Chapter 1: Introduction

Anna S. Agbe-Davies, Christopher Fennell, and Terrance J. Martin[1]

Frank McWorter, also known as "Free Frank," was a remarkable man. The town that he established is only a part of his legacy, which included purchasing his own freedom and that of generations of his family. But it was in part by acquiring land on the frontier, establishing the town, and selling the lots, that he furthered his ambition to free his children and their families from slavery. The town, "New Philadelphia," or sometimes just "Philadelphia," was an experiment of sorts, a community composed of African-American and European-American residents decades before the abolition of slavery in the United States. Descendants of McWorter also point to the town's location—so close to the slave state of Missouri. Could he have intended his town to serve also as a conduit to freedom for people escaping slavery?

McWorter platted New Philadelphia in 1836. At the same time, he petitioned the Illinois legislature to confirm his right to conduct business and enter into contracts—a necessary step for an African American in a state still controlled by Black Codes. The town was established in Pike County, Illinois, just south of McWorter's own farmstead. New Philadelphia covered 42 acres divided into 20 blocks with 8 lots in each, except for the western column of half blocks with only 4 lots each. There were 144 lots, total, each measuring 60 by 120 feet.

The site, cultivated, but no longer occupied by the middle of the twentieth century, presents a unique opportunity for archaeologists. Few settlements occupied by free African Americans have been excavated. The comparison of New Philadelphia with the more widely-studied plantations and segregated cities of the same era expands our understanding of social relations in that turbulent era.

The story of the town's founding is described in *Free Frank: A Black Pioneer on the Antebellum Frontier* (Walker 1983). A new phase of research began with the historical and archaeological studies undertaken at the behest of the New Philadelphia Association, starting in 2002. Research from 2004 to 2006 was supported in part by a grant from the National Science Foundation and its Research Experiences for Undergraduates program (NSF-REU Grant number 0353550). A second NSF-REU was awarded in 2008 (Grant number 0752834). Reports on prior research are available on two linked websites dedicated to the New Philadelphia archaeology project (www.heritage.umd.edu/ and www.histarch.uiuc.edu/NP/). The present document presents developments and findings for the 2008, 2010 and 2011 field seasons, supplementing the interim reports for 2008 (Fennell 2009c) and 2010 (Agbe-Davies 2011).

The 2011 season marked the final year of research sponsored by the NSF-REU grant of 2008. The project was co-directed by Anna Agbe-Davies (University of North Carolina, Chapel Hill [UNC]), Christopher Fennell (University of Illinois, Urbana-Champaign [UIUC]), and Terrance Martin (Illinois State Museum [ISM]). The twin goals of the project continue to be 1) exploring the nature of social relationships in this frontier town through archaeological and documentary research, and 2) ensuring the preservation and protection of the site. The major research objectives also remain consistent, to:

[1] University of North Carolina, Chapel Hill; University of Illinois, Urbana-Champaign; and the Illinois State Museum.

- understand New Philadelphia's founding and its development as an integrated town
- explore and contrast dietary patterns between households of different ethnic and regional backgrounds via the examination of faunal and botanical remains
- reconstruct the town landscape and the use of town lots, with the understanding that the different ethnic and regional backgrounds of the town's households may have an influential role
- elucidate the consumer choices made by households in this frontier context, with particular attention to the role played by markets and structural racism

Research and related developments preceding the 2011 excavation season

Archaeological work from the 2004 through 2011 field seasons uncovered over 150,000 artifacts, faunal and floral remains, and the locations of 21 structures, including numerous residences, a grocery, and a blacksmith operation. Based on our investigations and analysis of data to date, a number of general findings can be summarized here. These findings have also been detailed in earlier reports to the NSF and in our members' publications in books, peer-reviewed journal articles, and other media, including television and online.

Archaeology revealed early house sites not indicated in historic-period documents, such as deeds, tax ledgers, and census records. Most structures and occupation sites appear to have been concentrated in the landscape covered by the north-central portion of the town plan.

There appears to have been no spatial segregation based on race within the town. The locations of residences and businesses of African Americans and European Americans were spatially interspersed in the town during the nineteenth century. The town residents did experience the impacts of segregation in their cemeteries and their schools. We uncovered no archaeological evidence of violent destruction of properties within the town, even though the community was located within a region sharply impacted by racial strife.

Residents enjoyed access to local, regional, and international commodities from the outset of settlement of the town. Ceramic housewares were similar in style, expense levels, and types of assemblages across house sites of both African-American and European-American families. There may have been some variations in dietary and culinary practices based on the region of origin or ethnic background of particular families who moved to New Philadelphia.

The town suffered dispersal of its population after it was bypassed by the construction of a regional railroad in 1869-1870. Persuasive evidence indicates that this bypassing of the town was motivated by racial dynamics.

Preservation

Participants in the New Philadelphia project successfully nominated the town site to the National Register of Historic Places in 2005. This list of "historic places worthy of preservation" also includes the Frank McWorter grave site—successfully nominated in 1988 by Dr. Juliet Walker. In 2008 the National Historic Landmarks Committee voted unanimously to approve the

nomination of the New Philadelphia town site for National Historic Landmark status. The designation was granted in January 2009 (see NPS website 2009). This successful application was officially supported by numerous elected representatives including, from Illinois: Senators Richard Durbin and Barack Obama; U.S. Representatives Ray LaHood and John Shimkus; State Senators Deanna Demuzio, Emil Jones, Jr., and John Sullivan; and State Representatives Jil Tracy and Mary Flowers, among others. Notably, Sen. Obama's support letter was submitted in Autumn 2008, in the midst of his very busy and successful presidential campaign.

Additional legislation was introduced by U.S. Senator Roland Burris and U.S. Representative Aaron Schock. These two acts (S. 1629 and H.R. 5455) sought to authorize funding for activities including "determining the suitability and feasibility of designating the study area as a unit of the National Park System." These legislative initiatives were continued more recently. Congressman Schock introduced the *New Philadelphia, Illinois, Study Act*, H.R. 930 in the 113th Congress to authorize the Secretary of the Interior to conduct a feasibility study, and U.S. Senators Mark Kirk and Richard Durbin introduced a companion bill, S.1328, to the Senate in July 2013. These legislative efforts are ongoing. At the local level, the New Philadelphia Association has coordinated development of a walking trail and accompanying brochure at the town site.

The Archaeological Conservancy finalized the purchase of approximately nine acres of the town site, another important step for the site's preservation. The parcel includes Blocks 2, 3, 8, and 9 and the Conservancy's mission will ensure that the archaeological site at New Philadelphia will be protected for future generations to explore and enjoy.

2008-2010 research activities

On February 28, 2008, members of the McWorter family, other descendant family members, and members of the local community, gathered at the Lincoln Presidential Library, to commemorate African-American History Month. The group presented the Library with a bronze bust of Frank McWorter, sculpted by Shirley McWorter Moss, and a bound, eleven-volume set of archival papers and archaeology reports.

Also in early 2008, co-director Anna Agbe-Davies reported to the New Philadelphia Association and others on the New Philadelphia research team that the Time Team America program had expressed an interest in undertaking archaeological research and filming an episode at the site of the town founded by Frank McWorter. Members of the local and descendant communities as well as the research team were very enthusiastic about this opportunity. The Time Team program in the United Kingdom enjoyed an excellent reputation for employing rigorous, scientific methods, and in educating large-scale, public audiences in the techniques and results of archaeological and historical research.

We communicated to the producers of Time Team America, including director Graham Dixon, that such a project would mean taking a research approach consistent with our past work and the status of the town site on the National Register of Historic Places, maintaining the archaeological integrity of the town site. This included, for example, limiting excavations to the bisecting of cultural features, so that we always leave one half of each cultural feature intact for preservation and future study. Because the Illinois State Museum (ISM) is the designated curator for all

archaeological, faunal, and floral remains from the New Philadelphia town site, all materials obtained by Time Team America were also to be curated by ISM. The Time Team America producers and archaeologists agreed entirely with all these recommendations, which were consistent with the overall approaches the program had taken at other sites as well.

As researchers, we consult regularly with members of the descendant and local communities on their views for the goals of the archaeological and historical research using principles of civic engagement. We have been as transparent as possible in formulating and communicating our research questions and we have made our archaeological and historical data readily available to the public through our public archaeology internet sites. We explained that we wished to see the Time Team project take a similar approach, with a commitment to making data publicly available. They again agreed whole-heartedly, and the results of their research, undertaken simultaneously with the 2008 field school, have been disseminated both through their internet publications and their television program. The show was broadcast nation-wide on July 22, 2009, and in repeat broadcasts thereafter, including community-based discussions in 2010 and 2011.

Such broad dissemination and discussion of the subjects and lessons of New Philadelphia are not unusual. Our research team members have worked continually to engage debates on these subjects throughout the United States and abroad. For example, our research questions, findings, and interpretative debates have been the subject of keynote talks and public debate in locations as diverse as South Africa, Israel, China, and Taiwan.

The overall plan for the research components of our ten-week field school in the summer of 2008 included new ground-based geophysical surveys in the first week, followed by four weeks of excavations and surveys at the town site, and a subsequent five weeks of laboratory research and analysis of the material, faunal, and floral remains at the Illinois State Museum's Research and Collections Center in Springfield. The spring of 2008 was marked by unusually high rainfall, providing very good conditions for geophysical surveys. In past years at New Philadelphia, low moisture content in the ground surface made the process of obtaining and interpreting such geophysical data very challenging. Among other results obtained in the week of May 27, 2008, Michael Hargrave obtained vivid data in the area of Block 3, Lot 4, on the north edge of the town site, which was later explored by two of our excavation teams.

The educational components of the ten-week field school included discussions among the participants on issues of race and racism in American history and contemporary society. Our discussions included debates concerning facets of the social construction of concepts of race and the deployment of racial ideologies against different target groups in American history. Discussions also addressed evolving concepts within biological science of physiological and genetic variations among populations, research purporting to identify DNA links between population locations over time, and arguments concerning the dangers of racial profiling in modern medical and pharmaceutical practices.

In the field we undertook systematic soil core sampling (with a one-inch diameter sampler) at the locations of new anomalies identified by geophysical surveys in the week of May 27, and selecting some of those areas for excavation later in the season. We also expanded survey and excavations in the area of Block 3, Lot 4, owned for a period of time by Alexander Clark and located near a lime slacking pit uncovered as Feature 2 during the 2004 excavations.

Excavations resumed in Block 7, Lot 1, for which a newly discovered tax record from 1845 listed a higher value assessment that might indicate the presence of building at a time when Frank McWorter owned the parcel. We ground-truthed previously identified geophysical anomalies A8, A9, and A36 in the area of King Street north of Block 8, and anomalies A37 and A38 in the space platted for Walnut Alley on the northern edge of Block 8, Lots 5 and 6. We also employed a hammer-driven, soil core sampler (with two-inch diameter and up to six feet in sample length) to test thermal anomalies from the aerial survey and anomalies identified in ground-based geophysical surveys, and to explore the stratigraphic profiles of earthen terraces on the west side of the town site.

The summer included a series of public speakers and audience discussions on the theme *African-American Heritage in the Midwest* held in June and July of 2008. This program provided a forum for lectures and broad audience discussions of subjects concerning African-American history and struggles for freedom and equality in ongoing efforts to combat racism in American society. This forum contributed to a broad, collaborative project of archaeologists, historians, and members of the local and descendant communities to place such topics of African-American accomplishments in greater focus within our national memory and heritage. The program was sponsored by the New Philadelphia Association, Sprague's Kinderhook Lodge, and the Illinois State Museum, with the support of a grant from the Illinois Humanities Council, the National Endowment for the Humanities, and the Illinois General Assembly.

With grant support from the Community Informatics Initiative at the University of Illinois, in 2009 PI Christopher Fennell also designed and launched a new cluster of interactive internet resources for enhancing the involvement of national, regional, local, and descendant communities in the ongoing research efforts of the New Philadelphia Archaeology Project. These resources, which utilize Web 2.0 applications, can be accessed on the internet at http://www.histarch.uiuc.edu/NP/.

Although there was no excavation in 2009, the New Philadelphia project speaker series continued, supported by grants from the Illinois Humanities Council, the National Endowment for the Humanities, and the Illinois General Assembly. The six lectures in the series addressed such topics as the undergraduate experience of the NSF-REU program, the use of technology in public outreach and presentation, inequality and the built environment in nineteenth-century Illinois, and the life and accomplishments of Harriet Tubman.

In May 2010, Fennell obtained a grant from the University of Illinois to support a LiDAR (Light Detection and Ranging) survey of the New Philadelphia town site and surrounding landscape.

This survey is an important compliment to other survey techniques that have been used to identify significant archaeological features within the town. Furthermore, it provides detailed topographic information for comparison with the original town plat, which should help to establish how much of the town was ultimately developed as planned.

Planning for the 2010 excavation season included an introductory week of geophysical survey and four weeks of excavation at the town site. The remaining five weeks were devoted to artifact identification, cataloguing, and analysis at the Illinois State Museum Research and Collection Center in Springfield. The research team established a number of priorities through discussions including consulting specialists and community stakeholders.

Excavators targeted Block 12 for geophysical survey and excavation. A shovel test pit survey of Lots 1-4 indicated a likely nineteenth-century occupation of the parcel. It also provided an opportunity to follow up on oral history evidence that placed the town's school house on this block.

A number of surveys were conducted during the 2010 season. The first used large-bore hammer-driven core sampling to: 1) test thermal anomalies identified in the 2008 low-aerial survey; and, 2) further investigate modern agricultural terraces on the western side of town site. Excavators also undertook core sampling and targeted excavation at the northern edge of the east-most of the agricultural terraces on the western side of New Philadelphia, where large-bore core sampling in 2008 revealed intact stratigraphic profiles. We also initiated geophysical surveys on Blocks 11, 12, and 13 and commenced systematic core sampling of newly-identified anomalies, following up with excavation as warranted.

We also initiated a geophysical survey, with follow-up core sampling and excavation, on Block 11, Lots 1-2. This would be the first investigation of the easternmost reaches of the town. Documentary research indicated that these particular lots were owned by Josephus Turpin, who later served in the 29th Colored Infantry during the Civil War (C.F. Martin, pers. comm. 2010).

Finally, and most prominently, the excavation team continued core sampling of geophysical anomalies and excavation of the cellar identified on Block 13. This feature was discovered in 2005 and appears to be the remains of the dwelling of Louisa McWorter and her household.

Since 2010, the New Philadelphia project has included collaboration with geoscientists from the University of Iowa. "Geoscience" refers to "earth processes, earth history, and environmental sustainability using physical, chemical, and biological methods" (http://geoscience.clas.uiowa.edu/). E. Arthur Bettis is advisor to Mary Kathryn Rocheford, a doctoral candidate in the Department of Geoscience, University of Iowa. The focus of Rocheford's dissertation research is on the landscape and environmental history of the New Philadelphia town site. She served as a team supervisor and instructor for field school interns in the 2010 and 2011 field school programs, supervising activities related to geoscience theories and methods. The geoscience work builds upon the primary research questions of the New Philadelphia Archaeology Project and includes comparative analyses of the multiple data sets of geophysical and archaeological evidence compiled in this multi-year program. Laboratory analyses of Rocheford's data sets are ongoing.

Different land-use types can be expected to have different effects on the physical and chemical properties of soils and potentially to produce physical and chemical "signatures" indicative of these land uses. To evaluate such phenomena, soil and micromorphology samples were collected from different land-use areas within the New Philadelphia town site. The properties of the soil samples (e.g., bulk density, moisture content, organic matter content, particle size distribution, pH, and cation exchange capacity) are being quantified to differentiate discrete periods of historic land use. Reconstructing the spatial and temporal pattern of various land-use activities across the landscape can be accomplished through investigations of ethnographic and historic maps and documents and remotely sensed data such as aerial thermal infrared and LiDAR surveys. Interpretation of these sources must be ground-truthed by surface walkover surveys and one or more non-destructive geophysical surveys such as electrical resistivity, magnetometry, or ground-penetrating radar. This multi-prong analysis of soil characteristics will

be used to design a framework for the interpretation of the effects of different land-use practices on soil characteristics at the site over time.

The purpose of this geoscience research is to evaluate the effects of historic land uses on soil characteristics to address research questions such as the following:

1. What are the spatial and temporal contexts for the biological, physical and chemical characteristics of the soils across this landscape?
2. What have been the impacts (e.g., erosion/deposition rates, soil productivity) of different land-use activities across the town site over time?
3. Can the effects of different historic landscape modifications (e.g., historic settlement vs. restoration/modern agriculture) be differentiated?
4. How might these data sets be used to inform sustainable land-use practices both within the individual locations and for the surrounding geographic region?

In the 2010 field season, hand-driven AMS soil core samples were collected at New Philadelphia to investigate thermal anomalies identified in a thermal infrared (TIR) survey conducted by Bryan Haley of the University of Mississippi and Tommy Hailey of Northwest State University in 2008. Descriptions and interpretation of the cores and recommendations for future investigation were included in the 2010 online report in "Chapter 6: Geoarchaeological Investigations of New Philadelphia: Soil Core Testing of Thermal Infrared Anomalies" (Rocheford 2011). AMS cores provided an inexpensive method for quick assessment of the archaeological potential at the core location. In addition, this method was useful in the identification of disturbed versus undisturbed soil profile locations for further investigation.

Based on characteristics of the AMS cores, geophysical data, and on-site observations, Rocheford and Bettis collected eight soil core samples using the three-inch diameter, six-foot long, trailer-mounted power cylinder in the Fall of 2010. This power cylinder core sampling device avoids the compaction of samples experienced using the hand-held and slide-hammer-driven AMS equipment. These power cylinder samples were also curated in plastic wrap and stored for future laboratory analysis.

The summer speaker series continued in 2010 with a program that included a variety of speakers on the theme *Navigating Landscapes of Struggle and Freedom*. The theme was particularly appropriate for the first year that the series was designated the *Marvin J. and Thomas Leo Likes Memorial Lecture Series*, in honor of two individuals who did so much to provide crucial surveying assistance in the project's early years, and continued to offer advice as the archaeological investigations moved forward. The talks were sponsored by the New Philadelphia Association, Sprague's Kinderhook Lodge in Pike County, and the Illinois State Museum Research and Collections Center in Springfield.

The lectures gave the students an opportunity to hear cutting-edge research from a range of experts, but were also geared toward a general audience. Students, New Philadelphia Association members, Pike County residents, and McWorter family members, descendants of families who resided at New Philadelphia, along with many others formed a lively and attentive audience. Talks were presented by Michael Hargrave and Carl Carlson-Drexler (U.S. Army Engineer Research and Development Center, Construction Engineering Research Laboratory, Champaign, Illinois), Andrew Agha (Brockington and Associates, Cultural Resource Consultants), Norman D. Ellerbrock, PLS (Likes Land Surveyors, Inc.), Paul A. Shackel

(University of Maryland, College Park), Anna S. Agbe-Davies (UNC), Terry Ransom (Illinois Underground Railroad Research Network) and Christopher Fennell (UIUC), Rebecca Ginsburg (UIUC), and John Michael Vlach (George Washington University).

In November, 2010, a backhoe was used to excavate a trench through an agricultural terrace ridge constructed in the 1990s. This excavation trench was 15 m long. Rocheford recorded a profile description and collected of bulk soil and micromorphological samples from each exposed soil horizon within that sample.

Overview of 2011 research and educational activities

After discussions among members of the research team, community stakeholders, and consulting specialists, the following five priorities were selected to be focused upon in our 2011 field season:

(1) Follow up on prior explorations on Lots 1 and 2 of Block 8 to search for any evidence of a schoolhouse. This facility may have served the African-American families in New Philadelphia from the 1850s through 1874. A number of historical documents, including an array of deed records, provide strong indications that this small structure was located on Block 8, Lot 1. Geophysical surveys and limited excavations in earlier field seasons had not uncovered evidence of such a structure. A rotating team of excavators worked in the 2011 field season to conduct a systematic shovel test pit survey of the space of Block 8, Lot 1 to thoroughly explore that area for subsurface remains.

(2) Reopen and complete excavation units that were opened in Lots 3 and 4 of Block 12 in the 2010 field season, but were not completed due to the high water content in the ground. A systematic shovel test pit survey conducted in 2005 provided evidence of possible house site remains in Block 12, Lots 3 and 4. Geophysical surveys were attempted in this area in the 2010 field season, but with limited success, again due to saturation of that area during that field season from rainfall.

(3) Initiate a bisection of a cellar feature identified as the house site of Louisa McWorter on Block 13, Lots 3 and 4. This feature was investigated in 2005 and again in 2010. During the 2010 field season, work focused on fully exposing and mapping the horizontal, "plan-view" dimensions of the foundation walls and cellar of the house in Lot 4. In the 2011 field season, we concentrated teams of excavators to complete a linear sample of the cellar fill and create a contiguous profile of the deposit by excavating adjacent, five-foot square excavation units arrayed in a line from east to west across the central portion of the foundation and cellar space.

(4) Continue the program of geoscience investigations across the town site. This element of the project was undertaken by geoscience specialist Mary Kathryn Rocheford, with the supervision of Arthur Bettis of the University of Iowa. Teams of NSF-REU interns assisted in collecting subsurface samples of soil and sediments using an array of soil core sampling methods.

(5) Identify, collect and analyze original documentary evidence concerning the town residents using the archives of the Pike County Courthouse. Project historian Claire Martin trained and supervised the interns in these research tasks.

The research methods and related findings for each of these initiatives are discussed in the appropriate chapters of this report.

Figure 1.1. *Our 2011 field school participants visited the McWorter cemetery near New Philadelphia on Memorial Day and placed flowers on Frank and Lucy McWorter's grave sites in commemoration (Photograph courtesy Christopher Fennell).*

In 2011 our field team consisted of co-managers Anna Agbe-Davies (University of North Carolina), Terrance Martin (Illinois State Museum), and Christopher Fennell (University of Illinois, Urbana-Champaign [UIUC]). Kathryn Fay, a graduate student at UIUC, served as our Archaeology Laboratory Director and also supervised and assisted in the instruction of undergraduate interns in surveys and excavations. Mary Kathryn Rocheford, a graduate student at the University of Iowa, supervised rotating teams who assisted her in geoscience field work at the site. Annelise Morris, a graduate student at the University of California, Berkeley, supervised and assisted in the instruction of undergraduate interns in surveys and excavations (Figure 1.1).

The undergraduates participating in the NSF-REU program were divided into teams, each of which was supervised by project staff:

Team X
Kaila Akina (University of Idaho)
Shawn Fields (Wake Forest University)
Joseph Tonelli (Hofstra University)
Volunteer: Tom Winarski
Supervisors: Kathryn Fay and Annelise Morris

Team Y
Amanda Burtt (University of California, Berkeley)
Thomas Glantz (University of Maryland, Baltimore)
Elizabeth Usherwood (New College of Florida)
Supervisor: Mary Kathryn Rocheford

Team Z
Hillary Christopher (University of New Hampshire)
Miriam Manda (Wesleyan University)
Antionette West (Howard University)
Supervisor: Terrance Martin

These students were the top candidates from a very competitive pool of over seventy applicants from universities across the U.S. As in past years, the cohort was a model of institutional, geographic, and cultural diversity. In accordance with the NSF-REU mission, a significant number of the interns were members of minorities underrepresented in the sciences and/or students attending universities where archaeological field programs were not available.

Additional senior personnel participated in the project as well. Paul Schackel (Professor, University of Maryland, Department of Anthropology), Claire Martin (Research Associate at the Illinois State Museum), Marjorie Schroder (ISM Research Associate, plant remains), Christopher Widga (Assistant Curator of Geology ISM, consulted on samples), E. Arthur Bettis, III (Associate Professor, DGS, Department of Geoscience, University of Iowa).

The ten-week field school commenced on May 24, 2011 and concluded on July 29, 2011. Instruction in excavation and recording methods, artifact identification, archival research, and laboratory analysis was complimented by field trips to nearby archaeological and heritage sites. During the field component of the project, all REU students received extensive training in geoscience and geophysical survey methods, soil core sampling and surface survey methods, excavation and the recording and collection of archaeological data. Skills in mapping with laser transit total station and high resolution GPS devices were also included. Detailed training in recording archaeological excavations with stratigraphic analysis, soil and sediment descriptions, and scientific form completion were also integral to the field school experience. After switching over to the laboratory portion of the project, REU students learned how to process and identify artifacts, cataloging them in a relational database. Specialized instruction included the curation, identification, cataloging, and analysis of faunal and floral remains.

Throughout the summer, students participated in discussion sessions that framed the project in light of larger issues such as race and racism, heritage, and public history. Several of these sessions used as their prompt videos, such as the PBS series “African-American Lives” and the New Philadelphia episode of “Time Team America,” or other reference points, such as the controversy surrounding remarks about reparations by leading African-American scholars, and proposed DNA profiling of university students in California. Other discussions included debates about future directions for heritage management and presentation at the town site.

On the first day of the field school Fennell, Terrance Martin, Claire Martin, and other senior personnel greeted the students and introduced them to the project. They provided an overview of the history of the site and the archaeology work that had been completed to date. They discussed

field methods, site sampling strategies, and the project's data retrieval protocols.

REU students also received an orientation in historical documentary research. They learned how to identify, acquire, and critically evaluate primary and secondary resources in order to develop a sense of the history of New Philadelphia and the surrounding regions. Later in the summer, historian Claire Martin accompanied the REU students to the Pike County Courthouse in Pittsfield, as well as to the State Archives and the Abraham Lincoln Presidential Library and Museum in Springfield, and guided them in the use of documentary resources. At the end of the initial orientation discussions, students were divided into teams, and they discussed which town lots they would excavate and analyze. Staff members discussed the importance of research designs, and each team worked to develop a research design for their specific units of study.

Field work at the New Philadelphia site began during the first week. Geoscience surveys were conducted, with supervisors guiding the REU students in conducting geoscience core sample surveys within specific lots at the New Philadelphia site. Using the data from past geophysical surveys, the REU students learned how a noninvasive subsurface approach can help field investigations be more efficient in the discovery of buried architectural structural remains, refuse pits, and fence lines. The students then considered which subsurface anomalies would be tested and the techniques evaluated for their successful application at the New Philadelphia site. Similar methods using core sampling surveys of previously identified anomalies were also undertaken.

Using archaeological survey data, the results of geophysical and aerial thermal surveys, and documentary evidence, students and supervising archaeologists identified discrete concentrations of artifacts and likely structural remains within specific town lots. All of these data provided the foundation for the student teams' excavations. Students worked in teams of three or more and each team excavated within a specific town lot under the supervision of Fennell, Martin, Agbe-Davies, and field assistants. Each team was also responsible for the cleaning, labeling, identification, and computer entry of the materials recovered from their town lot excavations.

During the 2011 field season, geoscience samples were collected from STPs in the systematic survey conducted in the area of Block 8, Lot 1. Also in 2011, NSF-REU interns assisted Rocheford and Bettis in collecting power cylinder soil core samples from across the town site. Locations were based on historical records and evaluation of geospatial data including: landscape position, soil classification, land use history, as well as areas identified for investigation from thermal infrared, electromagnetic survey, ground penetrating radar and LiDAR interpretations.

A variety of land-use areas were selected for data collection during the 2011 field season. These included relatively undisturbed contexts outside the perimeter of a cemetery associated with the town site and from parcels on the outer perimeter of the town. Samples were also collected from known residential sites within the town, and areas believed to have been used as gardens and orchards in the southern portion of the town site during the early twentieth century. Other locations consisted of possible pasture or corral spaces located near known residential spaces in Blocks 13 and 19. Laboratory and quantitative analyses of these data sets are still ongoing. These soil core samples were curated for transport to the ISM and University of Iowa laboratory facilities for detailed analyses by Rocheford.

After the initial field processing was completed, students also worked as a team to analyze artifactual, archaeozoological, and archaeobotanical materials that they recovered. This second

five-week phase of the ten-week field school was conducted at the Illinois State Museum's Research and Collections Center (RCC) in Springfield. The time at the RCC was divided between artifact processing and analysis, on the one hand, and scheduled exhibit tours and guest lectures on the other. Tours of the Illinois State Museum (ISM) and Abraham Lincoln Presidential Museum emphasized the interdisciplinary nature of modern museum exhibit design and provided students with information about the cultural and natural history of the region. At other times, ISM professionals and other collaborating participants also provided overviews of their respective fields of study.

When the REU students worked in the laboratory facilities of the RCC, several of the ISM professionals helped to mentor them as they analyzed materials from the excavations. For example, Marjorie Schroeder, ISM Research Associate in the Landscape History Program, instructed the REU students in the methods of flotation to retrieve floral and micro-faunal remains and subsequent identification and analysis of those remains. Terrance Martin, ISM Curator and Chair of Anthropology, directed students in analyzing the faunal remains from the New Philadelphia site. Martin also discussed with the students the challenges of curating archaeological collections and the ethical considerations of collections management. The professionals' expertise provided an interdisciplinary focus for the field school along with personal guidance and instruction during the second five weeks of the project.

The summer of 2011 also included a series of public speakers and audience discussions on the theme of *Memory and Heart: Pasts and Presents of African-American Communities*. This series was funded in part by the Illinois Humanities Council, the National Endowment for the Humanities, and the Illinois General Assembly. The talks were sponsored by the New Philadelphia Association, Sprague's Kinderhook Lodge in Pike County, and the Illinois State Museum Research and Collections Center in Springfield. The series of lectures and discussion included:

- Annelise Morris, doctoral student in archaeology, University of California, Berkeley *Social Networks and Social Lives: Examining the Lived Experiences of Free African Americans in Illinois*
- Dale Philips, National Park Service Superintendent for the Lincoln Home National Park *Teaching Histories and Present Aspirations at National, Regional, and Local Scales: How Heritage Sites Can Engage and Educate American Citizens*
- Mary Kathryn Rocheford, doctoral student in Geoscience at the University of Iowa *Geosciences Insights into the Past Landscapes of an African-American Community in Illinois*
- Edward González-Tennant, Monmouth University *New Archaeological Perspectives on Violence and Inequality: Engaging the 1923 Rosewood Race Riot in Historical Context*
- Vibert White, Associate Professor of History and Director of the Public History Program at the University of Central Florida *Mother Laura Adorkar Kofi: The Female Marcus Garvey, Adorkaville in Florida, and its Relationship with New Philadelphia*
- Paul Gardner, Midwest Regional Manager for the Archaeological Conservancy *Matters of Heart and Heritage: Challenges of Public Engagement, Conservation, and Stewardship*
- James Davis, Professor Emeritus in History at Illinois College *Illinois Frontiers, New Philadelphia, and the Challenges of National Landmark Status*

Impact

We continued to expand our publicly-engaged internet presence in 2010 and 2011. Fennell has also engaged as a primary participant in The Digital Archaeological Record (tDAR) project, http://www.tdar.org, to broadly disseminate the resources, findings, and data from the New Philadelphia project, available online at http://core.tdar.org/project/3805.

Based upon the success of the archaeological investigations in earlier years, the archaeology project succeeded in placing the town site of New Philadelphia on the National Register of Historic Places in 2005. In 2008, nomination of the town site to National Historic Landmark status was approved by the National Historic Landmarks committee in Washington, D.C. Patricia McWorter presented an eloquent and moving statement on behalf of the McWorter family at that hearing on the powerful legacies of New Philadelphia and its African-American founder, Frank McWorter (http://www.anthro.illinois.edu/faculty/cfennell/NP/McWorterNHLstatement.html). The nomination received final approval by the Secretary of the Interior on January 16, 2009, and the New Philadelphia town site is now recognized as a National Historic Landmark. The town site was also recently added to the National Park Service's "National Underground Railroad Network to Freedom." Charlotte King, a graduate student at the University of Maryland, has also authored an excellent lesson plan based on the history of New Philadelphia as part of the National Park Service's Teaching with Historic Places program (http://www.nps.gov/history/nr/twhp/). Many college instructors utilize the New Philadelphia Archaeology Project's public history internet resources as lesson plans and research sources in their teaching of university students.

This archaeology project has succeeded in communicating to local, regional, national, and global audiences the role of scientific methods and investigations in understanding the American past—and challenging racial ideologies in the present—. Investigations of the social history and past racial dynamics affecting New Philadelphia and surrounding region are providing a focus for interdisciplinary engagement which will be of regional and national interest. Historical and archaeological research focused on New Philadelphia already has been the subject of nation-wide media coverage and dialog, including news coverage by the Associated Press, Chicago Tribune, Los Angeles Times, Archaeology Magazine, American Archaeology Magazine, and Smithsonian Magazine, read by millions in the United States and other countries. The Public Broadcasting System, National Public Radio, and network news programs have broadcast television and radio coverage of the New Philadelphia Archaeological Project to tens of thousands of viewers and listeners. Such news coverage and public outreach efforts have dramatically increased many Americans' knowledge of the remarkable history of New Philadelphia and ongoing efforts to combat the formation of racial ideologies in today's society.

Publications

The project team continues to publish technical reports on all research undertaken for the New Philadelphia project, including analyses of excavated material, results of geophysical, surface, and shovel test surveys. We have also transcribed relevant census, tax assessment, deed, and newspaper information for use by colleagues and the general public. These reports and transcriptions are available via the Internet on sites hosted by the University of Maryland's Center for Heritage Resource Studies and the University of Illinois.

Earlier reports about the New Philadelphia archaeological project include: the report on the 2008 field season (Fennell 2009c); the 2010 report (Agbe-Davies 2011); an update of the aerial thermal survey report (Fennell 2009a), and databases and transcriptions of historical documents uncovered in the course of research. These latter resources include: Hadley Township census data; New Philadelphia census data; deed records of New Philadelphia; Hadley Township tax assessments for New Philadelphia; and maps, surveys and plats related to New Philadelphia (all available from http://www.anthro.illinois.edu/faculty/cfennell/NP/reports.html). Recent articles written by members of the project have appeared in such publications as *Illinois Antiquity* (Fay, et al. 2009), *Living Museum* (Martin, et al. 2012), *Outdoors Illinois,* the Society for American Archaeology's *Archaeological Record*, The Society for Historical Archaeology's *Newsletter*, and the *African Diaspora Archaeology Network Newsletter*.

Members of the project have also presented numerous papers and posters about specific aspects of the project at regional, national, and international conferences. The results of one New Philadelphia conference symposium recently appeared in print as a special issue of *Historical Archaeology* "New Philadelphia: Racism, Community, and the Illinois Frontier" (Fennell et. al. 2010). Other professional conferences include those of the Society for American Archaeology, Society for Historical Archaeology, Midwest Archaeological Conference, and Illinois Archaeological Survey. A number of those papers were written by undergraduate participants in the NSF-REU field schools. A full summary of presentations and other outreach can be found in the Appendix: "Media and Conference Outreach Activities."

Chapters about New Philadelphia have appeared in books about intangible heritage and the archaeology of post-Emancipation African America (Fennell 2009b; Fennell 2011). *New Philadelphia: An Archaeology of Race in the Heartland*, by Paul Shackel, was published in 2011.

Roadmap of chapters

The findings of the past three field seasons are contained in this comprehensive report, reprising and updating information from the 2008 and 2010 reports (Agbe-Davies 2011; Fennell 2009c) along with new information from the 2011 season. Chapter 2, "Background History," provides the historical context for the excavations at New Philadelphia. In Chapter 3, "Excavation Methods," we describe the excavation strategy that guided our research and describe the field and laboratory methods used in its execution. Chapters 4, 5, 6, 7, 8, and 9 describe the results of historical research and archaeological excavation on Blocks 3, 7, 8, 12, and 13, as well as excavation in what was once King Street. In Chapter 10, "New Philadelphia National Historic Landmark Designation," we recount preservation and recognition efforts, including the successful nomination of New Philadelphia as a National Historic Landmark. Chapter 11 "Animal Remains from the New Philadelphia Site (11PK455), Pike County, Illinois: 2008-2011 Seasons," reviews the faunal analysis undertaken to date. "Status of Geoarchaeological Investigations at New Philadelphia Historical Landmark," Chapter 12, describes the contributions of geological science to the field effort. Chapter 13, "Surveys," describes additional archaeological testing on blocks where archaeologists have yet to open up full-size excavation units. Chapter 14, "Unit Summaries," contains basic excavation data in the form of unit summaries. We also provide an Appendix that summaries media and conference outreach

activities undertaken by project participants. The report section of the project web site presents a catalogue of the artifacts recovered during the 2008, 2010, and 2011 seasons.

Chapter 2: Background History

Kathryn Fay[1] with contributions from Paul Shackel[2]

Early Settlement of Illinois

Most of the early European settlers of Illinois came from states in the southeastern portion of the country, and they typically established communities by waterways where they had easy access to transportation, power sources, and food. The general settlement pattern of the area which would become Illinois went from south to north, with Chicago beginning as a relatively remote trading post. The French were the original colonial occupiers of the area, constructing many forts, missions, and trading posts throughout the Midwest region. Illinois was a valuable location in the French colonies, as it provided a somewhat central location for trade and defense.

The French lost their territorial claim to land in North America after the French and Indian War in the 1750s and 1760s, and control went officially to the British. Illinois was not nearly as central of a location for the British, as their primary colonies had already begun developing along the eastern coast of the continent. For the British, Illinois served as a buffer from Native American encroachment, even though some colonists continued to move west and challenge the land claims of the native groups.

After American independence, the new government set out to place some sense of order to the western lands they were fast acquiring. The Land Ordinance of 1785 created townships six miles square and aligned to the cardinal directions. Each township contained 36 sections, each one mile square and containing 640 acres. As a result, roadways often developed along section lines and crossed each other at right angles (Davis 1998:93–94). This new, ordered grid system helped to tame the western frontier by making it regular, measurable, and standardized. While encouraging self–government, the ordinance also ensured the same protections found in the Bill of Rights. While the ordinance proclaimed that three to five states should be developed from the Old Northwest Territory, it also stated that each territory needed 60,000 free people in order to seek statehood. Article 6 of the ordinance banned slavery and involuntary servitude, although there was an exception for French and Canadian settlers, as well as those who had sworn allegiance to Virginia (Davis1998:96).

Many of the early American settlements in Illinois developed around the established communities in the American Bottom such as Kaskaskia, Prairie du Rocher, and Cahokia (Alvord 1920). The European settlement of present day Illinois began at a relatively slow pace and access to familiar consumer goods was difficult. Material goods came to the western frontier from manufacturers in Pittsburgh, Wheeling, Cincinnati, and Louisville via the Ohio River. James Davis (1998:133) describes the material culture of early European/Euro-American settlers:

---

[1] University of Illinois.
[2] University of Maryland.

In southern Illinois and in other wooded regions log cabins were the norm for settlers. These pioneers ate at rough tables, some fashioned from bottom and side boards of discarded wagons. Benches and stools persisted for years. Chairs appeared only over time, and were reserved for esteemed household members and guests. Eating utensils were wooden or, at most, pewter. Few early households had silver or plate. Window glass, metal door hinges and locks and even nails were expensive and rare. Weapons, axes, and fireplace implements were the most common metallic objects. Settlers arrived with few clothes and imported even fewer, unlike eighteenth–century French Illinoisans, who enjoyed imported European clothes and fabrics. Hunting and trapping yielded hides, pelts, and skins for moccasins, boots, gloves, and britches, dresses, and other garments; much production occurred during winter's slack hours. Predators, though, continued to suppress wool production for decades after statehood.

In 1800, France won the Spanish Louisiana Territory and three years later sold it to the United States. This new acquisition allowed settlers on the American western frontier to have unimpeded access to the Mississippi River, New Orleans, and the Gulf of Mexico. New frontiers opened in terms of trade and migration and the large, mostly French trading town of St. Louis became a principal market for goods imported from the East Coast. After 1800, the steamboat greatly reduced shipping prices from the Gulf and along upriver routes (Davis 1998:118; Troen and Holt 1977:211). Trade with Native Americans also played a significant role in the exchange of goods (Mazrim 2002:13).

Figure 2.1. *Map of Illinois Territory, 1809-1818 (Sommers 1977).*

On February 3, 1809, Congress established the Territory of Illinois, which included modern day Illinois, Wisconsin, northern Minnesota, and the western Upper Peninsula of Michigan (see Figure 2.1). At the same time, Native Americans from the territory continued raiding new white settlements (Davis 1998:135). After the War of 1812, immigrants began a steady migration into the area. Many of the new residents were poorer European Americans from the southeastern and southwestern states.

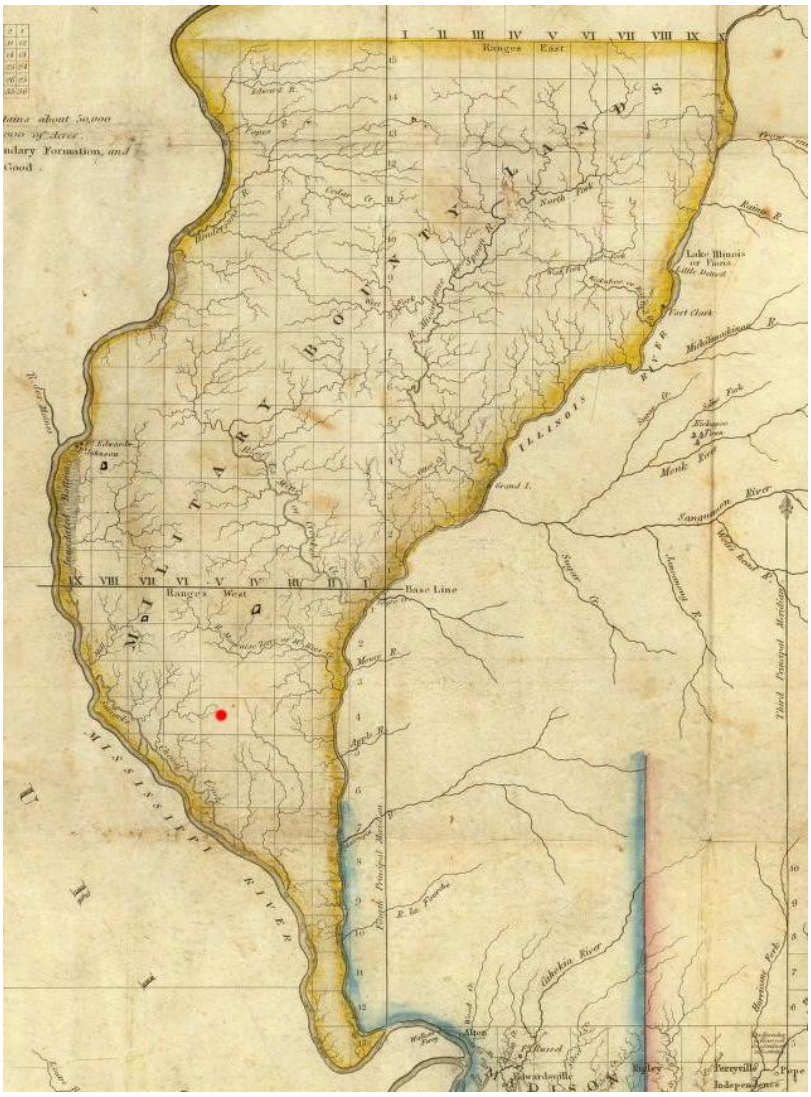

Figure 2.2. *1820 map of Military Bounty Land in western Illinois. Red dot shows approximate future location of New Philadelphia (Melish 1816).*

In 1817, Congress set aside 3.5 million acres known as the "Military Tract," and allotted 160 acre tracts to veterans in an area between the lower Illinois River and the Mississippi River (see Figure 2.2). Veterans also received back pay to help them move to the new region. The public could also purchase tracts of land at $2.00 per acre with only a small down payment. In 1820, the credit system was dismantled and the minimum parcel was reduced to 80 acres at a price of

$1.25 per acre. The government later reduced the minimum purchase to 40 acres, which is the amount of land Frank McWorter initially purchased in Illinois (Mazrim 2002:25).

The territory soon became a battleground between proslavery Southerners and abolitionist Northerners (Davis 1998:19). Six of the first seven Illinois governors came from slave states and they influenced the abolitionist issue. According to Davis (1998:20), no other state north of the Ohio River had as many slaves nor came as close as Illinois to providing constitutional protection for slavery. Many of the new settlers from the South supported the existing institution of slavery (Davis 1998:161).

When Illinois became a state in 1818 it had about 40,000 residents, with over one third of them living in the greater American Bottom. Some of the early nineteenth–century immigrants brought enslaved persons with them into Illinois. In 1818, most of the slaves north of the Ohio River resided in Illinois in the American Bottom as well as another area known as the "salines." The salines area, named for the saltwater springs present in the terrain, produced salt for harvest and export. Enslaved laborers retrieved the water and boiled it down to extract the salt. By the early 1820s, the salines produced $11,000.00 a year in tax revenue, or about one-fourth of the state's expenses. The 1818 Constitution allowed enslaved laborers to be imported into Gallatin and Jackson Counties for one year in order to work at these facilities. The enterprise was required to cease operations by 1825 (Simeone 2000:25).

Political leaders reached a compromise in order to minimize the debate on slavery, a strategy influenced by the likelihood that Congress would reject a proslavery state constitution.

While the majority of the early settlers came from the South, Illinois's Constitution was based on articles used in the constitutions of New York, Ohio, and Kentucky. The new Constitution stated that enslaved persons owned by French citizens could be retained in bondage. Indentured servitude, whereby African Americans were contracted to work for decades, was acceptable under the state's Constitution. The offspring of indentured servants had to serve until they became 21 years of age for males, and 18 years of age for females. Enslaved people could also be brought into the salines until 1825 (Davis 1998:165).

Slavery proponents called for a constitutional convention to revise Illinois's Constitution in order to allow chattel slavery. In 1818 through the early 1820s Illinoisans faced an economic depression and many believed that they suffered because Missouri now gained a steady flow of Southern immigrants because it was admitted as a slave state as a result of the 1820 Missouri Compromise. In addition, an epidemic of yellow fever had hit most of the American Bottom. Over half the population died in Atlas, the county seat of Pike County (Simeone 2000:50). Illinois was a northern state with a majority of its citizens from the Upland South area of the United States, which included Kentucky and Tennessee, as the principal sources of immigrants. However, by the early 1820s Northerners began their steady influx into the new state, thereby beginning to sway the majority of public opinion against the idea of chattel slavery.

The influx of Northerners brought new customs to the area. Previously, business deals were typically sealed with a handshake. As one former Tennessean wrote, once the "Yankees" infiltrated the area they introduced a "system of accounts and obligations" which was looked upon by the Southern community with great distrust. The Yankees used words and writing that

intimidated “the white folks” (Buck 1917:291). It is interesting to note that she constructed whiteness as including Southerners, while others, including European American Northerners, were not included in that category.

Many of the early settlers flocked to the American Bottom, but periodic flooding meant that it was susceptible to outbreaks of malaria. This problem, many of the American Bottom settlers believed, could be solved by introducing slave labor, much like their French predecessors had done. Post-statehood, plans arose for a limited slavery system whereby the Illinois General Assembly would allow the importation of enslaved people to clear the land and build drainage canals. After a 10–year period these enslaved laborers would be shipped down the Mississippi River and sent to Africa. This proposal met stiff resistance and new debates arose about the future of slavery in Illinois.

Generally, the new Illinois residents who were typically poor, white, and from the South, felt threatened by the invasion of Northerners, and by free African Americans who would compete for similar resources. On August 2, 1824, in a referendum proposing the universal legalization of slavery, the proposal fell to defeat by a vote of 6,640 to 4,972. Pike County overwhelming voted against the referendum (23 for and 261 against) (Davis 1998:167). Generally, Southern settlers joined Northerners to voice their opinion against slavery. Eleven of the 18 abolitionist state legislators came from the South. However, the proslavery faction gained many seats and the control of the General Assembly. Illinoisans created a society that hampered the introduction of slavery, but nevertheless contained an implicit white supremacy. Black Codes passed in 1819 and 1829 restricted the rights of African Americans and discouraged their settlement in the state (Simeone 2000:157).

The 1830s served as one of the most speculative eras in Illinois land sales. The Blackhawk Wars ended in 1833, thus forfeiting the last Native American lands in Illinois. The era was characterized by wild speculation in the incorporation of towns that were platted from 1835 to 1837. Some town plans remained only on paper and others barely developed before they folded (Davis 1998:236).

Frank McWorter

The founding of the town of New Philadelphia in west–central Illinois by Frank McWorter, a freed African American, in 1836 is both a compelling and heroic story. Frank was born near the Pacolet River in South Carolina, to his mother Juda, with his father most likely being his master. In 1795, when he was about 18 years old, his master George McWhorter relocated him to the Kentucky frontier in Pulaski County. George McWhorter later purchased additional properties in Kentucky and Tennessee and left Frank behind to manage the farm. Historian Juliet Walker’s (1983) biography of Free Frank describes that while he was enslaved he also established a saltpeter mining operation in Kentucky. Frank married Lucy in 1799, who was also enslaved in Pulaski County. He became the father of four children while still enslaved: Judy, Sallie, Frank and Solomon. In 1815 George McWhorter died without making any provisions for Frank’s manumission.

In 1817 Frank had saved enough money to purchase his wife’s freedom for $800.00. Since

Lucy was pregnant at the time, this action ensured that their son Squire would be born free. Two years later Frank was able to purchase his freedom from George McWhorter's heirs for the same sum. The document that declared his freedom stated that, "a certain Negro man named Frank, a yellow man," was to be liberated. His former owners signed the document on September 13, 1819, in Pulaski County, Kentucky (Matteson 1964:2). In the 1820 Federal Census he is listed as "Free Frank." He continued to live in Pulaski County while he speculated on and expanded his saltpeter operations near the town of Danville. After he and his wife were free, they had three additional children: Squire, Commodore, and Lucy Ann (Matteson 1964:1; Walker 1983:28-48).

In 1829 Frank traded his saltpeter enterprise for the freedom of his son, Frank, Jr. In 1830 Free Frank decided to leave Kentucky and he acquired a quarter section (160 acres) of land from Dr. Eliot, sight unseen, in Pike County, Illinois. Free Frank, Lucy and their freed children arrived in Hadley Township in the spring of 1831 after spending the preceding winter in Greene County, Illinois. The McWorters were the first settlers in that township, and other settlers finally joined them two years later (Charles Chapman and Co. 2006 [1880]:216-217).

Frank left three children behind, along with 11 other family members, their spouses and children. Over the next 25 years he succeeded in purchasing their freedom (Walker 1983). During his tenure in Illinois, McWorter acquired over 500 more acres. He grew wheat, corn, and oats, and on his farm he raised cattle, hogs, horses, mules, and a mixed variety of poultry (Matteson 1964:5). By 1835 Free Frank purchased his son Solomon's freedom for $550.00 (Walker 1983:89).

Several citizens from Kentucky and Illinois vouched for Free Frank's character in order to pass a legislative act to change his name to Frank McWorter, taking the surname of his former owner while changing the spelling of that name. The act also gave him the right to "sue and be sued, plead and be impleaded, purchase and convey both real and personal property in said last mentioned name" (Illinois State Archives 1837b:175). The law also stated that his children shall take the name of their father. The Illinois legislative act made note that Frank had laid out the town in 1836 "which he calls Philadelphia, and understanding and believing that the said Frank has laid out the town intending to apply the proceeds of the sales for the purchase of his children yet remaining slaves, two young women about twenty years of age – The said town is in handsome country, undoubtedly healthy" (Illinois State Archives 1837a).

New Philadelphia was at times referred to as Philadelphia and was platted with 144 lots, each measuring 60 x 120 ft. Each block typically contained eight lots, and the two main thoroughfares, Broad Way and Main Street were platted as 80 ft. wide, secondary streets were 60 ft. wide, and alleys measured 15 ft. wide (See Figure 2.3). While African Americans developed towns before 1836 (Cha-Jua 2000), New Philadelphia is the earliest known town founded and platted by an African American. Both European Americans and African Americans purchased property in New Philadelphia and moved to the community.

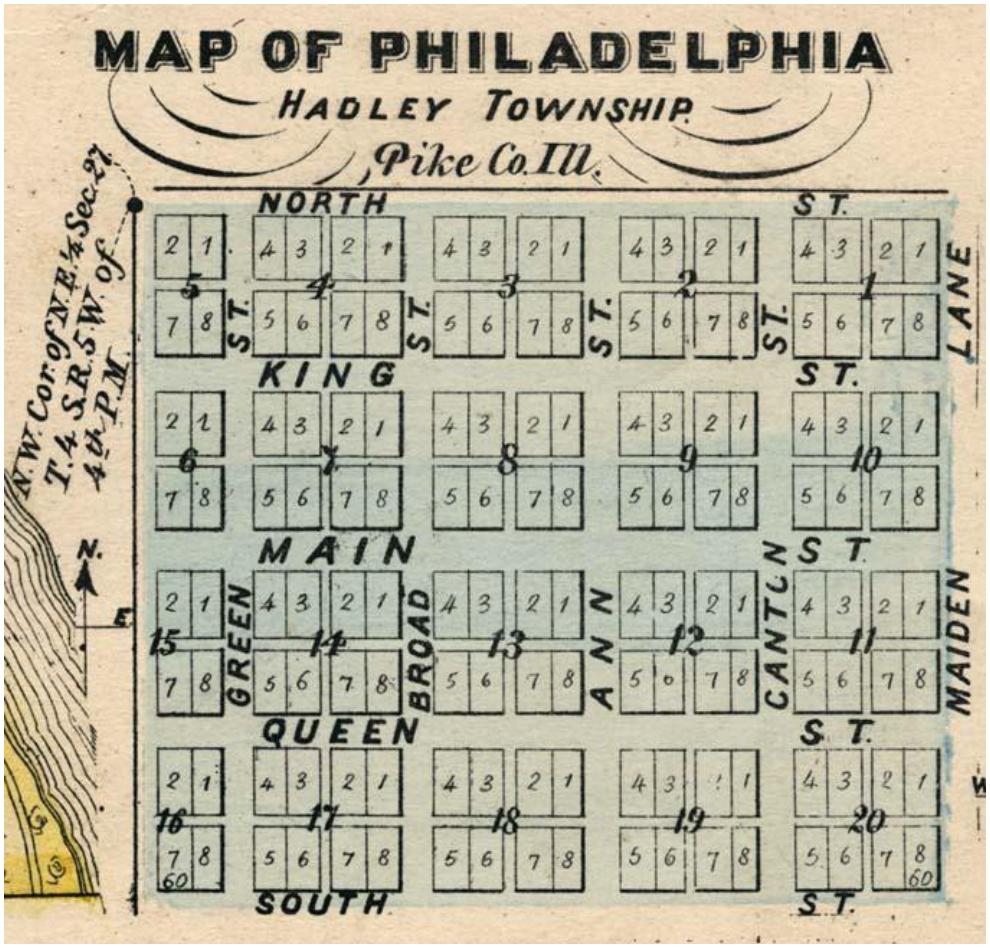

Figure 2.3. *1872 Plat Map of New Philadelphia (Ensign 1872).*

Frank died in 1854 at 77 years of age. Frank McWorter not only purchased the freedom of himself, his wife, his four children, and two of his grandchildren before he died, but, also his will provided for the purchase of the family members who were then still in slavery (grandchildren and great-grandchildren), freeing sixteen people in total. His two sons Solomon and Commodore carried out the provisions of his will (Matteson 1964:10; Walker 1983).

New Philadelphia: Frontier Town

New Philadelphia existed as a small rural town through the 1880s until its virtual abandonment in the early twentieth century. The 1850 federal census indicates that the town had 58 residents living in 11 households. The town had a Baptist preacher, a cabinet maker, a laborer, two merchants, two shoemakers, a wheelwright and four farmers. About one quarter of the town's residents were born in Illinois. The federal census listed racial categories, including "white," "black," and "mulatto." The 1850 census lists 20 (35%) residents as mulatto, 2 (3%) individuals as black, while the majority (36 individuals, 62%) were categorized as white. The State of Illinois had less than 1% of its residents listed as black. Twenty residents (37%) were born in the Great Lakes region, 13 individuals (22%) came from Illinois, and 11 people (19%) came from New England and the Northeast region. Some of the prominent town residents included

McWorter, Burdick, Clark, and Hadsell (King 2006).

Five years later, the 1855 state census lists 81 town residents, an increase of 40%. The 18 African–American residents accounted for only 22% of the town's population, and the rest (n=63) were listed as white. The 1860 census shows an increase of the town to 114 individuals. A blacksmith, a carpenter, a physician, a schoolteacher along with 13 farmers resided in the town proper. Ninety–three (82%) of the residents were listed as white and 21 individuals were recorded as black or mulatto. The State of Illinois had less than 1/2% of its population listed as black. No doubt, the legislative restrictions enacted in 1819 and 1829 prohibited any real growth of the African American population in Illinois.

A large proportion (43.9%) of the town came from other Illinois communities, and 24 people (21%) were born in the Northeast portion of the United States, including states like Maryland, New York, New Jersey and Pennsylvania (King 2006). New Philadelphia's population peaked by 1865 with a total of 160 individuals residing in 29 households. The census indicates that 112 (70%) individuals were categorized as white and 48 (35%) were of African American descent, indicating a twofold increase in the number of African–American residents over that recorded on the census just five years earlier. Place of origin was not recorded in this state census, but perhaps the influx of African Americans was a result of the northern migration of formerly enslaved persons leaving plantations. Only 9 of the 29 households reported owning any livestock compared with 14 of the 15 households a decade earlier. Prominent families included the Burdick, Hadsell, Clark, Cartwright (Kirtwright), and McWorter households. The Bower, Kellum, Vaughn (Vond), Baker, Johnson, and Shipman families also lived in the area (King 2006).

Throughout the history of the town all of the lots were sold, and many were sold up to a dozen times. The high turn–over rate of lot ownership is noticeable especially in the early settlement of the town. This trend may indicate that while the town survived as a small rural community serving the immediate hinterlands, many others prospected on town land with the hope of making significant amounts of money if a railroad line was laid adjacent to the town. There are many cases of small town speculations in Illinois in the 1850s where properties adjacent to the railroad doubled in value, and in some cases the values increased by as much nine times the original price (Davis 1998).

In 1853 the Pike County Rail Road Company, made up of prominent farmers and businessmen in the area, met to create a route for a new railroad line. The interests of New Philadelphia were not represented on the board. The route for the Hannibal & Naples Railroad came from the east and if it continued in a direct westerly direction it would have intersected New Philadelphia. Instead, the railroad company routed the line to New Salem and Hadley Station, north of New Philadelphia. In order to reach New Salem and Hadley Station, the line looped north and around New Philadelphia (see Figure 2.4). When the line reached a point west of New Philadelphia it swung south to a point directly west of the town and it again ran in an east to west direction until it reached the town of Barry (Charles Chapman and Co. 2006 [1880]:904; Matteson 1964:9; Pike County Railroad Company 1853).

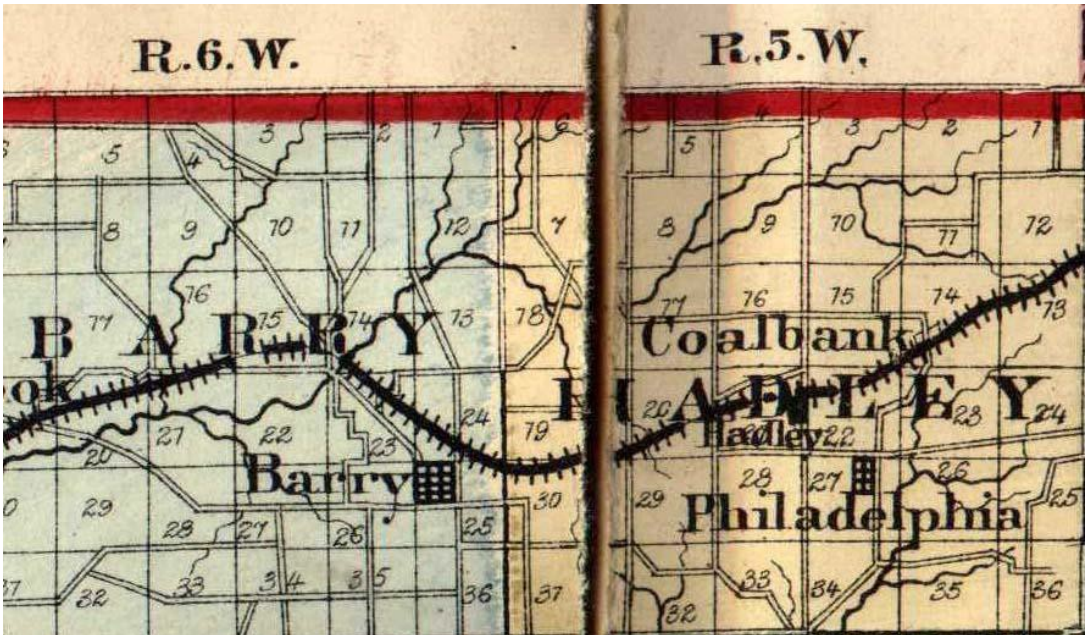

Figure 2.4. *Excerpt from 1875 Illinois Atlas showing railroad bypass of New Philadelphia (Warner and Beers 1875).*

The construction of the railroad across Pike County, from Valley City on the west bank of the Illinois River to Hannibal, Missouri, meant that purchasing consumer goods became more convenient and farmers had more outlets for their agricultural products. The railroad constructed a spur to Pittsfield, the county seat, shortly after its initial construction. Other railroad lines in subsequent years eventually connected the other sections of Pike County to larger regional markets. New Philadelphia's population decreased to about 123 residents by 1870. Some townspeople left for other opportunities west of the Mississippi River while others migrated to larger metropolitan areas.

Those classified as white continued to be the majority of the town (n=92, 75%) in 1870, while 25% (n=31) were listed as either black or mulatto. The Burdick, Clark, and Hadsell families continued to reside in the town. The town's workforce included one carpenter, two blacksmiths, a coal miner, three school teachers, a physician, a minister, three laborers, a seamstress, a shop worker and a speculator resided in the town along with farmers (King 2006).

By 1880, the number of residents in New Philadelphia fell to about 84 individuals (and 17 households), almost half of its size when compared to the 1865 state census. The town included 20 people employed in farming (farmers and farm hands) as well as a blacksmith, a school teacher, a storekeeper, two house servants, and nine general laborers. The majority of the residents (52, or 62%), were Illinois natives, and 13 individuals (14%) came from Ohio. The federal census listed 68 (73%) people as white; 22 (24%) as mulatto, and three residents (3%) were noted to be black. The routing of two main transportation arteries away from New Philadelphia severely hindered its growth. In 1880, Chapman (2006 [1880]:740–41) wrote, "At one time it had great promise, but the railroad passing it a mile distant, and other towns springing up, has killed it. At present there is not even a post office at the place."

The depopulation of New Philadelphia follows the trend for the rest of Pike County. While the county experienced rapid growth before the Civil War, expansion slowed in the 1870s and by the end of the century urban areas and western lands drew people away from Pike County (Smith and Bonath 1982:74-76). In 1885, the size and layout of New Philadelphia changed dramatically. Blocks 1, 10, 11, and 20, as well as the eastern half of Blocks 2, 9, 12, and 19, were declared vacant and no longer part of the town as the property was returned to agriculture. Canton Street and Maiden Lane were removed, and Queen Street became known as Stone Street. The platted land of the former town had shrunk from 42 acres to about 27.5 acres (Walker 1983).

Figure 2.5. *1939 Aerial photograph of the New Philadelphia area (United States Department of Agriculture 1939).*

By the early twentieth century only about a half dozen households remained in New Philadelphia. Throughout the twentieth century, several maps still designated the area of the former town site as Philadelphia or New Philadelphia. Oral histories of several former residents performed in the early 1960s indicated that a multi–racial community survived into the 1930s (Matteson 1964). The land was virtually abandoned by the 1930s with only the Burdick family remaining (see Figure 2.5).

Chapter 3: Excavation and Analysis Methods

Kathryn Fay[1] with contributions by Paul Shackel[2]

Archaeological work began at New Philadelphia with the assistance of Likes Land Surveyors, Inc. of Barry, Illinois. They located the original plat and imposed the town plan over the existing topography, marking the boundaries of the town, blocks, and lots. Likes Land Surveyors, Inc. then produced a map, which was overlain on an existing aerial photograph, which then guided our initial archaeological survey in the fall of 2002 and the spring of 2003 (Gwaltney 2004).

Figure 3.1. *1998 Aerial photo with town plat map overlay (Image courtesy of Christopher Fennell).*

Survey and Excavation Techniques

In order to create an excavation and research strategy, the archaeology team decided that a pedestrian survey should be the initial phase of work. The survey helped locate and identify artifacts on the surface and allowed the archaeologists to determine which areas were settled within the town proper. The walk over survey under the field supervision of Joy Beasley and Tom Gwaltney provided important information that furnishes artifact distributions over the site. The clustering of artifacts shows distinct patterns that are highly informative for understanding the town's settlement. The analysis of the plow zone data indicated that there were large

[1] University of Illinois, Urbana-Champaign.
[2] University of Maryland.

concentrations of artifacts found within the lots bordering Broad and Main Streets in Blocks 3 (Lots 3–6), 4 (Lots 1, 2, and 8), 7 (Lot 1), 8 (Lots 1–8), 9 (Lot 5), and 13 (Lots 3–4) (Figure 3.2). While the archaeological data from the walk over survey were from a plowed context, the artifacts provided some very important information that guided our excavation strategies. This information indicated that there is a high probability of locating domestic occupations of the town, especially along Broad and Main Streets (Gwaltney 2004).

