deaccession form and the exchange agreement or conveyance (donation) agreement and deaccessions the objects.
the published notice produces requests or protests from other institutions or individuals,	the superintendent consults the collections advisory committee, as appropriate, and determines the recipient.

The superintendent determines the recipient based on the recipient's superior ability to preserve and protect the objects and make them available to the public. The superintendent may request evidence to this effect from the potential recipients (see Section K.5).

L. Outside SOCS Procedures

1. *How do I find non-NPS recipients?*

If other parks don't need the objects, explore the other dispositions in the order of preference in Section K.2. Use all reasonably available means to contact institutions that may be in a position to make an exchange.

To locate potential non-NPS recipients, the park may advertise in whatever way it can best reach potentially interested parties, including:

- the Clearinghouse listing on the NPS Museum Management Program World Wide Web site (see Section O for submission procedures)
- the AAM newsletter *Aviso* or other professional newsletters (the park must pay the costs of advertising)
- regional or local publications or listings, if appropriate

The notice should include:

- the intent to deaccession objects
- a list of the objects
- information on how to contact the park, such as a person to contact and phone number

Allow at least forty-five days from the date of publication for response. A longer period of time may be needed for complex transactions. The park and the potential recipient can negotiate for additional time.

Note: You will have to advertise a second time on the World Wide Web if

you find a recipient and intend to exchange objects outside the federal government or convey (donate) objects. See Sections K.8-K.11.

2. *How do I document a transfer?*

Use a Transfer of Property, DI-104 (Figure 6.10) to legally document a transfer. ANCS+ will print a completed transfer. Include a statement on the transfer to verify that the NPS owns the objects. The statement should note that there are no ownership or disposition restrictions on the objects.

Example of a title verification statement: The NPS certifies that it holds free and clear title to the subject property. The NPS may dispose of the property in any manner that it determines is appropriate and lawful.

For transfers within the NPS, the superintendents of both parks must sign the transfer. For transfers to other DOI bureaus or federal agencies, the park superintendent and the appropriate bureau or agency accountable officer must sign the transfer.

Keep the original documentation and give the recipient archival quality copies of the pertinent accession and catalog documentation. Give non-NPS recipients copies of only the documentation essential to future management of the object.

3. *What are some special considerations for exchanges?*

Before conducting an exchange, you must make sure that:

- the exchange is fair, justified, and in the public interest
- every effort has been made to keep museum objects in the public sector
- the objects received from the exchange fit the SOCS and are of a quality appropriate for the NPS museum collections
- there is a need for the objects received from the exchange and the park can adequately care for them

Consult the regional/SO curator before exchanging natural history specimens. Don't exchange type or voucher specimens.

4. *Can an exchange be unequal in monetary value?*

Yes. Objects in an exchange should be approximately equal in monetary value. However, it is sometimes appropriate to exchange NPS objects for objects of lesser monetary value. This situation might occur when the NPS has a great need for the objects and has been unable to get them elsewhere. You must fully describe such circumstances in the justification. Exchanging NPS objects for objects of greater value is also acceptable.

You must get formal, written appraisals for exchanges outside the federal government. You must get appraisals for both the objects you deaccession and the objects you acquire through an exchange. Get a minimum of one appraisal for objects below $20,000 in value. Get two appraisals for objects over $20,000 in value. See Section E.6.

5. *How do I document an exchange?*

You must document an exchange with a written legal agreement. You can print an exchange agreement from ANCS+. The superintendent and the bureau or agency accountable officer or owner sign the exchange agreement. See Figure

6.11 for a sample exchange agreement. You may create your own exchange agreement, but it must include the introduction and sections 1-9 of the sample exchange agreement.

6. *What documents do I attach to the exchange agreement?*

Attach these documents to the exchange agreement:

- a list of the non-NPS objects to be acquired
- a list of the NPS objects to be exchanged
- the required appraisals for exchanges outside the federal government (see Section E.6)
- a written and signed proof of ownership statement from the other party

Include a justification to show why the exchange is in the best interest of the NPS and the general public. Include a statement on the exchange agreement to verify that the NPS owns the objects and that there are no ownership or disposition restrictions on the objects. (See example statement in Section L.2.) Make every effort to acquire the copyrights for the materials you acquire in an exchange, especially if they are held by the current property owner. Document any and all restrictions clearly and spell out when such restrictions expire.

Refer to Chapter 2 in this handbook and the NPS *Museum Handbook*, Part III (*MH-III*), Chapter 2, Legal Issues, for information on copyrights.

Keep the original documentation and give the recipient archival quality copies of the pertinent accession and catalog documentation. Give non-NPS recipients copies of only the documentation essential to future management of the object.

7. *When do I post a World Wide Web notice of intent to exchange?*

If you are doing an exchange outside the federal government, you must post a 45-day notice of intent to exchange on the World Wide Web. Post the notice when you have found a recipient. Refer to Sections K.8-K.11 and Section O for additional information about the notice.

8. *How do I document a conveyance (donation)?*

Use a Conveyance (Donation) Agreement, Form 10-99 (Figure 6.13) to legally document the conveyance (donation) of museum objects to a private institution or non-federal governmental entity. You can print a completed conveyance (donation) agreement from ANCS+.

The superintendent signs for the park. The responsible official signs for the institution.

Keep the original documentation and give the recipient archival quality copies of the pertinent accession and catalog documentation. Give the institution copies of only the documentation essential to future manaagement of the object.

9. *When do I post a World Wide Web notice of intent to convey (donate)?*

All conveyances (donations) require a 45-day notice on the World Wide Web. Post the notice when you have found a recipient. Refer to Secitons K.8-K.11 and Section O for additional information about the notice.

10. *When can I use voluntary destruction or abandonment to deaccession museum objects?*

Before destroying or abandoning museum objects you must determine that they have no scientific, cultural, historic, educational, esthetic, or monetary value.

Generally, if you can't deaccession the objects through any other way, you can propose destruction or abandonment. The justification for this type of deaccession must include the steps you took to determine that the objects have

no value.

The NPS may not destroy or abandon objects that are outside a park's Scope of Collection Statement unless all other disposition methods have failed.

The collections advisory committee members must review all actions to destroy or abandon museum objects. The superintendent must approve and request destruction. In accordance with 41 CFR-101-45.902-2, the regional director, or other authorized reviewing official who is not directly accountable for the property, must approve abandonment.

11. *What are some special considerations for voluntary destruction or abandonment?*

Abandonment is a very rare action. Abandon objects only when destruction is not feasible. For example, a large piece of badly rusted mining equipment may be too large to move.

If the park abandons museum objects, the superintendent should take some type of mitigating action. For example, the park could place an explanatory sign by abandoned property. Such actions will counter potential public perception that the park is not properly caring for its resources.

As part of the destruction process, objects may be reduced to scrap, destroyed, or cannibalized and the remainder destroyed. Cannibalized parts are designated expendable personal property. They may be used for park maintenance providing that the use has no scientific, cultural, historical, educational, interpretive or esthetic purpose. For example, nuts and bolts may be cannibalized from a disintegrated wooden crate that has been approved for destruction. The park maintenance division may reuse the nuts and bolts. The wooden scraps are burned.

The superintendent, considering the recommendations of the collections advisory committee, may request a particular destruction process. The Board of Survey must recommend the process.

12. *How do I document voluntary destruction or abandonment?*

Follow the Board of Survey procedures in Section I of this chapter and the Personal Property Handbook No. 44.

Note: Section I of this chapter has information on voluntary destruction/ abandonment for objects within the park's SOCS. This is a different type of deaccession from voluntary destruction/abandonment of objects outside the park's SOCS. The Board of Survey procedures for both types of deaccession are the same.

M. Destructive Analysis

Refer to Sections D-F for processing, documenting, and tracking deaccessions.

1. *When do I deaccession objects under the destructive analysis category?*

Deaccession objects in this category only when the entire object is destroyed in analysis.

2. *Who approves destructive analysis?*

The superintendent may approve destructive analysis for research purposes for cultural resource collections when the object is common. The superintendent may approve destructive analysis for research purposes for natural resource collections when:

- the request is based on a professional research design that clearly documents the scientific need for the use of destructive analysis
- the specimen doesn't represent an extinct species or a type or voucher specimen

The regional director must approve all requests for destructive analysis that involve rare or significant objects, specimens, and archival items. The regional/SO curator should review such requests and arrange for review by appropriate discipline specialists.

3. *How do I document destructive analysis?*

Follow the Board of Survey procedures in Section I of this chapter and the *Personal Property Management Handbook No. 44*.

4. *Where can I find information on destructive analysis?*

For guidelines on destructive analysis, refer to:

- Section V of Chapter 4 in this handbook
- *Cultural Resource Management Guideline,* Chapter 9

N. Native American Graves Protection and Repatriation Act (See Flow Chart Figure 6.5)

Refer to Sections D-G for processing, documenting, tracking, and packing and shipping deaccessions.

The NPS may deaccession museum collections in compliance with the Native American Graves Protection and Repatriation Act (NAGPRA) of 1990 [25 U.S.C. §§ 3001-3013].

1. *What types of items are subject to NAGPRA?*

Lineal descendants, Indian tribes, Native Hawaiian organizations and Alaska Native villages and corporations may request the repatriation of certain:

- human remains
- associated funerary objects
- unassociated funerary objects
- sacred objects

- objects of cultural patrimony

To determine which items are eligible for deaccessioning by repatriation, refer to:

- definitions of NAGPRA categories outlined in the statute (items *must* fit the definitions to be considered for repatriation)

- *Cultural Resource Management Guideline,* Appendix R: NAGPRA Compliance

2. *Who can request repatriation?*

The request for repatriation must be from a lineal descendant or an official representative of an Indian tribe, Native Hawaiian organization or Alaska Native village or corporation. You must receive this request in writing or document it in writing.

3. *How do I respond to requests for summary items?*

Summaries are written descriptions of collections that may have unassociated funerary objects, sacred objects, or objects of cultural patrimony. Parks prepared summaries in compliance with NAGPRA. The NPS sent summaries to tribes, Native Hawaiian organizations, and Alaska Native villages and corporations in 1993.

Requests for summary items must include evidence supporting the claim.

On receiving a request for repatriation, you should notify and consult with the regional/SO curator. See Section N.5. Give the regional/SO curator the available documentation that includes:

- a copy of the request for repatriation

- copies of accession and catalog records

- completed affiliation data that:

  - identifies and supports the claim of the lineal descendant, Indian tribe, Native Hawaiian organization, or Alaska Native village or corporation with whom the items are culturally affiliated

  - includes information on how the cultural affiliation was determined

  - includes a list of consultations conducted with relevant Indian tribes, Native Hawaiian organizations or Alaska Native villages or corporations

4. *How do I respond to requests for inventory items?*

Inventories are item-by-item descriptions of human remains and associated funerary objects. The NPS completed inventories of human remains and associated funerary objects by November 16, 1995.

When you receive a repatriation request for an inventory item from the culturally affiliated tribe(s), you should notify the regional/SO curator.

Prepare the deaccession package as noted in Section N.6. For inventory items:

- the regional/SO staff have already recommended a cultural affiliation

- the superintendent has already approved cultural affiliation

5. *Who does the regional/SO curator consult about repatriations?*

The regional/SO curator should consult with the regional/SO archeologist, ethnographer, NAGPRA coordinator, or NAGPRA committee. These staff make recommendations concerning the repatriation. Record their recommendations in the Notes field of the ANCS+ Deaccessions associated module.

6. *What do I include in the deaccession package?*

You prepare the deaccession package. In addition to the documentation listed in Section E.3, the package must contain:

- the request for repatriation or documentation of the request
- completed cultural affiliation data as described in Section N.3
- a repatriation agreement or equivalent (see optional sample, Figure 6:12)
- the regional/SO recommendation, as appropriate

Make a recommendation to approve or disapprove the repatriation request. You can print a repatriation agreement from ANCS+. You then forward the deaccession package to the superintendent.

Note: You can't recommend against repatriating inventory items.

7. *What does the superintendent do with the deaccession package?*

The superintendent must:

- review the park and regional/SO recommendations, as appropriate
- approve or disapprove the repatriation of summary items (the superintendent can approve all or selected items for repatriation)
- approve repatriation of inventory items
- prepare a written response to the requester

By including items in the NAGPRA inventory, the superintendent has approved repatriation of those items to the culturally affiliated tribes. The superintendent can't disapprove repatriation of items listed in the NAGPRA inventory.

8. *What happens to disapproved requests?*

The superintendent may disapprove the repatriation on the grounds that:

- the items do not fit NAGPRA definitions
- the individual or group making the claim doesn't have standing to make such a claim (is not on the list of recognized tribes maintained by the National NAGPRA Program for the purposes of implementing NAGPRA)
- no relationship of shared group identity can be traced between the present-day Indian tribe and the affiliated cultural group associated with the item
- there is insufficient documentation to support the claim

The superintendent must notify the requester of this decision in writing. See Section F.1 on filing disapproved deaccessions. The individual or tribe can appeal decisions to the NAGPRA Review Committee. Refer to the *Cultural Resource Management Guideline*, Appendix R: NAGPRA Compliance.

Note: A Web-based database provides NAGPRA contacts for the federally recognized tribes. The Bureau of Indian Affairs web site at <http://www.cr.doi.gov/bia/tribes/entry.html> provides access to the database.

9. *What happens to approved requests?*

The superintendent may approve the repatriation but must inform the requester of the 30-day Federal Register notice requirement. See Section N.10. All approved repatriations must identify the federally recognized tribe in the Affiliated Tribes field of the ANCS+ NAGPRA supplemental record.

After the 30-day Federal Register notice and the resolution of any claim disputes:

- the superintendent signs the deaccession form and repatriation agreement
- the recipient(s) signs the repatriation agreement and receives the repatriated items

10. *What is the Federal Register notice?*

The Federal Register notice is a NAGPRA requirement.

Repatriation cannot take place until at least thirty days after a notice of intent to repatriate has been published in the Federal Register.

If the superintendent approves the request for repatriation, he or she sends:

- a notice regarding the proposed repatriation of museum items to the Manager, Archeology and Ethnography Program, National Center for Cultural Resources, for publication in the Federal Register

To make sure that no counter claims have been received, contact the regional/SO curator or NPS NAGPRA coordinator.

If. . .	*Then. . .*
no additional claims are received within 30 days of publication,	the park repatriates the items.
the published notice produces additional claims,	the claimants settle the dispute, and the park repatriates the items.
the claimants don't settle the dispute,	the NAGPRA Review Committee reviews and resolves the dispute. Repatriation cannot occur until the committee resolves the dispute.

All the NAGPRA notices of repatriation published in the Federal Register and inventory completion appear on the web at <http://www.cr.nps.gov/nagpra/>.

Note: The NAGPRA Review Committee is a statutorily established panel of seven private citizens. The committee is charged with facilitating the resolution of NAGPRA-related disputes nationwide.

11. *Are there time limits for responding to a repatriation request?*

Yes. The requested repatriation is to take place within 90 days of the initial request if:

- the objects meet the NAGPRA definitions (refer to the NPS NAGPRA consultation guidelines in the *Cultural Resource Management Guideline*, Appendix R: NAGPRA Compliance), *and*
- appropriate supporting documentation is available, *and*
- the proposed repatriation is approved

12. *What documentation should I give to the recipient?*

Keep the original documentation and give the recipient archival quality copies of the pertinent accession and catalog documentation.

Send a copy of the deaccession form or repatriation agreement to the central NAGPRA file maintained by the Museum Management Program, National Center for Cultural Resources. This copy is for informational purposes only. Send it to Museum Management Program, National Park Service, 1849 C Street, NW, Room NC230, Washington, DC 20240, Attn: Chief Curator.

O. NPS Clearinghouse Services

1. Can the NPS Clearinghouse help parks with deaccessions?

Yes. The NPS Clearinghouse, administered by the Museum Management Program, National Center for Cultural Resources, can help parks with deaccessions by:

- giving advice on deaccession procedures and assistance in preparing deaccession transactions
- helping you to locate potential recipients for museum objects that are outside your park's Scope of Collection Statement
- advertising objects throughout the NPS and to non-NPS institutions
- giving advice on appraisals and lists of appraisers

2. *How does the NPS Clearinghouse advertise objects for deaccession?*

The NPS Clearinghouse uses various means to advertise objects outside a park's Scope of Collection Statement. These include the *Clearinghouse Classifieds* newsletter and a World Wide Web listing.

By advertising through the Clearinghouse, you can determine whether objects are needed by other parks before deaccessioning them outside the NPS. The Clearinghouse newsletter also allows you to advertise to many non-NPS subscribers.

Use the Clearinghouse World Wide Web listing to advertise for non-NPS recipients. See Section L.1. You must use this listing to advertise your intent to exchange or convey (donate) outside the federal government. See Sections K.8-K.11.

Note: The NPS Clearinghouse doesn't accept physical custody of museum objects.

3. *How do I send information to the Clearinghouse newsletter?*

Send information to the NPS Clearinghouse newsletter (*Clearinghouse Classifieds*) to advertise for NPS and non-NPS recipients.

Send information to: NPS Clearinghouse
Bombshelter, Filmore Street
Harpers Ferry, WV 25425
Phone: 304-535-6204
Fax: 304-535-6203

Send electronic copy to: WASO National Catalog Office

The *Clearinghouse Classifieds* is published twice a year. Advertisements are free.

4. *May I post information about potential deaccessions on the Curatorial Bulletin Board?*

Yes. You may post information directly on the Curatorial Bulletin Board in cc:Mail to advertise for NPS recipients.

5. *How do I publish notices on the Clearinghouse World Wide Web listing?*

Send electronic submissions in an attached file, using the current NPS software, via cc:Mail to "Clearinghouse-WWW". Refer to the appropriate sections below for what to include in the notice. The NPS Museum Management Program World Wide Web site is at <http://www.cr.nps.gov/csd/>.

For publishing notices to advertise for NPS recipients, see Section L.1.

For publishing a notice of intent to deaccession objects by conveyance (donation) or exchange outside the federal government, see Sections K.8-K.11.

P. List of Figures

\+ Print these forms from ANCS+.

* You must use the Deaccession Form (Form 10-643) for all deaccessions. You must use the Transfer of Property (DI-104) for all transfers between federal entities. You must use the Conveyance (Donation) Agreement (Form 10-99) for all conveyances (donations).

Exchange Agreement

In accordance with the authority granted to the Secretary of the Interior by the Museum Act of 1955 (16 USC, Sect. 18 [f]), and in consideration of the mutual promises set forth in this Agreement, the National Park Service and _____ (other party) enter into this agreement for the exchange of museum objects.

1. _____ (NPS Unit) hereby becomes the owner of the objects listed on the first attached inventory (Attachment 1 of this Agreement). _____ (other party) hereby becomes the owner of the objects listed on the second attached inventory (Attachment 2 of this Agreement).

2. _____ (other party) represents and warrants that he/she/they will possess clear title, free of all liens, claims, and encumbrances of any kind, to the objects listed in Attachment 1 at the time the exchange takes place. If at the time the exchange is to occur _____ (other party) is unable to present the objects listed on Attachment 1 and proof of ownership for the said objects he/she/they is/are exchanging, the National Park Service is under no obligation to complete the exchange.

3. _____ (other party) represents and warrants that the objects listed on Attachment 1 were secured in compliance with all applicable International, Federal and State laws. Documentation evidencing the source of acquisition of the objects listed on Attachment 1 will be attached to this Agreement at the time the exchange takes place (Attachment 3).

4. _____ (other party) represents and warrants that the objects listed in Attachment 1 have been authenticated and appraised in writing, at market value, by at least one objective appraiser within six months previous to the date of this agreement. Copies of the appraisals for the NPS and non-NPS items are attached to this Agreement (Attachment 4).

5. _____ (other party) represents and warrants that he/she/they is/are the sole owner(s) of all rights in the objects listed on Attachment 1. _____ (other party) hereby assigns in _____ (NPS unit) all of _____ (other party) common law and statutory copyrights to the objects listed in Attachment 1. _____ (other party) agrees to indemnify _____ (NPS unit) against any claims, damages, losses, or expenses of any kind that _____ (NPS unit) may suffer as a result of any infringement or alleged infringement of the copyrights to _____ (NPS unit).

6. Title to the objects exchanged under this agreement shall pass when the objects have been delivered pursuant to the terms of this Agreement and the parties have inspected the objects and found them to be in a satisfactory condition and are as represented in this Agreement. Inspections of the objects shall occur on the date of delivery.

7. As provided by 41 U.S.C. §§ 22, no member of or delegate to Congress, or Resident Commissioner shall be admitted to any share or part of this Agreement or to any benefit that might arise therefrom; but this provision shall not be construed to extend to this Agreement if made with a corporation for its general benefit.

8. No NPS employee or members of a NPS employee's immediate family shall be admitted to any share or part of this Agreement or to any benefits that may arise therefrom.

9. The exchange of all firearms must be in compliance with all state and local law enforcement regulations related to the acquisition of firearms. Upon consummation of this Agreement, the National Park Service shall not be liable for any action related to the use of firearms described within the Agreement.

10. The National Park Service will pay all costs of transporting and insuring the objects listed on Attachment 2 to _____ (address).

Exchange Agreement (Continued)

11. The parties agree that the physical transfer of all objects covered by this Agreement will occur on or before _____ (date) and that time is of the essence to this Agreement. If _____ (other party) fails to deliver the objects listed on Attachment 1 to the agreed-upon place of delivery by the date given in this paragraph, the National Park Service may, at its option, terminate this Agreement, recover any objects which it may have delivered pursuant to this Agreement and sue for damages for undue delay of the performance of this Agreement or for specific performance of this Agreement. _____ (NPS unit) remedies hereunder are not exclusive and _____ (NPS unit) retains the right to pursue any and all legal remedies available to it for the breach of this Agreement.

12. Catalog information on all NPS objects incorporated under this Agreement is included by reference to the NPS catalog number listed on Attachment 2.

Repatriation Agreement

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) provides definitions and procedures for the repatriation of certain Native American human remains and cultural items, as defined in 25 U.S.C. 3001-3013, in the possession of federal agencies and museums that receive federal funds to lineal descendants, Indian tribes, and native Hawaiian organizations; and

The representatives of the National Park Service _____[NPS unit] have engaged in consultation with representatives of _____[The TRIBE] to determine the applicability of these definitions and procedures to objects currently in the possession of the National Park Service _____[NPS unit].

The National Park Service _____ [NPS unit] and _____ [The TRIBE] do hereby agree to the following:

1. That _____ [The TRIBE] is recognized as eligible for the special programs and service provided by the United States to Indians because of their status as Indians, and thus has status to make a claim for repatriation under NAGPRA;

2. That all cultural items described on the attached list meet the criteria outlined in the Native American Graves Protection and Repatriation Act of 1990 (25 USC 3001-3013) and 43 CFR 10.2 (b), such that:

   a. all *human remains* are of Native American ancestry and do not include remains or portions of remains freely given by the individual from whose body they were obtained;

   b. all *funerary objects* are known or reasonably believed to have been placed intentionally at the time of death or later with or near individual human remains;

   c. all *sacred objects* are specific objects needed by traditional Native American religious leaders for the current practice of traditional Native American religions by their present-day adherents;

   d. all *objects of cultural patrimony* have ongoing historical, traditional, or cultural importance central to _____ [The TRIBE], rather than to an individual tribal member and, as such, may not be alienated, appropriated, or conveyed by an individual Tribal member; and such object shall have been considered inalienable at the time the object was separated from _____ [The TRIBE];

3. That all cultural items described on the attached inventory were produced or used by an identifiable earlier group;

4. That evidence exists of a shared group identity that can be reasonably traced between _____ [The TRIBE] and the earlier group;

5. That a Notice of Inventory Completion concerning the human remains or associated funerary objects, or a Notice of Intent to Repatriate concerning unidentified funerary objects, sacred objects or objects of cultural patrimony described on the attached list has been published in the *Federal Register*. In the time since that publication [at least thirty days] neither the National Park Service _____ [NPS unit] nor _____ [The TRIBE] has become aware of any competing claim;

6. That, effective on the date of execution of this Repatriation Agreement, the National Park Service _____ [NPS unit] transfers to _____ [The TRIBE] all responsibility associated with the items described on the attached inventory.

7. That this Repatriation Agreement releases the National Park Service from any future claims by _____ [The TRIBE] regarding the objects described on the attached inventory.

Collections Advisory Committee Procedures

Committee Purpose

In keeping with National Park Service policies for preserving and protecting cultural and natural resources, (park name) has established a collections advisory committee to review the following types of deaccessions from the park's museum collection:

- transfers to non-DOI federal agencies
- conveyances (donations)
- exchanges outside DOI (excluding exchange of natural history specimens)
- voluntary destruction/abandonment of museum objects

The committee will advise the superintendent regarding the appropriateness of deaccessions and dispositions. The committee will be guided by the NPS policies and procedures set forth in the *Museum Handbook*, Part II, Chapter 6, Deaccessioning. Establishment of this committee should ensure that the above deaccession transactions are fair, open, and in the best interests of the public.

Committee Structure

Policy requires that the collections advisory committee at (park name) will consist of a minimum of two members. One member will be a curator at or above the GS-11 level. The other members of the committee will not be under the supervision of the curator. No maximum number of members is required on the committee. Members may be from outside the park, but all members must be federal employees. The superintendent will choose other members of the committee from park or center resource and interpretation specialists. Individuals who aren't federal employees may be consulted on a case by case basis, as necessary.

The superintendent will select which members of the committee will review a particular deaccession and appoint a lead committee member. The size of the committee may vary, depending on the subject matter and the complexity of the deaccession(s), but each review must involve the curator (GS-11 or higher) and one other member.

Committee Members

The collections advisory committee at (park name) will consist of the following specialists:

Curator (Lead)
Archeologist
Chief Interpreter
Cultural Resource Specialist

Committee Procedures

The committee meets as needed. The lead committee member distributes copies of the deaccession package(s) to other members, including non-federal individuals who aren't on the committee. The lead committee member schedules the meeting and documents the meeting (date, location, names of attending members). He or she attaches each committee member's review comments, and the comments of non-federal specialists, to the deaccession package and forwards it to the superintendent.

Each member receives a copy of the deaccession package(s) for review prior to the meeting. Members should be familiar with Chapter 6, Deaccessioning, in the *Museum Handbook*, Part II. Committee members may consult with subject matter specialists who are not on the committee regarding specific actions. Each committee member must record his or her comments on the review form and document any consultations with other specialists. The lead committee member forwards the comments to the superintendent.

Appendix A: Mandates and Standards for NPS Museum Collections

APPENDIX A: MANDATES AND STANDARDS FOR NPS MUSEUM COLLECTIONS MANAGEMENT

A. Overview

In this appendix you will find information on:

- appropriate laws, regulations, and conventions related to NPS museum collections
- governmentwide and departmental standards related to NPS museum collections
- NPS management policies and servicewide standards for museum collections
- mandates and policies for NPS integrated pest management programs

B. Laws, Regulations, and Conventions – NPS Cultural Collections

1. *Laws related to NPS cultural collections*

These laws provide the legal mandates for NPS management of museum collections.

- Act for the Preservation of American Antiquities, June 8, l906 ("The Antiquities Act") (16 USC 431-433):
  - authorizes the President to declare national monuments to protect sites and objects
  - authorizes federal departments to grant permits for survey and excavation and to enforce protection of archeological sites and objects under their jurisdiction
  - requires that excavated materials be permanently preserved in public museums
- Organic Act of 1916 (16 USC 1 et seq.):
  - authorizes the creation of the National Park Service
  - states that the mission of the NPS is "...to conserve the scenery and the natural and historic objects...therein and to provide for the enjoyment of the same in such a manner and by such means as will leave them unimpaired for the enjoyment of future generations"
- Historic Sites Act of 1935 (16 USC 461-467) authorizes the Secretary of the Interior through NPS:
  - to preserve and maintain objects of national historical or archeological significance
  - to establish and maintain museums
- Museum Properties Management Act of 1955, as amended (16 USC, Sect. 18 [f]) authorizes the Secretary of the Interior through NPS:

- to acquire collections through donation, bequest, and purchase and through transfer from other federal agencies

- to exchange collections

- to accept and make loans of museum collections

- to deaccession collections by transfer to qualified federal agencies, conveyance (donation) to qualified tax exempt private institutions and non-federal governmental agencies, and destruction

See Figure A.1 for the complete text of this law.

- Reservoir Salvage Act of 1960, as amended (16 USC 469 - 469C):

  provides for the recovery and preservation of "historical and archeological data (including relics and specimens)" that might be lost or destroyed as a result of the construction of dams and reservoirs.

- Archeological and Historic Preservation Act of 1974 (16 USC 469-469C):

  extends the application of the Reservoir Salvage Act of 1960 to recover and preserve "historical and archeological data (including relics and specimens)" that might be lost or destroyed as a result of any federal construction project or federally-licensed activity or program.

- National Historic Preservation Act of 1966, as amended (16 USC 470 - 470t, Sect. 110):

  directs the Secretary of the Interior to issue regulations that ensure that significant prehistoric and historic artifacts, and associated records, subject to Section 110 of this Act, the Reservoir Salvage Act (as amended), and the Archaeological Resources Protection Act are deposited in an institution with adequate long-term curatorial capabilities.

- Archaeological Resources Protection Act of 1979 (ARPA) (16 USC 470aa-mm):

  - defines archeological resources as any material remains of human life or activities that are at least 100 years of age, and which are capable of providing scientific or humanistic understandings of past human behavior, cultural adaptation, and related topics through the application of scientific or scholarly techniques

  - requires that a permit be obtained before conducting archeological studies on public and Indian lands

  - requires that information on the nature and location of resources on public and Indian lands remain confidential if its release may harm the resources

  - establishes civil and criminal penalties for the excavation, removal, or damage of resources on public and Indian lands without a permit (materials lawfully acquired prior to the passage of the law are not subject to the penalties)

- requires that materials excavated from public lands and Indian lands and associated records be preserved in a suitable repository

- gives the Secretary of the Interior authority to issue regulations for the proper curation of federally-owned and administered archeological collections

- American Indian Religious Freedom Act of 1978 (42 USC 1996):

  - reaffirms the constitutional right of "freedom to believe, express, and exercise the traditional religions of the American Indian, Eskimo, Aleut, and Native Hawaiians, including but not limited to access to sites, use, and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites"

- Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 USC 3001-13):

  - states that lineal descendants or culturally affiliated Indian tribes or Native Hawaiian Organizations may claim ownership or control of Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony that are excavated or discovered on federal or tribal lands after passage of the law

  - establishes criminal penalties for trafficking in remains or objects obtained in violation of the law

  - requires federal agencies and museums that receive federal funding to inventory Native American human remains and associated funerary objects in their possession or control and identify their cultural and geographical affiliations within 5 years

  - requires federal agencies and museums that receive federal funding to prepare summaries of information about Native American unassociated funerary objects, sacred objects, or objects of cultural patrimony within 3 years

  Note: The inventories and summaries provide for repatriation of items when lineal descendants or Native American groups request it.

- National Parks Omnibus Management Act of 1998 (16 USC 5937) Sec. 5937:

  - establishes the confidentially of sensitive information regarding certain types of museum objects and other resources

  - mandates a program of inventory and monitoring for NPS resources

  - allows the withholding of information (in response to a Freedom of Information Act request) on the nature and specific location of resources (specimens) that are endangered, threatened, rare, or commercially valuable, mineral or paleontological, and of objects of cultural patrimony

2. *Regulations related to NPS cultural collections*

The following regulations include major requirements for NPS museum collections management. Many other regulations may apply in specific situations.

- 43 CFR Part 3 “Preservation of American Antiquities” (implementing regulations for the Antiquities Act):

  - authorizes federal land managers to seize materials recovered illegally from archeological resources located on federal lands

  - directs federal land managers to dispose of seized materials by depositing them in the proper national depository or by other means

  - requires that every collection recovered under the Antiquities Act be preserved in the public museum designated in the Antiquities Act permit, and be accessible to the public

  - states that the Secretary of the Smithsonian Institution must approve in writing the removal (deaccession) of an Antiquities Act collection

  - mandates that deaccessioned Antiquities Act collections must be transferred to another public museum

  - requires that an Antiquities Act collection revert to the national collections whenever a museum holding such collections ceases to exist

- 43 CFR Part 7 “Protection of Archeological Resources: Uniform Regulations”:

  - requires that repositories proposed by ARPA permit applicants to certify in writing their willingness to assume curatorial responsibility for the collections

  - requires that, for resources located on public lands, repositories must certify that they will safeguard and preserve the collections as property of the United States

  - requires that ARPA permit applicants certify that, not later than 90 days after the final report is submitted to the federal land manager, the collections will be delivered to the repository named in the ARPA permit

  - requires that federal land managers specify in ARPA permits the name of the repository in which collections are to be deposited

  - states that archeological resources excavated or removed from public lands remain the property of the United States

  - states that archeological resources excavated or removed from Indian lands remain the property of the Indian or Indian tribe having rights of ownership over such resources

  - authorizes the Secretary of the Interior to issue regulations for the curation of federally-owned and administered collections. In the absence of such regulations Federal land managers are authorized to provide for the exchange of collections among suitable repositories

  - restates the confidentiality requirement specified in ARPA

- 36 CFR Part 79 “Curation of Federally-Owned and Administered Archeological Collections”:

- states the responsibilities of federal agencies to manage and preserve collections

- identifies methods for federal agencies to use to secure and fund curatorial services

- states terms and conditions for federal agencies to include in contracts, memoranda, agreements, and other written instruments with repositories for curatorial services

- establishes standards for federal agencies to use to determine when a repository has the capability to provide long-term curatorial services

- provides guidelines for collections use

- specifies procedures and guidelines for conducting periodic inspections and inventories of collections

3. *International Conventions related to NPS cultural collections*

The following international convention applies to NPS cultural collections.

- 1970 UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (implemented in the United States by P.L. 97-446 in 1983, 19 USC 260l). Signatory nations agree to work to prevent the import of and trade in archeological and ethnographic materials (when requested) and in stolen cultural collections. This convention:

  - was ratified by the United States and 90 other nations by 2000.

  - provides protection for archeological and ethnographic materials when the home nation requests that other signatories not import these materials. (As of 2000, Bolivia, Cambodia, Canada, Cyprus, El Salvador, Guatemala, Mali, and Peru have had such requests approved.)

  - provides protection for stolen property, including cultural and natural history collections, that have been taken from a museum or public institution (including churches, monuments, and archeological sites) To be covered, the materials must have been previously inventoried as part of the institution's collection.

  - exempts objects imported for temporary exhibits

  Note: The United States and France are the only major art-importing countries to sign the convention to date; Canada, Korea, and Australia are also signatories. It is enforced in the United States by the Customs Service.

4. *Contacts for laws, regulations, and conventions – NPS cultural collections*

Direct questions relevant to laws and regulations about cultural collections to the regional/support office (SO) curator, the regional archeologist, historian, archivist, and ethnographer.

C. Laws, Regulations, and Conventions – NPS Natural History Collections

1. *Laws related to NPS natural history collections*

These laws relate to NPS natural history collections.

- Lacey Act of 1900 (18 USC 43-44):
  - makes the violation of any state, federal, or foreign wildlife law a federal offense
  - places stipulations on the importing and labeling of wildlife and their parts
  - poses complex problems for museums in relation to the acquisition and deaccession of wildlife materials and the sale of wildlife materials in museum shops because it is hard to prove the legal history of such pieces
  - requires proof of intentional violation for enforcement, but ignorance of the relevant state, federal, or foreign statutes is not excusable.

  Note: The Black Bass Act of 1930 (16 USC 851) added fish to the list of wildlife under the Lacey Act.

- Migratory Bird Treaty Act of 1918 (16 USC 703-711):
  - protects birds flying between the United States and Canada, Mexico, and Japan
  - covers all wild, native birds not legally hunted by state law
  - clarifies that some non-native species may be covered by state law and, therefore, by the Lacey Act
  - makes it illegal to kill, capture, collect, possess, buy, sell, ship, import, or export listed species including their parts, nests, and eggs
  - allows museums and non-commercial institutions to get permits for legal possession, collection, and transportation of objects, but permits impose extensive record-keeping requirements
  - states that only museums and other specified institutions can purchase any protected bird or part thereof, and the seller must possess a federal permit for a legal sale

- Bald Eagle Protection Act of 1940 (16 USC 668a), amended in 1962 to include golden eagles:
  - prohibits taking, buying, selling, trading, possession, importation or exportation of eagles or their parts, nests, eggs, or products made of

them

- authorizes permits for taking, possessing, and transporting eagles and their parts for scientific, exhibition, and Native American religious purposes

- exempts possession and transportation of eagles held prior to the law

- requires permits for any materials acquired by museums after the law was established

- Marine Mammal Protection Act of 1972 (16 USC 1361-1407):

  - places a moratorium on the killing of marine mammals by United States citizens

  - restricts the possession, sale, purchase, importation, or transportation of the animals and their products and parts

  - requires permits for exhibiting marine mammals and their parts and for holding them in storage.

  - allows Native peoples to use such parts for the manufacture and sale of handcrafts as long as the sale is handled by a licensed dealer

  - exempts museums from permit requirements for pre-Act materials or to purchase legitimate handcrafts, although they should consider getting permits for all other marine mammal materials.

- Endangered Species Act of 1973, as amended (16 USC 1531-1543):

  - prohibits harassing, harming, or killing listed species

  - prohibits the purchase, sale, or use of listed species or parts thereof in the course of an interstate commercial activity. Intra-state transactions are allowed if pre-Act ownership can be proven.

  - doesn't apply to fossils and objects greater than 100 years old, but age must be verified

  - requires park museums to have a permit to purchase more recent objects that contain parts of endangered or threatened species

  - allows gifts of endangered or threatened specimens to museums if there is proof of pre-Act ownership and if the objects have not been offered for sale since the date of this law.

  - allows loans or gifts between educational institutions. In such instances permits are not required, even if the objects cross state lines.

2. *Regulations related to NPS natural history collections*

The following regulations apply to NPS museum collections.

- 36 CFR, Section 2.5 (Revision effective April 30, 1984), "Research Specimens" Section 2.5(g) states: "Specimen collection permits shall contain the following conditions:

  - Specimens placed in displays or collections will bear official National Park Service museum labels and their catalog numbers will

be registered in the National Park Service National Catalog.

- Specimens and data derived from consumed specimens will be made available to the public and reports and publications resulting from a research specimen collection permit shall be filed with the superintendent."

Note: A revision to 36 CFR 2.5 is in progress.

- 50 CFR, Sections 17.11 and 17.12, "Endangered and Threatened Wildlife and Plants." These annually revised sections provide lists of names of all the species of wildlife and plants determined to be endangered or threatened.

3. *International conventions related to NPS natural history collections*

The following international convention applies to NPS natural history collections.

- Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES):

  - protects endangered species of plants and animals by regulating imports and exports

  - was ratified by the United States in 1974, and by 150 other nations by 2000

  - allows for certificates of exemption for the import or export of items acquired before CITES, and for non-commercial exchange between institutions

  - is enforced in the United States by the Fish and Wildlife Service

  - includes three appendices that protect materials of varying degrees of scarcity:

    Appendix I. Species are in danger of extinction and there is no commercial trade in them. Any international transport of these materials requires permits from both the exporting and importing nations.

    Appendix II. Species require strict regulation to prevent the danger of extinction and/or look like Appendix I species. Permits for international transport are issued by the exporting nation, and are allowed for any purpose not detrimental to the species.

    Appendix III. Species are protected only within their native countries. They require permits for export even if they are plentiful elsewhere.

4. *Contacts for laws, regulations, and conventions – NPS natural history collections*

Direct questions relevant to the Endangered Species Act, and other laws and regulations about natural history collections to the regional/support office curator and the regional chief of natural resources management (or equivalent).

For information on CITES and other wildlife laws, including procedures and applications for getting permits to have endangered or threatened wildlife and plants in a park's museum collection, contact:

D. Policies and Standards

1. *Governmentwide and departmental policies and standards related to NPS museum collections*

The following governmentwide and departmental policies and standards apply to NPS museum collections:

- 41 CFR 101 Federal Property Management Regulations (FPMR) prescribes regulations, policies, procedures, and delegations of authority about the management of federal property.

- Interior Property Management Regulations, *Departmental Manual* Part 410, Personal Property Management (Subpart 114-60):

  - prescribes policies, procedures, and responsibilities governing the receipt, accountability, record-keeping, management, and survey of personal property in the Department of the Interior (DOI)

  - applies to all personal property acquired by all DOI bureaus and offices

  - ensures the safeguarding of government property against waste, fraud, and abuse

  - references the management of museum collections, noting exceptions to normal property procedures. These references are summarized in Figure A.2.

- *Departmental Manual* Part 411, Museum Property Management, Chapters 1-3:

  - defines the types of museum property

  - establishes organizational responsibilities, policies, and standards for the preservation, protection, and documentation of museum property

  - establishes organizational responsibilities for developing plans to implement these policies and standards

  - identifies mandatory procedures, reports, and data

- *Departmental Manual* Part 517, Chapter 1, Pesticide Use Policy,

outlines the pesticide use policy of the Department of the Interior. It is the policy of the Department:

> "To use pesticides only after full consideration of alternatives - based on competent analyses of environmental effects, safety, specificity, effectiveness, and costs. The full range of alternatives including chemical, biological, and physical methods, and no action will be considered. When it is determined that a pesticide must be used in order to meet important management goals, the least hazardous material that will meet such goals will be chosen."

2. *NPS management policies for museum collections*

Excerpts from NPS *Management Policies* (1988) that are specifically relevant to museum objects are as follows (chapter and page references appear in parentheses). This section will be updated when the revised *Management Policies* is issued (anticipated fall 2000).

Chapter 5 - Cultural Resource Management

Inventories (Page 5:1)

> "The following cultural resource inventories will be maintained for the national park system: …(3) a National Catalog of Museum Objects encompassing all cultural and natural history objects in NPS collections."

Preservation of Data and Collections and Protection of Research Potential (Page 5:3)

> "Field data, objects, specimens, and features of structures retrieved for preservation during cultural resource research and treatment projects, together with associated records and reports, will be managed within the park museum collection. Where practical, the features of sites and structures will be left in place."

Treatment of Museum Objects (Pages 5:9-10)

> "Preservation. A museum object will be preserved in its present condition through ongoing preventive conservation if (1) that condition is satisfactory for exhibit or research, or (2) another treatment is warranted but cannot be accomplished until some future time. Interventional measures will be taken when preventive conservation measures are insufficient to reduce deterioration to a tolerable level, or when the object is so fragile as to be endangered under any circumstances. Intervention will be minimized to reduce the possibility of compromising the object's integrity.
>
> Restoration. A museum object may be restored to an earlier appearance if (1) restoration is required for exhibit or research purposes, (2) sufficient data exist to permit restoration with minimal conjecture, and (3) restoration will not modify the object's known original character. Restoration will be accomplished using the techniques and materials that least modify the object and in such manner that the materials will be removable at a later time with minimal adverse effect. Restored areas will be distinguishable from original material and documented. Restoration will take into account the possible importance of preserving signs of wear, damage, former maintenance, and other historical and scientific evidence.

Reproduction. Museum objects needed for interpretive presentations will be reproduced for such use when the originals are unavailable or would be subject to undue deterioration or loss. The National Park Service will observe copyright laws with respect to reproduction."

Acquisition, Management, and Disposition of Museum Objects (Page 5:10)

"Objects and related documentation essential to achieving the purposes and objectives of the parks will be acquired and maintained in accordance with approved Scope of Collection Statements for each park. Archeological objects systematically collected within a park and natural history specimens systematically collected within a park for exhibit or permanent retention will be managed as part of the museum collection. Museum collection management and care will be addressed at all appropriate levels of planning.

Museum objects will be acquired and disposed of in conformance with legal authorizations and current NPS curatorial procedures. The National Park Service will acquire only collections having legal and ethical pedigrees, and each park will maintain complete and current accession records to establish the basis for legal custody of the objects in its possession. Museum catalog records will be prepared by each park to record basic property management data and other documentary information for museum objects. Objects will be inventoried in accordance with current procedures."

Historic Furnishings (Page 5:10)

"When the historic furnishings of a structure are present in their original arrangement, they will not be moved or replaced unless required for their protection or preservation, or unless the structure is designated for another use in an approved planning document. A structure may be refurnished in whole or in part if (1) its history is significantly related to a primary park theme, (2) refurnishing is the best way to interpret that history to the public, and (3) sufficient evidence of furniture design and placement exists to refurnish with minimal conjecture. Reproductions will be used only when prototypes exist to ensure the accurate re-recreation of historic pieces."

Archives and Manuscripts (Pages 5:10-11)

"Archival and manuscript collections are considered museum property and will be managed in ways that preserve them intact for the future while providing current access.

When an archival collection not owned by the National Park Service falls within a park's approved Scope of Collection Statement, every reasonable effort will be made to acquire it if (1) an appropriate storage facility will be provided by the Park Service or a cooperating institution, (2) the facility will be staffed by at least one archivist,

curator, librarian, or other person experienced in caring for documentary materials, and (3) the collection will be made available to serious researchers under conditions that maximize both preservation and use and ensure security against theft and vandalism.

Parks will retain notes or copies of records significant to their administrative histories when they periodically ship their official records to federal record centers."

Fire Detection and Suppression (Page 5:14)

"When warranted by the significance of a historic structure or of the museum objects in a nonhistoric structure, adequate fire detection, warning, and suppression systems will be installed. Fire-fighting personnel will be advised of any peculiarities or dangers inherent in a structure and any objects to be given priority for protection or rescue. Park personnel will receive training in fire prevention and suppression with hand-held extinguishers at historic structures and museums, and designated personnel will be trained to respond to all emergencies involving museum collections.

Smoking will not be permitted in spaces housing museum collections or in historic structures other than those adapted for modern residential and administrative uses."

Pest Management (Page 5:14)

"The National Park Service will follow the integrated pest management approach in addressing pest problems related to cultural resources. All feasible nonchemical methods will be exhausted before resorting to the use of chemicals. Any use of pesticides for cultural resources will conform to the NPS pesticide use policy."

Chapter 4 - Natural Resource Management

Natural Resource Collections (Page 4:4)

"Natural resource collections include nonliving and living specimens and associated field records. If placed in exhibits or retained in permanent collections, nonliving specimens and their associated field records will be cataloged into a park's museum collection. Management standards for such collections are specified in the *Cultural Resource Management Guideline* and the *Museum Handbook*."

Integrated Pest Management Procedures (Page 4:13)

Integrated pest management (IPM) procedures will be used to determine when to control pests and whether to use mechanical, physical, chemical, cultural, or biological means….

The choice to use a chemical pesticide will be based on a review by regional and Washington office coordinators of all other available options and a determination that these options are either not acceptable or not feasible; cost or staffing considerations alone will not be adequate justification for use of chemical control agents. Chemical pesticides that are not specifically exempt from reporting (regardless of who the applicator is) will be used only with prior approval by the

Director on an annual basis. The application of such pesticides is subject to the Federal Insecticide, Fungicide, and Rodenticide Act (7 USC 136 et seq.), Department of the Interior policies and procedures (DM 517),…Environmental Protection Agency regulations in 40 CFR, and Occupational Safety and Health Administration regulations."

Paleontologic Resource Management (Page 4:19)

"Management actions will be taken to prevent illegal collecting and may be taken to prevent damage from natural processes such as erosion. Protection may include construction of shelters over specimens for interpretation in situ, stabilization in the field, or collection, preparation, and placement of specimens in museum collections. The localities and geologic settings of specimens will be adequately documented when specimens are collected."

Chapter 7 - Interpretation and Education

Interpretation and Native Americans (Page 7:5)

"The National Park Service will not exhibit native American disinterred skeletal or mummified human remains or photographs or replicas of them. There will be no display of grave goods or other objects if native Americans who are culturally associated with them object to such exhibit. Associated native American tribes and groups will be consulted to determine the religious status of any object, the sacred nature of which is suspected but not confirmed, before it is exhibited or before any action is taken."

Chapter 8 - Use of the Parks

Research and Collection Activities (Pages 8:15-16)

"Research activities by non-NPS personnel that, in the superintendent's judgment, might disturb resources or visitors or that require the waiver of any regulation may be allowed in parks only pursuant to the terms and conditions of an appropriate permit. Scientific collecting activities that involve the removal of plants, animals, minerals, or archeological, historical, or paleontological objects will be allowed only if they are (1) proposed in conjunction with authorized research activities and (2) authorized and conducted in accordance with all applicable legislation, regulations, and guidelines…."

Chapter 9 - Park Facilities

Curatorial Facilities (Page 9:15)

"Park curatorial facilities should be adapted to the needs of each park. They may share space in visitor centers or administrative office buildings or be housed in completely separate buildings; however, incorporation with maintenance facilities should be avoided because of the heightened danger of fire, chemical spills, and similar accidents. Curatorial facilities will meet the collection's special requirements for security, fire suppression, and environmental controls."

Chapter 10 - Concessions Management

Merchandise and Handcrafts (Pages 10.8-9)

> "Concessioners may not sell merchandise that violates conservation principles. The sale of original prehistoric or historic archeological artifacts or vertebrate paleontologic specimens is prohibited. Clearly labeled replicas of such artifacts and specimens may be sold."

3. *NPS Director's Orders and guidance for museum collections*

Director's Orders supplement the NPS *Management Policies*. All Director's Orders are on the Web at <http://www.nps.gov/refdesk/DOorders/>.

Director's Order #28: Cultural Resource Management

Director's Order #28: Cultural Resource Management, is implemented through Release No. 5 of the *Cultural Resource Management Guideline* (1997). The *Cultural Resource Management Guideline* gives guidance on how to apply policies and standards. The *Cultural Resource Management Guideline* applies to museum objects and archival and manuscript collections that are housed in parks, archeological and preservation centers, and other NPS organizational units. Excerpts from this guideline follow:

Research

- Each park has an approved stand-alone Scope of Collection Statement defining the purpose and prescribing limits and use of its museum collection.

- Every museum object is accessioned as soon as it is in NPS custody and cataloged promptly thereafter. Paper museum records and ANCS+ magnetic media are kept in secure fire-resistant storage.

- All materials resulting from systematic research projects associated with an accession are housed at the same repository, except when on temporary loan for specific use elsewhere. Within that repository, objects and records composing an accession may be stored or filed separately from related objects and records to the extent required for security, fire protection, enhanced or reduced access, preservation, fiscal control, or exhibition.

- Each park has consulted with affected Native Americans on any acquisitions that involve human remains and associated funerary objects, unassociated funerary objects, sacred objects, or objects of cultural patrimony.

- Archival and manuscript collections are surveyed, appraised, accessioned, cataloged, rehoused, arranged, and described according to procedures and guidelines contained in the *Museum Handbook*, Part II, Appendix D.

- Archival and manuscript collections are arranged and described by or under the guidance of an archivist in accordance with professional standards and procedures. A preliminary finding aid is produced as described in the *Museum Handbook*, Part II, Appendix D.

- Museum objects not relevant to a park according to its SOCS are deaccessioned as permitted by current NPS procedures.

- Archeological objects and natural history specimens systematically collected within a park are deaccessioned only if lost or so deteriorated that they no longer have scientific value.

- Objects and archival and manuscript collections in a park's museum collection are made available to qualified researchers who can demonstrate a need to use them. Access is permitted under conditions

designed to ensure the security and preservation of the materials, including adequate staff supervision. Copyright is respected in accordance with guidance in the *Museum Handbook*, Part I, Chapter 2; the *Museum Handbook*, Part II, Chapter 2 and Appendix D.

- Each outgoing loan is documented by an outgoing loan agreement. All loaned museum objects are cataloged unless loaned to NPS repositories for collections management and storage purposes. Conditions for preserving, handling, and shipping and an itemized list of museum objects are included in a loan agreement.

Planning

- Plans for park management, development, exhibits, interpretation, and research address the proper documentation, protection, preservation, and use of objects.

- Each park and center has a collection management plan to guide proper management and care of its museum collection and a separate collection storage plan if necessary.

- Each park and center has one or more collection condition surveys to detect problems with the condition of museum objects and determine conservation treatment priorities.

- Proposals for environmental control measures in historic structures are based on data from environmental monitoring for at least one year.

- Each park ensures that the cataloging and curation of objects, specimens, and associated records recovered from archeological and scientific projects are accomplished.

- Each park ensures that approved museum plans and reports are entered in the Cultural Resources Management Bibliography (CRBIB).

Stewardship

- Each park and center has identified threats to the security and protection of its museum collection and has taken appropriate measures to deal with them, including emergency planning.

- Each park and center has implemented a preventive conservation program whereby museum objects are exhibited, handled, and stored with sensitivity to their specific environmental needs and vulnerabilities and are regularly inspected for evidence of deterioration.

- Preservation and use of museum objects accords with Director's Order #24: NPS Museum Collections Management; the *Museum Handbook*, Part I; and National Archives and Records Administration standards.

- Conservation treatment required to stabilize or restore museum objects entails the least intervention necessary to satisfy treatment goals.

- Inventories of museum objects and status reports on collections are completed and submitted in accordance with current NPS museum property procedures and other administrative requirements.

- Any use of museum objects likely to damage them or hasten their

deterioration is undertaken only after careful review and approval.

Director's Order #24: NPS Museum Collections Management

Director's Order #24: NPS Museum Collections Management, gives requirements for managing park museum collections. It is supplemented by the *Museum Handbook*, Parts I-III. Director's Order #24 is reprinted in full in Figure A.3.

E. List of Figures

16 USC Sec. 18f Management of museum properties

The purpose of this section and sections 18f-2 and 18f-3 of this title shall be to increase the public benefits from museums established within the individual areas administered by the Secretary of the Interior through the National Park Service as a means of informing the public concerning the areas and preserving valuable objects and relics relating thereto. The Secretary of the Interior, notwithstanding other provisions or limitations of law, may perform the following functions in such manner as he shall consider to be in the public interest:

(a) Donations and bequests—Accept donations and bequests of money or other personal property, and hold, use, expend, and administer the same for purposes of this section and sections 18f-2 and 18f-3 of this title;
(b) Purchases—Purchase museum objects, museum collections, and other personal properties at prices he considers to be reasonable;
(c) Exchanges—Make exchanges by accepting museum objects, museum collections, and other personal properties, and by granting in exchange therefore museum property under the administrative jurisdiction of the Secretary which is no longer needed or which may be held in duplicate among the museum properties administered by the Secretary, such exchanges to be consummated on a basis which the Secretary considers to be equitable and in the public interest;
(d) Accepting loans of museum objects—Accept the loan of museum objects, museum collections, and other personal properties and pay transportation costs incidental thereto, such loans to be accepted upon terms and conditions which he shall consider necessary; and
(e) Making loans of museum objects—Loan to responsible public or private organizations, institutions, or agencies, without cost to the United States, such museum objects, museum collections, and other personal property as he shall consider advisable, such loans to be made upon terms and conditions which he shall consider necessary to protect the public interest in such properties.

Sec. 18f-1. [Does not apply to the National Park Service.]

Sec. 18f-2. Additional functions

(a) Museum objects and collections—In addition to the functions specified in section 18f of this title, the Secretary of the Interior may perform the following functions in such manner as he shall consider to be in the public interest:

(1) Transfer museum objects and museum collections that the Secretary determines are no longer needed for museum purposes to qualified Federal agencies, including the Smithsonian Institution, that have programs to preserve and interpret cultural or natural heritage, and accept the transfer of museum objects and museum collections for the purposes of this section and sections 18f and 18f-3 of this title from any other Federal agency, without reimbursement. The head of any other Federal agency may transfer, without reimbursement, museum objects and museum collections directly to the administrative jurisdiction of the Secretary of the Interior for the purpose of this section and sections 18f and 18f-3 of this title.

(2) Convey museum objects and museum collections that the Secretary determines are no longer needed for museum purposes, without monetary consideration but subject to such terms and conditions as the Secretary deems necessary, to private institutions exempt from Federal taxation under section 501(c)(3) of title 26 and to non-Federal governmental entities if the Secretary determines that the recipient is dedicated to the preservation and interpretation of natural or cultural heritage and is qualified to manage the property, prior to any conveyance under this subsection.

(3) Destroy or cause to be destroyed museum objects and museum collections that the Secretary determines to have no scientific, cultural, historic, educational, esthetic, or monetary value.

(b) Review and approval—The Secretary shall ensure that museum collections are treated in a careful and deliberate manner that protects the public interest. Prior to taking any action under subsection (a) of this section, the Secretary shall establish a systematic review and approval process, including consultation with appropriate experts, that meets the highest standards of the museum profession for all actions taken under this section.

Sec. 18f-3. Application and definitions

(a) Application—Authorities in this section and sections 18f and 18f-2 of this title shall be available to the Secretary of the Interior with regard to museum objects and museum collections that were under the administrative jurisdiction of the Secretary for the purposes of the National Park System before November 12, 1996, as well as those museum objects and museum collections that may be acquired on or after November 12, 1996.

(b) Definitions—For the purposes of this section and sections 18f and 18f-2 of this title, the terms “museum objects” and “museum collections” mean objects that are eligible to be or are made part of a museum, library, or archive collection through a formal procedure, such as accessioning. Such objects are usually movable and include but are not limited to prehistoric and historic artifacts, works of art, books, documents, photographs, and natural history specimens.

Figure A.1. Museum Properties Act of 1955 as amended November 12, 1996

114-60.100(b)	All museum property is accountable with no dollar threshold.
114-60.100(e)	Museum property is not capitalized.
114-60.100(n)	Definition of museum property
114-60.100(bb)	Sensitive property shall, at a minimum, include firearms…
114-60.200(a)	(1)…museum property will not be controlled in a general ledger control account. All items in a museum collection will be controlled through accessioning and cataloging.
114-60.401(c)	All museum property is controlled through accessioning and cataloging, regardless of value.
114-60.503(e)	An Accession Receiving Report will be used to document receipt of museum property.
114-60.601(b)	Because permanent marking of museum property is potentially damaging, items of museum collections are exempted from the marking requirements of this subpart. Bureaus and offices having museum collections will develop and implement procedures: (NPS procedures are outlined in the NPS *Museum Handbook*, Part II).
114-60.802-1(a)	A Certificate on Unserviceable Property will not be issued for…museum property.
114-60.811-2(f)	Examples of property irregularities include…loss or theft of a firearm or weapon.

Figure A.3. Director's Order #24: NPS Museum Collections Management

United States Department of the Interior

NATIONAL PARK SERVICE
1849 C Street, N.W.
Washington, D.C. 20240

DIRECTOR'S ORDER #24: NPS MUSEUM COLLECTIONS MANAGEMENT

Approved: Mary A. Bomar
Director

Effective Date: 9-03-08

Duration: Until amended or rescinded.

This Director's Order supersedes Director's Order #24 issued August 21, 2000. It supplements NPS *Management Policies* and is augmented by procedures in the *Museum Handbook.*

1. Background and Purpose

The National Park Service is custodian in perpetuity of irreplaceable and priceless museum collections that include objects, specimens, and archival and manuscript materials (textual, electronic, cartographic, architectural, and audio-visual documents), representing cultural and natural resources in the United States, including but not limited to the disciplines of archeology, biology, ethnology, geology, history, and paleontology. NPS museum collections are park resources that are part of the natural and cultural heritage of the country and are collected, preserved, and interpreted for public benefit.

NPS museum collections inform and enhance every aspect of the NPS mission, from resource management and interpretation, to research and public accountability. Featured in exhibits, interpretation and education programs, films, and print and electronic publications, NPS museum collections are key resources for educators, students, researchers, park managers, park neighbors, and the general public. Accessibility of museum collections is a prime component of museum management.

The NPS *Management Policies* lay the foundation by which the NPS meets its responsibilities toward these museum collections. This Director's Order provides further policy guidance, standards, and requirements for preserving, protecting, documenting, and providing access to, and use of, NPS museum collections.

2. Authority for this Director's Order

Authority for issuing this Director's Order is found in 16 U.S.C. 1 through 4, and delegations of authority contained in Part 245 of the Department of the Interior Manual. Additional key related authorities are found in the Antiquities Act of 1906 (16 U.S.C. 431-433), the Historic Sites Act

of 1935 (16 U.S.C. 461-467), the Management of Museum Properties Act[i] of 1955, as amended (16 U.S.C. 18f, and 18f2-3), the National Historic Preservation Act of 1966, as amended (16 U.S.C. 470 et seq.), the Archaeological Resources Protection Act of 1979 (16 U.S.C. 470aa-mm), the Native American Graves Protection and Repatriation Act of 1990 (25 U.S.C. 3001), the National Parks Omnibus Management Act of 1998 (16 U.S.C. 5901 et seq.), and the Departmental Manual 411 DM, Managing Museum Property.

This order is intended only to improve the internal management of the NPS and is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, its departments, agencies, instrumentalities or entities, its officers or employees, or any other person.

3. Objectives

The objectives of this Director's Order, in conjunction with the accompanying *Museum Handbook*, are to:

- Ensure that NPS managers and staff have information on the standards and actions for successfully and ethically complying with NPS *Management Policies* on museum collections.
- Provide a means of measuring and evaluating progress in preserving, protecting, documenting, accessing, and using museum collections.

4. Responsibilities

4.1 Associate Director, Cultural Resources

The Associate Director, Cultural Resources, with the assistance of the Chief Curator and the Park Museum Management Program (PMMP), has the following responsibilities:

4.1.1 Code of Ethics: Follow the Code of Ethics for the museum management program (see 4.1.2).

4.1.2 *Museum Handbook*: Develop, issue, and periodically update a *Museum Handbook* containing the information park managers need to know to comply with laws, departmental and Service-wide policies, regulations, professional standards, and a code of ethics applicable to museum collections management. Include in the *Museum Handbook*, as a supplement to this Director's Order, specific guidance for collecting, preserving, protecting (including security and fire protection), documenting, accessing, and using museum collections, clearly distinguishing between those actions that are mandatory requirements and those that are discretionary. Cite those laws, policies, and regulations in relevant sections.

4.1.3 Strategic Plans: Develop strategic plans and goals to improve and maintain the management of NPS museum collections Service-wide, consistent with the Government Performance and Results Act of 1993 (31 USC 1115).

4.1.4 National Catalog: Maintain for management and public benefit a National Catalog of Museum Objects, consisting of electronic and paper catalog records, with accession and catalog data for all parks. Develop and maintain an automated collections management program (the Automated National Catalog System [ANCS+ and its successor]) for use by parks, centers, and offices Service-wide, as well as the general public.

4.1.5 Report Requirements and Analysis: Identify reports that are required annually, or at other times, to further museum collections management. Reporting requirements will be kept to the minimum necessary. Maintain, analyze, and report on data submitted by parks, centers, and regions, including: the Collections Management Report; the NPS Checklist for Preservation and Protection of Museum Collections; funding distributions and accomplishments; storage planning data; and other required reports and surveys. Maintain a current Service-wide museum collections storage plan based on regional storage planning data.

4.1.6 Annual Inventory: Review regional certifications of annual inventories, summarize and report certification results to the Service-wide property management officer, and take any necessary corrective action.

4.1.7 Museum Supplies, Equipment, and Technologies: Research products and facilitate park and center acquisition and use of appropriate supplies, forms, equipment, and technologies for management of museum collections.

4.1.8 Service-wide Initiatives: Develop and coordinate Service-wide initiatives, reviews, and funding to improve museum management.

4.1.9 Technical Information: Publicize and disseminate technical information on museum management, including conservation and archival collections management.

4.1.10 Information Access: Publicize NPS museum collections by developing and maintaining access to collections information through various media, including the World Wide Web and ANCS+.

4.1.11 Professional Qualifications and Training: Evaluate Service-wide professional competencies and training needs in museum management, and develop strategies, guidelines, and curricula to meet those needs. Coordinate training to address new technologies, programs, and initiatives.

4.1.12 Plan Review: Review draft park plans that receive Washington Office review, such as general management plans, for appropriate coverage of museum management.

4.1.13 Technical Assistance: Provide technical assistance and advice to park and center managers regarding acquiring, preserving, protecting, documenting, accessing, and using museum collections. Provide this assistance and advice at the request of regions.

4.2 Regional Directors and WASO Associate Directors with Museum Collections Responsibility

Regional directors (assisted by regional associate directors and regional museum support staff), and WASO associate directors accountable for museum collections, have the following responsibilities:

4.2.1 Code of Ethics: Follow the Code of Ethics for the museum management program in the *Museum Handbook.*

4.2.2 Plan and Performance Review: Use the strategic and annual performance planning processes, the park planning process, and the performance management system to ensure that superintendents and center and other managers meet their responsibilities to manage museum collections according to this directive. Review park plans for appropriate coverage of museum collections management, and to ensure consistency with NPS requirements. Review design and construction plans to ensure that museum preservation, protection, documentation (including information technology), and access requirements are met.

4.2.3 Technical Assistance: Provide technical assistance to parks and centers to assist them in meeting NPS museum management requirements, and in providing for access to and use of collections.

4.2.4 Staffing and Training: Evaluate museum management staffing and training needs, and develop and provide training to park and center staff. Regional directors will alert the Associate Director, Cultural Resources, about regional training needs that may apply Service-wide.

4.2.5 Plans, Priorities, and Reports: Develop plans and set priorities (including funding priorities) for managing museum collections based on all approved planning documents, including strategic plans, the Service-wide storage plan, and park Collection Management Plans, and information provided through Service-wide reports and requirements, including the Collections Management Report, NPS Checklist for Preservation and Protection of Museum Collections, and Automated Inventory Program. Review reports to ensure that parks and centers meet reporting requirements. Maintain current regional storage planning data, consistent with the Service-wide storage plan and standards, and submit data updates to the Associate Director, Cultural Resources.

4.2.6 Annual Inventory Certification: Annually certify to the Associate Director, Cultural Resources, Attention: Manager, PMMP, no later than **September 30** each fiscal year, that parks and centers have completed their annual inventories. Review park and center annual inventories and take any necessary corrective actions. Establish a regular schedule for parks in the region to submit the inventories. Approve exceptions to this requirement for extenuating circumstances, such as when collections are inaccessible during construction projects or after major natural disasters; or when non-NPS repositories have equivalent or more rigorous annual inventory procedures, those procedures are documented in a current repository agreement or repository loan

agreement, the repository annually reports inventory results to the parks with collections stored in the repository, and the results are reported in an addendum to the park superintendent's annual inventory certification and noted in the regional director's annual inventory certification.

4.2.7 Destructive Analysis and Consumptive Use: After careful review, if the benefits can be clearly shown to outweigh the resulting or potential damage or loss, approve destructive analysis of rare or highly significant objects, specimens, and archival items, and any consumptive use of museum collections.

4.2.8 Unconditional Gifts: Grant exceptions to the unconditional gift policy on a rare and case-by-case basis.

4.2.9 Delegation of Authority to Accept Donations: Delegate authority to accept donations of money and other personal property for the purposes of museum management to superintendents and center managers, as appropriate, and in compliance with NPS donations policy (see Director's Order #21, Donations and Fundraising).

4.2.10 Accreditation: Authorize parks to apply for accreditation by the American Association of Museums upon request from a park superintendent and recommendation of the regional curator.

4.3 Park Superintendents and Center Managers

Park superintendents, center managers, and others who manage collections (with the assistance of museum management staff) have the following responsibilities:

4.3.1 Code of Ethics: Follow the Code of Ethics for the museum management program in the *Museum Handbook.*

4.3.2 Standards: Meet museum management standards in the NPS *Museum Handbook* (Parts I-III) for:

- acquiring, preserving, protecting (including security and fire protection), documenting (including accessioning, cataloging, lending, deaccessioning), accessing, and using museum collections; and
- completing actions specific to archival and manuscript collections (appraising, arranging, describing, producing finding aids, and providing reference and duplication services).

4.3.3 Procedures: Follow procedures in the *Museum Handbook.*

4.3.4 Ongoing and Corrective Actions: Provide ongoing funding for recurring museum management functions and take appropriate action to correct identified preservation, protection, documentation, and access and use deficiencies, including programming for funding to correct such deficiencies. Complete Project Management Information System (PMIS) project statements that identify all preservation, protection, documentation,

access and use needs. Monitor projects to ensure conformance with preservation, protection, documentation (including information technology), and access policies and procedures.

4.3.5 Staffing and Training: Evaluate and address museum management staffing and training needs according to established personnel qualifications standards and Service-wide professional competencies.

4.3.6 Scope of Collection: Approve and keep current a Scope of Collection Statement to identify the scope of collecting activities and define the purpose of the collection. Ensure that the statement is consistent with natural resource and archeological permit conditions. Ensure acquisitions are consistent with the Scope of Collection Statement.

