2000-2004*

The White House Grounds and Gardens
2000-2004

Preface

The White House grounds and gardens are a living monument. The landscape character has evolved through many administrations, covering more than 200 years. These grounds and gardens change with the seasons and are continually improved by human hands.

It is, therefore, important to document for future generations one of the most famous gardens in the world. This booklet records for posterity the image of the White House grounds during the first term of the George W. Bush administration, 2000–2004. It supplements previous volumes published for 1976–1980, 1980–1984, 1984–1988, 1988–1992, 1992–1996, and 1996–2000.

The White House Grounds

2000–2004

North Panel

2001 Winds spawned by local tornadoes split a large tulip popular planted prior to 1900. The tree was removed on September 25 by National Park Service arborists. A hollow trunk prevented an accurate age count of growth rings. Section 4 / Tree 8

2002 Palestrina azaleas along the east tradesman's entrance were removed to facilitate the restoration of the walls. Section 4 / Shrub 14

A hybrid yellow buckeye was removed on September 12. This tree was destroyed by gray squirrels stripping the bark and girdling branches. This tree was attributed to be a seedling of a tree from George Washington's Mount Vernon estate. It was a hybrid of *Aesculus octandra* and *Aesculus pavia*. The tree was planted prior to 1900. Section 2 / Tree 4

2003 Azalea plantings on the east and west perimeter were renovated on May 12. The existing plants had been damaged by a severe winter. The azalea cultivars "Pleasant White" and "Gillie" were chosen to provide late spring color. Section 1 / Shrub 1, Section 4 / Shrubs 6, 7

A linden was blown over on June 1 during a thunderstorm. This tree had been damaged a year earlier by a lightning strike and was in poor health. Section 3 / Tree 8

Credit: Office of the NPS Liaison to the White House

Credit: Office of the NPS Liaison to the White House

Middle Panel

2001 Approximately 50 English boxwood were planted around the Oval Office steps on March 16-18. This completed the renovation begun in 2000. Section 7 / Shrubs 7

President and Mrs. Bush planted a Wier cut-leaf silver maple on July 16. This tree replaces an old Wier maple removed in 1999. This rare, native tree was a commemorative planting. Section 9 / Tree 19

A 35-year-old horse chestnut was removed on August 22. This tree had been fatally damaged by gray squirrels gnawing bark. Section 8 / Tree 14

The eight small-leaved lindens planted in 1963 along the east colonnade were removed during the week of October 15. Two of the trees had died, and the others were in poor health. The small-leaved holly hedge along the walk was removed at the same time. A window project began soon after the tree removal. Section 6 / Trees 6-13

A falling limb from an adjacent linden crushed a Cherokee Princess dogwood in the west triangle planting. On November 11 the dogwood was replaced. This is a commemorative planting. The rhododendrons in the area were replaced at the same time. Section 8 / Tree 2, Section 8 / Shrub 57

Credit: Office of the NPS Liaison to the White House

2002 A Potomac crepe myrtle was planted in the east triangle in April. It will provide summer color and winter bark display. Section 10 / Shrub 25

The Green Pillow boxwoods from the original 1962 plantings around the Oval Office were removed on May 19. These plants had suffered from shading and root competition. Justin Brouwer boxwoods grown at the nursery replaced the old boxwoods. Section 7 / Shrub 12

A multiyear year project for stone restoration on the West Wing was initiated in the spring. Plantings were removed from the patios and adjacent pool areas. The cabana was refurbished and utilities were updated. The plantings will be restored at the end of the construction and stone conservation. Section 8 / multiple trees and shrubs

In August, two 30-year-old Kingsville boxwoods were planted near the East Wing. These were original stock plants from the Henry J. Hohman Kingsville nursery in Maryland. Section 10 / Shrub 26

Credit: Office of the NPS Liaison to the White House

2003 Eight new small-leaved lindens were planted along the east colonnade on March 29. These 3-inch caliper trees replaced the declining lindens removed in 2001. The trees were grown in New Jersey. Section 6 / Trees 6-13

The Katherine crabapple trees in the Rose Garden have been in decline for several years. One tree was removed in fall 2001 and replaced in April 2002 with a tree from the south grounds. That tree failed to thrive and was removed in May. The remaining crabapples were removed on May 1, 2003. New Katherine crabapples were located in New Jersey, and all 10 trees were replanted. Section 7 / Trees 8-12, 15-19