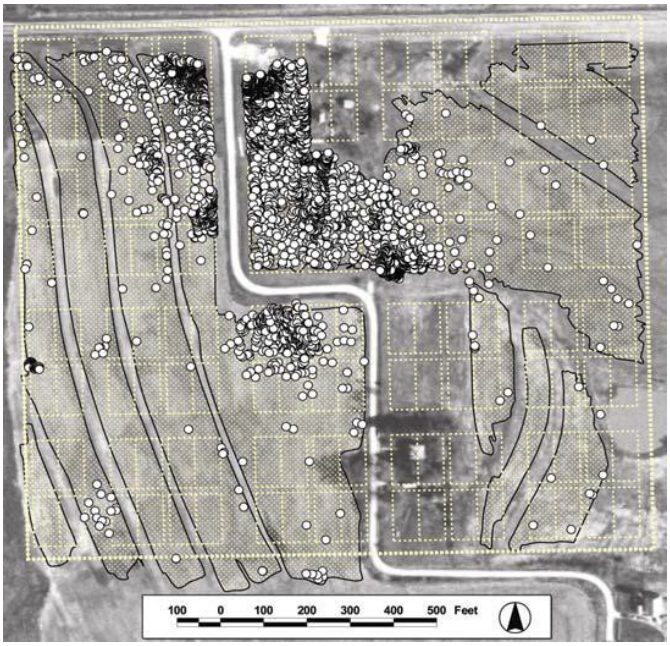

Figure 3.2. *Distribution of historic artifacts found at New Philadelphia (image from Gwaltney 2004).*

After determining the areas of highest artifact concentrations, geophysical surveys were performed by Michael Hargrave and Carl Carlson-Drexler (U.S. Army Engineer Research and Development Center, Construction Engineering Research Laboratory [CERL]) for three days at the beginning of each field season. This work, using several geophysical methods including electronic resistance and magnetometry, indicated the presence of subsurface anomalies. Thermal imaging cameras were used in an aerial survey of the New Philadelphia site in 2008, conducted by Bryan Haley and Tommy Hailey (Haley 2008). A LIDAR survey was also conducted on the town site and the surrounding area in 2011, the results of which are being analyzed in an ongoing basis for different areas of the town's vicinity (Fennell 2011). Further discussion of the variety of survey methods used in this multi-year project is presented in Chapter 13.

Prior to excavations the archaeology team used a one-inch diameter core to test many of the anomalies. Resistance from stone or artifacts, or finding cultural material in the core samples, such as plaster and mortar, is an indication of a subsurface feature. This combined work allowed the archaeologists to concentrate excavation units on more specific areas of the town site.

In general we have a very good sense of land ownership (based on deed research), the general population of the town (based on census data), and the development of the lots (based on tax records). Based on the historical documentary evidence, archeological survey, and geophysical survey, the archaeology team chose to work in several areas of the town site, including: Block 3, Lot 4; Block 7, Lot 1; Block 8, Lots 1 and 2; Block 12, Lots 3 and 4; Block 13, Lots 3 and 4; and, an area in King Street north of Block 8. Several other areas of the site were investigated for geosciences studies on the soils (Chapter 12, "Status of geoarchaeological investigations at New Philadelphia Historical Landmark").

The archaeology team used engineer's scale (tenths of a foot) since it is the most commonly used form of measurement in historical archaeology. The archaeology work then proceeded in two steps. First, a form of sampling using 5 x 5 ft. excavation units retrieved data from the town lot and gave us a sense of the plow zone, subsurface features, and artifact concentrations. Second, the archaeology team selected anomalies identified in the geophysical survey and systematically sampled them using a one-inch corer. If feature material, such as mortar, stone, artifacts, or unusually deep subsoils were encountered, we tested these areas through controlled excavations. Once features were identified excavation teams preceded with a larger block excavation using 5 x 5 ft. excavation units as a standard, but some units were smaller or larger if the case warranted (Figure 3.3).

Figure 3.3. *Example of standard 5x5 ft excavation units (Photograph courtesy of Doug Carr, Illinois State Museum).*

Generally, the archaeologists removed plow zone materials in 0.5 ft. arbitrary levels until they encountered features or subsoil. Since most of the area was plowed these excavations proceeded quickly until the archaeology team encountered subsurface features and/or undisturbed stratigraphy below the plow zone. Features, such as subfloor cellar pits, foundation walls, cisterns and wells,

were bisected and excavated according to stratigraphy, and the team systematically collected soil samples for flotation in order to retrieve archaeobiological data.

The sod and plow zone layer of each unit was labeled A, with an additional number marking each 0.5 ft arbitrary level (A1, A2, etc.). At the first soil change after the plow zone, denoting a different stratum of soil, the labeling system switched to B (in addition to a number per arbitrary level within it, if necessary), and would again change to C and so on, if more soil changes were encountered.

Lab Work and Analysis Methods

During each season, five weeks of fieldwork at New Philadelphia were followed by five weeks of laboratory work and analysis at the Illinois State Museum (ISM) Research and Collections Center (RCC) with museum staff members serving as additional mentors. Students cleaned, labeled, and identified archaeologically retrieved data. The data were recorded on paper spreadsheets then entered into a computer database (Figure 3.4). Students then performed a minimum vessel analysis for the archaeological materials found in undisturbed contexts, and performed further research on identifiable artifacts. Students also learned stabilization and identification procedures for archaeobiological specimens. Marjorie Schroeder (ISM) mentored students during the macrofloral analysis. The students processed soil samples through a flotation device in order to recover archaeobotanical remains, small–scale animal remains, and very small artifacts, such as glass beads.

Figure 3.4. *NSF-REU Field school students John Schultz and Tyquin Washington process artifacts at the ISM-RCC (Photograph courtesy of Doug Carr, Illinois State Museum).*

Terrance Martin mentored the field school students with the identification of animal remains and demonstrated various ways of categorizing anatomical elements as cultural entities (skeletal portions and butchering units), recognizing natural modifications (e.g., carnivore and rodent gnawing) and cultural modifications (burning, sawed or chopped margins, and knife cuts), and quantifying faunal assemblages in terms of specimen counts, minimum numbers of individuals, and biomass (Figure 3.5).

Chapter 4: Block 3, Lot 4

Megan Bailey,[1] Christopher Fennell,[2] and Terrance Martin[3]

Our survey and excavation efforts focused on Lot 4 in Block 3 in 2008 for a number of reasons. This lot was located at the north edge of the town site, adjacent to Broad Way, the major street within the town as planned by Frank McWorter. An existing gravel road runs along the space of Broad Way, representing a remnant of the nineteenth-century plan. Block 3, Lot 4 was located in an area very likely subjected to successive episodes of development and occupation in the town's history, with its position at the north-central entrance point for the town and along a regional road that still runs east-to-west along the town site's northern edge. The archaeology project had previously uncovered Feature 2, a lime slacking pit, in the area of Lot 4, and that feature dated to the late nineteenth century. Such a pit was utilized for mixing mortar and plaster to use in the construction of house or business structures. We had continued work in the area around Feature 2 in 2004 and 2005, searching for the remains of the structures served by that source for construction material.

During the 2004 to 2006 field seasons we had also positioned a large field tent in the area of Block 3, Lot 4, to provide shelter during the day for our field lab and as a space for visitors to congregate when touring excavations each summer. This was a logical placement of this tent facility, adjacent to an existing gravel-covered parking area, and we made that choice after consulting with members of the local and descendant communities on how best to provide such on-site shelter for visitors and researchers. That tent arrangement, however, constrained our ability to conduct more thorough surveys and excavations in the area of Block 3, Lot 4.

In advance of the 2008 field season, we arranged to place this tent facility elsewhere on the town site, so that Block 3, Lot 4 could be re-examined with geophysical surveys and excavations could then target those areas identified in resulting survey data. A resistivity survey conducted in Lot 4 in the week of May 27, 2008, revealed substantial anomalies that Michael Hargrave recommended for further exploration through soil core probes and excavations. This resistivity survey was particularly productive due to the heavy rainfall the area had received in earlier weeks. Such conditions often yield richer data quality, because the overall increase in rainfall can result in variable moisture retention of the ground surface from one specific area to another as a result of buried cultural remains.

The next sections of this chapter provide background information on Block 3, Lot 4 based on documentary evidence, followed by a discussion of the survey and excavation results obtained in

[3] Illinois State Museum. This report chapter was also written with the aid of contributions of data and interpretations from (in alphabetical order) Anna Agbe-Davies, Megan Bailey, Joshua Brown, Mathew Davila, Kathryn Fay, Kathrine Hardcastle, Michael Hargrave, Claire Martin, Alison McCartan, Annelise Morris, Camille Sumter, and Christopher Valvano, who participated in the 2008 field season investigations of Block 3.

the 2008 field season. Research efforts and results concerning other portions of Block 3, including the nearby site of a blacksmith operation, are described in our 2006 report (Shackel 2006).

Block 3, Lot 4 History

As summarized in our 2006 report (Shackel 2006), the following data concerning past property owners and potential residents of Block 3, Lot 4, can be ascertained from documentary records, including deeds, tax ledgers, and census lists.

The deed and census data indicate that Frank McWorter sold Block 3, Lot 4 to Henry Brown in 1838. There were ten transactions involving the lot throughout the following century. Using the deed, census, and tax records (see below), we can infer that the Cobb family made some improvements to the property before 1867, but by 1868 buildings no longer existed on the lot. The Clark family owned the site before the earliest known tax record. The Hadsell families owned the lot and lived in New Philadelphia for most of the 1870s. William Welbourne purchased the lot in the twentieth century and he and his family appear in the 1880 Federal Census. Welbourne, his wife Josephine and their three children were classified as white in the census. The deed, tax, and census data related to Block 3, Lot 4 are set forth below. The names italicized are those who may have occupied the lot, as they appear both in the deed and census data. The Venicombe family may also have maintained a household on this location in the early 1900s.

Block 3, Lot 4 Archaeology

The following is a summary of the archaeology for Block 3, Lot 4, in 2008. For a more detailed technical overview see the unit and feature summaries in Chapter 14, "Unit Summaries," of this report.

Excavators in Teams Y and Z worked together to investigate anomalies revealed in electric resistivity surveys conducted by Hargrave in May of 2008. Hargrave typically recommends that archaeologists place priority on those anomalies that appear both in the data of a magnetic survey and also in an electric resistivity survey of the same space. An earlier magnetic survey had revealed anomalies A31 and A32, as shown in Figure 4.1. Earlier resistivity surveys in the same area had proven difficult to interpret, due to dry soil conditions in prior years. The spring months of 2008 were marked by higher than normal rainfalls. In May, 2008, a new resistivity survey in Block 3, Lot 4 benefited from higher soil moisture content and revealed anomalies A50-A53, which correlated with the same space of anomalies A31 and A32 in the earlier magnetic survey (Figure 4.1).

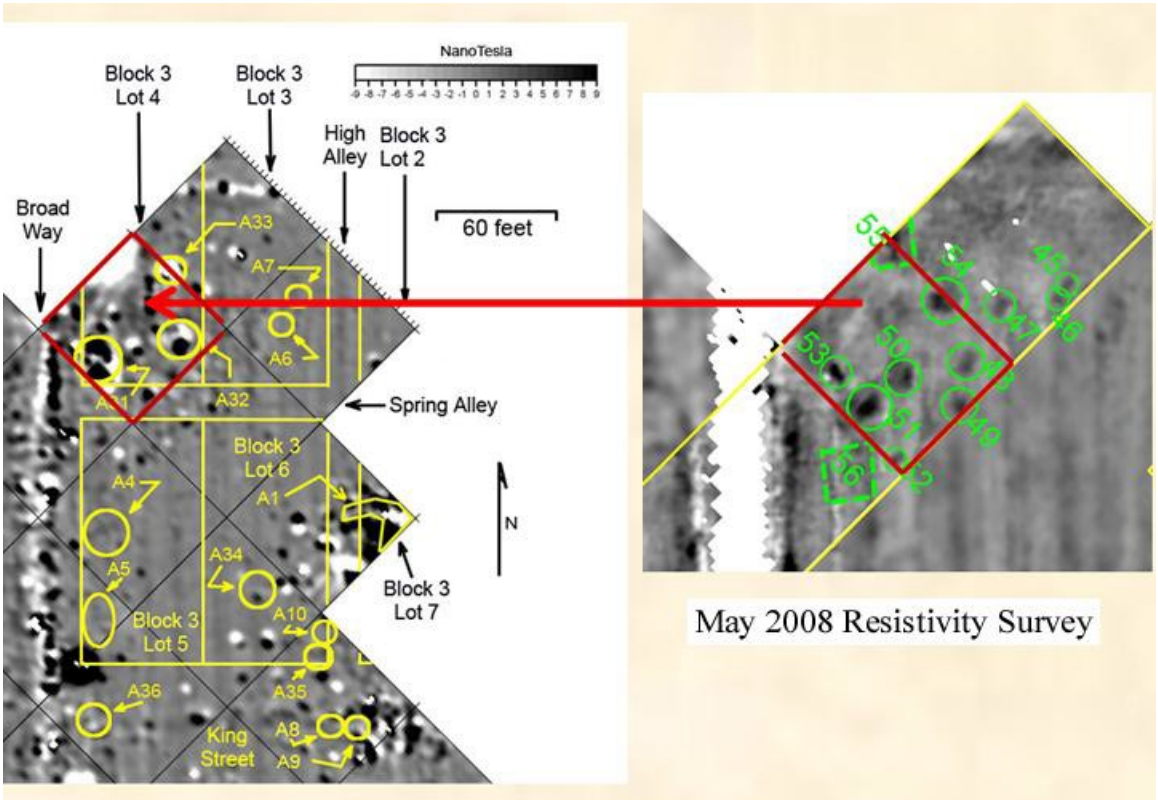

Figure 4.1. *2004 magnetic survey data in Block 3, Lot 4 (left), showing anomalies A31 and A32, and 2008 electric resistivity data results of the same lot (right), revealing anomalies A50-A53 in same space (Geophysical survey data images by Michael Hargrave; overlay by Christopher Fennell).*

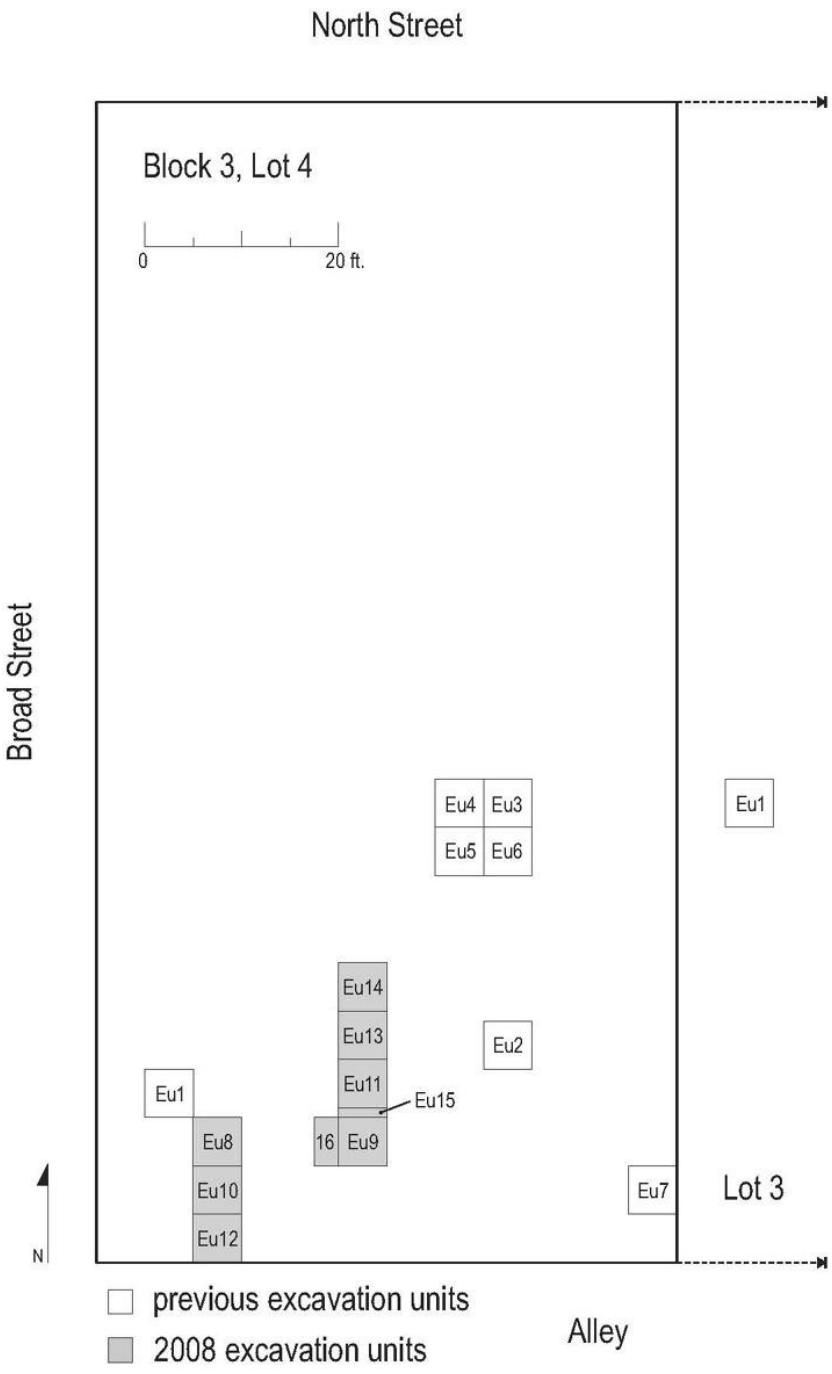

Figure 4.2. *Map of excavation unit locations within Block 3, Lot 4. In 2008, Team Y concentrated on EU 9, 11, 13-16, and Team Z excavated EU 8, 10, and 12 (Image by Christopher Valvano).*

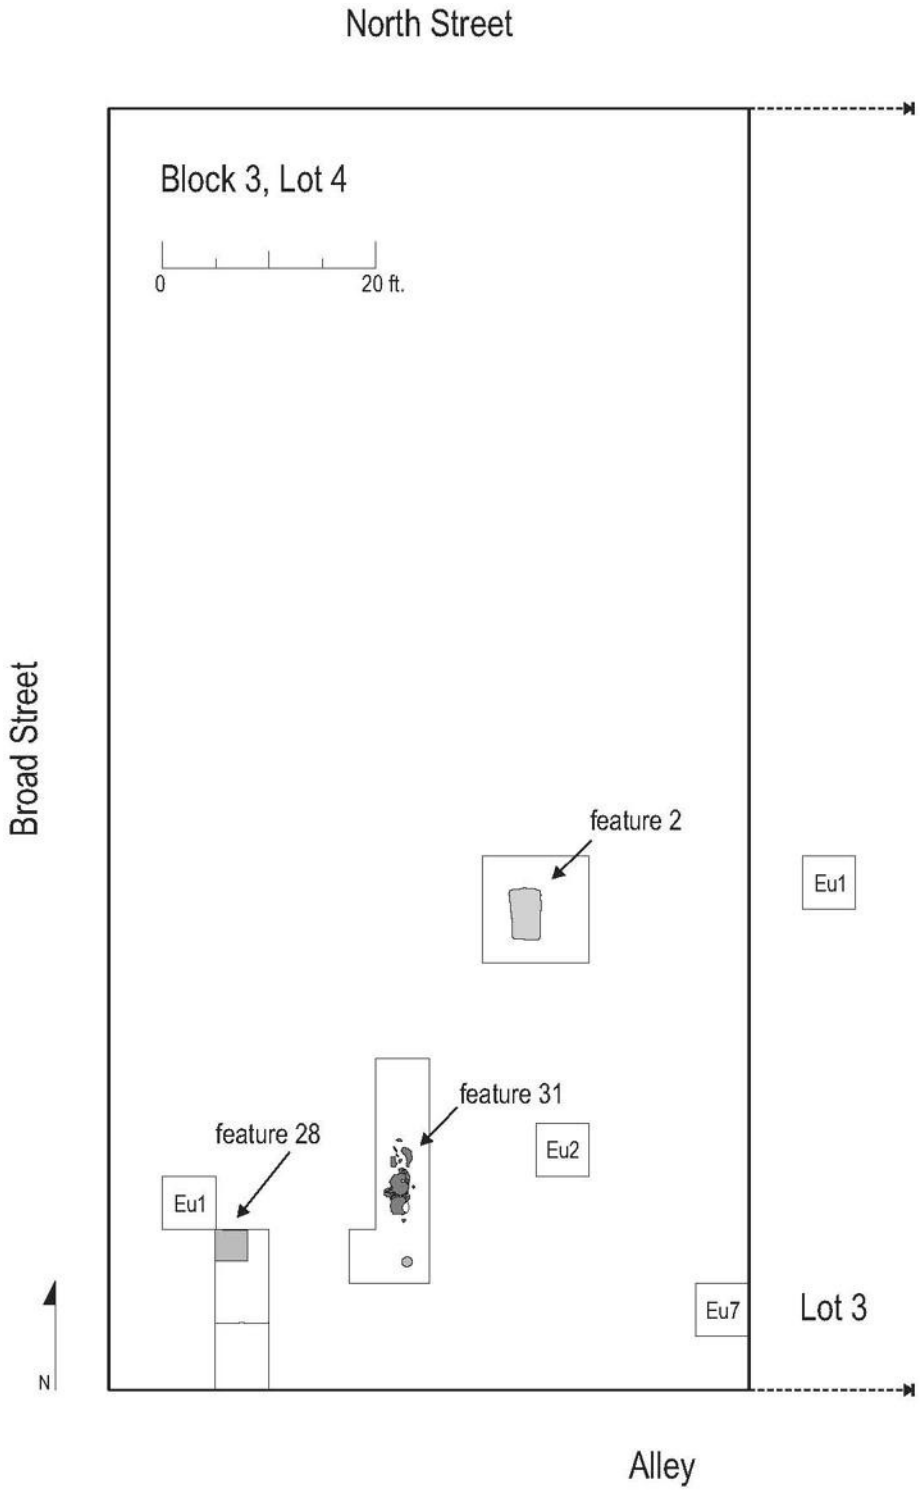

Figure 4.3. *Map of feature locations within Block 3, Lot 4. Feature 2 is a lime slacking pit, uncovered in 2004. Features uncovered in 2008 included Feature 31, a fieldstone foundation base; Feature 29 is the circular post mold immediately south of Feature 31; Feature 28 is a portion of a refuse pit spanning several occupation periods of this residential site (Image by Christopher Valvano).*

Teams Z and Y first tested the locations of anomalies A50-A53 with systematic soil core probes, using a one-inch diameter soil core sampler and a grid of sample locations in one-foot increments spread across the area of these anomalies. Based on the results of this soil core survey within the defined area, Teams Z and Y placed excavation units on the most promising locations over these geophysical anomalies.

The excavation team used soil test probes T5-1 through T5-7 in order to select the best location for these excavation units. The soil test probes were conducted every 2.5 ft. on a north-south transect of A51. The archaeologists discovered artifacts in soil probes T5-3 through T5-6 at 1.5-1.8 ft. in depth. The location of the probes marked the eastern edge of Unit 8, which was inserted at N10-15, E1-15 (these relative coordinates are in U.S. survey feet from the southwest corner of the lot). The location of Unit 8 would allow for the excavation unit to capture the suspected feature area as well as the area outside and not associated with the feature.

As shown in the maps provided in Figures 4.2 and 4.3, archaeologists in Team Z concentrated in the area of anomaly A53, and placed excavation Units 8, 10, and 12, uncovering Feature 28. Below, the levels of each Excavation Unit are described, followed by a summary of Feature 28 as a whole. Each of the levels below the plow zone (e.g., Level B1) include both the feature fill and the surrounding subsoil for the corresponding elevation.

Excavation Units 8, 10 and 12 and Feature 28

Excavation Unit 8

The southwest corner of Excavation Unit 8 is located five ft. east and five ft. south of the southwest corner of Unit 1. Team Z excavated Level A1 as an arbitrary 0.5 ft. level. A1's average opening was 765.975 ft. above mean sea level (amsl), and its average closing elevation was 765.439 ft. amsl. Level A1 was a plow zone consisting of loam sediments. Level A1's highest artifact concentration was glass (n=266) but also included buttons (n=2), red ware (n=2), white ware (n=128), stoneware (n=8), yellow ware (n=2), slate pencil fragments (n=2), bricks (n=49) and nails (n=75). The team excavated Level A2 as a 0.5 ft. arbitrary level. The average opening elevation was 765.439 ft. amsl and the average closing elevation was 765.181 ft. amsl. Level A2 was a plow zone layer composed of loam. Artifacts recovered from Level A2 were likely associated with a residence, and included ceramics (n=202), glass (n=452), charcoal, slag, metal, bricks (n=37), and nails (n=248). Level A2 was cut by rodent burrows which account for small pebbles throughout. Archaeologists initially set to excavate Level A3 as an arbitrary level of 0.5 ft. but terminated after 0.25 ft. due to the emergence of Feature 28. The average opening elevation was 765.181 ft. amsl and the average closing elevation was 765.071 ft. amsl. Level A3 was a plow zone layer composed of loam. This level yielded glass (n=164), flint, bricks (n=6), ceramics (n=45), nails (n=119), and metal. The artifacts in A3 are associated with the top portion of Feature 28, a refuse pit.

The team excavated Level B1 as an arbitrary level of 0.5 ft. Level B1's average opening elevation was 765.071 ft. amsl and the average closing elevation was 764.758 ft. amsl. Level B1

was a loamy sediment and the top level of fill in Feature 28. Level B1 was nearly the same color and composition as Level A3. Feature 28, first identified in Level B1, appeared as an area of artifacts in the southwest unit wall. Feature 28 contained concentrated amounts of household rubbish and was interpreted to consist of refuse fill. Artifacts recovered were vessel glass (n=59), flat glass (n=26), metal, brick (n=1), mortar, leather, a complete glass bottle, and ceramics (n=56). Two milk glass lid liners and associated glass Mason jars were situated within Level B1. The style of Mason jar with a zinc screw top lid was patented as of November 30, 1858 and in 1865 a glass lid liner was added to the manufacturing process. This style of jar was produced until 1920 (Milner 2004; Munsey 1971).

Archaeologists excavated Level B2 as an arbitrary level of 0.5 ft. but terminated it after 0.37 ft. due to the emergence of charcoal, brick, and mortar. All of the bricks discovered in the layer were broken. This pattern suggested that full bricks were reused and the broken pieces were discarded in the refuse pile. Level B2's average opening elevation was 764.758 ft. amsl and the average closing elevation was 764.438 ft. amsl. Level B2 was a sandy-loam fill, the next level within Feature 28. The soil surrounding Feature 28 was a loamy clay. Level B2 yielded buttons (n=2), flat glass (n=39), vessel glass (n=140), bottle necks (n=3), various metals, nails, brick (n=15), fabric, and charcoal. Ceramics in the layer were limited to white ware (n=44) and stoneware (n=2) with an approximate date range of 1820-1900. The excavation unit displayed a heavy artifact density in all regions except for the northwest corner, which was interpreted to consist of subsoil external to the contours of the feature. The team excavated Level B3 as a 0.5 ft. arbitrary level. The average opening elevation was 764.438 ft. amsl and the average closing elevation was 764.263 ft. amsl. Level B3 was a loamy clay within Feature 28 and a clay in the non-feature areas. Artifacts recovered from Level B3 include flat glass (n=27), metal, bricks (n=6), nails (n=64), leather, and a toy gun handle. The ceramics in the layer were porcelain (n=7), large white ware plate fragments (n=5), white ware tea cup fragments (n=6), a white ware bowl fragment (n=1), and miscellaneous white ware (n=41). A glass ball with a spiral design was discovered in the layer, it is 1.35 inches in diameter and 1.7 inches in height. It resembles a bottle stopper from the 1906 Illinois Bottle Company catalog (Lindsey 2013). The northwest corner of Level B3 consisted of sterile clay subsoil; all other areas of the excavation unit continued to contain a heavy artifact density.

Archaeologists excavated Level B4 as an arbitrary level 0.5 ft. thick. The average opening elevation was 764.263 ft. amsl and the average closing elevation was 763.857 ft. amsl. Level B4 was a refuse fill zone composed of very dark gray sandy-loam. Level B4 yielded buttons (n=9), metal, bone, ceramics (n=69), bricks (n=4), a pipe stem, and fabric. Additionally, six whole bottles (n=4 L&M Quincy, n=1 Coca Cola Quincy, n=1 condiment bottle), bottle necks (n=5), vessel glass (n=104), flat glass (n=38), and milk glass lid liners (n=5) were uncovered in that level. The Coca Cola bottle discovered would have been manufactured between 1893 and 1916. Also within this time frame falls a trademark from a Knowles, Taylor, and Knowles white ware plate, circa 1881-1904. Glass and ceramic objects from Level B4 are overall larger and more complete in relation to other artifacts in the previous layers.

The team excavated Level B5 as an arbitrary level of 0.5 ft. Level B5's average opening elevation was 763.857 ft. amsl and the average closing elevation was 763.481 ft. amsl. Level B5 was a refuse fill zone composed of loamy clay. Artifacts recovered were metal, charcoal, slag,

brick (n=9), mortar, ceramics (n=38), a large sickle blade, vessel glass (n=125), and flat glass (n=38). Among the glass objects was a clear glass jar embossed with the patent date "Feb 10 03 (Creswick)" and the top portion of a glass hurricane lamp which could have been purchased from a 1902 Sears and Roebuck catalog. The archaeologists excavated Level B6 as an arbitrary level of 0.5 ft. but terminated after 0.37 ft. due to a heavy concentration of architectural debris. Level B6's average opening elevation was 763.481 ft. amsl and the average closing elevation was 763.087 ft. amsl. Level B6 was a refuse fill zone composed of loam. Level B6 displayed fewer artifacts than previous layers, but yielded brick (n=26), mortar, bone, glass (n=24), white ware (n=7), metal, nails (n=171), a button, and charcoal.

The team excavated Level C1 as an arbitrary level of 0.5 ft. Level C1's average opening elevation was 763.087 ft. amsl and the average closing elevation was 762.366 ft. amsl. Due to the positioning of the rubble pile and the associated increase in architectural materials the excavators designated this as "Layer C." Level C1 was the area beneath the rubble brick zone composed of loamy clay. Artifacts recovered were charcoal, copper, glass (n=20), nails (n=138), metal, brick, mortar, and ceramics (n=18). Portions of the artifacts in Level C1 were burned or melted. Only the north edge was excavated for Level C1; this was the area situated underneath the brick rubble pile. Archaeologists excavated Level C2 as an arbitrary level of 0.5 ft. in the northern portion of Unit 8. Level C2's average opening elevation was 762.366 ft. amsl and the average closing elevation was 762.031 ft. amsl. Level C2 was a plaster layer *beneath* the brick rubble and was composed of loamy clay. Level C2 yielded buttons, a cat skeleton, ceramics (n=4), metal, nails (n=9), charcoal, and glass (n=6). Level C2 continued to display evidence of burning. The team excavated Level C3 as a 0.5 ft. arbitrary level. The average opening elevation was 762.031 ft. amsl and the average closing elevation was 761.468 ft. amsl. Level C3 was beneath Feature 28 and was comprised of clay. Artifacts continued to lessen in Level C3, which yielded ceramics (n=1), glass (n=1), metal, bricks (n=2), nails (n=5), charred wood, bone, and a button. Throughout the C layers the most diagnostic artifacts were the ceramic vessels; however, most of those items are associated with a wide date range of 1820-1900+. The archaeologists troweled beneath Feature 28 to expose the lower lying sterile soil to ensure the termination of the feature.

Excavation Unit 10

Archaeologists in Team Z continued excavations of Block 3, Lot 4 by placing Excavation Unit 10 directly south and adjacent to Excavation Unit 8. By inserting Unit 10 at this location the archaeologists intended to gain a clearer view of the size and composition of Feature 28. The team excavated Level A1 as a 0.5 ft. arbitrary level, with an average opening elevation of 766.024 ft. amsl and an average closing elevation was 765.765 ft. amsl. Level A1 was a sod layer composed of loam. Historic-period artifacts distributed throughout the layer include glass (n=153), stoneware (n=8), white ware (n=75), metal, bricks (n=13), pencil lead, and nails (n=74). The team excavated Level A2 as a 0.5 ft. arbitrary level. The average opening elevation was 765.765 ft. amsl and the average closing elevation was 765.263 ft. amsl. Level A2 was a plow zone layer composed of sandy loam. Artifacts recovered from Level A2 include white ware (n=119), yellow ware (n=1), stoneware (n-12), flat glass (n=232), vessel glass (n=128), a pewter plate, bone, slag, metal, bricks (n=7), nails (n=180), and buttons (n=4). Level A2 displayed a

uniform color and texture throughout the layer. The floor of the layer was speckled with flecks of brick and mortar which was consistent with the material uncovered in Unit 8. A white ware table vessel possessed a maker's mark that could be attributed to the Thomas Furnival and Sons Pottery from England; the trademark on the vessel was utilized from 1871 to 1890 (Birks 2013).

The archaeologists continued by excavating Level A3 as an arbitrary level of 0.5 ft. depth, but terminated after 0.25 ft. due to the change in soil texture and the emergence of Feature 28. The average opening elevation was 765.263 ft. amsl and the average closing elevation was 764.966 ft. amsl. Level A3 was composed of loamy clay and was below the plow zone. Level A3 yielded mortar, brick (n=41), white ware (n=35), stoneware (n=5), nails (n=94), charcoal, a pipe stem, flat glass (n=72), melted glass (n=6), bricks (n=41), and vessel glass (n=45). The base from a glass vessel sherd was embossed with the letter R and can be attributed to a glass manufacturing processes which was used from 1893 to 1920. The artifacts in the lower portion of Level A3 are situated in the top portion of Feature 28, which consists of a refuse pit.

With the emergence of Feature 28, the team excavated Level B1 as an arbitrary level of 0.5 ft. Level B1's average opening elevation was 764.966 ft. amsl and the average closing elevation was 764.573 ft. amsl. Level B1 was a loamy clay with a soil texture and composition similar to that of Level A3. In view of the fact that Level B1 was at a depth beneath the reach of historic plows, the archaeologist refer to this layer as "sub-plow zone." Artifacts recovered were vessel glass (n=185), flat glass (n=87), melted glass (n=3), metal, brick (n=31), mortar, bone, a marble, a hair comb, ammunition casings, miscellaneous metal objects (n=105), nails (n=208), white ware (n=28), and stoneware (n=2). Among the glass vessels were body and base fragments that display partial letter embossing from the Riesch Brewing Company of Springfield, Illinois. These bottles were manufactured and distributed from 1893 to 1920. In addition, .22 caliber ammunition casings were found in the layer. The casing is a "rim-fire," manufactured by Winchester Repeating Arms from 1878 to 1911 (http://www.ammo-one.com). The ammunition casing was specifically produced to be used in the Spencer Arms .22 caliber rifle. This style of ammunition was effective at close range and typically used to hunt wild game not larger than deer.

Archaeologists excavated Level B2 as an arbitrary level of 0.5 ft. Level B2's average opening elevation was 764.573 ft. amsl and the average closing elevation was 764.049 ft. amsl. Level B2 was a refuse fill zone composed of very dark brown loamy clay. Level B2 yielded a button, flat glass (n=46), vessel glass (n=396), bottle necks (n= 16), melted glass (n=9), white ware (n=15, stoneware (n=4), porcelain (n=12), metal, nails (n=145), miscellaneous metal objects (n=379), brick (n=2), a pipe bowl, shoe leather, and charcoal. A pewter spoon was discovered in this layer. This specific spoon design, "Narcissus," was only produced in 1908 by the Silver Plate Company of Rockford, Illinois. Unit 10 Level B2 revealed the south boundary edge of Feature 28 with 25 percent of the layer extending outside of the feature's contours. Bottles discovered in the excavation unit continue to be the most diagnostic for dates. Two small bottles were discovered with vent holes at or near the corner of the vessel. These vent holes are attributed to a style of mouth blown glass created from 1885 to 1890 (Birks 2013). Additionally, two container bases were discovered with the text "PORT 3." This was a maker's mark used by the Port and Glass Company of Belleville, Illinois from 1902 to 1904. In 1904, the Ball Company purchased

the Port Company; the use of the mark Port was continued, but the script design was changed to resemble gothic letters after the purchase in 1904 (Toulouse 2001:422).

The team excavated Level B3 as a 0.5 ft. arbitrary level. The average opening elevation was 764.049 ft. amsl and the average closing elevation was 763.523 ft. amsl. Level B3 consists of a sandy loam inside Feature 28 and sandy clay for the areas outside of Feature 28. Level B3 contains a brick layer underneath a deposit of glass, metal, and ceramics. Feature 28 fill within Level B3 continued to display a heavy artifact density. Artifacts recovered from Level B3 include a bucket handle, a toy gun, a pocket watch, ceramics (n=151), vessel glass (n=983), flat glass (n=106), metal, bricks (n=2), nails (199), miscellaneous metal objects and fragments (n=975), leather, bone, fabric, and a ceramic marble. A ceramic cap from a perfume vessel was also discovered in level B3. This ceramic cap was produced by France Excellence for their Dorin perfume product line. Named for Maison Dorin, which produced cosmetics used by French aristocracy such as Marie-Antoinette, the Dorin perfume line was introduced to the public at the 1839 Paris Exposition and later in the United States during the 1893 Chicago Exposition and the 1894 St. Louis Exposition (http://www.maisondorin.com/en/la-maison-dorin/). This perfume cap may have been brought home as a souvenir from either of these nearby locations.

Archaeologists excavated Level B4 as an arbitrary level of 0.5 ft. depth. The average opening elevation was 763.523 ft. amsl and the average closing elevation was 762.971 ft. amsl. Level B4 was a refuse fill zone composed of black loam inside of Feature 28 and clay outside of Feature 28. Level B4 yielded a thimble, miscellaneous metal objects and fragments (n=233), nails (n=460), flat glass (n=47), vessel glass (n=86), milk glass lid liners (n=3), buttons, bone, bricks (n=102), and ceramics (n=54). The white ware vessels in Level B4 have a date range of 1820-1900s, and the tea cups have a narrower range of post-1890. One vessel in the layer possessed a maker's mark. This plate has a scalloped edge with a green floral print. The maker's mark is from the Buffalo Pottery; the buffalo displayed on the mark was used with the green floral pattern from 1909 to 1914. Level B4 contained large amounts of potash and lime in the floor of the unit. Due to the change in artifact types, the excavation team terminated the B levels with Layer B4.

Team Z excavated Level C1 as an arbitrary level of 0.5 ft. Level C1's average opening elevation was 762.971 ft. amsl and the average closing elevation was 762.357 ft. amsl. Archaeologists refer to this zone as Layer C because it had an abundance of architectural material and to distinguish it from the rubble layer above. Level C1 was composed of a very dark brown loamy clay. Artifacts recovered were a doll head, buttons, corn cobs, vessel glass (n=19), flat glass (n=80), miscellaneous metal objects and fragments (n=58), nails (n=109), brick, mortar, white ware (n=15) and stoneware (n=3). Two William Jennings Bryan Presidential campaign buttons were also located in Level C1. These buttons display the portrait of Bryan and are attributed to his 1896 or 1900 bid for office. A number of the artifacts in Level C1 were either burned or melted. Additionally, Level C1 contains a large amount of plaster mortar and small, lathing nails.

Archaeologists excavated Level C2 as an arbitrary level of 0.5 ft. Level C2's average opening elevation was 762.357 ft. amsl and the average closing elevation was 761.803 ft. amsl. Level C2 was a plaster layer beneath the brick rubble and was composed of loamy clay within Feature 28

and clay outside of Feature 28. Level C2 yielded buttons (n=4), a penny (with an inscribed date of 1903), pencil lead, decorated brass, bone, brick (n=10), ceramics (n-6), miscellaneous metal objects and fragments (n=20), nails (n=30), charcoal, vessel glass (n=29), and flat glass (n=183). The remainder of the feline skeleton located in Unit 8 was discovered in Unit 10 at Level C2. The team excavated Level C3 as a 0.5 ft. arbitrary level. The average opening elevation was 761.803 ft. amsl and the average closing elevation was 761.580 ft. amsl. Level C3 was beneath Feature 28 and was comprised of 10 YR yellowish brown clay. Artifacts recovered from Level C3 include ceramics (n=1), flat glass (n=2), vessel glass (n=1), nails (n=6), a miscellaneous metal fragment (n=1), bricks (n=4), pencil lead, and mortar. The archaeologists trowelled lower than Feature 28 to expose sterile subsoil. Excavation Unit 10 was terminated with the discovery of sterile subsoil beneath Feature 28.

Excavation Unit 12

Archaeologists in Team Z began excavation of Block 3, Lot 4, Excavation Unit 12 in an attempt to identify the southern boundary of Feature 28. Unit 12 was situated south of and contiguous to Unit 10. The team excavated Level A1 as a 0.5 ft. arbitrary level. Level A1's average opening elevation was 766.140 ft. amsl and the average closing elevation was 765.768 ft. amsl. Level A1 was a sod layer composed of loam. Historic-period artifacts distributed throughout the layer include a knife blade, flat glass (n=180), vessel glass (n=35), stoneware (n=16), white ware (n=12), various other ceramics (n=87), metal (n=5), bricks, slag, and nails (n=77). The team excavated Level A2 as a 0.5 ft. arbitrary level. The average opening elevation was 765.768 ft. amsl and the average closing elevation was 765.263 ft. amsl. Level A2 was a plow zone layer composed of loam. Artifacts recovered from level A2 included ceramics (n=106), stoneware (n=6), flat glass (n=235), vessel glass (n=67), bone, shell, slag, metal fragments (n=4), bricks (n=3), nails (n=149), and a button. Level A2 consisted of mostly smaller artifacts and no large pieces such as those associated with Feature 28.

The change in soil characteristics indicated the transition to the B levels. The team excavated Level B1 as an arbitrary level of 0.5 ft. Level B1's average opening elevation was 765.263 ft. amsl and the average closing elevation was 764.867 ft. amsl. Level B1 was the first level below the plow zone and consisted of a loamy clay. Artifacts recovered were vessel glass (n=10), flat glass (n=28), brick (n=6), mortar, nails (n=24), and ceramics (n=6). The majority of the artifacts recovered from Level B1 were located in the upper portion of the layer. The lower portion of Level B1 was nearly devoid of artifacts and none were found at the base of that level. Archaeologists excavated Level B2 as an arbitrary level of 0.5 ft. Level B2's average opening elevation was 764.867 ft. amsl and the average closing elevation was 764.353 ft. amsl. Level B2 was a sterile clay. Level B2 contained only 4 artifacts: 3 small pieces of brick and 1 fragment of flat glass. The artifacts in Level B1 are assumed to have fallen from the excavation unit walls. Excavation Unit 12 was terminated due to the relative paucity of artifacts in Level B2.

Feature 28.

Feature 28 was discovered while archaeologists searched for the source of geophysical Anomaly 51 (A51). Excavation Units 8, 10, and 12 had been situated so that A51 could be identified and the feature sampled. As the archaeologists excavated Unit 8, the

northwestern corner of the unit was sterile of historic period artifacts, providing the team with an outer border for part of Feature 28.

The sod layer was made up of sandy loam and displayed a high density of nails, glass, and ceramics. At the bottom of level A3 the excavation unit began to display the traits of a fill episode. The soil began to appear heavily mottled with mortar and brick fragments. Feature 28 emerged at approximately 1.25 ft. below the surface. In the excavation units the archaeologists referred to this as Level B1. At this depth in the excavation units the artifact assemblage contained a high density of household objects; ceramics vessels, metal can fragments, items of clothing, and glass. Large and more complete objects appeared the farther archaeologists dug away from the feature edge. Six complete soda bottles were recovered that have a date range from 1893 to 1920. These bottles were manufactured and distributed by the L & M Soda Company in Quincy, Illinois. In the B layers the soil was dark and loosely compacted, providing evidence that the soil surrounding Feature 28 was indeed fill dirt used to cover a refuse pile. In the southern portion of Unit 10, the archaeologists discovered 104 broken bricks. These bricks were devoid of mortar and no complete bricks were discovered in this concentration. Beneath the rubble layer the archaeologists identified Level C1. Level C1 was comprised of architectural materials, brick, mortar, charcoal, and plaster. In Level C2 panes of broken flat glass were stacked on top of one another. Underneath the pile of glass the excavation team discovered a 1903 penny. The soil in the C layers continued to be a dark brown in color, consistent with the anticipated color of fill materials. In these lower layers the archaeologists discovered many small personal objects, buttons, jewelry, a comb, and the two Presidential campaign buttons.

Figure 4.4. *East profile of Feature 28, showing sample of artifacts in east wall of the excavation units (Photograph by Terrance Martin).*

Figure 4.5. *Terry Martin and Kathrine Hardcastle of Team Z excavate Feature 28. Next to Kathrine is a sample of the brick fragments included within Feature 28 (Photograph by Joe Conover).*

Feature 28 was a multi-layered refuse pit associated with an adjacent house site. This trash pit contained extensive refuse, including ceramics, bottles, glass, iron, tin, and household hardware, dating principally from the 1870s through the early decades of the twentieth century (Figure 4.4). Feature 28 also contained extensive faunal remains from the subsistence refuse of the households that had occupied the site, and also the remains of several domesticated cats. A nearby fieldstone foundation associated with this trash pit very likely supported a brick chimney stack at the end of an adjacent house. Feature 28 contained a high volume of brick fragments, and no complete bricks (Figure 4.5). It appears that at some point the brick chimney was taken down, whole bricks were removed for reuse elsewhere, and the broken fragments of bricks were deposited into this trash pit.

Among the many engaging artifacts recovered from this refuse pit was a campaign pin with the image of William Jennings Bryan, from the 1896 or 1900 presidential contest (Figure 4.6). Among other roles, Bryan was memorable to many Americans as the skilled orator and populist Democratic candidate. He opposed a Republican platform of promoting a gold standard for the United States monetary system to aid industrialists and bankers (Burton 2007). As historian Vernon Burton emphasizes, Bryan's populist political advocacy linked the sentiments of demands for social reform from the early 1800s to the new challenges of the 20th century:

> Bryan's powerful rhetoric invoked the millennial ideal of antebellum reform: "Having behind us the producing masses of this nation and the world, supported by the commercial interests, the laboring interests and the toilers everywhere, we will answer [the Republicans'] demand for a gold standard by saying to them: You shall not press down upon the brow of labor this crown of thorns, you shall not crucify mankind upon a cross of gold." (Burton 2007: 356, quoting Bryan)

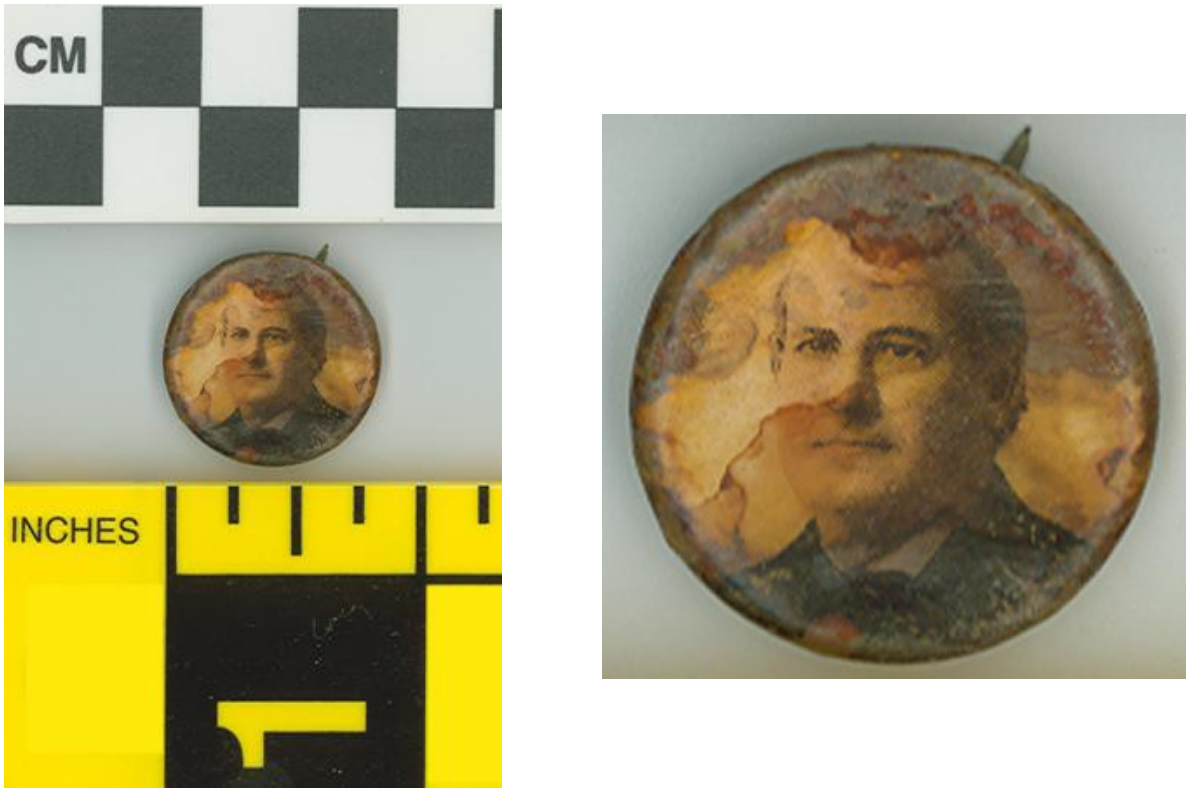

Figure 4.6. *William Jennings Bryan campaign pin from Feature 28 (Images by Christopher Fennell).*

He was the target of opponents' many criticisms and most famously parodied as the "cowardly lion" in Frank Baum's parable of the 1900 election, *The Wonderful Wizard of Oz* (Burton 2007:352-53).

Also recovered from Feature 28 were whole bottles, including embossed Coca-Cola and soda water containers (Figure 4.7). These numerous artifacts from the early 1900s were likely associated with a household of the Welbourne or Venicombe families. Additional analysis of the faunal remains recovered from Feature 28 are included in Chapter 11, "Animal Remains from the New Philadelphia Site (11PK455), Pike County, Illinois: 2008-2011 Seasons," of this report.

Figure 4.7. *Team Z excavator Alison McCartan holds two bottles from Feature 28, including a Coca-Cola container (on left) bottled in Quincy, Illinois (circa 1893-1916), and an early 1900s soda water bottle (right), also from Quincy (Photograph by Joe Conover).*

Excavation Units 9, 11, 13-16, and Features 29, 31, 38, and 39

While Team Z worked on investigations of Feature 28, archaeologists in Team Y began excavations that uncovered portions of the foundation remains of a house structure related to Feature 28. Team Y assigned the label of Feature 31 to a fieldstone foundation base for a chimney stack that stood at the east end of that house. Features 38 and 39 consisted of a builder's trench and foundation fill adjacent to that fieldstone base. Feature 29 was a post mold that once held a support post for the house foundation, and was located in a north-south line that defined the base of the east façade of the structure. Figure 4.8 provides an overall map of these features, and closer scale plan views of the features are provided in Figures 4.9 and 4.10.

Archaeologists in Team Y began excavations to ground truth the area of the most productive soil core probes in the location of anomaly A50. They excavated Units 9, 11, and 13-16, and uncovered Features 29, 31, 38, and 39 within these units.

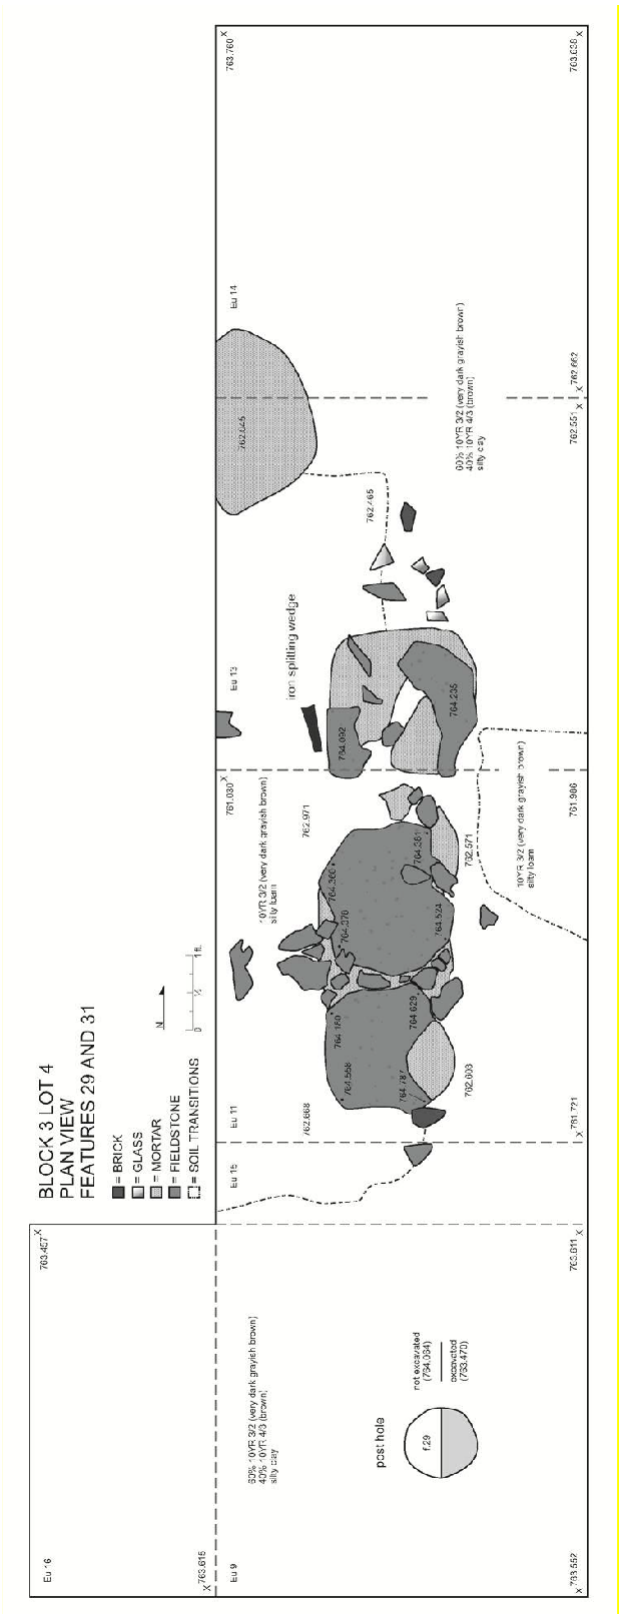

Figure 4.8. *Plan view of Features 29, 31, 38, and 39 together (see Figures 4.9 and 4.10 for close-up plan views of each of these features) (Image by Christopher Valvano).*

Feature 29

Feature 29 was a circular soil stain that Team Y interpreted as a post mold (Figure 4.9). It was located to the south of Feature 31 in the southeast quadrant of Block 3, Lot 4, Excavation Unit 9, Levels A3-B1. The dimensions of Feature 29 are 0.88 ft. (N-S) x 0.9 ft. (E- W). Feature 29 was bisected north-south in Level B1, and excavators then removed the east half of the feature bisect and profiled the western wall of the feature.

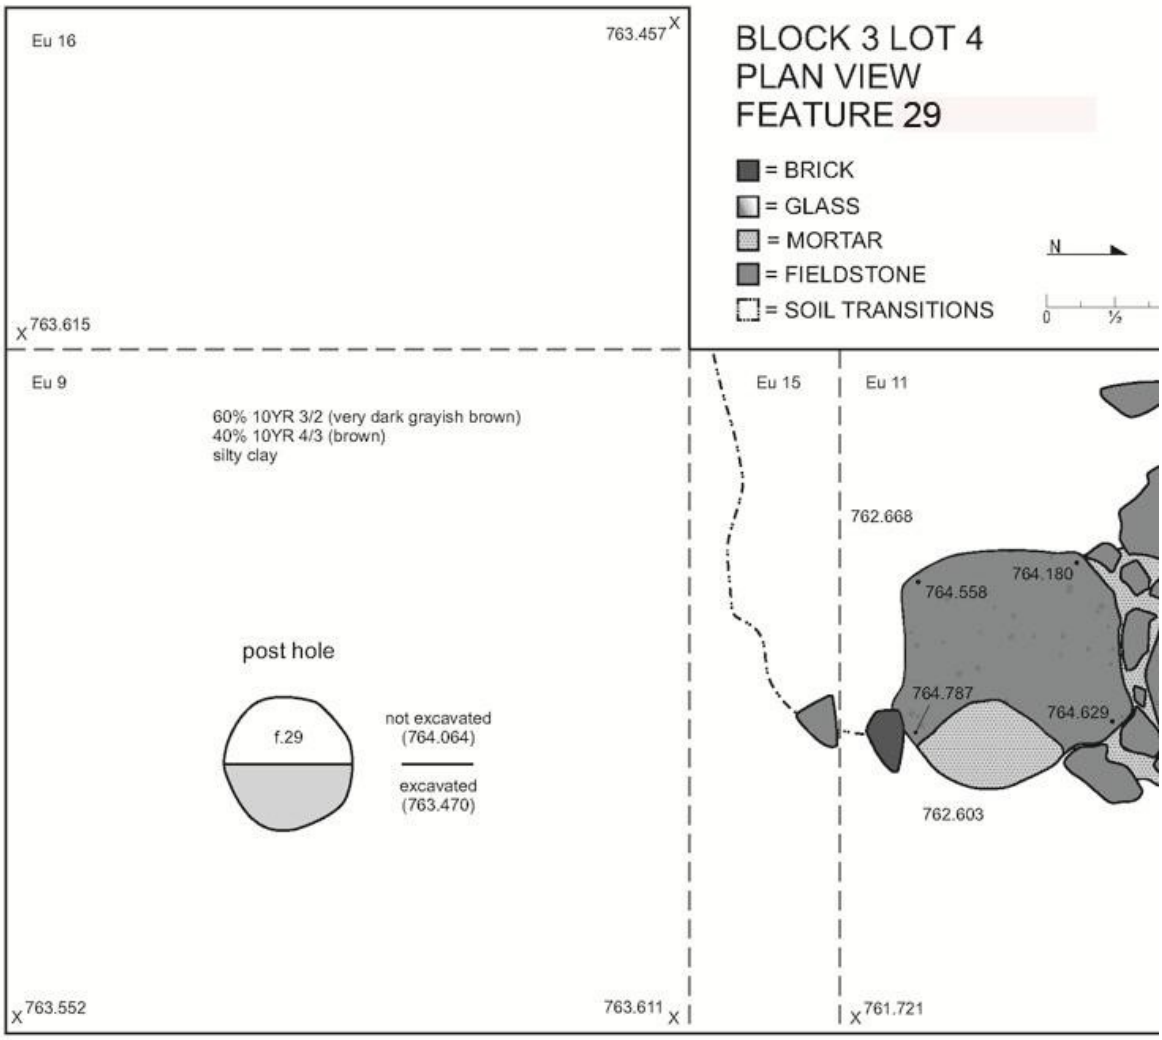

Figure 4.9. *Plan view of Feature 29, post mold, within EU 9, a 5 ft square excavation unit. Elevations (e.g., 763.552) are in U.S. survey feet above mean sea level (Image by Christopher Valvano).*

Archaeologists mapped the west wall profile of the feature, which indicated that the feature tapered to a bowl-like shape at its base. The eastern portion of feature fill contained brick, charcoal, mortar, nails, metal fragments, and bone. The subsoil below this fill was sterile.

Feature 31

Feature 31 was first discovered in Block 3, Lot 4, Excavation Unit 11, Levels A2- B2. It consisted of a concentration of two large fieldstones oriented north-south and surrounded by several large cobbles and aggregates of mortar (Figures 4.10 and 4.11). Team Y interpreted this grouping as an isolated foundation which likely served as the base of a brick chimney stack.

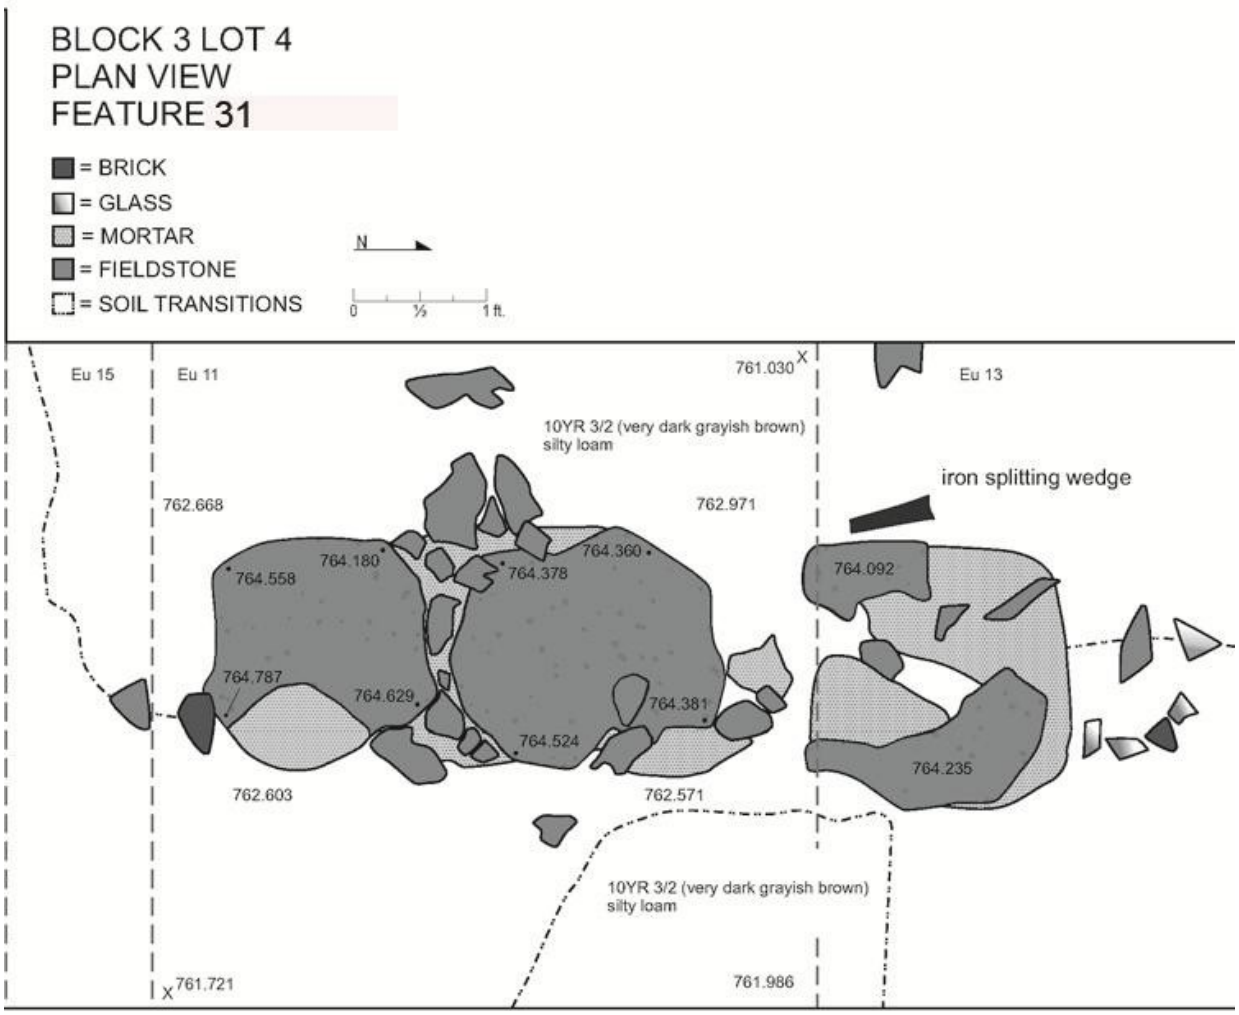

Figure 4.10. *Plan view of Feature 31, fieldstone foundation base, within EU 11 and EU 13. Feature 38 consists of the 10YR 3/2 silty loam deposit on the west (interior) side of Feature 31, and Feature 39 is a builder's trench represented by the 10YR 3/2 silty loam deposit defined on the east (exterior) side of Feature 31 (Image by Christopher Valvano).*

Within Excavation Unit 11 the dimensions of the feature are 4.6 ft. (N-S) x 1.9 ft. (E-W). Numerous flat glass fragments and nails were recovered from the matrix surrounding the feature. The team opened Excavation Units 13 and 15 to determine the extent of the feature.

Feature 31 was identified as the source of geophysics Anomaly A50. The feature was oriented north-south and runs through the middle of Excavation Units 11 and 13. The average opening elevation was 764.421 ft. amsl and the average elevation of the feature's base was 764.208 ft.

amsl. The feature emerged in Level A2 of Excavation Units 11 and 13, and was fully exposed at the top of level B2 in Excavation Unit 11 and at the base of level B1 in Excavation Unit 13. Its thickness varies from 0.75 ft. to 1.4 ft. Feature 31's dimensions are 6.4 ft. (N-S) x 1.9 ft. (E-W) at its widest points (Figures 4.10-4.12).

The soil west of Feature 31 tended to have a color of 10YR 3/2 (very dark grayish brown) and a texture of silty clay. Brick, charcoal, mortar, red sandy deposits, and pebbles of varying sizes were found west of the feature. Team Y recovered a large number of architectural materials such as flat glass, nails, and other metal objects from this side. Ceramics, bone, and beads were also found. To the east of Feature 31, the soil had a texture of silty clay and a color of 10YR 3/2 mottled with 10YR 6/6 (brownish yellow). Archaeologists recovered artifacts from this side that were similar in number and variety to those recovered from the west side.

Figure 4.11. *NSF-REU field school excavator Annelise Morris and Team Y describe Feature 31 and surrounding Features 38 and 39 and other deposits in a field school tour and progress report on each excavation site in 2008 (Photograph by Terrance Martin).*

The team interpreted the feature's characteristics as being consistent with a fieldstone foundation base for a brick chimney stack. Feature 31's proximity to Feature 29, a post mold, suggests that it was part of a structure that relied on wooden posts for support rather than an extensive stone foundation. In addition, the team noted that Feature 31 was south of a heavy mortar lens, which was composed of flat and round aggregates of mortar, and west of Feature 28, which contained a concentration of used and broken bricks. One possible interpretation of these observations was that recycling activities were carried out nearby, in which bricks that once topped the chimney were removed, the mortar and broken bricks discarded, and the intact bricks reused elsewhere.

Due to time constraints, archaeologists were unable to excavate further west to explore in greater detail the possible connections between Feature 31 and Feature 28.