4.3.7 Collection Management Plan: Approve, keep current, and implement a Collection Management Plan to:

- evaluate issues of preserving, protecting (including security and fire protection), storing, documenting, accessing and using collections;
- address issues specific to archival and manuscript collections (appraising, arranging, describing, producing finding aids, providing reference and duplication services, and migrating electronic documents so that they remain accessible); and
- propose a strategy to address the issues, including staffing and cost estimates, consistent with park and Service-wide strategic and other planning documents, including the Service-wide storage plan.

4.3.8 Housekeeping Plan: Approve, keep current, and implement a Housekeeping Plan for every space that houses museum collections to ensure that housekeeping routines are sensitive to museum collections preservation needs.

4.3.9 Integrated Pest Management: Approve, keep current, and implement an Integrated Pest Management Plan that addresses the museum collections.

4.3.10 Emergency Operation: Approve, keep current, and implement a Museum Collections Emergency Operations Plan, as part of the park's Emergency Operations Plan and consistent with the National Incident Management System, identifying museum collection vulnerabilities to events (such as fire, earthquakes, and floods) and responses that will protect resources without endangering human health and safety. Ensure staff trains, practices, and prepares for emergency response. Assist other NPS areas and park partners, as authorized, in emergency response for museum collections. Assist other federal agencies, and tribal, state, and local governments in the event of a major disaster or emergency under the National Response Framework, Natural and Cultural Resources and Historic Properties part of Emergency Support Function #11.

4.3.11 Collections Hazards: Complete a Job Hazard Analysis (JHA) for all museum jobs that have an associated history of injury, illness, or death; or that require the use of

personal protection equipment, such as respirators; or that involve activities that are clearly dangerous, such as handling collections with mold, working with toxic or flammable chemicals, or operating heavy machinery. Notify collections users when collections may have been treated with potentially toxic substances consistent with Department of the Interior guidance at http://www.doi.gov/museum/.

4.3.12 Collection Condition: Monitor and record information about the environment in spaces housing collections and manage the environment to maximize preservation. Complete Collection Condition Surveys, as needed, to assess conditions in spaces housing museum collections, to record the condition of objects or groups of objects, and to determine treatment needs and priorities. Incorporate survey data in ANCS+ and in accession or catalog files.

4.3.13 Accession and Catalog Records: Accession collections upon acquisition to establish basic accountability. Catalog the collections immediately following acquisition, or have funding requests in place to catalog them in the near future. Survey, appraise, rehouse, arrange, and describe archival and manuscript collections and prepare finding aids. Develop park archival duplication and reference procedures. Have funding requests in place to address eliminating any archival processing backlog.

4.3.14 Collections Management Records Backup: Maintain a complete current backup of all electronic data at a location that is not vulnerable to the same catastrophic events as the computer workstation. In addition, submit the required annual backup to the National Catalog in Harpers Ferry, West Virginia (see 5.4).

4.3.15 Unconditional Gifts: Accept only unconditional gifts and bequests, and, where possible, obtain applicable copyrights and releases with acquisitions. Obtain regional director's approval for rare exceptions, on a case-by-case basis.

4.3.16 Project-generated Collections: Require project budgets to include funding for the initial management of collections that are project-generated. Initial collections management includes cataloging; labeling; conservation examination and treatment (including specimen preparation); housing and storage of objects and specimens; and organization and storage of project documentation, including appraisal, arrangement, description, finding aid production, and appropriate archival housing.

- Before starting, permitting, or contracting a project, specify in writing in the task directive, proposal, agreement, permit, or contract, the parties responsible, the designated NPS or non-NPS repository, the collections management tasks, and a time schedule for completion.
- Hold NPS project coordinators, permittees, and contractors responsible and verify compliance in completion reports and with park collection management staff.
- Fund subsequent ongoing maintenance costs of collections management from the operating base of the responsible park, center, or other repository.
- If project-generated collections cannot be accommodated in available or planned

storage space and new storage space is necessary, request modification of the regional storage planning data to accommodate the expanded collection. If interim storage is needed, specify in the project task directive the location of that storage, and state that it must meet NPS standards. Identify the funding source for interim storage.

- Strategically manage permit designations of and subsequent loans to non-NPS repositories to facilitate research and access while consolidating collections, as appropriate, to minimize the park's administrative workload.
- Ensure compliance with Director's Order #19, Records Management, in creation and management of resource management records.

4.3.17 Systematic Collections: Add collections made through systematic field inventory, monitoring, or research to the museum collection in accordance with collection permits and the Scope of Collection Statement. Collected materials not authorized for consumptive analysis remain federal property and will be accessioned, labeled and cataloged into the NPS cataloging system. House those collections associated with a single accession at the same repository to facilitate research and use. Superintendents may authorize housing of collections from the same accession at different repositories if by so doing preservation, research, and use will be improved. As appropriate, lend these collections for exhibit, research, conservation, and other approved uses.

4.3.18 Deaccession Records: Deaccession objects inconsistent with the Scope of Collection Statement. Complete Case Incident Reports, Reports of Survey, and deaccession actions when thefts, losses, and involuntary destruction occur. Complete deaccession actions in compliance with the Native American Graves Protection and Repatriation Act and other laws.

4.3.19 Collections Management Report: Annually complete the automated Collections Management Report (CMR) in cooperation with the PMMP (see 5.1) The report provides information on accessions, deaccessions, cataloging, backlogs of objects to be cataloged, use of museum collections, and total collection size. The report must include all collections, whether kept in park facilities, other NPS facilities, or in non-NPS repositories. Verify, sign, and file the CMR at the park by **January 15** (see 5.1).

4.3.20 Annual Inventory: Conduct an annual collection inventory on a regular schedule using the Automated Inventory Program (AIP) in ANCS+ and reconcile the results with existing accession and catalog records. Take any necessary corrective action. Certify the annual inventory and submit it to the regional director (see 4.2.6 for exceptions applicable to non-NPS repositories; and 5.3).

4.3.21 Checklist: Keep the NPS Checklist for Preservation and Protection of Museum Collections (Checklist) up-to-date in the Automated Checklist Program (ACP) in ANCS+ (see 5.1). The Checklist records information on preservation and protection conditions in parks and centers, identifies deficiencies, and provides estimated costs to correct deficiencies.

4.3.22 Conservation Treatment and Documentation: Provide conservation treatment required to stabilize or restore museum objects using the least intervention necessary to satisfy treatment goals. Document treatment of collections, record that information in ANCS+, and retain reports and documentation in accession or catalog files.

4.3.23 Cellulose Nitrate and Cellulose Ester Film: Identify cellulose nitrate and cellulose ester film, and take steps to preserve the visual information contained by duplicating the images onto polyester-based film. After inspecting the copies, evaluate and destroy the original film, or, in the case of original film with high artifactual, intrinsic, evidential, or associational value, provide for long-term storage according to the criteria in *Museum Handbook*, Part I, Appendix M, "Management of Cellulose Nitrate and Ester Film."

4.3.24 Access and Use: Promote access to cataloged collections for research, educational, and interpretive purposes through a variety of means and media, such as exhibits, interpretation and education programs, loans, publications, film and television, the World Wide Web, archival finding aid production and distribution, and posting of finding aids and repository-level guides for archival and manuscript collections in the National Union Catalog of Manuscript Collections (NUCMC).

- Ensure that access and use are consistent with the laws and NPS policies pertaining to Freedom of Information Act disclosures, copyright, privacy, publicity, obscenity and pornography, defamation, and resource protection.
- Document controlled access and use of collections and museum records with a researcher logbook, signed access policy statement, researcher registration, copyright and privacy restriction statement, and duplication forms.

4.3.25 Consultation: Consult with affiliated groups in managing collections, including Native American groups when managing collections subject to the Native American Graves Protection and Repatriation Act.

4.3.26 Preservation vs. Destructive Use: Manage objects to preserve their condition, including using reproductions when originals may be damaged by use. Authorize in writing destructive analysis of collections, except for rare or highly significant objects, specimens, and archival materials. Obtain regional director approval for destructive analysis of rare or highly significant objects, specimens, and archival materials and for any consumptive use of collections.

4.3.27 Exhibits: Exhibit collections according to an approved exhibit plan, accompanied by maintenance instructions. Ensure that all exhibits meet the standards in the NPS Checklist for Preservation and Protection of Museum Collections. Develop and implement a rotation routine for environmentally-sensitive items. Develop online exhibits to expand access to collections while protecting them from the stress of exhibit conditions.

4.3.28 Objects in Historic Structures: Document furnishings that are exhibited in their associated historic structures with an approved Historic Furnishings Report. Consider the preservation requirements of both objects and historic structures when objects are on exhibit or in storage in historic structures.

4.3.29 Exhibit of Human Remains: Never exhibit American Indian, Alaska Native, or Native Hawaiian human remains or photographs, drawings or renderings, or casts of the remains. Exhibit non-Native-American human remains and photographs, drawings or renderings, or casts of the remains only in consultation with traditionally associated groups.

4.3.30 Distribution of Approved Reports and Plans: Ensure that approved research reports, such as Historic Furnishings Reports, are distributed according to the guidance/handbook associated with Director's Order #28, Cultural Resource Management. Maintain multiple copies of approved museum plans, as needed, in the park and submit one copy of each plan (including the Scope of Collection Statement) to the regional director; Park Museum Management Program, WASO; Park Cultural Resources, Attention: CRBIB, WASO; Technical Information Center, Denver Service Center; Harpers Ferry Center Library; and NPS archeological or preservation center, as applicable. Redact any sensitive or confidential data, such as security systems or certain locality information, before distributing reports and plans that may be accessible to the general public.

4.3.31 Accreditation: Consult with the regional curator and seek approval from the regional director before applying to the American Association of Museums (AAM) for accreditation. While accredited, parks may display a modest-sized AAM accreditation logo in a public place near the museum or visitor center entrance and on the park's web site in association with information about the collections. Seeking accreditation is optional but encouraged for parks with substantial museum operations.

5. Submissions and Deadlines

5.1 Collections Management Report: Parks and centers submit, via e-mail, data on research requests and noteworthy information, including noteworthy accessions and deaccessions, for the current fiscal year by **September 15** to PMMP. Using these data and data extracted from the park's catalog records (see 5.4), the PMMP prepares the CMRs and posts them on InsideNPS on or about **October 1**. Parks and centers review the CMRs and submit any corrections, via e-mail, to PMMP. Corrections to be included in data submitted for Government Performance and Results Act (GPRA) reports and performance-based funding allocations must be submitted and accepted within one week of posting on InsideNPS. Other corrections should be submitted as soon as possible, but no later than **December 31.** Superintendents verify, print, sign and file the park's CMR by **January 15.** NPS uses CMR information for strategic planning and annual reporting, including reporting on NPS strategic operational plan Goal Ib2D consistent with GPRA.

5.2 Checklist: Parks and centers update their Checklist in the ACP by **September 15** to show changes as of the end of the current fiscal year. Parks and centers submit the Checklist as part of the National Catalog submission (see 5.4) and may update the Checklist at other times, using the ACP, by submitting it separately to the PMMP. The PMMP compiles and distributes regional and Service-wide reports. NPS uses Checklist data for strategic planning and annual reporting. Parks and PMMP use Checklist data to report on NPS strategic operational plan Goal Ia6 consistent with GPRA.

5.3 Annual Inventory: Parks and centers annually submit the inventory generated using the AIP to the regional director, according to a schedule that the region approves. The regional director certifies the completion of the inventories to the Associate Director, Cultural Resources, Attention: Manager, PMMP, no later than **September 30** each fiscal year.

5.4 National Catalog Submissions: Parks and centers annually submit to the National Catalog complete electronic backups of their ANCS+ natural history and cultural resource directories by **September 15**. The National Catalog prints and stores archival paper copies of the catalog records. The National Catalog prints and sends paper copies of catalog records to parks and centers upon request. This submission includes the Checklist (see 5.2) and data that PMMP uses to generate the park and Service-wide Collections Management Reports (see 5.1). Parks have the option to include the archives directory in the National Catalog backup. They may also submit, via the U.S. Postal Service or express carrier, a backup of images on CD.

5.5 Project Proposals and Funding Reports: In response to the Service-wide Comprehensive Budget Call, parks and centers submit museum collections project proposals in PMIS and include required museum collections program-specific information in PMIS or on optional forms. For projects funded in the previous year, by **October 31**, parks and centers provide accomplishment reports in PMIS and include required museum collections program-specific information in PMIS or on optional forms.

--- End of Director's Order ---

---

[i] Congress did not give this act a formal title. It is also known as the Museum Act.

Appendix B: Cataloging Costs

APPENDIX B: CATALOGING COSTS

A. Estimating Cataloging Costs

1. *How do I estimate the cost to catalog objects?*

If you…	*Then…*
have cost data from a comparable cataloging project	use that data and adjust the variables to accommodate the new project
lack comparable cost data	contact other parks that have similar collections and ask for their cost data, then adjust the variables for your situation
are uncertain about the costs	use the regional or Servicewide average in Figure B.1, Recent Cataloging Costs

Figure B.1 charts provide high, low, and average cataloging costs. The charts also include costs by discipline and region, as well as Servicewide costs, for recent fiscal years.

Note: Do not use regional costs data that seems to be out of line compared with other regions' costs for that discipline. Cost data can be skewed when only a few objects are cataloged.

Approach the question of cataloging costs from two angles. Determine a rough estimate of the cost and determine the cost per item. Base cataloging cost estimates on:

- how long the work will take
- how the work will be accomplished
- the level of personnel needed to do the work
- additional costs, such as travel, materials, overhead, computer equipment, and benefits

After you determine the overall cost, divide the cost by the number of items to determine the cost per item. Use the cost per item to compare with the costs of past projects or the costs in Figure B.1. Make adjustments as appropriate.

2. *What variables affect cataloging costs?*

Costs for cataloging vary and depend on many factors, including the:

- expertise and skills of the staff or the contractor who will do the work
- size of the collection (for example, larger collections tend to have lower costs because of economies of scale)
- type or discipline of the material you are cataloging (for example, ethnology tends to have higher costs; archeology has relatively lower

costs)

- type or discipline of the material you are cataloging (for example, ethnology tends to have higher costs; archeology has relatively lower costs)
- complexity of the collection (for example, a collection of unorganized personal papers will take longer to catalog than a collection of organizational files that are neatly filed in original order)
- amount of lot cataloging (for example, material that you lot catalog would have lower costs than items you catalog individually)
- condition of the collection (for example, maps might need to be relaxed and unrolled before cataloging)
- amount of documentation that is needed (for example, history objects may require identification and dating; natural history specimens may already have labels that include identification)
- overhead charged by contractors and other service providers
- costs for computer equipment
- costs for materials, such as archival supplies, that are essential to the cataloging process
- travel costs, if travel is required to accomplish the cataloging

3. *How do I interpret the data in Figure B.1?*

For each discipline in each region, the charts provide a high, low, and average cost for cataloging an object. The charts also show how many objects were cataloged at that cost. Remember that there are economies of scale. Projects with few objects tend to have higher than average costs. Projects with many objects tend to have lower than average costs.

B. Funding Cataloging Costs

1. *Where can I get funds to catalog recent acquisitions?*

Projects that generate collections must fund the cataloging, preservation, and preparation of those collections for storage. Project funds may be from archeological or natural resource projects, exhibit development, historic furnishings implementation projects, historic structure stabilization projects, or other sources.

- catalog other acquisitions, such as gifts, with:
- base funds
- Cultural Resources Preservation and Protection (CRPP) funds, *or*
- Natural Resources Preservation and Protection (NRPP) Funds

2. *Where can I get funds to catalog the backlog?*

Catalog collections that are part of a pre-1987 uncataloged backlog with:

- park base funds
- Backlog Cataloging funds, *or*
- CRPP funds

Catalog post-1987 backlogs using:

- park base funds, *or*
- CRPP funds

3. *Where can I get funds to recatalog the collections?*

Park base and CRPP funds are good sources for recataloging.

C. Applyinf For and Spending Cataloging Funds

1. *How can I apply for cataloging funds?*

The Associate Director, Cultural Resource Stewardship and Partnerships, makes an annual call in late summer for cultural resources projects to be funded by CRPP and Backlog Cataloging. The Associate Director, Natural Resource Stewardship and Science, makes an annual call for NRPP projects. Contact the regional/support office (SO) curator for guidance in seeking funding.

2. *What are some things to remember when applying for cataloging funds?*

When you apply for cataloging funds, make sure:

- your project meets the criteria for the fund source
- your park submitted a Collections Management Report (CMR, Form 10-94) last year (see Section VIII of Chapter 4 in this handbook)
- the data on the CMR are consistent with your proposal (for example, the park has a backlog of 5,000, and you are proposing to catalog 2,500)
- the project will enter the catalog data in the Automated National Catalog System (ANCS+) or its successor
- you identify the project in the park's Resource Management Plan and Project Management Information System (PMIS)
- archives to be cataloged are archives that belong in the museum collection and **are not official records** (see Appendix D in this handbook)

3. *What are some things to remember when spending funds for cataloging?*

When you spend funds for cataloging museum collections, make sure:

- you spend the funds and accomplish the work as proposed, or submit a revision to the fund manager after consultation with the regional/SO curator

- you submit an accomplishment report to the fund manager at the end of the fiscal year
- you submit the catalog data on disk to the National Catalog (see Chapter 3 in this handbook)

Appendix C: Cataloging Guidelines

APPENDIX C: CATALOGING GUIDELINES

A. Overview

1. *What types of guidelines are in this appendix?*

This appendix has recommended guidelines and terms to help you with cataloging your museum collections. It includes information on:

- cataloging component parts, pairs, and sets
- methods of describing objects
- uniform terms to use when describing condition
- measuring and recording dimensions and weight
- cataloging nitrate negatives

2. *Can I use the information in this appendix with all types of collections?*

In general, the guidelines in this appendix apply to cultural resources collections. The guidelines for measuring (Sections E-F) also apply to natural history collections.

The lists and terms in this appendix are by necessity incomplete. Add your own lists and references for descriptions and terms specific to the material in your park's collection.

Refer to Appendix L: Bibliography, in this handbook for references on specific types of objects.

B. Component Parts, Pairs, and Sets

1. *What are component parts?*

Many objects have removable parts. The most common example is a teapot and its lid. Objects with component parts usually meet the following conditions:

- the parts can be physically separated or detached from the object
- the object is more or less incomplete without all of its parts
- the object and its parts were manufactured or made together
- the object name includes its separate parts

A vacuum cleaner with attachments is a good example of an object with component parts. You can separate the attachments from the vacuum cleaner. The vacuum cleaner isn't complete without its attachments. The vacuum cleaner and its attachments were manufactured together. The term "vacuum cleaner" is broad enough to cover the vacuum and its attachments.

2. *How do I catalog objects with component parts?*

Give an object with component parts a single catalog number, and count it as one item. Assign a lowercase letter designator to each removable part. Use the Component Parts field that appears after the Catalog Number field in ANCS+. The component part designators appear after the catalog number. For example, PARK 345 a-f shows that the object 345 has six component parts. You should mark the catalog number and appropriate designator on each part.

The ANCS+ Component Parts supplemental record allows you to list the names of the component parts. Refer to Section III of Chapter 3 in the *ANCS+ User Manual* for information on using this supplemental record.

Don't assign individual catalog numbers to the component parts of an object.

3. *How do I catalog pairs?*

Catalog a matched pair, such as a pair of shoes or matching andirons, with a single catalog number. Give each item a suffix of a or b. Use the Component Parts field that appears after the Catalog Number field in ANCS+. Count the pair as one item. Note in the Description field that the object is a pair. You should mark the catalog number and appropriate designator on each part.

Don't catalog pairs on separate catalog records.

4. *What are sets?*

Sets or kits are groups of objects intended to be used together. The word "set" or "kit" should be part of the object name. A set or kit usually includes different types of items, such as a surgical kit or a manicure set. If objects are the same, such as a set of identical bowls, use lot cataloging. Refer to Appendix I in this handbook for information on lot cataloging.

Note: For history objects, check the ANCS+ controlled table of history terms. This table includes a list of the approved terms that use "set" or "kit" as part of the object name.

5. *How do I catalog sets?*

Give the set or kit one catalog number. Give each removable piece of the set or kit a lowercase letter designator. Use the Component Parts field that appears after the Catalog Number field in ANCS+. You should mark the catalog number and appropriate designator on each part. Count the set or kit as one item.

The ANCS+ Component Parts supplemental record allows you to list the names of the pieces in the set or kit. Refer to Section III of Chapter 3 in the *ANCS+ User Manual* for information on using this supplemental record.

6. *Can I give the pieces of a set separate catalog numbers?*

Yes. You should individually catalog items in a set or kit that are of high value or susceptible to theft. For example, you might assign individual catalog numbers to the items in a Civil War surgeon's kit that is on exhibit.

If you individually catalog the items in a set or kit, be sure to cross-reference between the catalog numbers.

C. Methods of Describing Objects

1. *What's the best way to describe an object?*

There isn't one best way to describe objects. Descriptions depend on the type of material and the subject discipline. For example, archeologists use terms and standard descriptions that are different from descriptions of fine arts material.

The best way to describe the objects in your collection is to be consistent in the terms and methods you use. Set up templates for how to describe the specific materials in your park's collection. Consistency is especially important if you have many different catalogers. It gives you and others better access to data about your collection.

Note: If you are unfamiliar with cataloging, look at the ANCS+ fields and the on-line field help for the discipline you are cataloging. Specialists chose the discipline-specific fields for each discipline. These fields will give you a good idea of the types of information you need to record.

2. *Are there common ways of looking at objects?*

Yes. There are some common methods for looking at objects. Record the distinguishing and significant features. You can learn a lot of information about an object by looking at it. Other types of information, such as the date when an object was made, will require research.

Use the list below as a guide to get you started recording observable data.

Overall Shape/Style	Round, square, rectangular.../ Chippendale, Queen Anne...
Details of Shape	Work from the base to the top or describe it as it's normally described in the discipline.
Manufacturing Techniques	Fired, tanned, coiled ...
Materials	Mention materials if not sufficiently covered in the Medium/Materials field.
Texture	Corrugated, cord-marked...
Color	Reference to the Munsell color chart.
Design Details	Rosette, scroll, cross-hatching...
Condition Features	Point out features that make the object unique, such as "paint peeling" or "foxing".
Marks	Proofmarks, hallmarks, serial numbers, signatures, watermarks in paper, inscriptions.
Labels	Copy any original labels that are attached to the object or labels made with or for the object.

Note: ANCS+ has separate fields for many descriptive elements, such as marks, color, style, and manufacturing technique.

D. Terms for Describing Object Condition

1. *Are there standard terms for describing an object's condition?*

Yes. There are standard terms for describing the condition of an object on an object condition report or on the catalog record. Using these terms helps you precisely describe condition and helps other people understand your description.

Note: Conservators may use different terms for describing condition.

2. *Why is it important to be precise when describing condition?*

Precise vocabulary allows you to detect changes in the condition of an object from one inspection to the next. For example, condition descriptions, such as "corrosion on tip of blade" or "flaking paint," may call attention to the need for conservation work.

3. *What are some standard terms for describing condition?*

The following list includes terms that will help you with condition descriptions.

Abrasion	A surface loss apparently caused by friction. The loss may be to the substance of the object or to paint or other decoration on it. Often superficial. Related terms: Scrape, Rub.
Accretion	A relatively widespread accumulation of extraneous material adhering to the surface of an object that alters the original texture and usually the color, either generally or locally. Usually tenacious. Often seen on objects that were buried. Related terms: Incrustation, Stain, Spot.
Adhesive Residue	Usually a sticky residue from glue, paste, or tape.
Bleaching	Lightening of color through exposure to light and/or chemical agents.
Bleeding	The suffusion of a color into adjacent materials, usually other colors or a ground. Often caused by water or other solvents. Also refers to the penetration of ink through paper.
Blister	An inflated pocket in a film or layer. A separation between layers that appears as an enclosed, bubbled area. Generally used when describing painted surfaces. A broken blister may result in a rupture.
Bloom	The bluish-white cloudiness often seen on varnished surfaces, especially paintings and wood furniture. Sometimes called efflorescence.
Break	An abrupt, significant change or interruption in a continuous surface. Disruption or total separation of parts, as distinguished from a fracture.
Brittle	Loss of flexibility causing the material, usually thin, to break or disintegrate when bent.
Bronze Disease	Appearance of powdery, light green spots, resulting from exposure to moisture. Attacks copper, bronze, and brass.

Buckling	A distortion of a plane surface caused by shrinkage or compression. A distortion of the flat plane of a painting or other picture often accompanied by a rupture in a paint or ground layer.
Check	A rupture in wood along the grain and less than the length of the piece, usually caused by the drying of wood at an exposed end grain. Checks may appear anywhere along the grain due to surface shrinkage. An incomplete split.
Chip	A small cavity in the surface of an object caused by material that has been broken away. See also: Dent, Dig, Gouge.
Cleavage:	Separation between or in any of the layers in a stratified composition or construction. This term is used primarily when describing oil paintings and refers to separation between paint layers caused by the contraction of the support.
Corrosion	The chemical alteration of metals caused by agents in the environment or by reagents applied purposely. Hard nodules or crusts are formed on metal surfaces. The color and texture of a metal surface may be changed without alteration of the form if there is no increase in the volume of the corrosion products. Rust is the corrosion product of ferrous metals. Tarnish is a corrosion product of silver. Use the general term "corrosion" for all other metals. See also: Incrustation, Efflorescence, Patina.
Crack	A surface fracture or fissure across or through a material. It can be in a straight line or branch. There is no loss to the object. A blind crack stops part way. A hairline crack is a tiny fissure. An open crack is a large fissure.
Crackle	A system or pattern of fracture lines in a painted or varnished surface. Also a system or pattern of fissures, sometimes purposeful, in the glaze of ceramic ware.
Crazing	A very fine system of crackle or cracking in a varnish, paint film, and glass that appears slightly opaque to the eye. It may be found in aged painting films that are very dry and are approaching their final stages of embrittlement. It can powder off. This term also applies to surfaces of old varnished furniture.
Crease	A tightly pressed fold, causing fibers of cloth, paper, or leather to weaken and break.
Cupping	Varnish, paint, or ground that stand as islands with edges lifted and raised away from each other or from lower layers. Strong cupping can distort the support of an oil painting. Related term: Curling.
Delamination	A separation of layers. A type of splitting.
Dent	A surface defect caused by a blow. A simple concavity from which no material is missing. See also: Chip, Dig, Gouge.

Dig	A surface defect caused by a blow. A dig implies that some surface material has been displaced, usually laterally, but that little or no material has been completely removed. See also: Chip, Dent, Gouge.
Discoloration	A partial or overall change in color caused by aging, light, and/or chemical agents. Includes yellowing and darkening; bleaching, the lightening of color; and fading, a loss of color and/or change in hue.
Disjoin	The partial or complete separation of a join between two members or elements of an object, as distinguished from separation at some point other than a join, such as a fracture, tear, check, or split.
Dry Rot	Decay of seasoned wood that is caused by fungi that consume the cellulose of wood, leaving a soft skeleton that is readily reduced to powder.
Efflorescence	Change from a crystalline salt to a powdery mass with loss of water. The term is used more broadly for museum objects to describe powdery or crystalline crusts on the surface of stone, ceramics, or metals, resulting from other interactions. Not to be confused with corrosion, which is a surface oxidation or other chemical reaction between surface molecules and the environment. Efflorescence results from molecules surfacing from the interior of the object because of chemical changes or hydrostatic pressures within. See also: Corrosion, Incrustation.
Embrittlement	A loss of flexibility that causes material such as paper and leather to break or disintegrate when bent or curled.
Ferrotyping	Glossy patches found on the surface of photographs that have had lengthy contact with a smooth-surface enclosure, such as polyester or glass.
Flaking	A loss of material, usually from the surface, resulting from cleavages or crackles in the surface layers. Also a method of manufacture for stone tools.
Fracture	Refers to the cracking of hard substances, such as bone, and implies an incomplete break in which there is no significant separation of material. A break can later occur along a fracture line. See also: Rupture.
Fragment	A part broken off or detached, or an object that is incomplete. Use of the term usually implies a small percentage of the whole.
Fraying	Raveled or worn spot indicated by the separation of fibers, especially on the edge of fabric or paper.
Gouge	A surface defect caused by a blow. A gouge implies that some material has been scooped away. See also: Chip, Dent, Dig.
Grime	Soil tenaciously held on the surface of an object.
Hole	An opening through a substance. Usually implies that some of the substance is missing and not simply pushed aside as in a tear or dig. Also implied is that the hole is a defect, although it could be a later intentional modification. See also: Gouge.

Incrustation	A crust or hard coating of some foreign material or product on the surface of an object. Use the more specific terms corrosion and efflorescence, if the nature of the incrustation is known.
Iridescence	Color effect in glass due to the partial decomposition of the surface and the formation of innumerable thin scales, resulting in an uneven, flaky surface.
Loss	A general term applying to a missing area or hole. Note the extent of the loss.
Missing element	Loss of an integral component of the object.
Oxidation	Surface "crust" or tarnish on metal resulting from a chemical reaction with oxygen in the presence of moisture. It can be a dull, reddish-brown or black film, depending on the metal type.
Patina	A surface oxidation, corrosion, or decomposition, usually on glass, lead, pewter, or copper or one of its alloys, which is homogeneous, usually hard, and often attractive. A patina or lack of it is no guarantee of age. The patina often provides a protective barrier against further corrosion, and, consequently, may be desirable to retain. See also: Corrosion, Incrustation. The term may be used to describe the polished glow acquired by wood that has been frequently handled.
Pitting	Series of small, irregular, shallow pinhole-size surface depressions due to the introduction or spattering of some eroding or corrosive agent.
Red rot	Powdery red substance found on vegetable-tanned objects that is the result of a chemical reaction with pollutants in the air.
Rip	A hole or flaw caused by a pulling in one rapid uninterrupted motion, especially along a seam or by a joint, or along the straight-line of a fabric. A rip has relatively even or straight sides.
Rub	A mar on the surface of an object caused by contact with another body under pressure and friction. Distinct from abrasion or scrape in that no surface material appears to have been removed, although surface texture, sheen, or reflectance may have been altered.
Rupture	Refers to the tearing or breaking of soft substances, such as layers of an oil painting. It implies that surface material is forced outward, though not necessarily lost. See also: Fracture.
Scrape	Surface damage or injury caused by one or more strokes by an edged instrument or an abrasive resulting in shallow loss of surface material over a relatively wide area. Shallow gouges may occur simultaneously. See also Abrasion.
Scratch	A linear surface loss due to abrasion with a sharp point.
Silvering	Shiny or mirror-like discoloration in the shadow areas of a photographic image caused by the aging of excessive residual silver compounds. Also known as bronzing or mirroring.

Spalling	Shallow losses or flaking from the surface of stone or ceramic.
Split	A rupture running along the grain of a piece of wood, bone, or ivory. It's usually caused by external mechanical means or too rapid drying. A split could develop into a break.
Soil	A general term referring to any material or substance that dirties the surface of an object. Use more specialized terms whenever possible. Dust refers to loose soil generally distributed on the surface. Grime refers to soil tenaciously held on the surface. Smear and Fingermark refer to localized forms of grime, usually caused by human action. Spatter, Run, and Stream refer to dried droplets or splashes of liquid foreign material. Spot refers to a small area visibly different (in color, finish, or material) from the surrounding area. It is a mark made by foreign matter, such as mud, blood, paint, or ink. The implication is that the foreign matter hasn't penetrated the surface. Stain is similar to a spot, but the term implies discoloration of the surface by penetration of the foreign matter. Spots can stain if the surface is porous or absorbent.
Stiffness	Loss of flexibility and suppleness of fibers, offering resistance to bending.
Tarnish	A dullness or blackening of a bright metal surface.
Tear	A hole or flaw caused by a forceful pulling apart of a material leaving ragged or irregular edges. If the material is organic in composition, such as paper, cloth, or basketry, individual fibers often will be split. See also: Disjoin, Rip, Split.
Wear (Worn)	Impaired, deteriorated, or consumed gradually by use or by any continued process, especially by rubbing, scraping, or washing. The term can apply to all parts of an object, not just to its surface. It can describe a defect in an object's function as well as its appearance.
Weeping	A reaction on glass between water and formic acid.

E. Measuring Objects

1. *Why should I measure objects?*	Measurements can give you important information about an object. They help you: • identify and describe an object • calculate storage and exhibit space requirements

Note: Researchers may use measurements of archeological materials and natural history specimens for comparative purposes.

When you measure objects, be sure to follow the rules for handling museum objects. Refer to the Museum Handbook , Part I, Chapter 6: Handling, Packing and Shipping.

2. *What tools do I use when measuring objects?*

Measurements should be consistent and accurate. Accuracy increases when you use the most appropriate tools for the material. Keep the equipment clean, calibrated, and in good working condition. The equipment you'll need to measure and weigh objects includes:

- folding rule
- steel tape
- cloth tape
- steel or aluminum meter rule (or smaller)
- measuring stand (upright measuring rod and a movable arm at right angles to it, for measuring height of irregular objects)
- measuring frame (grid lines marked or inscribed on a board with a raised frame along two adjacent edges for measuring length and width of irregularly shaped objects)
- calipers
- balance

Note: You can get many of these materials through the Federal Supply Service, General Services Administration (GSA).

3. *Should I use metric or English measurements?*

In most cases, use metric measurements. Use English measurements only when they are the standard measuring convention for an object. For example, the bore diameter for a Rodman Cannon is measured in inches.

The Measurements field in ANCS+ has enough space to enter both metric and English measurements, if you choose to do so.

4. *Should I convert English measurements to metric?*

No. Don't convert English measurements to metric. Remeasure the object.

Don't remeasure biological specimens. Collectors take measurements from fresh specimens. The specimens may dry and shrink over time.

5. *May I abbreviate units of measure?*

Yes. The following list supplies common examples of units of measurement and abbreviations. Use all capitals or lower case for abbreviations, but be consistent in your use. Don't use periods with abbreviations.

centimeter	CM	cm
cubic centimeter	CC	cc
cubic feet	CF	cf
feet	FT	ft
gram	G	g
inches	IN	in
kilogram	KG	kg
linear feet	LF	lf
liter	L	l
meter	M	m
milligram	MG	mg
millimeter	MM	mm
milliliter	ML	ml
ounce	OZ	oz
pound	LB	lb

6. *What types of objects should I measure?*

Take measurements appropriate to the specific discipline. For example, measure archives by linear or cubic feet.

Measure or weigh all cultural objects if you catalog them individually. For lot cataloged objects (see Appendix I in this handbook), you might:

- measure all the objects, if there are only a few
- measure a representative sample from the lot
- decide not to measure the objects
- choose to weigh the objects

Measure or weigh geological and paleontological specimens, as appropriate.

Usually you'll find biological specimen measurements on the specimen label. Copy the label information exactly. There are specific conventions for measuring most specimens. For example, the measurements for mammals are total length, length of tail, length of hind foot, and height of ear in millimeters. The dimensions are followed by the weight in grams. Dashes separate the measurements.

Generally, collectors don't take measurements of plant or insect specimens. Collectors usually measure mammals, birds, and reptiles while the specimens are fresh, before preparation.

7. *How many measurements should I take?*

Take a minimum of two dimensions or measure by volume or weight. In general, use height (or length) and width for two-dimensional objects. Use height, length or width, and depth or thickness for three-dimensional objects. You may need additional measurements for specific types of objects.

F. Recording Dimensions and Weight

1. *What degree of accuracy do I need?*

You want to be as accurate as possible. Use the following guidelines when taking measurements:

- Don't measure beyond the level you can accurately judge.
- Make all measurements for a single object in the same unit of measure to the same degree of accuracy.
- Measure the point of greatest dimension, such as the widest part of the object.

If an object…	***Then…***
measures less than one meter,	measure it in centimeters to the nearest tenth (0.1) of a centimeter.
measures more than one meter,	measure it in meters to the nearest centimeter.

2. *What are some common dimensions and their abbreviations?*

Complete measurements include the unit of measure and the type of dimension. The most common types of dimensions and abbreviations appear below. Use all capitals or lower case for abbreviations, but be consistent in your use. Don't use periods with abbreviations.

Circumference	CIR	cir
Depth	D	d
Diameter	DIA	dia
Height	H	h
Length	L	l
Radius	R	r
Thickness	T	t
Volume	V	v
Width	W	w

Note: Use depth for measuring an item from an outer surface to some interior space, such as the depth of a chair. Use thickness to measure the distance between outermost edge to outermost edge, such as the thickness of a book.

3. *Must I enter dimensions in a consistent order?*

Yes. Use the same order when recording dimensions, and use the same format consistently for each type of object. For example, enter the height, width, and depth of chairs. Height usually goes before width. Consistent order and format make it easier to compare objects.

Separate dimensions by a comma and a space, unless there is a standard convention for the discipline. For example, dashes are always used between mammal measurements.

Place the abbreviation of the type of dimension before the number. Place the

unit of measurement at the end. If the value is less than one, use a zero before the decimal point.

Example: H 15.0, W 8.9, L 5.6 cm
H 10.3, W 6.8, D 4.5 cm
L 20.3, W 15.6, T 0.5 cm
H 15.5, DIA 8.4 cm

4. *How do I measure irregular objects?*

Always give maximum measurements unless otherwise noted. If necessary, use the abbreviation "irreg" in parentheses. Use height or length for the greatest dimension, unless you know the orientation of the object is different.

Example: H 4.9, W 3.7, T 1.3 cm (irreg.)

5. *How do I record more than one measurement for an object?*

Use qualifiers for more than one measurement or maximum and minimum measurements. Place the qualifiers in parentheses after the dimension type.

Example: H (max) 20.3, H (min) 10.5, W 5.0, T 1.2 cm
H 40.0, W (Top) 32.0, W (Btm) 36.5, T 12.1 cm

6. *How do I measure objects with parts?*

Record the overall measurements for the entire object. Normally, overall dimensions include separable parts like a vessel and its lid or a pipe and its stem. You can use notes to show whether the measurement includes parts such as a handle or base.

Example: L 5.3, Dia 6.9 cm, w/handle

If you want to separately measure the parts, record these measurements after the overall measurements. Note which part you are measuring.

Example: Pipe: H 3.8, L 17.5, DIA (bowl) 2.5 cm
Handle: L 12.5, W 1.0 cm
Bowl: H 3.8, L 5.0, DIA 2.5 cm

7. *How do I measure incomplete objects?*

Record the overall measurements of the object. If the object is incomplete, note this in the Condition field of the catalog record. You may want to note which parts are missing in the Description field of the catalog record.

To show that a certain dimension is incomplete for the object type, use "inc" in parentheses after the measurement.

Example: L 5.9 (inc), W 3.2, T 0.8 cm

8. *When should I weigh material?*

You can measure some objects better by weighing them. Use this method for items like pollen and lot cataloged items. Weigh to the nearest 0.1gram or kilogram.

Example: 0.05 g

Note: You don't need to use an abbreviation, such as WT, to show that you are recording weight.

9. *When do I use volume as a measurement?*

Volume is the most accurate measurement for objects in liquid form. It's possible to use volume either by itself or in conjunction with other measurements. The volume of certain scientific or kitchen equipment, like a 150-milliliter beaker and a liquid measuring cup, can aid in identification.

Example: V 150 ml
V 8 oz

10. *What other ways can I use to show dimensions?*

Images are a useful supplement to dimensions, particularly for irregular objects. Use a sketch, trace, or photograph to further identify the measurements of an object. You can trace small objects, if tracing won't damage the object. Note that the drawing is a trace.

Mark the image to show where you measured the object. With a sketch or trace, you can place the measurements directly on the drawing. When possible, make the sketch to scale.

With a scanner, you can digitize a sketch or trace and attach the image to your ANCS+ catalog record. If you don't attach the image to your catalog record, note on the catalog record that the drawing exists. Store the image in the catalog or accession folder.

You could also show dimensions on a digitized photograph by using photo editing software. You can attach these images to your ANCS+ catalog record.

11. *How can I learn the measuring standards for the types of material in my collection?*

There are standard methods of measuring most types of material. Consult curators with similar collections, or refer to discipline-specific texts. *The New Museum Registration Methods* has a section on measuring specific types of material. See Appendix L of this handbook for a publication citation.

APPENDIX D: MUSEUM ARCHIVES AND MANUSCRIPT COLLECTIONS

A. Overview

1. *What information will I find in this appendix?*

This appendix gives guidance on how to manage archival materials that are accessioned into NPS museum collections. Archival materials advance the NPS mission of education, management, preservation, and research.

2. *What categories of archival materials are covered in this appendix?*

This appendix covers all categories of archival materials that may be accessioned into NPS museum collections, including:

- Records created by the park (such as associated records and other resource management records)
- Copies of records created by the park, if the park is required to transfer the originals to the National Archives
- Personal papers acquired through donation or purchase
- Organizational archives acquired through donation or purchase

3. *Where can I find further guidance on NPS archival materials?*

Further guidance on archival materials appears in:

- NPS-28, *Cultural Resources Management Guideline*, Chapter 9.1
- ANCS+ *User Manual*, Appendix F
- DOI *Museum Property Handbook*, Vol. II
- NPS-77, *Natural Resource Management Guidelines*
- DO-19, *Records Management*
- NPS-19, *Records Disposition Schedule*
- NPS *Records Management Handbook*
- NPS *Conserve-O-Grams*

Guidance on NPS records falls under the authority of the NPS records manager and the National Archives and Records Administration (NARA). Park records include materials such as central files, financial records, and personnel records. Guidance on these records appears in NPS-19, *Records Management*, and in the NPS *Records Management Handbook.*

B. General Information On Archives

1. *What types of materials are considered archives and manuscripts?*

Archives and manuscripts include all types of documents, regardless of format. See Table 1 for examples. Documents may be in hardcopy (paper), or in any kind of magnetic, electronic, digital, or film technology.

Individual documents may be loose, or they may be contained in file folders or in bound volumes. Carbon copies, photocopies, and other duplicates may be regarded as "original documents," depending on specific circumstances. For example, if an individual sent a letter to someone and kept a copy of that letter in his or her own files, then that copy would still be regarded as an original document in the individual's manuscript collection.

Examples of Archival Materials

- letters, reports, memorandums, minutes, notes, telegrams
- newspaper clippings
- maps, charts, architectural/engineering drawings
- albums, ledgers, diaries
- photographic prints, photographic negatives, slides
- motion picture film
- microfilm, microfiche
- phonograph records, sound recordings on reel-to-reel or cassette tapes, digital sound recordings
- video recordings on VHS, Beta, or other formats
- punch cards, automated data on magnetic tape, and any type of material contained on floppy disks, compact disks, and DVDs

Note: Individual documents may be loose, or they may be contained in file folders or bound volumes.

Table 1. Archival Materials

2. *Are rare books or periodicals generally considered archival/ manuscript materials?*

No. Rare books and periodicals aren't considered archival/manuscript materials unless they are part of a larger archival or manuscript collection.

If…	***Then…***
published books and periodicals are sufficiently rare to warrant accessioning into museum collections (as opposed to being managed as part of library collections),	handle them as individual museum objects, not as archival materials.

However, there are exceptions to this rule. For example:

If...	***Then…***
a collection includes a letter that discusses a particular book, and a copy of the book was sent as an attachment to the letter,	consider the book as part of the letter, and as such it's archival.
an archival collection includes the research files of an individual or organization, and magazine	the magazines would be considered archival.

articles, or even entire magazines, were included as part of those files,	
a person or organization actually published books, pamphlets, or other publications, and kept a record set of those publications,	the publications would be part of the archival collection.

Note: Ledgers, diaries, albums, and other bound materials that resemble published books are not actually books. These are unique records created by individuals or organizations. Handle them as archives.

3. *Is there a difference between "archival collections" and "manuscript collections"?*

Yes. "Archival collections" generally are groups of documents created by organizations, such as government agencies, corporations, and non-profit groups. ("Archives" can also mean the building or room where archival collections are housed and the organization responsible for managing archival collections).

"Manuscripts" are single documents or collections of documents created by individuals or families. These collections are sometimes called "Personal Papers."

"Manuscripts" may also refer to groups of individual documents that were:

- created by different persons or organizations, *and*
- assembled later from multiple sources

To avoid confusion, this appendix will call such collections "Assembled Collections."

Archival collections or manuscript collections created by a single person or organization are "organic collections," because they grow naturally as the result of the record creator's activities. They include the letters, reports, receipts, and other documents that a person or organization accumulates and files as they go about their business.

Manuscript collections that are assembled from multiple sources or created by different persons or organizations, however, are "artificial collections." These collections did not accumulate naturally as a by-product of a person or organization's activities, but were acquired and brought together artificially by a collector.

4. *What's an archival collection?*

An archival collection is a group of documents:

- created or received by a single government agency, corporation, non-profit organization, or other body, in the course of doing business, *and*
- filed together as a unit

An archival collection should include all the historically significant documents that the organization:

- actually created, such as reports, letters, memorandums, charts, photographs, and sound recordings, *and*

- received, such as letters sent to the organization by outside individuals or organizations

An archival collection should remain intact. Don't parcel it out among multiple collections. Don't mix it with other collections.

Note: For guidance on how to determine the historical significance of a collection, see Section E, Appraisal.

5. *What's a manuscript collection?*

A manuscript collection is a group of documents:

- created or received by a single individual or family, *and*

- filed together as a unit

A manuscript collection should include all the historically significant documents that the individual or family:

- actually created, such as letters, diaries, photographs, and sound recordings *and*

- received, such as letters sent to the individual or the family by other individuals or by organizations

A manuscript collection should remain intact. Don't parcel it out among multiple collections. Don't mix it with other collections.

Manuscript collections are also called "Personal Papers."

6. *What's an "assembled" collection?*

An assembled collection is:

- a group of documents created by different individuals or organizations, *and*

- compiled later from multiple sources

An assembled collection is also called an "artificial" collection because the documents bear no organic relationship to each other. That is, they were not created by a single person or organization. They didn't accumulate naturally as a record of the activities of that organization or individual.

For example, a manuscript collector draws upon a variety of sources to assemble a group of letters from African-American soldiers during the Civil War and a group of photographs on a single site taken by different photographers. The collector then sells or donates these "assembled collections" to the park.

7. *What are "park records"?*

Park records are records created or received by park staff in the course of conducting official activities. They can include letters, reports, notes, and memorandums actually written by park staff, as well as letters or other documents that they received. NPS records should be handled in accordance

with NPS Directors Order 19 (see Section F).

Example: A park superintendent writes a letter to a contractor concerning an archeological monitoring project carried out at the park and keeps a copy of the letter in the park's files. The contractor responds by sending the superintendent a letter, which also goes into the park's files. Both the copy of the letter sent by the superintendent and the letter that the contractor sent to the superintendent are park records.

8. *Are personal papers or organizational archives acquired by the park through donation or purchase considered park records?*

No. Only documents created or received by the park in the course of official activities are park records.

Documents created or received by a private individual, family, corporation, or non-profit organization, retained as part of the files of that person, family, corporation, or non-profit organization, and later acquired by the park through donation or purchase are not park records. They are not a record of official activity but are simply museum property.

9. *Are there legal factors that make park records distinct from personal papers or the archives of non-NPS organizations?*

Yes. Park records are covered by the Federal Records Act and access to them is governed by the Freedom of Information Act. They generally cannot be copyrighted. The personal papers of individuals or families and the archives of corporations or non-profit organizations:

- are not covered by the Federal Records Act,
- are not subject to the Freedom of Information Act or other regulations governing access to Federal records, *and*
- may be protected by copyright—even if those collections are owned by the park.

C. Archival and Manuscript Collections Owned by NPS Museum Programs

1. *Is the NPS required to keep archival and manuscript collections?*

Yes. In accordance with law or NPS regulations, parks must keep certain types of archival materials created by the NPS. For example, NPS regulations require parks to maintain resource management records. Parks are required by statute to retain associated records (such as field notes and reports on projects carried out at the park in archeology, paleontology, biology, ethnology, and geology—regardless of whether they were carried out by NPS staff, contractors, or private researchers working under park-issued permits). Parks should also retain files on historic structures, cultural landscapes, and other mission-related activities.

2. *Can a park acquire archival and manuscript collections for the museum collection?*

Yes. Parks can acquire archival collections that fit their Scope of Collection Statements. Parks can acquire archival collections through donation, purchase, transfer, or exchange.

Archival and manuscript collections play the same vital role in a collection as three-dimensional museum objects. These collections can document, commemorate, and reflect the cultural, natural, and historical themes and events associated with a park. For example, the museum collection at Thomas Edison NHS includes Edison's personal papers and the records of

the Edison Company. These materials are as important a part of the collection as Edison's first phonograph and the desk where he did his work.

3. *What purposes can archival collections serve in a collection?*

Archival collections can serve a variety of purposes. They can provide:

- baseline information essential for managing cultural and natural resources
- contextual information necessary for understanding archeological, biological, and paleontological museum objects
- research materials for use by NPS staff, as well as by non-NPS historians, archeologists, and other scholars
- information for park-based educational and interpretive activities, such as exhibits, curriculum development, publications, and websites

4. *Should I manage archival/manuscript materials in the same way that I manage museum objects?*

No. Don't manage archival/manuscript materials in the same way that you manage museum objects.

Although individual documents technically are counted as objects for reporting purposes, they are fundamentally different from objects. They are part of a larger archival collection. All of the documents within a given collection are interrelated. This affects the way documents are housed, arranged, and cataloged.

5. *What are the principal differences between archival work and curatorial work?*

There are several principal differences between archival work and curatorial work.

Cataloging by collection versus cataloging by object or lot

- Archival cataloging is fundamentally different from object cataloging. Object cataloging involves creating individual catalog records for each object or for each comparatively small lot of objects. Archival cataloging, however, involves cataloging an entire collection under a single catalog record, no matter how many documents it contains. A single archival collection can contain an infinite number of documents, and the documents themselves can cover an infinite number of projects. Lot-cataloged objects, on the other hand, relate to a single project and have the same name and provenience.
- Regardless of how many documents it contains, you should regard an archival collection as a single object. Assign a single catalog number to the collection as a whole.

  Object cataloging is a one-step process, involving completion of a catalog record in the Collections Management Module. Archival cataloging is a two-step process, involving completion of a catalog record for the collection as a whole, followed by Archives Module descriptions of the collection's various subordinate parts. (**Note:** Archives Module entries,, in turn, can provide the basis for a full finding aid—which is a critically-important tool for using any collection. See Section S "Description" and Section T "Folder Title Lists and Finding Aids".)

- Object cataloging usually is done on an object-by-object basis, but archival cataloging should *never* be done on a document-by-document basis—unless a document is not part of a larger archival collection. For individual documents on loan or of high monetary value, the park may complete individual catalog records in the Collection Management Module or item-level entries in the Archives Module—but it should still manage such documents as part of the larger archival collections to which they belong. Those individual catalog records for documents contained in larger collections would be done for accountability purposes only; since those documents would already be covered under the collection-level catalog record, they should not be counted a second time in the park's Collections Management Report. When these individually cataloged documents are returned, change the status of that document's catalog record to "Incorporated into Larger Archival Collection."

Arrangement

- An archival collection needs to be arranged in its proper order before you attempt to catalog it. You must complete this essential preliminary work before you can create a catalog record for the collection. You can't take a single document off the shelf and catalog it and move on to the next document. You must approach the collection as a whole and process and arrange the entire collection. Then you will understand what is in it and how the documents fit together. This is true whether the collection contains thousands of documents or only a handful of documents.

Multiple Accessions

- A single archival collection may be composed of multiple accessions, while a museum object is always associated with only one accession. For example, one archival collection may be composed of ten accessions from a single original source. Even though there are ten accessions, catalog the collection with one catalog record and one catalog number. The reverse is true in object collections, however, because an accession containing ten objects can result in ten catalog records and ten catalog numbers.

Classification versus Organization

- You don't classify archival collections in the same way you classify museum objects. For example, you wouldn't classify an archival collection by time period and material of manufacture or by genus and species. Instead, you analyze how each collection is organized and identify its component parts, such as series and subseries. You then base your cataloging and description on the unique internal organization of the collection.

6. *Why are archives managed on a collection-by-collection basis, rather than a document-by-document basis?*

Archives are managed on a collection-by-collection basis as opposed to a document-by-document basis for two reasons:

First, a document that is part of a collection has context and meaning in a way that an individual document cannot. A collection of documents can:

- reflect the development over time of historical themes and events
- suggest cause and effect
- show entire sequences of activities and thoughts
- help to authenticate individual documents

A single document is at best a snapshot, with little clear connection to what came before or after.

Second, as a practical matter, it's often impossible and usually unnecessary to describe each individual document in a collection. Some collections include thousands of documents. Attempting to describe each in the same detail that you would describe a three-dimensional museum object would be time-consuming and largely unnecessary. You can find individual documents more expediently in a well-organized collection than you can find individually cataloged items.

If…	***Then…***
it's necessary to provide detailed descriptions of individual documents within an archival finding aid,	it must be done within the context of the collection as a whole--and to do this, you should use the ANCS+ Archives Module.

7. *What kinds of archival and manuscript collections are likely to be accessioned into NPS museum collections?*

Archival and manuscript collections that may be accessioned into NPS museum collections include:

- personal papers and records of corporations or other organizations that meet a park's Scope of Collections Statement. (The park may acquire these through donation, purchase, transfer, or exchange.)
- resource management records created or received by the park for the purpose of managing park cultural or natural resources
- copies of certain NPS-created records

Note: Associated records are an example of resource management records. Associated records include field notes, site forms, reports, correspondence, maps, and drawings prepared in connection with studies or projects in such areas as archeology, ethnology, paleontology, geology, biology, etc. They are considered associated records because they are associated with objects and specimens that are accessioned into museum collections and with park sites where studies and surveys were conducted. It's necessary for the park to retain these records in order to understand and manage the objects, specimens, and sites (see Section M, "Handling Resource Management Records").

Other types of resource management records include maintenance files on historic structures, files on cultural landscapes, and land use files. These records provide baseline data and other information necessary for managing resources.

Apart from resource management records, original NPS files need to be handled in accordance with NPS-19. Even if you manage such records as a collateral duty, don't accession these records into the museum collection.

D. Fundamental Principles Of Archival Work

Archivists and curators have similar skill sets and interests. However, there are important differences between the underlying theories of archival and curatorial work. The most basic difference is that:

- archival work focuses mainly on *collections* of documents
- curatorial work focuses mainly on *individual* museum objects, or on object lots associated with *individual projects*

This section outlines some of the most important archival theories and procedures. You'll need to understand these before attempting to manage archival and manuscript materials. For further information, you may want to check the sources listed in the bibliography, or attend one or more of the archives classes offered by the National Archives and Records Administration, institutions of higher learning, and professional organizations (such as the Society of American Archivists).

1. *What's "provenance"?*

"Provenance" is the basis for modern archival work. It's the principle that the records of one organization or individual remain together. They must never be mixed with the records of another organization or individual.

The collection of documents that an organization accumulates in the course of doing business is a coherent whole. The collection of documents that an individual accumulates in the course of living his or her life is also a coherent whole. It's evidence of what that organization or individual did or knew. A collection shouldn't be broken up into smaller collections, and it should not be integrated with other collections. When documents from one collection are intermingled with documents from another collection, the integrity of both collections is compromised. Their research value and historical reliability are diminished. Even when collections cover the exact same subjects, themes, events, or individuals, you must maintain absolute fire walls between them.

Another meaning of "provenance" relates to the chain of custody or ownership of a collection. For example, you can trace the provenance of a park collection by starting with its current owner, the National Park Service. Then go back through any intermediate owners, to the collection's origins as the records of a particular organization or individual.

There are different options for managing associated records. Technically, you should treat associated records as series within an overall collection of the park's resource management records. Because of their special importance, it's permissible to treat all of a park's associated records for a single discipline as a stand-alone collection.

Example: All of a park's records on archeological projects may be handled as either series within the park's resource management collection or as a collection unto itself. Similarly, all of a park's records on biological projects may be handled either as a series within the park's resource management collection or as a collection unto itself (see Section M, "Handling Resource Management Records").

2. *What's "original order"?*

When organizations and individuals create records, they usually file them according to some kind of logical structure. They might keep all their correspondence together, arranged alphabetically. They might keep all their financial statements together, arranged chronologically. They might keep all their project files together, arranged according to a numerical filing code.

"Original order" refers to the way in which an organization or individual chose to maintain their records from the outset. That is, "original order" is the way in which the records were originally organized and filed.

> ***Good archival procedure requires that a collection of records be kept in its "original order." You should avoid rearranging archival collections.***

A common misconception among non-archivists is that "original order" is the order in which they found the records. This isn't necessarily true. Some collections remain in their correct, original order from the time they were created until the time they were acquired by NPS. In other cases, documents in a collection can get all mixed up before they reach NPS. When this happens, don't simply leave the collection in the order in which you found it.

When a collection has gotten out of order, you must put the collection back into its "original order." You must do this before you can proceed with further processing or cataloging. Unfortunately, there is no universal template for organizing an archival or manuscript collection. All collections are going to be unique. Section H, "Arrangement," gives tips on how to discern and re-establish the "original order" of a collection that has gotten jumbled.

There may be rare occasions when the original order of a jumbled collection is indiscernible or unusable. In such cases, an archivist may put the collection into an intelligible order. This should only be attempted if the archivist can determine that the original order cannot be re-established. For further information, see Section H, "Arrangement," Item 14.

3. *What's an archival "hierarchy"?*

The internal structure of an archival collection is called a "hierarchy." Archival collections are organized hierarchically. That is, collections are broken down into subordinate parts. These parts may in turn be broken down into subordinate parts, and so forth. You start from the top of the hierarchy with the collection as a whole. You go through the levels of the hierarchy to individual documents at the bottom of the hierarchy.

For example, suppose that a collection is composed of four parts called "series":

- Series I: Correspondence
- Series II: Financial Records

- Series III: Project Files
- Series IV: Annual Reports

Each of those series, in turn, may be subdivided into individual file units. Series III, Project Files, would be composed of individual files for each project. Each individual project file, in turn, would be composed of individual letters, memorandums, forms, or other documents.

Thus, an archival hierarchy goes from the general to the specific. Starting at the top of the hierarchy, the collection as a whole is the most general. Then the hierarchy becomes more specific as it moves down to the individual series. It then becomes even more specific as it moves down to the individual file units within those series. Finally, it reaches the most specific when it moves down to the individual documents within those file units.

Documents aren't individual museum objects or disconnected pieces of data. They're small parts of a whole. Each document will have a definite and permanent location in a larger context. Each document is related to something larger. For example, a document may be part of a file unit, which is part of a series, which is part of a full collection. This is why it's inappropriate to handle or catalog individual documents separately.

4. *What are the standard levels of an archival hierarchy?*

The standard levels of an archival hierarchy go in descending order:

- Collection Level
- Series Level (plus subseries, sub-subseries, etc., as necessary)
- File Unit Level (**Note:** A file *unit* is not the same thing as a file *folder*. A file unit is a group of documents filed together under a particular topic or title. A file folder is simply a physical device for holding those documents. It is not unusual for a single file unit to contain so many documents that it would take multiple file folders to hold all of the documents contained in that one file unit.)
- Item Level (individual documents)

5. *Must each collection follow a standard hierarchy?*

No. Each collection will have its own unique hierarchy. There's no universal template.

Some collections can have extremely simple hierarchies. A collection may be composed of a small number of individual documents that aren't organized into files or series. In that case, the hierarchy would simply involve the Collection Level and the Item Level.

At the other end of the spectrum, another collection may have an extremely complex hierarchy. It would encompass multiple series, some of which might be organized into subseries. Some of those subseries might be organized into sub-subseries. Some subseries might be made up of files that are arranged alphabetically. Some might be made up of files that are arranged chronologically. Some may be made up of bound ledgers that are arranged numerically. Some may be made up of individual documents that are not part of file folders or bound volumes.

The key is to evaluate each collection individually, by answering the questions:

- What are the collection's components (the series, subseries)?
- How are files within the various components arranged (alphabetically, chronologically, numerically)?

Remember: A hierarchy can be as simple as a single group of files arranged alphabetically, or it can be as complex as a collection that is divided into 10 or more series, all of which are divided into subseries, some of which are further divied into sub-subseries.

6. *What's an easy way to remember archival hierarchy concepts?*

Think of a collection as a multi-volume publication. Each volume would be analogous to a series. Within each volume, each chapter would be analogous to a file unit. Within each chapter, individual pages would be analogous to individual documents.

In other words, the pages of a multi-volume publication are not stand-alone objects. They follow a specific order and are arranged into chapters and volumes. Similarly, individual documents in a collection are not stand-alone objects. They follow a specific order and are arranged into file units and series.

A hierarchy is a little like an outline—you have to have two or more elements to justify going to a subordinate level. It is pointless to have an outline with just one heading (Roman Numeral I, but no Roman Numeral II), or just one subheading under a heading (Subheading II.A, but no Subheading II.B). It's the same way with archival hierarchies. You have to have at least two series to warrant organizing a collection into series. If you don't, then you just have a collection arranged into file units, with no series structure. Similarly, you should only break a series into subseries if you can identify at least two subseries.

7. *Why is it important to maintain a collection's provenance and to arrange it according to its original order?*

A collection is evidence of the knowledge, statements, and activities of the organization or individual that created the collection. If provenance and original order are protected, the collection will reflect historical development. It will show what the organization or individual knew or thought over time and document decision-making. It will also provide the context and background that are critically important to understanding the significance of each document.

For example, researchers can compare a person's diary entries with his or her outgoing letters. They can compare an organization's internal memorandums with its press releases to see if they are consistent. They can compare incoming letters with outgoing letters to determine how a person or organization responded to questions or events. They can compare documentation filed at the beginning of a project with documentation filed at the end of a project. This helps to provide a full picture of what took place.

One can evaluate the authenticity of documents more readily when they are retained in context with related documents created or received by the same

organization or individual. You compromise provenance and original order by mixing documents from one collection together with another or by rearranging collections. This makes it more difficult to:

- discern an organization's or individual's actions or responses
- recreate the context for that organization's or individual's actions or decisions
- authenticate documents

8. *Why is it important to arrange a collection in a hierarchical order?*

Hierarchical organization makes archival cataloging easier and more practical. Once you establish a collection's hierarchy, it's usually sufficient to catalog or describe only the upper levels of the hierarchy. In the vast majority of cases you don't have to catalog hundreds or thousands of individual documents or file units. It's usually only necessary to:

- complete a catalog record for the collection as a whole
- write descriptions similar to catalog records for the various series and subseries that make up the collection
- prepare a folder-title list or container list for the collection, if desired

Hierarchical organization also provides for an additional and useful method of access. Word searches and searches by accession number or catalog number are the primary methods to retrieve documents from collections that were cataloged on a document-by-document basis—but this often means that a researcher needs to have a fairly clear idea of specifically what to request. Hierarchical arrangement facilitates broader and deeper research by focusing on document types, functions, and creators. You can still do word searches and searches by accession number in a hierarchically arranged collection, but hierarchical retrieval in many cases is a more rewarding method because it does not limit researchers to documents, file units, subject terms, or accessions that they already know to request.

A properly arranged archival collection can be almost self-indexing. If a series is arranged alphabetically, you can search for specific files just as easily in the records themselves as in a finding aid—without having had to take the time to enter the titles of each file into the Archives Module. On the other hand, if you need to create finding aids with titles of each file unit, the Archives Module will make it easy to do.

9. *Am I prohibited from describing archival collections at the file unit or item level?*

No. It is always an option left to your discretion—but it should only be done when necessary. In most cases, having logically-arranged and properly-described series and subseries will be sufficient to enable researchers to zero in on the 5 or 10 file units containing the documents they need. Additional description at the file unit or item level won't add enough value to make it worth the effort—especially since container lists can provide an extremely easy alternative to full file unit descriptions. But it is always *possible* to do descriptions at lower levels of the hierarchy.

In a few instances, such as situations where you are working with associated records, full file unit descriptions may be recommended (see Section M, "Handling Resource Management Records).

One example of the sort of material where file unit description should be considered would be records relating to archeological projects. All records on a specific archeological project can be handled as a file unit within the Archives Module, and you can enter information on subjects, activities, locations, findings, investigators, and any other data concerning the project into the file unit screen—along with accession numbers linking the project with any associated objects. The files on each project will thereby retain their individual identity within the hierarchy, and will be readily identifiable within the hierarchy—but it will still be possible to do word searches and searches by accession number.

10. *What are the principal functions associated with archival work?*

The principal functions of archival work are:

- appraisal, scheduling, and accessioning (determining the long-term value of archival materials; deciding whether or not to accession them)
- arrangement (putting each collection into its hierarchical original order)
- processing and preservation (foldering; boxing; labeling; removing clips, staples, and other foreign objects; separating textual from non-textual materials; placing damaged or unstable documents into protective sleeves)
- description (including cataloging and the preparation of finding aids)
- access and use (including reference, exhibits, publications, and education)

Note: Each of these functions will be discussed in detail in its own section of this appendix.

Note: Never attempt to do any of the phases listed above before learning about the person, family, or organization that created the collection, and the history or other subjects covered in the collection.

11. *Why is it necessary to carry out these archival functions in the correct sequence?*

You should perform the archival tasks in the sequence listed above for several reasons.

- Before accessioning a collection, you should appraise it to determine whether it possesses sufficient value to warrant retention.
- Trying to use a collection before the important work of arrangement and description has been completed is difficult. You wouldn't have a finding aid or an arrangement scheme that could help you find the documents you need.
- Attempting to use a collection prematurely could interfere with the work of arranging, processing, and describing it. This would be like moving furniture and inviting guests into a room that's still being painted and carpeted.

Note: On very rare occasions you may have to use a collection that's still being processed. However, you must have a strong justification for doing so.

12. *Why is the arrangement of a collection necessary before cataloging?*

There's at least one sequence of archival tasks that's mandatory. Archival collections **must** be arranged before they can be cataloged. Description always follows arrangement.

> ***Never attempt to catalog an archival collection before it has been physically arranged.***

Archival cataloging and description are based on each collection's unique hierarchical arrangement. Therefore, you cannot begin to catalog a collection until you have completed arranging it. You must also have a good general sense of what's in the collection as a whole before beginning to catalog. You need to know the:

- physical types of documents
- information contained in those documents
- functions served by those documents

The best way to acquire this knowledge is through arranging and processing the collection.

Arrangement is the necessary preliminary work before cataloging. It can take a considerable amount of time. You can spend many days or weeks organizing and processing a collection before you can write a single catalog record. However, don't attempt to catalog archival materials before that preliminary work is done.

See Sections H-M for a full discussion of arrangement.

13. *How is cataloging an archival collection different from cataloging museum objects?*

You can't catalog archival materials in the same way that you catalog museum objects. When cataloging museum objects, you catalog one object or one small lot of objects at a time. Even with scientific collections, where it is important to classify objects and to document the relationships between objects, the result is still going to be one catalog record per object or one catalog record per lot. With non-scientific collection, where there may be little or no direct relationship between objects, it is possible simply to catalog one object at a time with no reference at all to other objects.

An archival collection, however, should never be cataloged on a document-by-document basis, as object collections are cataloged on an object-by-object basis. Instead, you have to create a single catalog record for an entire collection of archival materials (which might involve many thousands of documents). Then, you must develop separate archival descriptions for all series, subseries, or sub-subseries in the collection. If necessary, you can also describe individual file units or even individual documents.

Further, the cataloging and description of archival materials is based partly on how they are filed or housed. Object cataloging is not affected by the physical placement of the objects being cataloged. Even objects that were

collected as part of the same project or are otherwise related may be shelved, boxed, or stored in different locations. Apart from noting the physical location of each object or lot, a catalog record for an object will not be based on the object's physical placement. Actual physical arrangement, however, is central to archival cataloging.

> ***Never attempt to catalog archival materials by cataloging one document, putting it back in the file or back in the box, and moving on to catalog the next document.***

Archival cataloging is based largely on the physical arrangement of a collection. It is necessary to organize a collection into its hierarchical component—both physically and intellectually—so that you can describe those various components. Once the collection has been physically arranged, you will be able to describe the collection as a whole, then each of the series that make up the collection, each of the subseries that make up the series, and so forth.

Even though it can be time-consuming to complete the physical arrangement of a collection, the actual task of producing an archival catalog record can be done relatively quickly. A single catalog record may cover thousands of individual documents. These are counted as individual objects in the Collection Management Report. The time spent on cataloging and description is far less when you follow archival methods. This is true even if you complete series and subseries descriptions or container lists in the Archives Module.