A small-leaved linden was lost in a storm on June 1. This tree was a commemorative planting by Franklin Roosevelt. On November 11, President and Mrs. Bush planted a replacement small-leaved linden. This is a commemorative tree. Section 9 / Tree 25

2004 Declining foundation plantings of elaeagnus were replaced in June. Section 7 / Shrub 19

A silver atlas cedar planted in 1987 was removed June 5. This tree was a replacement to match one of the original pair on the east and west Jefferson knolls. Section 9 / Tree 11

Boxwoods from the 1962 plantings near the Rose Garden were replanted in July. Four English boxwoods and 14 Kingsville boxwoods were chosen as replacements. Section 7 / Shrubs 14, 15

Boxwoods adjacent to the Oval Office windows were removed during construction. The area was replanted on December 3 with Vardar Valley boxwoods. This compact selection was discovered in 1935 in the Balkans. Section 8 / Shrub 2

Credit: White House Photo Office

South Panel

2001 A holly osmanthus screening along the west perimeter was replaced by eight oak leaf hollies in April. Section 12 / Shrub 42

The renovation of the west side of the Children's Garden was completed during the spring and early summer. Hollies, camelias, and new flowering shrubs were added to finish the project begun in 2000. Section 12 / Shrubs 16-19, 21, 23, 26-29, 31-35, 37-39.

A storm on July 1 destroyed a horsechestnut planted prior to 1900. The tree was removed on July 2 by National Park Service arborists. Section 12 / Tree 23

A tulip tree considered hazardous was taken down on September 9. This tree had been in poor health for several years. Section 11 / Tree 11

2003 A strong summer storm destroyed a golden rain tree on August 16. The tree was planted before 1900. A cut-leaf silver maple was planted on October 21 as a replacement for the golden rain tree. Nellie Stevens hollies were added to complete the landscaping. Section 11 / Tree 9, Section 11 / Shrubs 72-76.

A sugar maple adjacent to the south roadway was removed in October. Planted in 1965, this tree had been in slow decline for several years. Section 11 / Tree 4

2004 On April 8 a spruce was removed in the southwest plantings. Senescence caused the death. Section 12 / Tree 33

2001

Replacement of North Portico Landing Pavers

Within the east and west landings adjacent to the north portico, there are 206 Alabama limestone pavers that were installed as part of the Truman Renovation project, completed in 1952. At the time of the initial installation, all pavers came from the same quarry and were of the same color and texture. Replacement pavers were obtained from the original quarry until its closing in the early 1980s, requiring that replacement pavers come from a different location. Initially, the replacement pavers were a close match to the existing pavers. However, after installation the replacement pavers darkened and there was a distinct difference between the original pavers and the replacements.

The Alabama quarry reopened in 2000, and four sample pavers were used to determine if the active vein of stone matched the existing pavers. Mr. Irvin Williams, Superintendent of Grounds, approved the sample pavers, and in August 2001, 56 cracked, chipped, and/or discolored pavers were identified for replacement. In addition to this, 2000 linear feet of mortar joints within the portico were removed and pointed.

Credit: White House Photo Office

Paint Perimeter Fence

In 1819 James Monroe had New York ironworker Paulus Hedl construct entrance gates for the north side. A similar ornamental fence for the perimeter was mounted on a parapet wall. Andrew Jackson disliked the fence 12 years later and ordered the stone pillars placed 30 or 40 feet apart, as well as having the fence straightened. By June 1851, an iron fence enclosed the entire grounds of the White House on the recommendation of Andrew Jackson Downing. When the south grounds were enlarged in 1937-1938, a fence was installed that matched the fence on the north grounds. The fence appearance has remained the same, but was replaced with a replica of heavier materials; the last remaining section was replaced in 1976.

This project included the removal of all loose and/or flaking lead-based paint, rust, scale, or otherwise deleterious material on the 4,150 linear feet of the 7-foot-high metal fence forming the perimeter of the White House grounds. A total of 17 pedestrian gates, 11 vehicle gates, and all adjacent support posts were included. Upon completion of the removal of the deleterious material, fresh paint was applied to all surfaces of the fencing and gates, including the fence stanchions along the entire perimeter.