Figure 4.12. *Feature 31 and surrounding area of Features 38 and 39 and other deposits (Photograph by Megan Bailey).*

Feature 38

Feature 38 was located immediately west of Feature 31 and has dimensions of 5.0 ft. (N-S) x 1.5 ft. (E-W) in Excavation Unit 11. Feature 38 was the east portion of a rectangular area of structure fill, a dark organic soil containing architectural materials. It was bounded to the north, south, and east by clay subsoil. It is likely that the feature extends to the west of Excavation Unit 11 but due to time constraints the team was unable to explore the feature further during the field season.

Feature 38 was the eastern portion of a rectangular concentration of dark fill. It was located immediately below and west of Feature 31. Feature 38 was identified in Levels B1-B5 in the west half of Excavation Unit 11, Levels B2-B4 in the west half of Excavation Unit 13, and Levels B1-B3 in the west half of Excavation Unit 15. The team identified Excavation Unit 11 as containing the eastern edge, Excavation Unit 13 as containing the northern edge, and Excavation Unit 15 as containing the southern edge of this feature. The average opening elevation for Feature 38 was 764.122 ft. amsl and the average elevation of the base was 761.752 ft. amsl. Its dimensions are 9.75 ft. (N-S) x 2.5 ft. (E-W). The soil within Feature 38 was 10YR 3/2 (very dark grayish brown) in color and had a silty clay texture; the surrounding soil was a 10YR 6/6

(brownish yellow) clay subsoil. Archaeologists recovered large amounts of mortar, nails, and flat glass from Feature 38, as well as moderate amounts of bone, brick, and ceramics. The team interpreted Feature 38 as structural fill below Feature 31. Although Feature 38 extends deeper and to the west, archaeologists could not excavate these areas due to time constraints and the end of the field season.

Feature 39

Feature 39 was present in Levels B4 and B5 of Block 3, Lot 4, Excavation Unit 11 and extends into Excavation Unit 13. It was discovered in the northeast corner of Excavation Unit 11; its dimensions in that area were 2.2 ft. (N-S) x 1.9 ft. (E-W). The feature was an intrusion of dark organic fill bounded to the north, south, and west by clay subsoil, and likely represents a builder's or maintenance trench dug into the exterior side of the foundation of the chimney stack. Due to time constraints and the conclusion of the field season, the excavation team was unable to determine the eastern border of Feature 39.

The average opening elevation of Feature 39 was 763.222 ft. amsl and the average elevation of the feature's base was 761.471 ft. amsl. The feature's dimensions are 2.0 ft. (N-S) x 1.8 ft. (E-W). The soil in this feature had a color of 10YR 3/2 (very dark grayish brown) and a silty clay texture. The team recovered charcoal, mortar, glass, eggshell, and nails from this feature, as well as bone, beads, and ceramics in smaller amounts. Time constraints prevented the archaeologists from reaching the bottom of this feature.

Chapter 5: Block 7, Lot 1

Christopher Fennell[1] *and Christopher Valvano*[2]

One of our 2008 excavation teams focused on Block 7, Lot 1, based on multiple points of information, including previously known data and newly discovered evidence. A structure was located in the southeast portion of what was Block 7, Lot 1, of the New Philadelphia town site in a 1939 high-altitude aerial photograph (Figure 5.1). This farm was described in Burdick's (Burdick n.d.) memoir of the town site's mid-twentieth-century appearance as the "Betsy house." That house was removed sometime in the decades before a 1998 high-altitude aerial

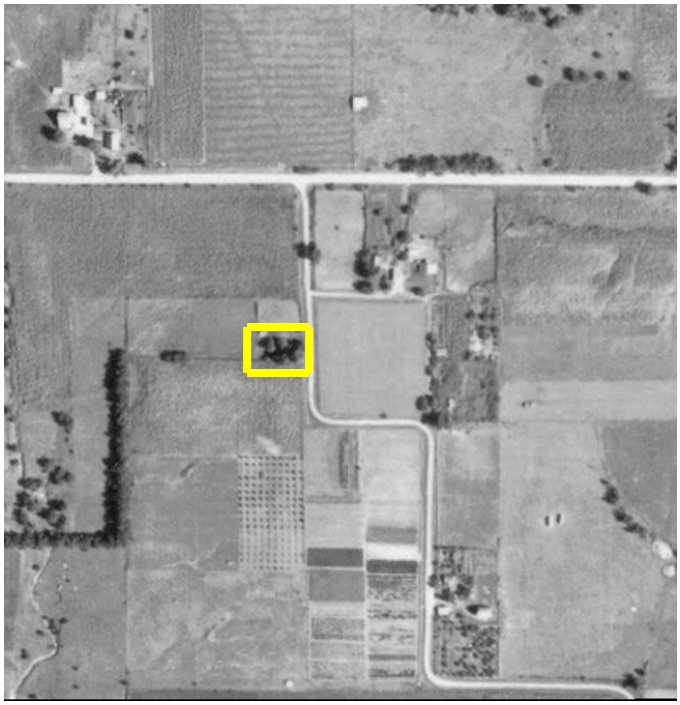

Figure 5.1. *1939 aerial photograph of New Philadelphia town site. The farmstead referred to as the "Betsy house" by Burdick (1992), located on part of Block 7, Lot 1, is outlined by the rectangle in the left center portion of this image (Photograph from U.S.D.A. Aerial Photographs Collection; overlay by Christopher Fennell).*

[2] Michigan State University. This report chapter was also written with the aid of contributions of data and interpretations from (in alphabetical order) Anna Agbe-Davies, Joshua Brown, George Calfas, Shalonda Collins, Kathryn Fay, Michael Hargrave, Claire Martin, Terrance Martin, and Elizabeth Sylak, who participated in the 2008 field season investigations of Block 7.

photograph, which shows no remains above ground. This area also showed a heavy concentration of artifacts in a walk-over survey conducted in 2002 and 2003 (Gwaltney 2004), including a modest number of early nineteenth-century ceramic fragments on the ground surface, and a higher frequency of surface artifacts dating to the late nineteenth century. Archaeologists worked on two excavation units (each 5 ft. square in size) in Block 7, Lot 1, in 2004 to locate the potential layers of remains of the residence or business operations that once existed there. Feature 3 was identified as part of a fieldstone foundation of a house in the southeast corner of Lot 1 associated with artifacts that dated to the 1870s (Shackel 2006) (Figure 5.2). A later magnetic gradient geophysical survey of this area by Michael Hargrave primarily showed anomalies in the same southeast corner portion of the parcel (Hargrave 2006) (Figure 5.3). An aerial thermal survey conducted in May 2008 also shows evidence of potential sub-surface foundation remains in this vicinity (see Chapter 6, "Block 8, Lots 1-2" of this report).

Figure 5.2. *Feature 3, fieldstone foundation remains to an 1870s house site located in Block 7, Lot 1, was uncovered in 2004 (Photograph from Shackel 2006).*

In 2008, Claire Martin, a historian working on the New Philadelphia project, discovered a misplaced tax ledger book in the basement of the Pike County Courthouse in Pittsfield. Examining this aged ledger, she discovered that it listed a tax assessor's records of valuations assessed in 1845 in areas that included blocks and lots within New Philadelphia (Pike County Tax Collector 1845). Frank McWorter was listed as the owner of Block 7, Lot 1, and the value of that parcel was assessed at $60, which was significantly higher than the values placed on other parcels in that area in 1845. This documentary evidence provided an indication that a building may have been standing on Block 7, Lot 1 in 1845, resulting in such a higher assessed value. Based on our knowledge of Feature 3 from excavations in 2004, and this newly discovered evidence in 2008, one of our teams focused on further excavating the southeast portion of Lot 1 to learn more about the 1870s occupation and to see if the remains of an earlier residence or business structure underlay that site location.

The next sections of this chapter provide background information on Block 7, Lot 1 based on documentary evidence, followed by a discussion of the survey and excavation results obtained in

the 2008 field season. Research efforts and results concerning other portions of Block 7 are described in our 2006 report (Shackel 2006).

Block 7, Lot 1 History

As summarized previously in our 2006 report (Shackel 2006), the following data concerning past property owners and potential residents of Block 7, Lot 1, can be ascertained from documentary records, including deeds, tax ledgers, and census lists.

The earliest recorded sale of Block 7, Lot 1, occurred in 1848 when Frank McWorter sold the property to James Pottle. In total there were over 20 transactions involving this property until 1930. The purchasers also found in the census data include: Christopher Luce, Squire McWorter, and William Hadsell. There is strong likelihood that at least some of these families lived on this lot. The tax records indicate that some improvements existed on the lot until 1867. After this date the value of improvements decreased significantly. However, in 1878 W. S. Cowder was assessed for $114 in improvements, although this assessment included both Lots 1 and 2. In 1883 and 1888 J. O. Smith was assessed for $125 and $60 respectively, for Lots 1-4 on Block 7. The deed, tax, and census data follow and the italicized names are those that may have resided on the lot, since they appear in both the deed and census records.

Block 7, Lot 1 Archaeology

The following is a summary of the archaeological excavations for Block 7, Lot 1, in 2008. For a more detailed technical overview see the unit and feature summaries in Chapter 14, "Unit Summaries," of this report.

To begin further investigation of the likely remains of successive occupations on the southeast corner of Block 7, Lot 1, Team X first relocated the coordinates of Excavation Unit 2, in which Feature 3 had been uncovered in 2004 (Figures. 5.3, 5.4 and 5.6).

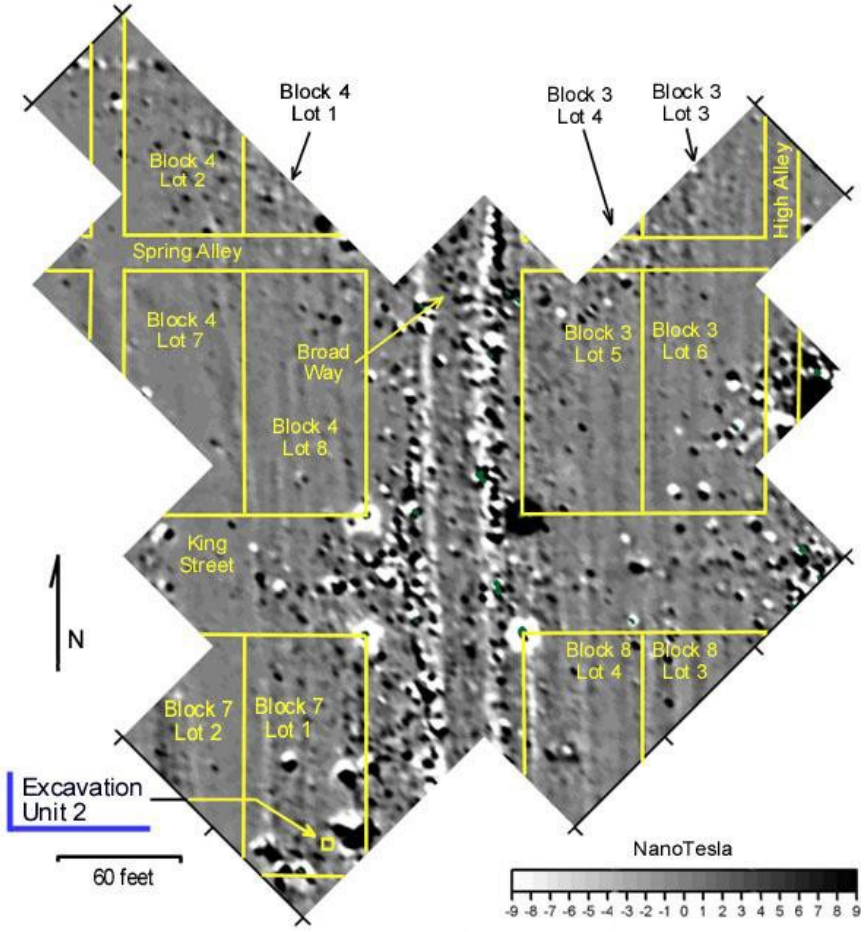

Figure 5.3. *Magnetic survey data map, showing anomalies in southeast corner of Block 7, Lot 1, and location of Excavation Unit 2, in which Feature 3 was located in 2004 excavations (Image map by Michael Hargrave; overlay by Christopher Fennell).*

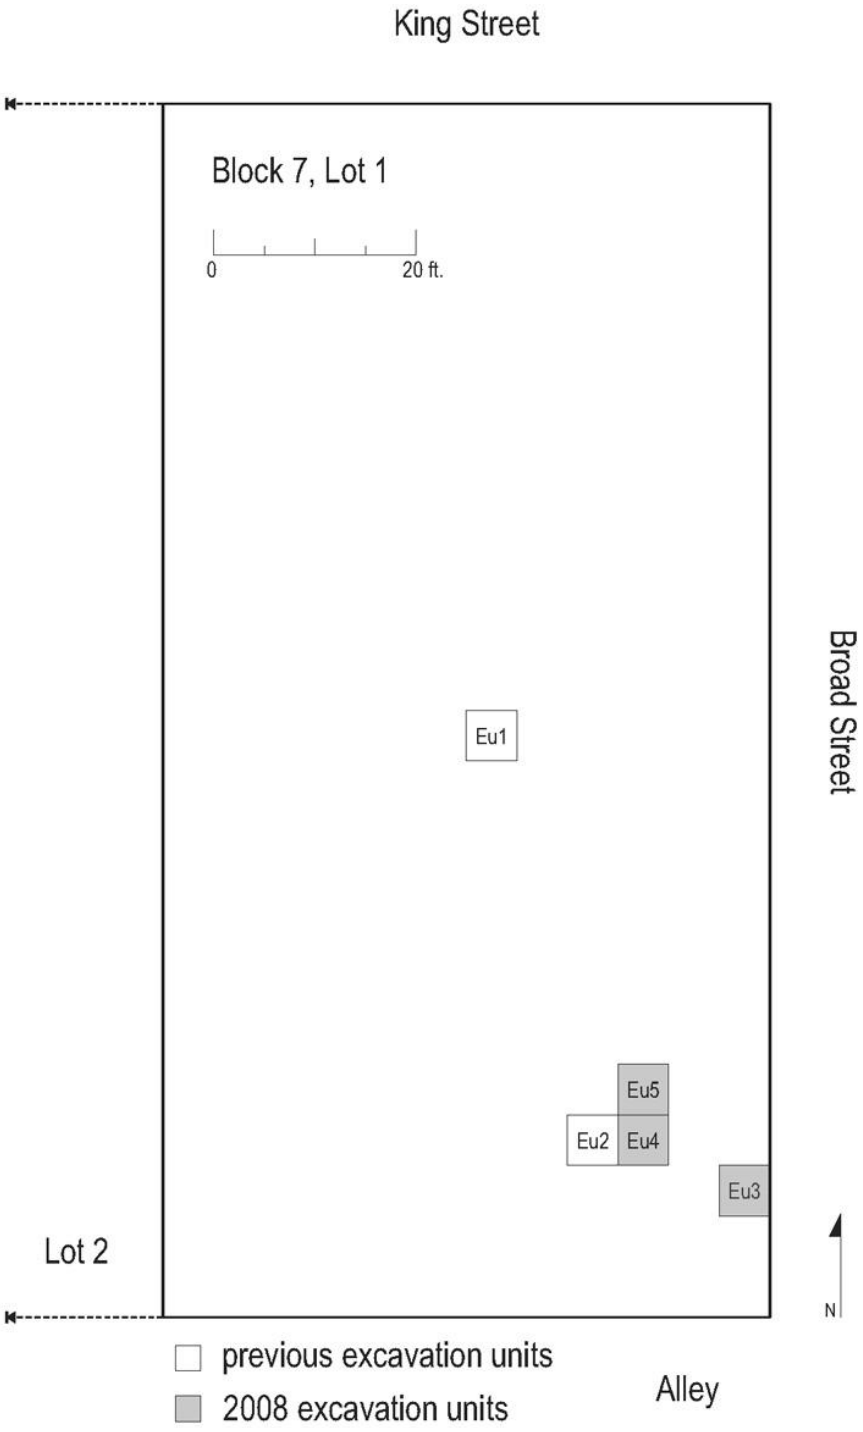

Figure 5.4. *Map of Excavation Units in Block 7, Lot 1. Units 1 and 2 were excavated in 2004, and Units 3-5 in 2008 (Image by Christopher Valvano).*

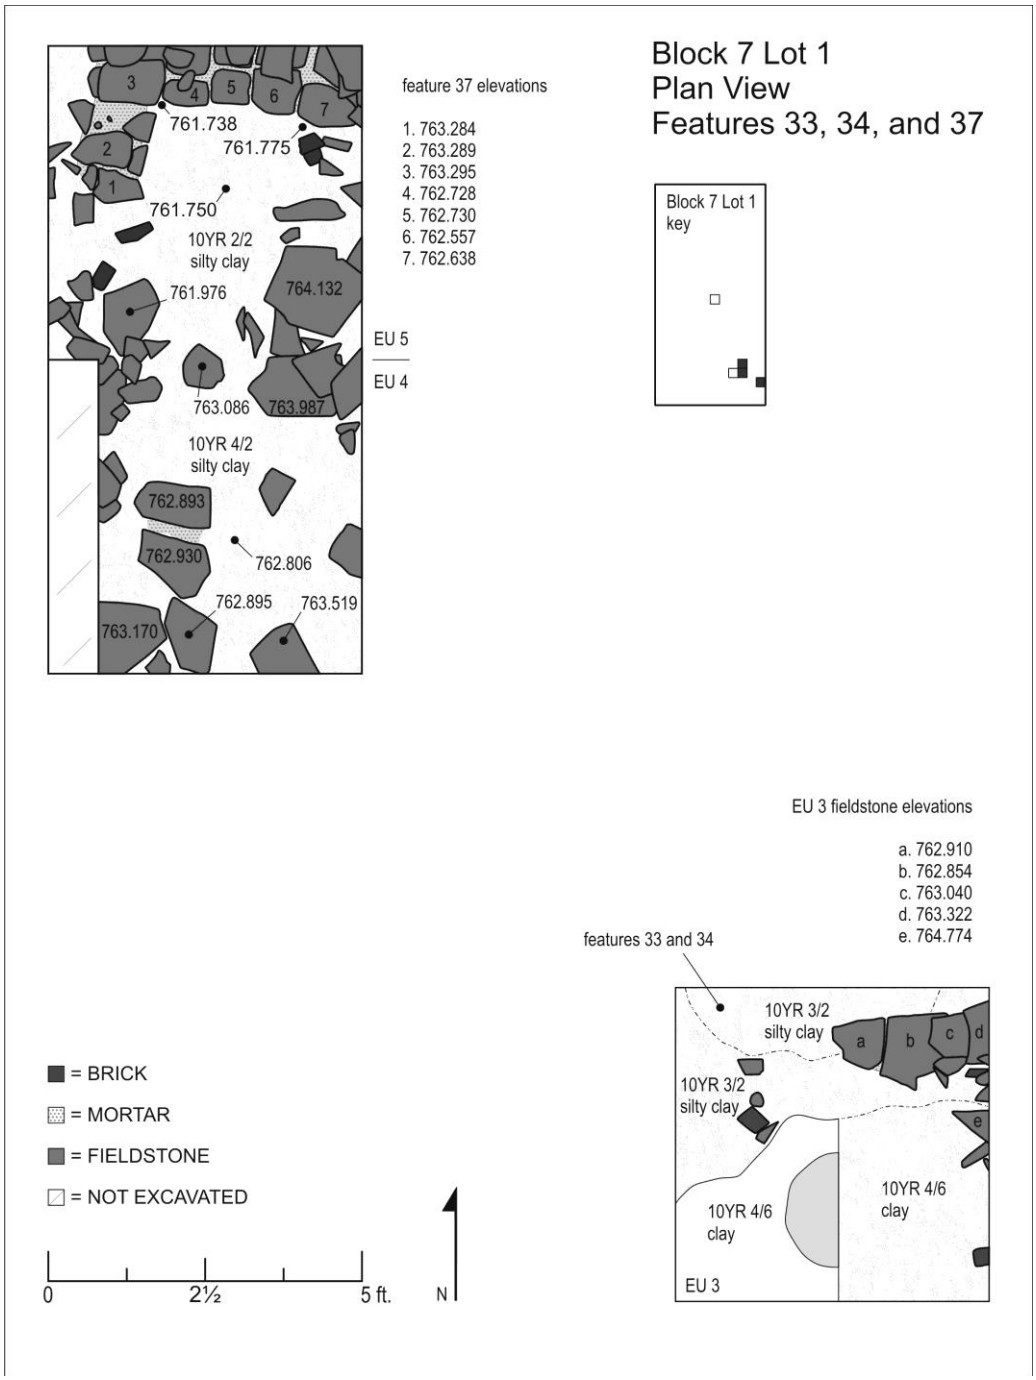

Figure 5.5. *Map of Excavation Units 3-5 and Features 33, 34 and 37. Elevations (e.g., 762.910) are in U.S. survey feet above median sea level (Image by Christopher Valvano).*

In the 2008 field season, archaeologists excavated three more units in Lot 1, located in the immediate vicinity and to the east of Unit 2 and the buried fieldstone foundation segment labeled as Feature 3. Figure 5.4 provides a map of the locations of these excavation units, and Figure 5.5 provides plan views of the Features 33, 34, and 37 uncovered in these new excavations.

The southwest corner of Excavation Unit 3 was located 10 ft. east and 5 ft. south of the southwest corner of Unit 2. Team X excavated Level A1 as an arbitrary 0.5 ft. level. Level A1's average opening elevation was 765.769 ft. above mean sea level (amsl), and its average closing elevation was 765.262 ft. amsl. Level A1 was a combination of silty loam and plow zone, with a large concentration of historic ceramics (n=97), glass (n=164), and part of a harmonica reed. Archaeologists excavated Level A2 to a natural depth of 0.92 ft. below ground surface. The excavation team chose to forgo excavating this level to an arbitrary depth of 0.5 ft. (1.0 ft. below surface) after exposing a concentration of brick, stone, and mortar in the eastern half of Unit 3. This "rubble concentration" averaged a depth of 0.92 ft. below ground surface. Level A2 yielded a large amount of architectural debris, including historic artifacts such as wire and machine-cut nails (n=129), fragments of container and flat glass (n=287), and three distinct ceramic pipe fragments.

Figure 5.6. *Team X at work in Block 7 in 2008, including supervisor Christopher Valvano and NSF-REU field school excavators George Calfas, Shalonda Collins, and Elizabeth Sylak (Photograph by Doug Carr, Illinois State Museum).*

Level B1 in Unit 3 was excavated to a 0.5 ft. arbitrary level. Because Level B1 contains soil nearly identical to its overlying levels, but exists at depth beyond the reach of historic plows, the excavators described this level as "sub-plow zone." Team X first excavated the soil surrounding the rubble concentration. This yielded historic artifacts dating to the late nineteenth and early twentieth centuries. Artifacts from this level are domestic items such as ceramic vessel fragments (n=82) and decorative copper tubing found near copper wiring. The tubing is likely either a fragment of a lamp or curtain rod (see Sears 1969:803, 903). Artifacts from this deposit are mainly architectural items like machine-cut and wire nails, flat glass, and tar-like roofing paper. The team then excavated Level B2 as a 0.5 ft. arbitrary level, and recovered historic

artifacts throughout that level also. The bottom of this level showed two horizontal soil transitions. These two areas of distinct deposits were excavated separately and labeled B3–B4 (northern), and C1–C2 (southern).

Archaeologists excavated Level B3 as a 0.5 ft. arbitrary level. The team began excavating level B3 with the intent of removing the majority of the northern half of Unit 3. This half contains mottled silty clay made up of 70% 10YR 3/2 (very dark grayish brown) and 30% 10YR 4/6 (dark yellowish brown). As excavations proceeded, portions of the mottled sediment appeared more solidly as a 10YR 4/6 (dark yellowish brown) clay. Team members later identified this deposit as a clay cap (Feature 33) that extended into the northern wall of Unit 3 (see Figure 5.5). As excavators encountered Feature 33, they left the solid 10YR 4/6 (dark yellowish brown) clay portions in situ and removed the surrounding 10YR 3/2 (very dark grayish brown) silty clay that included relatively more organic material. Further excavations of Level B3 exposed a second 10YR 3/2 silty clay layer underneath Feature 33. The team later identified this soil lens as Feature 34. This method of excavation defined Unit 3 with a trench-like appearance with two elevated areas of 10YR 4/6 clay (one to the north and one to the south), and a low area of 10YR 3/2 silty clay within the center portion (Figure 5.7).

Archaeologists excavated Level C1 to an arbitrary 0.5 ft. level. Level C1 was subsoil, made up of mottled 30% 10YR 3/2 (very dark grayish brown) and 70% 10YR 4/6 (dark yellowish brown) silty clay. The team excavated this level in the southern half of Unit 3 to confirm this soil was sterile subsoil different in nature from the clay cap identified in the northern portion of Unit 3. The level shows intense burrowing activity with fewer historic artifacts than previous levels in Unit 3. Team X determined that the presence of large burrows and historic artifacts required further excavations to identify the soil as sterile subsoil (Figure 5.8).

Archaeologists excavated Level C2 to an arbitrary 0.5 ft. level. Level C2 was a bisection of C1. It was made up of 10YR 4/6 (dark yellowish brown) clay. The team removed the eastern half of C1 (also the southeastern quadrant of Unit 3) and recovered no cultural artifacts. This level confirmed the excavation team's distinction between the clay soil in Unit 3's southern half and the clay cap in Unit 3's northern half. Excavations in this unit were terminated at this point.

Feature 33

Feature 33 was a semi-circular clay cap overlying an identically shaped dark organic fill (Figures 5.7 and 5.8). Archaeologists bisected this feature and excavated separate levels with separate bag numbers. Both halves of Feature 33 are made up of 10YR 4/6 (dark yellowish brown) clay. Feature 33's east half was removed as a single level: "A1-East." Level A1-East's average opening elevation was 763.271 ft. amsl, and its average closing elevation was 763.094 ft. amsl (0.177 ft. average thickness). This level contained 16 pebble-sized mortar and brick fragments. Feature 33's west half was removed as A1-West. Level A1-West's average opening elevation was 763.174 ft. amsl, and its average closing elevation was 762.921 ft. amsl (0.253 ft. average thickness). This level contained 10 pebble-sized mortar and brick fragments with one similar sized piece of bone, glass, and porcelain.

Figure 5.7. *Excavation Unit 3 with Features 33 and 34 (Photograph by Christopher Valvano).*

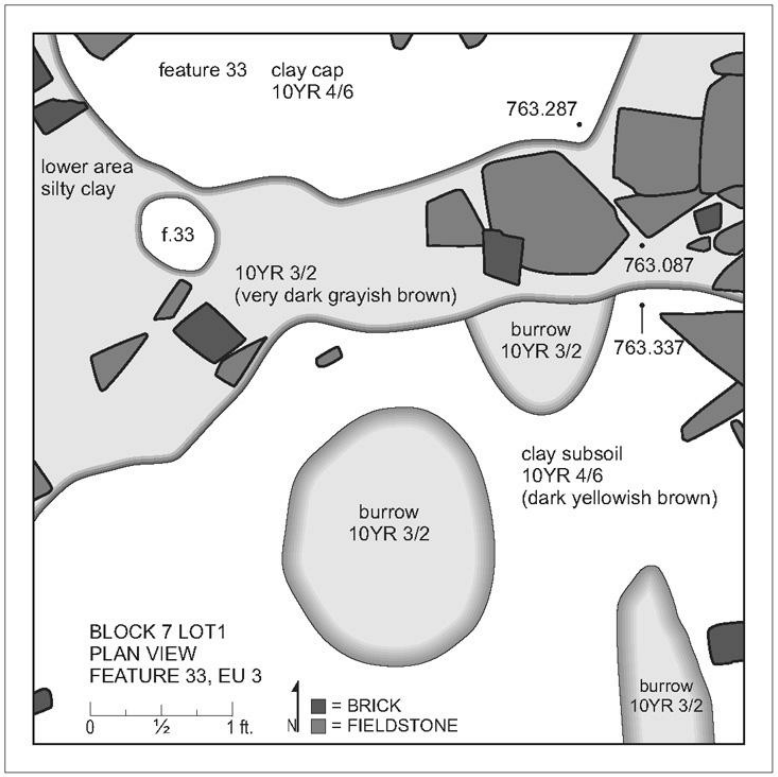

Figure 5.8. *Plan view diagram of Feature 33 in Excavation Unit 3 (Image by Christopher Valvano).*

Feature 33 was located in the north half of Unit 3. It presumably extends to an unknown distance in the unexcavated area beyond Unit 3 to the north. Feature 33's halves were completely removed in one level to expose the basin-shaped organic fill of Feature 34. Archaeologists interpret Feature 33 as a clay cap intentionally placed above the organic 10YR 3/2 (very dark grayish brown) silty-clay fill of Feature 34.

Feature 34

Feature 34 was a semi-circular dark organic fill completely underneath Feature 33 (Figures. 5.5, 5.7 and 5.8). Archaeologists bisected this feature and excavated separate levels with separate bag numbers. Both halves of Feature 34 were made up of 10YR 3/2 (very dark grayish brown) silty clay. Feature 34's east half was removed as a single level: "A1-East." Level A1-East's average opening elevation was 763.174 ft. amsl, and its average closing elevation was 762.759 ft. amsl (0.415 ft. average thickness). This level exposed a continuation of the flat fieldstones chinked with mortar partially exposed by the removal of level B4. It also contained architectural debris, one bone fragment, and a circa 1860 Federal military button made by Scovill Manufacturing Company (Figure 5.9). Level A1-West's average opening elevation was 763.271 ft. amsl, and its average closing elevation was 762.854 ft. amsl (0.417 ft. average thickness).
The layer showed an abrupt end to the fieldstones just to the west of the bisect line. The layer yielded architectural debris including tar paper and wood. Other pebble-sized artifacts such as glass, ceramic, slag, and nails were recovered.

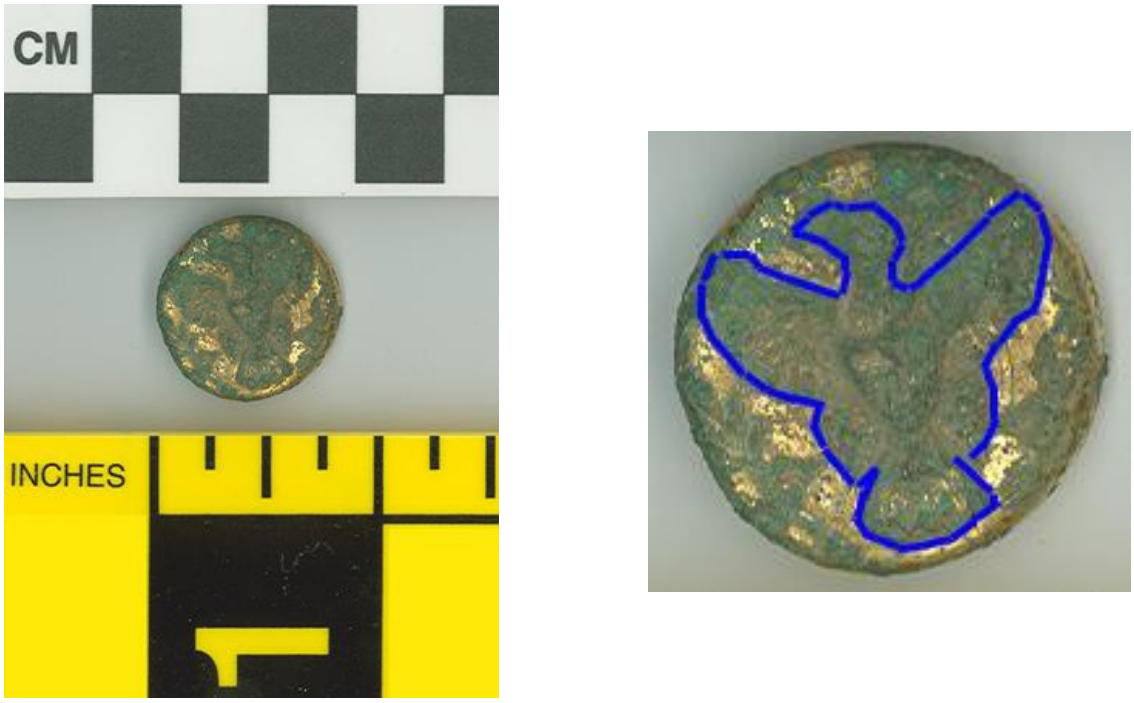

Figure 5.9. *1860 Federal military button, made by Scovill Manufacturing Co., from Feature 34, with eagle motif outlined in close-up view (Images by Christopher Fennell).*

Feature 34 was located in the north half of Unit 3. It presumably extends to an unknown distance in the unexcavated area beyond Unit 3 to the north. Archaeologists cannot confidently distinguish Feature 34's fill from the similar fill found in levels B3-B4. Nor can they confidently state that the semi-circular shape of Features 33 and 34 was not the result of post-depositional disturbance. Feature 34 might be related directly to the shape of Feature 33 from a single depositional event; however, the visible semi-circular shape might be a product of multiple, undetected historic events.

One can infer a formation scenario for the creation of both features. The configurations of these features suggest that the southern half of Unit 3 (made up of Levels C1-C2) reflect the historic excavation of subsoil to prepare an area for laying a stone foundation. The flat fieldstones chinked with mortar in Unit 3's northwest corner might be the remnants of this foundation, even though their northern distance from C1-C2 suggests an unusually large builders' trench compared with those identified for Features 16, 17, and 21 in Block 3 of the town site and nearby in Feature 37 in Block 7. Future excavations could determine the presence of additional courses below these exposed fieldstones in Unit 3. At some point after 1860, residents of the lot either modified or abandoned the structure and placed the dark organic fill (B3-B4) over the former foundation. The circa 1860 Federal military button made by Scovill Manufacturing Company found vertically between the fieldstone and Feature 33 should mark the earliest possible date of this event. Once residents placed the dark organic fill above the former foundation stone, they (or later residents) placed a smooth clay-cap surface atop the organic fill (Feature 33). Archaeologists have identified similar "capping" activity within the stratigraphy of Feature 13 in Block 4 of the town site. The clay cap identified as Feature 33 may have been originally deposited in the observed semi-circular shape, or it may have been much larger, thereby reflecting later modification by cultural or natural disturbances.

Archaeologists excavated Excavation Unit 4 in Block 7, Lot 1, to further investigate the fieldstone foundation (Feature 3) identified during the 2004 archaeological field season, and to determine the relationship between Feature 3 and Unit 3 located to the southeast (Figures. 5.2-5.4). Unit 4 was located adjacent to Unit 2, with a 0.8 ft. baulk separating them and making up Unit 4's west wall to provide support against the backfill inside Unit 2. Excavators removed Level A1 of Unit 4 as an arbitrary 0.5 ft. level (5 ft. x 4.2 ft.). Level A1's average opening elevation was 765.200 ft. amsl, and its average closing elevation was 764.771 ft. amsl. Level A1 was a combination of silty loam and plow zone, made up of 10YR 2/1 (black) silty clay loam, and included a large concentration of historic artifacts.

Team X excavated Level A2 as an arbitrary 0.5 ft. level. The excavators recovered an abundance of flat glass fragments (n=101) as well as machine-cut and wire nails (n=67). Level A2 produced the first signs of underlying rubble from a former structure. The team excavated Level A3 as an arbitrary 0.5 ft. level. Team members described this level as "sub-plow zone" with extensive boulder- to cobble-sized fieldstone rubble. It was made up of 10YR 3/1 (very dark gray) silty clay. Excavators recovered historic-period materials throughout this level, including a 1930 U.S. penny. Team X excavated Level A4 as a 0.37 ft. natural level to a depth 1.8 ft. below ground surface. Level A4's average opening elevation was 763.961 ft. amsl, and its average closing elevation was 763.596 ft. amsl. Level A4 contained extensive boulder- to cobble-sized fieldstone rubble, in a matrix of 10YR 4/2 (dark grayish brown) silty clay. The team ended this level at a natural floor of compacted soil with heavy concentrations of

architectural debris consisting mainly of fieldstone and white mortar fragments. The number of historic-period artifacts was pronounced, but less abundant than in higher levels.

The team excavated Level B1 as an arbitrary 0.5 ft. level into the compact soil within the fieldstone rubble. Team X described Level B1 as "possible" foundation fill because they anticipated, but could not confirm, that this soil consisted of fill from an historic-period structure. Level B1 contained extensive boulder- to cobble-sized fieldstone rubble in a matrix of 10YR 4/2 (dark grayish brown) silty clay. The level yielded historic artifacts, including streaks of a red mineral compound likely comprising a residue of paint or similar pigment (7.5 YR 4/8 (red)). Archaeologists excavated Level B2 as an arbitrary 0.5 ft. level into the compact soil within the fieldstone rubble. Level B2 was possible foundation fill with extensive boulder- to cobble-sized fieldstone rubble and a matrix of 10YR 4/2 (dark grayish brown) silty clay.

At the bottom of the level, excavators found three flat fieldstones chinked with mortar in the southwestern quadrant of Unit 4. These stones lay 2.45 ft. below ground surface and were similar in composition and shape to the overlying rubble. They were, however, only half as large as those found in the rubble (approximately 1.0 ft. versus 1.7 ft. maximum length). This level yielded historic artifacts, including an 1889 U.S. penny. Archaeologists excavated Level B3 as a "floor scraping" level of less than 0.1 ft. Level B3's matrix was identical to Level B2 and was excavated to provide a continuous, even floor between Unit 4 and Unit 5, which was located directly north (Figure 5.5). Team X recovered 12 historic artifacts from this level of Unit 4. Excavations in Unit 4 were halted to open an adjoining Unit 5 directly to the north.

Excavators opened Unit 5 adjacent to the north side of Unit 4 to further investigate these residential foundation remains (Figures 5.4 and 5.5). They excavated Level A1 as an arbitrary 0.5 ft. level, with an average opening elevation of 765.206 ft. Level A1 was a combination of silty loam and plow zone, made up of 10YR 3/2 (very dark grayish brown) silty clay loam, and included a large concentration of historic-period artifacts. Archaeologists excavated Level A2 as an arbitrary 0.5 ft. level, and recovered an abundance of container and flat glass fragments (n=101) as well as machine-cut and wire nails (n=90). The level also produced the first signs of underlying rubble from a former structural foundation. Team X excavated Level A3 as an arbitrary 0.5 ft. level. The excavators observed extensive boulder- to cobble-sized fieldstone rubble in this level. It was made up of 10YR 3/2 (very dark grayish brown) silty clay, and the team recovered historic artifacts throughout the level.

The archaeologists excavated Level B1 as an arbitrary 0.5 ft. level into the compact soil within the fieldstone rubble. Team members describe Level B1 as "possible" foundation fill because they anticipated, but could not confirm, that this soil was fill from an historic-period foundation. Level B1 contains extensive boulder- to cobble-sized fieldstone rubble within a matrix of 10YR 2/2 (very dark brown) silty clay. Excavators identified a line of three flat fieldstones chinked with mortar 2.0 ft. below ground surface in the northwest quadrant of Unit 5. A possible builder's trench touches the stones' western edges (Figure 5.5). This sediment was mottled, made up of 60% 10YR 2/2 (very dark brown) and 40% 10YR 4/6 (dark yellowish brown) silty clay. The stones chinked with mortar were later identified as the western side or edge of Feature 37 (Figures 5.5 and 5.10). Team X recovered historic materials throughout Level B1, broadly dating from the last half of nineteenth century to the early twentieth century. Among the later-dated objects was a curved and beaded hair comb. The comb's material is a type of plastic manufactured since the 1930s. Archaeologists excavated Level B2 as a "floor scraping" level of

less than 0.1 ft. Level B2's matrix was identical to Level B1 and was excavated to provide a continuous, even floor between Unit 5 and Unit 4. The team identified heavy concentrations of mortar and clinker/slag in the center portion of Unit 5, and recovered 54 fragments of historic artifacts.

Team X excavated Level B3 as an arbitrary 0.5 ft. level. Level B3's average opening elevation was 762.910 ft. amsl, and it consisted of possible foundation fill with extensive boulder- to cobble-sized fieldstone rubble. Its matrix was made up of 10YR 2/2 (very dark brown) silty clay. Excavators did not remove any stones identified as Feature 37 (i.e., stones laying flat and

Figure 5.10. *View of Excavation Units 4 and 5 looking from north to south, with Unit 4 (top, south) and Unit 5 (bottom, north), and Feature 37 fieldstone foundation segment along north, east, and west edges of Unit 5 (Photograph by Christopher Valvano).*

chinked with mortar) (Figures 5.5 and 5.10). Level B3 produced an abundance of architectural artifacts as well as domestic items like a hard rubber mangle (or roller) from a hand-operated washing machine and an ironstone bowl marked "Helen" and dating to 1903. The level also showed a second and third course of stones below the ones identified in Level B1 (Figures 5.10 and 5.11).

Archaeologists excavated Level B4 as an arbitrary 0.5 ft. level. Level B4 likely consists of foundation fill with less of the boulder- to cobble-sized fieldstone rubble than was present in previous levels. Its matrix was made up of 10YR 2/2 (very dark brown) silty clay. Team members did not remove any stones identified as Feature 37. At 2.60 ft. below ground surface, they identified a second line of flat fieldstones chinked with mortar. These stones connected and formed a right angle with the stones detected in Level B1 (Figures. 5.5 and 5.10). These were later identified as part of Feature 37. Level B4 exposed two lower courses of stones on both the north and west sides of Feature 37. Time constraints and the end of the field season terminated excavations in Unit 5 before the lowest fieldstone course was detected. In total, the team exposed five courses on the west side of Feature 37 and three courses on the north side. Future excavations could identify the maximum depth of Feature 37's bottom course.

Feature 37

Feature 37 was the corner of a fieldstone foundation chinked with mortar. Archaeologists first detected its western side in Level B2 of Unit 5. Feature 37's west side was located approximately 2.0 ft. below ground surface. Archaeologists exposed five courses of fieldstones. This side of Feature 37 also appears to end abruptly midway along the western edge

Figure 5.11. *View of Excavation Units 3-5, looking north, with Unit 3 on right (east), Units 4 and 5 on the left (west), with multiple and overlapping courses of successive fieldstone foundation assemblies, including Feature 37 (top left) (Photograph by Christopher Valvano).*

of Unit 5. The upper-most stones were fully exposed showing a soil transition along the western edge to a mottled soil interpreted as a builders' trench. Feature 37's north side was located approximately 2.60 ft. below ground surface. Archaeologists exposed four courses of fieldstones. This side runs directly into the eastern wall of Unit 5. The north wall of Unit 5 partially covers Feature 37's north side obscuring evidence of a builder's trench (Figures 5.5 and 5.11). Given the depth of these additional and offsetting courses of foundation walls in Units 4 and 5, it is possible that this location in Block 7, Lot 1 contained an earlier occupation that predated the 1870s and the later residential site of which Feature 3 was a part. In addition to Feature 37, Features 33 and 34 in nearby Unit 3 both are associated with artifacts that date as early as the 1840s (Figure 5.10).

These archaeological remains can be interpreted in the context of our expanded body of documentary evidence, including tax, deed, and census records. Examining these multiple lines of evidence, it could be that James Pottle's household purchased this lot from Frank McWorter in 1848 when a residential structure was already present on the parcel. Members of the Pottle family, or some other family, likely leased the parcel from McWorter before 1848 and constructed that home. Alternatively, that house may have been constructed by members of the McWorter family before the 1848 sale.

Chapter 6: Block 8, Lots 1-2

Anna S. Agbe-Davies[1]

Schoolhouse research background

In the early decades of New Philadelphia's settlement, Illinois law did not provide for the education of the children of African-American residents of the state. To overcome this racial bias in the state law and related public funding, Frank McWorter and residents of New Philadelphia worked to provide a schoolhouse for educating the African-American children of the town in the 1850s and 1860s. They may have done so by subverting the existing laws and channeling the resources for a township-supported schoolhouse facility for this additional purpose.

For many small towns in the nineteenth century, the schoolhouse served as an important focus of community life. Area children would gather there for lessons, to be sure, but the building could also serve as a public space for meetings and social gatherings, particularly in a town without its own church. However, in a community like New Philadelphia, with residents of different races, the schoolhouse *could* be a site where segregation and internal divisions were more clearly manifested.

The laws of the state of Illinois specified that school funds be apportioned according to the number of "white" school-age children in a given district. Over the years there were several attempts to divert taxes paid by African-American residents of the state to the schooling of African-American children, but these were largely unsuccessful (McCaul 1987). Educational historian Robert McCaul estimates that merely 10% of black children were in public school at mid-century, whereas the figure for white children was closer to 80% (McCaul 1987:46).

In 1847, "sundry" citizens of Pike County petitioned that the free-schools law be amended so that "the black and colored children of our State may have an equal benefit of the money appropriated by law to school purposes, or so amend the law as to exempt the property of blacks" (McCaul 1987:37). The Illinois General Assembly was not moved. Given these circumstances, it would be no surprise if Frank McWorter together with other members of his family attempted to establish a school that would serve the African-American children of New Philadelphia. As historian Juliet Walker notes, in 1848 Frank McWorter was arranging for the development of the Free Will Baptist Seminary to serve as a school and church for the town. The decision seems prescient on his part, as a year later the Illinois General Assembly affirmed the exclusion of black children from state-sponsored schools (Walker 1983:136). Such private efforts by free people of color to provide schooling opportunities for themselves and their children were typical of mid-century educational activism (Agbe-Davies 2002).

[1] Department of Anthropology, University of North Carolina, Chapel Hill.

Several sources of information contributed to the search for the schoolhouse. First, consider the information that comes from oral history. Former resident Lorraine "Larry" Burdick described a square within the town site bounded by Broad Way, Main, Ann, and King Streets (i.e., Block 8), further stating that "[the square] originally had two schools, one black school and one white school" (Burdick n.d.). On the other hand, local historian Grace Matteson recorded testimony from area resident Irene Butler Brown that there was "a schoolhouse for colored people near the center of the town of Philadelphia on block 12" (Matteson 1964).

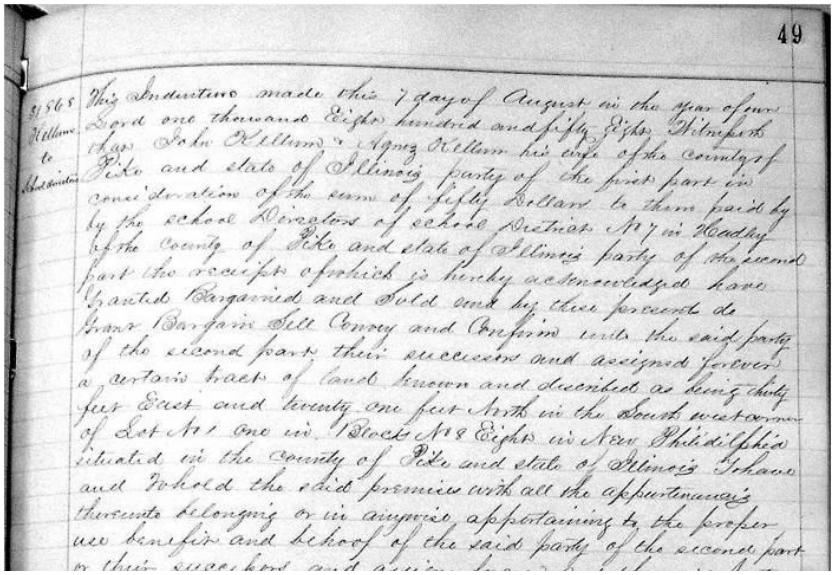

Burdick's account did not specify whether the "two schools" were facing the square (possibly in Block 9) or within it (in Block 8). Several other sources placed a school on the east side of the town's square or park (i.e., in Block 9). Matteson did not indicate if her source specified Block 12, or if that specific location came from her own interpretation of a verbal description or visit to the site. Block 12 is not necessarily near the center of town, but it is due south of Block 9, which is associated with the schoolhouse via the Kimbrews in Matteson's own narrative.

Also according to Matteson, the schoolhouse was purchased by George and Martin Kimbrew (also "Kimbro") who converted it into a residence. A Martin "Kinebra" appears in the Hadley County Tax Records of 1888 for Block 9, Lot 4, but nowhere else in the town, suggesting that Block 9, Lot 4 was his residence. These factors led archaeologists to believe that perhaps Matteson may have conflated Blocks 12 and 9, and that the search should commence with Block 9, Lot 4—the parcel associated with the Kimbrews.

Archaeologists searched for remains of this schoolhouse in the area of Block 9, Lot 4, in 2005 (Shackel 2006a) and located the remains of a stone footer, or pier. However, that single feature provided inconclusive proof of a schoolhouse.

Another line of evidence indicating where the schoolhouse may have been was uncovered in deed provisions. Figure 6.1 shows an excerpt of a deed recording an earlier sale in 1858 by John and Agnes Kellum of Block 8, Lots 1 and 2 with the exception of a parcel for use as a schoolhouse location (Pike County Deed Books 1820-1938: vol 55, p. 49). Therefore survey and excavations in 2008 and 2011 focused on the southern half of Block 8, Lots 1 and 2. Such documentary evidence is discussed in greater detail in the next section "Block 8, Lots 1-2 History."

New Philadelphia project historian Claire Martin has compiled the following account of the transactions concerning Block 8, Lots 1 and 2 during the nineteenth century, most of which reserved portions of the land for use in hosting a schoolhouse. None of these deed provisions expressly stated that a schoolhouse had been constructed on either of those lots; the deed entries instead make references to a portion of the land as a "schoolhouse lot" or dedicated "for schoolhouse" use.

This Indenture made this 7 day of August in the year of our Lord one thousand Eight hundred and fifty Eight Witnessth that John Kellum & Agnez Kellum his wife of the county of Pike and state of Illinois party of the first part in consideration of the sum of fifty Dollars to them paid by the school Directors of school District No 7 in Hadley of the county of Pike and state of Illinois party of the second part the receipt of which is hereby acknowledged have Granted Bargained and Sold and by these presents do Grant Bargain Sell Convey and Confirm unto the said party of the second part their successors and assigned forever a certain tract of land known and described as being thirty feet East and twenty one feet North in the South west corner of Lot No 1 one in Block No 8 Eight in New Philadelphia situated in the county of Pike and state of Illinois To have and To hold the said premises with all the appurtenances thereunto belonging or in anywise appertaining to the proper use benefit and behoof of the said party of the second part

Figure 6.1. *Excerpt of 1858 Deed (PCDR, Vol. 55, p. 49).*

In 1858, John and Agnes Kellum recorded a deed of transfer provided in part as follows:

> This Indenture made this 7 day of August in the year of our Lord one thousand Eight hundred and fifty Eight, Witnessth that John Kellum & Agnez [sic] Kellum his wife of the county of Pike and state of Illinois, party of the first part in consideration of the sum of fifty Dollars to them paid by the school Directors of school District No. 7 in Hadley of the county of Pike and state of Illinois party of the second part the receipt of which is hereby acknowledged have Granted Bargained and Sold and by these presents do Grant Bargain Sell Convey and Confirm unto the said party of the second part, their successors and assigned forever a certain tract of land known and described as being thirty feet East and twenty one feet North in the South west corner of Lot No 1 one in Block No 8 Eight in New Philadelphia situated in the county of Pike and state of Illinois. (PCDR, Vol. 55, p. 49)

On October 12, 1859, the Kellum family sold Lots 1 and 2 to John Kellum's mother Elizabeth for $325.00, making no mention of reserving any portion for the location of a schoolhouse (Pike County Deed Books 1820-1938: Vol. 57, p. 363). On December 15, 1860, Elizabeth Kellum sold Lots 1 and 2 to Sarah McWorter for $200.00, "with the exception of Twenty (20) feet East and (21) Twenty one feet within the South west corner of lot No One (1) in Block No Eight (8)" (Pike County Deed Books 1820-1938: Vol. 59, p. 237).

On October 15, 1860, Sarah McWorter sold Lots 1 and 2 to A. B. Cobb for $200.00, but the deed made no mention of a school tract (Pike County Deed Books 1820-1938:Vol. 89, p. 223). These deed records were not filed until 1874, which likely accounts for the chronological discrepancies between transactions. A. B. and Laura Cobb sold the lots to Alexander Beard/Baird for $250 on November 7, 1870; again with no mention of a school tract (Pike County Deed Books 1820-1938:Vol. 89, p. 224). But on October 12, 1874, Alexander and Mary Beard sold the lots to

Cordelia Racy, "except twenty one (21) feet by thirty (30) out of the South West corner for Schoolhouse" (Pike County Deed Books 1820-1938: Vol. 87, p. 130).

On November 21, 1881, the executor of Cordelia Racy's estate sold the lots for $125.00 to William D. McKinney, "excepting a school House lot in the South West Corner 21 by 30 feet" (Pike County Deed Books 1820-1938: Vol. 101, p. 299). On May 10, 1887, William McKinney sold Lots 1 and 2 to James McKinney for $75.00, "excepting a School House lot in the South West corner 21 by 30 feet" (Pike County Deed Books 1820-1938: Vol. 113, p. 266). On October 22, 1902, James McKinney sold Lots 1, 2, 7 and 8 in Block 8 to William Butler for $80.00, but the deed of transfer made no mention of a schoolhouse portion (Pike County Deed Books 1820-1938: Vol. 147, p. 123).

Block 8, Lots 1-2 History

One can combine evidence from deed entries with additional data from census and tax records to develop an integrated chronology of Block 8, Lots 1 and 2. The first owner of Block 8, Lots 1 and 2 following the patenting of the town was Christopher Luce. He purchased these lots in 1840 and was shown living in Hadley Township in 1850 with his wife Sally and two sons, one a farmer of 15. The three elder Luces were born in New England, the youngest (age 8) in Illinois. All were designated "white" on the U.S. census. Luce was a Baptist preacher and had contracted with Frank McWorter to build the Baptist seminary that the latter envisioned for the town. Luce did not fulfill his contract, leading to a lawsuit in 1851 (Walker 1983:138-139). No subsequent censuses include Luces in Hadley Township.

Clarissa Arnold owned the property in 1857. Clarissa may have been a member of the household of Calvin Arnold. He was listed in the 1855 State Census as the white head of a household of six people. John Kellum, who purchased the property in 1857 from Clarissa Arnold, is also listed in the 1855 Illinois state census. He was the "white" head of a household of three in the 1855 state census. In the 1860 federal census, his mother Elizabeth, who by then had purchased the property from him, headed a household that included four young adults and two smaller boys born since the last census.

Elizabeth Kellum sold the lot back to the McWorter family in 1860, to another woman, Sarah McWorter. Sarah, a "mulatto" woman well into her thirties, appeared in the 1850 census as a member of a household that included her father and mother and at least two of her children, an adult daughter and a young girl. In 1860, she resided in her mother's household. She became the family head ten years after her ownership of the lots, in 1870.

A.B. Cobb purchased the lot from Sarah McWorter in 1860, the same year in which she purchased it, suggesting it was an investment rather than a residence for her. She conveyed some form of interest in the property to Cobb in 1860, but remained responsible for tax payments on the property listed for 1867 and 1868, according to the Hadley Township Tax Assessments. Her 1867 assessment was for property valued at eight dollars. One year later, the value was for a total of $100.00, including improvements.

The Cobb family was headed by Arden, a physician from the Northeast. His wife Emily, along with their three small boys, was born in Illinois. They appeared in the 1860 census as "white." In 1870, the year Cobb sold the lot, the family included two of the previously-listed children as well as an older girl (13) and a little boy. The new Mrs. Cobb (Laura) apparently brought at least one child to the marriage. Cobb assessment in 1869 was for property valued at $100.00 as well, but the value dropped to $35.00 in 1870.

Alexander Baird, a painter, who purchased the lot from A.B. Cobb in 1870 does not appear in the census for that year. However, given his age and birthplace as listed in the 1880 census, it is likely he was the son of other Bairds who resided in Hadley Township in 1860. In 1870, he would have been 31. Mary Baird was his wife in 1880, if she were the mother of his son, who would have been five in 1870, then would have been his wife at the time of his purchase of the lots. All of the members of the Baird family were listed as "white." From 1871 through 1878 Alexander Baird was assessed for improvements. The value of the property was generally constant, increasing somewhat through the 1870s.

Cordelia Racy purchased the lot from Alexander Baird in 1874. Several Racys appeared in the 1850 census. Cordelia was listed only in the census of 1880, when she was a middle-aged widow, and the head of a household that included only her disabled adult son. They were both listed as "white." She was born in the Northeast, he was a native Illinoisan. She bought the lot six years prior to the census.

N. V. Hadsell was a 35-year-old farmer in 1850, which would have made him 66 in 1881, the year he sold the lots to William McKinney as the executor for Cordelia Racy's estate. James McKinney purchased the lot from him in 1887. By 1888 the assessed value decreased to $75.00. The McKinneys, neither of whom appears in the 1880 census for Hadley Township, owned the property into the twentieth century, when James McKinney sold it to William Butler. Butler was the father of Irene Butler Brown whose reminiscences, as indicated above, inform our understanding of the location of the New Philadelphia school.

The following tables contain deed, census, and tax data related to Block 8, Lots 1-2.

Immediately south of Block 8, Lots 1 and 2, lies Lot 8 of that block (Figure 6.2). The following table provides the history of land transactions concerning that neighboring tract. No features or significant artifacts were recovered in 2008 from the single excavation unit on Block 8, Lot 8.

For further discussion of the individuals associated with that lot, the reader is referred to Chapter 5 of the technical report for the 2008 season (Agbe-Davies 2009).

Block 8, Lots 1-2 Archaeology

In 2006, archaeological work on Block 8, Lots 1 and 2 focused on a residential structure with a large cellar feature at the northern edge of Lot 2. An electric resistivity survey undertaken in 2005 by Michael Hargrave had shown a strong indication of cultural remains, labeled as anomaly A43 in Figure 6.2. Anomaly A43 was excavated in the 2006 field season and proved to be the remains of a residential site.

The cellar feature measured about 18.6 ft. by 16 ft., and had underlain a house with plaster walls, dating from the 1850s. The house was dismantled and the cellar filled around the time of Sarah McWorter's ownership of the property in the 1860. The final filling, with a collapsed stone foundation and chimney remains, occurred in the early 1870s. The investigation of that residence is discussed in detail in the 2006 report (Shackel 2006b: chapters 3E and 4).

Block 8 was undertaken in the 2008 field season in collaboration with a group of geophysicists and archaeologists from "Time Team America," a documentary television program. PBS and Oregon Public Broadcasting produce the show, based on a long-running and highly successful series in the United Kingdom. Time Team America challenges a collaborative group of historians, geophysicists, and archaeologists to spend three days in the field to answer some puzzle concerning a specific archaeological site, often working with a long-term archaeology project, like New Philadelphia. The team researchers commit to applying the same protocols and standards of practice as the academic archaeologists in charge when addressing such a particular

question at the site. Stakeholders, such as some of the descendants of Frank McWorter and members of the New Philadelphia Association, agreed that participation would benefit the project, and so fieldwork commenced (see Figures 6.3 and 6.4).

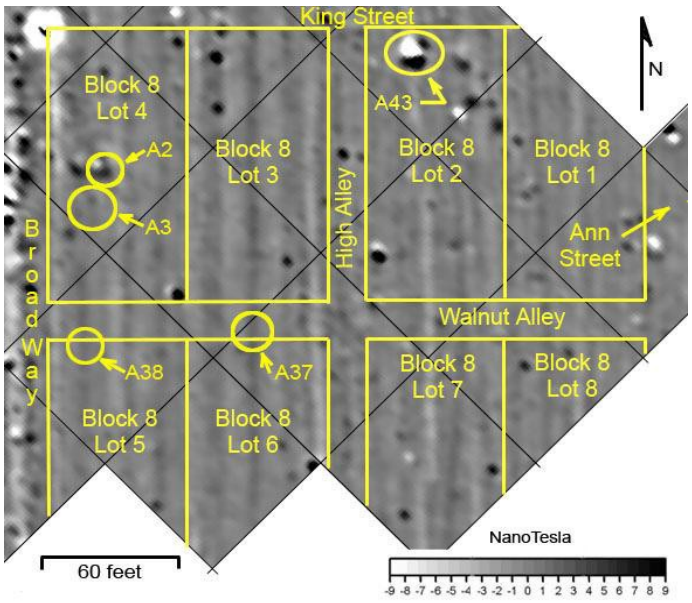

Figure 6.2. *Resistivity Survey of Block 8, Lots 1 and 2 in 2005 and 2006 (Image by Michael Hargrave; overlay by Christopher Fennell).*

Time Team America's archaeological investigation was conducted over the course of three working days in June 2008, during which the process and results were filmed for the New Philadelphia episode of their television program (Oregon Public Broadcasting 2009). The Time

Figure 6.3. *Time Team America archaeologists and film crew working on Block 8, Lots 1-2, June, 2008 (Photograph by Joe Conover).*

Team America crew included Jeff Brown, Colin Campbell, Eric Deetz, Bryan Haley, Adrien Hannus, Luke Pecoraro, Chelsea Rose, Julie Schablitsky, and Meg Watters. They worked along with a local crew headed up by Rochelle Lurie and Catherine Bird.

Figure 6.4. *Time Team America's helicopter crew obtained aerial views of the town site and surrounding landscape (Photograph by Joe Conover).*

Geophysical prospection played a large role in selection of excavation areas. Archaeologists knew that the southwest corner of Block 8, Lot 1 was an important target area, but units were also placed nearby in order to follow-up on information obtained via geophysical survey techniques. Margaret Watters and Bryan Haley conducted the geophysical surveys for Time Team, in consultation with Michael Hargrave. Figure 6.5 depicts the results obtained in the thermal infrared (TIR) survey in this area, and also indicates the locations of excavation units placed by Time Team to investigate anomalies observed in the data results of the TIR, ground penetrating radar (GPR), electric resistivity, and magnetic gradiometry surveys.

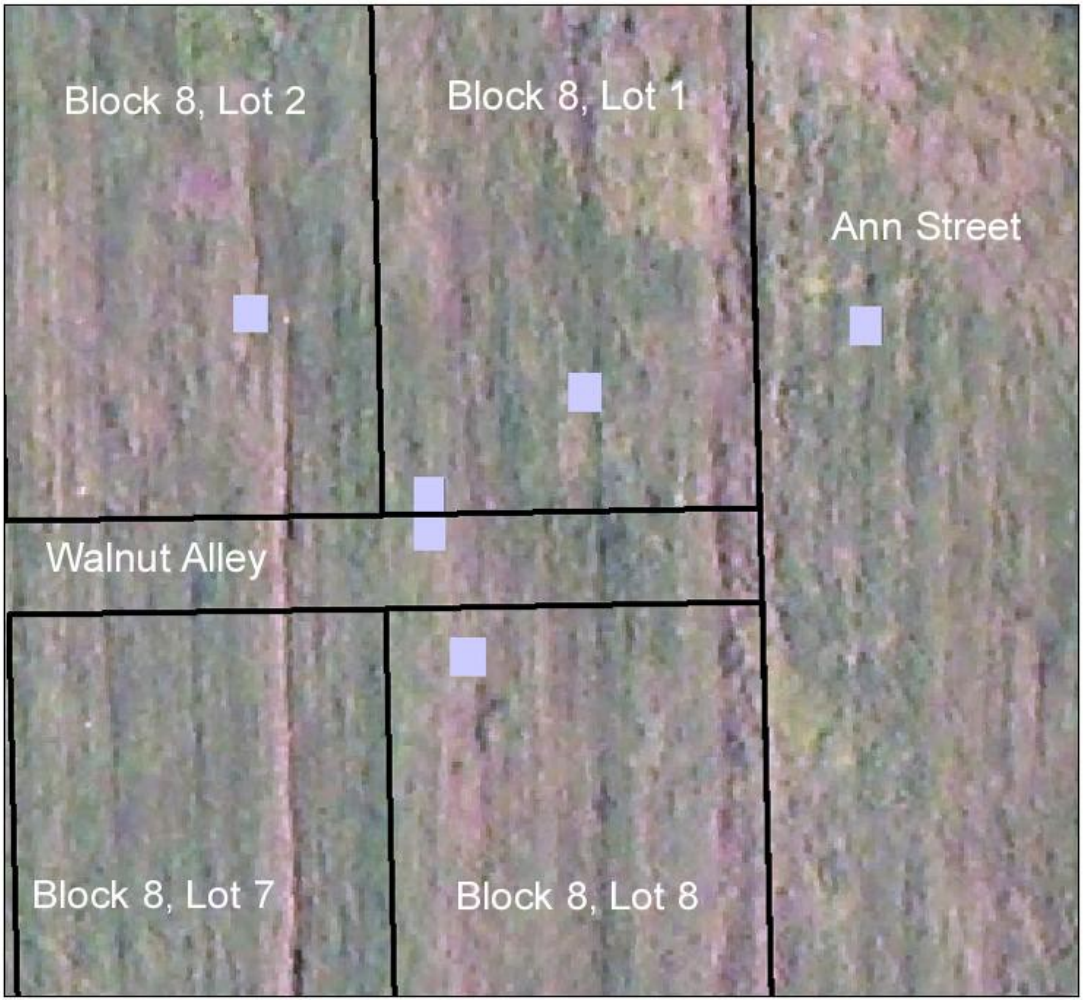

Figure 6.5. *TIR image map of part of Block 8, with locations of excavation units indicated (Image by Margaret Watters; label overlay by Christopher Fennell).*

The specialists used GPR to identify an anomaly at the southern edge of Block 8, Lot 1, which archaeologists tested with two adjacent 5 ft. x 5 ft. units, one within the lot, and the second to the south, in Walnut Alley (Figure 6.6). The plow zone was removed in two arbitrary levels of 0.5 ft. until subsoil was reached. Flat glass, brick fragments, and cut nails suggest a structure from the appropriate time period, but archaeologists did not uncover any architectural features below the plow zone. Underneath Level A2, which extended to 1.0 ft. below the ground surface, archaeologists identified several plow scars running north-south through the two units.