> ***Individual project files in archeology, paleontology, geology, biology, etc., can still be co-located with their associated objects at partner repositories even if the collection as a whole is arranged hierarchically. Just do a file unit description in the Archives Module, and note in the location field that the file unit is housed at another repository. If you do not already have an on-going agreement with that repository, you should also complete an Outside Loan Agreement. Even though the file unit is separated physically from the remainder of the collection, it is still part of that collection intellectually because it retains the same provenance as the remainder of the collection.***

In short, don't attempt to catalog an archival collection on a document-by-document or file-by-file basis. Put all the pieces together in a hierarchical arrangement before cataloging.

E. Appraisal

This section outlines the criteria, standards, and methods you should employ to determine whether a collection is:

- historically significant, *and*
- eligible to be accessioned

1. *Why is it necessary to appraise archival and manuscript materials before accessioning them?*

For legal, professional, and practical reasons, it's unwise to accession all archival material that may be available. Just because documents are old doesn't necessarily mean they are worth keeping. NPS curators and archivists must apply specific criteria and make serious decisions about acquiring archival collections.

> ***Federal records that must be retained by statute or because they are covered by an existing records disposition schedule don't need to be appraised. They are automatically eligible for accessioning (see Section F, "Records Schedules").***

Example: Records associated with archeological projects at parks are covered by NPS-19, and Federal regulations require that they be retained. Therefore, you do not need to appraise them before accessioning them.

The Federal Records Act requires that certain types of park records be transferred to the National Archives. It would be inappropriate to accession such materials into NPS museum collections, no matter how valuable they are. The records schedule in NPS-19 provides clear guidance on this.

See Section F, "Records Schedules," for additional information on the Federal Records Act and NPS-19.

By applying good appraisal techniques, you can prevent museum collections from being inundated by:

- documents with minimal historical value that shouldn't be accessioned
- certain park records that are required to be sent by law to the National Archives

Appraisals prevent valuable NPS resources from being diverted away from legitimate museum holdings and activities.

> ***Once archival collections are accessioned, it becomes very difficult to deaccession them. The items will be counted in the backlog and eventually will have to be processed and cataloged. The best deaccession policy is always a good accession policy.***

2. *What are the two methods for determining whether a given collection of archival or manuscript materials should be accessioned?*

The two methods for determining whether you should accession archival materials are:

- Apply an *existing* "records schedule" to see if directions are already in place for handling this particular type of records. (**Note:** NPS staff apply existing records schedules to park records *only*. Records schedules don't apply to donated material.) See Section F for information on records schedules.
- Conduct an original appraisal of the materials in question. Evaluate the records according to several well-established criteria.

3. *How do I appraise donated materials?*

You can't apply existing NPS records schedules to donated materials. Appraise each collection of personal papers or organizational records offered to your park. Follow the appraisal guidelines cited below in this section. Parks can appraise these kinds of materials completely on their own authority. You don't need to get authorization from the National Archives. See Section F for specific schedules covering NPS records.

4. *What are the guidelines for appraising archival and manuscript materials?*

To qualify as a museum accession, a collection of archival or manuscript materials must:

- fit the park's Scope of Collections Statement, *and*
- demonstrate enduring value in one or more of the following areas:
  - evidential value
  - informational value
  - legal value
  - intrinsic value
  - associational value

Note: The Scope of Collections Statement (SOCS) defines the museum objects and archival/manuscript materials a park will collect. Each park is required to have one. The SOCS reflects the park's mission. It focuses on museum objects and archival/manuscript materials that:

- relate to the park's cultural resources and natural history
- relate to the site, subject, person, event, or other entity the park was established to preserve and interpret

For further information on SOCS, see the *Museum Handbook*, Part I, Chapter 2.

5. *What's "evidential value"?*

"Evidential value" documents the activities, goals, policies, programs, administration, and organization of the records creator. Such records constitute evidence of the actions taken or considered by the records creator.

A collection of personal papers that reflects the activities and thoughts of the person who created it has evidential value.

6. *What's "informational value"?*

An archival collection has "informational value" if it contains information on historical events, themes, issues, and eras apart from the organization or the person that created the records.

The archives of the Olmsted Firm at the Frederick Law Olmsted NHS are an example. They document the company's activities (evidential value), but also contain informational value about the:

- evolution of landscape architecture and urban planning in the late 19th and early 20th centuries

- cities where the Olmsted Firm designed parks and thoroughfares

The records of the Calumet and Hecla Mining Company and the Quincy Mining Company at Keweenaw NHS document the activities of those corporations. The records also contain informational value by documenting the:

- history of the mining industry and labor relations in Northern Michigan from the 1880s through the 1930s
- political and social history of mining towns in that area

7. *How do I evaluate a collection's informational value?*

Most collections will have at least some trace of informational value. However, not all collections with informational value should be accessioned.

> ***To warrant retention on the basis of informational value, a collection must contain information that is unique, concentrated, and important.***

Unique Information

Information contained in a collection is unique if:

- it's not readily available elsewhere (such as, in books, or in newspapers, or in other archival collections), *or*
- the collection contains information from a particular perspective that is not available elsewhere

Concentrated Information

Information in a collection is concentrated if it presents:

- many facts on a small number of persons, things, issues, or events; *or*
- a few facts on a large number of persons, things, issues, or events; *or*
- many facts on a large number of persons, things, issues, or events

Note: Collections that contain only a few facts about a small number of persons, things, issues, or events may not be sufficiently concentrated to justify accessioning.

Importance of the Information

The collection should have importance as a potential information source. The information should be primarily important for the NPS and secondarily for outside historians, scientists, and other researchers. Don't accession collections that are of no use as a reference tool or source of information for the NPS or outside researchers or would be readily available at public libraries or other repositories.

8. *What's "legal value"?*

Documents such as deeds, wills, articles of incorporation, and contracts may

have ongoing "legal value." Such documents may be necessary to establish ownership, authority, responsibility, or obligation in a legal sense. Documents with legal value may be important not only for historical research, but also for present-day and future activities, from title searches to litigation.

Note: For park records, most records with legal value are already scheduled in NPS-19 (Appendix B) for permanent retention. They are retained either in the museum collection or at the National Archives.

9. *What's "intrinsic value"?*

Some documents have value not for the information they contain, but rather as artifacts. Documents that are important as artifacts have "intrinsic value." An excellent non-NPS example would be the Declaration of Independence. Innumerable copies of the Declaration of Independence exist all over the world. The original Declaration of Independence is on permanent exhibit at the National Archives. It contains no evidence about the operations of the Continental Congress or information about the American Revolution that isn't readily available elsewhere. However, the document itself, as a physical object, has tremendous artifactual or intrinsic value.

Intrinsic value is seldom a factor when appraising an entire collection. However, it's an important consideration in determining how to handle individual documents. Some documents are physically unstable and may cause surrounding items to deteriorate. These include newspaper clippings or telegrams on pulp paper, nitrate-based photographic negatives, and motion pictures. If an item is exceptionally deteriorated, it's permissible to replace the original with a surrogate archival quality copy. If the original lacks intrinsic value, you may discard it without having to formally deaccession it. If it has intrinsic value, you should keep it for as long as possible.

10. *What's "associational value"?*

"Associational value" refers to a collection's relationship to a person, organization, or event whose history the park preserves or interprets. For example, Golden Gate NRA preserves and interprets the history of the former U.S. Penitentiary on Alcatraz. Accordingly, that park has collected archival materials associated with Alcatraz.

Associational value alone is usually not sufficient to warrant accessioning. It's basically the same thing as meeting the park's Scope of Collections Statement. Collections must not only fit the Scope of Collections Statement or have associational value; they must also possess evidential, informational, or legal value.

"Associated records" are also documents generated through the collection or analyses of artifacts or specimens. They are necessary for the management and future research use of those artifacts and specimens. Examples include field notes and reports produced as part of permitted research projects at the park. These records are associated with archeological, paleontological, geological, or biological objects or specimens in the park's museum collection. Check both the Scope of Collections Statement and NPS-19 (Appendix B) for information on associated records that should be accessioned.

11. *Are there other types of archival "values"?*

There are other types of archival "values":

- "Monetary value" refers to the dollar value placed on rare or

collectable documents. It should seldom, if ever, be regarded as a criterion for accessioning. In other words, if a collection has sufficient informational or evidential value and fits the park's Scope of Collection, but has little or no monetary value, it should still be accessioned. If, however, a collection has monetary value but does not fit the Scope of Collection or has insufficent informational or evidential value, then it probably should not be accessioned.

- "Administrative value" refers to the usefulness of a collection of park records for purposes of park management. Resource management records, as defined in NPS-19 (Appendix B), may be scheduled for permanent retention in park museum collections because of their administrative value.

Note: For further guidance on the methods and objectives of records appraisal, see "Strategic Directions: Appraisal Policy" (NARA Directive 1441), at http://www.archives.gov/records-mgmt/initiatives/appraisal.html.

12. *How should a records appraisal be conducted and documented?*

Records appraisals should be conducted and documented as follows:

If…	***Then…***
you are simply applying an existing records schedule to a collection of park records,	you should indicate the specific schedule and item number in the accession file.
you are developing a specific records schedule,	you should draft an appraisal report (in the form of a memorandum) and complete National Archives SF 115, Request for Disposition Authority.
you are considering whether to purchase or accept the donation of an archival or manuscript collection,	you should draft an appraisal report (in the form of a memorandum) stating how the collection meets the Scope of Collections Statement and has sufficient evidential, informational, or legal value to be accessioned.

Note: The appraisal report should explain how the records have sufficient evidential, informational, legal, or administrative value to be accessioned. Follow the chain-of-command and procedures at your park to get the appraisal report and SF 115 approved. Then submit them to the National Archives for a final decision.

13. *What is the collections advisory committee, and what role does it play in appraisal?*

Each park is required to have a collections advisory committee to review proposed deaccessions and make recommendations to the superintendent. The committee may also review proposed accessions, although this is not mandatory. Although this is left to the park's discretion, it might be a good idea to have the collections advisory committee review any appraisal reports prior to accessoining. The superintendent, of course, makes the final decision on both accessions and deaccessions.

14. *When is it appropriate to conduct an archival survey?*

You should initiate an archival survey of possible storage areas to locate any records eligible for accessioning if:

- your park doesn't have an active records management program in place to identify park records that should be transferred to the custody of the museum program, *and*
- it's likely that resource management records are stored at various locations throughout the park (offices, workshops, basements, garages, attics)

> ***Records surveys and records appraisals are best conducted by a qualified archivist or records manager. If one is not available at the park, you may want to hire a contractor or seek assistance from your regional office.***

15. *What kind of information do I need to gather about any records I find?*

Gather enough information to make a decision whether or not to accession any records that you locate. See **Figure D.1**. The survey should include:

- information on the physical location where the records were found
- name of the park office or park employee who created the records
- overview of materials, including the type of documents (ledgers, correspondence, invoices, press releases, photographs, reports), volume, date range, and topics
- NPS-19 file code, if applicable

16. *Should I prepare folder title lists, full collection level or series level descriptions, or catalog records?*

No. In-depth descriptive work usually can wait until after the records have been accessioned. There's no need to prepare folder title lists or other detailed description for records that aren't eligible or appropriate for accessioning.

Simply follow the instructions under "Disposition,"

17. *If I identify records in my survey that fall under an NPS-19 file code, how should I handle them?*

If…	***Then…***
NPS-19 calls for records under a given file code to be accessioned into the museum collection after a certain date,	accession them at the specified time.
the disposition instructions specify that the records are "temporary" or "non-permanent," or if they indicate that records should be transferred to the National Archives and Records Administration.	don't accession them into the museum collection.

18. *What if I find NPS records that are not covered by a file code under NPS-19?*

Consult with the servicewide Records Manager. The Records Manager will advise you whether and how to submit a "Request for Disposition Authority" to the National Archives.

19. *What if I locate non-NPS archival materials during my survey?*

Ideally, any non-NPS archival materials acquired through donation, purchase, or other means would already have been appraised and accessioned. If your survey uncovers any non-NPS materials that haven't been appraised and accessioned, you should:

- ensure that your park has legal title (one way to do this is to check the accession file to see if there is a Deed of Gift).
- appraise the materials according to the guidelines specified above to determine if they have sufficient evidential, informational, legal, administrative, or intrinsic value to warrant accessioning

F. Records Schedules

1. *What's a records schedule?*

A records schedule is a set of directions for handling certain types of records that are likely to be created on an ongoing basis. In effect, a records schedule pre-appraises certain types of records. A records schedule will set forth directions for handling all records that fit into a specific category. The directions are based on a general assessment of how valuable any records in that category would be.

A typical records schedule will list one or more types or categories of records. The records schedule provides descriptions of the sorts of documents that would be included in those categories. See Table 2 for some examples.

Examples of Records Categories
[Please note: This list is not an all-inclusive; these are only examples]

Narrative Reports and Related Correspondence
Public Relations Files
Records of Conferences and Meetings
Special Events Files
Concessions Reports
Construction Programs Files
Maintenance Program Records
Roads and Trails Files
Contract Files
Budget Formulation Files
Land Use Files
Environmental Impact Records
Official Personnel Folders
Applications for Employment
Law Enforcement Reports
Fire Management Reports

For each record category, the records schedule provides instructions on the

disposition of those records. Examples of "disposition authorities" (or instructions) include:

- destroy when no longer needed
- hold for a specified time period, such as 5 years or 20 years, and then destroy
- hold for a specified time period and then transfer to the National Archives
- retain permanently at the park

Only records scheduled to be kept permanently at the park should be accessioned into NPS museum collections.

2. *What records schedules are available for use by NPS staff?*

NPS staff use the following records schedules:

- NPS-19 (Appendix B)
- General Records Schedules
- specific records schedules developed for individual categories of records at individual parks

3. *What's NPS-19 (Appendix B)?*

NPS-19 (Appendix B) is the Records Disposition Schedule for the National Park Service. It lists hundreds of categories of records in 12 general groups:

- Administration
- Concessions
- Development and Maintenance
- Fiscal
- History and Archeology
- Interpretation and Information
- Lands and Recreation
- Natural and Social Sciences
- Personnel
- Supplies, Procurement, and Property
- Laws and Legal Matters
- Fire Management

NPS-19 (Appendix B) is available on-line at: http://data2.itc.nps.gov/wapc/records/Index.html.

It's also available via InsideNPS. Go to NPS Policies, click Records Management in the Select Policy Subject drop-down menu, and choose Records Management Intranet Web Site.

4. *How should I apply NPS-19 (Appendix B) to park records?*

Apply NPS-19 (Appendix B) to park records only (see definition, question 8 below).

If…	***Then…***
the records have been filed according to the filing codes provided in NPS-19,	you should compare the actual records to the appropriate code to confirm that they were properly filed.
the records were filed under the correct filing code,	follow the directions cited under "Disposition" for that particular code. Those directions will tell you whether you should: • destroy the records after a certain period • transfer them to the National Archives • accession them into the museum collection
the records in question were not filed according to the NPS-19 filing codes, or if they were filed incorrectly,	review the filing codes to find the one that matches those records. Then follow the directions cited under "Disposition" for that particular code. Those directions will tell you whether you should: • destroy the records after a certain period • transfer them to the National Archives • accession them into the museum collection
you are unfamiliar with the NPS-19 records codes and how to apply them,	consult with the park's administrative officer, the regional curator, or the NPS records manager.

Note: Certain file units—such as project files—may contain copies of documents with different filing codes. In such cases, leave the files intact.

5. *What's the General Records Schedule?*

The General Records Schedule is a collection of records schedules. It covers more than 20 broad categories of records that are commonly produced by Federal agencies. The National Archives and Records Administration (NARA) issues the schedule. It's available on-line at http://www.archives.gov/records-mgmt.

Apply the General Records Schedule to park records in the same manner that you would apply NPS-19 (Appendix B).

Most General Records Schedules relevant to the National Park Service have already been incorporated into NPS-19 (Appendix B).

6. *What are "specific" records schedules?*

You may discover park records that don't appear to be covered by either NPS-19 (Appendix B) or the General Records Schedule. Consult with your park's administrative officer to see if a specific schedule for those records exists. If there is a specific schedule, follow the disposition instructions. If there isn't a specific schedule covering those records, you'll need to get one.

7. *How can my park get a specific records schedule?*

To get a specific records schedule:

- Appraise the records in question, following the guidelines in Section E.
- Submit a "Request for Disposition Authority" to the National Archives and Records Administration. Provide the findings of your appraisal and propose a disposition (such as, destruction, transfer to the National Archives, or permanent retention at the park).

Note: The National Archives has legal authority over the disposition of all Federal records covered by the Federal Records Act. The Federal Records Act includes all NPS records. If you need assistance preparing a Request for Disposition Authority:

- check the National Archives website (http://www.archives.gov/records-mgmt.), *or*
- consult with the NPS records manager

8. *Should NPS-19 (Appendix B), the General Records Schedule, or specific records schedules be applied to any kind of archival or manuscript materials?*

No. Records schedules can only be applied to records produced by the National Park Service.

NPS records include all materials such as reports, letters, memorandums, photographs, sound recordings, films, floppy disks, CDs, maps, blueprints, videotapes, and any other kind of document filed in the course of official business. NPS records also include materials from outside sources that a park receives in the course of doing business. Some examples are letters written to park officials and contract proposals sent to the procurement office.

9. *Should NPS-19 (Appendix B), the General Records Schedule, or specific records schedules be applied to donated or purchased materials?*

No. Donated or purchased materials, such as personal papers and the records of non-federal organizations are not Federal records. Federal records schedules don't apply to them.

G. Accessioning Archival Materials

1. *When should I accession a collection of archival or manuscript materials?*

As detailed in Section E, you should accession archival or manuscript materials only after determining that the materials in question:

- meet the Scope of Collections Statement, *and*
- have sufficient historical value to justify permanent retention

Use one of the following methods to determine whether you should accession collections:

- For park records: Follow guidelines contained in NPS-19 (Appendix B).
- For park-generated documents that aren't considered official records: Appraise the materials to determine if they have evidential value, informational value, legal value, or administrative value. Include findings in a written appraisal report.
- For donated or purchased materials: Appraise the materials to determine if they have evidential value, informational value, or legal value. Include findings in a written appraisal report. **Note:** Only a qualified archivist or records manager should attempt to do an appraisal report.

2. *What steps should I take to accession an archival collection?*

Take the following steps to accession an archival collection:

> ***Follow the accessioning procedures outlined in* Museum Handbook II, *Chapter 2, Accessioning. The same basic procedures and rules for accessioning museum objects also apply to accessioning archival collections.***

- For donated materials: Have the owner sign a Deed of Gift (Form 10-830). Always ask for all copyrights when conveying title to the NPS, and get signed release forms.
- For purchases: Have an appropriate purchase document and statement of ownership. Always ask for all copyrights when purchasing collections for the NPS, and get signed release forms. **NPS policy states that donations or purchases of archival materials should be made without restrictions** (although exceptions may be made in certain cases).

- For materials from another park or Federal agency: Complete a Transfer of Property Form (DI-104).

- For records associated with field collections (such as field notebooks of archeologists, paleontologists, geologists, and biologists conducting research under NPS permit): Complete a Receipt for Property Form (DI-105).

- For materials acquired via loans: Complete an Incoming Loan Agreement and Receipt for Property (DI-105).

Note: It's permissible to accept copies of field notes and similar materials produced by outside researchers. See *Museum Handbook III*, Chapter 2 for information on copyright issues for field notes.

3. *Does each document have to have an accession number?*

No. Archival materials generally are accessioned in bulk. However, under certain circumstances it's possible for accession numbers to be assigned to individual items within a collection.

4. *Does each collection have to have a single and unique accession number?*

This is ***preferred***, but isn't mandatory. There may be occasions where a single accession can contain materials from multiple collections. There may be occasions when a single collection may be acquired in multiple accessions. It's simpler and more efficient to handle archival materials when a single accession represents a single collection in its entirety, if at all possible. In defining an archival collection, however, the overriding factor is provenance—not the accession.

> ***You should never intentionally combine multiple collections in a single accession – but sometimes this can happen by mistake. Example 3, below, provides guideance on what to do if you should encounter an accession combining two or more collections.***

Example 1: The personal papers of a particular individual are donated to the park by that person's descendants,and receive an accession number. Then the family discovers an additional cache of that person's papers, and donates them, too. Because the park didn't receive these papers until many years after the initial accession, the new donation receives its own accession number. But the two accessions should be combined under a single catalog record because they are two parts of a whole: the personal papers of the individual who created them.

Example 2: All Resource Management Records for the park are being handled as a single collection (see Section M for more information on how and why this should be done). This collection contains several "recurring series," which are on-going series of records that will grow over time with the addition of new file units. New file units for these various series, such as "Grazing Records" or "Fire Management Records," should be given new accession numbers as they are received, but they should simply be added to the existing collection. Therefore, this collection of Resource Management Records may receive an infinite number of accessions over the years, but it will remain a single collection.

Example 3: The park receives a donation of archival materials as a single

accession. Upon further examination, it appears that the accession contains the personal papers of two different individuals. The accession therefore contains two distinct collections and should be split between two catalog records—one for each collection.

5. *Can accessions be divided?*

Yes. It's conceivable that multiple collections can get mixed together in a single accession. For example, a park may acquire two or more collections from a single donor and handle the donation as a single accession. When that happens, it's necessary to separate the different collections and then catalog and shelve each of them separately. If an accession contains three different collections, enter them into the ANCS+ Collections Management Module as three different catalog records. The same accession number should be cited in all three catalog records.

> ***The most important unit in archives and manuscripts is the collection, not the accession or the individual document.***

6. *Can multiple accessions form a single archival collection?*

Yes. It's not uncommon for a collection to be acquired by a park in two or more accessions. Sometimes collections can be acquired through many small accessions over a period of many years. This is particularly true for ongoing or recurring series, such as Resource Management Records, which will be produced as long as the park continues to exist. Although *cataloged* Resource Management Records will always have an end date, that end date will always be subject to change as you accession more recent records. (See next question, "What's an 'accretion,'?" for more information on adding new accessions to existing collections.

When a single collection is broken out among multiple accessions, the collection needs to be reassembled. It's necessary to combine all of the accessions and handle the collection as a single item. Enter the collection into the ANCS+ Collections Management Module as a single catalog record. All of the accession numbers for that collection, however, should be cited in that catalog record.

7. *What's an "accretion"?*

"Accretion" is another name for an accession that is added to an existing collection that has already been cataloged.

It's not unusual to receive additional materials belonging to a collection after the collection has been arranged, shelved, and cataloged. For example, a donor could transfer all the papers of a famous ancestor to the park. Years later, he or she discovers another portion of that collection. In such cases, the donor might transfer the remainder of the papers to the park long after the original accession had been cataloged.

In another example, most parks accession field notes and other associated records relating to permitted research. The associated records for archeology or geology might each constitute a collection. They might also each constitute a series within a larger collection of Resource Management records. Unless parks discontinue permitted research, associated records will continue to be accessioned. In most cases, treat these records as accretions to the existing series or collections. Don't treat each new accession as a new collection.

8. *How should I handle accretions to a collection?*

Interfile accretions with existing materials or add them to the collections as a new series, depending on the arrangement of the collection. See Sections H, I, and J for additional information on how to arrange collections.

Update the existing catalog record by:

- adding an additional accession number for the accretion
- updating the volume of the accretion to the volume of the collection as a whole
- updating the date range for the collection if the accretion covers years beyond those covered in the existing collection
- revising the description field if the accretion covers subjects not noted previously and types of documents not previously listed
- revising the organization/arrangement field to show an additional series if the accretion is being handled as a new series within the collection (Remember to complete a new series screen in the Archives Module.)

H. Arrangement

Once you have accessioned a collection, the next step is to arrange it in its proper order. There's no universal template that can be used when arranging a collection. However, there are clear and fairly simple rules and standards that you must follow.

1. *What's arrangement?*

Arrangement is perhaps the most important step in managing an archival or manuscript collection. Arrangement is the process by which a collection of any size is brought under both intellectual and physical control. The way in which a collection is organized becomes the basis for all subsequent activities or uses in connection with that collection. Effective cataloging and access is possible only if a collection has been arranged. An unarranged collection cannot be cataloged properly or used efficiently.

> ***Never attempt to catalog a collection until it has been arranged.***

2. *Why is it necessary to arrange a collection before cataloging or using it?*

The "collection," not the individual document or file, is the basic unit of control in archives. A collection, regardless of size, represents a single grouping of items that's documented on a single catalog record.

> ***Although an entire collection should be cataloged in a single catalog record in the Collection Management Module, you cannot stop there. For most archival collections, proper documentation requires description of the lower levels of the collection's hierarchy—such as the individual series and subseries—in the Archives Module. These descriptions are based on the actual arrangement of the collection. The catalog record, therefore, documents only* part *of a collection. For full documentation of a collection, you need to enter descriptions in the Archives Module.***

Remember that a collection contains *ALL* historically significant documents in the park's custody that were created or received by a particular

organization or individual. If the park has 100 folders of documents created or received by an organization (such as a corporatin, a non-profit foundation, or a government agency), then treat all 100 folders as part of a single collection. Do not handle each folder as an individual collection.

To make sense of a collection, it must be arranged. All but the smallest collections typically are subdivided into series. The series may be further subdivided into subseries and sub-subseries, which typically are subdivided into file units. Each document has a permanent location in this structure of series, subseries, and file units. The structure is similar to a book in which each page has a permanent location within a chapter. Otherwise, a collection would be nothing but a chaotic jumble of disconnected documents. There would be no logical order, no context, and no way of locating information except to search each document, one at a time. It would be like a book that is bound without regard for pagination.

Put another way, an unarranged collection is like a disassembled puzzle. To make the collection manageable and useful, you have to put the pieces together. Only then will the full picture become apparent. Trying to catalog a collection before arranging it would be like trying to describe the picture before assembling the puzzle. Trying to do reference in an unarranged collection is equally inefficient. It's like trying to find a particular scene in a thousand-piece puzzle by sorting through the loose pieces.

Fortunately, most collections will be in at least rough order when they are accessioned. Some collections may have been mixed up between the time they were created and the time they were accessioned. However, there are many clues and guidelines to help you put a collection back into its original order.

3. *What are the two key steps that I have to take in order to arrange a collection?*

The two key steps to arranging a collection are:

- *Define the Collection*. Clearly identify what materials are in the collection. In most cases, a single collection would include all documents created or received by a particular person or organization. Make sure the collection remains intact and is not mixed with any other collections.

- *Establish the Internal Organization of the Collection*. Determine if the collection is ordered correctly, or if you need to put it back into its correct order.

4. *How do I handle items that pertain to more than one collection?*

A collection consists of all documents created *or received* by a particular person or organization. Although some documents may pertain to other collections, all documents must be kept as part of that person's or organization's collection.

For example, you have a collection of George Washington's papers and a collection of Thomas Jefferson's papers. The Thomas Jefferson papers include an original letter that George Washington sent to Thomas Jefferson. Even though Washington wrote the letter, he sent it to Jefferson, who kept it in his own collection. Therefore, the letter becomes part of Jefferson's records, not Washington's. If Washington kept a copy of the letter for his own collection, however, that copy would properly be part of the Washington Collection.

5. *May I combine similar or related collections?*

No. Never mix one collection with another collection, no matter how closely related they might appear to be. Two collections of records that cover exactly the same topics created by two different organizations are two separate collections.

6. *May I break collections up into multiple collections if they are very large or cover different topics?*

No. You should never break up a collection. You may subdivide the collection into series and subseries and thereby address questions of size and subject. Those are internal or organizational divisions. The collection as a whole should remain intact and should be handled as a single catalog record.

> ***One exception to the rule against breaking up collections into smaller collections involves associated records. You may treat <u>all</u> project files for a particular discipline as a collection, rather than as a series within a larger collection of park resource management records. Do not, however, treat individual project files as separate collections.***

7. *Should I combine archival materials created by an individual while he or she was working for an organization into a collection with materials created by that same individual in his or her spare time?*

No. It's best to keep an individual's personal papers separate from documents he or she created while working for an organization or agency. For example, your park has the archives of an organization that includes the speeches and business correspondence of the organization's president. In addition, your park has that individual's personal correspondence and diaries. You should keep the documents created by that person in his or her official capacity as president of the organization with the organization's archives, and you should manage that person's private papers as a separate collection.

8. *Should each accession be regarded as a collection?*

Not necessarily. It's possible that:

- a park could acquire an entire collection as a single accession
- a park could acquire an entire collection through multiple accessions, sometimes spread out over several years
- a single accession may contain more than one collection, or portions of more than one collection
- the park may acquire a portion of a collection in an accession that is received *after* that collection has been cataloged (In such cases, add the new accession to the rest of the collection and revise the catalog record accordingly.)

Note: See Section G for a more detailed explanation of how to accession archival collections.

9. *What's meant by "archival arrangement"?*

Any collection of archives or manuscripts is going to be arranged in some manner. The arrangement patterns of larger collections may be fairly complex, but the overall concept of archival arrangement is a simple one.

As individuals or organizations create and save records, they seldom do so in a random manner. They usually don't keep loose documents in boxes or drawers without some kind of logical arrangement or filing system. Instead, they place documents into folders. Then they may group the folders based on subject, function, source, or document type.

For example, staff members in an office start working on a particular project. They are likely to open a file on that project. All of the letters, reports, notes, meeting minutes, and reference documents concerning the project would go into that file. The file, in turn, would be kept together with files on all of the office's other projects. These project files would be kept together in the same file drawer. There would be some kind of logical scheme for arranging them. They might be arranged alphabetically by the official title of the project or numerically according to an established filing code.

The office might also keep "reading files" containing copies of all outgoing correspondence. One way of handling these documents would be to open a new reading file every month. Staff would place copies of outgoing letters into that file as they are completed. All the monthly files would be kept together in the same file drawer. Similarly, as invoices are received from vendors, all of the invoices would be filed together. They could be filed in alphabetical order, by the name of the vendor, or in chronological order, by the date received.

An archival arrangement usually is nothing more than the basic structure that a person or organization adopted when filing records.

You could walk into almost any NPS office and quickly see that certain types of files are kept in one drawer. Other types of files are kept in other drawers. Those varying groups of records in the different drawers are like series in an archival collection. Each series—the project files, the reading files, the invoices, etc.—consolidates a group of files by type or function, and arranges them in a consistent pattern (alphabetically, numerically, chronologically, etc.).

10. *Should all archival or manuscript collections follow the same arrangement patterns?*

No. Each archival or manuscript collection will have a unique structure. All archival collections, however, follow the same "bigger to smaller" format. The goal is to keep the order in which the collection was originally kept. But the actual components and filing schemes will vary from collection to collection.

Some collections may be nothing more than a group of individual documents or individual file units. More commonly, however, individual documents or file units are organized into series or subseries. The file units or individual documents in some series or subseries may be arranged chronologically, whereas file units or individual documents in other series or subseries may be arranged alphabetically. There is no standard template. It all depends upon the specific collection because each collection will have its own unique organizational structure. For examples of variations in hierarchical structures for one category (park resource management records), see **Figure D.4a-D.4g**.

Arrangement patterns will vary based on any number of factors, such as:

- the work a person or organization does
- the size and complexity of the organization that created a collection of records
- individual preference for types of filing schemes and formats (certain

organizations or individuals may produce certain physical types of records that they choose to file together.)

Example: Type of Work

The records of the Thomas Edison Corp. at Edison NHP, include laboratory notes. The notes reflect the fact that the corporation was engaged in original research. The records of American President Lines at San Francisco Maritime NHP include ships' logs. The logs reflect that company's activities as a shipping line. A person or organization's specific activities or functions help determine the kinds of records they create. The activities and functions also determine the internal structure or arrangement of their archival collections.

Example: Size and Complexity

A small company may have one central filing system. It would keep all of its correspondence files together, all of its project files together, and all of its purchasing files together. A very large organization may be broken down into several components. Each component would have its own filing scheme. The arrangement of that organization's archival collection might therefore be broken out by the various organizational units. It would then be further broken out by the specific types of records that those units maintained.

Example: Individual Preference

Some individuals or organizations may keep financial records in bound ledgers. Others may keep financial records on loose sheets in file folders. Some may choose to arrange a particular type of material alphabetically. Others may choose to arrange a similar type of material chronologically or according to an alpha-numeric code.

Example: Types of Records

An organization may choose to file physical types of records together, such as architectural drawings, engineering drawings, maps, photographs, sound recordings, or motion pictures.

One of the most critically important responsibilities of the archivist or curator is to examine each individual archival or manuscript collection very carefully. The archivist or curator must be able to:

- ***discern a collection's specific and unique arrangement scheme***
- ***figure out how a collection was <u>originally filed</u> by the person or organization that created it***

11. *How can I determine original order if the collection has gotten out of order over the years?*

Use common sense, ordinary logic, and a basic familiarity with archival principles to determine the original order. See Section D for the archival principles that you will need to understand.

There are two key points to keep in mind:

- First, many collections will still be in their proper, original order when they're accessioned. All you have to do is identify that order and then maintain it. What are the main groupings of records? How are the files arranged within those groupings? If a file from one obvious grouping has gotten misplaced in another grouping, put that file back where it belongs. Draw up a "hierarchy" based on the order that you have identified (see Sections C and I for an explanation of a hierarchy.) Base your processing and cataloging of the collection on the way in which the collection is ordered.

- Second, there are many clues and guidelines that can easily help you put a mixed-up collection back into its original order (see item H-13, below, for examples).

You have to put the collection back together before you can proceed with any other tasks related to that collection. It's almost impossible to process, catalog, or use a collection effectively if it's not properly arranged.

12. *Is it okay to alter original order to suit current needs?*

No. If you can establish a collection's original order, then you must keep it. Even if there may seem to be a better way of organizing the collection, you must maintain the original order. There are several reasons for this.

The "original order" reflects how the records were filed. It also reflects the historical events and the historical contexts that they document. The original order is evidence of what actually happened, just as much as the documents themselves. Keeping a collection in its original order can help researchers discern:

- causes and effects

- responses to events

- the mindset of individuals at the time those events occurred

- the flow and patterns of history

By reordering a collection into what might seem like a more useful arrangement, such as topics that seem important at the time, you're imposing a subjective order on the records. This could make it more difficult for others to use the records in the future.

13. *Is it possible to arrange a collection that's no longer in its original order?*

Yes. Even if a collection gets all mixed up before it's accessioned or processed, it's usually possible to put it back into its original order. For example, mix up 26 volumes of an encyclopedia (arranged alphabetically), a ten-year run of a weekly magazine (arranged chronologically), and a set of financial ledgers (arranged by volume number). No matter how mixed up they are, it's easy to see that the encyclopedias belong together. The magazines belong together, and the ledgers belong together. It's equally easy to see that the encyclopedias should be in alphabetical order. The magazines should be in chronological order, and the ledgers belong in numerical order. Putting a disarranged archival collection back together is similar.

To determine original order, look closely at:

- arrangement schemes
- physical formats
- subject matter and function
- time frame
- source
- titles on file folders and bound volumes

For example, suppose you have 26 big bound volumes scattered throughout a collection. The volumes all carry the same title. Each volume is marked with a letter from A to Z (with none of the letters being repeated). The volumes all contain the same kinds of documents and information. Bring all of those volumes together as a series or subseries, and arrange them alphabetically. See Section J for information on series and subseries.

Similarly, suppose that hundreds of file folders labeled "Outgoing Correspondence" are also scattered throughout that collection. Each file folder is marked with a month and a year between 1937 and 1952. No month or year is repeated. The content of these file folders matches. All of the folders contain carbon copies of outgoing letters. The folders may be badly scattered through the collection. They may be jumbled with file folders containing different titles and are no longer in chronological order. However, they all appear to be part of one series. You should consolidate them and arrange them chronologically.

Figure D.2a is an example of a collection whose individual file units have gotten out of series order. **Figure D.2b** shows the hierarchy for that same collection upon being reassembled into its original order.

14. *What if the original order is hopelessly lost, and there is no way of re-establishing it?*

You must do everything you can to understand and preserve a collection's original order. If the original order cannot be discerned, or if the original order was purely random, then the archivist may impose an order to make the collection useable. This should not be attempted except in extreme situations. If you have to impose an order on a collection, you should observe the following guidelines:

- Retain the provenance—that is, make sure that you are working with a single collection. Do not mix the collection with materials produced by another records creator, and do not divide the collection into multiple collections.
- Exert every effort to discern the original order. Do not attempt to impose an order unless you are certain that the original order cannot be ascertained or cannot be used even if it were ascertained.
- If at all possible, retain series and subseries structures. Confine yourself to reordering file units or documents within the original series organization.

Note: The decision on whether to impose order on a collection whose original order cannot be established should be made by a qualified archivist or records manager.

If a collection is out of order, it's not acceptable to leave it that way. Don't box, shelve, or catalog it in that condition.

I. Hierarchical Structure

1. *What's a "hierarchy"?*

The "hierarchy" is the internal structure of a collection. It shows how a collection is organized into its subordinate parts (series). It shows how series are organized into their subordinate parts (subseries). It shows how file units in series or subseries are arranged. It is like an outline of the collection or a table of contents. By surveying and arranging a collection, the collection's archival "hierarchy" will be identified. See Section D for additional information on hierarchies.

2. *Why is hierarchical structure the key to arranging a collection?*

The key to arranging an archival collection is to build from the top down. Begin with bigger elements and move down to their smaller components.

In other words, an archival collection should be arranged *hierarchically*. The top level of the hierarchy is the largest part of the hierarchy. This is the collection as a whole, which is all-encompassing. The bottom of the hierarchy is made up of the smallest parts of the collection or the individual documents themselves. In between, in descending order, would be the series, subseries, and file units.

The vast majority of collections are broken up into *groups* of archival materials. These groups are called "series." Each series, in turn, is broken down into components. In some cases, a series is broken down into smaller groups, called "subseries." In other cases, series are broken down into individual file units. Following the same pattern, these subseries may be broken down into yet smaller groups called "sub-subseries." They may also be broken down into individual file units. Each file unit, meanwhile, will contain one or more individual documents (or "items").

Looked at from the bottom up, this means that each document will belong to a file unit. Each file unit will belong to a subseries. Each subseries will belong to a series, and each series will belong to a collection.

The internal structure of an archival collection is not unlike the internal structure of the *Museum Handbook*. For example:

- An archival collection may be divided into *series.* The *Museum Handbook* is divided into *volumes*.
- An archival series may be divided into *file units*. Each volume of the *Museum Handbook* is divided into *chapters* and *appendices.*
- An archival file unit is divided into individual documents, or *"items."* The chapters and appendices in the *Museum Handbook* are divided into *sections.*

You can take the *Museum Handbook* out of its binders and shuffle the pages.

However, you can still put it back together in its original order. Similarly, if individual documents and file units in an archival collection get shuffled, it's still possible to put them back in their original order.

3. *What should a hierarchy look like?*

Figure D.3a shows a sample hierarchy for a collection of organizational archives. **Figure D.3b** shows a sample hierarchy for a collection of personal papers. Both hierarchies show how collections may be subdivided into series. They also show how some of those series, but not all of them, may be further subdivided into subseries and sub-subseries. The sample hierarchies show how subdividing into series, subseries, and sub-subseries may be based on:

- differences in the physical format of documents
- the type of documents
- the content or function of documents
- the origin of documents
- the filing or arrangement schemes

Most importantly, the sample hierarchies show how the different components in a collection relate to each other. Every element in a collection is part of a larger element. An item is part of a file unit, a file unit is part of a series, and so forth.

It's important to remember that these hierarchies are only examples, not templates. You should not simply try to force collections in your custody into these sample hierarchies. Each collection will have its own hierarchy, based on what the collection actually contains and how it's actually structured.

> ***Identifying a hierarchy is not like classifying an object. You are not trying to place each document or each file within a taxonomic structure. Instead, you need to identify a collection's unique components. Identifying a hierarchy is nothing more than identifying a collection's internal structure. It all depends on how a collection is organized and how the documents are filed, which will be as different for each collection as the table of contents is different for every book.***

4. *How should the various elements in the hierarchy (such as series, subseries, file units) be titled?*

Each element should have a unique title.

- No two collections among your holdings should have the same title. Never use generic titles when naming collections, such as "Associated Project Documentation." Indicate the creator of the records and the type of materials, such as: "Thomas E. Edison Papers" (the records creator is Thomas E. Edison, and the materials themselves are personal papers) or "Records Associated with Archeological Projects at Andersonville NHS" (the records creator is Andersonville NHS, and the materials themselves are archeological project files).
- Within a particular collection, no two series should have the same title.

If you have two very similar series, find some way to differentiate between them. For example, if you have a series of subject files covering the years 1920-1940 and a series of subject files covering the years 1941-1960, you can differentiate them in the titles as follows: "Subject Files, 1920-1940" and "Subject Files, 1941-1960." Do not just put "Subject Files" in the title fields for both series. (Of course, it is all right to have a series entitled "Subject Files" in one collection and a series entitled "Subject Files" in another collection. Because the two series are in different collections, there is no conflict).

- Within a particular series, no two subseries should have the same title.

- Within a particular series or subseries, no two file units should have the same title. (Very large files can be contained in multiple folders, all of which would have the same title, but they are still all part of the same file unit. Example: You have a series of "Accounts Receivable" files that are arranged chronologically. The file unit for "Accounts Receivable – March 1938" is so voluminous, however, that it needs to be broken out into three separate folders. But these three folders all are part of a single file unit, so it is okay to put "Accounts Receivable – March 1938" on each of them. In such cases, they should be numbered "1 of 3," "2 of 3," etc.)

- Within a particular file unit, each document should have a unique title. If you are doing item level description—which is strongly discouraged—do not just identify individual items with a generic title such as "Letter" or "Memorandum." Indicate what the document actually is, such as "Final Report of the Planning Committee, August 13, 1905" or "Letter, Smith to Jones, December 5, 1915."

- Through a hierachical approach, every series, every subseries, every file unit, and even every item will have a unique and permanent intellectual address. This is essential for managing, retrieving, and citing documents. For example, there can be only one document with the following intellectual address: "Fred Smith Papers: Correspondence: Outgoing Letters: December 1915: Smith to Jones, December 5, 1915." This intellectual address clearly identifies the item ("Smith to Jones, December 5, 1915"), the file unit ("December 1915"), the subseries ("Outgoing Letters"), the series ("Correspondence") and the collection ("Fred Smith Papers").

Note: This unique hierarchical address method works, even if you only describe a collection down to the series or subseries level. If someone requests a copy of the letter from Smith to Jones, December 5, 1915, you do not need to have that individual letter described in the Archives Module in order to find it. If you have the series and subseries descriptions entered into the Archives Module, however, you will know where to find the letters that Mr. Smith sent out. You can just go to the box containing the outgoing letters for 1915. Thumb through the files until you come to the "December 1915" file, and flip through the letters until you come to the one you want. It is like looking up an article in an encyclopedia. You don't need to know the exact page where the article is printed. All you need to know is the alphabet and where the set of encyclopedias is located.

For further information on naming conventions and other standards for archival description, you may want to consult the Society of American Archivists' publication* Describing Archives: A Content Standard (DACS) *(2007), or its predecessor volume,* Archives, Personal Papers, and Manuscripts *(1989), by Steven L. Hansen.

5. *How should a hierarchy be used?*

Once you have established a hierarchy, you have a blueprint for all future work involving that collection.

Processing and Arrangement Phase

As you process and arrange a collection, the hierarchy serves as your guide for putting documents and files into their proper order. The physical storage of the collection will reflect the hierarchical structure. Box and shelve series and subseries in the same order as they appear in the hierarchy.

Cataloging Phase

As you catalog a collection, you base your descriptions on the different levels of the hierarchy. You write a brief overall description of the collection as a whole. You then write similarly brief descriptions of each series, subseries, sub-subseries, and so forth. Generally, you should avoid individual descriptions of file units and items. See Sections R and S for further discussion on how to catalog archival and manuscript collections.

Reference and Document Search

As you conduct reference and search for documents in a collection, the hierarchy serves as the roadmap. It's the basis for the development of finding aids.

J. Organization—Series And Subseries

1. *What's a "series"?*

A "series" is a "natural" grouping of records. It's natural in the sense that the person or organization that created the records devised the groupings. The creator grouped the records mainly for ease of retrieval.

2. *How are series grouped?*

Series are grouped based on one or more of the following elements:

- *Arrangement Scheme:* A series should reflect a single arrangement scheme throughout. All the files, volumes, or documents within a series should be arranged alphabetically, chronologically, numerically, or according to some other consistent pattern.

- *Physical Type of Document:* The creator of a particular collection of records may have filed all the photographs together, or all the architectural drawings, or all the maps together. If so, these groupings by physical type might each constitute a series--but only if that is the way in which they were originally filed. If the records creator filed photographs together with letters and reports in a single series, then those photographs must remain part of that series—even if you have to separate them physically for preservation purposes (see Sections P and Q for more information on the physical removal of oversized

documents and photographs from textual series; also see the "If-Then" table under item 8, below).

- *Subject Matter or Function:* The records creator may have filed all the personnel files together. All the project files or all the financial records may be filed together. Series breakdowns typically reflect this kind of division.

- *Time Frame:* Certain types of records may be broken down into series by time periods. For example, a collection of correspondence may be arranged alphabetically by the name of the correspondent and grouped into blocks of 10 or 15 years. It may make sense to leave those blocks of correspondence intact as separate series. Grouping the records by time period might be better than attempting to interfile them with alphabetized correspondence from a subsequent 10-year period.

- *Source:* It's conceivable that a group of documents received from a particular source could constitute a series. For example, a collection of financial records may consist of account statements, financial reports, correspondence, and cancelled checks received from different banks. These materials could be organized into one series per bank.

Note: People and organizations that create collections of records usually file their documents in a logical format. They keep certain types of documents together in a consistent filing scheme. For example, a filing cabinet may have one file drawer containing Project Files. A second file drawer could contain Correspondence Files, and a third file drawer might contain Invoice Files. Each of those components would be a series. Identifying the various series in an archival or manuscript collection should be as simple as identifying the drawers in the filing cabinet.

3. *What's a "subseries"?*

A "subseries" is a series within a series. Sometimes it's appropriate to break a series up into smaller groups called subseries.

4. *When is it appropriate to have a subseries?*

There are many reasons why it may be appropriate to break up a series into two or more subseries. Here are the most common reasons:

- different arrangement patterns
- different time periods
- different physical formats
- different sources or different types of records

Different Arrangement Patterns Example

Suppose all the correspondence files for a particular collection are kept together. This would constitute a single series. Within this series of correspondence files, however, the incoming letters are arranged alphabetically by name of correspondent. The copies of outgoing letters are arranged chronologically. You cannot have a series in which some of the file units are arranged alphabetically and some are arranged chronologically. Subdivide this series into two subseries. One subseries is for the alphabetically-arranged incoming letters. The other subseries is for the

chronologically-arranged copies of outgoing letters.

Different Time Periods Example

Suppose the records-creator filed incoming and outgoing letters together, arranged alphabetically. Then suppose that the person or organization that created the records stopped adding to this body of correspondence after 10 years. The individual placed it in storage and then started a new batch of alphabetically arranged correspondence that would run for the next 10 years. The archival collection would have two separate 10-year blocks of alphabetically arranged correspondence files. All of these correspondence files properly constitute a single series. However, it wouldn't be practical to try to integrate them into a single alphabetized group of files. Instead, break the series into two subseries--one for each 10-year block of records. To avoid confusion, be sure to include the beginning and ending dates of these subseries. Enter the dates in the date fields when you catalog the records. You should also incorporate the dates into the formal titles of the subseries: "Correspondence Files, 1960-1969" and "Correspondence Files, 1970-1979."

Different Physical Formats Example

It's not unusual for a group of photographs to constitute a series within a collection. But good records preservation practice calls for prints and negatives to be housed separately. Moreover, it's not unusual for prints and negatives to have different arrangement schemes. Prints are likely to be filed by subject and negatives by image number. In such cases, it's appropriate to subdivide a series of photographs into two subseries. Create a subseries of prints and a subseries of negatives.

Different Sources or Different Types of Records Example

An organization that creates a collection of archival materials may do so along administrative lines. It may file all of the correspondence together. It may file all of the personnel records together and all of the project files together. It would then subdivide them according to the division of the organization that created them. The Correspondence Files could be broken down into groupings such as the President's Office, the Research Division, and the Publications Division. In this case, the basic types of records--Correspondence Files, Personnel Files, and Project Files--would all be handled as series. Then each of them would be sub-divided into subseries for each of the organizational units. Alternatively, all of the records of each organizational unit could be filed together. There would be three series: President's Office Records, Research Division Records, and Publications Division Records. Those series, in turn, would be subdivided into subseries for each records type. For example, the series of Research Division Records would be broken down into subseries. There would be three subseries: Correspondence Files, Personnel Files, and Project Files.

5. *What's a sub-subseries?*

Just as a subseries is a series within a series, a sub-subseries is a series within a subseries. Not all collections in NPS custody will reach that level of complexity. However, it can happen, and it's just as easy to identify a sub-subseries as it is to identify a subseries.

Suppose the records of an organization were divided by administrative unit.

The records of the Research Division would constitute a series. The series would be subdivided according to type of records. The series might include a subseries of photographs. That subseries of photographs would likely be subdivided into a sub-subseries of negatives and a sub-subseries of prints.

It's even possible to go down to the sub-sub-subseries level. Suppose the sub-subseries of prints in the preceding example were subdivided. One group of prints is arranged by subject. A second group of prints is arranged by the name of the photographer. Each of those subdivisions would constitute a sub-sub-subseries.

6. *Why is it necessary to keep dividing and subdividing archival collections?*

You need to subdivide a collection until you have consistent bodies of records. A consistent body of records is the same kind of records arranged according to a single arrangement scheme.

7. *When should I stop subdividing?*

When a series or subseries or a sub-subseries consists of chronologically arranged correspondence files, you can stop subdividing, or when you have a series or subseries of personnel files that are arranged alphabetically, you can stop subdividing. If you have a group containing any other mismatches of record types or arrangements, then you need to continue subdividing. For example, if you have a series of alphabetically-arranged project files and numerically arranged ledgers, you should divide it into two subseries.

In most cases, you will not have to subdivide beyond the series or subseries level. In some cases, you will not have to subdivide. All of the files in a collection may contain the same type of material and follow a single arrangement pattern. Subdivide collections into series and subseries (and additional lower levels) only as necessary. Subdivide only to group bodies of like records in a single arrangement scheme.

8. *Should all items in a particular physical format be consolidated into a single series or subseries?*

Not necessarily. Only consolidate items of a particular format into a single series or subseries if the records creator originally filed them that way.

If…	***Then…***
the records creator kept all photographs in a set of albums,	those albums would constitute a single series or subseries.
the person or organization that created the records filed photographs with other types of materials, such as attachments to letters, or as illustrations for reports,	they are a permanent part of those letters or reports and would not constitute a separate series. Even though they should be separated *physically* for preservation purposes (see Section Q), *intellectually* they remain part of the file in which they originally were kept.

Don't store records with different formats together because they can damage each other.

Photographs that are kept next to letters, for example, can damage the fibers and inks in the letters. The fibers and inks in the letters can also damage the

photographs. In such cases, you have two options. First, you may place the photographs into protective sleeves, and leave them in their original location. If this is impractical (because of the photographs' sizes, volume, or condition), then they should be physically removed and stored separately from the letters. Place a separation sheet where the photographs were initially located, indicating that the photos were moved (see **Figure D.5**). If possible, put a photocopy of the removed photograph with the separation sheet. Even though the photographs will be stored elsewhere, they technically remain part of the letters. They should still be considered part of the file units and series in which the records creator originally filed them. They don't constitute a separate series or subseries.

For further guidance on removing certain types of documents from their original locations for preservation purposes, see Sections N-Q.

9. *What's the difference between a "closed" series or collection and an "open" or "recurring" series or collection?*

A "closed" collection or series has been accessioned and cataloged. There is no expectation that additional materials will be accessioned later for addition to that collection or series. Closed collections and series tend to be those that were created many years ago by individuals or organizations that are no longer producing records. It's possible that supplementary accessions (or "accretions") can be added to closed collections or series. This typically occurs when some historical material is overlooked when the bulk of the collection was first transferred to NPS. When such material is discovered, it may be restored to the existing collection in the form of an accretion. Ordinarily, however, accretions of new material are not added to closed collections.

An "open" or "recurring" collection or series is one where additional accessions are expected routinely. The collections or series are still being created on an ongoing basis. You can keep adding new accessions to these series and collections even after they have been cataloged. All you have to do is add the new material (as a file unit within an existing series, or as a new series within an existing collection). Modify the collection level desciption in the catalog record to reflect the addition of the new material (for example, the volume and date range could change and the hierarchical structure could change if there is a new series). Contact the Park Museum Management Program in the Washington Office to adjust your Collections Management Report when you make your annual National Catalog submission. (The "new" cataloging will show up under previously Cataloged Part I and Total Cataloged Part III.)

The various categories of park records are the most prevalent type of open collections or series likely to be maintained by NPS museum programs. This is because the same kinds of park records are being produced on an ongoing basis by the parks.

Example: Associated Records are a textbook example of recurring series. A park is likely to accession new project files in archeology, paleontology, biology, or geology on an ongoing basis—perhaps annually, for some parks. Once you have established a collection or a series for project files in a particular discipline, you only have to add the new project files to that existing collection or series and then update the catalog record.

As noted in Sections E and F, only certain types of park records may be accessioned into museum collections. Park records should be disposed of in accordance with NPS-19 and the Federal Records Act. It's permissible for

museum programs to accession resource management records, as defined by NPS-19. Most other park records should either be destroyed or transferred to the National Archives and Records Administration.

10. *How should I arrange an open or recurring series or collection?*

There are two ways of handling additional accessions for an open or recurring collection or series:

- Newly accessioned file units can be added to the end of an existing series if minute interfiling is not required. For example, suppose an existing series consists of reports that are arranged chronologically from 1940 to 1960. The accretion contains the same kind of reports arranged chronologically from 1961 to 1970. The accretion can be added seamlessly to the previously accessioned materials as part of the same series. Adjust the collection level catalog record and the collection and series level archives records to reflect the additional material.

- Newly accessioned file units that can't be added easily to an existing series may be added to the existing collection as a new series. For example, suppose the accretion contains the same kinds of material, but the material is arranged differently. Create a new series record in the ANCS+ Archives Module. Adjust the collection level catalog record and collection level archives record to reflect the existence of a new series.

Note: Accretions to open or recurring collections or series shouldn't be handled as new collections. They shouldn't receive separate catalog records. For example, your resource management records include a series of plant surveys covering the years 1985-1989. You accession additional plant surveys covering the years 1991-1995. Those new plant surveys should be added to the existing series. They shouldn't be cataloged as a new collection.

K. Organization, File Units And Items

1. *What's a "file unit"?*

A "file unit" is the basic means by which individual documents are physically consolidated and arranged. File units are the building blocks of the series (or subseries). A series that doesn't need to be subdivided into subseries (or a subseries that doesn't need to be divided into sub-subseries) is typically a body of records that is made up of one or more file units, arranged in a consistent pattern.

When records creators start accumulating records, they usually do so by setting up file units. The file units hold documents relating to particular projects, or topics, or individuals, or functions. The file unit, therefore, is the component of the series (or sub-series) that contains all of the documents relating to a project, individual, or function, that were filed together.

2. *Is a file unit the same thing as a file folder?*

No. It's important to understand that the file *unit* is not the same thing as a file *folder*. A file unit is a grouping of related documents. A file folder, however, is merely a physical device for holding those documents. There is no limit to the size of a file unit. If a project is especially complicated or protracted, the project file may grow. It may encompass hundreds of pages, held in dozens of file folders. The project file constitutes just one file *unit*,

no matter how many file *folders* it requires.

3. *How are file units arranged?*

File units are arranged in several ways.

If…	***Then…***
the title on a file unit contains names or words,	the files probably will be arranged alphabetically.
the title of a file unit is a number,	the files probably will be arranged numerically (or by filing code).
the title on a file unit is a year or date,	the files probably will be arranged chronologically.

4. *Should I subdivide file units?*

No. File units should remain intact, even if they contain a mix of documents. For example, suppose a records creator routinely places all of his or her records each month into a single file unit. These may include reports, invoices, correspondence, newspaper clippings, and transcripts of speeches. You would not subdivide this group of material. Each file unit would contain the same sort of thing (that is, everything). The file units could be placed into a consistent arrangement pattern (arranged chronologically by month).

Leaving a file unit intact, however, is not the same thing as leaving everything in one folder. If a single file unit contains many pages, it may be necessary to use several folders to contain all the pages, but doing so does not mean you are creating new file units. Instead, you are just using more than one folder to contain a single file unit. Also, a file unit may contain oversized maps that should be removed and flattened, but doing so does not mean you are creating a new file unit for those maps. The maps are still part of the file unit intellectually, even if they have been separated from the rest of the file unit physically.

Remember: a file unit is not the same thing as a file folder. A file unit would contain all of the documents filed together by the records creator on a particular topic, or project, or individual, regardless of how many documents there might be. The file unit might cover many folders, depending on how many documents it contains.

Note: If a folder is so full that it is bulging, you may divide it into enough folders so that everything fits comfortably. Dividing a file unit into multiple folders is like slicing a pizza. You can cut it into four pieces or six pieces or eight pieces, but it is still a single pizza. You cannot cut it into halfs, however, and sell it to customers as two separate pizzas.

5. *What are some types of file units that are not contained in folders?*

Although the majority of documents are placed into file folders, there are other types of file units that don't use file folders, such as:

- *Volumes and Binders.* Some records creators place documents into loose-leaf binders or bind them into volumes. A file unit might constitute all of the documents:

- in the binder
- under one tab in the binder
- in multiple binders

In such cases, you have to look carefully at the titles on binders and tabs to make sure you are able to identify file units properly.

Note: If you are able to remove documents safely from binders or volumes, you should transfer them to regular file folders. See Section O, "Processing and Preservation—Paper-Based Documents," for information on preservation.

- *Ledgers, Logbooks, and Diaries*. Whether identified by number, date, or name, individual financial ledgers, logbooks, or diaries tend to be regarded as individual file units.

- *Drawers and Divided Drawers*. Oversized maps and charts may be placed into map cases. In such cases, it's possible that the records creator treated individual drawers as file units. Note the tabs or labels on the drawers and scrutinize the contents closely. This will help you to determine if file units were handled on a drawer-by-drawer basis. Similarly, a records creator may have placed photographs or index cards into rows within filing cabinet drawers. He or she separated the rows with dividers noting name, subject, or some other kind of file unit identifier. All of the photographs or index cards between two dividers might be regarded as file units.

- *Electronic File Folders*. Records creators may keep all of their documents electronically, grouped into electronic files. Retain the electronic arrangement of documents as the file units. In many cases, it may be advisable to print all the documents. Then place them into file units that replicate the electronic arrangement. See Sections N-Q for information on preservation and processing.

6. *What's an "item"?*

An "item" is a single document. Most collections are made up of series, and most series are made up of file units. File units are made up of items.

"Item" and "document" are not synonymous with "page" or "sheet."

An item may only be a one-page note, or it may be a report extending to hundreds of pages. Whether one page or hundreds of pages, it would still be just one item. An item might also be a single magazine, or a photograph, or a reel of audio tape, or even a roll of film.

An item may include attachments. If a letter is received with other documents as enclosures, those enclosures should be regarded as part of the letter. The letter and the enclosures together would constitute a single item.

Remember, archival and manuscript collections should be organized hierarchically, from the general to the specific. The collection level is at the

top of the hierarchy because it's the most general (the collection as a whole). The item is at the bottom of the hierarchy because it's the most specific (individual documents). In between are the intermediate levels of series, subseries, sub-subseries, and file units. These become increasingly specific as you move down the hierarchy.

L. Step-By-Step Arrangement

1. *What's the first step in arranging a collection?*

Step 1: Review the collection in its entirety.

You may do this as part of a formal archival survey, or you may do this informally. In either case, you need to become generally familiar with all parts of the collection. You need to understand the full scope of the collection before you can start arranging the collection. You can't start arranging a multi-box collection simply by opening the first box, taking out a handful of documents, and putting them into some kind of order. You need to have a basic idea of what's in the collection as a whole. You'll then have a basic idea of how everything will fit together. Avoid moving or rearranging anything until you have completed this review. As you conduct our review, be sure to take notes that will help you carry out subsequent phases of the arrangement process.

2. *What sorts of things should I look for in a review?*

Review or survey the collection and conduct additional background research to determine the following:

- What types of records does the collection contain?
- What subjects, functions, and years are covered in the collection? (This shouldn't be an exhaustive and comprehensive list. All you need is a very basic sense of what's in the collection.)
- What is the history of the organization (or the biography of the person) who created the collection?
- Most importantly, can the collection be subdivided into multiple groupings (or series) of records? Does it appear that the person or organization that created the records filed all of the following together:
  - correspondence
  - financial records
  - project files
  - photographs

Note: Not all collections need to be subdivided into series. A collection that consists of one type of material arranged in a consistent fashion doesn't need a series organization. For example, a collection may consist entirely of letters received from various sources. If you can incorporate all of them into a single alphabetical, numerical, or chronological arrangement scheme, then series breakdowns are inappropriate.

3. *What's the second step in arranging a collection?*

Step 2: Identify each of the broad, basic groupings of records within the collection. These are the series.

The series provide the overall organizational structure for the collection. This is critically important because this is the structure you'll have to follow when arranging the collection.

4. *What's the third step in arranging a collection?*

Step 3: Carefully review *each* series you have identified to determine if it needs to be subdivided into subseries.

If so, then identify those subseries, just as you identified the series within the collection as a whole. If there are no series, then skip to Step 7. (Remember that the theory behind breaking series down into subseries is exactly the same as the theory behind breaking collections down into series.)

5. *What's the fourth step in arranging a collection?*

Step 4: If a particular series should be broken down into subseries, then review *each* subseries.

Determine if the subseries need to be divided into sub-subseries. If so, then identify those sub-subseries, just as you identified the series and subseries. If there are no sub-subseries, then proceed to Step 7.

6. *What's the fifth step in arranging a collection?*

Step 5: If a particular subseries should be broken down into sub-subseries, then review *each* sub-subseries.

Determine if the sub-subseries need to be divided into sub-sub-subseries.

7. *When do I stop subdividing a collection?*

Don't get carried away when identifying groupings of records such as series or subseries. Follow the pattern of subdividing until you have identified a body of records that consists only of:

- file units or items, *and*
- the file units or items don't need to be subdivided into groupings

For example, suppose you have properly identified a series of correspondence files. These correspondence files are arranged alphabetically by name of correspondent. Then suppose that there are multiple file units for several of the correspondents. There might be five letters from Mr. Smith, seven letters from Mrs. Bell, and eight letters from Mr. Jones. All of the letters are filed separately. Don't break these out as a subseries of letters for each person. Handle them all as individual file units within the series, arranged according to the series-wide alphabetical arrangement scheme. Be sure to include the date of the letter and the correspondent's name as part of the file unit title. Then arrange the file units for each individual correspondent chronologically. The series would be arranged alphabetically by name of correspondent. The alphabetized file units would be arranged by date.

Note: Such decisions often rely on judgment calls and common sense. A series of correspondence files that includes hundreds of letters from several sources might be appropriately broken out as subseries.

8. *What's the sixth step in arranging a collection?*

Step 6: Identify the arrangement scheme for the file units in the series (or subseries, or sub-subseries, and so forth).

Are these file units arranged chronologically, alphabetically, numerically, or according to some kind of filing code?

9. *What's the seventh step in arranging a collection?*

Step 7: Physically arrange the collection. Make sure all of the:

- items are in their proper file units
- file units are arranged according to the applicable filing scheme
- series, subseries, sub-subseries, sub-sub-subseries are properly grouped

Remember that if a collection is divided into series, then everything in that collection should be contained in one of those series. The collection shouldn't be organized into 10 series plus a few stray documents or file units. If you've identified 10 series for that collection, then every item must be contained in one of those series. You'll have to create new series to accommodate stray documents that don't logically fit within an existing series.

If a series is broken down into subseries, then everything in that series must be contained in one of those subseries. The same principle applies for sub-subseries and for additional levels below that.

If a series or subseries is organized by file unit, then everything should be part of a file unit. If you have a series made up of 100 file units, you cannot also have an individual document included as part of that series. Either locate the file unit where it belongs or create a new file unit for that one document.

10. *How should I arrange an assembled collection?*

An assembled collection is a body of documents selected from multiple sources. The documents have no organic connection to each other. Any order they might have would reflect the activity of the collector, rather than reflecting the activities of the individuals or organizations that created the documents. Therefore, there is no "original order" to an assembled collection and no true hierarchy.

Because an assembled collection is completely artificial, you are free to arrange it in whatever manner seems most efficient. A few suggestions:

Assembled Collection of the Same Kind of Documents

Catalog a collection level record. In the ANCS+ Archives Module, ignore the series, subseries, and file unit levels, and go straight to the item level. Arrange the individual items chronologically, or alphabetically, or any other way that seems to work.

Assembled Collection of Different Types of Documents

Catalog a collection level record. In the ANCS+ Archives Module, create series for each of the different formats, such as letters, diaries, and maps.

Assembled Collection of Small Groups of Documents from Different Sources

Organize the assembled collection into series according to the sources. The U.S.S. Arizona Memorial, for example, includes groups of 5-20 documents that various individuals donated. Most of the documents were collected rather than created by those individuals. The individual groups of documents don't really rise to the level of a true collection. Organizing them each as series within an assembled collection is a way of managing them efficiently, while retaining their provenance.

Assembled Collection Compiled and Arranged by a Private Collector, and Later Donated or Sold to the Park

Catalog as a single collection, retain in the order established by the collector, and provide series, filie unit, or item level entries—as appropriate—in the Archives Module.

M. Handling Resource Management Records

1. *What are resource management records?*

Resource management records are park files. They include baseline and other types of information that the park needs to manage its cultural and natural resources effectively. Depending on the park, resource management records might include files on:

- land use
- wildlife management
- construction and maintenance
- research projects in archeology, paleontology, biology, and geology

2. *What are the two acceptable methods for handling resource management records?*

One method is to handle all resource management records for a park as a single collection, covered by a single catalog record and a single catalog number. This collection, of course, will expand as new resource management records are created and accessioned. This means that the catalog record will have to be modified as the collection grows.

The second method is to handle associated records separately from other resource management records. Under this method, all associated records for a specific discipline would constitute an individual collection, with one catalog record and one catalog number. Thus, all records associated with archeological projects would constitute a collection, all records associated with paleontological projects would constitute a collection, and so forth. These collections of discipline-specific project files would also expand over time, necessitating updates to the catalog records.

3. *What commonly used method of handling resource management records should I avoid?*

Many park museum programs have treated files associated with specific projects, studies, or maintenance jobs as individual projects. As a result, parks have many tiny "collections" that in reality are nothing more than file units. This method of handling resource management records is ineffective and fails to meet archival standards.

Handling project files as separate collections is not consistent with standard

archival practice. Archival management is based on provenance (the records creator), not on individual projects. All Resource Management project files are records made or received by the park—regardless of whether they were authored by park staff, regional/center staff, contractors, or outside researchers. Therefore, all resource management records are official records of the park, and that is the basis for defining the collection. Individual project files, rather than constituting individual collections, would be part of a larger series or collection of resource management records.

Example 1: Five different archeological projects took place at a park. One project was initiated by the park and carried out by the park archeologist in order to locate foundations of a historic house that can be highlighted in interpretive programs. Another project was initiated by the regional archeological center and carried out by staff members at the center in order to comply with Section 106 requirements. The third project was carried out by a contractor hired by the park to monitor the impact of new construction on one of the park's archeological resources. Another two projects were carried out under park permits by local university professors working on separate research projects. Associated records for each five projects were accessioned separately, but they should not be cataloged separately. Even though the five projects were conducted by different archeologists, for different organizations, and for different purposes, **they are all park records relating to one type of activity—archeology.** Instead of each accession being cataloged separately, they should all be cataloged as:

- part of a single series of archeological project files within the park's collection of resource management records, *or*
- as a single collection of the park's records associated with archeological projects.

Example 2: A park-owned historic structure is painted in 1960 and again in 1968, 1975, 1982, 1990, and 1995. It is legitimate to keep the documents as resource management records. But these slender files on individual paint jobs down through the years should not be handled and cataloged as separate collections. Instead, they should be handled as simple file units, within a subseries relating to the painting of historic structures, within an overall series relating to construction and maintenance, within a collection of general resource management records.