2002

Repave West Executive Avenue

West Executive Avenue is located between the Executive Old Eisenhower Office Building and the West Wing of the White House. West Executive Avenue was closed to traffic in 1941 at the beginning of World War II and serves as a vehicular access, parking, and circulation area for executive branch staff.

Although deterioration of the road surface was obvious, the extent of damage on West Executive Avenue showed that some subbase deterioration was also present. In 2002 West Executive Avenue was milled and repaved, and the parking delineation was reconfigured. Repairs were made to the cracks in the road sub-base and the brick gutter.

Credit: White House Photo Office

Repave South Grounds Driveway/Jogging Track

The south grounds driveway is a circular drive that provides access to the south entrance of the White House. In February 1993, a 5-foot jogging track of recycled rubber tires was added to the interior of the south grounds driveway.

This repaving project was necessitated by normal wear and tear and deterioration of the asphalt road surfaces, and a localized depression of a small area on the east side of the south grounds driveway required repair. The rubber jogging track on the south grounds driveway had buckled and split from expansion, was torn and punctured from snow removal and other maintenance operations, and suffered general deterioration from exposure to fertilizers and other chemicals along with natural elements.

The south grounds driveway was milled and repaved, and the rubber jogging track was replaced. Additionally, 80 locking stanchions and stainless steel chains were located around the jogging track’s perimeter for safety.

Credit: White House Photo Office

Replacement of South Portico Pavers

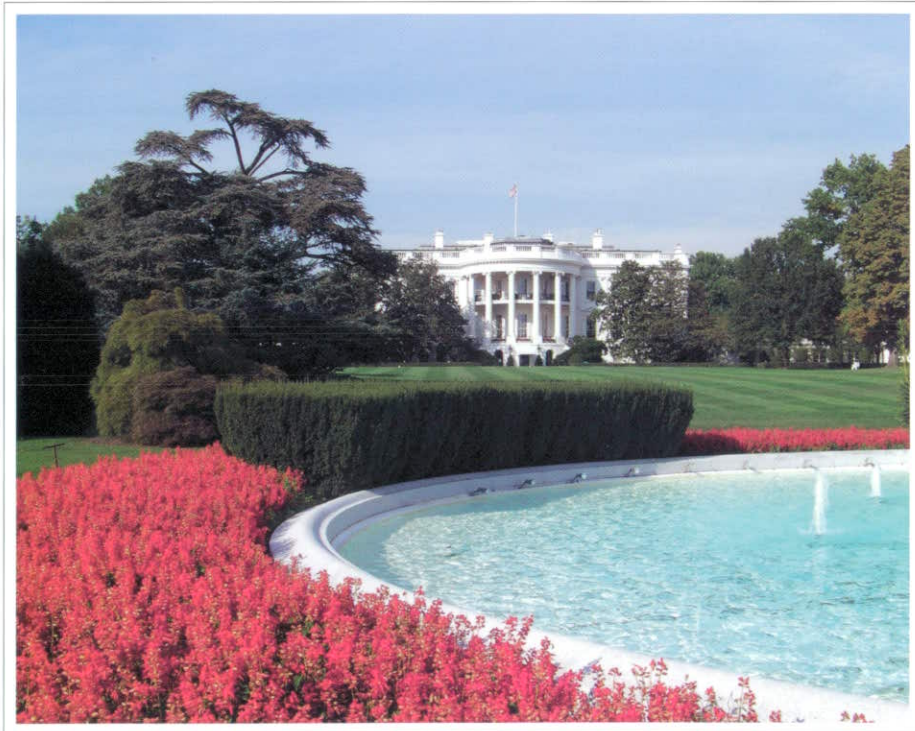

The south portico was built in 1824 after the initial 1814-17 rebuilding of the White House was completed. The sandstone paving at the south portico was cracked and deteriorated, and it was removed and replaced. To prevent future cracking, a new setting bed was installed and the thickness of the “star” stones was doubled. The 13 brass stars, representing the 13 original colonies, were reinstalled in the new paving stones.