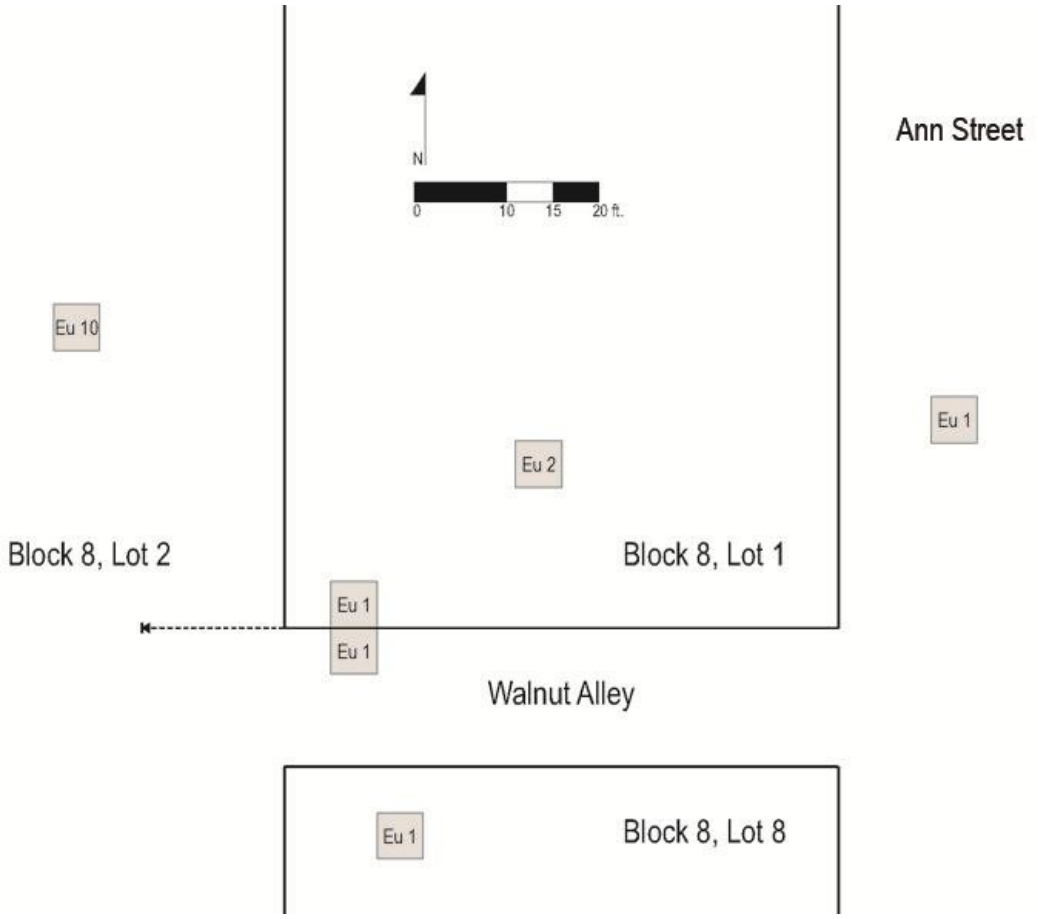

Figure 6.6. *Map of excavation units placed by Time Team in the area of Lots 1 and 2 on Block 8 and surrounding vicinity. Following protocols used by the New Philadelphia Archaeology Project, Time Team labeled these units in consecutive order within each lot or within the space of a platted alley or street. Thus "EU 1" in Walnut Alley was the first unit placed within the space of that alley, and the contiguous "EU 1" in Block 8, Lot 1, was the first unit placed within the space of that adjacent lot (Image by Anna Agbe-Davies and Christopher Fennell).*

Archaeologists identified a second anomaly in the southern section of Block 8, Lot 1, using a resistivity survey. No artifacts came from the first 0.5 ft. arbitrary level of the 5 ft. x 5 ft. excavation unit (EU 2 in Block 8, Lot 1, see Figure 6.6). Level A2 included unidentified nail fragments and brick fragments in the silty loam matrix, in addition to lamp chimney and flat glass. There was no feature present to account for the resistivity anomaly.

Magnetic gradiometry suggested the location of a 5 ft. x 5 ft. excavation unit in what had been Ann Street, just to the east of Block 8, Lot 1 (Figure 6.6). The plow zone was removed in two arbitrary levels of 0.5 ft. each, and a third level that terminated on the top of subsoil, identified by the appearance of several features in the yellowish brown silty clay. (Figure 6.7).

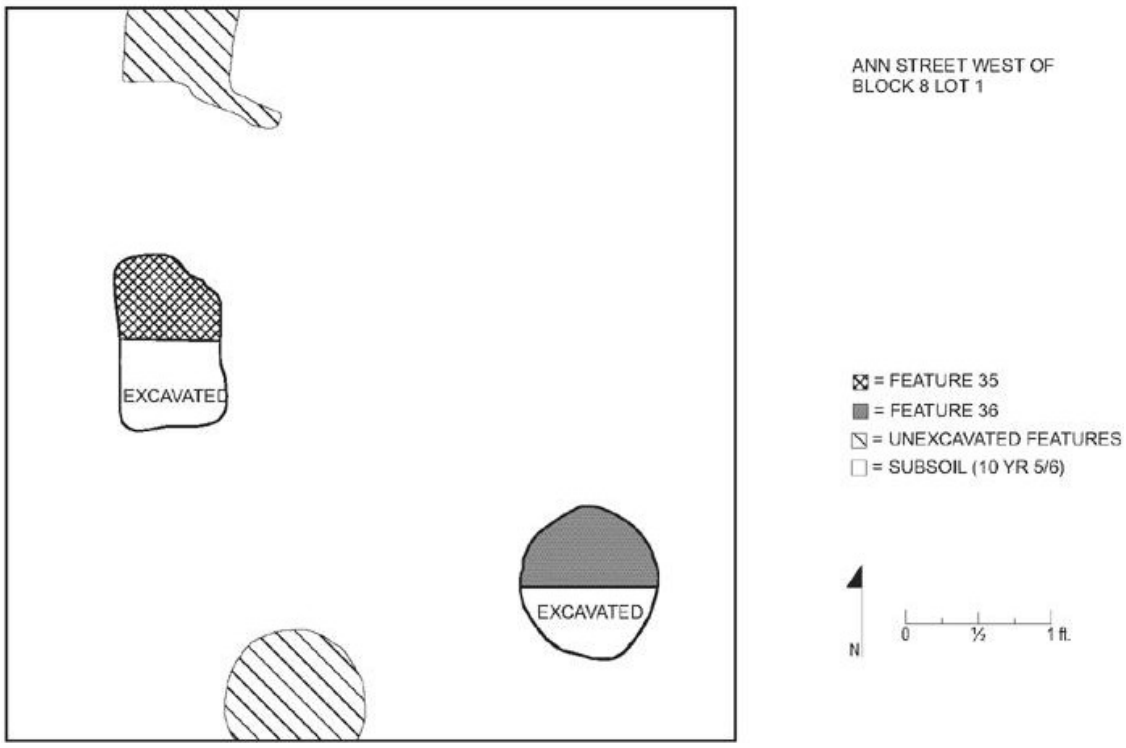

Figure 6.7. *Plan view of Features 35 (on left) and 36 (on right) (Image by Anna Agbe-Davies).*

Feature 35

Feature 35 appeared initially to be a small post hole or post mold measuring 0.7 ft. x 1.2 ft. (Figure 6.7). However, once archaeologists bisected it, the deposit was revealed to be less than 0.1 ft. thick. Excavators did not remove any artifacts from the feature fill, and their final interpretation was that Feature 35 was a segment of a plow scar that had been distorted through animal burrowing or other non-cultural activity. A second similar feature (shown on the upper edge of Figure 6.7) did not receive an identifying number, nor was it excavated.

Feature 36

Excavators described Feature 36 as perfectly round, and exactly 1.0 ft. in diameter in plan view (Figure 6.7). The bisection revealed that the feature had very straight sides and extended 1.0 ft. into the surrounding subsoil (Figures 6.8 and 6.9). No artifacts or inclusions were removed from the feature fill. The most reasonable explanation for such a feature is that it was dug with a mechanical posthole digger fairly recently. A second, similar feature (shown on the lower edge of Figure 6.7) was not given an identification number or excavated, given its probable comparability with Feature 36.

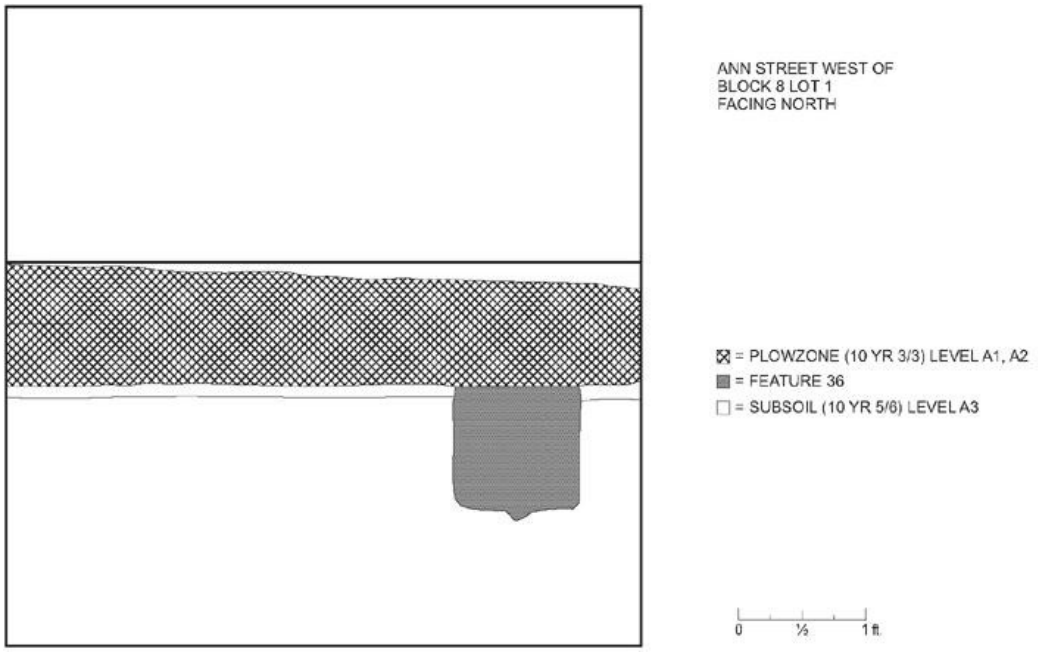

Figure 6.8. *Profile view of Feature 36 (Image by Anna Agbe-Davies).*

Figure 6.9. *Feature 36 bisected in Excavation Unit 1 in the area of Ann Street east of Block 8, Lot 1 (Photograph by J. Eric Deetz).*

On Block 8, Lot 2, geophysics experts identified an anomaly using TIR photography. Such an anomaly might indicate a large feature like a foundation that is composed of material different enough from the surrounding sediment that it warms or cools at a different rate than the matrix by which it is surrounded. Excavation Unit 10 was a 5 ft. x 5 ft. unit sited to test that anomaly

(see Figures 6.5 and 6.6). Archaeologists removed the plow zone in arbitrary levels of 0.5 ft. The first level (A1) included some architectural fragments. However, there were no artifacts or inclusions in the second level, and upon their removal, no features appeared in the subsoil beneath.

The final unit excavated by the Time Team America archaeologists was located in the northern portion of Block 8, Lot 8 (Figures 6.5 and 6.6). The decision to place a unit there was based on the magnetic gradient survey which identified an anomaly in that area. Excavation Unit 1 was a 5 ft. x 5 ft. square from which excavators removed the plow zone in two arbitrary levels of 0.5 ft. each. Level A1 included some white ware and yellow ware fragments as well as some architectural fragments. However, no finds came from the lower layer, and when it was removed, no features appeared in the subsoil beneath.

This collaborative effort by Time Team America allowed the New Philadelphia Archaeology Project to obtain data from a new portion of the town site, and to pursue leads regarding the location of a schoolhouse for the town's African-American children. Given the brevity of Time Team's research time, which was made more challenging by unusually rainy weather in June, 2008, we obtained very useful data about the landscape and sediment profiles on the eastern half of Block 8 that will help guide further investigations. Likewise, the geophysical data collected proved useful in planning for follow-up excavations several years later.

The tantalizing artifact assemblage, but lack of features in 2008, prompted a return to Block 8, Lot 1 with a different strategy in 2011. Participants in the field school excavated 0.5 ft. by 0.5 ft. shovel test pits on close intervals (5 ft.) in the southwest corner of the lot, the same 20 ft. by 30 ft. portion that was exempted in deed transactions as described above. Shovel test pits (STPs) at larger intervals (20 ft.) were excavated across the rest of the southern half of the lot (60 ft. by 60 ft.). There were no noticeable concentrations of artifacts to suggest a subsurface feature, nor did excavators encounter any features in the individual STPs.

This area included one of the Time Team America excavation units (Block 8, Lot 1 Excavation Unit 1), and when the time came to place an additional excavation unit in Lot 1, archaeologists elected to excavate in an area that had several important characteristics. First, one nearby STP (number 2) had significantly better drainage than the surrounding STPs—suggesting it was not underlain by clayey subsoils like the rest of the Lot. Second, the area was surrounded by STPs with slightly higher than average numbers of artifacts. Third, the area selected was immediately adjacent to (north of) the Time Team excavation unit, and thus still within the area of the ground penetrating radar anomaly identified in 2008.

The northwest corner of the 5 ft. by 5 ft. excavation unit was 5 ft. east and 10 ft. north of the southwest corner of the lot. No features were found under the plow zone, however, and although most of the artifacts recovered could easily date to the period of interest, the presence of a modern rubber hose embedded in the north profile 0.85 ft. below the surface indicates a modern intrusion—perhaps explaining both the anomaly and the lack of clear evidence for a structure in this location.

A schoolhouse of that era was a very ephemeral structure to begin with. An observer described a schoolhouse he saw in Adams County, which borders Pike County to the north. In 1842 he

observed:

> The school House I visited was built of unhewn logs, in a beautiful grove of thick shade trees. The door had no fastening but was kept to by means of a chip. for windows a single log was left out on each side, which allowed the rain the day I was there to patter upon the heads of the hearty sons of the west. The chimney was commenced with logs but was not completed & there was on all sufficiency of light admitted by the means of the crevices between the logs, to enlighten the whole school even without windows. (Lawrence 1842)

Such a building would leave little in the way of architectural evidence, unless it had been set on piers or a stone foundation. Likewise, few artifacts would remain, as no bricks, window glass, or nails were used in this simple structure. Other surveys of rural schoolhouses in the early nineteenth-century Midwest paint a similar picture. Only after the Civil War did communities begin to invest significant effort and resources in school design and furnishings (Bird, et al. 2010; Rotman 2009:70, 75-77). The visitor to the Adams County School continued:

> The floor & benches were made of puncheon these are logs hewn on one side & with the bark remaining on the other. there was one desk & that was made by inserting the edge of a wide board in the crevice between two logs. & there with their spines resting upon the desk & their legs dangling between heaven & earth sat the young aspirants for literary honors. (Lawrence 1842)

Many of the items that would be used in schoolhouses, either as part of their instructional function, or for other community purposes, would differ little from the artifacts from a dwelling site, particularly in this very early period of unspecialized structures and furnishings. Well-appointed schools may have had provisions for lighting, whether glass windows or lamps. Specially-made desks, and their associated hardware, are typical of later period schools. So how might artifacts be made to demonstrate the presence or absence of a schoolhouse? Very little comparative data is published (Gibb and Beisaw 2000). Descriptions of nineteenth-century Midwestern schoolhouse assemblages do not include proportions of education-related artifacts (Bird, et al. 2010; Rotman 2009).

Test excavations at a schoolhouse that was established in 1848 in Bermuda—interestingly, also for the children of former slaves—yielded a sample in which school-related artifacts were nearly 7% of all the items recovered (Agbe-Davies 2002). In the 20 ft. by 30 ft. parcel reserved for New Philadelphia's school, such items (essentially, slate fragments) made up only 0.9% of all artifacts. The discrepancy may be explained first by the great care and investment that went into the construction, and likely the furnishing, of the Old Elliot School, a stone building that is still standing, compared with what was likely a very ephemeral structure at New Philadelphia. Second, the Bermudian structure continued to serve as a school into the middle of the twentieth century, whereas any school located on Block 8, Lot 1 was only in use for a decade or two. Finally, the archaeological deposits at the Old Elliot School came from protected deposits within the foundation of the standing structure, while the Lot 1 artifacts came, without exception, from plow zone deposits.

Despite their paucity, the *distribution* of school-related artifacts is informative. Several features at New Philadelphia contained slate fragments, including Feature 18, Feature 19 and Feature 14 (see following table). The majority of slate fragments recovered from features come from lots in the immediate vicinity of Block 8, Lot 1, and could very well have included refuse derived originally from that location.

Table 6.1. Features containing slate fragments

Because it also can be used as roofing material, one cannot presume that all slate fragments represent "writing slates." None of the fragments from New Philadelphia were scored with lines to guide penmanship, unlike examples at the Old Elliot School, (Agbe-Davies 2002). However, slate is also shaped into pencils, which archaeologists recovered from plow zone and feature contexts on Block 3, Lot 7, Block 4, Lot 1, Block 7, Lot 1, and Block 9, Lot 5 (see Table 6.1). From this distribution, we might conclude that the numerous slate fragments recovered from Block 13, were less likely to be related to instruction than those on Blocks 3, 4, 7, 8, and 9.

The official documentary record, in the form of deeds, places the schoolhouse in the southwestern corner of Block 8, Lot 1. However, there is no compelling structural evidence for a structure in that location. The artifacts are suggestive—slate fragments were recovered from features on adjacent lots—but not conclusive (for more on the schoolhouse research, see Agbe-Davies and Martin in press)

Chapter 7: Block 12, Lots 3 and 4

Anna S. Agbe-Davies[1]

Oral histories collected from former New Philadelphia residents and neighbors emphasize the significance of Block 12 for the town. A study prepared in the mid-1960s states:

> According to one or two present-day citizens of the area, there was, in the early days, a schoolhouse for the colored people near the center of the town of Philadelphia on block 12. It was vacated some time before 1881…The old schoolhouse was purchased by George and Martin Kimbrew who installed a partition, and added a shed room and lived there. The building was later torn down. (Matteson 1964)

Research undertaken during the 2008 NSF-REU season indicates that a Martin "Kinebra" was taxed for a town lot (Block 9, Lot 4) in 1888. However, there are no documents associating him with Block 12. A memory map prepared by former occupant Loraine "Larry" Burdick also challenges the account provided in Matteson, saying, "This was land [that] was ajacent [sic] to the home I grew up in. This was a farm field in the 1930's. No buildings were present. If a school existed in this block it was removed before the mid 1930's" (Burdick n.d.).

Block 12, Lots 3 and 4 History

Deed research[2] reveals that Lots 3 and 4 of Block 12 were always conveyed as a unit, and so the following analysis applies to both lots. The first registered sale of Lots 3 and 4 was directly from "Frank McWorter" to George Conrad and D. Kitright in 1858. These two people purchased 72 lots all across the town during that year from what was in actuality McWorter's estate, given his death in 1854. In these transactions the second purchaser's name was spelled in a variety of ways.

Later that same year, Conrad sold the lots to Solomon McWorter (Frank McWorter's fourth child).[3] Solomon McWorter held Lots 3 and 4 of Block 12 for ten years before selling to William Marion in 1868. A year later, Marion sold to Louisa Stewart, who owned the lots until she sold them in 1877 to Louisa McWorter, the widow of Squire McWorter, and the owner of all of Block 13, immediately to the west. The next listed transaction was in 1883, in which James McKinney was listed as the seller and George McWorter (Louisa McWorter's son) was the purchaser. In 1897, George McWorter sold to Squire McWorter (presumably his brother, rather than his father, also named Squire McWorter).

---

[1] University of North Carolina at Chapel Hill.

[2] The deed information has been transcribed and is available in a searchable format online at http://www.anthro.illinois.edu/faculty/cfennell/NP/1872plat.html.

[3] All of the lots purchased by Conrad and Kitright from Frank McWorter's estate went to his son Solomon, with the exception of Block 2.

In 1916 Thomas McWorter sold the lots to Shelby McWorter, initiating a series of rapid turnovers involving various members of the McWorter family, a few apparently unrelated individuals, and the Barry State Bank. When the dust settled in 1918, Martha McWorter was listed as selling the lots to Frederick Venicombe. In 1924, she and Shelby McWorter had purchased the lots back from the Barry State Bank. Finally, in 1938, F. Venicombe sold the lots to W.H. Strolheker.

No one with either the Conrad or Kitright surname appeared in New Philadelphia for the 1850 Federal Census, or the 1858 Illinois Census. A Daniel Kirtwright/Kartwright appeared in the 1860 census as a six-year-old boy living in the household of Abraham and Anny Burkhead. A separate Kirtwright household consisted of a young couple in their 20s and a small child. Given the brevity of the Conrad/Kitright ownership, and its replication across much of the town, it appears unlikely that either one would have had a direct impact on sites located on Lots 3 and 4 of Block 12.

According to the Pike County Tax Collector's Books from 1845 to 1854, all of Block 12 was unimproved, and was owned by Frank McWorter. After his death (1855-1864) the lots were assessed to Solomon McWorter, as administrator of his father's estate (Martin 2010). No improvements[4] were noted for Lots 3 and 4 until 1868, after the transfer to William Marion.

Tax records[5] list both Solomon McWorter and William Marion for Lots 3 and 4 of Block 12 in 1868, while only William Marion was charged in 1869. G.W. Stewart, husband of Louisa Stewart, was listed as the "owner" by 1870. Solomon McWorter was never assessed for improvements to the lots, but the 1868 and 1869 tax lists indicate that William Marion, who owned Lots 3, 4, and 6, was assessed based on a value of $15.00 for the land and $70.00 for improvements. It therefore seems probable that the first construction on these lots took place in 1868.

Solomon McWorter did not appear as a resident of New Philadelphia proper in any census. On the other hand, William Marion owned the lots only briefly in 1868 and 1869, but remained in New Philadelphia long enough to appear in the 1870 Federal Census. He was listed as the head of a farming household that included only his wife Cassie, "keeping house." They were both in their early 20s and were listed as "white." He was born in New York; she was a native of Illinois. It does not appear that Marion owned any real estate at the time of the enumeration, so the transfer to the Stewarts had already taken place.

In 1870, the Stewart family consisted of George (22) and Louisa (21) and their three-month-old daughter, Elena. He was born in Tennessee, while both his wife and daughter were born in Illinois. They were all identified as "mulatto." The head of household was a minister; no occupation was given for the other members of the family. According to the census George Stewart's real property was valued at $250.00 and his personal property at $150.00, however, it

[4] During those years, no improvements were assessed on any of the lots other than Lot 5 (1859, 1861 and 1862). In 1864, Lot 4 was listed as "improved," but Lot 5 was not, so this may be an error (Martin 2010).
[5] Tax records are transcribed and available on-line at http://www.anthro.illinois.edu/faculty/cfennell/NP/taxmenu.html.

should be noted that Louisa's name was the one recorded in the deed book. Neither the Stewart nor the Marion household appeared in the 1880 census for New Philadelphia.

It seems that the improvements remained viable following the transfer of ownership from Louisa Stewart to Louisa McWorter, as indicated by the 1878 tax rolls.[6] However, it is unlikely that she lived there, given the evidence placing her home on Block 13. At the time of the 1870 census, Louisa McWorter (45) was listed as the head of a household that included her grown children, daughter Lucy (24) and son George (21). Lucy was "at home" and George was a "farmer." Their mother, despite the notation that she possessed $6,500.00 in real estate was simply "keeping house." All were identified by the enumerator as "mulatto." Louisa was born in Kentucky, and her children in Illinois. The information in the 1880 census, after Louisa's acquisition of Lots 3 and 4 of Block 12 offers much of the same information, but lists George as 28 in that year, and added Kasiah Clark (Louisa's widowed mother, 76) and Charles Jones (an "abandoned child," 15) to the household.

In summary, Lots 3 and 4 of Block 12 were unimproved until ca. 1868 and the only owners likely to have resided on the lots were the Marion and Stewart households (1868-1877). Available records do not indicate if these lots were leased to other occupants after 1877, but do suggest that the improvements remained at least until 1888. It is possible that Louisa McWorter was simply holding the property for her son George, as he was listed as the taxpayer in 1878, before he became the official owner in 1883. In any event, it is not certain that George ever occupied these lots, given the number of lots he owned elsewhere in the town, and the fact that the 1880 census listed him as a member of his mother's household elsewhere. We should note that in 1885, Lots 3 and 4 became the edge of town, as the lots on the eastern side of town were removed from the tax rolls -- including Block 12 Lots 1 and 2. Lots 3 and 4 remained "improved" in the 1888 listing, the last available. However, any structures had been razed, and the land returned to farm fields, by the 1930s.

[6] George McWorter was listed as the owner in that document.

Archaeology on Block 12

Lot 3

No surface survey took place on either Lot 3 or 4 of Block 12 during the initial phase of field research in 2002-2003, as landowner permission could not be obtained (Gwaltney 2004). Likewise geophysical investigations commenced on these lots only with the 2010 field season. Preliminary geophysical findings are presented in Chapter 13 of this report, "Surveys."

Archaeologists initiated a shovel test survey of Lot 3 in 2005, when it became available for examination. The density of the vegetation and low surface visibility ruled out surface collection as a method for identifying artifact scatters (Fennell 2006). The shovel test pits (STPs) were 1 ft. in diameter and sediments were removed in arbitrary levels of 0.5 ft. Screening through one-quarter inch mesh allowed for the recovery of artifacts as well as floral and faunal specimens. Excavators placed the STPs at 20 foot intervals across Lots 1-6 of Block 12 as well as portions of Block 19.

The 16 STPs placed on Lot 3 were located in the northern portion of the lot (Figure 7.1). Only one STP was "negative," containing no artifacts at all. Test pits with significant numbers of both architectural artifacts and nineteenth-century ceramics clustered along the northern and western edges of the lot.

In these STPs (4-7, 15-18), excavators encountered subsoil at a slightly deeper level below the surface (around 1.5-2 ft.) than other STPs on the lot. Every one of these STPs contained brick, and most contained either cut nails or window glass. Such finds may indicate a structure in the vicinity. The other artifacts included white ware, Bennington/Rockingham earthenware, and machine molded bottle glass. The manufacturing date ranges for these artifacts, along with the cut nails, point to an occupation date range in the mid- to late-nineteenth century. This range correlates with what the written record suggests about when the lots may have first been occupied (ca. 1860s).

During the 2010 season, excavators decided to place units in an area delimited by STPs 4, 5, 15, and 16. This decision was based on the artifact content, stratigraphic profile, and proximity of these STPs to Main Street, a major thoroughfare in New Philadelphia. The precise placement of the two Excavation Units (EUs) within this area was guided by the use of dowsing rods. Using this technique, two thin, high tensile steel pins, are held parallel to one another while walking across the target area. Atypical movement of the pins toward one another while in motion over the ground surface was interpreted as an indication of an in-ground anomaly. This dowsing technique was implemented and interpreted by archaeologist Eric Deetz, based on his decades of experience in field work and a desire to experiment with this technique in a setting with comparative data sets available. Such dowsing approaches have been viewed as controversial by some commentators and yet have also proven effective in the identification of archaeological features for others (Noël Hume 1969:37-40). The excavators at New Philadelphia viewed this as an opportunity to further test such methods.

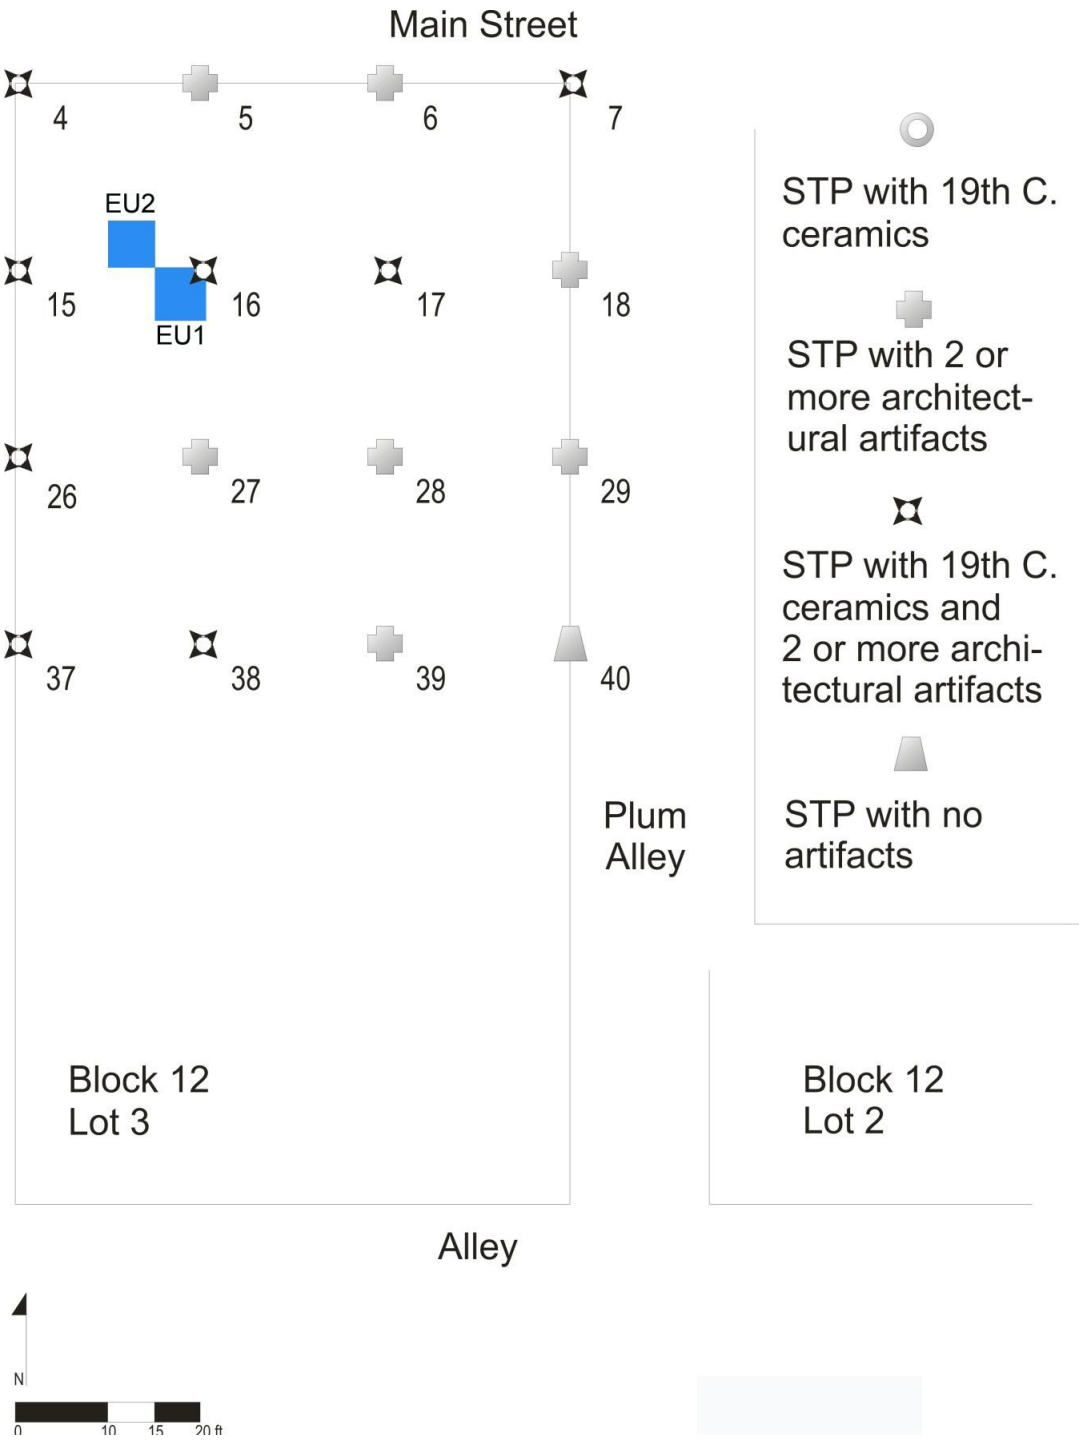

Figure 7.1. *2005 Shovel test pit survey data and location of 2010 EU1 and EU2 in Block 12, Lot 3 (Illustration by Christopher Fennell).*

The northwest corner of EU 1 was located 20 ft. south and 15 ft. east of the northwest corner of Block 12, Lot 3. Excavation Unit 2 adjoins EU 1. The northwest corner of EU 2 was located 15 ft. south and 10 ft. east of the northwest corner of Block 12, Lot 3. The disturbance indicated by

the dowsing rods was located at the center of EU 2 and extending towards the south, beyond the excavated area.

We have reason to speculate that any dwelling or other substantial building on Block 12 was located on Lot 3, given the notation in the 1888 tax assessment records indicating that Lot 4 was unimproved, while the combined parcel retained significant value.

Excavators began work in EUs 1 and 2 with the removal of the plow zone in arbitrary levels of 0.5 ft. The plow zone was generally a 10YR 3/2 (very dark grayish brown) sandy loam. Artifacts were similar to those encountered during the STP survey: architectural fragments and nineteenth-century ceramics and bottle glass.

Architectural fragments (brick, mortar, window glass, nails) predominated over other household artifacts, such as container glass and ceramics. Other than an anomalous piece of plastic, the artifacts point to an occupation date in the second half of the nineteenth century, with cut nails, bottle glass with embossed lettering, and white ware fragments (including one transfer printed shard). The artifacts from the second arbitrary level of the plow zone (A2) were much the same, with the addition of a fragment of a glass jar lid liner, confirming the mid-late nineteenth century date.

Excavation Units 1 and 2 were located at the foot of a moderate slope, and so received significant run-off and seepage from frequent rains in the summer of 2010. The constant soaking meant that excavation could not proceed without likely damage to any intact deposits below the plow zone, so after four weeks of persistent effort, the units were abandoned, shortly after commencing excavation of the second arbitrary level of plow zone, A2 (Figure 7.2). Our full exploration of these excavation units and an assessment of the results of our experimentation with dowsing in comparison with standard geophysical techniques would have to wait for the following field season.

In 2011, excavators returned to EU 1 and 2 and after removing the backfill placed in the unit to protect it during the preceding year, excavated Level A3 as a "cleaning" level. The sediment was a silty loam that showed discoloration in the northwest corner of the unit. The artifacts were typical domestic debris, especially architectural fragments and container glass. However, the deposit was still quite recent, as indicated by the fragments of Bakelite (terminus post quem 1907) also present. Level A4 extended from the bottom of the plow zone to a depth of 1.5 ft. below the ground surface. As A4 was removed, excavators noted a darker soil stain in the southeast corner of the unit. Given its linear alignment, they identified the feature as a possible rodent burrow. The feature was excavated separately from the surrounding subsoil and designated Level A5. The average opening elevation was 755.351 ft. above mean sea level (amsl), or 1.5 ft. below the level of the ground surface. Excavators continued to find architectural fragments, as well as charcoal and some ceramics in the fill. The deposit was not given a feature number because it was thought not to be the result of human activity.

It is possible that the dowsing experiment picked up the rodent burrow that excavators found. No other features or significant concentrations of iron artifacts could explain the action of the dowsing rods causing them to point to the location selected for excavation

Figure 7.2. *Water-filled excavation units 1 and 2 in Block 12, Lot 3 (Photograph by Anna Agbe-Davies).*

Lot 4

As noted above, in the discussion of Block 12, Lot 3, there was no surface collection survey of Block 12, Lot 4 in 2002-2003, nor was there any geophysical survey until the present field season (2010). A STP survey undertaken in 2005 provided the information necessary to plan the placement of EUs on Lot 4.

Archaeologists were interested in exploring deposits along Ann Street, given that so much prior attention had been directed toward features along the principal thoroughfares of the town (Broad and Main). The two most promising STPs near Ann Street proved to be STPs 46 and 48, each with concentrations of architectural fragments and nineteenth-century ceramics (Figure 7.3).

The precise location of EU 1 was established by selecting an area between these two STPS, but slightly closer to Ann St. The northwest corner of EU 1 was 25 ft. north and 15 ft. east of the southwest corner of Lot 4, Block 12.

Excavators removed the plow zone in three arbitrary levels of 0.5 ft. each. The sediment was a 10YR 3/2 (very dark grayish brown) sandy loam that contained large numbers of architectural and household artifacts.

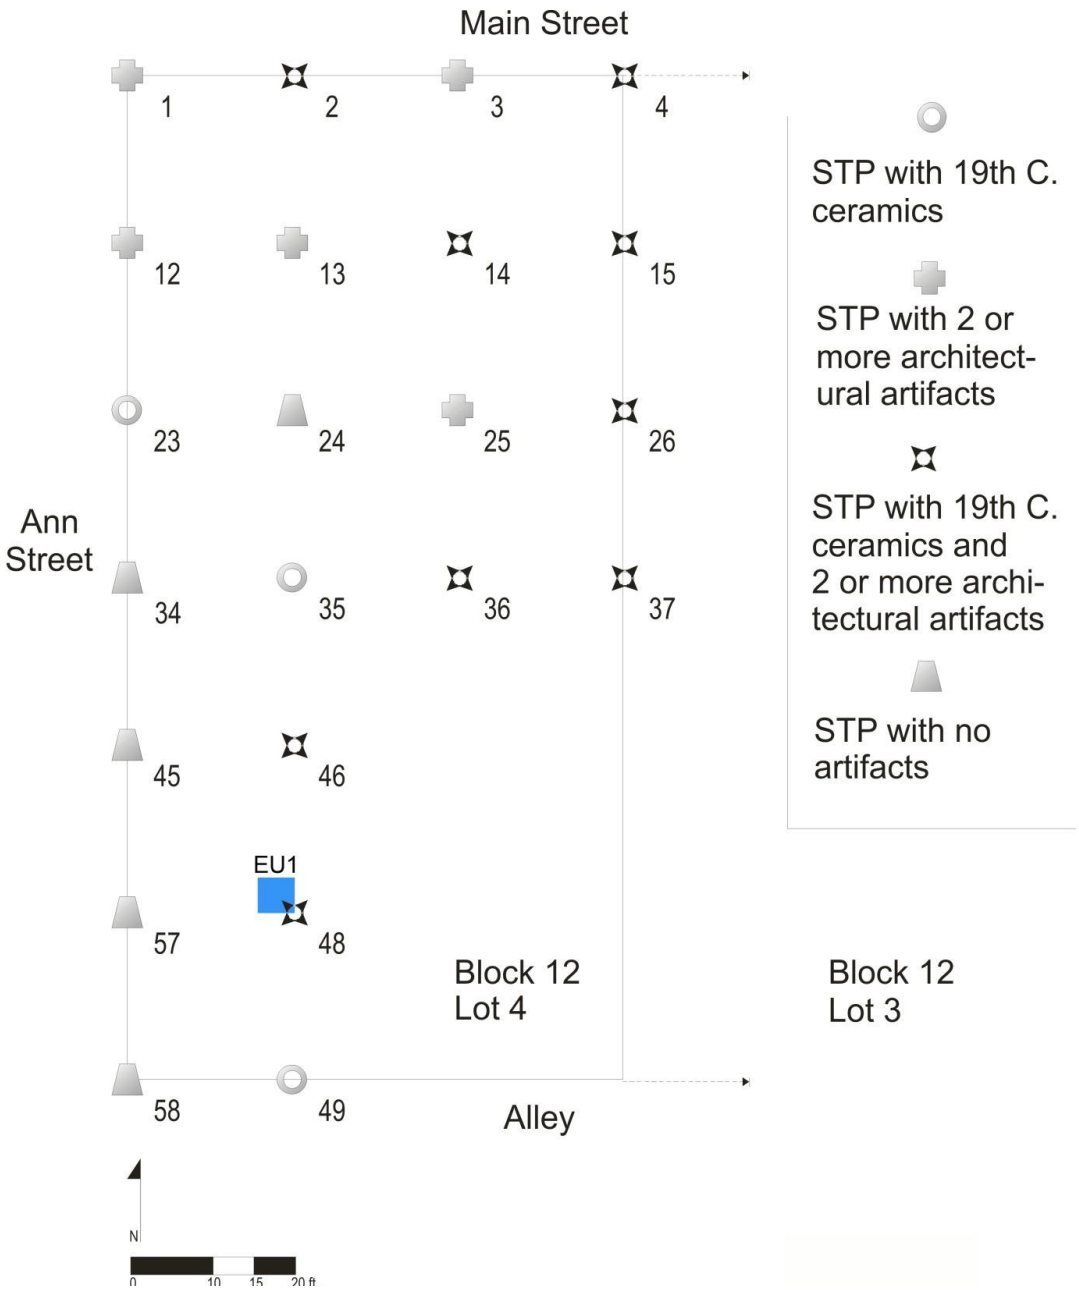

Figure 7.3. *2005 Shovel test pit survey data and location of 2010 EU1 in Block 12, Lot 4 (Illustration by Christopher Fennell).*

Subsoil was identified at approximately 1.25 ft. below the surface, but Level A3 was excavated to a full 0.5 ft. in order to ensure that the excavators were indeed in sterile soil. The transition to subsoil was much more apparent in the sidewalls of the excavation unit, particularly after a number of soaking rains. No features were identified in EU 1.

The artifacts recovered were consistent with those found during the shovel test survey as already been reported (Fennell 2006). Architectural fragments such as brick, mortar, window glass, and nails were found in A1, A2, and A3. The nails were either cut or unidentifiable, suggesting a nineteenth-century date for construction. Ceramics included tablewares and storage vessels, predominantly white ware and assorted coarse stonewares, again, suggesting a nineteenth-century occupation date. Fragments of colorless container glass had few distinguishing manufacturing characteristics and could not be precisely dated. The general date range could correspond to the years during which there were improvements noted on the lot, during the Marion and Stewart ownership periods.

Chapter 8: Research on Block 13, Lot 4

Kathryn Fay with contributions from George Calfas, M. Kathryn Rocheford and Paul Shackel[1]

Block 13, Lot 4 History

Louisa Clark was the daughter of Kezia Clark, born in 1824 in Spencer County, Kentucky. She was manumitted with her mother at the age of 12 months. Louisa married Squire McWorter in Pike County in 1843. By 1850, Squire, Louisa, and their three children were living within the town limits of New Philadelphia in the same household as Squire's late brother Frank Jr.'s wife Mary A. and her two children. By 1853, all of Block 13 (which had previously been listed as owned by Frank McWorter) is officially owned by Squire McWorter, with only Lot 4 showing improvement, meaning the McWorter home was built on that lot and likely between 1845 and 1853 (Martin 2010; United States Bureau of the Census (USBC) 1850). (It is noted that relying on census data could result in some inaccuracies due to historical problems such as reporting errors and/or racism on the part of the census takers. However, due to the lack of that type of data from any other source, both federal and state census data are used.)

Upon the death of her husband in 1855, Louisa became the head of the household and the sole owner and manager of the eight town lots on which she, her five children, and occasionally other family members lived, as well as other parcels of farm land throughout the township. In the 1857 Tax Collector's Book for Pike County, the improvement (house) on Lot 4 is not mentioned as it was in previous years, which may indicate that the home was destroyed or demolished, though there is no mention of this in other historical documents. Through excavations in the summer of 2011 it is hypothesized that this first home burned down, as evidenced by a pronounced ash, charcoal, and burned artifact layer discovered near the bottom of the cellar feature.

In the 1860 federal census, Louisa (though often referred to as Eliza) McWorter is listed on the agriculture schedule for Hadley County as farming 120 acres, with 410 unimproved acres. She owned machinery, horses, mules and swine, and her farm produced wheat, corn, oats, Irish potatoes, hay, and molasses (Martin 2010; United States Bureau of the Census 1860a, 1860b). Also in the 1860 census, Louisa McWorter and her household (including her sons, mother, and two of her brothers and their families) are listed as all living in Quincy, Illinois; no longer within New Philadelphia, though she and her family continued to farm the land surrounding the town.

The 1867 Hadley Township Tax Assessor's Book once again lists an improvement on Block 13 for approximately the same value as the previous house. If this indicates a new home built on the property, it would have been built between 1860 and 1867. In the 1870 federal census, Louisa and her household (her adult children Lucy and George, her brother Thomas Clark, her

[1] University of Illinois, Urbana-Champaign, University of Iowa, and University of Maryland.

mother Kezia Clark, and a foster son Willie Jones) moved back into New Philadelphia, presumably into the house on Block 13. Louisa is also again listed on the agricultural schedule as farming 96 acres and owning 24 unimproved acres. She also owned machinery, wagons, horses, milk cows, beef cattle, and swine. Her farm produced wheat, corn, oats, Irish potatoes, sweet potatoes, butter, and molasses (Martin 2010; United States Bureau of the Census 1870a, 1870b).

Once again listed in the 1880 Federal Census Agricultural Schedule, Louisa's farm then consisted of 120 tilled acres, one acre of meadow, and 40 acres of wood. She owned machinery, wagons, horses, mules, milk cows, cattle, sheep, swine, and poultry. She paid out $200 in wages for farm labor, possibly to hired hands or to her adult children. Her farm produced hay, butter, wool, eggs, wheat, corn, oats, apples, and timber Not greatly changed from the previous census, Louisa's household consisted of herself, her children Lucy and George, her mother Kezia Clark, and her foster son Charles W. (Willie) Jones (Martin 2010; United States Bureau of the Census (USBC) 1880).

Louisa Clark McWorter was listed as the head of her household on the state and federal census records from her husband's death in 1855 until her own death on February 18, 1883 at her home in New Philadelphia. At her death, Louisa McWorter owned approximately 120 acres of farmland outside of New Philadelphia and roughly six entire blocks within the town boundary. After her death, her daughter Lucy J. McKinney purchased Block 13 (including the house) from the estate. The property remained within the McWorter family through the 1920s, though it changed hands several times. Virgil Burdick owned the land which was Block 13 by 1930 and was renting the house and outbuildings. According to Larry Burdick's late twentieth–century written account of the town, he described the house having a full basement, and a large single story structure on the rear of the house that served as the kitchen. A barn and a well also existed on the property. The house itself burned on December 7, 1937, and was never rebuilt (Burdick n.d.; *Barry Adage* 8 December 1937). It is important to note that throughout the occupancy of New Philadelphia, the house on Block 13 was always the highest-valued residence on the tax rolls within New Philadelphia, which likely means it was the largest house in the town (Martin 2010).

Archaeology on Block 13

Lot 3

Archaeological investigation began when the excavation team inserted one-inch soil core test probes into the space occupied by geophysical Anomaly A25. The team established a grid at one-foot intervals that extended beyond the anomaly's borders to detect buried features or soil color changes. Anomaly A25 displayed varied soil colors, the space within A25 is 7.5 YR 3/2 (dark brown) mottled with 7.5 YR 4/6 (strong brown). Stone was encountered within the space of A25, making complete core sections unobtainable. Due to these factors the archaeologists decided to insert excavation units to further test A25. The team inserted eight excavation units (EU11-18) and subsequently discovered Feature 40 (Figure 8.1).

The plow zone for EUs 11-18 was 7.5 YR 3/2 dark brown in color and yielded large numbers of historical artifacts such as glass and ceramics. At approximately 768.954 above mean sea level (amsl) or 1.1 ft. below surface level (bsl), Feature 40 became visible. Feature 40 was circular in shape and displayed 7.5 YR 3/2 dark brown and 7.5 YR 4/4 brown clay loam mottling. After determining the extent of Feature 40 archaeologists chose to section the feature and continued excavations in the eastern portion. The team decided to use the baulk separating Excavation Units 11, 12, 16 and 17 from Units 13, 14, 15, and 18 to provide a natural boundary for the feature bisect (Figure 8.2). The baulk later provided an ample resource in determining the feature profile.

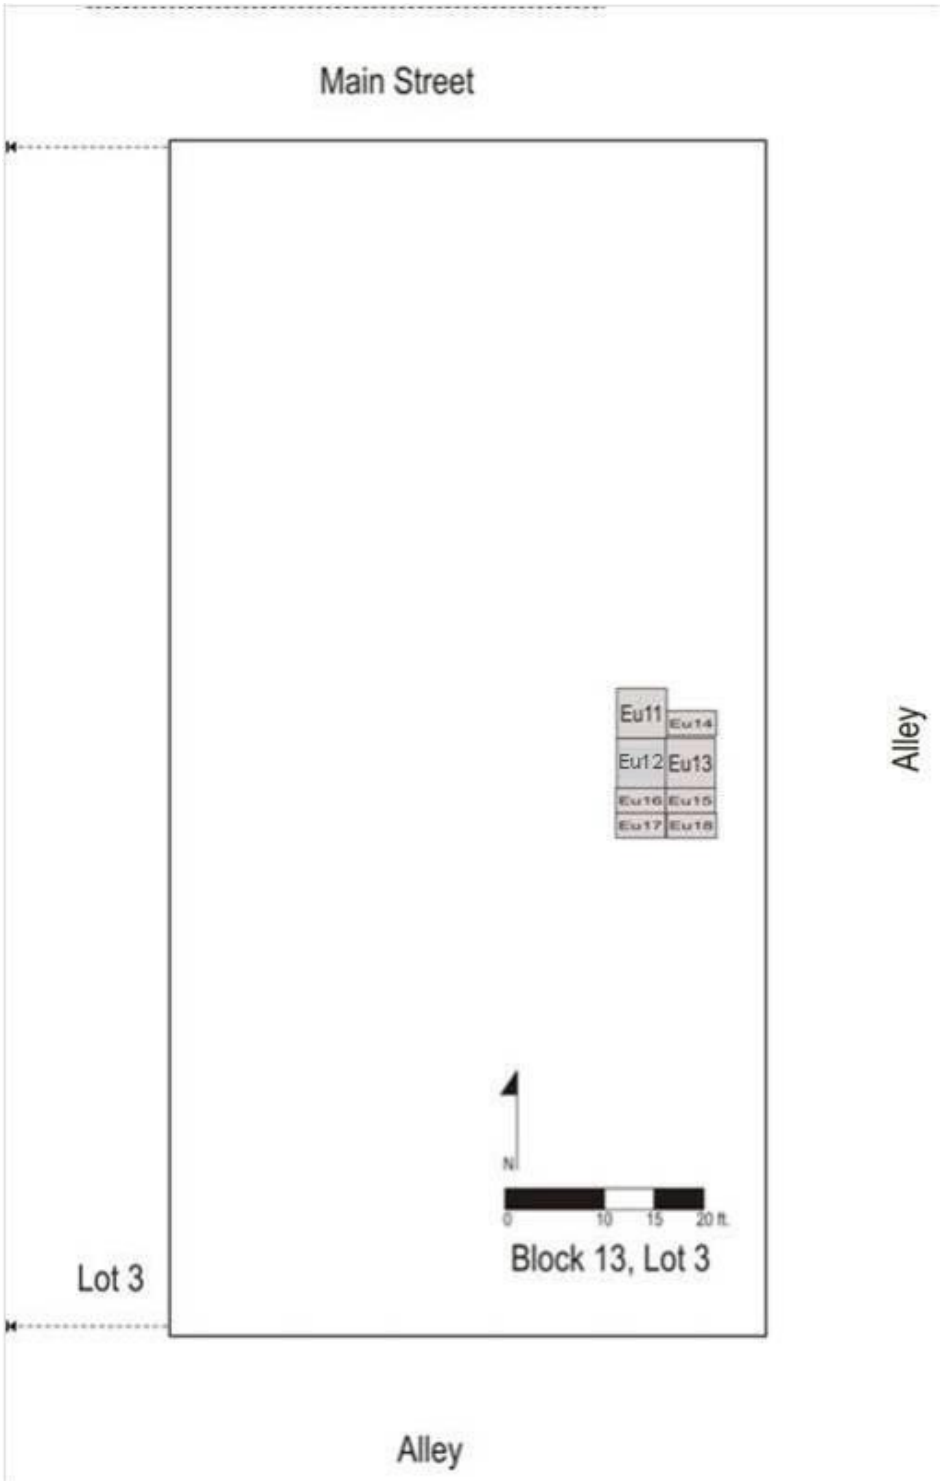

Figure 8.1. *Excavation units in Block 13, Lot 3, in 2010 field season (Illustration by George Calfas).*

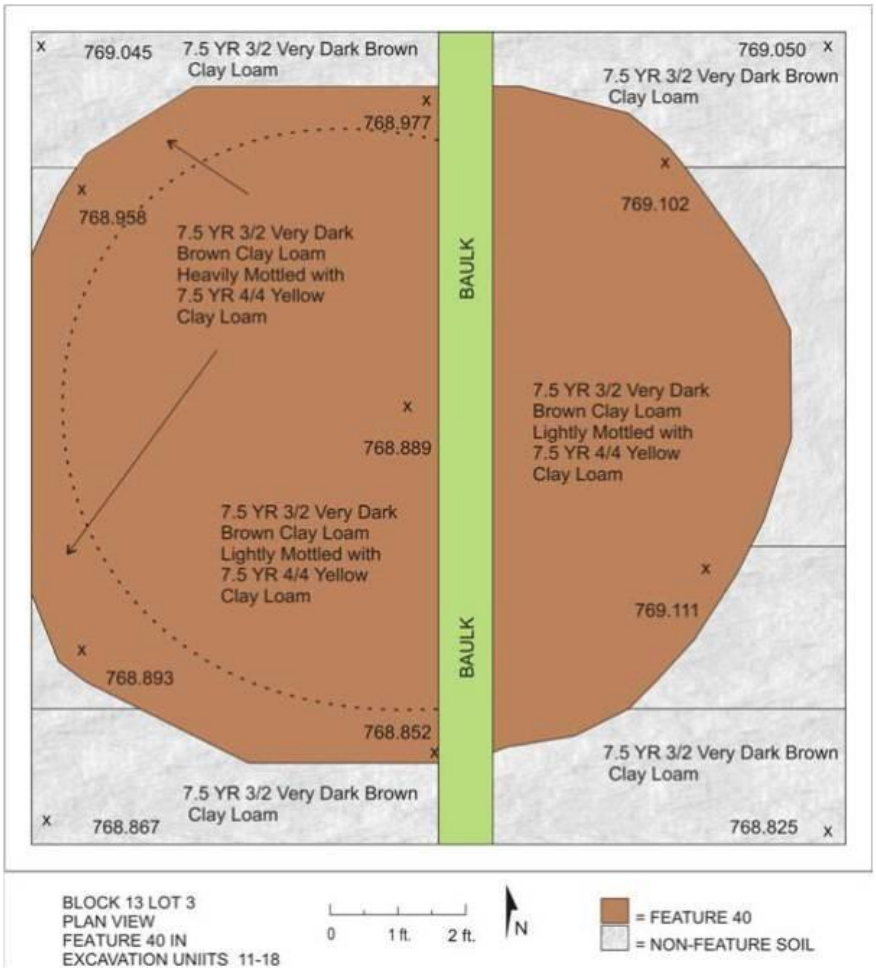

Figure 8.2. *Plan view of Feature 40 (Illustration by George Calfas).*

Excavations continued to an approximate depth of 4.0 ft. bsl. The excavation team interpreted Feature 40 as a well due to the shape and the materials discovered during field work (Figure 8.3). There were approximately 275 artifacts found within Feature 40, with date ranges falling within the latter-half of the nineteenth century through the early twentieth century.

Figure 8.3. *Profile view of Feature 40 (Photograph courtesy of NPAP).*

The majority of the stones have flat finished surfaces that would have been ideal for foundations or wall construction (see Figure 8.4). The stones likely originated from the nearby cellar foundation (Figures 8.3 and 8.4). Archaeologists were unable to reach the bottom of Feature 40

Figure 8.4. *Feature 40 photograph illustrating stones from within feature (Photograph courtesy of NPAP).*

to confirm that it was in fact a well; however, the soils did become moist at the lower depths due to the increasing proximity of the water table. The Burdick memory map displays a well in the general location of Feature 40.

General and architectural metal hardware and ceramic vessels made up a large portion of the artifacts, with glass vessel sherds having a relatively low count. Several portions of smoking pipes were found, as well as a portion of a doorknob (dating to 1878 or later) and a portion of a glass food canning jar finish (wax ring seal finish) dating from 1850-1890.

One of the more interesting artifacts discovered in the plow zone over Feature 40 was the uniform button of an Enlisted Civil War soldier (Figure 8.5). During the 2005 field season excavators discovered a similar button once belonging to a Civil War Officer's uniform approximately 25 ft. away. The discovery of these buttons helps explain that some of the New Philadelphia townspeople were involved in the fight for freedom. Documentary research shows that these buttons could have belonged to one of two men, Thomas Clark or Squire McWorter. Both Squire and Thomas served in the U.S. Colored Infantry and both had ties to Block 13.

Figure 8.5. *Photograph of button from Civil War uniform recovered from Feature 40 (Photograph courtesy of NPAP).*

Lot 4

2010 Excavation

Excavation of Block 13, Lot 4 continued research begun during the 2005 field season (see Shackel 2006). During the 2005 field work, excavation teams discovered a portion of the house foundation which once belonged to Louisa McWorter, indicated by the before mentioned deed records. In 2010 archaeologists set out to expose the entire foundation in order to learn the full dimensions of the 1870s home. The excavation team first removed the back fill from the six excavation units (EU 1-6) in order to pick up where the previous team had left off (Figure 8.6). Removing the back fill would provide a clearer picture of the foundation construction by season's end. After cleaning the wall and floor of the units the team inserted additional units to discover the eastern portion of the foundation. Geophysics aided the team in 2005 and based on the dimensions of Anomaly A12, it seemed that the foundation extended beyond the area excavated in 2005 by only a few feet.

Excavation Unit 7, a 5x5 ft. unit, was inserted adjacent to and east of EU 4. At approximately 2.5 ft. bsl the team discovered the northeast corner of the foundation. EU 8 and 9 were inserted along what was assumed to be the southern portion of the east-west running foundation wall. The team was able to discover the builder's trench which was 10YR 5/4 yellowish brown clay while the remaining soil in the southeastern corner of the foundation was 10YR 3/2 very dark grayish brown sandy loam. In the southern corner the excavation team discovered an 1862 penny between foundation stones (Figure 8.7).

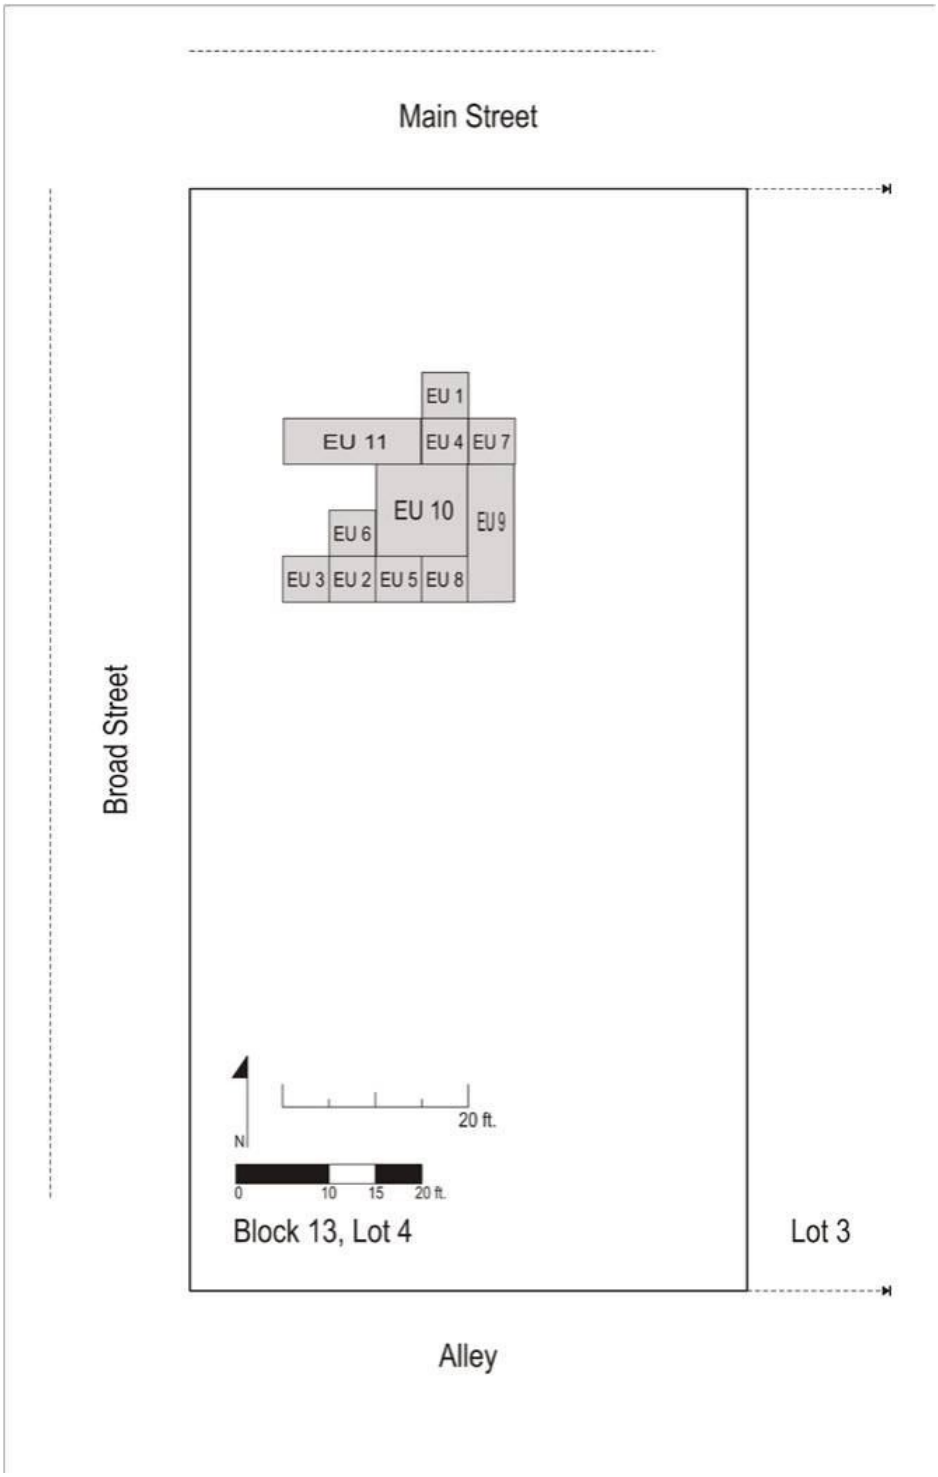

Figure 8.6. *Excavation units in Block 13, Lot 4, in 2010 field season (Illustration by George Calfas).*

Figure 8.7. *Penny embedded with foundation stone remains (Photograph by Anna Agbe-Davies).*

With the northern and southeastern corners located, the team inserted a 5x15 foot excavation unit (EU 9) to uncover the entire eastern wall. After the removal of the plow zone the team encountered large amounts of ceramics, glass, brick, and mortar (Figure 8.8). The material in this area was burned. The bricks appear to have fallen from south to north and in one singular event.

Research continued toward the center of the house foundation in order to uncover and determine the depth of the cellar. EU 10, a 10x10 ft. unit, was placed adjacent to and west of EU 9. The eastern portion of EU 10 continued to display evidence of burning and high artifact densities. The western portion of EU 10 contained fewer artifacts and following the ash and charcoal layer was much more difficult. Although the items in the cellar probably represent secondary fill, rather than a primary deposit, it is possible that the eastern portion of the house was an area of high activity. Due to the large quantity of burned brick, this may have been the location where the fireplace had been situated or may represent part of the burned remains of the house.

Excavation Unit 11 was inserted adjacent to EU 4 in order to determine the location of the northern foundation wall and the overall length of the house. Excavation Unit 11 was a 5x15 ft. unit which later had to be shortened due to time constraints. The team was able to discover a builder's trench along the western wall and the foundation's northwestern corner at approximately 767.260 amsl or 2.5 ft bsl. Soil in the northern section was mostly 10 YR 3/2 dark brown and displayed only slight variation in color.

Figure 8.8. *Remains located beneath plow-zone in EU 9 (Photograph courtesy of NPAP).*

After the discovery of the three foundation corners it was determined that Louisa McWorter's home was approximately 20 ft. long east to west and 15 ft. long north to south. The southern foundation stones were approximately 1.25 ft. bsl whereas the northern foundation stones were nearly 2.5 ft. bsl. Coupled with the excavations in Block 13, Lot 3 it is feasible that foundation stones from the house were also used to fill the well or another nearby feature. Artifacts from the house were much like others throughout the site, but of interest was the amount of stoneware. The Louisa McWorter home has a 50-50% split between stoneware and white ware vessels and a

low density of glass products. Other house sites excavated in previous field seasons displayed large amounts of white ware and glass with less than 10% stoneware.

2011 Excavation

The 2011 excavations laid in an excavation trench, 5 ft. wide x 35 ft. long, which bisected the cellar feature (Feature 12), but actually excavated slightly less than half of the cellar fill. Excavating half or less of a feature was done in accordance with National Park Service regulations, a process which has been followed throughout all excavations at the site. The southern edge of the trench was placed approximately two feet north of the southern wall of the cellar, which brought the northern wall of the trench to the approximate middle line of the feature. The trench was placed in such a manner as to investigate the stratigraphy of the cellar in profile on both sides of the trench, as it provides more information about occupation layers in the cellar fill, rather than exposing the remains of the southern foundation wall, constructed of dry-stack fieldstones.

Within the trench, five of the seven total units were within the feature (6, 13, 14, 15, and 16), while two units were placed outside the limits of the feature (12 and 17) for a control view of the surrounding sterile soil and in the hopes of seeing a more definite eastern and western edge of the cellar. The excavation team first removed the backfill from the previously dug units (6, 14 and 15 which were the southern half of Unit 10 in 2010, and 16, which was the middle 5x5 of Unit 9 in 2010) in order to pick up where the previous team had left off (Figure 8.9). After cleaning the wall and floor of these units, the team began excavating in them in earnest as well as in the adjacent new units.