4. *How is it possible to find individual files if all resource management records or all records associated with the projects in a specific discipline are covered in only one catalog record?*

It is easy to locate files ***if you use archival methods instead of curatorial methods***. This means:

- organizing files according to standard, hierarchical archival principles
- entering collection-level information into the catalog record and entering series and subseries descriptions (as appropriate) into the Archives Module, taking special care to explain how the files are arranged in each series or subseries. If more information is needed in order to locate individual files, you may either do file-unit level descriptions or container lists in the Archives Module.

It is never enough simply to provide a general description in the catalog record. Proper archival management requires that series descriptions and other information be entered in the Archives Module.

5. *How should I arrange a collection containing all of a park's resource management records, including the associated records?*

They should be organized into series according to discipline or function, such as:

- Land Records
- Wildlife Management Records
- Construction and Maintenance Records
- Archeology Records
- Paleontology Records
- Biology Records

The file codes in the NPS-19 (Appendix B) may help to identify appropriate ongoing resource management series. The various series, in turn, may be broken down into subseries and sub-subseries. These subdivisions depend on the nature of the records and the way in which they have been filed. Within each series or subseries, be careful to note how the files are arranged—alphabetically? chronologically? numerically?

6. *How should I arrange associated records at the park that are handled as separate collections?*

All files for a particular discipline for a particular park should be handled as a single collection (even if some of the files are held at the park, some at a regional center, or some in non-Federal repositories) because they are all park records, regardless of where they are housed.

A collection of associated records may be organized into series, depending on a variety of factors. **There is no universal template that you can follow when organizing any collection. The way in which the collection is organized depends on the type of material, the nature of the projects, how the documents are filed, and other considerations.**

See the "If-Then" Box for suggestions on how a collection of associated records might be organized. See **Figure D.4** for several examples of how to organize collections of associated records into archival hierarchies.

If…	*Then…*
you have to determine whether or not to accession Resource Management Records,	consult the NPS-19, Appendix B, to identify which types of Resource Management Records are appropriate for accessioning into the park museum collection, which types should be transferred to the National Archives, and which types should be destroyed.
you have accessioned Resource Management Records into your park museum collection,	handle them as a single collection, with one catalog number, and organize them into series and subseries approximating the various categories in the NPS-19, Appendix B. Carefully describe each series and subseries in the Archives Module, and prepare container lists as desired.
you receive *additional* accessions of Resource Management Records *after* you have already cataloged a body of Resource Management Records under one catalog record,	add the new accessions under the existing catalog record. If the new accessions fit under existing series, then simply modify the series descriptions to reflect the new material, and amend the container lists. Otherwise, add new series as necessary. Then update the catalog record to reflect the additional volume, the new date range (if applicable), and the added series (if applicable). Copy the revised catalog record over to the Archives Module. Contact PMMP to adjust your CMR when you make your NCS submissions. (The "new" cataloging will show up under previously Cataloged Part I and total Cataloged Part III.)
there are Associated Records included among your Resource Management Records,	you may handle all the files for a particular discipline (archeology, paleontology, biology, or geology) as a series within the overall collection of Resource Management Records, or you may handle all the files for a particular discipline as a collection unto itself (e.g., Records Associated with Archeological Projects, Records Associated with Biological Projects, etc.)
Associated Records in a particular discipline were originally filed	retain that basic structure by organizing the collection into

according to document type (for example, all the reports, correspondence, and other textual materials together; all the photographs together; all the maps together),	series by type; if the Associated Records for that discipline are being handled as a series within an overall collection of Resource Management Records, then organize the series into subseries by type.
maps, photos, and textual material for a collection or a series of Associated Records originally were all filed together in the same folders,	do not organize the collection into series by type (or the series into subseries by type). Instead, retain the simple file unit arrangement, but remove photos and maps for separate housing. Even though the photos and maps are housed separately, they would not constitute separate series or subseries because technically they will remain part of the file units from which they were removed.
Associated Records for a particular discipline include files relating to projects initiated by the park, by a center, or by private researchers working under permits,	either maintain a single arrangement scheme for all the files, according to the accession number, *or* organize the collection into series (or subseries) according to who initiated the project: one series for records of projects initiated by the park; one series for records of projects initiated by a center; and one series for records of projects initiated by private researchers.
your park is the lead park for multi-park projects in biology, and therefore receives accessions both for park-specific biological projects and multi-park biological projects,	organize your collection of Associated Records Related to Biological Projects into two series: one for park-specific projects, and one for multi-park projects.
Associated Records for a particular discipline include files for park projects, center projects, and private (permitted) projects, *and* were originally filed by record type (textual materials, maps, photos, etc.)	first, organize the collection into series according to who initiated the project (one series for the park, one series for the center, and one series for private researchers). Second, organize the series into subseries by record type.

7. *If all project files for a discipline are brought together into a single collection, isn't that like mixing collections or creating an artificial collection?*

No. Most associated records are simply the records of individual projects. Individual project files are not collections.

Archival management is based on the concept of "provenance," which refers to the person or organization that maintained a set of files. Project files in archeology, paleontology, geology, and biology may be authored by different people and organizations (NPS staff, contractors, outside researchers, consulting firms, universities). However, the actual copies that

were submitted to and retained by the park are park records. That is, they are records created or received by the park in the course of conducting official activities. One records creator (the park) plus one type of material (project files in a specific discipline) equals one collection. Therefore, individual project files simply are part of that single collection.

The concept of "non-mixing," however, still prevails. Just as you should not mix collections, you should not mix project files or file units within collections. The file for each project needs to remain intact and distinct from files for other projects, even as they are contained within a single collection or series.

8. *How should I catalog a collection of associated records?*

Enter collection-level information into the catalog record in the Collections Management Module. Then, copy that information over to the collection-level screen in the Archives Module. Then, enter series-level and subseries-level data into the Archives Module, as appropriate. Within the series or subseries, the associated records should fall into natural groupings of one or more folders that relate to a single research project (and any objects or specimens associated with that project). Each folder or group of folders relating to one project would represent one file unit (or project file). You may arrange these file units within their series or subseries in any scheme that works for your park. One option is to use accession numbers as the organizing principle. The accession number would also serve as the file unit number, and you would be able to arrange the project files by accession number. Provide a file-unit level description for each project, under the appropriate series. Include all the information you will need to locate it—such as name of project, name of project director, subject, dates, location of project. If a project file has multiple folders, you may list the titles of each folder in the container list (which can be found in the Supplemental Information attached to the collection-level screen in the Archives Module). See **Figure D.6** for an example of a finding aid based on this model.

Remember that the physical arrangement should mirror the intellectual arrangement. Project files should follow the same order in the Archives Module as they do on the shelves. Thus, if you identify individual project files by their accession numbers in the Archives Module, then they should be boxed and shelved in the same order. The primary exception to this rule is for project files that must be co-located at another repository so that they can remain with their associated objects (See Items 9 and 11 below).

9. *What if project files are held at different locations—with some at the park, some at a regional archeological center, and some at a partner repository?*

Because all the project files would be records of the park, they should all be described under a single catalog number as part of a single collection **regardless of their storage locations**. If the records relating to a specific project must be loaned or transferred off-site, all you have to do is complete the necessary Outgoing Loan documentation and indicate in the location field of the file unit screen where the file unit is housed. Provenance—not storage location—is what defines a collection.

10. *How should I arrange and catalog new project files that are accessioned after I have finished cataloging a collection of associated records?*

Since the files should be in accession order (or some other equally easy-to-administer arrangement), simply add new accessions to the end of the collection. Then, add a new file unit record in the Archives Module describing the new accession. List folder titles as necessary in the container list. Modify the catalog record to reflect changes in the collection's volume and date range. Make sure these updates also appear in the collection level screen of the Archives Module. At National Catalog submission time, ask the Park Museum Management Program to adjust your Collections Management Report to reflect the new cataloging. New accessions can be added this way indefinitely and in a very short time.

11. *Do these methods for arranging records satisfy the Code of Federal Regulations requirement for keeping archeological objects together with their associated records?*

Yes. The regulation specifies that objects and their associated records be held in the same repository, so that the documentation can be retrieved easily to provide context and background for the objects.

The requirement is met by:

- accessioning both the associated records and the objects into the park's museum collection
- ensuring that the documentation shows the link between the objects and the associated records
- co-locating project files with their associated objects, as necessary

The regulations do not specify that any specific filing schemes be followed, so the park is not required to follow such non-standard archival methods as cataloging each accession as a separate collection. Proper archival methods will not interfere with regulatory requirements and should make it even easier to locate project files and associate them with objects—even if they are housed at off-site repositories. Describing a project file within a single collection of park records will not prevent the park from loaning or co-locating that project file.

12. *Without a unique catalog number, how can associated records be cross-referenced to the objects?*

The file unit description for each project will contain its accession number, which should be the same as the accession number for the objects. Even if the objects and associated records are accessioned under different numbers, those numbers can be cross-referenced in the Associated Accessions field in the file unit screen of the Archives Module.

Project files can be cross-referenced just as easily to catalog records for specific objects. For example, suppose a natural history specimen is collected for one project, cataloged separately, and subsequently used for research in connection with another project. The catalog number for that specimen should be noted in the Summary Note for that project's associated records.

13. *How can I loan individual documents or files if they don't have unique collection numbers?*

Associated records can be tracked with the unique archival collection number, series number, and file unit number in the ANCS+ Archives Module. A series, subseries, or file unit remains in the same place in a collection's archival hierarchy, even if the records are on loan. You can also create an individual catalog record in the Collection Management Module for a document or file unit that you send out on loan, and cite the catalog number in the Outgoing Loan Agreement. When the loaned document is returned, you return it to its proper place in the collection's

hierarchy, and change the status in the catalog record to "Incorporated into Larger Archival Collection."

N. Processing And Preservation

1. *When should I process an archival or manuscript collection?*

It often makes sense to process a collection at the same time you're arranging it. This may be the only time you will need to handle virtually every document in the collection individually. It's efficient to use the opportunity to:

- refolder, rebox, and label the collection
- cull extraneous material
- take basic steps to protect damaged or fragile documents

Processing a collection in this way can serve as the first line of defense in preserving a collection.

2. *What supplies and equipment will I need to process an archival or manuscript collection?*

Examples of the supplies and equipment you may need to process a collection appear below. You probably won't need all of these supplies for every project, so you don't need to keep stockpiles of everything. It is probably advisable, though, to have supplies of boxes, folders, polyester sleeves, spacer boards, white gloves, and other most commonly used supplies readily available.

- acid-free document storage boxes (flip-top archives boxes) in letter-size and legal-size
- acid-free flat storage, newspaper storage, and drop-front storage boxes in various oversized dimensions, as appropriate
- acid-free records storage boxes (also called "records center cartons") in one-cubic-foot size
- acid-free photographic print and negative boxes
- acid-free slide storage boxes and slide storage cases (for holding the boxes)
- acid-free file folders in letter-size, legal-size, and various oversized dimensions, as required
- buffered photographic print and negative envelopes and sleeves (for black and white images)
- unbuffered photographic print and negative envelopes and sleeves (for color images) **Note:** Recent research suggests that high quality buffered paper may be better for color images than unbuffered.
- unbuffered, four-flap enclosures (for glass plate negatives)
- polypropylene sheets and sleeves for photographic prints, negatives

and slides

- archival-quality polyester sleeves (Mylar D) in legal-sized and letter-sized
- acid-free spacer boards
- white, acid-free, high tack neutral pH acrylic adhesive box labels
- soft lead pencils
- bond paper, interleaving sheets, and rolls of archival-quality interleaving and wrapping paper
- soft, unbleached cotton tying tape
- plastic or stainless steel paper clips
- micro-spatulas
- flat-blade staple removers (not standard office supply staple removers, which can damage documents)
- pH testing pens
- cotton gloves

In addition, refer to the *Museum Handbook*, Part I, the *Conserve O Gram* series, and the *Tools of the Trade*. They contain information on storage equipment, such as cabinets and shelving.

Depending on the archival materials already available to you, you may not need all of the supplies and equipment listed above. You may need additional items. For example, there are specialized boxes, sleeves, envelopes, and wrappings for microfilm, microfiche, compact disks, videotapes, motion picture film, and the diverse formats of sound recordings.

For additional materials you may need, consult the NPS *Tools of the Trade* or any of the various commercial archival supply catalogs.

3. *What are textual and non-textual materials?*

Textual materials are traditional, paper-based documents, such as letters, reports, notes, clippings, telegrams, and memorandums.

Non-textual materials are records in a variety of specialized formats. These include:

- cartographic records (maps)
- architectural/engineering drawings
- photographs (prints and negatives)
- motion picture film

- videotapes
- audio recordings (reel-to-reel tapes, tape cassettes, compact disks, wax disks, wax cylinders, and wire recordings)
- microforms, including roll film, sheet fiche, and aperture cards
- computer punch cards
- electronic records in all storage media (floppy disks, compact disks, magnetic tape, and even hard drives)

4. *Should I process textual and non-textual records differently?*

Yes. Process textual and non-textual records differently because specialized records require specialized handling. Records in different formats shouldn't be kept together in the same folders or the same boxes because they can damage each other.

5. *What should be done if a collection contains documents that are folded?*

Unfold them. Fold lines can cause damage to both standard-sized and oversized materials. See Section P for information on oversized materials.

For example, it's not unusual for letters to be filed as they were received folded into thirds. Unfold them and file them flat.

6. *How should I handle paper records that are acidic?*

If…	***Then…***
an acidic document has intrinsic value,	place it in a protective sleeve in order to keep it from damaging other documents. Also place a sheet of alkaline buffered paper in the sleeve, to keep the document from damaging itself with its own acidity.
acidic documents (such as telegrams and newspaper clippings) don't have intrinsic value,	replace them with copies made on acid-free paper and destroy the originals.
If you are in doubt about an acidic document's intrinsic value,	Don't throw it out; retain the document, but isolate it to prevent damage to other materials.

7. *How should I handle paper records that are fragile?*

If…	***Then…***
records are fragile but stable (such as letters typed on onionskin paper),	place them in Protective sleeves.

records are fragile and unstable (such as "Thermofax" copies, which become illegible over time and become so brittle that they can break into pieces),	copy them onto acid-free paper, and destroy the originals.

8. *How should I handle paper records that are damaged?*

If…	***Then…***
documents are moderately damaged (slight tears, holes),	place them in protective sleeves (avoid attempting to repair them yourself with adhesives).
documents are severely damaged (mold, burn marks, major tearing or shredding),	consult with a professional paper conservator to determine what treatment is necessary.

9. *When should I make "preservation copies"?*

Preservation copies are photocopies, microform copies, or digital copies of documents. They are produced so that researchers don't have to handle the originals. Having preservation copies helps prevent theft and damage to collections that can occur from overuse.

Note: Preservation copies are different from "surrogate" copies, which literally replace the originals.

It never hurts to have a set of preservation copies for any collection. However, the cost of making them is so high that preservation copying should be done on a very selective basis. Only those collections that are the most important and receive the heaviest use should be considered for preservation copying.

Light-sensitive items, such as albumen prints, should not be photocopied. For further guidance on preservation copying, see* Conserve-O-Grams *no. 19/4, 19/10, and 19/11.

10. *May I cull materials during processing?*

Yes. Materials ordinarily are identified for disposal during the appraisal process (see Section E, "Appraisal"). However, duplicates and extraneous material may be identified during the processing phase. Those materials may be culled from the collection. Consider the materials to have been accessioned in error. Thoroughly document the removal of the materials and place the documentation in the accession folder. This action is not a deaccession. Don't follow the standard deaccessioning procedures.

It's not unusual for a collection to contain multiple copies of the same document. Unless these duplicates have some kind of intrinsic value, it's permissible to keep just two or three copies. Dispose of the rest.

Follow the disposal procedures for permanent park records. Consult with the park's administrative officer to see how the park handles the disposal of such records. Remember, however, that culling is an option – it is not mandatory.

Also, be cautious about culling materials from pre-20th century collections. It is all right to cull recent photocopies of documents that have found their way into the colleciton—but rare handwritten ("fair") copies or "press" copies dating from the same time period as the documents they duplicate might be worth keeping.

Culling collections during processing is not a substitute for the adequate appraisal of records.

11. *What are some examples of the types of materials that can be culled?*

Types of materials that can be culled include:

- blank sheets of stationery
- inconsequential notes
- unannotated slips of paper used long ago as bookmarks within file folders
- empty and unmarked envelopes
- empty binders
- general publications with no associational value
- documents with privacy information that contributes no value to the collection

Note: It is conceivable that material culled from archival collections may have artifactual value. A ream of blank stationery that got filed with an archival collection may not have any archival value and should be culled. However, depending on its age, if it has a particularly unusual or interesting letterhead, it may have artifactual value. In that case, it may be appropriate to retain one or two sheets in the collection and recatalog the remainder as a non-archival history object.

O. Processing And Preservation—Paper-Based Documents

1. *How should I refolder and rebox paper-based documents?*

Unless a collection is accessioned in pristine condition, it's usually advisable to:

- transfer documents from their original file folders
- place them in acid-free file folders
- house the files in acid-free archives boxes
- remove oversized and non-textual records (see Section O)
- take steps to preserve any damaged or fragile documents that you encounter (see Section N)

Don't number the documents. Don't write on the documents for any reason.

2. *What size folders or boxes should I use?*

Use either letter-sized or legal-sized acid-free folders and boxes, depending on the nature of the collection. Collections often contain a mix of letter-sized and legal-sized documents. You should avoid folding legal-sized documents to make them fit into letter-sized folders and boxes. For this reason, legal-sized folders and boxes are preferred—even if a collection is composed predominantly of letter-sized documents. The snug fit of a letter-sized box can cause damage to the documents. Letter-sized storage materials, however, are less expensive than legal-sized materials.

3. *Should I remove paper clips, staples, and other fasteners?*

If at all possible, try to remove metal paper clips, binder clips, pins, brads, Acco fasteners, staples, and rubber bands from documents as you process collections—especially if they are rusty or doing obvious damage.

Take great care when removing staples. To avoid damaging the document, don't rip a staple out from the front by using a standard office staple remover. Instead, turn the document over. Use a flat-bladed archival staple remover. Fold back the ends of the staple so they are sticking straight up. Then turn the document back over. Slide the blade under the staple and gently slide it out of the document.

4. *Should I remove documents from binders?*

Yes. If it's practical to do so, remove documents from three-ring binders, and place them in file folders. Examine the binders carefully to determine if:

- the title on the binder as a whole represents the file unit title, *or*
- various tabs in the binder represent file units, *or*
- the binder is actually part of a larger file unit

5. *How should I handle multi-page documents?*

If multi-page documents are contained in a folder with other documents, they may need to be fastened in some way. If they aren't paginated, they can easily get mixed up with other documents in the folder. You can fold a sheet of bond paper in half (like a mini-file folder) and slip the document in that, or use interleaving sheets to separate documents. Alternatively, you may fold a very small piece of bond paper over one corner of the multi-page document as protection. Then place a stainless steel paper clip over top of the bond paper. You should only do this, however, if the document is not so thick that a clip would create impressions in the document.

6. *Can I break materials into multiple folders if the original file folder is too full?*

Yes. If the original file folder is overstuffed, don't transfer the entire contents to a single new folder. Instead, break up the contents into multiple folders that don't exceed 1 inch in thickness. As explained in Section K, this is still just one file unit. It doesn't matter how many file folders are needed to contain the materials. For example, a file unit entitled "Correspondence, July 1928" has to be broken up among three folders. It remains a single file unit even though it is contained in three folders. The titles on the folders should indicate that the file unit is foldered in sequence:

- "Correspondence, July 1928 (Folder 1 of 3)"

- "Correspondence, July 1928 (Folder 2 of 3)"
- "Correspondence, July 1928 (Folder 3 of 3)"

7. *How should I label file folders?*

Write the folder title on the upper flap of the folder, using a soft lead pencil. Titles should contain the following information:

- catalog number (from ANCS+ Collection Management Module catalog record) or local collection number (from ANCS+ Archives Module entry)
- collection title
- series title (if applicable)
- subseries title (if applicable)
- file unit title (if the file units are arranged under an alpha-numeric or other type of code, then that code designation is the file unit title; if the file unit title is a personal name, then put the last name first)
- the sequence of the folders (Folder 1 of 3, Folder 2 of 3) if the file unit is broken down into two or more file folders
- a consecutive number (acceptable but not necessary)

File units that are arranged properly, according to a clear filing scheme (alphabetical, chronological), don't require consecutive numbering. The number is superfluous. Moreover, the number of file folders is liable to change. For example, documents in a particular folder may become brittle and worn with time and use. It may be necessary to insert them into protective polyester sleeves. These will expand folders and may make it necessary to divide file units into multiple folders. This, in turn, would necessitate re-numbering all subsequent folders. Collection titles, series title, and file unit titles are permanent and immutable. However, the number of file folders can change for a variety of practical reasons. Thus, numbering all folders as a matter of routine can be an unnecessary exercise.

It's permissible to abbreviate titles, if that is necessary to fit all recommended information onto the folder label. The George Washington Carver Papers, for example, could be abbreviated as the "Carver Papers." This abbreviation is appropriate only in the pencil titles on the folders themselves. Enter only full, official titles into ANCS+.

8. *Should I copy everything written on the original folder?*

Not necessarily. Enter only the information that pertains to the actual title of the file unit. File folders often have little personal notes, names, telephone numbers, and other jottings. These have nothing to do with the title of the file unit or the content of the folder. Don't attempt to copy or preserve such extraneous information.

Notes may appear on the folder that seem to be connected with the content of the file unit. These would be like marginalia, only on the folder as opposed to the margins of the documents themselves. You may copy or save the part of the folder containing that writing. If you save a portion of

an acidic folder for this reason, place it in a protective Mylar sleeve. Keep it as part of the file unit.

9. *How many file folders should I place in a box?*

Only put the number of folders in a box that will sit vertically, comfortably resting on the bottom fold. There should be enough folders in the box to keep the folders from sagging, but not so many that the box will bulge.

If you don't have enough folders to fill a box completely, insert a spacer board to keep the folders upright. (A spacer board is a length of acid-free corrugated board. It can be folded to the desired size and inserted in a box to create a false back, against which folders can rest.) Spacer boards—also called "document support spacers"—are available through archival supply catalogs.

10. *May I mix files from different collections in the same archives box?*

No. Even if you don't have enough files from a particular collection to fill an archives box, don't mix collections. Never box different collections together.

If you're working with a very small collection, you may not have enough folders to fill a box. You may also have boxed all but the last two or three folders of a larger collection. In these cases, you have two options:

- Use a spacer board, as described above.
- Use a smaller box. Archives boxes with a depth of only 2.5 inches are available through archival supply catalogs.

11. *How should I label the boxes?*

As arrangement and processing are underway, you may label boxes temporarily. Write the:

- catalog or local collection number
- series title
- box number

Write lightly in pencil on the part of the box that eventually will be covered by the permanent label. For flip-top archives boxes, this would be on the narrow side that would be shelved facing out. This is the side where the top will flip from left to right. The label itself should be on the bottom half of the box. Place it beneath the flip top but above the finger hole or pull string. For records center cartons, the label should be in the center of the side that faces out when shelved.

After processing has been completed, go back and put permanent labels on all the boxes. Print or type the labels onto archival quality, self-adhesive labels. Include the following information:

- park name
- catalog number or local collection number
- collection title
- series, subseries, sub-subseries, sub-sub-subseries title, as appropriate

- title of first file unit in the box
- title of last file unit in the box
- box number

Note: Number boxes consecutively from the first box to the last box in the collection as a whole, regardless of series. Number each collection separately.

12. *Should I keep the original folders, binders, and boxes?*

No. After a collection has been refoldered and reboxed, throw them away or recycle them. They have no archival value.

The only exception would be for boxes, binders, or folders that contain information, such as notes that the records creator made.

If…	***Then…***
the notes have intrinsic value because they were written by a notable historic figure,	keep the relevant portion of the folder, binder, or box as part of the collection. It may be necessary to enclose that portion of the folder, binder, or box in a polyster sleeve.
the notes have informational or evidential value but no intrinsic value,	copy the relevant portion onto acid-free bond paper, keep the copy, and discard the original.

P. Processing And Preservation — Oversized Materials

1. *How should I handle oversized materials?*

Legal-sized or letter-sized textual records frequently will contain oversized documents. These typically have been folded to fit into a legal-sized or letter-sized folder or rolled and placed in tubes. Examples include:

- maps
- charts
- diplomas
- certificates
- posters
- newspapers
- bound volumes

- petitions
- architectural drawings
- engineering drawings

Ideally, oversized documents should be:

- removed from smaller folders
- flattened (unfolded); if folded documents are too brittle to be flattened safely, consult with a paper conservator
- placed in appropriate-sized folders and storage boxes

If they're so large that no folders or boxes can accommodate them, place them in map drawers. Separate them with interleaving sheets. (Because interleaving sheets can add weight and bulk, be careful not to overload drawers.) You may also place them onto acid-free rolling tubes.

Be sure to separate oversized materials by type. Store oversized blueprints separately, for example, from newspapers or oversized photographs.

2. *How do I show the removal of oversized materials?*

Whenever you remove an oversized item, you must replace it with a "separation sheet." See **Figure D.5**. The separation sheet should show the name of the document. For documents that don't have a formal title, give a short but meaningful description, such as "Map of Gettysburg, 1863," "Architectural Drawing, Park Visitor Center, 1968." The separation sheet should also show the title of the collection. As applicable, include the title of the series, subseries, and file unit.

Place the separation sheet in the exact location where the oversized item initially belonged. In addition, keep a copy of the separation sheet with the oversized document in its new location. It's necessary to have separation sheets in both places. Researchers going through the files will then know that a document has been removed. The original location will also be clear to anyone looking at the oversized document.

3. *Why do oversized documents have to be removed?*

Oversized documents often don't fit into legal-sized or letter-sized folders and boxes. Attempting to do so usually means folding the documents one or more times. Folding, unfolding, and refolding documents can cause damage. Documents become brittle and weak along fold lines and can easily break apart. Oversized documents can also become frayed and torn if edges stick out from file folders. Therefore, removal and flattening of oversized documents is a basic preservation action.

4. *How should I file oversized items after they're removed from their original locations?*

Typically, place oversized documents at the end of the collection from which they were pulled. Organize them by type—textual documents (documents on plain paper), architectural drawings, posters, bound volumes, and so forth. Arrange them in the same order as the collection as a whole.

For example, two oversized documents were removed from file A in Series I of a collection. Another oversized document was removed from file D of

that same series and another from file W of that same series. Three oversized documents were removed from Series II. The documents from Series I, file A would be filed first. The documents from Series I, file D and Series I, file W would be filed next. The documents from Series II would be filed last.

5. *Should I handle a group of oversized materials at the end of a collection as a series (or subseries or sub-subseries)?*

No. A group of oversized documents that has been separated from the original file doesn't constitute a series. The documents have no separate place in the collection's hierarchy. They are *housed* separately, but only as a practical measure, to help preserve them. Technically, they remain part of the file unit and series from which they came.

A group of oversized documents separated from the original files shouldn't be identified in the hierarchy. The documents shouldn't be regarded as a series or subseries. They shouldn't be described as any kind of unit within the ANCS+ Archives Module.

Such documents would be described specifically in the Archives Module only if the entire collection were being described down to the item level. This is almost never done. Even then, the item level description for each oversized document would be subordinate to its original file unit and series.

For further information on how to catalog and describe archival collections, see Sections R and S.

Q. Processing And Preservation — Photographs

When handling photographic materials of any type, it's important to wear white cotton gloves. The gloves protect the images from dirt and skin oils.

1. *How should I handle photographs that are part of standard textual files?*

Inks and papers in standard textual file units can damage photographs. Emulsions and chemicals from photographs can harm textual documents. If you encounter photographs in folders containing textual records, you should either remove the photographs (in the same manner as you would remove oversized documents) and replace them with separation sheets, or place them in protective sleeves and leave them in their original locations.

If you separate photos from the textual reocrds, you should organize them by type (prints, negatives, slides) and arrange them in the same order in which they appeared in their original textual locations. When a photograph is removed from a textual file, replace it with a separation sheet (see **Figure D.5)**. If possible, place a photocopy of the separated image with the separation sheet. Also be sure to keep a copy of the separation sheet with the photograph at its new location.

2. *What if photographs are attached to pages in a textual document?*

Unless they are doing damage or being damaged, leave them where they are. Place interleaving sheets between the pages. If you should note any damage being caused by the photographs, by the pages to which they are attached, or by the adhesives, you should consult with a conservator. (Also see Item 6, below, concerning procedures for handling photograph albums.)

3. *Should I add photographs that were separated from textual records to a series consisting exclusively of photographs?*

No. Some collections have series consisting exclusively of photographs. Ordinarily, this is because the person or organization that created the collection established a separate series of photos. For example, the records creator may have created albums of sequentially numbered images. Or the creator may have set up a working file of photos arranged by subject. That series should not be disturbed by adding photos that weren't there before.

Photographs located in textual files, for example, wouldn't have been part of that photo series. An individual photo may have been attached to an incoming letter and kept with that letter in a correspondence file. The photo is part of that letter. As such, it's part of the file unit and part of the series to which the letter belongs. Just because it's a photograph, doesn't mean it should be moved to a collection of photos that the records creator set up.

The reason for this goes back to the principle of original order. Separating a photograph or an oversized document from its original file unit doesn't alter the original file arrangement or series organization. Photographs and oversized documents are still part of their original file units and series in a technical or intellectual sense. Housing them separately is for preservation purposes only. It doesn't affect the archival hierarchy in any way.

4. *How should I house photographs?*

Separate photographic materials by type (prints, negatives, slides). Place them in protective envelopes or sleeves and store them in archival-quality photograph boxes. Slide storage boxes are small and narrow and should be placed into slide storage cases. The cases hold up to six boxes.

Place images in uncoated, inert, polyester (Mylar D) sleeves. The sleeves are expensive, but they allow you to view images without actually handling them.

You may also use paper envelopes and sleeves. Images have to be removed to be seen, but they are less expensive than polyester sleeves. They also do a better job of preventing the buildup of moisture and gasses because they are porous. Use unbuffered papers for color images. Use buffered papers for black-and-white images.

Store images less than 10" x 12" on edge. Don't stuff them so tightly into boxes that the boxes bulge. Don't store them so loosely that the photographs sag. Store oversized, fragile, or damaged images flat.

Place glass plate negatives into seamless, four-flap enclosures. Store them upright in document storage boxes lined on the bottom with Ethafoam. Nitrate negatives should be placed in cold storage. If possible, replace nitrate negatives with safety-base surrogates. Unless they have intrinsic value, destroy them after replacement—*especially if they are in poor and potentially unstable condition.* They should be handled as hazardous waste.

When nitrate negatives are replaced, the surrogate becomes the new object. You can destroy the original without having to deaccession it unless it has intrinsic value.

5. *Should I place loose photographs in albums?*

No. Envelopes and boxes are the appropriate storage media for prints, negatives, and slides.

6. *How should I process photographic albums?*

Ordinarily, photograph albums and scrapbooks are left intact. Trying to remove photographs that have been glued onto album leaves may damage the photographs. The albums may also have intrinsic value. This is especially true if they were compiled by a noted individual. The leaves may also contain captions, notes, and marginalia. Many of these old albums are quite stable; if they are, leave them intact and monitor for deterioration.

Photographs that were mounted in albums made of acidic paper may be in danger of being damaged. Consider the following steps:

- Make photocopies of each page of the album on acid-free paper.
- Make duplicate negatives and new prints of each of the photographs.
- Make digital scans of each of the photographs.
- Remove photographs from albums if this can be done without damaging the photographs. It may be necessary to consult with a professional photographic conservator to determine if the photographs can be removed safely.

R. Cataloging

1. *What's "cataloging"?*

Cataloging refers to the creation of a catalog record for archival collections. The catalog record should focus on the collection as a whole. Enter the catalog record in the ANCS+ Collection Management Module. The catalog record contains both collections management and basic descriptive data about the collection. It also serves as the principal accountability record for the collection.

> ***Don't attempt to catalog a collection before it's arranged. Arrangement establishes a collection's hierarchy, and the cataloging of a collection is based on that hierarchy.***

See Sections H and I for information about arrangement and hierarchical structure.

Note: Refer to Chapter 2, Section II of the *ANCS+ User Manual* for instructions on completing the fields on the collection level catalog record.

2. *Should there be a catalog record for each document in a collection?*

No. Don't catalog individual documents or "items." There should be only one catalog record for the collection as a whole. You may describe individual items in the Archives Module, but this is seldom necessary. In fact, avoid item level description if at all possible.

3. *What if a document is pulled from a collection to go on loan?*

To loan a document to another institution, the document will need to have a unique identification number. You can assign a unique identification number to a document for purposes of loaning it. Create an individual catalog record for that document, or create an item-level entry for that document in the Archives Module. Item level cataloging or description in this situation is done only to facilitate the loan process. It doesn't change the status of the document in any way. The document is still part of a larger collection, not a stand-alone museum object. Upon being returned at the end of the loan period, file it in its original location.

4. *Should there be a catalog record for each file unit in a collection?*

No. Don't catalog individual file units. There should be only one catalog record for the collection as a whole. You may describe individual file units in the Archives Module, but this is seldom necessary. As a time-saving alternative to full descriptions on each file unit, develop "folder title lists" or "container lists" in the Archives Module (see Section T).

5. *Should there be a catalog record for each series or subseries in a collection?*

No. There should be only one catalog record for the collection as a whole. There's only one catalog record regardless of the size of the collection or the number of series it contains.

> ***Fully describe all series, subseries, sub-subseries, and sub-sub-subseries in the Archives Module (see Section S).***

6. *What's the connection between archival hierarchies and archival cataloging/description?*

As explained in Sections H and I of this appendix, archival and manuscript collections are arranged *hierarchically*. They should be cataloged and described in the same fashion.

Hierarchical *arrangement* means that a collection is organized into subordinate groups. These groups are in turn broken out into subordinate groups, which in turn are broken out into individual items. The "top" of the hierarchy is the most general level: the collection as a whole. The "bottom" of the hierarchy is the most specific level: each individual document. In between the top level of the hierarchy and the bottom level may be groups of documents called "series." These are somewhat more specific than the full collection, but are still fairly general. Just as a collection may be organized into series, individual series may be organized into subseries. These are more specific than series, but more general than file units or individual documents. Subseries may be made up of individual file units, which are very specific. The file units are made up of individual documents or items, which are the most specific parts of the hierarchy.

Hierarchical *description* means that collections should be cataloged and described hierarchically, just as they are arranged. **Figure D.3a** shows a sample hierarchy for the Records of the XYZ Corporation. Description begins with a catalog record (in the Collection Management Module) for the records of the XYZ Corporation as a whole. Descriptions of the series and subseries can then be completed in the Archives Module. In other words, *the cataloging and descriptions proceed from the general to the specific, following the arrangement scheme*. The hierarchy serves as a sort of outline or table of contents.

You should describe each element in the hierarchy above the file unit level. You may draw up lists for file units. However, descriptions on individual file units and items is optional (and usually discouraged).

7. *What is the process for cataloging an archival collection?*

Follow these steps to catalog an archival collection:

- Enter a brief description of the collection as a whole into the ANCS+ Collections Management Module. This is the only catalog record for the collection that you should enter into the Collections Management Module.

- Copy your entry in the ANCS+ Collections Management Module over to the collection level screen of the Archives Module.
- Enter descriptions of each series in the collection, using as many series level screens as necessary. Each series gets its own screen.
- Enter descriptions of each subseries (or sub-subseries), if there are any. Each subseries gets its own screen.
- If you absolutely have to do it, enter descriptions for each file unit in the File Unit Level. Each file unit gets its own screen.
- If you absolutely have to do it, enter descriptions for each document in the Item Level.

Usually it's okay to stop at the series level. You need to describe most collections only at the collection and series/subseries levels. Going beyond that usually involves a lot of work and little gain.

8. *Do I have to enter the information from the top down?*

Yes. You have to go from the general to the specific. That is, you have to do your Collection Level description first. This is followed by Series Level descriptions, followed by Subseries Level descriptions, followed by File Unit descriptions (if necessary), and so forth.

Note: You can always go back and revise Collection or Series Level entries even after you have moved on to the Subseries or File Unit Levels. In other words, you have to *start* at the top and work your way down, but you can always go back up to the top to make revisions.

9. *Why must I enter information from the top down?*

Because the system is hierarchical, you have to enter information hierarchically. You enter the Collection Level description first, the Series Level descriptions second, and so forth. Your entries will be numbered so that all entries from the Collection Level down to the Item Level are linked. You have to do the Collection Level first because it will be the parent screen for all of the Series Level descriptions. You have to do your Series Level descriptions before you do subseries descriptions. This is because the Series Level screens are the parents for the Subseries Level screens. The same principle applies as you move down the hierarchy to the File Unit and Item Levels.

S. Description

1. *What's description?*

Description refers to written summaries of a collection and its series, subseries, and other components. You enter these descriptions in the ANCS+ Archives Module. The collection level description also appears in the catalog record, but the descriptions of series, subseries, and other components appear only in the Archives Module.

2. *How do I write a Collection Level description?*

To write a Collection Level description, you need to focus on three critically important fields:

- organization/arrangement
- scope

- history

Note: Refer to Appendix F of the *ANCS+ User Manual* for instructions on completing the other fields on the Collection Level record.

Organization/Arrangement (Collection Level)

List the series that make up the collection. Some small collections consist of file units that aren't organized into series. Indicate whether the file units are arranged alphabetically, numerically, chronologically, or according to some other filing scheme.

Scope (Collection Level)

First, list examples of the types of documents that appear most frequently in the collection. Examples include correspondence, reports, maps, architectural drawings, engineering drawings, photographs, newspaper clippings, and sound recordings. Second, provide a one paragraph overview of the collection. Cite the sorts of activities that are documented and examples of specific topics and highlights.

History (Collection Level)

For organizations, provide a brief history of the organization that created the records. For personal papers, provide a biography of the person that created the records. For example, provide a brief biography of Thomas Edison for a collection of Thomas Edison's personal papers. Provide a brief corporate history of the Thomas Edison Company for a collection of the company's records. Ordinarily, the histories or biographies should be no more than one to four paragraphs. In addition, you may want to include a time-line of dates and events pertaining to the records creator—perhaps as an appendix—but this is optional.

3. *How do I write a Series Level description?*

Follow the same basic procedure used for writing a Collection Level description. Treat each series as if it were a mini-collection (with some slight variations). Focus on three critically important fields:

- organization/arrangement
- scope
- history

Note: Refer to Appendix F of the *ANCS+ User Manual* for instructions on completing the other fields on the Series Level record.

Organization/Arrangement (Series Level)

List the subseries that make up the series. Some series consist of file units that aren't organized into subseries. Indicate whether the file units are arranged alphabetically, numerically, chronologically, or according to some other filing scheme.

Scope (Series Level)

First, list examples of the types of documents that appear most frequently in the series. Examples include correspondence, reports, maps, architectural drawings, photographs, newspaper clippings, and sound recordings. Second, provide a one paragraph overview of the series. Cite the sorts of activities that are documented and examples of specific topics and highlights.

History (Series Level)
You only need to complete the history field in the Series Level screen under certain circumstances. Provide historical information if series are based on specific functional units or events.

For example, suppose the records of a corporation are broken out by series for the various divisions of that company. There's a series for the Research Division, a series for the Manufacturing Division, and so forth. In such cases, it's appropriate to provide a one or two paragraph history of that division.

Another example would be the personal papers of an individual. These could contain series based on specific events or eras in that individual's life. There could be a series of papers on the person's military service, or exploration of the South Pole. Then it's appropriate to provide a paragraph detailing those phases of that person's life.

Don't provide historical information if the series are based simply on the types of documents. A series of correspondence, a series of reports, or a series of photographs doesn't require a history.

***Remember: You must use unique titles. No collections among your holdings should have the same title. Within a given collection, no two series should have the same title. Within a given series, no two subseries should have the same title. See Section I, Question 4 for further information. For further information on standards, see the Society of American Archivists' publication* Describing Archives: A Content Standard (DACS).**

4. *Should I enter descriptions in the Archives Module for all series, subseries, sub-subseries, and sub-sub-subseries in a particular collection's hierarchy?*

Yes. You must individually describe, in the Archives Module, every series, subseries, sub-subseries, and sub-sub-subseries identified in a collection's hierarchy.

For the Subseries, Sub-Subseries, and Sub-Sub-Subseries Levels, follow the same descriptive procedures as for the Series Level.

5. *How do I write a File Unit Level description?*

Complete the basic fields (title of file unit, file unit number). The only other information needed is a one-or-two line overview of the content of the documents contained in the file unit.

Note: Refer to Appendix F of the *ANCS+ User Manual* for instructions on completing the other fields on the File Unit Level record.

6. *Are File Unit Level descriptions required?*

No. File unit description may be done at the discretion of the individual curator or archivist, but most of the time it's unnecessary to provide full descriptions of each file unit. Researchers should be able to find the files

they need if:

- a series (or subseries) is well described, *and*
- the file units are clearly arranged

It's extremely inefficient to describe each file unit. For all but the smallest collections, it involves an enormous amount of time-consuming, labor-intensive effort. This effort only produces minutely detailed descriptions that provide little added value.

Instead of describing each file unit, prepare folder title lists or container lists (see Section T). These are a much more efficient alternative to full file unit description.

7. *Are there situations where file unit description is recommended?*

Yes. Associated records include project files in such fields as archeology, paleontology, geology, and biology. The records for each project should be treated as a single file unit, regardless of the number of folders it might contain. File unit descriptions for each of these projects may note the title of the project, the subject or purpose of the project, the location where the project took place, the project dates, the principal investigators, etc. It should also note the accession number (which will link the file unit to any associated objects) and the storage location (if the file unit is co-located with the objects at an off-site repository). For further information, see Section M, "Handling Resource Management Records." For an example of a finding aid describing archeological records down to the file unit level, see **Figure D.6.**

8. *How do I write an Item Level description?*

An "item" is an individual document (a letter, report, photograph, architectural drawing, memorandum, etc.) regardless of the number of pages. Complete the basic fields (title of document, item number). The only other information needed is a one or two line overview of the document's content. For example, list the subjects covered in the document.

Note: Refer to Appendix F of the *ANCS+ User Manual* for instructions on completing the other fields on the Item Level record.

If a document doesn't have a formal title, enter a brief, functional title. A letter "title" should include the names of the sender and recipient, plus the date. Example: "Jones to Smith, October 1, 1908."

9. *Is Item Level description required?*

No. In most cases, it's unnecessary. Like File Unit Level description, Item Level description is time-consuming and labor-intensive. It's always an option, but you should choose it carefully. Having a finding aid that can direct a researcher to the proper file unit (or group of file units) may be sufficient.

10. *Is it more appropriate to do Item Level description of certain types of documents than others?*

Yes. Photographs, maps, and architectural drawings typically are more appropriate for Item Level description than regular textual materials. However, Item Level description is still optional. Only do Item Level description for photographs, maps, and architectural drawings when there's a real need for it.

If you choose to describe such materials to the Item Level, be succinct. Enter a short sentence fragment, citing only the most essential elements.

Then move on to the next image.

For example, "Franklin Roosevelt and Eleanor Roosevelt sitting on a mule," is an adequate photo description. Include the date (if known) and the photographer (if important). You don't need to describe what they are wearing, which way the mule is facing, and what the background scenery is like.

Note: If you do Item Level description of photographic prints, it's unnecessary to do Item Level descriptions of the associated negatives (provided there is some way of connecting the prints to the negatives).

Generally, Item Level description is appropriate only for collections of the greatest historical significance. Very few collections in NPS custody rise to that level. The best candidates for item level description would be unusually rare or valuable documents—such as letters written by George Washington..

11. *Can Item Level description help preserve collections by reducing the need to search through the files?*

Not necessarily. There are two reasons why Item Level description isn't a good strategy for preserving collections.

- "Heavy use" is a subjective term, but there are probably very few collections in NPS custody that are used so much that Item Level description would reduce the handling of individual documents in a meaningful way. Therefore, providing Item Level description for the purpose of reducing the need to open boxes and physically retrieve documents may not be worth the effort. The costs to reduce a collection's use from 30 times a year to 25 times a year would vastly outweigh the benefits.

- Even when collections have been described to the Item Level, they still have to be handled. You should not assume that a researcher will decide not to see a document based on an Item Level description. A researcher is also likely to want to see other documents in that particular file unit. The materials will still be handled despite the Item Level description.

12. *Should I make Item Level entries in the ANCS+ Item Level-Only directory?*

No. The ANCS+ Archives Module includes both a hierarchical Archives directory and an Item Level-Only directory. The Item Level-Only directory was included in the Archives Module to accommodate Item Level-Only entries that were made in the past. Assuming that Item Level description for a particular collection is absolutely necessary, use the hierarchical Archives directory.

> ***Don't use the Item Level directory for any new Item Level descriptions. Enter Item Level descriptions into Item Level screens in the hierarchical Archives directory. In cases where a "collection" consists of one document, you should catalog that documenet individually in the Collection Management Module.***

Use of the Item Level directory is not good archival practice. Item Level-only descriptions aren't grouped logically under the appropriate file unit, series, and collection level descriptions. Instead, they are disconnected from each other and from their parent levels.

If you have Item Level entries in the Item Level directory, determine the collections to which those items belong. Transfer the descriptions to the hierarchical Archives directory as soon as possible.

13. *Why is it so important to enter Item Level descriptions in the hierarchically organized Archives directory and not the item level-only directory?*

Item Level entries in the hierarchically organized Archives directory are linked to the file units, subseries, series, and collections to which they belong. These entries reflect the actual physical organization and the provenance of the collection. The hierarchy also provides context for each document. This makes each item easier to understand and easier to find and retrieve.

Item Level entries in the Item Level directory exist in isolation, with no context, no provenance, and no organization. It's very difficult to find and retrieve items that are entered into the Item Level directory. You must know exactly what document you are seeking and exactly what keywords to use.

T. Folder Title Lists And Finding Aids

1. *What's a "folder title list"?*

A folder title list is also called a "container list." It's a list of all file units in a collection (or in an individual series, subseries, and so forth).

Preparing a folder title list is a highly-recommended alternative to entering a full description for each file unit in a collection. It takes much less time to do a folder title list than to do full file unit descriptions. Folder title lists also provide enough information to be very helpful to users.

You can enter folder title lists at either the Collection Level or the Series Level in the ANCS+ Archives Module. Enter them in the Container List supplemental record.

For technical and practical reasons, it's much better to provide a single folder title list for an entire collection. Use the Container List supplemental record at the Collection Level screen. If you include the folder title list as part of the Collection Level, it will automatically appear in printed finding aids. Folder title lists entered at the Series Level won't appear in printed finding aids.

Note: Refer to Appendix F of the *ANCS+ User Manual* for instructions on completing the Container List supplemental record.

2. *What are the two methods for preparing folder title lists?*

One method is to list the titles of every single file unit in each box. For example:

BOX 1: Aardvarks
Bears
Kangaroos
Leopards

BOX 2: Ocelots
Orangutans
Puffins
Zebras

The other method is to list the first and last file units in each box. For example:

BOX 1: Aardvarks to Leopards
BOX 2: Ocelots to Zebras

3. *Are folder title lists mandatory?*

No. Folder title lists aren't mandatory.

4. *When is it appropriate to do a folder title list?*

Doing folder title lists is a judgment call. Only do them when they can provide information that's not already covered in the basic collection, series, subseries, sub-subseries, or sub-sub-subseries descriptions.

A good candidate for a folder title list is a series of "Subject Files." Subject Files are files containing correspondence, memorandums, research papers, notes, and clippings. The material is on particular topics that were of interest to whoever created the records. Because a series might include dozens or hundreds of individual files, it's impractical to list every topic in the series description. Folder title lists are the most efficient and useful way of informing users of the specific subjects. Users can scan the list of subjects and select desired file units.

5. *When is it unnecessary to do a folder title list?*

In some situations folder title lists are superfluous. For example, suppose a series of memos is arranged in file units by year. All of the memos for a particular year are filed together. The title of each file unit is simply the year. There's no need to list each of the years if the user knows that the series contains one file unit for each year. The title of each file unit, in other words, is implied by the series description. At the most, a folder title list could facilitate retrieval by indicating the first and last file in each box. However, even that's not necessary.

6. *What's a "finding aid"?*

"Finding Aids" are reference tools. They can help NPS staff and outside researchers locate the files and documents they need in an archival collection. They are like a table of contents to an archival collection and can be in either hard copy or digital formats.

A finding aid is the basic tool for navigating through a collection. It should provide an overview of the structure and content of the collection. The standard elements of a finding aid are:

- history
- collection level description
- series and subseries level descriptions
- folder title lists

See Sections R and S for information on history and descriptions. See the beginning of Section T for information on folder title lists.

7. *Does NPS have a template for producing finding aids?*

Yes. A finding aid template exists in the ANCS+ Archives Module. You can generate finding aids from information entered into the ANCS+ Archives Module as part of the description process. Finding aids generated in this way require no additional keying of information. They are produced

from completed fields in the Archives Module.

You don't need to know anything about what a finding aid should look like or what it should contain. Just complete the various fields in the Archives Module as part of your cataloging and description activities. Include folder title lists in the Container List supplemental record on the Collection Level screen. Then choose the FindingAid/SGML function to automatically create a finding aid for the collection.

ANCS+ will copy data from the various fields into a finding aid that has been fully laid out and paginated. It includes a cover sheet, table of contents, and restrictions statement. The ANCS+ finding aid will be in Microsoft Word. You can send electronic copies of the finding aid to users. You can also print hard copy versions or post the finding aid on the Web Catalog.

An example of an ANCS+-generated finding aid appears in **Figure D.6.**

Refer to Appendix F of the *ANCS+ User Manual* for information on completing the fields in the Archives Module. This appendix also contains complete instructions for producing the ANCS+ finding aid.

8. *What are EAD and MARC-AMC?*

EAD stands for Encoded Archival Description. MARC-AMC stands for Machine Readable Cataloging Record – Archival and Manuscripts Control Format.

EAD and MARC-AMC are methods of coding catalog information about archival collections. They are used for posting to national, on-line bibliographic networks.

ANCS+ is capable of automatically putting data about NPS archival and manuscript collections into EAD and MARC-AMC codes. However, your park must have agreements with on-line bibliographical networks in order to post information about park collections. For further information, see the ANCS+ *User Manual*, Appendix F.

9. *Is it mandatory to use EAD or MARC-AMC?*

No. Coding ANCS+ data according to EAD or MARC-AMC format for submission to on-line catalogs is completely optional.

U. Access

This section focuses on access guidelines relating specifically to archives and manuscript collections in NPS custody. General guidance on access to NPS museum collections appears in the *Museum Handbook*, Part III, Museum Collections Use.

1. *Are staff members at my park permitted access to park archival and manuscript materials?*

Yes. Park staff can access park archival and manuscript materials but only for work-related activities. Curatorial staff don't need to withhold any documents from non-curatorial staff who are working on official assignments. Staff members who wish to conduct their own, personal research, however, shouldn't be granted special access. Instead, they should receive the same level of access as a member of the public.

Non-curatorial staff members should follow the same general rules as members of the public when handling archival or manuscript collections. These rules apply whether they're working on an official project or

conducting personal research:

- review original materials only in the museum program's research room
- have only one folder open at a time
- don't disturb the order of documents
- don't remove, add, write on, or otherwise mishandle documents

2. *Are non-NPS staff members permitted access to park archival and manuscript materials?*

Yes. Non-NPS staff members, including members of the public and employees of other Federal agencies, may access park archival and manuscript materials. They must follow certain rules regarding access and certain procedures regarding use. See Section W for information on use of collections.

3. *Is there one set of rules to follow when deciding whether members of the public are allowed to see certain documents?*

No. There are different sets of rules for different types of documents.

- For Federal Records (including NPS records), follow the rules set forth in the Freedom of Information Act. See Section V.
- For donated and purchased personal papers and private sector archives, there may be special restrictions established by the park.

4. *What are the rules for determining public access to a collection of personal papers, private sector corporate archives, or other non-NPS documents?*

Restrictions on access should be outlined in the donor agreement or deed of gift. Accepting donations with restrictions, however, should be avoided. Donated and purchased archival collections that weren't created by a Federal agency aren't subject to FOIA. FOIA exemptions don't apply to such collections. See Section V.

5. *What kinds of "personal privacy" information may I withhold from researchers?*

Personal privacy information in Federal/NPS records may be withheld under the Freedom of Information Act (FOIA). See Section V. Personal privacy information in donated or purchased materials may be withheld under the terms of the donor agreement. It may also be withheld under the park's policy for protecting personal information.

Parks are legally required under FOIA to withhold NPS records that "would constitute a clearly unwarranted invasion of personal privacy."

Not every mention of an individual rises to this threshold. The sorts of information serious enough to be considered an "unwarranted invasion of personal privacy" would include:

- medical, psychiatric, employment, and religious counseling information on an identifiable individual or individuals
- information that places an individual in a false light
- information (including photographs) that could cause embarrassment (such as nude images)

6. *Can these types of personal privacy restrictions be placed on non-Federal records as well as Federal records?*

As a matter of discretionary policy, parks may handle personal privacy information in non-Federal/non-NPS records, such as personal papers, in the same manner in which they handle personal privacy information in Federal/NPS records. However, these restrictions aren't required by law. Exemptions under FOIA don't apply to personal papers or other non-Federal archival materials.

7. *What types of restrictions may I place on "culturally sensitive" archival materials?*

NPS-owned archival collections may contain "culturally sensitive" archival materials such as photographs, motion pictures, maps, location information, or other depictions of American Indians:

- burial sites
- sacred sites
- human remains
- religious ceremonies

Federal records can be withheld only if they are covered by one of the exemptions in FOIA. However, these materials may be withheld from researchers in the following cases if the materials are:

- Federal records/NPS records, and restriction is authorized by an existing Federal law (such as the American Indian Religious Freedom Act or the Native American Graves Protection and Repatriation Act)
- donated (and non-Federal), and the donor agreement or deed-of-gift specifies that culturally sensitive documentation should be restricted
- donated or purchased (and non-Federal), and the park determines that their release would violate the standards of the affected group

Note: For further information on restrictions made at the park's discretion, you should consult with DOI solicitors.

8. *How should sensitive information in personal papers or private sector records be withheld from researchers?*

Follow the same basic procedures outlined in Section V for withholding FOIA-exempt information from Federal/NPS records.

9. *Should I withhold copyrighted materials from researchers?*

No. You shouldn't withhold documents from researchers based on their copyright status. Copyright status may have an affect, however, on making copies of documents for researchers to keep. See Section X.

10. *Is it permissible to restrict or withhold Federal records that have previously been released?*

Ordinarily, once a Federal record has been released, especially if it has been published, it becomes part of the "public domain." Materials in the public domain are open to everyone. In very rare cases, however, Federal records identified as "Records of Concern" may be withheld for national security reasons.

11. *What's the principle of "Equality of Access"?*

The principle of "Equality of Access" gives the same level of access to all.

If…	*Then…*
you grant one member of the public access to a particular collection of documents,	you have to grant the same level of access to all members of the public.

Parks are legally obligated under FOIA to provide an equal level of access to everyone requesting to see Federal records. If Federal records aren't exempt from disclosure, then they are open to everyone. If Federal records are exempt from disclosure, then they are closed to everyone.

Follow the same principle with regard to non-Federal records in NPS museum collections.

12. *Can I restrict access to archival or manuscript materials if the purposes or methods of a person's research is questionable?*

No. It's not ethical to censor, judge, influence, or endorse anyone's research, arguments, or interpretations. Access must be granted on an equal basis to all researchers. You cannot withhold publicly available documents from individuals because you don't approve of their research. Neither can you give special access to individuals whose research you support.

For Federal/NPS records, it's illegal to withhold or release a document based on the intentions of the researcher. Instead, you are required by law to make your decision based solely on the content of the documents. Documents that are exempt from disclosure under FOIA guidelines must be withheld from everybody. Documents that aren't exempt from disclosure must be open to everybody regardless of the purpose, nature, or methodology of their research.

V. Freedom Of Information Act (FOIA)

1. *What are the rules for determining public access to NPS or other Federal records that are part of the museum collection?*

NPS records that have been accessioned into park museum collections, such as resource management records, are subject to the Freedom of Information Act (FOIA).

Federal agencies are required to release all information that's not specifically exempted under the Freedom of Information Act.

The Freedom of Information Act applies <u>only</u> to Federal records. Donated personal papers, corporate archives, or other non-Federal archival materials in your custody are <u>not</u> subject to FOIA review.

See **Figure D.7** for a copy of the Freedom of Information Act.

2. *What are some FOIA exemptions?*

FOIA exemptions include:

- security-classified information relating to national defense or foreign policy
- privileged or confidential trade secrets and commercial or financial information

- personnel files, personal medical files, or other materials, but only if disclosure of those records "would constitute a clearly unwarranted invasion of personal privacy"
- law enforcement records, but only if disclosure of those records would:
  - interfere with enforcement proceedings
  - deprive a person of a fair trial
  - reveal a confidential source
  - reveal investigative or prosecutorial techniques
  - endanger the life or physical safety of an individual
- records related solely to a Federal agency's internal personnel rules and practices
- records of financial institutions
- privileged inter-agency or intra-agency memorandums or letters (for example, concerning management decisions that are under consideration but not yet made)
- records specifically exempted by statute, including records on:
  - protected archeological sites, including shipwrecks
  - caves
  - wells
  - endangered species

Note: FOIA exemptions include records already shielded by existing Federal laws. The Archeological Resources Protection Act of 1979, for example, presents disclosure of protected archeological sites.

3. *What are the procedures for responding to a FOIA request?*

Follow these procedures for responding to a FOIA request:

- Provide written response within 10 working days of receiving a FOIA request.
- If more than 10 days are needed to respond, notify the public affairs and FOIA officers at your park's regional office immediately. Request an extension.
- The denial of all or part of a FOIA request must be signed by the Regional Director or by the regional FOIA officer or public affairs officer.

- Parks may recover costs (based on fee schedules established by the Department of the Interior) from the requestor if the response:
  - requires more than two hours of research, or
  - entails copying more than 100 pages
- Researchers are entitled to appeal negative decisions. They should file their appeals with the FOIA officer in the Washington Office. If a researcher's appeal is denied, the researcher may appeal that decision in the appropriate United States District Court.

For further information, consult the FOIA officer at your park's regional office or read 383 *Department Manual* 15.

4. *How can FOIA-exempt information be removed from files or withheld from researchers?*

There are two ways to withhold documents or information from release:

- If an entire document is exempt, you may remove the document from its original file location. Place it in an acid-free file folder, labeled "Restricted Documents from [file name from which document was removed]." Put a separation sheet in the document's original file location (see **Figure D.5**). Give the name and date of the document and the FOIA exemption that required the document's removal. Place a copy of the separation sheet with the document itself. Place the folder containing the withdrawn document behind the original folder.
- If only a portion of a particular document is exempt, then provide the researcher with a "redacted" copy. To do this, make a copy of the original document. Then either obscure the exempted information with a heavy black marker or cut out the exempted information. Copy the redacted copy (so that it's impossible to see the original information through the black lines). Indicate the FOIA exemption in the margin next to the area that was blacked out or cut out. Provide this copy—not the original document—to the researcher.

Always redact a COPY of the original document. Never cut out or black out information on the original document.

5. *Do I have to conduct a new FOIA review every time a member of the public asks for a particular file or document?*

No. Once a file or document has been reviewed and released, it becomes permanently available to anyone who requests it. There's no need to conduct additional FOIA reviews for materials that have already been released.

6. *Should I handle all requests for information from archival and manuscript collections as if they are FOIA requests?*

No. Follow FOIA procedures only when responding to requests that are formally identified in writing as FOIA requests. Other letters, e-mails, or telephone calls that you receive may be handled as routine inquiries. See Section U.

Even when responding to a routine request for information, **you must always follow FOIA guidelines when deciding what records can be released and what records should be withheld.**

Never release Federal records that are exempt from disclosure.

7. *Should I review research proposals to determine if it's appropriate to grant access to the records?*

No. FOIA is the only basis for determining whether or not a member of the public can see NPS records.

If…	*Then …*
a document or file isn't exempt from disclosure under the FOIA,	release it to everyone who wishes to see it.
a document or file is exempt from disclosure,	withhold it from everyone.

The purposes of the requestor's research, the nature of the requestor's research proposal, and the requestor's research methodologies are irrelevant. The exemptions set forth in FOIA are the sole factor for determining release.

NPS records may never be withheld from an individual because of the nature of his or her research.

8. *Does FOIA apply to all archival and manuscript materials in NPS museum collections?*

No. FOIA is extremely limited. It applies only to certain types of Federal records—records created by Executive Branch agencies. Even within the Executive Branch, it doesn't apply to those offices that are actually part of the White House. This means that the records of all Executive Branch Departments, such as the Department of the Interior, are covered by FOIA. White House records, Congressional records, and Supreme Court records are not covered.

FOIA also doesn't cover:

- records of private sector corporations, non-profit foundations, or clubs
- personal papers of private individuals or families

Therefore, the only records in NPS museum collections that are likely to be covered by FOIA are NPS records.

9. *Are personal papers "records received by the Federal government" and therefore subject to FOIA?*

No. A collection of records may be owned by the Federal government, but that doesn't necessarily mean that they're Federal records. The papers of a private individual or the archives of a private sector corporation may be considered records. If they're accessioned into an NPS museum collection, they're the property of the Federal government, but they are not Federal records.

Federal records are records *created* by the Federal government, and they are records of Federal activity.

When a park accessions a collection of personal papers or corporation archives that it has acquired through donation or purchase, it's not creating

records. Instead, it's acquiring property. They're the papers of a private individual or the records of a private sector company, not the records of the Federal government even though the Federal government owns them.

The fact that this property happens to be a collection of records doesn't make it a collection of Federal records.

W. Use-Reference

This section focuses on guidelines relating specifically to the use of archives and manuscript collections in NPS custody. General guidance on use of NPS museum collections appears in the *Museum Handbook*, Part III: Museum Collections Use.

1. *Are researchers subject to any restrictions on using archival and manuscript collections?*

Yes. There are many restrictions that you may place on the use of archival and manuscript materials. These restrictions are outlined below. Researchers who fail to observe those restrictions may be prohibited from doing research in park facilities with original documents. They would still be entitled to purchase copies of publicly available materials.

2. *When members of the public come to the park to conduct archival research, where should they work?*

Designate a separate room or clearly defined area for use by researchers. Don't place researchers at a staff member's desk or at a vacant table in the collections storage area.

3. *May researchers be permitted to "check out" files, in the manner that someone would check a book out from a library?*

No. Original archival materials should never be checked out. They may be placed on loan, following the same rules that govern loans of all NPS museum objects. An archival repository is not a lending library and researchers should never be allowed to check out original documents.

4. *How should I configure a research room or research area?*

Follow these guidelines to set up a research room or research area.

Location of Research Rooms

- Research rooms or research areas may be adjacent to collection storage areas, but they must be separate from collection storage areas.
- Research areas should be close to collection storage areas. This minimizes the distance that archival materials will need to be transported for use. It also facilitates their quick and easy return to their regular storage locations.
- Research areas must be separate from collection storage areas to ensure proper security. This prevents researchers from having access to any archival materials other than those that they have specifically been permitted to use.

Contents of Research Rooms

- Research areas should be "clean." There should be no books, papers, files or other materials besides the documents that researchers have been authorized to use. This prevents archival materials that are brought to researchers from getting mixed up with other documents.
- Provide one or more worktables for researchers. Two or more researchers can be seated at the same table if they're working together

as a team. The team should be using the exact same documents at the exact same time. Otherwise only one researcher should be seated at a table at one time. Having two or more researchers at a single table runs the risk of getting papers from different collections mixed up. There are specially designed research tables with dividers to separate researchers (and the files they are using) from each other. These allow several researchers to work at the same table.

- Don't allow waste paper baskets or other trash receptacles near researchers. This prevents documents from being discarded by accident or through malice.

Environmental Conditions for Research Rooms

- Environmental conditions in research areas (heat, light, humidity) should be comparable to environmental conditions in collection storage areas.

- No food or beverages may be brought into research areas. Integrated Pest Management procedures should be implemented in research areas, just as they are in collection storage areas.

Security for Research Rooms

- Place lockers outside the research area, where researchers can store coats, hats, and briefcases. This is a security measure rather than a convenience for the researchers. It's intended to reduce opportunities for researchers to hide documents in their belongings and sneak them out of the research area.

- There must be a counter or desk for staff use in the research room. Situate it in such a way that staff can monitor all researchers at all times.

- Research areas should be secure. Grant entry only to authorized staff and authorized researchers. If a research area should abut a collection storage area, keep the doors locked between the two areas. This is especially important when researchers are present. Keep research areas locked or otherwise secured to prevent park visitors (other than authorized researchers) from gaining access to archival materials. This also prevents researchers from smuggling documents to someone outside the research room.

5. *What procedures should staff follow when working with on-site researchers?*

Staff are responsible for enforcing the research room rules and guidelines.

Retrieving Materials

Staff are responsible for retrieving and refiling all materials requested by researchers. Never allow researchers into the collection storage area to retrieve the papers they'll be using. Staff may pull several boxes of materials for a researcher at a time. However, the researcher may only use one box—and one folder out of that box—at a time. The researcher must put a folder back into the box before pulling another folder out. He or she must return everything to the first box and close it before opening the next box.

Monitoring

At least one staff member should remain in the research area at all times to monitor researcher activities. Staff should ensure that researchers are following the rules. In particular, staff should watch for any actions by researchers that might result in damage or rearrangement of documents. They should also be alert to any attempts by researchers to conceal documents on their persons or among their effects.

Inspecting

Staff should inspect all notes or other objects removed from the research room. Make certain that no documents are included among them.

6. *What procedures should researchers follow when they're in the research area?*

Researchers must follow these procedures when they're in the research area. Prohibit researchers from the research room if they fail to observe these rules:

- A researcher should use only one box at a time. No matter how many boxes of archival materials have been brought to a researcher, only one box may be opened at a time. Only one file folder from that box may be used at a time.

- Researchers must keep documents in the same order in which they found them. They should never move a document from one folder to another, or folders from one box to another. If researchers discover a file or document that has been misfiled, they shouldn't attempt to correct the situation themselves. They should report it to staff.

- Researchers should never write on archival materials.

- Researchers must handle individual documents carefully. If they're handling photographs or documents that are damaged or fragile, staff may require them to use gloves. The park should provide gloves to reduce the risk of damage. If researchers damage a document in the course of doing their research, they should report it to staff immediately.

- Researchers must never attempt to remove documents from the research room, unless museum staff give them permission to do so.

- If researchers are taking notes, they should use their own laptop computers. They can also write notes down on paper using *pencils* only. Never permit pens in the research area. Researchers must never use pens in the vicinity of original documents.

- Researchers are not permitted to have food, beverages, or smoking materials in the research area.

- Researchers should refrain from using cell phones or the Internet while in the research room. This is to avoid disturbing other researchers.

7. *What forms should I require researchers to complete?*

Require each researcher to complete the following forms:

Registration Form

Each researcher should complete a registration form before being permitted to use archival materials at the park. The form should include name, address, institutional address, research project, and publication plans. See **Figure D.8.** Upon completing the form, researchers should present both the form and a government-issued photo ID to a staff member. Write the type of ID and the ID's control number on the form.

Request Form

Require each researcher to complete a request form for all materials he or she wishes to view. The form should indicate the researcher's name, the date of the request, and the specific boxes, series, or files being requested. Retain request forms indefinitely, to identify individuals who had access to particular materials. This is in case you discover any missing documents. A "paper trail" of research use can deter theft. It can also serve as evidence in court cases seeking to recover lost or stolen items.

Copyright and Privacy Restrictions

Each researcher should read and sign the Copyright and Privacy Restrictions form before being permitted to use archival materials at the park. See **Figure D.9**.

Access Policies and Rules Governing Use

Each park should prepare and post its own Access Policies and Rules Governing Use for researchers to read. See the sample list of rules, **Figure D.10**.

8. *Do researchers need to meet any age restrictions?*

Archival repositories commonly prohibit individuals under the age of 21 from entering research areas and using original archival materials. Sometimes repositories make exceptions for college students working on class projects that require the use of primary sources.

9. *Should researchers make appointments before arriving to do archival research?*

Appointments are recommended but not required. Researchers should contact museum staff before they visit in order to make sure that the:

- papers they are seeking are actually in park custody
- papers in question contain the sort of information they are seeking
- materials they wish to see are available to researchers and are not exempt from disclosure

In addition, space constraints may make it advisable for researchers to make appointments to use the research area. Parks with limited space may be able to accommodate only two or three researchers at a time. Parks can handle researchers on a "first come, first served" basis. However, it may be fairer and more efficient for parks to schedule researchers in advance for specific blocks of time.