Repair South Grounds Fountain

The south grounds fountain was originally installed in 1875-76. At the time, it was the second largest in the city and included a French fountain jet composed of 500 smaller jets. The fountain sits on axis with the south portico, has eight small jets around a large central jet, and is surrounded by evergreen and annual plantings. Over the years, it has been repaired and upgraded. In 2002 the concrete coping was removed and replaced with new granite coping stones. The fiberglass basin was refurbished, and the nozzles were repaired and adjusted.

2003

Replacement of East Executive Pavers and Removal of East Executive Fountain

East Executive Park was closed to vehicular traffic in the early 1980s, re-designed as a pedestrian mall in 1985, and functions as the primary corridor for White House tours. The surface of the sidewalk pavers had become slippery due to heavy pedestrian traffic and normal weathering, posing a hazard to both visitors and staff. The fountain never functioned properly and leaked, creating hazardous conditions for pedestrians. The fountain was finally converted into a planter. The turf areas stage large busses and trailers during major events at the White House, and the sub-grade in the turf areas needed to be reinforced to accommodate these large vehicles.

In 2002 the old concrete pavers and broken granite bands and coping on the East Executive Avenue sidewalk were replaced, and the existing granite bands in good condition were reset. Stone drainage grates and supporting brick work were removed, and new cast-iron drainage grates were installed. The grass panels along the avenue were rehabilitated by installing stabilized turf with gravel and soil mix base, a new irrigation system and post and chain barriers. The fountain was removed, and a circular paving pattern was installed in its place.

Conservation of Sandstone Columns at West Colonnade and Restoration of the Exterior of the East and West Wings

Under the supervision of a master stone carver, work began on the colonnade project in January 2002 and was completed in August 2003. The conservation project included the restoration of the nine sandstone columns along the west colonnade and the ten limestone columns along the east elevation of the West Wing. A chemical stripping of the lead-based paint allowed for the assessment and documentation of the necessary repairs.

The restoration of the exteriors of the East and West Wings as well as on the east and west terraces included the general repair of the masonry and woodwork by the removal of paint and unsound masonry and woodwork, the installation of new masonry and woodwork, and the reapplication of paint.

Credit: White House Photo Office

Media Staging Area

Live television media broadcasts from the grounds of the White House have become an integral part of the president's communication with the American public. Prior to this project, broadcasts took place from a temporary gravel-surfaced area on the north lawn in front of the West Wing. Numerous television cameras, lights, umbrellas, hand trucks, furniture, and other supporting equipment cluttered the site in a disorganized manner. Electrical and communications cabling laid on the surface of the lawn and paved areas created a poor appearance and potential tripping hazards. Broadcasters stood in the mud and wet grass during inclement weather.

The media staging area provides an appropriate setting for live television media broadcasts from the north grounds of the White House. The new flagstone staging area fits within the historic landscape; provides a paved surface with excellent drainage characteristics; minimizes unsightly aboveground wiring; designates each network an area with optimal viewing of the north portico in the background; provides 18 permanent network areas, with the southernmost network area configured to accommodate five stand-up areas facing the West Wing on special occasions; provides 15 feet between the camera and the reporter and is staggered 4 feet between adjacent networks to minimize audio cross-interference and distractions; and softens the visual impact and contains the media personnel onto the paved areas by using low shrubbery.

Credit: Office of the NPS Liaison to the White House

Rehabilitation of the Grounds Maintenance Building

The grounds maintenance building was constructed to accommodate functions needed for the grounds maintenance operations at the White House and includes a garage for tractors, mowers, and grounds equipment; restrooms and lockers for the grounds staff; a break room; an office for the grounds foreman; and storage areas for plant materials, pesticides and fuel. It was constructed in three phases—the first phase during the Carter Administration (1977) and the second and third phases during the Reagan Administration (1983).

The grounds maintenance building was modernized in 2003. The project included the installation of a new roof with standing seam, lead-coated copper and a solar energy component for long-term energy savings in the form of a 7.2 kW photovoltaic array on the largest section of roof. The entire facility received an interior rehabilitation that included painting, new floor coverings, new cabinetry, and an upgrade of mechanical systems.

In addition, vehicular access was improved by widening the existing roadway in several areas. Supplemental vegetative screening eliminated site lines from the Executive Office and Residence, and the irrigation system was upgraded to maintain the landscaped areas.