Aside from varying densities of artifacts, there were few changes in the soil stratigraphy throughout the depth of the trench. Culturally sterile soil was reached at an average of 4.5 ft. below surface level across the trench. At an average of four ft. below surface level, a layer of ash was discovered, containing bits of burned wood, large burned logs which appeared to have fallen in situ, and a multitude of burned and melted artifacts just above the ash layer (Figure 8.10). This combination of remains is interpreted as the answer for the house's initial "disappearance" on the tax rolls; it likely burned down, prompting the family to move to Quincy for a few years. They seem to have returned to New Philadelphia and rebuilt the house on the same foundation, as artifacts closer to the surface have date ranges putting them further forward in time. This re-built house is the one which burned down in the early 1930's, once the house and land was no longer owned by the McWorter family (*Barry Adage* 8 December 1937).

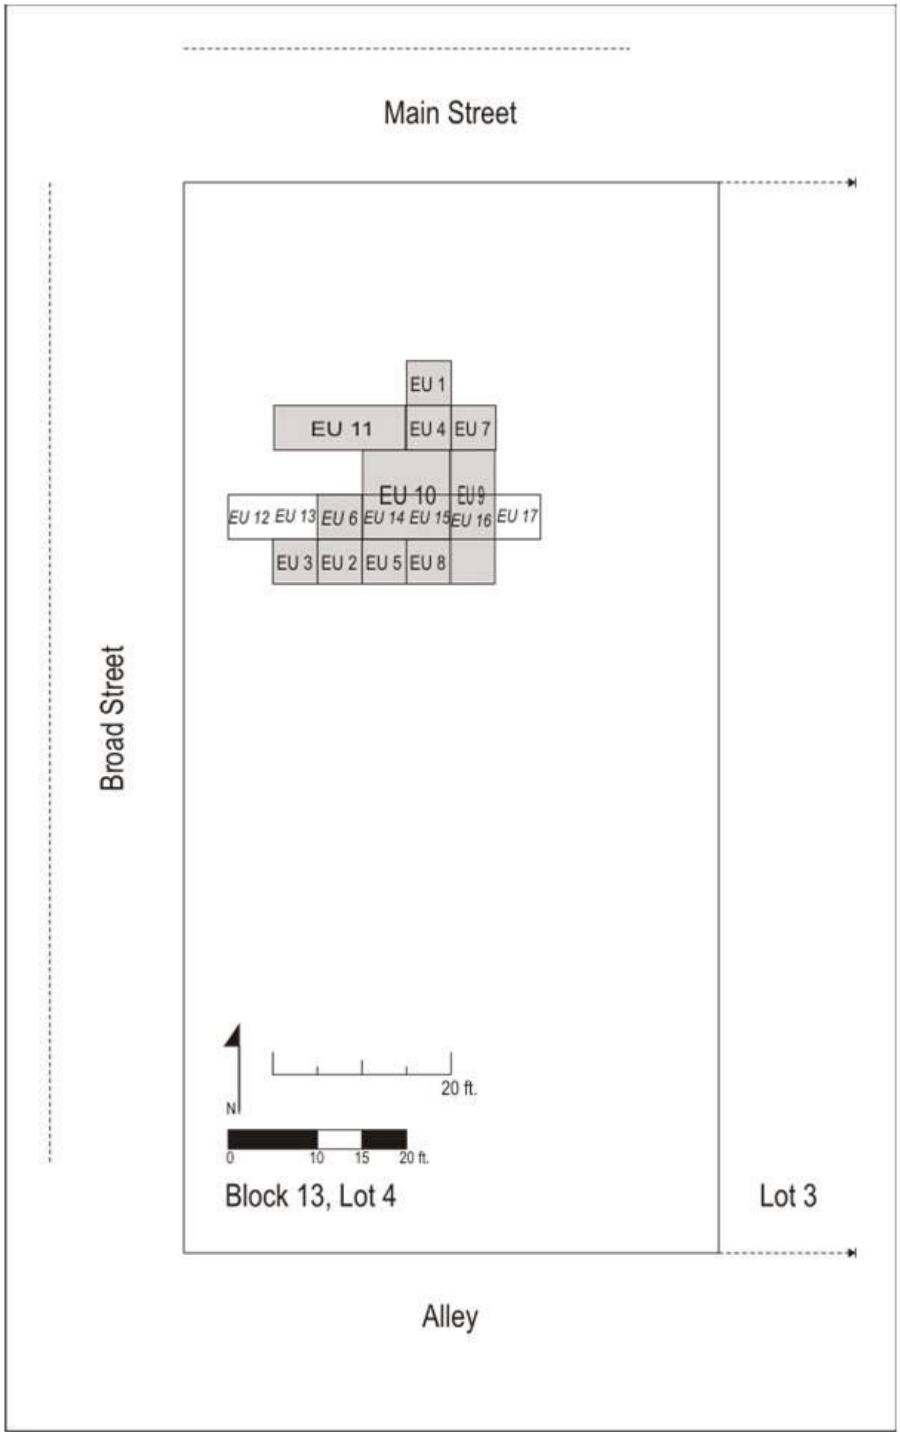

Figure 8.9. *Excavation units in Block 13, Lot 4. 2011 units (in italics) superimposed on 2010 units (Illustration by Kathryn Fay).*

Figure 8.10. *Ash layer near bottom of Feature 12 (Photograph courtesy NPAP).*

Beginning at the bottom of the previous seasons' excavation, the three center units of the trench displayed an average one-foot thick concentration of artifacts. The range of dates from these and the artifacts from the other units within the trench fall within the latter-half of the nineteenth century, approximately 1850 until 1900. This relative date range puts the excavated artifacts within the period of McWorter family's occupation of the house site.

The eastern and western ends of the feature showed evidence of a partially collapsed cellar wall/house foundation made of dry stacked fieldstones. There were portions of bricks and mortar in the feature fill, and though there were not enough to argue for a brick foundation, it is likely that the fireplace/chimney stack was constructed of brick. The eastern and western boundaries, having been further explored this season, align with the general dimensions of the cellar uncovered in the previous excavation season; that of a roughly 20-foot square cellar. This size cellar, along with the overall depth of the feature, argues that the Louisa McWorter home had a full basement, not just a shallow storage cellar. This matches oral history reports of the home in the 1930s, which stated the home had a full basement. There may have been an exterior access door to the basement, remnants of which may have been discovered in the 2010 season. There was also a post mold discovered in the southeast corner of Unit 17, the easternmost unit of the trench (Figure 8.11). It was roughly six ft. from the edge of the feature, and may be the remains of a lean-to kitchen, which was mentioned in the oral historical accounts of the property in the 1930s.

Figure 8.11. *Post mold in Unit 17 of Feature 12 (Photograph courtesy of NPAP).*

Several noticeable trends were evident in the artifact analysis of Feature 12, especially when the assemblage was compared to those of other house sites within New Philadelphia. In terms of relative percentages, Feature 12 yielded more stoneware than other features, perhaps suggesting that Louisa and her family were storing or cooking more food than others in town, due either to the larger number of people living in the house, or perhaps this was done as an extra income source or as work for others in town. There also seemed to be a much lower percentage of alcohol bottles than have been found in previous features, which could be the result of any number of personal choices made by the family. The large majority of identifiable bottles are from varieties of medicines or household use liquids such as machine oil. There also were a large number of clothing-related artifacts, such as buttons, pins, hook and eyes, buckles, and clips. As stated above, all datable artifacts could fall within a date range of the occupation of the home site by the McWorter family.

Flotation

Flotation of soil/sediment/cultural fill samples is a method commonly used in geoarchaeological investigations. Its purpose is to separate small floral and faunal materials from the surrounding material. In historical sites these remains can be used to interpret food procurement sources as well as consumption patterns.

Sixteen flotation samples were collected from Feature 12—the cellar in Block 13, Lot 4—and transported to the Illinois State Museum for flotation. Marjorie Schroeder demonstrated the procedure for water flotation to one of the 2011 NSF-REU student teams and I facilitated training the other two teams of students.

The water flotation procedure begins by measuring the volume of the fill sample and recording it on identification tags. Then a drum with a mesh screen at the base is nested into a larger drum that is filled with water. The sample is added to the nested drum and water is continuously pumped into the larger drum, agitating the sample. The water transports sample contents that are lighter than the specific gravity of water, which is 1, over a spout and into a fine mesh bag. Contents of the fill sample that do not float and are larger than the mesh at the base of the nested drum (heavy fraction) are rinsed until the water is clear of sediment and all floating material is removed. The float sample bag is hung to dry and the "heavy" fraction is dumped on newspaper and set aside to dry with their respective labels.

The "heavy" fraction may contain cultural artifacts and additional biological remains which can be separated by flotation in a "heavy" liquid. Zinc chloride (ZnCl), a standard heavy liquid, has a relative gravity of 1.62. Therefore, floral material heavier than water (e.g. seeds and some charcoal), but lighter than ZnCl floats and is skimmed off the top. Hillary Christopher, one of the 2011 NSF-REU students, worked with Schroeder to learn the heavy liquid flotation procedure and floral identification steps.

After ZnCl flotation, each fraction is rinsed several times with water to remove the toxic ZnCl and spread on newspaper to dry. Cultural artifacts are hand-picked from the heavy fraction and later catalogued. Each of these portions is weighed to calculate its respective percentage of the total sample. The ZnCl light fraction is added to the light fraction from water flotation for floral analysis and weighed to calculate its percentage of the total sample. Christopher documented the procedure, processed seven heavy fractions by ZnCl flotation, and identified the floral remains of one sample for her field school project. The remaining samples are accessioned at the Illinois State Museum for future analysis.

The first step of floral analysis is to separate the light fraction into three size classes: <0.5mm; 0.5 – 2 mm; and, >2 mm. Each fraction is weighed to determine its respective percentage. The <0.5 mm fraction is generally regarded as too small to have any diagnostic value. Analyzing every fragment in the 0.5 – 2mm fraction is time intensive; therefore, the standard method is to use a mechanical splitter to divide the sample. One portion is sampled for quantification and analysis of the charcoal and a quick scan is performed on the other portion to identify any unique particles not found in the sampled portion. The >2mm fraction is sorted, isolating bone fragments and charcoal from other plant remains. The bone fragments are labeled and bagged for zoological analysis. The >2mm fraction of charcoal provides the best opportunity for identification to the genus, so it is sorted between wood and non-wood. Then each piece is classified and placed in a labeled glass vial. Christopher (July, 2011) summarized her findings for one of the samples:

> Within the >2mm portion, evidence of hazelnut, hickory, butternut, black walnut, corn kernels, corn cupules, and a grape seed. The 0.5 – 2 mm [portion] contained

poace (grass), purslane, and copperleaf. The wood was identified as bark, hickory, red oak, white oak, and unidentified oak.

Chapter 9: King Street, North of Block 8

Anna S. Agbe-Davies[1]

The platted streets and alleys of New Philadelphia were first explored archaeologically in 2008. As designed, the town had five east-west and five north-south streets, as well as nine marked alleys that quartered the large blocks and halved the smaller ones on the western edge of town (Figure 9.1). However, it is clear that not all of the streets and alleys persisted an equally long time. A 1926 topographic map of Illinois shows a view of the New Philadelphia town site which suggests that even a major street like King Street no longer served as a thoroughfare by that time (Figure 9.2). Nevertheless, a 1939 high-altitude aerial photograph shows what appears to be a secondary gravel roadway in the location of the former King Street (Figure 9.3). Archaeologists discovered during the 2008 field season that the repeated use of this portion of the town site as a road is reflected in the archaeological record.

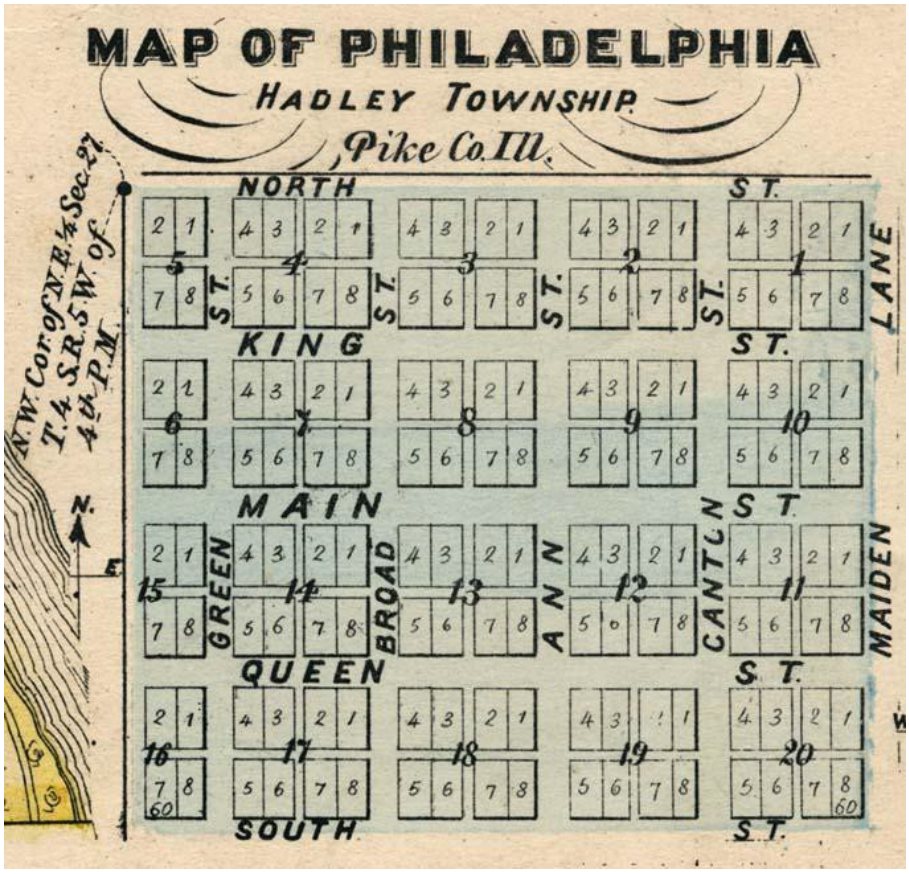

Figure 9.1. *Excerpt from Atlas Map of Pike County, showing platted streets and alleys of New Philadelphia (Ensign 1872).*

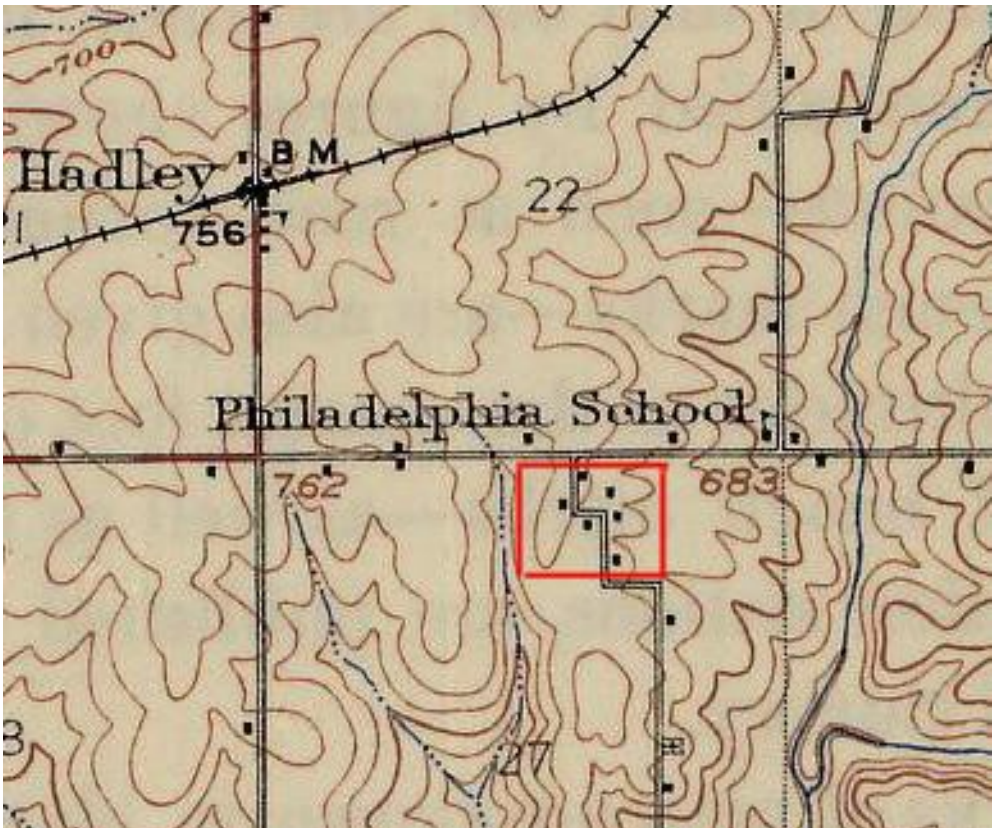

Figure 9.2. *Excerpt of 1926 Topographic Map, Pittsfield region, showing area of New Philadelphia town site with gravel roads traversing platted space of portions of Broad Way, Main Street, Ann Street, and South Street, but not King Street (U.S. Geological Survey; University of Illinois Historical Map Collections).*

Comparative Survey Findings

A walk-over survey conducted in 2002 and 2003 identified a major concentration of surface finds with its center at the intersection of Broad Way and King Street (Gwaltney 2004) (Figure 9.4). In 2004 and 2005, geophysical surveys over the same area identified several interesting anomalies in the center of what was formerly King Street (Figure 9.5). Resistance anomalies A8 and A9 were interpreted as possible tracks of the old road or potholes filled with gravel or looser soil. Anomaly A36, also identified using electrical resistivity, was thought to be either a discrete feature, or a localized component of an overall high resistance feature running east-west along King Street (Figure 9.5). Anomalies A8 and A9 were of particular interest, as they corresponded with magnetic anomalies as well. The combination of resistance and magnetic anomalies had successfully identified features at New Philadelphia in years past; therefore the area was selected for further testing.

Interestingly, a low-altitude aerial survey conducted in May, 2008, using a high-resolution thermal infra-red (TIR) camera did not detect any significant anomalies corresponding with this

area of King Street (see Chapter 6, “Block 8, Lots 1-2,”of this report). This area was selected for testing through soil core sampling and excavation in 2008 to investigate the sources of these

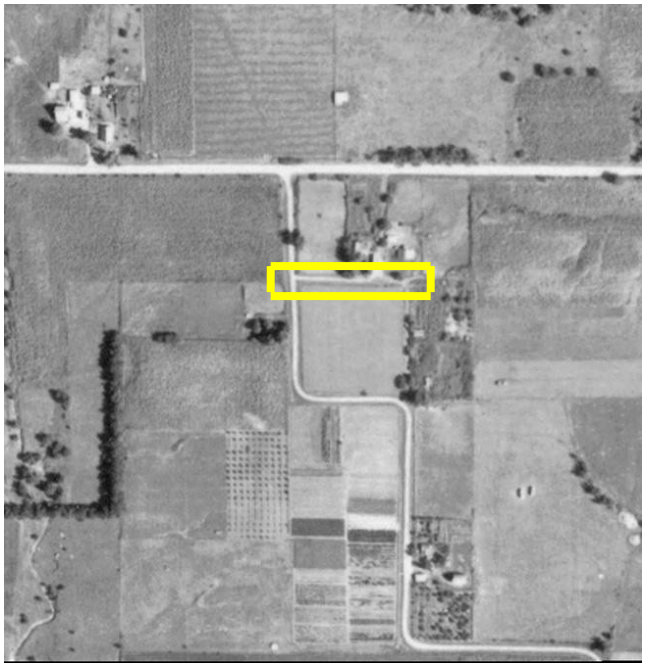

Figure 9.3. *1939 aerial photograph of New Philadelphia town site, showing gravel roads traversing platted space of portions of Broad Way, Main Street, Ann Street, South Street, and King Street (with the latter outlined by a rectangle) (Photograph from U.S.D.A. Aerial Photographs Collection; overlay by Christopher Fennell).*

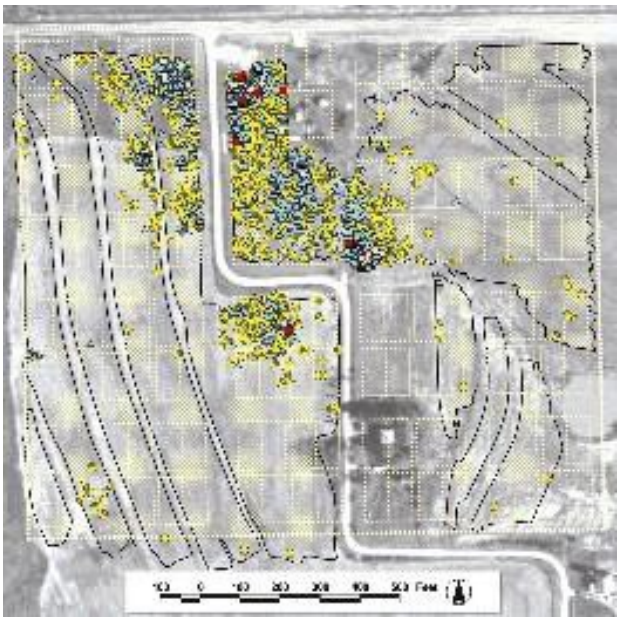

Figure 9.4. *Distribution of historic-period domestic artifacts in 2002-2003 walk-over survey (Image from Gwaltney 2004).*

ground-based geophysical anomalies and potential reasons for the absence of corresponding anomalies in the aerial TIR survey.

The location of anomalies A8 and A9 was covered with a single transect of 21 core samples (labeled Transect T6). A single transect of nine core samples (labeled Transect T2) was laid out through the area of anomaly A36. All soil cores samples were obtained using a one-inch diameter soil core probe (Figure 9.6).

Transect T6 consisted of a single line of core samples one ft. apart running east from T6-1 (30 ft. north of the northeast corner of Block 8, Lot 3). This transect picked up one ft. east of the east end of Transect T2, which is discussed in greater detail below. It was placed to ground-truth anomalies A8 and A9 (Figures 9.5 and 9.6). Below the sod, the core samples revealed 7.5YR 3/1 (dark gray) to 10YR 4/2-3/3 (dark grayish brown-dark brown) loam that reached a depth of about 1.2 ft. below the surface in cores T6-1 through T6-4. Below that the soil is a 10YR 5/4 silty clay. In the remaining samples, occlusions were encountered at 0.7-0.9 ft. below the ground surface. In many cases, fragments of jasper and chert were observed in the soil column or at the end of the probe. These fragments were interpreted as coming from a deliberately deposited gravel surface, and were consistent with the sample of pebbles collected from Feature 30 in Excavation Unit 1, discussed below. Minute artifact fragments (brick, charcoal, and rust flecks) were identified in samples T6-16 through T6-19 and T6-21. No further excavation was undertaken in this area.

Transect T2-1 through T2-9 ran east-west covering an extent of 110 feet. The series began 150 ft. north and 10 ft. east of the southwest corner of Block 8, Lot 4. The western end was placed to ground-truth anomaly A36.

In the core samples, the transition from 7.5YR 2.5/2 clay and silt loams to more clayey 7.5YR 6/6-5/8 soils occurred at approximately 1.4 ft. below the ground surface. Sample T2-2 reached 1.9 ft. below the surface at which depth sandier clay, also 7.5YR 6/6 was discovered. Exceptions to the norm were found in T2-3 and T2-9 in which rock or some other obstruction was encountered at 0.6 and 0.4 ft. below the surface. In the case of T2-6, sediments of 7.5YR 3/2 with pebble inclusions were encountered at a depth of 1.7 ft., deeper than any of the other probes. The pattern suggests features, likely part of a buried roadbed, at core sample points T2-3, T2-6 and T2-9.

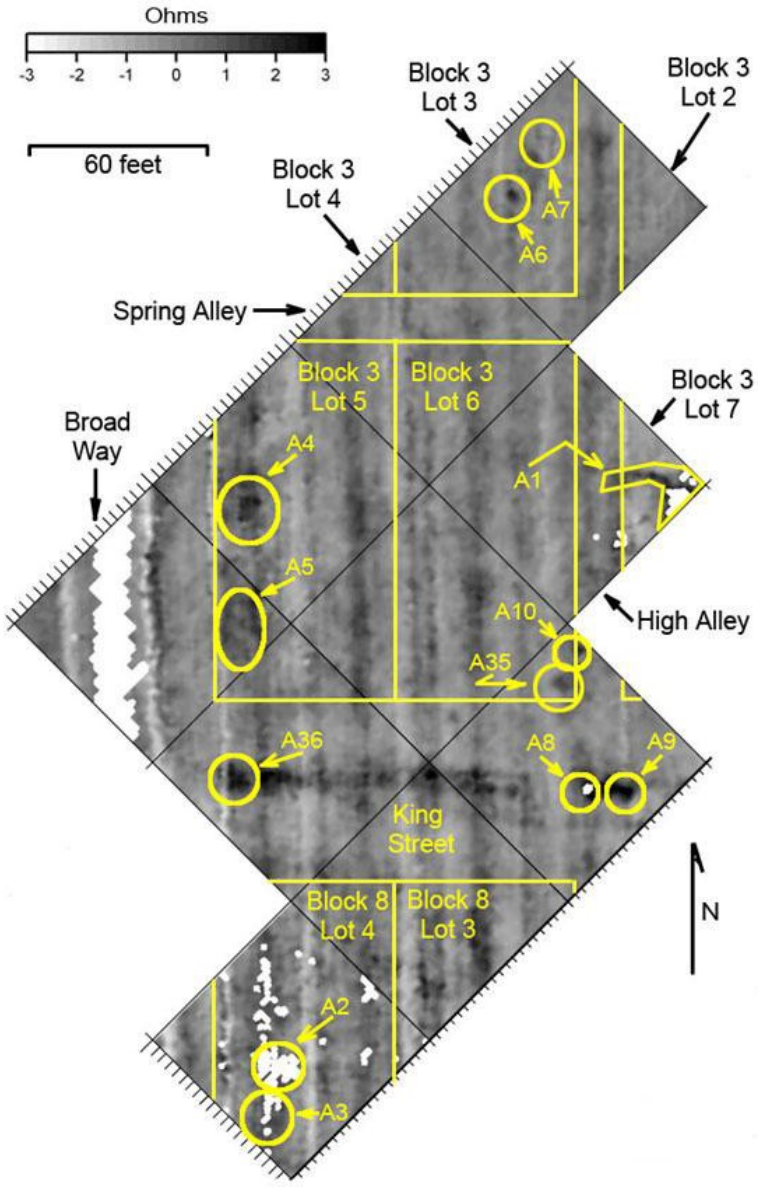

Figure 9.5. *Electric resistivity survey map showing alignment of anomalies A8, A9, and A36 along platted space of King Street north of Block 8 (Geophysical data map by Michael Hargrave; overlay by Christopher Fennell).*

Excavation Results

King Street Excavation Unit 1 was placed with its northeast corner 10 ft. north of T2-1 (Figures 9.7 and 9.8). Its purpose was to further explore the phenomenon indicated by anomaly A36 and probed using soil core samples along transect T2. It was the only unit excavated in King Street during the 2008 season. Within this unit, excavators uncovered Features 30, 32 and 32b (Figure 9.9). All of these features extend further than the perimeter of the unit, and were interpreted as remnants of historic roads. Therefore the archaeologists decided not to expand the excavation area further in an attempt to delineate their total extent. The plow zone was removed in two arbitrary levels of 0.5 ft. (A1) and 0.3 ft. (A2), level A2 being truncated by the appearance of a soil color change at the top of Level B1/Feature 30.

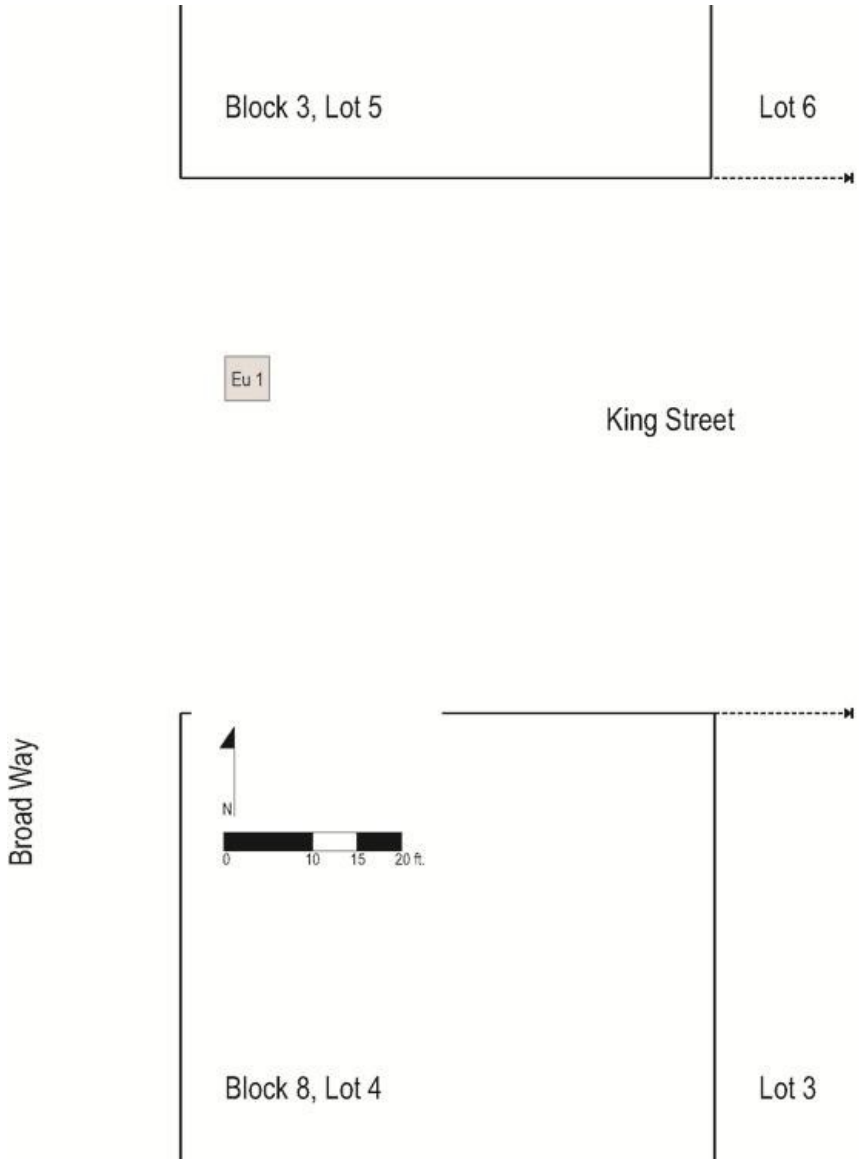

Figure 9.7. *Map of platted space of King Street near intersection with Broad Way and location of Excavation Unit 1 in King Street (Image by Anna Agbe-Davies).*

Feature 30

Feature 30 covered the 5 ft. x 5 ft. extent of Excavation Unit 1. It consisted of a 0.51 ft. thick layer of 7.5 YR 4/4 and 4/3 (brown) silty loam with extensive gravel and pebble inclusions (Figure 9.9). The stones were slightly less prevalent in the southeast corner of the unit.

A representative sample of these pebbles and gravel fragments was collected from level B1, Feature 30. Christopher Wigda, Assistant Curator of Geology at the Illinois State Museum, examined this sample and identified the elements as including:

- naturally occurring pebbles of chert and jasper that were well-rounded and worn by movement in waterways, such as a river or stream, with sample specimens measuring approximately 0.125 x 0.104 x 0.104 ft., 0.073 x 0.040 x 0.073 ft., and 0.125 x 0.089 x 0.104 ft.;
- naturally occurring fragments of sandstone, with a sample specimen measuring approximately 0.188 x 0.146 x 0.073 ft.;
- chert fragments with angular and irregular fractured surfaces likely caused by the material having been quarried or fragmented by cultural activity, with sample specimens measuring approximately 0.156 x 0.083 x 0.063 ft. and 0.146 x 0.104 x 0.052 ft.; and
- limestone fragments, also with angular and irregular fractured surfaces likely caused by the material having been quarried or fragmented by cultural activity, with sample specimens measuring approximately 0.170 x. 0.140 x 0.073 ft. (Wigda, pers. comm. 2008).

Other artifacts recovered from Feature 30 included ceramic, glass, iron, and plastic fragments dating from the late 1800s through the early 1900s.

Figure 9.8. *Anna Agbe-Davies excavates Unit 1 in the space of King Street (Photograph by Doug Carr, Illinois State Museum).*

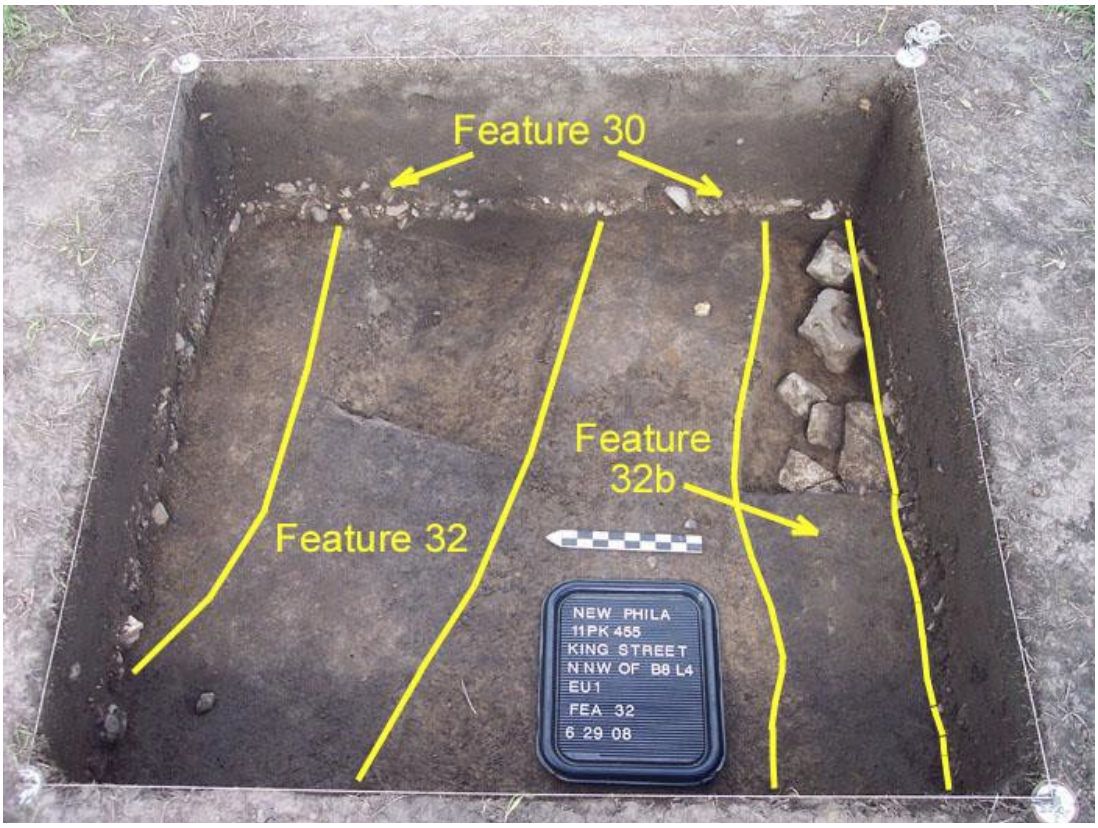

Figure 9.9. *Excavation Unit 1 in King Street, with profile and plan views of features outlined (Photograph by Anna Agbe-Davies; overlay by Christopher Fennell).*

This lens of buried gravel and pebbles appears to lie approximately 1.2 ft. below the ground surface and further extends approximately 0.50 ft. in depth throughout the extent of this linear series of anomalies running along this extent of the platted space of King street. This configuration was detected quite clearly in ground-based, electric resistivity surveys of the area (Figure 9.5). Yet, it was not detected by a low-altitude aerial survey conducted in May, 2008, that utilized high resolution thermal infra-red (TIR) imaging (see Chapter 6, "Block 8, Lots 1-2"of this report). It appears that such low-altitude TIR surveys can serve well to detect concentrated foundation remains, but cannot detect a more subtle feature like this buried roadbed consisting of gravel and pebbles.

Archaeologists have tentatively identified Feature 30 as a portion of the historic roadway that was still visible in the 1939 aerial photograph, which extended from Broad Way along King Street to the corner with Ann Street, where it terminated at a cluster of twentieth-century buildings, a distance of approximately 255 ft. (Figure 9.3). We interpret this linear, buried lens of gravel and small pebbles as the source of anomalies A36, A8, and A9.

Under Feature 30, excavators encountered a thin (0.1 ft.) layer of 7.5YR 4/4 and 4/3 (brown) silty clay loam. Level B2 is distinguished from the overlying Feature 30 primarily by the lack of pebble and gravel inclusions. Immediately under B2, archaeologists discovered two additional

features, initially identified as possible plow scars or wheel ruts (Figure 9.9). The visible portions of both Feature 32 and 32b were cross-sectioned in order to see the basin in profile and obtain information about their formation, while leaving a portion of each still intact (Figure 9.9).

Feature 32

Feature 32 is 2.4 ft. at its maximum extent (N-S) and spans the full 5 ft. (E-W) extent of the excavation unit. It is not possible to determine the feature's fullest extent without excavation of additional units. Feature 32 is a 10YR 3/2 (very dark grayish brown) sandy loam interleaved in extremely thin lenses with 7.5YR 5/6 (strong brown) clay. The entire feature contains flecks of mortar, brick and charcoal. The strong brown clay closely resembles the subsoil into which the feature cuts. One possible interpretation is that the lenses within Feature 32 were formed by multiple episodes of water erosion and soil weathering.

Upon excavating Feature 32, archaeologists uncovered a rounded V-shaped basin (Figure 9.9). The depth is 0.37 ft. at the eastern edge of the excavation unit, but only 0.28 ft. at the section line. Its width at the section line is 1.6 ft, flaring and curving slightly to the west (the area which was left intact).

Feature 32 is interpreted as a possible wheel rut subsequently filled in by eroding sediments, or deliberately filled in by human agents. The feature extends from the northwest corner of the unit east-southeasterly a distance of 5.2 ft. This shape corresponds nicely with the arc of a wheel turning north from historic King Street onto Broad Way. Artifacts in Feature 32 included a few fragments of refined, late nineteenth-century ceramics and a flattened fragment of lead, along with nails and nail fragments, dating to the mid- and late-1800s. Features 32 and 32b very likely represent the remains of a roadbed along the space of King Street that predated the gravel-lined roadbed of which the overlying Feature 30 was a sample.

Feature 32b

Feature 32b is less clearly exposed by the excavation of Unit 1. It extends east- west across the southern edge of the unit (Figure 9.9). The maximum visible dimensions are 5 ft. (E-W) x 1.3 ft. (N-S). Feature 32b appears to be an east-west linear feature not unlike Feature 32, but after additional cleaning may have developed a curve to the south in the southwest corner of the unit, indicating that excavators had uncovered the northern sliver of a circular feature extending further to the south. The fill in Feature 32b is composed of 7.5 YR 3/1 (very dark gray) sandy clay loam with charcoal and brick flecks. A number of large cobbles are included in the fill (0.5-0.7 ft.). Some of these stones are visible from the surface of the feature, and most extend to the bottom of its basin.

After being cross-sectioned, the feature appeared to have a shallow U-shaped basin (Figure 9.9). The maximum depth is 0.4 ft. at the section line and approximately 0.2 ft. (obscured by a cobble) at the eastern edge of the unit. Artifacts consisted almost entirely of slag, a sample of which the archaeologists retained.

Given Feature 32b's proximity to Feature 32, and the strikingly different artifact content, it could be a wheel rut filled in at a different time (perhaps at an earlier time, when blacksmithing debris

was still available for road maintenance). Additional cleaning also revealed a possible revision of the feature's shape, curving inward to the south wall of the unit.

Based on the success of this application of multiple survey methods, we hope to employ similar techniques to explore the extent of the constructed road and alley infrastructure of the town site in future field seasons. Town plats like the one created by Frank McWorter in 1836 often depict an idealized vision of a specific community landscape that often results in only partial realization of the planned network of planned streets, alleys, and developed lots.

Chapter 10: New Philadelphia National Historic Landmark Designation

Charlotte King[1]

Introduction

More than one and a half million properties are listed in the National Register of Historic Places; all are worthy of preservation for the stories they tell of our country and its people. Less than 2,500 of these historical and archeological sites are designated National Historic Landmarks (NHL), recognition reserved for sites deemed *exceptional* illustrations of our nation's rich heritage (National Park Service 2011). New Philadelphia, Illinois, designated a National Historic Landmark in 2009, ranks among these elite cultural treasures. This chapter focuses on New Philadelphia's National Historic Landmark nomination and designation qualifications; the NHL nomination process; a brief discussion of national preservation; and the implications of NHL status for New Philadelphia.

Developed as a Master of Applied Anthropology (MAA) project under the direction of Paul Shackel of the University of Maryland, I referred to and incorporated into the nomination archaeology reports, the National Register of Historic Places nomination form, atlases, doctoral dissertations, personal conversations with land owners and local residents, consultations with archaeologists, primary and secondary sources relating to the significant archaeological and historical themes associated with New Philadelphia, scholarly journals, internet resources, and the advice and guidance of my MAA chairman and committee members.

Once completed, the NHL nomination form, images, maps and supporting documents were submitted to the MAA committee for review. Erika Martin Seibert of the National Park Service (NPS) National Register and National Historic Landmark programs and Barbara Little of the NPS Archeology program, mentors for and MAA project committee members, along with committee chairman Shackel, dedicated countless hours developing, reviewing, advising and editing the nomination form. Vergil Noble of the National Park Service (NPS) Midwest Regional Office contributed valuable insight and advice throughout the nomination process. The nomination was then submitted for peer review to Timothy Baumann and Margaret C. Wood.

Requests by the proponents of the nomination for letters supporting New Philadelphia's NHL designation were sent to area residents, McWorter family members, descendants of New Philadelphia residents, academics, New Philadelphia property owners, members of the archaeology team, New Philadelphia Association members, as well as local, state and national political officials. Fifty-four supporters, including then U.S. Senator Barack Obama, submitted letters advocating NHL status for New Philadelphia (see Figure 10.1).

[1] New Philadelphia Association.

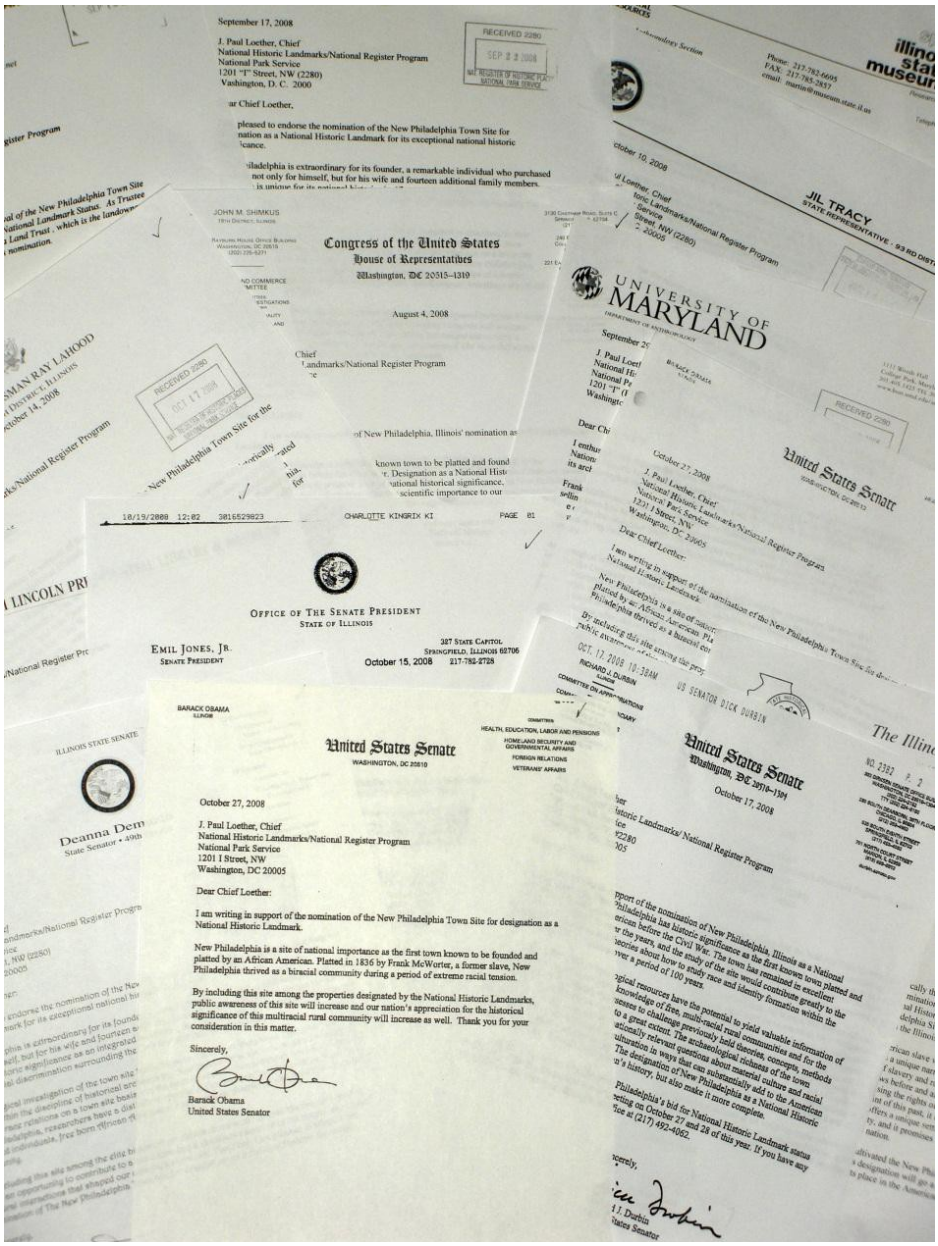

Figure 10.1. *Letters of support were submitted by proponents of NHL status for New Philadelphia, including future president Barack Obama (Image by Charlotte King).*

The NHL nomination form and supporting documentation were then presented to the NPS Landmarks Committee, a committee of the larger National Park System Advisory Board. At this meeting, held in Washington, D.C. in October 2008, the presentation to the committee focused on the extraordinary national importance of New Philadelphia. Shackel, Chris Fennell, and I fielded questions from the committee after Patricia McWorter, fifth-generation descendant of the town's founder, delivered an eloquent, moving statement on behalf of the McWorter family (McWorter 2008):

My name is Patricia McWorter, a Great Great Grand daughter of Frank and Lucy McWorter, and I rise to speak for and represent my family. We are so very pleased to be here helping the nation embrace its true self, something we have always known in our family, but now you will be enabling us to share and develop this story as part of the official history of the country. We thank you for this long overdue public recognition.

First and foremost I want to say that the importance of Frank and Lucy's accomplishments, specifically the founding and development of the abolitionist town of New Philadelphia, is about our family and all of the town's descendants, but it is also about Illinois and the entire United States. It's a message we can send to the world.

This story takes us back to the time of the birth of Frank and Lucy McWorter as slaves in the 18th century at the time of the founding of this country, (1771 and 1777). There have been some African Americans who have had their voices heard from the slave experience. Frederick Douglass, Harriet Tubman, Phyllis Wheatley, and Nat Turner, but there are so many, many more coming to the fore. The McWorter – New Philadelphia legacy is one of those voices.

Now, over 150 years since the death of Frank McWorter we stand here today reflecting on the meaning of his life and the town of New Philadelphia. Everyone is clear that the political struggle against slavery brings up the name of President Abraham Lincoln. Everyone is also clear that the moral and cultural struggle over slavery brings up the name of Mark Twain. Lincoln lived and worked in Springfield, and Mark Twain did the same across the river in Hannibal, Missouri. But where is the voice of the African American. We are fortunate to be able to call the name of Frank McWorter who gives us the chance to learn from the agency of an African American

Frank McWorter demonstrates the possibility of change based on what we can only call the birth of the American spirit for freedom. Born one year after the US won its national liberation from England, this slave worked under slavery, bought his pregnant wife first so that his fifth child would be born free, and in the end buying 16 family members including himself.

The town of New Philadelphia was an example of abolitionism at work, the sharing of a community by whites and Blacks, both as neighbors and as members of the same family. This was their lifestyle less than 20 miles from slavery. These were proud and noble people who were living up to the American dream in spite of what shape America was in at that time.

Our future is in the past. New Philadelphia is a key to the future of this country. The McWorters and the town of New Philadelphia were about freedom:

They assisted slaves running to freedom – "get to that New Philadelphia and one of those McWorter boys will give you a horse, a pair of shoes and guide you to Canada and freedom." – So goes our family oral history

Grandchildren fought in the Civil War as part of the Union Army, Infantry 38th Regiment, United States Colored Infantry (Squire McWorter, 1846 – 1915)

But most important of all is that they lived free in Illinois and are a beacon light for all to see that the American possibility is a great challenge for all of us to live up to. We are strengthened by the memory of New Philadelphia.

One can read the testimony in the Pike County History of 1880 to see that the story has always been part of the local Illinois history. Now is the time for this to officially become part of the national narrative, part of our collective story. Frank McWorter and New Philadelphia are about what a Black man accomplished, what an abolitionist town accomplished, and what hard work and sacrifice for family, for freedom for all, can lead to even under the most adverse of conditions. Isn't this the message we need to send today, to ourselves and the entire world that this is what this country strives to be about when we are at our best.

As a family we are committed to working with the New Philadelphia Association and the governmental organizations from the federal, state, county and local levels to make this a site of national heritage that we can all learn from and be proud of for years to come.

Thank you.

Approved by the Landmarks Committee, the nomination was then heard at the larger, full National Park System Advisory Board meeting and recommendations were made to the Secretary of the Interior for designation. After reviewing the documentation, Secretary of the Interior, Dirk Kempthorne, designated New Philadelphia a National Historic Landmark on January 16, 2009.

Archaeological Significance – The Basis for National Register of Historic Places Listing and National Historic Landmark Designation

Once a thriving community where townsfolk labored at a variety of occupations, such as merchant, shoemaker, cabinetmaker, teacher, wheelwright, blacksmith, doctor, farmer and farm laborer (see Chapter 2,"Background History"), today New Philadelphia is an archaeological site. No original buildings or structures are visible above ground, but the site possesses excellent archaeological integrity. New Philadelphia's historical and archaeological significance was recognized in 2005 by inclusion in the National Register of Historic Places (NRHP) for its potential to yield information important to history or prehistory under National Register Criterion D.

Figure 10.2. *Secretary of the Interior Dirk Kempthorne designated New Philadelphia a National Historic Monument on January 16, 2009 (Photograph by Charlotte King).*

However, the site is also recognized at a higher level than the National Register. It was designated a National Historic Landmark (see Figure 10.2). New Philadelphia qualified as an NHL under the NHL Program's Criterion 6 for archaeological sites

> That have yielded or may be likely to yield information of major scientific importance by revealing new cultures, or by shedding light upon periods of occupation over large areas of the United States. Such sites are those which have yielded, or which my reasonably be expected to yield, data affecting theories, concepts, and ideas to a major degree. (National Park Service 1999:11)

Archaeological investigations conducted at the site since 2002 confirmed that findings at New Philadelphia may encourage new research trends in historical archaeology; provide a better understanding of daily life in multi-racial communities of the era; and provide insight into social relationships through material evidence (King 2008).

The Historic Sites Act, 1935

Rooted in the Antiquities Act of 1906, The Historic Sites Act of 1935 amplified the government's determination to preserve and protect sites deemed *nationally* significant for their inspiration and benefit to our country and subsequently inspired the National Historic Preservation Act of 1966, which established the National Register of Historic Places, recognizing historic properties important to the histories of states and communities (King 2005; National Park Service 1999:8; Shull 1994:1)

In addition to bolstering the legal foundation for conservation, the Historic Sites Act of 1935 mandated the Secretary of the Interior, as director of the National Park Service, to identify National Historic Landmarks, properties that are extraordinary representations or commemorations of our country's history. NHLs are insights into historically influential people, trends, events, concepts and accomplishments that created our history and shaped our country's character.

National Historic Landmark Qualifications

National Historic Landmark criteria are more stringent than those of the National Register of Historic Places and most frequently identified with one or more of 34 NHL theme studies, such as westward expansion, architecture, science or education (National Park Service 1991:68-70). These theme studies provide a context and evaluation tools for properties associated with a nationally significant theme in American history.

National Historic Landmark Criteria

The National Park Service has specified the following criteria for National Historic Landmarks (National Park Service 1999:11):

> *The quality of national significance is ascribed to districts, sites, buildings, structures, and objects that possess exceptional value or quality in illustrating or interpreting the heritage of the United States in history, architecture, archeology, engineering, and culture and that possess a high degree of integrity of location, design, setting, materials, workmanship, feeling and association, and:*
>
> - *Criterion 1 – That are associated with events that have made a significant contribution to, and are identified with, or that outstandingly represent, the broad national patterns of United States history and from which an understanding and appreciation of those patterns may be gained, or*

- *Criterion 2 – That are associated importantly with the lives of persons nationally significant in the history of the United States; or*

- *Criterion 3 – That represent some great idea or ideal of the American people, or*

- *Criterion 4 – That embody the distinguishing characteristics or an architectural type specimen exceptionally valuable for the study of a period, style, or method of construction, or that represent a significant, distinctive, and exceptional entity whose components may lack individual distinction, or*

- *Criterion 5 - That are composed of integral parts of the environment and sufficiently significant by reason of historical association or artistic merit to warrant individual recognition but collectively compose an entity of exceptional historical or artistic significance, or outstandingly commemorate or illustrate a way of life or culture, or*

- *Criterion 6 - That have yielded or may be likely to yield information of major scientific importance by revealing new cultures, or by shedding light upon periods of occupation of large areas of the United States. Such sites are those which have yielded, or which my reasonably be expected to yield, data affecting theories, concepts, and ideas to a major degree.*

The archaeological resources found within the boundaries of New Philadelphia were deemed to possess a high potential to yield information of major scientific importance to our understandings of free, interracial, rural communities and for possibilities the town site possesses to affect theories, concepts, methods, and ideas in archaeology (King 2008).

Analysis of artifacts recovered during excavations conducted from 2004 through 2006 revealed little visual difference in the material culture of African-American and European-American households; however, small tokens that may be associated with the ancient game of mancala were found throughout the town site (Shackel 2011:158-160). Mancala originated in the Middle East about 4,000 years ago and was popular in many regions of Africa. Evidence found on plantations in association with living facilities of enslaved Africans and African Americans indicates that captive Africans brought the tradition to the United States (Townshend 1979:794-796).

The discovery of gaming pieces throughout the New Philadelphia town site suggests that cultural interactions occurred among the town's African-American and European-American residents. The findings indicate that the conventional practice of searching for cultural markers to identify ethnic or cultural groups does not apply to an integrated setting, such as New Philadelphia (Shackel 2011:159-160). These findings, and others, may revolutionize the way cultural and social scientists study race within communities and provide an opportunity to move beyond traditional research methods.

Finding mancala gaming pieces on sites associated with both African American and European Americans at New Philadelphia confirms the need to move beyond searching for cultural markers. Conventional historical archaeological investigations have been concerned with sites associated with the elite, colonial settlements and sites related to the founding of our nation. New Philadelphia's excellent archaeological integrity can potentially provide nationally significant information about the lifeways and cultural interaction of formerly enslaved individuals and subsequent free-born generations who struggled for autonomy and economic freedom.

National Historic Landmark Themes

The archaeological site at New Philadelphia contributes to two themes identified by the National Park Service: "Peopling Places: Westward expansion and the movement of people to the new lands;" and "Creating Social Institutions and Movements."

Peopling Places: Westward expansion and the movement of people to the new lands

The size of the United States of America doubled after the Louisiana Purchase in 1803 and, after the war with Mexico in 1848, the country's east to west borders spanned the continent, from the Atlantic to Pacific Oceans, south to the Rio Grande River, and north to the 49th Parallel. The United States Government provided incentives to encourage settlement of the vast country by offering land on the frontier at affordable prices or fulfillment of a requirement to put the land to productive use.

Population pressure caused by increased immigration in the early nineteenth century and the economic downturns of 1818 and 1837 also motivated settlement of the country's western frontier. Removal of Native Americans from the region following the Black Hawk Wars of 1832, and links to eastern markets by way of canals and steamship transportation and travel further encouraged settlement.

Settlers, attracted by the economic opportunities of the western frontier, spurred avid town planning activity in Illinois from 1835 to 1837, but only a few of the plats became actual towns and even fewer survived. By 1837 the cost of transportation improvements led to a nationwide economic downturn that stunted town planning (Davis 1998:232). By 1840 only about half of the towns founded around 1836 still existed. New Philadelphia was one of 126 towns laid out in 1836 (Walters 1983-1984b:332-333, 340) and one of the few to survive the economic crisis.

New Philadelphia seemed primed for success. It was located on fertile prairie land suitable for agriculture. Land surrounding the town straddled both timberland and prairie, crucial elements for town locations (Walters 1983-1984a:337). Accessible timberland provided material needed to construct dwellings, fences, wagons, implements of many types, and to provide fuel. The nascent town was near major country crossroads. Proximity to the Mississippi River provided access to the efficient cargo capacity and speed of steamboats that navigated inland waters. The town's location between the Illinois and Mississippi Rivers promised access to the proposed Illinois and Michigan Canal and a link to distant eastern markers.

Some towns, like New Philadelphia, that survived the economic downturn begun in 1837 succumbed when the railroad passed them by later in the nineteenth century. Historian James Davis explains, "railroads crippled towns they bypassed" (Davis 1998:377; see also Walters 1983-1984a:340). Chapman wrote of New Philadelphia in 1880 that, "At one time it had great promise, but the railroad passing it a mile distant, and other towns spring up, has killed it" (Charles Chapman and Co. 2006 [1880]:217,740-741). Many townspeople moved away by the turn of the century, but a few families continue to make their home in New Philadelphia into the 1940s (Burdick n.d.).

Creating Social Institutions and Movements—New Philadelphia's Ties to the Underground Railroad

While studies of the town site can add to our knowledge and understanding about the westward expansion of our nation, oral histories tell us about the town's involvement in the abolitionist movement to end slavery. For example, Solomon McWorter's son John reported his father's involvement in assisting runaway slaves to freedom, and family descendant Ellen McWorter Yates recalled that the original McWorter home included a cellar room used to hide fugitive slaves (Walker 1983:149). Local resident Elmo Waters remembered that a rock cellar underneath a building across from the town was associated with the Underground Railroad (Waters 2004). Mr. Waters's recollection may refer to the original McWorter home, which was located directly north of the town site.

Historian and McWorter descendant Juliet E. K.Walker relates that Frank McWorter's son, young Frank, escaped slavery in 1826 and found refuge in Canada. The elder McWorter negotiated with slaveholder Obediah Denham, exchanging his lucrative saltpeter manufacturing operation located in Danville, Kentucky, for young Frank's freedom in 1829. Once manumission legalities were completed, young Frank returned to the United States a free man. According to Walker, Squire, and other family members traveled to Canada to help enslaved individuals find freedom (Walker 1983:53, 61,149).

Pike County, where New Philadelphia is located, was reported to be part of the Underground Railroad network. According to one account, "Pike County had a few stations on what was known as the Underground Railroad in slavery times. Many honored old citizens were often severely censured because they sheltered and fed runaway negroes" (Massie 1906:132).

Ruby Duke, area resident, recalled her grandmother's accounts that a wagon used to carry produce to the railroad depot for transport to markets was specially outfitted to hide escaping enslaved individuals. "They had a box built under the bottom of the wagon and if a slave come in on the train, then they would hide them in it and take them back to the farm" (Duke 2004). Mrs. Duke remembered that fugitive slaves sometimes worked in her grandmother's garden and that the family dog barked

> At those posses coming up this little dirt lane…they would take off and run to the Creek. Down by the creek there was a big cave. Others would get into a box that was under the nest where the chickens laid their eggs. Then, my grandparents would let a chicken out and that dog would kill the chicken. So, when the bounty

hunters got there, that's what they thought was all the commotion….My great-grandpa never did lose one of the blacks then, even though they had a lot people looking. (Duke 2004)

National Historic Landmark Dedication Ceremony

To celebrate the designation of New Philadelphia as an NHL, Illinois Congressman Aaron Schock of the Eighteenth Congressional District presided over a dedication ceremony held at the site on August 23, 2010 (see Figure 10.3). The event was attended by many area residents and New Philadelphia members who generously provided homemade refreshments for the attendees (Pease 2010:5).

Figure 10.3 *Congressman Aaron Schock dedicated New Philadelphia National Historic Monument on August 23, 2010 (Photograph by Charlotte King).*

Additional Preservation Efforts

NHL status stimulated a great deal of interest in New Philadelphia. For example, The Archaeological Conservancy purchased 9.14 acres of the historic town site, an area documented as the center of the town's activities and the location of extensive household and commercial remains (Archaeological Conservancy 2009).

Many private individuals demonstrated their support to preserve New Philadelphia with monetary contributions. Organizations, such as the 1772 Foundation, also funded preservation efforts (New Philadelphia Association 2011).

The Illinois Rural Electric Cooperative recently pledged $7,500 a year for 10 years to finance improvements to the site. Local area residents, businesses, and a community college are collaborating too construct an informational visitor kiosk, develop a self-guided walking trail and plant native wildflowers along the historic site's perimeter (Husar 2012).

National Park Service Feasibility Study

National parks, regarded as the nation's cultural crown jewels, originally established as "an area maintained by the Federal Government and dedicated and set apart for the benefit and enjoyment of the people" were soon recognized for their educational opportunities. Interpretation of a park's educational, inspirational and esthetic characteristics became integral features of park administration duties and responsibilities (National Park Service 2003).

It must be noted that of the 397 parks in the National Park system, only seventeen parks, or 4.3 percent, are predominantly associated with African Americans and African-American history (Moyer 2012: pers. comm.). As a unit of the National Park system, New Philadelphia would be an inspiration and an educational tool to exemplify themes common to all Americans as a place of freedom, self-determination and opportunity and contribute to a more accurate account of our country's history.

The compelling story of New Philadelphia captured the interest of Congressman Aaron Schock and Senators Roland Burris and Richard Durbin when approached by proponents of the site. The lawmakers agreed to sponsor and introduce legislation authorizing the NPS to conduct a Special Resources Study required to assess New Philadelphia's qualifications to become a unit of the National Park Service. An act of Congress is required to authorize the study, which is designed to evaluate the site's national significance, feasibility and sustainability (Journal Courier 2010; Olson 2010; United States House of Representatives 2010; United States Senate 2010). The Senate Energy and Natural Resources Subcommittee approved the proposed bill and referred the legislation to the full committee, however, Congress adjourned before a vote could be taken.

Subsequently, Congressman Schock and thirteen bi-partisan co-sponsors introduced legislation, H.R. 1563, to the House of Representatives in April 2011 (Dutton 2011; United States House of Representatives 2011). After months of persistent follow-up, Senator Durbin and Senator Mark

Kirk introduced identical legislation, S 1902, to their colleagues in the United States Senate in November 2011 (United States Senate 2011). The bills were referred to the House and Senate Energy and Natural Resources subcommittees, where they await consideration.

In keeping with the National Park Service policy, "The national-park system should possess variety, accepting the supreme in each of the various types and subjects of scenic, scientific, and historical importance" (National Park Service 2003) the New Philadelphia town site is a viable candidate for inclusion as a unit of the NPS. Research confirms that New Philadelphia is unique as "one of the few archeological NHLs that can explore the relationships between African Americans and European Americans – in a town platted by an African American during the early nineteenth century – in the Midwestern United States" (Martin Siebert 2005).

Conclusion

New Philadelphia represents more than the compelling story of Frank McWorter and his family's pursuit of freedom, self-determination and economic opportunities. Long after the town site was abandoned, the story of New Philadelphia, its founder, its townspeople and the qualities they represent resonated among family members and the surrounding community who were determined to keep the town's memory alive.

National Register and NHL status acknowledge that New Philadelphia allows social scientists an exceptional opportunity to explore the complex issues of race and racialization and focus on research questions with historical and contemporary implications. Findings at the site may cause a reconsideration of history as it is currently written and revolutionize research methods and approaches for a better understanding of the complicated dynamics that shaped American history.

Chapter 11: Animal Remains from the New Philadelphia Site (11PK455), Pike County, Illinois: 2008-2011 Seasons

Terrance J. Martin,[1] Amanda Burtt,[2] and Kaila A. Akina[3]

As part of the ongoing interdisciplinary investigations of the New Philadelphia town site, assemblages of animal remains are subjected to detailed analyses so as to provide information on the animals that were exploited by the former site inhabitants, patterns of refuse disposal, and the natural habitats that were formerly present in the greater community. In order to acquire an understanding of the archaeological resources at New Philadelphia, as well as the families that formerly resided there, attention is routinely given to the regions of origin of these families to learn if differences in the animals consumed by the various households are due, at least in part, to the geographical backgrounds of the families and their retention of regional foodways (Martin and Martin 2010a; Martin and Martin 2010b).[4]

When families from different areas and backgrounds settled at New Philadelphia, did environmental setting, local markets, and subsistence practices of other households in the community influence changes in preferred animal species and foodways in general? If so, how long was necessary for such changes to occur? In contrast, is there a homogenous pattern for foodways at New Philadelphia, and has this pattern always been the same? These questions emphasize that family backgrounds such as region of origin and ethnicity should not be seen as imposing rigid choices. "Ethnic identities are not a given, and their fluidity can affect archaeological interpretations. Ethnic groups are not static, nor are they neatly defined and segmented into predetermined groups" (Shackel 2010:67). During the course of fieldwork during the 2008, 2010, and 2011 field seasons, excavations on four lots in Blocks 3, 7, and 13 yielded faunal assemblages from which to address these topics for different areas of the site.