10. *What other scheduling and logistical arrangements should parks make in order to protect and facilitate the use of archival materials by outside researchers?*

Parks may make additional scheduling and logistical arrangements to facilitate researchers and protect the collections:

Pull Schedules or Retrieval Schedules

- Parks may establish "pull schedules" or "retrieval schedules," especially if there is heavy demand for archival materials. These schedules set certain times during the day as deadlines for researchers to submit requests for archival materials. The times are usually at least once in the morning and once in the afternoon. Requests received by those times ordinarily should be filled within the next one or two hours, depending upon demand. Researchers missing a deadline would have to submit their requests for the next deadline.

Supplies

- To protect the documents, parks should have supplies of white cotton gloves and pencils. Make these available for researchers to use when working with original documents.

- As a security measure, parks may also wish to provide researchers with notepaper or note cards. These should have holes punched in the upper right corner. When researchers are leaving the research room, staff can suspend a sheaf of pages or cards by inserting a pencil through the hole. Any original documents that might have been hidden among the notes would then drop out.

Use Copies; Reference Copies

Particular collections (or portions of collections) may be damaged, fragile, or receive exceptionally heavy use. Parks may choose to make photocopies, microform copies, or scanned digital copies of those materials. Researchers could then use those "reference copies" instead of the originals. (**Note:** If you make reference copies of accessioned archival materials, you should not catalog them. They are just copies, and are not part of the collection itself).

11. *How should parks provide copies of documents to private researchers?*

If at all possible, parks should provide facilities for making copies of documents, preferably at the researcher's expense.

Don't allow researchers to make copies themselves. They should indicate to staff which documents they wish to have copied. No matter what type of copies a researcher requests, he or she should complete a Researcher Duplication Form. See **Figure D.11**.

The park may adopt various procedures for making copies.

Small Numbers of Copies

Researchers may bring individual documents or files to staff in the research area for immediate copying. This depends on the availability of staff and photocopy machines. Preferably, the park should set up a cost-recovery program, so that researchers will bear the expense of copying. It might be possible to set up such a cost-recovery program through the park's cooperating association or through the park's budget office. The park may

waive fees, however, for very small numbers of copies that incur negligible costs.

Large Numbers of Copies

Researchers may need more than one or two documents photocopied during their visits. In these cases, it's advisable for them to use strips of white paper as "bookmarks." The paper indicates the location of specific documents or files that they wish to have photocopied. The staff makes the copies at a time that's convenient. These "bookmarks" should be placed so that they stick up above the file folders as they sit in a box. They're then readily apparent to staff. Researchers should write the title of the document or file unit on the bookmark (in pencil). This prevents confusion over what they want to have photocopied. The park should have cost-recovery procedures in place so that researchers pay for the photocopies themselves. The park may choose to withhold copies until full payment is received.

Photographic Copies

Researchers may desire actual photographs of textual documents, duplicate negatives of photographs, or copies of motion pictures or videotapes. In such cases, the park may set up agreements with commercial photo labs or video labs to make these copies. The park would transport the items to the lab and retrieve them after the copying is completed. The lab would then be responsible for collecting payment from the researcher. Alternatively, the park could pay the vendor and then charge the researcher through its cost-recovery program.

Note: Do not charge park staff for copies made in connection with official work assignments. If a park staff member wishes to conduct personal research while off duty, however, he or she should be subject to the same cost-recovery provisions as members of the public.

12. *What are the procedures for responding to researchers who aren't on-site?*

Instead of actually visiting the park, researchers may contact the park via regular mail, e-mail, or telephone. They may request information from or access to archival or manuscript materials in the park museum collection. Follow the procedures listed below when responding to those requests.

Response Format

- Responding by letter is always acceptable, but you may respond in whatever format the request was made. For example, you may respond to e-mail requests by e-mail and to telephone requests by telephone.

Response Time

- Respond as quickly as possible. Remember that FOIA responses must be sent within 10 working days.

- If providing a full answer would take a great deal of time, send an interim response. Provide as much information as possible and indicate that additional information will be contained in a follow-up response.

- If a researcher requests a few easily-provided facts, it's acceptable to provide those facts. In general, however, you shouldn't do the researcher's work. Focus on the availability of archival materials and on their general content. Provide finding aids for researchers to review. As a general rule, don't research questions that will take more than an hour or two to answer. Instead, advise the researcher to review the archival materials at the park, or purchase copies of relevant files.

FOIA Requests

- For formal FOIA requests for Federal/NPS records that are covered by FOIA, follow the procedures outlined in Section V. Withhold restricted information by applying the exemptions listed in Section V.

- If a researcher doesn't formally identify the request as a FOIA request, you don't have to follow the procedures outlined in Section V. This rule applies even if the request is for Federal/NPS records that are covered by FOIA. You should still respond, and you should still withhold restricted information by applying the exemptions listed in Section V.

Non-Federal Records Requests

- A researcher may request personal papers or private sector records that aren't Federal records. Apply whatever restrictions are contained in the donor agreement or in discretionary park policy.

- A researcher may submit a formal FOIA request for personal papers or private sector records that aren't Federal records. Advise the researcher that the materials in question are not covered by FOIA. Then respond as you would to any non-FOIA request for non-Federal archival materials.

- If you identify any archival materials that may relate to a researcher's request, provide a very brief description of those records. Include estimated page counts. Then, unless the materials are restricted, offer to make them available to the researcher in the park's research room. Explain to the researcher how he or she can order copies of the materials. When sending copies to off-site researchers, include a copy of the "Copyright and Privacy Restrictions" form. See **Figure D.9**.

Fees for Research Requests

- As noted in Section V, "Freedom of Information Requests," your park could establish a cost-recovery program that would require researchers to pay for research services, based on fee schedules established by the Department of the Interior. See *Museum Handbook III*, Chapter 4.

Tracking Research Requests

- Keep paper copies of incoming and outgoing letters and e-mails involving substantive information on archival holdings at your park.

- Keep track of all responses, regardless of format (letters, e-mail, telephone, face-to-face). Report the number of inquiries in your park's annual CMR submission.

X. Copyright

1. *May I give researchers copies of copyrighted materials?*

You may provide single copies of copyrighted documents to individual researchers if the:

- copyright holder has granted permission, *or*
- copies are made under the "Fair Use" provision of the copyright law

"Fair Use" permits the copying of documents without the approval or even the knowledge of the copyright holder. Fair Use covers such purposes as:

- research and scholarship
- news reporting
- criticism, parody, or commentary
- preservation of original documents (for example, making reference copies of a document for researchers to use in order to avoid wear-and-tear on the original)
- deposit of a copy in another research institution for scholarly purposes

2. *Are materials in NPS-owned archival and manuscript collections copyrighted?*

Sometimes they are. It depends on the type of material and the stipulations of donor agreements.

Federal records (such as NPS records) generally are not copyrighted. Letters, memorandums, speeches, notes, or other documents prepared by Federal employees as part of their official duties are *never* copyrighted. Those documents are in the public domain unless they are exempt from disclosure under FOIA. Documents received from other sources and incorporated into official files, however, may have copyright protection.

Personal papers, the records of private sector corporations or non-profit associations, and other donated or purchased materials may have copyright protection.

3. *How will I know if a document has been copyrighted?*

In many cases you won't know. Here are some useful indicators:

- Documents written by government employees as part of their official duties aren't copyrighted.
- Donors of personal papers or other non-Federal archival collections may assign all copyrights to the NPS. This should be documented in the donor agreement or deed of gift.
- Published documents usually include a copyright statement. Unpublished documents usually don't, but that doesn't mean they don't have copyright protection.

- Photographs may be stamped on the back with copyright information.

- Copyright protection may have expired on older documents. However, there are many variations, and it may be necessary to consult with a copyright lawyer before making a final determination. Generally, copyright protection has expired on:

  – published works that are more than 75 years old

  – unpublished works that are more than 100 years old

4. *Who's responsible for determining if a document has copyright protection?*

The researcher—not the park—is responsible for determining the copyright status of documents.

The only time a park needs to determine the copyright status of a document is if it plans to include the document in an official NPS publication.

5. *When should parks grant permission to publish copyrighted materials?*

Parks should only grant permission when they are certain they hold the copyright on a particular document. The NPS Deed of Gift form explicitly states that copyrights are being turned over to the NPS. If there is a signed deed of gift that includes the copyright transfer, then it's acceptable to grant permission to publish.

In other cases, however, you should avoid either giving permission or withholding permission:

- No permission is needed to publish Federal records because Federal records cannot be copyrighted.

- No permission is needed to publish documents whose copyrights have lapsed, because they are in the public domain.

- The NPS doesn't have the authority to grant or refuse permission if the NPS:

  – knows that another party owns the copyright on a particular document

  – doesn't know if a document is copyrighted

6. *What warnings or guidance should I give to researchers regarding the use of copyrighted materials?*

Unless you're certain that a document is in the public domain, or that the NPS owns the copyright on a document, you should do the following:

- Warn the researcher that the document may have copyright protection.

- Advise the researcher that he or she is responsible for determining copyright status.

- Advise the researcher that he or she is responsible for obtaining permission to publish from the copyright holder.

- Ask the researcher to sign the NPS "Copyright and Privacy Restrictions" form (see **Figure D.9**)

- Refer the researcher to the Copyright Search System of the U.S. Copyright Office: http://www.copyright.gov/records/.
- Refer the researcher to the National Archives Source and Permission Contact List: http://www.archives/gov/research/.

7. *Where may I find guidelines for determining if materials are likely to be in the public domain?*

Consult "Copyright Term and the Public Domain in the United States" at http://www.copyright.cornel.edu/public_domain/.

Y. Use—Publications, Exhibits, Loans

1. *How should researchers cite NPS-owned archival materials that they have used?*

The standard method for citing documents in scholarly works is to go from the specific to the general (that is, from the individual document to the repository or agency). Under this formula, citations for NPS archival and manuscript collections should indicate the:

- title and date of the document
- title of the file unit
- title of the series/subseries/sub-subseries
- title of the collection
- name of the park
- National Park Service

NPS has also recommended providing citations that start with the general and move to the specific. Under that method, the order of the elements listed above would be reversed. Either method is acceptable.

Citations, however, are entirely the responsibility of the researcher, and researchers are under no obligation to follow NPS recommendations.

Note: A researcher's willingness to follow NPS citation recommendations must never be a factor in deciding whether to provide or withhold archival materials.

2. *May the park request a complimentary copy of publications based on NPS-owned archival or manuscript collections?*

The park may *request* a courtesy copy, but cannot require one. A researcher's willingness to provide a courtesy copy must never be a factor in deciding whether to provide or withhold archival materials.

Previous guidance recommended two complimentary copies—one for the park library and another for the museum collection. This may tax both the researcher's generosity and the ability of museum staff to handle additional materials. A single library copy is sufficient.

3. *Can I loan archival materials?*

Yes. Parks are permitted to loan documents to museums and other institutions. Parks may not loan archives to individuals. Loans of documents must follow the same procedures as loans of other types of museum objects. Follow the procedures outlined in the *Museum Handbook*, Part II, Chapter 5.

Although it's inappropriate to catalog each document individually, it's permissible to catalog individual documents for a loan. You'll then have a unique catalog number to cite in the loan agreement. Alternatively, you can complete an Item Level record in the Archives Module. You would use the local collection number (which would include the item number) on the loan agreement.

4. *May archival materials be used in park museum exhibits and in park interpretive programs?*

Yes, but only if strict guidelines are observed.

- Exhibit-quality color photographs can be taken of documents, for inclusion in displays. For both preservation and security purposes, this usually is preferable to displaying original documents.

- Original documents may be displayed, but only if they are protected by UV filters. The documents must be housed in conditions that meet all security and environmental standards. It's preferable to display photographs of documents rather than original documents. Documents placed on exhibit must have either a unique catalog number or a unique Archives Module number (see item 3, above).

- Documents can be published for general distribution only if:

  – they're Federal records

  – they're in the public domain

  – donor agreement/deed of gift has relinquished copyright ownership to the NPS

- Original documents and photographs of documents cannot be published or placed on exhibit if they're:

  – exempt from disclosure under FOIA

  – restricted under donor agreement/deed of gift

- Never allow visitors to handle original documents, unless they're authorized researchers working in the research area.

Z. Understanding the Language: A Glossary

Acquired archives: Organic collections created by a non-NPS organization as a routine part of doing business but removed from the physical custody of the originating institution and now in the physical custody of the NPS. These intact organic collections maintain their provenance and original order and are still referred to as archives, although legally severed from their non-NPS creator.

Active records: Official records needed and used for current business by NPS staff.

Administrative value: Refers to the archival material's usefulness for park management, as in the case of architectural drawings and plans useful for building repairs, maps necessary for landscaping or rescue, or other park records that indicate how an ecosystem has been affected over time.

Appraisal: (1) The act of assessing an archival or manuscript collection's value--including informational value, artifactual or intrinsic value, evidential value, associational value, and monetary value--using criteria such as age, subject content, contextual documentation, condition, quality, quantity, legal restrictions, organizational problems, public relations concerns, and associational nature. (2) The act of determining if a collection contains official (i.e., appropriate for disposition by NARA) or non-official (i.e., appropriate for park retention) records by consulting guidance such as *Cultural Resource Management Guideline*, Chapter 9; *Museum Handbook*, Part II, Appendix D, Section D; and *NPS-19, Records Management Guideline*. (3) Used in NPS museums to refer strictly to establishing monetary value.

Archival assessment: Evaluation of a park's total archival and manuscript collection management needs incorporating collection surveys, the production of collection-level survey descriptions, collections evaluations, and recommendations for action. Professional assessments facilitate records management and the care of archival collections in parks that have little previous experience with these issues.

Archival collections: (1) An organic accumulation of records created by an organization as a natural part of conducting business. Archival collections have a common provenance and a shared internal order original to the collection. See **collection**. (2) The total archival and manuscript holdings of a park. See **holdings**.

Archival quality: Permanent, durable, and non-destructive storage or copying materials or equipment suitable for use with archives. Also refers to long-lived (100-year-plus) documentation formats such as silver gelatin emulsions.

Archives: (1) The non-current records of an organization, with their original order and provenance intact, maintained by the original organization. (2) The organization that created and holds the records. (3) The physical building/room in which the records are held.

Archivist: A professional knowledgeable in archival theory and practice, who is responsible for the administration or management of archival and manuscript collections.

Artifactual value: refers to the collection or item's intrinsic value as unique or rare examples of material culture. This value relates to the age, format, process, media, condition, and quality of the material.

Artificial collections: See **non-organic collections** and **assembled collections.**

Assembled collections: Accumulations of documents, most often gathered from multiple sources by a collector, generally unrelated by provenance. The documents frequently are in the same format or related to the same topic. Assembled collections are sometimes referred to as "manuscript collections."

Associated records: All documentation generated by the activity of collecting or analyzing artifacts or specimens needed to effectively manage those related objects within museum property collections. (If there is no object or specimen, the record may not be "associated" but is instead a resource management record.) See also the definition in 36 CFR Part 79 and **resource management records**.

Associational value: Refers to the archival material's relationship, usually by ownership or use, to an eminent site-related individual or group or the material's relationship to a significant site-associated event.

Authority files: Published or unpublished lists of subject terms or names selected by a park for use in description. The lists may provide definitions, occupations, cross-references from variant versions of names or terms, and dates. Every park museum collection with archival holdings should have authority files for use in creating folder lists.

Cellulose nitrate film: A flexible film base used for motion picture film and photographic negatives between about 1890 and 1955. This film base self-destructs over time going through five stages of deterioration. The film should be handled with gloves, foldered in buffered sleeves, boxed, placed in Ziplock bags and removed to off-site (non-museum storage) storage in a freezer. See MH-I, Appendix M, Care of Cellulose Nitrate Film.

Collections: (1) An accumulation of manuscripts, archival documents, or papers having a shared origin or provenance, if organic; or having been assembled around a common topic, format of record, or association (e.g., presidential autographs), if non-organic. A collection may be any of the types of records described in section D (e.g., personal papers, organizational records, assembled collections, resource management collections, or sub-official records). (2) The total archival and manuscript holdings of a park.

Context: The circumstances of creation, history of ownership and usage, and original order of an archival or manuscript collection. A clear context gives a collection enhanced research value. See also **original order**, **organic collection**, and **provenance**.

Document: (1) Also called an "item," the smallest complete unit of record or manuscript material accumulated to form a file (e.g., a letter, photograph, or report). A document may consist of multiple sheets or may have a recto (front) and verso (back), both of which carry information. Documents are also referred to as archival collections, papers, records, and manuscripts. Documents are most clearly described when referred to by their specific formats and processes (document types), such as albumen stereographs, outgoing correspondence, diaries, ink drawings, or field notebooks. (2) Any information in a fixed format, regardless of type.

Ephemera: A broad category of documents originally created for temporary or short-term use, such as advertisements, broadsides, invitations, packaging, posters, programs, schedules, and tickets.

Evidential value: Refers to the collection's ability to serve as historical or legal proof of an activity, event, procedure, or process since the record(s) are byproducts of these activities.

Federal Records Centers (FRC): Regional repositories that serve as official records centers for the National Archives.

File unit. The second-lowest level of archival arrangement, immediately above individual items or documents. File units contain all of the documents that the records creator filed together under a particular heading, classification, or topic. "File units" are not to be confused with "file folders," which are merely physical containers for holding documents. A single file unit, in fact, may be so large that it requires multiple file folders.

Finding aid: (1) A broader term for any format of textual or electronic tool that assists researchers in locating or using archival and manuscript collections. Basic finding aids include guides (for example, repository, collection, and subject guides), descriptive inventories, accession registers, card catalogs, special lists (for example, shelf and box lists), indexes, and (for machine-readable records) software documentation. (2) The file

guides, indexes, registers, and filing system aids produced by the records creator, usually referred to as “control records” or “contemporaneous finding aids.”

Format: Refers to the document type or form, such as the document's size and shape or the configuration of the media and support. For a fuller description of document types or formats see the Getty Art History Information Program's *Art and Architecture Thesaurus*, 2nd edition, (Oxford, England: Oxford University Press, 1994) for a full hierarchical list of terms.

Genre: Refers to the document's style, content, and form, including the document's purpose (advertisements, presentation album), the document's viewpoint (panoramic view), broad topical category (landscape, still life, portrait, or street scene), method of representation (abstract, figurative), circumstances of creation (amateur works, student works), or function (dance cards, cigarette cards, death certificates). For a full list consult the *Thesaurus for Graphic Material II: Genre and Physical Characteristic Terms*, 2nd ed., 1993, Library of Congress Cataloging Distribution Service, Washington, DC 20541.

Holdings: The sum total of all archival and manuscript collections held in physical custody by a park. See also **archives**, **collections**, **physical custody**, and **repository**.

Holographic documents: Documents written in the handwriting (i.e., script) of the individual who created or signed them.

Informational value: Refers to the subject content of the archival collections, such as the people, groups, places, eras, activities, events, objects, projects, and processes documented.

Integrity: Refers to collections whose provenance and original order are intact and whose documentary context is complete.

Intellectual control: The mastery or command established over the informational and contextual content of archival and manuscript collections resulting from discovering and describing their provenance and original order and from the processes of arrangement and description.

Intrinsic value: See **artifactual value**.

Inventory: (1) A structured guide to an archival or manuscript collection that includes a brief history of the collection and a list of the materials arranged in series that functions as a type of finding aid. (2) A physical count of a collection conducted for accountability purposes. See MH-II, Chapter 4, Section A, Annual and Spot-Check Inventories and Audits. See also **survey**.

Items: Refers to individual documents or manuscripts. An item may be composed of multiple sheets or may have both a recto (front) and a verso (back) with writing or images on both sides.

Leaves: See **sheets**.

Lot: A group of related records cataloged with a single ANCS catalog record.

Manuscript collections: Groups of documents that have been assembled due to their individual literary or historical values. Manuscript collections are frequently contrasted with archives, which have a shared creator, a shared history of ownership, and a shared original order. See also **manuscripts**.

Manuscripts: Individual documents, primarily textual, that have literary or historical value. Manuscripts include a wide range of document types from correspondence, book drafts, and diaries to personal papers and resource management records. Manuscripts are often paper-based textual records.

Monetary value: Refers to the dollar value placed on rare or collectible manuscripts such as autograph letters or photographs. Monetary value is affected by all of the other values listed above.

Museum records: Official records generated by the museum property system to manage museum property, such as accession, catalog, inventory, and loan records. These records are appraised through NPS record schedule procedures (NPS-19). NPS-19 states that they are maintained in the parks as active official records for which the NPS is accountable to the National Archives and Records Administration.

Non-organic collections: A synonym for "assembled or artificial collections."

Non-records: Documents not covered under the Federal Records Act; documents that are not considered records created or received by the Federal Government. (**Note:** Do not confuse archival collections received by the park through purchase or donation as "record material" by virtue of their having been "received" by the park. Such materials in fact "non-record" because they are not received as a record of Federal activity; rather, they are acquired as museum property).

Organic collections: Files routinely created as part of the day-to-day activities of a person, group, or organization. The records have a systematic relationship to each other that reflects their function and the activities and viewpoint of their creator. Organic collections are sometimes referred to as "archives." They are said to exhibit integrity (their provenance and original order has been retained). Personal papers, organizational records (acquired archives), resources management records (including associated records), active records (including museum records), and inactive records may be organic. See **original order**, **provenance**, and **non-organic collections**.

Organizational records: See **acquired archives.**

Original order: The functional filing arrangement imposed on a document collection by its creator. The original order of collections can provide information not found elsewhere, such as when the creator received a communication, who reviewed a document, or what the sequence of an administrative activity was. Original order should be preserved or reconstructed in a collection as it allows for rapid arrangement, accurate contextual research, and additional insight into the record creator's methods and activities. If a collection has no order because of mismanagement or disaster, a decision to impose an order may be made only by an experienced archivist.

Personal papers: The records created or accumulated during a lifetime by an individual or family. They have an intact provenance and an original order. Personal papers differ from archives in that they are routinely removed from the custody of the collection creators and placed in external archival repositories, but they function as the archives of individuals and must be treated with the same respect as all organic collections. Parks may collect the personal papers of individuals related to the park, such as founding fathers, formative staff, or eminent individuals associated with the history of the site.

Photographs: A fundamental document type found in all categories of records from museum records to assembled collections. Photographs come in many formats (for example, from cartes-de-visites to stereographs), in a wide variety of vantage points (for example, bird's-eye-view, microscope images, satellite images), genres (for example, landscapes, still lifes, portraits), and processes (for example, silver gelatin, carbon). Photographs are formed by the action of radiation (usually light) upon a sensitized surface. While often thought of as a single process, photography is many hundreds of related chemical processes on a variety of supports, such as metal, paper, plastic, or glass.

Photomechanicals: Multiple copies of images made in ink from photographic printing plates. These permanent images include chromolithographs, duotones, halftones, offsets, photolithographs, photogravures, photoengravings, silkscreens, and Woodburytypes. Photomechanical reproductions were most commonly used for postcards and for illustrations in books, magazines, and newspapers.

Physical custody: Either temporary or permanent custody of an archival or manuscript collection. Physical custody does not entail intellectual control or copyright (the right to exhibit, publish, or prepare derivative works). This is particularly true for previously unpublished personal papers, organizational papers, or other historic manuscript collections. In general, the creator of the records holds the copyright. Nor does physical custody entail the right to dispose of portions of the collection without appropriate permission.

Provenance: (1) The entity (for example, person, family, organization, or office) that either created the records or accumulated them in the natural course of activity. (2) The history of physical custody of a collection or item. Note: Museum curators and archeologists use the related term "provenience" to refer to the source or origins of objects and to the exact location where the object was found or made.

Provenience: See **provenance**, definition 2.

Records: (1) All information fixed in a tangible (textual, electronic, audiovisual, or visual) form that was created by an organization as part of its daily business. (2) Two or more data fields that are grouped as a unit in machine-readable records. (3) Official NPS records, as defined by the Federal Record Act and described in DO-19 and NPS-19. These NPS records are organic collections of documentary materials created by the National Park Service to document the creation, development, organization, functions, policies, decisions, procedures, operations, or other routine activities of the NPS. They are made or received by NPS offices as a part of transacting business and preserved as evidence of the offices' actions or functions or because of the records' informational value. They may be active, in which case they are retained by the NPS, or inactive, in which case they are appraised via NARA records schedules and either disposed of or sent to a federal records center.

Records management: The process of determining the status, value, and disposition of park records throughout their lifetime (for example, official or non-official; active or inactive; appropriate to the park's scope of collections statement or not; relevant to the site's history or not; appropriate to the archival appraisal criteria or not; and appropriate for shipment to the FRC and NARA or not as listed on the records schedule). Records management also involves scheduling records for their ultimate disposition.

Recto: The facing page (front) of a single sheet of text or images.

Reformatting: Preservation duplication of original archival materials through the use of long-lived copy technology such as silver halide microfilms or large format digital files and computer output microfilms.

Separation Sheet: A form used to indicate the location of removed items within a collection and the reason for the removal.

Series: A group of documents arranged, file units, or volumes maintained together as a unit within an archival or manuscript collection because of their shared circumstances of creation, receipt, or use. Examples of series would include: 1) incoming correspondence, 2) outgoing correspondence, 3) project files, 4) annual reports, and 5) fiscal records. File units within a series usually conform to a single, consistent arrangement scheme (alphabetical; numerical; chronological, etc.). A series containing records arranged under two or more filing schemes should be divided into subseries, with each group of file units sharing a given filing scheme making up a subseries. Also see **subseries**. **Note:** If a collection is to be organized into series, there must be two or more of them. There is no such thing as a collection that is "organized" into one series. A collection may be made up of file units or individual documents that are not organized into series. If a collection is organized into series, however, then all file units or documents must fit into one of those series – even if a separate series must be established for a single item.

Sheets: Individual leaves of paper, for example a 5-page letter. An individual sheet may have both a recto (front) and verso (back).

Special collections: (1) Non-official collections of manuscripts, personal papers, non-federal corporate records, magnetic media, audio-visual materials, and other documents. (2) Non-textual records, such as magnetic or audio-visual materials.

Sub-series: A group of documents subordinate to a series, and maintained together because of their shared circumstances of creation, receipt, or use. It may be necessary to break a series up into two or more subseries because records created under the same circumstances serve different functions, cover different topics, or are arranged according to different filing schemes. See **series.**

Survey: A comprehensive and systematic review of a collection conducted either to obtain a brief overview of a collection or a park's holdings or to gain knowledge on a particular point, such as the amount of cellulose nitrate-based negatives and film in a repository, or the physical condition of a group of collections, or the level of conservation treatment needed by specific items. Surveys may be conducted on any level (item to repository) and on any topic (for example, the amount of stereographs in a repository or the level of documentation on women in the NPS).

Textual records: A broad category of written record including holographic, typed, word-processed, and mechanically printed documents, manuscripts, records, and archives.

Verso: The reverse side (back) of a single sheet of text or images.

Visual records: A broad category of records containing images including graphic, photographic, and photomechanical prints (in all formats from negative, interpositive transparency, and slide, to print); drawings; paintings; and watercolors. Visual materials may be found in all categories of records from official museum records to resource management records.

AA. Identifying Further Sources of Archival Training and Guidance

Seek further training through NPS archival training, your local universities, the National Archives and Records Administration's Modern Archives Institute, the Society of American Archivists' training courses, and through your regional archival organizations.

The Society of American Archivists offers regular training courses. Contact them at tel: 312-922-0140; e-mail at <info@SAA.mhs.compuserve.com> or @cserve<internet:archives@miamiu.acs.muohio.edu> or via fax at 312-347-1452. Their address follows in the bibliography section.

For further guidance read Federal regulations governing document creation, use, and management including the following: the *Records Disposal Act of July 7, 1943, as amended (44 USC 366-376, 378-380); the Federal Property and Administrative Services Act of 1949, as amended (44 USC 391-401); Federal Property Management Regulations, Subchapter B, Archives and Records, Part 101-11, Records Management;* Department of the Interior *Departmental Manual*, Parts 380-384, Records Creation and Disposition and Part 411, Official Records; and the Federal Property Management Regulations, Subchapter B, Archives and Records.

SAMPLE HIERARCHIES/FILING SCHEMES FOR ASSOCIATED RECORDS

Most parks make or receive records relating to cultural history or natural history projects that occur in the park and recover objects or specimens that are accessioned into the park's museum collection. These are called "associated records."

These records are park records, regardlss of whether they were actually produced by park staff, other NPS staff, contractors, or outside researchers working under park research permits. **Records for a particular project do not represent a stand-alone collection.** Project files should not be cataloged individually as separate collectoins, but should be managed as file units within larger collections.

Note: Even though project files should not be cataloged as separate collections, they may still be described individually at the File Unit Level in the Archives Module.

Note: Even though project files should be managed as part of larger collections, individual files may still be co-located at partner repositories with their associated objects. For files that are co-located, complete an outgoing loan agrement and indicate in the location field of the File Unit Level screen that the file is housed off site.

Associated records for a given discipline may be handled either as a collection or as a series within a larger collection encompassing all of the park's resource management records. Within the collection or series, however, parks will have to identify appropriate hierarchies and filing schemes based on particular circumstances. **Figures D.4b-D.4g** provide sample hierarchies and filing schemes that may be adopted.

There are only a few absolutes among the proposed hierarchical structures:

1. Associated records for any given project should be handled as project files—not as collections or series. Those files should be arranged within a single series or a single collection according to a uniform filing scheme. The recommended format would be to use accession numbers as file numbers, but the park may develop its own file designations.

2. If a park accessions associated records generated by its own staff or contractors, by the regional center, or by permitted researchers, it may create separate series reflecting this (as is shown in Figures D.4c and D.4d).

3. If a park accessions associated records produced exclusively in the park, as well as records produced through multi-park permits, it may create separate series reflecting this (as is shown in Figure D.4e).

Beyond these basics, parks will have to improvise and develop hierarchies based on what kinds of records are actually present. For example:

1. Suppose a park implements the hierarchy in Figure D.4c, to the extent of having one series for park-generated records and one series for center-generated records. There is no need for the park series to maintain the same subseries structure as the center series. The park series may be broken out into subseries and sub-subseries, but the series of center records may have nothing more than a simple file unit organization (as is shown in Figure D.4a).

2. Associated records accessioned by a park may fall into a series structure completely different from the "Reports Notes and Correspondence; Still Pictures; Maps" organization used in some of the samples. There may be additional series or subseries, fewer series or subseries, or completely different series or subseries. There is no universal template.

Figure D.4a Sample Hierarchies/Filing Schemes for Associated Records

SIMPLE FILE UNIT ARRANGEMENT

It is possible that a collection of associated records would be made up of file units that are not organized into series. This is the most basic hierarchy there is:

Local Coll. No. 5001: Records Associated with Archeological Projects at XYZ National Park

File Units no. 001 to ?: Individual file units, arranged numerically by accession number (or by any other arrangement scheme the park chooses).

Figure D.4b Simple File Unit Arrangement

BASIC SERIES ORGANIZATION

The series organization outlined below is just a suggestion. An actual series organization could take different forms, depending on the actual records and how they are maintained. Within this proposed structure, all of the park's projects files for a particular discipline are handled as a collection and are organized into series by physical type. Thereunder, the documentation on each project is kept intact, and should be described individually in separate File Unit Level screens in the Archives Module. In other words, the records are managed by project, but within a hierarchical structure.

Local Coll. No. 5002: Records Associated with Archeological Projects at ABC National Park

Series I: Reports, Notes, and Correspondence

File Units 001 to ?: Individual file units, arranged numerically by accession number.

Series II: Still Pictures

Subseries A: Prints:
File Units 001 to ?: Arranged by accession number.
Subseries B: Negatives
File Units 001 to ?: Arranged by accession number.
Subseries C: Slides
File Units 001 to ?: Arranged by accession number.

Series III: Maps

File Units 001 to ?: Arranged by accession number.

Figure D.4c Basic Series Organization

SEPARATE SERIES FOR PARK-GENERATED ACCESSIONS AND CENTER-GENERATED COLLECTIONS

In some cases, associated records may be managed partly at a center and partly at a park—but all of the materials, of course, remain park property. Since parks manage the assignment of accession numbers, it should be possible to coordinate between the parks and the centers using the park accession numbers, and thus maintain a single arrangement scheme for everything (regardless of location). That is, Accessions 00123 through 00129 could be at the park, Accessions 00130-00140 at the center, Accession 00141 at the park, and so forth. This could be reflected in that same order within a single run of file unit numbers in the Archives Module.

If it proves too difficult for parks and centers to keep track of accessions in this way, then collections could be organized into series based on whether park staff or park contractors carried out a project, or whether center staff or center contractors carried out a project. Assuming that both park-generated and center-generated records are organized in the same fashion as the materials in **Figure 4.c**, a collection divided into park- and center-generated archives would look like this:

Local Coll. No. 5003: Records Associated with Archeological Projects at XYZ National Park

Series I: Regional Center Projects

Subseries A: Reports, Notes, and Correspondence
File Units 001 to ?: Individual file units, arranged by accession number
Subseries B: Still Pictures
Sub-subseries 1: Prints (arranged. by accession number)
Sub-subseries 2: Negatives (arranged by accession number)
Sub-subseries 3: Slides (arranged by accession number)
Subseries C: Maps (arranged by accession number)

Series II: Park Projects

Subseries A: Reports, Notes, and Correspondence
File Units 001 to ?: Individual file units, arranged by accession number
Subseries B: Still Pictures
Sub-subseries 1: Prints (arranged by accession number)
Sub-subseries 2: Negatives (arranged by accession number)
Sub-subseries 3: Slides (arranged by accession number)
Subseries C: Maps (arranged by accession number)

REMEMBER: Within this hierarchical structure, project files may still be described individually—but at the File Unit Level of the Archives Module, not as separate catalog records.

NOTE: The proposed series/subseries/sub-subseries structure is just an example of how a collection broken up into Regional Center projects and Park projects would work; it is not meant to be an immutable template. Also, because the breakdown would be based on park- or center-generated records (as opposed to managed), the hierarchy would not have to change if records were sent from the park to the center, or from the center to the park.

Figure D.4d Separate Series for Park-Generated Accessions and Center-Generated Collections

SEPARATE SERIES FOR PARK-GENERATED, CENTER-GENERATED, AND PERMITTED PROJECTS

It should be possible to use the park-assigned accession numbers to keep all associated records for a given discipline in serial order in the Archives Module. However, the fact that associated records for permitted research not always arrive in a timely fashion may complicate the coordination process. Just as parks might divide collections into series according to whether the work was done by center staff/contractors or park staff/contractors, they might also maintain a separate series for associated records generated through the permit process. It may be necessary to use placeholders to reserve space and maintain proper sequencing in the Archives Module if parks assign accession numbers before receiving records. The sample hierarchy below would be for a park that has assigned accession numbers to park, center, and permitted projects alike, and finds it easier to file/track them separately:

Local Coll. No. 5004: Records Associated with Archeological Projects at ABC National Park

Series I: Regional Center Projects

- Subseries A: Reports, Notes, and Correspondence
  - File Units 001 to ?: Individual file units, arranged by accession number
- Subseries B: Still Pictures
  - Sub-subseries 1: Prints (arranged by accession number)
  - Sub-subseries 2: Negatives (arranged by accession number)
  - Sub-subseries 3: Slides (arranged by accession number)
- Subseries C: Maps (arranged by accession number)

Series II: Park Projects

- Subseries A: Reports, Notes, and Correspondence
  - File Units 001 to ?: Individual file units, arranged by accession number
- Subseries B: Still Pictures
  - Sub-subseries 1: Prints (arranged by accession number)
  - Sub-subseries 2: Negatives (arranged by accession number)
  - Sub-subseries 3: Slides (arranged by accession number)
- Subseries C: Maps (arranged by accession number)

Series III: Permitted Research Projects

- Subseries A: Reports, Notes, and Correspondence
  - File Units 001 to ?: Individual file units, arranged by accession number
- Subseries B: Still Pictures
  - Sub-subseries 1: Prints (arranged by accession number)
  - Sub-subseries 2: Negatives (arranged by accession number)
  - Sub-subseries 3: Slides (arranged by accession number)
- Subseries C: Maps (arranged by accession number)

Figure D.4e Separate Series for Park-Generated, Center-Generated, and Permitted Projects

SEPARATE SERIES FOR RECORDS GENERATED VIA MULTI-PARK PERMITS

Many natural history projects in NPS now involve multiple parks. In such cases, each park involved in a multi-park permitted project would get a copy of the final report, but the lead park would receive a full set of the project's records. Thus, a single park may have biological project files relating just to that park itself. A lead park could have records generated by one or more multi-park projects, involving numerous parks. To avoid confusion over park-only projects and multi-park projects, natural history collections could follow a hierarchy such as this:

Local Coll. No. 5005: Records Associated with Biological Projects at XYZ National Park

Series I: Park Projects

Subseries A: Reports, Notes, and Correspondence
File Units 001 to ?: Individual file units, arranged by accession number
Subseries B: Still Pictures
Sub-subseries 1: Prints (arranged by accession number)
Sub-subseries 2: Negatives (arranged by accession number)
Sub-subseries 3: Slides (arranged by accession number)
Subseries C: Maps (arranged by accession number)

Series II: Multi-Park Projects

Subseries A: Reports, Notes, and Correspondence
File Units 001 to ?: Individual file units, arranged by accession number
Subseries B: Still Pictures
Sub-subseries 1: Prints (arranged by accession number)
Sub-subseries 2: Negatives (arranged by accession number)
Sub-subseries 3: Slides (arranged by accession number)
Subseries C: Maps (arranged by accession number)

NOTE: These series structures are just suggestions. Actual organizational schemes would depend on what records are actually present and how they are actually arranged. Still, the basic division into series by Park Projects and Multi-Park Projects would be retained.

Figure D.4f Separate Series for Records Generated Via Multi-Park Permits

ASSOCIATED RECORDS FOR A GIVEN DISCIPLINE AS A SERIES WITHIN THE PARK'S COLLECTION OF RESOURCE MANAGEMENT RECORDS

Records associated with archeology projects at a particular park can be handled as a series within the Resource Management collection. Using the complex organizational scheme outlined in **Figure D.4d,** here is how a series of archeological records would fit into the hierarchy for a park's Resource Management Records:

Local Coll. No. 5006: Resource Management Records at ABC National Park

Series I: Land Records

- Subseries A: General Records
- Subseries B: General Grazing Files
- Subseries C: Family Grazing Allotment Records

Series II: Records Relating to Fires and Fire Management

- Subseries A: General Records
- Subseries B: Records Relating to Fires
- Subseries C: Fire Effects Studies

Series III: Construction and Maintenance Records

- Subseries A: Roads and Trails
- Subseries B: Buildings
- Subseries C: Grounds
- Subseries D: Water and Sewer
- Subseries E: Signs, Markers, and Memorials

Series IV: Records Associated with Archeological Projects

- Subseries A: Regional Center Projects
  - Sub-subseries 1: Reports, Notes, and Correspondence
    - File Units 001 to ?: Individual file units, arranged by accession number
  - Sub-subseries 2: Still Pictures
    - Sub-sub-subseries a: Prints (arranged by accession number)
    - Sub-sub-subseries b: Negatives (arranged by accession number)
    - Sub-sub-subseries c: Slides (arranged by accession number)
  - Sub-subseries 3: Maps (arranged by accession number)
- Subseries B: Park Projects
  - Sub-subseries 1: Reports, Notes, and Correspondence
    - File Units 001 to ?: Individual file units, arranged by accession number
  - Sub-subseries 2: Still Pictures
    - Sub-sub-subseries a: Prints (arranged by accession number)
    - Sub-sub-subseries b: Negatives (arranged by accession number)
    - Sub-sub-subseries c: Slides (arranged by accession number)
  - Sub-subseries 3: Maps (arranged by accession number)

Figure D.4g Associated Records for a Given Discipline as a Series Within the Park's Collection of Resource Management Records

Subseries C: Permitted Research Projects
- Sub-subseries 1: Reports, Notes, and Correspondence
  - File Units 001 to ?: Individual file units, arranged by accession number
- Sub-subseries 2: Still Pictures
  - Sub-sub-subseries a: Prints (arranged by accession number)
  - Sub-sub-subseries b: Negatives (arranged by accession number)
  - Sub-sub-subseries c: Slides (arranged by accession number)
- Sub-subseries 3: Maps (arranged by accession number)

TABLE OF CONTENTS

COPYRIGHT AND RESTRICTIONS

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted materials. The various state privacy acts govern the use of materials that document private individuals, groups, and corporations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a reproduction if the document does not infringe the privacy rights of an individual, group, or corporation. These specified conditions of authorized use include:

- non-commercial and non-profit study, scholarship, or research, or teaching
- criticism, commentary, or news reporting
- as a NPS preservation or security copy
- as a research copy for deposit in another institution

If a user later uses a copy or reproduction for purposes in excess of "fair use," the user may be personally liable for copyright, privacy, or publicity infringement. This institution's permission to obtain a photographic, xerographic, digital, or other copy of a document doesn't indicate permission to publish, exhibit, perform, reproduce, sell, distribute, or prepare derivative works from this document without first obtaining permission from the copyright holder and from any private individual, group, or corporation shown or otherwise recorded.

Permission to publish, exhibit, perform, reproduce, prepare derivative works from, sell, or otherwise distribute the item must be obtained by the user separately in writing from the holder of the original copyright (or if the creator is dead from his/her heirs) as well as from any individual(s), groups, or corporations whose name, image, recorded words, or private information (e.g., employment information) may be reproduced in the source material. The holder of the original copyright isn't necessarily the National Park Service. The National Park Service is not legally liable for copyright, privacy, or publicity infringement when materials are wrongfully used after being provided to researchers for "fair use."

This institution reserves the right to refuse to accept a copying order if fulfillment of the order is judged in violation of copyright or federal or state privacy or publicity law.

HISTORY

Andersonville National Historic Site, located 10 miles northeast of Americus, in southwest Georgia, was established as a unit of the National Park Service on October 16, 1970, under Public Law 91-465. Its mission, as specified in the enabling legislation, is to "provide an understanding of the Civil War prisoner of war story, to interpret the role of prisoner of war camps in history, and to commemorate the sacrifice of Americans who lost their lives in such camps."

Included within the boundaries of the 515-acre park is the former site of Andersonville Prison, which was the most notorious prisoner of war camp during the American Civil War. Known officially during the Civil War as Camp Sumter, it was one of the Confederate Government's largest military prisons. Operating for 14 months in 1864 and 1865, Andersonville held more than 45,000 Union prisoners-of-war -- nearly 13,000 of whom perished because of disease, starvation, overcrowding, poor sanitation, or exposure. The harsh conditions at Andersonville -- while scarcely more severe than other prisoner of war camps operated by the Union and Confederacy alike -- excited such outrage after the war that its superintendent, Captain Henry Wirz, was court-martialed by the United States Army. Wirz was found guilty of war crimes, and executed in November 1865.

In addition to the prison camp, the park also includes the prison camp’s burial ground (which was designated as a National Cemetery in July 1865, and which continues to inter the remains of deceased veterans), as well as the site of the camp hospital, the adjacent Confederate fort, and a National Park Service visitors center. Since 1998, the National Park Service has also maintained the National Prisoner of War Museum at Andersonville NHS; this museum tells the story of American prisoners of war throughout the Nation's history, starting with the Revolutionary War.

Archeological projects at Andersonville National Historic Site serve several academic, interpretive, and administrative purposes. They identify the existence of archeological resources, to help ensure their preservation and to prevent construction or other activity from damaging them. They provide data to help the park comply with Section 106 of the National Historical Preservation Act of 1966, which requires Federal agencies to consider the impact of their activities on historic places. They provide information on historic configurations of the prison camp, the fort, and the hospital, that can be used in interpretation and reconstructions. And they can yield artifacts that are accessioned into the park's museum collection and may be used for exhibits and research.

These archeological projects, therefore, add to the body of scholarship on Andersonville, for use by other archeologists, historians, teachers, students, and others. In addition, they contribute to a clearer understanding of the prison camp's history, and enhance the experience of those who visit the park. And they facilitate proper management of archeological resources, in order to minimize any impairment and to promote their preservation for future generations.

Notable projects include a series of studies conducted by the NPS Southeast Archeological Center between 1987 and 1990 to determine the nature, construction techniques, and location of the prison's stockade walls and gates, and to document prison conditions. The park used the findings of these studies to develop new or improved exhibits for the benefit of visitors, and to reconstruct a portion of the stockade walls.

SCOPE AND CONTENT

RECORDS ASSOCIATED WITH ARCHEOLOGICAL PROJECTS AT ANDERSONVILLE NHS
1970-1997

CATALOG NUMBER	ANDE 9804
VOLUME	12 LF
DESCRIPTION	Field notes, reports, correspondence, photographs, and maps relating to archeological projects carried out at Andersonville National Historic Site. Included are records produced by non-NPS archeologists conducting permitted research and submitted to the park under the terms of the permit, as well as records produced by NPS archeologists working on official projects. Most records are associated with accessioned objects. Records and objects associated with a single project will have the same park accession number.
ORGANIZATION	Organized into 3 series: Series I, Reports, Notes, and Correspondence; Series II, Still Pictures; Series III, Maps.
PROVENANCE	
RESTRICTIONS	NO
ASSOCIATED MATERIALS	

HIERARCHY

I. SERIES I: REPORTS, NOTES, AND CORRESPONDENCE

II. SERIES II: STILL PICTURES

III. SERIES III: MAPS

SERIES DESCRIPTIONS

I. *SERIES I: REPORTS, NOTES, AND CORRESPONDENCE, 1970-1997 (bulk dates: 1970-1997)*

Arranged numerically, with file numbers corresponding to park accession numbers, and thereunder arranged by subject.

Correspondence, final reports, draft reports, progress reports, trip reports, field notes, inventories, worksheets, photo logs, specimen logs, budgets, contracts, artifact analysis forms, stratigraphic profiles, and other papers relating to archeological projects at Andersonville NHS. Included are project files on surveys and tests prior to proposed construction activities, 106 compliance surveys, archeological monitoring, test excavations, and investigations of various locations throughout the park.

II. *SERIES II: STILL PICTURES, 1970-1997 (bulk dates: 1970-1997)*

Arranged by type (negatives, prints, slides), and thereunder by park accession number.

Black & white and color negatives, prints, and slides, relating to excavations, surveys, and other archeological projects at Andersonville NHS.

III. *SERIES III: MAPS, 1970-1997 (bulk dates: 1970-1997)*

Arranged by park accession number.

Maps, topographic maps, base maps, sketch maps, field maps, site plans, feature plans, grids, drawings, and tables showing artifact distribution by unit and level, relating to archeological surveys, excavations, and investigations at Andersonville NHS.

FILE UNIT DESCRIPTIONS

SERIES I: REPORTS, NOTES, AND CORRESPONDENCE

0001. ANDE 00062: SURVEY AND TESTING, 1977-1990
Cultural Resources inventory, conducted between January and June 1978, to locate and identify archeological features associated with Andersonville Prison and prehistoric sites on ANDE property. Survey carried out preparatory to proposed improvements to maintenance facilities and visitor support facilities outlined in General Management Plan, and other proposed development outlined in the Development Concept plan. Areas tested: Aboriginal site, Inner Stockade, North Gate, Middle Stockade, South Gate, Shed Hospital, Bake House, and development areas. Principal investigator: Ellen Ehrenhard, SEAC.

0002. ANDE 00166: SOIL RESISTIVITY STUDY OF THE HOSPITAL SITE, 1985-1992
Soil resistivity survey conducted at the Hospital Site by Rochelle Marrinan (Florida State University) and Kenneth S. Wild, Jr. (SEAC), July 1985.

0003. ANDE 00276: INVESTIGATIONS OF NORTHEAST CORNER FOR RECONSTRUCTION OF STOCKADE AND DEADLINE (WALKER 1987), 1986-1992
Archeological investigations of the Northeast Corner of the Stockade and Deadline, to determine the impact of reconstruction on the Stockade, conducted by John W. Walker of SEAC.

0004. ANDE 00322: INVESTIGATIONS OF NORTH GATE, 1989-1991
Archeological investigations of North Gate area, conducted in May-June 1989 by Guy Prentice, SEAC.

0005. ANDE 00355: INVESTIGATION OF SOUTHEAST CORNER OF THE INNER STOCKADE, 1990
Archeological investigation of Southeast Corner of the Inner Stockade, conducted by Guy Prentice (SEAC). The study located the Southeast Corner and an escape tunnel, and investigated units CC and DD (both of which were excavated previously by Ellen Ehrenhard).

0006. ANDE 00378: SURVEY FOR VISITOR CENTER AND ROAD, 1990-1991

Archeological survey for a visitor center and road, conducted February 1990 and September 1990 by Elizabeth A. Horvath (SEAC). Included shovel testing in area of proposed visitor center and parking lot, shovel testing in Pecan Lane area, and test trenches for entrance road.

0007. ANDE 00379: COOKHOUSE LOCATION STUDY, 1989-1994

Investigation to determine location of cookhouse, prior to construction of Visitors Center. Initial walkover conducted by Richard Faust of SEAC; full investigation conducted by Elizabeth Horvath of SEAC. Study failed to reveal the location of the cookhouse.

0008. ANDE 00409: INVESTIGATION FOR A NEW DRAIN LINE, 1991-1992

Archeological investigation for new drain line in area of North Gate, to replace 1930s era drain line installed by Civilian Conservation Corps. Project conducted by John E. Cornelison (SEAC).

0009. ANDE 00429: SECTION 106 COMPLIANCE SURVEY FOR MAINTENANCE BUILDING, 1976

Survey conducted as part of Section 106 compliance for maintenance building. The clearance effort concentrated on park property beyond boundaries of the fort, and revealed the location of a prehistoric site. Principal investigator: R. Faust, SEAC.

0010. ANDE 00430: TEST EXCAVATIONS AT STOCKADE, 1973-1977

Archeological testing in the stockade area by Lewis H. Larson, Jr., and Morgan Ray Crook, Jr., of West Georgia College, under NPS contract no. CX500031635. Objectives of the investigation were to locate and record prison features and to provide preliminary details of construction techniques.

0011. ANDE 00431: HISTORIC STRUCTURES REPORT, 1970

Historic Structures Report by Andersonville Superintendent Edwin S. Bearss.

0012. ANDE 00432: GUNBOAT STREET AND CEMETERY SECTION "P" CLEARANCE PROJECT, 1981

Archeological Clearance Project at Gunboat Street and Cemetery Section "P," conducted by Ellen Ehrenhard (SEAC).

0013. ANDE 00433: SURVEY OF TRACT 01-142 (1983), 1981-1985
Archeological survey of surplus parcel (Tract 01-142), conducted in August 1983 by Teresa Paglione and Richard Johnson of SEAC. The survey revealed the Civil War era Old Dixie Highway, the entrance road to the National Cemetery (ca. 1870-1932), and the Civilian Conservation Corps camp (1934-36).

0014. ANDE 00434: MONITORING OF PROVIDENCE SPRING PARKING AREA, 1986
Monitoring of Providence Spring Parking Area, overseen by John W. Walker (SEAC).

0015. ANDE 00435: MONITORING OF SEPTIC TANK AND DRAIN FIELD AT P.O.W. MUSEUM, 1986
Monitoring of septic tank and drain field area at Prisoner of War Museum. Project archeologist: Allen Cooper, SEAC.

0016. ANDE 00436: MONITORING OF HANDICAP ACCESS RAMPS AT SEXTANT'S HOUSE, 1988
Archeological monitoring of Handicap Access Ramps at the Sextant's House (also referred to as the Cemetery Lodge), conducted in November 1988 by Andrea C. Repp of SEAC.

0017. ANDE 00481: INVESTIGATIONS FOR NEW ENTRANCE ROAD AND VISITORS CENTER, 1993, 1993-1994
Archeological investigations for new entrance road and visitors center, involving shovel tests carried out in December 1993. Principal investigator: John Cornelison (SEAC).

0018. ANDE 00542: CEMETERY EXPANSION (SECTION "J"), 1996-1997
Archeological testing in area of proposed cemetery expansion (Cemetery, Section "J"). Principal investigator: John Cornelison, SEAC.

THE FREEDOM OF INFORMATION ACT

5 U.S.C. § 552

As Amended in 2002

§ 552. Public information; agency rules, opinions, orders, records, and proceedings

(a) Each agency shall make available to the public information as follows:

(1) Each agency shall separately state and currently publish in the Federal Register for the guidance of the public--

(A) descriptions of its central and field organization and the established places at which, the employees (and in the case of a uniformed service, the members) from whom, and the methods whereby, the public may obtain information, make submittals or requests, or obtain decisions;

(B) statements of the general course and method by which its functions are channeled and determined, including the nature and requirements of all formal and informal procedures available;

(C) rules of procedure, descriptions of forms available or the places at which forms may be obtained, and instructions as to the scope and contents of all papers, reports, or examinations;

(D) substantive rules of general applicability adopted as authorized by law, and statements of general policy or interpretations of general applicability formulated and adopted by the agency; and

(E) each amendment, revision, or repeal of the foregoing

Except to the extent that a person has actual and timely notice of the terms thereof, a person may not in any manner be required to resort to, or be adversely affected by, a matter required to be published in the Federal Register and not so published. For the purpose of this paragraph, matter reasonably available to the class of persons affected thereby is deemed published in the Federal Register when incorporated by reference therein with the approval of the Director of the Federal Register.

(2) Each agency, in accordance with published rules, shall make available for public inspection and copying--

(A) final opinions, including concurring and dissenting opinions, as well as orders, made in the adjudication of cases;

(B) those statements of policy and interpretations which have been adopted by the agency and are not published in the Federal Register;

(C) administrative staff manuals and instructions to staff that affect a member of the public;

(D) copies of all records, regardless of form or format, which have been released to any person under paragraph (3) and which, because of the nature of their subject matter, the agency determines have become or are likely to become the subject of subsequent requests for substantially the same records; and

Figure D.7 Freedom of Information Act

unless the materials are promptly published and copies offered for sale. For records created on or after November 1, 1996, within one year after such date, each agency shall make such records available, including by computer telecommunications or, if computer telecommunications means have not been established by the agency, by other electronic means. To the extent required to prevent a clearly unwarranted invasion of personal privacy, an agency may delete identifying details when it makes available or publishes an opinion, statement of policy, interpretation, staff manual, instruction, or copies of records referred to in subparagraph (D). However, in each case the justification for the deletion shall be explained fully in writing, and the extent of such deletion shall be indicated on the portion of the record which is made available or published, unless including that indication would harm an interest protected by the exemption in subsection (b) under which the deletion is made. If technically feasible, the extent of the deletion shall be indicated at the place in the record where the deletion was made. Each agency shall also maintain and make available for public inspection and copying current indexes providing identifying information for the public as to any matter issued, adopted, or promulgated after July 4, 1967, and required by this paragraph to be made available or published. Each agency shall promptly publish, quarterly or more frequently, and distribute (by sale or otherwise) copies of each index or supplements thereto unless it determines by order published in the Federal Register that the publication would be unnecessary and impracticable, in which case the agency shall nonetheless provide copies of an index on request at a cost not to exceed the direct cost of duplication. Each agency shall make the index referred to in subparagraph (E) available by computer telecommunications by December 31, 1999. A final order, opinion, statement of policy, interpretation, or staff manual or instruction that affects a member of the public may be relied on, used, or cited as precedent by an agency against a party other than an agency only if--

(i) it has been indexed and either made available or published as provided by this paragraph; or

(ii) the party has actual and timely notice of the terms thereof.

(3)(A) Except with respect to the records made available under paragraphs (1) and (2) of this subsection, and except as provided in subparagraph (E), each agency, upon any request for records which (i) reasonably describes such records and (ii) is made in accordance with published rules stating the time, place, fees (if any), and procedures to be followed, shall make the records promptly available to any person.

(B) In making any record available to a person under this paragraph, an agency shall provide the record in any form or format requested by the person if the record is readily reproducible by the agency in that form or format. Each agency shall make reasonable efforts to maintain its records in forms or formats that are reproducible for purposes of this section.

(C) In responding under this paragraph to a request for records, an agency shall make reasonable efforts to search for the records in electronic form or format, except when such efforts would significantly interfere with the operation of the agency's automated information system.

(D) For purposes of this paragraph, the term "search" means to review, manually or by automated means, agency records for the purpose of locating those records which are responsive to a request.

(E) An agency, or part of an agency, that is an element of the intelligence community (as that term is defined in section 3(4) of the National Security Act of 1947 (50 U.S.C. 401a(4))) shall not make any record available under this paragraph to--

Figure D.7 continued

(i) any government entity, other than a State, territory, commonwealth, or district of the United States, or any subdivision thereof; or

(ii) a representative of a government entity described in clause (i).

(4)(A)(i) In order to carry out the provisions of this section, each agency shall promulgate regulations, pursuant to notice and receipt of public comment, specifying the schedule of fees applicable to the processing of requests under this section and establishing procedures and guidelines for determining when such fees should be waived or reduced. Such schedule shall conform to the guidelines which shall be promulgated, pursuant to notice and receipt of public comment, by the Director of the Office of Management and Budget and which shall provide for a uniform schedule of fees for all agencies.

(ii) Such agency regulations shall provide that--

(I) fees shall be limited to reasonable standard charges for document search, duplication, and review, when records are requested for commercial use;

(II) fees shall be limited to reasonable standard charges for document duplication when records are not sought for commercial use and the request is made by an educational or noncommercial scientific institution, whose purpose is scholarly or scientific research; or a representative of the news media; and

(III) for any request not described in (I) or (II), fees shall be limited to reasonable standard charges for document search and duplication.

(iii) Documents shall be furnished without any charge or at a charge reduced below the fees established under clause (ii) if disclosure of the information is in the public interest because it is likely to contribute significantly to public understanding of the operations or activities of the government and is not primarily in the commercial interest of the requester.

(iv) Fee schedules shall provide for the recovery of only the direct costs of search, duplication, or review. Review costs shall include only the direct costs incurred during the initial examination of a document for the purposes of determining whether the documents must be disclosed under this section and for the purposes of withholding any portions exempt from disclosure under this section. Review costs may not include any costs incurred in resolving issues of law or policy that may be raised in the course of processing a request under this section. No fee may be charged by any agency under this section--

(I) if the costs of routine collection and processing of the fee are likely to equal or exceed the amount of the fee; or

(II) for any request described in clause (ii)(II) or (III) of this subparagraph for the first two hours of search time or for the first one hundred pages of duplication.

(v) No agency may require advance payment of any fee unless the requester has previously failed to pay fees in a timely fashion, or the agency has determined that the fee will exceed $250.

(vi) Nothing in this subparagraph shall supersede fees chargeable under a statute specifically providing for setting the level of fees for particular types of records.

Figure D.7 continued

(vii) In any action by a requester regarding the waiver of fees under this section, the court shall determine the matter de novo, provided that the court's review of the matter shall be limited to the record before the agency.

(B) On complaint, the district court of the United States in the district in which the complainant resides, or has his principal place of business, or in which the agency records are situated, or in the District of Columbia, has jurisdiction to enjoin the agency from withholding agency records and to order the production of any agency records improperly withheld from the complainant. In such a case the court shall determine the matter de novo, and may examine the contents of such agency records in camera to determine whether such records or any part thereof shall be withheld under any of the exemptions set forth in subsection (b) of this section, and the burden is on the agency to sustain its action. In addition to any other matters to which a court accords substantial weight, a court shall accord substantial weight to an affidavit of an agency concerning the agency's determination as to technical feasibility under paragraph (2)(C) and subsection (b) and reproducibility under paragraph (3)(B).

(C) Notwithstanding any other provision of law, the defendant shall serve an answer or otherwise plead to any complaint made under this subsection within thirty days after service upon the defendant of the pleading in which such complaint is made, unless the court other wise directs for good cause is shown.

(D) Repealed by Pub. L. 98-620, Title IV, 402(2), Nov. 8, 1984, 98 Stat. 3335, 3357.

(E) The court may assess against the United States reasonable attorney fees and other litigation costs reasonably incurred in any case under this section in which the complainant has substantially prevailed.

(F) Whenever the court orders the production of any agency records improperly withheld from the complainant and assesses against the United States reasonable attorney fees and other litigation costs, and the court additionally issues a written finding that the circumstances surrounding the withholding raise questions whether agency personnel acted arbitrarily or capriciously with respect to the withholding, the Special Counsel shall promptly initiate a proceeding to determine whether disciplinary action is warranted against the officer or employee who was primarily responsible for the withholding. The Special Counsel, after investigation and consideration of the evidence submitted, shall submit his findings and recommendations to the administrative authority of the agency concerned and shall send copies of the findings and recommendations to the officer or employee or his representative. The administrative authority shall take the corrective action that the Special Counsel recommends.

(G) In the event of noncompliance with the order of the court, the district court may punish for contempt the responsible employee, and in the case of a uniformed service, the responsible member.

(5) Each agency having more than one member shall maintain and make available for public inspection a record of the final votes of each member in every agency proceeding.

(6)(A) Each agency, upon any request for records made under paragraph (1), (2), or (3) of this subsection, shall--

Figure D.7 continued

(i) determine within twenty days (excepting Saturdays, Sundays, and legal public holidays) after the receipt of any such request whether to comply with such request and shall immediately notify the person making such request of such determination and the reasons therefor, and of the right of such person to appeal to the head of the agency any adverse determination; and

(ii) make a determination with respect to any appeal within twenty days (excepting Saturdays, Sundays, and legal public holidays) after the receipt of such appeal. If on appeal the denial of the request for records is in whole or in part upheld, the agency shall notify the person making such request of the provisions for judicial review of that determination under paragraph (4) of this subsection.

(B)(i) In unusual circumstances as specified in this subparagraph, the time limits prescribed in either clause (i) or clause (ii) of subparagraph (A) may be extended by written notice to the person making such request setting forth the unusual circumstances for such extension and the date on which a determination is expected to be dispatched. No such notice shall specify a date that would result in an extension for more than ten working days, except as provided in clause (ii) of this subparagraph.

(ii) With respect to a request for which a written notice under clause (i) extends the time limits prescribed under clause (i) of subparagraph (A), the agency shall notify the person making the request if the request cannot be processed within the time limit specified in that clause and shall provide the person an opportunity to limit the scope of the request so that it may be processed within that time limit or an opportunity to arrange with the agency an alternative time frame for processing the request or a modified request. Refusal by the person to reasonably modify the request or arrange such an alternative time frame shall be considered as a factor in determining whether exceptional circumstances exist for purposes of subparagraph (C).

(iii) As used in this subparagraph, "unusual circumstances" means, but only to the extent reasonably necessary to the proper processing of the particular requests--

(I) the need to search for and collect the requested records from field facilities or other establishments that are separate from the office processing the request;

(II) the need to search for, collect, and appropriately examine a voluminous amount of separate and distinct records which are demanded in a single request; or

(III) the need for consultation, which shall be conducted with all practicable speed, with another agency having a substantial interest in the determination of the request or among two or more components of the agency having substantial subject matter interest therein.

(iv) Each agency may promulgate regulations, pursuant to notice and receipt of public comment, providing for the aggregation of certain requests by the same requestor, or by a group of requestors acting in concert, if the agency reasonably believes that such requests actually constitute a single request, which would otherwise satisfy the unusual circumstances specified in this subparagraph, and the requests involve clearly related matters. Multiple requests involving unrelated matters shall not be aggregated.

Figure D.7 continued

(C)(i) Any person making a request to any agency for records under paragraph (1), (2), or (3) of this subsection shall be deemed to have exhausted his administrative remedies with respect to such request if the agency fails to comply with the applicable time limit provisions of this paragraph. If the Government can show exceptional circumstances exist and that the agency is exercising due diligence in responding to the request, the court may retain jurisdiction and allow the agency additional time to complete its review of the records. Upon any determination by an agency to comply with a request for records, the records shall be made promptly available to such person making such request. Any notification of denial of any request for records under this subsection shall set forth the names and titles or positions of each person responsible for the denial of such request.

(ii) For purposes of this subparagraph, the term "exceptional circumstances" does not include a delay that results from a predictable agency workload of requests under this section, unless the agency demonstrates reasonable progress in reducing its backlog of pending requests.

(iii) Refusal by a person to reasonably modify the scope of a request or arrange an alternative time frame for processing the request (or a modified request) under clause (ii) after being given an opportunity to do so by the agency to whom the person made the request shall be considered as a factor in determining whether exceptional circumstances exist for purposes of this subparagraph.

(D)(i) Each agency may promulgate regulations, pursuant to notice and receipt of public comment, providing for multitrack processing of requests for records based on the amount of work or time (or both) involved in processing requests.

(ii) Regulations under this subparagraph may provide a person making a request that does not qualify for the fastest multitrack processing an opportunity to limit the scope of the request in order to qualify for faster processing.

(iii) This subparagraph shall not be considered to affect the requirement under subparagraph (C) to exercise due diligence.

(E)(i) Each agency shall promulgate regulations, pursuant to notice and receipt of public comment, providing for expedited processing of requests for records—

(I) in cases in which the person requesting the records demonstrates a compelling need; and

(II) in other cases determined by the agency.

(ii) Notwithstanding clause (i), regulations under this subparagraph must ensure--

(I) that a determination of whether to provide expedited processing shall be made, and notice of the determination shall be provided to the person making the request, within 10 days after the date of the request; and

(II) expeditious consideration of administrative appeals of such determinations of whether to provide expedited processing.

(iii) An agency shall process as soon as practicable any request for records to which the agency has granted expedited processing under this subparagraph. Agency action to deny or affirm denial of a request for expedited processing pursuant to this subparagraph, and failure by an agency to respond in a timely manner to such a request shall be subject to judicial review under paragraph (4), except that the judicial review shall be based on the record before the agency at the time of the determination.

Figure D.7 continued

(iv) A district court of the United States shall not have jurisdiction to review an agency denial of expedited processing of a request for records after the agency has provided a complete response to the request.

(v) For purposes of this subparagraph, the term "compelling need" means--

(I) that a failure to obtain requested records on an expedited basis under this paragraph could reasonably be expected to pose an imminent threat to the life or physical safety of an individual; or

(II) with respect to a request made by a person primarily engaged in disseminating information, urgency to inform the public concerning actual or alleged Federal Government activity.

(vi) A demonstration of a compelling need by a person making a request for expedited processing shall be made by a statement certified by such person to be true and correct to the best of such person's knowledge and belief.

(F) In denying a request for records, in whole or in part, an agency shall make a reasonable effort to estimate the volume of any requested matter the provision of which is denied, and shall provide any such estimate to the person making the request, unless providing such estimate would harm an interest protected by the exemption in subsection (b) pursuant to which the denial is made.

(b) This section does not apply to matters that are--

(1)(A) specifically authorized under criteria established by an Executive order to be kept secret in the interest of national defense or foreign policy and (B) are in fact properly classified pursuant to such Executive order;

(2) related solely to the internal personnel rules and practices of an agency;

(3) specifically exempted from disclosure by statute (other than section 552b of this title), provided that such statute (A) requires that the matters be withheld from the public in such a manner as to leave no discretion on the issue, or (B) establishes particular criteria for withholding or refers to particular types of matters to be withheld;

(4) trade secrets and commercial or financial information obtained from a person and privileged or confidential;

(5) inter-agency or intra-agency memorandums or letters which would not be available by law to a party other than an agency in litigation with the agency;

(6) personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy;

Figure D.7 continued

(7) records or information compiled for law enforcement purposes, but only to the extent that the production of such law enforcement records or information (A) could reasonably be expected to interfere with enforcement proceedings, (B) would deprive a person of a right to a fair trial or an impartial adjudication, (C) could reasonably be expected to constitute an unwarranted invasion of personal privacy, (D) could reasonably be expected to disclose the identity of a confidential source, including a State, local, or foreign agency or authority or any private institution which furnished information on a confidential basis, and, in the case of a record or information compiled by a criminal law enforcement authority in the course of a criminal investigation or by an agency conducting a lawful national security intelligence investigation, information furnished by a confidential source, (E) would disclose techniques and procedures for law enforcement investigations or prosecutions, or would disclose guidelines for law enforcement investigations or prosecutions if such disclosure could reasonably be expected to risk circumvention of the law, or (F) could reasonably be expected to endanger the life or physical safety of any individual;

(8) contained in or related to examination, operating, or condition reports prepared by, on behalf of, or for the use of an agency responsible for the regulation or supervision of financial institutions; or

(9) geological and geophysical information and data, including maps, concerning wells.