Credit: Office of the NPS Liaison to the White House

Reconstruction of the Swimming Pool Cabana

In 1975 a swimming pool and cabana were constructed south of the West Wing. The cabana underwent an extensive reconstruction in 2002, including a new trussed, standing seam, lead-coated copper roof that completely changed the look of the cabana. Solar panels on the roof conserve energy by converting solar energy into electrical power. New flooring, new doors, and an upgrade of electrical and lighting completed the interior update. New trim and fresh paint transformed the exterior walls. The old wood deck around the hot tub was replaced with recycled wood decking. The retaining wall and irrigation behind the cabana were repaired, old trees were removed, and mature trees and evergreens were installed for privacy.

Credit: Office of the NPS Liaison to the White House

The Southside Barrier Project

Construction of a permanent security hardline was completed on 15th Street, E Street, and 17th Street. Construction began in February 2001 and continued through December 2003. Four new gatehouses were designed to blend aesthetically with the architectural features in President's Park with a honed limestone veneer and granite plinth. The roof and fascia are finished in terne-coated stainless steel. Ornamental vehicular gates control access and egress at each entrance. Granite retaining walls and 260 ornamental security bollards replaced the unsightly temporary security barriers.

Credit: Office of the NPS Liaison to the White House

Reconstruction of Pennsylvania Avenue

Closed to vehicular traffic in 1995 due to security issues, Pennsylvania Avenue was redesigned as a pedestrian walkway in 2003 by Michael Van Valkenburgh Associates under contract with the National Capital Planning Commission.

The rehabilitation of Pennsylvania Avenue in front of the White House was completed in 2004 and includes the installation of new roadway surfaces, sidewalks and curbs of four different types of granite (Deer Isle, Kershaw, Deer Brown, and Mount Airy), security bollards and gatehouses to controlled access, and landscape plantings (including American elms lining both sides of the avenue). The Federal Highway Administration performed the construction supervision, with funding provided by the United States Congress. The National Park Service maintains and cares for Pennsylvania Avenue.

Credit: White House Photo Office

Replacement of Sidewalks

Three deteriorated sidewalks on the White House grounds were replaced—the Oval Office sidewalk, the West Garden Room sidewalk and patio, and the north portico sidewalk.

The Oval Office sidewalk was originally constructed of Tennessee flagstone set in mortar on a concrete base. The existing sidewalk did not fit well into the surrounding lawn, and as the surface deteriorated the brown Tennessee flagstone was randomly replaced with gray Pennsylvania flagstone.

The sidewalk was entirely removed and replaced to provide a smooth transition from the Oval Office to the south grounds driveway. The new sidewalk was constructed of hand-picked Tennessee sandstone from Tri-State Stone Company set in mortar on a reinforced concrete base slab. Stepping stones to the swimming pool were removed and reset to match the new grade.

The West Garden Room sidewalk and patio were constructed of Pennsylvania flagstone set in sand. The existing walk did not drain well, and

Credit: White House Photo Office

often areas of the walk were inundated with standing water. Many of the existing flagstones were cracked, broken, and/or uneven due to settlement. At the threshold of the West Garden Room, a steep concrete ramp connected the walkway to the finished floor of the building and created a hazard.

The Pennsylvania flagstones of the West Garden Room sidewalk and patio were numbered, removed, and stacked in the Rose Garden. Existing sand and soil, excavated to a depth 6 inches below the proposed finished grade, was filled with compacted stone dust. The old flagstones were placed in the same (previous) pattern, and broken, cracked, or chipped stones were replaced. New stones were set in concrete at the threshold of the West Garden Room. The sidewalk received new steel edging, and the patio was edged with 12-inch-wide flagstones. The walkway and patio were sloped to drain to a new 4-inch-wide trench drain at the northeast corner of the sidewalk (near the time capsule) and to the south grounds driveway.

The sidewalk from the north portico to the media staging area is 190 feet long by 5 feet wide with curbs partially along both sides. The walk was cracked, with portions of the curbs broken and removed. The sidewalk was completely removed and replaced with an exposed aggregate concrete sidewalk. The aggregate is composed of two different sizes of Mt. Airy granite chips to match the walkways along the north loop drive to the portico.