Methods

Animal remains from the New Philadelphia site were examined at the Illinois State Museum's Research and Collections Center in Springfield, where an extensive collection of modern

[4] Acknowledgments: This work was supported by a grant from the National Science Foundation's Research Experiences for Undergraduates program (Grant number 0752834). Thanks to the students who assisted with the identification of animal remains during the laboratory portions of the 2008, 2010, and 2011 seasons of the New Philadelphia project. Also much appreciated are the observations and descriptions of pathological bones by Dennis Lawler, Illinois State Museum Research Associate, and editorial comments by Anna Agbe-Davies.

vertebrate skeletons and freshwater mussel shells are available for reference. Information for each identified specimen and each lot of unidentified specimens was entered on tags that were printed on acid-free, archive-quality paper. Specimens and accompanying tags were placed within 2 mil. or 4 mil. polyethylene zipper bags. Included on the specimen tags is information on archaeological provenience, animal taxon represented, anatomical element, side, portion of element, condition of epiphyseal closure (if present), completeness, weight of the specimen in grams, natural modifications (e.g., carnivore- and/or rodent-gnawing), and cultural modifications (e.g., burning and cut marks). Standard lengths of fish were estimated for each identified fish bone by referring to bones from modern fish of known size in the reference collection. Single specimen counts were tallied in the case of refitted broken specimens as well as rejoined epiphyses and shafts. All information was then entered into Excel computer files in order to facilitate the analysis.

Summary calculations are presented in tables and include the number of identified specimens (NISP), minimum number of individuals (MNI) per taxon, total weight of specimens per taxon in grams, and biomass (in kg) for each taxon. Scientific and common names for animals follow the Integrated Taxonomic Information System (ITIS) website (Integrated Taxonomic Information Systems (ITIS) 2007). Estimates of MNI were calculated from individual features (maximum distinction approach (Grayson 1973), assuming specimens from one individual do not occur in multiple features or other contexts), and from the spatial or temporal component at large (minimum distinction approach [Grayson 1973], assuming specimens from one individual could occur in multiple contemporaneous features or other contexts) based on element, symmetry, element portion, and biological age or body size. Biomass estimates were derived from allometric scaling (Reitz, et al. 1987). As described by Reitz and Scarry (Reitz and Scarry 1985:18), "the weight of the archaeological bone is used in an allometric formula [see Reitz and Scarry 1985:67] to predict the quantity of biomass for the skeletal mass recovered rather than the total original weight of the individual animal represented by the recovered bone." This approach avoids the problem of basing meat estimates on MNI and determining whether the meat from entire animals was consumed at the site from which the archaeological sample was acquired. Despite the problems inherent in the various techniques used to estimate biomass and usable or edible meat, the interpretive value of such measures are the *relative* importance of the various taxa rather than the *absolute* quantities.

For historical sites, perhaps as significant as identifying various species in a faunal assemblage is distinguishing skeletal portions for the larger mammals from which meat was procured. Different meat preferences among individual persons and social groups, different values of various animals and secondary butchering units, changes in butchering practices over time, and differences in butchering practices between rural and urban settings can contribute to interpretations of socioeconomic status and prosperity. These topics have been discussed by various authors (e.g., Hattori and Kosta 1990; Price 1985; Rothschild and Balkwill 1993; Schulz and Gust 1983). The large mammal remains recovered were tabulated by skeletal portion for each species.

Block 13, Lots 3 and 4

Squire and Louisa McWorter resided on these lots beginning in the middle of the nineteenth century. Following Squire's death in 1854, his widow Louisa stayed on until her death in 1883, when Louisa's daughter Lucy and her family took over residency in the house until early in the twentieth century. By 1930 Vergil Burdick owned the house and rented it until it was destroyed by fire in 1937. In addition to a large density of artifacts (especially nails and flat glass) being found here during the walkover surveys in 2002 and 2003 (Gwaltney 2004), geophysical surveys revealed several soil anomalies (Hargrave 2006). Anomaly A12 in Lot 4 was initially investigated in 2005 and found to be part of a house foundation that was designated as Feature 12. The entire foundation was exposed in 2010, and a five-foot wide trench was excavated from east to west across the southern portion of the structure in 2011 (see Chapter 8, "Research on Block 13, Lot 4," this report). Anomaly A25 in Lot 3 was also explored in 2010 and was determined to be the location of an abandoned well that was filled in with rocks. Because detailed analyses are currently in progress on the artifacts from these various contexts, a precise assessment of the faunal assemblage by temporal period, household, or family is beyond the scope of this technical report. Hopefully, some of the findings reported here will be addressed by future studies.

More than 1,000 animal remains were recovered from the excavations on Lots 3 and 4 with just over 75% by count (72.3% by weight) coming from Feature 12 (Table 11.1). A total of 32 animal taxa were identified from these contexts with 27 of all taxa being associated with the cellar fill. Table 11.2 presents a listing of all animal remains by taxa for Block 13, and Tables 11.3-11.6 show the species composition for each context on Block 13 (i.e., within and outside of Feature 12 in Lot 4 and within and outside of Feature 40 in Lot 3). Table 11.7 presents the skeletal portions of the large mammals that were recovered from these contexts.

Aside from cut marks produced by butchering animal carcasses, the most conspicuous modification to animal remains at New Philadelphia is the result of exposure to fire. Whereas a simplistic interpretation of burned animal remains traditionally involved cooking, many other activities may have been involved (see Lyman 1993:384-392). More likely, fragmentary bones and/or teeth that range from slightly discolored (i.e., superficially exposed to heat or fire), blackened (i.e., charred from direct exposure to fire), or calcined (i.e., burned white and nearly completely incinerated) reflect animal remains that were either purposely deposited in a fire as a form of refuse disposal, or were incidentally exposed to a catastrophic burning event such as a house fire. A total of 151 specimens from Block 13 (14% of the total) were either burned (i.e., slightly discolored or charred) (N = 83) or calcined (N = 68). Most of the burned/calcined specimens were associated with Feature 12 where 141 (77 burned, 64 calcined) were tallied (17.3% of the total NSP from Feature 12). Only five burned or calcined specimens were recovered from Lot 4 outside of Feature 12 (3.8% of that subsample), and only five burned/calcined specimens occurred on Lot 3 outside of Feature 40 (4.2% of that subsample). No burned or calcined bones were present among the 13 specimens recovered from Feature 40.

Table 11.1. Sample sizes of animal remains from Block 13, Lots 3 and 4

	NSP[1]	NISP[2]	NSP Wt (g)	NISP Wt (g)	Number of Taxa[3]	Total Biomass (kg)	Biomass from Identified Taxa (kg)
Feature 12 cellar in Lot 4	819	344	2,215.2	1,791.9	28	29.151	22.430

Totals	1,083	465	3,065.3	2,468.5	33	42.365	32.558
% Identified		42.9		80.5			76.9

[1] Total number of specimens.
[2] Number of identified specimens; i.e., specimens identified more precisely than class (Mammals, Birds, etc.).
[3] Number of animal taxa identified for each listed context. Note: the value given for "Totals" is not the sum of the numbers of taxa shown for each individual context; rather, a total of 33 taxa were identified from all contexts in Lots 3 and 4.

Mammals

Mammals contributed the largest number of specimens, both by count and by weight, and species diversity is greatest for this class. Mammal bones and teeth account for 65.2% of all specimens by count and 89.6% by specimen weight (Table 11.2). The significance of this class to the overall subsistence pattern is indicated by the finding that the minimum number of individuals for mammals (from 31 to 44 individuals; 47.7-53.7% of the total Block 13 MNI) contributed just over 95% of the total estimated biomass from all identified taxa. For each of the four contexts in Block 13, bones and teeth from swine outnumber those from cattle, but due to the larger size of cattle specimens, biomass estimates for beef is greater than for pork. Altogether, swine and cattle account for 86% of the biomass calculated from Block 13 with cattle contributing 61.1% and swine 24.9%.

[1] Number of identified specimens.
[2] Minimum number of individuals.
[3] One button made from freshwater mussel shell.

For all contexts within Block 13, a minimum of five individual swine can be calculated. At least one juvenile was identified from a radius and third metacarpal, both from Feature 12. The cellar was also the source of three bones (humerus, radius, and femur) from an older subadult individual. A minimum of three mature individuals are represented alternately by three right upper canine teeth (one each in Feature 12, Lot 4 outside of Feature 12, and Lot 3 outside of Feature 40), three right lower second molars (one in Feature 12 and two from Lot 4 outside of Feature 12), and three right distal humeri (one from Feature 12 and two from Lot 4 outside of Feature 12). Alternately, if one considers each of these four contexts separately and assumes that bones or teeth from a single individual could not occur in more than one context, then the MNI for swine expands to nine (Table 11.2). Isolated teeth dominate the Block 13 swine remains overall, as well as within each of the four contexts, and seven of eight cranial fragments occur in Lot 4 (four from within the cellar) (Table 11.7). The remaining swine specimens are from other skeletal portions with feet, ribs, and vertebrae being best represented, especially in the cellar.

Modifications from butchering and other processing activities are present in the form of a sawed proximal ulna (Feature 12), a chopped lumbar vertebra lateral spine (Feature 12), and a chopped dorsal portion of a rib (outside of Feature 12). Knife cuts were observed on four specimens: distal scapula, rib, and distal femur shaft from Feature 12 and a second metacarpal from outside of Feature 12. Pork appears to be a locally-raised commodity in addition to being locally consumed. According to Juliet Walker, "The new settlers [at New Philadelphia] discovered quite early that hogs could be raised without any expense except for a few breeders with which to start. Hogs weighing from 60 to 100 pounds usually sold for $1.00 to $1.50 per head" (Walker 1983:87).

Cattle remains are less frequent but more noticeable due to their typically larger size. Similar to swine, cattle specimens are far more abundant in Lot 4, especially in Feature 12. A minimum of three individuals for Block 13 was calculated on the basis of two left distal humeri (one from Feature 12 and one outside Feature 12), two left distal tibiae (two from Feature 12, one having an open epiphysis and the other having a fused epiphysis), plus a radius midshaft from a much younger calf that was recovered from Lot 4 outside the cellar. This MNI swells to six if separate

contexts are included as a criterion. Unlike swine, sawed cattle bones are much more frequent with a total of 14 (2 humeri, an ulna, a sacrum, an ilium, 2 femurs, 4 tibiae, a proximal metatarsal, and 2 ribs) along with a chopped rib. Also dissimilar to swine, all skeletal portions of cattle are present, although cranial fragments and isolated teeth are underrepresented (Table 11.7).

Except for the isolated teeth and seven phalanges, the cattle specimens from Block 13 seem to be primarily table refuse reflecting the consumption of beef. However, historical sources relate that cattle were also being raised by New Philadelphia residents. "Pike County's terrain encouraged cattle raising because about two-thirds of the county consisted of prairie. All farmers need for stock raising was to provide salt for cattle and keep them from straying" (Walker 1983:86). Especially pertinent for Block 13, according to the 1855 Illinois State Census, Squire McWorter had livestock valued at $1,000.00, the highest value of all New Philadelphia residents. Cattle remained important for the local economy as indicated by the *Barry Adage* newspaper in 1873 when Solomon McWorter drove "one hundred head of fat cattle" several miles west to the railroad depot at Barry from where they were shipped for sale (Fennell 2010:152).

Remains of sheep and/or goat are surprisingly well represented in Block 13, especially in the cellar of Louisa McWorter's house where they occurred scattered throughout Levels B1 through B7. Two bones diagnostic of sheep (Zeder and Lapham 2010) – a distal humerus and a nearly complete metatarsal – were recovered from the upper levels of Feature 12. Although not distinguishable between sheep and goat, a minimum of three individuals are represented by fragments of the acetabulum portion of three left pelves that were associated with the cellar (Levels B3 and B5) and the upper level of the well (Feature 40) on Lot 3. Fragments of ribs and vertebrae are most abundant, followed by foot bones (one metatarsal and three phalanges) (Table 11.7). Cranial fragments, isolated teeth, and bones from the proximal hindquarters are entirely absent. The only noticeable butchering marks occur on a lumbar vertebra and a rib that were chopped and a rib that has knife-cuts. Sheep and/or goat remains were previously reported from five other contexts at New Philadelphia, the most (six specimens) coming from Feature 14 in Block 8, Lot 2 where residents had Northern tradition backgrounds (Martin and Martin 2010b:92). Although mutton was not the meat of choice for families of any of the three regional backgrounds at New Philadelphia, the opening of a mill in Barry by 1850 apparently encouraged Hadley Township farmers to raise sheep for their wool (Martin and Martin 2010a:81).

Bones from at least three individual domestic cats were recovered from three contexts on Block 13. Five bones from the cellar (Levels B2 and B3) are from one kitten (right humerus, femur, and tibia) and one subadult (right distal humerus and right proximal ulna). Three specimens found in the well are from one or more adults and consist of a right auditory bulla and fragments of a left radius and left ulna. EU 15 and 16, outside the well in Lot 3, contained fragments of a left pelvis, left femur, and left tibia, all from adult individual(s). Although only one cat bone (from Feature 14 in Block 8, Lot 2) was previously reported for earlier excavations (T. Martin and C. Martin 2010b:94), numerous cat bones were recovered from excavations on Block 7, Lot 1 and from Block 3, Lot 4 (see later sections of this chapter).

Considering the domestic contexts of Louisa McWorter's property on Block 13, the occurrence of numerous wild animals was unexpected. Among the wild mammals are small and medium-sized rodents as well as a marsupial, artiodactyl, and carnivores. Remains of eastern mole, white-footed or deer mouse, and vole are probably intrusive. Mole bones are from non-feature contexts in Block 4 (mandible and humerus from outside the cellar) and Block 3 (postcranial bones in EU 15 and a sternum from EU 13, both outside the well). The mouse bone is an ulna from

Level B2 in Feature 12, and the vole specimen is a mandible from EU 10 outside of Feature 12. Nine specimens of Norway rat, all occurring in Lot 4, are from at least three individuals as indicated by three left mandibles (two from outside the cellar and one from Level B1 within Feature 12). Norway rats were introduced to North America by European settlers, and colonies of the dreaded Old World rodents became established in both urban and rural areas since they thrive on foods that humans discard as well as on foods kept in storage for livestock (Hoffmeister 1989:253). Not merely a coincidence, the presence of Norway rats undoubtedly accounts for the domestic cat bones found on Block 13, as well as elsewhere at New Philadelphia.

Ten of twelve opossum specimens came from the cellar fill (Levels B1, B3, B5, and B6), but all twelve could conceivably come from the same adult individual. A probable second individual is represented by a left tibia shaft from EU 12 and a left distal humerus shaft from EU 16, both outside of the well on Lot 3. A knife cut mark is present on a left proximal radius in Feature 12 (EU 6, Level B1), which suggests that the meat and/or the hide were purposely processed.

The dorsal portion of a left rib from Feature 12 (EU 13, Level B2) was tentatively identified as white-tailed deer and constitutes the only identified bone from the species at Block 13. A portion of an antler, either from deer or elk, that had been modified into a scale for a knife handle (see Dunning 2000: 35, 36) was recovered from deep in the Feature 12 cellar fill (Level B5 in EU 5). White-tailed deer was previously found in Features 1, 13, and 14 (Martin and Martin 2010b). In some areas of Illinois, deer were hunted in such large numbers by American settlers that many local populations were extirpated shortly after the middle of the nineteenth century (Hoffmeister 1989:31).

The presence of tree squirrel and eastern cottontail remains is reminiscent of an Upland South dietary pattern, as noted previously for Feature 1 on Block 9, Lot 5, the household attributed to Kezia Clark or someone else with a similar Upland South regional background. From 1870 until the 1880s, Kezia Clark lived in the same household with her daughter Louisa on Block 13, Lot 4 (Martin and Martin 2010b:87-92). For Block 13, a total of 36 eastern cottontail bones and teeth were recovered, and all were from Lot 4, with all but two specimens being associated with Feature 12. A minimum of four individuals are represented by four left pelves (one with a knife cut mark) and four right femurs from Feature 12. The two bones from outside Feature 12 (a right ilium and right proximal tibia) could conceivably represent a fifth individual for the assemblage. A pelvis from Lot 3 along with an ulna and tibia from Lot 4 are diagnostic of the fox squirrel due to their relatively larger size in contrast to the gray squirrel (*Sciurus carolinensis*). A proximal radius (from Level B3) and a lower incisor (from Level B6) from Feature 12 were not identified more specifically than the genus *Sciurus*. Eastern cottontail, tree squirrel, and opossum were also present among the faunal refuse in Feature 1 where smaller wild game provided supplements to pork and poultry as part of an Upland South dietary pattern.

Four carnivores also contribute to the species diversity in Block 13. One individual mink is represented in Lot 4 by a left proximal femur from EU 9, Level A1 and a left distal tibia from EU 7, Level A1, both specimens being outside of Feature 12. Although mink were probably available locally, the valuable furbearer would have most likely been trapped along Kaiser Creek or some

other permanent source of water where they would prey on many kinds of aquatic animals including muskrat, fish, crayfish, and waterfowl (Hoffmeister 1989:296). A striped skunk is indicated solely by a tooth (right lower first molar) that was recovered from EU 2 in Lot 3 during the 2005 field season. A dog or coyote was identified from a molariform tooth fragment that was found in EU 11 in Lot 3. Most interesting is a right proximal ulna with knife-cut marks from a gray wolf that was associated with Feature 12 (EU 15, Level B4). Occasionally referred to as "sharks of the prairie," gray wolves posed a major problem for frontier settlers because they preyed on livestock (Jones 2002:8). Bounties were established in many areas across Illinois, and the animal's pelt was used as proof of the kill so as to collect the financial reward. *The Pike County Democrat* newspaper in nearby Pittsfield printed the following account in 1864.

> Cyrus Holmes, living near Pittsfield, on last Monday made a quite respectable wolf haul. While clearing up a piece of land he heard while in proximity to an old tree, what conceived to be sundry pups whining. He thereupon proceeded to cut the tree down and found eight wolf pups – eyes not yet open – snugly ensconced in its hollow. He subsequently brought them to town and received five dollars for the scalp of each one, being aggregate $40. This, we consider, a very good day's work in the wolf business. (Pike County Democrat 1864)

Confusion exists when historical accounts refer to gray wolves, timber wolves, prairie wolves, and coyotes, and whether these narratives actually refer to the gray wolf (*Canis lupus*) or coyote (*Canis latrans*) (Hoffmeister 1989:32-33). A fragmentary gray wolf maxilla with third incisor, fourth premolar, and first molar was identified from the Squire site (11MS2244) in Madison County, an early-nineteenth-century homestead in the American Bottom (Martin and Brand 2010). The exceptionally large size of specimens from the Squire site and Feature 12 at New Philadelphia, as well as verification of identifications by comparison to gray wolf reference skeletons at the Illinois State Museum, attest to the presence of gray wolves and the threat they posed to settlers' livestock.

Mammal Bone Artifacts

In addition to the previously noted cutlery handle scale that was made from antler, nine of the unidentified large mammal bones in the assemblage were also fragments of bones that were modified to form the scales for cutlery handles. Except for a specimen from EU 17, Level A1 in Lot 4, the rest were all associated with Feature 12. One was found in EU 14, Level B4, the rest occurred in EU 15 in Level 1 (3 specimens) and Level 5 (4 specimens). Whereas eight of the scales were plain or stained, one scale was wedge-shaped and very ornate having diagonal-incising along the central zone and finely-spaced cross-hatches along both edges (see Dunning 2000:36, [Figure 13, middle illustration]).

Birds

Avian remains account for 20.9% of the total Block 13 assemblage by count and 3.4% by weight

with 91.6% of all bird remains being associated with the cellar fill (Feature 12). The minimum of 17 to 21 individuals contributed only 3.6% of the total biomass from identified taxa. Bones from domestic chickens constitute 86.4% of the identified bird bones from Block 13, with nearly 93% coming from Feature 12. A minimum of eleven individuals consist of at least six adults (as indicated by left distal radii), three subadults (based on three right humeri and three left radii), and two juveniles (represented by two right tarsometatarsi). When assuming that chicken bones found in other contexts represent unique individuals, the MNI can be expanded to 15. Six turkey specimens, all foot bones, were also identified, all coming from EU 14 (Levels B1 and B2) in Feature 12. Five bones (including a coracoid from a juvenile) could not be positively identified and are attributed to the family Phasianidae, which also includes domestic chicken, greater prairie-chicken, and turkey. A wild gallinaceous bird, the northern bobwhite was also identified from Feature 12 as represented by a right distal ulna in Level B3 of EU 15. This small, nonmigratory quail prefers brush, hedgerows, grassy fields, and pastures (Bohlen 1989:57) and is still present in the area of the site. Bobwhite was previously recovered at New Philadelphia from Block 9, Lot 5, the property associated with Kezia Clark, and greater prairie chicken was present in Feature 7 in Block 4, Lot 1 (Martin and Martin 2010b:89-90, 97).

Waterfowl are represented by four bones from three species, and all are associated with Feature 12. The anterior portion of a synsacrum and a scapula from Canada goose were recovered from EU 15, Levels B1 and B2. The proximal portion of a first phalanx (diget two) from a large duck was found in Level B1 of EU 16, and a left coracoid from a medium-sized duck was recovered from Level B5 of EU 14. Waterfowl remains were also present elsewhere at New Philadelphia in Features 1, 3, and 14 (Martin and Martin 2010b). A premaxillary from Level B2 of EU 6 was identified as a small passerine songbird.

Poultry was ubiquitous in the diets of people from the North, Midland, and the Upland South. According to the 1880 U.S. Agricultural Census, Louisa McWorter owned 20 yard poultry and 21 other poultry (United States Bureau of the Census 1880). According to Walker (1983:88), “It was not uncommon for farmers’ wives to raise three or four hundred fowls, beside geese, ducks, and turkeys, in a season.”

Reptiles and Amphibians

The left tibia from a medium-sized snapping turtle was recovered from EU 14 (Level B4) in Feature 12. Two toads are represented by left tibio-fibulae, one from EU 14 (Level B3) in Feature 12 and the second outside Feature 12 in EU 10. Two frogs were associated with Feature 12, four bones occurring together in Level B2 in EU 15, and a second individual from Level A1 in EU 12. A frog tibio-fibula in EU 15 exhibits remodeling along the mid-shaft where it had experienced a fracture. Although the frog may have avoided predation in the wild after suffering the injury, it is difficult to avoid speculating that someone kept it as a pet, thus allowing the leg to heal. Whereas terrestrial toads may be incidental inclusions in the archaeological deposits, frogs and snapping turtles would not naturally occur in Block 13 so far away from water, and thus must have been transported there.

Fish

A total of 91 fish bones were encountered, and all but one were associated with Feature 12. Aside from part of a right cleithrum from a bullhead (probably black bullhead in the 24 ≤ 32 cm-size class) and a cranial fragment from a bowfin, all of the identified fish bones are from buffalo, a genus of suckers that were formerly important in the commercial fishery in the Illinois and Mississippi Rivers until surpassed by carp (*Cyprinus carpio*), which were introduced from Europe during the 1880s (Pflieger 1975:127, 178; Smith 1979:147). Nineteen of the 25 buffalo specimens are ribs, three are from vertebrae, and the only cranial bones consist of two opercula and a scapula. The MNI for buffalo include one each in the 40 ≤ 48, 48 ≤ 56, 56 ≤ 64, and 64 ≤ 72 cm-size classes. The unidentified fish remains consist mainly of small fragments of ribs, rays, and spines along with pieces of broken cranial elements. Based on previous excavations, fish remains are not abundant anywhere at New Philadelphia, but where they were recovered, the taxa include buffalo, channel catfish (*Ictalurus punctatus*), yellow bullhead (*Ameiurus natalis*), sunfish (Centrarchidae), and freshwater drum (*Aplodinotus grunniens*) (Martin and Martin 2010b).

Bivalves

Twenty mollusk shells (all bivalves) were found in three of the contexts on Block 13. Ten of the shells are from freshwater mussels with the only identified species coming from Feature 12. The Ebonyshell is restricted to large rivers, such as the Illinois and Mississippi, where they occur in sand and gravel substrates. The Threeridge is more widespread and common throughout the Midwest and is present in small to large rivers(Cummings and Mayer 1992:40, 42). Neither of the more complete shells have modifications suggestive of how they were utilized at New Philadelphia, but one of the unidentified mussel shell fragments from EU 3 in Lot 3 (outside of Feature 40) was made into a clothing button. Freshwater mussels from the Mississippi and Illinois Rivers became the raw material for "pearl buttons" beginning in the late 1880s (Parmalee 1967:1-4) Freshwater mussel shells (mostly unidentified fragments) have been recovered from all of the New Philadelphia features that have been previously analyzed, but why mussel shells were collected and how they were used is uncertain (Martin and Martin 2010b).

Ten shells are from marine taxa. A small (2 cm long), whole right valve from Feature 12, EU 16, Level B1, has radial sculpture, a straight hinge line with numerous small teeth, and a grooved interior along the shell's margins. The shell is from the family Arcidae and most strongly resembles a Ponderous Ark (*Noetis ponderosa*) or Incongruous Ark (*Anadara brasiliana*), but is half the size. These shells occur along the South Atlantic and Gulf coasts (Rehder 1981:671-672). The other nine marine shells fragments are examples of cockle shells (family Cardiidae) with some of these resembling the Giant Atlantic Cockle (*Dinocardium robustum*), shells that commonly occur on beaches along the South Atlantic Coast (Rehder 1981:748-749). Eight of these shell fragments were recovered on Lot 4 from Level B1 in Feature 12 in EU 14, EU 15 (6 fragments), and EU 16. One shell was found in isolation on Lot 3 in EU 2, Level A1. Coincidently, examples of ark and cockle shells were also encountered in Block 8, Lot 5, outside

of Feature 1, and an ark shell was also found in Feature 14 on Block 8, Lot 2 (Martin and Martin 2010b:90, 94).

Discussion

The history of Block 13, Lots 3 and 4, within the community of New Philadelphia is most closely associated with Louisa McWorter, the daughter of Kezia Clark, wife of Squire McWorter, daughter-in-law of Free Frank, and mother of Lucy Jane McWorter McKinney, Squire McWorter, Jr., George W. McWorter, William McWorter, and Eliza Ann McWorter. Louisa McWorter resided on Block 13 until her death in 1883. She was followed by Lucy Jane McKinney and her husband James McKinney who occupied a house until 1896 when Lucy died. James McKinney and his second wife Lucy then lived at the house until his death in 1910 when the property reverted back to Louisa's sons and their children. The property was purchased by Virgil Burdick in 1930 and the house was rented out until a fire destroyed the structure in 1937 (Martin 2012). Whereas detailed analysis of artifacts, stratigraphy, and history of the cellar (Feature 12) on Block 13, Lot 4 is ongoing, the faunal assemblage from Block 13 cannot be attributed to any specific household or family. Diagnostic artifacts from the filled-in cellar, however, do not indicate significant amounts of refuse from occupations postdating the 1890s. Thus, even though the final capping of the cellar would not have occurred until after the house burned in the late 1930s, the sediments within the southern portion of the cellar seem to reflect occupations and activities from the second half of the nineteenth century. Viewed in this light, Feature 12 may provide insights into the lifeways of Louisa McWorter's family.

There are aspects of the Block 13 faunal assemblage that suggest that local environmental setting, economic status, and market conditions in Pike County influenced choices as to which species of livestock to raise, and these conditions would have influenced basic foodways. For example, swine remains in Block 13 are more numerous than cattle remains, a finding that is consistent with an Upland South dietary pattern. Skeletal portions of skulls, isolated teeth, and feet, as well as the presence of immature individuals suggests that swine were being raised on (or close to) Block 13. Contrary to this, however, beef is more prevalent than pork at Block 13 in terms of biomass.

An examination of the faunal assemblage from Feature 12 with respect to stratigraphy may indicate some interesting temporal trends, even though the amount of time that lapsed is unknown. Figure 11.1 shows that swine remains are consistently more numerous than either cattle or sheep/goat remains from Level B6 up through Level B1. Cattle remains are especially numerous in Level B1, with 43.5% of all cattle remains from Feature 12 occurring in this upper level. There is a consistent presence of sheep/goat bones throughout all levels of Feature 12, and similar to cattle, an increase in Level B1. Chicken bones are present in all levels below the plow zone with nearly 40% of the chicken bones occurring in Level B3. Stratigraphic occurrences of other categories of animal remains are illustrated in Figure 11.2 where fish share with chicken a peak in Level B3. Based on archaeological sites in southern Illinois, wild game species are often important supplements to an Upland South diet. When the occurrence of opossum, cottontail, squirrel, turkey, bobwhite, goose, and ducks are tallied together by level, we see Level A1 in the

plow zone contributes the greatest number (due to an abundance of cottontail bones) with fewer than ten specimens per level in Levels B1 through B6. Marine and freshwater bivalve shells occur in four levels, but are most numerous in Level B1. Ultimately, the significance of these trends will depend on temporal insights provided by diagnostic artifacts from Feature 12.

Block 3, Lot 4

Activities on this lot in 2008 signify a return to the area southwest of a lime slacking pit (Feature 2) that was discovered in 2004. The initial geophysical survey in this lot failed to reveal any significant soil anomalies, probably due to extremely dry conditions, and excavation of EU 1, 2, and 7 were likewise disappointing. Another attempt at geophysical coverage by Hargrave during the last week of May in 2008 benefitted from heavy precipitation earlier that spring. As a result, promising new anomalies were revealed both by the magnetic survey (A31 and A 32) and the electrical resistivity survey (A50-53). Subsequent excavations by Team Z revealed Feature 28, a refuse pit or portion of a filled-in cellar in EU 8, 10, and 12. Team Y excavated several units to the east and discovered a fieldstone foundation base (Feature 31) that may represent the base of a brick chimney. Adjacent to Feature 31 are builder's trenches and foundation fill to the west (Feature 38) and to the east (Feature 39). Temporally diagnostic artifacts from Feature 28 (including a U.S. Presidential campaign button for William Jennings Bryan and numerous bottles) indicate refuse associated with the late-nineteenth through early-twentieth century. The broken window glass, nails, metal fragments, mortar, and small ceramic sherds in the fill associated with Feature 31 do not provide a precise temporal span of occupation or abandonment. These features

and refuse may be attributed to the Welbourne or Venicombe families who occupied this lot during the early part of the twentieth century.

A grand total of 803 animal remains were recovered during the excavations, 73.5% of the collection being associated with Feature 28 (Table 11.8), 14.2% coming from builders' trenches adjacent to Feature 31 (Table 11.9), and 12.3% from non-feature contexts (Table 11.10).

Mammals

The single, most-prevalent mammal in Feature 28 is domestic cat. Adult and subadult cats are represented by 219 specimens (MNI = 3, based on 3 crania, 3 left mandibles, 3 left humeri [2 with

open proximal epiphyses, 1 with closed proximal epiphysis], and four other elements), and 46 specimens are from juveniles (MNI = 2, based on 2 right crania with deciduous teeth and four other anatomical elements from at least two individuals). A sixth individual is represented by a left femur from a juvenile cat that was found in EU 10, stratigraphically above Feature 28 (Table 11.10). Individuals include nearly whole internments and partial skeletons. Some articulated individuals were apparently disturbed during the later addition of refuse and soil fill.

Three mature cat bones are noteworthy for their pathologies. The right and left mandibles of one individual have anomalies on each horizontal ramus. The right mandible has an old abscess in the space of the third premolar; a receding and undulating alveolar rim on the medial surface in the area of the third premolar; a receding and perialveolar rim around the canine on the lateral surface; and porosity on the anterior surface adjacent to the symphysis, suggestive of periostitis (Dennis Lawler, pers. comm.; see Figure 11.3). The left mandible is more severely swollen in the area of the fourth premolar and first molar, especially on the medial surface, and there is a cavernous space for the roots of the fourth premolar and first molar (although the first molar survived in place). A callus in the molar area indicates a healed fracture of the horizontal ramus, and porosity on the anterior surface is consistent with the periostitis on the right mandible (Figure 11.4). A left tibia exhibits a traumatic injury where the bone was severely fractured and displaced laterally, one-third of the way above its distal end, followed by remodeling, shortening, and curvature of the bone, along with absorption of part of the distal fibula (Figure 11.5). All three of these bones were encountered in EU 8, Level C2. Although the context of several individual cats buried in household refuse and building debris (five of the bones burned black) would suggest that the cats were retained as "barn cats" or animals whose function was to control rodent populations, this may simply reveal how these animals were disposed of after death, but not how they were considered when they were alive (Thomas 2005:97). The survival of the individual with the infected mandibles and fractured and healed left hind leg implies that someone cared and protected this individual in the same way that one would care for a favorite pet.

Excluding cat, identified mammal remains account for 56.7% of all specimens by count and 91.6% by specimen weight for the three contexts in Block 3, Lot 4. The significance of this class to the overall subsistence pattern is indicated by the finding that the minimum number of individuals for mammals (22, excluding cats; 45.8% of the total MNI) contributed 91.6% of the total estimated biomass from all identified taxa. Similar to Block 13, swine remains are more plentiful than cattle, but biomass estimates for beef is nearly three times greater than for pork. Altogether, swine and cattle account for nearly 80% of the biomass calculated from Block 3 with cattle contributing 58.8% and swine 21%.

At least six individual swine are present in Block 3, Lot 4. Considered separately, Feature 28, Feature 31, and the non-feature contexts each have a minimum of one adult and one subadult (as indicated by the same anatomical elements having both fused and unfused epiphyses in the same context). Alternately, if one assumes that the refuse in these three areas are contemporaneous, then the MNI for swine is only two. Overall, foot bones make up 42% of the swine specimens on Block 3 (Table 11.11) with the cranial fragments and isolated teeth contributing 32%. Butchering and processing is indicated by a sawed distal third or fourth metapodial in Feature 28; a chopped rib and ilium in Feature 28 and a chopped lumbar vertebra in Feature 31; and an ilium from a subadult in Feature 31 with knife cuts.

If Features 28 and 31 and the non-feature contexts are considered separately, the cattle remains from Block 3, Lot 4 represent a minimum of three individuals. If assumed to be contemporaneous, the 16 cattle remains could have all come from the same individual. Foot bones, isolated teeth, and cranial fragments are present along with ribs, vertebrae, and proximal forequarter (Table 11.11). The most conspicuous cattle specimens consist of the greater portion of a left distal radius and ulna (sawed on the proximal end) along with four left carpal bones that were found in Feature 28, and a right mandible with worn teeth (fourth premolar through third molar) in EU 13 that was chopped at its anterior end. Other butchering marks include a chopped dorsal portion of a rib in EU 11 and a sawed thoracic vertebra in EU 15.

An assortment of sheep and/or goat remains were also encountered in Block 3, Lot 4 where they were most abundant in Feature 28. The only anatomical part not represented is the cranium (Table 11.11). A right distal tibia from Feature 28 is the only bone that is diagnostic of sheep. Although a minimum of one individual is calculated for each of the three contexts, all sheep/goat remains considered together without regard to feature association could represent only one individual. The only butchering marks are a sawed ischium from Feature 28 and a chopped radius shaft fragment from the balk between EU 11 and 13 (non-feature context). The sheep/goat specimens constitute nearly 11% of the biomass from identified mammals and 10.2% of the biomass from all identified vertebrate animal remains at Block 3, Lot 4. Albeit sheep and goat were occasionally consumed for their meat at New Philadelphia, their presence probably owes primarily to the use of their wool (Martin and Martin 2010a:81)

Remains of several wild mammals were also discovered among the animal remains in this part of the site. A small fragment of a thoracic vertebra (articular process on the posterior portion of the dorsal spine) from Feature 31 was tentatively identified as white-tailed deer. Two rib fragments from this same feature could not be confidently distinguished between deer and sheep or goat. The absence of any other bones or teeth from deer in either Feature 28 or 31 leads us to be conservative in the identifications of a species when dealing with sparse and fragmentary specimens.

In addition to the burial of several individual domestic cats in Feature 28, three other small and medium-sized mammals may have been disposed of in a similar manner. Several bones from one

individual striped skunk occurred together in EU 8. These include a fragmentary cranium, left and right mandibles, atlas and axis cervical vertebrae, right distal scapula, left distal humerus, and right ilium. Bones from at least two individual eastern cottontails were found in EU 8 (left cranial frontal bone, a calcined anterior portion of a left mandible, and a whole metacarpal) and EU 10 (maxilla with teeth, right distal scapula, left humerus, left proximal ulna, 2 right pelves [2 individuals], right proximal and distal femur [two individuals, based on size differences], left proximal tibia, a lumbar vertebra, a sacrum, and 7 whole and partial metapodials). One individual opossum is represented by five vertebrae that were found in EU 8 (1 cervical, 2 thoracic, and 1 lumbar) and EU 11 (an atlas vertebra).

Fourteen squirrel bones (six of which could be identified as fox squirrel) occurred in Feature 28 (two individuals), Feature 31 (one individual), and in non-feature contexts (EU 9 and EU 16). Noteworthy among the fox squirrel bones in Feature 28 are a right proximal ulna and a right distal tibia, both of which exhibit knife-cuts.

Perhaps a testament to the hunting prowess of the domestic cats, only one Old World rat bone (a left femur) was recovered from Feature 28. The only other rodent specimen in Feature 28 is a fragment of a small rodent (vole or mouse?) incisor tooth. A vole mandible was found in the plow zone of EU 10 above Feature 28.

Birds

Restricted to only two species, bird remains account for 11% of the identified specimens from the most recent excavations in Block 3, Lot 4 by count and 3.1% by weight. Turkey occurs in Features 28 (a sternum fragment and the mid-shaft of a right tarsometatarsus, with spur) and in non-feature contexts (a whole proximal phalanx of the foot from EU 8, outside and north of Feature 28). Domestic chicken bones came from adults, subadults, and juveniles in both features and in non-feature contexts. Feature 28 contributed 17 bones from adults (MNI = 2), five bones from subadults (MNI = 3), and five bones from juveniles (MNI = 2). Feature 31 chicken bones consisted of nine bones from adults (MNI = 1, including one fibula from a post mold [Feature 29] in EU 9 that was associated with Feature 31), one from subadult, and one from a juvenile. Chicken bones from non-feature contexts consist of ten from adults (MNI = 1) and two from subadults (MNI = 1). No cut marks were observed on any of the bird bones (identified or unidentified). Eggshell fragments, most likely from chicken eggs, were recovered from Feature 31 (EU 11 and 13) and outside of Feature 31 in EU 11.

Amphibians

The only amphibian specimens in the assemblage is a left ilium from an American toad that was found in Feature 28 (EU 8, Level C1).

Fish

Forty-seven fish bones were found on block 3, Lot 4, most of which were associated with Feature 31. Only two species were identified with buffalo contributing 26 of the 27 identified fish bones. Four individual buffalo in Feature 31 consist of 20 bones from at least two individuals (indicated by two left cleithra) in the 40 $\leq$ 48 cm-size class. Other elements include right cleithrum, right supercleithrum, left postcleithrum, right scapula, branchial, 6 vertebrae, and 7 ribs and spines. A left first pectoral ray was from an individual in the 48 $\leq$ 56 cm-size class, and four ribs were from a buffalo that was 64 $\leq$ 72 cm long. One buffalo vertebra was identified from the balk between EU 11 and 13, and it is comparable to an individual in the 48 $\leq$ 56 cm-size class. The only identified fish from Feature 28 is a left pectoral spine from a yellow bullhead (16 $\leq$ 24 cm standard length). The unidentified fish bones from Feature 28, 31, and the plow zone of EU 13 are mainly nondiagnostic fragments of ribs, rays, and spines.

Bivalves and Gastropods

Freshwater mussel shells occurred mostly in plow zone contexts in EU 9, 10, and 11, the exceptions being two specimens from Feature 28 and one from EU 8 that could not be identified to species. The identified shells consist of incomplete specimens of a right valve of a Threeridge (EU 8), right valve of a Wabash Pigtoe (EU 11), and a right lateral hinge tentatively attributed to Washboard (EU 12). Consistent with most other freshwater mussel shells that have been recovered at New Philadelphia, these three species would have been available in both the Illinois and Mississippi Rivers as well as some of the major tributaries and backwaters (Cummings and Mayer 1992). A medium-sized aquatic gastropod was found in the plow zone of EU 16.

Bone Artifacts

Three mammal specimens were modified into artifacts. Two bone cutlery handle scale fragments were found in the plow zone above Feature 31 in EU 9 and EU 13. Both are plain without incisions or other decorations. Another bone artifact is a small, polished fragment of a uniformly flattened bone, 1.9 mm thick, with two partial recessed, circular dots. The specimen is reminiscent of a gaming piece or die and was found in the plow zone of EU 16, west of Feature 31. An unidentified shaft fragment from a medium-sized bird is highly polished, but its function is unknown. It was recovered from the lower part of the plow zone in EU 8 in the vicinity of Feature 28.

Modifications

Alterations to animal remains from Feature 28, Feature 31, and from non-feature contexts were relatively minor. Only eleven bones exhibited rodent-gnawing: seven in Feature 28, two in

Feature 31, and two from outside of features. Carnivore damage was recorded only twice for Feature 28 and once for non-feature areas. Feature 28 has nine bones that were burned black and two that were calcined (= 1.9% of the collection that was exposed to fire). For Feature 31, only two specimens were burned black and four that were calcined (= 5.3%). For all other areas, one bone was burned black and seven were calcined (= 8.1%).

Discussion

The faunal assemblages that resulted from the 2008 excavations of Features 28 and 31 and the areas immediately adjacent to these deposits furnished a complex dataset that may eventually inform us about the residential history and lifeways for Lot 4 in Block 3. Whereas the table refuse and butchering waste provide information on the relative importance of beef, pork, mutton, and fowl for the early years of the twentieth century, the presence of at least six individual domestic cats along with partly articulated burials of species such as striped skunk, and opossum may offer additional insights into how people lived and coped with pests and intruding wildlife. Similar to other households, fish from the Illinois and/or Mississippi Rivers, especially buffalo, were consumed and seemingly preferred over other species that were available. Squirrels, eastern cottontails, and other local wild animals were also hunted as a way to offer variety to the diet. Unfortunately, we do not know whose refuse was used to fill in this deep pit or cellar that we have designated as Feature 28, nor do we know how it is related – functionally or temporally – to the nearby Feature 31, which we have tentatively identified as an old chimney base. Although the Welbourne and Venicombe families, both having ties to England, are associated with this lot, much more information is needed on these families and others who may have ties to this portion of New Philadelphia during the late-nineteenth and early-twentieth century.

Block 7, Lot 1

In 2004, EU 2 was excavated in the southeastern part of Lot 1 in Block 7. This work confirmed the presence of a building foundation that has been attributed to the mid-twentieth century "Betsy House." A tax ledger book from 1845, however, suggests that an older structure may have been present on the lot. In 2008, investigations resumed with the excavation of three additional units (EU 3, 4, and 5). Feature 33 was revealed as a clay cap above Feature 34 in EU 3. Together these features contained artifacts as early as the 1840s, but a circa 1860 military button was associated with the earliest date of abandonment of the structure and the placement of a dark organic fill on top of the foundation. Elsewhere in these units, artifacts dating well into the twentieth century have been recovered. Accompanying these complex building, occupation, and abandonment episodes is a faunal assemblage of 284 animal remains. Although the total faunal assemblage is fairly evenly distributed among the three excavation units by count, more than 60% by weight was associated with EU 5 (Table 11.12). In terms of stratigraphy, more than one-third of the animal remains by count were recovered from the plow zone, but this constitutes nearly three-quarters of the faunal assemblage by specimen weight. The species composition for all

animal remains recovered from EU 3, 4, and 5 is presented in Table 11.13. Less than 8% of the animal specimens by specimen count are associated with Features 33 and 34 in EU 4 and 5, and this accounts for less than 1% of all animal remains from the three units by weight (Table 11.14). Although two units were excavated on this lot in 2004, the only animal specimen encountered was a small shaft fragment (weight of 0.1 g) from either a medium-sized mammal or a large bird that was found in the plow zone of EU 1.

Table 11.12. Sample sizes of animal remains from Block 7, Lot 1, by EU, feature, and stratigraphic levels

[1]Number of specimens.

Mammals

Consistent with other areas at New Philadelphia, mammals dominate the Block 7 faunal assemblage by contributing 80.2% of the identified specimens by count and 92.8% by specimen weight (Table 11.13). Mammals constitute 71.4% of the MNI and 92.6% of the biomass calculated from identified taxa. Also similar to Blocks 3 and 13, swine specimens are more numerous than cattle but apparently were secondary to beef in terms of biomass.

Table 11.13. Species composition of animal remains from EU 3, 4, and 5 in Block 7, Lot 1

[1] The only animal specimen from Feature 33 is a fragment of a cattle sacrum; all other animal remains are from Feature 34.
[2] Number of identified specimens.
[3] Minimum number of individuals.

The swine specimens in this collection reflect a minimum of three individuals, based on the presence of specimens representing at least one adult (20 specimens), one subadult (two specimens – a right distal humerus shaft and a left ilium acetabulum fragment), and one juvenile (one rib). Whereas isolated teeth and ribs are the most numerous skeletal portions, the swine collection is unusual for the complete absence of foot bones (Table 11.15). Sawed margins are present on a thoracic vertebra dorsal spine and a fibula shaft. Rodent damage was noted on a left proximal ulna, a right ulna mid-shaft, and a right tibia mid-shaft, and a fibula shaft was chewed on by a carnivore.

Only eight cattle remains and two sheep/goat specimens were associated with the structure on Block 7, Lot 1, and these represent a minimum of one individual each. Although mostly food refuse with a sawed and chopped rib, a chopped sacrum fragment, and a chopped right ilium, butchering waste of cattle is also indicated by a molar tooth fragment and three foot bones. A right whole metatarsal with subtle knife cuts along the medial shaft surface (proximal end and mid-shaft) is present along two first phalanges, one of which articulated with the metatarsal. A left distal sheep humerus is also present along with the acetabulum portion of a left ischium from either sheep or goat.

Remains of at least four individual domestic cats were encountered. A minimum of one adult is represented by ten bones (including long bones with fused epiphyses) from EU 3, consisting of right mandible, two thoracic vertebrae, two ribs (one from Feature 34), left second metacarpal, right fourth metacarpal, left distal fibula, right calcaneus, and left third metatarsal. Nine bones from a minimum of two subadult cats came from EU 4 and 5, as indicated by one right tibia with open proximal epiphysis and fused distal epiphysis, and a second, smaller right tibia having open epiphyses on both proximal and distal ends. Other subadult bones (as attested to by smaller size and long bones with open epiphyses) include right scapula, right ulna, right second metacarpal, two lumbar vertebrae, left second metatarsal, and right third metatarsal. Eight bones from at least

one juvenile (i.e., kitten) were recovered from EU 5 (right scapula, two fragments of a right humerus, left humerus, left pelvis, right and left femur, and right distal tibia) and one bone (right proximal ulna) from EU 3. The left distal humerus has a severe enlargement on the proximal end of the shaft, thinning of the cortex, and filling of the large medullary cavity with porous material, suggesting chronic bacterial or fungal granulomatous osteomyelitis (Figure 11.6; Dennis Lawler, pers. comm.).

Figure 11.6. *Left distal humerus of a domestic cat kitten from EU 5 exhibiting chronic infection at the proximal end; anterior view on left; posterior view on right (Photograph by Dennis Lawler).*

Several species of wild mammals were also identified. Most abundant are bones of eastern cottontail, at least five individuals are estimated on the basis of right pelves. Norway rat bones are also numerous, a minimum of four individuals calculated from right femurs. Six tree squirrel bones were recovered, three of which could be identified as fox squirrel. At least three individual squirrels are indicated by left humeri. Two opossum cranial bones (right nasal and left zygomatic) were found below the plow zone in EU 3. Fifteen small rodent remains include a minimum of one vole (cranium and mandible) and two house mice (two right mandibles). The unidentified small rodent specimens have an MNI of two based on the presence of right humeri and right tibiae.

Birds

The identified avian remains from Block 7 are dominated by domestic chicken. A minimum of three individuals are accounted for by left humeri and at least one additional large individual

chicken can be added due to the presence of eight bones characteristic of a large chicken. Small eggshell fragments were recovered in two soil samples and are consistent with the impression that chickens were being raised for their eggs as well as for their meat. Three additional species include Canada goose (right ulna and right carpometacarpal), turkey (left proximal fibula), and woodcock (right tarsometatarsus).

Miscellaneous Taxa

Specimens originating from animals other than mammals and birds are rare in the Block 7 faunal collection. Only two fish bones were found: a hypural (caudal bone) from Feature 34 and fragment of a rib, ray, or spine from the plow zone of EU 4. A vertebra from a non-venomous snake was identified from Feature 34. Amphibian bones include a tibio-fibula from a toad and a right humerus from a frog, both of which were recovered from the plow zone of EU 5.

Bone Artifacts

Two bone artifacts were found in the plow zone of EU 5. Both are cutlery handle scale fragments made from large mammal bone. One is only 3.4 mm thick with a highly polished surface and no decorations or incisions. The other scale is 7.0 mm thick, not as finely finished, and from a heavy-duty knife or tool.

Modifications

Cultural modifications on the Block 7 faunal assemblage consists of six sawed specimens, three chopped, and two with knife cut marks. A total of 15 bones had been gnawed by rodents, and only two by carnivores. Exposure to fire is apparent on only two specimens (= 0.7% of the assemblage), both of which are calcined.

Discussion

The 2008 faunal assemblage from Block 7, Lot 1 may span from the early 1840s until the mid-twentieth century during which time the lot may have had as many as five different residents. Despite the relatively small sample, the collection has a surprising diversity of species of mammals and birds. Not only are swine, cattle, sheep and chicken present, but local wild species include eastern cottontail, fox squirrel, and opossum. Given the wild species, the underrepresentation of fish is somewhat surprising. Skeletal portions of cattle and swine suggest that butchering waste was discarded on the site in addition to table refuse. The abundance of Norway rat remains may reflect animals that inhabited an abandoned structure.

Conclusions

This report on the faunal assemblages from within Blocks 3, 7, and 13 at the New Philadelphia town site contributes additional insights on foodways and refuse disposal patterns for the former residents of the community that was established by Free Frank McWorter and inhabited by his descendants as well as other families that relocated to the community from the Northeast, Mid-Atlantic Coast, and Upland South regions. We have strived to present data in a consistent format to enable and encourage comparative analyses for all areas of the site where excavations have occurred (see Martin and Martin 2010b) , as well as to other sites in the region (e.g., Martin and Brand 2010) . Additional significance of our faunal analyses will be realized when more detailed artifact analyses and historical studies are carried out for these lots. Hopefully, for example, the temporal dimension of our studies will eventually be refined so that subsistence patterns can be perceived at least in terms of early, middle, and late phases of New Philadelphia's history. In addition to foodways, the discovery of bones from potential pets and commensal species contributes to an appreciation of various animals' roles at the site. Recognition of pathologies and modifications to animal remains provides additional insights on behaviors and attitudes of former site residents.

Information in this technical report is based upon work supported in part by the National Science Foundation under Grant numbers 0353550 and 0752834 (Research Experiences for Undergraduates program). Any opinions, findings, conclusions, or recommendations expressed in this report are those of the authors and do not necessarily reflect the views of the National Science Foundation.

Chapter 12: Status of Geoarchaeological Investigations at New Philadelphia Historical Landmark

M. Kathryn Rocheford[1]

Background

Soil is the medium upon which the interactions of cultural land-use activities and the "natural" environment are imprinted. Landscape modifications for early historic land-use activities began with the clearing and burning of "natural" vegetation. Yet little work has been done to document how Midwestern soils have responded to the early stages of historic land-use. In addition, the landscape at the National Historic Landmark of New Philadelphia, Illinois has been moderately disturbed by later agricultural activities. However, archaeological investigations have revealed buried features and cultural material with excellent preservation in the soil below the modern plow zone. Further, the physical, biological and chemical processes of soil are differentially impacted by different land-use activities which are preserved long-term in cultural soils and can be observed and quantified. Contrasting between an undisturbed soil and that of various land-use areas will reveal any differential effect from anthropogenic modification of the landscape. These data are used to reconstruct the history of land-use activities, not discernible from historic records, and provide important insights into the activities of the inhabitants of New Philadelphia.

Initial archaeological and geological investigations at New Philadelphia indicate the landscape has been modified extensively during three distinct stages of historic activity. The first stage was clearing the land for settlement and occupation of a racially integrated merchant community. According to census records the town had an integrated population of European and African descendants, reaching its peak population in 1865 (King 2007). Having been bypassed by a regional railroad, the population dwindled to four farmsteads by 1890 (Walker 1983). A 1939 aerial photograph of the town site illustrates that the town was largely abandoned with only two farmsteads remaining (Figure 12.1). However, it also clearly outlines orchards and large subsistence agriculture plots, and marks the beginning of the second stage during which most of the buildings were moved or razed and the land was converted to small-scale agricultural use. Also visible in the image are small tributaries on the east and west sides of the platted town and landforms nearby indicate that soil erosion was somewhat problematic. By the mid-1990s the tributary on the west side of town had been dammed forming a large pond, and erosion control terraces had been constructed (Figure 12.2). This marks the beginning of the third stage of landscape modification.

[1] University of Iowa.

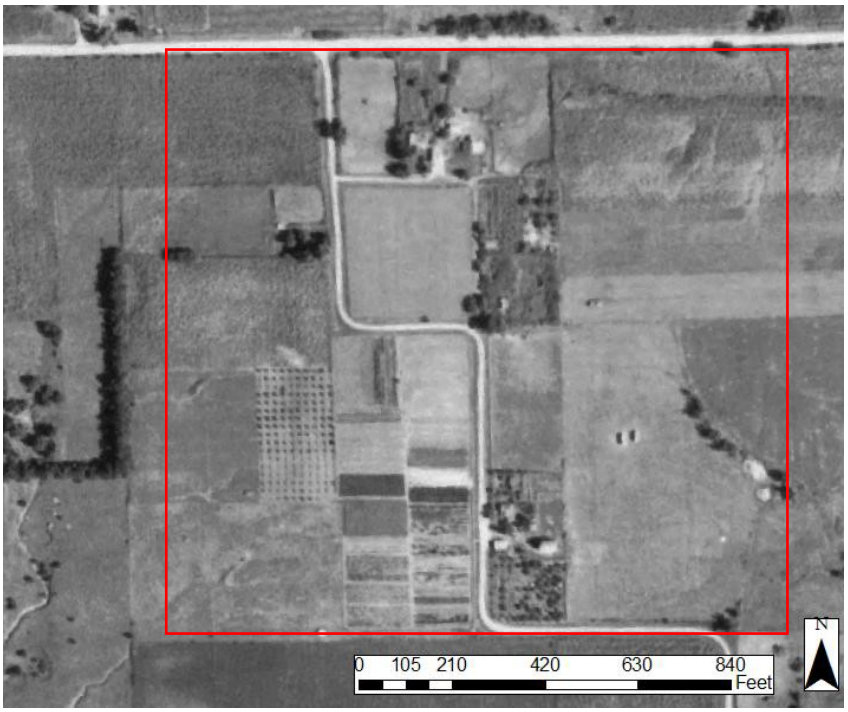

Figure 12.1. *1939 Aerial photograph of New Philadelphia town site (outlined in red), see text for features of note (Photograph from U.S.D.A. Aerial Photographs Collection).*

In 2008, a series of two-inch diameter soil cores were extracted along the ridges of erosion control terrace 1, 2, and 3 (Figure 12.2) using an AMS Inc. slide hammer soil corer. Fennell's interpretation from this testing was that "terrace 1 was created by digging out adjacent swales without bulldozing soils and sediments in a jumble onto the ridge-top" and suggested terrace 1 might be targeted for future investigation (Fennell 2009). Methods and other interpretations from soil core sampling in 2008 are detailed in Chapter 7, "Core Sampling of Terraces West of Broad Way," of Fennell (2009), which is available online at: www.anthro.illinois.edu/faculty/cfennell/NP/2008ReportChap7.pdf.

Figure 12.2. *1998 Aerial photograph of New Philadelphia town site (red square), illustrating erosion control terraces and large pond on west side. Excavation trench outlined in yellow (U.S. Geological Survey, Aerial Photographs Collection).*

Initial geologic investigations were conducted during the summer of 2010 and subsequent laboratory analyses ensued. The findings and recommendations are detailed in (Rocheford 2011), which is available online at www.anthro.illinois.edu/faculty/cfennell/NP/2010ReportChap6.pdf. Based on the initial investigations and additional evaluation of historical documents, a research plan was developed for additional fieldwork during the fall of 2010 in collaboration with Fennell.

Trench Excavation

In the mid-1990s ridge and swale terrace features were constructed on the west side of the town site to decrease erosion. This location has a Natural Resources Conservation Service (NRCS) soil classification of Downsouth silt loam with 5-10% slope, a mesic Oxyaquic Hapludalfs (Soil Survey Staff, 2006). These are soils with moderate development of soil horizons that developed under broadleaf forest in humid, temperate climate conditions. Soils that develop under forests typically have a thin A-horizon at the surface that overlies a zone that is significantly lighter in color due to leaching of minerals and clay size particles. Below these horizons is a zone of accumulation that is easily identifiable due to prominent color mottling within the soil from natural soil processes and is generally considered to be culturally sterile.

Results from the 2010 field school suggest that the eastern most erosion control ridge was built up. Therefore, a back hoe trench bisecting terrace 1 (Figure 12.2) to determine the potential for buried and/or disturbed archaeological features was excavated. A 4 ft x 12 ft trench was excavated and from the highest elevation of the terrace a profile of the soil measuring 4 ft, 4 in. was exposed (Figure 12.3).

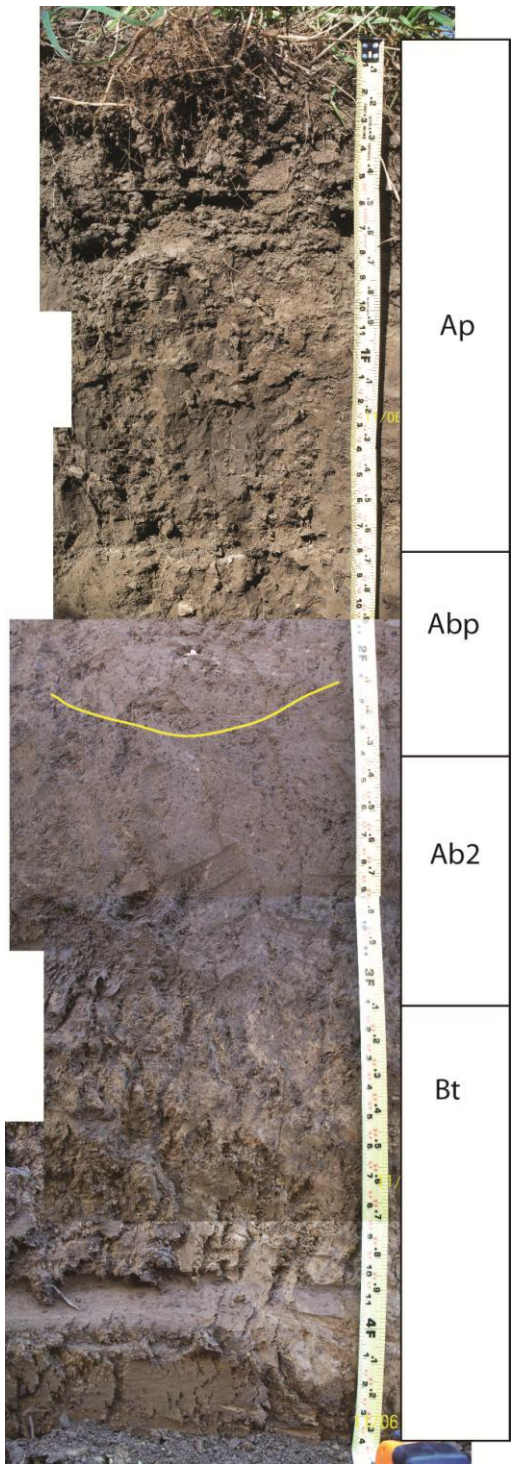

Figure 12.3. *Composite image of soil profile of erosion control terrace 1 with sketch of soil horizons on right. Note white mineral accumulation demarcating boundary between cultural fill (Ap) above and buried surface (Abp) below with plow scar (yellow).*

The soil profile description (Table 12.1) reveals a thick organic rich horizon (Ap) with a jumble of cultural artifacts that thins with distance from the apex of the terrace. The Ap horizon overlies a buried surface horizon (Abp) at about 20 inches below the surface (inbs). This horizon appears to have been scalped near the eastern end of the trench suggesting that some of the surface soil was borrowed from that area to build up the terrace, at least in this particular location along the terrace. Bulk soil samples were collected from each horizon for later geochemical analyses which would enable a more detailed comparison between the two locations.

Table 12.1. Description of soil profile from trench excavation of terrace 1

Horizon	Depth (inbs)	Color	Texture	Description
Ap	0 - 20	10YR 3/2	Silt loam	Dark brown 10YR 3/2 silt loam; weak, fine platy; very friable; abundant medium to coarse roots; common brick and mortar fragments; common 3-6 cm chert pebbles; non-effervescent; wavy boundary marked by light gray 10YR 6/2 calcic coatings.
Abp	20 - 28	10YR 3/2	Silt loam	Dark brown 10YR 3/2 silt loam; strong, medium subangular; friable; few fine roots; non-effervescent; sharp, wavy boundary.
Ab	28 - 37	7.5YR 3/2	Silty clay loam	Dark brown 7.5YR 3/2 silty clay loam; strong, medium prismatic; firm; common fine to medium roots; non-effervescent; gradual boundary.
Bt	37 - 52	10YR 5/3 & 6/6	Clay loam	Brown 10YR 5/3 and brownish yellow 10YR 6/6 mottled clay loam; strong, medium prismatic; very firm; abundant, very dark grayish brown 10YR 3/2 filled macropores; common, medium redoximorphic features with black 10YR 2/1 manganese coatings; non-effervescent.

Giddings Cores

The NRCS provides georeferenced electronic files that illustrate the geographic extent of soil classification (Figure 12.4). These maps are computer modeled from select soil sampling locations, topographic maps, and modern land-use records. The area for NP indicates that only the north central part of the town site has an area that contains soil of the Wakenda Series, which is classified as a mesic Typic Argiudoll. These are soils that develop in grassland (prairie) areas of humid, temperate climate that have weathered sufficiently to produce a thick, organic-rich horizon and deeper horizon that is enriched in clays transported by water and gravity down

profile. The remaining areas contain soils of the Downsouth and Winfield Series, which are classified as mesic Oxyaquic Hapludalfs (Soil Survey Staff 2006). These are soils with moderate horizonation developed under broadleaf forest in humid, temperate climate conditions. Subsequently, observations of significantly different thicknesses of the A horizon in locations may indicate areas of different "natural" vegetation or differential preservation of the "natural" soil profile due to anthropogenic and/or natural processes such as mechanical leveling or different erosion rates.

Eight soil cores, three inches in diameter were extracted from locations within the town site to represent different soil classifications, landscape positions, and land-uses at the site (Figure 12.4, Table 12.2). These cores were wrapped in plastic and aluminum foil and transported to the University of Iowa for processing.

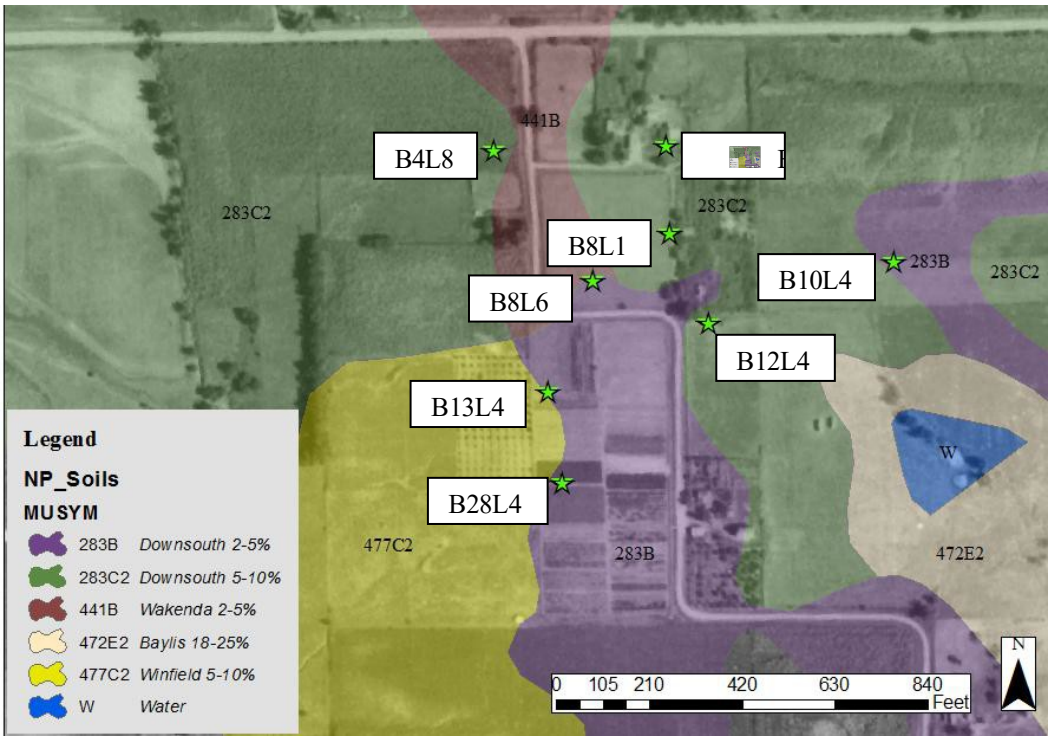

Figure 12.4. *1990 Soil classification map overlain on 1939 Aerial photograph with locations of Giddings soil cores extracted in November 2010.*

Table 12.2. Soil classification, depth to base of soil core, landscape position and Historical land-use for the Giddings soil cores extracted in November 2010.

Locale	Soil Classification	Depth	Landscape Position	Land-use
B10L4	Downsouth 2-5% slope	17 ft	Shoulder, convex	Pasture/Agriculture
B8L1	Downsouth 2-5% slope	4 ft	Summit	Unknown/Agriculture
B18L4	Downsouth 2-5% slope	4 ft	Summit	Residential
B12L4	Downsouth 2-5% slope	4 ft	Side slope, concave	Residential/Agriculture
B3L8	Downsouth 5-10% slope	4 ft	Side slope, concave	Residential
B8L6	Wakenda/Downsouth	12 ft	Summit	Unknown/Agriculture
B4L8	Wakenda/Downsouth	4 ft	Summit	Residential/Agriculture
B13L5	Winfield/Downsouth	4 ft	Summit	Pasture/Garden/Agriculture

Two cores with the same soil series classification with two very different land-use histories were selected for preliminary geochemical analysis: B3L8 and B10L4.