Any reasonably segregable portion of a record shall be provided to any person requesting such record after deletion of the portions which are exempt under this subsection. The amount of information deleted shall be indicated on the released portion of the record, unless including that indication would harm an interest protected by the exemption in this subsection under which the deletion is made. If technically feasible, the amount of the information deleted shall be indicated at the place in the record where such deletion is made.

(c)(1) Whenever a request is made which involves access to records described in subsection (b)(7)(A) and--

(A) the investigation or proceeding involves a possible violation of criminal law; and

(B) there is reason to believe that (i) the subject of the investigation or proceeding is not aware of its pendency, and (ii) disclosure of the existence of the records could reasonably be expected to interfere with enforcement proceedings, the agency may, during only such time as that circumstance continues, treat the records as not subject to the requirements of this section.

(2) Whenever informant records maintained by a criminal law enforcement agency under an informant's name or personal identifier are requested by a third party according to the informant's name or personal identifier, the agency may treat the records as not subject to the requirements of this section unless the informant's status as an informant has been officially confirmed.

(3) Whenever a request is made which involves access to records maintained by the Federal Bureau of Investigation pertaining to foreign intelligence or counterintelligence, or international terrorism, and the existence of the records is classified information as provided in subsection (b)(1), the Bureau may, as long as the existence of the records remains classified information, treat the records as not subject to the requirements of this section.

(d) This section does not authorize the withholding of information or limit the availability of records to the public, except as specifically stated in this section. This section is not authority to withhold information from Congress.

Figure D. 7 continued

(e)(1) On or before February 1 of each year, each agency shall submit to the Attorney General of the United States a report which shall cover the preceding fiscal year and which shall include--

(A) the number of determinations made by the agency not to comply with requests for records made to such agency under subsection (a) and the reasons for each such determination;

(B)(i) the number of appeals made by persons under subsection (a)(6), the result of such appeals, and the reason for the action upon each appeal that results in a denial of information; and

(ii) a complete list of all statutes that the agency relies upon to authorize the agency to withhold information under subsection (b)(3), a description of whether a court has upheld the decision of the agency to withhold information under each such statute, and a concise description of the scope of any information withheld;

(C) the number of requests for records pending before the agency as of September 30 of the preceding year, and the median number of days that such requests had been pending before the agency as of that date;

(D) the number of requests for records received by the agency and the number of requests which the agency processed;

(E) the median number of days taken by the agency to process different types of requests;

(F) the total amount of fees collected by the agency for processing requests; and

(G) the number of full-time staff of the agency devoted to processing requests for records under this section, and the total amount expended by the agency for processing such requests.

(2) Each agency shall make each such report available to the public including by computer telecommunications, or if computer telecommunications means have not been established by the agency, by other electronic means.

(3) The Attorney General of the United States shall make each report which has been made available by electronic means available at a single electronic access point. The Attorney General of the United States shall notify the Chairman and ranking minority member of the Committee on Government Reform and Oversight of the House of Representatives and the Chairman and ranking minority member of the Committees on Governmental Affairs and the Judiciary of the Senate, no later than April 1 of the year in which each such report is issued, that such reports are available by electronic means.

(4) The Attorney General of the United States, in consultation with the Director of the Office of Management and Budget, shall develop reporting and performance guidelines in connection with reports required by this subsection by October 1, 1997, and may establish additional requirements for such reports as the Attorney General determines may be useful.

Figure D.7 continued

(5) The Attorney General of the United States shall submit an annual report on or before April 1 of each calendar year which shall include for the prior calendar year a listing of the number of cases arising under this section, the exemption involved in each case, the disposition of such case, and the cost, fees, and penalties assessed under subparagraphs (E), (F), and (G) of subsection (a)(4). Such report shall also include a description of the efforts undertaken by the Department of Justice to encourage agency compliance with this section.

(f) For purposes of this section, the term--

(1) "agency" as defined in section 551(1) of this title includes any executive department, military department, Government corporation, Government controlled corporation, or other establishment in the executive branch of the Government (including the Executive Office of the President), or any independent regulatory agency; and

(2) "record" and any other term used in this section in reference to information includes any information that would be an agency record subject to the requirements of this section when maintained by an agency in any format, including an electronic format.

(g) The head of each agency shall prepare and make publicly available upon request, reference material or a guide for requesting records or information from the agency, subject to the exemptions in subsection (b), including--

(1) an index of all major information systems of the agency;

(2) a description of major information and record locator systems maintained by the agency; and

(3) a handbook for obtaining various types and categories of public information from the agency pursuant to chapter 35 of title 44, and under this section.

Copyright and Privacy Restrictions

The copyright law of the United States (Title 17, *United States Code*) governs the making of photocopies or other reproductions of copyrighted materials. The various state privacy acts govern the use of materials that document private individuals, groups, and corporations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a reproduction if the document does not infringe the privacy rights of an individual, group, or corporation. These specified conditions of authorized use include:

- · non-commercial and non-profit study, scholarship, or research, or teaching
- · criticism, commentary, or news reporting
- · as a NPS preservation or security copy
- · as a research copy for deposit in another institution

If I, the researcher, later use a copy or reproduction for purposes in excess of "fair use," I, the researcher, am personally liable for copyright, privacy, or publicity infringement and agrees to indemnify the NPS from any legal action as a result of the error. The [Park's] permission to obtain a photographic, xerographic, digital, or other copy of a document **doesn't** indicate permission to publish, exhibit, perform, reproduce, sell, distribute, or prepare derivative works from this document without first obtaining permission from the copyright holder and from any private individual, group, or corporation shown or otherwise recorded.

Permission to publish, exhibit, perform, reproduce, prepare derivative works from, sell, or otherwise distribute the item must be obtained by the researcher separately in writing from the holder of the original copyright (or if the creator is dead from his/her heirs) as well as from any individual(s), groups, or corporations whose name, image, recorded words, or private information (e.g., employment information) may be reproduced in the source material. The holder of the original copyright **isn't** necessarily the National Park Service. The National Park Service is not legally liable for copyright, privacy, or publicity infringement when materials are wrongfully used after being provided to researchers for "fair use."

This institution reserves the right to refuse to accept a copying order if fulfillment of the order is judged in violation of copyright or federal or state privacy or publicity law. This institution also places restrictions on the use of cameras, photocopiers, and scanners in the research room.

I, the researcher, understand and agree to the above terms and will indemnify, defend, save, and hold the National Park Service harmless from all claims, demands, losses, or damages (including attorney's fees and expenses) arising out of any legal action, settlement, or adjustment resulting from my not having followed the guidelines provided above.

Access Policies and Rules Governing Use
[Name of Park]

Availability

Researchers are encouraged to complete their preliminary research at archives and libraries with a broader topical focus before approaching the holdings of the [Park]. NPS has limited reference staff and research resources that must be made available to researchers whose work focuses on materials available only at the [Park]. Access to materials is dependent upon their physical condition and the level of processing to-date by the NPS. All research must be done on-site in the research room.

Access

- Researchers should submit a written request to the curatorial office, detailing their research project to the curatorial staff.
- Requests for materials should be submitted with enough lead time to allow for the evaluation of the request and the scheduling of curatorial staff to oversee the research.
- All research requests should be addressed to:
  Curatorial Office, [Park], [Street Address]
- Approval of all requests will be based on availability of curatorial staff to supervise researchers.
- The curatorial staff at [Park] requests that the researcher read the abstracts in the archival guide or finding aids before requesting to view any collection of documents.
- To ensure the conservation and security of this resource, browsing is not permitted.

Citations

- When crediting the park, list "National Park Service"; the full park name; collection title; the catalog, box, folder, and image numbers; and credit the creator of the item (e.g., photographer).

Reading Room Rules

- Only lead pencils, not pens or markers, may be used for note taking.
- Scanners, portable photocopy machines, and cameras (including digital cameras) are pro hibited to avoid damage to materials and copyright infringement.
- Use of tape recorders, typewriters, and portable computers is subject to security procedures. Use of any equipment must not bother other researchers.
- No food, beverages, or smoking will be allowed in the reading room area.
- No coats, packages, containers, folders, cases (including briefcases), or bags (including handbags larger than wallets) are permitted in the reading room area.
- Copying is available within reasonable limits at 25 cents per page.
- The reading room will close if no supervisory staff is available.
- Researchers must maintain quiet in the reading room.
- Researchers register annually and must sign in and out each time they enter or leave.

Figure D.10 Access Policies and Rules Governing Use (Sample)

Access Policies and Rules Governing Use
[Name of Park]

Reading Room Rules (continued)

- Researchers may not remove any archival or manuscript materials from the reading room.
- Researchers may work with archival or manuscript materials only in the reading room, not in museum storage or staff work spaces.
- Researchers must submit prepaid written requests for copies or duplicates.
- Researchers must submit for inspection all materials carried into and out of the reading room.
- The park reserves the right to limit access to fragile or restricted collections.
- The park archives is not a lending library. All materials must be used in the reading room.
- Researchers will work with only one document from one folder from one box of materials at a time to avoid damaging a collection's original order.
- Researchers who disregard these rules or endanger the records or the work of others will be denied access.

Permission to obtain a copy for scholarly purposes does not constitute permission to publish

[See Copyright and Privacy Restrictions Statement.]

Handling

- When handling the archival and manuscript materials, only one folder may be removed from a box at a time, and folders must be laid flat on the table.
- Documents should be handled with utmost care and viewed only one at a time.
- Manuscripts and books may not be leaned on, written on, folded, traced over, or handled in any manner that may damage them.
- Researchers must maintain the original order of documents within their folders. Attending staff should be contacted if there is any sign of damage or if items appear to be out of order.
- No attempt should be made to reorder or rearrange the documents or folders or to repair any physical damage.
- Cotton gloves must be used when handling photographic images.
- Only one box or volume of material will be issued at one time.
- Latex gloves must be worn when working with materials that may pose a health hazard.

I understand the rules listed above and will abide by them.

Figure D.11 Researcher Duplication Form

Appendix E: Archeology

APPENDIX E: ARCHEOLOGY

A. Archeology Classification

1. *When do I classify objects as archeology?*

Use the archeology classification for all objects that were recovered as a result of a systematic investigation using archeological techniques. They may come from dry land or underwater excavations. You should also catalog isolated surface finds as archeology.

> ***Catalog associated archeological field records as archival and manuscript collections. Process them according to the procedures in Appendix D of this handbook. Cross-reference the records and objects.***

2. *How do I classify archeology objects?*

Classify archeology objects according to general time period and material of manufacture. The time period is divided into prehistoric (before European contact) or historic (after European contact). Historic archeological objects may have originated from known Native American groups or Anglo-European/Eurasian peoples.

The NPS classification for archeological objects has four lines. You must complete all four lines of the classification.

- line one is the discipline (archeology)
- line two is the time period based on European contact (prehistoric, historic, or unknown)
- line three is a broad class of material, such as mineral or vegetal
- line four is a specific class of material that is a subset of the material on line three, such as stone or wood

Example:	Archeology	Archeology
	Prehistoric	Historic
	Mineral	Vegetal
	Ceramic	Wood

3. *Can I make changes to the classification?*

No. The four-line classification for archeology appears in locked tables in ANCS+. You can't make changes to these tables.

Refer to Section I of Chapter 2 in the *ANCS+ User Manual* for instructions on using ANCS+ to classify and catalog archeological collections.

4. *What if the object consists of more than one material?*

Many objects are made of more than one material. Classify these objects by:

- predominant manufacture material on classification line 3, and entering only one term on classification line 4, *or*
- entering "Composite" on classification line 3, and entering more than one type of material on classification line 4

For example, you could classify a stone axe with a wooden handle using the predominant material or as a composite of stone and wood. Using the predominant material, classification lines 3 and 4 would be:

Line 3:Mineral
Line 4:Stone

Using Composite as the line 3 entry, classification lines 3 and 4 would be:

Line 3:Composite
Line 4: Stone -- Wood

5. *How should I catalog floral and faunal specimens that are recovered in an archeological excavation?*

Catalog floral and faunal specimens recovered in an archeological excavation as archeology. Enter the genus and species on the catalog record, if known. Choose a field where you will enter these data consistently for all specimens.

6. *What are the classification terms for the archeology classification?*

Use the following information in the four classification lines in ANCS+.

Classification Line 1

Archeology

Classification Line 2

Use one of these terms:

Historic	(period after European contact)
Prehistoric	(period before European contact)
Unknown	(unknown at this time)

Classification Line 3

Use one of these terms:

Animal
Composite
Human Remains
Mineral
Unidentified Material
Vegetal

Note: For an object made of more than one material, use either the predominant material or Composite. See Section A.4 above.

Classification Line 4

Classification line 4 terms are dependent on classification line 3 terms.

For Animal, choose one of the following:

Antler	
Bone	(includes teeth, carapace, fish scales)
Coral	
Feather	
Hair	
Hide	(includes skin, fur, hair, leather, sinew gut, etc.)
Horn	
Ivory	
Other Animal Materials	
Quill	
Shell	

For Composite, choose one of the following:

Antler
Artifactual
Bone
Ceramic
Clay
Coral
Feather
Fibers
Glass
Hair
Hide
Horn
Ivory
Metal
Mud
Mummified
Osteological
Other Animal Materials
Other Human Remains
Other Mineral Materials
Other Plant Materials
Paper
Quill
Reeds
Shell
Soil
Stone
Synthetic
Unidentified
Unknown
Wood

For Human Remains, choose one of the following:

Artifactual (any artifacts made from human remains)
Mummified (includes fortuitous desiccation)
Osteological
Other Human Remains

For Mineral, choose one of the following:

Ceramic
Clay
Glass
Metal
Mud
Other Mineral Materials
Soil
Stone
Synthetic

Note: Ceramic is fired. Clay, Mud, and Soil are unfired.

For Vegetal, choose one of the following:

Fibers
Other Plant Materials(includes gourds, stems, leaves)
Paper
Reeds
Wood (includes twigs, bark)

For Unidentified Material, choose:

Unidentified

B. Archeology Object Names

1. *How do I name archeolgoy objects?*

There is no required lexicon for naming archeology objects. ANCS+ has an Object field, an Alternate Name field, and a Revised Nomenclature field for entering object names. You must complete the Object field. The other two fields are optional.

To name an object, use:

- a park-specific object name list
- the object name list for prehistoric material in Section E of this appendix
- a list of object names from an NPS center, such as the Southeast Archeological Center (SEAC) or the Western Archeological and Conservation Center (WACC)
- *The Revised Nomenclature for Museum Cataloging (Revised Nomenclature)* for a list of suggested object names for historic material

If you are unsure of which list to use, contact your regional/support office curator or regional archeologist.

Note: If your region has an NPS archeological center**,** it's a good idea to get a list of names from the center. The center's list will include the types of material in your region. Using a center's list will also help keep names consistent within the region.

Be consistent when naming objects. Consistency will give you and others better access to the data in your collection.

2. *Does ANCS+ include a table of object names for archeology?*

No. The ANCS+ Object field is a user-built table for archeology. You can enter the names you want for your site. You may have entries in this table from your ANCS conversion. The program built a table from the archeology entries on your old ANCS records. Check this table to make sure that names are consistent. You can add, modify, and delete entries as needed.

C. Cataloging Archeology

1. *Where can I find the guidelines for cataloging archeology objects?*

Refer to Chapter 3 in this handbook for general guidelines on cataloging. Refer to Section I of Chapter 2 in the *ANCS+ User Manual* for field-by-field instructions for cataloging archeology objects in ANCS+.

2. *Are there specific cataloging requirements for archeology?*

Yes. Provenience data are mandatory for archeology objects. You must enter data in one of the following fields:

- Field Site Number
- State Site Number
- Site Name
- Within Site Provenience

ANCS+ will enter Not Provided in all these fields if you don't complete at least one of them.

Note: A list of within site provenience terms and abbreviations appears in Section D of this appendix.

3. *What are the ANCS+ discipline-specific fields for archeology?*

The following list of fields appears on the archeology discipline-specific screen in ANCS+. None of these fields are mandatory.

Collector
    Collection Date
    Collector
Color
Decorative Motif
Decorative Technique
Field Specimen Number
Makers Mark
Manufacturing Technique
Object Form
Object Part
Previous Catalog Number
Revised Nomenclature
Temper
Type Name

Note: These fields don't print on the paper Museum Catalog Record, Form 10-254 Rev.. You can print the data from these fields using the All Fields report in ANCS+.

D. Within Site Provenience Abbreviations

Some common within site provenience terms and abbreviations appear below.

Term(s)	Abbreviations
Above mean sea level	AMSL
Alcove	ALC
Antechamber	ACHBR
Area	AREA
Ashpit	ASHP
Associated with	ASSOC
Back	BK
Backdirt	BKD or BKDT
Bedrock	BDRK

E. Archeology Object Name List

The following list of object names is adapted from the Arizona State Museum. It gives examples of object names for prehistoric objects. It is not a definitive lexicon of acceptable object names. Refer to Section B.1 for information on object names.

Abrader
Adobe
Adze Blade
Adze Head
Antler Artifact
Apache Tear
Apron
Armor Slat
Arrow
Arrow Foreshaft
Arrow Shaft
Atlatl
Atlatl Foreshaft
Atlatl Shaft
Awl
Axe

Bag
Bag Handle
Bag, Apron
Bag, Awl
Bag, Pipe
Ball
Band
Basket
Basket, Burden
Basketry Fragment
Basketry Fragment, Cord
Basketry Fragment, Sherd

Vessel
Vessel, Effigy

Weaving Stick
Whetstone
Whistle
Wig/Cord
Winged Object
Wood Artifact
Wristlet

Yarn
Yarn/Cord
Yucca Knot
Yucca Knot/Raw Material

Appendix F: Ethnology

APPENDIX F: ETHNOLOGY

A. Ethnology Classification

1. *When do I classify objects as ethnology?*

Use the ethnology classification for objects produced by or associated with Native Americans or other indigenous peoples from contemporary cultures. Most NPS ethnographic collections are from Native American, Polynesian, or Micronesian peoples who:

- have occupied an area within a park, *or*
- have some other present or past park association

Note: Classify all objects recovered by archeological means as archeology.

Catalog the associated records that document the collection and study of ethnographic collections as archival and manuscript collections. Process them according to the procedures in Appendix D of this handbook. Cross-reference the records and objects.

2. *How do I classify ethnology objects?*

Classify ethnology objects according to the geographic cultural area, the cultural group, and material of manufacture.

The NPS classification for ethnology objects has four lines. You must complete all four lines of the classification.

- line one is the discipline (ethnology)
- line two is the geographic culture area (such as Arctic, Plains)
- line three is the cultural group within the area (such as Aleut, Kiowa)
- line four is the material from which the object is made

Example:		
	Ethnology	Ethnology
	Southwest	Northeast
	Navajo	Huron
	Clay	Plant/Stone

Note: Use the most specific cultural group known. For example, use Southen Miwok rather than Miwok.

3. *Can I make changes in the classification?*

No. The four-line classification for ethnology appears in locked tables in ANCS+. You can't make changes to these tables.

Refer to Section III of Chapter 2 in the *ANCS+ User Manual* for instructions on using ANCS+ to classify and catalog ethnology collections.

4. *What about ethnographic objects from areas outside North America and the Pacific Islands?*

NPS museum collections have few ethnographic objects from South America, Africa, and other geographic areas outside North America and the Pacific Islands. You can use the ethnology classification to catalog objects produced by indigenous peoples from these locations. The ANCS+ program:

- includes other continents as geographic areas for line two of the classification
- doesn't include cultural groups for these areas

You must use Unknown for line three of the classification, and enter the cultural group in the Cultural Identification or Culture of Use fields. If you're unsure of the cultural groups for these areas, consult G.P. Murdock's *Outline of World Cultures*, 6th Edition, 1983.

5. *How do I classify materials from Oceania?*

Use Melanesia, Micronesia and Polynesia in classification line two for the islands of Oceania. Use Island groupings, rather than specific cultural group names for classification line three. See Section D of this appendix for entries. If you know the specific island, village, or cultural group, enter it in the Additional Groups field in ANCS+.

6. *What if I'm unsure of the cultural area or cultural group?*

If you're not sure of a cultural area or cultural group, use the Possible/Probable Classification field in ANCS+. This field allows you to enter a possible or probable classification for both cultural area and cultural group. This field appears on the ethnology specialty screen.

You may also use Unknown as an entry for the cultural area and cultural group. If you're totally unsure of an entry, use Unknown.

Note: Cultural affiliation may be a sensitive issue in terms of NAGPRA. You may need to do research to prove or confirm the cultural group. Check the accession records for information. For sensitive objects, work with a NPS ethnographer on consultation strategies and identification of cultural affiliation.

7. *What if a group no longer occupies its traditional culture area?*

Many Native American peoples have been forcibly removed from their traditional homelands. For example, tribes from the Southeast have been relocated within the Plains. Classify the material culture of displaced groups within their traditional cultural area. If the object reflects influences or contacts resulting from relocation, record the appropriate cultural areas. Use the Additional Area and Additional Group fields in ANCS+ to record influence from another cultural area or group. Enter narrative information in the Description field on the catalog record.

8. *How do I classify objects affiliated with more than one group?*

Enter the primary affiliation in classification line three. Place additional cultural affiliations in the Additional Group, Cultural Identity, and Culture of Use fields in ANCS+.

9. *How do I classify Euro-American style artwork by Native Americans?*

Make decisions about this type of object on an individual basis. Living artists may have a preference as to whether they want their work to be seen as art or Native American art. In general, use the ethnology classification if you place an object in the museum collection because a recognized Native American created it.

10. *How do I classify non-indigenous tradegoods?*

You can classify trade goods such as mass-produced beads, commercially tanned leather, and brass kettles as either ethnology or history. The classification depends on who used an object. Generally, use ethnology to classify objects you collect because of their association with Native Americans or other indigenous populations. For example, use the ethnology classification when cataloging a bear trap that a Native American used. Use the history classification when cataloging an identical bear trap that a European trapper used.

11. *What are the classification terms for the ethnology classification?*

Use the following information in the four classification lines in ANCS+.

Classification Line 1

Ethnology

Classification Line 2

Select one of the culture areas from the list below.

For North America, use one of the following terms:

Culture Area	Comments
Arctic	For more specific delineation of these culture areas, consult the Smithsonian Institution's Handbook on North American Indians.
Basin	
California	
Caribbean	
Northeast	
Northwest Coast	
Plains	
Plateau	
Southeast	
Southwest	(includes Northwestern Mexico)
Subarctic	
North American Unknown	

For Oceania, use one of the following terms:

Melanesia
Micronesia
Polynesia
Oceania Unknown

For Other Areas, use one of the following terms:

Africa	
Asia	
Australia	
Central America	
Europe	
Mexico	(excludes Northwestern Mexico, see Southwest)
South America	
Other Unknown	

For Unknown Areas use Unknown.

Classification Line 3

Select one of the cultural groups from the list in Section D of this appendix. Classification line 3 terms are dependent on classification line 2 terms. Many groups are subdivisions of larger groups. Use the most specific group known.

Classification Line 4

Select one of the materials, or combination of materials, from the list below. Enter the major materials from which the object is made. Enter additional materials in the Material field on the catalog record.

Example: For a beaded, hide shirt enter Animal/Glass.
For a stone axe with a wood handle, enter Stone/Plant.

Animal	(all parts including bone, teeth, and shell)
Animal/Clay	
Animal/Glass	
Animal/Metal	
Animal/Paper	
Animal/Plant	
Animal/Stone	
Animal/Synthetic	
Animal/Unknown	
Clay	(fired/unfired clay, soil, and plaster)
Clay/Glass	
Clay/Metal	
Clay/Paper	
Clay/Plant	
Clay/Stone	
Clay/Synthetic	
Clay/Unknown	
Glass	
Glass/Metal	
Glass/Paper	
Glass/Plant	
Glass/Stone	
Glass/Synthetic	
Glass/Unknown	
Metal	(manufactured)
Metal/Paper	
Metal/Plant	
Metal/Stone	
Metal/Synthetic	
Metal/Unknown	
Paper	(particularly works of art)
Paper/Plant	
Paper/Stone	
Paper/Synthetic	
Paper/Unknown	
Plant	(all parts modified or unmodified)
Plant/Stone	
Plant/Synthetic	
Plant/Unknown	
Stone	(rock, crystal, mineral, ore…)
Stone/Synthetic	

Stone/Unknown

Synthetic
Synthetic/Unknown

Unknown

12. *What should I do about names not on the standardized classification lists in Section D?*

For cultural groups that aren't on the list, check the Smithsonian Institution's Handbook on North American Indians or other references. You should be able to place most names under a broad cultural group on the list. Check the name to see if it's out of date. For example, Moqui is an outdated term for Hopi. If the name doesn't fit under any cultural group on the list, enter "Unknown."

B. Ethnology Object Names

1. *How do I name ethnology objects?*

There is no required lexicon for naming ethnology objects. ANCS+ has an Object field, an Alternate Name field, and an Aboriginal Name field for entering object names. You must complete the Object field. The other two fields are optional.

To name an object:

- use a park-specific object name list
- *The Revised Nomenclature for Museum Cataloging (Revised Nomenclature)* for a list of suggested object names for historic material used by indigenous groups

Contact your regional/support office curator or ethnographer for additional sources for ethnographic object names.

Many parks invert the object name. Enter the name, a comma, and a modifier.

Example: Needle, Sewing

Be consistent when naming objects. Consistency will give you and others better access to the data in your collection.

Note: Record information, such as place names, native names, regional designations, and other names, that the collector recorded in the appropriate fields of the catalog record.

2. *Does ANCS+ include a table of object names for ethnology?*

No. The ANCS+ Object field is a user-built table for ethnology. You can enter the names you want for your site. You may have entries in this table from your ANCS conversion. The program built a table from the ethnology entries on your old ANCS records. Check this table to make sure that names are consistent. You can add, modify, and delete entries as needed.

C. Cataloging Ethnology

1. *Where can I find guidelines for cataloging ethnology?*

Refer to Chapter 3 in this handbook for general guidelines on cataloging. Refer to Section III of Chapter 2 in the *ANCS+ User Manual* for field-by-field instructions for cataloging ethnology objects in ANCS+.

2. *How do I record cultural affiliation of use vs. cultural affiliation of manufacture?*

Enter the cultural group that made (manufactured) the object in line three of the classification. Use the Culture of Use field in ANCS+ to note when a different group used the object. Otherwise, culture of use is assumed to be the same as culture of manufacture.

If you know the culture of use but not the culture of manufacture, enter the culture of use in line three of the classification. Enter Unknown in the cultural identity section of the catalog record. Use the Description field to note that the cultural group in the classification is the group that used the object.

3. *How do I record two distinct cultural affiliations of manufacture?*

When more than one distinct cultural affiliation of manufacture exists, enter the most recent in the classification. For example, if the Dakota made a flute, and the Nez Perce made the flute into a dance wand, choose Nez Perce for classification line 3. Place additional information in the Cultural Identity, Additional Groups, and Description fields as part of the history of the object.

4. *What are the ANCS+ discipline-specific fields for ethnology?*

The following list of fields appears on the ethnology discipline-specific screen in ANCS+. None of these fields are mandatory.

Aboriginal Name
Additional Area
Additional Group
Manufacturing Technique
Object Use
Possible/Probable Classification

Note: These fields don't print on the paper Museum Catalog Record, Form 10-254 Rev.. You can print the data from these fields using the All Fields report in ANCS+.

D. Culture Area and Cultural Group Classification

This section lists choices for ethnology classification lines 2 and 3 by culture area and cultural group. The names in parentheses are synonyms. You may use these names in other fields, but the names don't appear in the ANCS+ classification tables.

List the most specific cultural group known (for example, Copper Eskimo, rather than Central Eskimo).

The cultural group classification was developed using the following texts:

Murdock, George P. *Outline of World Cultures.* New Haven, Conn.: Human Relation Area Files, Inc., 1975.

Sturtevant, William C., ed. *Handbook of North American Indians Series.* Washington, D.C.: Smithsonian Institution, 1981.

Swanton, John R. *The Indians of the Southeastern United States.* Washington, D.C.: Smithsonian Institution, Bureau of American Ethnology Bulletin 137, 1946.

Swanton, John R. The Indian Tribes of North America. Washington, D.C.: Smithsonian Institution, Bureau of American Ethnology Bulletin 145, 1952.

Arctic Culture Area

- Aleut
  - Eastern Aleut (Unalaska)
  - Western Aleut (Atka)
- Eskimo
  - Alaskan Eskimo
    - Bering Strait Eskimo
    - Koniag
    - Kotzebue
    - North Alaskan Eskimo
    - Northern Interior Eskimo
    - Pacific Coast Eskimo
      - Agligmiut
      - Chugach
      - Ikogmiut
      - Kaialigamiut
      - Kiatagmiut
      - Kuskowagamiut
      - Magimiut
      - Nunivagmiut
      - Tugiagamiut
  - Baffinland Eskimo
  - Central Eskimo
    - Caribou Eskimo
    - Copper Eskimo
    - Iglulingmiut (Iglulik)
    - Natsilingmiut (Netsilik)
  - Greenland Eskimo
    - East Greenland Eskimo
    - Polar Eskimo
    - West Greenland Eskimo
  - Labrador Eskimo
  - Mackenzie Eskimo
- Unknown

Basin Culture Area

- Bannock
- Chemehuevi
- Gosiute
- Kawaiisu
- Paiute (Paviotso)
  - Mono Lake Paiute
  - Northern Paiute
  - Owens Valley Paiute
- Panamint
- Shoshone
  - Wind River Shoshone
- Ute
- Washoe
- Unknown

Appendix G: History

Page

APPENDIX G: HISTORY

A. History Classification

1. *When do I classify objects as history?*

Use the history classification for materials made or used by cultures with a written tradition up to the present time. Historic objects relate to the people, activities, and events associated with a park's mission, themes, and history.

Catalog archives and manuscript collections as history according to the procedures in Appendix D of this handbook.

2. *How do I classify history objects?*

The NPS uses *The Revised Nomenclature for Museum Cataloging* (American Association for State and Local History, 1988) to classify history objects. *Revised Nomenclature's* classification system is based on an object's original intended function.

The NPS classification for history objects has three lines. You must complete all three lines of the classification.

- line one is the discipline (history)
- line two is one of the ten broad categories in *Revised Nomenclature,* such as Furnishings or Communication Artifacts
- line three is one of the classification terms under the category in line two, such as Furniture or Documentary Artifact

Example:	History	History
	Personal Artifacts	Tools and Equipment for Materials
	Toilet Article	Animal Husbandry Tools and Equipment

3. *Can I make changes to the classification?*

No. The three-line classification for history appears in locked tables in ANCS+. You can't make changes to these tables. *Revised Nomenclature* has categories for Other Tools & Equipment and an Unclassifiable Artifacts category. Use these categories for objects that don't fit under a more specific category.

Refer to Section IV of Chapter 2 in the *ANCS+ User Manual* for instructions on using ANCS+ to classify and catalog history collections.

4. *How do I get a copy of Revised Nomenclature?*

When the NPS adopted the use of *Revised Nomenclature*, copies of the book were sent to all the parks. If you don't have a copy at your site, contact the Supply and Equipment Program of the Museum Management Program.

5. *How do I use Revised Nomenclature?*

Read the first three chapters of the book before you begin to catalog. These chapters tell you how the classification system works and explain how to use the book. Chapter III has definitions of the categories and classifications along with reference sources for identifying objects.

6. *How do I classify an object that has been modified from its original function?*

Base the classification on the most recent function. For example, classify a boot made into a lamp as a Lighting Device.

7. *How do I classify an object that serves more than one function?*

Base the classification on the primary function. For example, classify a thermometer advertising a soft drink as Meteorological Tools & Equipment.

The primary function may not always be easy to determine. It may depend on the purpose for your collection.

Note: There is also a Multiple Use Artifacts classification for objects that fit under more than one classification.

8. *What are the classification terms for the history classification?*

Use the following information in the three classification lines in ANCS+.

Classification Line 1

History

Classification Line 2

Use one of the following ten categories:

Structures
Furnishings
Personal Artifacts
Tools & Equipment for Materials
Tools & Equipment for Science & Technology
Tools & Equipment for Communication
Distribution & Transportation Artifacts
Communication Artifacts
Recreational Artifacts
Unclassifiable Artifacts

Classification Line 3

Classification line 3 terms are dependent on classification line 2 terms. See the list of classification terms in Section D of this appendix.

B. History Object Names

1. *How do I name history objects?*

You must use the *Revised Nomenclature* lexicon for naming history objects. The NPS has expanded this lexicon with object terms from the Supplementary History Object Term List. See Section E of this appendix for a copy of this list. The Object field for history records in ANCS+ has both the lexicon and the supplementary terms in a locked table. You must complete this field.

Revised Nomenclature terms are made up of a single noun or a noun and an adjective. Terms are inverted, meaning that the noun comes before the adjective.

Example: Mitt, Catcher's

ANCS+ also has an Alternate Name field and an *Art and Architecture Thesaurus (AAT)* field for naming history objects. Use of these fields is optional.

Be consistent when naming objects. Consistency will give you and others better access to the data in your collection.

2. *Why does the NPS use a required lexicon for naming history objects?*

Use of the *Revised Nomenclature* lexicon makes object names consistent within the collection and between sites. For example, purse, handbag, and pocketbook are all names for the same object. When you consistently use one term for an object, it's much easier to search your data.

Note: Use the Alternate Name field in ANCS+ to preserve regional and local names for an object.

3. *What if I know the function of an object but don't know its name?*

Chapter IV in *Revised Nomenclature* has a list of object terms for each classification. Check here when you know the function of an object but are uncertain of a name. For example, if you know a tool is from a woodworking shop, look for an appropriate name under Woodworking Tools & Equipment.

4. *How do I know if a name is in the lexicon?*

Chapter V in *Revised Nomenclature* is an alphabetical list of object terms that includes the classification for each term. You can also search the lexicon table in ANCS+.

5. *Why do some of my records have object names that aren't in the lexicon?*

The old ANCS program didn't include the *Revised Nomenclature* lexicon. Park staff had to use the book to find correct object terms. If your park didn't follow the book, your history records may have object names that aren't in the lexicon. These names were converted into ANCS+.

The NPS also adopted modifications to *Revised Nomenclature* to help standardize entries in the old ANCS program. Modifications included:

- the use of the terms Fragment and Part with any acceptable object name
- placing specific object names and modifiers in parentheses after the *Revised Nomenclature* term

Your converted records may have entries with these modifications. You may no longer make modifications in the Object field, but you can enter modified names in the Alternate Name field.

6. *Are there NPS-specific rules for using Revised Nomenclature and naming objects?*

Yes. The NPS uses the following modifications with *Revised Nomenclature.* You may:

- use an object term with any classification; you don't need to use the classification that appears in the book for a particular object (*Revised Nomenclature*, page II-3, option 3)
- use the term Problematic (as a last resort) with any classification to show that you know the object's function but not its name (*Revised Nomenclature*, page II-4)
- place any accepted object term under the Toy classification (*Revised Nomenclature*, page II-6*)*
- place souvenirs and mementos created primarily to record an event under the Documentary Artifact classification (*Revised Nomenclature*, page II-6)

7. *How do I name fragments and parts of objects?*

Enter the name of the object in the Object field. Use the Classification, Alternate Name, Description, and Condition fields to show whether the object is complete. For example, if you only have the drawer to a chest:

- enter Chest in the Object field
- enter Fragment in the Condition field
- classify the object as an Artifact Remnant
- enter Chest Drawer in the Alternate Name field
- note that the rest of the piece is missing in the Description field

8. *How do I name models and samples?*

Almost any object can be a model or sample. Add a dash and the term Model or Sample to the object name, and enter it in the Alternate Name field (*Revised Nomenclature*, page II-5).

Example: Car, Cable-Model

Make a note in the Description field that the object is a model or sample.

9. *How do I name product packages and containers?*

Use a generic modifier, such as Foodstuff, to describe the contents of empty product packages and containers (*Revised Nomenclature*, page II-5). Enter the brand name or specific product name in the Alternate Name field.

Example: Jar, Foodstuff in the Object field
Jar, Mayonnaise in the Alternate Name field

If the lexicon doesn't have an appropriate generic entry, enter the name for the container in the Object field. Use the Alternate Name field to enter a generic or specific product name.

The following list includes examples of generic content names

Foodstuff
Medicine
Toiletry
Pesticide
Liquor
Condiment
Tobacco
Cleaning Product

Note: Use the same procedures for naming packages and containers that contain their contents. Use the Description field to note that the package or container still has its contents.

10. *How do I name consumable products?*

If the product is in a container, see the previous question. Usually you will catalog the container and refer to the product. In rare cases, you may need to catalog the product itself. The lexicon has a few generic names for products, such as Foodstuff, Medicine, Chemical, and Raw Material. Use one of these terms and enter a specific name for the product in the Alternate Name field.

Consult your regional/support office curator or the National Catalog office if you can't find an appropriate product name.

11. *What is the Supplementary History Object Term List?*

The Supplementary History Object Term List is a list of object names that the NPS has added to the *Revised Nomenclature* lexicon. The ANCS+ lexicon for naming history objects includes the names on the list.

See Section E of this appendix for a copy of the list.

12. *How do I add a name to the Supplementary Object Term List?*

The use of ANCS+ has greatly reduced the need to add names to the lexicon. You should be able to find a broad term in the lexicon to name most objects. Use the Alternate Name field for specific names that don't appear in the lexicon.

If you…	***Then…***
can't find an appropriate name,	contact the National Catalog office at 304-535-6204 for assistance.
need to add a name to the lexicon,	fax a copy of the name and a description of the object to the National Catalog office at 304-535-6203.

Subject specialists will review the proposed addition. If it's approved, the name will be added to the lexicon in the next update of ANCS+. National Catalog staff will give you an appropriate name to use, or let you know that the name will be added to the lexicon.

Note: Webster's Third International Dictionary is the standard dictionary to use when proposing additions to the Supplementary History Object Term List.

If the name…	***Then…***
is approved to go in the lexicon,	use Problematic as the object name until the lexicon is updated, and send the record to the National Catalog with your annual submission.

You can enter the specific name in the Alternate Name field. Correct the catalog record when you receive an update of the lexicon.

Note: Section E in this appendix (Supplementary History Object Term List) will be updated as needed.

C. Cataloging History

1. *Where can I find the guidelines for cataloging history objects?*

Refer to Chapter 3 in this handbook for general guidelines on cataloging. Refer to Section IV of Chapter 2 in the *ANCS+ User Manual* for field-by-field instructions for cataloging history objects in ANCS+.

2. *What are the ANCS+ discipline-specific fields for history?*

The following list of fields appears on the history discipline-specific screen in ANCS+. None of these fields are mandatory.

Copyright
Format
Genre
Inscription/Marks
Object Use
Patent Date
Process/Technique of Manufacture
School
Significant Event
Style
Subjects
Term (AAT)
Title

Note: ANCS+ contains the lexicon for the *Art and Architecture Thesaurus (AAT)*. The *AAT* is a standardized vocabulary for fine arts, architecture, decorative art, and material culture of the Western world.

E. Supplementary History Object Term List

The attached Supplementary History Object Term List was last updated in 1993. There have been no additions to the list since that date. Use of the Alternate Name field in ANCS+ has greatly reduced requests for new object names. The list will be updated as names are approved and added to the ANCS+ *Revised Nomenclature* lexicon.

See Section B.12 of this appendix for information on proposing additions to the list.

Appendix I: Lot Cataloging

APPENDIX I: LOT CATALOGING

A. General Rules for Lot Cataloging

1. *What is lot cataloging?*

Lot cataloging is a method of cataloging a group, or lot, of objects rather than cataloging them individually. It's a way to account for similar objects without having to catalog each individual item.

2. *When can I use lot cataloging?*

Use of lot cataloging depends on the subject discipline. See Sections B and C of this appendix for discipline-specific rules for lot cataloging. The items in the lot don't have to be identical. They do have to have certain common characteristics, such as the same accession number and object name.

See Figures I.1-I.5 for examples of lot cataloging.

3. *When can't I use lot cataloging?*

Don't use lot cataloging for:

- rare or high value items
- type specimens
- objects that you need to individually track, such as those on incoming loan or exhibit

4. *How many catalog numbers do I assign to a lot?*

Assign one catalog number to the lot. Don't use component part designators with lots. Refer to Section I in Appendix C of this handbook for information on component parts.

5. *How do I count the lot?*

If possible, count the total number of items in the lot. Enter this number in the Item Count field in ANCS+. For lots that are too large or difficult to count, use the Quantity and Storage Unit fields for:

- linear or cubic feet (for archives)
- the number of storage containers, such as 4 boxes

Note: Many archeological collections include weight. Enter information on weight in the Weight field in ANCS+.

6. *Is there a limit on the size of a lot?*

No. It's a good idea to divide extremely large lots into verifiable units of measure for inventory purposes.

7. *How do I number the objects in a lot?*

If there are…	***Then…***
only a few objects,	you can mark the number on each object.
too many items to number individually,	number or label the containers.

Note: Don't use designators with the catalog number. Use designators only with component parts, pairs, and sets. Refer to Section I in Appendix C of this handbook for information on component parts, pairs, and sets.

8. *What if I remove an object from the lot?*

You may occasionally need to remove an object from the lot. For example, one item in a lot may go on exhibit or loan. There also may be items missing from the lot that you will have to deaccession.

When an object is separated from the lot, give it a new catalog number and a separate catalog record. Cross-reference both the new and original records to each other. Adjust the Item Count field on the original record to show that you have removed items from the lot.

9. *How do I store lot cataloged objects?*

Usually you store lots in a common container or containers that you store together in the same location.

B. Discipline-specific Rules for Lot Cataloging Cultural Resources Collections

1. *What are the discipline-specific rules for lot cataloging archeology objects?*

Archeology collections are frequently lot cataloged. To lot catalog archeology collections, the lot must:

- be from the same accession
- be from the same provenience (to the smallest level)
- be of the same material (or composite materials)
- have the same object name

Lots must be from the smallest provenience recorded by the archeologist. Within provenience, split objects into groups by material. You can't mix different materials in the same lot unless you classify the objects as composites.

Further divide lots by the specific material type that falls within a broader material category. For example, don't catalog chert, jasper, and obsidian projectile points from the same provenience as one lot. Although these materials are all stone, make separate lots for each specific material type. It's especially important to separate material types that the archeologist considers to be diagnostic.

You can use the object name to further separate lots:

- from the same provenience
- made from the same material

For example, you can make separate lots for rim sherds and body sherds.

Object names can be general, such as chipped stone, or specific, such as projectile point. Use only one object name per lot. For example, don't list several projectile point types as the object name.

Example:

Accession:	Untyped sherds from Site 204, Kiva 1, fill and Kiva 1, floor
1 lot catalog record:	Sherds, untyped (Site 204, Kiva 1, fill)
1 lot catalog record:	Sherds, untyped (Site 204, Kiva 1, floor)
Accession:	Miscellaneous ceramic and metal fragments, Jones House Site, Room 5, floor
1 lot catalog record:	Chinese export porcelain fragments
1 lot catalog record:	transfer printed whiteware fragments
1 lot catalog record:	unidentified ferrous alloy fragments
1 lot catalog record:	unidentified copper alloy fragments

2. *What are the discipline-specific rules for lot cataloging ethnology objects?*

Ethnology collections are usually not lot cataloged. To lot catalog ethnology collections, the lot must:

- be from the same accession
- be from the same provenience
- be from the same cultural group
- be from the same date/period
- have the same object name
- have the same artist/maker (if known)

The objects should be identical or similar.

Example:

Accession:	Hopi and Navajo beads
1 lot catalog record:	Hopi beads
1 lot catalog record:	Navajo beads
Accession:	4 Comanche arrows
1 lot catalog record:	Arrows (object name Arrow)

3. *What are the discipline-specific rules for lot cataloging history objects?*

History collections are usually not lot cataloged. To lot catalog history collections, the lot must:

- be from the same accession
- be from the same provenience
- be from the same date/period
- have the same object name
- have the same artist/maker (if known)
- have the same eminent figure (if any)

The objects should be identical or similar.

Example:

Accession:	General service enlisted men's uniform buttons, 1855-1884 pattern, 7/8" size, donated by John Smith.
1 lot catalog record:	Buttons (object name Button)
Accession:	Square cut nails, 1775-1815, 2"-2.5", from Bishop Barnes House attic
1 lot catalog record:	Nails (object name Nail)

4. *What are the discipline-specific rules for lot cataloging archives and manuscript collections?*

Don't lot catalog archives and manuscript collections. You catalog archives and manuscript collections as a collection, and measure the size of the collection in linear feet. Refer to Appendix D in this handbook for information on cataloging archives and manuscript collections.

C. Discipline-specific Rules for Lot Cataloging Natural History Collections

1. *What are the rules for lot cataloging natural history collections?*

The reason for lot cataloging natural history specimens depends on the research objectives of the collecting project. In general, to lot catalog natural history collections, the lot must be:

- from the same accession
- from the same locale (same collection effort)
- from the same collection date
- from the same collector(s)
- be studied together as a unit
- be stored as a unit

Example:

Accession:	50 mixed insects and arachnids from a 5-minute sweep net sample
1 lot catalog record:	sweep net sample in a single vial of alcohol
Object/Specimen Nam:	Sweep Net Sample
Quantification:	Item Count =150 and Storage Unit = EA
Accession:	thousands of insect from a single light trap that was run overnight
1 lot catalog record:	light trap sample in a single vial or jar
Object/Specimen Name:	Light Trap Sample
Quantification:	Item Count = 0, Quantity = 1, and Storage Unit = Vial or Jar
Accession:	10 dental and skeletal fragments from a paleontological specimen
Object/Specimen Name:	Coryphodon radians (genus and species)
Quantification:	Item Count = 10 and Storage Unit = EA

See Appendix H in this handbook for additional information on cataloging units. Appendix H is in a separate notebook.

2. *How does lot cataloging relate to the research objectives of the collecting project?*

Some studies require collecting and studying samples that include many individual specimens. The collector collected the specimens as a unit and intends to study them as an assemblage. The definition of collection unit will, to some extent, be an arbitrary decision of the collector. The same is true for such collection data as date and time. For example, a light trap sample may represent hours of sampling time.

Locale is another variable. The collector determines if specimens collected within centimeters or meters of each other are from the same locale.

3. *Does lot cataloging vary from taxon to taxon?*

Yes. Mammal, birds, and reptiles are generally collected as individuals and are rarely lot cataloged. Smaller reptiles and amphibians are occasionally lot cataloged if they are collected on the same date from small sampling plots. Fish, particularly smaller, more common species, are frequently cataloged as a lot. Numerous specimens may be collected from a single seine haul or during electro-fishing or rotenone sampling.

Invertebrates are lot cataloged more than vertebrates. There are well-developed sampling techniques for invertebrates. For example, there are malaise traps, light traps, and pitfall traps for terrestrial arghropods. There are various grab, core, sled, or dredge samples for benthic and epibenthic organisms. There are a variety of net samplers for planktonic organisms.

Most plant specimens, like vertebrates, are collected as single individuals. Generally, give each herbarium sheet one catalog number. Count it as one item, even if the sheet has more than one plant of the same species. On occasion, numerous individuals of the same species are collected on the same date from a single sampling area. In these cases, you may lot catalog the specimens using more than one herbarium sheet. For example, if the

specimens from the sample are on four herbarium sheets, give them all the same catalog number. Enter 4 in the Item Count field on the catalog record.

Assign one catalog number and lot catalog paleontological specimens that make up one individual. You can also lot catalog a matrix that has a mix of fossils from several individuals of the same species.

4. *What is the maximum allowable taxonomic diversity within a lot?*

Taxonomic diversity is the dissimilarity among specimens. In general, you can determine lots by the lowest taxonomic level to which the specimens are identified when you accession them. This will vary from group to group depending on the:

- difficulty of identification within the group
- level of expertise of the collector, donor, or curator

Usually vertebrates, vascular plants, and large fungi will be identified to species. Insects or mollusks may be lot cataloged at the filing group level (line 4 of the classification). They may be undescribed as a species, and often only a few specialists can recognize them to family and genus. Other invertebrates or microscopic organisms, such as nematodes or protozoans, may be grouped at the major group level (line 3 of the classification).

If specimens are lot cataloged at the classification level, list the classification level entry in the Object/Specimen Name field. Enter Unknown in the classification levels that are lower than the last known entry.

5. *Are the procedures for lot cataloging natural history specimens different from cataloging specimens individually?*

No. The specific steps and guidelines for lot cataloging are essentially the same as those you use to catalog specimens individually. Treat the entire lot (rather than the individual components of the lot) as a single specimen. Enter the number of specimens (or number of parts of one specimen) in the Item Count field in ANCS+.

Use the Description field in ANCS+ to describe, in general terms the:

- contents of the lot
- specifics about the collection procedure, date, time of day
- associated data about climate and environment

Example:

Approximately 50 Daphnia pulex in various stages of development from a ten-meter plankton tow using a 100 micron mesh plankton net.

Place a completed NPS natural history label in the storage container for the lot. The label includes the catalog number and other pertinent information and identifies the lot. In some cases components of the lot have their own labels, such as pinned insects. You don't have to affix catalog numbers to individual items in a lot if they don't normally have individual labels.

6. *What do I do if I need to remove specimens from the lot?*

Scientists frequently borrow specimens for identification purposes. You need to track specimens that you remove from a lot temporarily for study. Record the following information:

- a full description and count of the specimens
- the name of the person who will be responsible for them
- where they will be kept
- the date they were removed
- the date they are to be returned

If the specimens…	*Then track them…*
will be gone for less than 30 days,	with a Receipt for Property, Form DI-105.
will be gone for more than 30 days,	with an Outgoing Loan Agreement, Form 10-127

Refer to Chapter 5 in this handbook for information about loans.

Place an Object Temporary Removal Slip, Form 10-97, or a note with the remainder of the lot. Refer to Section II in Chapter 4 of this handbook for information about Form 10-97. Record the same information on the note as in the list above. Use black ink on acid-free paper.

7. *What if specimens in a lot are recataloged?*

In the course of future study, it is likely that researchers will identify or re-identify specimens within a lot. Assign individual catalog numbers to single specimens or smaller lots of specimens. For example, a specialist may use environmental monitoring samples to document changes in species diversity over a period of twenty years. During that time, the specialist may identify all or some of the specimens in the original lot. As this happens:

- store the identified specimens with other fully identified specimens of the same or related taxon
- cross-reference to the catalog record for the original lot
- adjust the Item Count field for the original lot to show the removal of specimens
- include a cross-reference on the original record to the catalog records for specimens that have been removed from the lot

Note: If a specialist identifies many specimens of a single species from a lot, you can create another lot catalog record at the species level.

Figure I.5. Completed Catalog Record – Log Cataloging (Geology)

Appendix J: Marking

APPENDIX J: MARKING

A. Marking Guidelines

1. *Why do I mark museum objects with a catalog number?*

The catalog number on the object links the object with the catalog record, the accession records, and other documentation. The catalog number identifies the object. You need it for accountability and access. Mark all objects in the park's permanent museum collection with a catalog number that includes the:

- park acronym
- collection designator (if applicable)
- unique number

Example: INDE 3487

2. *When should I mark the number on the object?*

Mark objects as part of the cataloging process. Mark the object at the same time that you complete the catalog record. Don't mark numbers on objects until you are ready to catalog them. It's a lot easier to change a catalog number in ANCS+ than to remove a number from an object. You also run the risk of assigning duplicate catalog numbers if you mark numbers on the objects before you catalog them.

3. *What are the general rules for marking objects?*

There are different techniques for marking different types of materials, but every catalog number should be:

- legible and easily found (don't place the catalog number on the underside of a heavy object)
- durable but not damaging
- in a location that doesn't detract from the scientific, historic, aesthetic or intrinsic value of the object (doesn't cover any diagnostic or potentially informative features)
- unobtrusive (not directly visible when the object is on display)
- in a location where it won't receive excessive wear
- secure enough that it cannot be removed accidentally
- reversible

It's much easier to find catalog numbers if you place them in the same position on similar objects. For example, number framed images on the reverse lower right corner.

4. *Can I tag objects in addition to marking them with a catalog number?*

Yes. In addition to the permanent catalog number, you may want to tag objects in storage. Tags make it easier to identify and find objects and reduce handling. Use an acid-free, cotton tag with cotton string, and place it in a visible location. Don't use metal-rimmed tags. Don't attach tags with tape or glue. Don't place the tag on weak parts of the object.

5. *How do I mark objects that*

Never mark a number on objects that are on loan to the park. Attach an acid-free tag to the object using cotton string.

are on loan to my park?

If a tag is too obtrusive for a loan that is on exhibit, keep a detailed list of the catalog numbers for the loaned objects in the exhibit. Note the location of each loaned object in the exhibit and take photos to identify each object.

You don't have to catalog objects on loan to your park for less than a year. Use the lender's catalog number, if available, for tracking purposes.

Note: NPS centers and non-NPS repositories receive incoming loans from parks for the purposes of curation and storage. The center or repository marks the park catalog number on the objects as part of the cataloging process.

6. *Are there marking techniques that I can't use?*

Yes. Don't use any technique that permanently alters the object, such as etching, scribing, imprinting, stamping, engraving, or scratching. These methods are irreversible and permanently alter the object.

You can stamp, etch, or otherwise mark "Reproduction" on objects that are reproductions. For contemporary reproductions, you can add the craftperson's name and the date. Refer to Section IV in Chapter 4 of this handbook and the *MH-III*, Chapter 5: Three-Dimensional Reproductions, for information on reproductions.

Don't use the following materials:

- epoxy and cement
- nail-on tags
- nail polish and nail polish remover
- pressure sensitive tapes and labels (cellophane, masking, plastic, and adhesive)
- rubber cement
- spray varnishes
- typewriter correction fluid
- tags attached with wire
- staples or paper clips
- paint or ink on paper documents

7. *What if I have objects in my collection that have been marked or tagged with incorrect materials?*

Consult with a conservator about removing old numbers and tags. Some old numbers and tags may be historically important and shouldn't be removed. Place any tags you remove in the catalog or accession folder. If a tag will be destroyed during removal, copy the information, and place it in the catalog or accession folder.

8. *What should I do about previous catalog numbers from former owners?*

Previous catalog numbers are part of the documentation for the object. Don't remove these numbers unless:

- confusion with park numbers is likely
- the number is causing damage to the object
- the number occupies space needed for the park number

> ***Never remove field specimen numbers.***

Note: If you must remove a previous owner's numbers, consult a conservator. You will have to test for the correct solvent before removing the number.

Place tags you remove in the catalog or accession folder.

If a tag will be destroyed during removal, copy the information and place it in the catalog or accession folder.

9. *Can I use bar codes to mark objects?*

No. Some NPS centers are using bar codes successfully to help track the movement of objects. Bar codes require the use of a software package to produce them, a printer to print them, and a scanner to read them. At present, bar codes are not a substitute for marking the catalog number on an object. The bar code tags can become separated from the objects. There are still no satisfactory methods of adhering the tags to most objects.

10. *Should I remove numbers from objects that I deaccession?*

No. Let the recipient decide whether to remove the numbers.

B. Applying and Removing Numbers

1. *What is the most common technique for marking numbers on objects?*

You will usually use lacquer and ink when numbering museum objects. Use this method for all objects except:

- incoming loans
- paper
- textiles
- objects with unstable surfaces
- plastics, vinyl, resins, and rubber
- some natural history specimens

Refer to Sections C-J in this appendix for information on marking specific

materials.

2. *What tools and materials do I need for marking objects with lacquer and ink?*

You'll need these tools and materials to mark objects with lacquer and ink:

- clear lacquer (Acryloid B-72® acrylic resin/acetone)
- white lacquer (Acryloid B-72® acrylic resin/acetone with titanium dioxide white pigment)
- permanent waterproof ink (Higgins® Black Magic® or Pelikan 17)
- technical pen (Rapidograph®), or crowquill pen
- acetone and cotton swabs for cleaning surfaces and removal of lacquer to correct errors, if needed
- artist brushes

3. *How do I apply the number?*

To apply the number:

- Make sure the area is clean and free of dust.
- Apply a small rectangle of clear or white lacquer on the object using a small artist's brush or cap brush. Use clear lacquer on light objects and white lacquer on dark objects. Usually a spot 1/8" wide by 3/8" long is sufficient.
- Allow the lacquer to dry thoroughly.
- Write the catalog number on the spot, using permanent black ink and a crowquill or Rapidograph® pen. Keep a small jar of ammonia and water handy for cleaning pen tips.
- Allow the ink to dry. Drying times will vary depending on the material and climate.
- Cover the number with a coat of clear lacquer to protect it. The clear lacquer topcoat should extend just beyond the lacquer primer rectangle.

Refer to Conserve 0 Gram 1/4, Use of Acryloid B-72 Lacquer for Labeling Museum Objects, for detailed instructions on applying catalog numbers.

Apply numbers in a well-ventilated area, and use latex or cotton gloves when marking metal objects.

Note: You can get Material Data Sheets on Acryloid B-72 and acetone from the Supply and Equipment Program of the Museum Management Program.

4. *When do I remove a catalog number from an object?*

Remove a catalog number only when necessary. You will need to remove numbers when the:

- number is incorrect
- ink smears
- object is removed from a lot and individually cataloged

When in doubt, consult your regional/support office (SO) curator or a conservator before removing numbers.

Refer to Section A.8 for information about catalog numbers from previous owners.

5. *How do I remove a catalog number from an object?*

Before you remove a catalog number, you need to know what marking materials were used on the object. Check with a conservator if you're not sure. Be aware that removing numbers can alter the object. For example, you may lose a small amount of the finish on finished wooden objects.

Before 1987 the NPS used shellac for marking objects. Remove shellac with denatured alcohol.

In early 1987, the NPS issued a cellulose nitrate lacquer (clear and white) from GSA. In April 1987, the NPS switched to the acrylic lacquer (clear and white) currently in use. You can remove all these lacquers with acetone, but check to make sure there is no shellac overcoat. Sometimes lacquer was used with a shellac overcoat.

To remove the number:

- Make sure you work in a well-ventilated area.
- Apply a small amount of solvent with a cotton swab. The material is carried into the swab rather than diluted and absorbed into the object.

C. Marking Human Remains

1. *Are there special procedures for marking human remains?*

Yes. Consult with affiliated groups about marking human remains. It may be inappropriate to place catalog numbers on these items. An alternative is to mark or tag the container.

2. *How do I mark human remains?*

To mark cremations:

- Completely enclose the burial vessel with unbleached muslin and fasten it with cotton twill tape.
- Attach the catalog number and any other labels to the twill tape. Use acid-free paper or Tyvek® for the labels.

To mark inhumations:

- Group small bones by type and place them in a polyethylene bag.

Place an acid-free label in each bag.

- Place the catalog numbers on the storage container.

To mark skeletal remains with soft tissue:

- Place the catalog number on an acid-free tag, and tie the tag to the remains or the storage container.

D. Marking Paper Items

1. *How do I mark paper items?*

Never use ink or indelible pencils to mark paper items. Use #2H, HB or softer pencils only. You want to use a pencil that won't indent but yet is hard enough not to smear. Write lightly, so you don't leave an impression. Place the object on a clean hard surface before numbering it. You can use a sheet of heavy Mylar.

2. *What tools and supplies do I need for marking paper items?*

Use the following tools and supplies when marking paper items:

#2H, HB, or softer pencils
acid-free paper photographic enclosures
Mylar sleeves
archival film pen

3. *Where do I mark paper items?*

There are various locations for marking paper items.

Individually cataloged paper items

Place the catalog number directly and inconspicuously on the reverse side in the lower right corner. If the item has embrittled edges, place the number away from the edge. If the object is in special housing, number the housing as well as the object.

Archival and manuscript collections

Place the catalog number on the folder.

Books

Place the number inside the front cover at the lower edge of the right hand corner, and on the back of the title page at the lower edge of the right hand corner.

Framed objects

Place the catalog number on the frame and object, on the reverse, lower right edge.

Photographs

Place the catalog number on the reverse, lower right edge. If the number wears off you will have to reapply it. If necessary, set up a monitoring cycle to check the catalog numbers for wear.

For photographs in acid-free paper or Mylar enclosures, mark the enclosure. Use an archival film pen on Mylar sleeves. Mark the sleeve before placing the photograph inside.

When working with photographs, remember that inks (ballpoint pen, felt-tip, manuscript, and rubber stamp) may be acidic and can cause fading of silver images.

Never list additional information on the backs of photographs. Use a cross-reference sheet to list information about names of individuals in group shots.

Photographic negatives

Don't mark the negatives directly. Place the number on the acid-free

(including glass plates)

enclosures that hold the negatives. Mark the number on an archival print of the negative to make sure that you don't lose the number.

4. *How do I remove an incorrect catalog number from paper items?*

If you need to remove an incorrect number, use a white vinyl eraser. Avoid abrading the paper by keeping the pressure as light as possible.

E. Plastics, Vinyl, Resins, and Rubber

1. *How do I mark plastics, vinyl, resins, and rubber?*

There's no single method for applying catalog numbers to these materials. Identification of different types of plastics, vinyl, resins, and rubber is difficult. Their chemical compositions vary and can interact negatively with standard labeling materials.

2. *Why can't I use standard labeling practices with these materials?*

Solvents such as acetone and toluene may:

- dissolve the surfaces of some plastics
- cause stress cracking or crazing
- destroy some glossy finishes

Some water-based materials initiate stress cracking over time. In addition, these materials are not reversible in water when dry.

Regular oil paints and their solvents soften or otherwise damage some plastics over time.

Inks often contain metallic elements that can degrade rubber.

3. *What tools and supplies can I use to mark plastic, vinyl, resin, and rubber objects?*

Use the following tools and supplies when marking plastics, vinyl, resins, and rubber:

Teflon® tape (plumbers tape) with archival film pen
Mylar with archival film pen and nylon or Teflon® monofilament
cotton twill tape and pigma pen
acid-free paper tags with pigma pen

4. *What are some methods for marking plastics, vinyl, resins, and rubber?*

If possible, apply the catalog number to a component of the object not made of these materials using standard techniques with lacquer and ink or pencil. If you can't do this, consider doing one of the following:

- Use Teflon® tape (plumbers tape) and an archival film pen.
- Use Mylar, and an archival film pen. (This may be the most unobtusive way to label objects on exhibit.)
- Label the container or object mount.
- Use an acid-free paper tag and pigma pen.
- Use cotton twill tape and a pigma pen.

Write the catalog number on the labeling material before attaching it to the object. See E.6 for information on how to attach the labeling material to the object.

If you need to apply a number directly to an object consult with a conservator.

5. *Where do I place the catalog number for different plastic, vinyl, resin, and rubber objects?*

Placement of the catalog number for objects made of these materials will vary. It depends on the type of object, whether the object is on exhibit, and the labeling technique you use. Place numbers in a consistent location for the same types of objects. Keep in mind standard concerns. The number should be legible, durable, reversible, non-damaging, non-obtrusive, and easily found.

6. *How do I attach the catalog number to different plastics, vinyl, resins, and rubber?*

Make sure you apply the catalog number to the labeling material and allow it to dry before attaching the number to the object. Attach the number in a secure and unobtrusive but easily found location.

If you use…	***Then…***
Teflon® tape or twill tape,	use the tape itself to secure the catalog number to the object.
Mylar,	round the edges of the tag so they can't damage the object, and use chemically inert Teflon® monofilament to secure the tag to the object.
acid-free paper tags,	use cotton string to secure the catalog number to the object.
the mount or container,	use either lacquer and ink or pencil directly on the mount or container. For objects in storage you may place a tag inside the container.

F. Marking Textiles

1. *What tools and supplies do I use to mark textiles?*

Use the following tools and supplies when marking textiles:

cotton twill tape
pigma pen
colorfast cotton thread (Mettler, Guttermann, and cotton quilters thread)
small, sharp needles, various sizes
small, sharp sewing scissors
tweezers

2. *How do I mark textiles?*

Use permanent black ink (pigma pen), cotton twill tape, and colorfast cotton thread to mark textiles. Choose a size and weight of twill appropriate for the object. Use white thread, except for objects on exhibit. Write the catalog number on the cotton twill tape. After the ink has dried thoroughly, baste the tape to the textile.

Baste the linen tape directly onto the textile with colorfast cotton thread. For fragile or open weave items, such as lace, attach the tape with a small loop of thread.

3. *Where do I place the catalog number on textiles?*

Garments

Place the catalog number in the neckband or waistband of the garment. For garments on exhibit, place the number in an unobtrusive location. For example, place the number on the right or left side of the neckband rather than the center. This location will be less visible when the object is on display. If the threads go through the back of the garment where they could be visible, use colorfast cotton thread matching the fabric of the garment.

Flat textiles

For flat textiles, such as rugs, linens, draperies, and flags, place the number on the underside of the garment. Use colored colorfast thread that matches the color of the fabric for items on exhibit.

Rolled textiles

For rolled textiles, place the number so that it is readable without having to unroll the item.

4. *How do I attach the catalog number to textiles?*

Use a basting stitch to attach the twill tape to the textile. Baste all four sides of the twill tape using large stitches. If you only baste the ends of the tape, something could catch between the object and the tape. With a one inch strip of twill tape, you would use one stitch on each end and two on each side.

Keep a loose tension on the thread. Too much tension can stress the textile. Too little tension will leave loose threads that can catch on things and cause damage.

There are two methods for starting and ending your stitches. One method is to use the same holes and go through your first and last stitch twice. This leaves a tail at each end so someone can tell where you started and ended your stitches.

To use the second method, leave a tail with your thread when you start to stitch. After you are done, bring the tail through the second stitch and bring the ending tail back through the third stitch. You'll need tweezers for this technique.

Note: Don't use a knot to start and end your basting. You can pull knots through the fabric causing damage.

For loose weave textiles like lace, loop the string that holds the twill tape label through the weave.

5. *How do I remove an incorrect catalog number from textiles?*

Choose the finest needle that will work for the task. For silk, use numbers 10, 11, 12, or a quilting needle. Rugs may need a number 6 needle. Carefully lift the end of the thread, and pull it gently through the label.

G. Large and Small Objects and Unstable Surfaces

1. *Are there special techniques for marking large objects?*

Yes. Large objects such as wagons, cannons, anchors, and objects kept outdoors need especially durable numbers. Paint the number on the object following the instructions in Section F.3 below. Locate the number in the same place in a protected but accessible area for each type of object.

In addition to the painted number, you may choose to add a supplemental tag. Make sure the tag is attached with something non-abrasive.

You may attach a supplementary stamped or engraved aluminum tag to large outdoor items. Attach these tags with Teflon® tape. This tape is soft, chemically inert, and water, oil, chemical, and insect resistant.

For objects in storage, you can print information on 8 ½ x 11" paper or card stock that you put in a polypropylene bag. Attach the bag to the object with polyester or polypropylene cord in a prominent place.

For objects on exhibit, you may also use a Mylar tag. Round the corners so the sharp corners can't cause damage. This material is resistant to oil, water, and insects. Attach the tag with Teflon® monofilament, or for equipment you can use Teflon® tape.

2. *What are the tools and supplies I'll need to mark large objects?*

Use the following tools and supplies to mark large objects:

aluminum tags
Dymo® labeler (for use with aluminum tags)
engraving or stamping tools (use only on aluminum tags)
pencil or knitting needle
string ties or Teflon® monofilament
Teflon® tape to secure tags
red cadmium or black carbon pigment oil paint
mineral spirits
Tyvek® for labels
Mylar tags

3. *How do I paint numbers on large objects?*

Use mineral spirits to clean and degrease the area where you will apply the catalog number. When it dries, apply the number directly on the object. Use an appropriate size sable brush and cadmium red or black carbon pigment oil paint.

You may need to trim the brush and thin the paint with turpentine. Choose the color of paint based on the color of the object.

4. *Where do I place the catalog number for large objects?*

Apply the number to the right rear of vehicles or boats. Use an out-of-the-way but consistent spot. Because large objects are hard to move, be sure to place the number in an area that is easy to access.

5. *How do I remove an incorrect catalog number?*

While still wet you may remove the paint with VMP Naptha or turpentine.

Once dry, removing the paint will require a strong solvent like methylene chloride. A conservator or qualified member of the staff should perform this task. It's easier to paint over the number with artist's oil paint and reapply the correct number.

6. *Are there special techniques for marking small objects?*

If an object is too small for marking, place the object in a small container, and mark the container. Containers include vials, polyethylene bags, or acid-free envelopes. Place an additional tag inside the container. Tag containers of lot cataloged objects in the same way.

7. *How do I mark objects that have unstable surfaces?*

Some objects may have an uneven, friable, or powdery surface, such as corroded metals or leather objects. Don't use lacquer and ink on these objects. Place the catalog number on an acid-free paper or Tyvek® tag, and attach it with cotton string or polypropylene cord.

H. Leather and Baskets

1. *How do I mark soft leather and hide?*

Don't use lacquer and ink to mark soft leather or hides. You may use lacquer and ink on hard finished leather. Use either an acid-free tag or a textile label to mark soft leather and hide. Use existing holes in the piece to loop the tag through the label, or secure the label to an appendage. When using existing holes, take care not to stress the material.

In some cases, you can mark a component of the object. For example, mark one of the metal pieces of a bridle rather than the leather.

2. *How do I mark baskets, mats, bark cloth, and other fibrous materials?*

On some baskets and fibrous materials it may be difficult to use lacquer and ink because of the narrowness or texture of the fibers. You can apply lacquer and ink to these items, if the surface is firm. When in doubt, use acid-free tags or cotton twill tape. For flat items, place the number on the reverse right corner.

I. Numbering Component Parts, Pairs, and Sets

1. *How do I number objects with component parts?*

Number objects with component parts with the catalog number and the component part designator. Mark each component individually. Each part has a unique lower case suffix.

Example:

Object	Components	Catalog Number on Object
Teapot	Teapot	PARK 5a
	Lid	PARK 5b

See Section I of Appendix C in this handbook for a discussion of component parts. If you need more than 26 letters, double the letters. For example, use 10aa, 10ab, 10ac, and so forth.

Note: Don't use component part designators with biological specimens, such as animal skeletons. Count the bones, and enter this number in the

Item Count field in ANCS+. Mark each bone with the same catalog number. Place bones too small to be individually numbered in a vial with a specimen label showing the catalog number.

2. *How do I number pairs?*

Number pairs, such as a pair of shoes, with the catalog number and a component part designator. Mark each item individually.

Example:

Object	Components	Catalog Number on Object
Spur	Spur	PARK 4511a
	Spur	PARK 4511b

See Section I of Appendix C in this handbook for a discussion of pairs.

3. *How do I number sets and kits?*

Number sets and kits as you would number an object with component parts. Number each piece of the set individually with the catalog number and a component part designator. Each piece has a unique lower case suffix.

Example:

Object	Components	Catalog Number on Object
Kit, Needlework	Thread	PARK 78a
	Thimble	PARK 79b
	Needles	PARK 80c

See Section I of Appendix C in this handbook for a discussion of sets and kits. If you need more than 26 letters, double the letters. For example, use 10aa, 10ab, 10ac, and so forth.

J. Number Location for Specific Types of Objects

As a rule, place the catalog number in the same location on all objects of the same type. The list in this section includes standard locations and techniques for marking various types of objects.

Object	Location	Marking Material
Armor	Inside each element.	lacquer and ink
Baskets	On base. Don't place catalog numbers on a portion of the basket that may conceal diagnostic information. Tag baskets that are fragile.	lacquer and ink or tag
Beads	Place on the edge or on an attached tag. Put the object in a clear vial container or polyethylene bag with a paper label inside.	tag or place in a marked container

Object	Location	Marking Material
Books	On endpaper (blank leaf inside front cover), lower edge near spine, and on lower edge, right hand corner on back of the title page. Loose pages must receive the same catalog number, individually on reverse, lower right.	soft pencil (#2H, HB or softer)
Buttons	On reverse side or same procedure as beads.	tag or place in a marked container
Ceramic, glass, pewter	On the underside, but avoid parts that would be abraded when the object is moved. Label whole ceramic vessels on the exterior base, near the center. Number sherds on the undecorated surface. Use multiple applications of lacquer on porous surfaces to build up a base that will prevent absorbtion of ink.	lacquer and ink
Clothing	Place the number on cotton twill tape, and sew it on the costume to the neckband or waistband. Sew the number on in a location that is easily seen during inventory but not so obvious during exhibition.	sew-on label
Coins	On the edge/rim. *Don't* number mint condition coins. Place the number on the container holding the coin.	lacquer and ink
Documents, photos, prints, letters, postcards, and envelopes	Reverse, lower right corner.	soft pencil (#2H, HB or softer)
Dolls wooden or china head	Back of neck or bottom of foot.	lacquer and ink
Firearms	Inside trigger-guard, or on the breech of the barrel opposite the lock, or on the lower right butt.	lacquer and ink
Flags/pennants/ banners	Reverse side at top of hoisting edge.	sew-on label
Framed image	Reverse, lower right corner of frame.	lacquer and ink
Furniture	Near the inside top of the right rear leg; or for pieces without legs, on the right side near rear corner. Number heavy objects on the right side/leg at the base. Place number so it can be seen easily during inventory, but not obvious when on exhibit.	
beds	Top of back, right headpost or foot rail.	lacquer and ink
trunk/chest	Top right corner of back.	lacquer and ink
chairs, sofas	Top right of back leg, or seat frame.	lacquer and ink

Object	Location	Marking Material
mirrors	Lower right corner of back of frame.	lacquer and ink
stoves	Top right corner of back.	lacquer and ink
tables	Apron or top right corner of a leg at one end of table.	lacquer and ink
Jewelry	Smooth surface on the right lower corner on reverse side. Number cotton twill tape and sew around necklaces, bracelets, and rings.	lacquer and ink or cotton twill tape
Model vehicles, boats	Right side of back end or stern.	lacquer and ink
Paintings	Reverse, lower right corner. Number both stretcher and frame, in case they are separated. *Don't* place numbers or labels on the front or back of the canvas. For heavy frames that are difficult to remove from the wall, use the lower right corner on the side of the frame. Number scroll paintings on the scroll knob.	lacquer and ink
Rugs, tapestries, and drapes	Reverse side, lower right corner.	sew-on label
Scabbard	On reverse of the throat, at top, or (absent a throat) on the body near an opening.	lacquer and ink
Scrapbooks, albums	Lower corner near spine inside front cover.	soft pencil (#2H, HB or softer)
Sculpture in the round	At the rear of the base near the bottom; also at the lower edge of the back of pedestal.	lacquer and ink
Sculpture in relief	Lower right of back or edge in an inconspicuous place.	lacquer and ink
Stamps	Write the number on the back of the stamp with a soft pencil. You can also place stamps in acid-free containers, and label the container.	soft pencil (#2H, HB or softer) or place in a marked container
Stone	On base center. Don't put a number on flaking areas.	lacquer and ink
Swords, daggers, and knives	On reverse of the blade, on ricasso just below the counter guard, if it will not likely be scraped off by the scabbard.	lacquer and ink
Tools	Working part of tool (on head rather than on handle.)	lacquer and ink

For further information on placement of numbers see *The New Museum Registration Methods*, Washington, DC: American Association of Museums, 1998.

K. Natural History Specimens

1. *What are natural history specimen labels?*

The NPS uses standardized natural history specimen labels to identify all natural history museum collections. These labels are mandatory for all natural history specimens. See Appendix H in this handbook for a description and illustrations of the labels and their uses. Appendix H is in a separate notebook.

2. *Who completes the natural history specimen label?*

The collector or specialist usually completes the label. The accession and catalog numbers are added to the label after the specimen is cataloged. This may be done by park staff, the collector, or the repository that manages the specimens. Refer to Section VI in Chapter 4 of this handbook for information on following regulations for cataloging natural history specimens.

3. *What if the labels on my specimens are incomplete?*

Complete them using data provided by the collector. Follow the instructions in Appendix H of this handbook.

4. *When do I create new NPS labels?*

Only remove old labels if they are damaging the specimen. If you must remove the old label, place it in the accession or catalog folder. Never discard old labels!

Don't remove clearly legible, well-attached collector labels that have much of the information required on NPS specimen labels. Add any additional or new information, such as accession and catalog numbers, to the NPS label, and keep both labels with the specimen.

5. *Where can I get natural history labels?*

ANCS+ can produce all the required natural history labels. The program also completes most of the information on the label from data you enter on the catalog record. Use acid-free paper to produce labels.

6. *What kind of supplies do I need to mark and label natural history specimens?*

Use the following supplies to mark and label natural history specimens:

acid-free NPS natural history labels
glue for labels (white glue such as Elmers glue)
permanent, waterproof black ink
clear lacquer for rocks and minerals (Acryloid B-72® acrylic resin/acetone)
white lacquer for rocks and minerals (Acryloid B-72® acrylic resin/acetone with titanium dioxide white pigment)
acetone
polyvinyl acetate adhesive 5% in ethanol
crowquill or Rapidograph® pen.

7. *How do I mark a number on a natural history specimen?*

You don't mark the catalog number directly on all natural history specimens. For some specimens, mark the number only on the label.

When applying the catalog number to a specimen, use ink and lacquer. Follow the procedures in Section B of this appendix. Make sure you don't cover important features with the number. Place the catalog number and label in a location that minimizes handling the specimen.

Place very small specimens in vials, and attach a label to the vial. If appropriate, place the catalog number inside the vial. Place insect labels on

an insect pin.

When attaching labels directly to a specimen, use cotton thread. For oily and wet specimens you may want to use a polypropylene cord.

For lot cataloged specimens, place a label on the storage container. Place an additional tag inside the container. Refer to Appendix I in this handbook for information on cataloging specimens in lots.

8. *How do I mark plant specimens?*

Herbarium specimens

Don't mark the number directly on the specimen. Glue the Herbarium Collection Label, Form 10-512, on the lower right corner of the herbarium sheet. Mark the catalog and accession numbers on the label.

Don't use starchy pastes. They can attract insects and mold. Don't use glues with a toluene or acetone base (model airplane glues). White glue, such as Elmers glue or polyvinyl acetate emulsion works well.

Nuts, large seeds, and wood specimens

Place the number on the specimen. Use clear lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer.

Wet plant specimens

Don't mark the number directly on the specimen. Write the accession and catalog numbers on a Wet Plant Specimen Label, Form 10-506, and place it in the jar or container. Currently you should get labels for wet specimens from the Supply and Equipment Program of the Museum Management Program.

9. *How do I mark vertebrate specimens?*

Bones

Place the number directly on vertebrate bones. Use clear lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Locate catalog numbers:

- in the center of the largest part of the bone
- near the proximal end of long bones
- at the lower back center of the skull
- on the right ramus of the jaw

Put small bones in a vial or box and write the accession and catalog numbers on the Skull Vial or Box Label, Form 10-502. Place the label in or on the container.

Wet vertebrate specimens

Don't place numbers directly on wet vertebrate specimens. Write the accession and catalog numbers on the Vertebrate Wet Specimen Label, Form 10-500. Place this label in the jar or container. You can also write the numbers on a Vertebrate Specimen Label, Form 10-501. Tie it to:

- the right hind leg above the ankle
- for fish, through a nose or gill
- for some amphibians and reptiles, around the body near the head.

Currently you should get labels for wet specimens from the Supply and Equipment Program of the Museum Management Program.

Animal skins

Place the number on flat skins. Use clear lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Locate the number on the reverse, on the inside of the neck, or on the right hind leg. You can also number flat skins by writing the catalog number on a Vertebrate Specimen Label, Form 10-501. Attach the label to a right hind leg. For large skins, attach it through a natural opening like an eye or the nose.

Eggs

Place the number directly on the eggs. Use clear lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Also write the catalog number on an Egg Box Label, Form 10-508. Attach the label to the outside of the box with polyvinyl acetate adhesive 5% in ethanol (PVA).

10. *How do I mark invertebrate specimens?*

Insects

Don't place numbers directly on the insect. Write the accession and catalog numbers on an Insect Label, Form 10-509. Pin the insect with a rust-proof insect pin. Then pin the label at standard height, below the specimen, parallel to the insect's longitudinal axis. The label must be readable from the left side. A collector's label indicating locality, collector's name, and date may exist on a separate label placed in a similar orientation below the insect label.

Other Invertebrates

Place the number directly on other invertebrates, such as shells. Use clear lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Locate the number on the interior, bottom, or reverse of the specimen. Write the accession and catalog numbers on the Invertebrate Label, Form 10-507, or the Invertebrate Specimen Label, Form 10-503. Place the label in the container with the specimen.

Wet invertebrate specimens

Write the accession and catalog numbers on the Invertebrate Label, Form 10-507, or the Invertebrate Specimen Label, Form 10-503. Place the label in the jar or container with the specimen.

Currently you should get labels for wet specimens from the Supply and Equipment Program of the Museum Management Program.

11. *How do I mark paleontology specimens?*

Place the number on the specimen. Use clear or white lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Locate the catalog number in a flat inconspicuous surface, where it will not wear off or obscure any important features. Write the accession and catalog numbers on the Paleontology Label, Form 10-505. Place the label with the specimen.

Fossil resins may dissolve in solvents. Don't apply lacquer to a specimen of this type without consulting a conservator. Write the catalog number on an acid-free tag, and attach or place it with the specimen. You can also write the number on Teflon® tape with archival film pens, and tie the tape to the specimen.

12. *How do I mark geology*

You can usually mark the number directly on the specimen using lacquer

specimens?

and ink. Don't use lacquer with extremely fibrous and powdery or flaky specimens. Write the catalog number on an acid-free paper tag or cotton twill tape, and attach or place it with the specimen. Make sure the pressure of securing it won't damage the specimen.

If the specimen is a resin it may dissolve in solvents. Don't apply lacquer to a specimen of this type without consulting a conservator. Write the catalog number on an acid-free tag, and attach or place it with the specimen. Alternatively, write the number on Teflon® tape with archival film pens, and tie the tape to the specimen.

Rocks

Use clear or white lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Locate the catalog number in a flat inconspicuous surface, where it will not wear off or obscure any important features. Keep the number small. Also print the accession and catalog numbers on the Geology Label, Form 10-504. Place the label with the specimen.

Minerals

Use clear or white lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. Locate the catalog number in a flat inconspicuous surface, where it will not wear off or obscure any important features. Keep the number small. Print the accession and catalog numbers on the Mineral Label, Form 10-511. Place the label with the specimen.

13. *How do I mark microscopic specimens?*

For glass slides use clear lacquer for a primer coat with permanent black ink and a protective overcoat of clear lacquer. For cardboard slides, use pencil to write the number. Write the number on the end of the slide. Avoid touching the cover slip.

Write the accession and catalog numbers and any additional information, if provided, on a small acid-free paper label. For geology specimens, additional information might include age and formation. Store the labels by catalog number, near the specimen microscopic slides. These labels are not standardized.

14. *When do I use an annotation label?*

Use an Annotation Label, Form 10-510, when a specialist reviews a specimen to verify or correct the scientific name. Attach the annotation label to the specimen, or store it with the specimen. Include the name confirmation or change of name, the name of the identifier, and the date of review on the label.

Appendix K: Photography

APPENDIX K: PHOTOGRAPHY

A. Museum Record Photography

1. *Why should I photograph museum collections?*

Photography is an excellent supplement to cataloging. In most cases, photos are more effective than words in describing objects. Narrative description of texture, marks, damage and materials is difficult. Most of these qualities are apparent in a good photograph. Photographs are especially useful for recording the condition of an object. In the case of a loss or theft, a good photograph can help in recovering the object.

Photographs also reduce the need for handling objects. In many cases, you can use a photo for initial research rather than handling the objects.

2. *When should I photograph museum collections?*

You should photograph objects:

- as part of the cataloging process
- to document accessions and the condition of incoming loans
- to document the condition of outgoing loans
- before deaccessioning them

3. *Do I need to hire a photographer if I have no photography experience?*

No. You should be able to take acceptable record photos using the procedures in this appendix. If you have a large collection to photograph or want photos for publications, you may want to hire a professional photographer.

4. *How can I learn how to photograph objects?*

Become familiar with the equipment, especially how the camera operates. Read the camera operating manual, and practice. You will gain expertise through trial and error and experience.

5. *Do I need to follow the procedures in this appendix?*

No. This appendix gives you a list of the necessary equipment and a simple process for photographing museum objects. If you are an experienced photographer you can use your own methods and setup.

6. *Do I need to photograph the entire collection?*

No. You should photograph all controlled property. You must decide if a photograph is useful for non-controlled property. You can photocopy, rather than photograph, some archival materials. Refer to Sections C.9 and C.10 in Chapter 3 of this handbook for information about collections to photograph.

7. *When should I photograph archival materials?*

Photograph, rather than photocopy, archival materials if the item:

- is of very high artifactual value and is a continuous tone photograph (silver gelatin photoprint, platinum print, or similar process)
- is a detailed visual image with many nuances, such as an original drawing or architectural plan
- has nuances that can't be captured by a photocopy machine, such as a beautifully handwritten letter
- is of high evidential value, such as a land document

Note: Archival collections usually have very few items that you will need to photograph for documentation purposes. Consider the importance of the collection when deciding what to photograph.

You may want to photograph many archival items for access and use such as posting on the Web. These aren't photographs for documentation.

8. *Can I use digital imaging for record photography?*

No. Digital images are wonderful for access but, at present, not good for long-term preservation. Digital data can fail and vanish overnight. It is much more fragile than film, and has a shorter life expectancy. It also requires frequent migration to be compatible with rapidly changing hardware and software. There is a high cost to managing, refreshing, and migrating digital files over time.

You may want to purchase a digital camera to take images at the same time you are doing record photography. ANCS+ allows you to attach digital images to your catalog records. See Section VIII in Chapter 6 of the *ANCS+ User Manual* for information on using images with ANCS+.

Note: Video can also be useful for documenting collection storage, exhibit installations, and other collection activities.

9. *Should I use color or black and white film for record photography?*

Use black and white film for record photography. Black and white acetate film should last 100 years if stored at temperatures below 70° F and 30 - 50% relative humidity levels. Color film doesn't last nearly as long, but you may want to use it for additional images of your objects.

10. *How many photos do I need for each object?*

The number of photos you need for each object depends on the object. Complex objects may require several shots at different angles. If you are documenting condition, marks, or inscriptions, you may need close-up shots of particular areas. On the other hand, many objects may need only one photo taken at different exposures.

11. *What's the most important point to remember about museum record photography?*

Be sure to cross-reference the photographs to the catalog records so that you can easily retrieve the photos. Also make sure to record the documentation associated with the photography, such as recording roll and frame numbers. Use of the photo identification stand ensures documentation of the object in the photo. Refer to Section E in this appendix for information on documenting and storing the photographs.

B. Equipment

1. *What equipment will I need for record photography?*

The following list includes the equipment you'll need for record photography:

Camera

Use a 35mm single lens reflex camera. It offers flexibility and quality at a reasonable price. Be sure that you can set the aperture and shutter speed manually on the camera. Automatic cameras must have an override that allows for manual adjustment.

Lens

A 50mm lens has the most useful focal length. A 55mm macro lens is a good choice for small objects and close-up work as well as general use. For wide angle shots, use a 35mm or 28mm lens or a 28-85 or 35-105 lens with a macro feature.

You can use a close-up lens kit to increase focusing capability for small details.

Filter

Use a polarizing filter to reduce reflections and glare. Use an ultraviolet

(UV) filter to protect the front surface of each lens. For black and white images, it may cause a negligible increase in image contrast. For color films it may make the image slightly more reddish if there are light sources other than photoflood lights. You also might want to use polarizing gelatin filters on your lights to reduce reflections and glare.

Lights

Use EBW Number B2 photoflood lamps (500 watts each) mounted in reflectors. The reflectors should be between 10 and 16 inches in diameter with a preferred size of 12 or 14 inches. Quality and cost vary greatly. Some reflectors attach to adjustable lights stands, and others have clamps that you may attach to stable objects such as chairs. Lights are available through most photography supply stores.

Film, Black and White

The following film is recommended for record photography:

- Kodak T-Max 100 and 400
- Ilford Delta 100 and 400
- Kodak Plus-X 125
- Kodak Tri-X

You can get film at bulk rates through the General Services Administration.

Note: There is a new monochrome chromogenic film on the market that is advertised as black and white film. Kodak Advantix is one of the brand names. You can get this film porcessed at a color lab. The image is a black dye image, rather than silver grains, and is processed the same as standard color negatives. Because the image is dye based, the monochrome chromogenic negatives won't be as stable as traditional black and white films with silver-based images. This film is not recommended for museum record photography.

Film, Color

The following film is recommended for color photography.

- Fuji 160 NPS (daylight) and 160 NPL (tungsten) for color prints (very good dye stability)
- Kodachrome 25 or 64 for color transparencies

Note: Kodachrome is the most stable color transparency film, but it's sometimes difficult to find laboratories to process it.

Developer

For in-house processing, use the developer that the manufacturer recommends. For commercial processing, use the same lab so that processing will be consistent.

Refer to Section D of this appendix for information on processing film.

Tripod

You must have a sturdy tripod to hold the camera steady when using slow shutter speeds. A tripod with 2 or 3 telescoping section legs and a swivel or pan head is best.

Shutter Release Cable

Use a shutter release cable for slow shutter speeds to avoid moving the camera when releasing the shutter cable. The cable attaches to the shutter button. Movement of the camera will result in blurry images. Spending a little more on a cable release by a known manufacturer will ensure longer use.

Exposure Meter

You may use a reflected-light meter, either built into the camera or handheld, for metering the objects. This meter measures the amount of light reflected off the object. You should use it with a gray card. Another type of meter is a handheld incident-light meter, which measures the amount of light falling on an object. You don't need a gray card with an incident-light meter.

Gray Card

Use a gray card to take accurate exposure meter readings under lights with a reflected-light meter. The light reflected from the gray card gives a better reading than the light reflected from the object. An 8 X 10 inch, 18% gray card is available in photography supply stores. See Figure K.1 for instructions on using the Kodak gray card.

Background Paper

Use light gray and dark gray. You can buy this inexpensive paper at any professional photography supply store. It comes in widths of 54 inches to 11 feet by lengths up to 100 feet. There should be a distinct contrast between the object and the background. You can lose detail if the object is the same color or has the same contrast in shades as the background. For example, a piece of wrought iron would not show up well against a black background or a bone against a white background. In certain instances, black may create the best contrast. A large piece (3 X 6 feet) of black velveteen or dense black matte board is useful to have on hand.

Identification Stand

Place a stand with the film roll number and the object's catalog number (including park acronym) in every photograph. This information identifies the object and the photograph. You will need stands for both large and small objects, a roll label, and changeable magnetic numbers and letters. Stands, roll labels, and park acronym letters are available from the Supply and Equipment Program of the Museum Management Program (MMP). Refer to the *Tools of the Trade* catalog.

Meter Scale

Place a standard metric scale next to or on the identification stand in every photograph. The scale should have alternating black and white blocks in standard metric units. You will need a large and small centimeter scale for objects of different sizes. Scales are available from the Supply and Equipment Program, MMP. Refer to the *Tools of the Trade* catalog.

Color Control Card

Place a color control card next to the identification card in every color photograph. It provides a control for determining correct color in color printing and for identifying colors in the object. Color control cards are available from photography supply stores.

Gray Scale Control Card

Include a gray scale control card in black and white photographs to provide control for determining correct shades in black and white printing. It's especially good for two-dimensional printed materials. Gray scale control cards are available from photography supply stores.

2. *What additional equipment might be useful for photographing objects?*

The following list includes some equipment that you might find useful when photographing objects.

Materials to Support Objects

Materials for supporting objects include: styrofoam, plexiglass, cardboard, wood blocks, display easels, and wall hooks.

Diffusion Materials

You can place materials such as Rolux diffusion directly in front of the lights to diffuse them and create more muted shadows. For example, you can create a cone with this material and place it around an object such as a coin. The lights penetrate the material and create smooth, less specular highlights.

It's important to buy diffusion materials designed for use with photo lights. Buy diffusions materials from photography supply stores.

Light Form Panels

Use light form panels to add fill light to an image. They will soften shadows and bring out details that would otherwise be lost in the image. You can place a piece of white poster board in front of an object at an angle to reflect light into shadowed areas. Light form panels are available from photography supply stores.

Copy Stand

Use a standard photography copy stand to take photographs of small or two-dimensional objects. The stand has two or four lights with a temperature of 3200º Kelvin.

C. Procedures

1. *What are the basic procedures for taking photographs of museum objects?*

The following basic procedures for taking photographs should result in good record photographs. These procedures aren't the only way to photograph museum objects. Photographers with more knowledge and experience may use different techniques and equipment. The procedures in this section provide a simple process that anyone can use.

- group objects by size and type
- prepare background
- place object, identification card, metric scale, gray scale control card (color control card for color) on background paper
- load camera with film, and set the camera to the film speed (ASA, ISO, or EI)
- arrange lights
- mount camera on tripod
- attach shutter release cable
- compose the picture

- turn on lights
- place gray card in front of object and determine exposure
- remove gray card
- take photograph
- turn off lights, or change objects and repeat steps as appropriate
- record information about the photograph

Note: Turning lights on and off helps protect the objects from heat build-up but significantly reduces the life of the bulb. It's important to set up the photograph as much as possible before turning on the lights. It's more efficient to leave the lights on and move the object from under the lights. However, moving the object may not be possible and requires you to handle the object more. You can use a dimmer switch with halogen lights that have appropriate bulbs. Don't leave the objects under the lights for more than a few minutes.

2. *What are the step-by-step procedures for taking record photographs?*

By following the step-by-step procedures in this section, you should be able to produce good photographs of your museum objects.

Grouping Objects by Size and Type

Grouping the objects to be photographed by size and type will save you time and energy. You won't have to adjust distances or heights of the lights or camera for every object. It will also minimize the need to turn the lights on and off. You can remove one object and replace it with another one without having to change the lighting or camera setup.

Preparing the Background

A table against a wall works well for objects under 3 feet in size. Hang the background material on the wall, using drafting tape or gaffer's tape that won't mark the wall. Let the material drape over the table without forming a crease or seam. Larger objects will usually be easier to handle on the floor. For very large objects, you usually won't need a background material.

Placing the Object

Place the object in the middle third of the flat working surface, if possible. This placement avoids having the front edge of the background in the photograph or the back portion of the background in focus. See Figure K.2.

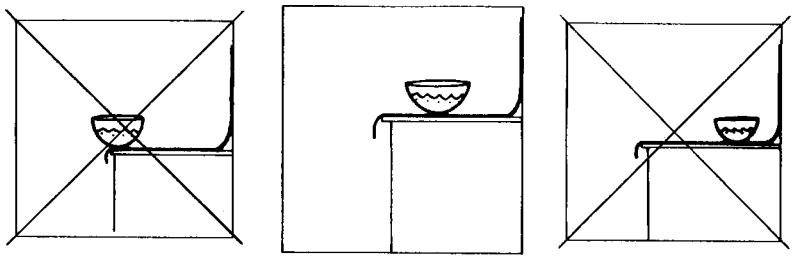

Figure K.2. Placement of Object

Place the identification information near the front of the object without blocking any part of the object. See Figure K.3. The identification information includes:

- identification stand with the catalog number and roll and frame number
- metric scale
- gray scale control card (color control card for color)

Note: Different size objects require different size indentification information.

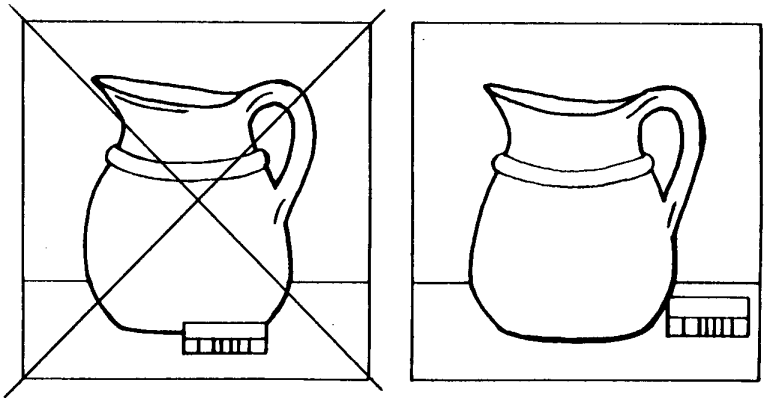

Figure K.3. Placement of Identification Information and Metric Scale

Loading the Film and Setting the Exposure Index

Load the film in the camera. Modern electronic cameras generally don't have rewind buttons. For older camera models or those with rewind knobs, check that the film is advancing properly. Wind to exposure "1" for manual cameras. Then turn the rewind knob carefully in the direction of the rewind arrow until you feel a slight tension. When the film is advanced after the first exposure, the rewind knob should rotate in the opposite direction of the rewind arrow. If the rewind knob doesn't rotate, then the film may not be loaded properly. Reload the film if necessary.

Follow the operating manual for your camera to set the camera to the film speed. Older camera models will use American Standards Association (ASA) to describe film speed. Usually you will see Exposure Index (EI) or International Standards Organization (ISO) on the film box. ASA is equivalent to ISO or EI. Set the Exposure Index on the camera to match the EI of the film.

Number each roll of film consecutively as it is used.

Arranging the Lights

The basic lighting setup for most objects will be a key light and fill light. The key light is the main source of light on the object. The fill light is the secondary light used to minimize shadows. See Figure K.4 and the information that follows below for the distance, angle, and height for the lights.

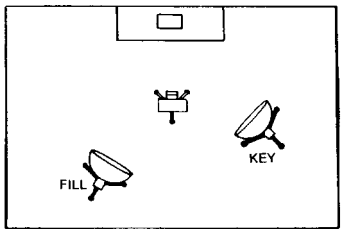

Figure K.4. Basic Lighting Setup

Carefully adjust the distance, angle, and height of the lights. This will make the difference between a properly lit object and one with many obscuring shadows. See Figure K.5 and K.6. Adjust the lights to best illuminate the object. Do this without overhead lights.

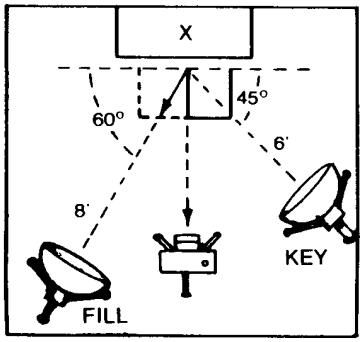

Figure K.5. Distance and Angles for Light Placement

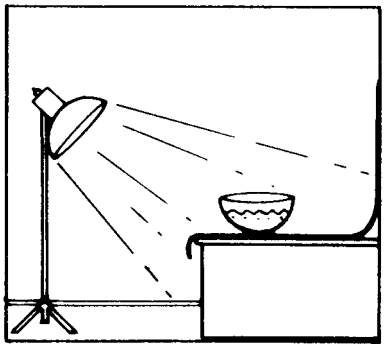

Figure K.6. Height of Light

Use the following standards to set up the lights, and then adjust them as needed for the best results:

- distance — key light at 6 feet; fill light at 7 or 8 feet
- angle — key light at 45º from the front plane of the object; fill light at 60º to 70º from the front plane of the object
- height — high enough to light the top surface and front of the object

You can also use a piece of string and a 12 inch cardboard square to

determine the distance and angles of the lights. To use this procedure:

- draw a diagonal line on the card from point A (starting at a corner) to point D forming a 45º angle
- from point A (the same corner) draw a second line to point C forming a 60º angle
- place the same illustrations on the reverse, keeping the A-D axis on the same diagonal of the card
- cut the string to 8 feet and knot it at 6 and 7 feet
- attach the string at point A
- place the card on the background, with point A on the spot where the object will be and point B in the direction of the camera
- hold the string taut and move around until the string aligns with the A-D line (45º at 6 feet) for the key light
- flip the card and align the string with the A-C line (60º at 7 or 8 feet) to position the fill light

See Figure K.7. CD is half of BD.

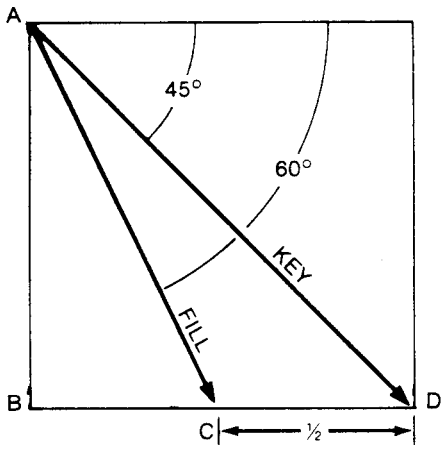

Figure K.7. Angles for Key and Fill Lights

The key light, at 6 feet, will create a harsh shadow. The fill light will lighten the shadow from the key light without creating a second harsh shadow. See Figure K.8.

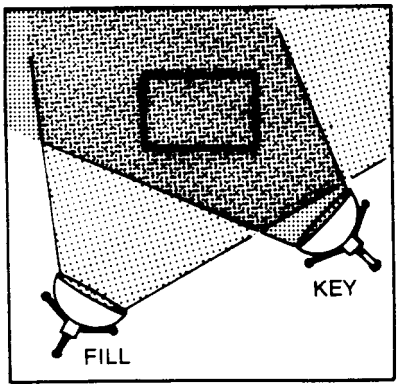

Figure K.8. Relationship of Shadows from Key and Fill Lights

Composing the Photograph

Mount the camera securely on the tripod, and attach the shutter release cable. Check the position of the identification information. Compose the photograph. Make sure the object fills up as much of the photograph as possible. Check the distance, angle, and format (horizontal versus vertical).

Adjust the distance of the camera to the object so that the object fills one-half to three-quarters of the frame. See Figure K.9.

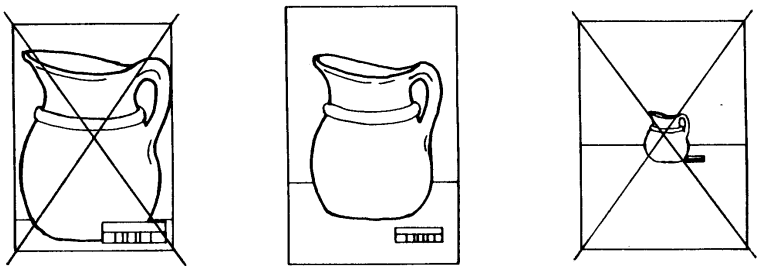

Figure K.9. Composing the Photograph: Distance

Determine the angle. For three-dimensional objects, place the camera slightly higher and looking down on the object. If you shoot the object on a straight line, it won't look three-dimensional. See Figure K.10

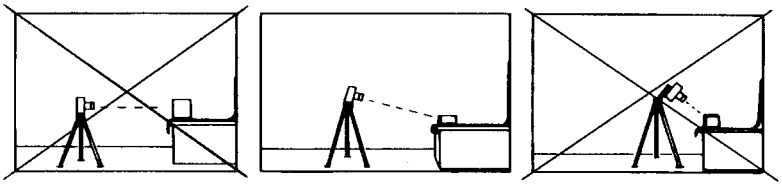

Figure K.10. Composing the Photograph: Camera Angle

For small, two-dimensional objects, use a copy stand that mounts the camera directly above the object. The stand usually includes fixed lights located about 30 inches from the copy board and at a 45º angle to the camera lens axis. Mount large two-dimensional objects on the wall. Place the two flood lights at equal distance and height, at a 45º angle from the object. The camera should be level and aimed at the center point of the object. Use polarizing filters on the lights and camera lens when

photographing reflective surfaces, such as oil paintings and reflective glass. Use a gray scale control card when photographing black and white photographs.

Choose the format. You want to frame the object within the image so that the object isn't surrounded by extra space.

If the object is…	***Then…***
taller than it is wide,	use the camera in a vertical position.
wider than it is tall,	use the camera in a horizontal position.

See Figure K.11.

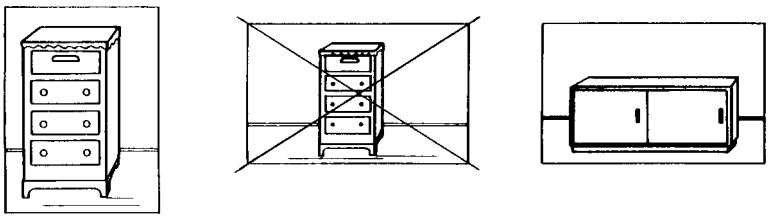

Figure K.11. Choosing Vertical or Horizontal Format

Turning on the Photoflood Lights

Remember that turning lights on and off reduces the life of the bulbs. It's possible to hook both lights up to a foot switch or a hand switch located next to the camera. Using a light switch will:

- minimize the length of time the lights are left on
- protect the objects from heat and humidity changes
- keep the work area cool

Ideally the photoflood lights should be the only source of light. Turn off overhead or other room lights (especially if they are fluorescent lights) because they:

- distort the color in color shots
- dilute the effects of the photoflood lights

Note: Be aware of how light from additional sources such as windows can affect the image, especially an image with a reflective surface. It may be necessary to cover windows or at least shoot the photograph on an overcast day. The room should be dark except for the photo lights.

Placing the Gray Card

Place the gray card perpendicular to the lens line of sight. Take the exposure meter reading using light reflected from the gray card. This reading will be more accurate than one taken using light reflected from the object and background.

Determining Exposure

Start by setting the aperture (f/stop). A larger f/stop number (small aperture) will result in greater depth-of-field (area of sharpness) in the photograph. Once you set the f/stop, match it with the appropriate shutter

speed setting.

To take an exposure reading, use a handheld meter or a camera with a built-in meter. To take a reading with the camera, place the meter near the gray card without casting any shadows on the card. Be certain that the gray card fills the entire viewing screen. The photoflood lights should be on. Take an exposure reading and set the camera f/stop and shutter speed to that reading.

Each package of film has exposure suggestions for different situations.

If a meter isn't available, use the following exposures as a guideline for Kodak T-Max 100 using two 500 watt photoflood lights. As the lights become older, greater exposures will be necessary. When taking photographs in this way, bracket to either side of the first shot. When you bracket, you take additional exposures around your first exposure. For example, for Kodak T-Max 100 ISO at f/16 for 1/8 second, use the following five settings:

- f/22 for 1/8 second
- between f/22 and f/16 for 1/8 second
- f/16 for 1/8 second
- between f/16 and f/11 for 1/8 second
- f/11 for 1/8 second

Exposures for 100 EI Film

Key Light	**Fill Light**	**Exposure**
6 ft.	6 ft.	f/16 at 1/8 second
6 ft.	7 ft.	f/16 at 1/8 second
6 ft.	8 ft.	f/16 at ¼ to 1/8 second
7 ft.	8 ft.	f/16 at ¼ second
8 ft.	10 ft.	f/16 at ½ second

Note: You can't use the guidelines for meterless exposure with overhead lights.

Review the negatives and the recorded exposures to judge if the settings are appropriate. Make sure that the negatives are not consistently overexposed or underexposed. Always shoot and process the first roll of film immediately to assess the correct exposure. Then complete the project.

Shooting the Photograph

Remove the gray card. Focus the camera. Squeeze or depress the shutter button slowly and smoothly. The shutter release cable is especially useful because it allows you to depress the shutter button without touching the camera. The shutter release cable eliminates the potential for camera movement, which causes blurry images.

Some objects may require more than one photograph to document detail accurately. After taking all the necessary shots, turn off the lights, and record the information about the photographs. If you're working with similar objects, put the next objects in place, focus, and take the next shots. For different objects, repeat the steps in this section to prepare the next setup.

Recording Information about the Photograph

Each time you use a new roll of film, start a new photograph record log that includes:

- roll number (check the roll number of the previous log sheet)
- exposure number (the frame number on the roll)
- exposure reading (f-stop and shutter speed)
- catalog number
- object name

When the film is processed, the frame number and object may not correspond with the frame number and object listed in the log. Correct the log to correspond with the frame number on the negative. Figures K.12a-b show a blank and sample object photograph record sheet.

D. Processing the Film

1. *Can I process the film at the park?*

Yes. If the park has darkroom facilities, park staff can process the film following the technical data sheet for the developer. Use the appropriate developer for the particular film. For example, process Kodak T-Max 100 using T-Max developer or standard commercial developer. Using a toning solution helps longevity. Most problems with longevity come from insufficient washing.

2. *What do I need to know about using a commercial lab?*

Processing can affect the quality of the final image. It's important to find a good place for processing film and use it consistently. You're then sure that the film is processed the same way each time, and you have a consistently good product.

3. *What if I can't find a lab that processes black and white film?*

Finding a local lab that will process black and white film may be difficult for many parks. You can call Kodak at 1-800-242-2424 to find the professional processing lab nearest to your site. You can also use Kodak's web site at <http://www.kodak.com> to locate a lab near you or in your geographic area.

4. *What kind of photos should I get?*

For record photos, make at least one black and white print for the photo file. Use either 3 X 5 inch prints or contact sheets. Contact sheets can be made exactly the same size as the negative or slightly larger (11 X 14).

E. Documentation and Storage

1. *Why is it important to document photographic negatives and prints?*

You need to document the negatives and prints to access them. Use a numbering system as a cross-reference.

2. *What is the photograph number?*

The photograph number is the roll number followed by the frame number. It serves as the cross-reference between the print, contact sheet, negative, object photograph log, and catalog record.

Roll	Frame	Photo Number
200	3	200/3
2050	25	2050/25

Note: Enter this number in the Images supplemental record in ANCS+. The most recent photo number in the Images supplemental record prints in the Photo Number field on the Museum Catalog Record, Form 10-254 Rev. Refer to Section VII in Chapter 3 of the *ANCS+ User Manual* for information on the Images supplemental record.

3. *How do I document the prints?*

The roll number and object catalog number appear in the photograph. In addition, you'll need to make a label with information about the photograph. Use acid-free paper or the front of an archival paper enclosure for the label. The label should include:

- catalog and accession numbers
- object name
- photo number (roll and frame number)
- date taken
- photographer
- remarks

See Figure K.13 for sample label information.

Note: The National Visual Inventory Card, Form 10-30 is no longer in use.

4. *How do I store the prints?*

File prints numerically by photograph number or catalog number depending on how you want to access the image. Store them in archival quality enclosures, either paper or polyester (Mylar®). There are several styles available. Refer to *Conserve-O-Gram (COG)* 14/2, Storage Enclosures for Photographic Prints and Negatives, and *MH-I*, Appendix R: Care of Photographic Collections. Both paper and polyester enclosures are available from the Supply and Equipment Program, MMP. See the *Tools of the Trade* catalog.

You can write the label information in pencil on the front of paper enclosures. For archival-quality polyester enclosures, place the photo and label back-to-back in double-sided photo sheets or envelopes. This method

allows you to view the photo and label without having to handle the photo. Some parks use a copy of the catalog card and photo back-to-back in a polyester sleeve.

Note: Use plastic materials only if you can maintain relative humidity below 70%.

5. *How do I store contact sheets?*

Place contact sheets or strips in polyester enclosures. Store them in archival quality three-ring binders with the matching photograph log sheets. Binders and enclosures are available from the Supply and Equipment Program, MMP. See the *Tools of the Trade* catalog.

6. *How do I document and store the negatives?*

Cut the negatives into strips. File them by roll and frame number in archival polyester holders. Place them in a three-ring archival quality binder. File one roll on each page. Shooting only 35 frames of a 36 exposure roll makes everything fit on one page.

Mark the roll number, with a permanent marker pen, in the space at the top of the page. You can use contact sheets as indexes to the negatives.

Binders and enclosures are available from the Supply and Equipment Program, MMP. See the *Tools of the Trade* catalog.

7. *Where do I store the object photograph log?*

Store the object photograph log in a three-ring binder and keep it with the museum collection records. File the sheets with the highest number on top. If you use contact sheets, store a copy of the pertinent log sheet with each contact sheet.

8. *What's the best storage environment for photographs and negatives?*

Storage conditions greatly contribute to the stability and longevity of your photographs and negatives. The storage environment is of prime importance. Carefully monitor the temperature and relative humidity (RH) to keep them constant.

Store black and white photographic prints and negatives at 20º C (68ºF) or below at a constant RH between 30% and 50% in dark storage. Avoid RH fluctuations of more than 5%. Humidity is the important factor. High RH levels dramatically increase the rate of deterioration. Very dry conditions may cause cracking and embrittlement.

You can significantly increase the film life of black and white negatives by lowering the humidity below 50%.

Store color prints and negatives at 2-10º C (35-50ºF) or below at 20-30% RH in dark storage. Temperature is the most significant factor in determining the rate of fading and staining.

You will also want to monitor and control the presence of pollutants in the air. Oxidizing gases and chlorides can greatly contribute to the destruction of photographic material. Dust is especially damaging because of its hygroscopic character. Dust causes abrasion when you move negatives. Never allow smoking in photographic storage areas.

Refer to the *MH-I,* Appendix R: Curatorial Care of Photographic Collections, for additional information on storage environment.

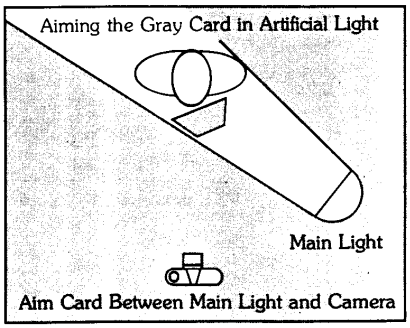
F. List of Figures

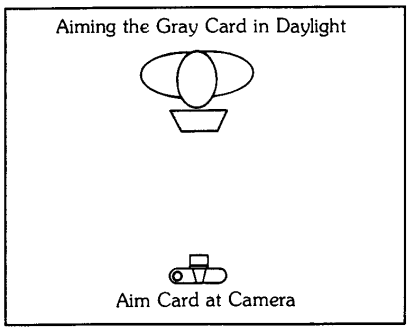
* Figures K:2 – K.11 appear in text.

How to Use KODAK Gray Cards...

To Determine Exposure

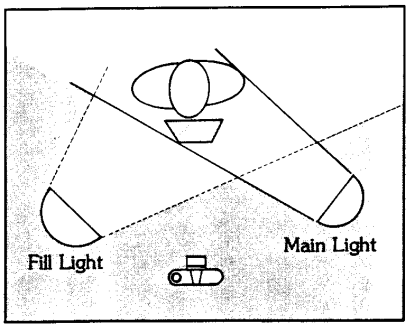
- All meter readings of the gray card are reflection measurements of *incident* illumination on the card. To get accurate exposure information, be sure the gray card is receiving the same illumination as the subject to be photographed.
- Position the gray card facing the camera so there are no shadows on it, no brightly colored objects reflecting light on it, and no glaring (specular) reflections coming off the card itself.
- Normally you should use the gray side of the card and the rated ISO speed of the film to figure exposure. (Or, if the light is so dim that your meter will not read the gray side, divide the film speed by 5, reset your meter to this value, and read the white side of the card.)
- To be sure you read only the card, hold your meter about 6 inches (15 centimetres) away. Of course, if you are using a single-lens-reflex camera with a built-in meter or spot meter, you can see exactly what you are reading.
- In artificial light, position the card close to and in front of the subject, aimed halfway between the main light and the camera.
- In daylight, position the card facing the camera and as close to the subject as possible. Or, you can make an exposure reading of the card near your camera, as long as you position the card so it receives the same angle and intensity of illumination as the subject.
- If your subject is quite dark, *increase* your calculated exposure by ½ to 1 stop.
- If your subject is quite light, *decrease* your calculated exposure by ½ to 1 stop.
- Bracket your exposures in situations where you are unsure of the best exposure.





To Determine Lighting Ratios

- A lighting ratio expresses the relationship between main plus fill-in illumination and fill-in illumination alone.
- Generally, the lighting ratio should not exceed 3 to 1 for color or 5 to 1 for black-and-white when full detail is wanted in a final print.
- You can use a KODAK Gray Card to determine, and if necessary adjust, the lighting ratio of a particular setup even if the lighting arrangement is complex. To do so, follow these suggestions:
  - — Position the card as close to the subject as possible.
  - — When reading main plus fill-in illumination, turn the card to the position that gives the maximum reading on the scale of your light meter. For this reading, all lights should be on except those positioned so far to the side or back that they might influence the meter directly. Record the reading.
  - — When reading fill-in illumination, turn the card so it faces the camera lens, and turn off the main light or lights. Record the reading.
  - — With both readings recorded, you can determine the lighting ratio by using the table at right.



Stops Difference	Lighting Ratio	Stops Difference	Lighting Ratio
⅔	1.5:1	2⅔	6:1
1	2:1	3	8:1
1⅓	2.5:1	3⅓	10:1
1⅔	3:1	3⅔	13:1
2	4:1	4	16:1
2⅓	5:1	5	32:1

MUSEUM HANDBOOK

PART III

MUSEUM COLLECTIONS USE

INTRODUCTION

The *Museum Handbook* covers a broad range of topics to guide National Park Service staff in managing museum and archival collections:

- Part I covers planning, preservation, and protection for the disciplines and materials represented in NPS collections, including professional ethics, specialized storage, environment standards, conservation treatments, and emergency preparedness.

- Part II outlines procedures for museum record keeping, including accessioning, cataloging, loans, deaccessioning, photography, and reporting annual collection management data.

- Part III provides guidance on access and use for interpretation, education, exhibition, and research. It covers legal issues, publications, two and three-dimensional reproductions, using museum objects in exhibits and furnished historic structures, and providing access for research.

NPS staff responsible for collections should make informed choices based on their own skills and experience, standards and procedures outlined in the *Museum Handbook*, advice provided by specialists, and additional information provided in the references found in the *Museum Handbook*. Staff should, as needed, seek advice or technical information from support offices, the Harpers Ferry Center, and the Museum Management Program, National Center for Cultural Resources Stewardship and Partnership Programs.

By following the practices represented in this guidance, trained staff can ensure that the National Park Service collections will be, as mandated by the 1916 NPS Organic Act, preserved and maintained for the use and enjoyment of the present and future generations.

Ann Hitchcock
Chief Curator
Museum Management Program
National Center for Cultural Resources
Stewardship and Partnership Programs
September 1998

ACKNOWLEDGMENTS

The NPS *Museum Handbook*, Part III, is coordinated by the Access and Use Team (AUT), Museum Management Program (MMP), National Center for Cultural Resources Stewardship and Partnership Programs. AUT members with contributions from selected NPS and other museum professionals wrote the first three chapters and appendices. AUT members who developed the first three chapters of the new *Museum Handbook*, Part III are Diane Vogt O'Connor, Senior Archivist; Virginia Kilby, Staff Curator; and Joan Bacharach, Museum Curator. AUT members Joan Bacharach and Diane Vogt O'Connor wrote the chapters on two and three-dimensional reproductions, and other uses of museum collections. Joan Bacharach coordinated the project. Cynthia Murdock, Program Assistant, MMP, assisted with the layout and final editing. Chapters on using museum collections in exhibits, furnished historic structures, and research are being developed.

Museum Handbook, Part III authors are:

Chapter 1: Virginia Kilby, Diane Vogt O'Connor, and Joan Bacharach. Jane Gray, Ethnographer, Archeology and Ethnography Program, National Center for Cultural Resources Stewardship and Partnership Programs (Section E) and Sandy Weber, Interpretive Specialist, Division of Interpretation, Washington Office (Section H) contributed to the chapter.

Chapter 2: Diane Vogt O'Connor

Chapter 3: Diane Vogt O'Connor and Joan Bacharach (Sections G, and I). Brian Jones, Chief, Division of Audiovisual Arts, Harpers Ferry Center (Section G), and Tom Valentine, Chief, Audio-Visual Services, National Gallery of Art (Section I) also contributed.

Chapter 4: Diane Vogt-O'Connor

Chapter 5: Joan Bacharach

Chapter 6: Joan Bacharach

Appendix A: Diane Vogt O'Connor

Appendix D: Donald Cumberland, Museum Specialist, MMP

The authors offer a special note of appreciation to Lorrie Castaneda, Editorial Experts, Inc.; Melissa Cronin, Chief, Publications Division, Harpers Ferry Center, National Park Service; Al Gardiner, Mammalogy Department, National Museum of Natural History, Smithsonian Institution; Bob Groves, Supervisor of Digital Imaging Services, National Gallery of Art; Brian Jones, Chief, Division of Audiovisual Arts, Harpers Ferry Center, National Park Service; Martha Lee, Museum Technician, Yosemite National Park; Melissa Smith Levine, National Digital Library, Library of Congress; Edward McManus, Metals Conservator, National Air and Space Museum, Smithsonian Institution; Walt Meshaka, Curator, Everglades National Park; Carla Mattix, Department of the Interior, Office of the Solicitor; Dave Nathanson, Chief, Library and Archival Services, Harpers Ferry Center, National Park Service; and Tom Valentine, Chief, Audio-Visual Services, National Gallery of Art,
for their contributions to this Handbook.

Members of the NPS *Museum Handbook* Steering Committee who guided an early version of the Handbook outline from 1991 to 1993 are Michele Aubry, Senior Archeologist, Anthropology Division, Washington Office; Betty Browning, Museum Curator, Valley Forge National Historical Park; John Brucksch, Staff Curator, Historic Furnishing Division, Harpers Ferry Center; Dan Chure, Paleontologist/Curator Dinosaur National Park; Trinkle Jones, Archeologist, Western Archeological and Conservation Center; Dale Durham, Regional Curator, Southeast Region; Steve Harrison, Deputy Regional Curator, Southeast Regional Office; Diane Nicholson, Museum Curator, Golden Gate National Recreation Area; Sarah Olson, Chief, Historic Furnishings Division, Harpers Ferry Center; Carolyn Rose, Senior Research Conservator, National Museum of Natural History, Department of Anthropology, Smithsonian Institution; Virginia Salazar, Regional Curator, Southwest Regional Office; Jim Thomson, Regional Archeologist, Pacific Northwest Regional Office; Sandy Weber, Interpretive Specialist, Division of Interpretation,

Washington Office; and Tony Knapp, Staff Curator and committee coordinator, Virginia Kilby, Staff Curator, and Ann Hitchcock, Chief Curator, Washington Office, ex-officio members. Members are listed by the institutions where they worked during their term of office on the committee.

Chapter 1: Evaluating and Documenting Museum Collections Use

CHAPTER 1: EVALUATING AND DOCUMENTING MUSEUM COLLECTIONS USE

A. Overview

National Park Service museums are responsible for properly preserving, managing, and providing access to their collections. NPS collections support, strengthen, and document the parks' cultural and natural history. To use collections effectively for interpretation, education, exhibition, and research, parks must provide both physical and intellectual access to collections.

Both preservation and use are fundamental to a successful NPS museum program. Collections are maintained because of their value to the park, NPS programs, and the general public. Neither preservation nor use are absolute values. Don't give one preference over the other. If you make informed decisions based on NPS policies and procedures, you'll be able to effectively manage and balance both preservation and use without significant compromises.

Park museum collections are an extraordinary resource. As a manager of park collections, you should make every effort to bring the tangible and intangible values embodied in these collections to the public.

1. *What is meant by access to collections?*

Good museum collections management makes collections accessible. Collections access can mean physical access to the museum facility and the collections or intellectual access to the available documentation and background data on the objects.

Providing access to museum collections supports your park's goals by:

- attracting scholars to research and write about your park's history as well as your cultural and natural resources
- encouraging publications, exhibitions, and similar works on your park or program
- developing a constituency of scholarly, international, heritage tourism and other public supporters of your collections who will speak for increased park resources for preservation and access
- helping you locate potential collaborators, cooperators, and partners in your work
- raising the profile of the park in the public's mind in a positive fashion

2. *How may museum collections be used?*

Collections may be used for:

- ***publications:*** journals, books, films, video, multimedia, and sound recordings
- ***exhibitions:*** furnished historic structures; museum, outdoor and in-situ

exhibits; visible storage; and media exhibits online or on CD-ROM

- ***interpretation and education****:* demonstrations and park, classroom, and long distance (via World Wide Web) education programs
- ***research****:* using both objects and documentation and material analysis
- ***reproductions****:* facsimile products; reproductions for sale; and preservation, deposit, and security copies (provided as alternatives to the original for use)
- ***derivative works****:* posters, T-shirts, postcards, reproductions, World Wide Web variants, games, toys, and coloring books

3. *What information does this chapter cover?*

In this chapter you will find information that will help you evaluate proposed uses of your collections and document access to the park's museum and archival collections. You will learn how to assess a request to use your park's museum collections.

A checklist to help you evaluate a request is provided. For a listing of NPS procedural guidelines that cover use of museum collections, see Section C, Management Issues.

B. Evaluating Proposed Use of Collections

1. *Why do I need to evaluate requests to use museum collections ?*

When you receive a request to use the collections, you need to obtain specific information about the proposed use, what access is required, research methodology, and which objects or collections will be used. Often researchers won't know what specific materials are in the collection and can provide only generic information on their needs. Review researchers' requests to use the objects to ensure the proposed use won't violate any laws; or ethical, cultural, or scientific concerns; or any management requirements associated with the use.

2. *What should I do before researchers arrive?*

Examine the objects and determine whether they can be used without risk of destruction or damage. Evaluate whether the objects can be used without compromising their security. Determine if their proposed use conflicts with any federal or state laws. Determine if the use will promote visibility for collections and further the mission of the park.

3. *What restrictions govern the use of museum collections?*

All data, information and collections, except those restricted by law or in accordance with NPS policy, are available to all. Allow only controlled access to a park's museum collection. When you grant permission for access to a user, follow procedures for using the collection and the research space, based on the park's access and use policies. Supervise researchers continuously. Clearly define visitor hours and public areas. Restrict access to all areas that house collections. Security, locked doors, and escorts are essential in non-public areas. For a summary of laws governing access to collections refer to *MH-III,* Chapter 2, Legal Issues.

Access guidance based on management, ethics, cultural considerations, scientific concerns, preservation, protection, and documentation are discussed in this chapter

4. *Who can use collections?*

Anyone can use NPS collections if the use conforms to NPS policies and guidelines. Users may include qualified NPS personnel, artists, contractors, historians, researchers, scientists, and the general public. Institutions and individuals may use park museum collections upon approval from the museum staff designated by the superintendent or center chief. Collections are open to researchers based on the park's written access and use procedures.

- Collections may be approved for non-commercial use:
  - when staff supervision is available, the requested collections are accessioned and cataloged, and the collections are appropriately stabilized
  - when individuals request access for research or study
  - when NPS staff, contractors, or cooperators on official NPS business request use of collections
  - when the NPS requests work (for example, conservation or reformatting) on an object

    The object may be loaned to an individual (for example, a contractor) for that work. Otherwise outgoing loans of NPS museum collections are only made to institutions, in accordance with *Museum Handbook*, Part II *(MH-II)*, Chapter 5, Outgoing Loans.
- Collections may be approved for non-commercial institutional use:
  - when parks loan collections to nonprofit educational, cultural, or scientific institutions (for example, museums, historical societies, and universities) for exhibition, long-term management, research, and/or photography
  - when representatives of Indian tribes, native Hawaiian organizations, or Alaskan corporations request access to archeological or ethnographic objects associated with their tribes
- Collections may be approved for commercial use:
  - when individuals or representatives of organizations, institutions, or corporations request collections or documentation for legitimate commercial or publicity purposes that are in keeping with park purposes and the NPS mission and don't conflict with legal restrictions such as copyright or privacy legislation or cause significant damage to the item (See Section C, Management Issues, for further guidance.)

5. *How does an interested party make a request to use the collections?*

An interested party can make an appointment by phoning, writing, faxing, e-mailing, or visiting the park curator. See Section I, User Qualifications.

6. *How do I assess a request to use museum collections?*

When you receive a request for access to collections, use the checklist in Section K and the Conditions for Access to Museum Collections in *Museum Handbook*, Part I *(MH-I)*, Appendix G, Figure G.7, to help you evaluate the request. Evaluate requests based on the park's ability to provide access according to law and policy.

You must consider all requests in an equitable manner, whether from staff, outside scholars, or the general public.

All access requests should be:

- acknowledged
- documented through the use of appropriate forms (See Section J, Documentation.)
- treated with courtesy and respect

Notify researchers promptly if their requests have been approved or not approved. Provide them with information on the park hours, address, parking, and other pertinent information.

7. *What issues do I consider when evaluating a request for use?*

You must consider all of the following issues:

- legal
- management
- ethical
- cultural
- scientific
- preservation and protection
- interpretation
- user qualifications

Legal issues are addressed in *MH-III*, Chapter 2. The other issues are discussed in this chapter.

C. Management Issues

1. *Who evaluates a request to use museum*

As the manager of the collections, you are delegated by the superintendent to evaluate all requests to use NPS museum collections. You must evaluate

collections?

all requests fairly and equally. Establish a museum collection committee to evaluate requests and assist in developing standard operating procedures for access and use, such as publication, duplication, and research requests. See *MH-I*, Appendix G, Protection of NPS Museum Collections, Figure G.7, and *MH-II*, Appendix D, Museum Archives and Manuscript Collections. All loans must be approved by the superintendent.

2. *What management concerns determine use?*

As a museum professional, you should encourage access to and use of collections and their data. You need to balance preservation and protection with providing physical and intellectual access to the collections. You must implement the requirements outlined by NPS policies and procedures, while adhering to professional museum standards, ethics, and the law. For additional information on museum and professional ethics, refer to Section D, Ethical Issues; for information on legal issues, see *MH-III*, Chapter 2, Legal Issues.

Consider the following when evaluating a request:

- Will the user be adequately supervised?

  Make sure users will be continuously supervised. You or your staff should take the selected materials to the research room and monitor researchers while they work. You should have sufficient staff to provide the objects, monitor researchers, and respond to their needs. You also should document all materials used. ***Your access hours don't have to be extensive but must be continuously supervised***. If staffing is an issue, limit access to certain predetermined times during work hours.

  Well-supervised access reflects a well-managed collection. Refer to *MH-I*, Chapter 9, Museum Collections Security and Fire Protection, and Appendix G, Protection of NPS Museum Collections, and *MH-II*, Appendix D, Museum Archives and Manuscript Collections.

- Will users have sufficient space?

  Assign a research room for users to view and study museum objects. The room should be outside the collections storage area. See *MH-III*, Appendix D, Guidance on Planning for a Research Space, and *MH-I*, Appendix F, NPS Museum Collections Management, which direct museum storage to be separate from all other uses.

  A research room also can be an appropriate shared space outside storage where the user can work. It should be a room close to the curatorial staff workspace. This proximity allows you to supervise users easily and answer their questions.

  You might use the park library reading room if no other space is available. Refer to *MH-III*, Appendix D, for additional information on using research spaces.

  Never leave a researcher unmonitored in areas with collection materials.

.

- Are the materials accessioned and cataloged?

  All collections should be accessioned and cataloged prior to use. This way you can track what collections are used and ensure greater accountability and security. If you allow access to and use of unaccessioned and uncataloged collections, you are exposing them to great risk, as you can't prove they are NPS property if they are stolen or damaged. You must make every effort, in accordance with *MH-II*, Chapter 2, Accessioning, and Chapter 3, Cataloging, to accession and catalog collections to make them available for use. Accession and catalog data also provide context, collection provenance or history, object provenience, and research information that are extremely valuable to the user. A catalog record greatly helps the user's research.

- Are the materials too fragile to use?

  Collections use should be compatible with preservation objectives. If the object is so fragile that handling it will cause irreparable damage, provide the requestor with an image (photographic or digital) of the object, or a facsimile of the item, plus accompanying information. You should have a collection conservation survey done, and prioritize and address collections conservation and stabilization needs. Refer to Section G of this chapter. You also should have high quality photographs of the most used and fragile objects in the collection.

- Does the proposed borrower's facility meet NPS outgoing loan standards?

  If the object will be used away from the museum collections storage, research room, work area, or from the park itself, you must generate an NPS outgoing loan agreement. The user (borrower) must meet all the conditions noted in the agreement. The user is responsible for treating collections carefully to maximize their future usefulness.

  The borrowing institution must meet the standards outlined in the *Revised Standard Facility Report* published by the American Association of Museums. See Section G of this chapter and refer to *MH-II*, Chapter 5, Outgoing Loans, Section C, Documenting Loans, for additional information on the facilities report.

- Are there any legal restrictions on the item?

  See *MH-III*, Chapter 2, Legal Issues.

3. *What NPS procedural guidelines cover using museum collections?*

NPS *MH-I* contains preservation and protection and *MH-II* contains documentation guidance to effectively use NPS museum collections. The *Conserve O Gram* (*COG*) series provides additional topical and timely information on preventive conservation for NPS museum collections.

- What NPS management policies and guidelines do I need to know?

  Become familiar with the sections related to managing museum collections in the NPS policies and guidelines listed below.

  – NPS Management Policies (1988)

    This document contains policies that provide direction and set the parameters for management decisions in administrating the National Park Service. The following chapters deal with museum collections:

    Chapter 4: Natural Resource Management, covering Natural Resource Collections

    Chapter 5: Cultural Resource Management, Museum Objects and Library Materials, covering Treatment of Museum Objects; Acquisition, Management, and Disposition of Museum Objects; Historic Furnishings; Archives and Manuscripts; and Library Materials

  – Director's Orders

    Director's Orders outline the policies, instructions, and requirements imposed on the NPS at the Director's discretion. They don't restate policies and requirements imposed on the NPS by law, the President, the Secretary, or any other entity. The Director's Orders may, however, affirm that the NPS will comply with those policies and requirements.

  – NPS Management Guidelines

    NPS management guidelines outline the policies and procedures for many programs. The following pertinent NPS guidelines contain policies and procedures directly related to managing museum collections. They allow us to identify, preserve, protect, and document museum collections for present and future uses:

    NPS Cultural Resource Management Guideline
    (formerly NPS-28)
    NPS Natural Resources Management Guideline
    (formerly NPS-77)
    NPS Personal Property Management Guideline
    (formerly NPS-44)
    NPS Records Management Guideline (in prep.)
    (formerly NPS-19)
    NPS Special Park Uses Guideline
    (formerly NPS-53)
    NPS Interpretation and Visitor Services Guideline
    (formerly NPS-6)

You should be familiar with the *Departmental Manual* Part 411, Policies and Standards for Managing Museum Collections. This document outlines policies, responsibilities, actions, and standards for managing museum property in Department of the Interior bureaus. Refer to *MH-I*, Appendix A, Mandates and Standards, Section B, Departmental Policies and Standards for further information.

- Are the items entered into ANCS?

  Make sure all museum collections that will be used have been accessioned and cataloged into the Automated National Catalog System (ANCS) prior to use. This includes objects loaned to off-site repositories. By entering information into ANCS and its successor, ANCS+, you readily can record and track information related to museum collection use.

- What are associated data and how may they be used?

  Associated data refer to related information on a specific object or group of objects. Associated data include but are not limited to source of accession information, collection provenance or history (object provenience), and legal documentation of the collection. The catalog record contains extensive data categories that capture information on the object. Additional related data, such as annotations and research findings, are filed in the accession or catalog folder. Field notes, in particular, contain important and associated collection data.

  These data are critical to the full understanding and appreciation of the object. Without these data, the research value of the object is diminished greatly. Know the various laws restricting access to museum collection data. Refer to *MH-III*, Chapter 2, Legal Issues, and to Question 4 below.

4. *What data do I need to restrict?*

MH-III, Chapter 2, Legal Issues, fully outlines the laws that deal with information on museum collections. Don't give out the following data:

- site location and the nature of archeological resources in accordance with the Archeological Resources Protection Act (ARPA) of 1979

- information protected by privacy and publicity law such as images or words of living private individuals (See *MH-III*, Chapter 2, Legal Issues.)

- location, character, and ownership information on historic resources, including cultural or religious sites, paleontological specimens, geological specimens, and culturally affiliated resources if the disclosure might invade privacy, impede the use of a traditional religious site by a practitioner, or endanger the historic resource according to the National Historic Preservation Act Amendment of 1980 (16 USC 470 w-3) (See *MH-III*, Chapter 2, Legal Issues, for guidance.)

Also restrict the following types of data:

- location information on nesting sites or other specific habitat information on threatened and endangered species consistent with the purpose of the Endangered Species Act (16 USC 1531 et seq.) and NPS Management Policies

- museum collection storage location and appraisal and insurance values, if the release may place collections at risk

- donor and lender addresses, the release of which may infringe on individuals' privacy

  Names may be restricted to the fullest extent allowed by law if the donor or lender requests it. Place a notation in the accession folder, describing the donor or lender's privacy request at the time of the accession.

  Such information may be considered releasable under the Freedom of Information Act (FOIA) on a case-by-case basis. If you receive a FOIA request, alert your superintendent and immediately contact and work with the FOIA officer to develop a response. Also talk to other affected NPS professionals such as the chief of resources (natural and cultural), Support Office (SO) curator and regional public relations officer. See Section F, Scientific Issues, and *MH-III*, Chapter 2, Legal Issues.