Block 10, Lot 4 (B10L4) – B10

This soil core is from a location that is now an agricultural field. This block was not developed and was ceded from the town site into agricultural land-use in 1885 (Hadley township tax assessments, transcribed by Claire Fuller Martin and available online at http://www.anthro.illinois.edu/faculty/cfennell/NP/taxmenu.html). The surface horizon appears mixed to a depth of ~15.5 centimeters as evidenced by weak soil structure and a sharp lower boundary, likely produced by plowing (Figure 12.5). This location is on the shoulder of a convex slope with a 2-5% gradient that receives direct sunlight throughout the day.

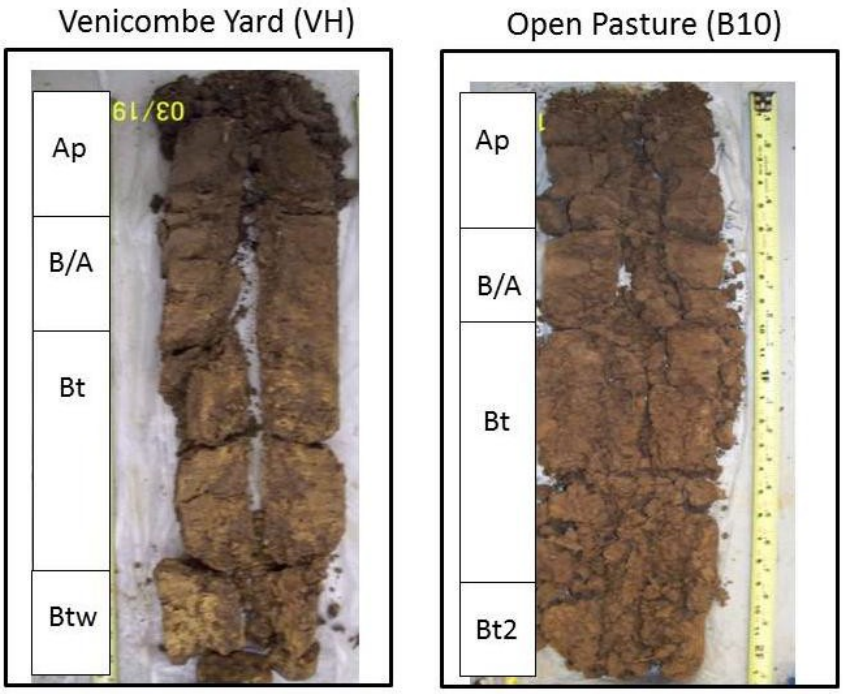

Figure 12.5. *Photographs of the two-foot soil cores from the B10 and B3L8 locations with sketch of soil horizons illustrating physical differences between the two locations.*

Block 3, Lot 8 (B3L8) – "Venicombe" house (VH)

This area is associated with above-ground foundations of a former residence, which was occupied until the mid-1990s, and associated outbuildings. Since then the house foundation has served as a collection area for miscellaneous metal implements. The soil core location is between the house foundation and a tree-lined wall constructed of fieldstone to the west. While the area has been mown periodically, it is protected from plowing. This location lies on a concave side slope with a 5-10% gradient that dips toward the northeast, effectively shielding the location from sunlight except when it is directly overhead.

Initial geochemical analyses of soil samples from the B3L8 core location (Figure 12.4) revealed high levels of trace metals that have been translocated deep in the soil. Furthermore, the physical characteristics of this core suggest that the location is periodically saturated, which along with a temperate climate increases the solubility and mobility of these elements both within the soil and potentially into the groundwater. Therefore, analyzing additional samples from this location will determine the extent of this contamination and an appropriate mitigation strategy. In addition, comparison of this residential area with other residential areas will help elucidate their respective histories.

The 2011 NSF-REU Field Season

Geoarchaeological goals for the 2011 field season were two-fold: (1) obtain additional soil samples from representative land-use areas for physico-chemical analyses; and (2) train undergraduate students in geologic theory and methods. During the course of the field school, students were given hands-on instruction and had the opportunity to practice a variety of geologic methods used in geoarchaeological investigations. These included the basics of: map reading, use of a Brunton compass, use of a total data station, platting survey points and sampling locations, operation of a Giddings drill rig, soil description, soil sample collection, and flotation of soil samples.

Total Station & Brunton Compass

In geologic practice as in archaeology, use of a total station (TS), equipped with an electronic distance measuring device (EDM), theodolite (aka Transit), and an electronic field notebook, is extremely useful for mapping out a grid of the site and precisely recording the distance (x- northing and y- easting) and elevation (z) of sample collection locations in reference to a point of known latitude, longitude and elevation (datum). These data are subsequently uploaded to a geographic information system (GIS) so that the locations can be georeferenced and combined with other georeferenced maps and images of the site.

> I learned how to set up the transit station from taking it out of the bag to shooting in points. According to Chris [Fennell], a lot of these machines are similar and knowing one version will translate loosely to using other types. I found this super helpful and good to overcome my fear of this machine. - Amanda Burtt [NSF-REU student]

A Brunton compass and topographic map can also be used to determine one's position on a landscape, as well as sight survey lines, however the precision and accuracy is much less than with a TS and is subject to operator variability. The advantage of using a Brunton compass and topographic map is that they are much less expensive and more portable than a TS.

Oakfield Soil Sampling – Thermal "cold" anomaly

Soil sampling is also common practice in both archaeological and geologic field investigations. During the course of the 2011 field school, students learned how to collect a soil sample using an Oakfield soil probe, determine the color and texture of soil horizons and document any cultural artifacts (Figure 12.6).

Figure 12.6. *NSF-REU field school students describing Oakfield soil cores.*

A large thermal infrared (TIR) anomaly in the northern half of Block 13, Lot 6 was selected for investigation. It was interpreted as a "cold" anomaly in the TIR 2008 survey conducted by Bryan Haley of the University of Mississippi and Tommy Hailey of Northwest State University. Students used the TDS and measuring tapes to determine the location of the corners of the lot from the reference TDS position.

Two parallel 75 ft lines were platted for a soil probe survey. One ran from the northwest corner of Block 13, Lot 6 to a point 45 ft south of the northeast corner, with the second line 20 ft south of the first line (Figure 12.7). Soil samples were extracted using an Oakfield one-inch diameter soil probe at one-foot intervals beginning at the 25 ft mark from the northwest end of each line. Detailed descriptions of the soil samples revealed very few cultural artifacts such as brick, mortar, and nails suggesting that this area was some distance from former building sites and that subsequent agricultural activity has not significantly transported and mixed materials from nearby building locations.

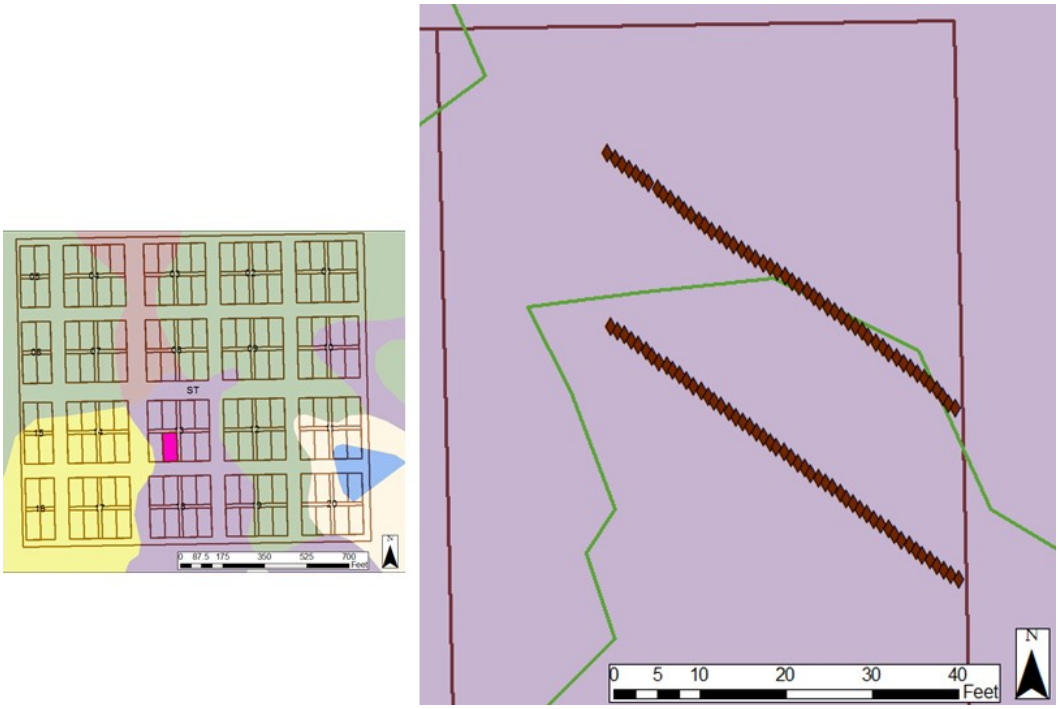

Figure 12.7. *Map of town site block, lot grid overlying the NRCS soil survey map. Block 13, lot 6 is highlighted in pink on left. Right image is close-up of northern half of lot 6, illustrating the GPS locations for the Oakfield cores (brown dots) in relationship to the thermal anomaly (green outline).*

Giddings Soil Core Collection

Based on preliminary findings from previous field work and lab analyses outlined above, four areas were identified for focused spatial analysis of soil properties. At each of the four locations detailed below, students used measuring tapes to map out a 20 x 20 ft grid and five-foot intervals within the grid. The trailer-mounted Giddings rig was maneuvered into position as close as possible to the flagged positions. The two-foot long, three-inch diameter, soil cores were extracted, wrapped in plastic wrap and aluminum foil, and labeled. The cores were transported to the University of Iowa for later description and sample preparation for physico-chemical testing. The geographic coordinates for each core location were "shot-in" with the TDS and these data were uploaded to a georeferenced database and are displayed in Figure 12.8.

Block 3, Lot 8 "Venicombe" house (VH)

RO-GC25 (VH, Figure 12.8) was extracted as part of the 2010 fall fieldwork and is described in "Background: Giddings cores: Block 3, Lot 8 (B3L8) – 'Venicombe' house (VH)," above. A 20 x 20 ft grid was positioned with this core location at the center and oriented between the house foundation and wall to permit maneuverability of the drill rig equipment.

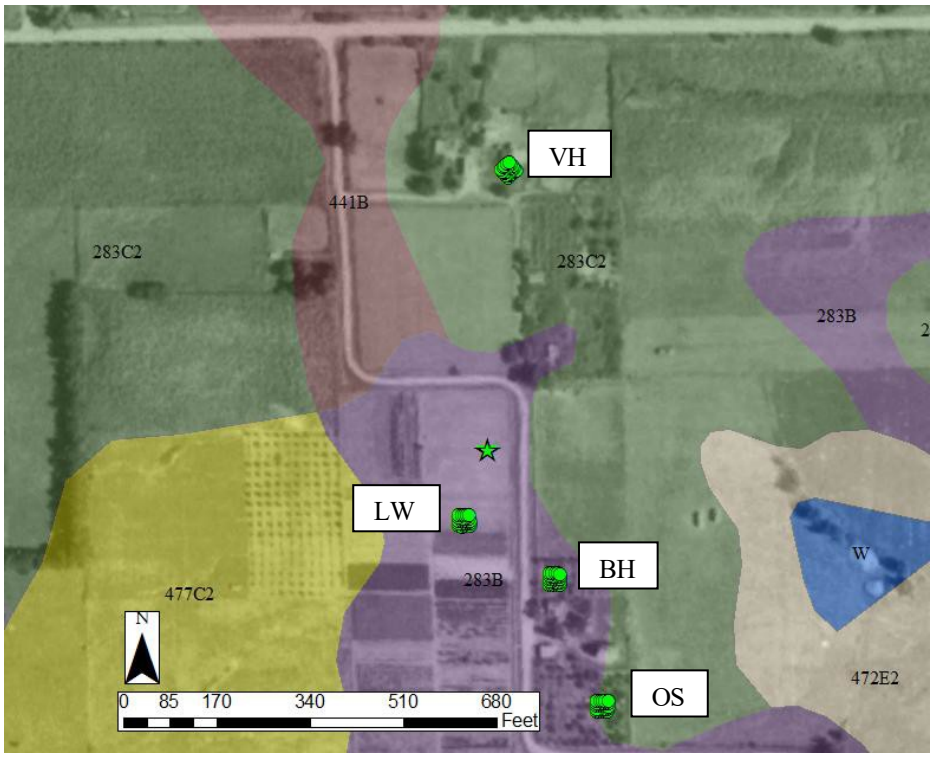

Figure 12.8. *Locations of soil cores extracted from four 20 x 20 ft grids (clusters of green dots). Green star denotes the location of an additional Giddings soil core nine feet in depth.*

Block 19, Lot 4 – Burdick Residential Yard

Another 20 x 20 ft. grid is located in the "Burdick" manicured front lawn (BH, Figure 12.8) just west of the existing "Burdick" house and directly north of a previous house. The existing house was built in 1941 and occupied intermittently until the present. Contrary to the soil classification mapped at this location (Downsouth), the center soil core from this grid, BH-GC14, contains a dark, organic rich horizon throughout (Figure 12.9), which more closely relates to the soil profile description for the Soil Survey classification of the Wakenda soil series that forms under prairie vegetation. This appears to suggest either a discrepancy in the classification map or that cultural fill has built up the thickness of the organic rich soil. Initial geochemical analyses of soil samples from the BH-GC14 soil core indicate similar provenance of the mineral components to those of the B3L8 and B10 soil samples. However, slight peaks in calcium concentrations with associated peaks in iron oxide and zinc concentrations may be the result of lawn fertilizer applications. Therefore, additional analyses of the surrounding cores will help clarify the preliminary results and subsequent interpretations of the land-use history at this location.

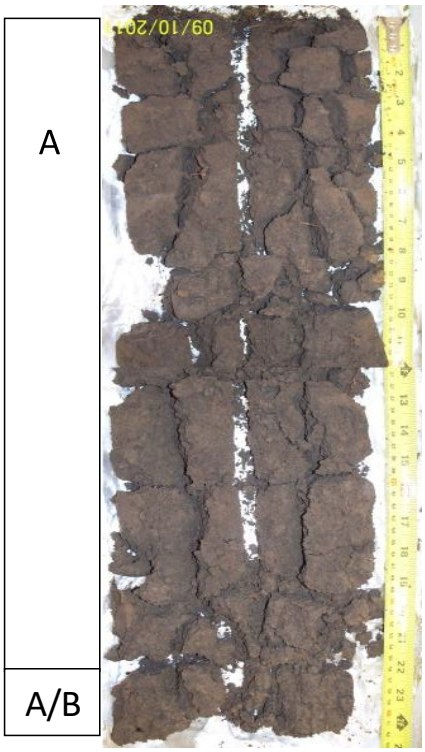

Figure 12.9. *Photograph of two-foot soil core, BH-GC14, with sketch of soil horizons.*

Block 19, Lot 5 – Burdick "Pasture"

The Burdick "pasture" area (OS, Figure 12.8) is associated with and south of an existing, dilapidated barn. In the 1939 aerial photograph, this area appears to be fallow with a few small trees. However, present day there are no trees, suggesting some additional disturbance of the soil from their removal. As the soil cores were being collected, it was noted that the organic rich soil horizon appears thicker in cores from the west side of the grid, which is somewhat surprising because the west side is slightly uphill from the east. Analyses of soil cores from this location will help elucidate the relationship of elevation change with soil horizon thickness and its potential cause(s). Furthermore, because this area appears to be undisturbed by modern agriculture, the geochemical effects of early historic land-use may be preserved.

Block 13, Lot 7 – McWorter "Pasture"

This area is associated with the Louisa McWorter house and outbuildings and may have been used for pasture or gardening during New Philadelphia's early-historic occupation, but was clearly being used for subsistence garden plots by 1939 (LW, Figure 12.8). This area has undergone modification for modern agriculture since the mid-1900's. Therefore, comparison of soil characteristics from this location with those from the "unmodified" Burdick pasture will assist in distinguishing modern agricultural effects from early-historic land-use.

Shovel Test Pits

The "Square" (Matteson 1964) in Block 8, Lot 1 may have had buildings in the mid-1880s as historical tax records indicate this area was "improved," but by 1888 it was not being taxed as improved (Hadley township tax assessments, transcribed by Claire Fuller Martin and available online at http://www.anthro.illinois.edu/faculty/cfennell/NP/taxmenu.html). In the 1939 aerial photograph (Figure 12.8), the "Square" appears to be an open grassy area. Since the mid-1900s it has been modified by modern agriculture. Comparing this area's soil characteristics to the soil profiles from areas that have not witnessed modern agricultural use (BH, BP & VH, Figure 12.8) may enable a differentiation between early-historic land-use and modern agriculture impacts.

During the 2011 NSF-REU field school, a 20 x 30 ft grid for shovel test pit (STP) excavations at five-foot intervals was platted in Block 8, Lot 1 for archaeological investigation. At 10 ft intervals starting with the STP in the southwest corner, 2 cm soil samples were collected from nine of these STP units to a depth of 40 cm, at which point all STP units were in the subsoil (culturally sterile horizon). Each sample was placed in a WhirlPak bag, sealed and stored at <75°F for later physico-chemical analysis. Detailed soil descriptions are in Chapter 14, "Unit Summaries," with the archaeological findings.

Cemetery

The cemetery is mapped as Winfield silt loam, 5 to 10% slopes, eroded (USDA-NRCS, 2006c). Like the Downsouth series, this soil series is classified as a mesic Oxyaquic Hapludalf, which forms under deciduous forest, but the E horizon is not as well expressed as in the Downsouth Series. The 1872 township map indicates this area was wooded (Figure 12.10a) and a 1939 aerial photograph (Figure 12.10b) indicates the location was on the boundary of an agricultural field. Furthermore, the lack of large, old trees in the present indicates it may have been disturbed by clearing of vegetation.

Figure 12.10. *Maps illustrating relationship of McWorter cemetery to NPHL: (a) on the right - portion of 1872 Pike county map illustrating cemetery in forested area; and (b) on the left – 1939 aerial photograph (cemetery outlined in red; NPHL in yellow; blue star is STP location).*

On the slope summit in a small opening among trees just outside the eastern boundary of the McWorter cemetery, a 2 x 2 ft shovel test pit was excavated to a depth of two feet by 2011 NSF-REU students Liz Usherwood, Amanda Burtt, Thomas Glantz (Figure 12.11). The team demonstrated their knowledge of soil descriptions by describing the color and texture of the soil profile of the west wall (Table 12.2). The team assisted in the collection of soil samples at 2 cm intervals for physico-chemical analyses and micromorphology samples of in-place soils for thin section examination.

Figure 12.11. *Top: 2011 NSF-REU students, left to right: Liz Usherwood, Amanda Burtt, and Tom Glantz with 2 x 2 foot shovel test pit near McWorter cemetery; bottom: 2-foot soil profile of shovel test pit.*

XRF Testing

A portable hand-held x-ray fluorescence (XRF) spectrometer was loaned by Bruker AXS for use during the field school. XRF is a fast, non-destructive analysis tool that can be used to characterize chemical composition of the surface of archeological artifacts, such as glass and

ceramics, as well as for geochemical survey of *in situ* soils. However, given the heterogeneity of soils across a landscape like at New Philadelphia, and limitations of the equipment without the vacuum functionality the XRF analysis revealed that characterizing the elemental composition of soil would not yield the precision necessary to differentiate the effects of land-use from variation inherent in natural geochemical processes at different soil locations. The vacuum functionality expands the detection limits of the XRF so elements important to soil geochemical processes, such as aluminum and magnesium can be measured. A better geologic use of this equipment would be determining the presence and spatial extent of environmental contaminants, such as heavy metals, that would not require the use of the vacuum.

I demonstrated the use of the equipment and interpretation of the data produced from some of the "unidentified substances" found inside what appeared to be apothecary bottles from the cellar excavations as well as different glazes on pottery sherds. Arsenic was one of the dominant elements associated with the ceramic sherds and a little bit of internet searching revealed that arsenic was used in ceramic glazes to produce certain colors. However, while XRF is non-destructive to the sample, it does not penetrate the surface of the artifact. Therefore, if the objective is to identify the composition of the ceramic, better analytical results would be obtained by preparing a powder of the artifact.

Future Research

To date, nine deep soil cores and 100 two-foot soil cores have been extracted and will be described and samples will be collected from each soil horizon. In addition, soil samples from shovel test pit units on Block 8 and near the McWorter cemetery, and bulk soil samples from a trench excavation have been collected. Physical and chemical analyses will be performed on select soil samples to elucidate variability of soil characteristics due to landscape position, slope, aspect, and land-use. Specifically, variability across the landscape, or at a macro-scale, will be delineated by examination of the physical descriptions of the nine deep soil cores and one two-foot soil core from each of the four 20 x 20 ft grids. Soil cores from each of the grids will be examined to describe any meso-scale variability of soil characteristics. Finally, micro-scale analysis of physical and chemical data produced from micromorphological thin-sections and incremental soil samples within the specified land-use areas: residential, pasture, and garden plots, will reveal geochemical signatures that are related to and differentiate past land-use activities that will help to elucidate the history of this cultural landscape and resulting soil changes.

Chapter 13: Surveys and Comparative Findings

Christopher C. Fennell, Anna S. Agbe-Davies, and Claire Fuller Martin[1]

Researchers at New Philadelphia use a variety of techniques to discover and assess the potential of archaeological deposits. Geophysical survey has been a key technique for identifying likely areas for intensive excavation, as have shovel test pit surveys and soil coring. These strategies have been as follows:

1. Apply electrical resistivity and magnetic gradiometry to Block 12, the first geophysical surveys of this portion of the site.
2. The agricultural terraces west of the center of the town site were tested using a larger-gauge (2 in.) AMS core sampler.
3. A portion of Block 13 was surveyed using ground penetrating radar and electrical resistivity.
4. Excavators used a one-inch diameter soil corer to test geophysical anomalies on Blocks 4 and 13. One of these areas was selected for follow-up excavation.
5. Electrical resistivity was applied to grids on Block 11. Follow-up work took the form of shovel test pits.
6. With a grant from the University of Illinois, the research team obtained a LiDAR survey of an area of 4.25 square miles that includes the town site.

Additional surveys, with an emphasis on geoarchaeology, are dealt with in Chapter 12, "Status of Geoarchaeological Investigations at New Philadelphia Historical Landmark," which focuses on these results specifically.

Geophysical surveys

Major geophysical surveys of the New Philadelphia town site took place from 2004 to 2006, with some additional data collected in 2008 (Hargrave 2006). In 2010, Carl Carlson-Drexler from the U.S. Army Engineer Research and Development Center, Construction Engineering Research Laboratory, Champaign, came to do additional data collection and provide instruction for the students participating in the NSF-REU program. All of the information reported here refers to personal communication with Carlson-Drexler (2010).

Carlson-Drexler supervised the use of electrical resistivity in four 20 x 20 m. data collection grids and conducted a magnetic gradiometry survey of three 20 x 20 m. grids. Ground penetrating radar was used on two 20 x 20 m. grids.

[1] The University of Illinois, Urbana-Champaign; the University of North Carolina, Chapel Hill; and the Illinois State Museum.

Electrical resistivity

Electrical resistivity works by passing an electrical current through the soil and measuring the resistance offered by the soil to that current (Figure 13.1). Differences in resistivity readings may indicate distinct soil conditions such as buried archaeological features.

Extremely wet soil conditions on Block 11 and a wiring fault in the resistivity meter made interpreting the data collected a challenge. Nevertheless, preliminary analysis of the readings suggested an area of high resistance in the northern portion of the Block 11 survey grids. Recommendations for follow-up included the application of ground penetrating radar to the same grids, and possibly re-sampling the grids with the resistivity meter. Results for Block 13 likewise pointed toward an area of higher resistivity in the northern portion of those two grids.

Figure 13.1. *NSF-REU students Margaret Wolf (center) and Tyquin Washington (right) assist Carl Carlson-Drexler with the resistivity survey (Photograph by Anna Agbe-Davies).*

Magnetic gradiometry

Magnetic gradiometry captures changes in the magnetic field across the site, and can indicate the presence of such cultural evidence as iron and burned soil. During the 2010 field season, magnetic gradiometry of the three grids that overlap with the northern portion of Block 12 picked up traces of the eastward continuation of Main Street (now a dirt track).

This technique also revealed several large dipoles, or readings with both a high and a low signature—typical of small iron artifacts—in the eastern grid. Two "significant" dipoles appeared in the northernmost of the grids (Carlson-Drexler, personal communication 2010) indicating a probable anomaly on Block 9. No anomalies appeared in the areas of interest (Lots 4 and 3) as determined by prior shovel test pit surveys (Fennell 2006).

Ground penetrating radar

Ground penetrating radar works by sending pulses of electromagnetic energy into the ground and measuring the varying rates at which the waves are reflected back to the surface. The ground penetrating radar data collected from Block 13 was heavily impacted by the plow furrows still apparent on the ground surface. This is true even for data collected at 1.5 meters below the surface. Recommendations for future use include running the machine parallel to the furrows, as opposed to across them, and testing the method elsewhere at the site (Carlson-Drexler, pers. comm. 2010). The 2010 season marked the first use of ground penetrating radar on the town site. As a result of these, and earlier geophysical findings, excavators collected core samples across several anomalies on Block 13 leading to full-scale excavation as described in detail in Chapter 8.

Core Sampling of Terraces West of Broad Way

Archaeologists investigating the New Philadelphia town site primarily utilized one-inch diameter soil core sampling tools for the initial systematic testing of anomalies identified through geophysical surveys. Those smaller-scale core sampling tools typically obtain core samples of three feet in depth below the ground surface. Starting in the 2008 field season, we also began utilizing a two-inch diameter soil core sampler that can obtain core samples of up to six feet in depth below the ground surface. Figure 13.2 depicts this type of heavier-gauge soil core sampling device, which is driven into the ground with a thirty-pound slide hammer assembly on the upper portion of the device, and which is withdrawn from the ground with a custom lever jack assembly.

Figure 13.2. *Example of a slide hammer driven, two-inch diameter core sampling device.*

This core sampling device, which is referred to as an "AMS core sampler," is part of our ongoing program to conduct systematic testing of anomalies identified through remote sensing methods employed at the town site. Such core sample surveys can be used to test the anomalies identified both in ongoing ground-based geophysical surveys, and the anomalies identified in the low-altitude thermal imaging survey conducted in May, 2008 (see, e.g., 2009 update report).

During the 2008 archaeological field school at New Philadelphia, we utilized the AMS core sampler to test a series of earthen terraces on the west side of the New Philadelphia town site. These terraces were constructed in the early 1990s by private landowners of portions of the town site as part of a federal program that promoted the creation of such ridges to control soil erosion on the landscape. One can readily observe the contours of these terraces by comparing a 1939 aerial photograph of the town site (Figure 13.3) with one taken in 1998 (Figure 13.4).

Figure 13.3. *1939 aerial photograph of New Philadelphia town site (Photograph from U.S.D.A. Aerial Photographs Collection).*

Figure 13.4. *A 1998 high-altitude aerial photograph of the New Philadelphia town site, with town boundaries outlined and three earthen terraces labeled (U.S. Geological Survey, Aerial Photographs Collection).*

The west side of the town site in the 1939 aerial photograph consisted of relatively even topography (Figure 13.3). That part of the landscape was modified in the early 1990s to create a series of curving terraces and a new catchment pond, as shown in the 1998 photograph (Figure 13.4). A systematic walk-over survey of the town site conducted in late 2002 and early 2003 recovered relatively few artifacts from the surface area of those terraces, in contrast to a high frequency of artifacts located on the surface of the north central part of the town site (Gwaltney 2004). We are still in the process of exploring the area of these terraces with ground-based geophysical surveys, and we have questioned whether this area of the town site was dramatically disturbed by the creation of those terraces.

During the 2008 field school, we undertook AMS soil core sample surveys along the ridges of the terraces labeled as 1, 2, and 3 in Figure 13.4. One general scenario for the method in which such terraces are created involves a bulldozer digging into the ground surface on either side of a terrace ridge and pushing soil and sediment layers up into that ridge in a way the significantly disturbs both the surrounding depressions, called swales, and the resulting ridges. If such a method was employed, one expects a soil core sample in a swale to show the absence of a thick top soil layer (which would have been scraped away onto the neighboring ridge) and one expects to find a soil core sample of the ridge top that exhibits significant mixing and disturbance of soil layers that were carved out of swales and pushed up to create that higher contour point.

Figure 13.5. *Paul Shackel and Chris Fennell obtain AMS soil core samples on terrace 1 in the New Philadelphia town site (Photograph by J. Eric Deetz).*

We placed several soil core sample points at approximately every 100 ft. from the north edge of the town site running southerly down the extent of terraces 1 and 2 and on part of terrace 3. The AMS soil core sampling device obtained sample profiles that went four-feet in depth and were two-inches in diameter. Core samples were later recorded in profile regarding soil and sediment colors, textures, and types, and any inclusions of cultural materials. We also took adjacent samples from points in the swale immediately east of terrace 1 (Figures 13.4 and 13.5). These soil core samples indicate that the strata underlying terrace 1 remain undisturbed, whereas the strata on the ridges of terraces 2 and 3 appear to be significantly disturbed from the creation of the terraces. Similarly, the swale immediately east of terrace 1 appears to lack the typical upper stratum of top soil found on other parts of the town site. It appears that terrace 1 was created by digging out adjacent swales without bulldozing soils and sediments in a jumble onto the ridge-top. Based on these results, we may target portions of terrace 1 for further archaeological investigation in future field seasons.

Coring Anomalies

Archaeologists selected several anomalies that had been identified by geophysics surveys conducted 2004-2008 for further testing. These anomalies were tested with transects across them at one-foot intervals using a one-inch diameter probe (Figure 13.6). The areas tested include:

Anomaly A57 on Block 4, Lot 8; Anomaly A58, on Block 4, Lot 7; and Anomaly A21, on Block 13, Lot 3.

Figure 13.6. *Members of Team X assess the sediments recovered when using an Oakfield probe to survey Block 8 (Photograph by Anna Agbe-Davies).*

Anomaly A57

Located on Block 4, Lot 8, Anomaly A57 is a resistivity anomaly that was identified by Michael Hargrave during a geophysical survey conducted in 2008. Excavators investigated this anomaly using a one-inch diameter Oakfield probe, testing the soil at one-foot intervals in one 50 ft. transect running north-south through the anomaly (Figure 13.7).

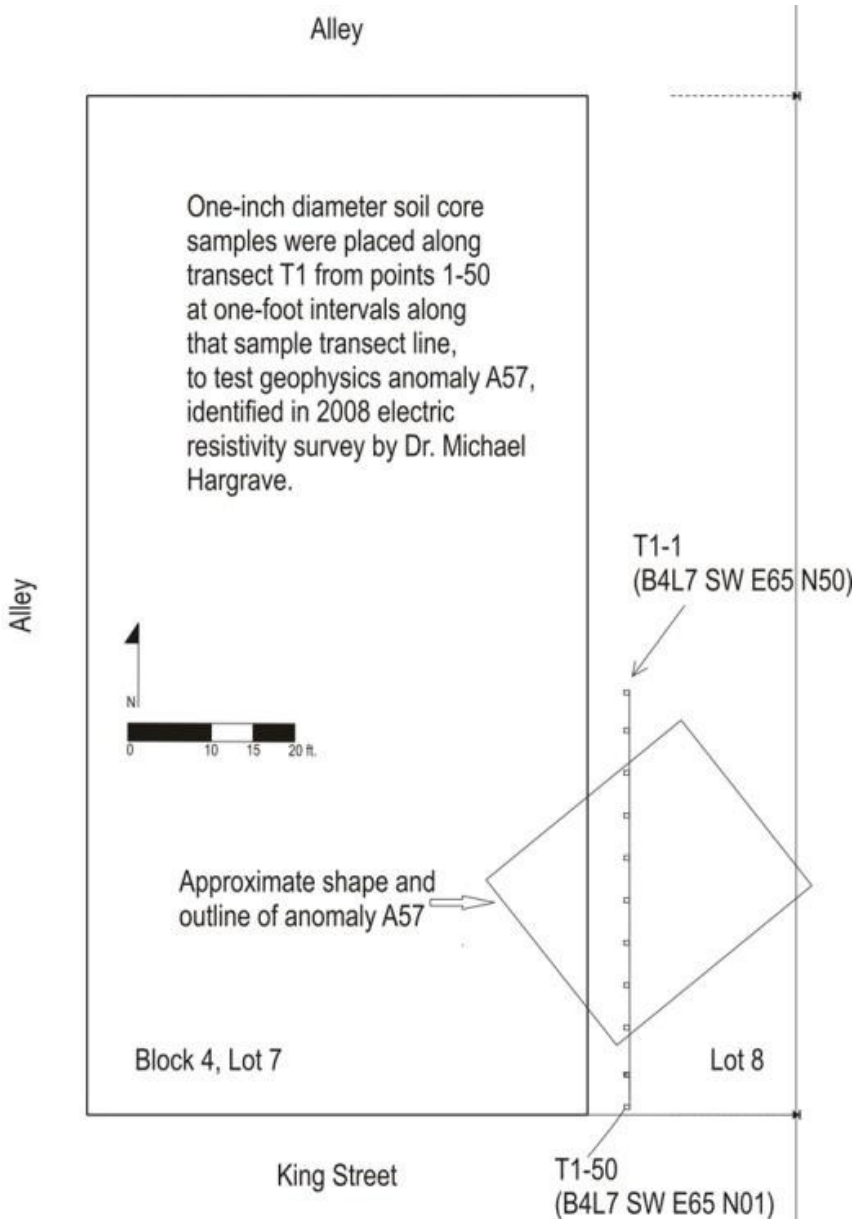

Figure 13.7. *Anomaly 57 was tested with a single line of 50 one- inch probes (Illustration by Christopher Fennell).*

Below the sod, the plow zone was predominantly a 10YR 3/2 (very dark grayish brown) loam. In the majority of probes, excavators identified the transition to subsoil between 0.5 ft. and 1.5 ft. below surface level (bsl). The average depth of the transition was 1.19 ft. bsl. Subsoil was more variable in color, but tended to be recorded as 10YR 6/6 (brownish yellow) to 10YR 5/4 (yellowish brown) clay loams or loamy clays (precise details about each core can be found in Chapter 8 of the 2010 report, "Unit/Feature Summaries").

A notable exception to the above pattern was found at the approximate center of the survey area. Probes 21, 22, and 23 all indicate darker loams and sandy loams at much greater depths than the

rest of the transect. Each of the probes sampled a depth greater than 2.5 ft. and none of them recovered the yellowish clayey soils typical of sterile subsoil at the town site. Instead, excavators reported darker brown sediments, sometimes intermixed with the more yellow clays. The grid coordinates are:

- Probe 21: B4L7 SW E65 N30
- Probe 22: B4L7 SW E65 N29
- Probe 23: B4L7 SW E65 N28

The average depth of the transition to subsoil excluding these anomalous probes is 1.09 ft. bsl.

Future testing should focus on this portion of Block 4, Lot 7, to determine if the unusual soil profiles in Probes 21-23 indicate a cultural, rather than natural, feature and to ascertain the relationship between that disturbance and the anomaly detected by resistivity in 2008.

Anomaly A58

Anomaly A58 is a resistivity anomaly that was identified by Hargrave in a geophysical survey conducted in 2008. Excavators placed a single transect north to south through the center of the anomaly using a one-inch diameter Oakfield probe. The transect line is 30 ft. east of the western edge of Block 4, Lot 7. It runs from a point 65 ft. north of the southwest corner of the lot, to a point 47 ft. north of the corner (Figure 13.8).

The cores in this location indicated a much thinner plow zone than the survey area further to the west around Anomaly A57. The plow zone may be characterized as a 10YR 3/2 to 10YR 4/2 (very dark to dark grayish brown) silt loam. The subsoil is a 10YR 4/6 to 10YR 5/6 (dark to yellowish brown) clay loam. The average depth of the transition between plow zone and subsoil is 0.69 ft. bsl. However, notable exceptions occurred in Probes 1, 2, 10, and 17, with depths in excess of one ft. Excluding these probes, the average depth was more like 0.51 ft. bsl.

In addition to revealing darker soils at unusual depths, Probes 1 and 2 both show interspersed dark grayish brown loams and yellowish brown clays. This disruption of the natural stratigraphic progression in this portion of the site may merit further investigation. Undisturbed subsoil does not appear until 2.11 ft. bsl in Probe 1.

Another important distinction to note is the unusually loose sediments in Probes 14, 16, and 17. Field notes also indicate that the darker sediments continue to a noticeably greater depth in Probes 16 (0.67 ft.) and 17 (1.15 ft.). Excavators tested to either side (east and west) of Probes 14 and 16 and found similarly lightly-packed sediments. All of these indicators suggest that additional excavation to explore Anomaly A58 should focus on the following areas:

- Probe 14: B4L7 SW E30 N52
- Probe 16: B4L7 SW E30 N50
- Probe 17: B4L7 SW E30 N49

As well as possibly exploring:

- Probe 1: B4L7 SW E30 N65
- Probe 2: B4L7 SW E30 N64

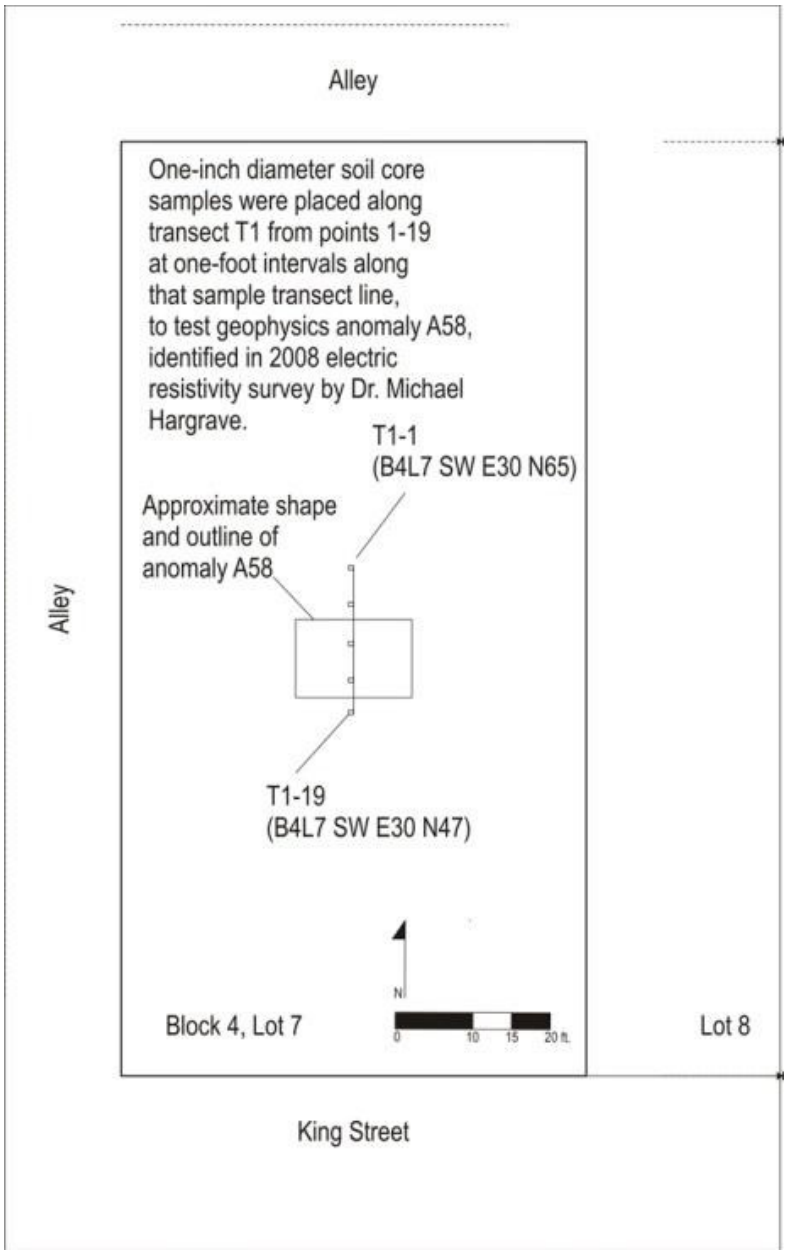

Figure 13.8. *Anomaly 58 was tested with a single line of 19 one- inch probes (Illustration by Christopher Fennell).*

Both A57 and A58 were considered low probability anomalies, because they were identified only with resistivity, and had no accompanying magnetic signature (Hargrave, pers. comm. 2008). However, both seem to be identifiable archaeologically. The question remains whether the anomalies are cultural, and whether they date to a period of interest.

Anomaly A21

Geophysicist Michael Hargrave identified Anomaly A21 on Block 13, Lot 3, during a resistivity survey conducted in 2004. In his report, he characterizes it as a "trench-like high resistance

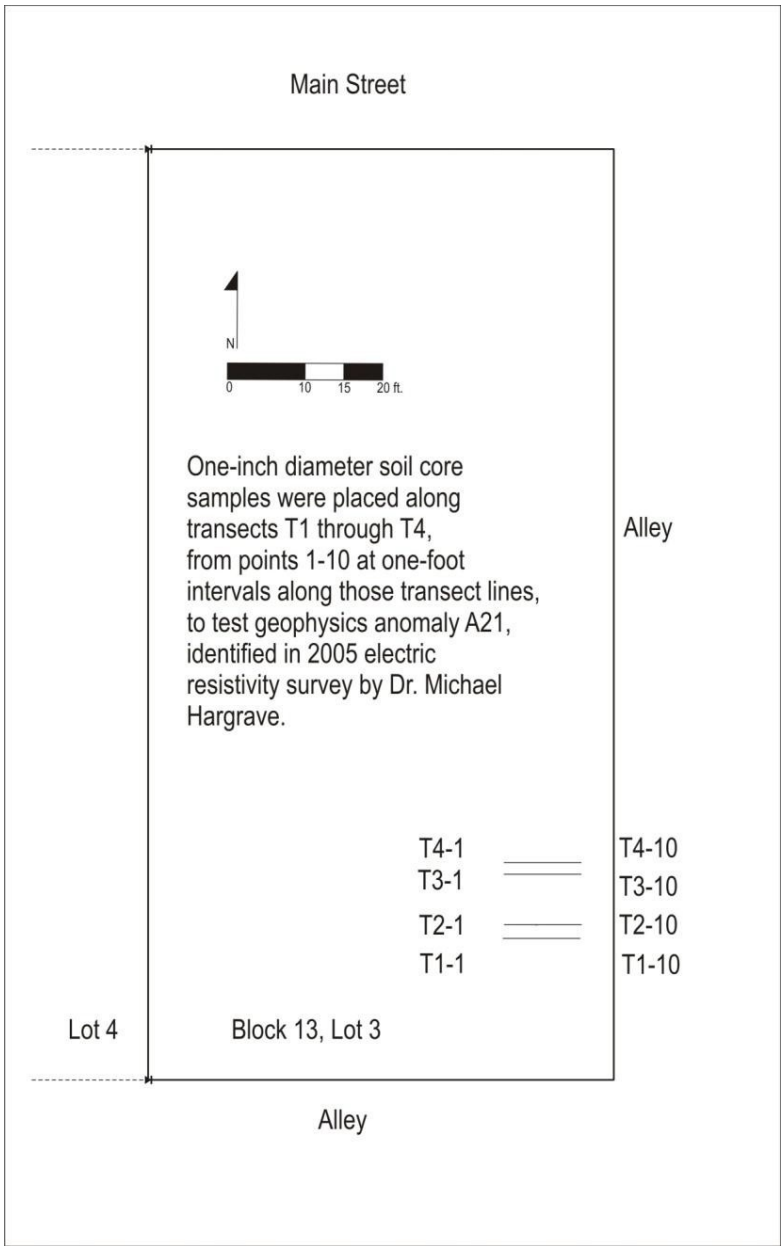

Figure 13.9. *Anomaly 21 was tested with four lines of 10 1-inch probes (Illustration by Christopher Fennell).*

anomaly" with a north south orientation that would be consistent with a structure (Hargrave 2006). In 2010, a team of excavators ran four transects across the anomaly, with 10 probes in

each transect, for a total of 40 probes. Each of the transects ran east to west from a point 47 ft. east of the western edge of Block 13, Lot 3, to a point 56 ft. east of the edge of the lot (Figure 13.9). Transect T-1 is 19 ft. north of the southern boundary of the lot; T-2 is 20 ft. north; T-3 is 26 ft. north; and T-4 is 27 ft. north.

Plow zone in this portion of the town site may be characterized as a 7.5 YR 3/2 (dark brown) clay loam. Transition to subsoil is typically 1.6 ft. bsl. The subsoil ranges from a 7.5YR 3/3 to a 7.5YR 4/4 (dark brown to brown) clay.

The most promising probes for pinpointing the likely source of Anomaly A21 are:

- Probe T1-6: B13L3 SW N19 E52
- Probe T1-7: B13L3 SW N19 E53

Probe T1-6 was blocked by a solid obstruction at 0.9 ft. bsl, while T1-7 contained darker brown loamy soils to a depth of 2 ft. bsl. Further excavation attempting to establish the nature of Anomaly A21 should focus on this area.

Anomaly A25

Excavators also initiated a probe survey in the vicinity of Anomaly A25. This effort was successful in identifying the source of the anomaly and was excavated during the 2010 season. Results are reported in Chapter 8 of the 2010 report.

Shovel test pit surveys

Block 11, Lot 1

Following the geophysical survey described at the outset of this chapter, a select area of Block 11 was investigated using shovel test pits (STPs). These STPs were excavated by volunteers from the Illinois Natural Resources Conservation Service, led by NRCS archaeologist Sharron Santure.

Eight STPs were placed in the northeast corner of Block 11, Lot 1. Two transects ran north-south 15 ft. apart, with STPs at 10 ft. intervals (Figure 13.10).

Each STP was one ft. in diameter. Excavators removed the sediment in arbitrary levels of 0.5 ft. each, while still noting color and texture distinctions as visible in the side walls of the STPs. Sediments were excavated with shovels and hand trowels and screened through quarter-inch hardware mesh to recover cultural material. The summaries for these STPs may be found in Chapter 8 of the 2010 report, “Unit/Feature Summaries.”

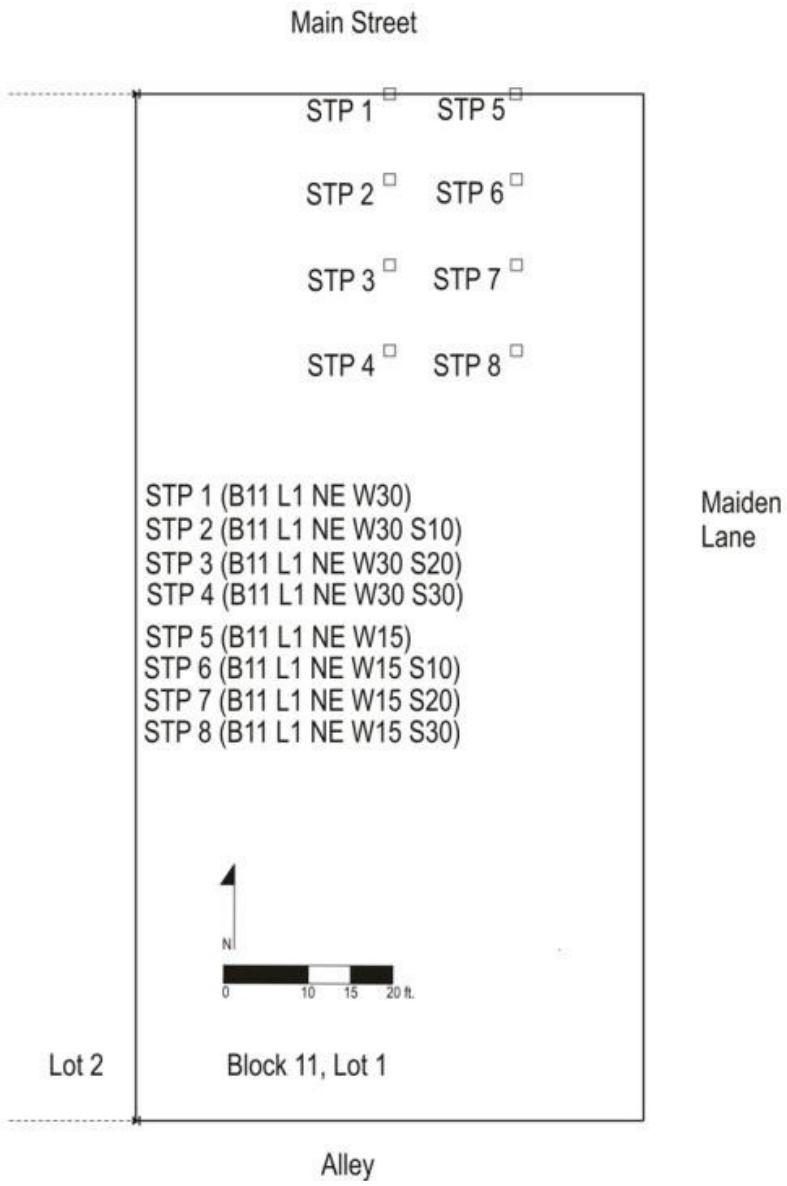

Figure 13.10. *Excavators placed eight shovel test pits on Block 11, Lot 1 (Illustration by Christopher Fennell).*

Immediately below the sod, excavators encountered a 10 YR 3/2 (very dark grayish brown) silty loam that ranged in depth from 0.5 to 1.0 ft. below the surface. In most of the STPs, the transition to subsoil was approximately 0.8 ft. below the surface. The subsoil was described as a 10 YR 4/3 (brown) silty clay loam.

All of the STPs except STP 1 contained cultural material. Pits at the southern end of the survey area tended to have more artifacts. Furthermore, artifacts were identified at greater depths (between 0.5 and 1.0 ft.) in this area. The artifacts include datable items such as transfer printed white ware (STPs 3 and 5) and nails, both machine-cut (STPs 7 and 8) and wire (STP 4). These finds are consistent with an occupation from the middle of the nineteenth century. Artifacts

associated with building construction (mortar, nails) are more broadly scattered across the study area (STPs 2, 3, 4, 7, and 8), while household artifacts cluster in the southern portion of the study area (STPs 3, 4, 5, and 8).

These preliminary results suggest that further shovel testing on Block 11, Lot 1 may be productive and could help pinpoint the location of archaeological features related to the lot's nineteenth-century owners and occupants.

Block 11, Lot 1 History

Block 11, Lot 1 was only a part of the town of New Philadelphia for a short while, but had a variety of owners in the years between its initial sale by Frank McWorter and his wife (1842), and its eventual removal from the town proper (1885). Several of these individuals are fairly well documented, both in town records, and in other histories of the region.

Frank McWorter sold Lot 1, along with the adjoining Lot 2, to William Bennett in 1842. Bennett in turn sold the two lots to an "Ebinezer" Franklin in 1844. The 1845 Tax Assessor's Book for Pike County valued the lots at $10.00 each, which is more than unimproved lots ($1.00-$2.00), but nevertheless not as high as the other improved lots in town ($25.00). Neither Bennett[2] nor Franklin appeared in the census records for Hadley Township. *The History of Pike County, Illinois* credits Ebenezer Franklin as the "first settler" of Pike County (Charles Chapman and Co. 2006 [1880]). Recent estimates put New Philadelphia's population at that point to be approximately 18 people (Martin 2010), so it is unsurprising that neither Bennett nor Franklin appeared to be in residence on the lot at that time.

Franklin and his wife conveyed Lot 2 to Elijah Thomas in a year that remains unrecorded, but clearly sometime after 1844. By 1849, Thomas and his wife had sold both Lots 1 and 2 to Erastus Clark. The surname Clark is one of long standing in New Philadelphia, though they do not appear to be related to the Erastus Clarks ("white" New Yorkers), who lived and farmed in a different part of the township. Most of the New Philadelphia Clarks are identified as "black" or "mulatto" and are descended from migrants from Kentucky (Martin 2010a).

In February of 1851, the lots were sold by Erastus Clark and his wife to James E. Wilson, who in August of that same year sold them to Peleg Hadsell. The Hadsell family was also central to the development of New Philadelphia. In the 1850 census, we find the household of Adam Hadsell. The 1860 census listed Peleg Hadsell as head of a household in the township, though probably not in New Philadelphia proper.

At some point between 1851 and 1853, the lots passed from Hadsell to Spaulding Burdick, as he was assessed for them in 1853 and 1854, by the Pike County Tax Collector. The lots appear to have retained minor improvements, as they were each valued at $20.00, in a year when unimproved lots were valued between $2.00 and $5.00. The Burdicks were yet another key New Philadelphia family. "Spalder Berdick" (Spaulding Burdick) and his wife Ann (63 and 55,

[2] Though in the 1860 federal census, a Bennett household, headed by 42-year-old Francis does appear.

respectively) lived in the town in 1850, along with two minor children, John (14) and Benjamin (9). The elder Burdicks had been born in Rhode Island and Massachusetts, while the boys were born in New York. The only occupation listed was for Spaulding, who was a shoemaker. The entire family was classified as "white." The value of their real estate holdings was $150.00.

That household was reduced to two members by the time of the Illinois census of 1855. The value of their livestock was $35.00. Spaulding and Ann Burdick sold Lots 1 and 2 to Josephus Turpin in 1855, in time for him to be assessed for them by the Pike County Tax Collector in that year. Lot 1 is valued at $8.00, which was typical for unimproved lots.

The Illinois census of 1855 also included the Turpin household, with three members, and livestock valued at $15.00. It was one of four "black" households in town. Marriage records indicate that Josephus Turpin had married a woman named Eliza Brown in 1848. It is likely that the other two members of the household were Eliza, and perhaps their child. Their family does not appear in any U.S. Census from 1850 to 1900 (Martin 2010b), but Turpin's military records allow us to estimate that he was around 36 at the time he purchased the lots on Block 11. Turpin was assessed in 1856 and 1857 at rates that suggests the lots were unimproved. By 1859, Turpin was no longer the owner.

Something is known of Turpin's life after he left New Philadelphia. He enlisted with Company A of the 29th U.S. Colored Infantry (Connecticut) and was mustered in April of 1864. He gave his place of residence as Quincy, Illinois, a city about 35 miles northwest of New Philadelphia. He gave his civilian occupation as an engineer, and rose to the rank of sergeant by 1865. His service ended when he failed to return to duty following a furlough, shortly after the end of the Civil War. This act was classified as a desertion, and rendered him ineligible for a pension (Miller 1998:19, 150-151). He died in 1891, and was buried in Muscatine, Iowa.

In 1859, Block 11, Lot 1 was assessed to J. Kellum, who likely lived elsewhere in town. He appeared in the 1855 Illinois census as the "white" head of a household of three, with livestock worth $320.00. He was not in the 1860 U.S. Census.

The Pike County Tax Collector's Book for 1862 lists Solomon McWorter as the man responsible for the assessments for all of the lots on Block 11. However, the notations for Lots 3-8 indicate that he was acting in his capacity as administrator for his father's estate, whereas he appears to have owned Lots 1 and 2 outright. In 1863, Lot 1 was assessed to "Lewis" McWorter.[3] But in 1864, the lots were again attributed to Solomon McWorter. In all of these cases, the lots appear by their value to be unimproved, as was true of the 1867, 1868, and 1869 Hadley Township Tax Assessor's Book. Solomon McWorter was never in residence on this lot.

Ownership of Block 11, Lot 1 is murky for the years 1868 to 1870. As early as 1868, R. M. Atkinson, a lawyer residing in Pittsfield, was associated with the lot, having been granted Lots 1 and 2 by the Sheriff in December of that year. Nevertheless, it appears that Solomon McWorter paid the taxes in 1869. McWorter was identified as the official owner in the Pike County Tax Collector's Book for 1870, but Atkinson paid the taxes in that year. It may be that Atkinson was acting as an agent for McWorter, or that he temporarily held the title pending payment of taxes

[3] Perhaps this is an error that should read "Louisa" McWorter.

by McWorter. Another confounding entry in the deed index shows McWorter acquiring the lots from Peleg Hadsell in 1870. Throughout this period, the lots appear to be unimproved.

By 1875, Solomon McWorter was again in control of all of Block 11, according to the Hadley Township Tax Assessor's Book. The value of Lots 1 and 2, combined, $20.00, suggests that they remained unimproved. The 1878 Book values the two lots at a combined $10.00, again suggesting that they were unimproved. The 1880 Pike County Tax Collector's Book assessed "S. McWater" for Block 11 in its entirety, though McWorter had died the previous year, and it was really his estate that owed the tax.

The Hadley Township Tax Assessor's Book for 1883 assessed Ansel Vond for all of Block 11. Vond was the husband of Solomon's sister Lucy Ann, and it is likely that she was in fact the true owner of the lots (Martin 2010b). In the 1870 census, he appeared as "Anson" Vond, and was not a town resident. They and all of their children were classified as "white." In the 1880 census, Ansel "Vaun" was listed as a 51 year old farmer, Lucy (55) was keeping house. Their children included 19-year-old daughter Lucy, son George E. (17), and daughter Francis N. (12). All of the family members were classified as "mulatto." George had attended school that year, and described as a laborer. Lucy and Francis were "at home." The elder Lucy had been born in Kentucky, after the emancipation of her mother. Ansel was born in New York, as was his son. The girls were born in Illinois. They lived in the township, but not in New Philadelphia, and certainly not on Lot 1 of Block 11.

In 1885 all of Block 11 was vacated on the tax rolls, effectively removing it from the town of New Philadelphia. This process also applied to Blocks 1, 10, and 20, as well as the eastern halves of blocks 2, 9, 12, and 19.

In summary, Lot 1 of Block 11 was at the edge of town in New Philadelphia. It passed through the hands of some of the key families in the town's development and growth. It appears to have had improvements of some kind during its early years in the town, but from about 1862 onward, was unimproved land that was by 1885 excluded from the town proper.

Table 13.1. Deed index for Block 11, Lot 1

DATE of transaction	DATE recorded	SELLER LAST	FIRST	PURCHASER LAST	FIRST
1842	1845	McWorter	Frank	Bennett	William
1844	1845	Bennett	William	Franklin	Ebinezer
1849	1851	Thomas	Elijah	Clark	Erastus
1851	1851	Clark	Erastus	Wilson	James
1851	1851	Wilson	James	Hadsell	Peleg

LiDAR Survey and Analysis in 2010-2011

A surveyor's plat and town plan filed in 1836 set out an intended grid of blocks, lots, alleys, and streets for New Philadelphia. Geophysical, aerial infra-red, and archaeological investigations to date have located fragments of the town's remains now buried beneath agricultural fields and prairie. In May 2010, Christopher Fennell received an award of grant support from the University of Illinois to conduct a low-altitude aerial survey using Light Detection and Ranging (LiDAR) technology. This LiDAR survey will be employed to obtain new data on the actual spatial extent and contours of New Philadelphia's lots, streets, activity areas, and occupation sites.

The New Philadelphia archaeology project presents an exceptional research opportunity to compare and contrast disparate survey methodologies, data sets, and analytic frameworks. This new LiDAR data set will be combined and analyzed comparatively with the data from a low-altitude aerial survey conducted in 2008 that utilized high-resolution infra-red sensors with grant support from the National Center for Preservation Technology and Training. Ground-based geophysical surveys, including methods using electric resistivity and magnetic gradient sensors, have also been conducted at the site with long-term support from the National Science Foundation. Professor Art Bettis and doctoral student Mary Kathryn Rocheford of the University of Iowa are using geoscience methods to analyze changes in the New Philadelphia landscape over time (see Chapter 12). These comparisons will both advance the research goals of this multi-year project and produce new methodological insights for the benefit of archaeological and geoscience techniques and investigations nation-wide.

Low altitude aerial surveys with high-resolution LiDAR imaging have been used successfully at prehistoric and historic-period sites in the United States (Harmon, et al. 2006; Petzold, et al. 1999; Riley 2009). At New Philadelphia, the project applied the technique to detect the grid pattern of the historic period town site buried beneath one-two feet of agricultural fields and prairie grass. The LiDAR survey will produce a micro-topographic analysis of the likely locations of past roadbeds, pathways, structural remains, and activity zone impacts embedded within and shaping the current landscape surface.

The 42-acre New Philadelphia town site presents a unique opportunity to test the full applicability of this surveying technique. The intended spatial extent of blocks, lots, and streets reflected on a town plan filed with an Illinois court in 1836 can be mapped onto the existing landscape. To date, it is not known whether the planned extent and configuration of streets and blocks were actually built on the ground in the way they were depicted on the town plan.

Aerial LiDAR Survey Methods

LiDAR technology transmits a stream of high-resolution laser light to the ground surface and records the differential time with which each pulse is reflected back to a receiving device (Figure 13.11). This high-resolution survey method records a three-dimensional elevation map of the "micro-topography" of the ground surface, accurate to mere centimeters of spatial resolution. Importantly, the stream of laser pulses penetrate beneath any vegetation coverage to measure the

underlying undulations of the ground surface itself, producing a high-resolution, micro-topographic map of features impacting the ground surface contours.

LiDAR surveys have been used successfully on other sites to detect historic-period roads, pathways, and site contours not readily visible on the surface. LiDAR surveys can also detect the surface manifestations of buried archaeological remains of structures and activity areas that were otherwise obscured from visibility by vegetation cover, giving a "bare earth" view of the site (Ackermann 1999; Harmon, et al. 2006; Petzold, et al. 1999).

Employment of such LiDAR surveys from low-altitude aerial platforms is particularly valuable when the resulting data are incorporated into a Geographic Information Systems (GIS) database and compared and contrasted with other types of archaeological and remote sensing data (Ackermann 1999; Harmon, et al. 2006). At New Philadelphia, the LiDAR data will be incorporated into a GIS database and evaluated in comparison with visible-spectrum aerial photographs, high-resolution infra-red images of the 42-acre town site, and geophysical surveys of over seven acres within the town.

Limited portions of the New Philadelphia town site have been investigated using electrical resistance and magnetic field gradiometry technologies (see Hargrave 2006). These geophysical techniques have detected archaeological features and the subsurface remains of part of a secondary street on the northern edge of the town site that matches the location reflected on the intended town plan. Yet, it is impractical to survey all 42 acres of the town site using ground-based technologies. A low-altitude aerial survey can be conducted efficiently and cost-effectively, and offers exceptionally valuable data results. The results of an aerial LiDAR survey can be matched against data from those portions surveyed previously and against the 1836 spatial plan for the town. In this way, researchers will be able to determine if the actual history of construction and settlement in the town matched the vision set forth in the founder's 1836 prospective town plan.

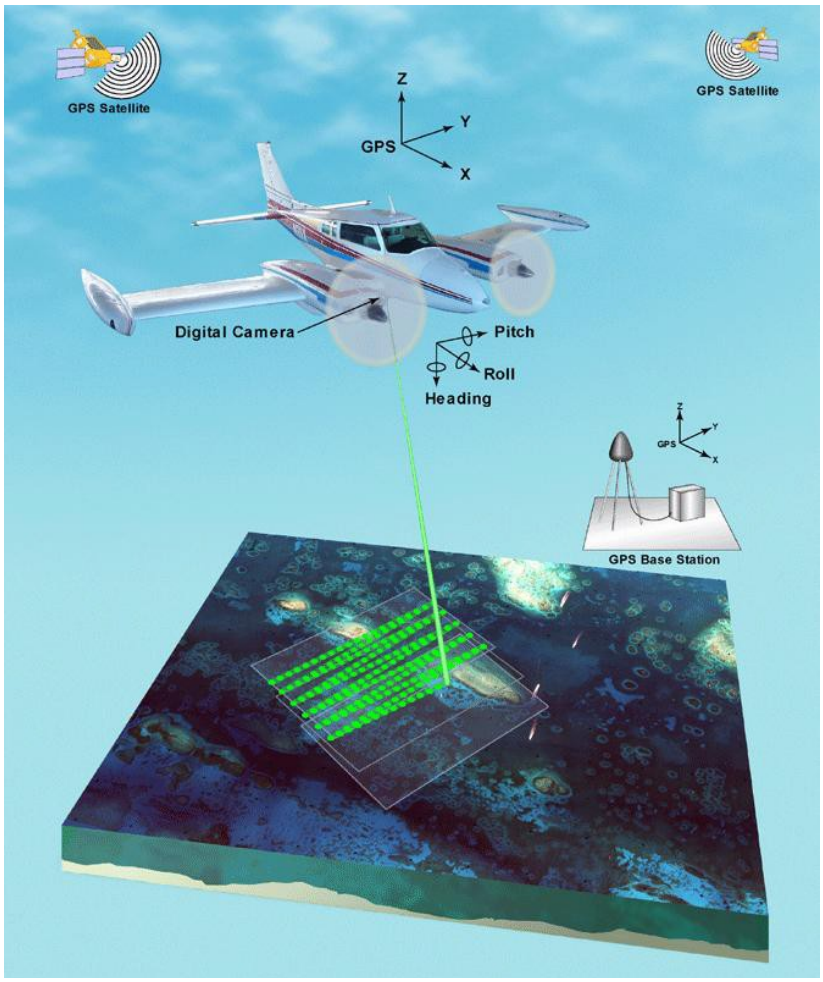

Figure 13.11. *This illustration from the U.S. Geological Survey web site details the main components and process for collecting LiDAR aerial survey data (Image courtesy U.S.G.S. http://gulfsci.usgs.gov/tampabay/data/1_bathymetry_lidar/index.ht ml).*

One of the most cost-effective approaches to obtaining LiDAR data is to employ the services of a firm that specializes in conducting such surveys. M. J. Harden Co. was selected to perform these services at New Philadelphia. Through Harden's survey work, LiDAR data will be collected across the New Philadelphia town site and adjacent surrounding landscape with multiple points per square meter and elevation resolution with an error factor of no more than 15 centimeters for each data point. Harden's aircraft was equipped with an Optech Gemini Airborne Laser Terrain Mapper (ALTM) sensor array (Figure 13.12). This system utilizes variable pulse and scan rates that enable the sensors to adapt immediately to varying topography and ground cover. As Harden's (2010) service statement describes, the "increased pulse rate of the Gemini greatly improves the efficiency of the ALTM by providing greater geographic area coverage while maintaining high point density." This Gemini multipulse technology thus provides the data acquisition benefits of acquiring maximum point density in the most cost-effective manner.