5. *What do I need to know about consumptive use?*

Consumptive use (destructive analysis or sampling) destroys or alters all or part of an object or specimen. It is an acceptable use of certain items in NPS museum collections. *Cultural Resource Management Guideline*, Chapter 9, Section 4, Consumptive Use of Collections states:

> *(c) Destructive analysis is a legitimate use of museum collections for approved research purposes when the impact is minor or when the object is common, in which case approval by the superintendent is required. If an object is rare or significant, a request for destructive analysis must be reviewed by the SO curator and approved by the regional director . . . .*

Consumptive use of type specimens is not allowed.

Cultural Resource Management Guideline, Chapter 9, further states:

(e) The regional director will grant no exemption for use that might lead to loss or deterioration of museum objects that are directly connected with or prime survivors from the park's historic periods, events, or personalities; or are type specimens or one-of-a-kind natural history specimens; or are from systematic archeological collections, have known archeological site provenience, or have scientific value that has not been extracted and documented; or remain of scientific interest. The justification statement must certify that the objects requested for exemption do not meet the above criteria. If this certification cannot be provided, an exemption may be granted only by the director . . . .

(f) No exemption will be granted for use of museum objects where such use may lead to loss or destruction of human remains, associated or unassociated funerary objects, sacred objects, or objects of cultural patrimony as defined by the Native American Graves Protection and Repatriation Act, unless such use is approved by the affiliated cultural group in addition to the regional director or director . . . .

(g) *An exemption may be granted for scientific analysis . . . of any museum object, except natural history type specimens, if that analysis is based on a professional research design that clearly documents the scientific need for the use of such techniques . . . .*

For specific information on how to obtain permission for consumptive use of collections, including threatened and endangered species, see *Cultural Resource Management Guideline*, Chapter 9, Section 4, Consumptive Use of Collections. The *Guideline* specifies that the regional archeologist or equivalent must be involved in the review of all proposals for destructive analysis of rare or significant archeological objects or materials. For additional information on threatened and endangered species, see Section F.

Many research uses involve destructive sampling. However, because of developing technologies that allow more powerful and non-invasive analysis, you should use caution when "using up" scarce objects or specimens for destructive analysis. The Guidelines for the Care of Natural History Collections published by the Society for the Preservation of Natural History Collections in *Collection Forum* 10, no. 1, p. 32-40 (1994) state:

Balance between use and preservation: *Associated with the responsibility of ongoing use and education use is obligation of the institution to maximize the value of each specimen for future use. This applies not only to the data associated with each specimen, but also to the physical and chemical integrity of the specimen. Thus, it is critical that the demands placed on natural history specimens for current research and education uses are balanced with the need for preservation of the specimens for future use.*

Consider the following criteria outlined in *Guidelines for Institutional Policies and Planning Natural History Collections* published by the Association of Systematics Collections, 1994, when you evaluate a written request to do destructive analysis:

- *The intended use must have scientific merit.*
- *The researcher must demonstrate competence with the proposed methods . . . .*
- *The proposed methods must be the least intrusive for obtaining the intended results, and must be likely to yield the intended results.*
- *The researcher must have sufficient resources to carry out the method.*
- *There must be sufficient material available to support the destructive sampling without sacrificing all the available material of the particular collecting event (lot or herbarium sheet) . . . .*
- *The researcher must be able to stipulate that (s)he has used all relevant specimens/objects available at the home institution first.*
- *The potential for compromising future utility of the specimen or object for other investigation should be minimized.*
- *The researcher should intend to disseminate results of the work within a reasonable amount of time.*
- *The researcher should be willing to abide by the institution's operational standards for processing and documentation.*
- *The researcher must indicate the quantity of material necessary for his/her research . . . .*
- *Failure of an individual to comply with institutional requirements and standards in previous transactions may be grounds for denying any new requests . . . .*

The researcher should:

- pay for all associated costs
- document the procedure used
- return all unused portions of objects or specimens unless otherwise agreed to in writing
- provide the park with a copy of the resulting analytical data and duplicates of tangible products such as slides within a stipulated time period

6. *What do I need to know about the chain of custody?*

Chain of custody is a legal term used when law enforcement issues or matters of evidence are at stake. Objects, specimens, archives, or personal papers that are collected or impounded for use in a court case as evidence may be subject to a chain of custody.

You must house these objects separately with tightly controlled security and limit access to authorized users. Everyone, including the curator and law enforcement officer(s), who views or handles the objects must log whenever these objects are accessed or used. As the person authorized to hold this material, you must be present whenever this material is viewed or handled by anyone. Nothing may be removed or rearranged. The chain of custody ensures that you can document everyone who had access to the evidence while it was in your custody. Your documentation must be able to withstand scrutiny in a court of law.

7. *What do I need to know about hazardous materials and chemical contamination?*

You should determine what parts of the collections may pose a problem; for example, mercury- or arsenic-treated specimens, radioactive minerals, asbestos-plaster mounts, or moldy, insect- or pest-contaminated records. Older collections especially are vulnerable and have a higher incidence of contamination from chemicals used to prepare, preserve, and protect specimens. Determine what problems may arise from materials used to treat or prepare collections historically, such as arsenic, mercuric chloride, DDT; vaporizing compounds with residues such as naphthalene or paradichlorobenzene; or wet collection fluids such as formaldehyde or alcohol. Review all collection documentation, annotation labels, and preparation notes to determine which chemicals were used to prepare collections. Research manuals and procedures that state past practices. Check the specimens for traces of chemical contamination.

Handling some objects and biological, geological, and paleontological specimens in the museum can present health risks. Be aware of potential hazards and, if appropriate, monitor for chemical agents.

If you suspect chemicals have been used, call in a specialist or test them yourself. Refer to *MH-I*, Chapter 11 and Appendix H, Curatorial Health and Safety, and the nine *Conserve O Grams 2/1-9* on security, fire and curatorial safety. Record all chemicals used to prepare or treat specimens on the catalog record and the accession and catalog folders.

Inform users about objects that may have been treated or contaminated. If possible, have the object decontaminated when you receive a use request. Consult your park safety officer, a conservator, and the SO curator.

When NAGPRA items are repatriated, notify the recipients of any hazards associated with the items, such as arsenic or residual chemicals from fumigation.

8. *How do I establish and implement a park access and use policy?*

Establish an access policy that covers the park purpose, times of operation, and general access procedures. Refer to *MH-I*, Figure G.5. Sample Park Museum Collection Access Policy and Procedures, for general museum collections, *MH-II*, Figure D.13, Access Policies and Rules Governing Use (Sample), for archival collections, and this chapter. You can adopt these sample policies as they are, or adapt them to your park's needs. The policy should be available to users of the collections. See Section C, Question 1, on establishing a working group to develop a park access and use policy.

D. Ethical Issues

1. *What ethical issues affect access and use of NPS museum collections?*

Ethical issues affecting museum collections use include equal access for all researchers; civility and cooperation with colleagues and the general public; scholarly integrity; respect for confidential and private information; and a professional commitment to preservation.

In general, NPS staff must perform their responsibilities as described in the *Museum Handbook*, Parts I and II, Appendix A, Mandates and Standards; *MH-I*, Appendix D, Code of Ethics for Curators, Archivists, and Conservators; and in the ethical statements of the American Association of Museums (AAM), the American Association for State and Local History (AASLH), and the Society of American Archivists (SAA). The questions below further define appropriate conduct for NPS museum curators and archivists.

2. *What is equal access and how do I provide it?*

Equal access is a fundamental principle. However, museum and archival and manuscript collections have two very different access and use traditions. See Section I, User Qualifications.

- ***For museum objects***, equal access means treating all researchers the same, whether they are NPS staff members or outside researchers. If you require an evaluation process before authorizing use of collec-tions, you must apply this requirement to all individuals conducting personal research, including staff.

  The International Council of Museums (ICOM) Code of Professional Ethics states:

  > *It is the responsibility of the museum to use the collections for the creation and dissemination of new knowledge through research, educational work, permanent displays, temporary exhibitions and other special activities...the museum should seek to ensure that information in displays and exhibitions is honest and objective and does not perpetuate myths or stereotypes . . . .*

> *Members of the museum profession should deal with the public efficiently and courteously at all times and should in particular deal promptly with all correspondence and enquiries. Subject to the requirements of confidentiality in a particular case, they should share their expertise . . . allowing bona fide researchers properly controlled but, so far as possible, full access to any material or documentation in their care even when this is the subject of personal research or a special field of interest.*

The AAM 1994 *Code of Ethics for Museums* states:

> *The museum ensures that . . . access to the collections and regulated information is [sic] permitted and regulated . . . .*

All policies and procedures (such as user evaluations) must be implemented equally for staff, visitors, and scholars. For a fuller view of how museum access and use policies have developed differently from archival access and use policies, see Section I, User Qualifications.

- ***For museum archival and manuscript collections***, equal access means providing access to all without review processes or credential evaluations. All taxpayers and visitors have a right to use federally held records and archival collections for research, according to FOIA and state Sunshine (state equivalent of FOIA) laws.

  The American Library Association-Society of American Archivists' (ALA-SAA) *Joint Statement on Access to Original Research Materials, in Libraries, Archives, and Manuscript Repositories* states:

  > *It is the responsibility of a library, archives, or manuscript repository to make available original research materials in its possession on equal terms of access . . . A repository should not deny access to materials to any person or persons, nor grant privileged or exclusive use of materials to any person or persons, nor conceal the existence of any body of material from any researcher, unless required to do so by law, donor, or purchase stipulation.*

  The American Historical Association (AHA) *Statement on Standards of Professional Conduct* states:

  > *Since historians must have access to sources—archival and other—in order to produce reliable history, they have a professional obligation to preserve sources and advocate free, open, equal and nondiscriminatory access to them, and to avoid actions which might prejudice future access.*

  You need policies, procedures, appropriate forms, and staff training in monitoring access and providing reference services before granting access. If you are determining procedures and restrictions as the research occurs, you are failing to meet NPS standards.

If you don't have enough staff to handle walk-in researchers (all collections use must be continuously supervised), your access policies may require an appointment. Your policy may not state that only scholars or staff may use the materials, nor may you restrict permanently your archival and manuscript collections without a legal basis. Not having a reference staff is an unacceptable excuse for long-term restrictions. You must learn how to handle reference work or train staff to do it.

FOIA requests may require you to provide access to collections previously designated as restricted by the donor. These restrictions must be honored to the extent allowed by law. It's NPS policy not to accept restricted donations. See *MH-II*, Chapter 2, Accessioning, Figure 2. When such restrictions conflict with a FOIA request, consult with your FOIA officer, the NPS solicitor, and the SO curator.

Once federal archival and manuscript collections are made available to one, they are available to ***all*** (with the exception of materials exempted by law or preservation condition). See *MH-III*, Chapter 2, Legal Issues, for further guidance on FOIA and other legal issues. For a sample access policy and rules governing use, see *MH-II*, Appendix D, Museum Archives and Manuscript Collections, Figures D.13a-b.

- ***For equal access to both museum and archival collections***, establish clear and fair written policies and procedures. Apply your standard operating procedure for handling research and duplication requests equitably, whether the requests come by phone, fax, e-mail, or in person. Restrictions must apply equally to staff, visitors, students, scholars, and others. Staff are not allowed to research within restricted collections. Restrictions can be applied only to the extent allowed by law. For example, FOIA may legally require access to some materials that donors or staff have restricted for legal, ethical, or cultural reasons. Work with your superintendent, FOIA officer, and the NPS solicitor to resolve conflicts between restrictions and legal access requirements.

3. *What are ethical standards of civility and professional cooperation?*

Professional behavior forms a crucial part of this ethical responsibility for equitable access. The ICOM Code of Professional Ethics states,

> *Members of the museum profession have an obligation . . . to share their knowledge and experience with their colleagues and with scholars and students in relevant fields. They should show their appreciation and respect to those from whom they have learned and should present without thought of personal gain such advancements in techniques and experience that may be of benefit to others . . . .*

- ***Courteous treatment of researchers:*** All researchers must be made welcome and treated courteously and equitably. NPS policy requires that museum staff serve the public in a professional and courteous manner, regardless of personal inclinations or other duties. NPS staff also are expected to work cooperatively with colleagues.

NPS collections are supported by taxpayer dollars; therefore, it is our responsibility to make these collections available to those for whom we hold them in trust. FOIA and state Sunshine laws provide external mechanisms for enforcing such access.

NPS should respond promptly to all reference requests for museum object and archival and manuscript collections, generally within 20 working days.

NPS researcher registration procedures provide an internal process for providing equal access. See *MH-II,* Appendix D, Museum Archives and Manuscript Collections, Sections T and U, for guidance.

- ***Collegial Civility:*** NPS staff also have a professional responsibility to:

  – treat their colleagues civilly and with consideration

  – respect diverse viewpoints

  – resolve disagreements without rancor

  – seek common ground for fruitful collaborations

  The ICOM Code of Professional Ethics states:

  > *Members of the profession form working relationships in the course of their duties with numerous other people, both professional and otherwise, within and outside the museum in which they are employed. They are expected to conduct these relationships with courtesy and fair-mindedness and to render their professional services to others efficiently and at a high standard.*

  When disagreements occur, as they do in all communities, both parties are responsible for working together to reach common ground. If personalities become an issue, return the focus to actual performance and behavior. Work together to resolve difficulties.

  The American Historical Association (AHA) 1992 Statement on Standards of Professional Conduct states:

  > *. . . the preeminent value of all intellectual communities is reasoned discourse—the continuous colloquy among historians of diverse points of view . . . .*

- ***Professional Cooperative Responsibilities:*** NPS museum staff are encouraged to work in partnership with other museums, libraries, archives, universities, and associations within their state and region to ensure the best preservation, protection, management, and access to NPS museum collections and data.

Staff are encouraged to develop cooperative preservation, descriptive, and access and use strategies to maximize resources and researcher access. For cooperative archival documentation strategies, refer to *MH-II*, Appendix D, Section Q, Questions 11-16. These strategies might include:

- cooperative development work to fund cataloging, preservation and use activities
- shared World Wide Web sites with area museums, archives, and libraries featuring online exhibitions, finding aids, virtual tours, and similar access systems
- cross-referenced and linked Web sites
- shared funding development campaigns with regional repositories, cooperating associations, the National Park Foundation, and other sources to enhance access
- shared published thematic catalogs or shared guides to multiple repository collections (union guides) in a region
- collaborative exhibits and exhibit catalogs using collections from several museums that can be sent to each museum involved
- collaborative research and analysis on collections in more than one museum

Forming partnerships with related organizations enhances the quantity and quality of work completed, giving the general public better access to collections. Additionally, sharing information on museum and archival procedures, techniques, and methods improves the professionalism of all involved. The NPS supports cooperative work with other federal, state, and local organizations and institutions to help meet preservation and access goals for parks and programs.

4. *What is scholarly integrity and what role does it play in providing access to collections?*

Scholarly integrity refers to the high standard of scholarly accuracy, balanced viewpoint, and lack of conflicts of interest that scholars are expected to achieve in their work. Scholarly integrity applies to NPS staff, including museum staff.

- ***NPS staff use of collections for personal research:*** You may use collections for personal research on your own time, as long as this research is:
  - supervised continuously by a professional
  - made known to your immediate supervisor
  - made known to other scholars using the same materials

You may not use restricted collections for ***personal*** research if those collections are not equally available to all researchers. However, you may use them for management purposes as needed. Avoid using NPS collections in a manner that may be judged a conflict of interest. Potential conflicts should be discussed with the NPS ethics officer.

- ***NPS staff publications:*** Staff should adhere to high standards of research, writing, editing, exhibitions, cultural consultation, and interpretation. Staff must:
  - be aware of changes in research resources, methodologies, and techniques by taking appropriate courses, learning from partners, reading widely, and consulting reviews of the published record
  - avoid factual inaccuracies by checking reputable sources carefully
  - avoid infringing copyright, privacy, and publicity laws and triggering lawsuits by obtaining necessary permissions and licenses
  - not plagiarize, but properly acknowledge others whose work has been used
  - keep informed of publications and exhibitions technologies and techniques in order to choose appropriate technologies for a message
  - conscientiously cite captions and credit lines as requested by creators and repositories holding original materials
  - avoid stereotypes and assumptions by reading widely both historical and current scholarship
  - obtain peer review from a range of qualified scholars and traditionally associated groups
- ***NPS museum staff personal collecting:*** See *MH-I*, Chapter 1, NPS Museums and Collections, Section F, 4b.2, Personal Collecting.
- ***Avoidance of Conflicts of Interest:*** NPS staff are expected to avoid situations that present a conflict of interest between their professional and private lives. See *MH-I*, Chapter 1, Section F, and *Ethics: An Employee Guide* (U.S. Department of the Interior, 1998). If you are uncertain if a situation poses a serious conflict, contact your supervisor, the NPS Ethics Officer, and your SO curator.

5. *How do privacy, confidentiality, and related restrictions affect my conduct?*

A variety of privacy and confidentiality issues affect how NPS staff grant access to and use of NPS collections, including those listed below:

- ***Privacy of donor and lender negotiations:*** Museums and archives have a professional responsibility to respect donors' and lenders' privacy by not divulging information on donor and lender negotiations or contacts. Honor this restriction to the fullest extent allowed by the law. This information might include:

- security arrangements of private or NPS collections
- quality and nature of materials brought into the museum for identification
- addresses of donors, lenders, or potential donors or lenders.

  Note: Names may be restricted to the fullest extent allowed by law if the donor or lender requests it.

When uncertain of the extent of privacy protection, contact the NPS solicitor and your SO curator. The solicitor may determine that you can restrict this information based upon the National Historic Preservation Act Amendments of 1980. FOIA requests for donor negotiation information must be dealt with according to FOIA policy. See *MH-III*, Chapter 2, Section E, Question 1, and Section F, Question 11.

- ***Privacy of employee personnel, medical, and psychiatric records:*** Don't accession this material into the museum collection; it should be maintained in the park's records management system. If the records are official records, they belong in the National Archives not in the NPS museum collections. If they aren't official records, they are protected by privacy legislation during the lifetime of the individuals documented. See *MH-III*, Chapter 2, Section D, Question 4.

- ***Privacy of research:*** Both museum and archival researchers, whether NPS staff or outside users, must complete registration and duplication request forms according to NPS policy. See Section J, Documentation. These forms are required to:

  - maintain use documentation
  - help plan future acquisitions strategies
  - plan for publications
  - enhance replevin (legal return of illegally removed collections through the courts)
  - discourage theft
  - document parties who may be responsible for collections damage, vandalism, or theft

  Although NPS staff collect and maintain these forms for administrative purposes, NPS curators and archivists support the privacy of researcher registration and duplication data to the extent allowed by law.

Treat researcher registration, circulation, and duplication data as if it were both privileged and private (restricted). In general, don't tell researchers:

- what topic other scholars or students are working on
- what is being used as research materials
- what is being duplicated

The only exceptions to this guidance are:

- When possible, notify researchers of similar research by other individuals using the same materials, to save both researchers from conflicts later. Obtain permission from both parties before such notification.
- Once permission is obtained, parks may share this information for management purposes, such as for Government Performance Results Act (GPRA).

- ***Privacy and confidentiality issues relating to the collection's content:*** Both federal and state law protect the privacy of living, private individuals, while publicity laws in almost half of the states protect celebrities and their estates from unapproved commercial uses of their images. Other specific legislation described in *MH-III*, Chapter 2, protects location information for certain types of materials.

  The ICOM Code of Professional Ethics states:

  > *There is a special responsibility to respect the personal confidences contained in oral history or other personal material. Investigators using recording devices such as cameras or tape recorders or the techniques of oral interviewing should take special care to protect their data and persons investigated, photographed, or interviewed should have the right to remain anonymous if they so choose.*
  >
  > *This right should be respected where it has been specifically promised. Where there is no clear understanding to the contrary, the primary responsibility of the investigator is to ensure that no information is revealed that might harm the informant or his or her community.*

  Museum staff and their families must not personally profit from, or publish data or information obtained, while working with restricted collections. Restricted access means no one, including staff, has access for personal research.

- ***Sensitivity to cultural issues:*** Cultural issues may pose powerful ethical challenges for many NPS museum staff. For guidance see Section E, Cultural Issues; *MH-III*, Chapter 2, Legal Issues; and *Cultural Resource Management Guideline.*

- ***Donor and lender access and use restrictions:*** While the expressed restrictions of collection donors and lenders don't override federal legislation, such as FOIA provisions or subpoenas (see *MH-III*, Chapter 2, Legal Issues), NPS staff should honor donor and lender restrictions to the fullest extent allowed by law. See *MH-II*, Chapter 2, Accessions. It may be necessary to talk with the NPS solicitor on how to best meet donor and lender requirements without conflicting with equal access or FOIA provisions.

6. *What role should preservation play in NPS ethical values?*

The ICOM Code of Professional Ethics states:

> *Subject to the primary duty of the museum to preserve unimpaired for the future the significant material that comprises the museum collections, it is the responsibility of the museum to use the collections for the creation and dissemination of new knowledge . . .*

- ***Preservation of the museum collections:*** Use of collections should not cause significant and irreversible damage to the collections. The exception is destructive analysis, which is a legitimate use of museum collections for approved research purposes when the effect is minor or the object is common. See *Cultural Resource Management Guideline*, Chapter 9, Management of Museum Objects. While all exposure to light, handling, and duplication causes some damage, this is a natural part of the inevitable self-destruction of all organic materials. NPS staff will attempt to mitigate this damage to the greatest extent by following the guidance in *MH-I*, and in Section G, Preservation and Protection Issues, below.

- ***Preservation of the informational context of museum objects:*** Much of an object's value resides in the information we have about it, including its creator, collector, provenance or history, provenience, cultural and historical context, and topical identifiers, such as:

  – collection provenience for archeology

  – phylum, class, order, family, genus, and species for biological, and paleontological specimens

  – artist, style, medium, technique, iconography, and period for art or historical works

  – creator, dates, provenance, physical description, subject matter, arrangement, restrictions, and historical background for an archival or manuscript collection

  It is equally essential, for legal reasons, to document any:

  – special permissions or authorizations for use

  – releases (model releases or interviewee releases)

  – site licenses

These legal authorizations allow copyright or privacy and publicity-protected materials to be used in publications, exhibitions, and other special uses, including the Internet, such as the World Wide Web. You are responsible for accurately maintaining this information and documentation.

Take care to accurately and sensitively reflect the object or document creator's perspective and the cultural context without the addition of errors or unsubstantiated personal opinions.

Museum staff must be:

- eager to serve their audiences with useful and accurate materials
- able to safeguard the accuracy and currency of the data they have on museum collections
- knowledgeable about how to conduct research in a professional manner
- willing to share their work for peer and associated community review and commentary prior to publication
- able to accept editing, fact-checking, and correction
- willing to share their sources, data, and evidence in case of a challenge to the publication or exhibition text
- responsible for monitoring to ensure the object's cultural context is accurately and sensitively reflected in products of researchers, in NPS publications and in other uses of the collections

When researching and interpreting museum materials during cataloging, exhibitions, publications, and reference work, avoid inserting stereotypes, assumptions, and unsubstantiated personal opinions into the accessioning, cataloging, description, and reference. All personal opinions and observations should be identified and documented as such.

Museum staff are responsible for enhancing this contextual information through accurate and scholarly research that follows the best practices of the profession. Every attempt should be made to capture substantiated expert knowledge held by donors, scholars, and associated groups for the museum documentation, particularly the catalog record and archival finding aids. Research of NPS museum collections must not endanger this informational context.

Databases, finding aids and other descriptive systems (including automated systems) must be designed and managed to make it impossible for researchers to change data or to access legally restricted data, such as archeological site location information. See *MH-III*, Chapter 2, Legal Issues.

Responsibilities of Museum Staff	
To whom are you responsible?	**What must you do?**
The General Public	• Provide equal access to all non-restricted collections to the extent allowed by law and consistent with NPS policy. • Protect private and confidential information to the fullest extent allowed by law. • Ensure the security of the museum collection. – Don't provide access to unaccessioned and uncataloged collections. – Don't provide access without supervision. – Don't provide access to originals of high-value or fragile materials. – Deny access to collections to researchers who have been known to steal from or damage collections. • Preserve integrity, accuracy, and completeness of the information context (documentation) of museum objects. • Preserve the museum collection physically. – Teach researchers how to handle items. – Provide photographs or duplicates for research when materials are fragile. – Maintain proper surveillance of researchers. – Ensure the research room environment doesn't endanger items. • Record expert knowledge of donors, scholars, and associated groups and add it to the museum documentation as appropriate.
Your Employer (the NPS) **Your Employer** (cont.)	• Avoid all conflicts of interest and appearance of such, in the subject area of the collections including: – personal research in restricted collections – personal publication or distribution of restricted information – competitive employment or businesses – appraisal of objects outside NPS – receipt of personal gifts – development or research on personal collections – removal of research materials and documentation created during the scope of employment • Follow the letter and the spirit of NPS and DOI policies and procedures. • Work in a fully professional fashion following the guidelines provided by professional associations (AAM, SAA, and AASLH).
Yourself and Other Employees	• Ensure your staff knows and uses NPS museum management ethics policy and legal guidelines. See *MH-III*, Chapter 2, Legal Issues, and *MH-I*, Appendix D, Code of Ethics for Curators, Archivists, and Conservators. • Monitor staff compliance. • Ensure staff use of museum collections is equitable, made known to supervisors and other scholars using the same material. • Determine that NPS staff don't conduct personal research in restricted collections, or publish or distribute restricted information. Staff must not get privileged access.

Responsibilities of Museum Staff	
To whom are you responsible?	**What must you do?**
	• Ensure NPS staff are informed they can't become dealers or receive gifts from dealers.
Our Donors and Lenders	• Ensure the privacy of donor and lender negotiation information to the extent allowed by law, unless or until written permission is received to share this information. • Follow existing access and use restrictions to the fullest extent allowed by law. • Capture the donor's knowledge about the donated materials. • Obtain from the donor all copyrights, model and interview release forms, and related permissions so that NPS can use the collection fully.
Creators and Their Heirs	• Obtain from all creators or their heirs all copyrights, model and interview release forms, and related permissions so that NPS can fully use the collections. • Give full credit to the creator in all credit lines and citations. • Respect creator restrictions to the fullest extent allowed by law.
Those peoples and groups whose collections NPS holds, or who appear as subject matter of NPS collections – Affected groups – Ethnic groups – Native Americans – Native Hawaiians **Peoples and Groups** (cont) – Private individuals – Religious groups	• Follow legal and policy guidelines on access and use. • Ensure collections are treated with respect and empathy for associated groups. • Investigate and document potential collection sensitivity issues when collections are acquired and ***before*** providing access. • Be aware of laws that affect access to these materials. See *MH-III*, Chapter 2, Legal Issues. • Consult with the associated groups ***before*** making decisions that may affect the group, such as acquisition of or access to sacred or otherwise sensitive materials. • Provide access to federal records as required by NPS policy and state and federal laws.
Your Users – Collaborators – News reporters – Park staff – Publishers – The public – Scholars – Students – Writers	• Provide equal access to all, regardless of whether they are staff, students, scholars, reporters, or public visitors. • Keep researcher registration and duplication data confidential to the fullest extent allowed by law. Only share this data with the researcher's permission. • Provide courteous, knowledgeable, and accurate reference service. • Maintain user documentation including copyright and privacy statements, researcher registration, and duplication forms. • Thoroughly document and maintain files on any permissions given or received to publish or use materials (including site licenses, publication permissions, copyright receipts) for exhibits, Internet sites, and publications.

Responsibilities of Museum Staff	
To whom are you responsible?	**What must you do?**
Your Professional Colleagues – Archeologists – Architects – Archivists – Biologists – Conservators – Curators – Geologists – Historians – Landscape Architects – Librarians – Paleontologists – Registrars	• Follow the professional ethics statements of archivists, curators, registrars, and related disciplines. • Provide to all high-quality reference and access service to collection records, consistent with NPS policy and state and federal laws. • Work with cooperative or collaborative partners, such as other museums, archives, educational programs, and libraries to: – create shared Web sites – publish union guides – develop travelling exhibitions and catalogs • Share information on NPS-developed access and use strategies at professional meetings

7. *What do I need to know about employee ethics*?

As a federal employee, you are expected to maintain high standards of honesty, integrity, impartiality, and conduct. These standards ensure the proper performance of government business and the continuing confidence of the people of the United States. As a federal employee, you're expected to serve the public responsibly and maintain the public trust. See *MH-I*, Chapter 1.

If you are offered monies for a work created during your normal scope of work as a NPS employee, consult your park Ethics Officer to determine if the park may transfer the money to the cooperating association or

equivalent approved donation accounts for use by the park. You must not personally accept a check or other payment for work completed on NPS time.

8. What do I need to know about professional ethics?

Most professional organizations publish ethics statements. See the Codes of Ethics for professions related to museum work in *MH-I*, Appendix D.

E. Cultural Issues

This section addresses some of the cultural concerns that affect use of cultural and natural collections. You should identify the associated groups that have an interest in the park collections, how they were made, created, and are stored, used, or made accessible. Work with the associated groups to identify their concerns and to honor those concerns to the fullest extent allowed under the law and NPS policies. Many groups have valid concerns about how their cultural heritage material is used. You need to understand and deal sensitively with these issues. Management Policies (5:10) states that interested persons will be permitted to inspect and study NPS museum objects and records in accordance with standards for preservation and use of collections and subject to the policies regarding confidentiality of resource data.

Where possible, consult with the associated groups before acquiring potentially sensitive museum collections. Keep in mind that access to NPS museum collections means balancing the interests of many traditionally associated groups—including makers, creators, scholars, and subjects—and those yet to come, whether of the culture represented or outside it. Consult with the SO curator, discipline specialists, your park FOIA officer, the NPS solicitor, and the NPS Ethics Office staff as necessary.

1. *What cultural concerns affect use?*

The western notion of intellectual property, copyright, and privacy is being widely discussed. Certain groups have proposed that indigenous peoples have special and collective rights to all aspects of their culture, whether expressed tangibly or not. Such an approach would protect ideas as well as recorded, filmed, painted, sculpted, choreographed, and written expressions of ideas. These proposals run counter to U.S. copyright legislation, which protects only tangible expressions for a limited time.

You should be aware of this debate, but remember you are obliged to follow the law (see *MH-III*, Chapter 2, Legal Issues), implement NPS policies and procedures, and act in accordance with professional standards and ethics. The concerns of some indigenous cultures need to be balanced against the:

- First Amendment rights to freedom of speech, allowing American citizens to write and speak about anything not expressly forbidden by law
- FOIA and related state Sunshine laws, which make information held by public institutions available to the public, unless a particular statutory restriction prohibits access
- lack of a mechanism for limiting access retroactively to information. Once information has been available to one researcher, FOIA requires that other researchers wishing to use the material in federal repositories have equal access
- existing copyright and privacy laws

2. *How do I identify the concerned parties?*

Work with your park or regional ethnographer to determine who the traditionally associated groups (the groups that may be affected by the use of the object) are by identifying the:

- creator of the object(s)
  - artist
  - collector
  - craftsperson
  - photographer
  - researcher
  - writer
- heirs and descendants of the original creator (who may still hold intellectual property rights, such as copyrights)
- donor(s)
  - may be the same or different from the creator or the creator's heirs
  - a collector who purchased or traded for object(s)
- descendants of the donor or former owners
  - may still hold some intellectual property rights, such as copyrights
- communities; tribes; social, ethnic, and occupational groups, whose identity is connected to the:
  - objects(s)
  - symbol(s) on the objects
  - non-symbolic representation(s) on the objects
  - associated rituals
  - associated stories or other legacy information
- archeologists, ethnographers, and others who may have excavated, collected, researched, or worked with the materials
- the general public as taxpayers, researchers, and potential users

An item may be associated with more than one group. Each associated group may have a set of cultural rules and meanings, each of which should be taken into consideration where possible.

3. *How does NAGPRA affect collections access and use?*

In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA) of 1990 (25 USC 3001-3013), NPS is required to consult with all associated or affiliated tribes and lineal descendants regarding the treatment and potential repatriation of those NPS museum collections defined as NAGPRA-eligible. Refer to *Cultural Resource Management Guideline, Appendix R, NAGPRA Compliance* and *MH-II,* Chapter 6, Deaccessioning, for additional information. Consult your SO curator concerning storage and handling procedures of NAGPRA-eligible collections.

NAGPRA doesn't provide a legal basis to restrict access and use of NAGPRA-eligible museum collections documentation or archives. NAGPRA doesn't call for the repatriation of archival and manuscript materials. Documentation of objects being repatriated via NAGPRA may be obtained by FOIA requests, even though the records may be sensitive. Traditionally associated groups should be informed that sensitive NAGPRA documentation cannot be withheld if a FOIA request for it is received. If you receive a FOIA request for NAGPRA documentation, consult with your superintendent, FOIA officer, NPS solicitor and SO curator as explained in *MH-III*, Chapter 2, Legal Issues.

Consider the effect on the traditionally associated groups if the information you collect and maintain is publicly available. You can't change the legal requirement to make information publicly accessible, but you can control what you collect. Collect and keep only the information necessary for managing NPS museum collections.

You may later need to justify your actions, such as deaccessioning, through appropriate documentation. If you have not collected adequate documentation or disposed of the documentation, you may be in a difficult situation. You can avoid this problem by providing more generic information without potentially problematic specifics. For example, you may be able to state, "this ceremonial rattle relates to Spring ceremonies," as opposed to "this XXXX rattle is held by the YYYY priest, who does the following six things with it to induce corn fertility in the Spring."

4. *How does the Executive Order 13007—Indian Sacred Sites affect access and use?*

The NPS management guidelines for carrying out the Executive Order are being drafted and will be distributed when finalized.

5. *What are the traditionally associated groups' concerns about access and use?*

Traditionally associated groups may be concerned about a collection item or the knowledge associated with it. This includes:

- what the item represents to cultural insiders
- information on object use

- documentation of ritual observations or associated stories

Potential concerns may arise with:

- ***Use by the museum in:***
  - exhibitions
  - conservation treatments
  - collections management handling
  - research
  - publications (including text, Internet, sound records, and moving and still images)
- ***Use by the general public when:***
  - photographing
  - interpreting
  - viewing
  - researching
  - handling
- ***Ceremonial use by the associated communities in:***
  - ceremonies in the museum
  - off-site ceremonies and ritual observances

There may be culturally defined rules for transmitting and controlling knowledge about the collection, which may involve rituals or prohibitions. See *MH-III*, Chapter 2.

Inform traditionally associated groups that NPS-held archives, manuscripts, and collections documentation are subject to FOIA.

As manager of the park collections, you must strike a balance among the rights of the:

- creator and the creator's heirs (may have the copyrights)
- potential users
- taxpayers who fund use of collections

- park to have accurate and complete collection management information
- individuals and groups documented

6. *What limitations may apply to access and use?*

Collections information may have the following legal restrictions. See *MH-III*, Chapter 2 for specific guidance.

- ***Federal and state privacy and publicity law*** restrictions may apply to the words, images, and persona of living private individuals and celebrities (whether dead or alive), including photographs, family letters, oral and video history interviews and transcripts, and similar materials.
- ***Copyright*** restrictions may apply to the words and works of individuals depending upon when they were created, and if and when they have been published.
- ***Archeological Resources Protection Act*** restrictions apply to location information on archeological excavations. You must **not** grant access to the location of archeological sites, potential sites, or shipwrecks in records, databases, or any format, even if the request is a FOIA request.
- ***National Historic Preservation Act*** restrictions may protect the disclosure of information that can create a substantial risk of harm, theft, or destruction of historic resources, as well as preventing disclosures that invade privacy or impede the use of traditional religious sites by practitioners.

Once made accessible to one researcher, archival and manuscript materials are available to all under the principle of equal access.

7. *What are some factors in determining access to and use of cultural materials?*

Different groups may have different rules about how acceptable access and use procedures are determined. These include:

- ***Gender:*** some materials are not available to women or to men
- ***Age:*** some materials are available only to tribal elders as keepers of traditional knowledge
- ***Social and occupational role:*** a person's occupation or membership in particular groups may prohibit using an object
- ***Group membership:*** a group may request access or information be restricted to a particular group
- ***Cultural prohibitions on information:*** for example, viewing or photographing powerful objects may be prohibited

This is one area where traditionally associated group concerns and NPS policies may be in opposition. Remember, you provide equal access to NPS museum collections, unless restricted by law or in accordance with NPS policy. Work with traditionally associated groups to share federal laws and NPS mandates, policies, and procedures, and to develop acceptable strategies. It may be possible to provide:

- ***Access during certain periods or only in certain spaces***
- ***Access via a copy***
- ***Access with notification***

  Allow the affiliated group to leave a statement with the museum explaining why the information is sensitive and should not be published. Researchers requesting the item may be asked to read the statement before access is granted.

If both parties are willing, arrange a meeting between the researcher and the traditionally associated groups to address concerns. Speak to your SO curator, discipline specialists, NPS solicitor, and FOIA officer for guidance.

8. *How does the use context affect cultural concerns about access and use?*

Some potential concerns include:

- ***Location:*** allowing access to a room where a negative event occurred can be a source of power or danger according to some cultures; a location may have negative or positive connotations
- ***Temporality:*** allowing researchers or staff to use material at a certain time of day or during a particular season may be problematic according to some cultures; the group may want certain uses restricted by date or time
- ***Object orientation:*** placing an object so that it faces a particular direction in an exhibit or for research may be problematic in some cultures
- ***Cultural context:*** allowing access by a researcher from a different group, may be a cause for concern; associated groups may object to exhibiting or loaning collections to rival groups
- ***Proximity to other objects:*** storing sacred objects of a particular group in a room that also has human remains or funerary objects may be problematic for some cultures

The associated group may request that certain ritual considerations be followed before or after use of a collection, such as the blessing of space or a cleansing ceremony. However, potential contamination issues can occur from some ceremonial or ritual activities (for example, if cornmeal is used, it may provide habitat for insects). Work with the group to ensure they understand the reasons for NPS policies and procedures. Make alternative arrangements, where possible, to accommodate these concerns.

9. *What cultural issues may arise when the general public uses a collection?*

When a member of the general public uses a collection, traditionally associated groups may request that public and researcher use be supervised by their representative in addition to NPS staff supervision. A member of the traditionally associated group could accompany the supervisor as an observer, if management so chooses, but only NPS staff should provide supervision. Alternatively, the manager may permit a qualified member of a traditionally associated group ***who is a NPS employee or volunteer*** to supervise. Another option is for the concerned associated group to leave a statement of concerns to be provided to researchers when the collection is used.

The NPS follows the principle of equal access. The researcher has the right to unobstructed access. Instead of installing a secondary observer, such as a member of the traditionally associated group, which may have a chilling affect on research, work with the traditionally associated groups to identify problematic material and develop access strategies that meet both NPS and the traditionally associated groups' goals. The agreed-upon access and use policies for these materials will be honored to the fullest extent allowed by law.

Work with traditionally associated groups to establish access procedures for sensitive cultural object(s) before providing access.

Traditionally associated groups may also request that the NPS restrict a type of use. For example, the associated community may indicate that viewing, but not touching, an object is acceptable or that some objects or information should be excluded from public or ceremonial use. Share the concerns of the aggregated group with the person(s) requesting access. Append a statement of concerns if one is provided. Anyone can use NPS collections if the use conforms to NPS policies and procedures.

10. *What concerns affect how traditionally associated groups use museum collections?*

The following issues may affect how traditionally associated groups use a museum object:

- ***Restricted use due to contested or shared affiliation:*** When an object is affiliated with several groups or when affiliation is contested, one group may ask that another be excluded from consultations and using the collection. Inform individuals requesting restrictions this is counter to NPS policy.

- ***Special use:*** Associated groups may request use of the collection for ceremonial activities, not all of which contribute to preserving the

  object. For example, the use may result in contaminates from blessing or cleansing rituals or body paint on textiles.

Special uses must be judged equitably by the:

- effect of the use on the object
- applicable legal restrictions on access
- donor and lender restrictions on access

- ***Off-site use:*** A use request may be for an off-site ceremony because the location of the event may be critical to its success. All uses, including off-site uses, must follow NPS policies and procedures, such as preparing an outgoing loan agreement. Each off-site use request is considered individually. You should have a NPS employee present to supervise the uses that are not traditional museum uses.

- ***On-site but unsupervised use:*** An associated group may want to perform a ritual unsupervised by NPS, which is against NPS procedures. If a member of the associated community is a NPS employee or volunteer, then that person could provide the supervision.

The following may affect how traditionally associated groups use collection data:

- ***Research and publication:*** If one group researches and publishes the subject document(s) or archival materials, it has opened the door for authorization of all future research and publication requests, regardless of source, under FOIA and equal access.

  Major research projects into a specific group's history, culture, or material culture initiated by NPS staff or an outsider should be undertaken in consultation with the traditionally associated groups where possible. There may be cultural concerns about who does the research, how the research is conducted, how the group will be represented in the study, and the distribution of the study. See *Cultural Resource Management Guideline* for guidance.

11. *What cultural concerns affect the use of natural history collections?*

Most cultural concerns affecting use of natural history collections mirror the concerns discussed above. Specific issues for natural history collections include:

- ***Use and value:*** The specimen may have multiple uses and values for one community, such as the yucca that has subsistence and ceremonial uses. These uses and values may be related to the traditionally associated groups' subsistence needs, or may be religious or ceremonial in nature. Refer to *Cultural Resource Management Guideline*, Chapter 10, Management of Ethnographic Resources.

- ***Meanings:*** The specimen(s) can have multiple meanings for different groups; for example, a bear skull can represent subsistence activities of one community, while it has ritual significance for another.

Associated groups may request that NPS restrict access to or use of certain information. This information may violate the parameters governing transmission of knowledge within a particular culture, for example:

- ***Ceremonial or medicinal access concerns:*** Groups may request that NPS restrict access to information on the ceremonial or medicinal uses of certain plants. For example, the medicinal qualities of a plant may be limited to all but a healer or midwife within the requesting culture.

- ***Plant locations:*** Groups may request that NPS restrict subsistence plant locations, especially for plants that gain power from a particular location.

Provide equal access to NPS collections with a few uniformly applied legal exceptions. According to the ethics policies of AAM and ICOM, and FOIA (for archives and museum documentation), if materials are available to one group they must be equally accessible to all. See Section D, Ethical Issues, Question 2.

12. *What other concerns may the traditionally associated groups have?*

Traditionally associated groups may be concerned about:

- scientific testing

- extensive handling

- reformatting or copying

Explain to the associated group, as you do to all users of NPS collections, how NPS staff care for collections. Share NPS guidance with the group. Consider inviting a member of the associated group to attend NPS collections management training. Where reasonable, legal, and ethical, follow the wishes of the associated group.

13. *When must I be sensitive to the concerns of traditionally associated groups?*

Always. Work with traditionally associated groups when developing procedures for using museum collections. Respectfully listen, understand, and honor concerns if they are legally, ethically, and reasonably possible under NPS policy and procedures. You should consult with the traditionally associated groups ***before*** access is provided.

> ***If the object, associated knowledge, use, or rituals have religious connotations or cultural restrictions, involve the associated group, where possible, in developing procedures to use and care for the object.***

14. *What do I do if I can't grant a traditionally associated group's request?*

If traditionally associated groups have made special requests for restricting or approving access or use of museum collections, it is important to work with them, even if their request can't be granted. Explain to them what NPS policies and federal and state laws dictate for access to NPS museum collections. Consult with your SO curator and ethnographer prior to meeting with the group to determine how best to ensure your message will be understood.

The group you are working with may have culturally defined roles and a specific context for transmitting knowledge on the associated materials. Some groups won't object to NPS doing research for management purposes, but they may want the data kept confidential. Because we can't guarantee confidentiality due to FOIA and state Sunshine laws, it is important to inform the groups of these legal constraints. In other cases, the group may request research, especially if its members are concerned that traditional knowledge is dying and they see NPS as a repository for their knowledge.

15. *What religious concerns must I consider?*

Cultural issues that affect use of religious item(s), include those discussed in Questions 1, 8, and 10. Identify the associated groups and religious concerns related to the collection. Sacred objects often require culturally specific procedures for care and use. Cultural rules governing the handling and use of an item may vary. See *NPS Management Policies* and *Cultural Resource Management Guideline. NPS Management Policies, Chapter 5:11, Ethnographic Resources,* requires that:

> *Certain contemporary Native American and other communities are permitted by law, regulation or policy to pursue customary religious . . . and other cultural uses of park resources with which they are traditionally associated . . . .*

NPS Management Policies, Chapter 8:9, Native American Use, states that in keeping with the spirit of the American Religious Freedom Act (42 USC 1996*),*

> *The NPS will be as unrestrictive as possible in permitting Native American access to and use of traditional sacred resources for customary ceremonials.*

and continues,

> *. . . requests to conduct Native American activities will be subject to the same criteria as other special park uses unless the activity is specifically authorized by federal statute or treaty right.*

Management Policies also states that the NPS will ensure the following:

> *. . . access to and use of natural and cultural resources in parks will be applied in an informed and balanced manner that is consistent with park purposes and does not unreasonably interfere with Native American use of . . . sacred resources and does not result in the degradation of park resources (8:9).*

Traditionally associated group(s) may request restrictions on access or use of information about the collection to cultural insiders or specific community members. The traditionally associated groups may:

- request specific procedures to protect the sacredness of the item, or to protect the people who come into contact with the item (See discussion in Question 1.)

- have cultural prohibitions on handling or viewing objects connected with a burial

- want to desanctify sacred objects in NPS custody, eliminating potential religious issues

Follow NPS policies and procedures, and legal guidelines for culturally sensitive collections, just as you do for all collections. Consult with your SO curator, FOIA officer, and the NPS solicitor if you have questions.

F. Scientific Issues

1. *What is a natural history type specimen?*

A type specimen is the actual specimen or series of specimens used to describe a taxonomic species or subspecies. It functions as the "name-bearer" of the species designated in the description of a species. Type specimens are the bearers of the scientific names for all taxa. There are several categories of type specimens, such as, holotype, isotype, paratype, and topotype. Refer to the *MH-II*, Appendix H, Natural History, for additional information on type specimens.

2. *What do I need to know about the use of type specimens?*

Type specimens are critically important to the scientific community and researchers because they are the international reference standards that provide objectivity in scientific nomenclature. It is an internationally accepted practice that all types are to be held in trust for science by those responsible for their safekeeping. In particular, type specimens are important to management of park natural resources.

Make every effort to ensure these specimens are readily available for present and future research, and for new and developing non-invasive analytical technologies by:

- maintaining them in good condition in a stable environment

- housing them in separate and secure housing within the museum storage area

- closely monitoring and controlling their access and use.

All requests to use a type specimen or series and associated collection data should be in writing. Students should include letters of recommendation from their advisors. The letters should include the type specimen(s) to be examined, and the nature of the use. Researchers should be able to demonstrate they are qualified to conduct the research, and that the particular type specimen(s) requested are critical to their research project. Consumptive use of type specimens is not allowed. See Section C, Question 5 above, for information on consumptive use of specimens.

Type specimens, in particular holotypes, should not be loaned from the collection unless they are on loan to a repository for management and storage purposes where they may be made available for research purposes.

Consult with the SO curator and specific systematic discipline specialists if you receive a request to borrow a type specimen.

3. *What are voucher specimens?*

The voucher specimen is proof, as a single specimen or series of specimens, of the existence of a species at a particular time and place. The presence of a voucher supports the tracking of habitat and geographic expansion of a species, or the presence or absence of a species following changes in its habitat.

The *Guidelines for Institutional Policies and Planning Natural History Collections* published by the Association of Systematics Collections (ASC), 1994, states that the voucher is a:

> *. . . specimen and its associated data that physically document the existence of that organism or object at a given place and time.*

The *Guidelines for Acquisition and Management of Biological Specimens,* edited by Welton Lee et al, published by ASC, 1982, notes the following:

> *Voucher specimens ensure that the identification of organisms studied can be verified . . . . They are the sole means to verify the data documented in a report . . . and to make historical comparison possible . . . they provide critical information . . . for future investigations . . . .*

4. *What do I need to know about the use of voucher specimens?*

Because of their importance in validating a study, voucher specimens must be documented thoroughly with field and other relevant reports. They must be maintained in good condition and be accessible to researchers.

Requests to use voucher specimens should be in writing. Refer to Question 2 above for what should be included in the request.

Because voucher specimens validate a study, don't allow consumptive use. In rare cases, consumptive use of voucher specimens is possible with approved justification. Consult with the SO curator and specific systematic discipline specialists if you get a consumptive use request. You may lend voucher specimens.

5. *What do I need to know about the use of threatened and endangered species?*

Be familiar with NPS responsibilities in the management of endangered, threatened, and rare species, and candidate and sensitive species. Refer to *Natural Resources Management Guideline*, Chapter 2, Endangered, Threatened, and Rare Species Management. NPS museum collections include threatened and endangered (T&E) species and candidate species. Requests to use T&E species should be in writing. Consumptive use of T&E is possible with a written justification. Refer to *Cultural Resource Management Guideline*, Chapter 9, Management of Museum Objects, Consumptive Use of Museum Objects.

You may lend T&E species. You don't need a permit to loan threatened or endangered species within the United States if they were taken lawfully and "if there is no barter, credit, other form of compensation, or intent to profit or gain . . . ." *Fish & Wildlife Facts*, U.S. Department of the Interior, Fish and Wildlife Service (FWS). However, you must get an export permit from the FWS for loaning T&E specimens outside the U.S. The export permit covers the Endangered Species Act as well as the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). Under these regulations, the U.S. established procedures to regulate the import and export of the species covered by the treaty. FWS, Office of Management Authority acts as the U.S. Management Authority for CITES. You'll also need to get an import permit to cover the loan return. You can get the permit from:

Fish and Wildlife Service
Office of Management Authority
4401 North Fairfax Drive
Room 430
Arlington, VA 22203
Tel: (800) 358-2104

For additional information, see the following FWS booklets, also available from the above address:

CITES, Appendices I, II, and III, to the Convention on International Trade in Endangered Species of Wild Flora and Fauna. August 12, 1996.

Endangered and Threatened Wildlife and Plants. 50 CFR 17.11 and 17.12. October 31, 1996.

6. *What do I need to know about access to information about threatened and endangered species?*

Location information on nesting sites or other specific habitat information on threatened and endangered species is extremely sensitive. Consistent with the purpose of the Endangered Species Act (16 USC 1531 et seq.), the NPS

> *. . . will promote the conservation of all federally listed threatened, endangered, or candidate species within park boundaries and their critical habitats. As necessary, the Park Service will control visitor access to and use of critical habitats, and it may close such areas to entry for other than official purposes . . . .*

Management Policies, Chapter 4, Natural Resource Management, Threatened or Endangered Plants and Animals.

In accordance with NPS Management Policies, you should control carefully access to this information. You should make these data available only in response to a written FOIA request. If you get such a request,

immediately contact your FOIA officer, chief of Natural Resources, SO curator, and solicitor. For further information, see *MH-III*, Chapter 2, Legal Issues.

G. Preservation and Protection Issues

1. *How do I balance preservation and use?*

Both preservation and use are fundamental to a successful museum program. Collections are maintained because of their value to the park, the NPS programs, and the general public, who provides the funding. If your museum focuses on preservation to the exclusion of collection access and use, you are not meeting NPS or museum standards.

Neither preservation nor use are absolute values. One should not be given preference over the other. If you make informed decisions based on NPS policies and procedures, you will effectively manage and balance both preservation and use without significant compromises.

2. *How do I preserve collections?*

- ***Material stabilization***

  Museum materials deteriorate over time. The goal of a balanced preservation and use program is to minimize collection deterioration, while maximizing access. Deterioration can be slowed greatly through the following actions.

  – Use proper storage and housing techniques and materials. See *MH-I*, Chapter 7, Museum Collections Storage.

  – Conduct collection condition surveys of materials and implement restricted handling procedures when recommended. See *MH-I*, Chapter 3, Museum Objects Preservation.

  – Provide treatment when necessary (for example, mending tears or rips in paper documents). See *MH-I*, Chapter 8, Museum Object Conservation Treatment.

- ***Proper handling***

  – Train staff and researchers how and why to handle all the types of objects and materials in the collection. See *MH-I*, Chapter 6, Handling, Packing, and Shipping Museum Objects.

  – Monitor all use for improper handling techniques, theft, or vandalism. See *MH-I*, Chapter 6, and *MH-II*, Appendix D, Museum Archives and Manuscript Collections.

  – Provide copies, duplicates, facsimiles, record photographs, or reproductions for research when an item is fragile, of high value, or vulnerable to damage, alteration, or theft.

- Document the collections to establish and maintain accountability and to monitor and track preventive maintenance.

- Keep proper records, such as researcher registration, copyright and privacy statements, and duplication forms, to track use of an object or a collection and any theft or vandalism.

- Encourage users to make initial surveys of holdings using images and documentation, rather than original objects, as they narrow the focus of their research.

- ***Proper storage environment***

  - Monitor and control temperature, relative humidity (RH), and light levels. See *MH-I*, Chapter 4, Museum Collections Environment.

  - Establish and maintain an Integrated Pest Management program. See *MH-I*, Chapter 5, Biological Infestations.

  - Establish and implement security and fire protection procedures. See *MH-I*, Chapter 9, Museum Collection Security and Fire Protection.

Deterioration of museum collections can't be totally halted, only slowed. Access and use must be provided and encouraged, while preserving and protecting the collections.

3. *How do I allow access to and use of collections?*

Access and use of collections must be done systematically in order to minimize the risks of:

- theft
- mishandling
- vandalism
- lawsuits due to intellectual property rights infringements, such as copyright or privacy infringements
- letters of complaint to Congress and superintendents resulting in investigations and audits

For further guidance, see *MH-I*, Chapter 9, Museum Collections Security and Fire Protection and Appendix G, Protection of NPS Museum Collections, and *MH-II*, Appendix D, Museum Archives and Manuscript Collections.

4. *What steps are necessary for providing access to and use of collections without critically affecting collection preservation?*

To effectively balance preservation and use of the park's museum collections, you must follow the standard management steps listed below:

- Review your collection restrictions for legality under FOIA, state Sunshine laws, Archeological Resources Protection Act (ARPA), and other laws outlined in *MH-III*, Chapter 2, ***before*** you provide access.
- Decide access and use policies and procedures ***before*** you provide access.
- Train all staff how to apply and follow these policies and procedures (including worst case scenarios, such as how to react in case of theft, vandalism, lawsuits, and mishandling) ***before*** they provide access.
- Make sure the park staff have and understand how to use all necessary forms for access and use, including forms for researcher registration, copyright and privacy legislation, model and interview releases, and duplication ***before*** providing access. See *MH-II*, Appendix D.
- Ensure the park staff understand that all researchers, ***including park staff***, must be monitored while using collections.
- Show researchers how to handle and use museum collections when they first register to use collections. (***Note:*** To simplify this task, you may want to ask the researcher to view a videotape or Web site on this topic.)
- Provide an appropriate space for use as a research or reading room.
- Provide adequate space in the research room for needed research equipment.
- Ensure that researchers sign all forms, such as researcher registration forms, copyright and privacy statements, and researcher duplication forms, so that NPS is protected from potential legal problems and so researchers can be held legally liable for any mishandling.
- Pay attention to how researchers handle materials and tactfully correct any handling problems.
- Monitor and manage your research or reading room environment. See *MH-III*, Appendix D, Guidance on Planning for a Research Space.
- Never store collections in the research room.
- Don't provide access in storage rooms (even if collections are in locked cabinets).

Never leave any researcher unsupervised or unmonitored in areas with collection materials.

5. *How do I assess physical condition?*

Use the following tools to help assess the condition of your park's museum collection:

- ***The Collection Management Plan*** (CMP) provides both short- and long-term guidance to parks for managing and caring for objects. The CMP assesses the park's collection management program, identifies problems, and recommends corrections. The subsequent action plan developed by the park identifies and prioritizes corrective actions and specifies needed resources. See *MH-I*, Chapter 3, Museum Objects Preservation, and Appendix F, Museum Collection Management Checklists.

- ***The Collection Condition Survey*** (CCS) is an assessment of the condition of the objects in a collection by a qualified conservator. It looks at objects either individually or in groups of similar materials and their treatment needs. The survey explores the factors that can affect the collections, including ways that collections are used in exhibits, interpretation, education, and research. The report can be used as a tool to develop a systematic approach to improving the conditions of collections and create a baseline for future assessments of object deterioration. See *MH-I*, Chapter 3, Museum Objects Preservation.

- ***The Archival Assessment***, which can be completed as part of a CMP or on its own, evaluates a park's archival and manuscript collection management needs, incorporating collection surveys and evaluations. See *MH-II*, Appendix D, Museum Archives and Manuscript Collections. The survey reports and recommendations from this assessment can help you evaluate the condition of your archival and manuscript collections.

- ***The Object Condition Report and Object Treatment Report*** are prepared by a conservator before and after conservation treatment of an object. The Condition Report provides a description of the materials, structure, and condition of the object based on any observed deterioration and is also used to document the condition of an object before and after loan, exhibit, or other activities. The Treatment Report describes the procedures, materials, method, and extent of treatment. See *MH-I*, Chapter 8, Museum Object Conservation Treatment. The curator keeps these completed reports in the accession or catalog folder, where they can be consulted to determine object condition when a use proposal is received.

- ***Developing a critical eye*** is a skill learned through experience and training for evaluating object condition. This is discussed in *MH-I*, Chapter 4, Museum Collections Environment, Section B. Over time you can become expert in assessing visual clues that signal an object's condition.

6. *How do I assess physical and mechanical preservation risks associated with the proposed use and how can I prevent damage?*

Physical damage includes:

- melting
- burning
- warping
- buckling
- shrinking
- softening binders, such as gelatin or albumen

This type of deterioration results from poor or widely fluctuating climatic conditions.

Prevent physical damage by stabilizing climatic conditions.

Mechanical damage includes:

- tearing, breaking, cracking, or chipping
- scratching or abrading
- soiling or smudging
- creasing or wrinkling

This type of deterioration results from careless and improper object handling and use, neglect, or vandalism.

Prevent mechanical damage by following this advice.

- Make sure that users know your handling policies and procedures. For General Rules on Handling Museum Objects, see *MH-I*, Chapter 6, Handling, Packing, and Shipping, Section C.
- Provide users with a clean, stable, and well-lighted environment.
- Don't allow pens, knives, or similar materials where objects are being used.
- Require and provide No. 2 graphite pencils for notetaking.
- Require researchers to wash their hands and wear gloves, as appropriate, when working with museum collections.
- Register and continuously monitor all researchers
- If you find any signs of vandalism or theft, such as illustrations cut out of historic volumes, check the registration records and determine who has used the collection. Look for a pattern in the damage. If only one

researcher had access to the particular object or collection, this tells you who might have stolen or damaged the material. Contact NPS law enforcement and your SO curator who will inform other parks to watch for this individual.

7. *What are the chemical risks and how can they be avoided?*

Chemical damage includes:

- oxidation, such as rusting
- corrosion
- damage to pigments
- some staining

This type of damage is caused by reaction to another chemical, such as air pollution or oils from a user's hands.

Photochemical damage includes:

- some staining
- color shifts
- fading
- flaking media
- embrittlement of textiles and paper

This type of damage is caused by exposure to excessive light levels.

Chemical risks associated with use can be avoided by following this advice.

- Monitor and manage your storage, work, exhibition, and research room environments.
- Establish a light monitoring program in exhibit and research areas. Correct light levels that exceed standards. See *MH-I*, Chapter 4, Museum Collections Environment, Section E.
- Follow the guidelines in *MH-I*, and the *COG*s for specific types of material.
- Limit the level and duration of light in all museum spaces.

8. *What are the biological risks and how can they be avoided?*

Biological damage includes:

- mold and fungal growth
- insect damage or residue

- rats, squirrels, mice, and other vermin damage or residue

Prevent biological damage by doing the following:

- Don't allow smoking, drinking, eating, chewing, or similar activity in the research room.
- Institute an Integrated Pest Management Program.
- Keep plants and animals out of storage, exhibition areas, research rooms, and work spaces.
- Monitor and manage your storage, exhibition areas, work space, and research room environments.
- Follow the guidelines in *MH-I,* Chapter 5, Biological Infestations, and the COGs for specific types of material.

9. *What are the security risks associated with the proposed use?*

Security problems may include:

- collection vandalism, such as ripping, marking, or damaging collections

  Follow the procedures described above and in Question 6.

- theft by staff or outside researchers

  Contact NPS law enforcement staff and SO curator immediately. Assemble all pertinent accession and catalog records, as well as researcher registration documentation on researchers who have requested access to the stolen materials during the last several years. See *MH-II,* Chapter 4, Inventory and Other Special Instructions, Section III on loss.

- misplacement or temporary loss of collection materials

  Look at which researchers used the materials most recently. Identify what other collections they worked with and check those locations. If you still can't find the missing materials, assemble all researcher registration and use information and contact your law enforcement officer and SO curator.

- damage during loans

  See *MH-II,* Chapter 5, Outgoing Loans.

- damage during transportation

  See MH-I, Chapter 6, Handling, Packing and Shipping Museum Objects.

- damage during exhibitions, especially in open display and furnished historic structures without protective enclosures

  Except for historic period settings, this open display technique should be avoided.

- damage during duplication

  See *COG* 19/12 Contracting for Reformatting of Photographs.

- arson and fire damage

  See *MH-I,* Chapter 9, Museum Collections Security and Fire Protection.

10. *How do I prevent security problems?*

Security problems can be avoided or minimized when you follow the guidance below:

- Provide continuously supervised access to museum collections. If supervision is not possible, you may refuse access if the refusal is temporary and applied equally to all researchers, including staff. See *MH-I*, Chapter 9, Museum Collections Security and Fire Protection, and *MH-II,* Appendix D, Museum Archives and Manuscript Collections, Sections T and U.

- Restrict access to unaccessioned and uncataloged museum collections and to not yet cataloged, described, arranged, or rehoused archival and manuscript materials. You may refuse access if the refusal is temporary and applied equally to all researchers, including staff.

- Provide additional supervision for access to original, high value, highly collectible, or similar objects (for example autograph materials, gold jewelry). Limit the number of objects to one or a few that you provide at one time to researchers, or make photographs or reproductions (such as digital, xerographic, or microfilm copies) available for use.

- Refuse access to researchers with a record of thievery or vandalism towards museum, archival, or library collections. Contact organizations listed in *MH-II*, Chapter 4, Section C, Reporting Loss of Museum Objects, to get information on convicted thieves and vandals. In the case of the destructive individual or documented thief, consult with your NPS law enforcement staff, the SO curator, and the NPS solicitor for remedies.

- Develop and implement researcher (including staff) registration procedures. See Section J, Documentation.

- Establish and implement research room operating procedures for monitoring and duplication. See *MH-II,* Appendix D, Museum Archives and Manuscript Collections.

- Follow outgoing loan procedures. See *MH-II*, Chapter 5, Outgoing Loans.

- Establish and follow exhibition procedures. See *MH-III*, Chapter 7, Using Museum Objects in Exhibits (in prep).

- Implement duplication forms and procedures. See *MH-II*, Appendix D, Museum Archives and Manuscript Collections.

11. *How do I deal with a disturbed, thieving, or destructive individual?*

Beyond the security issues described above, you may have to deal occasionally with angry, dissatisfied, or disgruntled visitors. When this occurs, you must follow these procedures:

- Ask for back-up from another collections person, so you have a witness.

- Locate another staff member to handle the research room.

- React in a calm, empathic, and tactful manner, without yelling or arguing.

- Determine what the researcher's concern is and restate the concern, so it is clear you understand it.

- Calmly inform the visitor of the NPS policy or procedure that covers the situation.

- Tell your visitor that you are expected to execute the procedure or policy the same way for all visitors.

- Explain that you are personally held accountable by a supervisor for applying the procedure equitably.

- Offer to show the visitor the policy or procedure.

- Offer to take the visitor to your park's public affairs officer or park ranger headquarters.

- Encourage the visitor to leave the research room, but ***don't*** touch the individual.

- Call the park law enforcement officers to defuse the situation if the individual becomes violent or abusive. Ideally ask the person to step outside and then lock the door to the research room. Notify the park public relations officer.

12. *How do I deal with staff theft?*

Don't confront the suspect. The thief may destroy essential collections documentation or hurt you. Report your concerns, with related facts or documentation, to law enforcement and the individual's supervisor or the park superintendent.

The supervisor and park superintendent will determine if the individual should be placed on administrative or other leave during the investigation. The suspect must be given a chance to clear his or her name without placing any portion of the museum collection at risk.

If a theft occurs, gather all appropriate collections documentation to indicate what was stolen, including catalog records, inventories, and researcher registration information. Follow the guidelines in *MH-II*, Chapter 4, Inventory and Other Special Instructions, Section III, Reporting Loss of Museum Objects.

Don't try to hide thefts. Work with NPS law enforcement officers, solicitors, and other museums, archives, dealers, and professionals to recover your stolen materials.

13. *How do I use a facilities report to evaluate risk?*

When your museum receives a loan request, you should request a completed facility report from the borrowing institution. See *MH-II*, Chapter 5, Outgoing Loans. This report details that institution's physical condition and the standard practices of its staff. It can uncover potential security, handling, or environmental problems that can be resolved before the loan is made.

A facility report typically provides information about the borrower's environmental controls, security, fire protection, and ability to care for and handle collections. You can use this information to determine the risk of lending the object by verifying the borrower will care for your objects properly. See *MH-II*, Chapter 5, Outgoing Loans. A standard facility report is published by the American Association of Museums Registrars Committee. Parks can contact NPS Museum Management Program for a copy.

14. *How do I protect objects from overuse?*

Monitor collection use. Refer to the researcher log book and researcher registration forms to determine frequency of use of a particular collection or object.

Look at the level of light exposure the objects are receiving. See *MH-I*, Chapter 4, Museum Collections Environment. If fragile or vulnerable materials are exposed to light levels exceeding those recommended for exhibitions, consider reformatting the materials via digital and microfilm copies.

Rotate objects on exhibit. See *MH-III*, Chapter 7, Using Museum Objects in Exhibits (in prep.).

If microfilm and digital copies are not an option, consider producing a master set of xerographic copies on acid-free paper of high-use materials. For three-dimensional materials, have high-quality record photographs made and later scanned for use.

If certain archival collections are heavily used for research or duplication for more than a month, have them reformatted into microfilm and digital formats for access. The original can then be retired to the museum storage space for preservation.
Computer software manufacturers are developing ways to turn digitized files of photographs into "virtual" museum objects so you may provide three-dimensional reference files of museum objects in CD-ROMS, on your hard drive, or on the World Wide Web. This technology makes your collections accessible to a wider audience.

15. *What do I do if objects are damaged?*

If an object is broken or damaged during use, return the object to storage until it can be stabilized and treated. Document damage on the catalog card and supplement with photographs. If the item is destroyed, follow the guidance in *MH-II*, Chapter 4, Section III, Reporting Loss of Museum Objects. Consult a conservator for treatment recommendations.

Damaged archival and manuscript items must be stabilized before they may be made available. If the damaged item forms part of a group of materials (for example, one document in a box of archival documents), replace it with a separation sheet and a xerographic copy. The separation sheet will indicate the new storage location of the item. Put the damaged original in safe storage until it can be treated by a conservator. See *MH-II*, Appendix D, Museum Archives and Manuscript Collections.

16. *How do I recognize over-use?*

When materials show obvious damage, such as fading, wrinkling, tearing, smearing, surface losses, abrading, wear, or other damage discussed in Question 4, they are being over-used. When reviewing accession or catalog files or the researcher log book, if you notice repeated use by researchers of the same object or collection, you should examine these items immediately for signs of wear.

By monitoring files and log books and inspecting object condition as they are returned to storage following use, you may anticipate potential over-use before objects reach this state. Consult a conservator if you question whether an object has become too fragile or vulnerable for further use without treatment.

H. Interpretation Issues

1. *What is NPS interpretation?*

Interpretation links park resources and the values, ideas, and meanings of the people who used them. The goal of NPS interpretation is to allow visitors to forge relationships with NPS resources. Museum collections are both park resources and a means to interpret and further the mission of the park and the NPS Servicewide.

2. *What is the NPS interpreter's role in using museum collections?*

The interpreter's role is to help visitors discover some of the uses of and values represented by the resources they see and experience in the park. You should work with interpretive staff to make museum collections a vital part of the park's interpretive program to:

> *. . . assure that the interpretive process manifests a variety of cultural and intellectual perspectives and reflects an appreciation for the diversity of the museums' public dimension.*
>
> as noted in the 1992 American Association of Museums report *Excellence and Equity, Education and the Public Dimension of Museums*.