Figure 13.12. *Optech Gemini Airborne Laser Terrain Mapper sensor array utilized by M.J. Harden, a Geo-eye Company (Image courtesy M. J. Harden).*

Harden acquired LiDAR data for an area of 4.25 square miles, including the New Philadelphia town site and the adjacent surrounding landscape of related cultural features, such as a nearby community cemetery and contiguous 19th century farmstead parcels (see Figures 13.13 and 13.14). By including this slightly larger area of surrounding landscape the research team hopes to obtain valuable contextual data related to the town site and its transport pathways without a significant impact on the overall survey costs.

The LiDAR data sets will be integrated with our pre-existing data from ground-based mapping, aerial infra-red surveys, and geophysical surveys, utilizing GIS relational databases. Such GIS datasets allow researchers to georeference multiple sources of evidence and overlay them with one another in a computerized mapping display. This analysis will be undertaken by our NSF-REU management team with the assistance of Robert Marcom, Cultural Resources Mapping, who is a specialist in GIS, mapping, and remote sensing survey analysis. Marcom will assist us in creating an integrated Digital Elevation Model (DEM) with GIS applications that will integrate these multiple data sets and provide a robust means for comparisons, contrasts, and additional analysis.

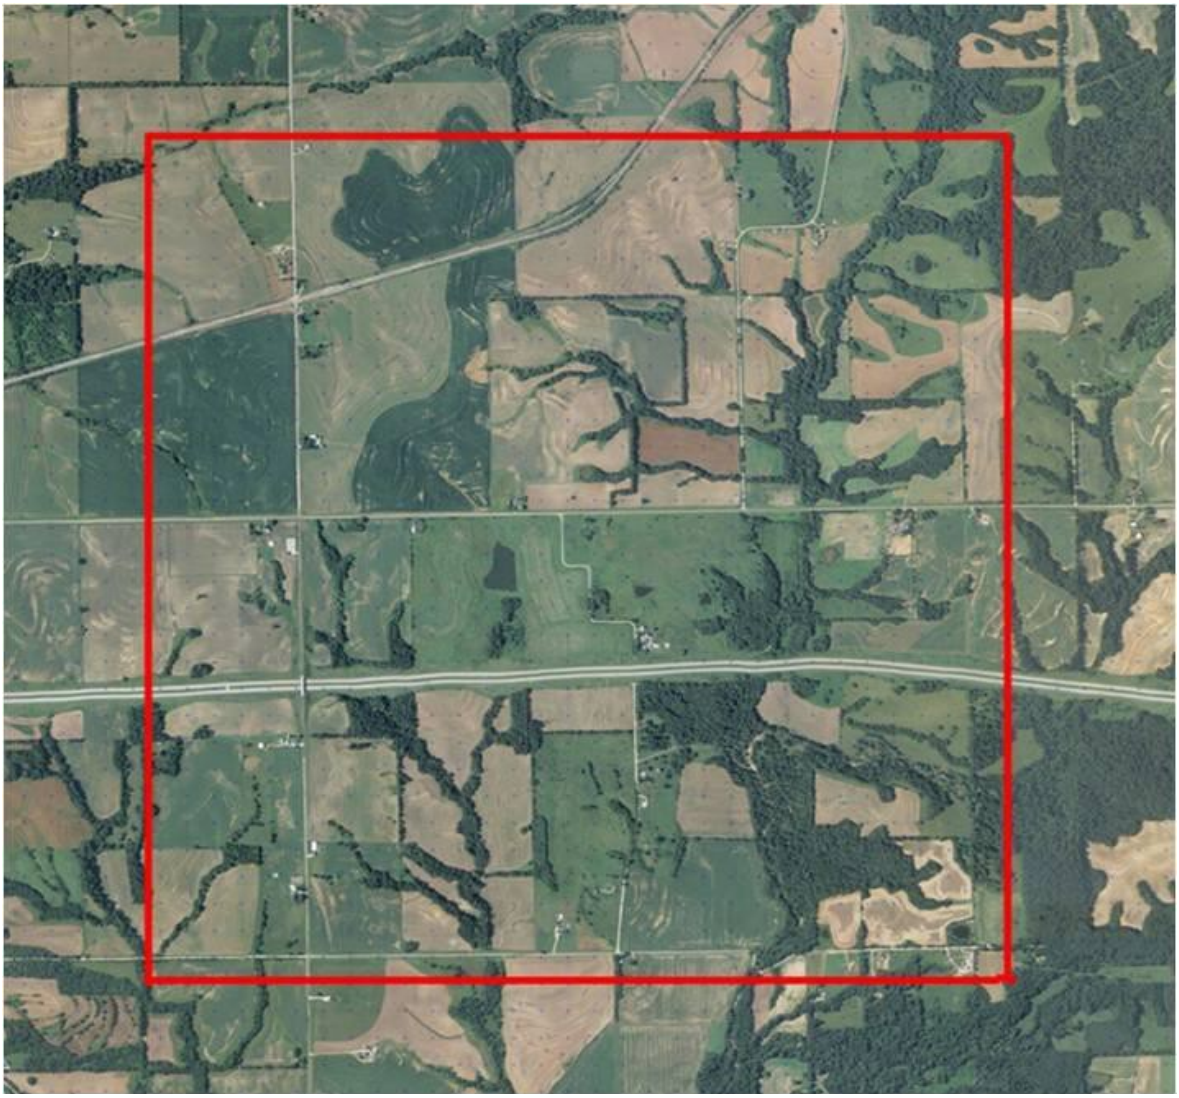

Figure 13.14. *Area of planned LiDAR survey by M. J. Harden. Overlay by Tyquin Washington, 2010 NSF-REU student, on 2010 satellite image of landscape surrounding the New Philadelphia National Historic Landmark.*

Results and Significance

The results of the LiDAR survey will be compared and contrasted with the data from ground-based geophysics and low-altitude aerial thermal imaging of the town site. All of these data sets will be geo-referenced and integrated using spatial mapping programs such as GIS. Researchers will use these data to create extremely accurate photo-mosaics of the entire town site. These will depict, compare, and contrast LiDAR, thermal, visible spectrum imagery, and geophysical data.

The results of this LiDAR survey will also provide a template for planning future ground-based excavations at New Philadelphia. We intend to continue excavations at the New Philadelphia town site in future years, either through archaeological field schools sponsored by participating

universities, or through field schools sponsored by grant agencies such as the NSF. Excavations within such a large-scale site as the 42-acre town of New Philadelphia must be conducted in an efficient and cost-effective manner by choosing locations with utmost care from available remote sensing survey data. The excavations completed by our archaeologists in six years of summer field schools have yielded highly valuable data while uncovering less than one percent of the spatial extent of the town site. It is impractical to excavate the remains of an entire 42-acre site; data from methods such as the aerial LiDAR survey will provide invaluable resources for undertaking efficient and effective research in the future.

Chapter 14: Unit Summaries

Block 8, Lot 1 shovel test pit summaries

The following inventory describes the shovel test pits (STPs) excavated on Block 8, Lot 1 during the NSF-REU field season of 2011. Locations are with reference to the town grid, indicating distance from a particular corner of the lot. For example "Block 8, Lot 1, SW E30" refers to a location 30 ft. east of the southwest corner of Block 8, Lot 1. The location of each STP was determined using measuring tapes pulled from established grid points. Following excavation, the location of each STP was recorded using a total station.

Soil characteristics are described using standard nomenclature. Color codes refer to the Munsell Soil Color Chart. Artifacts listed are based on identifications recorded on the original field forms and may differ from the items and counts listed in the catalogue, which are based on laboratory analysis, post excavation.

The shovel test pits (STPs) were 12 inches in diameter and excavated in 0.5-foot arbitrary increments. Excavators placed the STPs at five-foot intervals in a 20 foot by 30 foot area in the southwestern corner of the lot, and at 20-foot intervals in the remaining southern half of the lot.

The STPs were excavated by NSF-REU field school students, under the supervision of Terrance Martin, Christopher Fennell, and Anna Agbe-Davies.

1.0 ft. to 1.5 ft. – no artifacts

Block 8 Unit Summary

Terrence Martin, Miriam Manda, Elizabeth Usherwood, Shawn Fields, and Antoinette West

Block 8, Lot 1, EU 3

As noted above, the shovel test pits (STPs) were 12-inches in diameter and excavated in 0.5-foot arbitrary increments. Excavators placed the STPs at five-foot intervals in a 20 foot by 30 foot area in the southwestern corner of the lot, and at 20-foot intervals in the remaining southern half of the lot. Excavation Unit 3 is a 5 ft. x 5 ft. unit, placed between STPs 9, 10, 16, and 17. Its northwest corner is located 10 feet north and 5 feet east of the southwest corner of Block 8 Lot 1.

The location of EU 3 in Block 8, Lot 1 was established using several lines of evidence. When artifact frequencies from the STPs are plotted on a distribution map, EU 3 is located in between two concentrations of artifacts, including an especially high count for STP 16. Information gleaned from the analysis of STP stratification also encouraged further investigation. Excavation of the STPs revealed an unusually sticky sediment in STP 17. Shovel Test Pit 10 was unusual in the very shallow transition to undisturbed subsoil. And finally, excavators noticed that, after one of the season's many rainstorms, water that collected in STP 16 drained relatively rapidly, whereas the other STPs held water for a day or longer.

This location was also of interest because it is immediately to the north of EU 1, which was excavated during the 2008 season, based on the presence of a geophysical anomaly (Fennell 2009).

"Today I'm working with Dr. Martin on Block 8. It was amazingly awesome. We opened up a new unit - EU 3 – around the area of the STPs."

- Elizabeth Usherwood [NSF-REU student]

Excavators began Level A1 as an arbitrary level of 0.5 ft. The ground surface in EU 3 slopes downward from southwest to northeast so that after the removal of the sod, the northeast corner was nearly 0.5 ft. below the datum in the southwest corner. Level A1's average opening elevation is 765.043 ft. above mean sea level (amsl). The average closing elevation is 764.799 ft. amsl. The level consists of sediment that is Munsell code 7.5YR 3/2 (dark brown) with a silty loam texture. Historic artifacts uncovered in the level included: glass fragments (flat and container); slag; brick fragments; metal fragments; slag; and mortar. There was also a fragment of modern plastic, indicating how recently the area has been plowed or otherwise disturbed.

"Today I mostly worked with Terry on EU 3, taking it down one level from 0.5 ft to 1 ft, which we succeeded in finishing."

- Shawn Fields [NSF-REU student]

The team began excavation of Level A2 as an arbitrary layer of 0.5 ft. Level A2's average opening elevation is 764.799 ft. amsl. The average closing elevation is 764.352 ft. amsl. The level's sediments are Munsell color 10YR 4/4 (dark yellowish brown) with 7.5YR 3/3 (dark brown) silty loam plow scars running north to south through the excavation unit. Excavators noted that the density of historic artifacts in this layer was "light" and included: brick; slag or charcoal; metal fragments; ceramic fragments; and glass fragments. Excavators also remarked on the few pebbles encountered.

"I'm working on Block 8 today, where the schoolhouse was. We've been finding glass, small traces of brick and charcoal, and a nail."

-Miriam Manda [NSF-REU student]

Level A3 was an arbitrary layer of 0.5 ft. that included soils below the level of the plow zone. The average opening elevation of Level A3 is 764.352. The average closing elevation was not recorded on the field forms. The sediment continued to present as a 10YR 4/4 (dark yellowish brown) silty loam. Historic artifacts included: flat glass; nail fragments; brick fragments; chert; and a segment of a rubber hose. According to excavators, nearly all of these artifacts came from the eastern portion of the unit, where the profile is more shallow. The dividing line between plow zone and subsoil appears in the west sidewall between 1.10 and 1.15 ft. below the EU 3 datum (southwest corner).

Block 12 Unit Summaries

Anna Agbe-Davies, Meaghan Alston, Terrance Martin, Blair Starnes, Tyquin Washingon, Margaret Wolf (2010), Kaila Akina, Shawn Fields, Joseph Tonelli, Amanda Burtt, Elizabeth Usherwood, and Thomas Glantz (2011).

Block 12, Lot 3, EU 1

The Excavation Units (EUs) on Block 12, Lot 3 were excavated by NSF-REU field school students, under the supervision of Anna Agbe-Davies during the 2010 season, and Terrance Martin, during the 2011 season. Excavations commenced on Block 12 following several lines of evidence. Shovel tests excavated in 2005 indicated a concentration of artifacts on that block, from Lots 1-4, sufficient to warrant further investigation (Fennell 2006). The shovel tests were 12-inches in diameter and excavated in 0.5-foot arbitrary increments. Excavators placed the STPs at 20-foot intervals across Block 12, Lots 1-6.

Excavation of Block 12, Lot 3 was designed to further explore artifact concentrations identified during a shovel test pit (STP) survey conducted in 2005 (Fennell 2006). Excavators recovered significant numbers of architectural artifacts and nineteenth-century ceramics in STPs 4, 15, 16, and 17 in the northern portion of the lot. These STPs also reported subsoil appearing at a greater depth than the surrounding pits, perhaps an indicator of features below the plow zone. The archaeologists decided to place the 5 ft. by 5 ft. excavation units in an area bounded by the STPs of interest. The exact location was determined by the use of dowsing rods, with the idea that this would be an opportunity to ground truth this controversial technique. EU 1 is located 20 ft. south and 15 ft. east of the northwest corner of Block 12, Lot 3.

"[The] rods supposedly react to different magnetic fields in the earth. Holding loosely parallel to each other, you watch to see if they cross…I wonder how it works in a scientific sense."
- Tyquin Washington [NSF-REU student]

Excavation of the first level, A1, began as an arbitrary level of 0.5 ft. Level A1's average opening elevation is 756.687 ft. above mean sea level (amsl). The average closing elevation is 756.362. The level is composed of 10YR 3/2 (dark grayish brown) loamy sediments that were extraordinarily sticky due to wet conditions (see below). Historic artifacts recovered include: ceramic fragments; charcoal; slag; brick fragments; mortar; metal fragments; and nails. Excavators also identified several possible prehistoric (flaked stone) artifacts.

"The soil was so damp that it was easier to go through the dirt with water than just trying to dry screen. We did that, got soaked, and were able to level out all of Unit 1 and shoot the points."
- Margaret Wolf [NSF-REU student]

The unit is down slope from Block 12, Lot 4, EU 1, in an area that is much flatter and retains a great deal of water, both runoff from the hill to the west and water draining through the soil. Excavators water screened (1/4 inch mesh) much of the sediment, as it was too wet for ordinary screening. Rain fell so frequently that the unit was impossible to excavate completely. Level A2 commenced at 756.362 ft. amsl, but was soon abandoned.

Excavation resumed in 2011, with the removal of A3, a "cleaning" level with an average closing elevation of 755.961 ft. amsl, which is 0.401 ft. below the opening elevation of Level A2. The sediments were a 7.5 YR 3/2 (dark brown) silty loam and what appeared to be a discrete area of 7.5YR 4/4 (brown) silty loam concentrated in the northwest corner of the unit. Significant quantities of artifacts included: nails; curved glass; flat glass; ceramics; brick fragments; mortar; and a glass button. The *terminus post quem* was established by the presence of multiple fragments of Bakelite (1907). Excavators remarked on the water seeping into the unit from the layer below and also the side walls and indicated that water drainage was poor throughout.

"It seems as though water is seeping up from under the soil causing the need for continuous bailing. The soil, in fact, is mud, so sifting was a challenge."

- Antoinette West [NSF-REU student]

Level A4 extended from the bottom of the plow zone to 1.5 ft. below the surface. The average opening elevation was 755.961 ft. amsl. The average closing elevation was 755.393 ft. amsl. The sediment is a 7.5YR 3/4 (dark yellowish brown) silty clay loam. The finds from this layer included: brick fragments; mortar fragments; curved and flat glass; metal fragments and ceramics. In the southeast corner, a dark soil stain consisted of a 10YR 3/2 (very dark grayish brown) silty loam. The artifacts recovered from the feature were: brick fragments; charcoal; ceramics; metal fragments; flat and container glass; and mortar. Excavators described it as linear and identified it as a possible rodent burrow.

"Today we excavated EU 1 and found a dark area in the southeast corner, as well as some mortar, brick, and a small piece of transfer print ceramic."

- Thomas Glantz [NSF-REU student]

The dark stain first observed in Level A4 was designated Level A5 from 1.5 ft. below the surface and was excavated to the cut or basin of the feature. The average opening elevation was 755.351 ft. amsl. The average closing elevation was 755.128. The sediment continued to appear as a 10YR 3/2 (very dark grayish brown) silty loam. Artifacts included: mortar fragments; a ceramic fragment; brick fragments; metal fragments, and charcoal.

mega strat	***level***	***stratum***	***munsell***	***texture***	***opening elev. amsl***	***closing elev. amsl***	***description***
I	A1	SOD LAYER/ PLOWZONE	10YR 3/2	SANDY LOAM	756.687	756.362	The sediment exhibits gray mottling throughout and is clearly rich in organics--very strong smelling following a rain. Excavators noticed a concentration of artifacts along the southern edge of the unit. Overall, artifacts dominated by architectural fragments (brick, mortar)
I	A2	PLOWZONE	10YR 3/2	LOAMY CLAY	756.362	N/A	This level was begun, but not completed, due to the continual soaking by frequent rains. The artifacts recovered are dominated by brick fragments and glass.
I	A3	PLOWZONE	7.5 YR 3/2	SILTY LOAM	N/A	755.961	This "cleaning" level contained 20th century artifacts (synthetics) as well as less datable architectural items (brick, mortar). A discrete area of darker fill was observed in the northwest corner of the unit.
I	A4	PLOWZONE/ FEATURE	7.5YR 3/4 / 10YR 3/2	SILTY CLAY LOAM/ SILTY LOAM	755.961	755.393	Once below the level of the plowzone, a feature was observed in the southeast corner of the unit. It is a possible rodent burrow. Both the layer and the feature contained a small artifact assemblage consisting primarily of construction materials.
I	A5	FEATURE	10YR 3/2	SILTY LOAM	755.351	755.128	The feature continued slightly deeper than 1.5 ft below the surface, with a linear shape and similar, though fewer, artifacts.

Block 12, Lot 3, EU 2

Excavation of Block 12, Lot 3 was intended to further explore artifact concentrations identified during a 2005 shovel test pit (STP) survey (Fennell 2006). Notable numbers of architectural artifacts and nineteenth-century ceramics came from STPs 4, 15, 16, and 17 in the northern portion of Lot 3. These STPs also tended to report subsoil appearing at a greater depth than the surrounding pits, which might mean that features existed below the plow zone in those locations. Excavators wanted to place EU 2 in an area bounded by the STPs of interest. The exact location was selected using dowsing rods, with the idea of ground truthing this controversial technique. EU 2 is located immediately north and west of EU 1: 15 ft. south and 10 ft. east of the northwest corner of Block 12, Lot 3.

Level A1 was opened as an arbitrary level of 0.5 ft in the sod and plow-zone layer. Level A1's average opening elevation is 756.938 ft. above mean sea level (amsl) and average closing elevation is 756.695 ft. amsl. The level is composed of sediment that is Munsell code 10YR 3/2 (dark grayish brown) with a sandy loam texture that was nonetheless very sticky due to frequent soaking. Historic artifacts were uncovered in the level including: brick fragments; ceramic fragments; flat glass; container glass; nails; mortar; and slag.

"There are also more large pieces of brick and mortar in the unit and we continue scraping soil along the way. Maybe we will find a feature. Here's hopin'!"

- Tyquin Washington [NSF-REU student]

Excavators began A2 as an arbitrary level of 0.5 feet, but stopped when the sediments became too waterlogged to excavate without damage to the unit. The sediment was again a 10YR 3/2 (dark grayish brown) sandy loam. Artifacts included: ceramic fragments; glass fragments; nails and brick fragments.

"Our unit is still flooded so we are helping Teams Y and Z with screening and digging again…Afternoon and our unit is still flooded."

- Margaret Wolf [NSF-REU student]

Excavation resumed in 2011, with the removal of A3, a "cleaning" level with an average closing elevation of756.295 ft. amsl. The sediment was a mottled 7.5YR 4/4 (brown) and 7.5YR 3/2 (dark brown) silty loam. Excavators encountered a significant number of architectural fragments, especially flat glass, brick, nails, and mortar. Other artifacts included: container glass; ceramics; and two fragments of wood.

"We continue to sift the terrible mud, but it keeps piling up. It is frustrating work but artifacts continue to appear."

-Hillary Christopher [NSF-REU student]

Level A4 was an arbitrary level extending through the bottom of the plow zone to 1.5 ft. below the surface. The average opening elevation was 756.295 ft. amsl, with an average closing

elevation of 755.826 ft. amsl. The sediment was a 7.5YR 3/4 (dark yellowish brown) silty clay loam. The artifact density dropped precipitously and consisted of only a few fragments of ceramic, flat glass, container glass, metal and brick.

It may be that the dowsing rods were responding to the unusually high concentration of architectural debris (including brick and iron fragments) in Level A3 of EU 2. The anomaly might also reflect the tendency of the sediments to collect and retain water for long periods of time. However, no archaeologically significant features were uncovered as a result of the dowsing experiment.

mega strat	***level***	***stratum***	***munsell***	***texture***	***opening elev. amsl***	***closing elev. amsl***	***description***
I	A1	SOD LAYER/ PLOWZONE	10YR 3/2	SANDY LOAM	756.938	756.695	This level was a sandy loam that was unusually sticky due to frequent soaking. Architectural fragments dominated the artifact assemblage.
I	A2	PLOWZONE	10YR 3/2	LOAMY CLAY	756.695	N/A	Excavators only just began this level before it had to be abandoned. Among the few artifacts recovered were fragments of whiteware and yellowware, and several brick and nail fragments.
I	A3	PLOWZONE	7.5YR 4/4 W/ 7.5YR 3/2	SILTY LOAM	N/A	756.295	A large number of architectural fragments were found in this level of the plowzone, well over 100 artifacts. Also a large number of ceramic sherds.
I	A4	PLOWZONE/ SUBSOIL	7.5YR 3/4	SILTY CLAY LOAM	756.295	755.826	Similar sediments to the level above, but with far fewer artifacts.

Block 13, Lot 4 Unit Summaries

Kathryn Fay, Antoinette West, Miriam Manda, Annelise Morris, Elizabeth Usherwood, MaryKathryn Rocheford

Block 13, Lot 4, EU 6

Archaeologists began the 2011 excavations on Excavation Unit 6 at level B1, after removing the backfill from the 2010 season. Level B1 consists of cellar fill from Feature 12, and was excavated contextually until a context change was revealed (as a layer of rubble and brick). Archaeologists opened the level at 766.061 ft. amsl and closed it at 765.603 amsl. The sediment in Level B1 had a Munsell color of 10 YR 3/1 and a texture of silty loam. The southwest corner of this level contained a larger concentration of brick than the rest of the unit. Historic artifacts contained in this level were: bone (n=21); shoe parts; clothing; ceramic (n=48); glass (n=91); metal (n=168); charcoal; wood and brick (n=42). Level B1 was closed when archaeologists hit a layer of rubble and brick, also present at the same depth in EU 13.

"So far we have found small animal bones, metal nails, and some glass shards."
-Antoinette West [NSF Student]

Level B2 was excavated by context, removing the layer of rocks, brick, and rubble. The level was opened at 765.603 amsl, and closed at 765.365 amsl. The sediment in this level had a Munsell color of 10 YR 3/2, and a texture of silty loam. An abundance of historic artifacts were contained in this layer, including: mortar; charcoal; shell; one button; slag; brick (n=25); ceramics (n=30); glass (n=53); bone; one eyelet; straight pins (n=3); one pencil; leather (n=4); nails (n=183); metal; and, wire. Level B2 was closed at the bottom of the rubble/rock fill.

Level B3/a1 was excavated at an arbitrary layer of 0.5 ft. The level was opened at 765.365 amsl, and closed at 764.669 amsl. The sediment in this level had a Munsell color of 10 YR 3/1, and a texture of silty loam. Excavators noted that the rocks in this level were somewhat larger in the southeast corner, and were similar to the rocks present at this depth in EU 14. Archaeologists found that a concentration of charcoal, mortar, and brick was present in the southwest quadrant. Historic artifacts contained in this level were: metal; brick; wasp's nest; scissors; charcoal; nails (n=161); ceramics (n=29); glass; bone (n=23); one straight pin; and, a metal button.

"We found large concentrations of charcoal in the NE and NW corners, and we've also been finding more large rocks, ceramics, lots of nails, bone, and a strange bluish-green substance."
-Miriam Manda [NSF Student]

Archaeologists found Level B4 to be a level of ash, which was excavated contextually. The level was opened at 764.669 amsl and closed at 763.895 amsl. The ash layer had a Munsell color of 7.5 YR 3/1, and was mottled with burned brick, charcoal, and mortar. Excavators found that the Southeast quadrant of this layer contained a grey and pink ashy deposit, identical to the deposit in EU 14 at the same depth. The remainder of the unit was a mixture of ash and mortar, with a large amount of burned bricks. Historic artifacts uncovered from the layer of ash include: nails (n=559); ceramic (n=19); glass; brick; mortar; wasp's nest; metal (n=30); charcoal; leather; pencils (n=2); and, a button.

"This morning was ridiculous! It took maybe a half hour to bail out the tarps, and now the soil is muddy and hard to sift through."

-Antoinette West [NSF Student]

Level B5 consisted of a thin layer of cellar fill below the ash. The level was opened at 763.895 amsl, and closed at 763.488 amsl when archaeologists reached sterile soil. The Munsell color of the sediment in this layer was 10 YR 5/4 (yellowish brown) with a texture of heavy silty clay loam. Excavators noted that the sediment was mottled with sterile soil, mortar, and a small amount of ash from the previous layer. Few historic artifacts were recovered from this layer, including: Copper (n=1); glass; ceramic (n=4); shell; mortar; slag; nails (n=23); metal; brick; and, bone (n=13). This was the last excavation layer of this unit.

Mega-Strat	***Level***	***Stratum***	***Munsell***	***Texture***	***Opening Elev Amsl***	***Closing Elev Amsl***	***Description***

Block 13, Lot 4, EU 12
Terrance Martin, Anna Agbe-Davies, Liz Usherwood, Annelise Morris, Kathryn Fay

Excavations were begun with the plow zone in A1, at an arbitrary level of 0.5 ft from the datum (NE corner). This unit was placed adjacent to F12 on the West side. Excavations opened at 767.024 amsl and closed at 766.741 amsl. The sediment had a Munsell color of 7.5 YR 3/2 (dark brown) with a texture of sandy loam. Historic artifacts recovered from this unit include: charcoal (n=1); slag (n=5); a dense scatter of brick (n=12); bone (n=27) (cottontail rabbit, possibly intrusive); white ware (n=35); stoneware (n=23); metal (n=7); nails (n=34); and, glass (n=120). Seven possible prehistoric artifacts were recovered as well.

"I am working on the probably sterile unit 12 today; I would be extremely surprised if the unit had any artifacts outside of the plow zone."

-Elizabeth Usherwood [NSF Student]

Level A2 was a continuation of the plow zone, and as such was excavated at an arbitrary level of 0.5 ft. The level opened at 766.741 amsl and closed at 766.219 amsl. The sediment in this layer had a Munsell color of 7.5 YR 3/3 (dark brown), and at the base of Level A2 the color was uniform throughout. Level A2 had a texture of sandy loam. Excavation uncovered a north-south plow scar visible at 0.9 ft. below datum on the west side of the unit, but this disappeared by 1.0 ft. below datum. The density of artifacts decreased notably by the bottom of the level. Historic artifacts recovered include: ceramics (n=38); brick; charcoal; tooth fragments; buttons (n=2); an eyelet; slag; metal; flat (n=21); and, curved glass (n=84).

Level A3 was almost entirely sterile, and was excavated to terminate at the same depth of the adjoining unit, EU 13. Level A3 was opened at a depth of 766.219 amsl and closed at 765.944 amsl. The Munsell color of this level was 10 YR 3/4 (dark yellowish brown) throughout, with a texture of silty loam. The only artifact recovered from this level was one fragment of colorless glass. This unit was then closed, and these excavations determined that EU12 lies entirely outside Feature 12.

Mega strat	***Level***	***Stratum***	***Texture***	***Munsell***	***Opening Elev. amsl***	***Closing Elev. amsl***	***Description***
I	A1	PLOWZONE	SANDY LOAM	7.5 YR 3/2	767.024	766.741	The top of the plow zone contained a dense scatter of brick and other artifacts

Block 13, Lot 4, EU 13

Kathryn Fay, Elizabeth Usherwood, Thomas Glantz, Shawn Fields, Amanda Burtt, Annelise Morris

The team began excavation of Level A1 as an arbitrary level of 0.5 ft. below datum (NE corner). This opening level was adjacent to the known limits of Feature 12. Level A1 was opened at an elevation of 767.226 ft. amsl and closed at 766.883 amsl. The sediment had a Munsell color of 7.4 YR 3/2, and the texture was silty loam. Historic artifacts recovered were: bone (n=2); slate; charcoal; brick (n=32); metal; nails (n=25); button; ceramics (n=60); vessel glass (n=65); milk glass; and, flat glass.

"Today we finished the first level of EU 13. Artifacts were all fractions of their former selves and we expect to proceed onto the next level as soon as possible."

-Amanda Burtt [NSF Student]

Excavators removed level A2 (plow zone) at an arbitrary level of 0.5 ft. The sediment in the unit had a Munsell color of 7.5 YR 3/2, with a texture of silty loam. Level A2 opened at 766.883 amsl, and closed at 766.391 amsl. At the close of the unit, the soil began to gradually get lighter to the west, where the texture changed to silty clay loam. Mortar mottling was present in the southeast portion of the unit. Historic artifacts uncovered from this level include: metal (n=108); mortar; charcoal; brick (n=82); ceramics (n=38); glass; bone; shell (n=1); and, one example of lead gun shot.

Level A3 was also excavated at an arbitrary level of 0.5 ft., and at the base of the level, these excavations exposed the western edge of Feature 12. The opening elevation for Level A3 was 766.391, and closed at 765.888 amsl. Level A3 opened at the eastern 2/3 of Level A3, had a Munsell color of 7.5 YR 3/3 (dark brown), and exhibited a silty loam texture. The western 1/3 had a Munsell color of 7.5 YR 4/4 (Dark Brown) and a texture of silty clay loam. Historic artifacts uncovered from this level include: ceramics (n=37); metal (n=249); brick; mortar; flat glass (n=56); curved glass (n=25); leather; bone; charcoal; coal; mortar; bead (n=1); button (n=1); and, clothing (n=2).

Level B1 was excavated to expose the rubble layer just beneath A3, which was also visible in EU14 at the same depth. B1 was removed to match the same depth of EU6. The opening elevation for Level B1 was opened at 765.888 amsl and the level was closed at 765.822 amsl. As the western third of EU13 consists of sterile soil at this level, B1 only exists in the eastern 2/3 of EU13. Excavators noted that this level contained high concentrations of charcoal and mortar. Historic artifacts uncovered from this level include: glass (n=7); ceramic; and, nails (n=16). Excavators observed a distinct context change within EU13 matching that in EU6, as a result this level was closed.

"I found some ceramic that has a stamp of the maker so it would be easy to date. That will be cool to see about in the lab."

-Shawn Fields [NSF Student]

The team excavated Level B2 at an arbitrary level of 0.5 ft. This level's stratum consists of cellar fill, notably large amounts of stone and brick, with the brick concentrated in the southeast corner. This rubble/fill context continues east into EU 6. Level B2 was opened at 765.822 amsl and closed at 765.360 amsl. The sediment in this level had a Munsell color of 10 YR 3/2, with mottling of sterile soil on the west side, the sterile soil having a Munsell color of 7.5 YR 4/4. The sediment in Level B2 had a silty loam texture. Historic artifacts recovered from this level include: bone (n=12); ceramic (n=14); flint; flat glass; mortar; brick; metal (n=28); and, charcoal. A flotation sample was taken from this level.

Level B3/a1 was excavated at an arbitrary level of 0.5 ft. This level begins a new context, beneath the rubble/rocks removed from Level B2. The level was opened at 765.35 amsl and closed at 764.711 amsl. The level's stratum consisted of cellar fill. The sediment in Level B3 had a Munsell color of 7.5 YR 3.2 (dark brown), and in the west 1/3 of the unit, this was mottled with subsoil which had a Munsell color of 10 YR 4/4. The sediment had a texture of silty loam. Historic artifacts recovered from this unit include: mortar; charcoal; ceramic (n=9); brick (n=28); glass; metal; nails (n=44); leather; bone (n=25); a button; and, a brass fountain pen tip. Excavators reported that Level B3 contained a medium concentration of medium- to large-sized rocks in the northwest corner; and also exhibited a larger amount of brick and charcoal in the southeast corner.

"I worked today entirely on EU 13. Continuing to screen and dig and dig and screen…my hand hurts."

-Amanda Burtt [NSF Student]

Level B3/a2 was excavated at an arbitrary level of 0.5 ft, continuing within the same context of B3/a1. The opening elevations of this unit were 764.711 amsl and the unit was closed at 764.296 amsl. The sediment in this level had a Munsell color of 10 YR 3/3 (dark brown), and on the west 1/3 continued to show mottling of 10 YR 4/4 (yellowish brown). The texture of this sediment was silty clay loam. This level contained a medium concentration of brick, as well as small- to medium-sized rocks. The excavators reported a continuance of the concentration of charcoal and mortar in the southeast corner. Historic artifacts uncovered from this level include: brick; charcoal; ceramic (n=4); nails (n=48); metal; a bolt (n=1); and, burned nut shell (n=4).

Level B3/a3 was a continuation of the B2 context, excavated to the close of the context. The level was opened at 764.296 amsl and closed at 764.078 amsl. The sediment in this level had a texture of silty clay loam. The feature fill portion of the unit showed a Munsell color of 10 YR 3/3, while the west third of the level contained sterile soil with a Munsell of 10 YR 4/4 (dark yellowish brown). Historic artifacts contained in this level include: nails (n=98); copper; burned glass; mortar; wasp nests (n=6); brick; and, charcoal. The level was concluded when archaeologists uncovered a layer of burnt mortar and ash.

Level B4 was an ash layer from the house burning, and archaeologists excavated this level contextually. The level was opened at 764.078 amsl and closed at 763.928 amsl. The ash in this layer had a Munsell color of 7.5 YR 3/1, and the texture of this layer was ash, with inclusions of sand and decomposing mortar. Historic artifacts recovered from the ash layer were: ceramic (n=2); brick; mortar; glass (n=13); one metal ring; charcoal (n=10); and, nails (n=46).

"EU 13 has an ash layer in the east 1/3 of the unit, while the west 2/3 is sterile."
-Amanda Burtt [NSF Student]

Archaeologists excavated Level B5 contextually. This level consisted of the sediment beneath the ash layer, until archaeologists found sterile soil. Level B5 opened at 763.928 amsl and closed at 763.789 amsl. The sediments in this layer had a Munsell color of 7.5 YR 4/4 and a texture of silty clay loam. Level B5 terminated when sterile soil was encountered. Historic artifacts in this level were few, and were: nail (n=1); and, glass (n=1).

Mega strat	***Level***	***Stratum***	***Texture***	***Munsell***	***Opening Elev. amsl***	***Closing Elev. amsl***	***Description***
I	A1	PLOWZONE	SILT LOAM	7.5 YR 3/2	767.226	766.883	The top of the plowzone contained large concentrations of ceramic and glass
I	A2	PLOWZONE	SILT LOAM	7.5 YR 3/2	766.883	766.391	Plowzone contained rocks in the South half, and ceramics, glass, and brick
I	A3	PLOWZONE/ FEATURE FILL	SILT LOAM/ SILTY CLAY LOAM	7.5 YR 3/3	766.391	765.888	Feature fill contains a large amount of metal and brick, outline of feature edge beginning to show
II	B1	CELLAR	SILTY LOAM	10 YR 3/2	765.888	765.822	W 1/3 is sterile, Cellar fill E 2/3 of level. Contained few historic artifacts and uncovered a large rubble/brick concentration.
III	B2	CELLAR/RUBBLE FILL	SILT LOAM	10 YR 3/2	765.822	765.360	Rubble fill primarily contained rock and brick.
IV	B3/a1	CELLAR	SILT LOAM	7.5 YR 3/2	765.360	764.711	Cellar fill contained large, flat rocks, ceramics, brick, and nails
IV	B3/a2	CELLAR	SILTY CLAY LOAM	10 YR 3/3	764.711	764.296	Cellar fill contained brick, nails, and charcoal. West side was mottled with sterile subsoil.
IV	B3/a3	CELLAR	SILTY CLAY LOAM	10 YR 4/6	764.296	764.078	Cellar fill contained nails, burned artifacts, and wasps's nests. Level exposed ash layer.
V	B4	ASH	ASH	7.5 YR 3/1	764.078	763.928	Ash layer was thin in this unit, and contained fewer artifacts
VI	B5	CELLAR	CELLAR	7.5 YR 4/4	763.928	763.789	Sediment beneath ash layer came to sterile soil, and had few artifacts.

Block 13, Lot 4, EU 14
Kathryn Fay, Shawn Fields, Kaila Akina, Annelise Morris, Elizabeth Usherwood, MaryKathryn Rocheford, Miriam Manda

Excavations in 2010 removed the plow zone from EU 14. In 2011, excavations began at the top of the cellar fill of Feature 12, in Level B1. Level B1 was excavated contextually, and consisted of a dense lens of artifact fill within the cellar. This level was closed at 766.198 ft. amsl. The sediments in this layer had a Munsell color of 10 YR 3/2, and a texture of silty loam. Archaeologists noted that this layer was mottled with charcoal throughout, and that some bones were recovered from what may be a metal pot in the southeast corner; these bones were bottled separately. Historic artifacts recovered from this dense rubble fill consist of: shell; leather (n=5); slag; mortar; shoe eyelet; metal lids (n=2); whole bottles (n=8); pocket knife; buckle; buttons (n=4); metal caster; brick; bone (n=40); charcoal; flat glass (n=74); ceramics (n=132); metal (n=1018); and, glass (n=1623).

"We found two bones that were from a smaller animal, and also some more glass and ceramics."

-Miriam Manda [NSF Student]

Level B2 was removed at an arbitrary depth of 0.5 ft. The level was opened at 766.109 amsl and closed at 765.734 amsl. The sediments in this layer of cellar fill had a Munsell of 10YR 3/2 and a texture of silty loam. Archaeologists noted that medium to large rocks were present, clustering in the south-southwest quadrant of the unit and continue into EU 14; excavators hypothesize that this may represent some kind of wall fall. The level continued to have a large amount of historic artifacts (although not quite as dense as the previous layer). Historic artifacts recovered from this level include: bone (n=32); ceramics (n=43); glass (n=200); shoe leather (heel); buttons; glass; metal (n=210); mortar; charcoal; whetstone; brick; and, slate.

Archaeologists removed Level B3 at an arbitrary depth of 0.5 ft. The sediments in this layer had a Munsell color of 7.5 YR 3/2 and a texture of sandy clay loam. Level B3 was opened at 765.834 amsl and closed at 765.203 amsl. The rocks exposed in the previous level continued in this level in the southern quadrant, but were smaller. A flotation sample was taken from this level. Historic artifacts recovered from Level B3 include: leather; mortar; charcoal; brick; ceramic (n=26); glass (n=52); clothing hook (n=2); buckle; slate; lock plate; metal (n=28); nails (n=117); bolts (n=3); wire; bone (n=77); shell (n=2); white metal; bead; buttons (n=4); and, straight pins (n=2).

"Digging in EU 14 today, and it has much more stuff in it than EU 17!"

-Shawn Fields [NSF Student]

Level B4/a1 was excavated at an arbitrary depth of 0.5 ft. The level was opened at 765.203 amsl and closed at 764.602 amsl. The sediments in Level B4 had a Munsell color of 10 YR 3/2 and a texture of sandy clay loam. Archaeologists noted that the south quadrant of the layer was mottled with 10 YR 5/8 and a sandy concentration of 10 YR 7/2. In addition, the layer was mottled with charcoal, mortar, and brick throughout. Excavators noted that the rocks continued

to get smaller, and the amount of brick increased towards the bottom of the layer. Historic artifacts uncovered from this unit were: slate; brick; slag; charcoal; glass (n=38); ceramic (n=15); wasp's nest; metal buttons; glass buttons; tacks (n=8); metal (n=10); nails (n=216); wire; bolt; white metal (n=2); milk glass button (n=3); and, bone (n=51).

Level B4/a2 was a continuation of the B4 context, excavated contextually until archaeologists came down on the ash layer. This level was opened at 764.702 amsl and closed at 764.533 amsl. This thin layer had a Munsell of 7.5 YR 3/2 and continued to be mottled with sandy ash and charcoal, with a texture of sandy clay loam. Historic artifacts excavated from this layer were: bone (n=3); pipe (n=); wasp's nest; charcoal; ceramic (n=4); glass (n=15); burnt brick; nails (n=91); white metal (n=3); slag; and, other metal (n=5).

Archaeologists excavated Level B5, a layer of ash and charcoal, contextually. The level was opened at 764.533 amsl and closed at 764.186 amsl. This layer was mottled with sand, ash, mortar, and charcoal, and had a mottled Munsell color of 10YR 3/3, 10 YR 6/2, 10 YR 5/2, and 10 YR 5/6. Excavators encountered a "rainbow" colored patch in the western quadrant and opted to excavate that separately. This layer, consisting of ash and charcoal, was predominated by bricks and historic artifacts recovered were: charcoal; bone (n=6); wasp's nests (n=3); glass (n=10); brick; nonferrous nails (n=50); metal (n=312); and, ceramics (n=17).

"We found the layer of ash, which suggests that the house burned down. We are finding fewer artifacts but lots of nails especially."

-Kaila Akina [NSF Student]

Level B6 consisted of the "rainbow" colored section of the ash layer, and was excavated contextually. This layer was opened at 764.186 amsl and closed at 763.999 amsl. The sediments in this layer had a Munsell color of 10 YR 3/3, 10 YR 2/1, 10 YR 6/2, and 10 YR 5/6. Historic artifacts recovered from this layer were: bone (n=6); ceramics (n=4); metal; nails (n=31); charcoal; and, glass (n=2).

Level B7 was the terminal layer of this unit, consisted of a thin layer of cellar below the ash layer, and was excavated contextually until archaeologists reached sterile soil. This layer was opened at 763.999 amsl and closed at 763.586 amsl; and, it should be noted that the level sloped from the northeast (highest) to the southwest (lowest). The sediments in this layer had a Munsell color of 7.5 YR 6/6 and a texture of sandy clay loam. Few artifacts were uncovered from this layer, and they included: bone (n=13); shell; button; charcoal; ceramics (n=7); glass (n=15); tack (n=1); coin (n=1); and, metal (n=13).

Mega Strat	Level	Stratum	Texture	Munsell	Opening Elev. Amsl	Closing Elev. Amsl	Description
II	B1	CELLAR FILL	SILT LOAM	10 YR 3/2	N/A	766.198	Dense artifact layer, metal and glass predominated and a pocketknife was found.
III	B2	CELLAR FILL	SILT LOAM	10 YR 3/2	766.198	765.734	Fewer artifacts than the previous layer, rock cluster in SW corner uncovered.
IV	B3	CELLAR FILL	SANDY CLAY LOAM	7.5 YR 3/2	765.734	765.203	Layer contains smaller rocks and a sizeable amount of bone
V	B4/a1	CELLAR FILL	SANDY CLAY LOAM	10 YR 3/2	765.203	764.602	Layer was mottled with sandy sediments, and nails predominated the artifact assemblage.
V	B4/a2	CELLAR FILL	SANDY CLAY LOAM	7.5 YR 3/2	764.602	764.533	Thin layer just above the ash layer contained brick concentrations, and nails predominated.
VI	B5	ASH	ASH	10 YR 3/3 10 YR 6/2 10 YR 5/2 10 YR 5/6	764.533	764.186	Ash layer contained predominantly brick and nails
VII	B6	ASH	ASH	10 YR 3/3 10 YR 2/1 10 YR 6/2 10 YR 5/6	764.186	763.999	Separated from B5 due to color, however they're likely the same context.
VIII	B7	CELLAR FILL	SANDY CLAY LOAM	7.5 YR 6/6	763.999	763.586	A coin was recovered from this layer, which terminated in sterile soil.

Block 13, Lot 4, EU 15
Kathryn Fay, Annelise Morris, Hillary Christopher, Amanda Burtt, Elizabeth Usherwood, MaryKathryn Rocheford, Antoinette West, Shawn Fields

Previous excavations removed the plow zone from EU 15, and excavations in 2011 began below the backfill, at Level B1. This level was excavated contextually, removing the cellar fill/rubble layer and closing when the rubble layer was removed. Level B1 was opened at an average of 767.186 ft. amsl and closed at 766.460 amsl. Level B1 consisted of a cellar fill/rubble artifact concentration, had a Munsell color of 7.5 YR 3/2 (dark brown) and a texture of silty loam. Excavators noted that this layer was mottled with small charcoal bits throughout and mortar and sand in the northeast corner. This layer was closed when the dense rubble pile ended. Archaeologists encountered a large portion of burned wood in the southeast quadrant, and an ash deposit containing burnt earth and metal artifacts.

Level B2 was removed at an arbitrary level of 0.5 ft. Archaeologists note that this layer of cellar fill contained fewer artifacts than the previous level, and contained more rocks and rubble. Level B2 was opened at 766.469 amsl and closed at 766.034 amsl. The sediment in this layer had a Munsell color of 10 YR 3/3, and a texture of silty loam. Excavators noted that this level was mottled with mortar and charcoal. Historic artifacts uncovered from this layer consist of: leather (n=5); gun flint (n=1); mortar; textiles; charcoal; slate (n=6); bone (n=38); brick (n=34); ceramics (n=69); metal (n=218); flat glass (n=36); and, curved glass (n=99).

"We have been uncovering more stone and ceramics, metal, and lots of glass bottles."
-Hillary Christopher [NSF Student]

Archaeologists removed Level B3 was removed at an arbitrary level of 0.6 ft. and consisted of cellar fill. The level was opened at 766.034 amsl and closed at 765.397 amsl. The sediments in this layer had a Munsell color of 10 YR 3/3 and a texture of silty loam. Numerous historic artifacts were recovered from this layer, including: brick; slate; whetstone (n=1); charcoal; mortar; ceramic (n=45); glass (n=69); eyeglasses; leather; bone (n=44); buttons (n=6); glass bead; nails (n=133); barrel strapping; buckle (n=1); wire; and, unidentified metal (n=136).

"We found huge amounts of glass shards from broken bottles and a belt-chain type object."
-Antoinette West [NSF Student]

Level B4 of the cellar fill in F12 was excavated contextually, and closed when archaeologists came down on a layer of ash and charcoal. This level was opened at 765.397 amsl and closed at 764.979 amsl. The sediments in this layer continued to have a Munsell color of 10 YR 3/3, but the texture had changed to sandy clay loam. Historic artifacts recovered from this level include: buttons; nails (n=329); glass (n=30); metal (n=40); charcoal; ceramic (n=26); bone (n=31); burnt wasp nest; and, burnt glass (n=26).

Excavators removed Level B5, a layer of ash and charcoal, contextually. The level was opened at 764.979 amsl and closed at 764.575 amsl, but it should be noted that this level had a pronounced slope from south (higher) to north (lower). The sediments in this layer were mottled

with ash, charcoal, and mortar, and the overall Munsell color was 10 YR 3/1, mottled with 10 YR 7/4. The texture throughout was ash. Archaeologists discovered a large burnt timber through the center of the unit, which was removed in chunks for later testing and identification. Historic artifacts removed from this layer include: ceramic (n=74); glass (n=17); charcoal; mortar; bone (n=22); nails (n=482); wasp's nests (n=2); metal (n=59); buttons; and, a burnt timber sample.

"We found a lot of ash, so that might be evidence of a house fire and we are trying to get to sterile soil underneath it."

-Shawn Fields [NSF Student]

Level B6 was the terminal layer of this unit, consisted of a thin layer of cellar fill below the ash layer, and was removed contextually until archaeologists encountered sterile soil. The layer was opened at 764.575 amsl and closed at 764.05 amsl. Historic artifacts uncovered from this layer include: carved shell (n=1); bone (n=18); brick; tacks; button; glass (n=28); mortar; ceramics (n=7); charcoal; metal; nails (n=43); and, timber. This level was closed when archaeologists reached sterile soil.

Mega Strat	Level	Stratum	Texture	Munsell	Opening Elev. Amsl	Closing Elev. Amsl	Description
II	B1	CELLAR FILL	SILT LOAM	7.5 YR 3/2	767.186	766.46	Cultural layer of cellar fill just beneath backfill, contained a very dense artifact concentration
III	B2	CELLAR FILL	SILT LOAM	10 YR 3/3	766.46	766.034	Fewer artifacts than previous level, recovered a gun flint
IV	B3	CELLAR FILL	SILT LOAM	10 YR 3/3	766.034	765.397	Archaeologists recovered a nearly complete pair of eyeglasses from this level
V	B4	CELLAR FILL	SANDY CLAY LOAM	10 YR 3/3	765.397	764.979	Nails and burnt artifacts were predominantly found in this level.
VI	B5	ASH	ASH	10 YR 3/1 10YR 7/1	764.979	764.575	Ash layer consisted of a heavy nail concentration, and a burnt timber was recovered from this layer.

Block 13, Lot 4, EU 16
Kathryn Fay, Annelise Morris, Joseph Tonelli, Thomas Glantz

Excavations in 2010 removed the plow zone in Excavation Unit 16. In 2011, excavations began at Level B1. After opening the level, archaeologists immediately encountered cellar fill, and so this layer was excavated at an arbitrary level of 0.5ft. Level B1 was opened at 768.251 ft. amsl and closed at 767.327 amsl. The sediment in this level had a Munsell color of 10 YR 3/3 with a texture of silty loam. Excavators noted that this level was mottled with charcoal. The level also exhibited small burning stains. Historic artifacts uncovered were numerous, and included: metal (n=848); ceramic (n=379); vessel glass (n=1230); flat glass (n=245); bone (n=22); burned glass (n=21); mortar; brick; slate; buttons (n=37); charcoal; slag; eyelets; lid liners; leather; whetstone (n=6); eyeglasses; hairpin; buckle; bottles; shell; wood; bullet casing; and, shotgun shell.

"We started working in unit 16 today and found two tea cups: one was white and gothic style and one was white and blue."

-Thomas Glantz [NSF Student]

Excavations of the cellar fill, Level B2/a1, began with an arbitrary level of 0.5 ft. The level was opened at 767.327 amsl and closed at 766.575 amsl. The sediments in Layer B2/a1 had a Musell color of 7.5 YR 3/2 and a texture of silty loam. This layer of cellar fill yielded an abundance of historic artifacts, including: plaster; mortar; brick; stoneware (n=8); yellow ware; white ware; charcoal; leather (n=3); eggshell; glass buttons (n=3); metal buttons (n=2); bone; white metal; glass (n=64); hardware; metal (n=31); and, nails (n=44).

Level B2/a2 was excavated at an arbitrary level of 0.5 ft. The cellar fill in this level had a Munsell color of 10 YR 3/2 with a texture of silty loam. This level was opened at 766.515 amsl and closed at 766.180 amsl. At the close of this unit, a layer of large rocks are beginning to show. Historic artifacts uncovered from this layer include: bone (n=29); ceramic (n=48); leather; charcoal; glass (n=28); shell; a fork; metal (n=70); mortar; brick; a metal button; and, porcelain doll leg (n=1). Archaeologists uncovered largely intact shell from this layer.

"We're making good progress and finally found lots of rocks that could be evidence of the foundation!"

-Joseph Tonelli [NSF Student]

Level B3 was a rocky layer beneath the layer of fill in the cellar of F12, included a large amount of rocks, and was excavated at an arbitrary level of 0.5 ft. This level was opened at 766.180 amsl, and closed at 765.589 amsl. The sediment in this level had a Munsell color of 7.5 YR 3/2, and a texture of silt loam. Archaeologists report that this level was also mottled with clay deposits throughout. Historic artifacts uncovered in this layer include: bone (n=21), brick, mortar, burned nutshell, metal tack, a straight pin, milk glass buttons (n=2), glass (n=18), ceramic (n=30), metal (n=45). This level was closed when it became impossible to excavate past the rock layer.

"I managed to get some dirt out of the unit but there are many rocks. Which doesn't rock."

-Joseph Tonelli [NSF Student]

Archaeologists excavated Level B4/a1 at an arbitrary depth of 0.5ft. The level was opened at 766.589 amsl and closed at 764.977. This level had a Munsell color of 7.5 YR 3.2 (dark brown) with a texture of silty loam, and was mottled with 10 YR 4/6 (dark yellowishb) with a texture of silty clay loam. Excavators noted that the rocks present in the previous level terminate at about three ft. below datum, and also noted a concentration of large, flat rocks along the eastern wall. Archaeologists also noted that the largest concentration of artifacts was near the top of the level, decreasing with depth with the exception of a bottle fragment found very deep in the level. About one foot out from the north and west walls, excavators encountered a sandy sediment concentration, and in the center of the unit, a concentration of "reddish clay". Historic artifacts uncovered from this layer were: a horseshoe; a metal round coupling; straight pin (n=1); mortar; charcoal; nails (n=53); a bolt; a metal button; glass (n=17); ceramics (n=21); metal; and, bone (n=7).

Level B4/a2 was removed contextually by archaeologists. The southern half of this layer exposed sterile soil, while the northern portion came down on an ash layer. Level B4/a2 was opened at 764.977 amsl and closed at 764.814 in the north half and 764.208 in the southern (sterile) portion. This layer had a Munsell color of 10YR 4/3 (dark brown). This level shows clearly the outer limits (on the southern side) of the ash layer. Historic artifacts uncovered from this layer include: bone (n=6); nails (n=63); other metal; mortar; ceramic (n=12); glass; buttons; and, charcoal.

Archaeologists excavated Level B5, a layer of ash and charcoal, contextually. This layer was opened at 764.814 amsl and closed at 764.707 amsl. This level consists of the northern half of EU16, that half that had not terminated in sterile soil up to this point. The ash layer in this level was multi-colored due to mixtures of sand, mortar, and charcoal and had a mottled Munsell of 10 YR 6/3 (pale brown), 10 YR 5/2 (Grayish Brown) and 10 YR 3/1 (Very Dark Grey). The texture of the sediments in this layer was ash and sand. Excavators noted that there was a large intact piece of burnt wood found in the northwest quadrant of the level, and also that a circle of heavy clay was noted in the corner of the unit, approximately three feet in diameter. Historic artifacts uncovered in this layer were dominated by nails: ceramic (n=4); charcoal; bone (n=19); copper (n=5); glass (n=3); unidentified metal (n=6); and, nails (n=125).

"The ash layer's edge is exposed in EU 16, likely delimiting the extent of the cellar."
-Annelise Morris [Crew Chief]

Level B6 consisted of a thin layer of cellar fill below the ash layer and was excavated by archaeologists contextually. The level was opened at 764.707 amsl and closed at 764.302 amsl. The sediment in this layer had a Munsell color of 7.5 YR 3/2 (Dark Brown) and a texture of sandy clay loam. Metal predominated the assemblage recovered from this layer: metal (n=30); ceramic (n=4); glass (n=3); bone (n=11); and, beads (n=2). This unit was closed when the layer terminated at sterile soil.

Mega Strat	Level	Stratum	Texture	Munsell	Opening Elev. Amsl	Closing Elev. Amsl	Description
II	B1	CELLAR	SILT LOAM	10 YR 3/3	768.251	767.327	Cellar fill contained an abundance of artifacts, including a large amount of metal, hairpins, and a pair of eyeglasses.
III	B2/a1	CELLAR FILL	SILT LOAM	7.5 YR 3/2	767.327	766.515	Cellar fill had an abundance of glass and ceramics in this layer.
III	B2/a2	CELLAR FILL	SILT LOAM	10 YR 3/2	766.515	766.18	Cellar fill came down on a rock layer, had an abundance of intact historic artifacts, including shell.
IV	B3	CELLAR FILL	SILT LOAM	7.5 YR 3/2	766.18	765.589	Level contained a large concentration of rocks, and historic artifacts such as straight pins and buttons.
V	B4/a1	CELLAR FILL	SILT LOAM	7.5 YR 3/2	766.589	764.977	Archaeologists encountered few artifacts, and the rocks began to thin out
V	B4/a2	CELLAR FILL	SILT LOAM	10 YR 4/3	764.922	N: 764.814 S: 764.208	This level exposed sterile soil in the Southern half, and the Ash layer in the Northern half.
VI	B5	ASH LAYER	ASH	10 YR 6/3, 10YR 5/2, 10YR 3/1	764.814	764.707	The ash layer contained a predominance of nails and other burnt artifacts.
VII	B6	CELLAR FILL	SANDY CLAY LOAM	7.5 YR 3/4	764.707	764.302	Metal predominated this layer, which closed in sterile soil.

Block 13, Lot 4, EU 17

Annelise Morris, Kathryn Fay, Joseph Tonelli, Shawn Fields, Anna Agbe-Davies, Terrance Martin, Kaila Akina

EU 17 was opened adjacent to Feature 12 on the east side. The opening layer for excavations of EU 17 began at A1, a sod and plow zone layer, with an arbitrary depth of 0.5 ft. The average opening elevations for this unit were 768.109 amsl and the level closed at 767.701 amsl. This level consisted of sediment with a Munsell color of 10 YR 4/3 and a silty loam texture. Historic artifacts uncovered in this layer include: brick; mortar; glass (including flat glass, curved glass (n=44), and milk glass); ceramics (including whiteware and porcelain, for a total n=39); charcoal; slag; bone (n=7); buttons (n=2); and, metal.

"Found a fair density of artifacts today, including a cool shell and some ceramics and glass."
-Joseph Tonelli [NSF Student]

Excavations on Level A2 were undertaken as an arbitrary level of 0.5 ft., as the stratum consisted of the plow zone. Opening elevations were 767.701 amsl and excavations closed at 767.2 amsl. The sediment had a Munsell color of 10 YR 4/2 with a silty loam texture. Historic artifacts uncovered were: glass (n=35); bone; brick; charcoal; metal (n=19); ceramic (n=17); and, one marble. Excavations in A2 revealed a stain (at 10 YR 3/2) in the southeast corner of the unit, which was identified as a possible post mold. This area was pedestaled throughout the excavation of the next level, A3.

"Excavation was interesting today because we found a soil change, circular in shape, near the southeast corner of the unit."
-Kaila Akina [NSF Student]

Level A3 was opened at 767.2 amsl and closed at 766.694 amsl. This unit was also excavated at an arbitrary level of 0.5 ft. and terminated in sterile soil. The majority of the sediment in this level had a Munsell color of 10 YR 4/4, with 10 YR 3/4 on the western edge of the unit (bordering F12). Few artifacts were uncovered from this unit, including: white ware (n=1); milk glass (n=1); glass; bone; wood; charcoal; brick; mortar; and, metal, with metal predominating (n=13). The stain revealed in Level A2 was pedestaled, and was observed to continue through Level A3.

Feature 41 was assigned to the post mold revealed in EU 17, in Levels A2 and A3. In Level A3, feature 41 was pedestaled, then bisected to expose the profile of the feature. The top of the feature was at a depth of one foot from EU 17's datum (the southeast corner) and the bottom at 1.5 ft. The sediment within the feature had a Munsell color of 10 YR 3/2 and the texture was silty loam. We observed mottling of charcoal and mortar within the feature, and there were no artifacts recovered from feature 41. The team hypothesized that this could possibly be a support for a porch.

Mega Strat	Level	Stratum	Texture	Munsell	Opening Elev. Amsl	Closing Elev. Amsl	Description
I	A1	PLOWZONE	SILT LOAM	10 YR 4/3	768.109	767.701	Plow zone with a small scatter of artifacts
II	A2	PLOWZONE	SILT LOAM	10 YR 4/2	767.701	767.2	Plow zone with small scatter of artifacts and likely post mold (F 41) in SE corner
III	A3	PLOWZONE	SILT LOAM	10 YR 4/4 & 10 YR 3/4	767.2	766.694	Plow zone few artifacts and termination of post mold (F 41)

Media and Conference Outreach Activities

Broad-scale media and conference dissemination of educational information concerning the conduct of scientific research at the New Philadelphia town site and a related tDAR project by Digital Antiquity in 2011 and 2012 included the following presentations and interviews, listed in alphabetic order by presenter:

Kaila Akina (2011 NSF-REU Intern). 2011. Interview on NSF-REU experiences published in open access article, "Exploring History through Archaeology," by Emily Frank, Department of History, University of Idaho, http://www.uidaho.edu/class/history/news/kaila-akina.

Jamie Arjona and Christopher Fennell. 2012. "Diverse Methods and Landscape Analyses at the New Philadelphia National Historic Landmark." Paper presented in symposium entitled *Knowledge Woven of Many Threads: Interdisciplinary Investigations at the National Historic Landmark Site of New Philadelphia, Illinois*, convened at the Annual Meeting of the Society for Historical Archaeology, January 6, Baltimore, Maryland.

Adam Brin and Francis P. McManamon 2012 "Introducing Digital Antiquity and tDAR." Paper presented at the Society for Historical Archaeology Annual Meeting, Baltimore, MD. 5 January 2012.

Amanda Burtt (2011 NSF-REU Intern). 2012. *Evidence of Animals at New Philadelphia, Illinois*. Submitted in completion of the Senior Honors Thesis Program, Department of Anthropology, University of California, Berkeley.

Amanda Burtt (2011 NSF-REU Intern). 2012. "Evidence of Animals at New Philadelphia, Illinois." Presented at CalDay (University Open House) at the University of California Berkeley.

Amanda Burtt (2011 NSF-REU Intern). 2012. "Evidence of Identity through Zooarchaeology." Paper to be presented at the Midwest Archaeology Conference in October 2012.

Amanda Burtt (2011 NSF-REU Intern) and Terrance Martin. 2012. "Animal Remains from Block 13." Paper presented at the Society for Historical Archaeology Conference, Baltimore, MD.

George Calfas (2008 NSF-REU Intern, Doctoral Candidate, University of Illinois). 2011. "Light Detection and Ranging (LiDAR): Uses in Land and Heritage Management." Paper presented at *Spatial Decision Support Workshop*, U.S. Army Corp of Engineers in

Champaign, Illinois, October 18.

Kathryn Fay (2004 NSF-REU Intern, Doctoral Candidate, University of Illinois). 2012. Symposium organizer and chair, *Knowledge Woven of Many Threads: Interdisciplinary Investigations at the National Historic Landmark Site of New Philadelphia, Illinois*, presented at the Society for Historical Archaeology Conference in Baltimore, Maryland; January 6.

Kathryn Fay (2004 NSF-REU Intern, Doctoral Candidate, University of Illinois). 2012. "Historic Beginnings: The Site of New Philadelphia, Illinois and its Archaeological Project." Paper presented at the Society for Historical Archaeology Conference in Baltimore, Maryland, January 6.

Kathryn Fay (2004 NSF-REU Intern, Doctoral Candidate, University of Illinois). 2011. "Archaeology in Illinois and Beyond." Invited lecture for 6th grade students at Countryside School in Champaign, Illinois, October 24.

Kathryn Fay (2004 NSF-REU Intern, Doctoral Candidate, University of Illinois). 2011. "Gender Boundary Crossings by Women at New Philadelphia, Illinois." Paper presented at the Society for Historical Archaeology Conference in Austin, Texas; January 7.

Christopher Fennell. 2012. "Multidisciplinary Approaches to African Diaspora Studies." Invited lecture presented at the Institute of History and Philology, Academia Sinica, Taipei, Taiwan, June 15.

Christopher Fennell. 2012. "Using the Digital Archaeological Record (tDAR) for Management, Research, and Education." Discussant for forum convened at the 77th Annual Meeting of the Society for American Archaeology, April 22, Memphis, Tennessee.

Christopher Fennell. 2012. "Multiscalar Analysis of Racism's Impacts on New Philadelphia, Illinois, a 19th Century Integrated Town." Invited lecture presented March 22, to the Department of Anthropology, Syracuse University, New York.

Christopher Fennell. 2012. "Examining Structural Racism in the Jim Crow Era of Illinois." Paper presented in symposium entitled *The Materiality of Freedom: Archaeologies of the Recent African American Past*, convened at the Annual Meeting of the Society for Historical Archaeology, January 5, Baltimore, Maryland.

Christopher Fennell. 2011. "African Diaspora Archaeology and Interdisciplinary Challenges." Invited paper presented October 13, to the Graduate University of the Chinese Academy of Science, Beijing, China.

Christopher Fennell. 2011. "Archaeology and African Diaspora Legacies in the Americas."

Invited keynote presentation at the XVI Congress of the Brazilian Archaeological Society (SAB) and the XVI Worldwide Congress of the International Union of Prehistoric and Florianopolis, Brazil.

Christopher Fennell. 2011. "Serving Descendant Community and Research Constituents in the New Philadelphia Digital Archaeological Archive." Invited presentation as part of forum entitled *Using the Digital Archaeological Record (tDAR) for Management and Research*, presented April 1, at the Annual Meeting of the Society for American Archaeology, Sacramento, California.

Keishaia S. Griffith (2011 NSF-REU Intern). 2011. "Free Frank and New Philadelphia." Student Research and Creativity Celebration. Presented at Buffalo State College, New York, April 30.
